

SHSBC TAPES 101-200

Black/White Version (suitable for print) (BW, Black/White)
Compiled 4. February 2015

a) Table of Contents, in Checksheet order:

1.	62-01-09	TWENTY-TEN, 3D CRISS CROSS	1
2.	62-01-09	TWENTY-TEN, 3D CRISS CROSS	25
3.	62-01-10	SEC CHECKS, WITHHOLDS	31
4.	62-01-11	HOW TO AUDIT.....	59
5.	62-01-16	NATURE OF WITHHOLDS.....	85
6.	62-01-17	3D CRISS CROSS AND GPM ANATOMY	111
7.	62-01-18	HOW TO DO 3D CRISS CROSS.....	137
8.	62-01-23	BASICS OF AUDITING.....	163
9.	62-01-24	TRAINING: DUPLICATION.....	191
10.	62-01-25	WHOLE TRACK.....	216
11.	62-01-30	IN-SESSIONNESS.....	242
12.	62-01-31	USAGES OF 3D CRISS CROSS.....	268
13.	62-02-01	FLOWS	290
14.	62-02-06	WITHHOLDS.....	312
15.	62-02-07	MISSED WITHHOLDS.....	336
16.	62-02-08	ASSESSMENT.....	352
17.	62-02-13	PREPCLEARING	372
18.	62-02-14	DIRECTING ATTENTION.....	394
19.	62-02-15	PREPCHECKING	416
20.	62-02-20	WHAT IS A WITHHOLD?.....	432
21.	62-02-21	USE OF PREPCHECKING	448
22.	62-02-22	PREPCLEARING AND RUDIMENTS	464
23.	62-02-27	PREPCHECKING AND BASICS.....	484
24.	62-02-27	AUDITOR'S CODE	498
25.	62-03-01	MODEL SESSION, PART I.....	512
26.	62-03-01	MODEL SESSION, PART II.....	530
27.	62-03-19	THE BAD "AUDITOR".....	548
28.	62-03-19	MECHANICS OF SUPPRESSION.....	566
29.	62-03-20	TV DEMO: 3D CRISS CROSS ASSESSMENT, PART I.....	584
30.	62-03-20	TV DEMO: 3D CRISS CROSS ASSESSMENT, PART II.....	612
31.	62-03-21	OBJECT OF PREPCHECKING	626
32.	62-03-21	PREPCHECKING, ZERO QUESTION.....	642
33.	62-03-27	PREPCHECKING DATA.....	654
34.	62-03-29	CCHS.....	678
35.	62-03-29	QUESTION AND ANSWER PERIOD: CCHS, 3D CRISS CROSS	692
36.	62-04-03	THE OVERT-MOTIVATOR SEQUENCE	708
37.	62-04-05	SACREDNESS OF CASES DETERMINISM	730
38.	62-04-05	AS-ISNESS: PEOPLE WHO CAN AND CAN'T AS-IS	746
39.	62-04-17	AUDITING.....	758

40.	62-04-17	HOW AND WHY AUDITING WORKS.....	774
41.	62-04-19	GROSS AUDITING ERRORS.....	792
42.	62-04-19	DETERMINING WHAT TO RUN.....	808
43.	62-04-24	RUNDOWN ON 3D CRISS CROSS, PART I.....	822
44.	62-04-24	RUNDOWN ON 3D CRISS CROSS, PART II.....	836
45.	62-04-25	TV DEMO: CHECKING LINE PLOTS.....	854
46.	62-04-26	RUNDOWN ON PREPCHECKING PROFESSIONAL ATTITUDE.....	880
47.	62-04-26	RUNDOWN ON ROUTINE 3: ROUTINE 3A CRISS CROSS.....	896
48.	62-05-01	ARC BREAKS AND MISSED WITHHOLDS.....	912
49.	62-05-01	ROUTINE 3G (EXPERIMENTAL) PREVIEW OF A CLEARING PROCESS.....	930
50.	62-05-02	TV DEMO: PREPCHECKING, PART I.....	944
51.	62-05-02	TV DEMO: PREPCHECKING, PART II.....	970
52.	62-05-03	CRAFTSMANSHIP, FUNDAMENTALS.....	1004
53.	62-05-03	PREPCHECKING.....	1018
54.	62-05-15	NEW TRAINING SECTIONS.....	1032
55.	62-05-15	NEW TRS.....	1049
56.	62-05-16	TV DEMO: PATCHING UP 3D CRISS CROSS CASES.....	1067
57.	62-05-17	AUDITING ERRORS.....	1099
58.	62-05-17	PREPCHECKING AND ITS PURPOSES.....	1115
59.	62-05-22	ADMINISTRATION OF COURSES.....	1131
60.	62-05-22	MISSED WITHHOLDS.....	1147
61.	62-05-23	TV DEMO: CHECK ON "WHAT" QUESTIONS AND HAVINGNESS PROBE.....	1165
62.	62-05-23	TV DEMO: FISH & FUMBLE CHECKING DIRTY NEEDLES.....	1187
63.	62-05-24	E-METER DATA: INSTANT READS, PART I.....	1219
64.	62-05-24	E-METER DATA: INSTANT READS, PART II.....	1235
65.	62-05-29	Q AND A PERIOD: GOALS ASSESSMENT, HAVINGNESS.....	1253
66.	62-05-29	SECURITY CHECK PREPCHECKING.....	1273
67.	62-05-30	TV DEMO: GETTING RUDIMENTS IN, PART I.....	1294
68.	62-05-30	TV DEMO: GETTING RUDIMENTS IN, PART II.....	1311
69.	62-05-31	VALUE OF RUDIMENTS.....	1331
70.	62-05-31	MIDDLE RUDIMENTS.....	1347
71.	62-06-12	HOW TO DO A GOALS ASSESSMENT.....	1363
72.	62-06-12	MORE ON MIDDLE RUDIMENTS.....	1379
73.	62-06-13	TV DEMO: CHECKING OUT A GOAL, PART I.....	1395
74.	62-06-13	TV DEMO: CHECKING OUT A GOAL, PART II.....	1421
75.	62-06-14	FUTURE TECHNOLOGY.....	1439
76.	62-06-14	LISTING.....	1455
77.	62-06-19	DO'S AND DON'TS OF R3.....	1469
78.	62-06-19	QUESTION AND ANSWER PERIOD: GPMS, RELEASE.....	1485
79.	62-06-20	TV DEMO: NEW MODEL SESSION.....	1503
80.	62-06-21	MODEL SESSION REVISED.....	1531

81.	62-06-21	QUESTION AND ANSWER PERIOD: TR 4, MODEL SESSION	1549
82.	62-06-26	E-METER QUALITY.....	1569
83.	62-06-26	PREPCHECKING AND THE TIME TRACK.....	1585
84.	62-06-28	RUDIMENTS.....	1602
85.	62-06-28	QUESTION AND ANSWER PERIOD: CCHS, NULLING GOALS.....	1618
86.	62-07-10	REPETITIVE RUDIMENTS AND REPETITIVE PREPCHECKING, PART I.....	1638
87.	62-07-10	REPETITIVE RUDIMENTS AND REPETITIVE PREPCHECKING, PART II.....	1652
88.	62-07-12	METER READING.....	1672
89.	62-07-12	METER TRAINING.....	1688
90.	62-07-17	E-METER READS AND ARC BREAKS.....	1704
91.	62-07-17	ANATOMY OF ARC BREAKS.....	1720
92.	62-07-19	THE E-METER.....	1738
93.	62-07-19	QUESTION AND ANSWER PERIOD: GOALS LISTS, FIELD AUDITORS.....	1754
94.	62-07-24	ROUTINE 3GA, PART I.....	1768
95.	62-07-24	ROUTINE 3GA, PART II.....	1783
96.	62-07-26	ROUTINE 3GA DATA.....	1799
97.	62-07-26	PREPCHECKING WITH MID RUD BUTTONS.....	1815
98.	62-08-07	ROUTINE 3GA DATA.....	1831
99.	62-08-07	ROUTINE 3GA DATA ON GOALS PART II.....	1845
100.	62-08-08	TV DEMO: ROUTINE 3GA, NULLING GOALS.....	1863
101.	62-08-09	CLEARING.....	1887

b) Table of Contents, in chronological order:

1.	62-01-09	TWENTY-TEN, 3D CRISS CROSS	1
2.	62-01-09	TWENTY-TEN, 3D CRISS CROSS	25
3.	62-01-10	SEC CHECKS, WITHHOLDS	31
4.	62-01-11	HOW TO AUDIT.....	59
5.	62-01-16	NATURE OF WITHHOLDS.....	85
6.	62-01-17	3D CRISS CROSS AND GPM ANATOMY	111
7.	62-01-18	HOW TO DO 3D CRISS CROSS.....	137
8.	62-01-23	BASICS OF AUDITING.....	163

Twenty-Ten, 3D Criss Cross

A lecture given on 9 January 1962

Thank you.

Well, you look different. You do, you know.

[part missing]

We had a bit of water under the dam, over the bridge, since I've been gone. I had a wonderful congress, absolutely fabulous congress in DC. People thought it was wonderful. Almost ruined me, but probably saved Scientology United States without much trouble. They were running on American meters which had been manufactured, God help us. If any of you've got American meters, there's a garbage can out there. Because these things were built, you know, without any consultation with me, and across – over my dead body, practically, on circuit changes, and so forth.

And this is not propaganda, but by George, you know, they don't pick up withholds. And that left practically all the Scientologists in the United States with missed withholds. Just like that. Bang! And that was what was the matter.

And the first day of that congress, I had to just scrape them up off the floor. It was the hardest show to get on the road you ever wanted to see.

Got to talking to them about withholds, told them what was wrong, and so forth, and they came right along with it. Laid into the organization along about Tuesday. They had by that time three British meters, and they all of a sudden had been finding that there was practically one missed withhold per question on the Joburg, and things like this. And their morale started going up. Everything started moving along very well in the field, and so forth. A lot of excitement about this.

Very funny. The people came to the congress with big plans on how to rewire and salvage American meters. And they took a look at the British Mark IV and saw the thing in operation and just scrapped the American meters. Actually, it was all over the floor that they should scrap American meters. Just skip them.

But Reg gave a demonstration, very ably done, and had an American meter element of all things in the projector, and we got a pc, a field auditor's pc, and he ran her there on the stage, and the withholds were pretty juicy. [laughter] And they were all missed across the boards, and Reg glancing back at me in the wings because it was an American meter, you know, should he pull more, you know, and I told him I thought there were probably two more. So although they weren't showing on the meter, he went right ahead and pulled two more. [laughter]

And then, of course, I stepped on and told people, "Well, you see what withhelds do." This girl, by the way, started looking very bright and so forth, after she had been looking rather gloomy at first. And I gave the auditor who audited her – I didn't even know his name, you see – I gave him hell and Maria and mischief, and said people shouldn't do that sort of thing, you know, and really cut it up. His mother wrote me a congratulatory letter saying it was about time somebody took him apart. [laughter, laughs]

But anyway, anyway, it was a great congress, and things are really rolling very nice.

But there was a great deal of technical data suddenly swung into place while I was gone. Had some time to think and consolidate a few things. Got a look at havingness amongst other things, and havingness in its relationship to withhelds. That was the main thing

And out of this you get Twenty-Ten on which you have just had a bulletin. And I think you'll find Twenty-Ten really makes a pc soar. If it doesn't, you haven't got his withhelds off or you haven't got his Havingness Process. But in view of the fact that a withhold cuts down havingness – that's all you can say about that, a withhold cuts down havingness – and when you get the withhold off, all you have is potential new havingness.

I better start at the beginning. This is the 9th of January, [*female voice: Yes.*] and this is the mystic month. The mystic month, 9 Jan. You know what a jann is, don't you? It's a ghost from Arabia. And this is the mystic month. This is month of mystic mystics. We're going to cure them this month.

Saint Hill Special Briefing Course.

This business about havingness, now, this is very important. Havingness had as many as forty-three different reasons why it worked. And you'd be very interested that it came down to a child's definition. The sixth lecture of that Washington congress, by the way – January 52 [62] congress – one whole hour is devoted to this, and so forth. And a very concise rundown, if I say so myself. I'm going to give it to you in about thirty seconds. That is to say, that havingness is best understood by no-havingness. And I had this in the bull pen for, oh, I don't know, seven years, trying to get the common denominator of what havingness was so that it could then be applied to auditing, and so on.

And all of a sudden, Reg ran some havingness on me, and I kind of took a look at it, and we had an error going in the session, and all of a sudden boom! Why, I suddenly realized what havingness was. It's best understood by the reverse definition. What is no-havingness?

No-havingness is the concept that one cannot reach. I know this is so elementary it's going to take you twenty-four hours for it to dawn on you. Anybody knows this, you know. Everybody always knew this except nobody knew it until the other day.

No-havingness is prevented reach, in other words. Concept of no reach, no-havingness. All right. And then havingness is simply the concept that one is able to reach, and that is all havingness is. One merely has to have the idea that he can reach something in order to have it. You see, you don't have to reach it in order to have it. You merely have to have the concept that you can reach it. And that is havingness. And out of forty-three chances in which this definition did not occur, we all of a sudden have a common denominator to havingness.

Now, this is of tremendous value to you as an auditor. We're back, of course, on Reach and Withdraw. And we're back into the common denominators of communication and all these old-time proven truths. And we're right there, you see. And that is, Havingness fits right into the bracket at once.

So now I'll give it to you with the twelve-inch-gauge barrel. On the other hand, a person with a withhold, of course, has the concept that he can't reach. So withholds reduce havingness. I mean, that's... And therefore running withholds improves havingness. It is so elementary. There is nothing really to it, except it is one of these sweeping truths like the world is round. I mean, it'll make that much difference.

All right. Now, let's look at this. Let's look at this a little bit further.

This tells you that the moment when a pc has released a withhold, he has a potential reach. And if you don't capitalize on it in the very near future, of course, he doesn't realize that anything new or strange has happened to him, very often. He gets off a withhold and it doesn't do him any good.

You've seen that happen, you know? The fellow gives up a withhold and all of a sudden it doesn't seem to do him any good. Well, the reason it doesn't seem to do him any good is he hasn't practiced reaching since. You're waiting for the accidental: Three or four days from now he all of a sudden finds out he can reach in that particular quarter, don't you see?

Well, instead of leaving it on automatic and just letting him find out about it suddenly, well, straight away, why, after you've pulled a few withholds run some Havingness, that's all. And you run the withholds, and you run the Havingness, and you run the withholds, and you run the Havingness.

And the reason I tried to figure out some reasonable ratio – and that auditors can remember it is the better reason for the exact ratio than any other reason – call it Twenty-Ten, and that's twenty minutes of withholds pulled and ten minutes of Havingness, no matter where you're sitting in the withholds, see? No matter what part of the question you've gotten, whether you've gotten a question flat or not flat, it doesn't matter because you're going to come back to that question anyway.

I had to do some experimental workouts on this to smooth it out, and that apparently is the way it sits. So it doesn't matter then, you just say, "Well, we'll come back to this question later," or anything you care to say to the pc, and, "Right now we're going to run some Havingness."

And just do that on the twenty-minute mark, and you'll find that you're – if you run the Havingness ten minutes, why, you're all set. Now, the rule of Havingness is you should run Havingness until the pc can have large objects in the room. But you know very well that a lot of Havingness Processes out of the thirty-six don't tell you whether the pc can have large objects or not.

Now, Havingness will run to a rise in the needle and then a blowdown. You'll get a rise, rise, rise, rise, rise, rise. You watch the needle, and the tone arm keeps following it on up, on up, on up, on up, and all of a sudden the tone arm blows down.

Well, it would be optimum to run it to blowdown if some pcs didn't wait for two or three sessions to blow down. So that's why we don't use blowdown as a criteria when to stop running Havingness. Just run it ten minutes. That's good enough, and you'll find out that will do a lot of good.

Now, test the havingness after the first eight or ten commands. After the first eight or ten commands, get the second can squeeze.

In other words, when you start to run the Havingness, get the can squeeze. You get your needle set, you see, so that you'll get a third-of-a-dial drop or something like that. Just make a crude estimate of it. Swing your sensitivity back down, don't you see, from where it's been while you were security checking.

And get him to squeeze the cans and watch the degree of squeeze. Well, that's fine. Run eight or ten commands and ask for a second squeeze. And if it drops more, the needle drops more, and it is looser, you're all right, see? You're okay.

And if it doesn't loosen up at that point, of course, your rudiments could be badly out or something like this could happen, but the point is the Havingness Process should put the rudiments in.

In other words, you should get a loosening needle even – if the pc is doing it at all, you should get a loosening needle on the Havingness Process. So although some wisdom will occasionally monitor this and you will do something else like ask him if he has an ARC break or something like that, you ordinarily – and this practice would not go wrong at all – you would ordinarily get another Havingness Process. And you just keep testing for Havingness Processes. And that does not go on the Twenty-Ten. You see, that time stands alongside of the Twenty-Ten. If you have to find a new Havingness Process, you don't count that into the Twenty-Ten. And then you find it finally, and you run ten minutes of that, and you go back to your withholds.

Now, you're going to find out that a pc – the more intricate or oddball the Havingness Process you find for the pc is, the more – higher probability is that it's going to wear out. And you usually come down to something like "Point out something." That will last a long time. "Look around here and find something you can have." When you finally get on to that and it's running smoothly, it generally will run practically forever.

But "What is the emotion of that room object?" you see? Oh, man, I mean, that thing can wear out, clang! By the way, that is a remark that is seldom made about Havingness Processes. That particular one, you know, is a changed process. After a little while the emotion runs out, and their Havingness Process changes – and you might not have known this – but changes to "What is the condition of that room object?" What is the condition of it instead of what is its emotion. But you realize that that thing changed. I don't think it's written down anyplace. I don't think it's written down anywhere. Might be. It might be in a lecture someplace. But there is that point about it. That one goofball thing

Now, getting back to Twenty-Ten, I would advise you, at this time, not to security check any other way because it capitalizes on your withholds. And you'll find out it should work like a hot bomb.

Now, if this is working properly and you are actually pulling withholds on the pc, and all is going along splendidly, and you're not missing withholds at every turn, and so on, and the Havingness Process is working, you actually – running this on some character off the street, something like that – should produce some interesting miracles. I mean, some interesting things should happen to the case just as a result of this.

Now, there's another mechanic that I haven't told anybody, and that's this: The oldest test of circuits shows that when you run Havingness, when you run Havingness, the circuits key out and move out of the person's perimeter and out of his head. These black-mass circuits, that are mentioned in Book One, they key out and move out of the person's head.

Now, let's move right on into 3D here. The Goals Problem Mass with terminal, oppterm, terminal, oppterm, terminal, oppterm going on up the line, tremendous number of terminals and opposition terminals could make – if you drew them as circles opposite each other; a long series of circles vertically, one opposite each other, one representing the terminal, the other representing the oppterm – they would represent what you might call the main chance, the main line. Those are the terminals, and those are the opposition terminals as the person has deteriorated down the track until he finally became human here.

And that is the main chance. That's the main track. And when you're trying to get a 3D package, what you want is the main chance. You don't want a whole lot of locks.

Now, if you'd consider that as these two circles facing each other, see, and then below that two circles facing each other and two circles facing each other below that, and so on, as it went on down the line... Now, as you get down lower and lower and lower, you're getting more and more to present time. Let's plot it that way. All right.

Now, back there about the middle of the patch or toward the beginning of track or middle of track, or something like that, just as an example, you have a whole bunch of lock valences. Now, they depend on the main terminal and the main opposition terminal for that particular period of the track, but they are locks. And they confront each other, and they face each other, and they are just little offbeat valences.

And there are so many of these that a pc almost has one for every type of personality there has ever been. I don't know if you're aware of the tremendous multitude of these lock valences. It's something like trying to count the stars in the Milky Way.

Now, what we're interested in is the main chance, the 3D package. There aren't very many of those, you see, and that's what holds all the rest of the bank together.

Well, if you've got the terminal and the opposition terminal for any given period, these will run. These will run very nicely. But – but you could get your hands on literally any one of thousands of subsidiary lock packages. And some of them run, oddly enough. Some of them look so close to something. They look so near in and they register so nicely for a while that you actually could put your hands on a false 3D package if you were assessing people who were very bad off and very keyed-in. Why?

Well, let's say that one million years ago he had some kind of a game going and – he was a waterbuck and – oh, now you know I'm back, huh? [laughter] And the other valence was a tiger, and you've got – now, hanging on to a waterbuck, you have a school of fish. See,

water and water and there's a school of fish. You know, he got mixed up, and he was a fish for a lifetime or two, you know.

And then hanging on to this was a school. For some reason or other, there was a school where they taught waterbucks to be waterbucks or something of the sort. And hanging on to this a totally false valence – if you were going to try to run it as a 3D package; it's nevertheless there – we have schoolteacher. See, it's just a piece of this school. But that's hanging on to a school of fish, so that's hanging on to something else. In other words, some silly concatenation of this character, you see, all related in some wild, idiotic way, you see?

And over on the tiger's side of the thing, over on the tiger's side of the thing was, of course, another valence, tigress, is associated with that valence. And then for some reason or other, women who have tigerish habits, you see, is associated with that. And then a girl student, you see, hangs on to that in some mysterious way because she liked to lick her chops or something like that, you know. And she's hung over there on that side of the thing, you see?

Now, unfortunately, he has led a very enturbulated present time life, unfortunately. He's in a very much of an enturbulated state, and he's a schoolteacher in a ladies' seminar.

Well, now, that valence doesn't separate off the school for waterbucks – school of fish – waterbuck, you see, package way back there.

They're so inseparable, short of auditing, that that whole package pulls up into present time, and it makes the Goals Problem Mass have a great big curve on it into present time.

And on the other side, the oppterm, unfortunately, was matched at that point, so the oppterm curves into present time. And in present time, he would read schoolteacher versus girl student. If you were just asking for it, just off the bat, you'd get schoolteacher versus girl student. And it'd look like a 3D package. As a matter of fact, it'd stay in for a little while, a very little while. It'd read kind of sporadically and stupidly, and so forth.

Of course, it's been restimulated so the Goals Problem Mass is warped into present time. If you can get the idea of the mass ever having been straight, you see, which it probably hasn't been – but it has the potential of being straight; it has the potential of being a plotted time track.

And instead of being straight, of just being bent over from a hundred trillion years ago, let us say, down into now, on both sides – you see, it'd look like quite a snarl because it brings along with it a school of fish. And as a schoolteacher, he has always been deathly afraid of fish. This is inexplicable to him. And there's all kinds of other things in there. And if a woman were to look a little tigerish, why, he would either marry her or kill her. You know, sometimes there isn't much choice. [laughs]

And so there is a Goals Problem Mass which will give you a scratchy needle. Gives you a dirty needle, scratchy. You can't read past it. He's got a horrible present time problem. He's a schoolteacher versus girl students. This is keyed in perpetually in session, has nothing to do with the first available terminal and oppterminal that you're going to run.

You're not about to find a waterbuck, and you're not about to find a tiger. You see, you're not going to get anything here but a big mess.

And you try to audit past this and you try to assess past this, and you're in difficulties perpetually. You can't quite figure out what's going on here. You know the pc has present time problems and yet he doesn't assess and all this kind of thing, and it's just all kind of hay-wire. Do you see, what's happened there is that the present enturbulence has caused one of these myriad of valences to match up in some kind of a pair up in present time, and they've got no business being in present time. And that makes unavailable other packages, so therefore the pc is more or less unassessable.

Now, your Havingness runs out circuits and runs out valences. And as a matter of fact, if you've ever been audited on some of the old skills, you may very well yourself subjectively have seen one of these things leave while you were running Havingness, seen it peel off.

Actually, you can do a really interesting clinical experiment. You can run a pc's havingness down by making him talk against strain, and you can see one of these things move in, and run some Havingness on him and see it move out. And it's peculiarly noticeable when it is a talking valence, you know – when it's a valence that actually talks – chattering valence. Because the pc at first will notice that it is speaking, and he will be speaking a certain way himself. And if you're very clever on the observation, what will happen next is the pc will start telling you what it is saying as the answers. And then the pc himself will not distinguish between himself and the circuit, but will merely dramatize the circuit that has just been keyed in.

And then you run some Havingness and it moves out, and the pc will again be telling you what it is saying, and then it goes on out, and the pc is not paying any attention to it and talking like himself.

This dramatization type of action can be keyed in and out, and sometimes in auditing you may have seen, actually, a black mass depart from you.

Well, now what holds a black mass in? Havingness, you see, is intimately associated with withhold. So as havingness drops, of course, one withholds harder so as not to lose anything so therefore, when a pc has withholds, he holds the circuits in, and his havingness remains low.

Now, you may have had this experience. You may have taken somebody and audited him for seventy-five hours on Havingness – I'd say some auditors here have done just that – and watch the fellow polish up to the nines – actually just look marvelous, you know? Everything is fine. Everything is going *beautifully*, and so forth. And he walks out about three feet off the floor. And twenty-four hours goes by and he still feels pretty good. And thirty-six hours and forty-eight hours and he's still alive. And sixty hours goes by and two weeks goes by, and where was your seventy-five hours? He has gone completely back to the original state. Well, how interesting. But I'm sure a lot of auditors here have seen just that thing happen. Now, what made him relapse?

You ran the havingness up in spite of the withholds. And the presence of the withholds pulled it back down again. So havingness, apparently, cannot remain stable in the presence of withholds. And when you get the withholds off and build the havingness up, you then are removing – as you take off the withholds – you are removing the reasons the havingness would drop again. Now, this is theoretical, but I think you will find it working out.

So in other words, this offers you an opportunity to be able to run Havingness without having it sag. And you know, that would be wonderful because pcs get all polished up at the end of a Havingness run and fall on their heads. All right. Supposing they got all polished up at the end of a Havingness run and didn't fall on their heads?

Well, the way to prevent their falling on their heads, of course, is get their withholds off. Hence, Twenty-Ten. And that is the design of Twenty-Ten.

Now, why should you run Twenty-Ten at all on a pc if I can give you such a thing as Criss Cross – which we'll take up in a moment. I might as well shoot you with 16-gauge, 12-gauge, 10-gauge, and 8-gauge loaded with buckshot and solid rounds, because I haven't been able to talk to you for some time. And I thought, "Well, I'll plot this out. And this week I will give you a nice lecture today, and I will take up the congress or something of this sort, and tomorrow I will take up perhaps Havingness, you see, and Twenty-Ten. And then Thursday I will take up Criss Cross, and so forth." But you know how it is. You have to get it all done at once, and so on. And I don't think I could withhold from you that hard on this much good news. It would be an actual withhold, so I said, "Well, I'll just let them have it with a grape and canister."

All right. Well, that wraps up Twenty-Ten. That's all you'll hear about Twenty-Ten except being scolded for not running it right. But this goes much further.

Let's take this seventy-five hours of preparation the pc should do, minimum, before he is assessed. Let's take this up, and let's see, now, that if the pc had keyed in to present time a schoolteacher and a girl student, and actually the waterbuck and a tiger weren't even available as part of the package, and these things would get some kind of a weird registry, and then the pc wouldn't go anyplace. And actually, he'd probably beef up the Prehav Scale and all sorts of things would happen if they were grabbed by some auditor in Cape Town or Sydney.

So some auditor just grabs these things, you know. He says, "Hey! It twitched. It twitched. Been sitting here for days waiting for it to twitch," you know. And see, "So, well, that's the terminal. We got it now. Got the 3D package. Didn't clear him though. 3D can't be much good. He spun in. Of course, the thing didn't register when it was checked out. And it was checked out after we'd run it 125 hours. Funny thing though. I didn't have any trouble with the Prehav Scale. You know, everybody talks about bad Prehav assessments and difficulty with the Prehav assessment. I could take anything on the whole scale that was all alive the whole time." [laughter, laughs]

Well, that kind of nonsense could immediately result, you see, from having a pc who was unassessable. Well, why would he be unassessable? He'd have these valences keyed in to present time, and every time you ask him for anything, they would simply bang. He'd bang on a present time problem, don't you see? He'd keep banging on this present time problem, the terminals resulting to it, and they're attached to the Goals Problem Mass at some tremendously early period on the track. And they're very beefy, you know, schoolteacher – schoolteacher in the days where the child didn't get his arithmetic, and they hanged him, you know. I mean, real vicious, you know? Something like the teacher at Saint Hill. And they – but totally unsuitable, and you can't assess past it.

Now, you run Twenty-Ten, the probability is that you will knock both of those out, and the Goals Problem Mass under Twenty-Ten should tend to straighten out, thus making available to you the main chance – the actual terminals and the actual opposition terminals of the pc on the whole track.

In other words, you've knocked these little button lock valences off like warts on an apple. You peeled the apple, and you found yourself a good apple and you ate it. But that's the way that would look. You see how that would be? Kind of interesting. So you could run Twenty-Ten, straighten it out, and the pc could be assessed. All right. Providing it were done right. All right. So much for that.

We move right straight in, then, into 3D Criss Cross as a logical sequence. Why is it called Criss Cross? It's because you go from the right to the left and the left to the right, upgrading each time you go, and it makes Xes, till you get a whole series of Xes out of it so it looks like a criss-cross, and I thought that would be a good name for it.

The liabilities of assessment are great. Misassessment is very easy to obtain. It's one of the easier things to obtain. Some people hardly have to try at all, and they get a misassessment.

Now, in view of the fact that these little valences, as locks – actual little circuits and things like that – they won't look little to the pc, but they're little in comparison to the Goals Problem Mass. In view of the fact that these things can exist left and right, and as long as they are the only thing you've got, they'll continue to run.

In other words, you'll continue to get a knock on them somehow, although you haven't got the right one, see? And it won't be the right one at all, but it'll continue to knock, usually sporadically, but it can come in and out, and you'll keep getting a reaction on something like this, you know, like schoolteacher. Actually, the terminal was waterbuck, and it was a long way between a schoolteacher and a waterbuck, but the pc made it.

Now, if you don't deintensify that area of the package, you're liable to get the schoolteacher, not the waterbuck. His attention is on waterbuck via the schoolteacher, and you get him to look no further than schoolteacher, and there you land. Do you see how that could be? You're trying to get his attention on waterbuck, and yet you only get his attention on schoolteacher unless you get some kind of a stupid, sporadic read.

Now, the pc does not have to be in bad condition for this error to be made. Now, this accounts for a mystery which students have had here for some time, and that is how they can find an item, and the checker doesn't prove it out. And I have heard more students grinding their teeth, you see. It's the small, petulant sound you hear, grind, grind, grind. It's different than sound of chewing gum. [laughs] It goes slightly different. And you hear it out here in the hall, occasionally, when the pc has just been not checked out or the checker has gone ahead and found the – another terminal entirely. Well, what happened? What happened?

It isn't really that the student was wrong, and it isn't really that the student was right. The student didn't null the whole list. When you get a wrong item, the checker always finds that there are several other items on the list still alive. Well, why is this?

They might have seemed null, but they could have all gone null because the rudiments went out at one time or another, and as you walk by them, you X them out, because the rudiments were out. And then you got the rudiments in and completed your assessment on some other part of the list and never went back and read that earlier part of the list, you see, with the rudiments in. So you didn't notice they were still knocking.

Well, in other words, those things haven't been knocked out. Assessment by Elimination actually is pulling innumerable locks off the actual item. And while you've still got a half a dozen of these locks still alive, you've got enough charge on the situation that you can get a lock. You get a lock valence, and it isn't quite the right one.

Now, the checker takes it and works with it for a while. He finds out it goes out. It was probably almost ready to go at the moment you turned the pc in. Maybe you turned the pc in hastily, hoping he'd be checked fast so that it would stay in. But the checker going over this checks against the list items, don't you see, and goes down the list items, and actually releases the remaining valences, and then finds he's got the 3D item. It's a highly mechanical proposition. It shouldn't be considered very esoterically, because if you haven't nulled completely anything that was on the list, you'll for sure have some valences left.

You see, the pc has just called on valences when he's given you the list. He hasn't just dreamed up a bunch of wrong things. He sort of counted the warts on the frog, you know? You were looking for the frog, and he counted warts. And he counted and he said there was a – there were all kinds of kittens and cats, and there were lions, and there were circuses, and there were circus performers, and there were flags with stripes in them, and there were clotheslines, and there were old men with whiskers, and there were cages, and tigers, and men with whiskers, and that's all.

And you've gone off down the line, and of course all these things are associated with a tiger in his mind, you see? These circuses and circus performers and cages and whiskers and all kinds of wild things, you see? So you just keep knocking these things off, you know, and you'll eventually find the frog.

Well, if you've got several of those alive, his attention can still be stuck on the locks. He has never given you a free list. Don't ever think that a pc ever does. A pc does not think thoughts of his own while dealing with the Goals Problem Mass.

And when you get to be an old, 'oary-'eaded veteran like myself, you never believe the pc in relationship to any part of the Goals Problem Mass because he's always talking to you *as* the Goals Problem Mass until you get an item nulled. It's quite remarkable. The pc that rises superior to his bank *does* exist, of course, and you do all the time when you audit.

You've just been finished off in a session, and they didn't finish anything off, and they didn't check the item out, and nothing occurred, nothing occurred, nothing occurred, you see. You didn't get the item. You're still in a big question mark as to what the item is, and our next stop is end of session.

And you go right into your next session and audit, see? And you audit somebody, and you do a creditable job. So you can rise superior to a Goals Problem Mass.

But a pc who has no necessity level or any reason whatsoever – any pc has no reason to rise above the Goals Problem Mass in any way, shape or form. There is no reason for the pc to do so, is there? He's just sitting there, isn't he? So if he says anything at all, I can assure you it has nothing to do with anything but the Goals Problem Mass.

That's why you don't believe a pc about his own case, particularly in session. The pc will say, "Oh, yes, yes, I'm a wart. Yes, oh, that's me all right. Yes, yes. Oh, oh, yeah, sure. Circus performer. That's awfully good. Yes, circus performer. I'm an old man with whiskers. That's right. Because you see, I'm – actually been always afraid of cages. So really I'm a cage, except I'm a high wire performer, except I'm a flag with candy stripes." And he tells you he's all these things because his attention, of course, has been put by you on the Goals Problem Mass, and he expresses himself very thoroughly in this particular direction.

You see, his attention is on them and there is no reason for his attention to be on anything else. So you actually never find a pc actually being audited in the vicinity of a Goals Problem Mass who ever tells you anything but the contents of the Goals Problem Mass. Just make up your mind to that.

Now, you characters who occasionally believe a pc and take the pc's choice about some matter make me wonder sometimes because he's just running off like several phonograph records.

He says, "*Rrrrowr*," and he gets there, and he says, "Circus performer." And he says, "Well, I've always been on high wires. I've always been deathly afraid of them, and that's why I am, and so forth. And this is me."

And it's absolutely true. Because he's in a valence, you see?

You think, at first glance, that there is only this type of valence. You think that there is only the type of valence which exists wholly as itself, and that you are looking for it, and it's not any other valences around it, see?

Examine your thinking on this subject and I think you will agree with me that you more or less have looked at this thing as it was one rock in the middle of the ocean, and you were looking for this one rock.

No, that's not true. The ocean is full of rocks. You're just looking for a big rock, that's all. And when you first start looking, all the rocks look the same size, and then you finally find one is bigger than the other, and it's on the main chance. Don't you see?

So that whenever the pc's attention is on one of these lock valences, he's talking to you squarely out of a lock valence. You put his attention on it thoroughly, so therefore you must never take his judgment because as a circus performer, he's even start – he'll even start using circus lingo. He kind of thinks that way.

And that's the way he tours through the bank. Lock valences. Think of a bag of raisins with an apple in it. And do you know, he can thoroughly dramatize any one of those raisins. And it derives its whole force and power from the apple, but because the apple is invisible, why, of course, you don't know what the apple is, and the pc usually can't quite describe the apple.

He starts to describe the apple and he tells you about another raisin, and he thinks about the apple, but he describes another raisin, don't you see? And it isn't until you've got a tremendous number of these raisins discharged or eaten or something – nulled out – that the pc says, "Well, how silly. How silly. Tiger. Tiger. Knew it all the time. Couldn't think of it. I don't know why I couldn't think of it, but couldn't think of it. *Rrroooowr.*"

Well, if you understand those characteristics of the Goals Problem Mass, and if you've got that taped, that it's a mass of goo, but it is goo which has molecular composition, you see. Any one of these valences will look as big as your head. They will. They don't – they aren't small. They aren't microscopic. Any one of them can be drifting around or appear to be drifting around while thoroughly tied to the Goals Problem Mass, so that your way through all this is a treacherous way.

You see, a pc doesn't give you much help. Of course, he does try to help you. Very often the pc rises spectacularly above the bank, even in a session. He rises spectacularly and he says, "Well," he says, "this is all fine, and it's so-and-so and so-and-so." And we've checked off so-and-so and so-and-so, and it's fine. But that could also be the valence of a judge that has suddenly come up, you see. And as an auditor, you just can't take that chance. Well, it's a judge, so he of course, he can adjudicate at that point.

If he slips a little bit, he'll say, "Well, off with their heads," too. It will sort of slip into the sentence structure.

So you're walking a very tough road, because although there may be just a relatively few vital combinations which are hanging gorgeously suspended in space, gorgeously suspended in time – absolutely fantastic how they could continue to balance themselves this intricately so as never to discharge down through the trillennia – they have accumulated under themselves the most fantastic number of fellow travelers you ever cared to mention.

See, he's got a valence for everything he's ever been, and it gets hooked over onto the Goals Problem Mass. As long as the Goals Problem Mass is charged up, these things are liable to stick together and cross-associate, and so forth.

So the way to find one, of course – the most reliable way to find an actual part of the 3D package is with the goal. Let's find a real goal for the pc and a goal the pc has had, and it'll lead you straight into the main chance. That's 3D which is formal or standard assessment. You find the goal, you find the opposition terminal, you find the opposition goal, and you get the modifier, and you get the terminal, and so forth, and that's it.

And if the case is assessable, of course, that's perfectly workable. And the case could be put into an assessable state by enough preparation, and then you could go ahead and handle it on its standard way, just as you have been doing it.

All right. Is there another way to enter all this? Let me tell you now some of the liabilities of all this. One is, auditors have lost pc's goals lists. You know, that's one of your greatest liabilities. Pc then, when he writes up the goals list, doesn't ever give you the goal. You know? Because it was ticked and stressed, and then rejected in some way, in some fashion, he doesn't come up with it. It's so often true that if you can find the pc's original list, you

can find the pc's goal. And if you can't find the original list, you've had it. You get the goal by bleeding down the meter and by doing all kinds of odd things.

And it makes a very tough, long assessment, and you're usually trying to find the goal anyway before the pc is any shape to be assessed, and it takes six weeks to no goal, you know. Rough deal.

Well, is there any way this can be short-circuited? Is there any way this could be short-circuited? Is there anything else we could do about this? And yes, there is. There's 3D Criss Cross.

Let's supposing the pc has had some preparation. Let's say the pc can be kept in session. Those as requisites. And let's say that some auditor has lost the pc's goals list after finding the wrong one and the pc's kind of ARC broke and it's all invalidated, and we don't know which goal was invalidated, so we don't know quite how to straighten out the invalidation, and it's all sort of rough. Is there any other way to go about it?

Well, the first and foremost method of going about it is to run General O/W on the pc, self – General O/W on self – and make a list of his answers: "What have you done to yourself? What have you withheld from yourself?" And make a list of his answers. This is a real slippery action here.

And then you up and say to him in this many words – you say to him, "Who would you treat like that, mate?"

And of course, this takes him by storm because he hasn't thought of this as an activity. He just thought of this as life. This was him, you see.

"Well, who would you treat like that?" you know. "What have you done to yourself?"

"Well, I've kept myself up late at night."

"Well, what have you withheld from yourself?"

"Bad news."

"What have you done to yourself?"

"Well, I've put myself in the hospital every time I've been feeling bad."

"Well, what have you withheld from yourself?"

"Well, I withheld from myself certain beverages such as coffee."

Goes on like this, and you say, "Well, who would you treat like that?"

And he says, "Gor, a sick person."

And you say, "Who else would you treat like this?"

And he gives you a very nice, neat list. You assess that list and you'll find some part of the 3D package. It's quite an interesting thing.

Be prepared, however, to also not find a part of the pc – of the 3D package because this one can slip to this degree – that you again find only a lock. See, that's not a sure-fire method. A sure-fire method is goal and standard, see?

But that gives you a starting point, and that is a thing which is perfectly usable and perfectly assessable. And if the thing does prove out, and if it does match up properly into a package, of course, you've got a 3D item. Of course, all 3D items are susceptible to test, and that is a way of entering a case because it gives you an item, bang!

All right. Now, let's take up a more specialized case. You may not have been aware of the fact that in this running of Routine 3D, one of your greatest liabilities is clearing the character. Yes, you can come up along the line and take your finger off your number and run a piece of free track. You know, there's free track outside the Goals Problem Mass, and you've had a long lot of look at free track. Most of the engrams you've run are actually pc's free track. This lifetime, in most cases, is free track except where this lifetime has been a total dramatization and a restimulation in an enturbulative area so that the person has had the Goals Problem Mass all his lifetime. Ordinarily, it'd be free track.

So you have free track and then you have the Goals Problem Mass, and these things are two different things.

All right. You got the Goals Problem Mass. Here it is.

Free track. You run the pc down this, and you can find a valence floating free, utterly and completely free, and audit it, and have it slope off to the side, sort of at right angles to the Goals Problem Mass, raise the pc's determinism like mad, everything goes along dandy, everything is beautiful, and the pc will clear without having taken apart the Goals Problem Mass, and this can happen to you running 3D. And you all of a sudden find yourself sitting there looking at a floating needle.

Well, having taught you how to make Clears in some cases, I now have to have the dismal pleasure of teaching you how to wreck them. How do you wreck a Clear? Well, it's very simple.

You take any goal on which the person was run and simply find its modifier, and he will no longer be free of the Goals Problem Mass. That is it. Hell make a head-on collision. So all you have to do is make a – actually just start groping in the direction of the modifier, and you've spoiled a Clear. And they spoil that easily. You can spoil them in auditing far more easily than you can spoil them in life. So you should know this about that because if you did ever accidentally make a Clear, you, of course, are up against it if you didn't know this other trick because nothing will read on the meter.

Yeah, a person feels fine. They don't think they need any auditing yet. Everything's wonderful. A few twitches here and there occasionally, but fine with them, you see. They're Clear. But they're only keyed-out as Clear.

So the trick is just find a goal they have run – or find a goal in any event – and get its modifier. And when you get the modifier, of course, that was still a sleeper, and it was contained in the Goals Problem Mass if it was found in the first place, and it pulls the whole Goals Problem Mass in on the pc with a *clunk*, and it is a pc again, not a C.

You should know this. You should also know why life can key in an oldtime Clear, and why, since 3D came out, we have had a general – any time anybody was indifferently

assessed in the direction of his Goals Problem Mass, don't you see, even though he had been Clear before, he caves in as a Clear rather rapidly. You should know that. All right.

Now, it's a liability doing this because this can make a Clear. And that is about the only thing wrong with 3D Criss Cross, because you don't have a goal to key in the Goals Problem Mass if you accidentally made a Clear.

Because Criss Cross is getting a package without a goal, see. And then after you've got the terminal and opposition terminal, then you find the goal and the modifier and the opposition goal.

So you could go the whole distance here and wind up at the end with a terminal and an opposition terminal of some kind, but these things just by inspection just sort of went *phsssst*. So early in the game, for heaven's sakes, find a goal for one of the items that you find. And I don't think that's in this bulletin. Just find a goal. Just take a moment out and find a goal. You've got an item, it's sitting there, it's banging good and hard. You're going to go on and find some more items. You're going to do some more Criss Cross on the thing, but this is early in the game, find a goal for that item. This item of the pc's – it's this kind of an item is, "Well, that's me. That's me. That certainly is me. I always... If I ever ran across one of them, I'd kill them, and so forth. I won't have anything to do with them personally, you see. That's me," and so forth.

He's in a kind of a mixed state with regard to this item.

And this item is reading beautifully on the meter, and so forth. Everything is going along gorgeously. Well, just let's find out what kind of a goal that person or that thing would have, and then find out what kind of a modifier it might have.

But you don't have to find the modifier right then. You don't have to find it because you can leave that off till later if the pc went Clear. Now all you'd have to do is remember you found a goal for this item. See, I'm talking about a fresh pc from someplace or another, you know, and you haven't got a goal yet. If you've got the goal, why, find a modifier for that goal, and your Goals Problem Mass will come right back in with a clang, and you can go on with your Criss Cross. Okay?

It does have this liability that a person will go Clear on it. Now, we're warning you against clearing people, you see? [laughter] Life is tough.

Now, let's take a Clear – somebody who has been run through to Clear – and let's get an application of Criss Cross. Let's get the person to remember, this Clear to remember, the first goal, preferably, on which he was run. And let's find the modifier to it. Now, that spoils the Clear. That's the end of that.

And let's take the first terminal that was found. Now, he's only got one item, oddly enough. Just a terminal, see. There's no opposition terminal. Must have been the right one, however. And let's take that terminal and let's list: "Who or what would oppose that terminal?" Let's make a list, a long list of these things. And then, having made a long list, bleed the meter, make sure that you got all items. No more needle reaction on asking for further items, and eliminate by assessment until you are left with one item.

And then, having been left with one item, be sure it is the right item out of that list, and check it over just as carefully as you check over anything, but don't take forever about it.

"Who or what would oppose *that* item?" That new item. Do the new item in the same way. Now you get this. Get a list, "Who or what would oppose that?" and so on and etc., and so on and so on.

Well, this is rather unsatisfactory because it gives us a single track, and we're not getting a crisscross. We're getting a sort of a cross-stitch that has just got one side of the X each time, don't you see? And we're missing one half of all of this as we go. See, there's some more things mixed up in all this, and we know there are, and we will be missing them, and we will wind up with only one item. And we want two items. So let's find out, before he was cleared, let's do half of this this way, just as I've told you, you see.

We'll treat that first terminal he found as one of the items, and let's find out, before he was Clear, did he like or dislike that item that was first run on him to clear him. Before he was Clear, did he like or dislike it. And really make him remember this because it's quite important.

If he liked it, you now run the dislike list. If he disliked it, you now run a like list for your second item. And I'll go into that a little more fully in a moment, but that will give you two. Remember, then, that in a person who has had a 3D package already ass – I mean a 3, Routine 3 package already assessed, which is proven out, that you have one item already found. But it requires that you find the other item, another item, at the same time. And you are thinking, of course, "Who or what would oppose that?" gives you the other item, and it doesn't.

There are two tracks. A crisscross of two tracks runs through a Goals Problem Mass. This is what is difficult about it all. And you'll get a skip. You'll skip half of it. If I drew a picture here, you would see it very easily.

You've got your terminal, oppterm, each one represented as a circle. And you've got these two circles. Two circles, two circles, two circles, two circles, see?

Well, you're getting every other circle as you go up on a single side, and you need the X. You need everything connected to everything with a cross-slant, see? And you only got half of this thing if you're just assessing from a single terminal, see? You got the idea?

And it gives you a much more definitive look at the bank to have two sides to this thing.

So remember you have half of this done if a person has ever been assessed on Routine 3. You already have an item. Now, that's dandy. That's dandy, and just leave it at that.

But get the other side with a like or dislike test item. Now, this will all be very, very clean, clear and beautifully understood in about two seconds, so you can stop looking blank. Because let me tell you, now, what a Criss Cross would be from scratch. And this is from scratch.

One: You ask the pc, "What kind of person or being haven't you liked?" Probably better to get the dislike off first. People dislike easier than otherwise.

Now, that's the burning question. "What kind of person or being haven't you liked?"

Now, if you said, "What person" or "Who or what," you see, he would give you "Aunt Agnes" and "Mabeline," and "George Bernard Shaw," and so forth. And these things are relatively useless to you. They're not sufficiently generalized, so you snake him into giving a generalized term, and you put yourself right up on top right away. And you make a *long* list of this thing.

Well, I frankly don't care whether you bleed this list or not. Just make sure it's a nice long list. Don't let it go to fifteen hundred items or something like that. Any one of these – I would consider a hundred an unusually long list. A hundred items, *aaaah*, that's pretty long. Be perfectly prepared to go to that and if the pc gives it to you, well, take them. But this is getting awfully lengthy at a hundred, you see. Eighty. Eighty would probably be more natural. Average list might very well be no more than fifteen or twenty, see? So that's why I say a hundred would be awfully long.

All right. "Who or what haven't you liked, mate?" would produce "Aunt Agatha," "Mabeline," "Uncle Bill," and so forth, and we want "a disagreeable bum," see, "a cockeyed marine," "a parachutist." See? We want burning items that will go backtrack and "Aunt Mabeline" will not go backtrack. [laughter]

So we have this. Now, it doesn't give us the pluralities that we might get. And you could vary the question so that you got plural answers, like "criminals." And you can say, "What kind of people or beings haven't you liked?" if you wanted to go into that. However, this doesn't require all that precision.

I tell you that on 3D Criss Cross, you can blow your brains out with precision that is not necessary. You would remind me of the ensign, who, having taken a sight with a sextant he left out all night and sat on and dropped on the deck, and had its prism missing, and besides didn't get the North Star but shot the truck light [laughter], then goes in and by the hour calculates with the greatest, neatest, mathematical precision that he is within six and a quarter millimeters of a certain drop of water in the ocean, you see? Calculation is terrific, you see, and the data from which he is taking it is the roughest kind of a shotgun shot that anybody ever had, see?

Because this is a real shotgun shot, you see? The possibility of his actually coming up with a 3D item with his test list is quite remote. Because you're not asking him against any goal. You're not asking him against any stable data. He doesn't even really know what you're asking him for.

But you get a nice, long list. And then number two, you null that list and locate one item that remains or was last in.

That means you would actually be allowed to go down the line and have them all null except "a machine." And "a machine" was the last one in. So the machine was the last one in. Well, it had something to do with something.

Now, supposing you had the terrific misfortune of being left with three alive that you couldn't get rid of. Well, you either have three powerful locks or maybe even three 3D items. Well, it doesn't mention it in this bulletin, but all the time you're working with this, you keep

a data sheet over here. And every time you find an item or something on the pc, mark it independently of the lists. In other words, keep all the lists, too, and keep them circled, and do anything you want with that, but you find you wind up with an item, you also write it over here on this data list, see, and any other data that you want to write with it so you can identify that item.

All right. We take off, then, with this as a *test item*. We call that a test item, the item we found resulting from this list.

See, that's a very simple operation. Anybody could do this. You can do this on almost anybody. You could actually do it on somebody who was relatively unassessable, which is quite interesting – which makes it very interesting to you, extremely interesting.

Now, you come over here and write that item in, whatever it was, anything you want to write about it. Now, the one thing I want you to remark on such an item list is what gave the pc somatics. That I want you to remark on. Any time the pc said *ouch* or he had a pain – an actual pain, not a sensation – why, write it down. Somatic. And any time he had a *gloozle* of energy going through his *goozlum*, and it was giving him a sensation, you write down *that* as part of that item. And also when listing, and he calls any of this to your attention. It was Buffalo Bill he passed by, and you're nulling Buffalo Bill, and he suddenly looks at you, and you say, "What's the matter?"

And he says, "Well, I had an awful pain of an arrow going through my back at that moment."

And you say, "Well, that's very interesting," and write opposite "Buffalo Bill" – on the nulling list, not on the main list – write "somatic," see?

You see what we're doing. We're being very smart. We're tracing so that we can identify the terminal when we finally wind up, see? And we can finally look back through and scout down and find the terminal right on the button. So this is a neat way of going about it. All right. So much for that.

We have now nulled one list, and we have wound up with one test item. We've written it over here on a separate sheet of paper, and we have clearly marked it a test item. That doesn't mean that it's a 3D item.

All right. Now, we turn around and we ask the pc, "What kind of person or being have you liked?"

Now, I don't care how strong you make this. Some pcs are stronger than others, and some pcs would much better respond to "Whom have you absolutely, completely, detestably, despised with hatred?"

And the pc smiles, you see, and he thinks that is very nice because it includes everybody he ever ran into. [laughter]

And on the other one, you'll find pcs that incline in the other direction, and you have to say to them – not "What kind of a person have you liked?" You see – you'll have to say, "Whom have you desperately adored?" [laughter] Don't you see? "Whom have you loved?" You see? That sort of thing.

You can make these as strong as it seems to appeal to the pc. You know, you say, "Well, what kind of person have you liked?"

And the pc looks at you rather tepidly, you see, and says, "Well, well, just people, just people."

"Yeah, well, whom have you – what kind of person have you loved?" you see?

"Oh, men, men. Usually men."

Well, shift your question around: "What kind of person have you absolutely, thrillingly adored?"

And he says, "Well, there's just schoolteachers, uh, schoolteachers, librarians, uh, railroad engineers, uh, professional men, yes," you see?

You ask them the question that gets them the list. But remember that it's the love-hate duo that you're using here. You've already assessed for hate or dislike, and you're not going to assess for like or love. And you're going to make another list, and you're going to ask the pc that. And then you're going to null the list and locate one item as in two. And that again is a test item, and you put it over here.

And when you've got the first test item, you had better write whether or not it produced a somatic or didn't produce a somatic, and you had better also say "liked" or "disliked" on those two items to identify the list. Okay?

If it was the liked list, you write "liked," and if it was the dislike list, you write "disliked" on it. That gives you a little further clue, you see?

All right. Now, you're off to the races. You've got two points located in nowhere but which are, nevertheless, takeoff points. And these are just test items. They're not 3D items at all.

Now. Now, you play the old game which you know so very, very well. On each one of these, you're going to run: "Who or what would oppose that (blank)?"

So you take a piece of paper and you write across the top of it: "Who or what would oppose a schoolteacher?" – what you wound up with, see. And you get a long list of whatever it is, and you proceed on through. You bleed it down if you can, and then null the whole list.

One of the ways of bleeding down is asking the pc, "Well, are you satisfied that any of those items are it?" And it sometimes will produce a search for some additional items. That's almost as good as bleeding the meter. That's just a little side trick I've used. "Are you satisfied that any of the items you've given me are it?"

And then he has to inspect this thing, you know, and he says, "What was the question again?"

"Well, the question was, 'Who or what would oppose a schoolteacher?'"

"Well, have we written down inkwells?"

And "Well, all right." You see, and that's just the same as bleeding the meter.

Then if finally you null the remainder, and so forth, he says, "Well, that's it. That's it. It is inkwells. Yeah. I got it. That's why the mass is black. I know now. I understand that." He even has a cognition on it, see?

Now, that is your first possible 3D item. The remaining item. Now, that's highly probably a 3D item. But you write it down whether it had a somatic or not and whether it proceeded from the other item or not. In other words, this was an item which proceeded from a "Who or what (so on)?" But we don't really care whether these two match up or the list is kept that neatly straight because this thing has run to collision, is what it has run to.

You're taking two different tracks, and they're going to come on to a head-on collision eventually.

Then we take the second item, the second test item, we do the same thing with it – identically the same thing with it. And we run that on down. And we get another potential 3D item, and that will probably either be the term or oppterm. And you've got a package there that possibly you could do something with, but that we don't do anything with it.

We use those two items now, and we take a new sheet of paper, and we write on top of it one of them, and we make a list of who or what would oppose it, and we bleed it down, and we null that whole thing, and we write that over here on the list, you see?

And then we take the second one that we actually found, we write that on a sheet of paper, and we write a list for that, and then we bleed it down, and we null the whole thing, and that gives us another item.

And we just keep on collecting items. And we just go on and on and on and on collecting items until we can't collect anything else.

And we say, "All right. Who or what would oppose a waterbuck?"

And he says, "A tiger."

And we say – we'd say, "Well, that ended that list." And we try to bleed it down, and we get nothing but a rock slam, see.

All right. "Who or what would oppose a tiger?"

"A waterbuck."

All right. And you'll find out those two lists will eventually collide. Even though they started rather far apart and went through tremendous vicissitudes, and you found lots of items, you now have guaranteed that you've got 3D items. You couldn't have anything else.

See, that is just assessment by *kwam!* You also have walked well upgrade while you were doing this. And you have also blown several sacks of raisins. They're now went. So there you go. You'll wind up then with a package. It becomes impossible to get any other package. See?

Now, you go ahead at that point and find your goal, and you find your opposition goal, and you find the modifier to the package, and you get the package all taped out. And that's the package, and that's the way it is.

Now, make fairly sure, make pretty darn sure that as you get these items, they're not wrong items because that can throw you a curve and walk you back out of the Goals Problem Mass, you see? Let's make sure that that item hung fire. Let's make sure that item stayed in. Let's make sure this thing didn't go astray. Let's do it with the rudiments in, and let's be careful as we proceed.

All right. There's one further note to make on this because, of course, if you get the wrong item, you're taking off from a lock, and you are not likely to travel the same course as you were taking off from an actual item each time.

Number 1, This cuts down restimulation.

Number 2, It has fantastic therapeutic repercussions on the pc. In spite of himself, he feels much better. He can't argue about this one. He's blowing them in all directions.

And Number 3. It cuts down the amount of error which you might make because even if you missed on one of the curves, your possibility is that you just lengthened the number of assessments you had to do. You've just given – you've had to do some additional assessments before you got back into the mass again.

And number 4, Gives us a method of upgrading which runs like this: A pc got a package. Pc already got a package. Pc now running package. Pc very happy with package. Pc all set with package. Everything going beautifully with package. You can crisscross it. You take the package the pc has got and you crisscross it.

The funny part of the thing is, you will go on a grand tour, and the probability is that if he was running a center track package or a rather early track package, he'll walk back into the same package again, but this time with terrific clarity. He'll feel wonderful about this package, you see. And this also runs very quickly and will discharge very rapidly.

In other words, you can go on the complete excursion of Criss Cross and get back to the package again, which is rather startling. And you will have blown off all the locks that were making it hang fire. You know, it would have run anyhow, but you can just blow all these locks perforce by recognition and he knows what they were surrounded by and how it all links up together now, and so forth, and he's in better shape.

We were trying this a little bit earlier. I was telling you an upgrade, and all you did was go ahead and find a new package of some kind or another, and the pc became considerably depressed because he didn't think he was going to get a chance to run his old package. And the new package didn't appeal to him as much as the old package did, or something like this, see?

Well, in this particular way, if that was the package he should have been running, believe me, he'll come right on back and run it. And if it's not the package he should have been running, then he would have been on it much longer, and he will come into the package he is running. But he will now know what package he is in the middle of and how.

Now, there's nothing wrong with continuing to run a pc on a package he is running well on. Nobody is asking you to do otherwise than this. But also part of running that very package would be to do a Criss Cross on it. You could just start out. Now, you take his termi-

nal and run "Who or what would oppose that?" Pay no attention to the oppterm he's already got, you see? You don't keep that on the list.

By the way, don't keep any old items on. Don't carry an item forward on the list.

Well, you got a Criss Cross from "a waterbuck," see? And it wound up with "a tiger," see? And then – you null down and you've got "a tiger." And now you do a new list of "Who or what would oppose a tiger?" Don't perforce put "waterbuck" on it, see? Put only on each list each time what the *pc* has given you. See, don't carry your old item over. You'd have a tendency to do this because all it does is start hanging the *pc* with what he already has. If it's right he will move right on back to it anyhow anyway, and there you'll be at. Very simply. Okay?

In other words, you can take any package a *pc* is running and go on a conducted Cook's tour of the Goals Problem Mass, blow off locks in all directions, soften the whole thing up, blow a tremendous number of cognitions, and you will either walk back to the exact one he is running or an upgrade that will run better. And it's quite amusing that it will go back to the same package again after turning all the way around through a tour of the bank – if it is a middle track package. It's quite funny. It's quite funny.

But having done this, you will find you come back to running the package, and he will now have pictures when he wasn't running with good pictures before. In other words, it takes that much charge off of it.

Now, your next action with this: You can take a *pc* who is having present time problems all the time and run a Criss Cross on him without even intending to get a 3D package, and you will produce some of the wildest changes he ever cared to have. Quite interesting.

You're not even interested in getting a 3D package. In other words, you've got a day or two to audit this *pc*, and you want to produce a remarkable change on the *pc*, and you can read his needle, and you can keep him in session. Well, you could go ahead and do the first few steps of a Criss Cross, and it'll land right squarely in the middle of the present time problem he's sitting in. That's the first thing it hits.

See, and he feels wonderful about this sort of thing. So it stands as a totally independent operation, if anything else, which I think is quite amusing

Well, now, that is quite a package, and that's quite a bag of tricks all by itself. And it has many uses. As I've studied it over, I've seen tremendous numbers of uses to this thing.

One of the uses is prove up a package. Well, you got the package on a standard run. You had the *pc*'s goal, so you went ahead and found the rest of the package, and so forth, and you found the opposition terminal and there it sits. And you say this is all fine, and this is ready to run. Good. Run a Criss Cross on it and run it until it can't be anything else, and then for sure you have the package, don't you see?

The other thing is, it is an excellent way of finding out which is the terminal because as you run down the list every time the *pc* says ouch, you mark what made him say ouch. And you will rapidly find out which side of this stuff the *pc* is normally on. Is the *pc* on the no change side of the ledger, always?

You look at it, you know. You say, "Well, what do you know."

You can finally wind up at the other end and you will always hit it right on the button. In other words, you never have to do a test run, one side, then the other side, or make the pc dizzy or uncomfortable or anything like that because he's already been saying *ouch*.

Just every time he said ouch, you looked at what you were nulling at that time or looked at the item that you were putting down as the "ouch" item, and this "ouch" item will be the terminal every time. Very interesting. And that every time he got dizzy and foggy and upset in some fashion or other, or had electronic sensations going madly across the fields in front of him – in other words, he had sensation that didn't add up to any change or somatic – you were probably running the oppterm at that time.

In other words, you were nulling the oppterm. So you quickly find out that "people who change everything around" is inevitably the oppterm, and "people who never change anything" is inevitably the term. And you'll find out that's the way he's sitting. And that's the attack line he's always been on.

And you'll find some other pc, he quite likely has as change... You see, then, not all games are change-no change. I'm just giving the idea they could be any kind of a – well, any of your Scientology combinations can make up one of these games. He's always the create side of the ledger, see. *Ouch*, you know.

You say, "Well, a design engineer."

"Ouch," you see.

And you're going over it, and he says so on and so on and so on. And he says, "A pain at the back of my neck and so forth," and you've got it all set. And you scratch it all out, and you just mark in – "somatic," see? You'll find these things get studded with somatics, you know.

And then over here on your final recapitulation list, you'll have "somatic" marked in here. Design engineer, painter, sculptor – somatic, somatic, somatic, somatic. Town builder, planet designer. You know, they're all *ouch, ouch, ouch*. And destructive types who insist on no creation of any kind whatsoever – they're always *dzzzzzz*, you know, *dzzoo-wuug*, you know, or *zzzzzz*. In other words, the winds of space, that kind of phenomena.

And you'll get it as you run down the bank. And you – of course, after you've done a lot of these things, you can spot them, and you will know which side is which. You can hit it right there. Put the commands together; the pc will run like a shot duck.

All right. Now, you've got something to learn then, haven't you, because some of you I've seen take... This was much earlier of course, and doesn't apply to now for the older students, but applies definitely to those people who are here recently. If they have an idea that it takes two or three sessions, or preferably two or three weeks, to write down a – I'm sorry to get sarcastic like this, but I have to do that. I ran a lock off of "a sarcastic professor" the other day, so I have to take advantage of this because I'm free to do it now, you see? And I used to just writhe under this. This made me wince because it was defeating everything in the shop.

Two or three weeks to write down twenty labels or items, you see, or test items, and then assess them and null them all. This didn't seem to me to be optimum.

I would consider that if you could not find three or four test items in a session, you were slipping. Just raise your sights. Of course, that's impossible. I have a hard time auditing that fast myself. Oh, I'll give you something to shoot at.

I will settle for an item per session. I'll settle for an item per session, because that's what it's been taking me. But that is not too difficult, an item per session. But don't you go dragging out two sessions with no item. Not on Criss Cross.

On standard 3D package – oh, yes, by all means. Getting them checked out, proving them up, all that kind of thing – oh, yes, that's a different proposition entirely, but not on this.

First place, they're very easy to find; in the second place, they're very available; in the third place, the pc gives them out; the fourth place, the pc is in-session just *obsessively*. You start running these things, of course, he's in one valence, then he's in another valence and he's another valence and he's another valence and he starts to look like a raisin. [laughter] Just one right after the other, *bangety-bangety-bangety-bang*. And he gets – he's really in there tight.

All right. Well, that is Criss Cross. That is Havingness. That is Twenty-Ten. And of course, there are a lot of other things I could tell you, but at the present moment, you haven't got the time, so well have to take it up later. All right?

Audience: Yes.

Thank you.

TWENTY-TEN, 3D CRISS CROSS

A lecture given on 9 January 1962

Thank you.

Well, you look different. You do, you know.

We had a bit of water under the dam, over the bridge, since I've been gone. I had a wonderful congress, absolutely fabulous congress in DC. People thought it was wonderful. Almost ruined me, but probably saved Scientology United States without much trouble. They were running on American meters which had been manufactured, God help us. If any of you've got American meters, there's a garbage can out there. Because these things were built, you know, without any consultation with me, and across – over my dead body, practically, on circuit changes, and so forth.

And this is not propaganda, but by George, you know, they don't pick up withholds. And that left practically all the Scientologists in the United States with missed withholds. Just like that. Bang! And that was what was the matter.

And the first day of that congress, I had to just scrape them up off the floor. It was the hardest show to get on the road you ever wanted to see.

Got to talking to them about withholds, told them what was wrong, and so forth, and they came right along with it. Laid into the organization along about Tuesday. They had by that time three British meters, and they all of a sudden had been finding that there was practically one missed withhold per question on the Joburg, and things like this. And their morale started going up. Everything started moving along very well in the field, and so forth. A lot of excitement about this.

Very funny. The people came to the congress with big plans on how to rewire and salvage American meters. And they took a look at the British Mark IV and saw the thing in operation and just scrapped the American meters. Actually, it was all over the floor that they should scrap American meters. Just skip them.

But Reg gave a demonstration, very ably done, and had an American meter element of all things in the projector, and we got a pc, a field auditor's pc, and he ran her there on the stage, and the withholds were pretty juicy. [laughter] And they were all missed across the boards, and Reg glancing back at me in the wings because it was an American meter, you know, should he pull more, you know, and I told him I thought there were probably two more.

So although they weren't showing on the meter, he went right ahead and pulled two more. [laughter]

And then, of course, I stepped on and told people, "Well, you see what missed withholds do." This girl, by the way, started looking very bright and so forth, after she had been looking rather gloomy at first. And I gave the auditor who audited her – I didn't even know his name, you see – I gave him hell and Maria and mischief, and said people shouldn't do that sort of thing, you know, and really cut it up. His mother wrote me a congratulatory letter saying it was about time somebody took him apart. [laughter, laughs]

But anyway, anyway, it was a great congress, and things are really rolling very nice.

But there was a great deal of technical data suddenly swung into place while I was gone. Had some time to think and consolidate a few things. Got a look at havingness amongst other things, and havingness in its relationship to withholds. That was the main thing

And out of this you get Twenty-Ten on which you have just had a bulletin. And I think you'll find Twenty-Ten really makes a pc soar. If it doesn't, you haven't got his withholds off or you haven't got his Havingness Process. But in view of the fact that a withhold cuts down havingness – that's all you can say about that, a withhold cuts down havingness – and when you get the withhold off, all you have is potential new havingness.

I better start at the beginning. This is the 9th of January, [*female voice: Yes.*] and this is the mystic month. The mystic month, 9 Jan. You know what a jann is, don't you? It's a ghost from Arabia. And this is the mystic month. This is month of mystic mystics. We're going to cure them this month.

Saint Hill Special Briefing Course.

This business about havingness, now, this is very important. Havingness had as many as forty-three different reasons why it worked. And you'd be very interested that it came down to a child's definition. The sixth lecture of that Washington congress, by the way – January 52 [62] congress – one whole hour is devoted to this, and so forth. And a very concise rundown, if I say so myself. I'm going to give it to you in about thirty seconds. That is to say, that havingness is best understood by no-havingness. And I had this in the bull pen for, oh, I don't know, seven years, trying to get the common denominator of what havingness was so that it could then be applied to auditing, and so on.

And all of a sudden, Reg ran some havingness on me, and I kind of took a look at it, and we had an error going in the session, and all of a sudden boom! Why, I suddenly realized what havingness was. It's best understood by the reverse definition. What is no-havingness?

No-havingness is the concept that one cannot reach. I know this is so elementary it's going to take you twenty-four hours for it to dawn on you. Anybody knows this, you know. Everybody always knew this except nobody knew it until the other day.

No-havingness is prevented reach, in other words. Concept of no reach, no-havingness. All right. And then havingness is simply the concept that one is able to reach, and that is all havingness is. One merely has to have the idea that he can reach something in order to have it. You see, you don't have to reach it in order to have it. You merely have to have the

concept that you can reach it. And that is havingness. And out of forty-three chances in which this definition did not occur, we all of a sudden have a common denominator to havingness.

Now, this is of tremendous value to you as an auditor. We're back, of course, on Reach and Withdraw. And we're back into the common denominators of communication and all these old-time proven truths. And we're right there, you see. And that is, Havingness fits right into the bracket at once.

So now I'll give it to you with the twelve-inch-gauge barrel. On the other hand, a person with a withhold, of course, has the concept that he can't reach. So withholds reduce havingness. I mean, that's... And therefore running withholds improves havingness. It is so elementary. There is nothing really to it, except it is one of these sweeping truths like the world is round. I mean, it'll make that much difference.

All right. Now, let's look at this. Let's look at this a little bit further.

This tells you that the moment when a pc has released a withhold, he has a potential reach. And if you don't capitalize on it in the very near future, of course, he doesn't realize that anything new or strange has happened to him, very often. He gets off a withhold and it doesn't do him any good.

You've seen that happen, you know? The fellow gives up a withhold and all of a sudden it doesn't seem to do him any good. Well, the reason it doesn't seem to do him any good is he hasn't practiced reaching since. You're waiting for the accidental: Three or four days from now he all of a sudden finds out he can reach in that particular quarter, don't you see?

Well, instead of leaving it on automatic and just letting him find out about it suddenly, well, straight away, why, after you've pulled a few withholds run some Havingness, that's all. And you run the withholds, and you run the Havingness, and you run the withholds, and you run the Havingness.

And the reason I tried to figure out some reasonable ratio – and that auditors can remember it is the better reason for the exact ratio than any other reason – call it Twenty-Ten, and that's twenty minutes of withholds pulled and ten minutes of Havingness, no matter where you're sitting in the withholds, see? No matter what part of the question you've gotten, whether you've gotten a question flat or not flat, it doesn't matter because you're going to come back to that question anyway.

I had to do some experimental workouts on this to smooth it out, and that apparently is the way it sits. So it doesn't matter then, you just say, "Well, we'll come back to this question later," or anything you care to say to the pc, and, "Right now we're going to run some Havingness."

And just do that on the twenty-minute mark, and you'll find that you're – if you run the Havingness ten minutes, why, you're all set. Now, the rule of Havingness is you should run Havingness until the pc can have large objects in the room. But you know very well that a lot of Havingness Processes out of the thirty-six don't tell you whether the pc can have large objects or not.

Now, Havingness will run to a rise in the needle and then a blowdown. You'll get a rise, rise, rise, rise, rise, rise. You watch the needle, and the tone arm keeps following it on up, on up, on up, on up, and all of a sudden the tone arm blows down.

Well, it would be optimum to run it to blowdown if some pcs didn't wait for two or three sessions to blow down. So that's why we don't use blowdown as a criteria when to stop running Havingness. Just run it ten minutes. That's good enough, and you'll find out that will do a lot of good.

Now, test the havingness after the first eight or ten commands. After the first eight or ten commands, get the second can squeeze.

In other words, when you start to run the Havingness, get the can squeeze. You get your needle set, you see, so that you'll get a third-of-a-dial drop or something like that. Just make a crude estimate of it. Swing your sensitivity back down, don't you see, from where it's been while you were security checking.

And get him to squeeze the cans and watch the degree of squeeze. Well, that's fine. Run eight or ten commands and ask for a second squeeze. And if it drops more, the needle drops more, and it is looser, you're all right, see? You're okay.

And if it doesn't loosen up at that point, of course, your rudiments could be badly out or something like this could happen, but the point is the Havingness Process should put the rudiments in.

In other words, you should get a loosening needle even – if the pc is doing it at all, you should get a loosening needle on the Havingness Process. So although some wisdom will occasionally monitor this and you will do something else like ask him if he has an ARC break or something like that, you ordinarily – and this practice would not go wrong at all – you would ordinarily get another Havingness Process. And you just keep testing for Havingness Processes. And that does not go on the Twenty-Ten. You see, that time stands alongside of the Twenty-Ten. If you have to find a new Havingness Process, you don't count that into the Twenty-Ten. And then you find it finally, and you run ten minutes of that, and you go back to your withholds.

Now, you're going to find out that a pc – the more intricate or oddball the Havingness Process you find for the pc is, the more – higher probability is that it's going to wear out. And you usually come down to something like "Point out something." That will last a long time. "Look around here and find something you can have." When you finally get on to that and it's running smoothly, it generally will run practically forever.

But "What is the emotion of that room object?" you see? Oh, man, I mean, that thing can wear out, clang! By the way, that is a remark that is seldom made about Havingness Processes. That particular one, you know, is a changed process. After a little while the emotion runs out, and their Havingness Process changes – and you might not have known this – but changes to "What is the condition of that room object?" What is the condition of it instead of what is its emotion. But you realize that that thing changed. I don't think it's written down anyplace. I don't think it's written down anywhere. Might be. It might be in a lecture someplace. But there is that point about it. That one goofball thing

Now, getting back to Twenty-Ten, I would advise you, at this time, not to security check any other way because it capitalizes on your withholds. And you'll find out it should work like a hot bomb.

Now, if this is working properly and you are actually pulling withholds on the pc, and all is going along splendidly, and you're not missing withholds at every turn, and so on, and the Havingness Process is working, you actually – running this on some character off the street, something like that – should produce some interesting miracles. I mean, some interesting things should happen to the case just as a result of this.

Now, there's another mechanic that I haven't told anybody, and that's this: The oldest test of circuits shows that when you run Havingness, when you run Havingness, the circuits key out and move out of the person's perimeter and out of his head. These black-mass circuits, that are mentioned in Book One, they key out and move out of the person's head.

(...)

SEC CHECKS, WITHHOLDS

A lecture given on 10 January 1962

Thank you.

Oh, you like me today. [laughter]

All right. Good enough. This is what?

Audience: 10th.

Is this the 10th? No kidding. 10 Jan. 6-2, AD 12, planet Earth – I guess. I guess.

Now, we have a terrific amount of ground to cover because you're way behind. [laughter]

You've got the nasty problem of having to confront effectiveness. And this is a summary of 3D Criss Cross, being the latest and the most. And you're in the very, very nasty position of having to confront effectiveness. And this is a wicked position for you to be in because I know what the processes can do if they are properly used. And it's now pretty easy to do these things providing you are perfect. That's all that's required.

Absolutes are unobtainable, as many of you will quote at me on occasion. And you'll say, therefore, we cannot have a perfect score because absolutes are unobtainable. I just say, "Well, I said that." [laughter]

What you've got to face up to is that people, because you've been here, will expect the impossible from you, and all you've got to go – do is go ahead and do the impossible.

And the advent of the impossible occurs with Twenty-Ten and 3D Criss Cross.

Now, you haven't yet, right here, seen these things in full, flamboyant action, and it's quite interesting. That's why I say you've got to catch up. Because I know where these things sit and I know what they are about and I know what they're capable of. And you have already seen very excellent Security Checking do some interesting things with cases, haven't you? Yeah, you've seen people brighten up and all that sort of thing.

All right. Now, what if you were able to take Security Checking and without any unusual questions – no unusual questions or no unusual action on your part but just doing what you exactly could do – produce some fantastic results just on standard Security Checks and so forth, on a case that has some psychosomatic difficulty. Some nice, tough, rough, psychosomatic difficulty.

Well, all you have to know is your Class II skills and be highly standard and it would be no strain on you of any kind whatsoever.

In other words, there's the case. And he's moaning and groaning and screaming that he's got lumbosis up to his ears, and there he is. And wouldn't it be very nice if you, simply by

auditing this case directly with your routine actions and so forth, made him snap and pop and come out of it, and the lumbosis vanished, and so forth. That would be very nice, wouldn't it? Be very nice.

Well, you have that, potentially, in this Twenty-Ten. There you have it, but you should know the basics of Security Checking. The basics of Security Checking

If you know the basics and fundamentals of Security Checking, then you check with the basics and fundamentals of it, and therefore you can produce some interesting reactions and actions in cases.

And this is quite, quite pertinent, then, that you shouldn't be going around security checking by ritual. There's a considerable danger in your just sitting there security checking by ritual. You should security check by fundamentals. And if you security check by definition or fundamental, then you'll have the most relaxed time of it you ever had and you won't be worrying so much about ritual. Because here's what happens to you.

Because you don't quite grasp a fundamental, the next thing you know, somebody stiffens up the ritual. See, that's rather inevitable. And then because you don't quite grasp the fundamentals, then they again stiffen up the ritual. And the next thing you know, you're a ritualist. You're just doing everything by the count and you don't understand quite what you're doing, and so forth.

And you – therefore you can depart a considerable distance from effective auditing in auditing by ritual only, you see?

The thing to do is to get the job done, do you see? In the first place, auditing is what you can get away with. And that is what auditing is. What you can get away with, with the pc. Sounds almost criminal, but it's a fact. I have sat down with no Model Session, rudiments, or anything else with a pc who has withholds from here to Halifax, and taken his lumbosis and thrown it in the nearest ashcan.

And years later he's writing me a letter saying, "Well, Ron, I'll just never forget that auditing session you gave me."

And you would have stood there with your hair on end wondering what the devil I was doing. Well, I was doing nothing but auditing the pc. And it was what I got away with, see? It was what I got away with.

Now, because you can't get away with everything, why, a ritual gets laid down circumscribing what you should try to get away with. But remember that within that ritual or within that rote, you still have an enormous amount of things that you can get away with. You see what I'm talking about here?

Now, let's say we run a good Model Session. Well, I use Model Session because it's a good thing, not because it's a ritual. But because it covers those points *bang, bang, bang*, that are liable to give you trouble.

But let me tell you this about Model Session: Some pcs can't be audited in Model Session. Isn't that an interesting thing to know? They can't be audited in Model Session. Now,

why can't they be audited in Model Session? Because you'd never get past about the third question in the beginning rudiments.

Let's take a pc with a bank that is absolutely *crawling*, see, with withholds of some kind or another, present time problems all over the spot, and so forth. And instead of going into session, he goes out of session because these aren't the things that have to be hit.

In other words, you could imagine a case that is so critically poised – he is not a case which is being audited, don't you see, routinely and regularly. He is a case that has just come to you; he's critically poised in that you have to find out what the mind is doing in order to parallel it. And because you have to find out what the mind is doing in order to parallel it, if you did a Model Session – now I'm talking about neurotic and psychotic cases, you understand – if you did a Model Session, or tried to do a Model Session, you would immediately find yourself in a cul-de-sac because the case is not that much concentrated or in communication.

Now, let's take an extreme case. Let's take a madman in a cell, and he's spinning around like mad, you see. You're going to run Model Session on this madman, are you? Oh, hell you are. But oddly enough, oddly enough, Scientology could handle him as it exists today, see? Just that. This is fascinating. And under the exact definitions of Security Checking, Scientology could handle him.

Well, you can't even get him to hold on to an E-Meter, you understand? He couldn't concentrate that far. Well, you say, "What the devil kind of Security Checking is Ron talking about now?"

Well, I'm talking about basic and fundamental Security Checking. Why is he insane?

Well, he's insane because he's keyed in an insane valence. Well, how did he key it in? Well, he keyed it in, obviously, by withholding. He's got withholds.

All right. So just by definition, we know a 3D Goals Problem Mass – see, we know that the thing exists. We know if this fellow's insane, it isn't something that happened to him in this lifetime. You may not have thought this thought all the way through in your auditing and assessing, but it – *nothing* has ever happened to anybody in this lifetime which was capable of driving them even faintly worried. See, nothing. Why, just wash it out.

People come around, and they tell you, "Well, my mother and father left me at a very early age, and I was on the streets by myself. And I learned to steal from garbage cans, and so forth, and that's why I am what I am today."

I generally ask them, "What was the author of that sociology textbook?" You see, because it doesn't have anything to do with them or their case or anything else, you see?

Well, answer this one. The fellows who have run into the mental field and run out again hurriedly and taken up psychiatry – something else distantly removed from the mind – they've consistently made this kind of an error, that they've tried to attribute all difficulties to this lifetime, you see? And then they've hung themselves. That's why you mustn't let somebody push you into saying, "Well, really, past lives is just a theory." Theory, hell. You can't make anybody well if you audit this lifetime only. You should know that. A lot of you here

have tried it and nothing very spectacular happened. You got rid of some somatics for the pc, and so forth. But the pc was still back in there, his old, grubby self very shortly afterwards. You ever notice how consistently that occurred? All right.

This one boy, his father and his mother leaves him, and he leaves him on the street, and he has to eat out of garbage cans, and he goes bad and becomes a big-bad-wolf gangster or something of the sort, and there we have it.

And the next one's father and mother left him and he had to eat out of garbage cans and he went to the – in the orphans' home and he just had all of the reasons why he should have had just as dreadful a time. And we meet him and talk to him and he's fairly successful these days. He's a salesman or something.

Well, you can't find the cause in this lifetime. So people then can say, "Well, of course, there's no answer to the human mind because you can't find the cause for difficulties in this lifetime." Do you see how that would be?

Well, they confuse this lifetime with the fundamentals of the mind, and they make mistakes on this line ever since. They've been doing it ever since they've tried to do this, you see?

Because this fellow is insane. He's keyed-in from Arcturus, Arslucus, to hell and gone back someplace or another, and he probably went nuts by processing invader troops as they came in through the spaceport, you see. Only he processed them, not the way we're doing it, he processed them with a little copper skullcap, see. And they'd blast these birds down, you see, and they'd throw this copper skullcap on them, and they'd give them the *zzzzurb-byut*. Because they knew what would happen, you see. The fellow would just exit out of the body he was in, go back and pick up another body, he'd pick up another rocket ship, and now he knew where you were, and come in and shoot hell out of you, you see? That was the way it used to be.

So, of course, you *had* to give him some processing of some kind or another or he'd really mess you up. I mean, that was the way they thought about it.

And after he'd done about ten thousand of them, and a lot of them had gone insane, you see, and spinning, and so forth, why, he himself, you see, got this all associated with the Goals Problem Mass. And after he'd been at it fifteen, twenty, thirty thousand years, you see, he eventually began to get the idea that he was a little shaky in his wits.

And then one day he went overboard in some fashion. He did some particularly outrageous thing like they had just bombed a town, and all the inmates of the insane asylum were running out in the streets. So he sat there back of the zap gun, and for no good reason at all, since he merely could have corralled them, he just shot them down one by one to see them squirm and scream. And then he occasionally wasn't himself after this, you see?

After a few more minor incidents of this particular character on the whole track, he has eventually developed a circuit package which is an insane person. He's got a good one now.

All right. We find this madman in the insane asylum. What's he doing in the insane asylum? How did he get there? What duress did it take to put him there? What overts did he have to commit to put him there? Well, they're all packaged up in a valence and he's sitting in the valence and there he is.

It's quite fascinating that crazy people can be clicked through valences just as fast as you can snap your fingers. You can click them into almost any valence you can think of.

In other words, they're susceptible to valences. Very. They go through the barrier and you can just go click, click, click. I've had an insane person being a dog, being a girl, being a boy, being a woman, being a dog, almost as fast as you could count.

"Oh, you'd like to see me be a dog, huh? *Woof; woof; woof*" And she'd be jumping all over the floor, and so forth.

Only she thought this was a sincere activity, and she thought she was a dog while she was doing that. Quite interesting.

But anyway, what do we find here, then?

Well, we find a madman in a cell who has a keyed-in valence. Now, you for sure are not going to run out all the times he's gunned down insane people. That's for sure. Not the way he is. And yet you've got to start somewhere.

And we come right back to the basics and fundamentals of Security Checking. It is the not-know they have run on other people that results in a withhold on themselves.

So what basic and fundamental question could you ask this fellow and get him to answer that would start keying out this package called insanity? You could simply ask him, "What don't people know about you?"

And you know, he'd answer it? It's so fundamental he couldn't help but answer it.

You could actually spring that valence. In other words, move that valence off of him, and he'd turn sane.

Girl up in a hospital up here not too long ago, estranged from her family, very upset and dying. Nasty situation withal.

I tried to get an auditor to go up and process her. I didn't make the grade on this particular activity, mostly because, when the auditor went up, the medicos had this girl on a cot out in a corridor or something of the sort or parked in the laundry room or something because the hospital was overcrowded and there wasn't any way anybody could do it, and nobody would let the auditor come near the patient. You know, standard hospital procedure.

And in overcrowded hospital conditions today, it's nothing for an accident victim to lie six hours on a stretcher someplace without attention in a hospital. If I had anybody smashed up in an automobile accident, I wouldn't take them to a hospital. I'd do something else.

But anyway, this girl was in very bad condition. She was lying there and she was about to pass in her chips. And I didn't get her processed, but the only thing I would have done if I *had* gotten near her is, "What doesn't your family know?" See, "What doesn't your family know about you? What have you been doing your family doesn't know about?" Now,

she had a dreadful, incurable disease and you would have seen this thing gradually blow away. Because she was a young girl, and she was only worried about her family. So obviously her family didn't know something about her, see? Get the fundamental? Now, how fundamental can you get?

Now, if you'd gotten to process her before she died – because she did die in two or three days – if you'd gotten to her, if the hospital had let you and so forth and you had gotten to her, you would have been faced with this question: What to run on her? What to do?

Well, of course, you're not going to run a Model Session on her. You're going to get involved in was it all right to audit in this laundry room?

No, it's not all right to audit in the laundry room. Now, what are you going to do, see?

Ain't no shape to run rudiments. Rudiments process is too light. Person's mind's so intensely concentrated upon their own difficulties that, actually, to get the rudiments in would be to take their mind off their case, don't you see?

In other words, the case, as far as you're concerned, is in-session to a marked degree, already rolling.

I did an interesting thing one time. A guy collapsed in the middle of a restaurant – a big public restaurant of one kind or another, a rather nice restaurant. So therefore, the nicer the restaurant, the quicker they try to dispose of the bodies.

You can always tell, you can always tell a nice restaurant because they're very anxious to get rid of people who collapse and you can always tell a bad restaurant because they don't care. They just keep stumbling over the person in the middle of the room. It's one way of classifying restaurants. Anyway ... And so I saw this fellow collapse, so I got up from the table where I'd finished up dinner. I was about to leave anyway. And I kneeled down alongside of him, and asked him where he was on the track. This was back in Dianetic days, you know? I asked him what he was stuck in, you know? And pushed him on through what he was stuck in, and already, why, they'd been calling for his doctor, and so on. And they hauled him out into a pantry, so I stood by him in the pantry and ran him through the rest of the engram just as sort of passing by, you know, still wiping my hands on a napkin. That casually, you know.

And the doctor got there and the fellow was very much alive and was looking up and was much brighter. Well, I possibly underestimate or overestimate the condition the person was in as a result of this, but the doctor was quite startled, you know? His patient wasn't supposed to be breathing that way. After all, he was a patient.

And he wanted to know who I was. And I told him, "Well, I'm ..." (paraphrase) "I'm just me," and walked out, you know? And left a mystery forevermore. Anyhow, done that fairly often.

But the point is there was no time to get any rudiments in on that person. This person is gasping for breath and is in asphyxiation and is strangling to death and probably hasn't got but four more breaths to draw. You got no time to ask him if he has any withholds. [laughs]

And it'd certainly be an insult to anybody's intelligence to ask him if he had a present time problem. [laughter]

Well, now, you get the idea. There's a point where Model Session must be done and should be done, but there are these emergency conditions, and so forth, where it'd be nonsense to do a Model Session, see? You have to decide that.

But here is a condition where a person's mind is very badly deranged and you couldn't get him to concentrate on anything anyhow, but you can ask him the question necessary to resolve the case. That question will normally – could be considered to lie most effectively – and the one that he will answer the fastest – somewhere in the vicinity of a Security Check. It'll be something other people don't know, you see? It'll be something he is withholding, something he hasn't let others in on.

Now, you see, the question "don't know" crosscuts and short-circuits this other question which is "What have you done?" and "What have you withheld?" or "What are you withholding." Now, this withholding kick, that's all very well for somebody that considers it a withhold. But as you're security checking in general, you'll find that most cases answer up very nicely to "What have you done?" and that sort of thing.

But when a case does not consider this – you don't only use "don't know" on this case. You could use "don't know" on many other types of cases, too, you see? It doesn't mean that because you're using "don't know" this person hasn't got what a withhold is, he's too far south to know what a withhold is or an overt is, don't you see? It isn't necessarily true.

People get worried sometimes because they think a process assigns level of case, and they refuse to run them sometimes. And it'd be a shame to avoid that one on that grounds because it isn't true. But it is true that a person who considers it an overt or doesn't consider it an overt – doesn't matter whether he does or doesn't or consider he is withholding or isn't withholding – certainly he will answer up to other people not knowing about it because that is factual.

And then, having answered that a few times, he will begin to consider that he has a withhold on the subject.

In other words, by getting off the "don't know" you get him up to enough responsibility to have an overt and a withhold, see? But up to that point, he's boosted, you see, by this "don't know." So it's an undercutting mechanism. So therefore, if you could communicate in any way with an insane person or a very sick person, and so on, it, of course, is the key question. And if you just ask somebody, "Well, what don't I know about you?" – if you just ask them that much, you know, or if you ask them, "What don't you know about your condition?" I mean, that's really coming into a total introversion area by, "What don't you know about your condition?" God help us. Anybody will answer that.

"Well, I don't know this, and I don't know that, and I don't know the other thing."

But present time is to these people an engram, and you're sort of running an engram as a not-know. But you ask anybody who is having any difficulty what others don't know about him or about his condition or about what he's been doing, and you're going to get some very fruitful replies. They will just rattle out left and right. And it's interesting to put it down at that level of an assist.

Now, any auditing, of course, that is done outside Model Session, except the CCHs, would – could only be regarded in the nature of an assist. So don't be too amazed if after you've done this patch-up type of auditing your pc falls on his head. They do routinely. They don't fall downstairs as far as you've picked them up. But very often after you've patched somebody's broken leg up or something of the sort with an assist, you see, a couple of days later his leg hurts like hell and he's complaining about it. Because the effects of an assist are not very lasting unless *all* of the withholds are pulled and a lot of Havingness is run in on top of it. Then an assist would be fairly lasting.

We had an example right here in the house. The children's teacher came in Tuesday, but only because the Tech Sec and so forth, had processed her a bit on Monday night. She had a slipped disk, and of course she came in, she was all right because of the very minor assist. And I assure you it probably wasn't very much of an assist because, naturally, she slumped. She felt wonderful and then she went downhill. Well, that is characteristic of an assist. That is just what you expect out of it. Because to have done anything for this particular case would have required hours of auditing and should have been done months ago or years ago or something of that sort, you see?

This business of waiting until somebody goes mad before you audit them is sort of a dull way to go about it anyhow. We've got a boy right out here on the grounds and one of these fine days he's going to take another motor car – which he just got through doing – and throw it through a brick wall, and they'll scrape him off the brickwork and bury what's left. Because just today he saw a big curtain we were putting up in front of a garage area out here. And I was standing around and everybody was working very peacefully and getting along too well, so I interfered with them. And – wanted to show that I was important to the situation, too. And this kid came up helping it out, and all of a sudden he looked at that curtain and that was too much for him. It was flopping around. How were they going to drive in and out of a garage with a curtain across it. Well, he had the solution.

"I'd drive straight through it," he says. "I would, you know. I would."

And I said to myself, "I'll bet you would, too." [laughter] That's the way he operates.

Of course, the time to process him is now. The time to process him is now. And the Tech Sec should actually get him by the nape of the neck and straighten him up a little bit on this kind of thing because he's a very good workman, a very good boy. But he just gets that way around cars. There's something about cars.

Anyway, that is an example of a case, of a case level, a case action, and so on, where the case should have been audited a long time ago and all of a sudden is sick and then you're going to do everything with an assist that you should have done with high grade processing a long time ago.

Well, of course, you can't do that much with an assist, so don't expect too much out of a Security Check. Just expect the person who is insane to go up to a point where they are only a bit neurotic, see? You can bring an insane person up. It's very hard for a person to stay on being insane, anyhow. Takes a lot of doing. Neurotic tendencies, and so forth, are very hard to keep in place. I mean, an auditor just shakes them a little bit with Reach and Withdraw, and the person can sit up all night trying to put them back, and they won't.

And you would not expect too much. And after they were in fair condition, you would have to give them some decent auditing. But while they're in that condition, this is no time to use a Model Session – getting back to what I'm talking about. But auditing which is done outside and not with a Model Session should simply be regarded in the light of an assist and should be handled on the light that you're going to pick it up later anyway. And then go ahead and pick it up or not as the case may be.

Well now, auditing by fundamental, then, would be to restore the person's communication with society or with that group to which he is most intimately connected. Therefore, you could expect a person who is ill and very worried about their family or very angry with their family to, of course, have withholds from their family.

See, these are the fundamentals of Security Checking.

A person who is being very angry at the society or is having a hard time with the social structure he's surrounded with, and so forth, has withholds from that social structure, and so it goes.

Now, that's just the fundamental Security Checking.

Now, you see this in vignette all the time. You see a little tiny, microscopic example of this. I wonder if this has happened to each and every one of you. If it hasn't yet, why, be alert for it. It possibly has happened, yet you haven't noticed it. That you missed a withhold and the pc got upset with you. Have you seen that yet? Have you got a reality on that?

You missed a withhold, and the pc had an ARC break. Let me put it that way. Or you found the pc sitting in an ARC break and when you put it together again, it didn't go together well until you get off a withhold. You get the idea?

Well, it's a severed communication line. I see that it hasn't happened to some of you or you haven't noticed it, so you just better get enthusiastic with your observation. Get your obnosis going because you've never had any trouble with a pc unless you missed a withhold. You've never had any trouble with a pc and you never *will* have any trouble with a pc until you miss a withhold. That is all there is to it.

Just reduce it all down to then because look-a-here. An ARC break, of course, what is that? That's severed communication. Well, you didn't sever the communication so somebody did. Well, it – the only other person present is the pc so he must have. Well, how did he sever the communication? By having a withhold that he didn't give you. That's the only way he could sever the communication line.

Now, we move out into this perimeter just a little bit further, and we find that a present time problem is because he has withholds from people. You go along with that, don't you? He has withholds from people so he has a present time problem with the people, of course. We don't care how antique the withholds are from the particular valences he's having a present time problem with. They're nevertheless withholds.

And the pc, then, in any rudiment in the beginning rudiments, of course, has fundamentally severed communications. Well, how has he severed communication? He severed communication with a withhold. There is something people don't know. And because people

don't know, why, then he's severed communication with them. And that is all there is to that. So naturally, the common denominator of all beginning rudiments out is a withhold missed. That's all.

Now, let me tell you, you will see at once what I am talking about. I see that this is causing a little bit of consternation with you, but let me assure you of this, that it's very, very easy to follow.

You shut the window rather noisily at the beginning of session, and the pc thinks it is rather noisy and doesn't mention it to you. Now, you try to get the rudiments in and you find out that the room isn't all right and they have an ARC break and they got a present time problem. And you're just a knucklehead if you go on running an ARC break and running a present time problem, and so forth. Just ask them directly.

"Well, what's your withhold?"

And the pc, "Well, I don't have any withhold."

Well, you clear it on a meter. Maybe it doesn't even register on the meter because they don't consider it a withhold. You see, a withhold is a withhold whether the pc considers it a withhold or not.

You know, there are laudable withholds. Laudable withholds. Have you ever not lost your temper with somebody? Well, that's a laudable withhold. You should be patted on the back, but you got a withhold.

You know, you can get awful mad at people you don't dare lose your temper with? Form 19 is either out or just out or will be in your hands shortly, and it covers all this. The Know to Mystery Security Check. And those are all laudable withholds.

Anyway, you've got a condition here of the pc didn't consider that he had a withhold from you but he was withholding something so you have to follow it up – you have to clarify this. "Well, did you think something you didn't tell me?"

"Oh, well, yes."

And your meter will fall off the pin.

"Oh, yes, yes. I did. I did. When you closed the window, you slammed it very loudly and I didn't tell you."

And all of a sudden he doesn't have an ARC break and doesn't have a present time problem and the room is all right and your rudiments are all in. From what? From just that crazy, tiny, little impulse, he broke his communication line with you. He severed it right at that point.

Now, if you're not looking for that type of withhold on your pc as an actual withhold and if you're not asking questions which get off that type of withhold at the beginning and during a session, you, of course, are having the devil's own time keeping rudiments in. Because a pc is a busy, busy, busy little beaver. Figure, figure, figure, think, think, think, think, think. And you get some pcs that just have an avalanche like a critical circuit going all the time. And they're just sitting there natter, natter, natter, natter, natter, natter, natter, natter.

And they're looking at you, and of course they're getting madder and madder at you because of all the nasty things they're thinking about you. Well, logical, isn't it? Perfectly – the most logical thing in the world. What's more logical to get mad at somebody because you're mad at them? You see, that's the best reason in the world to get mad at somebody.

But of course, you won't get mad at somebody unless you're not being mad at them or you're carefully not being mad at them or you're carefully not offending them or you're carefully not. And if you get sufficiently "carefully not", believe me, you've got no ARC in all directions.

So, all right, now, I'll give you an example. This is an actual example of a session.

I was getting withholds in, in this session – I mean, getting the withholds pulled and getting them in view in this session – at the rate of two or three every five minutes. And this person had been audited quite a bit, but the package kept stopped – it stopped reading, so I'd say "All right. Now, what have – what are you – what have you been busy thinking now? What have you invalidated now?"

"What are you withholding" in other words, I was also asking, although I apparently was asking, "What are you invalidating? What were you thinking?", you know? "What reservation did you have about this?" and so forth. And they'd all of a sudden give me a withhold. And then I would vary this by asking for actual withholds; "Well, have you withheld anything from me during this session?" and so forth.

And the pc would think, you know, and the meter would go bang. And the pc would say, "Oh, nothing. Except – except right at the beginning of session ..." or something stupid like this, you know.

They weren't really thinking critical thoughts about me. That was what was appalling about this. It was knocking the whole package out, but the person was actually not thinking anything that anybody would have ever considered a crime.

I've been meaning to tell you this for some time, that withholds are not confined to crimes. The amount of crime involved in the withhold does not establish the magnitude of the withhold. The amount of crime which you think the withhold has in it does not mean it has a magnitude of withhold. Do you follow me?

The quality of the withhold does not establish the magnitude of the withhold. And you might as well get that very plainly. It's the force with which they are withholding. That is all. It's the amount that they are not informing, not the quality of what they are informing about.

All right. Now, I'll give you an example. A little kid sitting there; little kid wants you to like them, is rather dependent on you, wants something from you, and so forth. And all of a sudden the little kid has this appalling thought that you look awfully fat these days or something, you see? But the little kid says right away, "I mustn't say such a thing," don't you see?

And he's partially appalled at himself for thinking such a thought. And it occurred right then, you see, and he goes *nyaa-uggg*, you know? You can practically smell the rubber smoking, you know? And it makes quite a withhold. Get the idea? It's just the ferocity of the withhold, not the quality of it.

Now, a lot of people on Security Checking think if you can turn up some nice, juicy, antisocial crimes of some character or another in the pc – you can turn up some nice, juicy ones – why, you're all set, and the pc will get better. And then you find out that the pc raped the banker's daughter and hung her body in a tree and then hung it off on his best friend who got hanged as a result of it.

And you say now, of course, we've solved the case because look at the quality of this withhold. And he's sitting right there, and so forth, and it doesn't seem to bother him a bit. So we get appalled at this and we say, "Well, he ..." Therefore, we explain it by saying this person must be awfully antisocial or terribly irresponsible. You see, it's not the quality of the withhold at all, because we're liable to find – if we think that this is what constitutes a withhold, is the amount of crime or social reprehensibility contained in the withhold, then we're going to miss, miss, miss, miss, miss. Because he very well at some time on the track might have belonged to a society where the biggest crime you could have possibly committed against this particular society of girl rapers and murderers was to have let a girl stay alive. And that's the only thing they would have considered a crime, you see?

Like a thuggee in India. He doesn't kill his proper quota of people in any given month. And this would be a terrible thing, and he would be withholding this. And you would say, "What horrible crime have you committed?"

And he would look at you and he would say, "Well, there was a traveler rode down the road and there was a whole party of them following and they had not a gun amongst them. They had no protection of any kind. And I and three of my friends were standing there, and they went into camp and we went into camp, and we talked to them and we went away without killing them."

And he's liable to spill a grief charge. All kinds of misemotion is liable to come off of this thing. It's the omission of doing what – a now-I'm-supposed-to, you see.

So any time they omit doing a now-I'm-supposed-to, they consider themselves in trouble because that's against the mores of the society of thuggees, with Kali herself ready to take them apart as they step into the underworld, you see?

"And that's a pretty bum thing to do. And one of the merchants there was very affluent, and we didn't kill him and disembowel him."

That doesn't sound like the magnitude of the crime. That's the magnitude of the crime in reverse, isn't it?

So you cannot say with any pc, since the pc could just well be in the valence of a thuggee... Let's say he's a bank clerk, but let's say, as in many cases of countries that have conquered other countries, you get a bunch of people in the other country who are very anxious to get even with the conqueror. And the way to get even with a conqueror is go pick up a body and raise hell in that country. See?

I wouldn't go so far as to say that some of the upper-class English officials have occasionally been picked up by thetans of this character, but I would say that on a minor level it has happened, and so forth, like the secretary of the Treasury or something like that.

But it has happened. In any country which has been active in creating an empire and making any conquests, and so forth, can expect this as a normal course of human affairs. The people got awfully mad in the conquered country and they had no recourse at all but to – when they kicked off next time – to go over and pick up one in the conquering country. You can eventually wind up with an army which is almost totally composed of enemy soldiers. [laughter] It's quite remarkable. It requires a considerable amount of study. The society doesn't realize what it's doing to itself with some of the unusual punishments which it undertakes.

And countries conquering other countries never realize what they're doing either. And if they make no provision for this kind of thing in their conquest and no provision in their reeducation and reorientation in the home country, of course, they're in trouble all the time.

This has been so bad on the whole track that factually people have – whenever a thetan was killed, he was supposed to come back and pick up a body, you see, at the base. That kind of thing, it's quite common. That's quite ordinary. And they used to have identifications and passwords. If somebody came back and picked up one of the bodies at base and didn't know the password, well, they got rid of him fast. That would sometimes give some of you an anxiety about recovering your memory.

One of the things you're trying to recover, of course, is the password. "This is X49C. The password today is 'spacecraft'. " Otherwise, of course, why, they'd just zap you out of existence. Your own folks, you know.

But anyway, not to make a long story out of it, it is not the quality of the withhold that you're in contest with at all. It is simply the degree that the pc is withholding it. And therefore, anything a pc is withholding constitutes a withhold, no matter if it's very laudable.

Now, you got a pc who is customarily trying to sock his auditor in the jaw, something like this, you can ask him, "Well, during this session, have you had any impulse to sock me in the jaw?"

"Yes, I did."

All right. You clear up eight of them and get the rudiments in. You get the idea? It is what the pc is not communicating that is the withhold. As soon as you can learn that as a fundamental definition of withholds and rudiments, and so forth, you will be security checking by definition and you will find some marvelous things start occurring.

You'll get sessions in – *clank!* And all of a sudden, the pc will be running. I was assessing an unassessable pc just on this basis right over in Washington, but every three, four minutes, I was sitting there getting off the withholds. And the pc was withholding the fact that it might be an overt for me to audit her because I was probably tired after the congress, you see?

And the pc thought and the pc thought and the pc thought, and a busy, busy, busy little pc. You see, they were all good, good deeds, you see. They were all kind things this pc was thinking and withholding them like crazy and would withhold one and knock the package out so that nothing would read and you couldn't null anything.

And then I'd get the withhold off and then for a – oh, I could get in there for about three, four minutes of nulling before all of a sudden I would say, "Well, something else has happened because the character of the needle pattern." And I asked the pc what they were withho- what she was withholding, and she would give me the withhold again, you got this? That's the way it was, I mean, it just went that way: one, two, three, four.

So you see, you're probably – if you're having any trouble security checking – you're probably looking for some quality of withhold. You're probably saying, "Well, if we could just find a good, slimy, solid rape-murder here, then this pc would recover."

Well now, if you think that's the case, then Security Checking is going to fail you. And it's going to fail you on this basis: because your expectancy was the quality of the withhold would give you the magnitude of the recovery.

You could say, "Well, if this pc got off a withhold of that tremendous magnitude, why, therefore, he should make a magnitudinous recovery," see? And therefore, your observation of the whole thing is completely unreliable. To you it's not comparable. So you think that Security Checking doesn't work or it's failing you, see? Because you think, well, if he got off this huge withhold and buried the body, and so forth, and never told anybody, got this withhold off, he ought to be sitting there mopping his forehead with a handkerchief, you see, and saying, "*Wheeew*. I feel so much better getting it off," and all of this kind of thing.

And you say, "Well, obviously."

Well, look. He'd only be doing that if he were worried about it. And you often get treated with this level of expectancy. You often get treated to another spectacle entirely.

"Yeah, well, I raped the girl and put her body in a culvert."

No handkerchief, no sweat on the forehead, no recovery, no reduction of the tone arm.

Oh, yes, the person was even withholding it, but not very much. So there was no magnitude of *withholding*. There was only quality of crime in your mind. And here you're processing this fellow from upper Manchester, and you're saying, "Well, now, withhold, withhold, withhold. And did you withhold, withhold, withhold?"

And you're getting off withholds and they're not going anyplace. And you finally ask him – it finally comes through to you that you're not getting off anything that the pc is withholding. The pc isn't withholding any of this. And it suddenly comes through to you, so of course, what's the difference?

Well, you still have to get it off – if the needle starts knocking, why, you have to get them off. But let's get smart about this time and find out what this pc considers a withhold, you know?

Well, one of the ways of doing that is, "What doesn't (eight dynamics) know about you?" See, that's the phrase question. "What doesn't (any one of the eight dynamics or any part thereof) know about you?" see? Or "What have you done," you see, "that God doesn't know about?"

And you could say this to the archbishop and he'd flip his wig, man. He'd have a ball right about that time. Probably find out the poor man has never – ever since he was made

archbishop, he's never gone to bed on top of the bed. He's always had to go to bed under the bed because God could see what he was doing. [laughter, laughs] Quite remarkable, you know.

You take somebody that's been deeply immersed in spiritualism on the seventh dynamic, and so forth. "What don't the spirits know about you?" And they get pretty shaken up. And they have taken some unusual measures to secure a small amount of privacy.

And you will ask some guy who is about three-quarters wogged in on electronics, or something like that, "What doesn't space know about you?" and the thing will fall off the pin. See? And you say, "Well, how could that be a withhold?"

Well, you find out he won't go out into space. He won't have anything to do with space, and he's withholding himself from space crazily. And as a matter of fact, the interesting part of it is, is the only way you have any gravity is by withholding yourself from space. It's quite amusing.

If you ran off a person's – all of a person's withholds on the sixth, they'd float, man. If you want to do a Houdini, why, just – or make a Houdini out of some pc, why, just roll up your sleeves and get a Security Check on "don't knows" and "withholds from," and so forth, on all the elements of the sixth dynamic, you see?

If you want to make a very fine spiritualist, why, get it all cleaned up on the seventh. Very simple.

If you want somebody to do a Saint Francis of Assisi, why, clear him up on the subject of birds, you know?

And you could almost call your shots, you know. Once in a while you really miss on the fourth because you're so monomaniac on the subject of being a human being that you don't realize that you're very often processing an ex-duck. [laughter, laughs] And you'll find out that he has some very peculiar withholds on the subject. And, of course, an ex-seagull would have even more peculiar withholds.

But anyway, the person is doing what the person was, don't you see? So the fourth dynamic would be what specie a person had been most closely associated with rather than mankind because, you see, the fourth dynamic is simply a whole species of something, not mankind. Most people read it differently, you see?

You go back into the early descriptions of the fourth dynamic, well, it's ants or it's camels or it's palm trees or whatever unlikely thing the person might have had anything to do with.

And of course, the third. Now, we open up the ball. Now, we open up the ball because there are more groups than anything else. There have been more groups and more types of groups and more types of societies, and so on, that you could easily count. And every one of them has entirely different mores.

I imagine the Christian Science church of Boston would be shocked to discover that practically every Christian Science church in the world has a slightly different mores. See, they don't even all have the same mores, don't you see? But the one in Los Angeles, I'm sure,

does not follow the mother church in Boston. I have no acquaintance whatsoever with Christian Science and the Christian Science church, but I have a large acquaintance with Los Angeles. I understand that Sydney and Cape Town share these honors in their respective continents. It always seems to be one of these cities.

Anyway, when you get into the third dynamic, you can't even say the goals, and so forth, of the thuggee because I imagine the thuggees of northern India and the thuggees of southern India – maybe it's Delhi that's the Los Angeles, or Calcutta. No, let's see. I don't know. Bombay is probably the Los Angeles of India. It would probably be entirely different, you see, in Bombay. There it's really an overt act to not let the corpses rot for a day or two before you bury them, you see? Up in the north country, why, it's merely a crime to not kill them, you see? It's gotten more complicated in Bombay, perhaps.

But you take the group after group after group after group as you go down the line, you are going to find uniformly and routinely that these groups are all different in their mores. So the moral codes by which they operate are not even constant from group to group.

Well, I imagine the Puritans of Holland and the Puritans of America were widely divergent in their mores although they were by label the same group.

So you get into a lot of randomness on the third dynamic. In fact, that is the greatest randomness known – is on the third dynamic. And there's where most of your Security Checking is done. So much so, and you get so concentrated on it and it's so complicated, that you forget the other seven dynamics. But they're – they exist and they're very fruitful sources of Security Checking.

Now, your second dynamic, well of course, that defies all imagination – the amount of moral codes or immoral codes that can exist on the second dynamic! I was reading some books one time on the subject of the moral codes and sexual practices of some zone or area, and I think it was Zanzibar, and some psychiatrist, you know, knows that he will get all right if he goes out, you know, and collects enough obscene acts, you know, and catalogs them properly, he knows he'll be blessed in the insane asylum. So they always are doing this. And this – Freud, of course; old papa Freud rather, set the example, and so the boys can check these things off left, right and center, you know. And they've got all of these immoralities so well cataloged.

Well, of course, they followed this through – because psychiatry's a rather religious activity – they followed this through from the church. And the church, of course, has been death on creativeness, of course. Like in Ireland, you can't even get a PE course – in Ireland you can't get anybody in that course to give you a definition for "create." It's one of the harder jobs you would ever have. And that's just because the church has lain all over the top of them for so long.

So that any overt, perforce, must have been a second dynamic action. I mean, it gets to that volume and violence, that an overt must, must have been on the second dynamic. If a person did anything to anybody anywhere, it must have been on the second dynamic. And you'll find an awful lot of people think that way.

I know it seems quite strange to your thinking, but that is – they couldn't think of any other type of overt. You could kill and slay and burn, but if it weren't with a sexual intent, it wouldn't be an overt, see?

As a matter of fact, matter of fact, some squirrel branches of psychoanalysis define overts all back into the second dynamic. If a person murders, it's because of sexual restimulation, see? If a person hangs somebody, well, it's because of a sexual bang of some kind or another, you know? It has nothing whatsoever to do – they're just – they got stuck on this one dynamic. So all overts and withholds must occur on that one dynamic.

Imagine a psychoanalyst beating his chops and his brains out, and so forth, in an office, and there's the pc on the couch, you see, and he's trying to find the pc's second dynamic withholds, you know? And he's just working at it. Just sweating, you know. And just – the perspiration running off of his brow. The pc only has withholds on the eighth dynamic. They didn't pray. The only type of withhold available on the whole case.

Yet they keep saying, "All right, now. Give me a detailed account of the amount of incest. Give me a detailed account of the amount of rape. What childhood activities didn't you engage in that you should have?"

And you get all this rolling along very nicely, only nothing happens. Case makes no recovery, keeps going this way. Psychoanalyst gets a total lose. Well, why does a psychoanalyst get a lose? He gets a lose only for one reason. Just one reason. He isn't asking for withholds in the zone where the pc has withholds. It's too glibly phrased to say he isn't asking for withholds that the pc considers withholds because, you see, I've already shown you the pc can have laudable withholds.

Pc doesn't consider them withholds. Doesn't consider anything wrong with them at all, but they're withholds. So you see, it's the zone of withholding. If you want to consider it on the dynamics, why, you'll have a very good picture of it, don't you see?

And in Form 19, you've got it on the Know to Mystery Scale. And the Know to Mystery Scale gives you other fruitful zones of withholding.

All of this is quite interesting to follow down. But these are the fundamentals of Security Checking. It is what the pc is withholding. And you can just redefine this from what the pc considers a withhold is because that doesn't work too well as a definition and this other works beautifully as a definition. And I've done quite a bit of work on it lately, which is what I'm trying to get you to catch up to. And that quite a bit of work demonstrates this one fact very conclusively: that a withhold is what the pc is withholding and it does not have to include what the pc considers is a withhold.

So, therefore, the fellow who glibly tells you, "Oh, yes, I murdered her and threw her body in the culvert." He wasn't withholding it, was he? So it wasn't a withhold, see, by definition.

Well, if it knocks on the E-Meter needle, it's a withhold; plus if you can get it to knock on the E-Meter needle, it is a withhold; plus if the pc gained relief from telling you, it was a withhold. See, all those things are true.

Now, what do you mean when you say *withhold* ? Well, let's broaden the whole idea of withhold out as I've been doing lately and just say it is restraining self from communicating, and you've got it made. So you get a much better definition of a withhold. Do you realize you've never had a definition of a withhold? It's restraining self from communicating

Now, the overt that goes immediately and directly with a withhold is restraining another from communicating. Of course, that will stack up to a withhold whether a person thinks it's a withhold or not.

Now, for instance, this fellow might have had a very good notion that the best way in the world to have gotten somewhere in the world was to have shot every policeman he saw. Every time he saw a policeman, shoot him. See, that's a natural course of human events. See a policeman, shoot him. And he was getting along well this way. Went along many lifetimes, all very successful, you see?

Then this valence dropped out and stayed out for many a millennia and eventually came in again. Only nowadays it is frowned on by his mother. In the old days his mother was made of stronger stuff, you see, brawnier mental material, and she used to pat him on the back and give him his porridge *only* if he had shot a policeman that day, you see? Something like that.

But this mother, this mother was raised in a different church, you see, and has different ideas about it, you see. And after all, things are sort of going down scale. And every time he has mentioned shooting a policeman, she has said, "*Tsk, tsk, tsk, tsk, tsk. Mm-mm.*"

And the guy goes around all the time withholding shooting policemen. And the more he withholds shooting policemen, the more he gets into the valence that shoots policemen. And there's the mechanics of the situation. And when you look at the basics of withholding, it doesn't matter *what* he is withholding, it is that he *is* withholding that counts.

Now, you see, mores, moral codes, all of these things add up into it, but to moral codes, you had better add patterns of behavior. So the moral codes are patterns of behavior of individuals or groups; or moral codes or patterns of behavior on all eight dynamics. And that takes in the whole confounded universe. And it means simply this: that you are triggering those moments when the pc was not communicating performe, see?

He should have been singing and he was saying nothing. That's the way it all adds up. He should be talking and he wasn't. That's what it amounts to. And that in essence is the ne plus ultra definition of a withhold.

Now, the ability of a thetan in this universe is expressed on the lines of reach and withdraw. Reach and withdraw. He is reached and withdrawn from and he reaches and withdraws from. There are four basic actions. There is another being who reaches toward him and withdraws from him, and then there is himself reaching toward another and withdrawing from another. And you have four actions.

Now, if you wanted to get real complicated, you go on right up into a five bracket and you can see the numbers of reaches and withdraws. And now if you want to get very, very complex about the thing, you can push it up into a fifteen-way bracket and now you can push

it up to a thirty-way bracket and you can probably push it up, if you wanted to, into, oh, I don't know, a sixty-four bracket? I don't know how many ...

Somebody was counting these up one time here in England, and I think he got tired. I've forgotten how high he got. But it was a high level.

Now, each one of those is a direction of a reach and a withdraw. See, that's a direction, and so forth.

Now, when the person should be reaching and is withdrawing, that's a withhold. Simple? That's a rough one. And that will come off with velocity.

Then you get the withholds of omission and he should be reaching and he's not. And that's just a withhold of omission and is not really of the same value as the one when he should be reaching and he is withdrawing.

I'll give you an idea. This individual will really bang on it. Let's find some war. Let's take almost any pc and let's find some war in which they were a soldier. And let's find an incident where they should have been – they received orders to attack, and they ran like hell. Well, armies consider this sufficiently important that they always shoot them when they do this kind of thing, although I always thought it was rather interesting.

Studies of tactics include having troops run like hell. As a matter of fact, the famous British Major Tarleton in South Carolina met his doom on just such a maneuver. The enemy troops were instructed to run like hell until his dragoons were caught in an enfilade fire.

So you see, it isn't the fact of running away, then, that is reprehensible. It's the reverse of the now-I'm-supposed-to. See, the person is supposed to be attacking and runs away. All right. He is withholding his whole body. Now you got a rough one.

All right. Now, he's supposed to be running away and he runs away. So what? He's supposed to keep his mouth shut and he keeps his mouth shut. So what? See, that doesn't amount to a withhold, see, if it adds up to his I'm-supposed-to's.

But on the other hand, you can get a very profitable set of withholds off a child which are quite interesting because it seems to improve the child, but that's the only reason you could say so. You run the other side of the bracket – people who didn't want the child to talk. Well, children are so outflowing that all this restrained communication puts a withhold in from the other side of the picture and adds it up so the child then starts withholding on other things of his own volition and you'll get things rather tangled up. But it gets assisted by the inflow on the child of "you mustn't talk."

Well, add all that up and what does it amount to? It amounts to failure to communicate with the environment, or restrained communication with the environment which, of course, winds up with not being here in the environment, which winds up with being – having the environment pulled in on oneself, which winds up with any other condition that you could possibly think of.

And insanity itself is simply must reach-can't reach, must withdraw-can't withdraw, just a built up ridge.

In other words, double sets of overts and withholds will produce the same mechanism.

In other words, he should have been shooting Germans and he wasn't, you see? But at the same time, why, he wasn't supposed to be shooting Germans and he did. You see, this would compound the felony and get it all mixed up in circles. And either one of them he might not communicate to anybody about, which would then constitute a withhold which is charged up with both of these contrary acts. You get this thing really going in circles after awhile.

You could ask somebody, "Well, what should you have communicated?"

Marvelous question. Doesn't apparently lead to anything at first glance. It's a marvelous pattern withhold question. Marvelous Security Check question. "What *should* you have communicated?" You're liable to take in a pc who's been running at a normal one division drop, and he falls off the pin on the thing. He really has a ball with this thing. He winds the tone arm around twice and comes out and a small cuckoo jumps out of the sensitivity knob.

In other words, you get action here. What should he have communicated? You didn't even say "and didn't." See, that's the trick question. What should he have communicated?

You can also get the same thing of "Where should you have been?" But, of course, this is an operating, full effort withhold, see, "Where should you have been?"

Well, you didn't even say that "you should have been there" or anything, and he will instantly leap to this conclusion, complete the whole situation just as you did a moment ago. He'll instantly complete the question. He knows that you meant that he should have been there. He would know that you meant he should have said and spoken and what he should have said and spoken, and so forth. But all you're asking is what should he have communicated. Not to anybody, and so forth. And you'll get an immediate response. Why? Because it sits on top of a withhold.

You see what you're fishing for.

All right. If your Security Checking is done in the perimeter of those definitions and understandings, it'd be very, very successful. And if your Security Checking is just done by a wooden, wound-up doll proposition of "What are you withholding? Thank you. All right. Good. Thank you very much."

And the pc sits there and the pc says, "I'm not withholding anything" The E-Meter's not very lively or operative, you see. "What are you withholding?"

You're getting a rise, and you keep on getting the same rise, and so on, you see?

"Well, what are you withholding? I'm supposed to ask you this question. It says over here on the sheet, 'What are you withholding?' All right. It doesn't produce any reaction on the E-Meter, does it? That seems to do it then."

Of course, the package doesn't read, and nothing reads, and you can't get the rudiments to read, and the pc won't talk to you, but you've done your duty.

No, you haven't done your duty until you've applied the fundamentals of the mind. And then you've done your duty.

Now, a very withholdy pc will stack up withholds on top of withholds, which is quite interesting. If they've got a set of withholds on a subject, then the tiniest, tiniest impulses to withhold will remain as withholds. So you see that mechanism all the time. This pc has critical thoughts, critical thoughts, critical thoughts, critical thoughts. Well, he's got some withholds behind all these critical thoughts, you see.

But for the purpose and sake of auditing, if you're not doing Security Checking, then it is perfectly valid for you to say to a pc, "What are you withholding?"

And you get no fall, you get no needle reaction, go on. Because he doesn't know he's withholding anything. But don't make the mistake of believing he's not withholding, because he is. He definitely is.

See, you got your rudiments in, and the pc – you didn't get a fall on the meter. You don't now have a missed withhold, see, to contend with. You obeyed all the rules of the game and you've got the pc now into session and going along fine.

But if you've made the assumption at that moment that the pc isn't withholding anything, then you're bats because the pc undoubtedly has some laudable withholds. This alone. This for sure. The pc has a withhold. He's being very nice. He's being in-session, see? The pc's sitting in the chair. He'd rather have sat over by the window and looked out through the window but he's sitting in the chair. Actually, he's withholding himself from sitting at the window. But he considers this a laudable withhold.

He's very happy because he's complying with what you want him to do and he classifies it all up under the subject of control and he's very cheerful about it and he won't get mad at you and everything is fine. But don't make the mistake of believing he doesn't have a withhold because he does. He'd rather sit over by the window. He's withholding himself from sitting over by the window. No matter how lightly he's withholding himself, it's still there, you see?

Of course, that withhold possibly doesn't amount to anything unless all of a sudden the pc starts getting upset in the session from other causes. Now, you have to go back and pull the withhold that didn't register. It didn't register because it wasn't a withhold that he knew about. But it *was* a withhold.

And he all of a sudden goes out of session and you apparently have all the rudiments in, but - you had all the rudiments in, but there was a withhold.

Now, "rudiments in" merely means in condition to be audited. That's all that means. If you always have to audit somebody through a present time problem who has one, this is a *reductio ad absurdum* and a piece of nonsense.

This fellow who's sitting there, he's got a set of crutches, well, you couldn't audit him at all, could you, because he obviously has a present time problem. He doesn't consider it a present time problem or a problem that is here and now although it is here and now. But he doesn't consider it so *at the moment* is the only thing that gets you by the withhold and gets you into the session.

But sooner or later, if you start ARC breaking him and upsetting the thing in general, and the pc isn't making any progress, you'll go back and you will find that there's always been a withhold on the subject that he had a present time problem. Because of course he had a present time problem. He has two crutches, doesn't he? And it's a hell of a job getting around. Of course, he has a present time problem.

Now, it doesn't register, however, as a present time problem, so you go on and get your auditing done because he isn't thinking about it. But you could stir up all manner of withholds on a case.

If your purpose was to use the rudiments to audit the case, you could always find the rudiments out. You could always shove... I can take any case right after you've checked the case, or one of the Instructors checked the case, and I could show you that all the rudiments are out.

You've just checked it for the auditor that the rudiments are in. The Instructor has just checked it for the rudiments, the rudiments are in, and so forth. And I could give you one of these "PDH the cat" routines and show you conclusively that the rudiments are out. I could sell the pc on the rudiments being out quicker than scat. See?

"Well, have you had an ARC break? Do you have an ARC break?"

"No." There's no response. That's what you've been asking and what the Instructor asked.

And I would say, "Well, have you had an ARC break lately?"

And the pc would say, "Well, yes, as a matter of fact. I was quite cross with the auditor yesterday," and so forth.

Now, I don't ask "Has that been handled?", you see. I say, "Well, are you still feeling a little bit – well, just a little bit cross with the auditor?"

In other words, I'd pull the ARC break in present time from yesterday, don't you see? And then infer that it's happening now in a sort of a curve, and the pc would consider it and some casual observer would say, "Well, gee, you know, those rudiments are out. That's all there is to it."

Well, I put them out, see, overtly put them out. And, "All right. Now, do you have a present time problem?" I get no reaction of any kind whatsoever. He isn't thinking he has a present time problem. That's the only thing you can say about it.

I could say, "Well, do you mean there's nothing wrong with you in this whole world?" [laughter]

And the pc would immediately say, "Well, put it that way, I don't have much money."

"All right. Well, now, have you thought about that in the last few days? Do you think you'll be thinking about that in the future at any time? Well, could that apply to this session? Might your attention slide forward in the session?" [laughter]

And I could completely sell the pc and sell anybody else observing, "Well, good God, these rudiments are way out. How could he possibly be audited?"

In other words, all these things are there latently and could be pulled into view, and your purpose in getting them in – your purpose in getting them in – is, of course, to cruise across the lot of them to where the pc's mind isn't on any of them and get the session going. And that's the only reason that you're running rudiments in the first place. And you don't want the pc ARC broke or upset during the middle of the session; well, the best way to guarantee it is to make sure the rudiments are in. But because you've got the rudiments in doesn't mean these things don't exist. And that's the only point I'm trying to make to you.

So if you can cruise across them this lightly in the rudiments – you say to this person, you say, "Well, are you withholding anything?"

And he says, "No," and you get absolutely no reaction on the meter.

And then you say, "Do you have a present time problem?"

And he says, "Yes."

And you do get a reaction on the meter, well, then the rudiment which went just before that must have been out. You'd say, "Must have been out."

No, it wasn't out, you see? He couldn't have a present time problem unless he was withholding something so then obviously the withhold question is positive, not negative. But it didn't register because, of course, you didn't stir anything up, see?

You could have tackled it this way, you see, and you'd have found it way out.

"Do you have – are you withholding anything? All right. Nothing Thank you very much. Well, have you been worried about anything or anybody lately?"

Now, the guy is going to have a present time problem in just a minute, see?

"Have you been concerned about anything? Has your attention been on anything at all?" and so forth.

And he finally says, "Well, yeah. Matter of fact, attention's been on the boss quite a bit lately, and so forth and so forth. I've been thinking about my pay raise and whether I was ever going to get it or not."

And you say right promptly, "Well, is that a present time problem?" you know, hopefully.

And the fellow says, "Well, yes, come to think about it, come to think about it, it is. Hmm."

Now, you say, "Well, now are you withholding anything from the boss?"

"Well, yes. As a matter of fact, I haven't asked him for the pay rise."

"All right, then. Were you withholding anything when I asked you the question?"

"Oh," he'd say, "well, what do you know, I ..."

He's guilty now, you see. [laughter]

In other words, you could throw those rudiments into a cocked hat. The best way to clear up rudiments, of course, is to clear up the exact rudiments that are out. And to go

through the rudiments like a little tin soldier on parade. You know, "*Brrrt-bup-bup!* Thank you. *Brrr-bump-bump.* Thank you. *Brrr-bump-bump.* What was the fall? Good. *Brrr-bump-bump.* That's flat now. Thank you very much. *Brrrm-bump-bump.* Now, we'll begin the session."

That's the best way to get through the rudiments. But that isn't the way you security check.

You security check quite differently. You security check more or less in the light I was trying to show you, you could always throw the rudiments out.

You always try to throw the rudiments out on the Security Check. Now, take that cautiously. But you get the idea? You use that same proceeding.

You're saying in effect, "Are you withholding anything on some dynamic or zone of action?" and so forth, whatever else you're saying.

And the pc says, "No."

And you say, "Well, do you mean you've never withheld anything on this?"

"Oh, well, that's a different proposition. You say I never withheld. Yes, well, I have had a withhold at one time or another on this subject. But that's all settled now" – fall on the needle.

And you say, "Well, what was that withhold?"

"Well, I've never told anybody that."

"Well, all right. Tell me now."

"Well, I don't know that I should tell you now, but, *ahhh*, here it is," you see?

In other words, you can throw rudiments out by implication. Do you see that? And therefore, you can get ahold of withholds by stirring up the bank.

Now, if you sit there running withholds the way I was telling you to run rudiments, of course, you won't get anything off the case.

If you run withholds with, "*Brrrm-bum-bump.* Thank you. *Brrrm-bum-bump.* Thank you. *Brrrm-bum-bump.* Thank you. *Bmm-bum-bump.*"

Well, you see he's clean, I mean, perfectly clean. But don't let me get ahold of that pc immediately afterwards because I'll show you some withholds. There's a question there: "Have you ever been mean to your wife?"

And he got off a couple of withholds, and so forth. And he doesn't now consider that any withholds are missed. It's all right. It's clean, you see? He doesn't think any withholds are missed. And it's all right. And that question will sit in place unless something drastic happens because he's still worried about his wife.

So, you say, "Well, have you *ever* withheld anything from your wife?"

You see, you've asked him, "Are you withholding anything from your wife?" you see. You know, that's *brrrm-bum-bump*. Like a rudiment question, you see? *Boom*, you see? "Thank you."

See, *brrrm-bum-bump*, now, all right. *Bang!* He says, "Well, I withheld the fact that I really wasn't at the club last night, that I was at the billiard parlor," or something, see?

And you say, "Thank you. Now, are you withholding anything from your wife?"

"No."

"All right. Now, it's all right. Okay. Good."

You go to your next question.

And you see that you could do this same gruesome trick that I was just showing I could do. Get ahold of this pc. It's a null question. You say, "Well now, what would be the consequences of communicating to your wife?"

Let's do it by fundamentals, see, let's not do it by rote.

"What would be the consequences of communicating with your wife?"

"Oh, nothing. I could tell her most anything. *Most* anything."

You say, "Most anything. Well, very good. Well, what is included on the ones you couldn't, you know? What's the rest of it from the most?"

And he says, "Well, that's another thing."

And your needle starts to get very restive now.

"Well, all right. Well, what couldn't you communicate to your wife about?"

"Well, I actually couldn't ... Got a letter the other day from a girl that I said goodbye to a long time ago and promised my wife I'd never have anything to do with again. And if I told her about that – I wouldn't be able to tell her about such a thing, and so forth."

Well, you come in triumphantly on the end of this thing and say, "Well, are you withholding that from your wife right now?"

"Well, as a matter of fact, *ha-ha-ha, ha-ha-ha-ha, ha-ha-ha-ha*, as a matter of fact, I am, you know. Hadn't realized it, you know."

And you say, "Good. Thank you. Now, what else wouldn't you be able to communicate to your wife about?"

Good enough. And you're going to find out that he's got a whole stack of withholds, and you can sit there and get them all off by rote. You don't have to know anything much except what can't he communicate about where.

You could run a whole Security Check by just taking and writing down all the parts of the eight dynamics. And just going down the line and finding out where the pc couldn't communicate at all and what he's withholding from them. And you'd produce some fantastic gains on the pc. But after you've stirred them up, you've got to pull them.

But the auditor, in doing Security Checking, must realize that he has a [speaks the word with a French accent:] mission, and *le mission* is not to find the withholds so much as stir them up so the pc can find them, too. And the difficulty you're having in this – in pulling withholds, and so forth – is you're trying to pull withholds the way you find out if the rudiments are in, "*Brrrm-bum-bump*. Thank you."

You know, hopeful that nothing happens, see? Well, God, you must be hopeful that nothing happens in the rudiments. I tell you, I myself always sort of hold my breath from beginning of session, you see, until I finally said that fateful word, "problem," and a good, solid, Tone 40 "Thank you." I try not to get too much relief showing in the final acknowledgment of the rudiments or too much speed going in, "Well, all right. Now, we'll run this process on you if it's okay," you know.

And sometimes the Model Session goes all to pieces at that point, you see, because I'm so elated; we got through the rudiments and we're really going to do some auditing here and everything is fine and here we go.

Oh, that's not the mood with which you approach Security Checking. The way you approach Security Checking is quite differently. You approach it as an auditing session and an auditing session is supposed to reach into the mind and pull out string after string like the magician pulls all of the magic flags out of his breast pocket and out of his sleeve, and out of the finger ring; just thousands and thousands of flags coming out of thin air, you see?

Well, you're supposed to find material when you security check because that is the stuff of which aberration is made. And the way you security check is as suggestively as you possibly can. But don't be like the psychoanalyst and decide from your own past what the pc's withholds will be. That is quite fatal.

You could do a Dynamic Assessment on the pc and get a Dynamic Security Check. Well, you don't have to be that crude. You could be much more fundamental. You wouldn't even have to have a form in front of you to do some of the most fantastic Security Checking you'd ever done in your life.

Just say, "Well, all right." Just watch the meter very carefully. Say, "I'm going to run a little set of items. Thank you very much. Now, just sit there quietly. Don't say a word. Shut up. Ah, that's good. Thank you. All right. Now, God. Spirits." You know?

And right on down through the first dynamic. Got a *bang* on one.

And you say, "Well, tricky, man. All right. Fourth dynamic. Mm-hm. Mankind. Good enough. That's very good. That's what you said, and that's what you got a fall on. Very good. All right. What doesn't mankind know about you?"

"What doesn't *mankind* know about me? Well, they don't know *anything* about me."

"Good. That's more like it." Now, let's get in there and kick, you know? "Now, what have you done that mankind wouldn't like?"

"Oh, well, first and foremost amongst these, I have to confess I've been a man. Oh, and that's not allowed."

"Well," you say, "well, that's very interesting," and you can carry right on down through the line.

You can just find not-know, not-know, not-know. "What have you done to – ?" "What wouldn't they like about it?" "What wouldn't this happen?" "What wouldn't that happen?" You got the whole thing all taped out in front of you. In other words, you've got the whole thing mapped.

You found a dynamic he was hot on. You'll find it'll only run for about twenty minutes on one dynamic before it shifts dynamic, I must warn you.

You don't sit there for a Dynamic Assessment for a twenty-five hour intensive. It's going to vanish on you in something on the order of one hour or two hours at the absolute outside. You've got to shift to another dynamic and then shift to another dynamic. Every time it starts going cool, shift to something else.

You'd have that case roaring. But it's your job to find withholds and therefore your job to stir up withholds and therefore your job to get imaginative on where you're going to locate the withholds. And then, of course, you are bound by this consideration: that you mustn't miss any.

But what is a – what is "missing a withhold" means? It means that something that falls on the meter and the pc thinks he's getting away with.

So therefore, the easiest way to handle missed withholds is just to clear any question you're asking and then say, "Have I missed a withhold on you?" and watch for the fall on the meter. If you get none, you've not missed a withhold on him even though there are eight thousand more, because he doesn't think you've missed a withhold on him.

If he doesn't think you've missed a withhold on him, you have not missed a withhold on him. That is all, you see?

"Have I missed a withhold on you?" does not register on the meter, then you haven't. Simple as that. But you can always stir up withholds. You can always stir them up. And you ought to.

But you really, basically, should security check by definition, by fundamental. There are areas into which this person cannot reach. There are areas into which this person has reached that he shouldn't reach. You must get those things off the case. And all of a sudden he starts straightening out and the first thing that reacts, of course, is his communication. He goes more into session.

If you're doing Security Checking wrong, if you're doing "*Brrrm-bum-bump*. Thank you. *Brrrm-bum-bump*. Thank you. *Brrrm-bum-bump*. Thank you. *Brrrm-bum-bump*. Thank you," and think you're security checking, ah, well, you're not because the pc is going out of communication, not going into communication. Getting withholds off frees up the pc's communication line.

And the first place it's to manifest, of course, is in the auditing session.

So that's the long and short of Security Checking. Those are the bases of Security Checking. Those are the fundamentals with which you operate on Security Checking. And I

wouldn't really consider that you were much of an auditor unless you could audit straight against fundamentals.

Very dangerous to teach an auditor to do anything else but audit against fundamentals and so you should know something about that.

And the next time you're security checking a pc – which will be in the very near future, in fact in the matter of an hour or two – you should try this on for size.

"What were you withholding?" "What doesn't (something) know about?" "What are the dynamics – are you out on?" "Now, what Security Check question should somebody have stirred up so that it would have been a withhold?"

In other words, realize that the auditor is monitoring them, dealing them through, and ready to grab them. And then you're going to see relief, providing, of course, you run adequate Havingness along with them to restore the pc's ability to reach after you've got off the reason he couldn't reach. And you'll see some miraculous things happening with pcs. Okay?

Audience: Yes.

All right. Thank you.

HOW TO AUDIT

A lecture given on 11 January 1962

Thank you.

And this is what? Eleventh of Jan. The mystic month. And we are finding ourselves in the middle of – no, it's at the beginning... What cycle are you in? [laughter]

Well, anyhow, it's on a planet, on a twelfth-rate sun, and it's the beginning of the – it's shortly after the winter solstice. Saint Hill Special Briefing Course.

Well, if you lived right and if you knew what you were doing and many other unlikely activities, you have it made. But we have to assume – we have to assume that if none of you have grown wings in the last twenty-four hours and you actually have had a pc on an E-Meter as an auditor and the pc hasn't grown wings in the last twenty-four hours with all the tools which you've got, we must assume that there is some faint disconnection between what I *am trying to teach you* and what you are doing I would say there's some *small gap*. Maybe not a large gap. Maybe only a light year or two. [laughter, laughs]

I don't mean to open up with that sarcastic, professorial attitude, but like a student or two that we've had who never had any critical thoughts "because they were all true" [laughter] – that we've run into two or three times, by the way; it's quite an interesting mental phenomenon – why, we have to assume that you have not confronted some of the facts of life. And this lecture is devoted to some of these facts of life.

And it's a scrambled lecture because it's on both Security Checking and 3D. And some of the people who are listening to the lecture, of course, haven't gotten up to Security Checking yet and will immediately have a tremendous impulse to go out and run a 3D promptly and immediately on anybody in sight.

And let them do so. Let them go ahead and fall on their heads. It's all right. It's okay. Let them get a half a dozen wrong terminals, and you know, and get these things all mixed up in some way and null the wrong things. Get a list null by getting the rudiments out. You know the system. And then – decide then that this best fits the pc and force it on him. That's what is known as a California assessment. [laughter, laughs] Oh, I'm awfully hard on California.

Actually, I haven't got any overts particularly on *this* California – this particular California. But I must have some awful overts on some California on some planet or another to get as many motivators as I get from that quarter. The only way I can figure it is that this must be somewhere else.

Well, anyway, getting down to the facts of life, there is some small difference between the way I would security check and the way you're security checking. Let us put it that way.

And I was showing Mary Sue at lunch how I would go about this and she unburdened herself of about three very juicy withholds I'd never suspected before, so there must be some-

thing ... [laughter, laughs] And she'd never suspected she had them either. So there must be some effectiveness in this particular method of Security Checking. Because as far as I was concerned, she was clean as a wolf's tooth clear back to the beginning of track, you know.

I said, "Well, this is the way I'd go about it," you see. And I was talking about this very thing with her and I said I would ask so-and-so and so I asked her so-and-so, you see and then I would ask so-and-so and so-and-so and so-and-so and, *bang*, you see, she was in-session giving me the withholds. I knew she had withholds because she was so embarrassed, but there it was. It was something fantastic. It was something on the order of not collecting a diploma or something like this. It was very – something or other, but seemed to produce considerable charge and I noticed her eyes turn color – different color.

And if you can't make a pc's eyes turn color, don't talk to me. You're not in my class. [laughter] Do you know I actually watch a pc's eyes? If I can't make a pc's eyes change color, I don't think I've done anything. That's one, maybe you've never – maybe you've heard me say that before. Maybe you haven't.

But if I can't make a pc's eyes that are sort of a slate brown, you know, a sort of a mixed up pea soup that's got some cement in it, you know, and if I can't warm that up and – actually, you think I'm just talking now, something that should be qualified about change color. No, I mean that. Change color. I made a pc's eyes turn from a very arctic killer blue to a brown in one session.

You even know the pc, only he probably – I don't think anybody commented on it particularly. It was one of those things which they just couldn't confront, you know?

And there are things like this. There are things like this. I notice I have your attention very alertly.

It's all in whether or not you get to the *pc*. After all, you're auditing a *thetan* and a *thetan* has various characteristics. And if a *thetan* can communicate directly and straightly toward what he is communicating with, of course, he immediately begins to communicate more immediately and directly with his body as a – as a completely secondary effect.

Somebody gets well, so what? So somebody made a body well. Well, well, well. We've been doing that for ages. You've been making people well among the Aesculapians and amongst the Indians and amongst the thises and thats. You can always make somebody well.

I had a sailor one time that insisted on going overboard to recover a line that he had carelessly gotten mixed up in the propeller. And it had really gotten chewed up down there and the water was about fifty degrees or forty-five degrees or thirty degrees or something like that. He didn't quite have to break through the ice.

And he said, "Well," he said, "I'll go over and free it."

So I said, "That is an excellent idea. An excellent idea."

He went in and got chilled to the marrow. Most people get only chilled to the bone, you see, but he got chilled straight through to the marrow. And he came out of the water shaking so that the stern of this rather heavy boat was quivering.

I made him well. I handed him a bottle of issue brandy. That's it. Total action. Didn't even put him in-session. Handed him a bottle of issue brandy. And he promptly and instantly recovered and then I had nothing – I had from about 150 men nothing but volunteers to go over and free the nonexistent lines. [laughter, laughs]

So I get back to the fact that making somebody well is not much of a trick. It really is not much of a trick. Even a medical doctor occasionally does it by accident. He tries not to, but he occasionally does it.

Actually, if you want immediate first aid surgery, why, go to some old grandma someplace. Stay away from the medical profession.

But you get – that's a plug. That's a – that's a commercial. [laughs] I'll collect from the grandmas of the world for that.

Anyhow, it's true. My old grandma used to – I used to get a sore throat when I was a little boy running around in subzero weather and she'd take a wet cloth and hang it around my neck and I'd go to bed with a sopping wet, cold cloth around my neck and next morning, so help me Pete, the sore throat would be gone. It's fantastic.

So anyhow, if you're going in – if you're in the business of curing bodies and you can't cure bodies, why, God help you. Because anybody can cure a body.

Hand them a bottle of brandy. Pat them on the back. Whistle at her. You know? Raise her morale. Anything. Anything and you're liable to get into a situation where you've cured a body.

In a society where care of the body, care of the body, care of the body, care of the body, care of the body is read on all the best television programs and in all the best periodicals and is featured in all of the best stories, they get off no further than a game called "care of the body." "Brush thy teeth and thou will be salvaged," you know? They're all set.

Well, all right. Bodies are okay. The bodies are okay. There – nobody's running down a body with it, but to fixate totally on this as a game, sounds to me to be one of the more interesting idiocies.

It's true that a thetan can feel like the devil if the body's falling apart, but what's he in that kind of condition for?

Now, all you've got to do to cure a body is put a thetan in some kind of condition and you promptly and immediately have somebody who is happier, but you have a well body. And one of the first manifestations of somebody recovering is he recovers from some chronic somatic of some kind or another.

Now, if you're dealing with technology which is able to restore the communication lines of a preclear, you inevitably will cure up all manner of maladies. You also, with what you are running today with Security Checking, Twenty-Ten and 3D, you will run into the condition where you cure up all the maladies they had and they get a whole new set.

I remember Pon, the day she left here and so forth. I asked her how some horrible somatics and difficulties – she came in here worrying about them, you know. And she said, "Oh, they're all gone. I have an entirely new set now."

But a body responds in direct ratio to the communication level of the pc who is engineering that thar vehicle. All the body is is a meat vehicle if you can imagine such a thing. And, of course, somebody imagined one one time or another. You wouldn't be sitting there in one now. But it's a meat vehicle.

And communication of the thetan is the monitoring factor. Now, it is true that a body will run on total automatic and sometimes you find thetans who aren't even there and a body in pretty good condition. Well, that's because he hasn't communicated with it. It's quite the reverse, you see? There's been no communication with the body of any kind.

It has been born and has growed and has come up to its present estate of elegance without being the least bit troubled by inhabitants. No, no habitation has occurred.

You see some girls like this in – get down around Hollywood, something like that, you see them walking around. And what they are is an operating body. And they're fine. There's nothing wrong with this – to be an operating body. But you start talking about the finer things of life or something like this and you find out you get no response whatsoever. It is just an irresponsibility.

But it's an irresponsibility of fantastic magnitude. I've looked at this many times and been quite amused by it. It's the low-scale mockery of it all, don't you see? This thetan hasn't even got enough horsepower to make a body *sick*. See? And they will very often be sitting – you read about this in *E-Meter Essentials* – they'll very often be sitting on Clear read. You know, they're eight hundred thousand fathoms deep and sitting on Clear read. You know, way below anything.

Start to process them, your first reaction that you get is they fall off to about 1.5 or they fall off to 6.5 or something like that. And you have to work pretty hard to get them into a density. In other words, they come up to density. And then they go on and proceed on upward. And they start getting into some relaxed state of mind.

Well, somewhere in that middle ground, you start processing a pc without creating a physical change in this pc and you are doing something different than what I am trying to teach you to do right now with the technologies which you have at hand.

This is rather typical of me, by the way, that twenty-four hours after you've got the package that resolves all packages, I always bawl you out for not being able to do it and that keeps up the record and keeps everything straight.

Now, it's almost what this is.

Actually though, you should have been getting results with 3D and Security Checking consistently and continually for some little time. Rather horrendous results, so therefore you must be doing something different than what I'm trying to teach you to do. Now, that unsettles all of your stable data.

Let me go into this very – in very detailed fashion. All I expect you to be able to do is run a perfect Model Session. Read anything that the E-Meter tells you and read it right now, not an hour after the session. Do a very good detection of an out rudiment or a withhold – and what's the difference. Just do a instantaneous detection of it. Just be able to smell that thing

right there through the meter. In other words, that's something you can do. You can look at that meter and if it goes *whap*, know that you have hit something and find out what you have hit. In other words, if you get a needle reaction, know that you have a reaction.

Now, I'm talking, however, about a British Mark IV. I am not talking about a Model T 1922, Mathison. I'm very much inclined to the theory that most auditing falls to pieces exclusively on this one point of a busted thetan running an E-Meter, see. I mean, there's something wrong here that this thetan won't communicate with that needle. That is the biggest breakdown in auditing. When somebody can't audit or the pc's getting mad at the auditor and so forth, you can trace it back pretty doggone routinely to just this one point, is the auditor was not handling that box in his hands. That's all. I mean, the main breakdown in auditing is not some little tiny ramification someplace. It's right there on that one button of they can't run an E-Meter.

So I expect you to be able to run an E-Meter and know what its manifestations are and handle it perfectly all right.

And know, when you have asked a question, if you have gotten a response and to be able to clear that response off of the meter. Now, that is a specific skill. And you'll find that there is no faintest, slightest, tiniest change of any character whatsoever, as we go along in technology, that changes this. This definitely is the same thing and it is what it is and you can read a meter or you can't. I mean, that's all there is to that.

I mean you either can read a meter and if it's a good meter and know what it is saying and so forth or you can't read a meter and that's the end of that. You follow this? I mean, this is an open and shut proposition. This is a specific skill and this skill is itself. And there isn't any arguing with this skill. I mean, a fellow can either read a meter or he can't read a meter. And if he can't read a meter, he can learn how to read a meter. We've proven that time after time. So that is something that you have to be able to do. In order to produce any kind of a – of an action of any kind whatsoever on a pc, you have to know what that meter is doing and what it is all about. Period.

Well, that's your chief skill right there for your lower activities or any auditing activity. And you'll find out if an HGC is running with the rudiments out and you'll find out if they're turning out unchanged profiles and if they're having an awful time of it and a terrible time of it and all of that sort of thing, as occasionally happens some place in the world. You'll find nothing very esoteric. You just find out they can't read E-Meters. I mean, it's just gross auditing error. Also, they could be equipped with – as they have been in the past – they could be equipped with E-Meters which don't read. See, squirrel meters, the various meters that were built in the United States. These meters don't read.

By the way, the old green and gold meter of the 5th London, alike with all of the early American meters, don't even vaguely come up to this Mark IV. This is not any plug – I mean that they don't read things that the Mark IV does read.

In other words, all earlier meters than a Mark III could be counted upon to miss withholds. So you needn't curse yourself too much about that. I mean, that's the way it is.

All right. We've got a situation there where if you have an E-Meter and you can read it you can then obtain certain results.

In other words, you know what's going on in the pc. All right. If you have that as a skill, *voilà*, you have it as a skill. And if you don't, you don't. And no auditing is going to count. That's for sure. Going to have pcs upset with you, going to be in a tangle and so forth.

All right. Now, that's a specific skill – *reading* the meter. It's a specific skill being able to *pull* a withhold. That's a very specific skill. Being able to chomp down and yank the withhold up and let it be aerated.

Running a process routinely is something that auditors do well. It was looked on as a highly desirable skill many, many years ago. I call it to your attention that they do it with the greatest of ease now. There is hardly anything to it now. It's just a *bang!* I mean, every – anybody can run a repetitive process.

Now, let's look at a much more specific skill than all this, and that is listing and nulling a list. Now, let's not call it any other thing than just that.

Take what the pc says, write it down on the page and assess it by elimination and come up with a result at the end of that time. That is a skill. And that skill is not likely to change. It's one of the tools of the auditor. That's something you have to know how to do before you can start assessing anybody.

And you've got a condition here where if an auditor can read a meter and if an auditor can list and assess by elimination, then your chiefest and most direct actions of an auditor are performed. If an auditor can do these things, wonderful. If an auditor can't do these things, well, he can't audit, that's all, see?

You know, any of you are going to go home and you're going to be absolutely horrified, you know? You curse your Instructors for beating you over the head and so forth. But when you get home and when you get back to your operating area, you will appreciate it because you're going to see some – hah – auditing.

Hasn't anybody left Saint Hill that didn't go home and say, "Oh, my God! How could I ever have considered this *auditing*." I mean, they've been *horrified*, just horrified.

In other words, their own expectancy of what an auditor should look like and sound like and do had been raised up the line. And they go home and they find auditors with their feet on the back of the pc's chair muttering into the electrodes, you know, and just – and all of a sudden break off the session, go out and get a Coke, talk around the front of the building for a while, you know and then remember they got a preclear in session. I mean, that's how ragged it looks. Actually, it isn't that bad, at all. But that's how bad it looks to these people when they see it. And they get quite militant along this line.

Well, I'm not saying there's that much of a gap between what you're doing now and what I think you ought to be doing, but almost. Almost.

You *must* learn the mechanical action and most of you have, of reading a meter accurately and well and making a list and nulling it to come up with one item. Now, those are specific skills and you should be able to do those skills. No matter what we dream up from here

on, running a repetitive process, getting the rudiments in, being able to read the meter on Security Check questions, being able to list and assess by elimination, boy, that's going to be with you a long time. So you might as well learn how to do those things well. But please, please, please don't think that you have now learned how to audit. Because you can do those specific skills does not mean that you are a sentient, alert, quiveringly-fast-on-the-trigger auditor. It doesn't. There is more. There are more above that.

You learn – you learn how to keep the rudiments in, run the Model Session, read a meter, security check, make lists and null them and come up with items and run repetitive questions. By all means, these I expect of you *perfectly*. I expect you to be able to do those things without a *flaw*. And *then* I can teach you how to audit. And it's just about that bad. That's about what it amounts to.

The knowledge of the human mind – a knowledge of the human mind – a knowledge of a thetan that we have now are so basic, so fundamental, that you ought to be able to think, sitting there in the auditor chair, straight through any kind of an impasse and achieve any type of result, *bang!*

I'm not trying to give you a lose. A lot of you think you're doing fine. I don't think so yet, because I haven't seen you changing the color of anybody's eyes. Isn't that a hell of a thing to demand of you?

But I can. So why don't you? I don't even consider it a trick. A girl sits down in the pc's chair – a lot – a lot of people who have watched me audit never noticed this. I'll audit a pc until their eye color changes. Maybe it's just a very faint change and maybe it's from brown to blue, but it's a change because that's the most direct channel of communication from the thetan to you and to the outside world. And if you can improve that channel of communication from that thetan outward, he can't help but do something to his eyes.

So if you've altered a thetan's channel of communication, you have done something to the amount of sparkle or glisten or something of his eyes.

Now, I don't care if you turn them flaming red. *Do something* to the color of his eyes.

Now, you see, I'm talking straight from the shoulder now and I hadn't actually let you in on some of these little facts of life. You recognize this now. Now, I'm saying there're certain technical skills that you can perform. And these technical skills are excellent skills. And there are very few auditors in the world at this present instant who can even approach any of you. *But that doesn't mean that you know all there is to know about auditing.*

I can sit down, look at a guy, put him in session, ask him what he's worried about, which way he's going and so forth. I'll usually use the current and the most and the best, you know. But I'm not above using anything that fits his case. But I use it very positively and very directly and I ask him what the score is and, using usually the most and current and the best, will apply it directly to that particular case by definition, not by a rote action. Not by a rote action. I'd apply it by definition. Of course, I'd do the rote actions. I can do those as well as you can.

I mean, actually you can get as good as I am on that level very easily. Very, very easily. Because what is it? It's reading a meter and translating it into set forms which are all per-

fectly lined up and which are perfectly valid and which are the product of years and years and years of application, observation and research. Yeah. Well, you can get up to doing that.

Now, I'm asking you to do another thing. Now, I'm asking you to audit the pc who is sitting in front of you and not somebody else. And not some synthetic person that you dreamed up or some person that's sitting at the other end of a form or something of the sort. Audit the guy who is there, please. Audit the person.

Now, there are certain things you're going to *do* that are going to produce disaster. And one of those is miss a withhold. First and foremost across the boards, that one. That's the biggest – after you know all these other skills, then the biggest mistake you can make is to miss a withhold.

You just miss one withhold and you've had it. And for your information, the next time your pc is ARC broke, you follow it right back, puppy to the root, to that missed withhold and you will *find* the missed withhold. And the pc will just settle down and just act like a complete lamb as a pc the moment you've got it.

You can do that. You can do that. You can keep all of your rudiments in just with withholds. Withholds are that important. So you can hold a pc in session. You can keep him in session no matter how many present time problems or state of case or scratchy needle or anything else he's got. You can hold him in session.

You got technical tricks that hold him in session, one way or the other. But because you've got these tricks, don't fall so far short. Don't think you've got it wrapped up because you can do a few tricks. You've got to be able to audit the person who is sitting in front of you. Audit that person. Handle *that* person's peculiarly constituted mishmash, based securely on the fundamentals that we know.

Now, you see, he is no mystery as far as fundamentals are concerned. We know what makes him cook. We know from what spring his aberration proceeds. We could give you all the rules and theories by which he got aberrated, for sure. But nevertheless he is an individual package of cow's breakfast versus dog's breakfast.

You see, he's his own peculiar handmade mud pie. See? He is that. And that's peculiar and that's peculiar to that pc. Now, you got all the rules, you know all the basics, you know all the rules by which he got aberrated, you know the fundamentals and so forth. That's all fine. But on those he's built a peculiar edifice that he calls "me" or "my mind." And you have to be able to put your finger on any button in that, that is there to be pressed and produce a considerable reaction in the pc.

You have to be able to produce an advance of his communication. That is what you are trying to produce and that's all you're trying to produce. I don't care how many ways you phrase it, that is all you are trying to produce – an advance of his communication.

This person says, "Well, the good old days. And why aren't I still able to operate in a space opera. That was lots of fun. We used to take our electronic cannon, mount it on the flight deck and depress the rheostat and a space fleet one-and-a-half light-years away would blow up in smoke. And now I have trouble spilling a cup of tea. Ah, sad. Ah, woe. Ah, woe is me. What has happened to me? Is it because my mother was mean to me? Could that be it? Or

is it because I once read a book by Freud? Perhaps – perhaps that caused it. Or perhaps it's because the world has changed."

It isn't any of these things. This is just one of your basic fundamentals. These are one of your basics of the theory of the mind. This is one of these things. His communication reach has shortened. He can't blow up any space fleets one-and-a-half light-years away, he can't now. He can't even reach into a spilled cup of tea eighteen inches from his schnozzola.

Did you ever see anybody spill a cup of tea? They always leap back. Funny thing to do, isn't it? In other words, they aren't reaching at all already and they want to decrease their reach further.

Now, what's the matter with this character? His communication no longer has the same reach. And that's all that's wrong with him. As his ability to reach – which is to say to communicate – decreases, he considers that he is aberrated. It's this stupidly fundamental, see.

And when you audit this person, all you've got to do is extend his communication reach. That's all you've got to do. Now, there were many things that did this and most of them were short reach things. 8-C. That's one of them. That's a short reach, but it nevertheless is pretty good. When it would work, it just was wonderful. But that was increasing the reach to MEST and that was showing your – showing him, "Now, look, it doesn't bite when you touch it. And it doesn't kill you to be orderly in your emotions."

Told him these things. "And it won't – you won't perish because I am here communicating to you. Therefore, you can receive a communication without dying. And it isn't killing you because you're touching MEST and look, you've got your reach."

Well, actually, that works best on a fellow who heretofore has not been able to reach quite to the end of his nose. And you get him to reach out to arm's length. That's all there is to it. You extend a pc's reach, that's all. Which means extend his ability to communicate. Anything else you want to call this, any other way you want to go about this, you will find that whatever you're trying to do with the pc is covered by this one point. And your technical skills are addressed to this one point.

Now, his inability to reach can come about from these two things: One, he is restraining himself from reaching in some fashion or another, just directly restraining himself from reaching or he doesn't know what to reach. And there's only those two things.

He's keeping himself from reaching and he never suspected that before you came along. And the other one is, he doesn't know what to reach into or at. And there you are, too.

Now, it's on that one second button that you get your biggest gains. That's why 3D works. You show him what this character's – you show him what he's been trying to reach into. It's Goals Problem Mass.

Every time he went floundering around in his mind, of course, he collided with all this impacted mess of valences of one kind or another, all of them filled with terrific enturbulances and he couldn't even identify them. He didn't know where he was and he didn't know what he was doing, so he just didn't know which way to go. He didn't know what to reach. He

didn't know what was the future and what was the past and where he sat and so forth. He had a hell of a time.

All right. On the first one, the auditor has to be smart enough to be able *to find out* what the fellow's restraint of reach is and we call this withholds. How is he restraining himself from reaching?

Well, there are many mechanics to withholds. He has reached at sometime or another, overtly. He has reached. And then he has decided that that was a bad thing to do, so now he withholds the reach next time. And of course, this gives you a confusion immediately followed by a rest point, the withhold, and of course it locks it up very nicely on the track and makes it float rather timelessly. Not as bad as a problem, but it's a confusion and a stable datum, one after the other and it locks it up.

And now that he has decided he must never reach that way again, see, type of reach – he has never – he has decided he must never exercise that *type* of reach again – he has now forgotten utterly what type of reach he was exercising that he mustn't reach again. So he's in a total confusion as to what he is withholding.

He doesn't know what he's withholding. All he knows is he's restraining his reachingness. He's – he'd better. All sorts of horrible things might occur if he didn't. All of them imaginary. Oh, not all of them imaginary. I imagine if one or two of you went down and pounded on the door of the local gendarmerie and spilled a couple of your withholds, why, they would probably lock you up in a sanitarium or something. They probably wouldn't send you to jail, or something. I think, in terms of criminal withholds, well, the burden – the burden of proof is on the other fellow that you did it. You just got it off as a withhold.

Some people go so far as withholds, is – in order to know that they've gotten them off, they have to get hanged. And that seems to me to be a terrific exaggeration. That seems to me to be aberrated conduct.

All right. So there's the auditor. There's the auditor and he's faced in this one pc – who is not all the pcs there are – in this one pc, there is a randomly cockeyed mess of ill-assorted pullbacks that forbid him from communicating. See, a bunch of withholds.

Well, he has his own line and lot, as I've mentioned in other lectures. He's got his own brands. Here are all these withholds. Well, how are you going to get these withholds? You think I could write up enough forms to give you to cover the withholds of the whole universe? No, I'm going to take a shortcut on it. I'm just going to tell you, "Get off somebody's withholds."

Go ahead and use forms, by all means. They're very useful. I think you should also know how to get off a withhold. I think you should know how to find one. I think that would be interesting. Just directly and overtly find the withhold and get it off. *Crack, crash!*

Here is this pc. He is not any other pc. He definitely is himself. And although he runs on all the rules of the game and those rules of the game are invariable pc to pc and although you are auditing definitely on the rules of the game and no other rules; nevertheless, he's his own peculiar breed of aberration. He is festered in his own individual way.

The package which he is with – restraining is his own, has infinite variety. Now, an auditor can get so lost in the infinite variety of the pc's 3D package and the fantastic complexity and unexpected idiocy of the pc's withholdings, that he thinks there wouldn't be any way possible to reach him. But that's the auditor's belief that *he* can't reach. Isn't that interesting?

You know why you don't – why the pc doesn't reach into valences? Because they're enturbulative. Every time he reaches into one of these black masses, it bites. He gets somatics and he gets cold and he gets this and that. But honest, it won't kill him. Oh, yes, they have killed him many times though in the life of livingness. Not in auditing sessions. But living a life – yeah, oh, man, they killed him many times.

In fact, he couldn't even die if he didn't have them. So from his point of view, he is handling the stuff which murders thetans particularly and especially him. And he's sitting there, you know, not going through this and if he lives very carefully and he doesn't look very much or if he only looks from eight feet out forward only for a foot, he'll be all right, maybe.

And then one day he accidentally – he gets out of a car and he accidentally, *gong*, he misses and he will look at this valence over here, you know. And he'll put his attention right square on the valence and it will activate and that is his sinusitis. And it goes *splat*. He knew he shouldn't do it. In fact, he knew he shouldn't do it so well that the second he does it, he instantly forgets he's done it and said it was because he got chilly today.

The rapidity with which he can forget his goofs in handling his own bank is marvelous. No, he daren't reach into these things. They bite. They bite. They killed him and killed him and knocked him off and killed him. He knows this.

He's out – he's out driving on the highway and one of these valences moves in. *Mm-hmm-mm-humm-hmm-hmm-hm*, that's the end of him. He reached in the wrong direction.

He's chewing on something, he's chewing on something and chewing on something, thinking about something and all of a sudden he feels kind of agitated, you know and he chews on something. All of a sudden, why maybe he blanks out and drives straight into a tree. That would be the most elementary thing.

More complicatedly, he accidentally restimulates one of these things. He sees a pretty girl and he's thinking about something else and he thinks about how pleasant all that is and he thinks it all – how nice all that is. And then all of a sudden he realizes he shouldn't think all that was that nice. And he realizes he shouldn't be thinking like this. And then he sort of says that he wouldn't be able to tell his current girlfriend that he'd been admiring the girl in the roadster, don't you see. And so then he realizes he'll have a withhold from his present girlfriend and having a withhold from his present girlfriend, he brings in a valence. See, he brings in this valence and the valence activates and he gets very agitated and he can't coordinate suddenly and it's two highways and he drives on the wrong one. Yeah, he had been killed by his valences many times, so he knows better than to touch them – that's dangerous.

All right. And as far as his withholdings are concerned, why, he knows he'd better withhold. There isn't anybody understands him anyplace. He knows that.

Of course I – from our point of view, if he came up and told us that, we would say, "Well, your difficulty is that we understand you too well."

You know, people complain about Scientologists not being sympathetic. Well, I didn't breed this no sympathy into Scientologists. But once you've learned to handle something to that degree, confound it, you just can't bring yourself to worship it anymore, you know.

And this fellow comes in and he says he's led an unhappy life and his mother was mean to him and his first wife was mean to him and his second wife was mean to him, his third wife was mean to him, his fourth wife was very mean to him and his fifth wife is being just as mean as the others. And a Scientologist doesn't follow through with the proper human cue, you see.

He's supposed to say, "Oh, you poor fellow," or something like this. Instead of that, he says something – something blatant, you know. "What do you do to these women?" [laughter] Something elementary, you see, something down to earth, something effective and so on. Busts the guy's dramatization badly. That's all right. He'll recover faster.

Now, as far as withholds are concerned, what are the basic withholds that a person is confronted with? Well, they could be anything. They can be in the most assorted and unlikely packages. But he knows he can be punished for getting them off, because one of the things he's done is make people guilty every time they got off withholds. So he knows if he gets off a withhold out in the public, why, of course, he knows that he'll be made guilty and they'll hang him. And it's that type of mechanism. His overts are visited upon him.

So he's rather educated into submerging these overts. And of course, they have nothing – these withholds – they have nothing to do with his state of health. And he knows that better than anything else. That he really knows. His withholds have nothing to do with his state of health. No. Nothing to do with his brightness. Nothing to do with anything. He could just go on withholding forever. You'd think some of these thetans just think that, you know. They can just go on withholding forever. And somehow, while withholding, recover miraculously on some level or another. Can't be done.

You cannot teach somebody to communicate better while that person is restraining their own communication equally throughout the activity of trying to reach better. Do you see what an idiocy this would be? If the person is going to keep on restraining the communication throughout the exercises to reach better with that communication, of course, the communication is never going to arrive. So of course, he's never going to be any better. That's it.

So an auditor has these two zones of action. He's always had these two zones of action. In Dianetics he had pictures. And these pictures, by the way, are quite interesting. But pictures are a very shallow look. They are a hundred billion miles deeper than anybody ever looked before on these sort of things, but they're a shallow look compared to valences because valences are some of the wildest packages of pictures you ever saw. We're now auditing pictures by the quintillion. You throw out a whole package of pictures when you throw off a valence, see. And that – I don't know how many pictures a person would have in a lifetime. And every valence is at least one lifetime, so just count up the number of pictures that would be expressed in this valence.

Somebody was telling me the other day – it was very funny this package that floated in on him because he could look in on it and, just about the size of a 35-millimeter slides, he

could see these pictures. Well, of course, what did he think they were? They're engrams and nothing else, don't you see?

There's types of engrams. You have condensed engrams, you know and crossfiled engrams and impacted engrams and sometimes you can take engrams and mush them up like a – like a bunch of black dough and then when you try to take them apart, you see, why, they explode. Something like this happens.

Pictures have nothing to do with it, now. Let's not worry about pictures. Let's talk about valences. And then you're into 3D. Now, let's not talk about drills and getting the pc to communicate better. Let's talk about knocking out the things which keep the pc from communicating. There – what things are impeding the reach? And we know that he is impeding his own reach and that these are being impeded by having things he cannot – or he feels he cannot communicate.

All right. It's up to the auditor to get those off. Now, I don't care if we have policy letters. The auditor does it standing on his head, hanging by his toes, does it by handing carrots to the pc every time the pc gives up a withhold. I don't care what method is used here. The point is the auditor has to be good enough to get that pc's withholds. Not some other pc's withholds. But that pc that's sitting right in front of him. He has to be able to get that pc's *withholds*.

What are they? Well, the auditor doesn't know. On the basic fundamentals of the game, you could say, well, a generality of withhold is the pc is not communicating something because he doesn't want to, thinks he'll be hung, tried to make other people guilty, is restraining people from knowing about him. You could go on and make a long category about it, but just come down to the solid fact that the pc is not communicating because he's holding back the communication and you've got it.

The pc isn't reaching because he's not reaching. And why is he not reaching? Well, he has self-imposed restraints called withholds. And that's that. That's it. That's the entirety of Security Checking. All you're trying to do is release jammed communication lines that are pulled in by the pc so that he will not anymore communicate into certain areas. That's all.

And that's all you're trying to do. I don't care how many systems or rituals or anything else. You're just trying to find out what he is withholding from *whom*. And of course the converse of this is that if he is withholding from *whom*, why, he ain't communicating somewhat to that *whom*. So therefore, he isn't reaching that *whom*, so therefore, he doesn't feel he can be free in that direction, so therefore, that is just one more channel in this universe that he cannot put a communication on. That is just one more zone into which he cannot reach.

In other words, men build their prison cages out of these bars of "mustn't reach." And one by one they say, "I cannot reach into that zone and I cannot reach into that zone." In other words, "I have withholds from this zone and withholds from that zone," see?

And every time they do that, they put another bar on the cage and after a while somebody wheels them off and uses them in a circus as a freak. They get elected president or something.

But withhold after withhold, you see, they just pile it up and the next thing you know they're in a cage. That's all there is to it. That is all there is to it.

Now, knowing that and understanding that completely, why, you should be able to get withholds off. You see, these other technical skills learned and truly done and well done, you should be able to get withholds off.

What would you have to do to get withholds off? Well, all you'd have to do is find out where the fellow ain't. Not isn't, that's too polite because that's where he ain't. Where ain't he?

Well, I could pull a withhold off any of you just on this one basis. You're here, so you're not home. I'll show you a formula if you want one. All right. You're here, so you're not home. Isn't that a self-evident fact? Hmm? That's self-evident.

Well, any pc who is sitting in the auditing chair opposite you isn't home. You may be auditing him in his living room at which this would alter. Then he would not be at his office.

In other words, he ain't somewhere. That's – isn't that the first fact that meets the eye?

Female voice: Yes.

You can't avoid this fact. Here he is *in* the auditing chair. In the pc's chair. And you're *in* the auditing chair. You sit in the auditing chair, look at the pc in the pc's chair and the first thing that you could observe, as far as location is concerned, is he ain't somewhere else. He's there. Isn't that the first thing you'd observe?

Well, how come he blew from this other place? [laughter] Now, let's be real crude about the thing. All right.

Of course, we could say this is *far, far* too significant. This is *far, far* too fundamental. But why ain't he there, see?

All right. *Reductio ad absurdum*, he is of course withholding himself from home as he sits in the pc's chair. Not being home, he's withholding himself from home, obviously. He isn't there, so he must be withholding himself from there. That's the most evident idiocy that you could possibly imagine. So *there's* a withhold. If you're looking for withholds, *there is one*. He *ain't* somewhere.

Now, consciously or unconsciously or factually – certainly factually – this pc – this pc is not where he was. It's just that crazy, you know. So he is withholding himself from where he was or he wouldn't be here.

Now, that would be the first tiniest little gradient and of course, it's not aberrative. Nobody's upset by it except people who want to be there. And there's nothing more complicated about it than just that. That's all there is to it. And yet it's a withhold. And if you're looking for withholds, there's the pc, so therefore the pc isn't somewhere else, so therefore the pc must be holding himself.

Now, if you took a pc – and I'll show you really how to find a withhold, you say to the pc, you say – you say, "Where haven't you liked to be?"

"Well," the pc says, "I just never ain't liked to be down at the seashore."

All right. Now, you've really developed a nice, interesting situation right there. Pc does not want to be down at the seashore. He is sitting in the pc's chair and he is not at the seashore. This is obvious. And he does not *want* to be at the seashore.

Now, that he doesn't *want* to be at the seashore at *all* and he is sitting in your chair there, he's not at the seashore – given those conditions, I could develop you some of the nicest withholds you ever saw. *Bang-bang-bang-bang-bang!* They'd feel – the pc would feel much better. He'd be in communication in all directions all of a sudden. How?

Well, you'd ask him, one, what they have done to him at the seashore. That's very carefully worded, see. "Well, what have they done to you at the seashore?"

Oh, he'll answer that. *Oh-ho-ho*. Who was it and you know, get the details of this. What they've done to him at the seashore.

Now, your next thing is *who* did it to him at the seashore.

And then the next one that comes up, of course, is has he thought any critical thoughts about that person.

And then immediately behind that, you ask him, "What have you *done* to that person?"

And that formula lands you in some of the hottest withholds on any case you ever heard of.

Just find out where the pc ain't and doesn't want to be. He doesn't want to be there and he isn't there, so obviously he must have some withholds on the place which are quite in addition to not being there physically. And then find out what they've done to him there, that stirs up the motivators. And he's always happy to pass on the motivator. That's always safe communication – a motivator. It's nothing the pc can be hanged for, he always thinks. Only Scientists hang them for having a motivator.

And there's your next action, of course, is *'ho*. *'ho* did it? Get a name, you know. Get one, two, three names. "*'ho* did it? *'ho* was this brute?" And then, "What critical thoughts have you thought about that?" You know.

Well, it's proving itself all the way. They didn't want to be there. They aren't there. They didn't want – don't want to be there. They have motivators there. Well, we're getting warmer here now. And there's some person there who did these motivators to them. *Mm-hmmm!* There we are. And now they have critical thoughts about that person. We're moving right in close. Now, at – up to that point you have not done *anything* to help the pc or cure his aberrations. Now, you understand you have not done *anything*.

I don't care whether you were pleasant in session or sympathetic or I don't care what juicy motivator you pulled off of him. I don't care how many critical thoughts you managed to get and I don't care. You haven't done anything for this pc. *Baa!*

It's – you do those things, you possibly could change his profile. You'd make him happier. *Yip-yap, yip-yap, yip-yap*. See, I mean now, *pfffft*. These are little grains of sand. They're nothing, see? You haven't really done anything.

Now, that spring-trap question. *Nyaa-ha-ha-ha*. "What have you *done* to that person?"

"Oh," the pc says, "*Ha-ha*, well, *ha-ho*, that's something else. *Hooooooooo. Ha-ha-ha.*" As goosey as a bear on hot skates, and you have to fish now. But go on and let him tell you a few more motivators and a few more critical thoughts and you'll loosen it up.

Now, the odd part of it is in Twenty-Ten, after you've gotten that far and you've gotten the withhold or two off, you know that running Havingness will cause them probably to volunteer a few more withholds on the same area. It's quite interesting. Havingness will get them to give you some more withholds. Elementary.

And you say to the pc, "What did you do?"

And the pc will tell you. And when the pc has told you all, when you run some Havingness, he will tell you the rest of it.

Then run some Havingness and stabilize and the pc will feel wonderful. And you'll change the color of the pc's eyes. Why?

Because the pc *really* was being careful not to communicate in that direction, has been careful ever since not to communicate in that direction.

Well, it's not at any accident that you arrived at a proper set of withholds because you applied the first principle. He ain't somewhere else. He's here. Well, why ain't he someplace else? Well, the obvious common denominator, from someplace on the track he must have blown. Obvious he must have blown.

So if he blew he must have withholds. He must have committed overts before he got out of there. Obvious. I would say, "my dear Watson," but I'm afraid this is a little smarter than Sherlock. It's just on this prima facie evidence. And there's your basic *Security Checking*. That is the basics of Security Checking and that's all the basics there are to Security Checking. And you can change a pc's eye colors and hair wave and anything else you can think of just by applying such a principle.

But that's because you're auditing the pc who is sitting in front of you and because you do want to find out what this pc is and you do want to get the withholds off of this pc and you do want this pc straightened out. So given the basic skill of being able to do Model Session, get the rudiments in and *read a meter*, that is *important*. Being able to do those things, why, of course, you can audit the pc in front of you and find out what *that* pc's withholds are. Now, if that pc doesn't consider any withholds withholds and so forth, you have other versions.

You'd run the whole thing all the way through and then find out what the – what the who that you got out of this package doesn't know about the pc's deeds, actions, looks and so forth. And all of a sudden, the pc comes up enough in responsibility to know that that was an overt. You can play this any way you want to, you get off withholds.

I'm not necessarily stressing how you get off a withhold now. I'm telling you how to locate a withhold and how to take a pc who is right there. And, golly, you know, you've already accomplished the greatest miracle of all time. You've got this thetan into the pc's chair. From there on, it's easy as long as you know your business.

See, the biggest miracle was getting him there to be audited. The biggest miracle is that Scientology exists. Why, after that, there's nothing to it. There he sits, so why are you

dodging, see? Audit the pc in front of you and get off the withholds that pc has. If he doesn't think he has any withholds, get off the things other people doesn't know about him and he'll all of a sudden find out he has withholds.

All kinds of ways to go about this, but what a pc considers is a withhold has nothing to do with what you consider a juicy withhold would be on a standpoint of quality. It's what the pc's withholding.

Honest to Pete! You can listen to some girl sometime or another who is just bursting into tears over this fantastic, *horrible* thing they've done to their family. *Oooooo*, how *awful* it is, you know? They didn't send Aunt Molly a Christmas card, you know. That's the withhold.

"All right. Now, is there any overt connected with it?"

"Well, it's a pretty bad overt. Didn't send one last year either." [laughs]

Don't badger her. Clears the meter. The meter's clear on the thing. You can't find any more on it. Don't ever make the mistake of saying, "The quality of the withhold is not such as to have produced tears in the pc. Therefore, there must be much deeper and more significant overts in this particular area because nobody would cry over not sending a Christmas card."

How do you know? It's not your bank. What do you know what kind of a Goals Problem Mass package prompts all this, huh? *Hm?* Do you realize this person might have been the biggest Christmas card manufacturer in the whole of Germany three lifetimes ago? Do you realize this is absolutely contrary to every mores of a Christmas card manufacturer?

And it very well may trace back to fifteen hundred thousand years ago when they didn't send a Christmas card, they sent a bomb. It said "Merry Christmas, family dear," and they opened it up and that was the end of the tree and everything.

How do you know what it goes back to in the package? The thing about it is, is did it clear the meter and are there any more?

Now, I told you the other day I could throw rudiments out at any time. Well, you got to throw the pc out. The trick is – the trick is, you see – to audit with the rudiments in and to run the rudiments so they stay in, see?

You open the session. Keep the rudiments in. And then you throw the pc around, see? You handle the pc. You're the one who stirs up the pc's bank. *You're* the one who restimulates the pc's bank and gets the withhold. There's nobody else around. The pc isn't there. I'm talking truth now, you see. You're the one that stimulates the pc's bank.

Now, an auditor auditing this way is auditing improperly: "While running the withholds, stir up the pc's bank all one possibly can." Pardon me. "While running the rudiments, stir up the pc's bank all one possibly can," you see? "While running the rudiments, get them out as far as possible so as to get them in," you see? "Really run the case while running the rudiments." See, that's highly improper. But it's – has an equally improper sequel: "And when doing the main body of the session, be as careful as possible not to stir up the pc's bank." See? "While auditing rudiments, always get the pc in a turmoil and while running the body of the session, why, keep it as calm as possible and do as little muddying of the still waters as you can," you see? That's exactly in reverse.

You want to audit the pc with rudiments in. Every once in a while when you're doing Security Checking on a pc with the withhold question in the beginning rudiments and the session has started. See, the session has now started. The pc has a half a dozen he thought yesterday and last night and came in and decided to tell you and so forth. The session started.

Well, recognize the session started and just run it from there. That's a clever auditor. Clever auditor never lets auditing get in the road of auditing results. Auditing results are not something that would happen in spite of an auditing session.

What you've got to get is a smooth approach into the rudiments. Don't muddy up the still waters. With an air of great confidence and command of the situation, by taking over and controlling all environment in all directions clear on down to the horizon regardless of storm clouds, winds and leaking window panes. In spite of all this sort of thing, have that session *so deeply* under control in the rudiments that the pc never *dreams* that he is anyplace but in-session. Now, that's auditing.

The pc had a present time problem before he sat down in the chair. He doesn't have one now because you're auditing him. Not because you ask him, not because you ran one, not because you handled it, but just because you're auditing him. Obviously, he doesn't have a present time problem, you're auditing him. He realizes all will be resolved and it all keys out and there he goes and so forth.

Now, get that in *smoothly* and *rapidly* and then arrive at the rest. And then take a *great* big butter churn, about half-universe-size butter churn and put the pc in it and attach the motors to it. As far as his mind is concerned, rile it up all you possibly can. And the reason why you're not changing the color of the pc's eyes is because you're not muddying up his bank. You're letting still water be still.

It's you that do it to the pc. You think the pc's going to think of all these things? He's – look he spent lifetime, ages. Why, he's been careful not to think about this for the last millennia. And you think he's going to think about this all by himself? What do you expect him to do? Sit, be – there he is in the auditing chair and unless there isn't something else happening, he's just going to sit there in the auditing chair, just as he has in the whole last millennia.

Well, what else is going to happen? Nothing else is going to happen unless the auditor makes it happen. So it's the auditor who's got to stir it up. It's the auditor who's got to do something. It's the auditor who's got to get something done. And if the auditor doesn't start anything ... oh, this idea of sitting there very carefully, you know and sticking closely by the rituals so that we keep the still waters of the pc without a single ripple to be seen anywhere and so forth.

We get to the end of the session, I guarantee, absolutely, you will never change a pc's eye color.

Now, by cutting the pc to ribbons with sabers, by getting angry with the pc and busting the Auditors Code in all direction – well, you've stirred him up, [laughter] but you didn't necessarily get your hands on anything in the case.

No, you want to stir him up. Just as I was telling you in the last lecture, that you say to this pc, "Well now, did you have a present time problem? You been concerned about anything in life the last day or two? *Ha-ha.*"

And you can see you didn't get a read on the present time problem. Disappointing, isn't it?

And you say, "Well, in the last day or two have you worried about anything in life? Is there anything in life that is worrying you?"

And the pc says, "Well, I have been a little bit worried about the payments on my house and so forth."

"Well, could it be possible that that's worrying you now?"

"Well, now that you mention it, yes, it ..."

See, you could always connect the pc up to present time problem. Well, you don't do that in rudiments, but you do it in the body of the session.

The pc says – you say, "How do you feel?"

And the pc says, "I feel fine."

And the auditor says, "Well, I can fix that, too," to himself and goes ahead and does something. [laughter]

Man, if you're going to run these quiet sessions with no somatics and nothing going on and everything very nice, the pc will wind up at the end; the pc will say, "I feel fine," and he'll think you did fine and everybody did fine and so on. Everything is fine.

But you're not going to change anybody's eye color. I don't know. You got about a ten thousand hour expectancy to Clear.

No, you got to look at this pc. This pc is sitting there. You're going to take this pc and you're going to put him over the jumps, man.

You say, "All right. Now, are you very happy?" during the rudiments, you see. "Are you very happy about everything? Are you happy to be sitting there? Nothing is troubling you sitting there? Are you very happy?"

Now, you got the bulk of the session. The question you're asking now is, "How unhappy can I make you about a few of these things in order to get you to take a look at them and get the withholds off of them and clean them all up at the other end and come out the other end alive and in better communication. How unhappy can you get?"

Well, you sit there overtly and you say, "Aunt Grace, Uncle Bill, George," something, you see? You say these various things. All of a sudden, you get a fall on George, you know.

And you say, "What's that?"

Well, what are you doing except restimulating the pc so the pc can find something?

"George? George? Oh, I get this on George. George who?"

Well, the wrong way to attack the problem is, "Oh, I get a fall here on George. Oh, good. Have you done anything to George? Very good. Thank you very much. All right. Now, we don't have a fall on George now. That's fine. Now, here's Aunt Bessie now. Have you ever done anything to Aunt Bessie? Well, thank you very much. Very happy that you've never done anything to Aunt Bessie. All right. Uncle Bill. If we can just keep this meter from reading and we can just keep this awfully null, we somehow or another will get through the Sec Check."

Well, that's not the way to do it.

We say, "George?" We get a needle twitch. And we say, "Well, have you done something to George?"

No, that would be the wrong way to approach the thing. At least get the pc talking to you. Stop omitting this Auditor's Code line about staying in two-way comm with the pc.

"George? Who's George? George 'ho? When did you know him? What did he do to you? What critical thoughts have you had about him? *Ooooo*, is that so? *Ooh*. How interesting What did you do to him?"

"Agggg. And it's this and it's that and it's the other thing and it's the other thing and it's the other thing and it's the other thing. And I don't want to tell you and besides *hee-hee-hee*, that wouldn't be very important," and so forth.

And I'm still getting a fall on the meter. You say. "What is it? What is it? What's some more about George? Well, what *did* George do to you about then?"

"Well, *ha*, it isn't what I did to George. It's what George did to me. That is obviously the whole thing, you see."

Well, what are you looking at the meter for to find out if the pc still have a withhold? The pc's still got a *motivator*, so they must have a *withhold*. How could a pc get a motivator without having a withhold. See, that's auditing by the rules, but it's also auditing with good sense.

Instead of looking at the meter, you could say, "Well, have your families been mean to you?" You're trying to pull overts on the family. "Has your family been mean to you? What has your family done to you?"

And the pc still goes off on a long machine-gun parade of what the family has done to him.

Well, you say, "That's fine. Good. Thanks. Thank you. Thank you. Thank you very much. Now. Have you ever had any critical thoughts about all that? *Oh*, yes, very good. Well, what did you do to your family?"

Anything. Any way you want to enter it.

A little bit later they told you this. They burned down the house and ran up grocery bills and had their father accused of treason and a few other minor things. And there you get all these things off, pc says, "Funny thing, I never told anybody about this before," and so forth.

And the auditor says, "Oh, fine." You finally null the needle down on the thing. Well, another way to null the needle down on the thing is say to the pc, "Well, all right. Now, what else did your family do to you?" See?

And they say, "Well, the family did this and the family did that and the family did something else, the family did something else."

And you'll say, "What did you do to them?"

See, I mean, you're sitting there looking at the needle. Any time the needle twitches, they still got withholds. Well, any time they still got motivators, they still got withholds.

And this is just the rules of the game. This is auditing by the good sense of what it takes to audit. That's all. It's you're there to take these still, running waters. That's the trouble with them, you know. Their still, running water is only about a quarter of an inch deep. From there on, they're a churning torrent of total introversion because it's all held in and nothing is flowing out, see.

And you say, "Where are these self-imposed prison bars?"

That's what you're doing and you have to stir him up like mad sometimes to find that. Oh, you can get a pc so absolutely *sweating* on the subject. *Not* at the thought of telling you their withholds. That's the wrong direction for them to sweat.

But just sweating on the subject of how terrible *life* has *been*. These still running waters are no longer running still.

"Well, did you have a bad time with your first husband?"

Girl has a second husband, must have left the first husband. Well, that's a fruitful field of withholds. They aren't there, are they? Not still married to the guy, are they? All right. They must have left, so therefore the rules apply that they still have overts on the person. I mean, it's as elementary as it is, you see.

Pc has left places all over the track. Every time they left anywhere, they left some withholds. Simple. But you have to stir these things up and bring them into view and you have to move the case around. And you can't sit there, "Have you ever looked at a pretty girl? Thank you. Have you ever looked at a pretty girl? Thank you. Have you ever looked at a pretty girl? Thank you. Have you ever looked at a pretty girl? Thank you. Have you ever looked at a pretty girl? Thank you. I don't get a reaction now. We'll go on to the next question. Have you ever stood on your head? Thank you. Have you ever stood on your head? Thank you. Have you ever stood on your head? Thank you. Have you ever stood on your head? We got all the withholds off that now. Thank you very much. Now, we'll go on to the next one."

I could cry. I watch this, I could cry, man. I could just cry. There's a pc sitting in front of you. This pc has got perfectly – well, a sort of a slate mauve colored set of eyes set in deepest bloodshot. Pc is not in communication with life. Pc every time they – you start to think they have developed a reputation of being a very conservative person because they always think first. Well, the reason they think first, because otherwise they'd stutter. What makes this pc this way? What's this pc all about? What withholds does this pc have? Same thing, isn't it?

Where isn't this pc communicating to? Well, let's look it over and let's find out what the score is here. Where is the zone of no communicate. Certainly, you're not going to learn it by talking much to the pc. You're going to get the – learn it by getting the pc's responses to what you're saying to the pc. You can't just sit down and say to a pc, "All right. Tell me the zones of communication that you're not communicating into in life. Good. Thank you. Now, what withholds do you have from those areas? Thank you very much. One, two, three, four, five. Thank you very much. Well, then the meter's clear now."

"I wonder why the color of his eyes hasn't changed. Ron said the color of his eyes would change." No, you audit the pc that's in front of you and, man, you can turn their hair green.

No, you improve somebody's ability to reach and you improve somebody's physical health. You also improve their – the calmness in their environment. You also improve their ability to live. You also improve all the people that associate with him indirectly – their ability to reach. Thetans are basically good. When they can reach, they do all right. And when they can't, they raise hell. And that's about all there is to it.

Now, as far as 3D packages are concerned, 3D's the same way. You do a dozen things with 3D. This is almost unlimited, numbers of things that a sloppy auditor that can think on his feet can do with 3D.

Pc says, "Well, I've always had dyspepsia and I want to get rid of my dyspepsia."

"All right. Give me a list of people who would have – who would oppose dyspepsia."

And you list the people who had dyspepsia. It doesn't matter.

All right. Now, "Who or what would oppose that (finally assessed out item)?" End of session – no dyspepsia.

Fantastic. You say to this pc, "What have you always wanted to do?"

You see, you're not going to audit this; you're not going to run it, so it doesn't matter if it's the wrong terminal. You've only got to have a right terminal if you run it.

So you can say to this pc, "Well, what have you always wanted to do in life?"

Pc would say, "Oh, I always wanted to be an artist. Never understood why, but I always wanted to be an artist."

You say, "What kind of an artist?"

"A painter."

"All right." You say, "You wanted to do what now?"

"Well, I wanted to paint. Paint, specifically."

"Well, who would paint? What sort of a person would paint? What kind of a person would paint?"

"Well, a painter."

"All right. Good. Who else would paint?"

"A dilettante."

"Who else would paint?"

"Oh, uh ... an artisan."

"Who else would paint?"

"A painter!"

"All right. You see if there are any more of these?"

No. No more of these. Assess it. You get a painter. That was elementary enough, but it'd be a good thing to do.

Now, you roll your hands up and you say, now, "Who or what would oppose a painter?"

List, list, list, list, list, list, list and null, null, null, null, null, null, null and all of a sudden the individual will be looking at you rather oddly and strangely – particularly if you've run some Havingness somewhere in the vicinity of this.

"Let's see, I certainly feel strange. I certainly feel different about the whole thing. The thought of painting makes me want to vomit."

And you say, "Well, that's very, very interesting, what do you know about that."

"I didn't realize it before, but I just can't *stand* the idea of painting."

Well, that's very interesting. You've now made him reach into the zone and area of painting. All right. And whatever item you've finally found, who or what would oppose that? Next thing you know, why, the guy will be sitting home diddling with the crayons and making good with the pictures. All of a sudden, he can paint.

The guy says, "Well, I know I'd get better..." (This is another use of hidden standards.) "I know I'd get better if I suddenly started speaking Arabic. I've never been in Arabia and I haven't run into any Arabic in this lifetime, but I know Scientology would work if I suddenly started speaking Arabic." That's a very good way to handle that hidden standard. Say, "Who or what would speak Arabic?" List, list, list, list, list, list, list, null, null, null, null, null, null, null.

"Good. Who or what would oppose that item? Who or what would oppose that item?"

And he says, "*Allah, Allah, uk, Allah, ugala, ugala... splig-wug, dates*" – other Arabic words.

Who knows? He's liable to start speaking Arabic. On the other hand, he certainly will stop worrying about speaking Arabic. You see, those things are minor results. They don't have too much to do with the case. Don't have too much to do with anything. It would simply be a subsidiary use to 3D. You can do anything with 3D. If you don't – if you don't – don't run those items, you understand. I mean, don't set those things up and run them on the 26 December command sheet or something stupid like that because they're not proper items.

But they certainly did shift the bank around and blew out terminals, particularly when you accompany them with lots of Havingness.

You see, Havingness blows terminals and withholds loosen up terminals and 3D finds them and throws them away and you're in the business of circuits whether you like it or not. So you better learn how to audit and learn what you're auditing and stop sitting there saying, "Well, have you ever raped a waterbuck? Thank you. Have you ever raped a waterbuck? Thank you. Have you ever raped a waterbuck?"

And you finally wake up after a while and find out that the pc has been saying for some time, "What is a waterbuck?"

That is not the way to audit. No, learn to do these skills by rote, learn to do them absolutely perfectly. And then learn to audit. And it's on the basis of auditing who is in front of you and so forth.

Now, whenever I make you a lecture like this or I tell you to do something like this, always here or there a student goes into some wild skyration in some direction and does everything backwards, upside down and somebody is chucking his cookies out of an upstairs window. Something like this is going on. And it's disastrous in all directions. And the Instructors and other people around that are responsible for these things actually hate to hear me say things like that.

But have it very clearly understood, there are some things that you should know perfectly before you start this kind of thing and then you can get off the springboard of knowing how to audit the pc who is sitting in front of you.

And speaking of waterbucks – speaking of waterbucks – Mike was nice enough to get us a picture of a waterbuck. [laughter] And I thought you'd be very interested in this waterbuck. I understand that the waterbuck has kinder eyes than this, but there is a waterbuck. There is a waterbuck. And by courtesy of Quentin who got this for Christmas, here is a tiger. [laughter]

Now, I didn't want you to not have any havingness on these two terminals and so forth. Because I realized that if I kept talking about them, sooner or later somebody would start running them as a package. [laughter]

Well, I've now given you some havingness on the subject and I hope that remedies it enough so the circuit will blow.

Okay. Well, you've gotten along pretty well and you only have a thousand light-years yet to go before you get off to the starting point. I don't like to – I don't like to be sarcastic or upsetting along this particular line. I usually tell you you're doing fine. I usually flatter you. I try to keep up your confidence and that sort of thing. But frankly there isn't a rough case in the lot of you. There isn't a rough case in the lot of you. That's right. I'm saying that absolutely factually. There isn't a rough case in the lot of you.

And the weapons which you have right at this particular moment will take any case that is here and blow it to ribbons. If anybody is sitting around worrying about his case, why, I hope that his auditor has heard this and I hope the person who was worrying about his case stops worrying about it and starts auditing.

But the main – main thing that we're interested in – the main thing we're interested in is your obtaining results and we're very interested in these results. And I can tell you frankly that it's all right to teach somebody out in some Academy someplace, "*Da-da-da-da-da-da ra-ta-tat*. Thank you. *Da-da-da-da-da-da ra-ta-tat*. Thank you. *Da-da-da-da-da-da ra-ta-tat*. Thank you." And expect them at the other end in some way or another to achieve some kind of result.

Well, it's magic that I can make them achieve a result, even that way. That is – that's pure magic. But I'm not asking you to totally exercise this particular magic. I'm asking you to exercise – to learn these skills well and then exercise your own magic. You know you have some. It's about time you brought it out of mothballs.

Thank you.

NATURE OF WITHHOLDS

A lecture given on 16 January 1962

All right.

Okay. What's the date?

Audience voices: 16th.

All right. 16th Jan. 62, AD 12.

Now, it's a moot question whether I lecture you today about 3D or 3D Criss Cross or Security Checking Twenty-Ten. It's a moot question because the difficulties of both are exceeding you enormously.

In fact, it's almost, "Have you ever heard of them?" [laughs] I don't mean to be sarcastic and I never lay it into people. I gave you a low-toned lecture the last time I gave you a lecture, remember? Last week – gave you a low-tone lecture; told you there was enormous gap between what you ought to be doing and what you are doing – as great as the gap between what you are doing and what is being done in the field. And that's a pretty wide gap. See, there's a big, a big lot of stuff that you could be getting in there and pitching on.

Now, we have various things that would assist this. And these things are normally summed up in a subject of technology. Now, technology is what you ought to be studying.

Technology is divided into two parts. And these two parts are *how* you do it, what motions you go through, and *what* you do. How you do it and what you do. Don't try to wrap up technology under one heading of "Well, it's technical."

How do you run a session? And what do you run in the session? And these are two different subjects and they are very broadly different subjects.

Now, actually, I'm torn in several different directions in giving you a lecture today because I've got so much data to give you on Security Checking and on 3D Criss Cross and other things like this, and the anatomy of the Goals Problem Mass, which we have a lot more data on that you'll be very interested in, and so forth. But it's very difficult for me to keep this in a very orderly groove, because there is just – how'd you get this stupid? I mean, you know, you must have worked on it, you know? You must have worked on it. Somewhere or another on the track, you must have said to yourself, "They shouldn't know, and that includes me." [laughs] Somewhere here. But I wish you just hadn't done it so often. If you'd just done it less frequently.

Now, of course, it's a good thing that you do have withholds, some of you. That's a good thing. That's a good thing. Think of the cities that would be destroyed, the planets burst into pieces if you hadn't withheld here and there. We're not trying to teach you to not have

withholds – that if you have an impulse, just do it; we're not trying to teach you to do that. We're trying to get you out of the tangle you got yourself into. What do you mean doing – having such terrible impulses? *That's* the tangle we're trying to solve in a pc. How come the pc has these impulses that he then has to withhold? See, now *that's* the problem. It isn't the problem of withholding.

Now, if you took all the withholds off of a born killer, see, and you didn't remedy the case in any other way at all – ha-ha-ha-ha. I could look at a few of you right now – I'm not mentioning any names; [laughter, laughs] I don't want to be personal – but just supposing you didn't withhold some of the things you think of. Just supposing.

Immediately we get a cough here. [laughs]

All right. The withhold is, of course, that area of motionlessness which follows that area of doingness which you "shouldn't ought to have." And the whole study of withholds comes about from "shouldn't ought to have done it," you see? If you shouldn't ought to have done it, you then begin to withhold it, which, of course, classifies action under the headings of "things you should have done" and "things you shouldn't have done."

But what do you know? There's a whole bunch of things called "laudable withholds." Now, it was very laudable of you not to sink the battleship. This was very laudable. It's very laudable of you not to have gotten angry at the waitress. Yeah, it's laudable. But a laudable withhold, of course, is always something that society expects of you, providing you've got these other impulses which society has classified (whatever society you happen to belong to), has classified as shouldn't-ought-to-have-done-it actions.

Now, it all depends on where you was brung up (some people were brought up and some people were brung up) and exactly what you shouldn't ought to be done-ing. Now, the whole subject of that is not the subject of philosophy, it's a subject of mores. It's what is moral. To whom and where and what group, under what circumstances, is a laudable action and an action that ought to be withheld?

Now, you have, then, all withholds divided, and all actions divided into "laudable actions" and "laudable withholds." And the laudable withhold goes along with the undesirable action, and the laudable action goes along with an undesirable withhold. Well, figure it out. That's true, isn't it?

So you is always horsed between two horses. See? Is it laudable to went and done it? All right. Well, then it's not laudable to withhold it. All right. If it's laudable to withhold it, then it must be coupled with of – "You shouldn't ought to have done it. It shouldn't be done." You see?

So one of the pair of the overt or the withhold is always laudable and always desirable. And the other one is, it is undesirable. See, if you got a laudable withhold, you must have had a desirable action. In other words, a laudable withhold is an undesirable action – get it straight: laudable withhold, undesirable action. Desirable action, on the other hand, of course: you have a bad withhold.

For instance, it is laudable in some societies to hand out money indiscriminately. See, that's very laudable. That means you're generous, you believe in Allah, all kinds of other ac-

tions. You must hand out money in all directions. And if you withhold it, if you withhold any money, you're of course a miser. See, you're a cheapskate. You're a miser, you see? Now, that is the punishment they assign in order to – you see, that's a derogatory withhold because the action is considered by the group to be desirable.

Take any given action – let's take kissing a girl – just take that as an action. I don't know whether you're familiar with this action or not, but – [laughter] Kissing a girl. All right. Now, let's take a look at the various societies and their various regards of it. And you find out it'd be very interesting. The Marriage Counselors Society of Los Angeles. Of course, this is a very laudable action and therefore you are a very evil man if you don't kiss a girl. If you're not the type of man who kisses girls, then you're an evil man. That's according to the mores of the marriage counselors. Because of course the more girls that get kissed, the more business they have. [laughter] Elementary. Elementary.

All right. Now, let's take the Sex Is Evil Society of New York City. The Sex Is Evil Society. All right. Every time you kiss a girl, you see, you are evil. So you're an evil man because you kiss a girl.

Now, you go down to Hollywood, for instance, and kiss a girl, they think you're crazy. I didn't mean to – it as a crack, and so forth. I didn't mean it as a crack – a derogatory. In the first place, it couldn't be derogatory because you can always explain cracks about Hollywood on the same basis, "It isn't critical – it isn't a critical thought because it's true!" You hear that? [laughter] How do they say?

Now, there's just one action. And the fellow who does it in one group is evil and the fellow who doesn't do it in another group is evil. It's a case of "you can't win." But there's another side to this game, too, you see? The one action of withholding kissing girls in New York – then you're a *good* man, you see? And in California, you see, why, you're a – Marriage Counselors Association – why, you're a *good* man if you kiss girls. In New York – Anti-Sex Society, you see – you're a *good* man if you withhold kissing girls. Now, between these two things you get confused.

In a war there's nothing quite as upsetting to a company officer as a soldier who won't shoot enemy troops. This is very upsetting, very upsetting. The War Department in the United States, and I am sure in England, has often sat up all night long compiling statistics as the number of unfired weapons or weapons fired in the air at no target during actions of World War II. And it is a terrible worry to them, particularly when the figure gets above 50. When the figure gets above 50 percent, you see. Why, look at – the taxpayer has devoted his blood and treasure to manufacturing bullets, and there is this chuckleheaded soldier sitting on the front line who won't even pull the trigger, you see? So this is a bad withhold. Very bad business, you see? This is a rough thing here. A fellow shouldn't do it, you see? He shouldn't withhold that bullet.

All right. Now let's say he's even a member of the police force and he goes down the middle of Main Street, and he fires this – fires off a gun – somebody fires off a gun. The same officer at a different period of time may then be sentencing him for having *shot* a gun, arresting and sentencing him for having done this action. So the *time* it is done has something to do with it. Not only the society, but the *time* this is done. The timing of the action tells you

whether or not the desi- the withhold is desirable or the action is desirable. So it's no wonder you get confused.

You get it all straightened out, you see, that certain society, called the United States population, considers it laudable if you fire a gun at a man in time of war, and considers it evil if you *refuse* to fire a gun at a man at time of war, see? That's in time of war.

Now, in time of peace, the same society, the same people, consider it laudable to *withhold* firing the gun and evil to *fire* the gun. See? So you get confused. So your pc gets confused.

Your pc after a while doesn't know whether it is laudable to act or to withhold. And if you were to ask a pc bluntly, "Now, is it best to reach or to withhold yourself from reaching? Which is best? Which of these two actions would be the best action? Is it better to reach or better to restrain yourself from reaching? Now, what is the answer to that question?" Then if you – the person asked it, if he were really forced to solve it, would go around the bend – because it all has to do with the mores and the time and place. What group would consider it, you see? When? That's the anatomy of the situation.

In other words, you've got a situation going here where you cannot say that at all times one certain action... Let's take one action. There *is* no action that at all times is good in all places. And there *is* no withhold that at all times should be in action or withheld, see? There is no one certain withhold that at all times must be withheld everywhere.

So you cannot say that there is a bad withhold or a good action, or a 100-percent-bad action or a 100-percent-bad withhold, see? It all depends on from what viewpoint do you view this?

Now, that's all viewed with a worm's-eye view of the wog. And if you ask a wog these questions, you've had it. Because he can never answer this question. He will never answer it from one end of the world to the other if you say, "Tell me an action that is at all times good in all places. Tell me something that should be withheld in all places at all times by everything and everyone. Tell me such a withhold."

You can't, from a wog's-eye view.

Therefore, we must be dealing – and when we're security checking – with another factor. We must be dealing with something else. We can't, then, say, "He has withholds," and feel cheerful about it or feel depressed about it, either way. Because good men probably have more withholds than bad men, which therefore makes everybody very puzzled. And they don't want to become good because they know that all good men never communicate. And by this definition, the goodest men they are, are out in the cemetery.

You see, so everybody gets in a, in a ball-up about this. So we must be doing something else than pulling all withholds from all people at all times – all withholds. See, we must be doing something different. And we are.

We are remedying the compulsion or obsession to commit actions which have to be withheld. In other words, we're remedying unreasonable action. And that's all we're doing.

And that covers Security Checking like a blanket. You see, you're remedying unreasonable action. That's all.

Now, if we were fixing somebody up so that he would fit very well into the society of the Calakahoochie Indians, we would have to study up the Calakahoochie Indians and find out what they considered to be undesirable actions, remedy these in the pc, and he would be considered a very good man indeed amongst the Calakahoochie Indians. The only trouble is we cannot guarantee that our pc is going to pick up a body with the Calakahoochie Indians. This we cannot guarantee. They probably, by the time they get around to it, will have been totally wiped out by the United Nations.

The United Nations hears about it these days, they exterminate it. This is the – it's the modus. That's – the word is out these days. I don't mean to say anything bitter against the United Nations. Nobody is fonder of cooperative, coordinated action than I am, and – of course, I don't see any of it in the United Nations so I don't like them much, but that's all right. Let's just pass over that silently with a moment of bowed heads.

The – we can't guarantee that the United Nations will not have gotten there first, you see, or somebody else will have gotten there. We can make no guarantee where this pc is going to go next. There he sits in the pc's chair or there he sits in the Academy for that matter, and well, times are uncertain, and the generals they got on this planet aren't up to my standards. And they're liable to blow the whole top off the place at any minute, and – or some auditor from Burbank, or something like that, is liable to get hold of this person next, and the person does a bunk and passes Arcturus and thinks one of its planets would be a good place to stop.

In other words, we cannot predict, we cannot predict where our pc is going to land within the next century. Well, he has two hundred trillion years behind him, the probabilities that he will land in different places in the next hundred years are rather certain. He's been landing in different places for two hundred trillion years and to say that he is now never going to land in another place is idiocy.

He for sure is going to land in different places elsewhere. He's going to be in different societies than he is in now. Therefore, there is only one thing that you can rehabilitate in the pc. There's just one thing that you can rehabilitate in the pc, and that is his ability to determine his own actions. And that's all you can rehabilitate. You can rehabilitate nothing else. Do you follow that?

All you can do is make him governor of his own deeds. And if he can be made to be governor of his own deeds, we have then done the job for all societies in all places. And we have also rehabilitated totally, 100 percent, communication for this person. Because communication isn't, as some people would like to think, one constant long blah, which was started several thousand years ago and is still going on, you see? Most people – a lot of people have that; about 50 percent of the people have that. Or on the other hand, one total silence that began a long time ago and will be silent for a long time to come.

You see, communication is neither one of these things. Communication is the ability to control an outflow or stop it. It is to run start, change and stop on outflowing and inflowing actions: control of communication.

Now, control of communication, of course, downgrades into heavier MEST as control of reach, so that you have the ability to start, change and stop outflowing and inflowing reach. And the ability to do this is, of course, the thing that you are rehabilitating.

What your pc is afraid of is that one fine day he will be in Piccadilly Circus or Times Square and take off all his clothes. Now, you recognize that it's perfectly all right to take off all one's clothes in one's bedroom or even some other bedrooms; [laughter] that is perfectly all right. But it is not all right to take off all one's clothes in the middle of Piccadilly Circus.

Now, one of the reverse mechanisms of the human mind is that a person can be so worried about doing this that he will begin to think about nothing but withholding this. So he goes around twenty-four hours a day, except when he's asleep – and he doesn't sleep much either because he might walk in his sleep; you could even take care of that, you see? And he is afraid that one of these days he's going to go down in the underground, or the subway, take a train and go to the exact center of the city, stand on the sidewalk and take off all his clothes. He's pretty sure that sooner or later he's liable to do this and he becomes totally concentrated on doing all he can to *not* do it. And you could devote a wh- a person's whole life to not performing that one action. You could actually train a person to a point – you could get him so worried, you could get him so obsessed, you could get him so upset, you could get him so concentrated on this one point – that he would never think about anything else.

Of course at that moment you would classify him as insane because he couldn't even remember to eat, he couldn't remember to go to bed. He would walk around all the time thinking to himself about "I must not go down to Times Square and take off all of my clothes." Do you see that?

Well now, what he is doing, then, is practicing a consistent withhold of an undesirable action and most of his attention is wrapped up in restraining himself from performing this undesirable action. And it's an attention trap to end all attention traps.

All right. The reverse of it is true, too. He must remember to *do* a desirable action. Now, you could get somebody and you could train him completely that he must never pass a beggar without putting a coin in the beggar's cup, and that terrible bad luck will ensue if he fails to put a coin in a beggar's cup.

All right. That's fine. That's fine. That's a very laudable outflow, isn't it? Only a cheap-skate would not do that. Only a miser would fail to perform this very desirable action, you see?

All right. Now, let's multiply it. Let's multiply it. Let's make it so that he begins to believe that if he doesn't do this action at least once every day, that he will be ostracized and cauterized. He must do this in order to live. He must outflow this action. He must give to charity.

If you think I am being a little bit archaic here, just to this degree, that this particular obsession is most resident in the Middle East and was most prevalent about fifteen hundred years ago. Boy, they and – well, fourteen hundred years ago, thirteen hundred years ago, twelve hundred years ago. They were really working on this hard, you see? "Alms for Allah,"

you know, and so on. And the *Koran* was all written around how thou must give in order to be lucky, you know?

But anyway, it still exists today to some degree. But let's supposing that we trained this guy on an obsessive, compulsion basis, rickracked him up one way or the other, gave him electronic implants and made him implant others to do it – in other words, got him real set; and gave him a bunch of failures implanting others – so that he must put a coin in a beggar's cup every day.

Now, let's speed it up. He must put a coin in a beggar's cup every hour. Now let's really fix it up so that it must be a different beggar every hour and he has to keep a map, then, and a roster of all the beggars in the city in order to perform this action. Otherwise, the sky will cave in or the muezzin will not hold up the minaret or something.

Well, you see, that's an obsessive action. That's an obsessive action.

Now, what would happen to most of the citizens of Western society today if they failed to come to work in the morning? That's a desirable outflow, isn't it? They have to outflow a body from home and put it down at work, right? Correct? Hm? And on this we have accompanying economic disaster, social disgrace, denial of all things that go along with having a position and a salary in the society, you see?

All right. If we enforce that to that degree and then we withheld it in that degree, we'd probably have the fellow – he wouldn't have any clothes, so he'd be in the middle of Piccadilly Circus without any on whether he liked it or not.

Now, if we educated the same man to never outflow any money and never to give any money – we've educated him both ways now, a hundred percent – and we got this exactly and equally balanced, we'd have an insane ridge. And he'd have the glee of money or something.

Now, if we had this fellow totally educated to believe that he must never go away from home because he might go down to Piccadilly Circus and take off all his clothes, but that he must go away from home in order to have money to buy clothes, every time he went across the lintel he would not know whether he was heading for Piccadilly Circus or work. Which way was he going? Was he going to Piccadilly Circus to – ? Oh, no. He'd better not go to Piccadilly Circus. And after a while he forgets why he is leaving home. And he just doesn't leave home anymore.

And you find a tremendous number of people who cannot leave their houses. Well, you can run houses in vain on them without curing this phobia. You can remedy the havingness of houses and everything else. Why? Because it – the trouble with them is not the house, it's Piccadilly Circus. They don't know why they mustn't leave home because they've now forgotten that they might go down to Piccadilly Circus, you see, and take off all their clothes. And because they might do that, then they'd better not go out of the house. But they've forgotten why, what they're liable to do, and therefore you have a covered overt with a covered withhold, and you've got the present time action of a motionless person.

See? There he sits; he's motionless. In some sphere he is not free to communicate. Why isn't he free to communicate? Because he cannot find out what is the desirable action

and what is the desirable withhold, and what's the undesirable action and what is the undesirable withhold?

See, he doesn't know what these things are now. He cannot any longer differentiate amongst good actions and good withholds and bad actions and bad withholds, and he is no longer master of his own communication or his own reach, so therefore he has to be very careful to not reach and he has to be very careful to reach while he is being very careful not to reach; he must not reach, you see, because he might reach, but if he doesn't reach then he wouldn't reach. And you get your average wog. Average person. This is not an insane person I'm talking about. This is just the average bank. That's what it's composed of.

The fellow doesn't know what he mustn't reach and he doesn't know what he must withhold, and he's forgotten that he must reach and he's forgotten that he must withhold. But the habit pattern stays with it as caution. And it's interesting that all that psychoanalysis ever trained anybody to be was cautious. The more – longer they were psychoanalyzed, the more cautious they got. That's the difficulty.

Now, this other fellow who was trained obsessively to reach, he's trained obsessively to reach – he's got to reach, he's got to reach, he's got to reach, he's got to reach – he never has a chance to do anything else but reach, and he must never withhold on this subject, he must never stay home from work, see? *Never* stay home from work. Never, never, never.

And now he hasn't got a job. And not having a job, what does he now have? He has compulsion to go, but he doesn't know what he's supposed to go to. He doesn't know where he's supposed to go or why he's supposed to go or what he's supposed to arrive at or anything else. He just knows that he must go, you see? He's got to leave home.

And you'll find that these leaving-homenesses and things like that are cyclic. For instance, insane person is only insane sometimes between two and four o'clock in the afternoon. A person who has insomnia very often cannot sleep between one and four in the morning, see? Well, one and four in the morning, someplace along the line – one and four in the morning is a wakeful period of something or other. And they must – might have been a one – a night watchman sometime or another, you know, and they always had to be there at one o'clock. There is no telling why they had to be there but it was necessary that they reach at that particular time. So they feel agitated because they don't know where they're supposed to go, and they feel nervous. *Heh. Wzzzzzzz!*

Well, you – there isn't anybody you know that doesn't have a nervous period in the day sometime. If you sorted it out carefully, you would find that some period of the day they became very active, and another period of the day, at least one, they became very quiet. You don't know anybody who doesn't do this.

They get up in the morning, they have to get active. In the evening they go to bed and become inactive. Why? I don't know.

But a lot of people have a lot of trouble with sleep, because they're accustomed to sleep, or their sleeping hours compare with some other part of the planet, or some other time area somewhere on some other planet. And they're trying to go to sleep and wake up in the period that they're most accustomed to going to sleep and wake up because their training pat-

tern of going to sleep and waking up is that training pattern of, let us say, Los Angeles. And they're now living in London. There's eight hours difference, you see? Eight hours difference.

So actually, in Los Angeles you ought to be getting up around seven or eight o'clock in the morning, but you see, there's an entirely different time in London for seven or eight o'clock in the morning, so one just about goes to bed and becomes very wakeful. The second they go to bed, they become wakeful. Well, it may be coinciding with some period when they should be getting up. You see how dizzy all this can be, see?

Well, what is all that? Let's characterize that with what it is. This is strictly, totally and only a confusion of a reach and a withhold, according to the time and place and action. They don't know whether to reach or withdraw, and why or when or something. In other words, they have lost knowingness over the action.

Now, in order to restore control over one's communication or not-communication, receiving communication or not receiving communication, control over one's reach or not-reach, be reached or not be reached, one must get these unknowingnesses out of the road or the person will appear nervous sometimes to a point of total apathy and collapse.

When you ask them to do something or other, suddenly you'd – they're not able. They just – they just feel very nervous about this. They're not quite sure why they feel nervous about this. Matter of fact, they don't go into it so deeply as saying, "I feel nervous about this." See, they're not that analytical.

They're supposed to go down to the grocery store and they sit down on the porch and they stay there for two hours. But yet that's never happened to them before. But the next time they go down to the grocery store, they go down to the grocery store all right. They haven't any idea of lingering. It never occurred to them, you see, they were going down to the grocery store at the time they should have been going to bed in some other part of the world. You see how confused all this gets? How confused a person could be.

Now, in order to aberrate somebody on this subject, you establish compulsion to reach or a compulsion to withdraw or withhold – you establish this as an absolute necessity – and then shift them in time and place so as to bring about no necessity for this of any kind whatsoever, so that they forget it and so that they don't remember what they are supposed to do. In other words, make an unknowingness out of the whole thing. Bury it.

Somehow or another cloud the thing over, and after that, why, they've, to some degree, had it. But doing this once wouldn't aberrate anybody very much. After it had been done several hundred thousand times, though, it would begin to tell – begin to tell. The person would begin to get the idea that they didn't quite know what they were doing. That would become rather apparent, even to them.

Have you ever seen anybody that knew exactly what he should have been doing, knew exactly what he ought to be doing, gets all geared up to do it, get out all the equipment to do it, and then doesn't touch anything? Did you ever see anybody do that? See?

Well, his "Now I'm supposed to" worked right up to the point where it restimulated the hidden withhold. See? He goes right straight up. He's going into action. Now he's supposed to withhold it, you see?

Did you see – ever see anybody sit down, decide to relax – decide to relax, sit down, take it easy, have a good rest – turn around and they're tearing all over the house, you know, and the walls are caving in practically from the amount of running and fussing and scattering and changing the furniture and so forth. You ever notice anybody do anything like that?

Well, they've just hit the wrong side of things, see? Their compulsions to withhold or to reach are not in agreement, so that they sit down to withhold – in other words, they're going to withhold themselves from action, they're going to rest now – and they've hit so close to a borderline, some kind of a restimulator causes them to go into action: having decided to withhold causes them to go into action.

Now, when a person gets very bad off, any decision to act causes them to withhold. They have no differentiation at all. Any decision to act causes them to withhold. You've seen them. They get elected to office all the time.

Government program: That's a very, very good one, a government program. They're going to "do" this, and then the letter sits in the out-basket, you see, for six weeks and then it goes into another in-basket and sits there for seven months, and then it goes over to appropriations, and appropriations dawdles with it for a year or two, and that's just from the fact that the government is guilty, collectively, of overt acts.

You never have an effective government where you have tremendous numbers of overt acts mixed up in the government that are being withheld.

All right. Do you see, then, that the whole subject of withholds and Security Checking is intimately wound up with the action and inaction of people, and the determinism and the – of people and their failure to be self-determined, and so forth.

You take some bird, he's in a total hypnotic trance. He comes in and you say, "Well, close the door," and the door is closed. And you tell him, "Close the door." And they go over and they pick up an imaginary door knob and shut the imaginary door so that they will comply with what you've said.

You've set them down in a chair and they're in a chair. If you stood them up, they'll stand up.

In insane asylums they stretch them out, they lie down, they lie down there fine. You pick up one arm, put it in the air; it'll just stay there – catatonic schizophrenia. It's marvelous. They're just like tallow or clay or something. It's – anything you can do to them, you know?

Any – you know, you got – you'll get pcs like this. You want to watch it. They have eye flutter and various things. And you, if you were to suggest anything – it – this isn't why we suggest things to people on assessing – but if you were to suggest to this person that a battleship was his terminal, a battleship, yeah, boy, you're going to get a battleship registering. Because you shoved a battleship right into his skull, and he's got the battleship registering, and that's it and that's all that's there. You said it, so therefore it's it.

I have trouble with that. I sometimes assess people's terminals and so forth, and you can't get them away from them with shotguns – sometimes, sometimes. That doesn't mean those people are hypnotic. They know it was probably right. Oddly enough, it usually is right.

Good thing to do, good thing to do is take all eva- invalidations and evaluations and all overts off it, and strip it down to where nothing registers with regard to it and still see if it's it. That's the only way you would recover that. But this gives trouble every once in a while, where an auditor has suggested a terminal or where an auditor with altitude has found a terminal the pc isn't about to give it up.

Now, you're not in that range right now with 3D Criss Cross. It isn't as hard as that. Somewhat amusing to me to see some of the terminals I have assessed coming up again on 3D Criss Cross. There they are. They were there all the time, of course.

But here's your action. This person is totally susceptible to any restimulation. Now, get off the idea the person is totally susceptible to suggestion and how nice that is, because that's for the birds. The person is totally susceptible to any inflowing action of any kind – the person is totally susceptible.

In other words, they restimulate – *bang!* Their bank is so rigged that they see a spotted wall, they get measles, see? And anything that happens to them in society, they are instantly – reaction is to have that with them. They restimulate at once. And they are very, very bad off.

Now, a gradient scale of that is the average person. He sees a few things and they restimulate him where he's on a total effect basis.

Now, what's the matter with that total effect basis? There's only one thing wrong with that basis, only one thing. And that is a person has no command over his reach and withdraw. He has lost this. He cannot, then, be master of his own actions. He of course, then, is never governor of his own fate and of course he cannot be sensible about what he does.

IQ is the degree that a person can observe, understand actions, that's all – then withholding of actions, a person's grip of this situation.

You say, "Well, it could have a lot more ramifications, a lot more prettinesses about it, and so forth, and it'd be very much more complicated than that," but it isn't, really. It's one's government of one's environment.

Now, we are strange, as – if we considered Scientology a philosophy, which it is not, we would find ourselves almost alone in this one idea: that man should have any self-determinism. Because others, falling short of this, have looked on this point – and it's an important point – they've fallen short of it. They have seen that a criminal has a compulsion to commit crimes. And then being unable to pick up any part of the overt act of committing crimes or doing anything for the criminal, they say there is only one further answer, and that is to make the criminal withhold his crimes harder.

Now, that is peculiar as a philosophy because it doesn't work and that philosophy hasn't worked on this planet since I don't know how long.

You can compel a fellow to not go down to Times Square and take his clothes off to a point where he *can't do anything else!* Every time we see him, why, he's on his way to Times Square.

"Well, hello, Joe. Where are you going?"

"Well, I'm going down to Times Square – take my clothes off."

And you say, "Well, all right. I'll be down at four o'clock at the police station, bail you out."

And he'll say, "Well, thank you very much." Much relieved now, he goes down to Times Square and takes his clothes off. It's because he's withheld it so far that the withhold has failed. And it becomes a compulsion.

So, the action which is severely withheld very often reverses and becomes a compulsive action. A person knows he cannot withhold the action and therefore has to do it. And that is the danger of this philosophy that the more good, total withholds we have around, the better off we all are.

If you don't know this mechanism of overts and withholds, and you don't know why people act this way, of course you're liable to fall into this other philosophy as the only possible remedy. It's not a very good remedy.

Now, there's your basis of action. There's your basis of action and human beings. One, he does not know what his compulsive actions are or his "must dos" are – he doesn't know what these things are therefore he doesn't know what he is withholding. And not-knowingness is the common denominator of all withholds and overts which are operative on the individual.

Those things which are operative on the individual are *always unknown* to the individual. I might even teach you that someday. I keep telling you, and so forth. You're still always willing to look in a known area.

I know of some pcs that have been audited on their mother-in-law for years and years and years and years and are still having trouble with the mother-in-law, and it's never occurred to any auditor that the trouble couldn't *possibly* be the mother-in-law if the pc knew all about it. See? Pc knows about it – can't be the trouble.

Now, that gets in your road in Security Checking, that fact. Because the pc can know about it without you knowing about it. But that's half a know. And that isn't a good enough know, see? That's just half a know. So you don't know about it, but he knows about it. And he'll get upset if you don't let yourself in on it.

And you get the missed withhold phenomena, which is the most serious phenomena that stands in the road of Security Checking. Might teach you that someday, too.

I taught FCDC recently. Man, I got a despatch this morning. Boy. Wild, man. Absolutely wild. They've been going around tearing people's missed withholds. They have – that's all they've been doing. They haven't getting – been getting people's withholds off, they've been taking people's *missed* withholds off. Takes them one or two sessions per staff member. It's going gorgeously. All of a sudden, people are going back and straightening up their departments and fur is flying in all directions, and so forth.

They're even getting cocky, you know? They don't say they don't care whether you people are coming back from Saint Hill or not, but they say, well, even if you don't, they might make it. You've been gone too long. They've forgotten you. Well, anyhow, have to go home pretty quick and reestablish your altitude.

The difficulties we have are that a missed withhold is a half a know. And evidently there's nothing more painful to somebody who has got to withhold something he no longer has to withhold. You don't know about it, so he has to withhold it, but now he knows he has to withhold it because you don't know about it.

You see, the mechanics of this are very logical. They actually are very logical. You see, he has to go on withholding it because you don't know about it yet, and it's very arduous to have to go on withholding it because it's – that's a half a know, see?

See, you don't know yet, and you didn't find out, and he found out, only he wasn't able to communicate it, so now you've got a knowing withhold, and the individual just practically goes to pieces on this basis, see, on a half a know.

You know, he's got to walk around, knowingly withhold this now. Nobody to tell it to, nobody else can be let in on it, so therefore there is no other know to compare. So it won't duplicate, so obviously won't blow. It's a single terminal at that moment, so there is no duplication of it in any other terminal. So as there is no duplication in any other terminal – of course, he knows by perfect duplication, that nothing will blow unless it is duplicated and other mechanisms which thetans have been very, very clever, very, very clever in working out. So you got a missed withhold is upsetting to the pc.

And a missed withhold, a pc will just come down on your neck with a crash. "*Nyah, nyah, nyah, nyah, nyah, nyah, nyah, nyah.*" That's the Tone Scale of a pc on which there's been a missed withhold. Or...[laughter] Tone Scale of a missed withhold.

Now, when you're operating with a bad meter throughout an organization, everybody is at everybody else's throats. Everybody's missed withholds on everybody, so the tone of the organization is "*Nyah, nyah, nyah, nyah, nyah, nyah, nyah, nyah.*" Or... [laughter] and that's all there is, see? And I say I might teach you that someday.

Up to the moment, however, if you yourself don't run into it, you won't know it. One day you'll be sitting there as the auditor, and the pc will be going, "*Nyah, nyah, nyah, nyah, nyah, nyah, nyah,* and you've done this and you've done that." You will get smart enough to look for the missed withhold. And then all of a sudden the pc gets that off and, "Well, what were you mad about? What was I mad about? What was it all about? There isn't anything here. Nothing disturbing."

You feel, "You idiot."

Of course, the thing you feel most idiotic about is the caliber of the withhold you miss. You're still looking for quality. The missed withhold might be that the pc thought the E-Meter was shiny and didn't tell you and the rudiments went out. And that's a missed withhold. And the next thing you know, you've got an ARC break.

Remember I told you long, long, long ago that it took about an hour and a half for an ARC break to build up to magnitude in a session. Well, we find out why that is now, is usually the missed withholds, the first missed withholds are at the beginning of the session – not in withhold rudiment at the beginning of a session, but the pc sits down and says, "Well, I hope this will be all right," and doesn't tell the auditor.

See, he has a misgiving about the session and doesn't mention it to the auditor and the auditor doesn't pick it up. And then an hour – a half an hour, an hour, or an hour and a half later, you have a pc who is in a blowing, screaming mess, because that withhold, you see, adds to a next withhold, and they don't have to be serious withholds. The pc sat there and said, "Well, I wish I had a cigarette," and he doesn't tell the auditor. That is a withhold. Pc knows he's supposed to be in communication with the auditor and he's not in communication with the auditor on that point.

And the next point is, he wonders how late it is and he doesn't tell the auditor. He wonders what the next command is and he doesn't tell the auditor. And all these little grains of sand add up to a Sahara Desert with the pc on one side of it and the auditor on the other and cannon going in both directions.

You see how this multiplies? It isn't the quality of the withhold, it's the fact that it exists.

Now, the pc, oddly enough, doesn't know about these withholds when he thinks them. You have to make him think for a moment to remember them. In other words, they've drifted by and they're relatively unknown to him. If you keep those picked up, just those alone while you're assessing a list, the rudiments will stay in.

Now, an invalidation usually betokens a withhold. So you can ask for invalidations and then ask for withholds as a very fruitful method of getting both sides of the thing.

If you want to keep a session clean and the needle reading throughout a Security Check activity, you're in just a constant look over of this one point: Has the pc invalidated anything and is the pc withholding anything? And those are the Gemini twins of Security Checking and assessing and nulling. Invalidation and withholding. These are the two things which go glove in hand, hand in glove. Invalidation, withhold.

Now, the common denominator of every out-rudiment is withhold. That is the common denominator of every rudiment out.

Present time problem? All right. Well, he has withholds from somebody or he wouldn't be having a problem with them. You can ask, "Well, what withholds do you have from your wife?" and watch the present time problem evaporate in smoke, see?

All right. The pc has an ARC break with you; well, the pc must be withholding something from you, no matter how tiny it is. So therefore that's the common denominator of all these rudiments. No matter what rudiment is out, a withhold is the basis of it, including, of course, the rudiments about withholds. That is more seriously concerned with withholds. But it's still the missed withhold that causes you the trouble in a session.

The missed withhold is back of the ARC break. The missed withhold is back of all auditor upsets, save one – which I should mention to you – save one: where you are running the session for form's sake and not for the pc. You're not auditing the pc who is in front of you, and you are running a session just for form's sake, you have disobeyed the Auditor's Code to not being in communication with the pc and have set up an unintentional withhold for the pc throughout the whole session.

Do you remember I classified withholds from you – the unintentional and the intentional, and so forth? Well, you see, the pc who cannot talk to the auditor is on an unintentional withhold, but it is nevertheless a withhold and causes an ARC break with the auditor. And that is why difficulties in talking to the auditor cause ARC breaks. Because it makes an unintentional withhold on the part of the pc.

There sits the pc. He is trying to tell the auditor something. And in trying to tell the auditor something, he finds he's unable to tell the auditor something, because the auditor will not listen, will not acknowledge, will not stop doing what he is doing obsessively, whatever it is, will not listen to anything the pc has to say, and the pc suddenly, dimly – well, he doesn't really knowingly ever counter this point – nevertheless recognizes reactively and goes into reaction because of a withhold, because the pc is unintentionally withholding.

You – well, I'll give you an idea of an unintentional withhold. Have any of you ever unintentionally withheld anything? See? It's unintentional. You couldn't be there. Well, just think of not being home for Christmas because you had to work. Well, you had to work or something like that. Therefore, it was unintentional.

Now, when somebody will not listen to what you are telling them, you of course are put on an unintentional withhold.

Little kids ARC break and become teenagers along one curve of unintentional withholds. My little kids do pretty well on the basis that I'll knock anybody's head off that won't acknowledge them. See, let's not put the kids on an unintentional withhold. As a matter of fact, I think you've seen them around. They're very outspoken and quite polite, usually. And they're not ARC broke with people, that's for sure.

Well, get this idea. (I'm not setting them up as paragons of virtue, but I will say, I will say that my children are superior in one respect. I will say that my two little boys can dig more worms than any other.) [laughter, laughs]

A little kid comes up and he says, "Mama, Mama, can I go outside? Mama, can I go outside?"

And Mama just goes on knitting the dishes or whatever she's doing [laughter] and doesn't say a blessed word to the kid, you know? And pretty soon the kid gets the sensation of being mad at his mother and breaks her favorite teapot in the middle of the floor.

Almost all breakage by children is totally occasioned by the fact they've been put on an unintentional withhold. That's your ARC break mechanism amongst children. I imagine the Steiner schools and some other things would be very happy to know that.

You got this, you got this point, then, where the pc is on an unintentional withhold and then does react as an ARC break. See, the basis of an ARC break is a noncommunication.

Well, it's more serious than just a noncommunication because you can sit and ignore a tree for hours and have a tree sit and ignore you for hours without getting mad at it.

The intention to communicate must be present for a withhold to occur, which is another thing you must recognize about all withholds: an intention to reach before the person

has to restrain it. In other words, an intention to communicate must exist before an ARC break can result.

All right. If that is the case, if that is the case, then a pc who is being audited by somebody who is out of communication with the pc is on a perpetual unintentional withhold, but is nevertheless a withhold and will ARC break.

Now, it isn't that an auditor has to turn himself wrongside out just for the pc, but I want to call something to your attention. This is also under the head of Security Checking and withholding, and so forth. And that is: Every session you run is *for* the pc *by* the auditor. The session you run is *for that pc* and for nobody else in the whole world. It is not for the Instructors, not for the persons who are going to read this auditor's reports or the D of P or anybody else. The session is not for anybody else in the whole world than the pc who is sitting in that chair. It is *his* session.

And some of you training auditors over in DC and down in South Africa and in Australia can clobber them with just exactly that remark, because you will find *every* time you're having a *lot* of trouble, every time you're having lots of trouble with some pc in the shop, the pc doesn't have any idea that the session is for him, and you may have an auditor who isn't running any kind of a session *for* that pc.

The auditor is running it for some other reason. He is running it to run a ritual. He was running it to please the D of P. He is running it because he was told to. He was running it because he was taught at the Academy to do this.

Oh, you could just list – one of the things you could do in training auditors is just ask them to make a long list of all of the things, *why* they were running a session, see?

Now, why are you doing that session? They're liable to give you some fabulous long list, and it never occurs anyplace in it, that, you see, that they're running the session for the pc and because the pc is there to be audited, you see? That is liable not to occur to them. The auditors that are having trouble will always miss that point, see? They always will.

And actually, if an auditor masters just that one point, that one point, he can be an awful crock with his technology, and pcs will get well and think he's wonderful, and send telegrams to the organization to reserve that auditor. And you say, "Oh, no. You know, we were just about to send him back to the Academy." But this person does run a session for the pc. See? It is the pc's session, nobody else's. It is run by the auditor, a session is, but it's run *for* the pc. And the ownership of the session is the pc's. It is not the auditor's session. It is the pc's session.

If you can just master that point as oddly peculiar, as simple as the point may seem, you will master most of your difficulties in auditing, and also, by the way, most of your distaste for auditing, whenever that occurs. There is nothing more satisfactory than running a session for the pc you are auditing at that moment. And that is, its – it keeps you from getting very strained up. Oh, your attention is on the pc. Pc is usually very happy and pc is puttin' right along, *pocketa, pocketa, pocketa, pocketa*. And you're making hay in all directions, and so forth. And you say, "Boy, that was a good session, you know?"

And you check it over: You missed three of the end rudiments, you see, and you goofed up. You didn't even find an item. It's been three sessions and you haven't found the item yet.

You couldn't find any good reason at all, if you were to examine it technologically, why this is such a satisfactory session. Well, you see there, you could just set all technology and form aside and keep that one point, and you'd find it was very fascinating how well that one point would operate.

Now if you move in on that – good technology, you see, and good form – wow! See? You just – Wham! Pcs go up the line like startled gazelles, you know? They just right on up the Tone Scale.

But there is the anatomy of a session. If you want to make it smooth technically is you just keep those withholds off and then you don't give the pc a restimulation of all the undesirable actions.

Now here's what happens: The pc feels he is withholding something. It doesn't matter whether it's an unintentional or an intentional withhold. That he is *withholding* something now restimulates the fact that he is withholding something, you see? It's not withhold – it's not the withhold he's doing, it is the withhold back of the withhold he's doing that gets restimulated. And that withhold, of course, is a withhold of undesirable action. So, the fact that he is withholding anything causes a withhold to go into restimulation.

That withhold, being in restimulation, may be a failed withhold, which is so close to the borderline that it brings about obsessive action at once. And the pc finds himself in this god-awful position of engaging in actions he knows are reprehensible and is incapable of stopping himself from acting. And he wonders how in the hell he got in this condition.

There he is saying to this perfectly nice auditor, he's saying, "Well, you rat, you – you – you – you bum, when did you ever learn to audit? You ought to be shot. You ought to be hanged. You ought to be stood up against the wall and electrocuted." He gets confused, you see? And – . See? And he hears himself saying these things and he is unable to stop saying them.

Well, how did he ever get into this position where he's doing these things? Because he feels very bad that he is doing these things while he is doing them, you see?

Now, he's in the position – you've hit on something which is very hot on the bank – and he's in the position of having to go down to Times Square and take all his clothes off, see? And he doesn't want to do that. But you have inadvertently restimulated the fact that he must *withhold* going down to Times Square and taking all of his clothes off, so that means he *must* go down to Times Square and take all of his clothes off, see?

He doesn't want to do that. So his power of choice is overwhelmed. And you, by letting him have a withhold in the session, or by missing a withhold on him – I'm talking about a session withhold now, not a life withhold, you see – by letting him have a session withhold and not keeping those cleaned up, you're liable to kick back into this other channel. And you get into this, and he's got to go down to Times Square and take his clothes off. He just can't stop himself from doing it, you see? And he's amazed at himself.

You know, it's a very funny thing. People who do things like that are the most amazed people around, you know? They're much more amazed than anybody else. You know, they're saying, "What am I doing?" as they go right on and do it.

It's fantastic.

So you see, the fact that you put a pc on an unintentional withhold of being unable to communicate to you as the auditor – . See, it isn't his session, he's just an outsider. He just dropped in while you were running a session. See, he's just an outsider to the whole thing. He is probably there to make a report to Inland Revenue or something. Or he's holding down the chair so gravity won't make it skid. But he hasn't anything to do with the session, see? Nothing to do with him. Whatever the auditor is saying has nothing to do with the pc, you see? And the pc finds himself quite startled occasionally, he suddenly wakes up and he says something to the auditor. He doesn't recognize this condition exists till he tries to say something to the auditor. And he's saying something to the auditor like, "It's warm in here," he tries to say, you know. "It's awfully warm in here, you know?"

And the auditor is nulling a list, you know, and says, "A category analyzer. A category analyzer. A category analyzer," you know?

And the pc says, "It's awfully warm in here."

And the auditor goes on and he says, "A mica shifter. A mica shifter. A mica shifter."

And the pc says, "It's warm in here, you know? It's warm in here."

And the auditor goes on and says, "All right. Waterbuck. Waterbuck. Waterbuck."
[laughter]

And what happens is, the mechanic is that the pc becomes aware of the fact that he can't communicate to the auditor. And this equates to this fact that he must then be withholding from the auditor. See how silly this is? But it nevertheless equates to that. Because remember, you're dealing with a whole reactive bank that is totally constructed on the obsessive action and the withhold, see?

So the fact that he isn't communicating says he must be withholding, which rekindles a withhold in the reactive bank, and God help the auditor if that withhold in the reactive bank triggers the undesirable action. Because the pc is liable to do anything, just anything.

And there's how you get blows, there's how you get scolds, there's how you get upsets, there's how you get pcs saying remarkable things to you. See? That's how you get the lot, see? Unintentional withhold.

So you see, you avoid the whole mechanism if it never enters the pc's mind that he is withholding anything. See? Now, if that's thoroughly enough established, actually, he could withhold a little bit, you see, without rekindling anything. Because it's *his* session, see, and he *is* in communication with the auditor. He realizes if he said it, the auditor would hear it.

TR 4 from a standpoint of holding somebody in session is, of course, the most important of the TRs. TR 0 is the most important from the auditor's viewpoint, and TR 4 is most important from the pc's viewpoint. You can't run a session at all without TR 0, but a pc sees

TR 4 out like rockets, barrels of tar being burned and Parliament exploding, see? TR 4 – "Oh, this auditor can't handle TR 4."

Well, the way to handle TR 4 is handle it in advance and just give the pc the session, see? Because it's his session. It's his session. This is peculiarly for the pc.

All right. Now, in the field of Security Checking, in the field of Security Checking, what you're trying to do, fundamentally, is release or discover both the undesirable actions considered undesirable by the pc and the withholds which restrain them. So you get off the withhold by blowing the prior confusion. And when you're doing Security Checking, you're on the business of the prior confusion, you see, and the motionless point: the problem.

But the problem in this case is only half there. It's the withhold, so it blows very easily. So the prior confusion and the withhold, you see? And all you got to do is reach underneath the withhold to get the prior confusion to it. "What did you *do*?" you say. "What did you *do*?" It must be some impulse from the pc because the pc is the only one there. Some people who listen to what the college did to the pc, or what the pc is told, have not noticed something: The college is not present in the auditing room. It really isn't there, so therefore it can't be audited. It's what the pc is doing, you see, that you're auditing.

So the pc, what the pc's – outflowed that he didn't want to outflow, and what the pc withheld that he didn't want to withhold, these things are your main points of action and interest.

And "What have you *done*?" you see, releases the not-do.

But the anatomy of a withhold is the: *done* undesirable action, *stop* the undesirable action, *natter*, see? So you – the fellow says, "Oh, I am upset. I mustn't say anything to anybody. I mustn't talk about it, and so on. Those bastards are dogs. I mustn't say anything to them. They're a bunch of hound dogs and so forth. They're really no good, and I mustn't say anything about it because I might have some undesirable actions. Because if they found something where I was wrong – because if I said anything it would be terrible, and then it would screw everything up. So I'd better be very careful not to say anything, and so forth. And I'm not saying anything."

And you – most, most, most people, when they're giving you gossip, are always prefacing it with, "I don't mean to be critical" or "I don't wish to say anything bad," or "I don't want to get John in trouble," or something like this. They're always being preface about the thing, and then "Natter, natter, natter, yak, yak." And you get a generation, actually, you get a generation of the outflow undesirable, which underlies it all, pinned against this other, just operates something like a motor battery. And floating off the top of it you get all this entheta.

Guy can't reach and he can't withhold, but he can natter. So you find what is the critica– good formula, see?

You had a bulletin the other day which has a correction in it. It says, "Ignore all unkind thoughts." That's not actually accurate. There is one little point about it: You *use* the unkind thought, the critical statement, and so forth, to find the overt. They're a sure indicator.

You say, "Well," you say to this person, "Well, what, what's your unkind thought?" They give you the unkind thought. "Have you ever had any unkind thoughts about Joe?"

"Oh, all right. I got unkind thoughts about Joe."

"All right. What have you done to Joe?"

Bang! They got it. See?

It's a leader. It'll go right straight down the line. So you don't *pull* them. Don't spend five hours pulling unkind thoughts, you idiot – that's usually the phrase that goes through an Instructor's mind when he sees somebody doing something like that. Person's spent five hours working and sweating and so forth to get all the unkind thoughts off about their wife, you see? Instructor kind of obsessively thinks "You unkind – you idiot!" on the end line, because that's four hours and fifty-nine minutes completely wasted.

One minute of natter about the wife, see, is all you want. That is a whole fish basket full. You have no more room on the truck. What you do after that one minute is conclude that the pc has *done* something. If the natter is there, then the underlying done must have been present, which is being withheld. Otherwise, you don't get this motor action going.

And so you just say – the person says, "And, and actually, actually ..." – it doesn't have to be motivatorish – "... actually, my wife, my wife actually uses false, false hair all the time. Just uses false hair all the time and I just go into the house, I'm always falling over this false hair, you know. Ge- have a drink of beer – false hair. Eat dinner – all through my teeth, you know? It's a hell of a thing. And false hair – ."

Beca- he'll kind of state it as a motivatorish, but it could be overt and it could be motivatorish; the natter, you see, is not necessarily motivatorish. It's just either way, see? It's that it's natter, that it's critical, is all you want, and so forth.

And you say, "False hair. Well, good. Thank you. All right. Now, what have you done to your wife?" And the needle falls off the pin.

And he tells you something or other. And then he says, "Well, it's the false hair that really worries me, though. It gets into the – it's – I had a wedding cake. I remember it goes clear far back to the wedding. She baked the wedding cake, you know? And we couldn't even eat the stuff, it was all full of false hair. And so – ."

So you figure that it must have something, then, to do with the exact thing he's complaining about.

So you say, "Well, what have you done to your wife's hair?"

"Well, I haven't done anything to my wife's hair. I held her down on the bed one day and cut it all off with the scissors."

"Well, have you done it since?"

"No! Ha-ha."

And you'll see him brighten up at once. Blow the withhold off the overt, see?

Actually, if you're a master of the anatomy of this kind of thing, you can do some of the trickiest things for the pc you ever heard of. You'll leave the pc just gasping, you see? "How did you know?"

"Oh, a little bird told me."

It's just a matter of, if there's a natter, then there must have been an overt. And if there's an overt, there must have been a withhold, see?

So you could always follow – you got a big, juicy *done* off the line, see? And just ask the pc, "Well, have you ever done that since?"

The pc has to recognize that he's withholding the action – is liable to give you the rest of the overt. There might be more overt there after you release that much withhold off the thing.

In other words, it's a – an action followed by a withhold. Well, of course, mostly you're counting on the fact that they both blow by his telling you, and this is usually true. And this is safe enough, and you don't have to know all the facts of life, you see? And – but the other point is that if you ask, "Have you done it since?" or "Did you ever do that again?" he'll think you're looking for another overt, see?

And he'll look it over very carefully, and you blow the withhold. And you'll suddenly see the pc look very relieved. See, he's been, he's been holding back with ten-ton-truck motor, see? It's going perpetually, keeping him from holding his wife down on the bed and cutting all her hair off again, see? *Zzzuh! Zzuh-uh!* And he hasn't noticed that there's no reason to have the truck motor.

So he tells you he did it. Now, this should explain to you the mystery of why you sometimes see a withhold blow and sometimes not see one blow, and sometimes see a pc very relieved and sometimes not see the pc relieved.

All right. The anatomy is this: You find a withhold in the pc, see? The pc is withholding and you find out that the pc is withholding, see? You find out he hasn't told anybody about something or other, see? He hasn't told anybody about that sex in college, or something, you see? He hasn't told anybody. You've just triggered the withhold, see?

And the pc at that moment could feel uneasy. He sometimes will feel relieved at having told you but he also could feel very uneasy at that moment. Because you've sort of taken some of the straps off, and he's liable to do it again. And he knows it's an undesirable action, so he's not happy about having given up that withhold. Do you see that?

He's not happy about giving it up at all, because you've taken away some of the means by which he's keeping himself compressed as a jack-in-a-box, see, and somebody is liable to press the catch on the lid at any moment, see? And he's liable to do *that* again, you see? You see what he's worried about.

So you triggered some of the ways he was restraining himself without finding out what it was. And you'll see an unhappy pc. He doesn't get the session very well and it doesn't finish up too good.

"Well, he was security checked for two hours," see?

You read the auditor's report. "Did you make any goals for the session?"

"No," or "Partly." These are all very sad remarks.

Well, you can just count on some of this mechanism having gone on this way. You triggered the withhold, got the withhold slightly off, he didn't dare let it come all the way off because if he let it come all the way off, then he might do it again.

There he is down there at Times Square taking off his clothes, see? Hmhm-huh-huh-hhuh! He's almost conquered that, you see? He's withheld it, and he knows he can withhold it if he keeps his head in this exact position and goes to his psychoanalyst regularly. See, he-he-he-he-he knows he can live with that. Only he doesn't really know about it, you know, but he knows he might do something and *ooouuuoo*. And you take the withhold off and you got the restraint.

So if you made it a rule, an operating rule, that every time you got a withhold off, "Well, I've never told anybody or they don't know this about me," or something of the sort, that you try to find the overt under it. And then you'll blow the rest of it. And that every time, including that time, that you have blown a heavy overt that the person has done, you ask him if he's done it again, or did he ever do it another time – he'll tell you another time and another time, and then so on.

And if you ask him, also, when he'd not done it, the rest of the thing would go *phooft!* and all of a sudden the pc would look very relieved.

So if you pulled just purely a withhold without the fellow telling you what the overt was, you've actually goofed a little bit by not asking him, well, what did he *do*. See, "What have you done, done, done?"

"Well, I've just never told anybody about my conduct in college."

"All right. Fine. Good. We'll go to the next question."

Male voice: Huh-huh-huh-ho!

Now you see why the guy is upset with you. You've released some of the straps by which he holds himself down without permitting him to let go of it. So you've – he thinks maybe you've damaged him somehow.

No, you've got that far, you must go on from there and you must say, "Well, what did you *do* in college?" See? "What did you *do*?"

"Uh, well, I *woo-woom-mm*. I'd forgotten all about the – *ooo-mm-a-huh*. Well, actually it wasn't very much. There was just some of us boys, and it wasn't very much. It was just kind of a joke. We laughed it all off."

"Well," you say. "Well, you laughed it all off, what is the needle doing falling off of the pin here? What's that? What's the part you didn't laugh off?" (Only you wouldn't talk that way to a pc.) And if – he all of a sudden comes clean and your needle clears up.

And then having told you all that dirt, and he's got all the overts off, remember there may be some residual withholds. And the residual withholds, of course, come off best if you ask for them.

You say, "Well, did you ever do it again?" Heh-heh.

"Ooo, well, no, except that, uh-oo-well, there, *hoom-mm* Miami Beach Hotel, I mean the mmm-hm. Yeah. Well, no, we didn't. Ha! Yeah, I didn't do it at the Miami Beach Hotel. I *m-rr-r-raw* and didn't do it in Los Angeles, and didn't do it up there when I was at Canada, and then *b-rroo*. What do you know? Didn't do it during the whole war. Life is wonderful. Isn't that great? Except after the war."

"Well, what about that one?" "All right. Well, did you ever do that one again?"

Y-ng-ngt and *zoom-zoom*, and so forth. All of a sudden the guy feels like fresh air has been ventilated through the reactive carcass.

But if you know this as the anatomy of a withhold, and you know that the person, after you've gotten the overt off, may still be *withholding* obsessively, and it may not all be gone, and you know that if you get some of the withhold off, the person may be – without getting the overt – why, you know the person will get nervous. If you know that where there is a critical thought, there is a withhold *and* an overt underlying it, and if you know all of these things and keep the pc from going on little session withholds – keep those little session withholds and invalidations cleaned up as you go – and don't run the pc for the wall, run a session for the pc.

You see, there's various things that you could get confused on. It's the pc's session and it's his session exclusively, and run it for that pc. And the auditor runs it, but it's for the pc. Don't let your control go down particularly, but also, man, don't let the pc get the idea it's for somebody else.

And if you follow through, on the two-way comm – your TR 4 is good – you never have any trouble, and, boy, you can just blow somebody up through the roof. Oh yeah, they can just go up, up, up, up. Terrific. *Bangity-bangity-bangity-bang*.

But the point which is general – the points which are generally missed is sessions are not for the pc – that's missed. See, sessions are run for the piece of paper or the E-Meter, or something. I'm not being sarcastic. I mean, people treat a pc sometimes like a piece of driftwood. The pc doesn't exist in the session. If the pc thinks something, why, you don't have anything to do with it. He doesn't know what's going on. It's true, he doesn't know what's going on in his bank. True, you know better than he does, but at the same time – ha-ha-ha-ha – at the same time, you're there to straighten this out. And if you don't pay attention to what the pc is saying, you of course go out of communication with the pc, the pc goes on an unintentional withhold and so forth and there you've had it.

Also you could let the pc talk too much and not shut the pc off, but the way to shut a pc off, of course, the best way to shut the pc off is just shift his attention on to what you're doing.

Not, "Well, let's stop talking about *that* now, and start doing something else." That might appear a little bit crude. But just refer the pc's attention over onto some other part of the session and carry on with it. You can do those things very smoothly.

If you can learn to do those things, my God, how you will carry somebody up through the – through the Tone Scale. I mean, *zoom!*

Now – this is on just Security Checking, Twenty-Ten. And every time you run twenty minutes' worth of this stuff, why, run ten minutes of Havingness, and residual impulses to withhold blow in the Havingness, of course, and other things happen, and up they go.

But there is something else that you should know about Security Checking and running Security Check sessions, something that you should know very well. And that's another one of these – of "run it for the pc" in the mechanics of the withholds. And that's this – that's this: You try to null rudiments. You takes them as you finds them and youse tries to null them without shoving the pc around in any other zone or area than he is in. You don't go looking for withholds and present time problems and ARC breaks and down havingness while you're running rudiments – end rudiments or beginning rudiments.

In other words, you try to null the needle. Just overtly and directly try to null the needle. You takes the pc as you finds him and you tries to null the needle. That's what you does. And that's all you does. That's rudiments.

But you're the world's worst – maybe not the world's worst, but – close candidate – let me put it that way: you're a candidate for the world's worst if you carry this action of the rudiments over into the session body. Now if you carry the spirit of taking the pc as you find him and try to null the needle on things you ask the pc, and *only* try to null the needle on things you ask the pc, the way you handle rudiments, you are not going to get any gain on that pc to worth a nickel. Because nothing is going to happen in the session, and he – sometimes you accidentally find something. And if you null the needle real good, why, you'll end up the session, the pc feels a little bit better, he makes his goals partly or no. And it's all about here.

Now, there's a vast difference between running rudiments – a vast, vast, *vast* difference between running rudiments and the body of a session. You're trying to null the needle on rudiments but in the body of the session you are trying to find data and clean it up, and it's an entirely different activity.

In other words, you find the data, and then you null the needle on the data. And you find the data, and you null the needle on the data. And you – one of the reasons some of you very well might have rudiments out so often is because you put them out.

Rudiments are simply there to be nulled. The pc is accidentally sitting in something, you null it. See, if he's accidentally sitting in something, you null it. Good. That's it. Bang!

You might be looking around and have these two things reversed. You might be trying to run the rudiments so as to find things and then null them, at which time you would do nothing but run rudiments, and in the body of the session just trying to be nulling the needle – see, these things here could be completely reversed – and you'd get no reaction at all from the pc. You'd get no real gain on the part of the pc from any auditing.

Now, the body of a session is devoted to finding data and nulling the needle on it. And it's another action, it's the additional action. And that action must be done. And if it is not done by the auditor, what has he got? He has got a pc who is sitting there in the chair. He is calm, cool and collected. He is getting a session. He is happy. He is in a room. He is *miles*

away from any trouble. Isn't it sweet? He doesn't have a present time problem, he doesn't have an ARC break, he doesn't have anything. And so he has nothing in restimulation of any kind whatsoever and now you're simply going to read him some questions, one after the other, and null the needle on them.

You have an unrestimulated pc. Now, listen. You have to restimulate the pc in order to clean it up, because it won't come to the surface of the bank unless you pull it up to the surface of the bank, I assure you.

See, your rudiments smoothed him all out, didn't they? Now, supposing you ran the body of the session just to null the needle. Well, of course, you're not going to get anything done at all.

How do you get the pc restimulated so as to run something off? Well, I've given you other systems of doing that and that's not part of the lecture. That is very pertinent to the lecture, however, that you *null* the needle in the rudiments. And in the body of a session looking for withholds or auditing the pc on anything else, you've got to find what you are looking for and you've got to persuade the pc to look for it. You've got to get the pc in there digging. And you've got to dig. And the body of the session is done with a pick and a shovel and dynamite, and all kinds of digging tools, oil-well drilling rigs, anything you can think of. And you keep stirring this stuff up and clearing it off the top of the mound, and – and you're *busy*, man! *Busy!* Get *busy* in the session. Don't just sit there and say, "*Dadadadadadadadadadad-poooh! Dudududududududududu-poooh. Dadadadadadadadadu-poooh. Dadadadadada* – well, I had a good session today. Pc didn't have an ARC break the whole session." Nothing happened either.

No, you gotta dig it up to clear it away. Otherwise, it's just there, see? And you look at sessions from that point of view – that you've got to dig them up before you find anything and then you've got to clear it up, having dug it up – you all of a sudden will see what a session is all about and why you've got to have rudiments nicely. Because you don't want the pc digging things up accidentally. You only want the pc to dig up what you want the pc to dig up.

And if the rudiments are out, of course he's digging things up accidentally all the time and he's sitting over there, a busy little beaver. Dig, dig, dig, dig, dig, dig, dig. Chop down trees. Dig, dig, dig. Make a dam. Grout up the dam. *Dadaroom-dadeedada-dadadaroom. Boom. Boom. Boom. Boom.* There he is. Dig, dig, dig, dig, so on.

And you're sitting over there mining coal, and he's sit- . Hasn't anything to do with him; he's drilling for oil. [laughter] And that's the secret of it all.

Of course, if you know the anatomy of the reactive bank, that it consists of overts and withholds, and that you're trying to restore his knowingness first, and then his self-determinism over these actions, and so forth, and if you know those things you could almost audit by definition. Just audit by definition. Say, "Well, the pc isn't there. Why did he blow?"

Just ask the pc, "Well, has he blown from anyplace lately?"

Guy will say, "Yes, I left a cafe before I finished dinner last night."

You say, "Good. Now, what are you withholding about that?"

"Oh, well, I didn't realize I was withholding anything about it, but as a matter of fact I am."

"All right. Good. Thank you. What is it?"

"Well, it's so-and-so."

"All right. What overt did you pull just before that?"

"Oh, well, we don't want to go into that, do we?"

"Yes, we do. We're going into it right now. All right. Good enough. There it is. Well, then, you going to do that again, and so forth?"

"Well, I decided I wouldn't. Ha-ha!"

And you say, "Well, that's good. Now, where else have you blown from in the last two hundred trillion years, son?"

And you will see the depth and distance to which a Security Check can reach. Do you see?

All right.

[end of lecture]

3D CRISS CROSS AND GPM ANATOMY

A lecture given on 17 January 1962

Thank you.

Okay. Good enough. We do this one sitting down. Okay.

This is what?

Audience: 17th.

The what?

Audience: 17th.

Of what month?

Audience: January.

17th of January. What year?

Audience: AD 12.

AD 12. And where are we?

Audience: Saint Hill.

Huh?

Audience: Saint Hill.

Yeah, I know, but what planet?

Audience: Earth. [laughter]

Earth. Okay. Thank you very much. All right. Thank you very much for orienting me. I've been flying about here and haven't had much time to look up.

All right. I have a lot of data to give you about 3D Criss Cross. And I'll try to make it graphic to you in spite of a lack of chalk. Piece of chalk around here?

And you don't know from nothing. I mean, you're stumbling and fumbling in the dark in all those black masses. I never saw people get so lost.

3D Criss Cross is the natural outgrowth of Routine 3. Find a goal, find a terminal, run it. But of course, you cannot guarantee that the auditor will find a goal that is the pc's goal. Might be an oppterm goal, you see? Or a terminal that is the pc's terminal. Might be just a lock terminal. Might not be checked out and it might be done in California. [laughter] I

shouldn't be hard on California. Actually, these are sufficient overts that we can take over the lot. Have to run up a few overts before you mount the attack, you know.

So this Routine 3 was successful in a relatively few cases to produce a Clear. Now, its percentages are quite poor. I never gave you anything but the facts I know. And the percentages on the thing are quite poor. I suppose they're something ridiculous like about, oh, I don't know, 85 percent, 90 percent, 95 percent flunk. Meaning only about a 5 – somewhere between a 5 and 15 percent is about all you get out of Routine 3 Clear. I've been telling you that for years, that we're just clearing a few and we're looking to clear a lot more.

Well, there are two things there. You see, the goal could be an oppgoal and it could not be something the pc wanted to do anyhow and the terminal could be the opposition terminal, at which time you'd wrap up the pc and he wouldn't know which end he was standing on.

And in view of the fact that these techniques always get done by somebody who doesn't know what he's doing – that's true. That's true. These bulletins get out. You'd be surprised the distribution we have which is out from under. And somebody reads half a bulletin and hears the lecture backwards and then they're all set, see. They miss all the things you're not supposed to do, you know, and so they do those. And then they can't duplicate all the things they're supposed to do, so they don't do those. And you can't have around too long techniques that have a terrific liability to them, don't you see? Too many people get cut to pieces with them through unauthorized use and untrained auditors and all that.

So Routine 3, however, did produce Clears. Now, the way it produced Clears was to produce a key-out Clear. You ran this terminal out and when it blew, it disconnected the pc from the Goals Problem Mass. That is how that produced a Clear. And it did lead the person out into an area of free track and you might as well get used to that idea that there is a lot of free track on the case, even when there's a Goals Problem Mass, you see? The person can – does have track to run on that does not impinge on the Goals Problem Mass.

But one day he's running an engram that has an airplane in it and the left wing of the airplane is black. Oh, oh. And you run it and you run it and all of a sudden, the pc has got a field. And he has never had a field before, but now he's got one.

Well, you see, he was running on free track. That is to say he could move on the time track because he was not keyed in on the Goals Problem Mass. Well, what you did then when you found his terminal was to find that terminal most intimately connected with the Goals Problem Mass which could be run on the pc and when that was discharged, it disconnected him from the Goals Problem Mass, but it left the Goals Problem Mass floating about unchallenged by the pc.

Therefore, a person cleared by those particular technologies – were unstable. That is to say they might have gone for a century, they might have gone for a minute. It was all in the lap of the gods how rapidly the Goals Problem Mass would move in on them.

Now, they had a good chance that it wouldn't because they were already well separated from it, you see. But there was still something in the bank that could bite. Now, the Clear, then, was an apparently stable person only so long as the Goals Problem Mass didn't key in on him. But there was something that you could key in on a Clear which was unsus-

pected and that was a Goals Problem Mass. That is the thing that could be keyed on him and that was the thing which was unsuspected. That is it. That is *the weenie* as they say in Hollywood. Except the weenie is something by movie scenario technology which everybody is after. Everybody is after the weenie. That'll be the gold in the gold mine or it'll be something of this sort. It's what the hero is fighting the villain for and if the villain gets it, that's bad. And if the hero gets it, that's good, you see. That's a weenie.

Well, this is not quite a weenie because nobody wants it. [laughter] So it's a kind of a reverse weenie.

And the Goals Problem Mass is the reactive bank. These things are synonymous. There is no difference between the Goals Problem Mass and the reactive bank, aside from this little addition. The reactive bank includes or could include sections of free track, you see. And actually, analytically, the pc can touch these things, too, and is quite often surprised to find out he's lived before and that sort of thing, by touching free track in past lives. So you could say the reactive bank also has it, on a borderline, some free track.

But these engrams that the preclear was so excruciatingly screaming about and was so upset about and that you've run pcs through and they were all tangled up and rolled up in balls and had their heads come off and so forth, brother, that's nothing. That's free track. Huh? [laughs] Will looks at me. Huh, yeah, it's just free track, that's all. You can run this stuff. Not aberrative. Analytically approachable.

You're the executioner at the Tower the time that you smothered the two little princes.* They're still looking for that guy, by the way. Did you do it? We'd like to get the thing cleared up. [laughter] We never could determine whether they were smothered or not smothered, you know, quite, you know. Anyhow, we'd like to clear that up over here in England. We like our crime, us English. Anyhow ... [laughter]

So, that's free track. You can run engrams and you can have a ball, you see? And you can run free track and everything is fine and wonderful and very inviting and it's all very colorful and very nice and one day you get near the Goals Problem Mass and after that, you have black and white. And then you get a little closer to the Goals Problem Mass and you get two-dimensional pictures.

And then you get into the Goals Problem Mass and the lights go out, and you haven't got any pictures from there on. You see how it works?

But of course, you could get keyed out and all of a sudden, you get two-dimensional pictures and then you'd get three-dimensional black and whites and then brilliant three-dimensional color and you're back onto free track again. See, this thing could be keyed in and out. Well, that's what you auditors have been fooling with when you're auditing a pc, you see?

* Editor's note: This is an allusion to a historical event from 1483, the time of the Wars of the Roses. After the death of his brother, King Edward IV, Richard of Gloucester (afterwards Richard III) arrested his nephews, Edward V and his brother Richard, threw them in the Tower and asserted that the marriage of his brother was invalid and thus the children had no claim to the throne of England. Soon afterwards the two children were murdered, probably on the orders of their uncle.

And you probably right now could think of many instances where you've done this on a pc. Can you?

Have you ever run a pc – run a pc along gorgeously and all of a sudden he didn't have any picture? Huh? Very embarrassing, isn't it? And you all of a sudden got yourself into a situation where everything was black and the next thing you know, it was white and beautiful and green and gorgeous and 3-D and everything was fine. Have you ever done that? It's more – rarely done, but auditors have done that – all of a sudden turned on a pc's pictures.

You run enough responsibility on a black mass and you will get the pc out into pictures again. And the keynote of that is responsibility and there's been a lot of material on that that you've already had. It's in bulletins of last – of 1960.

Therefore, something was in the road of Dianetics. Something lay directly across the path of Dianetics. And that was a thing that ... What was it? You know? Nobody knew.

Well, all these years, a decade afterwards, here it is. It's a Goals Problem Mass and that's pretty good. In terms of geological time, it only took ten years to dig it up. All right.

That is the thing which keeps you from running a person to Clear through running engrams because sooner or later you run into some edge of the Goals Problem Mass and of course, it doesn't go out with engram running.

If people didn't have the Goals Problem Mass, Dianetic processing by running engrams could send somebody to Clear rapidly.

But because of the Goals Problem Mass, hitherto undetected and called in Book One – it's all covered in Book One, by the way. It's circuits and valences. And circuits, valences, machinery, stuff of this character. Machinery isn't mentioned in Book One, but circuits and valences are. And I think there's a page and a half or two pages or something like that, listing types of circuits.

Well, those circuits add up to and become, in modern usage, the Goals Problem Mass. Because we can now tell you what a circuit is. And it's taken quite a while to find out exactly what a circuit was and exactly how to handle the circuit.

Now, the first technologies of clearing were better than *Dianetics: Modern Science of Mental Health*. The earlier technology was the better technology, which was simply to key out, key out, key out. See, what picture could the character confront? What could he tolerate, you see. What could he tolerate? Sort of a gradient scale of tolerances and so forth. And eventually, of course, he'd blow off the Goals Problem Mass and off the free track, too. And he would give an appearance of Clear. Of course, we don't know what the needle characteristic was of the first Clears because we didn't have any meters.

That's a good reason why we didn't know what the characteristic was. But, nevertheless, these people acted Clear and they weren't troubled with engrams and they answered up to these various characteristics. But if they did have any track, as it says in Book One, it was free track.

In other words, an individual could be dug out of what lingering edges of the Goals Problem Mass or circuits there were and put onto nothing but free track, he himself, a thetan,

and he would then feel wonderful and he would give the responses which we have called Clear. That's all elementary stuff.

But ten years after the fact, here it is – the Goals Problem Mass.

Now, when a person has lived a life in which he deserved no free track – in other words, he wanted to do everybody in or he wanted to get done in himself; you know, that sort of thing – he got into a grouper of some kind or another, which collapsed the track on him. About the time he blew out of his 'ead, he collapsed his track.

And this made a relatively black mass full of pictures and made out of energy masses. It had behaviors and characteristics. It had goals and everything else because it was that life-time packaged. He packaged it all right.

In other words, the whole track collapsed on the person – *boom*. One minute, why, there he was merely executing everybody in the British Isles and the next moment there he was – a twig fell on him or something like that – and that was enough motivator and he blew out of his body and collapsed the whole track of that lifetime into a ball. And it will; it'll collapse into a ball if it's got enough groupers. Electronic phenomena.

It'll also disperse and explode, by the way, and you haven't got a ball. You've got it all over the universe. So you got a dispersal-type circuit and you've got a condensed type circuit, which are quite interesting. You also have an inert circuit, which isn't condensed or dispersed. It's just persistent.

All right, you had a ball. And this individual then, thereafter, carried along with him a black mass which was a whole packaged lifetime. But it was a personality. And it had all of the characteristics of a personality because it was his identity in a whole lifetime. It was an identity which was carefully built up over a whole lifetime.

Now, that is a circuit. And that is all a circuit is. And if you think I'm going to belabor this on and on and you want to know about the engrams the guy developed and how he developed them and how the mental energy got into the circuit and what a grouper is and how it all collapsed, read *Dianetics: Modern Science of Mental Health*. There's phrases and all kinds of things and actions of one character or another.

You live a life as a communist and you'll get a nice circuit. Why? Because it's total togetherness. It's marvelous, you know. And you just get total togetherness, you see? Anything appended to that life where the total ambition was total togetherness, why, we get a crusher and we get a black ball of some kind or another. In other words, that's a grouper. Got it?

All right. Now, that is in essence a circuit. There are *three* types of circuits under *two* classifications. There is an inert circuit, which is neither outflowing nor inflowing and there is the active circuit. The active circuit is divided into two classes – inflow and outflow circuits. So you have an inert circuit, an outflow circuit and an inflow circuit. Actually, three circuits, but actually two types only. There is the active and the inactive circuit – the inert circuit.

Now, this is quite important to you because every now and then you will assess and assess and bang your brains out and assess and assess and so on. You finally get the pc and the pc reads beautifully and everything goes along fine and then you audit with the auditing

commands of the latter part of December, early November 61 and you just audit and you audit and you audit and you audit and you audit and nothing seems to happen and nothing seems to happen.

And there isn't anything happening and the pc goes on in the same characteristics and apparently gets a few cognitions and all going along. The pc's getting better, but you're taking the long route. Now, what kind of a circuit you got?

Female voice: An inert circuit.

You got an inert circuit. That's right. That's inert circuits. Why? Why does it behave that way? Well, it's neither outflowing nor inflowing. And that's the characteristic of an inert circuit. It doesn't outflow and it doesn't inflow. It's sort of an is-ness of beingness. But nevertheless it's packaged and it was pretty vicious in its day, but its activities were mostly the crimes of omission.

So you could say the crimes of omission characterize such a circuit. The pc, in running it, seldom recognizes omission as a crime. They cannot conceive of omission as a crime, you see.

They're a bunch of people standing on the bank of a river. This person comes along, notices the bank of the river is caving in, you see. Stands there and watches the bank of the river cave in and never mentions it to the people that the bank of the river is caving in, you see. And then the bank of the river caves in and all the people go into the water and drown and this person then says, "God is wonderful as he works his ways," you see. [laughter]

That is very inert activity and they don't recognize it as God-awful overts. You see, it's – the desirable communication is totally missing. They don't ever communicate, see? And actually they don't withhold either. And you'll run into this type of character and it's quite fascinating because they haven't got any withholds. When they're in that circuit – when they're in that inert circuit, they don't have any withholds.

If it happened to – if it occurred to them to tell you about a rape, they would. If it occurred to them to tell you about a murder, they would. They just murdered somebody, they'd come around and say, "Yes, well, I just murdered somebody." But it doesn't occur to them to withhold it but it also doesn't occur to them to ever mention it. See, that's no overts, no withholds; in other words, inert. The sins of omission. These are more or less the characteristics. These characteristics could be broadened and embroidered of an inert circuit and they have more mechanical importance to us than they do mental importance. It's the mechanical importance of this that I'll get along to in a moment.

All right. Now, you take an active circuit. Now, an active circuit could be a total outflow circuit or a total inflow circuit. When I say use total, remember absolutes are unobtainable. No such thing as a total outflow or a total inflow, but you know what I mean. I mean this character really outflowed or this character really inflowed. Now, when that circuit is found, you get *pocketa-pocketa-pocketa-pocketa-pocketa, audit, audit, audit, bing-bing-bing, cognitions, cognitions, terrific, terrific, terrific*, you know.

Or, actually, when an inflow circuit is opposed to an outflow oppterm, you see, or an outflow circuit is opposed to an inflow oppterm, see, or even when an inflow or an outflow

circuit is opposed to an inert circuit, you'll still get these various characteristics, one after the other. You see?

So what do you got? What do you got? You got various reactions of circuits, but you also have interactions with other circuits. You see how this is building up? Quite elementary, actually. Oddly enough, the whole of the Goals Problem Mass is about as difficult to understand as a kid's game of skittles or something. It's very, very elementary. That's why man has missed it. He's looked for the *deep significance*. You see, the *deep, deep, deep significance of it all*, you know. "And we were all made by God in a sea of ammonia by a scientist," or something, you know. And "Where did we all come from?" And he gets all involved and this sort of thing and goes on and on and on.

And he has never looked at what he is composed of. His own composition and mental thinking and that sort of thing, has never been inspected. In fact, we are the first to inspect it anywhere in the vicinity of this planet.

All right. The three types of circuits. Now, an active circuit, outflow or inflow, let me give you examples of these two.

Active circuit outflow: This fellow was a messenger. A messenger dispatcher is better. He was a messenger dispatcher that brought tidings of dismay or something in all directions.

In other words, he was always sending out messengers and eventually, of course, he became a messenger. So you'll find "a messenger" is mixed up in "a messenger dispatcher." So that circuit will be appended as a lock. So you'll have the messenger dispatcher. And the first thing you'll find, as an auditor, that goes *tickety-tick* and reacts, of course, is a messenger. And then you will find a messenger dispatcher as you move in on into the bank, you see? Because actually you're moving in against the outflow of that circuit. This case outflowed. This case outflowed.

Industrialist. Aroomroom – made cars. See, outflow, outflow, outflow, outflow. *Agitator*, issued propaganda. Outflow, outflow, outflow, outflow. *Gangster*, outflow, outflow, outflow, outflow. Knock everybody off, you know. Any type of terminal, you see, that's engaging in actions which outflow is potentially a circuit. Now, there's something else it takes to make a circuit and we'll get around to that in a minute, too. But get the idea that an active circuit is a circuit which outflows.

All right. An inflow circuit: An inflow circuit would be something that inflowed. A temple priestess. There's a honey. There's a doll as far as inflow circuits are concerned. A man comes up – inflow. People come up with offerings for the altar – inflow, and frankly, we haven't got them on this particular time span right this minute, we just have people dramatizing it.

But, I can remember in the old days of the temples of Astarte and so forth. *Boy! Wow!* You talk about an animated vacuum. [laughter] *Wow!* I've seen somebody absolutely torn to bits, the flesh torn right off of his bones. It was just *schlllp*. Vacuum. Give me! Give me! Well, you see them once in a while, today. But they're just dramatizations, that's all. And that was for good. That was for keeps, see. So that makes a – that makes an interesting valence.

And that is a well packaged valence, always. Because, of course, the inflow characteristic of it pulls everything else in, too.

So everything is assistive to "pull in." Now, there's – there's your three classes: the inert, the outflow and the inflow.

All right. Now, let's go a little bit further, now. What is it that makes some lives package and some lives not package?

It's the degree of overt and withhold connected with the life. It is the withhold which packages up the tightly packaged ones. And it is the "must communicate" which packages up the active ones. You get a dispersal type valence accompanied with a very solid pack-type valence.

Now, I told you it isn't just withholds, you're only running half of the picture when you run withholds only. You've got the other side of this situation. "Must communicate," see?

Now, exactly what you'd call that, I haven't bothered much to investigate. But I imagine it would be a "moutflow," you see "must-outflow" or something like that. A "moutflow," or something. But it's a "got to communicate." And it is the reverse of a withhold. Instead of "hold in," the guy must go, "flow out." And I was taking that up in yesterday's lecture.

Now, you've got the individual has compulsive pushouts which are desirable, which tend to mask, then, *undesirable* actions or prevent undesirable withholds, see? So the withhold in that particular case is undesirable. This is less usual as a mechanical mechanism, but nevertheless exists and you see it around most anywhere.

All right. Now, what hangs up the Goals Problem Mass? I refer to you my lectures of December and you can recall those – they, the lectures of December concerning the characteristics of the Goals Problem Mass, see? You've got a terminal and an oppterm and the terminal and the oppterm are fabulously balanced one against the other and it's absolutely impossible how these two got that well balanced. But you've got postulate-counter-postulate, effort-counter-effort or pull-counter-pull and you've got a problem as a result of this. In other words, you've got your problem. The idea of a problem. You've got the – the Force 1 versus Force 2. And that hangs up and they exactly balance, so the pc has a problem.

Whenever the pc has a problem, he's got one opinion, somebody else has got another opinion. Or he's got one force, or the – somebody else has got another force. And these things are counter-opposing. And all things we know about problems, back through the years, are all applicable to the Goals Problem Mass. Everything we know about problems applies to the Goals Problem Mass because it is a problem in magnitude.

Now, we've *really* got a problem. It is the problem of an identity versus an identity or the problem of an identity versus identities. It is not the problem of a thought versus a thought.

"We *will* go to the movies," he says.

She says, "No, we *won't* go to the movies."

Well, of course, that's a common domestic problem.

All right. This is blown up to "Priests must perish. Gods must perish," see. This is a little bit higher magnitude, isn't it?

All right. Now, let's blow it up further. During a *whole* cycle, *all* temples must cease and *all* temples must be created. Versus versus. Packaged into a total identity. Identities versus identities.

Now, you have the idea of the man against the man. The army against the army. The civilization against the civilization. The system against the system. You've got these things *crush*, one against the other and how they remained balanced so neatly for two hundred trillion years was one of the things which I told you was the vast delicacy and matter of interest to the Goals Problem Mass.

So I have, therefore, been studying this and believe me, I've really done some studying on this particular item. This is quite an item. And don't think that studying it isn't something like boxing with your hands tied behind your back with a grizzly bear. It's uncomfortable cuffing.

It's quite a – quite a ball. You know, it's something on the order of examining the characteristics of dynamite as it explodes.

Now, take a valence or circuit "A". Valences or circuits, we don't care which is which is which. Not even synonymous. They're an identity. And that has [with French accent:] *a mission*. That has *le mission* it must accomplish. And then we get circuit "B". And circuit B is "*Zat mission* she shall never be accomplish. *Ha-ha*."

In fact, "We concentrate on nothing else but ze nonaccomplishment of zat mission. *Ha-ha*." And there they sit. In ze bank for zeveral zycles.

Pc runs into them. One minute he doesn't know whether he's accomplishing the mission or trying to stop the mission from being accomplished. And this is one of the things that absolutely baffles people. How, with such terrific enthusiasm, they will go straight along the line, you see and try to – try to get this thing done, you see? And then the next thing you know, sit down calmly and tell everybody it just must not be done. That's all. I mean, that must be stopped. Such an activity is totally undesirable anyhow.

Usually they – to make – to keep themselves from looking silly, they sort of sit still and sort of disparage what they've been doing, when in actuality they've run in from the one valence into the other valence.

Now, a thetan is a handy little character and he's very slippy, but he is susceptible to vacuums. And he is liable to get pulled into most anything and he's liable to go into most anything. So he gets in the vicinity of one of these valences – which he himself, by the way, has kept mocked up and is keeping mocking up.

But remember, during the lifetime when he lived this... You see, he's lived all the lifetimes there are in the Goals Problem Mass. That you must know about this character, you see. There isn't a lifetime in the Goals Problem Mass that the thetan himself in person has not lived. You can talk all you want to. He can sit there and talk – "Oh, those damned tigers, you know." "Us waterbucks, now, we're the thing, you see. And those damn tigers, we're not go-

ing to have anything to do with tigers." And he'll give you a big sales talk and hire Batten, Barton, Durstine and Osborn to run propaganda campaigns against tigers and you know, he's going to have a ball.

But the truth of the matter is, he's been a tiger as long as he's been a waterbuck. In fact, he probably used to be a tiger and then be a waterbuck and while he was being a tiger, he'd say, "Oh, man, those waterbucks. Absolutely delicious. Absolutely delicious. The thing to do right now... Now, a freshly killed waterbuck is fine, but *cured* waterbuck is just – that puts the edge on it. You go down by the stream, you see and so forth and *schlurp, schlurp.*" And if he happens to be in this valence of the tiger at the time you're auditing him, he has entirely different viewpoints.

And the next thing you know, if he swivels around the next time, he goes into the valence of the waterbuck. He has entirely different viewpoints.

What you want to worry about is the fellow who never swivels. And you only get that when you're running an inert valence. He never swivels on an inert valence, see. No motion involved in it at all. He kind of drips out of it or falls out of it accidentally one day or something like that.

Now, he's lived both of these lives and during that lifetime he created like crazy. Either he created impulses to keep himself from impulsing or he created withholds to keep himself from withholding. He created something to contradict something which was usually the same thing. He was busy. He was busy.

And during that very lifetime, of course, as a waterbuck, he was death on tigers and all the time he was a waterbuck, he was mix – he'd just keep mocking up things about what he was going to do to tigers. You know? What he was going to do to tigers. And tigers, you know. Tigers.

And because those things are hanging in space, they're never resolved. They're still mocked up, but the valence, waterbuck, continues to *mock* these things up. Which is quite remarkable. He spent a whole lifetime mocking up, so that that valence just goes right on mocking up. It keeps itself mocked up, in other words.

Well, of course, what is everybody that is a being doing here on Earth? He's trying to keep himself mocked up one way or the other, you know? Survive, survive, persist, persist. And we get back to the common denominator, *Dianetics: Modern Science of Mental Health*, and the dynamic principle of existence is survive. And this is the common denominator of all life.

Nobody said that we threw this principle out simply because we said create and destroy. That restored the rest of the cycle. Some beings are on "destroy others." And some beings are on "create others" or "create self" or even "destroy self," but the funny part of it is that they destroy themselves to survive and they create to survive. And survive is the thing they get pinned up on most easily, you see? So it is a common denominator of existence.

So every one of these valences has as its common denominator that it must survive and persist. And it must create in order to persist in some way or it must withhold in order to persist and so you get the thing totally packaged.

Now, it really wouldn't do very much if it weren't opposed. See, it would resolve and it wouldn't be floating in present time unless it were pushed against another valence of equal crash. You've got to have these two things pushed one *against* the other in order to get a *timelessness*. And that's how these valences float into present time. That's actually how they *jammed* into valences. See, oppose, oppose, oppose, oppose, oppose, oppose. Whether they're opposing by withholding or opposing in any other way, it's opposition. They're agin it. They're agin something.

Now, this principle is quite interesting. This is a broad auditing principle I've talked about. I've said what you resist you become and that sort of thing. But actually if you want anybody to get locked up in this universe very nicely, just get him to agree that certain things are bad and mustn't be had. That's all there is to it. Just get him to agree that certain things are bad and he mustn't have them.

Now, what is the definition of bad is: mustn't have it. It's actually the only real definition of bad. That's the fundamental definition of bad – something you mustn't have or something others mustn't have.

Now, if people mustn't have it, it of course persists because it is never as-ised. So you get a non-as-ised thing. And the basic trick which makes this universe is simply this one trick. And a very interesting trick it is, which is just get everybody to agree that something is not *haveable*.

I imagine Immanuel Kant – somebody will run into Immanuel Kant sometime or another with his great unknowable unknowables and unattainable unattainables and how real truth – *real* truth, you see – transcended all human knowingness. So you couldn't have anything like real truth, you see, that sort of thing. See, you couldn't have it. Lord knows what you could as-is then, you see. So that any time somebody – if he really got that into a circuit, why – any time somebody would say, "This is the truth," it would be non-as-is-able. If you can't have truth, then it's non-as-is-able.

You should have the experience sometime of actually just running "have" subjectively. It is not very therapeutic, but you run "have" subjectively, you'll actually see a mass vanish as you can have it. You can sometimes run it on a somatic and you'll see the somatic vanish because the person has made up his mind he could have it.

So the non-haves persist. So it becomes a non-have universe. So it's the "not-have" characteristics of that valence that are persisting. It's something he couldn't have about the valence, so therefore it must be those things which oppose. So the valence actually is only composed of those things which oppose. Nice trick, isn't it?

I mean, the total energy mass left in this valence are those things which you can't have. So therefore, those things are oppose, so the total common denominator of a valence is oppose. Whether it is opposing by inflow or outflow or being inert or anything else, the characteristic of one of these packages is oppose. And none of its characteristics have ever been had. The pc doesn't have these characteristics, you see. He can't have anything that's in that package that remains in it.

Now, he might ... This is what is funny and what leaves your pc grasping in thin air once in a while. He's trying to find the rest of the life as a waterbuck.

He gets into this valence, you see and he can't find the rest of the life of a waterbuck. He can find spitting at tigers, running away from tigers, but he can't find very much grazing in the pasture, see, or swimming the stream, you know, or lying out on a rock someplace and no lady waterbucks. He can't find that. He'll look for that, you see. And he'll look in vain in this valence, you see.

He'll know that there must have been good times in this valence, you see, but he can't find them. He's had all those. See, he could have those, but what he couldn't have is a tiger. He couldn't have death, he couldn't have a tiger, he couldn't have this and he couldn't have that and all the things he couldn't have are then packaged in that valence. So you get a Goals Problem Mass as a can't-have. It's a total can't-have.

Now, oddly enough, its characteristics are usually more desirable than an ordinary life the pc lives. See, there were some things in there that were *very, very* select chop. Ummm.

Well, there's a temple priestess. See. I imagine that could be quite exciting at times. Yet the poor pc runs into the life of the temple priestess, which is all packaged into a circuit now. "Where's the bed," you know. Nonextant. Doesn't exist.

But reaching hands – they exist. Stabbing knives – they exist. The slit throat under the shadow of the idol – *that* exists, complete with blood. But only the less desirable blood, because maybe they had an appetite for blood while being a temple priestess, you see. And so – it's the things nobody wants that are left in this lifetime. And the pc almost goes around the bend trying to run it, see. Where's something nice about it all, because he knows something was nice about it. He knows it was exciting. He knows a lot of things about it, but he can't find them anymore and they're sort of all eaten up.

That's an interesting characteristic of valences. So you don't get pictures. One of the things that you run the pc – you run him in a Goals Problem Mass, he says, "There's no pictures here." Well, you know at once he's in a Goals Problem Mass. He says, "There's kind of a ridge and there's a thin veil and then there's a mmmm. And I sort of have an impression of the hand of an idol." And he keeps getting problems and it'll all give him the same pictures, you see. The ridge, the veil and the hand of the idol. Never seems to run into anything else while he's running it. That's because that's all that's there.

That's simple. I mean, it's elementary, my dear Watson, because there isn't anything else present.

Now, he himself as a thetan could mock it up again and will mock it up when it's no longer that undesirable and could put it all together again and would, except, of course, it would be sponged into the undesirable characteristics and he's not about to do that. And the attention of the person was always fixated on the terminal itself and on the opposition.

So there's two things of fixation. It's on the terminal and on its opposition.

Now, how does this Goals Problem Mass get so thoroughly condensed? How does it get so condensed?

Well, if you drew a picture, you'd get – really, you'd get something like this. There would be free track. All is well. And you have free track and the free track is going along, doing well. And then all of a sudden you've got a Goals Problem Mass, you see? Well, that's all right.

So there's a – there's a mass there. Well, let's don't call it a Goals Problem Mass. Let's just call it a circuit, an isolated circuit.

All right. The person had a trillion years of free track and then he's got a Goals Problem Mass, you see, because of his overts and restraints and inflow and outflow and all this sort of stuff and, all – you know, all that kind of business. And it just packaged that lifetime, *crunch!*

And he went along for another million years and so he's got another Goals Problem Mass. Well, let me tell you – pardon me, another circuit. Well, let me tell you the track could be just a series of free track with some beads on it. See, it'd look perfectly all right. I mean, a person would run back over it. He'd hit these things. He'd go into them, he'd come out of them, maybe get stuck on the track and you wouldn't have any trouble separating him from them. See, these are just isolated circuits spotted along in time.

And that's actually the way a Goals Problem Mass looks. It is not double. It is single, see? It's just – well, it's like a ladder. Free time track for maybe a trillion years and then there's a cycle. He spends a whole cycle in this weird game of a waterbuck, you see. And – but he's got a valence there of a waterbuck. *Crunch!* And it's all *condensed*. There's no free track in it at all. It's the unhaveables of the waterbuck.

And then you got free track for a million years and then you got some other valence. But this time he was an eagle and you got a – you got some kind of a terrific inflow-type terminal there, you see and it all went crunch, so that area's – no free track there. And it's just a little black lump on the time track and so forth.

And then go another half a billion years or something like that and then by that time he'd become a turtle. And there's nothing more inert than a turtle. And the inertness of it and the omissions of what he should have done as a turtle were overwhelming, so eventually the turtle's track caved in and that would just be there, you see. And then it'd go another billion or trillion years and he'd have another one of these *crunch* valences, you see? And it'd go along like that. And you, running the pc back over the track, would not have any trouble. None.

But that isn't what the time track looks like. That's what the time track should look like and what the pc thinks it probably does look like. And it doesn't look like that at all.

What happens? Well, he went along for a trillion years and one fine day found a waterbuck and a tiger. And there's a waterbuck and there's a tiger and everything's fine. And he sicced them on each other or something, you know. Made a game out of it. He was totally pan-determined over this thing.

And by the way, pan-determinism and self-determinism and other-determinism have as their controlling common denominator responsibility. All you have to do to get pan-determinism run down into other-determinism and self-determinism – all you have to do is just cease to take responsibility for zones. And if you take less and less responsibility, when

your responsibility goes to zero, you've got an other-determinism, you see? You've no longer got pan-determinism. You've got an other-determinism and now you're only responsible as a self-determinism. So you get maxims such as "take care of number one. That's my philosophy in life. Take care of number one," you know.

Well, I can show you somebody who has no responsibility for anybody else and at the same time has no ability to stand outside two sides of anything. He's always got to take one side. He's always one-sided in every view. He could never, in other words, handle anything but a fight. And the only – he couldn't *handle* a fight. He could only be *in* a fight.

You'll have a person that is never able ... If you had a cop like this, see, he'd always be coming in with beat-up criminals and he himself would be all beat up and so forth. And his neighborhood would always be beat up. Something would be beat up in this neighborhood and they've never had this much beat up in that neighborhood before so they merely figure it's getting to be a tough neighborhood. That isn't the case at all. They have a totally self-determined cop, who by the way has a Goals Problem Mass where he is a cop that is against them thar criminals. *Rrrrooop*. Well, the second he's got this type of a Goals Problem Mass, he can only take one side of a situation.

So anybody who is doing anything instantly falls into the oppterm characteristics and he can only do a fight. He can never see two people talking together without boosting it up into where one was fighting the other and taking sides with one. He'd identify one with himself and he'd identify the other one as other-determinism and he'd make a fight out of it.

In other words, he'd never bring peace. He would just bring war. And there'd be more war and more war and more war. Wherever he went, there'd be trouble, just trouble, trouble, trouble, trouble, trouble. He wouldn't be able to understand this and neither would anybody else.

But this guy would be all out, too, for number one. That would be his idea. He's a totally self-determined individual. He'll tell you the virtues of self-determinism are enormous and let the other fellow take care of himself.

Also he would never stand alongside of a chess game and watch two players. He'd just never do that. It would be a point he just could not stand to be. He could never be from town A and watch a football game between town B and town C. He just could never do it.

He would never go to such a football game. He just never would go. That's all. He would have to be part of town B, you see, to attend the football game and he could only attend the football game between B and C, you see. And he would always be violently against C and always be terribly pro-B. You see? And that's very embarrassing because his company moves to town C. He has to go to town C now, you see.

So now he's forced into a position where he might have to change sides or be pan-determined or be something else but what he's doing. And he can't do either of those, so he'll just find a new game. He'll just cease to be interested in football. That will be that. *Bing*, out, gone. That's it.

Well, he used to care for football. "Don't care for it much anymore. Horse racing's my game now. Us horses ..."

Anyway, there's nothing really wrong with other-determinism, pan-determinism, self-determinism, to be other-determined or pan-determined or something like that. It's no criticism particularly because it would never be a game. But to be obsessively self-determined and not know about what and to have a whole category of things which were always other-determined and then never know what they were either is to sort of walk in a weird mishmash of "God 'elp us. Who's against what?" And the person would always be rather upset. He'd never know what side he was on or why.

You see what's happened, though. His pan-determinism has deteriorated into total self-determinism.

Now, God help the fellow who goes out the bottom and becomes the mockery of pan-determinism which is "reasonable." It'll go down scale to a reasonability where you can *never* take sides. But you ask this person about taking sides and they kind of shudder horribly and they get a little bit sick at the pit of their stomach, at the idea of taking sides. "*Ohhhh*. Wouldn't be able to do that. *Ssssss*. No, no, no, no. Wouldn't be able to do that. No, no. No not now, no. No, we must be impartial. We must be reasonable. We must never take any sides of any kind whatsoever."

You get judges, United Nations, untouchables in general. And they're liable to be quite *reasonable*. And it'd drive you batty.

There can be somebody standing there with a knife in his hand, just having murdered somebody. The corpse is lying on the ground and they will be reasonable about what went on and who did it and so forth and they'll be very reasonable. And everything they say will be impartial. And they sound like a ruddy screaming maniac when you listen to them.

"Now, all right. Now, who committed this murder?"

"Oh, well, uh – well that – the – there can be several thoughts about that. There could be quite a bit of the – there'd be uh ... You could take many points of view with regard to that murder – if it was a murder, uh – and so on. We don't know whether a fellow did it, really and we don't know what his motives were. Frankly, we – we don't – we're not even positive the other fellow's dead, you know?" [laughter]

It'd drive you batty. You've talked to such people. We run into them sometimes in Scientology. They always have an open mind. They have an open mind to Scientology with the wind blowing straight down the hall, and you've got somebody who can't take sides.

And frankly, they're very close to an hypnotic state. If you really want to do something for them, you'd have to treat them more or less as an hypnotic person. It's quite interesting. The open mind.

"I'm open-minded about your ideas." I hear this every once in a while from somebody. They're real weird. Maybe somebody's stumbling in the front door, hit both sides of it, collapse over the stairs, you know and so on. And they turn around to the Receptionist, who's a girl and say, "Well now, Dr. Hubbard, I uh ..." It's quite remarkable, you know.

Because they don't know where they are and they don't know what side they're on and they don't know because it isn't safe to be on any side of any kind. That's the end of that. It's not safe to be on any side anyplace or to be anything.

Now, you nevertheless – this would all shake out in a Goals Problem Mass. They aren't any harder to process than anybody else by Routine 3D Criss Cross.

All right. Now, what happens in actuality? What happens in actuality? Well, it's a very simple mechanism actually.

The guy gets the tiger going toward the waterbuck and then he decides that he's been a little bit too rough on waterbucks and he starts favoring a waterbuck and going against the tiger, see? But he can't quite restrain himself from following the first postulates in the game which was to get the waterbuck fighting with the tiger. So he just gets more waterbucks eaten up, see? But he keeps going against the tiger more and more and more and more against the waterbuck and he gets terrific overts finally on the waterbuck and he becomes a waterbuck. He can no longer differentiate between himself and a waterbuck. He is a waterbuck. That's it.

Now, the waterbuck gets tremendous overts on the tiger of various types and other, usually very covert waterbuck overts, you see, and by being so beautiful and being so destroyed.

That is a marvelous type of overt and hardly anybody ever recovers from it because they can't quite spot what it is. Girls do this occasionally. My God, a girl could certainly get even with you after a spat. They're hollow-eyed, caved-in, you know. Their beauty is shot, you know. Their beauty is absolutely ruined and so forth. Such mechanisms.

And these are overts of one kind or another. And so he just stacks up enough overts against the tiger and one fine day finds himself being a tiger and eating waterbucks.

Well now, you see, waterbucks are an ally, but he's being a tiger and to live he has to eat waterbucks and he will develop all sorts of vegetable faddisms as a tiger. "Us tigers should be vegetarians. Tigers of the world, awake! You, too, can have glossy coats by eating grass." Can see it now. And he writes a book and calls himself Gayelord Hauser – [laughter] this sort of balderdash, you see.

He can't quite face up to committing this overt against his terminal. But he's being a tiger and he inflows waterbucks.

Well, after he's inflowed enough waterbucks – he's now gone down scale considerably, you see – why, one fine day he has so many overts on waterbucks that he becomes a waterbuck again on a second curve. He says, "Now, being a waterbuck" – very obsessively and hating it because "Us tigers". He'd always really gotten friendly with the tigers, you see. But "Us waterbucks" is just a little bit thinned down and he sort of has a vicious attitude toward waterbucks because, after all, he's eaten waterbucks, you see?

And while in the waterbuck's head, he's busy eating waterbuck, you see, because he's still in a tiger valence, only he isn't. He's in a waterbuck valence. Or he's in a tiger ... No, he's in a wate – water – tiger – water – water ... See? And he embarrasses himself because he's down drinking water one day along with the other waterbucks and he says, "*Groooooowr*," you

know. And all the other waterbucks look up and say, "Good God!" you know. "And I say, old fellow, that isn't done, you know."

So he has to withhold that because he might do it again, you see – an antisocial characteristic.

And he just starts avoiding tigers and avoiding tigers and after he's avoided enough tigers, he obsessively exteriorizes from a waterbuck and interiorizes into a tiger. And now he's a downscale tiger indeed. And he will take this tiger mock-up that he's now got and it gets mange. It gets mange, brother. Its teeth drop out. It loses its claws with the greatest of ease, see. He becomes a very moth-eaten tiger. Even when he is young, he is a moth-eaten tiger. His mother meeting him on the trail turns her head sadly. [laughter] And he does this confounded *yickety-yak*, *bickety-bop*, *boopety-bop*, you know. Waterbuck-tiger, tiger-waterbuck, waterbuck-tiger, tiger-waterbuck. He can't stay away from either of them.

He finally one day runs the game out and skips it and manages not to be a waterbuck and manages not to be a tiger and lives some free track and everything is fine. And he goes along and everything is dandy and gets involved with a temple. And here goes some kind of a wild game that has to do with a temple priestess and the evil priest, you see. Oh, some mad game going on of some kind or another and becomes the temple priestess, you see, because she's so beautiful.

And actually she goes out and with great purity talks to the multitude, you see and makes people happy and effects cures and it's all – all just so terrific, you know. High-toned. Ethical. Everything's fine. Nothing wrong with this, you see and gets after the – gets after the priest occasionally, you know. A little bit, you know. Not much. [laughter]

Here we go! Because the next thing you know, why, the priest gets too much money and is agin all of these nice people and she realizes this priest is shaking the populace down. The offerings put on the temple of Baal are never eaten by Baal. They are eaten by the priest and his friends. And this is a great shock and is a very unethical action. The priest should withhold doing this.

In other words, she gets an overt on a priest and you know, goes out and exposes the priest to the multitude or something like this, you see.

Well, she goes and picks up another body as a temple priestess, you see. And life is going on beautifully, you see, but there's still another priest and she gets more overts on the priest and some more overts on the priest. Been quite pan-determined about this originally, but she's sliding over into becoming *only* a temple priestess and the next thing you know she's bumping off priests left and right. A guy shows up, says, "I'm a priest." Bang! That's it. [laughter]

She says, "Oh." But it's quite overt, you know. He's just dead, that's all. There's hardly enough time to breathe between the announcement and the demise. And gets enough overts on priests and one lifetime suddenly finds herself a boy and walks on down to the local temple and signs up as a neophyte and becomes a priest and takes all of the food from behind the altar that was intended for Baal, and sort of avoids temple priestesses. Doesn't have too much

to do with them. Has an open mind about them, [laughter] and so on. And then one day gets exposed by a temple priestess. *Ohhhh*.

Well, that's an overt, you see – that's a – that's an overt by the temple priestess, but it's a motivator the guy can't have because he's already got overts on this line, you see, so he goes *yickety-yak, bingety-bang*.

Next time he picks up a girl's body, becomes a temple priestess and now, it's a little bit different the way to handle priests now. Now, she's got overts, more overts on a priest. A little bit different.

A fellow walks up and says, "I'm a priest." And she says, "Well, dear, have a drink of nice wine." A little more comm lag between the announcement and the demise, you see, a little more covert, but the same end product.

And then picks up a body as a boy and goes down to the temple, enrolls as a neophyte, walks up the steps and that's it. Takes one look at the newest crop of priestesses and goes quietly down to the cell and begins to grind up the arsenic, you know, and stir up the tails of the asps and sharpen up the ... Oh, it's a marvelous game, you know. Kills more of these girls, you know?

Finally, so a temple priestess shows up and says, "I am a temple ..." It doesn't get that far, you know. *Clank!* [laughs]

And eventually this game has gone *boom-bang, boom-bang, thud-bang, thud-bang*, you see. Back and forth, temple priestess, priest, here we go. And he gets tired of that and gets pan-determined about something else. You see, that's the cycle. Well, that *still* would be all right. You wouldn't have any trouble solving that, but look what happens.

One of these packages gets into a terrific outflow and one day the person misidentifies somebody in present time with an old game and the valence will restimulate and make one of these Goals Problem Masses.

In other words, an old game on the track suddenly comes into present time as a direct opposing problem to the game they're playing.

Now, it's bad enough to have the waterbuck and the priestess games. You see, they themselves form problems, oppositions, but they're not delicately poised and they don't hang up easily. They're just overts and withholds and so forth.

That's – that's not good enough. You've got to get one of these *whole* games opposed against a *whole* game. You get the idea? I mean, these things have got to become confused by the pc so that he doesn't know which is which so that he doesn't know which part of the track is which part of the track. You see how that is?

He's got a whole game series composed with a whole game series, so he becomes an order of priestesses which are dedicated to the preservation of waterbucks. And when asked to design a new headdress for the priestesses, of course, designs a pair of waterbuck horns. And – *th-th-th-th* – it's all getting sort of confused.

And as time goes on, the Goals Problem Mass, of course, is overlapped on itself many, many times and is becoming itself quite condensed. Just as the valence became condensed in

time, so can a series of valences become condensed in time and so can all of the serieses of valence become condensed in time and occur right now on the track in one lump. And that is a Goals Problem Mass – everything opposing everything, cycles opposing cycles, everything opposing everything else.

Now, that would be all right if the person didn't live side lives which themselves condensed, which aren't on any main game at all, which get locked onto main games. So they live these lock valence – they're lock valences. They're not main chance valences. They're lock valences. And they don't have too much to do with the game, but one day, right in the middle of being a temple priest, all of a sudden he becomes a merchant. Has a lot to do with temples, you see, but he's a merchant. He's going to reform. He's going to get out of the game. That's the usual thing, you see. Going to reform and finds himself dealing with nothing but the temple, you know, as a merchant. And lives a life as a merchant – kind of sick, but lives a life as a merchant. And then goes on and lives a life as the – as a priest, see?

So in the middle of all this – but then years later, ages after this game is all dead, decides to take an education at a university in a country. Goes to the university. Everything is beautiful. Everything is fine. Only you have – the only educated people in this particular country are, of course, members of the ministry.

He goes along with this because to be educated, of course, you have to be a member of the ministry and that's perfectly all right. And everything is fine until one day he's standing there and he picks up an altar cup. You know, it's just form, you know. Nothing to do with anything. It's just form. And he picks up this altar cup, you know and is going to put it – put it up on an arch. All of a sudden gets terribly dizzy and comes down with pneutyphoid ammoni-coccus or something.

And he kind – nobody can trace what happened to him, so it must have been a bug. You see what happens? That lifetime, in other words, moved in *toward* one of these main games that he doesn't ever want anything to do with again and doesn't have anything to do with, moves in and latches straight onto it.

Now, you, in assessing it, can find that life going to the university as a parson or something, you see? And it'll assess out and then disappear. You see? Because as you assess it and discuss it and differentiate it with the pc, of course he differentiates it off the main game. And he sees that it isn't the main game and that it doesn't oppose anything and it just blows, just like that. See?

But up to that time, it was totally latched onto the Goals Problem Mass.

Now, the danger in 3, 3A and 3D is just getting one of those things I just described to you. Just getting one of – getting your hands on one of those. It of course, if it were proved out and checked out expertly, it wouldn't stay. It wouldn't stay in. It would blow. But you can't count on every auditor that's ever going to run this checking it out expertly.

Furthermore, it is very difficult, with the original 3D type of assessment and the original package, to know whether you had a terminal or oppterm. Quite difficult to know this.

They sometimes are all mixed up and you can't tell which is which. And one imbibes the characteristics of the other and it gets very confused.

So, what have you got here? You've got a method, then, of peeling off – in 3D Criss Cross, you see – you have a method of peeling off and blowing all of these lock valences that don't have anything to do with the main chance. And then peeling off cycles off of cycles and straightening the thing out and getting it back on the track again so it's in some shape to run. And you could find the center pins of the whole mass which would cause it to come back together again and you run those out. I'll go into more about that later.

We're talking mainly about anatomy now and the ways of handling this anatomy, I must advise you, of course, are susceptible to change. But the anatomy is it. This is the stuff. This is the anatomy of what you're handling.

All right. Now – now let's show you how you get a total collapse of the main chance. And if anybody's bank collapses at this particular time, and it disturbs the lecture any, I won't forgive you. Now, so just – just hold on to it now. And here's the way it does it.

A heavy inflow package, the heaviest on the track, opposing a heavy inflow package will make a double vacuum. You will then have a vacuum between two valences. Two inflow valences, you see. If you got the idea of A and it's inflowing madly and B and it's inflowing madly, you see, it leaves a vacuum in between A and B, doesn't it? And, man, that's quite a vacuum.

All right. Now, let's take two outflow valences. This is an elementary exercise in the Goals Problem Mass, you see. Two outflow valences. And they're outflowing madly, C and D. Boy, are they outflowing. See, they're terrific. *Boom, boom, boom*. Outflow, you know, glare fight, kill everybody, you know, that sort of thing

And as – if these two things were facing each other, you'd get a blowby. In other words, you would get everything flowing from D at C and everything flowing from C at D, leaving a vacuum behind the back of C and a vacuum behind the back of D. It's a study in enturbulances is what it is.

And then you'd get all of this other stuff spraying all over the place, caroming. In other words, you'd pin C and D together by just the violence that they were blasting at each other because their blasts miss, of course. See, you got a lot of missed blasts.

In other words, they're pinned together by mutual force against each other which caused vacuums back of each. This is electronic phenomena I'm giving you, standing waves. Electronics men turn gray when I start talking to them about this kind of thing because this is more than is known about electronics on this planet. Electronics have standing waves and they have all sorts of things. And we think, on this planet, that we've really conquered it all because we can throw a light switch and turn on a very expensive light and mortgage our wife to the power company to pay the bills, you see. We think we got electrical stuff pretty well taped. We can also turn on a radio – turn on a radio with bad tone and pull in something a few miles away that sounds like music and that you hear through the static and we think this is pretty good. So we know all about this stuff.

In actuality, it goes a lot further and a lot more about this. There are standing waves, motionless waves. Energy itself has various characteristics. It has traction qualities and so forth. It can produce some different and odd phenomena.

Give you an idea. Even in the universities they know of the ground wave phenomena. You can pipe electricity or programs through the ground. It doesn't go through the air. And you ask anybody about this, of course, and they don't know anything about it. They say, "Well, that is a field that has never been studied and that, of course, closes the book, because it has never been studied, you see. *Ha-ha-ha.*" Great! Hope they wake up someday and find out that that phrase "never been studied" does not excuse ignorance. So there's a lot of electronic phenomena of one character or another.

Now, you don't have to be concerned with this electronic phenomena or identifying this electronic phenomena. It's of no particular use to you to become that learned on the subject, but you've got it right where you sit. You've got standing waves and you've got electronic masses and you've got all kinds of enturbulances and so forth and these things are the reactive bank.

All right. We get C and D blasting away at each other and by the very action of blast, hold each other together.

I'll give you an idea. A gunman facing another gunman may be shooting at the other gunman, but do – can you conceive of anybody really distracting his attention from what he's doing? See? And he also doesn't want the other gunman to go away. So you see, there's a traction beam between C and D which holds them together while they blow each other's heads off.

And that stuff is represented in electronic flow and it's still there, in the bank. And then you've got two inflows, as I was just giving you. And these inflowing madly, each one, of course, leave a vacuum and the time track can be sucked up right into the middle between A and B. *Schrrup!*

In other words, electronic mass, it's timeless, and so on. There's no reason why it couldn't be pulled in and it does pull in and it can be pulled in. In other words, you've got a terrific vacuum between A and B by the nature of two – they're both inflows – and therefore you have a nonexistence of electronic potential in the middle. So therefore, any electronic potential will instantly fly into that hole. There it is. *Bang!* You see?

Now, between C and D, anything coming near will be pinned down – either pulled into the vacuums back of C and back of D... You see, things can be pulled in. Objects, electronic objects, masses, standing waves can be pulled in back of C and D and just sucked up against these two outflow terminals. And what do you think is happening at the same time?

Of course, you get this tremendous blast of action. C versus D gets activated occasionally and naturally makes an awful enturbulance. So you get a – you get a like a cyclonic storm going around, around everything that is sucked in against C and D, you see.

So there they are pinned in, but the currents are going by like mad while they're pinned in. You get the – you get the notion?

Such phenomena as this – I haven't described to you all the phenomena, but these are the principle ones: mix up an A-B mess now with a C-D mess, then pour it full of a bunch of inerts-masses just to give it mass and now pour it full of other things like actual vacuums, pictures of vacuums. You know, you have engrams full of vacuums and that sort of thing, you

see? And now pour it full of stuff that have got traction beams that are condensing beams and so forth and, man, it looks pretty forbidding. It looks pretty rough. And you get the pc near this stuff and, of course, he can't – feels like he's getting his head blown off in his physical body. And of course, he practically is.

There are ways to approach this thing and it's very easy to approach it. Now, it's there because he is afraid to reach into it. He doesn't want to go anywhere near it.

If left to his own devices, he might, however, putter with it, but not seriously. He's somewhat of the frame of mind of the child wants to go down to the river, which is a roaring torrent and is perfectly competent to sit there on the bank and make mud pies providing the bank is fifteen or twenty feet away and Daddy is near. But no closer, thank you. Too much of a roaring torrent going on, too much action.

Now, every time, of course, a thetan ... This is all individual. Each segment of this is keeping itself mocked up because it was a living thing at one time and it still acts like a living thing. The thetan thinks of himself as haunted by these things.

You know, he hits them and they go *bing*. You know, he's liable to put an energy beam into it and it says, "One, two, three, four, five, six, seven."

"What's this?"

"One, two, three, four, five, six ..."

"Oh-oh. You know I think I've got thetans in my head." [laughter]

In other words, he gets action. He reaches and something else flies back at him. And therefore he becomes very timid about handling his own mind, so he forgets things and he does this sort of thing.

Now, the individual, of course, gets pinned into this Goals Problem Mass. He can get into any valence in it. He can scatter in through any valence in it. And so, of course, coming near he activates it and he gets into these valences and they restimulate valences and valences restimulate valences, you see. And he can make this thing pretty live and pretty electronic and he can be in one side of it and the other side of it and he can go through it and exteriorize out of it and exteriorize in – interiorize into it. And – in other words, he can just have an awful lot of fun messing around. And this is life as it is lived on this planet. It's an endless, random, falling out of and into circuits in the Goals Problem Mass.

These are known as personality, human characteristics, human behavior, psychology, psychiatry, anything you want to call it. These are characteristics. And all they've done is study these characteristics of various reactions, of package reactions.

Of course, you get the anatomy of what the thing is, you can change those characteristics almost at will.

Now, 3D Criss Cross is a very smooth and gentle approach to this because you peel off... 3D Criss Cross will improve and change. The characteristics of Goals Problem Mass and so forth, are what they are. But I'll give a note here on 3D Criss Cross anyway.

These things peel off and by recognition and differentiation ... You see, you just assess, but assessment is devoted to finding as many, isolating as many parts of the Goals Problem Mass as you possibly can and proving them up as actual parts of the Goals Problem Mass.

And the action of doing this, of course, blows off all the package valences which are standing out on the outskirts, starts straightening up the mass by getting rid of it and unburdening it and getting rid of things which aren't the mass and assesses it right on down into the actual pins that are holding the mass together.

Now, it is time to run a pc, if you have to, only when you have the active terminals which have got the mass inextricably pinned into present time and are in present time.

Now, a pc having done all this, of course, has no great fear of the situation and possibly you could go back and date and straighten out these lives almost by inspection. Perhaps you could do it all by assessment. But that's beside the point. The point is that it is therapy by assessment because you established differentiation.

And when I see somebody at this present moment sweating like mad to find *the* package, see, I know he hasn't got the word. He should be going like mad to get as many items differentiated by the pc and isolated as possible because items fall into three characteristics: Completely null items. They have nothing whatsoever. They're free track items. They have nothing whatsoever to do with the Goals Problem Mass. They're out – way out and, you know, it had nothing to do with it. Never got locked up on it. Nothing.

The next, of course, is the lock item. And that is something that didn't have anything to do with the game on the main chance. The main games. It has nothing to do with the main game. It's just an identity which, unfortunately, got moved in toward one of the main games and therefore stuck and at the moment is considered by the preclear to be a part of the main game. But actually it had nothing to do with the main game. When he looks at the thing again and inspects it, it blows off. And he is much less confused about what it was all about.

Like he got – he got into merchanting and one of his customers was the temple. And just to that degree, he's pinned onto the Goals Problem Mass, so he'll run into the life of a merchant and it is not runnable. You can't run this. The bank will beef up and everything will go to pieces because, of course, it's right next to the Goals Problem Mass. And it's agitating the Goals Problem Mass without doing anything *to* the Goals Problem Mass.

And if you agitate the Goals Problem Mass by running false items that have nothing to do with the actual games in the Goals Problem Mass, it charges up the Goals Problem Mass without discharging anything. And you've got to have items that discharge as fast as they charge in order to keep the pc this side of going around the bend, see. But you can get the Goals Problem Mass all charged up like mad by running these oddball, offbeat valences, lock valences.

Then the third type of valence is, of course, those which are intimately associated and were part of these games. Actual games.

You could find a goal for any item in the Goals Problem Mass. You could find a goal for any item in it. You could find an opposition goal. You could find anything in it. And 3D

Criss Cross, of course, you'll find it very easy to do on any pc because you go in with test items and you establish as many lines as possible. As many as possible. Run ten. Who cares? Run twenty. Who cares?

I'll give you a sample of how you could go about this. There is a method given to you on the 3D Criss Cross mimeo and it said you'd run General O/W on self and then say, "Who would you treat like that?" and make a list and assess it. And you'll come up with one of the items. And you'll come up with a test item. Then you can take – with opposition terminaling that test item, you can move on into the Goals Problem Mass with actual items. And you can differentiate like mad.

All right. You can take a list of the things a person liked. And you run a long list of those and differentiate them and null them and he'll come up with an item which is part of the Goals Problem Mass.

And you can take things a – a long list of kinds of people that the pc disliked and, you know, liked – the like-dislike lists – and you can do the same, so you got another item.

In other words, you got three items now. All right. That's dandy. They just give you points of departure for more opptermes going – sorting out track. That's all you're doing – just sorting track. All right. What else could you do?

Well, almost any way of locating an item you have ever been taught in Dianetics or Scientology would be usable. You could do a Dynamic Assessment on the person. Use it as a test item and depart from it. See? There'd be another method of doing it.

In other words, you've got method after method. Anything that ever found anything that stayed in with the pc as a method could be used as a test item for 3D Criss Cross. And it doesn't matter how many channels you have. Have twenty, have thirty. You get up above that, your pc would probably be very confused.

I would prefer to be running about five. About five lines. Line A, line B, line C, line D, line E. Why? Just that much more chance of getting differentiation. Because, you see, as you enter these things, you enter different corners of the Goals Problem Mass, so you don't dead end. You don't get a chance of dead ending. You're pulling the whole mass apart rather than some little section of the mass. And if a line dead ends on you, well, what the heck, you've still got five – I mean, you've still got four.

All right. Let's say another line dead ends on you someplace or another. You've still got three. In other words, you're playing in abundance. Then develop some more lines some other way and keep them running.

In other words, keep assessing. Keep assessing. Keep finding items and the process of finding items blows off null items. And it goes by null items, blows off lock items and locates actual 3D items.

And eventually you'll either get into a position where there is only one package. Every time you take one of these lines and ask for its opposition terminal, the pc says, "A tiger." And every time you take another one of the lines and you say, "All right. What is the opposition terminal of this line?" The pc says, "A waterbuck."

All right. Let's try and find something else now. So you find something else. You find a tiger. And let's try finding something else. All right. You'll find something else. You'll find a waterbuck. And you can't go anyplace else. You're just there. That is it. And so you don't have any further difficulties with differentiation of what the items are. And nobody has to check them out for you. And those are the items you'd run if you had to run items.

You'll find these things are in ribbons by the time that you've done that much assessment on them all. They're all unburdened to such a degree that they're just easy.

All right. Now, how accurate must an item be to do an oppterm. I would say it had to be pretty darned accurate. I'd say if you bypassed an actual 3D item on a list and got the wrong item on the list and took a departure from it, your pc would be uncomfortable and your line would dead end or something weird would happen to the thing.

So I think the item should be very, very accurate. You should do your assessment very, very carefully with a maximum of differentiation and a maximum of care. I'm not encouraging you to do less than that. For heaven's sakes, check them out. Prove them out. Make sure the whole list was null. Get the thing absolutely in the package there.

All right. Everything is right. And then take off from that point and go on for another item. Then by doing that, you will find you get lots of processing done.

If you fail to do that, however, in 3D Criss Cross, the liability is not very great. You'll just dead end and the thing will go up in smoke and you'll lose that line. You won't arrive anyplace and you'll wonder where you went astray and so on.

Now, in that preclears lost their goals terminals – lost their lists of goals and lost their lists of terminals and then that took fifty, seventy-five hours sometimes to assess a terminal and a lot of other things and so forth, 3D Criss Cross should be a great relief to you because it wouldn't matter if a – if a pc had lost all of his records, you could still do a 3D Criss Cross on him.

And he'd stumble around, he'd miss a few, but they'd eventually turn up in the long run, see.

In other words, you – we've got a type of package now which doesn't have liabilities, (1) of improper assessment doing the pc in and (2) which doesn't matter if the pc's records have been lost, you could still establish the whole of it and (3) where the assessment is just fantastically therapeutic.

And completely aside from everything else, I think you would find 3D Criss Cross well done in a preclear with the proper steps as given is more therapeutic than any other single action you could undertake on a pc. Properly done it is fantastic! And until it looks fantastic to you, you probably aren't doing it right.

Get lots of items, differentiate them, find your item, check it well against the list and you will find out that just by doing that all by yourself, the pc will start walking on air. It's the best processing you'll ever have done. And the easiest.

All right. Now, there's the Goals Problem Mass. Regardless of the way we approach or attack the thing, there is the anatomy of it. It's a ruddy mess. That's what it is. And it's been

quite heroic trying to find – first find it and then find the way through it and then settle down technology that rather easily took care of it without tremendous liability. And I think we have all of those things at this present moment.

Thank you.

HOW TO DO 3D CRISS CROSS

A lecture given on 18 January 1962

Thank you. Thank you.

And this is the 1-8 Jan. AD 12, Saint Hill Special Briefing Course.

All right. Well, I can stand up today.

This is about the Goals Problem Mass, how to do 3D Criss Cross. And those of you who are now struggling to attain Class I so that you can study for Class II probably will have to review this one later. But this is a good time to find out about this.

There are several things to know about the Goals Problem Mass. There are several things, and there are several things to know about assessment.

There are two leading auditor skills. And these are the skills included in Class II, and those give you Security Checking, Model Session, TRs, Havingness, how to find the Havingness Process; gives you Problems Intensive techniques, that sort of thing. And if you'll notice that these are all assessment type things, they're meter reading type things – to use the word *assessment* very carelessly – they are meter reading type things – in other words. It requires auditor decision on the meter. And in the whole body of Class II skills, there is only one fatal error that can be made in reading a meter.

This meter error is fatal because it brings about an ARC break of magnitude on the part of the pc, and all ARC breaks spring to some degree from this area. And that is the missed withhold.

So you could make a pile of errors in Class II skills. You could make a lot of errors of one kind or another, and your pc would go on getting better. Now the pc would recover and you'd get rid of this as long as you didn't miss any withholds. Well, the way to get over that one, of course, is to constantly be asking the pc, "Have I missed a withhold on you?" don't you know.

And of course, underneath your – your Model Session skills, you can miss a rudiment, I didn't think this was possible, but you can miss a whole rudiment with considerable consequence.

You know, you ask the question, "Well, is it all right to audit in this room?" And you just miss it clean. And it's not all right to audit in this room, and then you'll have trouble. And it isn't the type of trouble usually which causes the pc to go out and commit suicide or anything, but this is your screaming ARC break, the pc becoming very furious – all of these various mechanisms come straight out of the general classification "missed withhold," subclassification additional is "a missed rudiment."

And the reason for this is that you get an invalidation of the meter, an invalidation of what you're doing. You evidently don't know what you're doing because you can't read his mind. Pc evidently makes the demand that you're able to read his mind at any given instant, particularly with the meter. And he then is made to withhold, analytically, something that was a reactive withhold, and it's a half-know. And he, in trying to withhold this but trying to give it at the same time, keys in his reactive bank, and he caves in one of these dramatization things. So you find the pc dramatizing immediately after this because you've knocked in what? A Goals Problem Mass valence. See, you just can knock one in just like that.

So although you could audit all of Class II in total ignorance of a Goals Problem Mass, you should know what happens when the pc ARC breaks.

Probably a vast mystery to some Class II auditors – why the violence of the ARC break on some pcs? Well, there are two reasons for this. One is the modifier going into action. But that reason, of course, is because the pc has had to withhold, which has keyed in the Goals Problem Mass and then, having had to do that, then he dramatizes the modifier. In other words, he dramatizes the package actually. And he sits back watching himself do this, and he said, "How can I do this?" Well, he can do it very easily. Actually, hell become quite – can be made to feel quite ill.

It isn't ill because he has overts on the auditor, worse luck. He feels ill for another reason, is that you keyed in a valence hard. And the way to key in a valence hard is to miss a withhold – and subcategory, miss a rudiment. Just the mechanics of the thing. That's enough to know. All you've got to do is miss a withhold, miss a rudiment, and your pc is dramatizing. He is not now in-session, and you have, in his mind, apparently attacked the pc and have supported the reactive bank.

It's all under the old *Original Thesis*. You see, you – the pc – a thetan – plus the auditor is greater than the reactive bank, you see? But the – delete the pc from it totally, and you have the auditor probably a little bit less than the reactive bank. He can do quite a bit in that direction, but it's not an optimum session by a long ways. And now let's get the pc versus the auditor and the reactive bank, and of course, you have a situation at once in which the pc – now that the auditor has sided with the reactive bank, you see – is totally incapable of holding it. And he goes into a flat spin. Because look, walking about in life, he has trouble keeping this reactive bank under some kind of control, you see? And now the auditor has turned on him. So you have a condition where the auditor is on the side of the reactive bank, so now the thetan thinks he has to handle the reactive bank plus the auditor. And he knows he can't do this, and so he just goes *zzzzzzzooooooooom*, see, and he just keys in all over the place, and it makes him quite ill.

But that's about all that can happen in a Class II skill. There isn't much else can happen. You can't make a person – you can't key them in permanently or damage them to any great degree. You can miss within that framework. You can miss the withhold. You can – you miss the withhold and you miss the rudiment, you're in trouble, but you can miss all other kinds of things, you see?

You do a Problems Intensive. All right. The auditor just doesn't get the word. He runs the thing on other-determined changes. He makes a long list of other-determined changes.

He says to the pc, "All right. Now, when did you decide to change?"

And the pc says, "Well, well the biggest change in my life was when I had a tonsillectomy."

And so the auditor puts it down, "tonsillectomy," you see.

"And when was another big change in your life?" The auditor Qs-and-As to this degree. And he finally has a list of engrams. He doesn't have a list of postulates to change at all, you see. So he's got a long list of engrams. So he goes ahead and assesses these things, you see. And, of course, if you've got just one engram in the list, it'll assess. And you'll come up with the engram, of course, and that isn't what you're trying to do at all. You're trying to get the prior confusion to the problem.

Well, then, of course, we – he says tonsillectomy is what assesses out. "Well, what was the problem connected with that?"

"Well, the problem was how to keep the doctor off me ruddy neck, that was 'ow." That was the problem. So that's fine. The auditor can put down, "How to keep the doctor off of his ruddy neck," you see, and he's all straight.

And he says, "What was the prior confusion to that?"

"Well, kicking the doctor in the shins and screaming." And, you know? You could get a lot of things. And he goes ahead, and he runs an engram. Of course, he's kind of surprised at the other end of this. It hasn't done much good for the pc. But he hasn't damaged the pc. He's even improved the pc slightly. In other words, it can be that sloppy a job of listing and metering. See, that could be sloppy, and you could still make it very nicely.

You get missed withholds of one kind or another. Well, you pick up the missed withhold that the pc thought was missed. You pick that up and you clean it up. And if you keep those things cleaned up, then you could even make a boo-boo like "Were you ever dissatisfied?" Let's think that's a Security Check question, you see? "Were you ever dissatisfied?" And the auditor tries to clear this, and "dissatisfied," and he can't quite clear it up, and "were you ever –", he decides to compartment. He's heard someplace you compartment questions, so he compartments "dis-" and "satisfied." And things keep reacting in some fashion, you see, and he fuddles around and falls on his head.

Asks the pc later if he's missed a withhold, "And well, you have missed a withhold. I was dissatisfied while you were doing that." And this might straighten it up, see. He's – he still will get away from it with his life. That's just very inexpert, but it isn't going to kill anybody.

Now, of course, in such a thing, "Were you ever dissatisfied?" – well, probably the reverse of the thing, and an auditor who really knew his business, would say, "Well, have you ever made anybody dissatisfied? Is that the way it is?"

"Well, yes," the girl says, "as a matter of fact, that's my specialty." [laughter] And we're right into the middle of the case with a crash, you see, and we pull a lot of stuff off by the yard and so on.

But the Class II Auditor skill, done by somebody who is in training for Class II or something like that, why – it could be done sloppily is what I'm telling you, see? It could be done sloppily beyond those ramifications. You'd still get away with it. Now, that isn't true of Class III. We have immediately crossed the Jordan. And you start getting one of these things wrong, you're just in endless trouble.

Now, we're – in handling 3D I've tried like mad to minimize the amount of difficulty that an auditor will have. And we have a pretty good job of it. Done a pretty good job of minimizing the amount of difficulty, minimizing the lack of consequence. I'll tell you, the amount of consequence to the pc – worked on that hard. And we have patterns of assessment here which arrive with something.

But I'll give you here, at first glance, some of the errors that you might immediately and directly run into in handling a 3D Criss Cross.

You get a test item, and the rudiments go out, and you don't check it thoroughly, and your test item comes up as the wrong item on the list. The odd manifestations will be mostly disinterest on the part of the pc. The pc really will be rather disinterested. He's not sure that this is – this is doing him any good or something like that.

Now, you assess an oppterm from this test item. You get a list, you see, and the list goes null. And you get the rudiments in, and the list goes null. And you get the rudiments in, and the list goes null. Well, you just went up the wrong bank. That's all. You just went up the wrong track. You see, whenever an item is wrongly assessed, you get slackening of interest on the pc. It's a sort of a cousin to a missed withhold, you see? And you get a slackening of interest on the pc. The pc won't be terribly interested in listing this next list, and it'll usually go null. And you're suddenly – you've lost a channel. It's just gone, you see?

Now, if you did this clear across the top after your – all these types of things by which you could get a test item – see, after you've done all of these things; supposing you did a care-less assessment all the way across the top? See, every test item, let us say, was done with a Pasadena-type assessment – supposing every one of them, see?

Well, the auditor down along the bottom line would suddenly wind up with no items, everything null, the pc very bored and a little bit upset. And the auditor would wind up with the conclusion that, well, it just didn't work. Or something didn't work and he wouldn't quite understand why. You see, it just all evaporates in smoke because of the inaccuracy of the thing.

In other words, inaccuracy on a 3D Criss Cross results in no attainment, see? Class II, you can make a mistake and you still get a little win or a gain. Class III, you make a mistake, you wind up with exactly no attainment and you're fortunate if you don't wind up with a negative attainment.

Now, let's say we had five wrong test items, and then we had this auditor with vast enthusiasm force items in along the line, you see – you know, demand that they go in. Or have them reacting because he suggested them to the pc or something like that, you see? And he winds up with some offball items that have nothing to do with the case. And now we run an oppterm from that. And all of a sudden the pc starts getting very dizzy or upset, or a somatic

starts keying in but won't relieve. Nothing passes through. Then supposing, as the auditor went on, assessing from a wrong item, forcing an – a wrong oppterm, then gets a new list and forces a wrong oppterm onto that list. You spin somebody in.

And if you were to take one of these in 3D, without the Criss Cross, if you were to take an improper and incorrect package, you'd beef up the whole Prehav Scale. Your pc walks around, he feels like he has a head like a pumpkin. He feels in terrible condition. The key-out on it is probable in ten days, but I've known that one that went on for three months. Improper assessment, improper run.

Well, that had more liability. In a Criss Cross, you're not going to run these things, so it cuts the liability down. See, you're not going to run them, so it's all right. And you won't wind up with a package unless you do it all wrong and backwards.

Now, an item will continue to react if it is invalidated or ARC broke. If the pc is invalidated on an item, it will continue to react. What you're reading on it is the ARC break, not the item. So all you have to do is a 3D Criss Cross with the rudiments out, forcing some incidents on the pc, running with ARC breaks, and you've had it. You'll get items continuing to react, and you can walk into a totally incorrect and totally erroneous 3D package. That could just be a dog's breakfast.

Now, if anybody started to run this totally incorrect and erroneous package, God knows what would happen. Because you're right into the middle of the whir, you're right in the middle of a hurricane. And this would just be *blow*.

If you run a lock valence with 3D, you're going to beef up the Prehav Scale. That's for sure. It has to be a main chance. It has to be right on the main games of the pc. If you run a subordinate valence to this which is simply locked up on it, if part of the package has in it just one of these locked valences, you're going to beef up the whole Prehav Scale. You won't know which end you're standing on.

And the odd part of the hidden error – the hidden error in it – is you can actually audit the terminal with a wrong oppterm, and the terminal will bring the Prehav Scale down to maybe eighteen or twenty levels, and the oppterm over here will be beefing up all the time, all the time, all the time. And because you're not running it on the Prehav Scale, you never find out about it. The pc just feels horrible.

Now, that the pc feels horrible is not an indicator that you're doing something wrong. You see how we lack an indicator? Because he feels horrible any time you run a 3D package, as you know very well. He's running out somatics and – God help us, what else? You see, it's a mess.

So the amount of duress that the pc is experiencing is not an indicator that you've done anything wrong. So an inexperienced and inept auditor, having heard that the pc goes through the knothole and everything, and seeing the pc run all upside down and backwards, will simply continue to audit an improper and incorrect package.

In other words, there's this wide difference between Class II and Class III. That Class III done wrong is catastrophic, and Class II skills can be offbeat – possibly even to the degree

of a missed withhold without killing anybody. And the pc will only be upset if you do miss a withhold or miss a rudiment.

Now, that doesn't mean you should do Class II carelessly. The thing you sacrifice and lose in Class II is case gain. And when you see a lot of people who are going through Class II skills, Twenty-Ten particularly, and they're not getting anyplace, well, just figure it's being done more or less wrong and upside down. There's some gross auditing error involved in this because even indifferent auditing can give you case gains, you see. Some gross auditing error is involved.

You have to know that in training auditors. Don't start grabbing at the moon and handing out extraordinary solutions in Class II skills. It's something like he holds the meter upside down, you see, and tries to read the sensitivity knob, you know. I mean, it's gross auditing errors. Very gross. Or has heard, has heard that a latent read is the thing which you read. And if it reacts instantly at once, why, then you ignore that, you see. And you only act after it's gone one minute and fifteen seconds after the thing. You could get some kind of craziness.

It'll be something so wild that you, in training Class II Auditors – as your Instructors right here could tell you – at first glance miss it. It's the easiest thing to miss in the world because you're making the supposition that there's a house there, you see, and it's just a bare lot.

It's something or other. So you're telling somebody how to arrange the furniture in the living room, and that's all dandy, but you find out belatedly that they don't know you were talking about that because they don't have a house or a lot, much less furniture. So they think it's all theoretical.

And when you try to tell them this ... You can watch it. You're training an auditor on Class II skills, and this guy – it's all sort of foggy, and he doesn't quite get it. And he's agreeable all right, you see. He's socially agreeable, yes. Well, that's right. He'll do that. If you get to be an expert – and you particularly, because you'll be training so many students, and you too – you'll get this, you can sort of feel the fog back of their eyes, you know. And right about that point get inquisitive. "Now, what did I say? And what are we trying to do? And just what *are* you doing? And which is the needle on the E-Meter?" You see? Sort of – things like this, you know. It's almost impossible to outguess them because it'll turn up to be something absolutely fantastic.

The guy has got a log crossways, you see? And you think you've got some toothpicks to arrange, and you've got these logs that are twelve feet through at the butt, you see. And he's just got them sideways. And you watch it because when they are foggy about Class II, they've got something awful wrong, real wrong.

So therefore, you don't want an auditor who would be groping around in Class II skills, doing a Class III. He hasn't got time to learn how to run an E-Meter while doing listings and assessments. See, that's not the time to learn anything about it. You teach the person all about this kind of thing in a zone and area where it is safe if he makes a mistake. Then all you've got to pick up is some missed withholds, you know. Keep the missed withholds picked up, then you're all right. You can go along very nicely.

So that's the area to teach them how to use meters and everything else, and those are the skills. Don't ever make the mistake of thinking you can teach somebody to assess by – just hand them a meter and they've read in a book – they read the title page of *E-Meter Essentials*, you see – because they're going to have their hands more full of hurricane than it will have happened for a long time. See, they can just cave somebody in, *crash*, you see. And you'll have a hell of a time bailing them out of it. You get the differences here?

Well, now, the basic differences of all these skills – and this is not a lecture about Class IIs so much. I'm just trying to show you what it takes to run a Class III 3D Criss Cross. 3D was much more difficult. The basic nature of these skills depend on two operations only. And this is true of all auditor skills – two operations only – is reading a reaction on something within the perimeter of reality of the pc. That is the basic skill by which you do a Security Check, a Problems Intensive, get a rudiment in, and all that sort of thing, you see?

Well, naturally, if you can't keep rudiments in, you can't do a Class III skill, that's all. So if a person hasn't got that fundamental, that fundamental skill – and the fundamental is that he has to be able to detect a needle reaction on a thought that is in the perimeter of reality of the pc. See, he's got to be able to detect that, and if he can't detect that, he's no auditor for Class II, you see. In other words, he's got to read that needle. He's got to know what that needle's talking about. He's got to make that meter talk, you see, on the pc.

All right. Now, that is a basic skill. Now, selection – now, you've got a shadow of this in your Problems Intensive at Class II. Selection of an item by assessment – this is another skill. Slightly different. And it's very fortunate you have a Problems Intensive in Class II skills because, you see, the guy won't get accustomed to doing that kind of thing, you know, before he has to collide with a list.

Now, the list requires absolute precision. Now, we'll stop talking about Class II and talk about Class III only. The precision of selection of an item depends on getting the pc to communicate with the auditor so that the pc is in good communication with the auditor. In other words, you've got to be able to get the rudiments in extremely well, and get the pc interested in listing this list for you, and not do it all on a little – well, toss it off.

Well, you say, "Who do I dislike? Well, you, me, the Instructors."

"All right. That's a list. Good."

No, I think, this type – this type of thing, you see, it requires a more suitable auditor presence, shall we say, you see. By the time he gets down to the list, he should know whether the rudiments are in or out.

Now, in addition to having the rudiments in, in Class III, you have to know this about rudiments. You're handling dynamite called the Goals Problem Mass. And this stuff is highly explosive. And the rudiments go out like scat.

You ever see one of these greyhound races, you know? Did you ever see the greyhounds take off after the rabbit, you know? You were sitting there in the grandstand, and it was a beautiful sunshiny day, and the parade was all lined up in front of you, and all of a sudden there go the rudiments, you know – *swoosh!* [laughter] You had no warning. There they went. You look up, and not a thing reacting. You don't know whether the pc did anything.

You don't know what he said, why he said it, what he did to himself, what you did. Nothing. They're gone. And they go out that queasily because you're dealing with microscopically small reads. You're dealing with tiny reads. And that you can just make up your mind to – that you have to be able to read a meter small.

It's very nice to find out that the fellow has just killed the cop on the corner and get a three-dial drop. And after the fellow was all accustomed to this type of E-Metering, all of a sudden he will collide with this other thing, and these meter reads can just be absolutely microscopic.

You have a list that is not very hot. You have a Goals Problem Mass which is totally pulled in and twisted on itself so that you've only got available lock valences. The amount of charge on the whole thing is in the order of one-millionth of a grasshopper power, you see. And you're walking into the mass on indicators of that size. And boy are they small.

Now, that isn't true that they are always small. Sometimes you get good, healthy reads. But don't expect that a Goals Problem Mass listing is going to give you the kind of reads that you are fond of getting in Security Checking because you're not. And frankly, no squirrel meter, no meter that has been made before the British Mark IV, is up to reading it. That is just – just that. That's it.

Now, these tiny reads at sensitivity 16 are assisted by square block magnifying glasses dropped over your E-Meter plate. You just drop them over the needle. You read the needles through them. And it'll help you. It'll help you. Sometimes – Reg gave me the other day a big crane-neck magnifying glass. That's a very nice one. That's very assistive.

But just get out of the notion of two things. One, that more powerful detectors of bank restimulation are going to be immediately available off the assembly line, because you're awful lucky that it can be detected at all. That's it. You're just lucky it can be detected. And get out of your mind the idea that you shouldn't bother with those little reads because, of course, you're – every time you're assessing a case, you start going in from test items and so on. Bum show.

Now, it is much easier for you to hold with the microscopic reads that you get on test items and so forth, than it is to do a Goals Assessment.

Now, here was 3D. Well, here was Routine 3, Routine 3A – Routine 3D original – a type of assessment. Fifty to seventy-five hours with absolutely no gain and often no goal. You just sat there and sweated it out for that many hours, winding up at the end product of no gain and no goal. And if you did all this kind of on an ARC breaky basis of some kind, what did you finish with? You finished with an unhappy pc and a waste of fifty to seventy-five hours. And I frankly don't think that you like to waste fifty to seventy-five hours.

But if you did find the goal, then you could expect fairly healthy reads. These reads were pretty good, ordinarily – Routine 3 reads. Because you were stabbing into the middle of the bank. But you might have wound up with no goal at all.

If the person had ever lost his goals list or somebody had thrown it away or something like that had happened, what have you got left? You've had it, because he very often now has his goal buried, and he doesn't come up with the thing again. These things are serious, you

see. This means that every preclear who gets any auditing is at the total mercy of somebody else's administration. And a case shouldn't be that much at the mercy of administration. That's a fault or a flaw that was in 3 and 3A and, frankly, original 3D. They all came to the same thing, you see.

Now, you're going to do something else. You could always take a case, get the rudiments in, find a test item, and proceed from there, and walk on into the Goals Problem Mass. Now, that is what's designed here. And all the time you're going, and everything you're finding – providing you're listing and your – your auditing is smooth, your listing is complete, and your nulling is absolutely accurate; given those things – you are going to wind up with a case gain every session. You just will not miss. You'll have a case gain every session.

It will be almost unbelievable to you when you get this thing rolling. Right now, even you who have been doing it, you're sweating it out to some degree with the mechanics of this thing, you see. It looks pretty complicated, and you're trying to put it together and so on. You haven't had time to look up at your pc. You haven't actually looked your pc in the eye and seen where that pc was going. But you yourself in being audited on some of this, even though you might have only had two or three sessions on it and so on, you know something's happening. Something's happening.

Well, something happens to the degree that the auditing skill is excellent. The amount of gain is almost directly monitored by the excellence of the auditing. In other words, you can find 3D Criss Cross items. We're talking now only about 3D Criss Cross. You can find 3D Criss Cross items one after the other rather heartlessly and stupidly and out of communicationally – you can find the same items, without getting the same case gain. Isn't that interesting?

Now we're up against a factor that I first faced in 1949: The fact that a pc knew he could talk to me and was perfectly free to talk to me and therefore could blow things, being in a high morale state, which, if he didn't feel free to talk to the auditor and was all inhibited, didn't blow. You see, it's the difference between blowing the valence and not blowing the valence.

Confidence in the auditor, a feeling of power or freedom on the part of the preclear, gives you a gradient, and the totally mechanical auditor will get case gains and will carry a case through, see. He will get case gains. He can't help this, you see. The auditor who inspires the pc's confidence, and to whom the pc can talk easily, and when they're being audited, they feel beefy and hefty, you know, they feel that's fine. They'll get right on through. They're being helped and so on. Man, that guy will get case gains the like of which you've never seen with this thing. Because they just blow these valences, and they just blow them clean, *pooom*.

Now, let me orient you with regard to this. You think you are looking, possibly, for *one* item, and you think the magic of all this is predicated on the discovery of one item. That is not the case at all. The end product is the discovery of one item in any listing and assessment. But *every item* the pc gives you for that list with very few exceptions is a lock valence on the Goals Problem Mass. And every item that he gives you has added to the Goals Problem Mass. He gives you fifteen items for a list. Thirty – that's more usual. Gives you thirty

items. You go over and differentiate it with him, you're left with twenty-one items. He decides it's that other.

But remember those original thirty items. See, he gave you thirty. Now, you go over the list with him carefully, and he decides there are only twenty-one. He asks you to strike out nine of them. What happened? Why did he ask you to strike out nine? Well, when he first told them to you, he knew those were in opposition to the terminal, but all of a sudden, just a few minutes later, he's telling you to strike them out. Well, what occurred? He blew them.

You understand that every one of those that he blew is a whole package of aberration? All by its little, old, homely lonesome? It's got enough admiration to keep a psychoanalyst or a psychiatrist baffled for the next umptydozen trillennia. Any one of them. You just look over one of these lists sometimes.

I haven't got a sample list here, but let's say this – we're getting oppters to a – to a railroad engineer. Getting oppters to a railroad engineer. We have a stationmaster. And that's one of the items on the list. We have a ticket seller. We have a passenger. We have a roundhouse foreman, see. We've got this, that, the other thing, and he's going down the list. Well, you've got the list written now. Now you're going to go over the list with the pc. And here you say at the first thing, "All right. Now, just how would a" – any wording you wished to use – "How would a stationmaster oppose a railroad engineer?"

"Well, so-and-so. You know, he'd make the trains go before they were supposed to go or after they were supposed to go, and might make a mistake one way or the other and crash in the terminal. Actually, he wouldn't oppose a – wouldn't oppose a railroad engineer at all. Ah, you can strike that one out. All right."

What happened? Do you realize there was a whole little, in-vignette game. See? There was a whole game involved here. There was – he'd been playing this game as a little side game. You know, like – like you place side bets at a crap game, you know. You're not shooting crap, but you're over in the corner someplace basing side bets on how many players will stay in the game or something of the sort. You know, one of these little games that had nothing to do with the main chance. And shooting dice, you know, and "Stationmaster? Railroad engineer?" Boy, you got – every time he'd get anywhere near this kind of an attitude, he knew there was a big game going on there and so on. He's just blown it. That easy.

But you don't pay any attention to that if you don't know the workings of this sort of thing. You say, "Well, he's – there, we got that one out of the road, and we get another one, and we get that one out of the road. Let's see, what is the real item here? What *is* the real item here?" If you're asking that all the time, they're all real items. Every single one of them is a real item. But of course, as they blow off, they get less and less important and have less and less influence, because they're just lock valences.

But before you found them and listed them, before you discovered them, they weren't just lock valences. They were totally capable of being dramatized a hundred percent. Until they were recognized, differentiated, separated and nulled out, any one of them was a marvelous opportunity to go round the bend. And yet you could blow them off like that. Why? Because you're peeling off toward the Goals Problem Mass. And you're usually left with one item that won't blow. That's because you're in toward the Goals Problem Mass.

He actually gives you something that might look to you like a grapefruit with innumerable warts, or an apple in a bag of raisins – only that's not quite as good as a grapefruit with warts. The way it looked to the pc is any one of the warts were bigger than the grapefruit, until you've audited them, and then all of a sudden they get down to wart size. And the next thing you have a perfect grapefruit, which is the final item.

Now, if you assess very, very well, when you do a list of items from a test item – when you do a list – differentiate the list, null the list, and check it out (which is, of course, just more differentiation), you take the final kick off of any one of them; the pc is just left with a very fascinating conviction that that is the item. He knows that's the item. And he maybe is taken aback by it, but he knows that item belongs on the main chance.

Well, do you know what held that item into the 3D mass? All the lock valences that you blew. And it was only charged up because of an earlier, different item, which is even more pertinent to the 3D Goals Problem Mass, even more pertinent. So you wind up with this thing, and you got a "ticket seller," or something stupid like this.

All right. And we've got – that was the item that was – wound up. Well, that item is stuck. Now, what you've done is taken the warts off of this grapefruit, but this grapefruit is stuck on a pumpkin. And by the time you've taken all the warts off the pumpkin, what do you know? This grapefruit loosens up and is no longer associated too closely with the pumpkin. Might require some auditing, and it might require something else but is no longer as charged.

When you first find the item... You will miss this now that we're not listing on the meter, so I better call it to your attention. When you first find the hot item on a channel that's going straight in toward the Goals Problem Mass, you get consistently about a dial drop on your meter. Because you're so busy writing, you seldom notice this fact. You see, you're busy auditing, busy with the pc. But it goes *BOOM!* It's very easy to assess one of these 3D Criss Cross packages if you were just doing that. If you're just looking for items, this is the way you'd do it.

You'd just list it, and at the end of the list have noted how deep each one reacted, and it will be unmistakable.

There'd be one fall a dial or two dials or three-dial drop. And there'd be another one fall half-a-dial drop. And that would be out of the running, you wouldn't pay that much attention to it, and you'd just take that three-dial drop, and you'd say that's it, and you'd be right. Wouldn't do the pc any good.

When you first listed that thing, you got a heavy drop. The key 3D Goals Problem Mass item that you're really looking for reacted very heavily the first time the pc said it and you wrote it down. There was *charge* on it.

And you will notice that the next time you see it and go over it, it's still more charged and still falls more than the remaining items. And it gradually peters down and the charge goes off the remaining items so that they all become null, and this one that was so heavily charged at the beginning is now dropping "tick." No longer a charged item.

Well, in view of the fact that you're blowing without the meter when you list, you miss this point. If you want to check it sometime, list on the meter. Keep the pc thoroughly on the

meter as you're listing, and watch it each time he mentions the item. See, he mentions the item for the first time. Don't be looking at your paper and ballpoint, see. Keep your eye on that meter and say, "Is there another one?" And keep your eye on the meter. And he gives you that. Notice it's a degree of reaction.

Well, that's charge, and that charge is coming off the case forever. That charge is disappearing off the case! And when you've finally got this item, it is not seriously charged. In other words, he'd have a hard time dramatizing it. Just finding an item removes it from the perimeter of immediate dramatization. He won't dramatize it anymore, providing it's assessed in the fashion you are now assessing. It has to be assessed that way.

Now, if you assessed another way – as we were doing a few months ago; if he were assessed another way – and you just took it, and you found the one with the high – with the steepest drop and you said that was it and you audited it, it would be your auditing that would be discharging it, and it would be hard to discharge because it had so many lock valences which were holding it in place. In other words, the lock valences were keeping it charged up.

In other words, this is a series of batteries if you want to call it that. And you know very well that if you start taking batteries off of a pile of batteries, you start reducing current. And these things, as you take off these lock valences one right after the other, you see, you've got less and less voltage. And eventually the thing hasn't got enough voltage to push a baby carriage. See, there's nothing there.

Up to this time, any one of those valences were sufficiently charged to run the pc all over the universe. He became a railroad engineer. The moment he became a railroad engineer, he went into a wild, manic enthusiasm and then came down with cancer. Fate, see.

All right. After you've properly listed and assessed all the oppterm to railroad engineer and all the items before it that led to railroad engineer and so forth, you talk about railroad engineer, he said, "Yeah, yeah, railroad engineering. And that's real interesting. That's real interesting It gives me a little somatic in the jaw, that's all. But that's real interesting, railroad engineering is. You just sit there, your arm out of the cab, you know, and you whiz along one way or the other, and so on, it's ... This stuff they're running on this planet though isn't so hot. We had much better locomotives in ... " so on. He gives you some stuff like this. He's quite interested in it. You can get him to discuss it. But the funny part of it is he has some idea that he might be able to go down and climb in the cab of a train and drive it. Drive that engine, see?

Well, you know he's never been able to think of doing that before? He'd think of that with horror. When he was a little child, maybe a time or two he thought, "Well, gee, it'd be kind of nice to ride in a cab or to touch the throttle. Yeah, it would be very nice to do that," a little kid. And of course, the thing charged up, and he's never been able to think of it since, you see. That's just a shutoff. Total.

And one day he's walked down the depot. He can't stand riding on trains. He'll give this terrific dissertation on trains and how bad it is, transport on trains and all of this. This was before he was audited, you see. Trains? Oh, he can't stand trains. "You mean you ride train travel? I always fly myself. I ah – " so on and so on. "I – well – a train... cinders, you know,

dust, and so forth. Actually, I have a sinus condition. And I get around the dust, I can't take very much of that," and so forth.

But this goes further than that. You can never even get this fellow to meet you at the depot. And as he's gone back over the line, the thought of somebody having a job on a railroad has made him feel absolutely, fabulously ill.

This is where you get most of your socialists, by the way. They have these Goals Problem Masses and the idea of work puts them into a total belief, you see, that nobody can work. That is the thing that you can't do. And "the poor worker," you see. And it's all based on the fact they can't work. It's quite interesting.

It's very funny, your own attitude toward – toward some of these skills and work at large, and so forth, when you've blown some of this charge.

Anyway, you went down the line, and you null this thing. All right. He doesn't have to go down and climb aboard a train to prove it to himself. He doesn't have any compulsion to do it. He doesn't have any compulsion not to do it. He doesn't necessarily get terribly interested in trains. He doesn't necessarily totally abandon trains. He doesn't have to do anything about trains. But if somebody suddenly said, "Drive this engine down to the roundhouse and get it turned around," he'd sure give it a whirl, and he wouldn't come down with cancer and sinusitis either, see?

In other words, he can *be* this thing again because it's discharged. And watching the charge come off on the meter is something that you should pay some attention to just to get a reality on what happens. It's quite fabulous. But you'd have to watch it while you were listing because just the fact of listing is getting rid of about 75 percent of your charge.

The biggest amount of charge comes off on the original listing. Then the next biggest surge comes off on differentiation, going over the list with the pc. And then knocking it out the rest of the way is very easy.

Now, pcs have lists that stay in almost forever. Some pcs have lists that just seem to stay in forever. You just can't knock them out. Got a missing item on it; you haven't bled it down; key item isn't on the list. And if the key item is not on the list, you wind up with a non-discharge of many of the items on the list because, of course, these items you're trying to null are dependent for their charge on the charge of the main item. And if the main item isn't charged up, they can't be charged up. But if they remain all charged up and you just can't scrub them out, see... Your rudiments are in and you just – you say, "Waterbuck, waterbuck, waterbuck. Thank you. Tiger, tiger, tiger. Thank you. Huh, *ohohoom*. Waterbuck, waterbuck, waterbuck. Thank you." In.

"Tiger, tiger, tiger." In.

"Waterbuck, waterbuck, waterbuck." In.

"Tiger, tiger, tiger ..." you know. What the hell is happening here?

Well, what's happening here is you got – you got the thing missing.

Now, the funny part – thing about lines, which we'll take up in more detail in just a moment. The weird thing about lines is this, is you can sometimes get an item on one line

which is holding the other line up. See. You can have a half a dozen items still alive and they won't rub out on one line because the exact terminal, differently worded, has already been assessed out on another line. And you've got line C. You've got line C with "a roundhouse keeper." And line B has in it "railroad tender," "water tender," and "track roundabout man." And you got them on two different lines. And you just can't scrub them out. That is why you do an item on line A, an item on line B, an item on line C and an item on line D without any oppterming, until you've got all the lines filled.

Then do your oppterming. And you go across. Now, you finally broke it down and just bludgeoned it out so that you were left with a water tender, see, on that line. And then you went over and your next line to it was a roundhouse keeper, if you were so knuckleheaded you didn't combine these two. And of course, it just went *pfooot*. It's heavily charged. See, you assessed down to it, bang! You get it. Now the next time you go through C, you know, on your way to D, you see, you're oppterming from each line in column – the remaining charge blows off everything. This final item that you're – you oppterm to, oppterm very easily and it all evaporates up in smoke and you come out with some different item.

In other words, you're charging one against the other, you see? And where they start to nearly coincide – you have line B and line C, and line B has an item on it that belongs in the mess on line C. Very easy for a pc to do. This is the paean to confusion, the song of utter spin, when you're doing these things as far as the pc is concerned. "Nothing – nothing makes sense because it all makes sense. Yes, it's all very reasonable, but there isn't anything about it at all. Yes, I am very confused. I see it all now. It's very clear except it's so confused," you see?

So they very easily list the wrong things on the wrong lines, and they crisscross them up one way or the other. And if you don't take these lines – A, an item for A line, and an item for B line, and an item for C line, and an item for D line, and an item for A line, and an item for B line, and an item for C line, and an item for D line, you see – you're going to get funny hang-ups.

In other words, you're blowing consecutively on different approaches into the Goals Problem Mass. That's all that's happening here. And the discharge of major items brings about the easy discharge of minor items. You see how this goes?

Frankly, what you're doing – if you want to say you're looking for something, fine. I'm very glad you're looking for something. You will wind up eventually with a 3D package that can't be argued with. It just *is it*. The pc knows it, you know it, everybody knows it. You know which the oppterm is and which the terminal is. You go ahead and find the goal to it and the modifier and the rest of it, and you put together that package. But there's no question in anybody's mind by the time you get to the package. And of course, the bank is tremendously discharged by this time, and the package will run rather easily. What you're really doing is in approaching it, you are discharging it.

And it – what it gives you is gradient discharge of the Goals Problem Mass by assessment – if you want to be very, very technical sounding – gradient discharge of the Goals Problem Mass by assessment, see? And this thing can't keep its charge. It can't charge itself up again, that's all. There isn't anything to charge it up, unless you get a bunch of wrong items and try to run them, and then the charge of the item is increased. See, you get the wrong item,

so therefore you get the phenomenon of the whole Prehav Scale livening up. You get an improper item, you get a lock item, the charge will bleed over from the real item into the lock item, but it isn't releasing, and the pc's attention is forcefully held on this wrong item when actually his attention should be on the right item, you see. And you – withdrawal of his attention on the thing brings all of the charge over in this thing but doesn't as-is anything. Nothing you're running applies to what you're running, don't you see, and he's left in a terrible confusion.

Similarly, on a misassessment, when you misassess, your pc gets very restive and very disinterested and very upset. He's liable to be very queasy about the whole thing because you're not bleeding charge. You're going over items which are not properly discharging. All the stuff on the line is somewhat charged up. And that's because you're proceeding from an improper item. The item was never proved out, it isn't on the main line, it's just a lock item of some kind or another, and you're proceeding from there.

And the pc goes over the phenomena of ARC break, upset, beefed up bank, increased dramatization, terrific dizziness and so forth may ensue, or fantastic somatics that don't do anything, and nothing moves. It all – everything sort of hangs up in the thing. And he feels very confused, and he feels very distraught, and he doesn't know whether he's mad at you or what. You're doing an improper lineup of some kind or another. You've departed from the wrong side of the wrong whatnot.

But all of these wrongnesses are totally occasioned by improper technical assessment. Every wrongness is occasioned by not assessing right. Just according to the rules. And the rules of assessment are very simple. You list, you differentiate, you null them out by repetitive reads, you check it out to get off any remaining charge on any remaining items, and you've got it. And that is the right way to assess now for 3D Criss Cross because it produces such a tremendous amount of charge blow.

You do those things correctly and come up with a correct item, and there it is, and you know it is it, and there's no worry about it. That's it. That's good. That's fine.

Now you proceed to oppterm that item. In other words, list what would oppose that item, and you go on from what would oppose that item and get another list. List it all. Differentiate it. Null it with repetitive reads. And then check it out against all the items on the list so that they – any remaining charge disappears, *bang!* You know, very proper assessment.

Now you can oppterm from that one, and the pc will just be climbing a steep staircase. He'll be going up, up, up. He'll be feeling better and better. And everything's fine, fine. Everything's blowing, and everything's beautiful, and you'll go right along swell.

All right. Oppose this, too, list it on an ARC broke pc that doesn't give you much – he doesn't give you many; he doesn't give you anywhere near the list. And then you null it out, and then it all goes null, except one item in it, railroad engineer, is terribly ARC broke because when he said rail – railroad engineer, you went "Ha-ha-ha-ha-ha, ha-ha," you know. "Do you really want that one down?"

So of course, that's the one that remains in. As you read down the list, of course, it knocks every time you say it because you're reading an ARC break. You're not reading the item, you see.

And you wind up with railroad engineer. Now you cross-list to oppterm to railroad engineer. You're over in left field someplace climbing the fence. You're leaving the ballpark. You haven't anything to do with auditing. No telling what you're doing, and the pc will sort of be upset and irritated and won't think anything's working, and so forth. You get the difference here?

Now, you could make the pc worse with wrong assessment and bad assessment. Just make up your mind to it. You can make him worse. Any reason for me to hold your hand and say go ahead and be brave and audit him because nothing bad will happen to the pc. I'd be a liar if I told you that. You can practically spin them in with bad Routine 3 assessment, see.

Well done, it just shoots the moon. Wham! You'll never see such results in your life. Chronic somatics, things they're worried about – they'll have a new package of somatics every session. They'll have a new bunch of things that they're all concerned about.

Fellow comes in with a callous that has suddenly appeared on his thumb during his sleep. He went to bed, he didn't have a callous on his thumb. He wakes up, he's got a callous on the thumb. You assess him out. The terminal, "archer." Callous disappears. Really fantastic thing, you know.

You're assessing something down the line – you're assessing what really is oppterm. We're using this word oppterm carelessly. The line of stuff that would become the oppterm in the final 3D package makes the pc dizzy and gives him sensations. Sensations of various kinds – dizziness, wogness, and so forth. And when you're assessing terms that would eventually become terminals on the goals 3D package, the final thing, he gets pains. He hurts. He feels like somebody's shoving pins in him and chopping off his head with an ax, and cold masses turn in when you're running the terminal line and almost never turn in on the oppterm line. So he gets cold, and it's cold, and then he says to me, "Why don't you turn some heat on at Saint Hill?" and so forth. I cooperate *if* the furnace is out, you see. I'll cooperate like mad, but very often these chills and so forth ...

People are in these things permanently, by the way, walking around in the streets and in life and so forth. They'll be right in the middle of one of these 3D valence cold packages. And they'll be just ice-cold all the time. They feel cold to the touch. Their fingers and hands and arms feel cold, and so forth. Sometimes on an assessment like this, running some Havingness as you go and that sort of a thing, all of a sudden it goes *whooooosh* and that's the end of the cold package. And they're overheated now in the rooms where they've always frozen to death in. Very, very tremendous difference of temperature takes place on these things.

Anyway, in listing and assessing and nulling, anytime the pc gets a sensation, write "SEN" after the item, and anytime the pc gets a pain, write "SOM," somatic.

Now, somatic technically covers both pains and sensations, and so forth, and makes a little bit of a twisteroo on the line, and probably much more accurately to just say "pain."

Maybe we ought to change it right there and keep you from getting messed up, and keep from calling me a liar of years ago. Write pain – "PN." A SEN and a PN.

All right. And then when you look down your goals lines and so forth, and you know what to look for, you will find that what you finally find in the package – when you finally get the package assembled, you'll be able to trace it back through all the lists. And it's the one that hurt. And the oppterm is always the character of thing that gave him the dizziness and the sensation. In other words, you've already run your proofs out. You've already proved your items out long before you're going to run them. You know what they are.

It also is very amusing to know which side of the bridge this pc is on. It's very, very amusing. The pc comes up with something like a ..."space pilot," you see. Nothing to do with the pc. Wouldn't know anything about that. Only trouble is when it came up, why, there were these shooting pains of meteorites going through his head, you see. "*Errra!* There was another one. *Rrr*, there was another one, and there was another one," and so forth. And every time you read this thing to null it down, you see, "Oooh, there was another one," you know.

He says, "Well, it's not me because they're very immoral people, those fellows. I've never been one, you know. But a control tower operator, yeah. A control tower operator – that... I've always been sending those fellows out, yes, as a control tower operator." We know more about it than the pc, see. That's an oppterm. Winds of space blowing his head off, you know. Dizzy sensation and so on.

Now, I haven't quite made up my mind whether grief or other emotional responses could be classified as a pain or a sensation. To my way of thinking, all – I know this about all emotions – they are secondaries and have their root in an engram. And unless there's pain in the engram, you don't get the secondary response. In other words, you don't get grief unless the person has been hurt on the same subject. There's always the engram precedes the tears, in other words. The fear is always underlaid by pain. Now whether this has anything whatsoever to do or an indicator on the Goals Problem Mass, at this time I can't tell you.

All right. Now, let's go a little bit further on this, and let's give you a very graphic picture of exactly what you do in order to assess out a Goals Problem Mass.

Line A probably should be "disliked."

Line B, "liked."

Line C, "Who or what would you treat that way?" I'll give you this trick in a minute.

Line D, "Dynamic Assessment."

Line E – if you wanted to make one and you may find it necessary – "Withhold item search." I'll go into that in a minute, too.

Now, these lines actually form a list. And if you wanted to make a list of items for the pc, the very best way to make that list so that it's very graphic and everybody understands it in the code, take and put these line A, B, C, D, E at the top of the – of one sheet of paper, or on both sides of one sheet of paper with lines A, B, C on one side, and C, D or E on the other side, you see. And make a zigzag going down from the A, you see – a zigzag forty-five degrees off the vertical, and then zigzag back the other way ninety degrees, you see, so it's still

forty-five degrees off the vertical the other way, and zigzag back, back, back, back, back, back.

In other words, to the right, to the left, to the right, to the left, to the right, to the left, a zigzag, you know, like chain lightning going down the page.

That gives you a graphic picture of from which, and from what, the line proceeded. You see, now you know from what the line proceeded. And every time you get an opposition, see, you – thereafter you never get anything but oppositions to these things, you see.

When you go down to the next zig – down to the first zig, you might say – you've got the opposition to what was at the top, see. And then you go down to the next zag, you've got the opposition to the one that was at zig. And now the next zig, of course you've got the opposition to the last zag, you see.

So you've got your zigzag, and you just write a series of terminals down that line. Now, those are all found items. Those are found, checked out, proved out, they are items. Every one of them. You write nothing on that graph, if you want to keep your plot for the pc, you write nothing on that graph but found, proven items.

Now, of course, you have to start these with test items. So the first line only would be possibly not part of the 3D package. They would possibly be locks of some kind or another. They're indicator items. We call those test items. All the rest are called 3D items by proper terminology. A test item is something that we – we're just using in order to kick off from. But if you get anything to stay in on a list and check out, I can assure you it's part of the Goals Problem Mass, not a lock. It is right on the main line.

So you're liable to get an idea, because there are so many of these things, that you're actually just getting test valences going here or something. And it's not true. Any one of those levels, as you could add it up, could be called a 3D package and run, except the test level.

You'll find oddities, however. You'll find somebody will give you several terminal items and then only one oppterm item on your first lineups. So you can't take them at any one level and say that these things directly and immediately oppose each other. You'd have to ask the pc which one opposes which in order to make up a 3D package, you see. And then you'd have to run some kind of a check, and if you'd noticed the sensation and the pain indicators, as you listed some items, you would then know which was a terminal and which was an oppterminal.

You could go ahead and find the goal, you could find the modifier, you could find the opposition goal, you could make up the whole 3D package at any one of those levels, and it would run. It would run – run perfectly well using the auditing commands of the 26th of December 1961.

But there are faster ways to bleed these things than running them. As long as assessment can be made to carry forward with reliable packages, you're really finding package after package after package trying to walk in toward *the* package which won't blow unless it is run.

Now, it is characteristic and peculiar of auditing that you never audit unless you can't get it to blow. In other words, two-way comm. You ask the pc, the pc says, "I have a present

time problem." You ask the pc, say, "What is the problem? Who's involved with it?" and so forth. "Now, do you have a present time problem?" That's always your first action. The thing doesn't knock all of a sudden. Fell off the pin a moment ago, and now it doesn't do a thing. You discharged it, so of course you don't audit it.

You only audit things you can't make to blow by inspection. So therefore, obviously, the first goal of auditing is blow by inspection. You're trying to cause an as-isness by inspection only.

Now, you're bleeding – if you can bleed charge that way off of a case, you, of course, would. Oddly enough, you could sit down with a Prehav Scale and ask the pc every consideration he had on every level of the Prehav Scale. Just take it up and discuss it with him. You know, take level after level of the Prehav Scale, and it'd just – two-way comm it with the pc, see. And you would wind up with a gain. Of one kind or another, you would wind up with a gain whether you liked it or not.

It's not auditing, is it? You sit down and you read this Prehav Scale off to the pc and it starts in at the top, and you say, "*Buh*," and then, "What do you think of that?" and so forth. You had him on a meter at that time, you'd see the meter go – occasionally the meter would go *whooooowh*, and go over, you know, and then it'd be down. And as he talked about it, just charge disappears. In other words, you, it's – that's by inspection.

So if you can bleed a Goals Problem Mass by inspection, God 'elp us, let's sure do so, please. Wouldn't that be a smart thing to do? Well, so let's go as far as we can possibly go by inspection before we have to audit it. And if we do it very slippily, we'll find out in some cases that we will – depending, by the way, on the skill of the auditor and on the state of the case, of course, and the accidental combination of how the 3D mass is twisted and some other things – on some cases I think you will find that you just get a blow by inspection of the whole 3D mass. You just walk through to the other end of the thing and all of a sudden this guy is flying. He looks over at the table, and it levitates, you know? Or he unthankingly reaches over and hands you your E-Meter at the beginning of session, but he didn't use his body, you know – this type of action.

But this is then auditing and don't get it tangled up that it's not auditing. Otherwise, you won't care to spend time on it to bleed charge, and you will go at it with the impatience of "Well, we got to find the item, see. We got to find the item." And then, therefore, you'll find yourself with this anxiety – occasionally just bludgeoning the list, bludgeoning the list, you know. And trying to knock the charge off of the list just to find an item, you see?

It doesn't seem important to you to get the charge off. Well, if the list is discharging very, very poorly, and it's just all hung in, and it's all hung in, and it's all hung in, well, let's bleed the meter. See, let's be smart about this. Recognize where this comes from.

"Are there any more things that would oppose a railroad engineer?"

"Well, I've thought of several, but I didn't bother to tell you because it seemed so obvious. The president of the company. Well, that always seemed obvious to me." You've got the item now. But sometimes the person doesn't even see what the item would be until you've got the thing about half nulled, see?

So don't be of the opinion that if you just find the item, it's all right. Then you can chalk it up and Ron will be happy with you, and everything is fine, you see. No, you want the item discharged.

And if a list isn't discharging, there's something wrong here. See, you haven't got all of it or something is wrong. So you're actually auditing. It looks like assessing. It looks like a search for needles in haystacks and all that sort of thing. Funny part of it is if you're doing it right, doing it expertly, and got the pc's rudiments in the whole way, why, glory, glory, glory. We're all set because the pc is – man, he's making gains the like of which you will never see him make in any other way. And you're walking upstairs to what this character really is.

Now, the actual Goals Problem Mass will start unburdening, and the terminal he is really in, in, in – and before we would have audited to it, now we will assess to it – is actually unburdening because we're taking locks off of it all the time. We're blowing charge. And you will find that when this thing finally shows up, and you've got it, that he will become more "it" for a little while, and then he'll become less "it," and then he'll be able to operate in the field of "it" and he will feel much better about the whole thing.

But this is auditing by unburdening. This is one of the oldest systems there is – auditing by unburdening. I think there's about – I don't know, I don't remember exactly when that was taken up. I think 53, 54. I think – I don't know. I think it was mentioned, I think it was mentioned in the *Creation of Human Ability*, isn't it? Isn't unburdening mentioned in the *Creation of Human Ability*? Well, anyway, it doesn't matter particularly. But this is an old auditing skill, but we didn't drive it very hard because we didn't quite know exactly which direction it went. But this is how you unburden.

So you write up at the top of the sheet here, line A, line B, line C, line D, line E, and you get your thing. Now, your first item is "What kind of person or being have you liked?" I think I said the first one was "dislike," didn't I? That's best, by the way, because you get a reversal, see.

All right. "What kind of being have you disliked?" All right. Now, we go ahead and make a long list of this thing, and we go right ahead and operate with that list. Now, the pc may slip you a few that they liked. Occasionally, they will do this. That's kind of unfortunate, and that's sort of unneat, but put them over on another list. Put them on another sheet of paper because you're going to take up "like" next anyway, see.

Now, a pc would audit longer, and you'd get more list if you got a liked item and a dislike item and a liked item and a dislike item, and a liked item and a dislike item, and you'd get the two lists completely complete. So there might develop two schools of thought about this. Maybe you ought to do the two lists first, all at once, before you assessed anything. And it might save you trouble. I personally wouldn't bother to. You see, I'm just saying there's two schools of thought about this. That one apparently violates the line a little bit.

Because they're opposites, he's going to run a two-way flow. And you're going to free something up with this. And he's all of a sudden going to remember things and all that sort of thing.

Well, you want a 3D item on that list. That's all you want. And that's all you're demanding of that list. You're not demanding that he run the whole track with that first assessment list, and so on. So actually it would work if you just got disliked items, and then went through your usual regular routine on this, which has now been very standardized, which is to say you list. You ask him if he's got any more coming – this is all without a meter, by the way – you and – you list them all. And then you go over the list with the pc and ask him how each one would oppose and if he cares to keep it in or leave it out or what he wants to do with it. You see, it's his session and his list, and you simply consult him about this. And he'll strike a few of them out and he'll add a few in at the end of the thing, and he'll expand the thing one way or the other. And finally the list is in some kind of shape.

Now, ordinarily you would differentiate the list with just one read down the list. You could, of course, do a second differentiation down the list if you wanted to. And eventually, if you kept assessing the list in that particular fashion and got him to explain "how each one," he would eventually turn up with and give you the final item. But it would take quite a while to do so. This is a longer, longer type of action.

But if a pc's items were nulling poorly and the pc seemed very withholdy on items, and a bunch of things of that sort, I would then bleed the list with a meter. I'd go ahead and bleed the list with a meter. I'd then pick up my meter after I'd made the listing, put the pc on the meter directly and bleed the meter if there were any more, and "What was that?" And then make sure that I wasn't getting ARC breaks. And I'd stretch this list as far as I could stretch it every time, you see. And then go back over and differentiate and get them knocked off and get them squared around.

Of course, your next one is the nulling, and that is your bark, bark, bark, leave it in, take it out, you know. And just ordinary, routine, very sharp, very rapid nulling, and the pc will sit there, and he'll watch them go in and out, and what they are, and which way they're going, and he'll be very happy with all this. And you finally wind up with *an* item. And there's only one item in, and then you check that item out very carefully. Well, you check that item out against the remaining list.

In other words, you say the item, say other parts of the list, say the item, say the other parts of the list, say ... You know. He'd say the item and other parts of the list. You'll find out some of them have come live, and then they go dead again. That's because when you found the item and identified it, the pc has all of a sudden concentrated his attention on it very heavily, and as you're checking it against the other items they then discharge out, and his mind resolves and settles down on that item. Of course, his mind was on it all the time anyhow which is what the trick is.

All right. You wind up with that item, and you've got an item and you enter it at the next zig or zag on that particular line. Now, when you come back to that, you're now going to go on to the next line, you see? You're now going to go on to the "like" list, you see?

That's going to sit there. The best way to handle this is just let the test item sit there rather than oppterm the test item the way it says in the first mimeo. Ah, it's more profitable. I've checked it out a bit. Not very thoroughly, but it's more profitable. Just to leave the test item there and get another test item for the next list.

And you're going to do B. And then you're going to do your C, D, E – all done the same way. You've – that is to say, you're going to make a list, and so forth. No matter how you get that list. And then you're going to write the item down on the next zig or the zag. Then you're going to come back to A.

Now, these items are never crossed over. That is to say, because you found one in A, you don't now enter it in B and so on and so on. That – it's not that type of arithmetic. These lines are all independent. They are totally independent until they collide, and you can do anything but let them collide. You try to keep them from colliding, by the way, by inventing new types of lists and lines to keep the pc flying, you see? Don't let these things collide and lose a line if you can possibly help it. But if you do lose a line, then figure out a new way to get a test item, get a new line going Got the idea? Try to keep a minimum of four lines. Absolute minimum. I would much rather audit with five or more lines.

So you just keep these lines going, and once you have found the test item of A, then you want to know a list, "Who or what would oppose that item?" Then of course, you do your list, that is write your list down, differentiate the list with the pc, null it down, bark, bark, bark on the meter, get your final item, prove it, then prove it out by checkout, and so forth. That's your next item. You put that down at the next zig or zag on the A list, you see.

Now, after you've done the other lines, you come back to that again. When you pick that one up again, now you go and you say, "Who or what would oppose a (whatever that item was on the A list – A line)?" And you make a list, and you differentiate it, and you null it, and you check it out, and then you write that down on your A line, you see, and then you go to B. Same way each time. Actually, it's a repetitive package and is a very neat piece of geometry or action that you're moving in toward.

Now, this much order is moving in toward, God knows how much confusion, see. It's fantastic confusion that you're walking into, so keep your order very good as you're going into the confusion, see. Because, boy, this is confused.

All right. Now let me give you very briefly how you get additional lists. You got your "like," "disliked," and what was the next one I gave you there?

Audience: General O/W

Yes, that's it. You run General O/W on Self on the pc – General O/W on Self on the pc. "What have you done to yourself? What have you withheld from yourself?" you see. And you write these answers down. It's not a therapeutic process at all, you see. You don't care if it's flat or unflat or anything else. You just want about fifteen answers or twenty answers. And then you go down this, "Well, who would you treat like that?" is what you want to know. And you go over these answers, and you read them back to him. You know, "Who would you treat like that?" see. And you just get a nice long list on who would you treat like that, you know, using his different answers.

"Well, what have you done to yourself?"

"Well, I've kept myself up late and not put myself to bed early."

"Oh, yeah."

All right, well, that was part of the list. So when you come back, "Who would you consider it an overt to keep up late?" See, that's the question. See, that's what's obviously inspection by eye. It shows you at once that – well, this is an overt on self, is it? Well, what kind of a self is self? Don't you see?

And the pc'll say, "Well, a sick person. Of course, everybody'd know that." So you write down, "a sick person," you see, on the list.

And, "What have you withheld from yourself?"

"Well, candy," and so forth.

The obvious question that you ask is, "Who couldn't have candy?"

And the pc says, "Ha-ha. Well, what do you know. Uh-uh-uh-uh – a – a little child couldn't have any candy."

Well, that's kind of surprising, too, so you write that down on the list, and you get your long list going with this. Sometimes, sometimes this is quite a short list. It all starts becoming "A sick person, a sick person, a sick person, a sick person," you know. All right. Then you null it out the same way.

All right. Now your next one is Dynamic Assessment, and I won't take any time to tell you how to do one of those because the data is all over the place. You just simply find your Dynamic Assessment item and having found the item, you use it as a test item and proceed on down a line with it.

Now, your withhold is "What should be..." or "What should you withhold?" It's a list of what you should withhold, not to self, but what should be withheld. And you just get a long list of the things that the pc tells you what should be withheld. It's quite remarkable the numbers of things that should be withheld.

Now, when you've got that withheld list – it doesn't have to be complete, anything. Maybe sixty items on it is absolutely adequate. Now you make your potential item list, you see. And, "Who would have to withhold that? What kind of a person would be withholding that?" See? See, very slippery.

See, "Talking too much."

"What should be withheld?"

"Talking too much." Well, when you find that on the list, you ask the pc – you don't make one for each withhold. You write as many as he gives you for each withhold, you see.

"Who would have to withhold talking too much?" you see?

And he says, "Well, a ringmaster in a circus."

"Anybody else?"

"Well, yes. An opera singer."

And you almost can get dozens of lists out of this thing, but that's perfectly fine. A very fruitful source of stuff.

All right. Now, there are five systems by which you can get test items and this beats the seventy-five hours to no goal of Routine 3 and 3A and early work, you see? Because you've got all these test items, and they're all a ball to the pc, and you all han – handle them all the same way, and you do – it's a very pattern from that time on.

Now, it may be that you have to get inventive later on as to how you find some test items. Perfectly all right because you've got a pattern. You've got the Prehav Scale. You could assess the Prehav Scale, find the level the pc's stuck in, and find out what kind of people or beings or so forth would be whatever that stuck level is, see. Or take several levels of the Prehav Scale and do the same thing with it, or anything you can think of.

"Who do you have problems with normally?" You get the idea? See. You could get – there's dozens of ways you could get lists and so on. But try to keep that many lines going, and if a line peters out on you or goes null, the first thing that you should do is go back and see if the item before it might have gone flat. Something like that. Try to trace the line back and salvage it so as not to have an error on the thing, but don't spend much time doing it. It's actually easier to scrap the line and start a new one.

Okay. The net result of all this is terrific therapeutic gain, potentially faster than any other type of auditing I've ever had any development of. Terrific therapeutic gain on this, providing it is done well, providing it's done with a high-spirited pc, providing it's done with a pc with the rudiments in. Providing it's done expertly and the right items are found, there's nothing in the world can beat this one.

Now, the speed with which you do it comes into consideration even though you go rather easily with the pc and the differentiation. The pc does a lot of talking and that sort of thing. Let him talk. Don't worry about it. Just keep him on the subject. It apparently is a little slower but actually the greater amount of time spent in the differentiation of the objects means the lesser amount of time in nulling, so you make up in nulling what you waste, apparently, in reading the list to the pc. And you'll sometimes find that the list has just gone *brrrrrrr* – it's just evaporated, and you've just got one item sitting there. In other words, you've nulled it down. Well, that's a high compliment to your presence as an auditor because this pc is well in-session, and he's as-is-ing like crazy, man. He's just knocking the stuff out *boomityboom*. And he winds up with one item. Don't think this pc was in that condition before you read him the list back.

Okay. Well now, that's 3D Criss Cross. That's pretty well how you do it. Those are the liabilities of it, and where it winds up, you're not ready to worry about yet. But there you are.

The questions that you can ask about 3D Criss Cross, and so forth, are rather normally solved in just applying your gray matter to – you know. You, a thetan, you got some gray matter. You might have something to do with it. You never used it, you see. Apply it to this one, huh? And look over the thing and see just about how does this figure out because actually it's a very, very sensible little package of tricks. And it always goes the same way. It always winds up with the same answer. You always make the same mistakes if you're making the mistakes. And there it is. And if your eyes get too strained reading the meter, why, use a magnifying glass or something like that. But find what's there and oppterm it and you'll really get some gains on these pcs.

Now, you can audit almost any kind of case on 3D, but it is still much, much better to prepare the case to be audited with decent Sec Checking and so forth, before you start in.

We've bypassed the necessity now to have the case in perfect condition before you can assess, see? But it's much easier to do if the pc has been set up and this lifetime has been sort of cared for and everything is running a little better.

Well, that's 3D Criss Cross, and I wish you good luck with it.

Thank you.

BASICS OF AUDITING

A lecture given on 23 January 1962

Twenty-third Jan. 62, AD 12. And how are you this week?

Fair. We have three good people from California. I hope that you don't get as chewed up as the others do in their first week or two. That's very insincere. [laughs, laughter]

The first action a new student has, they've been auditing all this time, they've been doing wonderfully, everything's been going along fine and of course there's nothing to learn. And then they collide with the Saint Hill Special Briefing Course. *Crash!* And somebody says, "All right. Now, what is the confusion and the stable datum," and so forth.

And they say, "Well, the confusion uh – is uh – that was uh – *mm-hmmm-hm-mm-hm.*"

And the Examiner says, "Flunk!"

And they say, "What? You have to know this stuff? That's something new." And then they eventually say to themselves, "You know, I wonder why – if this was possibly why I've missed on a few pcs here and there, that I might not quite have duplicated something just right. I always thought before that the auditor held the cans and ..." [laughter, laughs]

Well, it's not quite that bad. It's worse. [laughter]

All right. Well, that's all due respect. But everybody who comes to this course learns sooner or later that there is something to learn here. After about three weeks of griping, why, then they decide to buckle down. And there's a way to cut short your time on course, is take the first three weeks of griping, scrub them and buckle down now. But this is a rough one as you will find out.

All right. Well, now, today I haven't the least idea what to talk to you about. You know everything there is to know. There's nothing left, and probably nothing I could teach you at all, at all – except Scientology, of course. That slight reservation.

Now, you're about to have – we've been upstairs... People think I work all the time. I don't. We've been upstairs loafing this afternoon, testing around on the new TV setup and you will shortly be seeing live sessions on TV. And the reason it's on TV is not because the BBC wants it, but because pcs never respond like pcs when being audited in front of an audience. And you audit the pc with television cameras, one going on a meter and showing up on a television set, and the other one showing up on the session. And you audit the pc just as you would run a session. And you run those things which the class is working on or struggling about.

But you actually audit the pc and you'll be able to see then what it might possibly look like. And this might help you out a lot. That is something we haven't ever been able to do.

Frankly, nearly all sessions are very artificial when they're demonstration sessions because the auditor has to hold down the audience, has to hold down the pc, has to get something done at the same time, has to be careful of the pc's reputation and all that sort of thing. You really don't get into a good auditing situation. So any auditing demonstration you've ever seen is actually an artificial demonstration, unless it's at long range such as this one.

And we've just had a very lucky win here. We have a Grundig camera that apparently it was – it was photographing just fine under the light shined by my cigarette lighter. So the pc, in this particular case, won't even be blinded by the lights of the television room.

The auditing room, of course, is quite remote from here. It's upstairs on the first floor and several – oh, I don't know, one hundred and twenty-five feet from here or something like that. I don't know how far. And the auditing session goes on there and you hear it and see it and so forth, down here on two screens.

Now, because it's difficult for a class that is this big to see it up, we have two pictures of the session on twenty-three inch screens and we have two pictures of the E-Meter on, I think, seventeen-inch. Isn't that the way it's supposed to work out or are they ... ?

Male voice: Nineteen.

Nineteen. And two nineteen-inch screens that show the meter in full view and two twenty-three inch screens that show the session. The only thing that you're going to see that's a little bit different about it – of course, you won't see the green color or the red of my hair. Otherwise, it will be fairly real. If you can mock those up and fill them in, you'll be all right.

And the – Fowler and Allen has just undertaken to build a Mark IV with a black rough face so that it won't reflect and a gray card. And they didn't like leaving off the glass because they said some dust will get into that element and it'll all of a sudden cease to work and we'll have had it. But I think we can do it with the glass on with a gray and a black faced meter. So that looks just like the meter you're using except it's duded up for television so that it registers well.

Well, that's what's in the immediate future. This will probably be in operation within – certainly well within presentation operation within two weeks. We'll have it done before that actually, probably. But it all depends on the second camera that comes from the North Pole apparently and has a small wait on it of eight or nine years. You know, the usual manufacturer's delay. That's the only bug on it. Everybody's working on this at the present time. You'll be seeing men down here stringing wire in all directions shortly. Cable in all directions and so forth.

Well, now, that's the – that's the immediate view. This of course doesn't supplant any other training that you're getting or doing. We just add the other hour or two on to your training day and you do everything you're doing now and then this other comes on, too.

In a month or two – in a month or two we'll probably have motion pictures going which give you meter reads. And we are already on a scout of that camera so that we can photograph meter reads. And you'll have a mile or two of film and you can sit there and the Instructor can say, "What's that?" And the thing is falling badly.

And you say, "A rock slam."

And he says in – he doesn't say flunk, he says, "Infraction sheet." [laughter, laughs]
And you can get a – you can get a good hasty review of what meter reads should look like.

One of the things that's most puzzling to people when they show up here is what is a null needle. That seems to be a very controversial item and so forth. And other such things as that and we'll have those things taped, too.

So we're moving up to it and I'm – we're hoping to get this in and operating so that those who are leaving mid-February get a week or two of viewing of this sort of thing so they can straighten out some little thing they may have been doing themselves such as sitting on the pc's lap. Spitting at the pc. Little odd tricks that they've developed unbeknownst to themselves in training, you know. Like throwing – throwing the E-Meter out the window to demonstrate that they're dissatisfied with the pc's answers, you know. It's these small bugs that a person picks up in his auditing procedure that possibly could be ironed out.

Now, we're very interested in you being a good auditor. And a good auditor's auditing begins first and foremost on an understanding of his basic data. It's quite a fundamental statement of fundamentals. And an awful lot of people pick up a datum and they sail at ten thousand feet with it, you see. And they've never landed with this datum and they're still up in the air with this thing.

And you'd be surprised how many data can get in crosswise. We're just now learning this in Central Organizations where morale is suffering because people are making them duplicate bulletins. And they are writing us to find out how we keep up the morale in the Saint Hill Special Briefing Course. And I'm writing back and saying, "Well, it's a very simple answer. We don't."

But this tells you at once that if they have a morale problem, then this tells you that they have never enforced duplication in their Academies. So that somebody's walking into something brand-new when he's asked to totally duplicate a bulletin or totally duplicate a tape or understand exactly what is on this. Or perhaps their examination is buggy. The examination might be poor. The examination might be on the basis of "What are the last seven words of the fifth paragraph of the HCO Bulletin of 22 December 1961?"

And the fellow can't answer that and so they say, "Flunk," you see. It's the data you're supposed to know on the bulletins. Of course, if you antagonize the Instructor, the Instructor has a perfect right to ask you what is exactly on that particular bulletin regardless if it contradicts some other bulletin. What is *that* bulletin?

All the auditor is expected to answer is what is on *that* bulletin. Not what is the right answer to the question, but what is on *that* bulletin, which is quite different, you see, than studying things.

You find out, then, they will develop an acuteness, an alertness to what the – what is being demanded of them. And they can measure up to this.

Anyway, when you're studying and you don't have good auditing going forward at the same time and when you're under this much duress and there's no auditing going forward, I don't think it could be done.

So of course, that makes an instant criticism of staff staff auditing in Central Organizations, see. If there isn't good auditing present by staff staff auditors on staff, why, of course their morale would suffer because you realize that if your ARC breaks with the Instructors were left even for twenty-four hours without being picked up by your auditor, you realize your whole bank would cave in. You recognize this – . Joke. They take it seriously. [laughter] It's almost true, you know?

And it takes good auditing to carry forward hard training. And that's something for you to realize sometime when you start in on a small group of auditors someplace and you're going to make Class IIbs out of them, something like that. And you're really going to fix them up one way or the other and you're doing it while they work at the filling station or something of the sort. And they're all out of your sight and they aren't getting much cross auditing and nothing much is happening in the way of results. Their auditing is so poor that no results are occurring. And then you hit them with this much duress, this much insistence, this much this, this much that, they're going to go up the chimney. They can't take it, that's all.

The reason why you can get this high a velocity of learning in is just one little reason and that is because you are applying that learning at the same time and you are getting case gains while you learn, so that you're getting a reality on these various things – at least some are.

And the person, of course, who has no basic reality on Scientology itself, who is still in a big question mark, of course, is actually stuck in some kind of a ridge, usually, of just no reality, you know. Big question mark. You recognize that.

You ask him also – the way to test that one out is to say, "Well, do you think medicine works?"

And he will say, "Well, I doubt it."

"Well, do you think that car repairing works?"

"Well, I doubt it."

"Do you think that anybody ever painted a picture?"

"Well, I doubt it."

And you begin to spot that the circuit hasn't anything to do with Scientology. He's just going on this way. When you run into that problem in learning, there's no sense in trying to shove it down the person's throat one way or the other. It's simply such a case problem that there isn't very much you can do about it except audit the person.

That is the only real problem that anybody should ever encounter in an Academy. Somebody who comes around and says he has no reality on Scientology and then you try to give him one and he can't get one and all that sort of thing – well, most people's reality on Scientology consists totally of having read something about Scientology. They recognized that was true and that was all there was to it.

But this other person is making a big fuss out of this, see. He has *no* reality on Scientology. He has *no* way – he doesn't *know* whether – and so on and so on. He's right in a ridge. You'll find out that you have to run negatives and positives on that person because he's sitting in the middle of a maybe. Of course, his whole life is in a maybe. Is he alive? No, he doesn't know that. See, he's doubtful.

This is about the only problem you'll run into in education is the ridge of doubt. There is another one which is rather easily overcome and that is pretended knowingness. And that, of course, is another downscale mockery of knowing, is pretended knowing. The person has a horrible sensation of pretended knowingness occasionally. You yourself have had this once in a while, I imagine. You all of a sudden recognize that you were pretending that you knew something or something like this. And it gave you an odd sensation. And then that was gone.

Well, think of somebody leading their whole life with that sensation. They're going around pretending that they know they're here and insisting to everybody they know they're here why they – while they know themselves that they are not here, you know.

And it's a funny sensation. They just feel like fakes all the way through. That one, however, is not as difficult – that, because it doesn't buck your data. It doesn't fly back in your face. It's only this – the person who doesn't have a reality on (blank) or can't get a reality on (blank) that you really worry about in instruction.

Now, when you have that as a chronic thing, it is, of course, a very low case level. This is the "What wall?" proposition. I'm not being essentially hard on this particular person. I'm just regarding it with regard to training people and training in general and that is a tough one to jump.

Now, that's also very tough to jump on a pc and you'll occasionally see that in an auditing session. The pc will set goals, sometimes very extravagant goals. You want to watch a pc, by the way, who sets extravagant goals for a session, see. Wants to be Clear by session end. Wants to be OT by session end. You know, a person wants to be Clear, that's a perfectly normal goal. But this session, that's got to make him OT, you see, and so on.

That person is in an obsessive games condition with the auditor and is attempting to give the auditor loses. That's the whole works about that. If you want to know if a pc is in an obsessive games condition, well, you look at those goals. And if they're too extravagant and they're just beyond anything that anybody ever could possibly have anything to do with anywhere, why, just recognize to that degree that the pc is in a games condition with you. And watch it because this pc will go out of session at the drop of an electron. And to try to run very much on them is very hard because they're scat. They're insecurely in-session. They're indifferently in-session. They are not under the auditor's control. And you can actually plunge them in over their heads and then can't control them in the session and then they get all upset and, you know, this kind of stuff. It makes a messy session.

And the thing to do with that pc is, of course, is run very easy, very fundamental processes – very, very fundamental. Audit him lightly. Audit him with a feather.

If you want to knock over a pc who is a no-effect pc, of course, audit him with a feather. Don't do what the psychiatrist does. The less effect the person can have, the more effect the psychiatrist tries to give them. Don't do that.

The way to handle such a case is give them the breath of air from a slowly wafted feather and you will just be absolutely amazed what will happen.

Such a person can very often run 8-C. Oh, man, they'll touch those walls and they'll march over and they'll touch the other wall and turn around and they just go on and on and on. Never a comm lag, no change of any kind. Just do it. Nothing to it. Well, why couldn't they do it? They're not there. It doesn't bother them any. Doing it on the auditor's determinism; they have no reality on it at all. Perhaps many of you have seen this phenomenon in running 8-C. Well, apply that to mental reaction. In other words, 8-C, as simple as it is, is too far up scale for this person to run. That's all.

Now, you sit down with a very tiny, microscopic object. I'll tell you a good gag for this person that can't run 8-C like that. You sit down with a little microscopic object. Very small. Smaller than a cigarette lighter and sort of dull. Well, actually, this piece of chalk would do just fine, see. Dull and can be seen and so forth.

And just ask them to get the idea that the chalk is there and that the chalk is not there. Total process. And just do that one after the other, something like that. Man, you pick up more confusion. More randomness will fly off

"How can you say that the chalk isn't there when the chalk is there?"

Ah, you just say, "Well, get the idea the chalk isn't there."

"Well, all right. I can get the idea maybe that the chalk isn't there, but the chalk actually is there and you can see it right in front of you," and so on.

"Well, go ahead and do the auditing command. Get the idea the chalk isn't there. I'll repeat it for you."

"Well, nobody can get the idea the chalk isn't there because the chalk is there, you see, and that defies all the laws of reality and so forth."

"All right. That's fine. Now, just get the idea the chalk isn't there. I'll repeat it again."

"Ah, well, you can't do anything like that. You'd see the cloth through it if you got the idea the chalk wasn't there and so forth. And that would violate physical phenomena."

And you say, "Good. Well, I'll repeat the auditing command. Now, get the idea that chalk isn't there."

Man, you go on like this for about a half an hour, you know, and you finally get it answered. I've even gone to this degree.

I've said, "Now, look-a-here, see that – see that piece of chalk? Now, you see it right there right now. All right. Now watch. Now, can you – can you see no chalk? Can you see no chalk? All right. Now I'm going to put the chalk there and now you look at the chalk. Now get the idea there's no chalk there. Can you do that? No. All right. Well, I'll do this again now. Now, here's your chalk. Now, you see, now you're supposed to get the idea the chalk isn't

there and if you did that and this is what it would visually look like, see. No chalk. Now, just watch that. Watch that. Good."

"By God, you're right, you know."

"All right. There's the chalk."

Work with the person. Work with the person until the person could actually take over the automaticity of not-ising physical objects. And all of a sudden the room starts to go solid on them, you know, and things like this supposed to happen. Just keep on working.

"Get the idea now the chalk is there."

You haven't told him to see the chalk. You told him just get the idea the chalk was there. You haven't told him not see the chalk. And you'll see the confusion blowing off on something stupid like this. That's what I mean, just take a feather and waft the wind off that feather very gently past one ear at a distance of about a yard, you know, and they say, "God almighty, turn off that Pratt & Whitney engine."

See, you have an effect. What you're dealing with there, of course, is the old Effect Scale. And as the person goes down, down toward total effect, the effect that can be had on them is a breath of air. See, that's a terrific effect. But if you were to blow them up, if you were to drop a building on their heads and so forth, they'd never find out about it. See, that's too much effect.

Now, we see that clearly in our overt-motivator phenomena. The overt that the person has, we think it's a comparable motivator. No. The more motivators that the person has earned, the less motivator the person can have. So you'll be astonished sometime to say to somebody, "Sneeze" and the person has said, "What is the idea of killing me with that terrible, piercing scream which you just uttered?"

Let's take last year's or last lives' *Murders of the Rue Morgue* character. Man, he had bodies strewn from one corner of Paris to the other. We pick him up in this life in the auditing chair, he actually taps his toe with the faintest of taps – you see, just a slightest tap, see, against it – in avoiding your toe, see. Your toe was there and he didn't step on your toe, but he tapped his toe against the side of the chair. Boy, is he upset. That's the motivator. That's a motivator. That is enough to practically kill you for. Do you get the idea? And it's just nothing, nothing for a motivator.

He thinks everybody is against him, as they go by him on the road because their wheels are going round or something, you know. That's enough motivator.

Well, the more overts a person collects, the less motivator it takes to blow him to pieces. That's an interesting principle. If you look this over, you'll understand auditing this no-effect pc rather easily. The greater the person's overts, why, the less motivator. The motivator can be just absolutely, fantastically microscopic.

Let's take this girl, she's gone out with other men. She's stolen all your money. She's sold everything out in all directions. She's acted in a most outrageous fashion, you know. And then you give her a bunch of flowers and the petal of one flower is bruised. You hear about it. That's enough motivator. That's a motivator. Got the idea?

But frankly, you could throw her the length of the block and run over her head with a truck and it wouldn't be much of a motivator, you see? That's too much effect. It is – it's simply that she doesn't notice it. She can't perceive that much of an effect. So you get the idea of people perceiving large, explosive actions and people perceiving very small actions. Now, who could perceive a large, explosive action?

Well, it'd be a person in fairly good shape. And he'd say, "Look at that, you know?"

And somebody else sees the large explosion and notices that a little puff of smoke, see, came up at the side. And they'll tell you about the little puff of smoke at the side, but not all the debris and the arms and legs flying through the air. See, they won't tell you about that. They take up that other. And that would be enough. That's a terrible explosion because of the little puff of smoke. And you say, "Well, how about all the arms and legs and the factory chimneys that were flying through the air?"

And they'd say, "Well, where were those?"

You get the idea the person wasn't viewing the same view that you viewed. The person probably wasn't in the same universe or something Well, evaluate it just on this: Their automatic not-is takes care of all large effects. And the little tiny effects are left on the fringes. So they can really get upset with small things.

Well, you'll see this in a session. And the funny part of it is you probably could give somebody no auditing. I mean, gross auditing error, see. Just no auditing. You know, I mean, do something or other. Crank up the E-Meter, ride him yappety-yappety-yap through the rudiments, you know and then say yappety-yap to him, and miss a half a dozen of this and don't do anything of that and then end rudiments and end session and that sort of thing. Just a clown, you know, a total clown type of auditing with a bunch of crash in it, you know, a bunch of crushers, you know. The pc didn't instantly answer the auditing command. "Are you withholding anything?", And you say, "Why the hell don't you speak up? Come on. For Christ's sake, you know." Swear at him.

But really no auditing at the same time because you don't care whether they answer or not, you know. Just a total no-auditing session. And this person doesn't think anything has happened to them. The person doesn't think anything bad has happened to him. They didn't get any auditing, but that's all right. The auditing is so gross, you might say, the errors are so gross that they don't notice it's bad. All right. Now, let's take the reverse. They get a very good auditing session, somebody's going through perfectly all right and they miss one tick on an ARC break or something of the sort, you know. That's enough motivator. See, they take off like a startled gazelle. Doesn't have to be a good session particularly, but a mediumly good session. But just – it's the little tiny error that they will notice. They won't notice the rest of it.

Well, we see this in critics of auditing. They're always looking for the little error when the whole session is missing. Pc hasn't even sat down in the chair, you know, that sort of thing. We see somebody trying to straighten up an auditing session on this. Well, what would he consider a motivator? That's what he finds wrong with the session is what he would consider a motivator.

Therefore, a critic of a session is also indexed, frankly, by his own ability to have an effect.

Now, you get along in life with this and you'll notice that the Spanish people, the Mexican people, regardless of their reputation with revolutions, of a bombastic and brutal governmental action, banditry, tortures, imprisonments, civil abuses of great magnitude and we think maybe that they're vicious people or something like that.

No, basically they're very good people. You could probably leave a bicycle lying all day in the middle of Madrid and nobody would touch it. Maybe not Madrid, but Sevilla for sure. And you – nobody'd touch it. You leave your wallet on a counter in a store or something like this and my God, the manager himself runs five blocks to return the thing to you and make sure that you see that all the money is still in it and all that sort of thing. Fantastic, you see, their level of honesty, as you would call it honesty and so forth, is utterly fabulous. And this in the middle of countries – a country which tolerates enormous criminality in its government, atrocities in its wars and actions, exclamation points in its banditry and so forth. People don't object because they don't see it. See, it's not a motivator. Doesn't have anything to do with them.

A democracy is only as good as people can observe what's going on. And a democracy goes to pieces promptly that people cannot see what's happening and get onto this enough-motivator kick.

Oh, my, you should see though what happens in a Spanish family if little Juan or something like that, accidentally loses a penny or a peseta or something or takes one off the living room table, you see or fails to sit for four hours in the sun waiting for his father to come in from fishing and so on. My God, you'd think the empire had just been torn to pieces, you see, just fantastic crimes have been committed here. It's something that everybody goes and cries about quietly in the corner, and Aunt somebody-or-other goes and – into the convent, you see. It's just – it's just enough motivator, you know. It's just "Oh, my God, how could they do such a thing?" you know. He didn't sit there for four hours in the boiling sun. He went and sat in the shade. Terrible. Terrible.

And yet their bandits, their governments, their supersystems of some kind or another. These things are utterly just *blaaaah*. Just total uncontrolled criminality from the word go. That's Mexico. That's Spain. That's the way an old empire has gone. It gets down to enough motivator. What's enough motivator? What can people see? Well, "What effect can they have?" is all this adds up to.

And in auditing pcs, in auditing pcs, this shows up very strongly so that you in auditing low-level pcs could have a perfectly fine time auditing some spinning psycho. Oh, you could sit on his head and sit all over him and make him answer up one way or the other and push him this way and that way and he might get some big gain out of it, you see. With gross auditing errors, you could audit this psycho, see. I mean, it could just be fantastically bad auditing. And he'd take it. It's perfectly all right.

Now, you take a person in the middle band of sanity, something like that and it's a different proposition. It goes from low-scale cases can be given; shouldn't be given by you, but could be given without their noticing it – I don't advise this, of course, but they could be given

without their noticing it – very bad auditing and take it. All they'd notice is that it just wasn't happening very good. Nothing much was happening.

But you could just knock their heads off, you know. Run everything backwards, upside down. And just be a complete, colossal mess. Do you see that? You could just give them a *horrible* session and you'd have no objection of any kind whatsoever. You'd have no objection.

Now, that's something for you to look over. You wonder why you don't get objections in some quarters and spheres and so forth, in auditing clinics or something like that, when very bad auditing is done by some auditor on low-scale cases and you got no objection to it.

Well, that isn't the reason. It wasn't that it – wasn't bad auditing, don't you see. It's that the pc couldn't tolerate that big an effect. Couldn't tolerate that big of an error.

And if the pc were asked to criticize the session, if pushed very hard to find something wrong with that session, it's actually not even, you see, that the pc is in propitiation. The pc just doesn't see it, that's all. And if he was asked very hard to search over the session very, very hard to find something wrong with the auditing he had had, see, he would come up with the fact that the auditor one day was five minutes late for the session. And that was everything that was wrong with the auditing, see?

It's quite fantastic. Actually pitiful.

But in your middle-range auditing, people who are not in that kind of condition, the little tiny errors are registering and the mediumly large errors are registering. And it'd be pretty hard to audit wildly enough so that they couldn't see it. So that they'd see auditing errors, don't you see? And these do have an effect on them. And as they come up scale, then they see the whole of the auditing error, you see. They see everything in the error that – in the auditing that is in error. And actually, it has less effect on them than it would have on the lower-scale case, you see.

Don't make the mistake of thinking because the person didn't observe the effect that it didn't have an effect. It did have an effect on them, see.

But you get an upper-scale case that audits pretty easily and so on. Man, he can see everything wrong with an auditing session from the word go. He could criticize the whole living lot of it.

Therefore, as you audit people up the line, your auditing has to *improve*. See, if you get them off the launching pad while sitting with your stocking feet on the windowsill and puffing a cigarette, you see and looking at the E-Meter now and then, don't you see and never starting the session and never ending the session and never cleaning anything up that happens and always Q-and-A-ing with the pc, auditing will still give some gain.

All right. That person will come up to that gain point and your auditing would have to improve. Do you see how that would be?

All right. Now, you give this person – at your improved auditing status – you give this person a lot of wins and they get better and everything is fine along that level. And now to make them any better, your auditing has got to improve. You see where we're going with this?

Now, we're not monkeying around with improving your auditing while the pc is improving. We're trying to put your auditing straight up at a high peak right now because there is no sense in Q-and-Aing with this. Just audit well always. I myself don't particularly follow that maxim. I've given lousy sessions. I've gotten cross and upset in sessions over the years and so forth, but when I sit down to give a session, I give a session. And unless I'm involved in some particular way trying to clean something up that doesn't have anything to do much with auditing – you know, using auditing to do something else with it – but as far as the sessions go, sit down to give a session, yeah. Well, I'll give something that's very, very close to a letter-perfect session.

Well, what do you mean a letter-perfect session? Well, it just takes up what's wrong with the pc and handles it and pushes it along through and ends it up with the pc improved. That's a perfect auditing session. You couldn't be more perfect than that because that is exactly what you are trying to do, don't you see?

It is – perfection does not necessarily derive with how you hold your little pinky in the air. You know, your little pinky up here and you must hold this finger as you hold the E-Meter, you see, this, this – the posture of this finger is important. Whether or not you have the index finger and the little finger up while your thumb is on the tone arm, you know, that kind of thing. It doesn't matter. It's whether or not your auditing communication with the pc is effective at the pc's level of case. That is what is it.

Now, of course, in the forms which we have today, you have Model Session. And Model Session has been very arduously, very carefully worked out over a long period of time to pick up the maximum number of pcs and the maximum numbers of upsets that pcs can be prone to and the maximum numbers of things that upset sessions. So that's there and that's well tailored. But you come along, you knucklehead, and you lean on that. And you got a beautiful tool, you see and there you lean on it. And you say, "Well, this will see me through." No, nothing will ever see you through but auditing. That's all that will ever see anybody through a session as an auditor is just auditing.

Now, the second you start *leaning* on the Model Session [speaks in an extremely dull, fast and nearly inaudible way] – "Start of session. Is it all right with you if we audit in this room? All right. Good. Talking about (*mumble*), *hmm?* Withholding anything? Oh, well, you don't want to go into that. All right. Have a present time problem? Huh? Oh, well, hm? Hm? Hm-mm. Ah, hm. Let's see, what are we going to audit in this session? Oh, yes, Security Check. All right. Have you ever raped anyone? Thank you. That's clear. There ..."

What's phenomenal is without paying any attention whatsoever to the pc you can make a gain on the pc. You don't have to pay attention to the pc or get mixed up in his nasty old case.

You see? What's carrying you through there is just the mechanic. See, the ritual. And if you went through the ritual and went by the meter, you would wind up at the other end of the session with having done a session. And what do you know, you would have something done with the pc.

Now, immediately you think, "Well, if that isn't good enough, if I'm not just supposed to sit there and reel off Model Session and read the E-Meter and take up what I see on the E-Meter and come out the other end, what the hell is auditing? See, what's that?"

Well, that you would ask the question shows that you have defined auditing as a Model Session going off in a certain unit of time monitored by an E-Meter. That's what – what you've been defining auditing by if you ask that question.

No, auditing – auditing is a science, definitely a science, not an art, contrary to old Joe Winter. He used to stand up and tell students, "Auditing is an art." Joe used to watch me audit, didn't have a clue what I was doing and it all appeared different to him every time he saw it, you know? So of course, to old Joe auditing was an art. It was rather fantastic.

There was nothing scientific about auditing because it all looked different. Well, when we start TVing these sessions, you're going to get some of that reaction around here. You're going to say, "My God, you must have thrown away the whole rule book." That's why we're going to have to run a tape every time we do one of these things. So the arguments will cease. And you go back through and you'll find a Model Session and you will find the E-Meter and you'll find the readings of the E-Meter are taken up and you'll find it's all going off and after you get all the auditing off the top of it, you will find a Model Session and an E-Meter. Got the idea?

I'm not talking to you about how wonderfully I audit. As a matter of fact, my auditing could improve. There's no doubt about that. As a matter of fact, right now because we're going to televise these things and so forth, I've got to learn the end rudiments perfectly. [laughter] I had – I had them down perfect in the old version, you know and since I – since I rewrote them and worked them out, I haven't got these new ones taped. It's very funny. Even in my auditing now, I say, I always have to say to the pc, "Well, you'll have to pardon the lack of end rudiments here, but are you withholding anything? How's your havingness? Anything you'd care to say before we end this session?"

I've gone completely off the old rudiments and I haven't picked up the new ones. But you can expect that to happen to you too, see? The end rudiments weren't something I suddenly dreamed up. The end rudiments were a whole bunch of errors that were being made by auditors that were worsening cases and there was a wonderful opportunity to scrap the end rudiments as a repetition of the beginning rudiments and put all those beautiful stopgaps in at the end. And they were simply worked out rather arduously of what is the wording that works and what sounds good and what carries it in and that sort of thing. They're all perfectly worked out.

But working them out wasn't memorizing them and I was caught right there. But if you took my auditing, if you took a session and you took all of the auditing off of the top of it, the bones that you would find would be an auditor, a pc, an E-Meter, Model Session and the TRs. But you'd have to take all the auditing off the top of it to find 'em, see.

Now, get the idea of a very, very, very skinny girl. A very, very skinny girl, you know. You'd have to stand twice in the same place to make a shadow. And now, if she had a little flesh on her, she'd just look gorgeous, you see. Well, your auditing may be looking like the

skinny girl. Even the best of your auditing right now kind of looks a little bit like a skinny girl. It hasn't got any flesh on it, see. Those bones show through.

The pc is very, very aware of the fact that you are taking up beginning rudiments. Well, isn't it interesting that a pc even though he's a trained auditor is aware of your taking up anything? What's the pc doing listening to the auditing bones? See? Well, he must be out of session. He's supposed to be interested in his own case and willing to talk to the auditor and there he sits watching the bones rattle. See? Now, if you want a test of good auditing, did you know that the auditor was using Model Session? If you didn't he either wasn't using it or it was a perfect session. [laughter] *Smooth*, man, *smooth* is the keynote of this sort of thing.

Auditing a pc the other night. Now, think what you would do in this situation. The pc's havingness isn't working. We've run the pc's havingness, we've given the can-squeeze test – all standard, you see, all perfectly nice – and it isn't working.

All right. Now, what's the textbook solution but not necessarily the textbook solution? What would you do in that particular case? Think what you would have done. You'd have bridged out of what you were doing and you would have tested for a new Havingness Process and then you would have bridged out of that and run it. And a half an hour later, you would have gotten the session going again. Wouldn't that – isn't that the way it looks?

All right. That's fine. And I wouldn't for a minute take away any ability you have to do this because you often have to do it.

All right. But what about this as a situation? Watching this session I was running, you would have – you would have been – "What the hell is this?" you know. You're sort of alert that something else was happening here that you hadn't quite noticed.

Pc ran it – can-squeeze test. Run Havingness – can-squeeze test. Five more commands – can-squeeze test. Five more commands – can-squeeze test. Pc has a long history of having had Havingness run. What's wrong here?

So, without breaking pace and the pc never even noticed this, I just asked the pc how many Havingness commands the pc hadn't ever executed. And the answer was "thousands". The pc had never done a Havingness command in the pc's entire history in Scientology. Had never done a Havingness command. Had told some early auditors, two or three of them, that this was not possible to do. And it cut loose on the Havingness Process and run it that way.

All right. Here's some thousands of commands never done. Thousands. Here's maybe three, four auditors, whole sessions, upsets, unanswered auditing commands, ARC breaks. Here's the whole mess, yawning wide for the auditor to dive into and get lost, see.

Cleaned the invalidations off, shifted to a Havingness Process that was elementary – just an elementary Havingness Process, having gotten the invalidations off havingness. The unanswered commands. Having attacked that. And simply asked this other command and got the can-squeeze test and it worked and went on with the Havingness session. And the total lapsed time was 2.5 minutes to straighten out a pc's whole history of Havingness. And the pc never noticed this, but thought that was very nice that Havingness was now operative, you know? They just thought it was nice, but never noticed that it was nice because the auditor had done it.

In other words, there's no gears ever got shifted. There was no difference in the reading of the speedometer in the session. The pc never noticed any change of pace. This was a discussion between can-squeeze tests.

This was apparently to the pc just a little two-way comm that went on and the auditor interested in the pc's case, you know. No more important than that. No big resurges. No bridges. Nothing. All in the middle of this.

All right. Now, you should be able to know the right way to go about things and find the Havingness Process and straighten out that sort of thing. All right. That's fine.

Well, how about this other thing? Why make a production out of it? See? How come each one of these things has got to be a production? That's what I would like to ask you. How come? See?

So the pc's Havingness Process isn't working and it was working yesterday. Well, you can find a new pc's Havingness Process and you probably should if it's some esoteric process like "Tell me the cubic inch capacity of that – what the cubic inch capacity of that wall might be." If it's something this complicated and esoteric, why, certainly you'd better be working on it gradually, session by session, to improve their Havingness Process till it's something very simple like "What can you have here?"

See, I mean, that's the essence. You're trying to work toward a simplicity, by all means. But the pc is already running "Point out something. Point out something. Thank you. Point out something." The pc's running on this and it loosened the can squeeze – on the can-squeeze test yesterday and it isn't loosening on the can-squeeze test today. Well, why the production?

Isn't it perfectly obvious that the pc has invalidations or withholds on the subject of havingness? Isn't that all that would make that Havingness Process cease to function? It's too – it's an elementary process. Yes, we can see that other things, such as "What is the emotion of that (indicated object)?" We could see that that, for God's sakes, let's get off of it and get on to something else because that's a complicated process and we'd love to better it.

But why make a production out of improving something which is very simple already? This is a perfectly satisfactory Havingness Process. "Point out something. Thank you. Point out something. Thank you." Auditor can just sit there and yawn. It's very easy. The pc thinks it's marvelous. Everything is going along whizzingly.

Well, it ceases to work, what should you do with it? Well, let's patch it up. How long does it take to patch up something and get an invalidation off something? If the pc is in-session, doesn't take very long to find it. And the more the pc is in-session, the faster the pc will blow an aberration, the less afraid they are of things, the less they duck and dodge, the braver they feel. And they'll take on large masses and blow them and blow holes out of engrams and they're just brave as hell, you see, because they've got confidence in the auditor and they know the auditor will take it up if they go wrong.

So why the production, see?

This pc comes into session. This pc is saying, "Natter, natter, natter, yap, yap, yap and it was so-and-so and so-and-so," got a roaring present time problem. The pc is right on the top of the present time problem, has nothing else but a present time problem, what are you going to do? Yank the pc's attention all over the room and on the floor and the ceiling and go through this and talk to you about your difficulties? Why, hell, they're talking to you about your difficulties and so forth.

I'd handle the present time problem then start a session. See? You're auditing a case that's in front of you, not something else. The pc is stuck in a present time problem, it's perfectly obvious the pc is stuck in a present time problem, what are you doing handling anything else? What are you doing starting any sessions? Session got started someplace. Lord knows where the session got started or why it got started or something like that and if you want to square it with your conscience, why, just mutter, you know, "Well, start of session. What was that again?"

But even that might distract the pc. All right. She says, "Oh, my, this garage mechanic. My God. And it took my car and I mean they took the rear wheels and put on the front wheels and they got the flywheel off and they put on the steering wheel. And they just poured oil all over everything, right afterwards," and so forth.

And you're going to say, "Start of session. Is it all right to audit in this room?"

Going to say something like this, are you? Well, how many ARC breaks can you handle at once? How many can you handle? That's all. Now, you've got the present time problem and an ARC break. You've got an ARC break with life and an ARC break with the auditor. Let's see if we can't dig up another ARC break someplace. Two doesn't seem like enough. Two ARC breaks and a present time problem and the auditor out of session – yeah, this'd be good, this would.

No, the obvious thing is to say, "Well, what are you withholding from him?"

"His payment. I'm not going to pay him a dime!"

"What else are you withholding from him?"

"Well, I've got the car. I've got the car outside."

"What were you withholding from him before that?"

"Well, it was a wreck."

"Well, was there any earlier withhold on him?"

"Ha-ha-ha. Well, I wasn't really going to pay for the repairs anyway."

"Oh, is that so? Well, all right. Any other withholds on that? Any other upsets, withholds?"

"No, no."

"How do you feel about that now?"

"Oh, I feel all right about it, I guess. I guess."

"Well, were there any other withholds?"

"Well, withhold from you that I had withholds from them."

"Well, all right. That's fine. Okay if we start this session now? Start of session. Look around here ..." There we go. That's auditing. That's auditing. It's auditing the case that's in front of you.

At the time you do that, however, you are not absolved from any of the obligations of the auditor to have a proper Model Session running. You're not absolved from any obligations whatsoever, but you audit the case that's in front of you.

You're just about to ask the pc, "Are you withholding anything" and the pc dopes off. You say, "Hhh ..."

Well, what's the matter with you, that you can't shift gears at that point? You know the pc's Havingness Process. All right. Your classic method of starting that would be to say, "Is it all right with you if I run some Havingness now?"

But if the pc is so dopey he couldn't even hear it, I don't waste the English. I would just say, "Point out something. Thank you. Point out something." And the pc does, you know. [laughter]

Get the pc back up into session again and say, "Well, all right. Are you withholding anything?"

"Oh, well, that's something else." Here we go.

A lot of you are saying, for instance, "The elements, the items found – the items found – are going in and out." Why do you say something like that? That's an odd thing to say.

No. Elements never go in and out. For them to go out, they would probably have to be audited or blown in some fashion that would be very arduous, so these items are not going out, but rudiments are. Rudiments are, which is cancelling the read.

In other words, rudiments are going in and out if an item goes in and out on its read. The item doesn't go in and out. The rudiments go in and out and cancel the item's read. That's all. You get the rudiments back in, the item is reading again.

Well, that doesn't mean that the *item* was going in and out. It wasn't, which gives you an entirely erroneous picture. You now – you now present the fact that an item is not the item. Why isn't it the item? Well, because it's disappearing and appearing. Well, that would be characteristic of a bad item, a poorly assessed item, sporadic read. You're not dealing with that at all. The rudiments are going in and out and cancelling the reads.

No, you don't say even that the item is being cancelled by rudiments out. You say rudiments are cancelling out the meter reads. See? The rudiments are cancelling the meter. That's proper. That is to say that's factual. That's what's happening.

So you're whizzing on down the line – you're whizzing on down the line auditing somebody – what are you going to run into? Well, how many parts are there to a human mind? And how many thinks can a person think, particularly if he's a thunky kind of thinker. Hm? How many?

You're liable to run into any one of them. You're either going to handle him with TR 4 as an origin or you're going to have to take them up and keep your session going. That doesn't mean you Q-and-A all over the place. You have to know whether or not something is out of session or in session or going to throw the pc out or something. You have to have an adjustment. You have to have an idea of what you're doing.

In order to accomplish what you're doing, however, move heaven and earth to get the pc down that particular *slot*. See, just do anything you can do to get the pc down the slot. The pc's trying to move away and you say, "There's the slot, see? That's the cliff and we want you to go to the edge of the cliff and jump off."

And the pc is saying, "I don't like the cliff and I don't like the edge of the cliff and it's going to take a lot more than an auditor to make me jump off the cliff."

And you say, "Good, well, how deep is it?"

Pc says, "Well, it's quite deep."

"Where you looking at it from?"

"Well, from up here at the edge," and so forth. And the pc says, "But I'm not going anywhere near that because another auditor ran that at some time or another and had a lot of trouble with it."

"Well, you got any withholds from that auditor?"

"Oh, yes. That I didn't want to run it. I just pretended to run it before."

"Good. Now, how deep is it? All right. *Jump. Thank you.*" [laughter]

No, sir. A pc hasn't got a prayer if an auditor is a good pony wrangler. He hasn't got a prayer.

Now, if a – if an auditor is that good so as to keep a pc rounded up at all times and headed in toward the slot the auditor wants him to be headed into, don't you think it'd also be a good idea if the auditor knew what slots to head the pc into? Don't you think that would be a good idea, huh?

If an auditor possesses all this horsepower that he can head the pc down this particular slot, then he certainly ought to know the slots. That's why you duplicate bulletins and things like that, so you get some idea where the slots are.

Of course, you take somebody that's been eighty-nine years a member of the Theosophy Society and two lives ago founded it, says, "Well, uh... *tsk!* Hubbard's a little bit wrong here. Actually, what he's talking about when he's talking about these black masses, he's talking about astral selves, which have begun to haunt the pc. And I know that, and so forth. And so obviously the thing to do is every short distance in the auditing session, why, we will put in this cancellation thing so the astral selves, you see, will dissolve and so forth and that will make it all work." And then he uses auditing techniques to head the pc down toward the astral selves slot.

Of course, there's no slot there, so the pc doesn't know where to go and everybody winds up in a – in a horrible bash. No, you've got to have a slot there for the pc to go into and

you got to know what the slot is and then you ride him into it and through it. And it's very easy to do if you're doing that.

Now, I'll give you an idea of auditing on your feet, auditing there on the spot. I've just given you a flow process.

All right. There are four flows.

One is outflow. And the other, of course, is *restrained* outflow, which you know as a *withhold*. That's all a withhold is, is a restrained outflow. That's number two. And then there's an inflow and there's a restrained inflow. That's very simple. These are all self-determined flows. They're the most easy flows for a pc or a thetan to self-determine.

Now, we have heretofore looked on the inflows as motivators and the prevented inflow as a sort of a motivator side of it. And that was very easy to do because these things are very snarled up. But mixed up inside the motivators, there was a pc self-determined action to make the inflow occur and a pc self-determined action to make the inflow not occur.

And of course, also, the pc's self-determined actions to make the outflow occur. Now, flows 3 and 4, which is the inflow and the restrained inflow, are not as important as the withhold and outflow.

Now, you handle the withhold and outflow all the time in a Security Check. You ask – on one hand you're asking, "What are you withholding?" and on the other hand you're asking, "What have you done?"

In other words, you've asked for the outflow and you've asked for the withhold. So you've asked for flows 1 and 2.

Now, you've got flows 3 and 4, however, still available; and although these are fainter flows, they nevertheless can be self-determined flows. A pc self-determines an inflow. Now, oddly enough, a pc can self-determine a bad inflow and can practically force you into making an auditing error because he has to have a good inflow. Good, nice ARC break is what he needs at the particular moment and he'll force you to inflow something. But he has something to do with it. In other words, however, the action is so much yours that you seldom notice that there was a self-determined action involved in it.

Now, he might have done this so he could thereafter outflow a make-you-guilty. So you've got these little, tiny inflow and braked inflows which are self-determined which are operative in a mass.

Now, you have this in the Flow Process.

You run the Flow Process fifty minutes. The reason you can't run it less, particularly early in sessions, is because it cycles too hard and it's too ridgy and it's too beefy. You can't run it slightly. It's got to be run heavily. I already tested that out. I originally thought that it would be ten minutes of the Flow Process and twenty minutes and ten minutes. But I've underestimated entirely the power of the process and the power of the process kicked it up that the minimum length of time the process can be run is about fifty minutes.

Now, that's all right because that gives you fifty minutes of that and it gives you twenty minutes of Sec Checking and ten minutes of Havingness and twenty minutes of Sec

Checking and ten minutes of Havingness and you've got ten minutes worth of rudiments before and after and you've got a two-hour session, which is fine.

Now, that is all very well, but understanding this mechanic of the four flows... Of course, you know, there are some more flows. That is, it doesn't exhaust all the flows there are. There are the flows from left to right and right to left and there are all four flows for somebody else – the pc determining the four flows for somebody else. And you could be determining them for England.

In other words, they could occur on the – on the third dynamic, you see. The pc's busily running "What should be outflowed? What should be inflowed?" and so on and he's running them for England. He isn't running them for himself. "What should be outflowed? Exports. What should be inflowed? Dollars," you know? "What inflow should be prevented? Jamaicans," you know. All kinds of wild things. Actual answers that came out of a session. Pc was running what should be inflowed, you know, and that sort of thing, and I was – and the answers were well, food, you know, all logically. And then exports. Exports? What's this, you know?

And three or four commands later, I suddenly realized the pc was running these for England. This was England. The pc ran out the whole British Isles in about eighteen or twenty commands. It was quite remarkable.

Now, you got a principle of four flows. I said there's the principles from right to left and left to right and the principles from bottom to top and top to bottom. And there's a lot of weird ones in that particular line. You could run into those on the basis of "What are you holding down?" and "What are you keeping from being held down?" And you see, you could get terribly involved in all this, but it isn't necessary to get that complicated to get an effect – get a proper auditing effect.

Supposing you were to use these things in session to keep the rudiments in. I'll show you something on the order of auditing on your feet and auditing by basic principle.

This pc says, "Well, I'm very tired of being audited."

And you say, "Do you have a withhold?"

Well, the pc – yes, the pc has a withhold. Withhold themselves from the session.

All right, good. We got that session withhold off and a couple of seconds later we have another session withhold and a couple of seconds later we have another session withhold, and there's just more session withholds than we can easily take off of the case.

Well, if there are four flows, don't you think that it would be a simple thing if you tripped one of the other flows that was causing the person to withhold?

So let's take as an auditing question, "Well, are you outflowing anything?"

"Yeah, auditing answers. I answer just one more of – these list items, you know. Just one more and you keep asking and asking and asking me these items. I – I – I – I – I – I – and I give you all the items there are and so forth."

"Well, good enough. Well, did you withhold any?"

"Well, a ton or two, of course. Had to," and so forth.

"All right."

Now, all of a sudden you'll find the pc isn't going to get a withhold every two seconds. See, you tripped the outflow that was causing the pc to withhold. See, it was actually the being demanded to outflow – the demand to outflow, you see, was what had the pc withholding.

You keep picking up the session withholds and getting the reads back in, but you had to keep picking them up all the time. And you're just mopping your brow, you know and "Aw, all right. There they went again," you know, and you've gone down three lines, null, null, null. They weren't null before. And one of those items didn't even vaguely look like it was going to null. All right, that's out.

Now, if you just say, "Are you withholding anything"

"Yes, well, I'm withholding. I'm just – well, no, no. Just – yes. A few minutes ago I thought..."

"All right. Good." Get it in and you're reading again, see. Well, you have to keep doing that unless you balanced up the flows someplace. There must be something else he is upset about.

All right. So we say – we say, "Are you outflowing anything?"

"Hell, yes. Can't you hear me?", you know? "I just had to outflow about four more of these things."

"Well, when did you decide that it was a rough thing to have to outflow?"

He said, "Well, early in a session. I don't like to mention this, by the way. I don't like to mention these – this particular item. After all, it isn't nice for a young girl to have to list a whole bunch of opposition terminals to a policeman. It's not seemly."

"When did you first think that?"

"Well, I just thought it ... just it was a bad thing to do and so on."

Of course, it is a specimen of withhold, isn't it? But nevertheless, it's the outflow they've been objecting to. All right. You get the objection to the outflow off and of course the tendency to withhold vanishes.

All right. Now, let's use another one of the flows.

You say, "Are you inflowing anything?"

And the person says, "Yes, auditing commands. If I just get one more auditing command ..."

And of course, your tendency is, of course, at once to ask why and to be concerned about your auditing, but that just shows that you're ignorant and stupid and a knucklehead and were born that way.

No, the person says auditing command – yes, they're inflowing auditing commands. One of the troubles people have with auditing is they don't realize that these things *blow* and they take them up after the pc has got rid of them.

In other words, a pc says, "Are you with – ." Auditor says, "Are you withholding anything?"

And the pc says, "Well, yes, I was withholding a critical thought about the nasal twang you were using in your auditing commands," and so forth and so forth.

And you, you knucklehead, all too often say, "Well, what is wrong with that?" or "What does that associate with?"

Look, the pc spat it out, there it is, you've got the withhold, it is now lying on the floor and it's totally doggo. If you jumped all over it, it couldn't be more dead, you see. And you carefully pick it up, attach an air hose to it, you see, and pump it up and put it back in the session.

See, it's just the basis of the – you don't believe the pc ever blows anything. The pc mentioned it and it's gone. The auditor is very often left stonied, you see, because the auditor gets in a bit of a games condition with the pc sometimes.

Well, he ought to take this up. The pc objects to his nasal accent, how in the name of common sense could he audit the pc? Well, it's all gone, you see. There isn't anything more on it. Let it lie. The Shakespearian phrase of "Let sleeping dogs lie" is "Let blown withholds and overts expire." Don't keep beating them to death because they're already dead. The pc blew 'em.

One of the ways to stop a pc from blowing is to take up everything he has blown after he has blown it. This is one of the nice ways to keep a pc from advancing because it's so innocent. Nobody ever quite notices what's happening.

The pc says something and the auditor takes it up. He doesn't do a TR 4 on it, you see. He takes it up. The pc says something else and that's blown now. He doesn't express an interest in it or something like that. The auditor doesn't. He wants to know, now, how he can remedy this situation.

This is the way you really stop a session, see: The pc has just had a cognition. Now, the auditor wants to know how he can remedy it. You almost train the pc never to have a cognition after a while because the auditor is going to take it up. That's what's called Q and A, normally.

Q and A is – covers a multitude of situations of this particular character and that isn't exact Q and A. But you watch; it's a specialized kind of it. See, "Well, I just was having trouble because a nasal accent always upsets me."

"Well, when did you first withhold that?"

"Oh, I don't know. I thought that several days ago."

"Well, all right. Have you thought it often since?"

"Yes, yes, I have."

"All right. Well, that's fine. Thank you."

That would be everything that you could do. That would be sort of polishing it off, you know and buffing it up and putting out a piece of velvet and setting it in the middle of the velvet, you see and turning a couple of spotlights on it, you see.

Everything you could possibly do is done in just that little phraseology I just told you, see?

Oh, no. Some auditors won't do that.

They say, "Well, did you ever know anybody that had a nasal accent? Did anybody in your family speak with a nasal accent? When you were in the army, did you ever notice anybody with a nasal accent? Do you yourself ever use a naval accent?"

And then the auditor suddenly wakes up and realizes he's talking about naval accents and the pc is talking about nasal accents and it's all – it's all bogged down somewhere. And then the auditor has an ARC break and the pc doesn't take it up and that's the end of the session. [laughter, laughs]

See, but that is a common error. Sometimes even the best auditor is startled into this error. He's just momentarily startled. It just took him a little bit off guard. It was something new and he has a tendency himself to satiate his own curiosity with regard to this sort of thing.

He's sometimes trapped into this one, but my God, don't make it a habit, you know, that every time the pc blows something, hand it back to the pc and say, "Did you lose this?" [laughter, laughs] Anyway, in handling this sort of thing, you could say to a pc, "All right. Now, have you inflowed anything?" Or "Have you prevented an inflow in this session?"

"Yeah, I'm sitting here waiting for that picture – that picture to – to move the other way."

"Oh." The pc hadn't mentioned this picture before, see. Prevented an inflow. There's the picture.

"Well, how long has the picture been there?"

"Oh, well, I don't know. It's been a long, long time."

"All right. Well, when did you first start preventing that inflow?" Not "What is in the picture?" I'll clue you. That's wrong. That's wrong. That's a gross auditing error. It'd be, "Well, when did you first prevent that inflow?"

See, on any flow line, you want to know when is it first and has it been going on for very long. You just want to know this in order to get their attention to pick up the – an early one. You don't want the first one. If you're auditing withholds or something, for heaven's sakes, get the first one. Get the first tiny glimmering as it came out of the divine ether into the pc's left eardrum, see. For heaven's sakes, just *hound it down* with the meter, *pin it down* in time and find out what color the clock was painted.

In other words, go the limit if you're doing something that is utterly dependent on this. If that's the channel you're driving the pc into and no other channel, well, for heaven sakes, be thorough.

But you are going down into channel Q and you're trying to get a list assessed. And all of a sudden you ask the pc something like this and the pc says, "Yes and it's that picture and I'm trying for that."

"Well, have you been preventing that long? All right. When was that? Yeah. Have you done it many times since? Thank you very much. All right. Thank you." And go on with the list because it'll now be reading. You get the idea?

In other words, when you're driving them into channel Q, don't change your mind and try to get him over here into this other channel. You weren't heading for that way. That's what Q-and-A really is.

Pc dives for channel G and the auditor, who has heretofore been heading for channel Q, immediately reverses his monowheel bicycle and goes clear across to the other side of the plain and heads down what he thinks the pc's channel is, you see.

In other words, he doesn't keep on with what he's doing at all. He does something else. Now, these are the lick-and-a-promise sort of thing and the way you handle the flow on a lick and a promise is just *bang, bang*.

All right. "Are you?" see? "When?" "How often?" "How is it?" That's just about the limit of it. You don't go any further into it than that. That's it. It's blown.

Now, you've actually got four flows that you could monkey with on this basis of keeping rudiments in and you'd find every one of them would trigger some kind of a rudiment.

Pc who's sporadically getting rudiments out has got a flow off that you were not asking about. Now, that gives us a question. On beginning rudiments, do we do something on this order? Do we say, "Well, all right. Are you withholding anything? Are you outflowing anything? Are you inflowing anything? And if you – are you holding off any inflow?" Yeah, it predicates that you very well might do something like that.

It would certainly give you all the pcs you would ever audit. Pcs have to outflow. They have to inflow. They have to prevent inflows, you see. And they often think they have to withhold. So that's the score.

It'd be perfectly legitimate, in other words, to balance out a person's flows with a simple question. Or with two questions. Or with all four questions relating to those flows. It's just what is this pc doing that he isn't communicating about? That is what the final analysis is. So it all comes under the head of a withhold.

But which direction is the withhold? See? Don't get lost on this and think that it is because the pc is outflowing that has got everything upset. It is because the pc is withholding his resentment and expression of that resentment that he is outflowing. You got that? See?

It is not that the pc is inflowing your auditing commands. It's the pc has not bothered to communicate to you that he sometime since has started to resist the inflow of your auditing commands, that he has not communicated. That is the button that is off, see?

The pc has noticed for some time that there was a cold draft of air coming in some portion of the room and the pc is trying mentally to hold off the cold draft of air and it is not holding off the cold draft of air that is going to do anything to the session. It is the fact that he has not told you about it and that you haven't found out about it that has got the session off

So you'd say there are four flows you could find out about in clearing up things and making lists read. And those four flows will just be the four flows that are the four flows. And of course, it's withholding data about any one of the four flows that is the most aberrative thing to the session. So withhold is still king, but you have to remember these other things that go along with it.

All right. You could straighten up a pc and keep a session running under almost any circumstances providing one thing were present: an actual desire to assist the pc and to keep the pc in communication with you. Not necessarily to communicate with the pc but certainly necessarily to keep the pc in communication with you. That is more important than communicating to the pc, although that has some importance, too. You see, you can be communicating to the pc, but the pc isn't communicating to you.

Now, an auditor can interfere with a pc's communication to him in various ways. There are things called obsessive withholds on other people. The cop is totally inspired in all of his duties in restraining people from undergoing dramatizations of these mad impulses known as kleptomania, homicide and other Latin phrases which all mean "a mess," see? And those are all getting somebody else to withhold.

Now, the tax collector, of course, is up against an entirely different problem and he has to get people to outflow. So if you have an auditor who has a tax-collector background, why, probably they keep the pc talking forever and if you have an auditor who has customarily been a cop, why, he won't let – ever let the pc say a word.

And actually an auditor can function so as to shut off the pc's communication line. Not to keep the pc going down a channel, but just because pcs mustn't talk.

Now, auditors always talk too much. That's one of the earliest criticisms I ever uttered of auditors. They always talk too much. An auditor always says too much. This is – this is true.

You look back over a session and you won't be able to find places where you didn't, ordinarily, speak when you should have, but you will find several places where you should have kept your ruddy mouth shut. If you'd just kept your mouth shut, it would have been all right. You can always find those as you review a session. So the point of the thing is, is some nice adjudication on the part of the auditor.

Havingness is defined as that which a person believes he can reach. And no-havingness is defined as something that a person can't reach or doesn't permit itself to be reached. So an auditor who is talking too much, too roughly, too crossly, interfering too much with the session appears to be a confused area into which the pc cannot reach and therefore the pc cannot talk into this confused area and the pc simply clams up. It doesn't matter how (quote) "interested" the auditor appears to be. It doesn't matter how the pc this or the auditor's

this or that or the other thing or whether or not the auditor is monitoring the session with his little finger raised forty-five degrees or sixty degrees. None of those things would count.

It's just that the auditor appears to be such an enturbulated area that the pc could not possibly reach into that area. If the pc has this sensation about the auditor then the auditor is simply making too much confusion for the pc.

Now, in that pcs very often can't have much anyhow, a slight confusion and too much yap on the part of the auditor can cut the pc's havingness down and the pc will dope. See, any communication was almost too much communication for the pc.

Well, that means the auditor is out. "Who would I have to be to audit you? What don't I know about you?" Processes of that kind. Clean this up, you see? But it's a very bad thing for an auditor to use the auditor's body in any way in the session, by the way. That's a good tip for you. It's just bum, bum auditing for the auditor to call attention, for instance, to his body as a part of Havingness. For instance, you're running "notice that" and so forth and call attention to the auditor's body. That's just poor auditing in general.

However, regardless of that, a rather interesting phenomenon can be observed with a pc who has believed the auditor is too enturbulative to reach into.

Just tell the pc, "Put your hand on my shoulder. Thank you. Put your hand on my shoulder. Thank you."

All of a sudden, the pc smiles and that's fine. You say, "All right. End of that process."

That's never good to use the auditor's body in this lineup at all, but I'm just giving you that as an example. Give the pc the illusion of being able to reach the auditor and the havingness of the auditor picks way up. And what is more demonstrable by that than the fact that he could put out his hand actually and reach into the auditor's zone.

The pc finds this out and all of a sudden he's got an auditor. Now, when you have people around who are terrified of anybody coming into their zone and they say or attempt auditing, of course, they put the pc on – in an odd frame of mind.

Now, the auditor who is trying to make the pc obsessively withhold "because everybody should withhold, because we know how to control life and we know how life should operate. If everything withheld everywhere, then life would be okay, wouldn't it?" Well, anybody who is operating on that as a sole modus operandi, of course, makes a poor auditor because every time the pc speaks, the auditor makes the pc guilty for speaking. And "Boo," you know. "How dare you?" you know?

"All right. How tall is a bear?"

The pc says, "Six feet."

And the auditor says, "HMMMMM. Are you sure you answered the auditing command? Oh, you are. All right. Good."

You know, builds up high ARC. [laughs]

Now, just as you have that mechanism, so you have the other mechanism, which is the auditor to – into whose zone nobody must ever reach. Nobody must ever reach into the auditor's zone because the auditor should run away. You see, the proper thing to do is to run away. And you will find the auditor changing the auditing process as a symptom of running away and doing many other things, all of which are classifiable under running away.

See, punish the pc for reaching or run away to keep the pc out of your zone of area. These are all basic auditing error mechanisms. And where those are going on, you will discover that the pc is more aware of it than the auditor. The pc just knows he isn't getting an auditing session. That's the way the pc sums it up. See, when he says something, it's never taken up. When he tries to do something, it's somehow or another handled. And when he tries to speak, he's prevented from speaking, you see? When he asks the auditor something, the auditor isn't there.

And all of this sums up to is, of course, out of communication in some fashion which then sums up for the pc of an inability to talk to the auditor which is unintentional. See, he's on an unintentional withhold all the time because he can't talk to the auditor. The auditor's putting him on a continuous withhold.

Well, if he's into that kind of a condition, why, of course, the auditor doesn't have the pc in-session and we get rather poor auditing. There's numerous mechanisms I could mention in this particular line, but those are the principal mechanisms which make an auditor have trouble. It's not that the pc gets these ideas but that the auditor fosters them.

Oddly enough, a pc – how you could ever have trouble with a pc, I wouldn't ever know. That does exceed my reality. When I tell people to sit down and do something, they always sit down and do it. Whether I have to pick them up and put them bodily in the chair or fast-talk them into the chair or sweet-talk them into the chair or whatever I have to do and then to get it done, they always do it, see. And it just never enters my head that they won't. So therefore, it really never enters theirs.

I'm perfectly willing to carry out the auditing command on the pc, see, whereas perhaps other auditors are more willing to have the pc carry out the auditing command. Now, I'm perfectly willing to carry it out on the pc. I have no illusions about the pc's bank. I know I have more control over it than he does. It doesn't scare me, so let's roll.

And the only thing that ever upsets me is when a pc starts out intentionally to give me loses. And I can even cure a pc of that. But I think that's the one thing that pcs do occasionally. They just set out to give you a lose, you know, give you another lose, give you another lose. I don't like that. And I'm not above punishing them. Drop them in an engram and say, "Well, it's getting awfully late. Don't you think we ought to end session?" But that's a bum thing to do. But then, I'll be human someday.

Anyway, the difficulties that you have as an auditor actually are basically of your own creation and they stem from using ritual to avoid auditing and various things of this character. And there is no substitute for just sitting down, taking the pc, sitting there and you audit his case and you use what you know about the human mind and so forth and putting it in the most optimum form and the most optimum presentation you can for that pc, just get that session

rolling, fix it up, find it, what it is, tape it all out, square it up, *bang!* There it is. Write it down on the auditing report.

The pc always says, "Boy, that was a wonderful session, you know. And *woooooee*, you know."

Ah, it wasn't any different from any other session, but it was for the pc. And auditing was intended and if that's all you intend to do with a pc is audit them and improve them, *voilà*, you'll always have good sessions.

But if you've got other considerations entering your mind continuously, of pcs should be better than they are, they should be worse than they are. This pc is too tall; we will make this pc thinner, therefore and so on. And we're not really auditing the pc but sitting back in some long stream of criticism of the pc of some kind or another. Well, I don't know what could happen. There'd be ten thousand things that you could do. It'd be impossible for your Instructors to enumerate the number of ways of doing auditing wrong.

The easiest thing in the world is to articulate how to do auditing right. Audit. Only one word. And it all really comes out all right. And you vacillate from trying too hard to not trying hard enough and so forth. And when you get too baffled and too confused and you don't know what to do about it and you just think it's all up in smoke every way you possibly can think of, why, just remember what I've told you. Well, audit and I'm sure it'll come out all right.

Thank you.

TRAINING: DUPLICATION

A lecture given on

24 January 1962

Thank you very much. It's not deserved; I've been very mean to several of you in the last day or two; very, very mean, with good results.

Okay. What is this?

Audience: 24th.

It's the 24th of Jan. AD 12 – 1962 – in the Year of Our Travail, especially yours.

All right. Now, I have some good news for you.

Going to sit down in this lecture, if you don't mind.

But I have some very, very good news for you, some excellent news for you; that if you were beaten over the head, tortured, treated with sarcasm, hammered and pounded and generally abused, you eventually decide to find out – you go past, you see, merely attacking Ron, you see, that breaks down and you go past that, and you say, "Well now, if this much fuss is being made about it, maybe there is a right way to do it," and so you try that for a while and nothing much happens. And then if you are hammered and pounded and beaten some more, then you decide to do it right, and then all of a sudden there's tremendous dawning on every hand that there was something here. And that has just happened on this good day of our Dianetics in 1962. This just happened.

Several of you in just the last session you ran discovered that 3D Criss Cross worked like crazy; just discovered it – brand-new discovery. Some of you have not made that discovery yet, but many of you – the majority that were having any difficulty with this – all of a sudden it dawned that there was something here and that it did work and that the session ran like a hot bomb, and all became suddenly well.

Now, the old-time student here who has had a great deal of training – I will say this, a great deal of training shows up along these lines – got results with 3D Criss Cross at once. The second it was presented to them they started getting results with 3D Criss Cross, which is quite interesting, see. They looked it over, they said "That's okay," they started listing and everything, and the next thing you know, they were getting results with it.

But those of you who have just come up to the nervous state of newly created IIb didn't measure up this well. And you've been floundering and falling on your heads now for the better part of two weeks. It has been pretty gruesome. I mean I have actually suffered for you. I didn't suffer for the PC. I can always straighten out a PC. If I can straighten out a PC, why, I don't worry about the PC particularly. But I suffered for the poor auditor, sitting there doing

exactly what he was told (if doing it backwards), and with Ron shouldering the total responsibility of it all going bad because it probably didn't work, suddenly waking up, deciding to do it right, and then the second step: finding out that it worked like mad.

Now, that is quite a win. That is a win for me. However, it tends to validate this system of activity, a system of activity which begins with apathy. See, you confront somebody in apathy, "Nothing works anyway and there is no way to do anything right anyhow. But if you did do it right nothing would happen, because there isn't any way to do it right because nothing would happen if you did do it right."

Now, it is sometimes necessary in action to throw a bit of a hand grenade into that particular type of activity and just say "Yow, yow, yow!" outrageously, you see? Say, "Well, look a'here. You're only writing on one side of your auditor's report."

And the person says, "Well, yes, of course I'm only writing on one side of the auditor's report, and all auditors do, don't they?"

"Well, they mostly do, but you shouldn't, you see?" And then, "You should have known better than that, see? It has never been published or released, so you should have known about it." Expect the student to have picked it all up telepathically, expect the thing to have sort of leaked in through the pores by association with the tile, or something like that, you see? Doesn't much matter.

Now, this is very pertinent to you in the training of Class IIs. When you start training Class II auditors you should recognize this for what it's worth, and it's a little lesson that I could teach you on the subject of raising hell. That's the title of the lesson, "Raising Hell."

Now, there are two ways you could get somebody out of apathy, see? They don't know and there is no right way to do it and there are probably no results anyway. Now, there's two ways to approach this problem. One is on the route of making auditors and the other is on the route of auditing. Now, the way you make auditors differs entirely, of course, from the way you audit PCs.

There are two routes here that we employ, not necessarily for the betterment of cases but for getting the job done. Of course the net result of all this is the betterment of all cases, but there are two routes that we actually employ and you should recognize these as distinctly different routes. And the first of these is where a person is concerned as an auditor. And we have always had a bit of line on this, and you found in an Academy in the old days where they didn't have this policy in force they made very bad auditors. Wow! Terrible! And that was this type of an approach: "Well, we know you can't audit because you have a case, and we'll try to patch your case up, and if we get your case up, why, then maybe some day you will be able to audit." That type of approach does not work in the making of auditors. Just write it down to that.

You see, if we admitted that the auditor had a case then nobody on this whole planet would ever be sprung. Do you see that? So this is just a piece of arbitrary snarl. Do you see? This datum must not be true! It isn't that it is true or isn't true, it just must not be true! See, there's no logic to it at all. It just must not be true, because otherwise you would never bail anybody out of anything because there would never be anybody to audit him. And true

enough, over the years watching Academies that practiced the idea, "if we..." – the D of T, if he had the idea that "If we just processed all these students and somehow or another if I just gave them all a little bit of a case gain, and I got them all in shape so they could confront their PC and if I could get their cases from getting in their roads, why, then I could make them into auditors."

And this goes out as far as this: "If we only let 'good' people into the Academy..." We don't know what this "good" person is. He lurks out someplace under the rhododendrons or someplace but he never seems to have come near any organization to date, this "good" person, you see? "Now if you could just get 'good' people," that's the other song you hear, but that's just a little bit of a downgrade. Immediately after you hear this "good" people action the next tune that you hear being played on the out-of-tune street piano is "If we just could audit all of the cases in the Academy, why, then, you see, they would all be able to audit." And they of course have propounded a piece of nonsense.

You see, if there's nobody to audit all these cases in the Academy, how the hell are they ever going to get audited? And you don't have an Academy at all, you have an HGC. So this quickly defeats itself as a philosophy.

So very early, I think it was about the 7th ACC, this philosophy was entered into the training of auditors. And the philosophy is workable; it is not necessarily true, it is not necessarily easy, it is not necessarily kind, sweet or good. It simply works and it is in a workable line, true. But it's only a workable truth. And that is, simply, "Auditors do not have cases," period. That is the one thing that we must insist on.

Now, it goes as far as this, that if he's slightly warm and you can see a mist on a mirror held against his mouth, [laughter] he or she is in shape to audit. If they can be dragged to the chair and if an E-meter can be propped up in their vicinity, they're in condition to audit. This goes to a total extremity. They could be sitting there with both legs cut off from a street accident, but they are in shape to audit. That's it. That's just it.

It's like when nations get down to the last – they're getting the conscripts from their 14-year-old class, you know, and the 72-year-old class and the 14 year-old class; anybody who dares walk back in through, you see, from hospitals or anything else, anybody who dares come anywhere near the assembly officers who are putting together new regiments, you see, is instantly just stamped hugely "FIT FOR COMBAT," see? We don't get it from that particular thing, but it just gives you the idea.

Now, when time goes on and a nation gets more fit to work, they start then saying "Well, this person is not fit for combat and should be audited," and that sort of thing. But let me call something to your attention: that we are not a nation but we are certainly a people, and this is very germane.

We are not in that condition today where we can say "Well, let's take this person and let's audit him for a while, and maybe he'll learn how to audit some day and – you know, if we get his case out of the road, why, maybe he can audit." We're not in that condition. We're not that wealthy. See, we're just not that wealthy in people, nor are we that far advanced along the lines. So this datum not only has been true but will be true for quite a while.

Now, oddly enough this is a workable philosophy, totally workable as a philosophy. It does work, and today is one of those days when I have seen this philosophy work. Some people with Class IIB who are so far from clear they would have to have a moonshot to comprehend it (I'm talking about cases now, see, just casewise, bluuuhh! see?) have actually been driven in toward the absorption of data, the regularities of practice, to an actual recognition that what they were doing ended in a very, very powerful, fine gain for the PC, and that they could do it. That's much more important. Now, this is one of those days when that philosophy has worked out.

Now, I don't say that you're in horrible condition. I'd say when you get some processing and so forth you will probably get up to being in horrible condition. [laughter]

Compare the way you – the condition that you were in a couple of trillion years ago, or 500 trillion or something like that, whatever the outrageous figure might be, and you're not in such good shape these days, you know? And for you to actually start putting together a being – not a human being, anybody can put together a human being. You just take some electronic shock waves and some implants and kick him and destroy all their self-determinism, then destroy other-determinism, and then racket him between destroyed self-determinism and destroyed other-determinism, and you fix him up real good and get them to accumulate all masses and never as-is anything, and you've got a human being.

All right, so you just – it'd be no virtue to make one of those. Let's move it up just a little bit further – but to make a functional being, to take a big seven-league boot stride in the direction of making a functional being. Now, that has happened, and that's just happened just in the last couple of days. This sort of thing has been coming up. I'm very happy about this because it's far more significant than you might realize at first glance. It means that the thing can be bootstrapped.

Now, we expect somebody that's been under training for a half a year of heavy duress and so forth to be able to pick up a process and be able to do it, but I was very proud when those older students just did that and were able to do that and just kicked it off from the starting line and that was it.

Well, that was a little victory in itself, but it was not particularly a victory for this other philosophy because they have had good case gains and they are a long ways from where they were. The other people who have just come up to Class IIB had not had very significant case gains yet and they were able to do it. Now, that was very important.

Well, you see, this philosophy works, and it's a distinct philosophy: If he's warm he can audit. Get the idea? And that you can actually bring enough pressure to bear and enough training to bear on an individual so that he actually can do a properly laid out comprehension and action as far as the PC is concerned and arrive with a tremendously significant result.

Now, that's a victory, because if that weren't true we as a people would never make it. We'd just never make it, that's all. There would be a few able guys and they would quickly go out the bottom through auditing seven and a half hours a day. I've already scolded two or three Saint Hill graduates who have left and who all of a sudden sat down to a grind of auditing of about seven and a half hours a day and just didn't do anything else, didn't really bother to train anybody or try to pick it up or push it through. They were just going to audit people,

audit people, audit people, audit people – well, they can't audit enough people to do any good. It's just a spot in the ocean.

Now, if you looked around you would find out that there aren't on earth at the present moment enough auditors to give enough sessions to enough people to make any significant gain in the society at large in the next century. The mathematics are all against it. If you never made one more auditor, if we just took the auditors we had at this particular moment and everybody audited hammer and tongs, seven and a half hours a day for the next ten years or something like that, you add it up and you compare it to the world's population and you get a drop in the bucket. It's a discouragingly small amount. And if we never trained another auditor, the auditors that had been trained would have long since gone by the boards before they even got halfway through the population of New York City. You see, the mathematics are dead against it.

Don't think that you, with your auditing, cannot make a change in the society. You certainly can, you certainly can, but you would be making actually a rico and a pobre society. In other words, you'd be making the society of the rich and the poor, the aristocracy and the slaves, and so forth. It wouldn't help but do that, because of course you could pick out people here and there and put them into terrific condition and never fix it up so they're ever backed up, see? Well, they – oh yeah! They've got a big zone of influence, that's for sure! And they'll get things done, that's for sure; but let me assure you they would not, all of them, be tempered by the peculiarities that I suffer from which is that man should be free. Not even after you'd audited them would they suffer from that peculiarity uniformly, let me assure you. That just wouldn't be done.

And give it a decade, give it two decades, something like that, and they would be starting to get a little bit impatient. Enough victims would have been deposited on their doorstep for them to start erecting the stocks and the whipping posts. The next thing you know, we'd find we had two or three classes of citizen. We would have the clear and the slave, you know? We'd divide the whole society up in some kind of a line. It would just be forced upon us to do this.

That is actually a very dangerous direction in which to proceed because that direction has always led civilizations into decay and chaos. There is no such thing as a successful civilization which is made out of slave masters and slaves. I assure you that it is not successful. It's never been successful and it never will be successful. Now, it's attractive and it can be practical but it's not successful. It has no great duration and it doesn't make anybody much happier.

So this is quite interesting from a point of view of a long look. Very few of you ever give a long look to Scientology, you leave that up to me to a marked degree. Well, thank you; but when I look in the crystal ball and look up the line a century I can see a number of pictures presenting themselves, a number of aspects of what might come of all this. And don't think you can fire a shot of this volume and magnitude in a planet of this type without creating an effect. It might be a slow effect, just to the degree, you see, that it is practical. Its speed actually is determined not by the inertia of the masses but by the efficiency and effectiveness of what you're doing. And you can't let go of something like this in a society or a world of this

type or size without having repercussions that don't just go up a century. They'll be still racking up the line until this planet is a billiard ball.

Now, it might become a billiard ball sooner than you think. But not all of you will forget Scientology even if you go to another planet. So you see we've never fired this shot silently or without effect, you see?

I'm not degrading what you, yourself, as one person can do. But if you're going to do the job fully and wholly or do the job effectively, then the job will be done rather swiftly; and in doing the job relatively fast you save many of the cataclysmic aspects of what might happen because of the entrance upon this scene of Scientology. In other words, the more rapidly you do it the better the job is done. It's just like auditing a PC.

You see in one PC the world at large, you see? He is the microcosm and the world is the macrocosm; and you see that what is happening to a PC – you know that if you audit him slowly and poorly he makes thuhh, and he goes duhhh, and he gets a little bit better and in about two or three days he says, "Well, maybe I'll make it. Maybe I'll bla-bla-blah ..." and all of a sudden he doesn't feel so well, and so on; he didn't get much of a result and he slows down and goes into third gear, and he puts it all on the back burner, and so forth. Well, those fits and starts would be the fits and starts of the track of the civilization in which we live if we did not approach this problem effectively and do it with fair effectiveness.

And part of that effectiveness is make enough auditors. Now, you're not enough auditors. You just aren't enough auditors, that's all. There just aren't enough. We're not against a quantitative proposition here particularly, but when I say "auditor" I mean somebody who merely audits. You have to combine in your repertoire the ability to train auditors and then you're enough, then you become enough auditors, don't you see? Right away, just the people in this room would be enough auditors if they trained auditors. And providing you did your job superlatively well and you knew how to make an auditor do his job superlatively well, you see, if you knew that, then you – with that kind of progress you would wind up with enough auditors. Then you could do the job, you see? That could be done. But not otherwise.

I know I myself at times have felt rather muscular – mentally muscular – and have stood up baring my breast to the tirades and freakeries of fate and fortune and have said, "Well, this is enough. Just – I could do this all by myself, you know, just standing on my head, you know? No help at all. I'd just do it all by myself. That's easy, you know?" I just felt tough that day, you know? And before noon I didn't feel so tough. [laughs]

Now, in my particular levels of training and background I would have perhaps, not necessarily, but perhaps more reason than you to believe that I could do the job all by myself, see? I have done jobs all by myself and they were not necessarily easy jobs. Now, I did get away with them. I don't think I could do this one all by myself, see? Different type of job, it goes out in terms of longevity. It embraces many more lives and beings than anything else that's been attempted in this corner of the universe for a very long time.

Well now, the better it is done, the more rapidly it is done, the more effectively it is done, why, the smoother forward track it will have.

So therefore you are busy learning to audit. You are busy learning to audit and in that you are making progress and that's very, very good progress. We do not have here the facilities much to train you how to teach auditors, but by training you we can certainly give you a model and you'll know how to handle somebody else when you're training them, and maybe you'll profit by some of the mistakes we have made.

But don't try to profit in the direction of being kind. Don't try to profit in the direction of "If we just process him then he will be able to audit." Don't profit in that direction because there's no profit to be had there. If he's alive he can audit. He walked into the PE Course, he is a long-term Christian Scientist, until he got so many overts on Christian Science that he became a Rosicrucianist, and then had too many overts against Rosicrucianism to remain anything but a theosophist, and has arrived to prove that Scientology doesn't work. You can make him audit. You could teach him to audit; you really could.

But now we're getting to a dividing line: Why that many handicaps on the auditor, see? Why go quite that far afield to teach somebody to audit? No, there are people around you at once, in your immediate vicinity, that could be taught to audit well and those are the people to put lots of time in on. They are the people to put time in on, because if you make them very good auditors, of course they can make auditors. And it is better to have – right now, the way we're going – it is better to have a lot of crackerjack auditors than an awful lot of very mediocre auditors. See, that's better. And you sometimes look over "Who are you going to spend time on?" Well, the natural impulse is to take this bird I just described who has so many overts on Christian Science that they had to take off into Rosicrucianism, got so many overts on Rosicrucianism that they became a theosophist, and have wandered in to prove that Scientology doesn't work. Well, now this character...

Well, unfortunately you could make a tremendous error, and do you know that instructors will do this? Even an instructor here, now and then, catches himself; fortunately he catches himself doing it. He's so outraged by the performance he sees in front of him that he gives that person more time than he gives the apt auditor who needs just a little bit more coaching to do a very fine job. Instead of that he'll give this total dud, you see, a tremendous amount of time and pressure trying to get them up to a high level of mediocrity.

Remember that, when you're training auditors, take those that are very apt and give them most time. See, that's the way to go about it; and let the others drift along. Let them drift along. They've got a certain rate of absorption. And it isn't that you should let them go. You shouldn't let this fellow go; oh no, oh, nothing like that, see? You might put him... downgrade him a little bit in the zone or area in which he's being trained but you don't forget about him. But he plods along at a certain rate and that certain rate has very little to do with anything you're trying to teach him. He's just kind of slobby.

For anybody to assign the length of time it takes for somebody to learn something is adventurous. It can't ever be factual. I'll give you an experiment in this. Take one datum and try to teach it to somebody with the old educational processes of the 17th ACC. Those were very interesting processes, by the way. Try to teach him this datum. Take any datum in Scientology, say it to him and have him repeat it. This is the simplest of all these; just say it and have him repeat it, you see, and say it and have him repeat it, and then say it and have him tell

you what it is all about, you know, by giving you an example of it. You say it, he gives you an example of it. That is the wildest thing you ever did with anybody. That is quite incredible. As simple as this mechanism is, it has considerable horsepower and it is a very interesting thing. I have seen that datum move a very tough case, by the way. That was what was interesting about those educational processes. They were very limited in that they didn't move very many cases, but they could knock aside this "no effect" proposition on training.

Now, I recommend those to you. We actually don't have any students bad enough to start chugging in with these educational processes, and assign somebody to say a datum and he's supposed to say the datum back, and then he says the datum and they make an example, or any of the combinations of those processes. There were about three of them. But they're awfully good for the fellow you have despaired of utterly; they are much better than auditing. You assign a student to teach him with this system, you know? You of course don't have to use Scientology data. You can say, "The cat is black. All right, now tell me 'The cat is black.'"

And the fellow says, "Well, there are a number of instances I could think of where a cat wouldn't be black."

And you say, "All right, good, good. But now, now just tell me this one datum, 'A cat is black.'" And you'll finally get them to actually be able to – you say something, they can say something.

And then the second grade of that is you say something and they can understand it. In other words, let them duplicate the words and then let them duplicate the understanding. You in essence are doing this in training, only you're doing it live. You see, you're doing it all the way. You read a bulletin and then you go in and see Mike. Of course some of you – some of you wish you hadn't but that's all part of the game. And – I didn't manufacture Mike's 3D-terminal package [laughter], but I, I probably couldn't have done a better job than he's done.

But look a-here, he's not trying to be unreasonable with you; he's just trying to get you to do one thing – that's the one step of the educational process.

In essence what is happening is this: I have said something to you and then he's trying to find out if you can duplicate it. And don't think this isn't therapeutic. It is! It jolly well is! But we're not interested in it from a therapy line. We're interested in it from the basis of the communication of a datum, and you get, finally, so that you can actually take a datum and so on.

Now let's look at this. This process has been going on for six months or more with some of the older students here. And 3D came out incomplete, not well stated, just brrupt! you know, and that's it. And they did it at once and got results with it at once. In other words, it took them – oh, perhaps 10 minutes to understand it; this is length of time to look at it and read it. I mean it was that fast, you see, and they could put it into action and they could do something with it, and all of a sudden this happened. Well, this doesn't mean that they've become puppetized, it simply means that their ability to duplicate it has now gone over into a second stage – understand – because of course they weren't given any data to duplicate.

Now, you look at the original issue of 3D, of the original mention of 3D that was given to you. Why, the first mentions of it are just some scribbles in the case histories, you

know, in the case folders, the first mentions of it, and then there's a rather incomplete description of 3D Criss Cross that doesn't amount to a hill of beans, and then there's class rumor.

Well, what I'm showing you is there was practically nothing there to duplicate in the way of wording, and yet these people had actually gotten to this point, where they not only could duplicate the datum that was said to them but they could get a – what this was and they could understand what this datum was and put it into use. Now, look at that as a considerable gain, and look at it for just what it is, as a gain, a training gain. And that's quite remarkable.

Now, the comm lag on others who hadn't had that much training has been something on the order of ten days to two weeks, to first duplicate the wording – and complain because there wasn't any wording, don't you see? They were still in a step where they had to have the exact words. And then finally, it took an amplification of a bunch of exact words and a lot of individual notations in case folders for them all of a sudden to do what they were doing and get a result, and the understanding is dawning. See, that's slightly different action.

Do you see this as a training mechanism? Do you see where this winds up as a training mechanism? Do you see what its stages are? In other words, your first gradient of the thing is no comprehension of the words. This is your first gradient, see, no comprehension of the words. Now, it's quite shocking to find that morale is suffering, and all sorts of things are going wrong in some HGCs, by being made to exactly duplicate a bulletin. Do you see where they are there? Do you see where they are on the training step?

It would not matter, by the way, as far as their ability to learn was concerned – let's look this over. Let's say we were just trying to increase a person's ability to learn. Learning rate – that was the only thing we were trying to increase. Let's just think of that, see.

It wouldn't matter if we were teaching them automotive assembly books; you know, manuals used in Detroit for the assembly of automobiles, to a person who is never going to assemble an automobile and has never assembled one and hasn't even played with toy cars. See, it wouldn't matter if we were doing that. Or the "Works Progress Administration History of Socialism and its Development in the Northern Part of Arizona," you know, there's probably volumes of books on that. They paid them – they paid them if they got out some stacks of paper to – on the Works Progress Administration. They'd get somebody who was out of work, so they made sure he didn't do any because otherwise he would have been in work, and all he had to do was pile up old clippings and papers, you see? They didn't have to relate to anything. And then at government expense they were published between very thick covers in very heavy volumes, and they were quite available for a while. You could get them to hold up corners of desks where the leg was missing, you know, and they were very useful; but they were the most non sequitur nowhere as far as data was concerned you ever cared to cast your eye over. We could use that, do you see?

We could use the "Legal Code of the Early Church of England as Interpreted by the Catholic Church." We could! I don't care what you're using, as long as there's some data stated. Doesn't matter how much dunnage or how little dunnage as long as there's some data studied. Is data there to study? You would still do this. You'd still use this as learning rate.

You see where we are? See, we'd read it off. We'd have the individual sitting there and we would read it off to the individual. This would be the stylized auditor type of approach on

this, and we would say, "All the churches of Northumbria were deprived of their windows because of a window tax which was three and six per window per sabbatical." ("Sabbatical." That's what it said, see.) And we tell the individual, "All right, say that." You know? "Now, what did I just say?" you know?

And he'd say, "The window tax – window tax? What about window tax is this? What's sabbatical mean? What's this? Yeah. What book are you reading, anyway? Where did this come from? What part of Northumbria are you talking about?" You get all this confusion? And you've got an example now of your first step.

As you try to merely get him to repeat a line of sounds (you don't even call them words, you see?) he gets tremendous confusion. So your first step – your first state in which the person is in is one of tremendous data confusion which blows off at any attempt to duplicate data. So it blows off at once that there's an attempt to duplicate data on his part, he starts blowing off this confusion. "Northumbria? What Northumbria? What sabbatical? Two and six? Two and six window ta- but who would have been taxing them? Uh – who – what tax? What is a tax? Was there anybody taxing anybody at that particular time?" Now you get down to the communist level of this, we would have had a communist cell meeting to discuss whether or not capitalists should exist, you see, because we've mentioned tax.

In other words, it just would have hung up on some button some place or another, and would have come into a total collision with this button, and from there on we never would have moved off the button.

This is of tremendous use, by the way, when you're handling committees. You know, the art of getting something done through a committee has never been perfected. This has never been perfected in the history of man. If you don't want to get anything done, appoint a committee. And don't put anybody on it who has an individual responsibility for any piece of its work.

Just give it in general to the committee. Now, now we've really got malfunction in screaming exclamation points, malfunction from here on out.

Well, similarly, the way you can park any committee or any board – and some of you might want to know this sometime; it's sometimes of great moment for you not to have something discussed, and not permit them to come to any conclusion or pass a motion. Committees, being only a medium of half-thought-out averages anyway, generally will arrive at the wrong decision about most anything. You know, they haven't got much of the data, and they're not really interested, and nobody there is responsible, and they sort of just want to get rid of it all, you know? And they get into that state of mind, and they're suddenly discussing something that is a very, very important point that is going to affect the longevity and management of this company or group, and man, you just are not about to get something like that.

Now, the first thing is to introduce – the way you want to do this is just to introduce any button that will cause them to take zero responsibility. Just introduce any button that will reduce their responsibility. Anything! It doesn't matter. Give them a restimulative word. Just do it by symbols. You see, you're trying to paralyze this committee, that's what you're trying to do, you see, just overtly, so they won't make a wrong act.

They say, "Well, I don't know. Shouldn't the pay plan that is being brought up someplace – shouldn't the pay plan – this pay plan – maybe we could check with the guy – it's being prepared by the accounts department. Pay plan, shouldn't that be thought up by someone – pay plan?"

And you say, "Well, yes." You can just see it now, some outrageous damn thing that nobody could put into execution, you see? Nobody's particularly interested in this thing, so ...

One of the principal buttons that is used in this is the word "study", see, and that just hangs everybody. Just introduce "study" into the thing, you see? Bang! And it just hangs the works here. And just say, "We'll make a proposal that the matter be given further study," and hit "study" hard. And you get parked right there. It'll just stop. It's gorgeous! You don't have to introduce like that. You can say something, "Well, wasn't the last time this type of proposal was proposed, wasn't that – " you know, there was a fellow by the name of Bellham who was just hated throughout the whole organization, you see, just say this word and everybody went Eeeee! and so on – you say, "Wasn't that last proposed by Bellham?" Everybody of course takes no responsibility for it instantly, you see? And then they will get into a discussion about Bellham, and you're all set. [laughter] But they just derail on a button like that!

And you'll see somebody do this, you'll see it when they're studying like this. This fellow's got lots of overts on the Sabbath. So you say "sabbatical," he's wondering if this is connected with Sabbath, and you just get into a total discussion of "Sabbath. Is it right to have a Sabbath? Where was the Sabbath originated? Really wasn't it a pagan introduction in the first place?" and we go on and on and on. It has absolutely nothing to do with what we're studying. He'll derail right at that point. That's very interesting.

Now, you'd think this person would have to have lots of auditing to get rid of this. No, there is another system that gets rid of this and that is it sort of teaches him that he can ride past these hung points, see, that the hung points don't keep him from duplicating. And he gradually learns this, you see? These buttons that he's got really don't keep him from duplicating something. See, even if it's upsetting and he doesn't like it he can still duplicate it, and eventually he begins to see duplication in its proper light. Duplication is duplication. It is not running out buttons, it is simply duplication. It just is itself, that is all.

Now, you couldn't see at all unless you could duplicate. You've got to be able to look down that row of doors or something like that, you look down the row of doors and you see that there was a row of doors there. And – you can play this on some PCs in processing with the most fantastic results. You just say, "Well, what's over there along that wall?"

And some fellow will say, "Oh, uh – uh – must be students' lockers. Those doors don't fit very well at the top, do they? Well, they must be some kind of students' lockers. They were probably put in there for some purpose or another." Then all of a sudden he'd say, "Well, do you have a carpenter working for you?" What did you ask him? You said, "What's down that wall?" you see? Actually all he's got to do is look down the wall and say "There's some doors there," but he always does it the hard way. Just watch him at first glance and he will just do it the hard way. That's the way it will roll off of this whole operation.

You ask somebody, "What is over your head?" just ask them that sometime. "What is over your head *right now*?" Say it very meaningfully so that they really understand that it's

over their head, and you mean now. And brother, you're going to get some of the most interesting discussions you ever heard of. Things which are threatening them, and so forth; well, they're not quite sure. Some girl says, "Well, yes, I know my hair looks rather messy, but uh ..." You get all sorts of oddball, offbeat derailments of the whole thing. Well, what's over your head right now? The ceiling, of course, is what's over your head right now. They always manage to miss the obvious. And factually, it takes a lot of drilling before people will observe the obvious, and that is all there is to that step, is obnosis: the observation of the obvious.

"What is in front of your face?" just ask somebody sometime who has low havingness and can't reach much. Just ask that question, "What is in front of your face?"

Of course, the obvious answer is "You are."

But, you know, you can get some of the most conditional and oddball responses you ever want to hear of from simple questions of that particular type. Well, that's because the individual isn't really adding significances into everything, it's because every time he thinks of something significance plunges in and he thinks he's got to pay more attention to the significance than he pays to what was going on.

In other words, what is happening to him right now, you see, is less important than what might happen to him or what is coming in on him or the consequences of all of it. He's consequence-happy so he's really not in present time at all.

Well, when you take this parking button called "study," people tend to go sort of "Ummmmm," you know, on this anyhow, and that's a very good button to work on because it's inflow of data, therefore the duplication of data, and no more important than that, just the duplication of the datum spoken. You understand, I'm not now saying a datum like "there are ... a problem is postulate-counter-postulate."

I'm not talking about a significant datum. I'm talking about any datum, either significant or nonsignificant. You could say, "There is one Christmas in a year," and some people will promptly say, "Well, that is insufficiently important. Of course everybody knows there's one Christmas in a year." You'll get all kinds of chitter-chatter and so forth. The only thing you've asked them to do is repeat this after you, what you say.

You say, "There is one Christmas in a year."

And the person would say, "Of course I know there's only – any damn fool knows there's only one – what – what kind of a thing is it – you think – what – what is this all about?"

And you say, "Well, just rep- all right. Good. But – just – just – let's just repeat this after me, There is one Christmas in a year."

"Well, there's no sense in it. Of course, everybody knows that there's one Christmas in a year," and so forth. And they're into the terrible non-significance of it, you see? You stated something sufficiently non-significant that they can't do anything about it. There's nothing there to attack and they just get terribly disappointed, you see?

You say - you say, "Most men are male." You know, "Most men are male." Or you say, "Women are females."

"Women are females. Well, of course we know most women are fe – what are you talking about? Naturally," and so forth. "Naturally, of course, everybody knows that. What – what are you saying that for?" And you will get – all of a sudden the fellow becomes very curious about you, and what your motives are and what your intentions are and what you're trying to do here.

Well, it's a fantastic proposition. You just say, "Women are females." "There's one Christmas in a year." "Days begin at midnight." Some people would not realize that, you know, and they'd say, "Oh, really? Do they?"

And you say, "Well, all right. But 'Days begin at midnight,' I just want you to repeat that. Just 'Days begin at midnight.'"

"Well, that's a funny thing. I never knew that before, you see?" And they've just flown off into interest, see? And they're all stuck on the interest, you see?

And you're just saying, "'Days begin at midnight.' That's what you're supposed to say."

And the fellow says, "Ah, well... Why should I go into that, you know? 'Days begin at midnight....' What are we studying here? Is this a lesson in Scientology or about time? Or is time part of Scientology? Are there any axioms about time? Oh, I see! Oh, I see! Yes, I see! The days begin at midnight! And it's – oh, what axiom does that refer to anyway?"

And you say, "No, no. Just repeat after me, 'Days begin at midnight.'"

"Yeah, but why?"

You get the whole idea, see? In other words, they have an automatic reflexive mechanism. They're going on a total basis of stimulus-response and nothing else. Just total stimulus-response. But what's responding? The person or a bank? And this is just another way of digging up a thetan.

Eventually you get to a point where the thetan responds. You say, "The day begins at midnight." He says, "The day begins at midnight." It doesn't bother him any if the day begins at midnight or the day doesn't begin at midnight. Has nothing to do with it.

You just say, "The day begins at midnight."

He says, "The day begins at midnight."

"Good!" All right. You say, "Christmas comes once a year."

He says, "Christmas comes once a year." Right?

Now, people who don't like this and are still enturbulated on it say, "Well, you're making a slave there," you see, "that's slavery," or something like that. "That's something very deep-seated and very significant. There's something very significant about this operation. If you can get a person to do this, he of course thereafter is a slave, see, obviously!" – except the data is never borne out. The only time you really get a person to talk back sensibly is when he can do this, because he can observe what he's talking back about; and up to that time you get people talking back about things that aren't happening, and that's very disconcerting.

Somebody comes in and raises hell with you because of the hussars that are all over the front lawn. And you go and look, you don't see any hussars on the front lawn. And you ask him to go look and see if there are any hussars on the front lawn and he says, "Why should I look? I just know."

And you say, "Well, that's fine. Well, let's go look at the front lawn and see if there are any hussars there."

"Why should I do that? Are you doubting my word?" And now we go off into a discussion of whether or not you think he is a gentleman. Do you see the various excursions that we get on this?

He starts with some unreasonable premise and winds up with an idiocy. All you're asking a person to be able to do is simply duplicate a datum. You say, "Christmas occurs once a year," and he says, "Christmas occurs once a year," and it doesn't bother him and it doesn't not bother him.

Now, at the same time this individual can turn around and do something else which is quite interesting. This individual can cause himself to be duplicated. So, he has a brand-new thought all of his own little own, and he said, "I'm going to paint this house green." And he goes out and he says to somebody, "Paint the house green."

And the person says, "Um-hmmm-mmm. Viridian, eh?"

"No, no, just green."

"Oh, well. There's lots of greens, you know? Green, there's lots of greens. There's lots of types of paint, too. What paint store do you deal with? Well, I tell you what I will do. There is a house over in the next county that is painted a particular shade of green, and we will write them a letter and find out what paint company they got the paint from and what shade it was, but of course you will have to go over and take a look at that house first to find out what color that house really is."

And you'd say, "No, I want this house painted just common, ordinary, run-of-the-mill, just green."

And they will try again. They will say, "Some paints don't last as long as others."

If you can do that, you yourself have developed the ability to get yourself duplicated on your own ideas. And you'd be surprised; if you can do this well, you'd be surprised as your ability rises how the duplication occurs with the greatest of ease. You go out and tell somebody to paint it green, he pulls a color card out of his pocket and says, "You want this one or this one or this one? You want that one? That's it. All right." He goes and gets the paint and he paints the house green, does a good job of it and that's all fine. This cuts down randomness like mad.

In other words, by learning to duplicate you can get into a state where you yourself can be duplicated. Now, this is not exactly a processing activity. This is the process of life and livingness that is most significant. And it's havingness like mad because you start to have the things that you're surrounded with.

All right. Beyond duplication comes understanding. Understanding comes after duplication, not before. Now, how much understanding do you think this fellow did when you said "Christmas comes once a year," and he said, "Well, why are we taking that up? It doesn't seem to have very much to do with the process," and so on and so on. Well, you'll find out nearly everything he's asking you summarizes into not understanding, or trying to understand. You've told him the datum "Christmas comes once a year"; this is the datum you've told him.

Now, he tries like mad to understand that datum and he can't grasp it. He'll just work himself frantic trying to understand this datum, to understand what datum is there, understand your motives in trying to get him to understand this datum, trying to understand what the datum applies to, try to understand why there is nothing there to understand; and you'll find out most of his "Ooooooo-oooooo-ummmm" is just some kind of an effort to understand.

And this is why study is such an important button, because that's "getting somebody else to understand relieves anybody of any responsibility for understanding." Every government in the world at the present moment is totally seized with this as a mechanism. This is their operating mechanism. They don't have to understand anything because they can always have it studied, you see? And that just absolutely stops any progress in a committee or anything else. You've stopped it instantly and at once. You say "It's going to be otherwise studied so therefore you don't have to duplicate any part of it; and therefore you don't have to... if it's going to be studied, you don't have to understand any part of it and therefore all we expect from you is to execute something which you have no comprehension of and haven't found out in the first place." And you get the usual democratic processes when they are totally abused. They're pretty mad. See, democracy does not work in the absence of understanding. It can't work.

Now, here's your second thing, then. If responsibility for understanding depends on personal study – and it does – why, then of course you have raised the person's ability to comprehend, or understand. Not only does Christmas come once a year, but now beyond that point he is capable of understanding and studying "Christmas" and "once a year" and what this refers to. Only now he's capable of finding out that it's a totally unimportant datum.

Up to that time it might be important, it might not be important; God help us, we never would be able to find out whether it was something we *had to know*, or something that we didn't much care about, or something we're liable to be *shot* because we didn't know, or something that we'd certainly better forget in a hurry, or something that goes along with the fact that most peoples have shoes, the bottoms of the soles of which are dirty. You see that?

So classification of the importance of data is the thing which lies up there as the second step. Well, that's your third step. Your first is non comprehension, non duplication, confusion. Your second one is merely the ability to duplicate. And after that we get the ability to comprehend, to understand, and therefore get the ability to observe. Judgment lies in that field and this is a road to judgment.

Now, nobody has really ever bothered to teach anybody judgment before in the last 200 trillion years. And you're not going to find much judgment in any bank you've got. If there had been much judgment in it, you wouldn't have it as a bank. Let's look at that. If this

valence had been capable of enormous study, differentiation and judgment, you wouldn't have it as an aberrative valence. Isn't that so? So this has been a scarcity on the track.

So you have here in essence, a new skill. It's going to be very difficult to process it into somebody because they've never had it. They were capable of observation once, but how did they observe? They always put a curve on the observation in order to make a game out of it or something like that. Pure observation, pure study, pure duplication, pure comprehension, or pure judgment have never been a study in the field of philosophy. They just don't exist. You just will not find these things as subjects of discussion, even. They are touched on very slightly by the Platos and Socrateses and so forth of yesteryear, but just touched on very slightly. Totally avoided in religions and religious philosophies. Oh, they're just avoided like mad! Oh, it's just like showing them a snake spitting in their face, you know?

Huuuuuh! Comprehension, understanding, duplication? Oh, no, no, no, no, no! That's what you're not supposed to do!

And of course we know what the source of all this is. The greatest overt there is is enforcing a noncomprehension. That's an overt! You don't believe it? Take somebody sometime, you say, "What have you done?" Oh, this girl has got withholds, she's got crimes, she can't wear any of her frocks because they're so bloodstained, you know? She doesn't dare reach into any of her purses because of the asps she's stacked away at one time or another, you know? She can't even open up her own medicine chest with any feeling of security because of the arsenic coming out, you know? And we say, "What have you done?"

And she says, "Done? Well, I ate dinner."

And you say, "Well, what have you withheld?"

"I haven't withheld anything."

"All right. Good. Well, what have you done?"

"Oh, I sat down here a while ago."

"Good. Well, what have you withheld?"

"Nothing. I never withhold anything. My life is an open book."

And you go utterly mad trying to security check this person because you can't find any responsibility on which to hang the Security Check. You've got to increase their responsibility before you can find any withholds. They're there but they're totally muzzled, you see, by the irresponsibility of the attitude of the PC. You see, one of the ways you tell if a case is gaining is whether or not it's getting more withholds off. Well, that's just a way of saying "Is the case gaining in responsibility?" Yes, the case is gaining in responsibility, because they're getting more withholds off. Weren't withholds up to that time.

But you can take this same person, this same girl, and you could say, "What doesn't your family know about?"

"Oh, well, that is something else. Well, they don't know that I poisoned Joe, that I shot Pete. They don't know anything much about where I hid the body last month. They don't know what happened to the children. Ha-ha-ha-ha! They – ah..." see, and "don't know" is still

a button. All the way down "don't know" is still a button, all the way down and all the way up. It's a button the whole way.

You can always security check with "don't know" and "not know," when overts and withholds are passing right over the PC's head like these orbiting space flights that aren't taking off, you know? See, "don't know" goes all the way.

So a study of not-knowingness has been approached by philosophy by two philosophers – notably two philosophers: one is Kant and the other one is Spencer. And they've concluded that what wasn't known couldn't be known. Oh, how interesting! In other words, the closest approach philosophy has ever made to "don't know" or "not know" has been that you couldn't know. That's interesting, isn't it?

So, as I tell you, there has been no road to judgment.

Now, for many years I've been trying to teach you characters judgment. It has been a tough and difficult job. Judgment on the subject of another being, the ability to understand what was going on in a session, and operating with judgment so as to do the right thing about it. Now, do you know what bars you from judgment? It's just the not-knowingness of it all. Well, where's the not-knowingness of it all come from? It begins first with duplication. There is the entrance.

Oh, of course you could security check it out. "What don't people know about you?" and so forth, and smarten the guy up no end; but that's a processing approach, and we're not now talking about a processing approach because there is nothing there to process to. You see, processing processes to what is there, see?

Now, if a thetan ever got himself in bad condition, he's invalidated his own judgment, he's come off of his own judgment. The whole lesson of this universe teaches a person not to duplicate, just as it teaches him not to communicate.

You know, there are only two crimes in this universe that you have committed and that you have made others guilty of having committed: One is being there and the other is communicating. Those are the two crimes. There are no other crimes than that, being there and communicating. Now, if those two crimes are crimes, and those things have been made into crimes, then there's only one other thing that you can possibly make up your mind about it: A person has to learn, you might say, not really learn, but become comfortable with being there and communicating. And the way and the route one would take to bring comfort on the subject of being there and communicating would of course be duplication of a datum.

Now, a datum is a location which doesn't have to be pinned down. A datum is a location, a cousin to a thetan, you know? All data is a sort of a cousin to a thetan. You know, he's an idea, he thinks sometimes and he's got ideas and he can communicate ideas. And you can always put a whole stack of ideas into your thetan briefcase and have no mass at all. So it's ideally portable, most portable thing in the world is an idea, so thetans chased out of here and chased out of there begin to use ideas for location. They feel comfortable when they have an idea, you know. And that idea that they feel comfortable about is an identity. Even though the identity is mobile, they feel more comfortable with an identity than without one because it gives them the sensation of being located. They like this.

So what's the conclusion here? The conclusion is that you can learn to have judgment, and the way you learn to have judgment is just those two steps: duplication of data, and, pursuant to that, understanding. There's the duplication, the understanding. You don't get it this way: you don't get understanding and then duplication.

Now, what you should know about this is it's any data would serve as long as it is data, any data. "Classification of the Geological Formations of the Middle East as Observed by the Geological Department of - Serving After the Fact of the Appointments from the Rockmount Foundation, Appertaining only to Schists and Slides of the Lower Saudi Arabian Canyons," in 185 volumes, folio, see? That's data, you know? It's wild data, you know?

"Anamorphic schists are often found most closely blended with hornblende." You say to the PC, "Anamorphic schists are most closely blended with hornblende." Well, this would be a "fascinating" situation. He would wind up, of course, with a drill. He would wind up with an ability to do something, and he would also wind up with judgments on the subject of women, which I think is marvelous. You know? Nobody could wind up with that. I've been trying all these years. [laughter] It's impossible. And yet he could, by studying the anamorphic schists for the formation of hornblende. Very interesting !

Now, beyond that you cannot go in the teaching of judgment. You cannot teach a man how he should judge something and still have him judge something. You understand that you can teach a person data. Yes, by force of beingness in you, you can relay communication and understanding to people and they do understand it.

Well, I'll give you an example of that. One ACC I did nothing but lecture. Nobody processed anybody this whole ACC and they all had marvelous profile gains. I gave them two lectures a day and we went over all kinds of data and so on. Well, that was just a relay of understanding and comprehension, and they felt better and they had a bunch of cognitions on the thing and life looked better to them. You understand? So that was in itself a kind of a processing. That had one of the highest gain ACCs we ever had, which is interesting.

Now, this is totally possible, and without that possibility of course we'd never get anyplace. So that possibility natively exists.

But let's take the other one. Let's take the other one. Let's raise a level of skill on the subject of judgment, just overtly and directly create a level of skill on the subject of judgment. We would do that by duplication.

All right. What's this amount to here? What's this amount to? We are doing this – you do not see how this is working out according to the educational processes of the 17th ACC; first reason (to have no withhold from you, and so forth) is it wasn't realized or rationalized from those directly. What you're dealing with right this minute is – stems from prior understanding to the 17th ACC; 17th ACC is an outcrop of that understanding of how to go about these things. Nor are you dealing necessarily with a preconcerted effort to give you understanding. You're not dealing with that either. You are dealing accidentally with two different things, and one of those things is just the action of understanding and duplication, you're dealing with that, and at the same time you are dealing only with the data of Scientology which you can learn.

But incidentally the data of Scientology is being used to develop in you judgment, not on the subject of Scientology. Now, you don't notice this because you're learning judgment across a pretty high, beefy line. This is a high-voltage line, you see? So if you can learn judgment off of this line, marvelous! Because this line, of all others, would tend to destroy your self-determinism and judgment, wouldn't it? Yeah, you're not given any chance to think what life's all about. My God! Is there anything else to think about than what life is all about? Isn't that right? Well, I'll give you what life is all about, and then you don't have to think about it at all, and you're all set, and that's it, hm?

Well, the data is true so therefore it tends to stick, right? Do you know that a lot of you, unbeknownst to you, have run straight through having been taught it. And some of you haven't noticed that you've gone through having been taught it. You've come up on the other side of the thing into a realization of it; and now you have the realization of it, not because you've been taught it, but because you realize it. And this is what we know as "making it *your* data." You've often said this to a student but some of you perhaps have not looked too closely on what we mean by "make it your data."

In other words, he has to go along the line of duplication of the data to an understanding of the data, and with that understanding of the data he has the final step, which is the realization, totally self-determined, of the existence of the data. And when you're dealing with truth you always have this fourth step. You have the ability to realize and to perceive.

So you have first this "Thaa! What wall? Don't ask me to duplicate anything." Then you have simple duplication, and that's followed by understanding, and that is followed by realization or own comprehension. So therefore one's own self-determinism is restored on such a track.

Of course it's most rapidly restored on such a track by teaching the person the exact truth of something. There is the truth of something, he is able to duplicate the truth of something after many travails, and this truth of something is immediately pursued by the understanding of that something he has been taught. You understand that that is a stage; he's still dependent on you for the understanding of what's been taught. And your next stage up is a realization, which he reached at a sudden step up the line on his own bootstraps, so to speak. He regained an ability to understand, and so then he himself could realize. That's the route that you're taking. That route has total self-determinism and other-determinism and, of course, therefore, pan-determinism all mixed up in it, all at one fell swoop.

The person becomes pan-determined over the data. The person can not only understand why they learned the data but why the data was taught to them, and understand and realize – of course the realization includes the independent truth of the datum regardless of having been taught the datum. And with that, of course, a person has reached a high peak of the ability to judge something. A person then has judgment. There's no other route that I know of. I mean if this is not a perfect route, all right, so it isn't a perfect route. There is no perfect route.

Perhaps there is a perfect route, but there is no perfect route to hand at the moment if this is not a perfect route.

But there is this, that it is the first route through to such an end product. It certainly is that. And it is married in against an entirely different function. So you get a side play of the same thing. That is to say, you've got this thing doing two things. It wouldn't matter – well, your instructor has the horrible idea occasionally – he says, "All right. Now, what time span is there in an instant read? How soon must the read occur after the thing, an instant read?" I don't know how many answers you've got. I wouldn't set it right for worlds; not for worlds, I wouldn't set it right. Gives the instructor a marvelous opportunity. He can say, "Yes. But that tape, see? What does it say on that tape? *That* tape!"

And you say, "Well, actually, it's a half a second, a quarter of a second, a fifth of a second, a tenth of a second, it doesn't matter. I mean there – there it is."

"Ah, but which one is it on that tape?"

"Well, I can't tell you what that tape is. It doesn't matter whether it's a quarter of a second, half of a second, a fifth of a second, and so on, so on. I mean, all these answers and so on" – natter, natter, natter, natter.

And he says, "Flunk!" [laughter]

And you go back and snarl, and run up a whole bunch of overts against me, and so forth, and listen to the tape again. And you say, "Well, what do you know? Hang on, let's see, what was it on that exact tape? Oh, gorbliney! I never heard that before! A twentieth of a second! Twentieth of a second! Kaaa! All right," and you go in. "Twentieth of a second."

"All right, that's it."

Now, you see, it'd be totally pedantic (and we're not doing it on this other system) for the instructor to say "What are the first seven words in the fifth paragraph of the third bulletin written in 1959 in the month of June?" See, that is just becoming a memory contest, and if you'll notice, nearly all study is devoted to memory contests. And nobody is asking you to engage in a memory contest. Somebody is asking you to engage in a duplication activity. If you can duplicate the data your memory will come up sooner or later – even yours.

It's very, very horrible; some of you first confronting this thing, you find it ghastly! You find it utterly horrible. It's the most terrible thing you ever confronted. Recognize the mechanism you're up against, and recognize that not for a moment is anybody going to relent on this datum. Also find out, as you go along, all of a sudden you're able to understand things you weren't able to understand before, which is all quite peculiar; and you possibly have never noticed this, but you're now understanding things you never understood before that have to do with other things that have nothing to do with training, nothing to do with the subject matter you're training on, which is quite amazing. You get something going like this, why, you've made gains in another direction, and that's what an auditor has to have. An auditor has to have comprehension. He has to be able to understand what he is looking at. He has to understand what is going on.

An auditor who gets into this kind of a situation is a dead one, he's lost. The PC says, "Ah, women are such a bore!"

And he's pulled the same gag you might have pulled on the committee, as far as the auditor is concerned. He said that fatal word – two fatal words: He said women and bore. These things are not compatible, outrageous! One can't possibly marry up those two words in the same sentence. Whoever imagined they could become bored with women?

This is incomprehensible, and the auditor just sits there and he starts some kind of a natter, natter, natter, interrupt the PC, you see? "Women, bore? Women, bore? What are you talking about?" And instead of saying "TR 4" cheerily, and going on with the session, he says "Natter, sub-natter." [laughter] He does all kinds of things, says Q and A, "What did you say? Where are we going? What are you doing? Why? Why did you say that? Have you got an engram there? What's happening in the thing?" and so forth. In other words the auditor goes into a "trying to understand," do you hear that?

PC can sometimes put you into a "trying to understand," and you'll find yourself having a hard time auditing the PC for quite another reason. You don't audit PCs by telepathy, and this PC isn't talking very much or loudly, you see? And you say to the PC, "All right now, what is your opinion of women?"

And the PC says, "Ummm-ummm."

And you have to say "What did you say?" Not to understand what the PC says is a misdemeanor of the first water. The PC is sort of putting you on a point where you are made to think that you don't understand the PC because you can't understand what the PC's saying.

I remedy this usually quite well; PC goes – tips over, is all curled up in a ball, head is down in the chair, mouth totally compressed against the curve of the arm, and is saying "Ummm, ummmm," and so on.

I don't risk any ARC breaks on my part or theirs. I say, "Sit up. That's right. Sit up. That's good. Now speak up."

And the PC says, "Ummmmmm."

You say, "All right. Now, what was that answer again?"

"Oh, women are such a bore."

"All right. Thank you very much," you know? "All right."

In other words, I make the PC communicate to me, which may be tougher but you'll find out that you'll run up ARC breaks when you don't. You pay your money and you take your chance. In other words, if you leave him in that condition, you're going to have – soon you're going to be totally out of comprehension of what's going on with the PC. You're also going to feel that you don't comprehend what the PC is doing, and therefore you can't observe anything that's happening to the PC and all sorts of things go wild.

But let's get back on the other thing. Let's take an auditor who cannot happily duplicate a datum, a non sequitur datum, but always insists that he hang up on a button. And the PC says, "Women are such a bore," and he knows that this can't exist, and he himself has lots of trouble with women, and his immediate response is "Why is women boring? What is this?" and so on, and go squabble out of session here. "You've challenged me. I don't believe that. That hasn't anything to do with this. Just why did you come to that particular conclusion? I

don't see what there is in the auditing command that would make you come to that conclusion."

The PC finally says, "Well, it was just a cognition!"

And the fellow says, "Well, it's a cognition. That's a remarkable thing to say when you come to think about it, you know? It's a remarkable thing to say – just a cog...."

But the PC says, "But it's just a cognition. You know, I just said it, you know?"

He says, "Well, all right."

And the auditor goes on, you see, and audits him a little bit longer, and the PC says, "But all men are stupid, when it comes right down to that."

And "stupid", you know, that's a button, so the auditor says, "Stupid? Who? Oh? Who? Who? Who? What did – what did you say again?"

"All men are stupid."

"Why did you say that? Do you have a picture there?" and so forth. "What's going on? I mean, have you got an ARC break? Got some withholds? Are you withholding something? Is that what you're withholding, that all men are stupid? Just exactly how does this add up?" and so on.

And the PC says, "But it's just a cognition. I – I just – just – I – I – I just had the idea. I'm sorry. I'm sorry."

And you then have a PC who won't blow anything. You have a PC who is punished for cogniting. You have a PC who is punished for auditing and therefore have a PC who is punished for getting rid of pieces of the bank. And if you audit the PC in that framework the PC will make no gain because they're being taught not to blow anything, because they don't ever dare mention anything; and they're made sorry every time they open their mouths because there's no comprehension. They look up, the auditor's trying to understand, trying to understand, trying to hear, trying to hear, trying to find out what it is, what it is, what it is, where it came from, where it came from, wha – da-da-da-da – if you'll just – you don't – no, no – you've got the auditor on trying to comprehend, trying to comprehend, trying to comprehend. And of course you haven't got an auditor at that stage who is capable of duplicating what the PC said.

My God, I've heard PCs say some of the most outrageous things you ever heard of in your life. Now, this never startled me particularly, but once in a while I have been startled by something. You notice that you're normally most startled by overts or withholds the PC has which pertain immediately and directly to you, or to somebody you're close to or like, you know? You're immediately influenced by these particular overts and withholds.

Well, what if the whole session – supposing the auditor were in such poor state with regard to duplication that every bit of the auditor's auditing was as reactive toward the PC as your sudden Rrrrr! when the PC has just told you some fantastic lying withhold about you. Now, you know your own startlement when you've heard one of these occasionally. Well, supposing they're trying to understand – "Where did you hear that?" you know? You – right away you're just yanked out of it sometimes, you know?

He says, "Well I – I have a withhold. I – I saw you...."

You say, "Yes, what?"

"Well, I saw you up at the corner of the lane up there the other night with – well, you know who."

"Well, who? Who? Who?" you know, "Who? Who did you see me up there with?" and so forth.

"Oh, well – well, you know. We needn't really go into it."

"Well, what's this all about? Where did you hear that? I mean, did you see that yourself? Did you see it in person? Were you there? What time was it? Well, did anybody else see it?" you know? You'll get caught off base, and you will ask more questions about it than you ordinarily would ask about something else. That's your effort to try to understand because you're hung up on some kind of a button that concerns you intimately. Do you see that?

All right. Now, an auditor who can't duplicate runs the whole session in that frame of mind. Not just things that relate to him, but anything that relates to anything, the auditor has the same greeting of that – the same greeting from the auditor. The PC says, "It's been a nice day all day."

The auditor says, "What? What? Where? Where? Where? I mean, where did you hear that? Oh, you – you what? Today. Oh, you're talking about today, not yesterday. Well, I thought it was a nice day today, too, that is, this morning, early. Er, yes, let's see. What were we talking about? Oh, yes. The auditing command was – what was the auditing command? Ah – yes – yes. Have I withheld anything from you? All right. Have I withheld anything from you?"

You watch it, man. Therefore, if you get a zone or area where the auditors are having one awful time trying to duplicate a bulletin, what must you also assume? That they've been in there endlessly trying to understand the PC, trying to understand the cases, being hung up on all kinds of wild-ball buttons, and they're right down there at the first stage I gave you.

They're in that stage. See, if their morale is going down because they can't pass any bulletin tests, you would know at once how they've been handling PCs. Do you see that? So duplicative training is absolutely essential. And it is successful. Now, you can make up your mind to that.

Now, what I've talked to you about you may or may not have found very burningly interesting. Naturally, it doesn't apply to you personally. [laughter, laughs] But in training auditors you should know it. The baptism of fire that causes people to look so pale and so drawn under the thing is, for instance, duplicating under resentment. See, they go through all kinds of emotional bars on this particular thing. Learn like mad but it's all resented like mad, you see, because "Uhhhhh! It couldn't possibly be – uhhhhh!" and so on. Well, they pass through that one, too.

But sometimes you see a student here who goes around for the first two or three weeks, and they get paler and paler, and shadowier and shadowier, more and more hollow-eyed, more and more gaunt, things looking worse and worse. Or they look more and more

apathetic. You can hear them the way they start up their cars, and things. You can hear about how a new student is going, you know? At first, why, they start up their cars in a sort of a puzzled way; and then they start up a car, you know, *very* angrily indeed, you see? You can hear the gears crash about three times as they get up the drive, you know? And then eventually they wander up the driveway running into both sides of the verge; you know about what state they have reached, and so on.

That's all done by training, and it is not the route of processing. Don't consider it a processing route. It is just a route by training because it is a new skill.

You very often have been asked in the past to memorize "the structural components of a Mark VII space vessel with gyro rotators, complete, all number parts." I'm sure you've had to do something like this. I'm sure you have had at some time or another. And the funny part of it is you wound up at the other side being able to look at the space vessel; and on the other side of that somebody says to you, "Oh, well, these Mark VIIs – these Mark VIIs, they – they – they sure fly low, and they sure fly slow, Mark VIIs do."

And, "No, no, no," you say, "you don't really understand this ship, you know. You don't understand how to run one. No, when you first get them into the outer area of an atmosphere, you see, you turn on the coolers, you see, at that moment. See, you don't slow them down as you come in. Just turn on the coolers way out there, you see, so that you supercool the whole hull, you see? That's the way you really handle these things. And then you come in, hit the atmosphere on a skip, always hit it on a skip the first time, you see? And then sort of smush in, you know, with everything supercooled. Come in fast, don't lose your speed, you're all right, you see? And then have your counter-blasters in excellent condition so that when you come down toward the surface, and that sort of thing, right at the exact proper – and so as not to waste any fuel – these Mark VIIs, you really have to pour that blaster to it. And if you pour it to it very suddenly and very quickly you stop, you see? And then you land all right. And the reason they're having crashes with them is they just don't understand them."

And somebody comes out and watches you land a Mark VII, you don't land one that way at all, but you sure understand one. You understand how to land one; but every time you land a Mark VII you land it entirely differently than at any other time you ever landed a Mark VII. You never land a Mark VII the same way twice, yet you always land them and they never crack up and everything is fine. You got the idea? But you never drive the same ship the same way two days consecutively running. That's because you understand it.

Routine and rote, in other words, are a poor substitute for understanding. And the place I'm trying to get you to is a place where you can process by realization, process by comprehension, process by the exercise of judgment. If I can get you to that point, I will have considered it very well worth doing, no matter how heroic it has been on the way.

Thank you.

WHOLE TRACK

A lecture given on 25 January 1962

Thank you.

Okay. What do we have here? We have the 25th of Jan. AD 12. And here we go for a lecture on what? I know. What do you need? What don't you know anything about? Oh, Scientology. All right. [laughter]

Come on. What don't you know anything about? What do you feel foggy on?

Female voice: Track.

Traps?

Female voice: Track.

Male voice: Track. Track.

Track? Oh, wow. [laughs]

Female voice: The whole track.

Yeah. Whole track. I don't know. I haven't given a lecture on whole track for years. Do you want to hear something about whole track?

Audience: Yes.

Well, once upon a time there was a thetan. [laughter] And he was free and all-powerful and *stupid*. And he didn't have any judgment at all, because he had no experience of any kind. And he thought if he just kept battering out things and withholding things and keeping things from coming in on him, that he would then stay as powerful as he had always been.

And that was a mistake. Because the more he battered out, the more he felt he ought to withhold – because at the same time he was doing all this, he was making other people guilty of battering out and telling them they shouldn't have done it. And then he duplicated those he told he shouldn't have done it. And the final analysis was that he was withholding. And here you are today. [laughter]

Oh, it's very intriguing, the ideas of the whole track, but it'd be a nice – it'd be nice if you had ever lived before but, of course, this is just an idea. This is just an idea.

I'm reminded of John Belusha and he left here in pretty good shape. That was a good win for us, but I think in all of the twelve years of arduous processing and hammering and pounding or something like that – I think it was just the educational process had just made a little dent on his case – 17th ACC. I think in all those years there wasn't a single process that had ever been brought out that had ever made a dent on him.

And he got over here and he started running into Routine 3A and 3D and Security Checking and a few things like that and all of a sudden, why, he blew off the first terminal of the Goals Problem Mass and found himself upgrading rapidly into other things and he was really flying.

And – give you an idea how he was flying: he cancelled the plane which would have gotten him home by Christmas to his family in order to get another session from Norman. He did, didn't he, Norman?

Male voice: Yes.

And Norman tied into it and found "an obstructionist" as the upgraded terminal of "a menial," and this was tying into the teeth of "a cruel person," and in between "an obstructionist" and so forth, there had been a hidden terminal called "a troublemaker." And in that session he became absolutely certain that he had been "a troublemaker" (which he had never been). And that blew in just that one session, didn't it? And then he found this "obstructionist," and I think went home with that package. Isn't that right? I'd think if he – he was smart, because if he had left here just teetering on the edge of tipping over into a troublemaker, look at all the trouble we'd had. [laughter]

Well, anyway, that is the toughest case I ever came up against, in that the case was just quietly tough. You know? There was nothing spectacular about it, but probably right here there are some people who have audited this fellow or seen him gone and they knew how rough this case was.

And so we made a dent on it. All right. We got him flying. All right. Swell.

But what did it take to do this? It took a very, very precise knowledge of the whole track. It took a precise knowledge of the consequences of – that a thetan runs into and how he had gotten himself balled up and how he'd tangled himself up along the line and then if you knew this perfectly, why, of course, you could take it apart. That's fairly easy to do.

Some lectures on this exist under Routine 3 and they have to do with this. But you are following a rule in auditing whole track and that rule is – it occurs actually as a first or second sentence of one of the sectional books of *Dianetics: Modern Science of Mental Health*: If you can parallel what the mind is doing and undo that or handle that, why, you will get a gain. And that is the basic rule of processing and we have not violated that rule in all these years. That's remarkable that that thing has remained that constant.

Well, let's take a look at this. If an individual had lived only once and then you processed that one lifetime he had lived, wouldn't it become apparent after a while that the individual would glow Clear and disentangle gorgeously on just having audited that one lifetime? Let's just present that as a piece of evidence. That'd be possible, wouldn't it?

Actually, if an individual had lived only one life – just one – here he was and if he was just a meat body and so forth and you know, he has a psychological-type brain; you know, solid meat and if that was all there was to this fellow, then he would untangle in this lifetime. In other words, the aberrations could be untangled and so forth if they ever could be.

Now, if one lifetime were true, then Freudian analysis would work. If just one lifetime were true, Freudian analysis would work. But Freudian analysis didn't work.

If just one lifetime were true, then running the engrams off one lifetime would clear somebody. Right? And that is not true and can't be done. You run the life – all the engrams out of one lifetime, you can straighten somebody up remarkably, you can do marvelous things. But for some reason or other, there is always a little additional bug

Unless you go at it on the basis of conditioning the individual to be able to confront all of the pictures and things and stuff that he found in the bank – that is to say, he isn't afraid of pictures and he's not fighting them – you can actually do a very delicate key-out on one lifetime and leave him separate from all of these masses and so forth.

Well, you can – you can accomplish that.

Now, there's just – that's just evidence. This has nothing to do with anybody's recall. This has to do only with the technical aspects of existence in Scientology.

Nineteen fifty-one, I rolled up my sleeves and started to investigate the whole track. Because in 1950 – late 1950 – it had started to raise its ugly and unseemly head. And auditors who would run into it and try to audit it and pcs who dare bring it up, of course, ran into a considerable social ostracism of one character or another. That was not done. The first Foundation board tried to pass a regulation, a board ruling to the effect that nobody would ever look at, believe in or investigate past lives, and so forth.

And yet auditors in auditing them kept running into them, you see? So that probably was the basic split-up of the first Foundation. The first Foundation wanted to sit there comfortably and just grind on and on in present-life engrams and consider that we had it all made and they wanted no further research or investigation of any kind whatsoever.

Well, that wouldn't go and that was that, because auditors were not turning out the results they should have turned out if one had only lived one life.

So in 1951 this – I didn't fly in the teeth of this. I would have investigated anything. I mean, there's no real resistance on my part. You show me something, tell me I can't investigate it, I'm liable to investigate it. You show me something and tell me I can investigate it, I'm liable to investigate it. I mean, there is no influence in that line.

I – just down through the trillennia, I have not paid attention to and/or paid no attention to people who have told me not to look. I just have not paid any attention to this one way or the other. This, of course, adds up to a total neglect of the – the "finer sensibilities," I think they're called, of other people. The finer sensibilities, I think, is another way of expressing the idea "he's too yellow to look."

So anyway, 1951, I started in to investigate how far back this went and where it went and actually an entire year was spent. And Mary Sue was of considerable assistance at that time and we went plowing around – I didn't mean to modify that by saying at that time only. I think – I think there was a time there in 54 when you were also of assistance for... [laughter] But to be very blunt about the thing, there wasn't anything, I don't think, that we didn't chew into one way or the other.

If there was any free track associated with it, we looked at it, and the result of that work, the records of that work don't exist because you can't sit around and do research and make records.

You either research and get research done or you make records. And the primary thing they do today in the field of research is to make records. And you'll find the time-wasting and expensive thing to do in research is making records. That costs like mad. And you have 185 clerks filing and compiling records in quintuplicate and crossfiling and crossindicating. And what they neglect on the modern research line is to have somebody who is finding any data to record. They've omitted him from the research line.

Of course, this is probably very wise, because when you think of the people the research is being done for, you could see at once why there would be a slowdown (a strike, you see, on people who could research). Well, look at it. Governments and politicians and that sort of thing. Who'd do any research for them?

I'd research them; I'd use them as case histories – research them: "Look around here and find something you can go out of ARC with." I think they ... [laughter] investigate that.

Anyway, what we found out basically, was a lot of the operational characteristics of the E-Meter were discovered at that time. And tremendous numbers of incidents of all shapes, sizes, squares and types were dredged up in whole sections of track and so forth. And I got a – did a track map at some time or another. And you can do a track map on an individual. It's fascinating, too. But you start to do track maps and you start to do this type of research, you are only researching free track.

Now, in view of the fact that amongst a dozen pcs, almost any part of the track is free track, you see, these twelve different pcs will have different parts of the track grouped and occluded into what we call valences. But they've still got lots of free track amongst them.

And if you take the free track collectively of these individuals, you can get a *whole* track. But the Goals Problem Mass consists of those sections of track you know not what of, which have become balled up into what we have for a long time called circuits; we've called them valences; we've called them ridges – they have had numerous names. Of course, a ridge deserves just a little bit of – it isn't a valence. A ridge is a ridge. But a valence or a circuit are definitely just an identity that is so dominant that it balls up a whole section of the whole track. It takes a large section of the whole track and bundles it all up in a black ball and it's got – all full of pictures and when you think at it, it does thinkingness and this is all very, very tricky.

A thetan never made these things. He lived this life and then he got in trouble and it all went scrunch. And he's since maintained it.

Well, of course, it was trying – he was trying to persist while he was it, so of course the common denominator of all such circuits and valences is persistence. So naturally, there they are and you'll find them right here in present time today. They're persisting.

Well, you take a whole section of lives. Let's say he lived numerous lives as a plumber. And all these lives as a plumber, if he then withheld it and considered them reprehensible and attacked things as a plumber and was attacked as a plumber and a bunch of other

conditions – in other words, your four flows are beautifully violated and mucked up during these four, six, eight, ten, twelve lives as a plumber. You're going to get a gaudy mass of condensed pictures and characteristics and individual thinkings, behavior patterns, everything that you now consider an individual, is all going to be bundled up in a little black ball. And that little black ball we call a valence or a circuit.

And when it be – gets activated or restimulated, of course, since he has been *it*, he can now dramatize *it*. And when it is too close in on top of him – and I do mean that in actual space – when it is too close in terms of space to the pc, he *will* dramatize it.

Now, to run out its individual characteristics is a long, thankless, arduous and stupid task. And there'd be no reason to do this. You can run out the whole package all at once. So there isn't any reason to take it apart characteristic by characteristic.

Now, that thing I'm talking about, that circuit or valence – better known as a valence, but it operates as a circuit; anything I've ever said about circuits are done by valences – all of that in a balled-up mass is a mass; it is an electronic mass; it does have weight; it does have density; it does have influence; you could feel it and so forth. It is actually – to the degree – to the degree that it is in the mind and therefore rather ephemeral, it has the same reality in the mind as a big black billiard ball would have, sitting out here on the table. You see, that's just – is it – isn't any *imaginary mass*, you know, that *all of us* have *heard about*, you know?

When you run into this thing, you go splat, see? If you picked it up and threw it at somebody, it would go splat. You see, it does have that characteristic. You might ask why is your body at this present moment persisting or why is that blackboard persisting? Well, that blackboard is a – is a mass which is persisting in time and that's all you can say about that. Present time is a persistence of mass.

Well, in the mind you get a mental mock-up which nevertheless is persistence, which nevertheless is mass. And the primary *mistake* that you could make about these things is that these things are – you'd say these things are imaginary because, of course, they occur in the *imagination*.

And of course, when the fellow first runs into one of these things... Let's take a bowling ball, you know, of some size, and – a black bowling ball – and he's standing there holding this black bowling ball and somebody has greased it up and he drops it and it hits him on the toe. Well, that would hurt. That would hurt, I guarantee you. And if you tried to tell him at that moment that it was an imaginary bowling ball, you are liable to get into an argument. You would be very likely to get into an argument.

As he stood there rubbing his toe, he would be likely to express not only his opinion of bowling balls but his opinion of you. He wouldn't enter into the logic or a discussion as to whether or not it was imaginary. He would simply refute that. That was intolerably stupid.

Well, similarly, one of these black valence masses, when collided with, or these mental energies when collided with, are imaginary just up to the time of that collision. And after somebody yo-yos in and out of one or tries to go through one and hits an apathy strata in one and dramatizes it, too, and after he's had one pushed up against his chest or tearing the back of his head off, after he's had all the somatics of the thing going through his stomach or some-

thing like that, he would not be in any condition to argue with. He wouldn't be set up nicely to argue with.

You couldn't come up and say – I think there are several in this class right now, that I don't think – I think it would be adventurous to go up to them and say, "Well, you know, these masses you've been running into, you know they're just imaginary. And they have no existence in fact and so on. They are just imaginary."

I think you would get a rather interesting argument at that point. Isn't that right? And in fact, I don't think you'd get much agreement at all. I don't think that would be the way to build ARC.

Well, it's not on the basis they're defending anything. It's just that it violates a reality. Well, what's reality? Well, reality is not what the individual thinks reality is. Reality is what the – the majority agree it is. And you look over this and if people can weigh these things in their hand or feel the pain of these things in the small of their back or, as they hover out in front of their faces, they perceive them one way or the other, why, I don't think you have any argument that they're unreal or imaginary. They are real within that viewpoint.

Well, it's so much for that. It's almost as if here, on a broader agreement in the physical universe, we were to take billiard balls and bowling balls and footballs and several other types and pile them all up on the table here, just keep piling these balls up and get a whole big mass of these things and so on. Well, that would be something that would look very like a Goals Problem Mass. I mean, it wouldn't look much different, except a Goals Problem Mass doesn't have the pretty stitching and it doesn't have orifices to blow them up. Otherwise – it doesn't have holes in them to pick them up with three fingers. But aside from that, that would look quite like a Goals Problem Mass.

Well, of course, a thetan is really in no great position to appreciate the character of their ephemeralness, once he collides with them and their ephemeralness ceases to be a matter of grave interest to him. Their isness is a great matter of interest to him. His effort to not-is them being combatted consistently by the isness of them causes him a considerable amount of worry.

So that we find, then, that the authorities on the field of the human mind dared adventure into those areas which had been totally not-ised.

Authorities on the field of the human mind do not believe in pictures, do not believe in engrams, do not believe in time track, do not believe in the masses, don't believe in any of these things. So we would say offhand, then, that they were only brave enough to adventure into those areas which had been totally not-ised by them. So if they had successfully not-ised something, then they were willing to look, if you call that looking.

There is looking and then there is not-ising and of course, not-ising, it's very – it's very easy to look. There's many a fool has gone out in battle while the cannonballs were flying by, saying, "I don't see any." And this – the sergeant there, lying under the log, says, "Well, you will presently."

Of course, they lug him off to the burial detail shortly if he keeps walking around in all this. So I imagine that's what's happened to field-of-the-human-mind people who have

been carefully schooled into believing it is all imaginary and then they've walked into one of these cannonballs. They probably tried to tell one another about these cannonballs. And the fellow tried to say, "You know, there's cannonballs around here," and they've said, "Well, he's gone stark, staring batty. He – now he thinks he is Napoleon or something of the sort," and they probably disposed of these chaps to the local institution, you see; the burial detail has gotten them. Or they've simply collided with them, have actually seen a tiny corner of one of these things and have cut and run and have said, "Well, we want nothing more to do with the study of the human mind. That is about that. I mean, that settles the point. We have now settled the point. Should anybody ever investigate the human mind? The answer is no. And therefore, we're going to stick very, very closely with Freud. We're going to stick very, very closely now with Wundt. Now, these are the boys to stay with. They don't cause you any trouble. They say there is nothing in the mind but meat or inhibitions or an unconscious and that nobody can see he's unconscious, so that's all very safe."

Well, now, you didn't know you were brave people, did you? But frankly – frankly, there is no substitute for guts when it comes to taking a look at what goes on on the backtrack. You're not necessarily brave people. You're just people who are willing to look and there were lots of people who would have been willing to look if everybody had told them there was nothing to see. And nobody is willing to look when he says there's nothing to see, you know? Somebody goes to the window and looks out and somebody says, "Well, what's happening out in the yard?"

And the fellow says, "Nothing," so nobody else goes to the window. And that's sort of been the field of the human mind.

Here was this terrific battle, these tremendous things out there in the yard, you see? There were all these masses and lines of soldiers and free track and pictures and identities and madnesses and pain and everything else out there in the front yard. The fellow went to the window, took a look out – it was his job to be lookout – and he went out and he looked. And he says – and they say, "What's at the window?"

And he says, "Oh, there's nothing there. Nothing there," you see? Blood running all over the place. "Nothing going on. There's nothing happening."

So nobody else bothered to look. That's about what it amounts to. Anybody who has an operation to control people in the past has apparently tried to work this operation on the basis of keeping them from looking at the mind, because all the mechanisms of control were resident *in* the mind. And if the mind was much *looked* at, it would as-is and therefore with it would as-is these mechanisms of slavery and control.

If you were to take a superstitious people – you know, superstition is a powerful control mechanism. You may run into a valence sometime or another that specialized in it. "Now, if you never touch the cherry trees in spring – never – and if you're careful not to look at the moon during the first part of its phase and if you're awfully, awfully careful never to eat your oatmeal with a left-handed spoon..." You get the enormous number of not-looks that they're sowing into the thing.

Well, if you – just on that basis alone, if you've sowed in enough not-looks, you would render a person so introverted he would be very easy to control. He would be very *simple* to control; he would be nothing but an automaton. You see how it's done, you see?

Militarily, you see this. You must not strike a superior officer, militarily. Well, what is this mechanism then? It means that you must not reach a superior officer, but a superior officer can reach you. It makes a nice stuck flow, doesn't it? So after a while, a superior officer says, "Now, the best possible survival action that this company of troops can take is to dash over that parapet into the teeth of those new machine guns the enemy has just started firing." This is a survival action. Nobody questions it at all and they go over the top of the parapet and that's the end of that. Nobody has to worry about that company anymore, you see?

But the recruiting sergeants are all talking about the line and they get people in. And people – they say the best possible thing to do is this or that or the other thing and everybody does it, you know?

If you can't look and if you don't look and if nobody is trying to get you to look, of course, these mechanisms, then, all add up to slavery mechanisms. They are mechanisms of introversion.

Now, if that is the bulk of thing which has been on the whole track, and it is – what do you expect the whole track's condition to be like? The overts of making people introverted so they could be controlled – you get this as a different mechanism; introverted so they could be controlled, you see – the motivators are getting introverted so that one was controlled and the common denominator of the whole thing was "Don't look." And, therefore, if we kept everybody from looking and if everybody kept us from looking and we get everybody's anchor points well in, we of course would wind up with balls of *goonk*, inevitably, you see?

If the individual led twelve lifetimes as a plumber and during that whole period of twelve lifetimes, he was basically dedicated to keeping customers from looking at their bills or at the plumbing work he had done, you see, and all of his customers were basically dedicated into keeping him from looking into the bathroom or the guest bedroom at the wrong time – in other words, their common ground of communication was not-look.

He didn't want *them* to look, they didn't want *him* to look. Well, if this is very acute, you wind up with a ball, not a track.

Now, your track can be plotted against time. It goes pocketa-pocketa-pocketa-pocketa-pocketa and the seconds go on, the minutes go on, the days go on and so forth and all of this can be plotted out.

Actually, the track isn't vertical or horizontal or diagonal in somebody's mind, but a person can move from one moment of time to another moment of time. The word *move* is used advisedly because he seems to be in different positions in location while he is in different positions in time. So he gets the *position* change associated with the *time* change, so therefore he thinks of himself as moving in time.

He does have a mobility in time in all those areas except where he has a mass. Where a life – series of lifetimes or a lifetime has become a mass, he no longer has the possibility of moving in time or in space. Why?

Because all the overts of it were introvertive and all the motivators of it were introvertive, so if the overts and the motivators both had the same thing in common, the commonest ground was not just don't-look between himself and other valences, but introvert. And this introversion or looking inward, carries with it pulling inward.

So we have these things taking up actually the most economical geometrical shape for the maximum mass for the minimum space. And that is a sphere. These things actually are spheres. [...laughter, laughs]

So the maximum – maximum amount of content – if you want the maximum amount of content or volume of any geometric shape, you get a sphere. And you want the minimal surface for the maximal content, you get a sphere. In other words, that's the most pull-in that's got the most packed into it.

And these valences are very funny. I heard of one, one time very recently, in the last three or four weeks. You peeked into it and you could see all these little pictures like 35-millimeter pictures and when this thing moved in on the pc, it hurt and when it moved off, that was very nice. But when it came around he could look into it and he could see 35-millimeter pictures, all color slides in it and so forth. Well, that of course was the fellow's track as that identity.

And you got this identity, you see, but all of its time track is in a ball. You see, yesterday is tomorrow is next year is last year. All time is this time and of course there – it's gone down to no time. So because it's gone down to no time, it'll float in present time like a shot. See, no time, present time, what's the difference – not according to this valence.

So here it is. In that ball, if you could lay this ball out like you could a – you take a – you know, you take a – ladies, you take these bundled-up tape measures you're always getting your hip measurements with to make sure that age is not creeping up on you, you know? Lots of those things. You take one of those tape measures and here it is and if you wadded it all up in a ball and laid it down in front of you, you see, *knead* it in, so it's nice and spherical and so on, that would be one of these valences all grouped. See, that's all time is no time, everything is here, now. It is a sphere. Now, that thing has got all the identities, characteristics, ideas, type of machinery thinking. Everything it's got is all in it.

Now, if you would take both ends of this tape measure, if you could find them, you see, and you just stretch it out like that, you'd have your – the lifespan stretched out. Well, it was like that once. See, it was nicely stretched out, but maybe about three-quarters of the way through that life, it started to ball up and the moment of death sure put the finishing touches on it, so it went *uomp*, and there it is all in a ball.

Now, that's these things you're handling. That's these things; that's these masses. Now, of course, they have engrams in them. Now, what you're facing there is a package of engrams. Now, we're auditing packages of engrams.

Now, if you think of Book One: supposing where Book One – Book One – everywhere you said "engram," you said "valence," you see that – instead of auditing an engram your target was a valence. You could have transferred over, then, all the characteristics of valences into these engrams, you see?

You got what I'm talking about? I'm just trying to give you some kind of an idea. So, today, we're not auditing engrams, we're auditing packages of engrams. And we're auditing these packages of engrams directly with 3D Criss Cross and that's what audits them.

And these packages of engrams contain in them, if audited one by one, enough engrams to keep an auditor busy for about ten thousand hours of auditing – just one of these packages. Just *one* of these packages would have enough engrams in it to keep an auditor busy for about ten thousand hours. And he'd have to be a good auditor at that.

All right. Now let's look at this more closely: There are tens of thousands of these packages in what we call the Goals Problem Mass. So it'd be tens of thousands times ten thousand hours. You add it up and it makes an impressive-looking piece of arithmetic, but it would be just trying to give you an approximate idea. Say ten thousand hours of auditing and there's tens of thousands of packages, each one of which would take ten thousand hours of auditing. You'd have to multiply ten thousand times ten thousand and you'd get quite a few hours. And I don't think you're going to be around that long – I mean, just auditing one pc. I think you'd get bored.

I do – I don't – I don't think he'd see enough gain, because he'd just be out of one engram into the next engram and on and on and on.

Well now, that all means if it were feasible to audit the engrams in these things, it would take ten thousand hours. But now let me *cap* this: It's not possible to audit the engrams in them.

Yeah, why isn't it possible? Well, that's because you've got the condensed tape-measure action. You could not separate out enough time in one package to audit one consecutive engram.

Now, you have seen a pc that every time you "put them on the time track" (quote) (unquote) they got *brrrrrrp*. Have you ever noticed this? You'd said to them, "All right. Now, go to the moment when you hurt your foot." And the guy gets about fifty feet.

See – you ever have this happen? He gets about fifty feet and there are about fifty different times and he can't tell the difference between them and you start moving him off of this point where he hurt his foot and he gets all sorts of feet and then he gets shoes and then the next thing you know he gets foundations and it all goes *rrrrrrrp*.

And you say, "Now, come on now. We just want that one foot that you're sitting there with right now and we're going – we're going to audit this foot" – *brrrrrrrp!*

You can't audit it, in other words. It – his attention, every time he hits anything, goes *brrrrrrrp*. Well, you've got a fellow whose present lifetime is a Goals Problem Mass valence. See, his lifetime – this lifetime has gone *blunk!* And, of course, all roads lead to now and all nows lead elsewhere, so that you've just got now, see?

And you say, "All right. Now, get in – get in contact with your tonsils." Say, the guy has got a sore throat, you know? Say, "Get in contact with your tonsils."

All right. He gets in contact with his tonsils, see?

"Well," you say. "What's happening?"

"*Yeaow – ayeaa – yeooo.*"

"Well, what happens when you do it?"

"*Yeooo.* It makes me very dizzy." He hasn't got an engram in his throat; he's got a Goals Problem Mass valence in his throat and it's an oppterm. And every time he hits it, he doesn't get the throat somatic, he gets dizziness, because it starts to move, you know? And it just shakes everything. And this is "*Ooo-o-o-oh*, no. We don't want to have anything to do with that." You see what this is?

So we're not auditing individual pictures or individual bodies. We're auditing *packages* of pictures and *packages* of bodies. We're auditing packages of identities, as far as that's concerned. I defy you to go into the middle of Goals Problem Mass. You know, I mean not with any 3DXX, see? Nothing like that. Let's just say, "All right. Now pick up the moment you were a Roman senator. All right. That's good. What's the matter?"

"Well, I don't find any moment when I'm a Roman senator. *Yeaow-uuuu. Thhhhhh.*"

"Well, go on. Find the moment when you're a Roman senator."

"*Uhhh.*"

"What are you looking at?"

"Well, it's just all black."

"Well, can't you find the period there where you were a Roman senator? I get a knock on the E-Meter here – Roman senator."

"*Nnaaa.*"

Well, you of course think you've moved him back in time. Of course, you've run him into the Goals Problem Mass and that's all now. So he hasn't gone back in time, he is right here at now. And as far as the Roman senator is concerned, he's contacted it. And if you watched him leave the session, he would swing his toga. [laughter] But he couldn't see anything.

See, his pictures are in a total condensation. That's what bars out knowledge. Every time you try to think like a Roman senator or think like a plumber, if you've got a valence of a Roman senator or a valence of a plumber, everything starts to move slightly and it goes *zzzzzz*. And you don't want anything to do with that. So you promptly don't think the kind of thoughts that a Roman senator or a plumber would think.

And you get into a technical school sometime or another and you're going along fine, you're learning some carpentry or something like that or how to saw small rabbits out with jigsaws or something. And then you have to put a pipe through them to make them stand up, you know? And, my God, you can't get the pipe through. You just do a beautiful job of sawing out the bunny out of the – out of the piece of board, but getting this little piece of pipe through so the bunny will stand up, you know? That's just something you just can't manage. You finally cut your finger on it and have to give up, you see?

Every other student in the place, they got the little pipe through okay. You didn't, see? That's because if you think or do like a plumber, you've had it.

And it isn't that you have a mechanism residual which says "Never again shall I ever be a plumber because it is a failed life." No, that thinkingness actually didn't have to take place.

If you've got a valence as a plumber that can get disturbed in the Goals Problem Mass, then every time you try to think like a plumber, you think like an idiot. Now, you either can go into it wholly and with no self-determinism whatsoever, simply be it with no resistance – you'll be a lousy one, by the way, but you could be it with no resistance at all. You can go on hooking up the cold-water pipes to the fridge, you see, and draining out – draining out all of the sinks into the fresh-water line and you could just go on and people wouldn't quite find anything right with your plumbing, but they really wouldn't find anything wrong with your plumbing. You'd be sick most of the time. You'd be a very sickly sort of plumber, but you probably could make it – you probably could make it. I think probably most of the politicians that are around right now busy politicking are in the valences of politicians.

It's one of the easiest things in the world to get into one of these valences. First the individual just can't stand the thought of it and then he makes up his mind to be it. And after that, he sort of goes through life this way, you see: fixed-eyed, steering an erratic course, no self-determinism, nothing of the sort, so that stimulus A happens, response B always occurs, you see? Just bang, bang. And they're very easy to handle; they don't make much sense.

But if they're in that state – now get this – they *don't dare think*. You see? They can only dramatize. They can't think; they can only dramatize. Now, how many pcs have you run into that you couldn't run "think" on?

Have you ever run into a pc you couldn't run "think" on? You had to run "Get the idea..." or something. I don't know where he's going to get this idea. It's evidently dragged in on an endless belt. And he takes it off of the assembly line.

But the idea of thinking is totally foreign to his abilities. He cannot think. Have you ever run into any like this?

Let me tell you, they're quite common – quite common. You possibly – because our processes over the last few years haven't ever used this to any great extent, you probably haven't noticed it too much.

But you say, "Put a thought in that object" or "Think a thought," or "Think of yourself as..." any think-think. You know, the individual has got to input a thought – can't do it. That's because he's sitting in the middle of a Goals Problem Mass. A case that cannot do that, does not really surrender on an auditing process auditing thinkingness.

You see, you don't want them to audit thinkingness in order to get them to think. Now, there were some thinkingness processes in the Fourth London we had some that – they worked a bit. "What isn't thinking," I think the process was. "Look around here and find something that isn't thinking." Well, that's very interesting, because it would raise their havingness and it would move this valence off far enough so that the individual could think a thought.

Of course, havingness being havingness and no withholds having been pulled off, he probably walked out the front door immediately afterwards, had it collide with him again and was unable to think once more. But it was an interesting phenomenon.

So there are a lot of people around that can't think and they don't dare think. If they think, it almost kills them. They can dramatize, but they can't think. Spot that particular pc, because he's of interest to you.

Now, trying to find an engram on that pc is one of the more adventurous things that you could do, because the second you try to find the engram, it goes *zzzzzzzzzt, bzooooooooom-swish*, and you say, "Now. All right. Now let's get the first moment you heard the news your father was dead. Now, let's get the first moment..." *Zzzzzzzzzzt-ba-zooooooooommm-boomp-boomp*. What's he got?

"Well; I've got myself as a pirate captain in the year 1051."

"Oh? All right. Now, let's just – let's just get that moment, the first moment when you got the news that..."

Zzzzzzzzzzt-boom-mum-zoooooooooom-boom. "What's happened? What's that – you look kind of startled. What's happened?" "Oh, uh – I don't know. I was thinking about my little brother."

"Well, uh – did he hurt his – hurt his foot?"

"Uh – oh, no. He had mumps."

And you get the idea of a preclear being totally out of the auditor's control and you're liable to start treating the pc as somebody who is out of control, when actually the pc isn't out of control, the pc is simply in a valence. And any time they move as the thetan – it's actual movement as a thetan, you see – any time they move slightly as a thetan or as a thetan put out any fresh energy, something activates. And *it* controls them more heavily than the auditor controls them. You see, the auditor can't hold the bank straight because there's no bank to hold straight.

So the auditor is trying to hold the bank straight and there is no bank and there's nothing there but a valence. Now, this is very amusing that a case of that character cannot have engrams run on him, but he can do 3D Criss Cross like a startled gazelle. Nothing to it. Give me a list of people you don't like. *Brrrrrrrrp bang-bang-bang-bang-bang*. Differentiate the list. *Bong-bong-bong-bong-bong*. Null it out. *Bu-bow-bow-bow*.

And all of a sudden, particularly if you run lots of Havingness with this kind of thing, why, you'll find the individual *zzz-rrrr-m-oom*. It's all right.

Now you could say, "Well, now, think a thought."

"Think a thought. *Mm-mm*." He'd be able to think a little bit, you know? Not for long, because you've still got some more masses for him to confront, but he wouldn't be solidly impacted into a dozen at once.

Now, they could be in *one* valence or they could be in *three* valences or they could be in a valence which is a combination of the oppterm and term – a combination valence. It has

all the characteristics of the terminal and oppterm. You'll find this occasionally. It's the most maddening thing you ever had anything to do with, because it'll do nothing but beef up the Prehav Scale and it'll – just won't run and *euuuuuuuuu*.

What it is, is the waterbuck has faced the tiger until you have a waterbuck, you see, that is thoroughly striped and has long paws and swims and you'd say, "What is this?"

And he'd say, "Well, it is, I'm a waterbuck."

"All right. That's fine, but what do you look like, you know?"

And he'd say, "Well, I have these – I'm a waterbuck, I have these long stripes. I roar, uh – and so forth."

In other words, everything is totally collapsed into it and he would as easily call it a tiger. Only it's the same thing. It's a waterbuck-tiger.

And if you – if he said he was in a tiger valence, well, he was in a tiger valence and goes *ga-zoo-uh*, and he's in a – he's a swimming sort of tiger and he has smooth, soft fur – only it's hair. He has hoofs. All his tigers have hoofs. In other words, it's a combination valence – waterbuck-tiger.

And it – actually, he has lived along some Goals Problem Mass package, on and on and on and on, until finally he has hit this as a valence; he has become this valence *in life*.

He is a police officer with all the characteristics of a criminal, you see? He is a politician – he is a politician – an American politician with all the characteristics of a Russian, don't you see? You get the idea? Or he is a criminal with all the characteristics of a police officer, or a Russian with all the characteristics of a...

This is a special kind of valence, see. It is one being. It is not two beings, but it has the characteristics of both sides and it won't run. *Won't run!* I insist on this, see?

This is the thing. This is a thing. And you'll hit that occasionally and the pc will *sell* this to you – will sell this to you with all of the salesmanship of a Dale Carnegie. Hell give you the whole thing. He'll try to fiddle the can and everything else because this is the thing. Hell tell you, "This is the me. Oh, man, *oh-oh-oh-o-o-o-ah*." It isn't that every one he tries to sell you is a combination valence, but the combination valence is almost always sold. He'll sell it to the auditor, you know? "Well, that's it. I know what that is. Yeah. *Ooooooh, yes*." Terrific game going on here. Yeah, *oh-oh, big, big game. Oh-oh, yes, yes, we gotta run that thing*.

The auditor ran it. The Prehav Scale would beef up and the pc would fall in pieces and fall on his head, see? It's a late valence on any cycle. Usually there is a combination valence toward the end of any long cycle.

In other words, a period of 60 thousand, 600 thousand years and so forth of one game going on and on and on – one game, the spaceship officer and the spaceship crewman. Let's call that just one game – the spaceship officer, spaceship crewman. And he will finally – you will finally get a spaceship crewman who acts like a spaceship officer who is a spaceship officer because he's a member of the crew.

In other words, you get your current breed of officer, as it exists more or less in the armies today, you see? They're not really officers. They're not really enlisted men. They're nice to all the enlisted men, you see and all the enlisted men are nice and then they all... Do you know, it's all kind of messed up? It's a very interesting state.

Now, that's – that's a combination valence and cycles finish in these combination valences – quite ordinarily. The guy goes on playing the game of the criminal, the police official, the waterbuck, the tiger – standard games. This is a very, very standard game type of thing and he finally winds up with the guy in CID. The CID man who was just arrested the other day for burglarizing a warehouse. See? He's a combination valence, you know? He's both at the same time, simultaneously in one body in a lifetime. Quite amazing.

Now, individuals, living as they come down the track, live a certain amount of free track and those are usually fairly happy lives. When you run into engrams on those, they will run them quite willingly, but what's the difference? Not going to make any difference because actually it's one engram out of God knows how many and it doesn't amount to much.

Don't mistake it though. You can change a case all over the place by running one of these whole track valences, you know? You can practically have him growing fleas. Everything is wonderful and so on. They say that's the exact somatics and so on. You can make a change in the individual.

In the same number of hours of 3D Criss Cross, you would make ten times the amount of change. See, so don't say that you – running engrams is no good. That is not true.

But you're running engrams off of free track. And the trouble with the bloke, that is going to be the long, persistent trouble, is this valence and there's no free track in the valence to run any engram out of.

All right. Now let's go a little bit further. How did these valences get there? Why did they get there? And why does a Goals Problem Mass hang up as a mass? Now, you already have an adequate answer when I say the motivators were to extrovert – introvert somebody and the overts were to introvert somebody and so on, you're naturally going to get a ball of introversion. Naturally.

But what makes it so persistent? It's because this ball, which is a valence, in its lifetime, had *hates*. It had things it didn't like and things it had overts on. So we have this fellow and he's lived this lifetime and he is this whole lifetime the temple priest. That's fine. The temple priest, and he's gone along, he's done all right – sacrificial altars have all been well bloodied and he's done every – all the now-I'm-supposed-to's of a priest – collected all the loot, lied to the peasantry, invented gods that everybody would be terrified of; he's done all the proper things that he's now supposed to do as a priest. He's been a very successful priest, lifetime after lifetime, after lifetime, after lifetime, after lifetime, after lifetime, you see?

But somehow or another, down along the line, he just didn't like these temple virgins. He just didn't like these temple virgins. He never could quite see a temple virgin. Actually, he had a few overts on them and this sort of pyramided up into more overts.

It's not actually an overt-motivator situation. A fellow accidentally gets an overt on something. One day he was raising one of the burning pots up before the brass god, you see,

and one of the vestal virgins was helping him and he slipped, because he was terrified of spiders or something, you see? He slipped and he spilled the whole ruddy lot on top of her and that burned her up to a cinder.

Well, having done this overt, you see, he now will do overts. See, he tries to prevent himself from doing this. So every time he gets around to burning incense pot, if there's a vestal virgin anywhere in the temple anyplace, he of course is very careful not to let the incense pot go toward her.

And it takes only a relatively short space of time, like a lifetime, two or three lifetimes, till just the thought of the incense pot and the vestal virgin, he's *h-hrum-hrum-hrum* – he's holding the incense pot – and by the reverse flow which he is setting up, he gets to a point where he sees the vestal virgin; he knows what he's supposed to do. He's supposed to take out the incense pot and dump it on her, you see? This is how you handle that situation. It's easier to do that – to keep on restraining yourself from doing that, you see?

And the fellow who every time he has an accident says, "Well, it ought – it had better be a good accident. We had better make it a *good* accident," you see? He's just tired of restraining himself from having accidents. So now that – the mere thought that he's going to have an accident, he's going to have a *good* accident. This is the laws of flows at work.

So inadvertently at first and then later on, more purposefully and then more and more purposefully and *more and more and more* purposefully, he just gets more and more and more overts on vestal virgins and temple virgins. He just gets more and more overts on them, you see?

And finally he gets up to a point where he's in a terrific games condition with them. They're on that side of the temple and he's on this side of the temple. If he is a priest in a temple, he knows that there's one thing that he has to be very careful about, because the whole cult is liable to be overthrown by those vestal virgins. He *knows* what they're up to; they're plotting to dump burning incense pots on his head. [laughter]

Now, of course, in view of the fact that all during this period of time the vestal virgins have been accumulating – the whole line has been accumulating overts on priests, we eventually get the two sides of the temple, which is the priest and the virgin and so forth. And we get this *awrrrr* and it goes *wraaaw* and wow! So he accumulates enough overts on one and he can't stay out of them. That's advisedly stated.

He kicks off as a priest one day: The mob as usual overflowing of the dikes of the temple has eaten them up and he takes off and he goes up and he sits on Cloud 19 for a little while and then he knows exactly what he should do. He goes right back down and picks up a girl and becomes a vestal virgin. See?

Now, you've got a real interesting game going. Up to this time, every time one of these lifetimes as a priest balled up, it would find itself opposed to only a thought of the existence of a temple virgin. And it's only opposed internally into pictures he has of temple virgins.

But now we're really going to fix him up. We're really going to fix this one up now. He picks up this girl, he knows exactly what he's supposed to do. He goes down – as soon as

she is of any age whatsoever, he won't let his parents rest, you see, until she is enrolled in the temple.

And he goes up through the lines and is very carefully virginal and goes carrying right straight on through and oddly enough, has a slight feeling that this virgin should be kept away from priests. He just has this idea as a virgin, there's just something tells him – you call it intuition if you like – but that he had better not go very close to any priests.

So by the fact of disassociation from the priest and by the fact of no communication with the priest, he of course is getting himself into a beautiful condition of just going into a long series of overts against priests.

So now as a temple virgin – as a temple virgin, every time the cups for the libation are served, why, she, now, goes down the line, you see? And somehow or another, every time she comes to a priest – not a – not one of the local citizenry or something – every time she comes to a priest, she's liable to trip – the wine, you see, is liable to be dripping slightly – there'll be something a bit wrong – and occasionally spill a whole tray, you see, in their direction. And we'll give her another lifetime or two running along this particular line and she doesn't just drop wine cups, you see, she carefully puts the hemlock into one or two at the proper occasions, all for the good of the temple, you understand.

This is well understood. Everybody realizes this. That it's nothing personal about this. It's just – it's better to get rid of the priests and everything'll be fine, see?

So we get up to the hemlock stage and then we get up to the cutthroat stage and then go back down into the hemlock stage and then somehow or another in all temple revolts claim the citizenry was the one who murdered the chief priest and it's always, of course, somebody else who did it – and carefully puts the bloody dagger in her shirtwaist afterwards, you see? And says, "A bunch of peasants came up and stabbed him to death as he knelt at the altar. Yes, my lord, that is the way it happened," you see?

You got big withholds building up on this particular line and enough of these and all of a sudden you have a round ball called vestal virgin. Now, this can drift around loose because internally it's only opposed to priests and it can drift around loose on the track but kind of floating in present time.

And then having *lived* a number of lives in this particular line and gotten this all balled up because it's a high games condition, takes off one fine day after the peasantry has burned down the temple – which is the usual indoor sport of the peasantry after being oppressed and taxed for long enough – takes off, picks up a boy and comes back and joins as a priest. Now he's a priest.

All right. Now let's accumulate some more overts against vestal virgins, you see? Oh, my God! The first time he shoves a dirk into a vestal virgin, all of a sudden it's so funny, but it's all those – kind of *waagh-thud!*

You've got the ball in the bank which was the vestal virgin and the ball in the bank which is already the priest, went together *scrooo* splat! And there they are – almost inseparable.

Now, he can go on and live lifetimes of priest; he can go on and live lifetimes of vestal virgin; he eventually will come up to a combination lifetime. He will come up to a life of an effeminate priest who has interesting habits. [laughter]

And that's the dying line. That's the combination valence he has arrived at there and eventually it's just too painful to be any of these things and he won't want anything much to do with them and he'll drift off. But he's carrying all of that with him.

It's all part of his baggage. He doesn't want anything to do with this baggage and he doesn't quite figure out how he got this baggage, but there it is.

Now, by the time he's gone through this whole cycle of the priest, the temple virgin, the combination valence and so forth, this whole thing balls up into a mass of some kind or another. It's composed individually of a lot of individuals.

Now, if he's – if he's got all this – priests and vestal virgins and the combination valence – all bunched together, you'd think he wouldn't have anything more to do with this, you see?

Now that's *it*. That's a finished action.

Well, he goes along for a little while and he lives a lot of free track. He gets out; he's – actually gets a job as a water boy or something like that to a camel train, goes travelling around the countryside – he gets a lot of free track. Nothing ever happens to that free track, it just stays free. It gets kind of looped up and squeezed in on other things. But one day he's got a body as a merchant. And there he is as a merchant. And he is busy selling Aladdin's lamps, cheap, cut-rate price, straight from Syria. And somebody drifts by in a canopied sedan chair and says, "Deliver it at the temple." He doesn't see anything wrong with this. So he picks up the lamp and he takes it down and delivers it to the temple. And as he goes out, why, one of the vestal virgins chucks him under the chin.

And he goes back and sits down. It's been a bad day. It's really been a bad day. Now he goes on as a merchant, gyps everybody, introverts them, keeps them from doing business, eventually becomes the military – a military governor who is bound and determined that nobody shall ever do any business, graduates up into a standard income-tax racket like they've got going in some countries now – I won't mention the name of – where they take all and give back nothing. And this – he goes on this whole line. It hasn't anything to do with anything like temples or anything like that, but it's a brand-new game, you see?

It's the merchant prince versus the tax collector versus the governor versus the army versus the government. The merchant prince versus the government, so he's a merchant prince and he's the government and he's the government and he's the merchant prince and he's a military governor and he's the collector of taxes and he's a prince of merchants and he is a merchant and he sells things and then he's an industrialist and then he manufactures armor and so forth, for the government. And we've gotten to our combination valence stage on this series of packages. See, he is an industrialist who manufactures only for the government; has only one customer, the government. And, of course, that's a combination valence.

Ordinarily, when that gets down to a total thing, you – generally the political form the country has is a fascism. That's the – generally the end product of fascism – all production is

for the government. And usually by force of arms to keep the rest of the population enslaved. Interesting economics. But regardless of that, it's some kind of a game of this character and it's run on. Of course, as a merchant he has formed these masses; of course, as a military governor he's formed these masses; and of course, by the overts, one another, you've got a whole new package here, see? You've got this whole new package.

So you had the temple priest, you see and the vestal virgin and all of that game and that became a package. And then you had a lot of free track. And then you've got this other thing and they have gradually grouped together as a package. You see, these things plotted out against time very nicely until they *grouped*. And of course, they grouped with the *ne plus ultra* combination valence sort of a thing.

A combination valence just groups everything anyhow. You see, the effeminate priest, he can't do anything that doesn't restimulate being a vestal virgin and he can't do anything without restimulating a priest. So he can't do anything without pulling his bank together. It's impossible.

So you've got this Goals Problem Mass. Now, that *is* a Goals Problem Mass. You see, your – the problem that a vestal virgin would have with the priest and the priest would have with the vestal virgin and all that sort of thing, that's a Goals Problem Mass all by itself.

And up here, we've got the merchant prince and the provost marshal and all that and that's a Goals Problem Mass all by itself. And then one day after that – he can't sell things anymore – what he does these days is he's a night watchman in a rice paddy. And he's sitting there nightwatching like mad and he notices there's a fire going on over in the edge of the woods someplace. And he decides to go over and investigate it and he finds that somebody has set up a brass idol and they are all going *oowah* and *wumm-wumm*. And they're all calling out to *woo-woo*, and so he says, "Hey! What you doing there?"

That's enough. They all come over and he has to knock one of them colder than ice. And he gets in trouble with the local authorities and all that sort of thing and the Goals Problem Mass of the merchant and the military governor and the Goals Problem Mass of the temple come together and they make one awful big mash of *bthaaa*. See?

Well, free track sort of sits out here someplace and these two things come together and become undifferentiated from any time in them. Now you're really getting the mass.

What do you think happens after a thetan has had ten thousand such games? Ten thousand such games on the track? You see, each one of these games is one whole Goals Problem Mass, see?

They've got terminals, they've got oppters, they've got everything all mixed up. And, of course, as these things associate, you see, he had two association points that could have brought it together: once he did visit a temple as a merchant, but that was enough to start and then he actually knocked somebody out who was practicing rites in a wood, you see, while operating as a guard. Umm. And that really keys him in. He, by the way, got malaria after that and got very sick and they eventually buried him in the rice paddy, thinking he was possessed of demons – and he was, too.

So these masses just keep adding together and adding together and adding together and sometimes they're not totally added together at the moment the auditor enters into one. The auditor says to the fellow so-and-so and so-and-so.

And all of a sudden the fellow says, "You know that has some vague connection – a merchant prince and a temple. And there's something between a mer – – . Oh, there's something between a merchant – " *Clank!* And two pieces of Goals Problem Mass – two Goals Problem Masses go together with a *splash*. And the pc will say – this has rarely happened, see? In other words, the auditing furnished the key-in, see? Don't let that worry you because it's inevitable. The thing was about to key in anyhow if it was that close, see?

Now you both key it in and separate it out again. He never would have had a chance of separating it out again, you see? So, don't let that worry you because you all of a sudden have these masses suddenly colliding with masses while you're auditing somebody.

You can sometimes group this lifetime. You're going along, pocketa-pocketa-pocketa-pocketa, auditing and you all of a sudden hit a whale of a grouper in this lifetime – overts and motivators and that sort of thing. And this lifetime goes *clank!* And it becomes a balled-up mass. It's nothing to worry about. It would have gone in another year or two anyhow. You can separate it out and so on.

Now, the odd part of it is, you can take this lifetime apart if you can find the exact prior confusion to the exact moment of group. And you better learn how to do that because you can always take a Goals Problem Mass and put it back into a longitudinal track. You can take one of these valences and stretch it right out along the track again by picking up – if you wanted to audit just that valence.

Let's take him as – let's take him as Ali the errand boy of Baghdad. And we've got a valence there that's Ali the errand boy of Baghdad.

And we managed to have gotten this thing straightened out and separate. We've peeled it off, you see? And we've got it separate and it'll stay separate, if you can imagine such a thing. It won't.

But let's say we could get it to stay separate. We could then audit it this way: We could say, "What is the principal problem that Ali the errand boy of Baghdad had?" and he gives it to us and we said, "Well, when did that happen?" and so on. And we run it down. And "What's the prior confusion to that?" and "What were you withholding at that time?" and so on. And we'll get Ali the errand boy of Baghdad straightened out, so that it'll be – it'll be a section of free track.

We could do that. We don't have to do that.

But you could get all of these valences straightened out again and you could straighten them out along the track or you could group them up in a ball. You could do almost anything you want to with them with auditing. They're fairly easy to handle.

The best way to do something with them, of course, is to differentiate them, one from another: Both by finding them, naming them, getting them inspected very closely by the pc and blowing them off, nulling them and winding up with those that won't *budge*. And those

that won't budge, of course, won't budge because they are impacted on others that are too heavily charged. And you just bleed charge, bleed charge, bleed charge.

Now, these things are dependent on one another for their own charge, and the thing wouldn't hang together as – now, you notice you didn't get a ball-up happening until the fellow had an overt on the oppterm and then you get enough overt on the oppterm, you get a ball-up. See, the priest didn't get the track collapsing on him – if you wanted to call it that, he didn't get the track collapsing until he actually had run up an awful lot of overts on vestal virgins.

Now, that priest thing could collapse all by itself because he had overts inside it on vestal virgins without any valence of the vestal virgin being around, see? But frankly, that will unwind very easily. There's not very much to it. So he had some overts against some vestal virgins. That's about all it amounts to.

It takes the mechanics of a problem to keep this thing in suspension and keep these things from straightening out.

Now if you've got valence A versus valence B, you have the terminal and oppterm of a 3D package – A versus B. And let us suppose that both A and B are heavy inflows. You've got a valence versus a valence which is flowing away from a valence while the two things are held closely together, you create a vacuum. And you have brought later valences up into the vacuum between these two valences.

You've got inflow – or outflow valences actually create the same thing. Two outflow valences flowing against each other will tend to create the vacuum at the *backs* of the valences – two vacuums created.

So you get the thing held together, really, by the mechanics of opposition. These things have to be in pretty close balance to hang there at all. Otherwise, they'd as-is. It takes a lot of doing to get one of these things persisting. I mean, it's very delicately, the way they hang together. It's something.

Now, once you've got these things shredded on, the charge blown and the fellow has looked at them and he's discarded them and he winds up with what it was and you find some more of them and blow that and you straighten them up, another step could – two more steps could be done with this stuff – is when you're doing line A, let us say, in the Goals Problem Mass, you could take every zig and find out what problem it had with every zag.

In other words, you could take the zig and the zag in it is temple priest and the zag is vestal virgin. And you could ask the individual, "Now, what problem would a vestal virgin have with a temple priest and what problem would a temple priest have with a vestal virgin?" And just state the problem.

The individual will usually state it that fast. But you could do a little assessment on that point and tend to blow these things even further than they have blown. Just a method of differentiation, this would be.

And then you could say – your next one is – that happens on that opposition line is for some peculiar reason an idol maker and you've got, well, "What problem would a vestal vir-

gin have with an idol maker?" Now you see, the vestal virgin always – already had a set of problems with the priest. Now, the vestal virgin can also have a set of problems with the next zig which is the idol maker, see?

So you could then get all the problems of the zags with the zigs. See? Consecutive. You got the problems of the zigs with the zags and now you can get the problems of the zags with the zigs. And you keep writing down problem and the fellow looks at these things. And it's like running problems on somebody, only he'll keep recognizing that he's had these problems and so on.

This thing blows, blows, blows, blows further apart.

Well, every time you enter this thing at all, you improve the person's ability to confront it and his ability to confront it as long as he's permitted to confront it. It takes good auditing; bad auditing inhibits his confronting of it. Poor auditing, rough auditing, keeps him from confronting it and it's trying to keep him from confronting it and the two complement each other and he really gets upset.

But it – let's say it's good auditing and he's going along fine, as it would be if any of you did it (or I'd knock your blocks off). The – the point we're making here is that the individual is continuously confronting the phenomena of the Goals Problem Mass, you see? He's continuously confronting it, one after the other and what these things are and he's handling these things by the bushel-basket load. And he's getting somatics here and getting somatics there. And it's kicking his brains in on this side and it's going on and on. And he gets accustomed to this sort of thing; he gets used to it, that's all.

He's blowing them. He's separating them, differentiating them. He's seeing what they are. And they frankly have less and less effect on him.

Now, all the way up the track, he has only been the effect of those things. He himself has been the effect of those things, but now they are being the effect of him. And just by reversing this cycle and doing no other action but just reversing this cycle, you'd stretch out the whole Goals Problem Mass. And you stretch it out back down the track.

And your eventual product of this, particularly if you added dating as a step (which I haven't taken up with you and which I sometimes shudder at having to teach you, because I've had loses on it before) but if you were to date the thing and if you were to get a long roller tape of some kind or another that was about four, five, six inches wide and – so that you could put sections; you know, like motion-picture film on a spool. And you just kept writing down where these things were and you dated these things, you dated these valences, where they were found and so on and you got them all neatly in place on this long, endless belt of tape that – not endless belt of tape – the tape was so fixed that you could cut it out with a pair of scissors. And you could take another section – because it looked like you had everything consecutive, but all of a sudden a million years opens up in here that you never suspected before. So you cut the tape and take some Scotch tape and put another tape in the middle, see?

You add a section of tape, you see, because this thing will keep going that way. It will keep spreading out, naturally, as you get more and more track, don't you see? Eventually you'd have a time track of the fellow and you wouldn't do it on a – on a simple paper graph.

You'd have to have an endless-belt proposition, because I think the paper required to do this sort of thing would be something like about a hundred feet long, I think about a hundred feet of paper at a wild guess (just to give you some idea of the magnitude of it, you see). By cutting and patching – and you write up the track that you've got, this whole thing: he was a this and then in so many years he was a that and he was a that and he was a that and he was something or other and you put that...

Now, you find out, horribly enough, that this belongs in the middle of the temple-and-vestal-virgin game; it was an excursion on the temple-and-vestal-virgin game. You had to cut the temple-and-vestal-virgin game plot in half and sticky-plaster the thing to the both ends and now you've got that smoothed out. Don't you see?

And you could keep on drawing time track on the individual like this as an exercise, which would again just increase his ability to roll on the thing.

Now, at the same time, if every time you made one of these plots, you had him tell you the principal problems that were faced between these terminals and oppters, you see, and the oppters and the terminals and you had to – wrote the problems down on this line, you'd eventually have a *long* run of *problems, problems, problems* of various kinds. You'd be running problems on him at the same time.

What would you wind up with?

Well, you'd wind up with a whole track. Well now, when would these things start to unball? Well, you'll eventually find, early on the track, the mechanisms which made them ball up in the first place. And the individual actually straightens out his postulates on this subject and you would only find his postulates by doing this.

And he straightens out his postulates on this subject and all of a sudden all of them just go *brump-brump-brump*, stretch out, stretch out, stretch out, stretch out. They're eventually all lying out like tape measures, not lying out like balls of mud.

Now he could run on the time track and he could go the whole length and breadth of the time track. He could think of anything he has ever done and remember it.

Now, the reason he can't remember it, of course, is too much of his existence is in areas and in valences at which he must not think. If he thinks at them, he goes stupid, because they can think and he can't think. So therefore, he cannot remember his past. His past is totally occluded as far as he's concerned, because of there – total areas of no thinkingness. Do you see how that would be?

Now, that's about the only way you would ever recover a person's memory on the whole track and that's about what a whole track is all about.

And don't blame me if after you've got this universe straightened out, you haven't straightened out the home universe yet. That's your worry. We're talking about the whole track, we normally refer to this universe's track. Because earlier track is not in agreement with one person and another person, beyond the fact that they usually agree that there was a home universe and that they were building their own universe and other things were happening

which were quite desirable and then those dirty dogs came with all the black muck and spread it all over everything and we stuck and that's why we're in this universe, see?

At first, in discussing things with them, you cannot find the identity of the dirty dogs with the black muck. I have discussed this with several pcs and they keep insisting on using the "*they*." They is the most prevalent pronoun with regard to this. So we haven't found the fellows who did this and got this universe started and this time track going on total agreement. We haven't found them yet. We're still looking. We're still looking to find the people who got this universe started that way and trapped everybody in it. We know it wasn't you.

But on the other hand, you might – you might have met one of them at one time or another. And you might have some responsibility for turning him against beings or something. You might have had some minor overt that took *them*, you see and made them antisocial so that they would do this.

Or on the other hand, on the other hand, on the other hand, thinking it over carefully, you might have been there and watched them – not intending to do it, of course and not having anything to do with it, but, you know, like people watch construction on the street – you might have been there watching them, something. And occasionally you might have offered them a small pebble – just to be helpful, you see; that's just to be helpful, but no responsibility of yours.

Or on the other hand, on the other hand, there is some possibility – there is some possibility that you knew one of them rather well and agreed with what he was doing, you see, just because you knew him well. And there's another possibility, if we reach a little bit further, that you were one of the workmen – of course, being driven with a whip, of course; but you were one of the workmen that was doing this.

And then there's another possibility if you look very carefully on the whole track. You may very possibly find yourself standing there and the picture of a whip just below the level of your eye, and a hand holding this whip; and it might come through to you as a sort of a dim suspicion that if you had this kind of a picture at that point of the track that it might be you who was making *them* build a universe and who trapped everybody. You see, that'd be pretty hard to face.

So I'm not asking you to look at that, now. But I am asking you to look back at that period when you might have been standing there, *caught*, a total victim at the beginning of track.

Anyway, there is the – there's the whole track and the way it rolls, that it exists, that it is there as a plot, that you're still mocking it up and so forth, is quite remarkable. That this universe exists at all is quite remarkable and I am – I congratulate you. You did a pretty persistent job on it.

Okay. Do you see what you're handling when you handle the Goals Problem Mass?

Audience: Yes.

Every one of the main valences has hundreds of subordinate valences and you can pull those off. And they're what you get on a list; they're the things that don't hold on a list.

They're little incipient warts on the main – on a main mass. And then you know, at first, why, you just – the pc can't tell the difference between them. At various – as you go on running, the pc can all of a sudden, even when he lists, recognize what the mass is and the identity of the mass. Even before you null it or differentiate it, he knows what it is.

And then that goes from there to knowing a little bit more about the whole track and knowing a little bit more about the game and then knowing more and more about life and knowing more and more and more and knowing more and then finally knowing all about it. That's the other end that comes out.

There are many assistive things that an auditor could do. Many of these things probably won't have to be done, because remember that you're auditing a pc toward a rather steep increase of ability and recognition.

That's the Goals Problem Mass as it relates to the whole track. You might find the information useful – if, of course, you ever find anybody with a whole track.

If somebody comes around, you know and tells you that past lives don't exist or you have no reality on past lives, I'll give you one little tip in taking this sort of thing apart. People can't think of past lives when they're stuck in one life. But they normally, quite normally, have had the subject of past lives itself invalidated heavily in this lifetime. And if you pull that apart as invalidation and get all the ramifications with relationship to that, why, generally it will all straighten out.

This is too new a subject for anybody to have too much antipathy against. After all, it hasn't been around since Egypt. And in those days, if you said there was no such thing as a past life, why, you were liable to have had it, because it went quite the reverse.

I remember vividly – one of the mechanisms and overts and uses of past lives in Egypt was that the king could come back and claim his possessions. And I thought that was an awfully handy mechanism: did very well for a number of years. Went many lifetimes before anybody got wise to this thing and thought, "Well, we've got a better idea; a better idea. And that is, if we claim that everybody when he dies is dead, dead, dead, then we never have to give him back any of his possessions. And that settles that!"

And the idea of one lifetime stems purely and entirely and completely out of ideas of property and that is all. So you see why the popularity of it. I imagine the Prudential Life Insurance people and the Bureau of Statistics and the Record of Wills and the Recorder of Wills and Testaments and so on would be amongst the first people to shoot you down on sight if you went around saying people have lived before and you are only living again, because, of course, they have a very vested interest in it.

But so does everybody have a vested interest in there only being one life. Unfortunately, unless we admit the evidence before us that there – one has lived more than one life, we don't clear anybody or make him any better.

The only reason we're interested in the subject particularly is because unless you pay attention to one lifetime as a fallacy and audit past lives and whole track and so forth, you make no gains. And we're interested in gains, we're interested in understanding of the subject

and interested in wins, so therefore, we have to admit something that seems much closer to the truth. Okay?

Thank you very much.

IN-SESSIONNESS

A lecture given on 30 January 1962

Thank you.

Okay. Now this is the what?

Audience: Thirtieth.

Thirtieth of January. What year?

Audience Member: 12.

Good. AD 12. Okay.

Haven't a thing to talk to you about. You're all doing so well, you're all doing so beautifully, know your stuff so well, everything's going along so swimmingly, I have nothing to talk to you about at all. There's only one small question, is when are you going to start to audit? [laughter] Now, that sarcasm was uncalled for because with very few exceptions, why, you're doing splendidly.

Now, you are about to get demonstrations here the like of which you never heard of with TV. That's coming along fine. And the sets are all upstairs, and I think the cameras are being adapted, specially built in Germany to be flown over here. Adenauer's bringing them personally. [laughter] Anyway, it's very special, so you can expect that in very short order.

Now, I'm tempted to give you a lecture about pure theory about things, speculative theory, and so on. You're doing 3D Criss Cross pretty well, and I'd like to make a comment on 3D Criss Cross, no more than that. And that is 3D Criss Cross sort of comes to you all of a sudden. It is one of these processes.

Now, in general auditing, in general auditing, you will find that there is a point where an auditor all of a sudden realizes he can audit and that he doesn't mind auditing and auditing is fun and that he can do it.

Now, there is such a point just in normal auditing You would expect that to happen someplace in Class II that all of a sudden, why, the fellow can sit there and ask Sec Check questions and run Havingness and get rudiments in, and so forth. And that's all right. He can do that. If a person hasn't had such a realization point, they can expect that sometime in the future.

But in 3D Criss Cross there is apparently another one. And it is just that one thing. A fellow all of a sudden realizes he can do 3D Criss Cross. It suddenly shows up in all of these reports. And I've never seen anything quite as sharp as that difference.

The reports right up to Tuesday are all "Well, *ha-ha, ha-ha-ha-ha* scratchy needle, couldn't do anything, and we got a list all right, and what do I do with the list, and I guess ..."

And then all of sudden, why, you get the Tuesday report, and that is to say, "Well, we made a list and differentiated it and got the object. Going to check it out tomorrow, and the pc feels much better, and everything is running."

And do you know that's happened with nearly every one of these auditor's reports? You, yourselves, might not have realized it, but anybody doing 3D Criss Cross went across this either gradually or suddenly in almost one session, you know. It was just *bang*. There it was.

One of the reasons for this, of course, at this particular time is you've been taught to assess in order to find something in order to run; to find something in order to run. That was the orientation point.

It took a little while to find that you weren't finding something to *run*, that you were *running* the case. And I suppose that is the main point of "geewhiz," you know, that comes up.

But I think you're prepared to say that 3D Criss Cross – when it's running – is about the hottest thing that you've had on two wheels yet, isn't it?

Audience: Yes.

That's very hot in the way it runs.

Now, I want to talk to you about pure theory. It has something to do with 3D Criss Cross.

First is flows. And this applies to Class II auditing, Class III or any other class of auditing – is rudiments have to be kept in during the session.

Now, reorient yourself with regard to rudiments. Rudiments were something you got in at the beginning of session in order to get the individual, pc, to run during the bulk of the session. Now, that was the basic orientation of rudiments over a period of many, many years. We looked on rudiments as just doing that and doing nothing else. That is to say the pc sat down, you got the rudiments in, and then *bang!* From there on there was no rudiments. You didn't have to worry about rudiments because you had those in. And then you went along and you ran the body of the session, and then you came to the end of the thing, and you said, "All right. Now we make sure the pc is all right. And we'll do something here at the end of the thing even if it's just say, 'End of session' or 'That's all, bud'."

We certainly did something to get the pc out of session at the end of the thing. Well, that's expanded, of course, to your very complex end rudiments today.

Now, end rudiments are there to keep the session from hanging up, and that's the purpose of end rudiments. It's to keep the session from perpetuating itself. And if you do end rudiments with that in view, you will be doing end rudiments properly. And you're not interested in anything except you don't want the session to hang up.

Well, the session can hang up on all the points of end rudiments. If you took them up one after the other, you would find out that any one of these points would hang the session in time. So you just take all these things that would hang the session in time, and you evaporate the session, see that? You not-is the session right there at that point. It's gone.

Now, beginning rudiments is to get the pc out of the Physical universe into an auditing session in his own universe. Let's be factual. That's really what it is. You see, there he was going along with all of his beautiful adjustments to how awful it was that he was not-ising, you see. And there he is going through life somehow or another, trying not to walk through brick walls, and his total concentration really is on how present time shouldn't be or is or wasn't or should be alter-ised or something like that. He's coping, you see. He's coping all the time. Now, this copingness is to a slight degree or to a great degree, but it's always slightly coping. Always. Right up to the point where you got the fellow all the way up the line, he is coping in every waking moment of the day. That's all he's doing. He's coping.

He's navigating a ship through the rapids. He's piloting a body down the highway. He's keeping a body seated at the desk properly. He's very aware of what's going on. The various impulses of existence are hitting him and he's resolving them, and his concentration's extreme on present time.

Now, if you have a pc who is still coping, while he is sitting in a session and is being made to cope while he's sitting in a session, with the physical universe and the life he lives out of session, you of course don't get him into session because it's a different universe.

It is his own universe that he is occupying in session. Now, if he is made to put too much concentration on the auditor, if he has too little confidence in the auditor, if his trust level is very poor, he, of course, carries the copingness of his day-to-day life over into the session, and he's on some sort of a social basis or a copingness basis or a handle basis on this other human being. And the auditor's a human being. He isn't an auditor, you see. He's just somebody else that – just as he'd meet the streetcar conductor or he'd meet a tradesman or he'd talk to the boss or something of this sort. He – that is the role that he puts the auditor into, and therefore he goes on coping with the auditor. And you will find him doing all sorts of social things with the auditor. You see, he'll be very socially minded toward the auditor, and so on.

Well, he wants to make a good impression; he doesn't want the auditor to get into the nasty, dirty little sewers, and so forth, that some of his life has run in, he thinks, you see, and the auditor must have a good opinion of him, and so on.

Well, this is actually the way he treats human beings out on the street. This is the way he treats human beings in his office. This is the way he treats human beings that he is in con-course with all the time.

And if that attitude continues, of course you have the pc really coping with the physical universe, not in-session. And that's a different attitude. There's a great difference in this.

Now, an auditor who does a poor job of getting rudiments in and fumbling around, you know, and he fumbles with the E-Meter and he doesn't know, and he misses a withhold, something like this, why, any one of these things will get the pc coping with the auditor, you

see, and puts him back into the physical universe somehow, but now puts him in the physical universe with a liability. He's supposed to be in-session and he is not, don't you see.

Now at the moment he went into session, he is then expected to cope with the auditor, you see? Now, actually, the state of a pc is no responsibility. No responsibility for the physical universe around him during the period of the session. It's a no responsibility. Let's just face up to it.

Now, that's the reason you can plumb the bank. The less responsible you make a pc for the physical environment and for the auditor and the auditing, the more no-responsible the pc is for those things.

Now, this sounds very peculiar. That sounds very peculiar because that also is a common denominator of an hypnotic trance. The pc in-session is not in an hypnotic trance. He definitely is not. The difference is very, very interesting

In an hypnotic trance, it is demonstrated conclusively that he has no control over anything. That is what is demonstrated to him, you see. He not only has no responsibility but he also has no control over anything and that the only person who can do any control is the hypnotist. May sound rather slight and esoteric, but they are nevertheless quite factual.

All you have to do is show somebody that you can make his right arm rise without touching it and that he is powerless – you always punch this home in hypnotism – that he is powerless to stop the right arm from rising, and he goes into a trance. Bzzzzz. It doesn't matter what trickery you indulge in to get these combinations of conditions to exist. Nevertheless, those are the combinations. So that he loses all control.

But hypnotism is devoted to the physical universe. It is devoted directly and immediately to his body and is not consulting the person concerning his bank, his reactions or anything else. Hypnotism is a total overwhelm. You do a total overwhelm and show the individual that he has no willpower of any kind.

Now, that state, a hypnotized subject, is very, very far from and has very little to do with an auditing session's pc's attitude, but nevertheless it is a state, and it was the only strange state that man had plumbed and could induce. Man could induce the state of cured by physical means. You know, set somebody's broken leg. He could induce the state of injured. He could induce the state of dead, and he could induce the state of hypnotized. And those are the states which man could induce on man. He couldn't induce much other states. He depended totally on other automaticities for other states to exist, such as get hungry. He depended on the automaticity of the individual, you see, and so on.

Well, there are a lot of minor states with regard to these other states but they're little tiny things that don't amount to anything, like get cheerful, get sad, you see. They're various tricks. They don't amount to much because they are not very deep-seated states. And they are all very much what we would consider the ordinary livingness and existence – we'd consider these states.

But these others are not really considered ordinary states. The state of dead, for instance, is not an ordinary state. It is so extraordinary that the very people who should know most about it, the medical doctors and the coroners, know nothing of it at all. They are the

most ignorant people on the subject of death we have on this planet. Almost any child could tell you more about death than a medico. It's quite interesting.

So they've become less and less familiar with this particular state. But man can induce that state on man, and it's an extraordinary state. He can induce the state of injured on man. He can induce the state of cured by a few minor means. Somebody has a headache and you give him an aspirin. And he can induce this other state called an hypnotized state. That's a highly specialized state. And that is the one string of man's guitar where it approaches the mystery of the infinite and the unknown. And that was the only string he could play on. And he strummed on that, and he played "Yankee Doodle" on it, and "Brahma Be with Us," – he's played that on it, and "Christ Save Us," – he's played that on it.

In other words, he plays all of – all these things are played on this one-string guitar: hypnotism. So it's very, very easy for somebody who has this in his background to get a mis-interpretation of an auditing session. And therefore, you get many states called "in-session" because there are many people auditing who have different interpretations of states. Well, you take somebody who was a gee-whizzer back in Egypt on the subject of levitation and rigidity and he knew how to handle the priesthood, you know, and the lesser priesthood, and the neophytes and the public, and that sort of thing. He knew, you know. He did *uuuuu*, you know, and that was all set.

And because you get these past experiences with the induction of these states, such as kill them, injure them, cure them, hypnotize them, you see, that sort of thing, you get different attitudes toward the pc from auditor to auditor.

They will color the quality or state of the pc in-session by these other things. Now, we also have, of course, all these social states which are near present time, which is entertained, happy, sad, hopeful, all of those things, you see. And that's one long, long catalog, but of course those are just social states. Anybody does this to anybody.

And an auditor who plays those exclusively, you see, really isn't auditing. He's trying to make the pc cheerful, he's trying to make the pc sad. He thinks the pc ought to have a grief charge, and so on, if he can force it, which is interesting.

But there's no sin in playing on that particular guitar. It's perfectly all right. I do it myself. Every once in a while I see a pc that is close to a grief charge, and I speak somewhat quietly and sympathetically. [laughter] And it'll spill, you see.

Now these states, then, all get mixed up in an auditor's individual interpretation of what is in-session. What is this thing called "in-sessionness"? What is it?

Well, is it hypnotized? Is it overwhelmed? Is it cheered up? Is it grievous? Is it injured? Is it dead? What are these things, you see?

How's this pc supposed to be? What is this thing called the beingness of the pc? That's the point. Well, you could probably draw up a long catalog, and you could do a lot of things, and so forth, and search forever for the answer if you bypass *the* answer. And *the* answer is, the state is simply this: willing to talk to the auditor and interested in his own case. And that's all there is to the state.

But this is such an idiotically simple statement that tremendous numbers of auditors think there must be more to it. And you get additive states on the top of this one. When you see an auditor doing that, you say, "Well now, there's something wrong with this session, but we can't say quite what it is."

Well, I'm sometimes horrified. I see somebody who has been audited consistently by some auditor – not here, around here. This is not a minor thing. This is a major thing and quite rare – who has done nothing but overwhelm. You know, he's got death or injury or something mixed up with the state the pc is supposed to be in or hypnotism or something – and you see, he's got a *total overwhelm* on this pc. And you'd see this pc, the pc is just way out of present time, you know. Every time the pc said "I thought," you see, we add the hyp – let's add the hypnotic angle now.

Remember the two shuns of the Auditor's Code. And all you have to do is don't shun 'em, and you can turn auditing into an hypnotic trance proposition. I'll show you how it works, see.

Pc says, "Well, I think it's a miller. I – I think it's a miller. I think that's the terminal. I think it's a miller."

And the auditor says, "Well," he says, "You know better than that. We had that on another list, and it couldn't possibly be a miller. Now what else is it?"

Well, the pc goes *ahh rhrrr*, you know. And he says, "Well, it – it might – might be a carpenter. It mi – mi – mi – mi – might be a m – m – mi – mi – might be mi – mi – might be a carpenter. Maybe."

"No, that's much too bold a terminal for that particular list. No, we don't want a carpenter on that list."

You see how gently it could be done. And do you know that at the end of that long thing the pc would be totally *thhhaaa*. But we would have violated in-sessionness. The pc not only unwilling but totally unable to talk to the auditor.

You know, the pc just – he had a dropped jaw in place of an in-session.

Now, as far as being interested in his own case, he's not interested in his own case now. He's totally fixated on what is this auditor going to do next. See? That's the fixation. What's he going to do next?

So of course, this definition, willing to talk to the auditor and interested in own case, are violated at once, and you can induce an hypnotic trance that way. Just overwhelm the pc, get the two shuns backwards, and you've got it all set from there on and you'll have trouble. But it's an overwhelm. And of course the overwhelm doesn't have to be that subtle. And when I see it in an extremity, it is not subtle at all. The person has simply been clobbered and wiped out, see.

I mean everything the person said was muffed and thrown back in his face, see. Any effort to communicate to the auditor was instantly blocked till – if we ran 8-C on the person, we would have it running on the auditor's willpower, you see, and we'd get the levitation of

the arm, and touching the wall, and we'd get a robotized attitude. This would be a pretty wild thing.

Now, this can't happen easily. It really takes some doing, and it's nothing that any of you are doing at the present time. I'm not being accusative, for once. But it is – it would happen. And you see, the auditor has made a different evaluation of what is auditing.

What you want is somebody who is no longer fixated on the physical universe or in a social state with the auditor. So that's why you run your beginning rudiments. But now, of course, if you violate the Auditor's Code too thoroughly, you've got somebody – a pc now – who is still hung up to part of the physical universe. He's got a person, not an auditor.

And so he's got this social chitter-chat going between himself and the auditor, and he's still out of session. And he's too interested in what the auditor might think and what the auditor is doing. And he is defensive, and he doesn't understand what's going on, and he's coping. He's almost sitting there with a pair of small theta boxing gloves on, you know, and you can kind of see him putting his dukes up every time you say anything.

Well, early in auditing, that can be expected to some degree from a pc. There is some degree of that always early in getting audited. Some tiny degree of it.

"What's this? It's all new and strange. Case? Case? I don't have any case. I've never had any trouble at all. The psychoanalyst always told me that if I were careful I never would have any trouble. I wonder if he really thinks I am crazy. Do you suppose my wife is right in saying I am just a fool to be sitting here with this stuff? Is this really black magic?"

You know, all kinds of wild little questions, you know.

And he's got to get a sense of trust. Therefore, the first auditing a person should have, should be optimumly the best possible auditing.

After a person's audited for awhile, you could get a little careless, but not early in his auditing. Why? Because you take that distrust and build it up into a constant, running thing. It's always there, don't you see. And the person's sort of been parked out of session permanently. This is how you regard an auditor, and that has been hardened into a habit. That is how you regard an auditor.

Now, getting rudiments in, getting beginning rudiments in, is getting the individual to be able to sit there without taking full responsibility for what's going on in Russia at the moment and what's going on in the United States at the moment, and without taking full responsibility for what's going on at the office, and taking full responsibility for having to go home at dinner and so forth. In other words, you detach him from all of this superconcern with the physical universe, and you set him up so that he can look at his own universe.

And you have to indicate that he has one, you know? And that's what's known as impingement, in various ways. The impingement is also part of the auditor saying things to the pc to make the pc respond. And he's in a state of no responsibility with regard to the physical universe. Its immediate concern is right now. That's quite interesting because, of course, he's been in this state since the beginning of track.

The first time he said, "Why did you build this universe?" you see, began that long career of no responsibility for the physical universe. What he's actually doing in the physical universe is, because he has no responsibility for it, he has to cope with it somehow. And because he can't be fully responsible for it, it's all agin him a little bit.

"Ah, *i-isth-this all?*" We're not quite sure about this, you see.

And it's an insecurity, you might say. Well, of course, this is a common denominator of bank. At those most aberrated spots on the backtrack, you'll find that the individual is 100 percent irresponsible for the lot.

Now, if you put somebody into the middle of the reactive bank, you would have him into the most zero responsibility state that a person could be gotten into, or that that person could be gotten into. Common denominator of the reactive bank is no responsibility.

So he goes into this state rather easily, but remember that we are more interested in the backtrack. In fact, we don't get any auditing done if we're not interested at any degree in the backtrack. We're more interested in the backtrack than we are [in] the present life. So the reason we're trying to detach him from present time physical universe is so we can put him into communication with back time physical universe, and that's about all it amounts to.

Now, if he stays obsessively – this is an old, old phrase that was used to describe certain pcs back as early as 1949 – were stuck in present time. He just couldn't get out of present time.

You'd say, "Now go to the time when you were three years old," and the person would just go, "*Uuuuuuuuuuh-uuuuuuuuuuuh*. Yes, I'm there."

No, he wasn't there. He was right here in present time, you see. Well, this is supercope. And he's just in a state of supercope, that's all. It didn't matter if he were lying on the couch, the house was dead quiet, there was nobody going to come near him, nobody knew where he was, including his wife. He had no worries, there wasn't anybody worrying about him. You could get all these things exactly right in present time, don't you see. I mean, you could make present time right. Perfect. And a person would still be stuck in present time. And you say, "All right, now get the idea of thinking about a clock."

"Yes, yes... yes..." [laughter] At no moment could he ever ... He actually had to mock up a new clock because otherwise he might move out of present time, don't you see, and that would be terrible.

Now, of course, the less willing a person is to move on the time track, the more dangerous he considers the time track to be, and the mind to such a person is already – because he has lived trillennia in this state of *zzzzzzuh* superalertness to present time – it is already an area of danger. It is an area of danger because the time track he has lived, in the consecutive moments we call – the consecutive moments of present time which make up a time track, of course, are fraught the whole distance with insecurity. And even greater insecurity than he feels in present time, don't you see.

So here he is in present time being very insecure about present time, and now you ask him to go to an even more insecure place, which is the insecurities of yesterday, and he just sticks right here. This is safer, thank you.

But oddly enough, the flipperoo on this is, of course, he is stuck on the backtrack. Nobody is ever *stuck* in present time. They have to be stuck on the backtrack which they *believe* is present time. So you're always auditing a certain – a person of that character with the CCHs – you're always doing backtrack auditing, which is very interesting

You're giving him present time exercises, and it's always backtrack auditing, because of course they can't even get close to present time, although they're stuck in present time, although they're coping with present time, although they're not in present time – all of these things, apparently contradictory, simply add up to a tremendous confusion. And the common denominator of the pc, of course, in that state of mind is confusion.

Well, now all of this adds up to a necessity to get your beginning rudiments in much better early in your auditing of a pc than you might later. And on taking over a new pc, I would just beat the beginning rudiments to pieces. And after I'd been auditing somebody for twenty-five or fifty hours or something like this, I would just take a long yawn one day. Everything seems to be going along just fine, you see, except we've lost the high rate of change that we were experiencing. The individual was changing with great rapidity and now isn't changing so fast.

In short, anytime auditing settled down to a long grind – let me characterize that and give you the stable datum for it – you just take those beginning rudiments and you just tear the thing to pieces. In other words, you *make* the rudiments function. Now, that's different than just seeing if they are in. Most sessions, you just want to see that they're in. That's great. That's nothing. *Zoom, zoom, zoom, zoom.* Fine. Fine. Now we get busy doing what we're doing, see.

But now we find out we've got a scratchy needle and not going anyplace, and there's not very much progress, and so forth. Now we make a different use of the beginning rudiments. Entirely different use of them. We use them to audit the case with regard to an auditing session. And we get those rudiments in. And we don't just get them in for the session we are running. We get them in for any session the pc has ever had anyplace, particularly his first auditing session. Let's get them in. Let's get them in, the lot of them.

Well, now, do you see then the difference, the two ways you could use rudiments?

Way number one, you go *zip zip*, disconnect the pc from all of his anxieties of present time so that he'll be interested in his own case and willing to talk to the auditor.

All right. That's the immediate, most common use of beginning rudiments. *Bang!* There they are, they're in. You're off. The individual's interested in his own case, willing to talk to you; you go on and audit what you're going to audit.

The same exact items have a wider use. And that wider use is to get the rudiments in for *every* session the pc has ever had. Make sure that all sessions are in. In other words, you could expand it from this session to all auditing with considerable profit.

Now, how many rudiments processes would you use? Ordinarily, it's enough, really, to flick the withholds off of every rudiment. Did you know you could do that? You can get any rudiment in by getting the withholds off at that rudiment level?

All right, that will normally get the pc immediately into session. He's willing to talk to you, and he's interested in his own case and ready to sail. But there are just about forty-eleven squared processes that could be run to get rudiments in. They are almost uncountable. If you'll notice, your last Model Session does not have any current rundown of processes connected to it.

Well, I was writing it up, and I finished it off. I worked on it rather late, and it was a tough evening in general, I suppose, or something like that, and it was getting on to about four o'clock in the morning, and I lifted my pencil to write down the processes, and I was simply overwhelmed. How many processes are there? Good heavens, I know of literally dozens and dozens and dozens of processes that could be used to get rudiments in.

They are really some of the cream processes of auditing of yesteryear.

For instance, I was running a session not too long ago, and what do you know – the 1st Saint Hill ACC, I got tired of the pc's boxing around and being social and standing off toward me, so I simply said, "Who would I have to be to audit you?" And we cleared this up in about four questions, and the session ran quite well.

Well, that's an interesting use of the situation. But it's just what process was needed at the moment, don't you see. There are lots of them, you know. "What part of that problem could you be responsible for?" Perfectly valid. On withholds, "What doesn't George know about you?" you see. Oh, you know – just know endless processes get withholds off on the withhold question.

There are at least thirty-six Havingness Processes, and just today an old-time field auditor had been dreaming up and had been culling the stuff out of old textbooks and had walked up to sixty-three Havingness Processes. I looked over the list and thought that's very industrious, and all of a sudden saw that there were six or seven more. There must have been that many because I got an additional one in the first two.

Well, at that ratio, it would have been ninety-some, don't you see. That's an awful lot of Havingness Processes. That's a lot of them.

Now, as far as getting somebody to talk to you is concerned, well, any communication process you ever heard of can be used. Yeah, just take a weird one, workable or not workable, just take a weird one.

Just thinking off the cuff, and the fellow is not facing you and that sort of thing, and say, "Well, what spot around me could you communicate to?"

You know, make him point it out, and he'd finally punch you in the nose or something of the sort, and he'd say, "There," you know. And he'd feel much better.

In other words, any of the old communication processes, just any of them, any valid process would get the auditor in to some degree. As far as ARC breaks is concerned, "Recall

an ARC break," would be the most strenuous of these that I know of. Run the whole track, run for hundreds of hours probably without ever fetching up to a dull halt.

So you could get in all kinds of aspects of the rudiments, and therefore it is necessary that you recognize what the rudiments are, you see. Exactly what these rudiments are. A rudiment is not a process. A rudiment is a reason why he's not in-session, see, a reason why he might not be in-session. And that's what they are.

And your job in using the rudiments is to get him in-session, and if you wanted to straighten out a pc, 100 percent straighten out a pc on the whole subject of auditing, then you'd simply straighten out the pc on the subject of every session he'd ever had. Well, that sounds more arduous than it is.

All you have to do is pick up the first session. That'll take you quite a while sometimes.

"Well, was the session then?"

"No, no, there was a session. Oh, no, no, there was a session – *ra-ra*, yeah. Then, then it was Joe, I've – had completely forgotten about Bill, yeah." And then, "Oh, no. No, no, there was – it was much earlier than that. Come to remember, I had a session in 1950. What do you know? I'd completely forgotten that one."

You know, it'll take quite a while to sort this out. What is the fellow's first session that he's absolutely sure of. And then you might run such a process as this – and this, I think, would possibly be the best process – is "What didn't that auditor know?" That seemed to run the motivator of the untrainedness of the auditor, gets off his withholds and that sort of thing, coupled with, "What didn't you know about that environment?"

Now, some such combination as that – "What didn't you know about the environment" and "What didn't that auditor know" – this could be marvelous.

Now, maybe this pc has been an auditor and has tremendous overts on pcs and you haven't run a complete 6 on him. The form about pcs, the Sec Check about pcs is the best one to handle this. But you might turn it around and say, "What didn't your first preclear know about you," you see. Locate the fellow's first preclear and clean up that session from the viewpoint of the auditor.

Therefore, by cleaning up his first pc and cleaning up his first "being a pc," and cleaning up these two, you start to release charge which has accumulated up the line through such things as bad auditing and nonsense that's been pulled, and cul-de-sacs he's run into, and sessions that have been run with the rudiments thoroughly out.

Now, you could go ahead to this extremity and get the rudiment in for every session the pc ever had. You'd get rudiments in. All rudiments. Every one of them.

Now, you could do worse than this. You could get all the *end* rudiments in for every session the pc had ever had. Now, that possibly might be more profitable because they haven't been around very long.

"Now, did you tell that auditor any half-truths, untruths or said something just to make an impression on him or damage anyone in that session? In *that session*, that one that we're talking about right there."

And, boy, you'd find some pcs had been having a wingding They've just been having a ball.

Even if you find it today, you find that damage question – if you're using it; it isn't in a written version; it was handed to you verbally, I think – "Or tried to damage anyone in this session?" You'll find this every once in a while a little bit charged.

And if it's always null, I'd get suspicious, you know. If it had always been null on some pc that wasn't making progress, well, the obvious answer, of course, is by not making any gains he's trying to damage himself, isn't he? That's the obvious answer, isn't it?

By failing to do auditing commands and to monkey up the auditor in some way and to get everybody upset in general, this all by itself is, of course, efforts to damage self. That should show up sooner or later – efforts to damage himself.

But you could get all those rudiments in, every one of them for every session the pc ever had. Now that looks absolutely fantastically laborious. It just looks too much. Well, what do you know? It'll only be the first session or two that have any importance. His first session or two as an auditor, his first session or two as a pc. And then the rest of it is all gross. It's just the gross here and there, one after the ... Well, three times he got mad at pcs and, you know, they're all small number stuff.

And probably the best, probably the very best method of doing that is, of course, your Sec Check, your Form 6 Sec Check is to follow through from that. So I would say offhand that in handling a pc, I would do these two things, if I was trying to straighten this pc out. If this pc behaved peculiarly as a pc, you know, just didn't seem to be able to get into session and didn't seem to be able to talk to me, and I was having an awful time straightening all this out, and this pc had a sort of a history of kind of grinding, never got anyplace and so forth, then I would smell a mouse called a bum session.

And I would straighten out – first session, I'd find and straighten out and get the rudiments in, all rudiments in, for the first session the pc had ever had, and for the first auditing session the person had ever given if the person were a Scientologist. I'd get those two in. Those two sessions. I'd just straighten them up. Beginning rudiments, end rudiments, I'd polish those things up and burnish them until, God, the pc wondered why he ever walked in that room in the first place, you know?

I mean, just get those things really polished, and then spot check the rest of them. Now, I'm not above scanning him from that point on once I've got those things straightened out to make the pc hang on the track. That's an old technique – lock scanning. Not engram scanning, but lock scanning. Old creaky technique. It has its own – only value it has is to find out where the pc's stuck. And there it is very, very useful. Extremely useful.

After you've got these first two sessions – you see, the one he gave and the one he received – after you've got these straightened out, you've got a takeoff point. Now, you'll rip up a certain number of locks, and you do something weird like this. I'm not giving you this as a

standard auditing. I'm just telling you you can do anything to get rudiments in. This is one of the creakiest old processes that ever existed.

And you can say, "All right. Now pick up that first session that we've just covered so well. Good. Got that first session? All right. Now scan rapidly forward to present time through all sessions you have ever had."

And he, "*Yyaayyayyy, mmmm*. Yeah, that was tough."

"All right. Fine. Good. Now get that first one again. All right. Now scan rapidly forward to present time through all the sessions you have ever had." Or "When I snap my fingers start scanning," you know, anything you want.

And you find by observation of the pc, this is what goes on. At first it takes place with fair rapidity. And then it takes him a little while. And then it takes him a little longer. And then it doesn't take him quite so long. And then the next thing you know, it doesn't take him long at all. And then the next thing you know – he ain't moving on the time track.

"Yeah," he says.

"All right. Scan on forward to present time."

"Yeah."

"Did you?"

"Yeah."

"Oh, you've done it already?"

"Yeah."

"All right. What are you looking at?"

And of course, he's stuck in 1955 in the middle of a session. Now, you've got that session, and that'll be a juicy one. That'll be the confusion prior to and all that sort of thing. Now, you can take this thing and straighten out that particular session, get all the rudiments in for it, don't you see. And you could do this over and over and over and over, and you would run out auditing. Actually shouldn't take you too long. You'd probably run out all the auditing the person had ever had in four or five hours.

But it'd just be the basis of getting the rudiments in for the sessions. If you wanted... I can tell you what a full straighten-out would be for an old-time auditor who'd been auditing a long time. It's just what I've been telling you, but I'll give you – it to you in a very one, two, three, four type of session thing or actions.

Straighten out all rudiments beginning and end for the first session he ever received. Straighten out all rudiments beginning and end for the first session he ever gave.

Pick up, no matter how you do it, the rough spots on the auditing track – the spectacularly bad sessions – and every time you'll find one, get all the rudiments in for that session. Give the pc a Form 6 from one end to the other to get off all of the overts as an auditor, pull all the withholds on the subject, run lots of Havingness, go back over and spot check it for anything remaining when the Form 6 was complete. Now, that would be quite an activity.

I don't know how long it would take to cover a full Form 6, but we have had, horribly enough, one question of a Form 6 require a whole week. So there's no estimating how long it would take. Also, we've done a whole Form 6 in a week, don't you see. So there's no estimate of the amount of time.

But that's how I would go about straightening out somebody.

Now, if a case were grinding, and if ordinary auditing and if ordinary activities did not bring the case in toward rapidly running and benefiting from 3D Criss Cross, that's what I would do – what I just enumerated. That is what I would do. I'd expect something was awfully wrong with the auditing either given or received on the past track or there was something *really* screwy on the subject here someplace, and I would devote time to straightening that out before I went on with it, with profit.

Now, if you're using old slowpoke processes, of course, it might take you longer than if you're using very whizzed up processes. Just plucking the withholds off from each rudiment, *bang, bang, bang, bang, bang*, would be the fastest way to go ahead and straighten out the rudiments for any given session.

But if I were confronted with a choice between going on and doing 3D Criss Cross on a very difficult pc that had a very scratchy needle and I just couldn't seem to read anything and the pc didn't seem to be interested in anything I was doing or if the pc were afraid of 3D Criss Cross or afraid of this sort of thing or I just couldn't read anything and it's going on and on and on, well, I wouldn't keep wasting time because you're going to find out eventually that there are ways to waste auditing time. Yes, you'll find it out. There are ways to waste auditing time.

Can you look back on any sessions where you should have done different? Can you look back on any two weeks of auditing that you wish you had done different? Hmm? And the answers all of a sudden loom up at the end of this period of time. Uuuuuh. You'll sometime – I hope you don't have this experience – wake up at the end of two weeks and find out that you haven't got an item in 3D Criss Cross. You haven't even gotten a good list. You just haven't gotten anyplace, and the pc has had no advance or gain. Well, you could do that. It could happen. It would take – it would be a pretty peculiar situation, but it could happen.

Now, the only thing that could be traced back to is total out-of-sessionness. Now, that out-of-sessionness could be arrived at from two different quarters. Either you did not prepare the person for assessment – that is the heaviest sin. You didn't get the person sec checked and straightened up in general and so on. You just didn't do any of that. No preparatory work of any kind whatsoever. You just sailed in and started running 3D Criss Cross and came a cropper.

Someday you'll get away with it. You're liable – much more likely to make this blunder because someday you are inevitably going to sit down to some raw meat pc straight off the street, you're going to ask him for a list of the things he likes, and get the item, and ask him for things he dislikes, and get the item. The person's going to all be straightened up with no more lumbosis, and everything is marvelous, and you'll say, "Well, look at that. Ron said you had to prepare these cases. *Ha-ha-ha*, and I didn't prepare *ha-ha-ha*."

And you get ahold of the next raw meat pc, and you spend three, four weeks – nothing happens. And you just wasted three or four weeks of auditing which, if you'd been sec checking and straightening the person up and so forth, wouldn't have been wasted. And the pc is disgruntled, and you're upset, and you've had a big lose, don't you see.

That will happen sufficiently frequently to make a citizen out of you with regard to preparing a case.

All right. This type of preparation – getting the rudiments in – is very beneficial, and remember, today there is no excuse for a case getting no gain. There's no excuse for a case getting no gain. You're an auditor, you've been trained, there is no excuse for the case getting no gain. There just isn't. It must be a gross auditing error of some kind or another.

I'm not just saddling you with terrific expectancies. Yeah, people fall off and fall on their heads and that sort of thing, and you have to spend three-quarters of three sessions in a row doing nothing but straightening up rudiments and that sort of thing, but if you're doing a good job of this, the pc will have a gain.

What I'm talking about there's no excuse for, is you do everything you think you ought to do, and at the end of having done this for a week or two, the pc makes no improvement or gain. That you shouldn't have. That you shouldn't have. That would be pretty gross. It would be something like trying to do 3D Criss Cross on some fellow who was fixed there in present time right straight on you and can't even think of anything and so he – he – he rapidly tailor-makes lists, see.

He – he doesn't pay any attention to the list because he's got to talk to you and keep you entertained. Well, it'd be a gross auditing error because, for God's sakes, you should pick it up in the end rudiments.

"Have you said anything just to impress me?"

"Well, everything I've said is to impress you." See?

It shouldn't have continued as an error longer than one session. Now listen, you can have one session with no gain, see. You could even have two sessions with no gain. You can even have two sessions with no gain and a session in which the pc slips backwards. I'll let you have that, see.

But beyond this point, no. No, no, no. You're abusing your margin of error, see. Something is going wrong now, and it must have been going wrong for those three sessions without your spotting it, and it must be something like the pc sits there all the time thinking how ugly you are or something like this, and you just haven't picked it up. That's all.

You – it's some gross error. You're just not reading the meter, you see, or it's something wild.

Now, to prevent that sort of thing from happening, you've got rudiments. You've got your beginning rudiments, you've got your end rudiments, and they prevent you from making gross errors, providing they are done. And they will also clean up all past sessions in which gross errors have occurred.

Now, you can make a case feel a lot better if the case has had a lot of bad auditing. Well, the case had some bad, overwhelming auditing. The auditor, he was the high priest of Noz, and he was that for a number of trillennias. As a matter of fact, just finished a life as a Roman Catholic bishop or something. And this bird didn't come in close to an Academy and started auditing and God knows what happened thereafter. Only God would have been able to find out, too, because it'd all be withhold from that auditor, you see. Something real sour had been going on.

He got the pc into a total overwhelm of some kind or another. Got the pc all involuted on the introvert, and the pc is sitting in the square root of nowhere. Knocked out of present time, you see. Nothing ever flattened, anything of this sort.

All right. That session could coast along as a sleeper. You know, just not noticed by anybody until all of a sudden you're running a process on the pc that should give the pc a gain. And you get a lose on this process? Well, don't be so busy at condemning your own auditing. Other people audit, too, and some people in the past have not audited so well either.

No, you didn't get a gain on this person! Your rudiments, as far as you were concerned, as far as you could get them in, were in, and they were apparently in, and you ran a process that should have gotten a gain on the pc, and there sits the pc with his lumbosis in full flare.

Well, one of the things you do is look for a missed withhold. Another thing you do is figure out if the pc's havingness was down. All these various things, they're all "rudimentary" sort of things, and then suspect a session.

You see, you've got techniques of sufficient power and magnitude that this shouldn't happen. I'd suspect a session. What, what session is it that's got this bird hung up, see? Did this fellow ever have a session that was hung up? Is there a session sitting on the backtrack where all rudiments are in, out, sideways and upside down? Yeah. And you'll normally find one.

Now, we've had two or three students here who have had just that experience and who didn't make very good progress until we found our past sessions, which is why I'm talking to you this way today. See? So auditing apparently, just empirically, if very badly done, has the power to nullify auditing on the basis of the first occurrence. The earlier occurrence has more force, more aberrative force, than the later occurrence.

This is one of the odd effects of the mind. It's one of the strange parts of the mind. That is odd about the human mind – that the earlier ones have more force than the later ones.

Now of course, the pc's interest is on the later ones, but the pc's aberration is contained in the earlier ones. Your pc's terribly interested. In this lifetime, the pc was a Christian Scientist, and everything just went bad, and they know the pc, everything, you know. Interest, interest, interest, you know. And – and there they were and – and Christian Science, and – and so forth. And the practitioners told him to not-is all the time. And they not-ised all this sickness, and so forth. And they know that – that's what's wrong. That's what's wrong. That's what's wrong, you know? The interest is right there, see, this lifetime. And you, knucklehead, all too often fall for it, following the pattern of your forebearers.

Other people interested in the field of mind have *always* bought this. This has been the uniform mistake of the whole track. That's why nobody knows anything about past lives. That's why nobody knows anything about technology of the mind – is because everybody buys this fact.

The patient, the pc, the individual being processed, audited, slugged, has his interest on the last occurrence, and all the person's aberration is on the *first* occurrence, so they're the whole track apart, given any existing track on any subject.

You could say somebody had a track as a railroad engineer, and so on. Inevitably, you fall into this on the last incident. And all the aberration is contained in the first incident.

So this pc comes around, and he says, "Christian Science, and it got me all loused up, and here I am, Christian Science, and we not-ised the physical universe, and I'm now so I can't have anything, and this is all very tough, and it's all very rough, and – and – and that sort of thing."

And the person auditing him says, "Well, now who in your family was interested in Christian Science? ... All right. What about Christian Science?"

Christian Science, Christian Science, Christian Science. Well, that hasn't anything to do with that. That's a track called religion. And although the person's interest is seized and gripped with a vice in the present lifetime, it started in a little, old cotton-picking town called Whumpfburg or something back on the Sea of Whumpf, when he didn't have anything to do one day, and he thought it'd be a good idea to build a mud idol. He got to building it. And then he thought it'd be a good idea to tell people a lot of lies about it. And then he thought it'd be an awfully good way to make his living. And from there on, man, we had a track called religion.

Well, of course, the pc isn't interested in that at all. He's had nothing to do with that. He is so irresponsible for it, he doesn't even remember it. But he can only take responsibility for the motivator – this life, now.

Now, that's very responsible. He can be very responsible for that, comparatively speaking. He can remember it. That is your first designation.

You see, bad memory is just a low responsibility on any subject. These two things are absolutely coordinated one against the other, and no memory means no responsibility. You'll be utterly fascinated. Those acts which a person has done in his lifetime for which he has the least responsibility are those he remembers the least. Well, that's the woof and warp of the Sec Checking which you do.

You've got to pull those things because the person has no responsibility for the worst ones he's done, and therefore has no memory of them.

Now, you get an inversion of this thing whereby the person has no responsibility for them but apparently some full memory of them. You get this occasionally, too. Only beware. That is no memory of them. That's a dub-in. That's the dub-in that goes below.

This guy tells you very factually, yes, he's been in prison. He's been in prison this lifetime. As a matter of fact, he's been in jail four or five times in this lifetime, all for chicken stealing.

You look up his record, and you find out he's been to the penitentiary for manslaughter – once, see. So you get the lower level, of course, of responsibility – the lower level of no responsibility is an inversion called dub-in. He's obsessively remembering the wrong thing.

Now, look at this then as a barrier to knowledge of the mind. That's a terrific barrier to knowledge of the mind. The only way you would ever get anybody over his aberration is track it from the beginning to the end, see. You could then do something for the person, but if you just took the end, and particularly the motivators at the end, you would do very little for the person. Run motivator, motivator. You can do something for him just running motivators. Don't think it doesn't work. Dianetics worked. And Dianetics ran mostly motivators, in its first year. And it did things.

But look at that. See your inversion? Now, the one place he can't go, of course, is the beginning of track because he has no responsibility for anything that went on then, so he has no memory of it, so it doesn't exist. Or it is dub-in, and he thinks he's just pretending to know about it. Boy, that is below having forgotten it. Man, you'll hear some of the wildest dub-ins off pcs. Every once in a while some of you get discredited in your own eye, and you invalidate your own past lives because you hear somebody going off at a mad rate on a super-pretended knowingness, you see.

You know, they'll be eight to twelve famous people in the same lifetime? Well, he might have been somebody in that lifetime. Give him that. You see, they remember it by dub-in, but it's below the level of responsibility.

See, it's this fantastic effort to take some responsibility for something they already have totally no responsibility for, and it all winds up backwards. This is a real goofy situation. Well, all you got to do is go down to the spinbin and look up Napoleon. Man, you find him all over the spinbins, so there must be something wrong with this. So – [laughter] yeah, he was not divisible. Thetans is not divisible.

Anyway, you see that this would operate as a considerable barrier to an auditor unless an auditor had a way to detect that there was something under it. And that's your E-Meter.

Your E-Meter will detect no-responsibility areas that the pc can't remember. And a bad meter will only detect those things which a person can remember, and detect them late. That's a bum meter. It only detects those things which a person already knows about.

But a good meter, like this Mark IV, detects below the level of conscious memory and detects into the zones of irresponsibility, and of course then appears to be very magical and appears to know more than the pc knows about it. Well look, if the pc knew about it, he wouldn't be aberrated. You can just always put that down in a little thumbnail margin on almost anything the pc says that is motivatorish.

If the – or the pc is talking to you about his case, and he's going, [makes a coughing noise:] "*khakha-kha kha-kha-kha* and so forth, and I've been out in the cold and - and uh - and - and uh - my mother was very mean, *mean* to me, *kha-kha-kha*," and so forth. And he gives

you this *long* history about all the horrible things that's happened to him in this lifetime, and he's still going *kha-kha-kha*, then you had just make up your mind that he doesn't know what's wrong with him. Because if he knew what was wrong with him, he wouldn't still be going *kha-kha-kha*, see?

This one day you're going to get an individual reality on of great magnitude. An auditor can't audit forever without running into a miracle – real, full-fledged miracle. You audit enough pcs, you'll sooner or later run into an honest-to-God miracle, you know. The only mistake you can make is wearing white robes yourself afterwards. [laughter] Takes a lot of washing and so on. Anyhow ... [laughter]

This bird sits down, and he's got a shrunk arm, you know, and you're puttering around with the E-Meter trying to get him in-session and that sort of thing, and all of a sudden his arm goes out to its full size and quite normal, you know. My God! You know? Or it grows an inch or something like this, suddenly, you know. Or somebody grows a new set of teeth, something like this. These miracles are not frequent because you're not particularly looking at them, but they do happen.

And it will always be because you have tripped an area which was right on the fringe of consciousness, and that the person knew nothing about whatsoever, and all of a sudden leaped full armed into analytical recall. What you've done, then, is take a no responsibility which was almost complete, and turn it into a responsibility which was almost complete, and of course, you're not going to do that very often. It takes a gradient scale.

But they are very, very interesting, these cases that know exactly what is wrong with them that will have sitting right in the middle of all that is wrong with them some totally occluded area, which when you trip it does something odd and peculiar to the case. And there's your zone of miracles. If you're going out to work miracles, why, just go along that line.

"Let's see, what's happened to you in this lifetime that you don't know about? Where are your occluded areas? Well, thank you very much. Good. Now that you've told me, we'll look elsewhere."

And just watch the meter very carefully and say, "All right. Start at birth and scan forward to present time, and the needle will fall on all occluded areas." Oh, no, I don't think that would be a good auditing command. But anyhow, that's almost what you're doing when you're sec checking. Everytime that needle goes *plang*, you're playing with a somewhat occluded area. He may know some of it, he may have a recollection of some of it, but he doesn't have a recollection of all of it. So some or all of it is occluded, and by yanking that into view, of course, you've shown the individual a spotlight on something, and the release of charge on the thing is sometimes quite spectacular.

Of course, Sec Checking is as spectacular as you make it. It's not as spectacular as it is written down on the sheet, you know. I mean there's a lot, a lot of people around who are asking Sec Check questions just, "*Da-de-da*, yeah, that's null, *ha-ha*. *Da-de-da*, well, that one is null. Okay. Thank you. Now *da-de-da*. That one is null. Next one. And that one's null. *Ahhh*," and think they're sec checking, you know. And think they're really getting somewhere. They're running Sec Checks like rudiments. The lick and the promise that you give rudiments to get the pc in-session is not the same way, of course, you handle a Sec Check. You've got to

handle a Sec Check probingly, searchingly. You've got to handle a Sec Check question as though it is a hint of a possibility, and then make the most of it.

And "Have you ever shot any angels with a 12-gauge shotgun?" That's the written Sec Check question. I'd take a Sec Check question sounded as oddball as that and wind up making something out of it, you know? "*Hmmmm*, all right. *Hmmm*, now, let's get down to work here. Got a Sec Check question. Have you ever shot any angel with a 12-gauge shotgun? All right. Here we are now. All right."

"Have you, ah, are you withholding something right this minute? What are you withholding right this minute? Oh, what did you think of? Oh, good, all right. Are you withholding anything else from me? Have I missed a withhold on you? All right. Very good.

"All right. Now, have you shot ... Yeah. All right. What about it?"

The guy says, "What about what?"

"Well, what about shooting people? What about shooting things? How about shots? And so forth. Did you ever play golf or something like that. [laughter] Did you ever cheat anybody in a golf game? Come on. Come on. Come on. Unload here. Shot. Shot. What is this? What is this?"

"I don't know."

"*Mmmmm*." [laughter] "I've got a fall on 'shot,' and he doesn't know. *Ha-ha*. I can..." There's a whole session: Have you ever shot any angel with a 12-gauge shotgun? You say that's absolutely impossible. Nothing would ever come out of the Sec Check question. No gain would ever occur on a case on something like this. A guy who was walking two feet off the ground, he says, "What in the hell happened, huh? It's just a bunch of words, and they restimulated things, and I was watching the meter. Only I was *making* it work, see." *Rhhh-rhhh*.

I never let a pc get in a disarmed frame of mind where the pc is calm about what I'm going to ask him or about his past. Only I don't want him to be interested in *me*. I want him to be interested in what's going to come up. I like him to be very interested in his own case, and after you've pulled a couple of rabbits out of the hat of this character, of course, the pc doesn't know what the hell's going to come up next. And he gets alert. The first lesson he learns in any Sec Checking I would give him is, he doesn't know all about it because the first thing he does when he comes into session and sits down, he's either in one or two frames of mind. "Nobody knows anything about their lives, do they? That makes me average," you see, the guy says. "I'm average. I don't know anything about yesterday or my youth or anything."

Or "Everybody knows everything there is to know about their own lives that's important, don't they? And what could there possibly be in their own life, you see, that has any value or importance of any kind whatsoever because, of course, a person can remember all these things, naturally."

And he comes in with one of those two frames of mind, and I, of course, make it my business to destroy whichever one it is. I shoot it down in flames with rapidity. Why? Not to trap him into his own bank, but to get his attention fluid on the subject of himself.

You know, he's been walking around all these years trying to live with that bank, and he's going to be around a lot longer, not living with the bank necessarily, but he's going to be living with his own thinkingness, and he'd better sure know what his own thinkingness is all about. If I only had five or six hours to process somebody, I think I would teach them to live with their own thinkingness, more, more thoroughly than that, just on Sec Check questions, you know.

I'd give him enough research, when he suddenly realized he had done something, to make him realize that he had some causation over his acts in life. Not to make him more careful about the things he was doing, but after he had done them, for sure remember them.

Anyway, this would be the handling of cases, and the handling of cases to a large degree is a technical matter. But over the top of all of this tremendous technicality, you have one thing that continues to loom far larger than all of the technicalities. All these other technicalities simply serve this thing as a state. That is, the rudiments, the beginning rudiments, the end rudiments, and so on, only serve this one thing, and that's in-session. That's the state of being in-session. That's the only thing they serve.

So what's in-session? And it's just simply in-session. An individual's willing to talk to the auditor and is interested in his own case. And that's all in-session is. And when in-session does not occur, you don't have auditing. And the most gross auditing error there is, is not being able to run a session in which the pc is in-session.

Now, a pc overwhelmed or a pc obedient or a pc propitiative or a pc this or a pc that aren't necessarily a pc in-session. See? Because the pc in-session is very simple and it has very few additives onto it. He's simply interested in his own case, and he's willing to talk to the auditor. Very good. More likely *able* to talk to the auditor, after I've seen a few auditors *prevent* pcs from talking to them.

And I defined it, I think, a little while ago as willing or able to talk to the auditor, but it nevertheless amounts to the same thing.

Now, what – what is this state? And it's one of these things that you recognize when you see it as an auditor. You'll simply recognize it. That is in-session. This pc is in-session. All of a sudden the things go *whiz, bang, boom*.

Now, the only thing which I'm calling to your attention is that you often fail to recognize when it is not occurring. You fail to recognize. You hope it will materialize. I'm trying to make plain to you in this lecture that it never materializes. It is not an accidental. It is just not an accidental. It's not something that you can put on automatic. That is all.

You put a pc in-session with the rudiments or you take advantage of the pc's state of in-sessionness when it occurs. What your end product is – in-session. If a pc is in-session, you certainly don't *put* him in-session. If you've accidentally achieved this state, that's it. I mean, you can accidentally achieve it, just by complete accident.

A person's sitting there, and they're rather bored, and so forth, and you all of a sudden say, "Well, all right. Now, are you willing to have me audit you?"

And the person all of a sudden looks at you and says, "Well, yeah! Yeah, I sure am, you know. What a good idea. I've a lot of things I'd like to tell you about," and he all of a sudden starts talking to you about his own case, and he's in-session.

Now, you're going to go ahead and put him out of session with the remaining rudiments. It takes a very clever auditor to be able to do that, but it can be done. [laughter]

If it weren't for setting a bad example on you, you see in these television demonstrations and so forth that probably some of my rudiments are barely audible. After the pc is practically climbing through the electrodes, you see, I don't see that you need to boost it up, you know.

It's something like, if you've got the highest steam pressure that you can get on a ship's boilers, there's no point in going on and throwing more coal on the boilers' fires. Just no point in it. You're not going to get any higher steam pressure anyhow. I'd take the highest steam pressure I can get per pc. And I'd say, "Well, that's his level of interest," you know. You say to the pc and so on, and the pc is sitting there.

Pc says, "Oh, I had an awful hard life."

I'd say, "Boy, he's in-session," see. [laughter] I mean, he's got it, you know. Dandy, fine, that's it. Oh, we won't go on any further, beating him to death, trying to get him in-session, see. He's in-session, let's do something, see. The usual state of the pc is what usually monitors the degree of in-sessionness the pc has, you know. The pc just is sitting there. [demonstrates it] [laughter] That's the way the pc always sits there, you know. You've actually gotten the person to look up to you and say, [in a feeble voice:] "I had an awful hard life."

Boy, is he in-session. He's interested in his own case, and he's talking to you. What more do you want? Man, give me that, and I can show you miracles.

But creating that particular state is something that the auditor is supposed to do before he does anything else. Now, if an auditor does it so badly that he knocks the pc consistently and continually out of session, there's something wrong with his auditing. That is all. Because it's never going in the direction of getting audited, see. It always is in the direction of *not* getting any auditing, you see. If the auditor in the process of putting in the rudiments knocks the pc out of session and holds the pc out of session, keeps the pc out of session, prevents the pc from having any auditing, you of course then wind up with a pc out of session. Seems elementary, doesn't it?

But the main thing that you don't notice, the main thing that you don't notice, is the fact that a pc goes out of session in the middles of sessions and that you should devote considerable amount of time to putting the rudiments in when they are out during the session.

Now, this becomes very necessary to do with 3D Criss Cross. You can't do 3D Criss Cross without putting them in. You've got to put them in.

One or two of you keeps telling me, "The item keeps going in or out." No, the item doesn't ever go in or out. The *rudiments* go in or out. The pc goes in or out of session, see.

Now, a pc can go out of session just like that doing 3D Criss Cross, see. [snaps fingers] Like that. They're gone. There they went. They're ... Saint Paul's is just passing below them about fifteen hundred feet. They're out. They're gone.

We don't care why. But actually you're reading charged items, and pcs run into these items, and they're having an awful hard time handling these items, and they just haven't got confidence enough to handle the item that just came up, so they have an ARC break with the auditor or something of this sort, or they invalidate the situation, or they withhold something. And man, some pcs just are busy little bees. They've just got this little automatic speaker system going, "Oh, I don't think that's it. That couldn't be it. That couldn't have anything to do with me," and so forth. "But there's no sense to tell the auditor because he'd just do something about it."

And you're busy nulling, and the whole list just goes null, that's it. There's nothing more. Nothing reads. Here it is. Now you have to go back there. And you have to find out, "All right, what did you think or what did you say to yourself a few minutes ago?"

"Oh, nothing. Nothing. No."

Clang!

"Well, what was it?"

"Oh, just – well, I don't see how it could be the item. That's all I said. I just don't see how it could be the item."

"Anything else?"

"Oh, and decided not to mention it to you."

"Oh, well, all right. That's good. All right. Thank you." And you can go on with the list.

The mistake which you most commonly make or is most commonly made by the auditor is to take this up, see. You don't think anything blows. Well, the guy *said it*. That's enough, man. It's blown. Skip it.

I ran into an excellent example of that in rudiments the other day. I was just doing it. And I suddenly saw a tremendous error that could be – had been made with it.

I said, "Who would I have to be to audit you?"

And the pc said, "A woman."

And I said, "Thank you." And went straight into the body of the session.

I'd just been thinking about this, taking up what the pc has already blown as the primary Q and A, and it occurred to me at that moment that that had been a marvelous opportunity. And I don't know how many auditors would have passed that opportunity up.

See, the pc said, "Well, you'd have to be a woman to audit me," and then look at the marvelous opportunity for the auditor to go in and say, "All right. What kind of a woman? When did a woman have a successful auditing session with you?" [laughter] You see, all of that kind of thing could've come up, but the item's gone. It's blown. You can keep the pc

smothered by insisting on taking up everything the pc has said that has already blown. This is an easy one, see. You read so much significance. You think the pc is telling you what's wrong with his case. He isn't. He's telling you what has just blown. And there's where you run into your biggest cropper doing middle rudiments, see.

The pc says, "Well, I didn't think that could be the item."

"All right," you say, "that's fine. Anything else?"

"Well, I was – decided to withhold it from you because there's no sense in telling you because you would have just blown it."

"All right. We've done so. Here we go." And go on with the list.

All right. Look at that as a marvelous opportunity, see. Similar. It's not quite as magnitudinous or gorgeous, you see, an opportunity to stray off the track. But you'll see you've already *put the rudiment in*. Your job has been done, see. Finished. Blown. It's not going to worry you. If you were to ask the question again, you would find there was no disturbance of the meter at all because it's now known to the pc.

Instead of that, you'll find you occasionally take up something that the pc has already blown. I know that you take it up because I often do on an off-guard. I will be startled by something the pc said. It's so far offbeat. You know, it's just so offbeat from anything I could conceive of the pc thinking or saying, you know. It's way over in the other pasture. And I say, well, why did the pc think that, you see, and take it up. The pc has said it, so it is blown, you see. But then I take it up out of my own curiosity or something like that and catch myself taking it up, you see.

My curiosity is suddenly trapped in a, "Why did the pc think that elephants were on the roof?" See, it seemed to be an intriguing thought. And I'm liable to say, "Well, why did you think elephants were on the roof?" See?

Well, the pc blew it. The pc says, "Well, I've had this goofy thought. I thought elephants are on the roof"

Your proper thing to do is just say, "All right. Fine," and go on with your session. Instead of that, "Elephants on the roof? How fascinating," you know. *Zzzzzzzzzp brrpp*. "Now, how come you thought elephants were on the roof? What reminded you of that?"

You'll notice that the pc starts to go out of session when you do this. Starts drifting out of session. That's because you have not comprehended that he has blown something. So there is a disagreement going on here between you and him, and you haven't spotted the growing disagreement on this thing. And so he goes out of session on this point.

But getting your middle rudiments in is just, it's very rapid. There's hardly anything to it.

One of the tricks of getting them in is find out what flow the pc has on automatic. There are four flows. One of them is on automatic and causes the others to appear. It's the hidden flow that causes the other – one or more of the others – to materialize.

The pc is holding off an inflow. There's a big withhold on the subject. The pc always has to have a withhold back of these, but these are highly specialized withholds.

The pc has never been able to understand or stand a male voice. All right, let's just put it down to that. So every time the male voice speaks – you, the auditor, speaks, you see, as a male – *bang!* The pc's got to go this way with the inflow, see, *bzzzzzzzt*.

And it causes a sort of a reversed-looking withhold all the time from the pc, see. So the pc is just always kind of back this way every time you as a male talked to her. All right. Or as a girl you're auditing this pc, and you say something, and the pc has the idea that he could never stand a girl's voice or he's afraid of women. They're liable to do something odd or peculiar, and you can never predict them or something like that, and he has to hold you back as an auditor.

You see, as a girl you'd have to be held back. And this will develop a whole bunch of automatic inflows. Well, it doesn't matter. You don't have to get down to the root of the first question, but you just trigger it, and you watch it go off.

You could simply say, "Are you doing something in a session? Are you withholding something in a session? Are you inflowing something in a session? Or are you preventing an inflow during a session?" See.

Phrase those any way you want to, and you're going to get a higher reaction on the meter. These are meter questions. And explore that one that went *bzzzzzzzt*, and you all of a sudden find your middle rudiments will stay in better because you know what the trigger is.

Every time the gun goes off and the pc goes out of session, you know all you've got to do is pull this trigger, and it'll last for a little while. And then you have to do the whole thing all over again.

The pc is preventing inflow from you. That's all you have to know. You don't have to know anything else. You don't have to know why the pc prevents inflow from you, a girl, or you, a man, see. You don't have to know that. You just have to know that the pc is resisting and preventing an inflow from you.

"All right. What inflow didn't you like then?"

"Oh, well. I – uuuuuou – nothing. Oh well, yes, oh, well, yeah, as a matter of fact, I – huh. I thought you sounded tired."

"Oh, all right. Thank you."

Rudiments are now in. Sail. All of a sudden everything starts to go null. And wait a minute. "All right. What inflow did you – have you prevented in the last few minutes?"

That's all you got to ask. It'll go *bang*. And you'll clear it.

You see how you could keep those in?

Similarly, with a very oddball pc, not necessarily an oddball pc, you could turn the beginning rudiment question into all four flows. Not only are you withholding, but have you *had* to outflow? Or are you outflowing anything? You'll be surprised how many pcs are sitting there radiating so that they will be properly tuned in in-session or something.

"Are you preventing an inflow?"

"Yes, I'm sitting here very carefully because I want to be in-session, and I want to be in-session, and I don't want anything to influence me from the outside world. And – so I'm in-session."

And you can trigger that one off, don't you see.

Or you can say, "Now, are you inflowing anything?"

And the person says, "Yes. Yes. I want some good auditing. I'm inflowing good auditing."

And you say, "Well, what does it look like?"

And he'll say, "Well, you know, it's the golden beams that come from you and me."

You'd be surprised. He's sitting there eating energy, not being audited. Energy eaters.

Anyhow, you've got – you've got a very handy method of handling middle rudiments by just sorting out the pc's flows, and keep your finger on what flow is now in vogue. What is the flow in fad at the moment, and you'll know that that is the one that keeps going out.

[The tape ends abruptly as did the original master recording.]

USAGES OF 3D CRISS CROSS

A lecture given on 31 January 1962

Thank you.

And this is 31 Jan. 62. I'm going to talk to you today about some peculiar usages of 3D Criss Cross. The material I am giving you is at the moment under test, and so on. But you have a right to know about it. And this will ju – also give you a clue while I am – why I'm being so utterly beastly on the subject of differentiation – so beastly about it.

If you can't differentiate, you can't do 3D Criss Cross, and I know you can differentiate and do 3D Criss Cross, and if you don't know it, why, catch up.

The bulk of the older auditors that have been on course longer are doing it beautifully. No complaints whatsoever. Gorgeous. But those that are on the middle grade right now, *aah, ooph, ugh!* Awful. Just horrible.

There's too much "I tried but I goofed," see? All I want is "*do*," you see? And if you equate "tried" plus "goof," you don't equal "*do*," [laughter] you see? There's in fact an old gag, you know, in Scientology, about try. You know, if you just keep trying, of course, you never reach it.

Now, I've been studying this, and 3D Criss Cross has a great future. And it has a great future in your auditing, let me tell you. And there are only some few basic skills.

And the basic skills are: Get the rudiments in. Know how to read a meter so as to get the rudiments in. You needn't write these down because I keep telling you, you know. [laughter] And be able to sec check somebody so that you don't miss any withholds anyplace. And be able to do the type of assessment that goes with a Problems Intensive – you know, that's just, run down a list and see which falls the most. And then there's assessment. And the whole field of assessment, of course, consists of those steps which you are doing for 3D Criss Cross. And this is a separate skill.

A person has to know all these other things before they can even attempt this other. But right away, because of the demands on the auditor, the precision of the process just shines up every missing TR. You might have gotten away, you see – in Sec Checking, you might have gotten away with smoking a cigar and blowing smoke in the pc's face in lieu of TR 2; or something like that. You might have gotten away with these little flubs, but not, not on a Class III skill. You just don't get away with it. It just – the auditing just doesn't work, that is all.

And it puts the burden on the auditor's skill. That is where the burden lies. The burden actually no longer lies on whether the technology works.

Now, more and more we have been moving into this area of less and less question about technology which, of course, makes us look around and find out where is the Q factor.

And the Q factor is in the application of it. And that is why there is a Saint Hill Briefing Course.

And when that fact emerged, that the auditor was not catching up with the technology, of course, it caused a total review of auditing as it was done all around the world, and we found it wasn't good enough. It wasn't good enough to get the total result. Hence, the Saint Hill Briefing Course. You make me make snide remarks like "Auditors aren't good enough." Actually, I have a lot of faith in auditors in general.

Auditors are good enough in their hearts. I want them to demonstrate it in the session.
[laughter, laughs]

Now, this is very germane to the material I'm about to give you. Now, the material will work for you or it won't. I mean, there's no grays in here. I mean, it just goes from dark black to brilliant white with no gray in between. The material will work for you or it doesn't.

And whether the material works for you has nothing to do with intuition or insight. It just has to do with TRs, running an E-Meter and keeping the rudiments in and doing the earlier skills well. And if a person moves up into Class IIb and is still ragged on some of his TRs – *bam!* – it shows up on 3D Criss Cross like somebody lighting tar barrels and throwing off rockets.

Now, he might have been able to sit there, and – he might have been able to sit there, you see, and do Sec Checks and do nicely and do marvelously and look very good, and everybody thought he was doing fine, and everybody thought it was all smooth, and everybody thought it was. And then you move into Class III and head-on into 3D Criss Cross. And what happens? See?

It – now you have a technology which demonstrates conclusively whether or not the auditor can audit, see? And if the auditor can audit – just do these various things, the TRs and keep the rudiments in, and do his proper address to just the technology of auditing. I mean, it isn't anything esoteric, you see? And if he hasn't got all of those very, very good, 3D Criss Cross – *poom* – doesn't work.

He sits down, he audits the pc, pc wonders why you're differentiating the list. This is one of the commonest remarks the pc makes: "Why are we wasting time differentiating?" That is a common remark. You just wait for that one. See, well, why are we differentiating? Well, why are we doing 3D Criss Cross, see? I mean, it obviously isn't working if people are busy asking questions of "Why are we doing it?"

And it goes straight back to nothing in the pc's case that is wrong. 3D Criss Cross will audit them all the way to the bottom. The lowest patient in the sanitarium, man – as long as he will talk to you, even gibberingly amongst his monkey squeaks, you can do 3D Criss Cross on him. And you can even go below that and do it on a psychiatrist. [laughter]

Now, this also goes all the way up to the top, and this thing has burst in upon us, and I haven't given you any top billing for 3D Criss Cross. I've just been waiting – letting you find it out. Well, you found it out. It works. And it works like mad. Well, all right.

Now, for whom does it work? It works for the trained auditor – not for the supersensitive auditor, not for the intuitive auditor, not for the auditor who knows more than the E-Meter, you see, none of those things. That has nothing to do with it. We're out of that because it just takes a good, clean job of auditing, that's all.

A person can do his TRs – pc makes an origin – origination, auditor handles the origination, *bang!* List goes null, auditor knows the rudiments are out, puts the rudiments in again, *bang!* He's back into session. You know, I mean, it's just *bingety-bingety-bing* But everything's got to be working.

This is no process to do – this is no process to do at all – if the auditor is still worried about whether the sensitivity knob should be moved before the tone arm. See, if this is still a big problem to the auditor, you see, he had no business doing 3D Criss Cross, see. He has to be able to integrate these tools into one package of action. That's what he has to be able to do. He actually has to be able to do them all at once, perfectly. Sufficiently so that he never has to spend any time worrying about whether he's doing it right.

All right. Then of course he's auditing the pc. He's not worrying about whether or not he's got his fundamentals straight. So that's the time that 3D Criss Cross works.

Now, there's no grays. It doesn't work slightly. It works very well if audited, or it doesn't work. You could make some junior process out of this whereby it could be done indifferently, and you could find a 3D package, and you could audit it with a repetitive process, and so forth. But it's something on the order of taking a jet plane and using the thing to keep the rain off the motor parts at the edge of the hangar, you know? *Thuh just thuhh.*

Now, some of the uses of this is what I want to talk to you about, not berate you about your auditing, because by and large, I think you're all doing well. Much better than should be expected in some cases, of course.

But just raise your sights. The final test on this sort of thing – it's the easiest thing in the world to classify a Class III Auditor. Just look at his last half dozen session reports on 3D Criss Cross. Was the pc flying? The guy can audit. Pc wasn't flying? *Nah*, he got a lot to learn. I mean that – it's no longer "What is wrong with this pc that this pc is not functioning" you see? That's not the question you ask.

You just say well, Class III, pc was fine. All right. Fine.

Class II is a much rougher examination than Class III, from that basis. I mean, much rougher on the standpoint of the Examiner. How do you establish whether or not a person can do that. Well, yes, he's cleared up several Sec Check questions. Yes, his rudiments are in. Yes, he can do these various things.

Well, we can examine that, and that's not hard to examine, but it is much more difficult to examine a Class II than a Class III, because a Class III, practically all you have to do is open up the case folders of the cases the fellow is working on: The pc is flying, he's okay. Pc isn't flying, he isn't okay. Do I make my point here? It's just an open-and-closed proposition.

Now, everything I'm going to tell you about the experimental use of 3D Criss Cross is modified by these very things I have given you here at the introduction.

Experimental use of 3D Criss Cross includes curing up anything. Just anything. I don't care whether a guy's got lumbosis or what. It could cure it. Experimentally, that is an asserted fact.

Any chronic somatic, any circuit, any hidden standard, any other anything that anybody has run into on cases apparently is curable by 3D Criss Cross worked right and used right. So you're looking at the Kohinoor diamond, in actual fact. And I wouldn't be so mean – because I'm seldom bestial about these things; I'm usually very kind, very kindhearted, mostly – except where I can see where you could go and you ain't going there, see? And then right away, why, I start riding at the flanks and pushing. And you right now, of course, as you well realize, are being pushed.

You're not being pushed. You're being shoved hard. You understand? And of course, you're only being shoved up to a realization of your own skill.

Now, here we go. How would you cure a person who had a circuit that accused him all the time of being a beast? Now, let's just take that as a hypothetical case. This is neurosis ne plus ultra. Neurosis Freudosis.

Well, you ask the guy what he's got, and the guy has got a voice which tells him he's a beast. And this is the only thing he will say he has got and this is worrying him. In fact, he is frantic about it. In fact, even as he tells you about it, the voice tells him he is a beast to tell you about it, don't you see? All right.

Now, what do we do? We take any statement that the pc has even vaguely made, and we find "Who or what would oppose (statement)?" – see, that circuit; whatever he's described it as, you see? And we make a "Who or what would oppose?" list. And then we just go through the various steps of 3D Criss Cross with that list, and we come up at the other end with some item that is sticking.

All right. *Voilà!* We don't do a thing with it. That is what is interesting. In fact, you'd better not do anything with it, because that item is unrunnable. Now, let's get into this more neatly here.

The condition which he has told you about – I don't care what the condition is. Mother-in-law stays with him too long every year. All right. You want to solve his present time problem about this, you see. You just do the same thing. It's a statement of what the pc says is wrong with him. You know, pc is always telling you something is wrong with him, and sometimes you look hard, you'll find the pc knows something is wrong with him but hasn't told you. The various methods of discovering this I will cover in a moment. But at the present moment, let's just say this condition.

All right. Now, mark my words now. This condition is not auditable with safety. You cannot safely audit that condition, because it is too far from the Goals Problem Mass. It is probably some kind of a lock valence, and if you ran it directly, you are liable to beef up the whole Prehav Scale. And the pc starts going around *wog-glog-zeboog* SEN is liable to turn on with considerable PN. [laughs]

So you don't want to audit that condition. Now, underscore that and mark that well, and flap your ears on it because that's really important. Don't audit the condition the pc told you about.

I'll give you a little back history on this. Along about 1954, I started telling you don't audit the pc's chronic somatics, and all that sort of thing. Lay off of this stuff.

Now, the basic background music to why I kept saying this is because it often enough didn't do the pc any good. That was often enough. But in some of the cases it practically spun the pc in. And there was a bug factor here which made it necessary to lay off of these things.

All right. I wasn't aware of the fact that everybody was spinning in all over the place, but I knew people were not being successful with this, and it was no business for us to be in at that time. Now, I'm telling you, it would very easily be in this business because these are the bugs associated with it.

Why? It is a lock valence on the Goals Problem Mass. The condition is just probably some lousy old lock valence that hangs at the – that hangs on a lock valence that hangs on a lock valence, and the pc is aware of it.

Now, that the pc is aware of it tells you, one, that it will not blow and that isn't what's wrong with the pc. He's got this circuit in full bloom, you see, or he's got these ulcers in full bloom, or he's got this mother-in-law in full bloom. It doesn't matter what he's got in full bloom, he knows what is wrong with it, and it is *still wrong*. Now, that is your main test. If the pc "knows what is wrong with him" (quote, unquote) and it is still wrong with him, then obviously what he knows is wrong with him is the wrong answer. Isn't that pretty obvious? Because if it was right, if he knew what was wrong with him, it wouldn't be wrong with him. Why? It would as-is.

And if it doesn't as-is, then he doesn't know what's wrong with him, you see? And that – you – probably, even in your own case in running down the line, sooner or later, you collided with this interesting point, and you say, "Oh, I'd forgotten that," you know? That was out of view.

Up to that time, you knew exactly what was wrong with you. You knew it was your upbringing or your father coming home and bringing you lollipops that gave you bad teeth or something like that, and you ran into something, and it didn't have anything much to do with that. It was just vaguely associated with, and you ran into the real reason, and the condition went boom or something like this, and you felt better about it.

All right. So remember that the condition the pc tells you about or that you ferret out of the pc, if in the process of ferreting out of the pc, doesn't disappear, of course, is a description that is inaccurate. Otherwise, the moment it was described, it'd go *whoow*, see. And that would be the end of it.

But it doesn't, and I wish you to note this very carefully on pcs. There are two conditions. One, the pc tells you about this problem or difficulty, and it goes *whoow*, and you can't find it anymore on the E-Meter. And the other one, he tells you about this problem or difficulty, and you have to audit it. You see these? You see these two different conditions?

Well, now the first one that blew on two-way comm was factual. That was what was wrong with him. And the second, it isn't – we're not saying he isn't suffering from this, but his description of what it is, perforce must be inaccurate, because it doesn't blow. Now, it is just as one, two as that, you see?

"Well," he says, "I got a terrible headache."

And you say, "All right." And you ask him what's wrong with him.

"I got a terrible headache."

You say, "All right. Good. Where does it hurt?"

And he says, "Well, it hurts around here."

Now you have to audit it.

Well, now, how come it hurts after he told you about it? It's probably because he didn't have a headache. You ever stop and think about that? See? There's something wrong here.

He's either got a backache or his head is hot or something, but he has not made an accurate description of his condition. Of course, that he did describe it, he only described it, of course, to the depth that he could observe it. And he couldn't observe it deeply enough to as-is it so therefore that isn't what's wrong with him.

It goes deeper than that. So you can say of any condition that does not blow on two-way comm that it is out of the pc's view. And that would be its first – the first thing that you could say about it.

So you have to resort to processes or activities which put it *in* the pc's view at which moment it would go *bloom*, and that would be the end of it, see? So it either blows or you have to audit it.

Now, if you have to audit it, it must – the auditing must disclose new data. And that is why you instinctively go round the bend halfway when a pc sits there for twelve consecutive sessions and has no single, slightest cognition of any kind. He never finds out anything. He never realizes anything. He never finds anything new. He never gets anyplace in his knowledge of life and the world.

Well, that auditing must be up against a dead end, mustn't it? There's something wrong with it. Because, you see, if he's not going to disclose any new data, then what he has said is wrong with him that didn't blow, of course, couldn't possibly be blowing. It'd have to have new data come up to blow it. Otherwise, it'd just blow on two-way comm, don't you see?

And if it didn't blow on two-way comm, then it must be more deep-seated than that, and it requires new cognitions, new information, new knowledge, new penetration, new insight, and then it would blow. And if he's not getting those things, of course, his case is going nowhere.

So sitting down and auditing somebody endlessly – and they never have a cognition, and they never have a new thought, and they never recognize anything.

John Sanborn, back about 54, something like that, made a very interesting remark about this. He said, "Well," he said – he was auditing some pc – and he said, "Well, I'm suspicious of this fellow. Never once has he looked up and said, 'What do you know,' you know? Never has said that. He just never, never said 'What do you know,' you know, in all the time I've been auditing him." He's right, too. Case never recovered from anything.

It was an awfully good description of what a pc might be expected to do – sooner or later, look up and say, "What do you know," you know? And a pc who never says "What do you know," never gives any indication that anything has occurred of any kind whatsoever that might be brand-brassy-new to him – uh-uh, uh-uh, uh-uh, because, of course, no new data's being recovered.

All right. Let's go to the next thing. What is the most buried thing about you? About you? Come on, what is the most buried thing about you? What is the most buried thing about you? What is the most *hidden thing* about you? You? Aside from you, of course. [laughter] What is it?

Well, if you can answer this question perfectly and rapidly without the slightest comm lag, why, you'll have disproved this whole theory.

What was your full name and street address in your last life? What was your full name and street address in the life just before that? What was your full name and street address in your life just before that? Now, you have possibly seen pictures of your last life. You possibly, if you were lucky enough to have your last li – unlucky enough to have your last life still kicking around into this life on the newsstands or something like this, of course, you're aware of what your name was. But you've seen some pictures of this sort of thing, and you've seen scraps of this and that and their surmises.

But sitting here in this lifetime, I can ask you this question. What's your name, see. And you'll sing out – *bang, bang*. You know, there's nothing much to that. Some of you have a slight comm lag, but ... [laughter, laughs]

Now, there's the proof of the pudding: that you can recover pieces of track and engrams. You can recover sequences and circumstances. Well, you can get an engram – the pc and somebody else is in the *bois* at dawn very early in the *matin*, and they have sharp tooth-picks that they are about to insert into each other's *vitals*, and we get this as an engram, you see? We get the somatics; we get all kinds of things. We get the twittering of the "boids"¹ as they twitter in the *bois*. We even get a death. We may even get a trial afterwards. We get all sorts of things, but we ask the pc, "What was your opponent's name?"

You say, "*Aah, oh*, well, that's a new thought. Um, René. Yeah, René. No, no, no, that was – no, uh – well.... But let me tell you about the birds in the *bois*."

Identity or beingness is the most hidden fact about you. Experience – we can find experience, you see? That's easy. We can find masses and pictures and engrams and somatics and all that sort of thing. That is easy. We can find flows, *bango*. Nothing to that, you see? But what's your name?

¹ Editor's note: boids = joking way to pronounce "birds".

So we get beingness as the most hidden factor. And that is why 3D Criss Cross works like a startled dream. Because you're recovering beingnesses, see. *Bangety-bangety-bangety-bangety-bang*. So you're working at the most hidden piece of knowingness there is on the track which is "Who was you, Mac?" You see?

You notice in crowded areas they solve this. They solve this beingness by always being the same beingness. Did you ever notice this? That makes everything very simple. All taxi drivers know this in New York City. To them everyone is Mac. [laughter] And they have no trouble with this whatsoever.

Now, you're recovering beingness, is what you're doing. And beingness, of course, is part of the package of experience. And I studied experience a year or two – a couple of years ago, and so forth, and never got much of anyplace with it because it was – experience is the doingness of a beingness. You see?

As long as you run doingnesses and beingnesses, you, of course, will recover experience. And apparently experience is the easiest thing to recover on the track.

You could always say to a pc, "You ever been drowned?" And the pc starts going *glug, glug, glug*, you know. Well, interrupt him at that point and say, "Well, what was your name then while you were being drowned?", you know?

He can't tell you, you know. He can tell you that he drowned. He can reexperience the drowning, but who was he? In fact, it's a big mystery all over the place. 3D Criss Cross in recovering this, of course, is throwing into view large sections of track. And in that – the basic game of a pc requires first, a beingness and a doingness and then a havingness – the basic game – or a no-havingness – gets into, then, a beingness versus a beingness. And we get the beingness versus a beingness situation, and these hang up like problems.

Now, a problem is a postulate-counter-postulate, idea-counter-idea, A versus B, and the reason a problem hangs up and tends to go on forever and floats in time is that it is rather well balanced. The idea versus the idea. Since you're not given a problem by a little child very often, who comes up and gives you a gratuitous datum, see? This is not usually a datum of magnitude to what you've got as a datum, see? So it doesn't hang up. You don't worry about it. But you run into a friend of yours, and you say, "Those Russians, those Russians never did get a man into space," and your friend says, "Well, they did, too."

Now, you've got beingnesses of comparable magnitude and it makes a problem, *ha-ha*. So you have a fight with your friend about – he says the Russians got somebody into space, and you say they didn't get anybody into space, and it was all hoax and propaganda. And he says no, it wasn't; he saw pictures of the moon and all kinds of things. It can be a problem, see, but what makes it a problem is the A plus B, the identity versus the identity. So you have to have identities of somewhat comparable magnitude to hang this thing up.

Now, the Goals Problem Mass consists of problems of the magnitude of a game. Big, big problems. And of course, these problems are resident in identities. And you can audit the identity out of the Goals Problems Mass, but peculiarly enough, you cannot audit the problem out of the identity. *Ha-ha, ha-ha*. Isn't that interesting?

You can't audit the problem out of the identity, but you can audit the identity off the problem. That's a funny mechanic, but it apparently works that way.

When you start running a pc on Rising Scale – this is dandy, by all means, run Rising Scale and early processes, and so forth – you're actually merely shifting around slightly the now-I'm-supposed-to's of the beingness that the pc is sitting in. And it doesn't shift much. Let me assure you. Well, it shifts a little. You can get some considerable gains and results. Enough to keep us going for a long time. I mean, it was all right. We were happy with them at the time.

But how about blowing the 'ole ruddy package, what? How about blowing all the 16,972 problems per minute that this character had, see? Because this beingness in the bank is posed against another beingness in the bank which keeps it in balance and floats it in time. So all time is that time, and here it is all locked up in the middle of nowhere. You get this idea?

All right. So now let's get back to the statement of the condition the pc has made. See, whether it's his mother-in-law's staying with him too long, or he has lumbosis, or it's – he's got a circuit or something that calls him a beast all the time. We don't care what this thing was. We say, "Who or what would oppose it?"

Now, we don't run the condition because the condition is probably a fragment of the beingness that he has not identified. Nor do we audit what we find as the opposition terminal to the condition. We don't audit the opposition terminal to the condition, but we oppterm that. And those three steps are necessary:

1: Identify the condition. Get a statement of the condition. Find out what the condition is. And believe me, that covers an awful bag of tricks, let me comment in passing. There's an awful bag of tricks attached to finding out from the pc what the condition is.

Number 2, find the opposition beingness. That is to say, you could call it the opposition terminal, but you find an opposition beingness to the condition.

And then number 3, find the opposition to number 2, and you'll wind up with the identity of what the condition has – the identity that – the beingness that had the condition.

You go around Robin Hood's barn to find this thing, you see? He's sitting there with nattering teeth. Let us say, this is his condition. Nattering teeth. And you can't ask him, now, "Who or what would have nattering teeth?" and really expect, in a large... On some cases, you'll get the answer promptly. Very few. But in – largely no. He's so fixated on these teeth that are hanging out in space in the bank, you see, that he can't quite....

Now, you say, "Who or what would oppose it?" Well, you've already knocked the chink out of the hidden suspension of that beingness. You see, for teeth to be suspended in the bank, there must be a beingness in the bank who has the teeth.

Well, you see, that is suspended in place by something he's never put his attention on which is an opposition terminal. So you just take that one, and you loosen that one all up. You take a lot of locks off of it and you loosen it all up, you see.

And then you go on around back and find out what would oppose that, and you get a beingness.

Now, if you do this very slippily and very well, something weird happens to his nattering teeth problem. Because now you've identified who and what has the nattering teeth. And you've also identified who and what would oppose the nattering teeth.

Now, you've shaken it up. Now, if you've done differentiation very well, you've blown it to glory. And if you're lucky, you just blew it up on step 2. And if you're – you don't need quite so much luck to blow it up on step 3. But you've certainly got something now that is safe to audit.

You see, supposing these nattering teeth, he thinks at first glance, would belong to some unproved part of a Goals Problem Mass. And let's say that if we ran mother-in-law – this would be so far from any part of the Goals Problem Mass and yet so closely pinned to it that we'd beef up the whole Prehav Scale. See, that would be a risky thing to do. No, let's prove it out. Let's go around Robin Hood's barn and prove the thing out.

Let's take the condition, find the opposition to the condition, and then find the opposition to the opposition, and we are going to wind up with a large chunk of bank with a hole in it. Now, that action alone may be adequate or sufficient, but you also have something that you could audit.

Now, you had to pay attention to what has SEN and what has PN because the – when you found the opposition to the nattering teeth, and it gave him sensation and made him dizzy while you were doing the list – several items on it give him sensation – watch it because in the 3D package term, that is an oppterm.

And then you come around and find step 3, get the opposition to what you found in step 2, and it turned on pain – we had pains, *ugggg-ugggg, clank*, while he was doing the list, you know, and while you were assessing it, and so forth; he had pains involved with the thing – that's a terminal.

Now, you run the terminal directly in such a case, or you can run a terminal, of course, against the opposition terminal which was the number 2 that you found. You see how you'd do that?

Now, therefore, just by this alone – depending the degree that the person is in-session and that sort of thing, and the skill of the auditor, and all that sort of thing monitoring it – you have in your hands about maybe a five-hour cure for arthritis. I mean a good case of arthritis, you know? It goes *hweeeeee*, you know? Wheelchair scrunch. See, you got that, actually, in your hands, because somebody had the arthritis, and it isn't the pc.

You see, if the pc goes around and tells everybody he has arthritis and it doesn't disappear, there must be a lie. There must be something wrong here somewhere.

And of course, the basic thing that is wrong is he doesn't have arthritis. It's like these people with chronic coughs. [gives a little cough] [laughter]

I blew old Belknap out of his head one time a way back when. I just got so tired of his cough, you know, because people would audit him to get rid of his cough – this was the trap he was manufacturing for everybody: "Get rid of my cough." So anyhow.... It was a game he

was playing. So I blew him out of his head out in Phoenix. You know, I just told him to get back there about ten feet, and I said, "*You cough.*"

He surprised himself to death. He started coughing – a thetan – started coughing. He, boy, *cough, cough, cough, cough, cough*. Body. At first, the body was kind of going *ough, ough, ough*. You know. After that he got so he could cough without the body coughing. And he found out that it was him coughing all the time.

Now, what was wrong with Belknap's cough is, is he said it was his body coughing. And his body was never coughing. So, of course, the condition never cleaned up.

When I blew him out of his head and told *him* to take over the automaticity of coughing, he, a thetan, sat out there in space, you see, several feet back of his head and was going *cough, cough, cough, cough, cough, cough*, coughing, you see. He took over the automaticity of it, and I don't remember if that was the entire cure, but I think I – I haven't heard him cough since, I mean, put it that way.

You see what this was?

Now, you could have gone a little bit further. How come a thetan was coughing. That's an interesting question. Well, he was stuck already in a beingness. Now, I must have blown him out of his 'ead in a beingness, see?

And actually it was the beingness that was coughing, so if I had any trouble getting him to take over the automaticity and it didn't blow at once, it was because we hadn't identified the beingness, see? It was still "who was coughing?" Well, he was, and he was being that being, but we hadn't identified who he was – you see the slippiness. So therefore it wasn't an instant and immediate blow.

Now, if we'd oppterm'd this in some fashion, we'd have worked it around with these three steps which I've just given you, we would have amounted to more or less the same thing. He would have found out somebody else was coughing. That's for sure. Well, he had been blaming the body, blaming his present body all the time, and his present body wasn't doing the coughing, which I think is of interest.

Actually, he, a thetan, wasn't doing the coughing, it was a bank identity. It was a valence or a circuit that was coughing. But of course, he so closely identified himself with this thing, and that was him, you see, that he – it did tend to blow even then. But it would have been a good, clean, quick blow if I had had this other datum, you see?

Now, beingnesses – any error, any condition which is wrong with the individual is, of course, a condition of a beingness. It is not the beingness. It is the condition of a beingness. I don't care if he's got a bullet in his chest and he just received it. His name is John Jones at the moment he got the bullet in his chest, and it's John Jones that's got a bullet in his chest. See, that's the beingness that got a bullet in his chest. And the reason it doesn't blow is because last life's Bill Doakes, and eighteen dozen lives ago soldier Pete and pirate Tom and various other chaps that he has been went around obsessively putting bullets in people's chests, you see?

So you got all of the oppterm's mocked up in the bank that he has shot the chests of, and there is all of the terminals that did the shooting of the chest of, and now you come along

and with a Touch Assist you think you're going to cure up his chest, are you? No, you're not. Because it's John Jones, or something like this, and that isn't really John Jones's bullet hole, and the body just got in the road of it. He's been deserving that bullet hole for a long time. Man, he earned it.

Most thetans work hard for their motivators, you know. [laughter, laughs] Very hard, hard work.

Anyhow, now, you look over this, then, as an action in auditing, and the thing ought to just go together, just click, click, click, you see, because it's the condition of a beingness. Of course, you can't audit the conditions of a beingness and expect to get anywhere. But you can audit identity or beingness, you see, and you get someplace with that. But naturally, why, as you oppterm the oppterm and go around, you're here or there going to run into a case that isn't blowing very cleanly, and you'll have to make a fourth step, oppterm that and run that down, and make a fifth step and oppterm that, and run that down. But that's all right. They're just more steps. And you'll find out there's – quite mysterious. You'll see this is mysterious. It'll even be mysterious to the pc. The pc knows nothing about past lives. Knows nothing about overts. Knows nothing about motivators. Knows nothing, you know. Standard citizen.

And here we are, and the pc's cheery, cheery, cheery. You know, "Only lived once. Only have the guilt of this lifetime on my conscience, and I get rid of that everyday to the priest. And I'm all set. I got it taped," and so forth.

And all of a sudden he gets lumbosis. And he goes around to the medico, and the medico administers some soup or syrup or pill or something, and it doesn't disappear. And he goes around, and he gets platinum shots, you see. They're made out of solid platinum, and they shoot him with platinum for a long time, and nothing happens, and so forth.

Well, he still only lives once, he still never is guilty of any overts, he doesn't know what could have happened here, it is a condition which has to do with the body, this lumbosis.

All right. You come along, and he says, "Well," he says, "I've got lumbosis."

And you say, "All right. Good. Who or what would oppose lumbosis?" In a good Model Session, you swing it right around, and you nail down a terminal that stays in. Now, "Who or what would oppose that terminal?" *Woo-Woo*.

I think your pc is going to be somewhat fascinated. He's going to be very curious. He's going to wonder, "Who is this standing looking at the last address to Wellington leaving his troops?"

Curious. In fact, he's liable to speak of it. And on the other hand, you're liable to have to pull it as a withhold because he thinks he's gone around the bend. [laughter, laughs] But it'd work. I mean, he wouldn't have to know anything about this. See, it'd work.

Just listing oppterm – you know, listing opposition terminals and listing oppositions to that, and so on. All of a sudden this would start all unreeling. And the reason he doesn't have to know anything about it, of course, is – that's what's wrong with him: He doesn't know anything about it. But the reason he doesn't have to know anything about it, of any kind what-

soever, is simply because it is. See, it just is. And this is your fastest route in on is-ness that you ever heard of. Identity. A packaged identity.

Now, every identity that you run into is a total package. Every identity. John Jones is a total package. But as old Gallusha said before he left here, he said, "I don't think that in this lifetime a man acquires even ten ideas." He says, "They're all on the backtrack. They're all on the backtrack, and in this whole lifetime I don't believe I've acquired ten ideas in this whole lifetime." It's true, too.

But yet an identity is a series of now-I'm-supposed-to's, packaged ideas – *da-da-da-da-da*, you're supposed to, and *da-da-da-da-da-de-da* and you're supposed to, you see? You're supposed to *da-da-da-da-da-de-da*. And when anything goes *do-do-do*, you go *da-da-da-da-da-de-da*, see, and it all works out very nicely. Everything works well.

When people run up the street in a large car, you know it is a General Sherman tank, and you reach for your tommy gun and fire at its treads. Or you run out and put a tar grenade in the tread at great danger to yourself. That's proper, you see. When you see large vehicles, that's what you're supposed to do. Only if you look closely, they don't have treads. And if you reach for something, your tommy gun isn't there, or your bazooka, or whatever it was supposed to be. And you reach carefully into your glove compartment or in your pants pocket, you find no tar bomb. And so you just remain sort of upset by large vehicles.

So you have this individual, and he comes up, and he says, "Well, I'm upset by large vehicles. I just don't like large vehicles, see. I just go all to pieces whenever I see a large vehicle. Gray ones – they drive me mad."

Now, this would be a pretty good pc that had identified it to this degree. Usually the auditor has to dig.

All right. Now, let's look at the mistake we could make. We could say, "Well, now, have you ever been in an accident with a large vehicle?"

I've given you the content of the thing. The fellow was a soldier, and he's supposed to attack tanks. Now, we ask him, "Have you ever been injured by a large vehicle? Has anybody you know ever owned a large vehicle? Have you any overts on a large vehicle?"

We ask him this, you see, without much attention to meter or beingness. And he says, "Well..." He swears at them, so we clean this up, and the condition alleviates slightly.

What are we working on? He goes out and he sees large vehicles, and he still feels a little bit nervous, but he says, "I can take it or leave it alone."

So what you've done is ended his current cycle of overts against large vehicles, and you can do that by Sec Checking, so therefore Sec Checking is valuable.

Let's look at another side to this thing

You say, "Who or what would oppose large vehicles?"

And he says, "Oh, well, that's easy. Who or what would oppose them? Traffic officers, policemen, drivers of small vehicles, a soldier, an antitank battery, an antitank infantryman, a soldier, an antitank infantryman with a bazooka, a bazooka operator, a bazooka pointer, a ba-

zooka handler, a tommy gun handler, a tar bomb manufacturer, a tar bomb thrower, a um.... Yes, well, I think that's about the list."

"Good." You differentiate it out, and you'll find out it's "a soldier," and then you move around on the other side of it, and you say, "Who or what would oppose a soldier?" you see? And we get some kind of a thing like "an army." That's what he's being. He's being an army. And this changes his point of view.

You see, he's always had the point of view of soldier. And he's looking straight out from being a soldier, whether it was a terminal or oppterminal, see, soldier, you know. Because that's a soldier's reaction. But there's something else that is holding a soldier in place, don't you see. And this tank is like a goal operates in Routine 3.

See, I mean this large vehicle, that's just a goal. It's an indicator. There it sits. It's the tab that's hanging out. And what we've done is find a whole bunch of new tabs.

So you just say, well, instead of fighting for seventeen days, day and night with the pc, no holds barred, judo, hari-kari, and other exercises, trying to find the pc's goal, well, just pick his condition out of the line and straighten it up, and you get through with the hidden standard right there at the beginning.

This experimental uses of 3D Criss Cross; and you'll find that you have a lot of use for them. You'll find you have to pilot your way through. Now, let's get down to what's the toughest operation about this. That's getting the pc to elucidate, elicit, spill, spew, impart or communicate the condition to the auditor. That's what's rough.

Pc says, "Well, there's nothing wrong with me." Come in on crutches, he's falling into the wheelchair, can't see, hand won't write.

"No, there's nothing wrong with me. I've led a happy and full life. Yes. I have a little trouble sometime with the pension bureau."

Man, he's not to grips with his problems at all. All the basic reason he isn't at grips with his problem is because he isn't at grips with any identity that he is. He doesn't know who he is.

While being John Jones, he's being Tom – Pirate Tom, or something of the sort. And he isn't suffering from the consequences of the war at all. He's suffering from that last time they went out and captured Julius Caesar. That was an unfortunate activity for many of the pirates involved. This made him a foe of governments ever since. So, you see, he's having a little trouble with the pension bureau. Get the idea?

His tags are hanging out all over the place, you know. The pc is practically walking down the street with long strings with labels on them, you know. But it's very hard to get him to impart a central problem or circuit. A pc very often will sit there with a chronic present time problem and never tell you anything about it. He worries and worries and worries about it. He worries consciously about it all the time, and he never imparts it to you.

Now, we have had a great deal of experience during the past few years trying to – the past couple of years with – trying to isolate difficulties with pcs. And a great deal of that technology has come forward, and you have hidden standards, you have present time prob-

lems of long duration as opposed to present time problems of short duration, and you have the mechanisms of circuits, and you have the entirety of the Goals Problem Mass and lock valences and that sort of thing – the way it operates on the pc. But principally, as far as you're concerned, with this particular activity, I recommend to you the Problems Intensive. I recommend to you a Problems Intensive.

You do a Problems Intensive from scratch. There it is. You know, there's a new form out on it, by the way. It's the same form that's in the bulletin. It's just been written up.

Self-determined changes. Never an other-determined change, if you please. Only self-determined changes. You make a list of the self-determined changes in the pc's lifetime, and you assess that list out, and you get the one which falls the most, and you find out what problem existed immediately ahead of that, just before that, what problem existed. Just as you usually were doing it. And – only we take a wild departure. We don't particularly knock out the prior confusion. See, that's a Class II skill.

Now, if we're going to use 3D Criss Cross on this thing, we're just going to rip up the bank with it. We're just going to tear up the bank in long strips, and we're really going to get there with rapidity. What are we going to do?

We're going to say to him, "Well, now, you have a problem. You don't want to go to school. Good enough. Now, what would you say the thing was, now?"

"Well, it's just I just don't want to go to school. I never have wanted to go to school. It's an awful problem."

He's stated a fact as a problem if you will notice.

And so you would have a list composed of "Who or what would oppose your not wanting to go to school?" See, it must be the exact condition stated by the pc. And although that's an involved sort of a statement, he'll master it. And so you make your list, and that's your – then you get all five steps of 3D Criss Cross, and you get your final line. You strike this final line, you know – your final item – and you've got it, *bang*.

Now, you get the oppterm to that, and you walked it around in a circle again. He will have had all kinds of cognitions and various things, and things blowing up in smoke, and he'll know he'd had a change. That I guarantee. Something will have happened if it was well done. It's an oddity, isn't it? You've unsettled this problem.

All right. Now, let's take an additional approach to this, then. We've settled that one. We got a couple of terms and oppterm. Well, let's call it a kind of a line. That's the school-problem line, see. Now, let's do this assessment again, and let's find out what are these self-determined changes, what they amounted to, you see?

And get him to state the problem to the one that now falls. We've struck the one off we've handled, you see, you strike that off. Now, you assess the remainder. Add anything the pc wanted you to add about, well, he suddenly remembered about self-determined changes. Get the problem that occurred just before the self-determined change. Get that problem, *bang*. And of course, you've got a problem like, well, "How to feel safe in a small car."

Well, naturally, there's been all kinds of car accidents in his lifetime, and so forth, and you, with your Class II skill, you'd follow them down, see check them on prior confusions, and so on. You'd really get someplace, too.

But with 3D Criss Cross approach, a Class III approach, what you would do would find "Who or what would oppose not liking small cars?" And you'd get a list, and you'd – that's number 2, and then you would do number 3, and you'd find out that'd wind out someplace, and you'd have another line, wouldn't you. Fascinating.

Now, let's strike that particular problem off the line, and let's assess this list again, adding anything the pc wants, and you're going to find – you're going to wind up with eight or nine lines. In other words, the whole case. Every corner of the Goals Problem Mass can be counted on to stick some thumb up in this lifetime. It's a fruitful source of lines.

But what would appear very mysterious to the pc about it, is his phobias would tend to desensitize and disappear, and change his mind about this sort of thing.

Let me give you a very practical example of this. We ask the pc what difficulty he is having in life. And we simply take that. We don't actually probe the case in any depth. And if the pc just gave us this difficulty, "Well, I can never leave home, see. I can never leave home. That's the difficulty I'm having in life."

Well, you just find who or what would oppose his never leaving home. You understand it's his "never leaving home," not "his leaving home." See, it's always the *exact condition*, you see, that the pc states because you don't know what trickery and treachery is mixed up in this, and if you already start to oppterm it by dropping the "not" out of it or something like that, why, you've thrown yourself a red herring, and you'll find out it won't work.

So you get your list, and you get your second list, and all of a sudden he'll be able to leave home. It'll all appear quite mysterious to him. You won't really have solved anything at all. He won't find that you have solved anything.

What you have done is find the identity of who wouldn't leave home, see, by finding the opposition to that identity and then going back and finding the identity. See?

Now, having found the identity to it, you've blown the identity into view as simply a descriptive identity. That's good enough – to cause the thing to soften up all over the place. So of course it's come into beingness. I mean, his beingness is known. Now, he knows who wouldn't leave home. You don't even have to point this out to him. He all of a sudden cognites. Calls you up at two o'clock in the morning and says he just realized something. "Just realized something, but a sick child would not be permitted to leave home." Big cognition. See? That's probably the end of his difficulty with leaving home.

In other words, here's a whole parade of problems. Now, people have come into HGCs for years, they always present some of these psychosomatic difficulties or a hidden standard or something like that, or their present time problem of long duration appears in their goals. Let me call that to your attention very closely, that if you want to find the pc's present time problem of long duration and you're sort of running out of problems to solve for the pc, or if it

ever occurred to you to read your own auditor's report that it is written up in the upper right hand corner of the report.²

The present time problem of long duration in one version or guise or another is always written in that corner providing you list the pc's goals for the session or life or livingness. That's very interesting.

I mean, it's very hard to find because your writing sometimes is difficult to read. I can read it. I can read it, but you I know have trouble reading your own writing sometimes.

But if you look up in the upper right-hand corner, you will find the present time problem of long duration stated as a goal, and this is the commonest occurrence of a pc. He hands you his case there, right there, *bang*.

You look over a dozen consecutive sessions of a pc – if he's in communication with the auditor at all and is talking at all, and look over all his life and livingness things, and you can see it integrating against a 3D Criss Cross list most interestingly.

In other words, let's take a pc's goals for last July. Any goals last July. No 3D Criss Cross, you see. The goals that he wrote down for the session and for life or livingness, see?

And now let's take his January auditor's report, you see? Same report on the same pc, but 3D Criss Cross. And now integrate last July's goals in life and livingness as present time problems of long duration and see how that stacks up against the terminal packages which he's running, the cognitions he's getting. You'll find out they're blowing He's blowing last July's goals. It's interesting.

Now, it isn't always easy to put your fingers on a pc's case. So in spite of the fact that they walk in and give it to you, apparently, in spite of the fact that they are advertising, in spite of the fact that this is what they're always worried about, by and large, there's usually something else that they're far more worried about. These things are quite red herring. I mean, there's multitudes of red herring go skittering across that trail.

The pc just is a little bit ashamed to talk about this other one – this other one, about the – the ghost.

"What about the ghost?"

"Well, he comes at 1:15 ... and demands lunch." [laughter]

"Oh, where does this ghost come?"

"Well, he comes around."

And the perceptive auditor says, "Well, is he here now?" you see, if he's quick. You know, the auditor's very quick. Notices the pc is looking at the corner of the room while he is talking about the ghost. You see, he's on the ball, in other words. And he asks him, "Where is this ghost?" or "Is this ghost here now?"

² Editor's note: this refers to an old version of auditor report form where the goals the pc set for the session and for life and livingness as part of the rudiments were filled in in the upper right-hand corner of the form.

And of course, the pc says, "Well, yes, of course. It's only 2:10, and he never leaves till 2:23."

Men go walking around down the streets with green alligators snapping at their heels. People walk up and down half a night worrying because they are going mad. They know that. There are all kinds of oddball things occur of one character or another. People worry about these things and they never bother to tell you. They don't let you in on this.

But if you're very perceptive and listen to what the pc says – you know, record it in English – you generally will find it. I'm not now being sarcastic and giving you the impression that it's dead easy. Actually, an auditor very often has to be terribly clever. And when an auditor's very, very clever and listens very keenly and questions just exactly right, sometimes he finds out the damndest things from the pc, and the pc sometimes didn't even know that was what was wrong with him, you know?

But he says, "Well, that's very true. Yes, very true. I have this horrible feeling that I am dying every time I hear the wind blow. I never realized it before, but I all the time feel like I'm – Yes."

But it didn't blow, so you know, then, that the identity cycle and so forth, there's something wrong with it. And you can go ahead and run a 3D Criss Cross on this, and it would clean up.

But don't go auditing those things which blow on discussion. See, don't audit something that blew on two-way comm. Don't take up yesterday's cognitions, in other words. Don't beat to death the item the pc has just blown utterly about you the auditor. Don't always take up what the pc just got rid of or he gets the idea that his aberrations are being continued by the auditor. Do you know that's the illusion he gets? And commonest hidden fault in auditing is probably just that one.

The pc says, "Well, you'd have to be a giraffe before I'd respect you as an auditor."

And the auditor – this is so new and strange, it is so intriguing and interesting, you see, that quite understandably he very often chases this one. And he chases this giraffe around for a while. Well, hell, the giraffe was out of the room and clear over in the next county until he started chasing it again. He chased it right back into the room again.

And he said, "When did you first start thinking of me as a giraffe," you see?

He didn't ever, you see. It's a completely balled up question because if he'd thought of the auditor as a giraffe, then the auditor could have audited, you see? But it's because the auditor wasn't a giraffe, don't you see, and the pc has to explain all this, and it gets all tangled up again, and you get misduplication and so on.

Well, I let pcs cognite and get rid of it. It's always the safer line. I repeat the question in its native form – the first form that it was in – not the question as it was altered to by the pc.

In other words, he said, "Well, in order to audit me, you'd have to be a giraffe."

And I say, "Good. Is it all right if I audit you?"

No reaction, fine, see? But not, "When did you first get the idea that I was a giraffe? Has a giraffe ever audited you?" [laughter] "Hm, this is very peculiar." [laughs]

Of course, you will do it. To the end of your career, you occasionally will do it. You just couldn't possibly keep away from doing it because it's often so intriguing, and actually it's some of your pay as the auditor to find out what the hell's going on here, you know? Perfectly allowable to ask. What I'm talking about is a habit. When you make a habit out of this, oh, my God! That's a dog's breakfast. That isn't a session.

Pc is never permitted to blow anything without it being questioned by the auditor. That's a Q and A straight across the boards. Another additional definition of Q and A is: "A prevention of a pc from blowing an aberration by insisting there is more to it."

Well anyway, look at this as a use and you'll find that if you can locate some of the central pins about which the pc is worried that you can run this by oppterm of 3D Criss Cross, and you can produce some interesting case changes. Now, how far this goes, I am not willing to hazard at this particular moment, because the data I'm giving you is basically experimental data. But it is in use. The data is in use at the present moment.

There's nothing dangerous about this data. In fact, it is much the safest auditing you ever did on anybody.

How far it goes, what ramifications this includes and so forth, I wouldn't at the present moment adventure to say.

I will say this. It's proven out far enough at the present time, that an auditor could just practically go and make a career out of it. Yeah, I mean, make a career out of it, you know, just out of some chronic somatic or something like that. He'd pick out one chronic somatic, you know? Just one like psychiatrosis or something like that, and just go ahead and start and mop it up. You could do all kinds of interesting things from an auditor's point of view this way.

But now let me give you a word of warning before I close this lecture: Don't audit pcs with the rudiments out. And don't audit pcs with present time problems of long duration which you're doing nothing about, because, of course, the rudiments are out.

You've heard this since last September, didn't you. Yeah. Then we sort of dropped it because there was no immediate remedy for it without taking up a whole week or something like this. Now, if you can do 3D Criss Cross rapidly and you can do it very slippily, you can probably knock in the head a present time problem of long duration just in the progress of doing 3D Criss Cross simply by moving over onto it and creating a line for it. Just leave it hanging there. Go ahead, oppterm it. You'll be walking into the bank on that line, too. You see what I mean?

Doing 3D Criss Cross, everything was going along splendidly and beautifully, and the pc all of a sudden put the brakes on like mad and had a present time problem with the pc's landlady, with all landladies, with the "Landladies' Association of Great Britain," you see. And the whole thing is liable to move up at any moment to a question in the House. And the – a discussion on this finds out that the pc has had this problem for months. Has always had this

problem. And there's something about landladies that just seem to have problems connected to them, and so forth. Well, you've isolated a piece of the Goals Problem Mass.

But the only piece you've isolated is the characteristic of one valence. You haven't located a valence "landladies," you see? You've located a characteristic, which is not liking landladies or having trouble with landladies, and that's just one characteristic of a valence, you see?

Well, it's like a little goal, a little tag here. And you move this little tag over and just add it as line H, you see, or line M or O, or we don't care where you've gotten to.

In other words, don't beat yourself to pieces trying to do a long and involved present time problem of long duration, you see, and work yourself to death on that unprofitably when you've got a very heavy process that'll handle it, and just add it into the work you're doing. That'd be a very slippery thing to do, wouldn't it? And just add it in and get yourself a new line. Well, good, you can always use a new line. You're going to start losing lines sooner or later as you go down the line and wish to heavens you could find some new lines.

My heaviest worry right now is how to keep lines going and how to get lines, and I'm working on a flows system of finding lines which would interest you very much. And I have a brand-new pattern of flows and a new description of flows and a new formula of flows, all of which are very intriguing

These give us bountiful methods, bountiful lists. I mean, they're hotter lists than like and dislike lists than you ever heard of. I mean, "Who or what would prevent an inflow?" you know, that kind of... The pc's bank goes off *brrrrrpt!*

Anyway, just all – make all grist to the mill. So the pc has a problem – present time problem of long duration, and you suddenly isolated this as a present time problem of long duration. You skipped back, yes, the pc has had this problem quite often. All right, we'll just give it the 3D Criss Cross treatment and add it as a new line. Only, the only thing that happens is, is you get the condition, you get the opposition to the condition, and then you get the opposition to number 2.

In other words, you'll wind up two items deep on that line before it's of any great value to the pc, and of course, the present time problem'll vanish in smoke, and you've got 3D Criss Cross going at a fast rate.

Now, it's valuable to know this, because it's very probable that doing 3D Criss Cross will throw up the characteristics of not-quite-revealed valences at this stage. And the not-quite-revealed valence may get himself a nice present time problem, you know? The person had never before had problems with fire hydrants. And all of a sudden he's having great many problems with fire hydrants. And it's getting to be very intriguing And he says, "Of course, it must be this new valence that you just found on me – fireman. And that explains it all, fireman."

Fire hydrant, fireman. And it's all explained, and he goes on having trouble with fire hydrants. Well, it couldn't possibly be explained, don't you see, or he wouldn't be going on having trouble with fire hydrants, if firemen... And you finally press it down a little bit further, and you find out it's the firehouse dog. So ... [laughter, laughs]

So anyway, there's many uses to which this can be put amongst keeping – amongst them, of course, keeping rudiments in on present time problems of long duration.

Now, you know what a present time problem of long duration is, don't you?

Audience: Hm-mm.

And a present time problem of short duration is just a breath of air, but it's very recent and very new. A present time problem of long duration? Well, that's been around for quite a while, and there are very precise definitions for this thing. The – there are quite a lot of lectures on this particular subject, and so on. It's really been pawed around and mauled around, and where you get them and how you get them and all that sort of thing.

Now, I'm giving you a way to handle them that's quick as a bunny, and therefore, all of that data becomes more valuable than it was. Okay?

Audience: Hm-mm.

All right. Well, I'm not intending to drive people out of the business of healing. I'm not intending to drive them out of the business of healing.

They can go on and heal all they want to, but that now includes us. I'm not going to drive us out of the business of healing either. Because there's no danger whatsoever, now, in addressing somebody's arthrosis lumbosis of the psychiatrosis, and you could probably cure it up like a scat without knowing any more about it than his medical doctor and psychiatrist did.

In fact, knowing far less because they pretended to know a great deal that they didn't know.

Okay?

Audience: Hm-mm.

All right. Well, I hope it's some use to you.

Thank you.

FLOWS

A lecture given on 1 February 1962

Thank you. And here we are at the what?

Audience: February 1st.

Oh, we've got the Feb. We finally moved into the Feb. The "Febs" are after us now. All right, 1 Feb. 6-2, Saint Hill Special Briefing Course.

And today – today we have a great deal to take up, but I forgot my notes. I wrote a bulletin in a rush today, and it's all in the bulletin, so the bulletin of 1 Feb. has something to do with what I'm going to talk to you about which is flows.

What is a withhold? A withhold is not a flow.

What's this?

A withhold is the unwillingness of the pc to talk to the auditor or tell him something, because a person can withhold about a flow.

So you actually have a withhold, which is what you're working on, as a "don't know." And you're working with the subject of knowingness when you are working of, "What have you done that the world does not know about, that you don't know about, that other people don't know about, and especially me, your auditor, what don't I know about?"

With withholds you're talking about knowingness. But this knowingness is tremendously influenced by the subject of flows. So when you say "withhold" in Scientologese, you actually mean something that the person does not wish the world, others, all dynamics and his auditor to *know* about. Or it has not occurred to him to tell the auditor or he is *incapable* or finds it *impossible* or is utterly *prohibited* from advising anybody else about it. Now, that is a withhold.

And oddly enough, a pc can withhold about flows. So get these two different things sort of disentangled, because all flows can be a withhold. And if you get flows gorgeously mixed up with withholds, you're sunk.

A withhold is knowingness. Now, I'm straining a point here. I'm straining a point to elicit your understanding of what you are doing as an auditor.

A person who is restraining something from being known is withholding, but basically it is *knowledge* that he is *withholding*. He's withholding knowledge, information and data. And you can put a withhold, as we're using it in Scientologese, under the heading, you see, of data and knowingness. That is a withhold. So restrained data and knowingness is a withhold, right?

Now, oddly enough, any one of the flows can assist, aid or abet a withhold because knowledge can be buried under the flow. You see what we're up against here? We've got a datum and let us say it is a white pebble. And we can cause various flows over the top of and away from and over and back to and so forth, this white pebble, to a point where it becomes totally obscured. See, we can just fix it up so that every time anybody starts to look at the white pebble, a flow starts. And then the individual has the sensation that he mustn't tell about it or something of the sort.

We therefore have a datum or knowingness which we call withholds and the next step and stage of this is the attitude toward flows. And then we have flows.

Now, all of this can be somewhat carelessly condensed under the heading and subject of flows. But I don't want you to remain totally in ignorance of the fact that the thing is compartmented.

We've got attitudes toward flows. Now, actually there are only two flows. Given any one point or any two points, that is, location and space, you only have two flows possible for any one of those points. And one is outflow and the other is inflow. Elementary, my dear Watson. That's all that's going to happen. You can only have outflows and inflows where flows are concerned.

Now, the thing that causes flows is the motionlessness or the fixedness of the point. So flows are regulated as flowing out and flowing into, from fixed points. Now, the point may or may not have a mass. All power, speaking now of electrical power, is derived from holding two positions in space. That is electrical power. It is the base of the motor. I call to mind 8-80. And it is the base of the motor. It isn't the armature nor the electrician nor his plans. Nor is it yet the diesel oil that is poured into the engine that does something or other. If you didn't have this first fundamental, you could have nothing else. And the first fundamental of power, electrical energy and power, is of course two fixed points in space. And whatever gives power has to have a base that keeps these two points separate. And to the degree that these two points can be kept separate, you can generate power, electrical power.

Now, if you had two little copper wires that were just stood up in space, one in one location and one in another location. And they're just stood up, you know. They're not braced at all. And they're stood up there with sticky plaster or something of the sort. And you took an armature and you developed a thousand horsepower of rotation between these two things, you see, you wouldn't be able to do it. They simply – the two wires would simply collapse into the armature and that would be it. Does that follow? You see?

You turn an armature there and you'll get these two wires falling in on each other. No, it requires a couple of pretty doggone big poles between the thing that is cutting the space between them, you see. And they've got to be very strongly fixed and the strength with which they're fixed has everything to do with the amount of horsepower or electrical current or kilowatts or anything else that can be generated between these two points. Do you see that?

Now, this gives you an idea of how *fixed* some of the points must be in a pc's bank to actually generate flows between them.

Now, as a person gets (quote) weaker (unquote) he is no longer able to hold two points in space. And he gets masses. Masses are collapsed locations. Therefore, asking somebody to locate things in space will generate flows.

Now, if you run Havingness long enough on just this simple command, "Point out something," you're – you'll start running into flows.

Now, you didn't realize that when you are running a pc, you actually should probably have an electrician's or an electrical engineer's license. You probably didn't realize that. But we're going to require this from all medical doctors who wish to practice on the mind. They have to have an electrical engineer's license because they frankly are handling a power plant.

Now, when the pc was no longer able to keep Keokuk separate from Sioux Falls in his mind, he has an identification between Sioux Falls and Keokuk. All right. Now, we're talking totally about the mechanics of space, don't you see.

When he couldn't keep his mother away from his father, he got an identification between his mother and his father. Do you see this? So identification is actually identifications of location in space. Foremost, of course, way above all this level of mechanics, you have knowingness and postulates and all the rest of that, but I – we won't stress that point particularly. You recognize that a thetan's mechanics derive from his postulates. And even this universe and its space derive from his postulates and considerations. But we're not going to bother with that right now. We're talking about this electric eel that you're handling.

And Keokuk and Sioux Falls are the same town. And then they become no town at all. They disappear as a location in space because he can do nothing to them or about them. His causation over Keokuk is zero. If he ever went inside the city limits of Keokuk, the police, he knows, would immediately scoop him up and throw him in the hoosegow and chew him up and hand him over probably to the hamburger mill to be fed to the wolves or something. He's sure of this and he can't do anything. He knows he cannot do anything to Sioux Falls. Sioux Falls can do all kinds of things to him, but he can't do anything to Sioux Falls, don't you see?

So he's total effect of Keokuk. He's total effect of Sioux Falls. He couldn't place anything in Keokuk and he can't place anything in Sioux Falls and you'll find these two towns are identified in him. And you say, "Where did you live early in your life?"

And he says, "Well," he said, "I've lived in um – uh – Keokuk – uh, Sioux F – Sioux – uh – Keok – Keok – um – Sioux Keokuk. No, Sioux Falls. No, Keokuk, yeah. No, I was in Keokuk when I was eight or nine and then uh – I was in Sioux Falls when I was five or six. No, no, no, no. I was in Sioux Falls when I was eight or nine and in Keokuk... No, I was in Boston that whole time." [laughter]

Have you ever watched a pc trying to place something? Well, just exactly that. Consider it just exactly that. He's trying to place something on the time track. Well, he's also trying to place its location in space. And when he can't do this, he gets a confusion between the two and therefore you get this principle of identification. The basic principle of identification, that's what you're dealing with here.

You realize that all aberrations and identifications A=A=A=A. All right. Book One. You realize also that the pc's ability to differentiate amongst two objects regulates to a large

degree his state of sanity. You realize also that when he can no longer differentiate, but tries to, he does it compulsively and you get a thing called disassociate. So that he can locate nothing, he simply disperses off of everything he tries to locate. See? So two things or three things or six million things all become one thing. And then they become one thing to such a degree that they cease to exist. In other words, he can't even spot the one thing and you have forgettingness or lack of memory. These are the mechanics of the memory.

All right. He said, "Well, I was in Keokuk between – I was five and six except at Sioux Falls uh – except that was eight or nine. No, that was another lifetime."

When you get this kind of thing going around and around, it sinks just one step lower. For lack of identification, he can't place it at all and you have – he can't identify. He can't even identify himself with Sioux Falls, Keokuk or the mass now that Sioux Falls and Keokuk have become in the bank. And that submerges out of view and you no longer have any ability of any kind to remember Sioux Falls, Keokuk or anything else. And that is the condition most past lives are in. The fellow has lost all of his power over that life and the cities and locations of that life and so he forgets that life. And that is all there is to it.

Now, of course, you understand that everything I'm telling you has nothing to do with postulates, considerations, attitudes. It's just simply the mechanics of how a thetan goes nuts. These are the – these are the electrical phenomena connected with going nuts.

Factually, you see, he forgets everything to get even. I don't know if you realize that. He ceases to be able to place things in order to make another effect. The fact of the matter is that a thetan never gets into a situation where he is not making an effect. He's always trying. Axiom 10 is always in with full throttle. You should know that about a thetan because it'll save you a lot of worry from time to time. You just remember that remark. It's a more important remark than you believe – that a thetan *never* gives up, *never*.

Forgetting is just a way of getting even. That's all. If you don't believe that sometime, ask somebody, "Who would be influenced by your forgetting about ... ?" whatever his chronic somatic is and you're liable to get an evaporation of the chronic somatic. You know, just trying to hold the idea of getting even by forgetting is liable to cause a vanishment of a chronic somatic or a change of his case.

This thing is susceptible to lots of proof. There are lots of demonstrations on this. But of course, we're talking now up in the zone and level of postulates, considerations, intentions and all that sort of thing and I'm lecturing to you on electrical phenomena. Don't lose sight of the other, but know that electrical phenomena can be treated as a separate field all by itself.

And you can do rather marvelous things with just electrical phenomena. "Point out something." He locates the cupboard and the fireplace and the floor and the ceiling. *He* is locating them, see? The fact that he is locating them tends to generate power and all of sudden his bank sort of goes *whuzwhuz*, and he gets a funny feeling back of his eyes, and his chest sort of feels odd, and then he feels kind of tingly all over. And, you know, as he's running "Point out something" – if that's his Havingness Process and that thing is working – why, he'll get all these electrical phenomena and those are *flows*.

Now, at the border between *flows* and intention, we have intention about flows. Now, that sounds awfully *odd*, but intention about flows. You see, you really only have outflow and inflow until you mix it up with trying to do something with the flows.

Now, completely aside from the electrical phenomena and the blown fuses and so forth and the collapsed motor bases and so on in the pc's bank – completely aside from this – we move a little bit higher – you see, we only have outflow and inflow as possible flows – we have his attitude toward those flows. And it's right there at that very tiny little borderline that you can produce some interesting fireworks on a case, because you're at the band between electrical phenomena and knowingness. And that band is his attitude toward flows.

Of course, some people's attitude toward flows is there ain't any. We'll neglect that attitude at the moment. [laughs] And we'll see here that there's only outflow and inflow and the speed of the flow and the magnitude of the flow. I mean, that's the only flow that a points could have. There aren't any other flows. But now, a thetan, he gets to thinking about it and he decides that he will *regulate* these flows and all these flows have regulations. So his knowingness is applied to the flow.

In other words, his intention is applied to the flows. And his intention about flows gives us at once, factually, several intentions of which only a few are important to us in solving cases. But the first band of intention about flows ... Now, you see, we've got just the motor and the thingamabobs and the whatnots, but now we have a living being who has intentions about these things. They outflow and they inflow. He's got intentions about them. All right. And we apply the CDEI Scale somewhat expanded and a little bit explained. Curiosity, Desire, Enforce, Inhibit – the old CDEI Scale moves in here.

Now, to get a thetan's intentions delineated with regard to outflow and inflow, we apply the lower version of the CDEI Scale. We don't say, "desire." We say, "permissible." Because that's an okay flow. A "so what" flow. That's an "all right" flow, you see. For lack of a better word, we'll call it "permissible." It also can be called "allowable." So that's the okay flow. And that's just at the lower edge of "desire," you see? That isn't really desired; it's really not desired. You say, "I'm hungry, so I will eat." You really don't want to eat, you really don't not want to eat, you see. You're just going to eat. In other words, that's an okay flow.

Well, that covers a wide band because it also covers a desirable flow and it also covers to some degree being curious about flows and that sort of thing, but it's an okay flow.

And just below this, we have enforced flows. And now we have two aspects of inhibit. We must point it out to the thetan that the flow can be prohibited and inhibited. From the point it is inhibited and from outside the point it is prohibited. You follow this? Outside this point it is inhibited, you see. You might say, "an other-determined inhibit," we will call that a "prohibit."

So we have these four things. We have "permissible," and we have "enforced," and we have "prohibited," and we have "inhibited." Now, oddly enough, these things harmonic, just to confuse you further. So we get permissible, enforced, inhibited, inhibited, enforced, permissible, as we go down scale. Now, it's quite important to know that there's an inversion there because as your pc runs it, this kind of phenomena takes place:

You say, "All right. Tell me a permissible flow."

And he says, "Eating."

That's interesting, isn't it? Eating has appeared there as an answer. Now, you've gone on asking for some more permissible flows, but after a while, you're asking him for enforced flows.

And he says, "Having to eat."

And then after a while, you're asking him for inhibited flows.

And he says, "Dieting."

See, he's got eating in here again. What's essentially happening? His considerations of eating are moving up scale. And so they're appearing on these harmonics, you see. And then you say, "All right. Now, tell me an inhibited flow."

And he will say, "Eating. Others won't let you eat," or something like this, you see? That's actually the lower one. Dieting is the other one.

And then he says – you're asking him later for an enforced flow and he says, "Eating" You ask him to clarify this. "Making them eat." See? "Making *them* eat. People have *got* to eat. It's good for you!"

And then you ask him – you are asking him a little while further in a flow process and you ask him for a permissible flow again and he will say, "Eating."

Well, you're actually not back where you started from. It is now, for the first time in his life, all right to eat. When you first asked him, it was down at the permissible, "Well, it's all right. Everybody does it. The poor little animals." You know, "The poor vegetables." And it moved, you see, from the lower scale permissible up through the – that is, the inverted permissible, to the inverted enforce, through the inverted inhibit – uh – prohibit, through the inverted inhibit, through the proper inhibit, through the prohibit, through the enforce, to the permissible. And therefore, the subject of eating, on the subject of flows, would graduate up all those bands and that's eight.

So there're actually eight attitudes toward flows, if you take the whole band – eight attitudes. And those, of course, I have just enumerated. Those are permissible, enforced, prohibited, inhibited, inhibited and prohibited, enforced and permissible. In other words, we take the thing turned over on one harmonic, in other words, and we've got eight attitudes.

But in auditing commands, you would only need four, you see, because it doesn't matter. The pc isn't interpreting whether you're asking him for the harmonic of it or the actual one, so you get away with four. So those four consist of permissible, enforced, prohibited, inhibited. And of course, they take care of both harmonics. Just don't lose sight of the fact that there's an inversion there, just because you're shorthanding it.

All right. Now, there's only two flows. There's outflow and there's inflow, until you add attitude to them.

All right. Now, we can discard the harmonic because it merely repeats itself. We have to know that it's there, but it merely repeats itself, so as far as fact in processing is concerned

– the factual use, the reality of the use – you're simply using these words in connection with each flow. And you get permissible outflow, enforced outflow, prohibited outflow, inhibited outflow, see. And that's – you've got four of them there, which will cover all of eight of the inversion. And then you have, of course, permissible inflow, enforced inflow, prohibited inflow and inhibited inflow. And that gives you the eight basic flows for purposes of processing. Understand that they are *sixteen*. There are actually sixteen flows there. But for purposes of assessment, Sec Checking, for purposes of keeping the rudiments in, for purposes of running a Flows Process, you only need eight because the harmonic is a duplicate of the two.

You see where this is landing now? Well, you've got eight things. You actually have four, phraseologically, attitudes toward an inflow and four attitudes toward an outflow, see? Four attitudes toward an inflow, four attitudes toward an outflow and it gives you an eight command process if you're running a flows process with all necessary flows.

Now, this is sixteen, actually, you're running sixteen flows with eight commands. Recognize that. But if you were to put "others versus others," and not only the thetan here but the other point over there and then you were to put over an extensional point as in a bracket, for an "other to another," you of course have got the "another to the other," also. And you got sixteen more flows sitting out there, which we could express, however, in eight commands. Do you see that?

This gives us thirty-two. Now, we've got "another versus others," and "others versus another." We've now got sixty-four. We haven't got sixty-four, but we could add the other versus self, which makes a round of roodles on the thing and we would get up to the sixty-four.

All right. Let's take a look at this and recognize that we don't have to run it by brackets. Thank heavens. I'm clever enough to figure out a way where we didn't have to do this, because I can just see you now trying to keep in touch with sixty-four auditing commands. And we get sixty-four auditing commands merely by this tricky system of shorthanding, you see. So that we do not – if we do not specify "self" or "another," we can run all available flows with eight commands. Providing we do not specify self or others or which point we are talking about, the automaticities of the pc will shift over to that point or that dynamic or anything else that the flows apply to, you see. Just leave that on automatic and you only have eight commands for a flow process.

All right. Well, what would this flow process be? Well, I – it's almost gilding the lily here to describe what the flow process would be. And there's no real sense in giving you the *exact* flow process because you should be able to work it out from just that basis. And if you can't work out a flow process from your data, why, you're going to get yourself in a spot someday as an auditor that you're sitting there with your mouth open when you should be talking, because it is a little bit different all of a sudden. And you're not auditing from data, you're auditing from a ritual.

And I rather frown on auditing from a ritual without knowing why you have tied the cat to the bed, do you see? "We always, to start a session, tie the cat to the bed." I can see auditors two hundred years from now, you know, and they always audit the pc's chair for a half an hour before the pc is permitted to sit down in it.

And this all came from a developed fact. It is true that you should set up your E-Meter and adjust the pc's chair before starting a session. [laughter] It's perfectly valid and you should do that because it places him in space and makes you cause over him.

But you could see that somebody on a ritualistic basis would figure this out that the pc's chair was pretty important in the session. Well, they wouldn't even be auditing the reactive mind, don't you see? They could move all sorts of directions, you see, by just losing bits and pieces. So I'd like to see the theory stay in. I like to see an auditor audit from fundamentals rather than ritual.

Of course, you – nobody really had to tell you to adjust the pc's chair. If you knew your fundamentals about flows and positions in space, you know darned well if your auditing commands are going to stick with the pc, you would adjust his chair. Pc shifts his chair over two feet or something like that at the beginning of session and you leave it there. Oh, *ha-ha-ha-ha-haha*. Whose flows are going to dominate this session? The pc placed himself in the session, didn't he?

Well, that's the same as asking the pc to say ... All right, you say to the pc, "All right now say, 'Start of session,' so that you get the session started for yourself."

A session has a lot to do with flows and has a lot to do with knowledge, so you should know about your eight flows – four to inflow and four to outflow – and it's simply the simple formula. It is nothing but permissible, enforce, prohibit and inhibit.

Now, so that you get to know these things very well, I'm going to ask you sometime after the lecture to draw these flows. Take one point and draw all eight flows from that one point, so that you really got this in your mind's eye so that you just aren't understanding some kind of a ritual, so that you know what's going on here.

Will you do that?

Audience: Yes.

All right. Now, what's the use of all this? Why did it become necessary that all of a sudden after *all* these years I all of a sudden start researching the pc as an electric motor? Why? Because you're having a hell of a time keeping rudiments in during listing and differentiation and assessment.

Rudiments go out. Well, why do they go out? Well, rudiments get kicked out by triggering automaticities of flows. And that's how rudiments go in and out. The pc is so much the subject or the effect of electrical energy and bank that he feels the flow and obeys it. In other words, boy, is he inverted, see? He feels the flow and he minds it. "Oh, oh, that's – I shouldn't do that," you see? But of course, underneath this flow is a consideration about this sort of thing. And that consideration is resident in the 'ead of – visible or not visible – some identity in the bank that will be someday discovered by 3D Criss Cross.

All considerations about flows that are present at Class II auditing are, in effect, the considerations of identities which are contained in the bank and noplacelse. Recognize please, in Class II that you can do wonderful things with a case. You can get the case started. You can get the case bouncing along. Everything is fine. You can accomplish considerable

gains. But recognize at the same time that you are processing the considerations of beingnesses, which are whole beingnesses resident in the bank or in the pc's 'ead. Have you recognized that about Class II?

It's very hard to shift, by the way, the considerations of a beingness. Very, very difficult. But if you can produce results with Class II auditing, you can be trusted with Class III. That's for sure. And furthermore, pcs wandering in from here or there who are all of a sudden confronted with having to dabble with their mind – which they have not been in very good communication with for the last few trillennia, you know – being asked to communicate it, will find that they are far easier to communicate it probably along the lines of Class II, like a Problems Intensive. Just a standard Problems Intensive or something like this – they'd think that was very nice. And they'd get some gains out of it.

But recognize what you're processing You're actually not processing the pc. You're processing a package of beingnesses which have long since overwhumped the pc and you're changing the considerations of these beingnesses, which is difficult. That's what Class II auditing does. I'd be dishonest if I didn't explain to you exactly where Class II auditing begins and ends.

Now, these beingnesses which are resident in the bank have considerations with regard to flows. And when flows flow, the beingnesses in the bank all of a sudden get ideas because they become activated electronically. So a little trickle of electrical energy goes *whiz-biz*, and the pc says, "*Ooooooooooh*. Now I'm supposed to inhibit outflow," and sits there in a comm lag, which is what a comm lag is.

And something else goes trigger-whiz-click in some other department as you're processing him and he says, "*Ooooooooooo*. Now I know what I'm supposed to do. Now I know what I am supposed to do. I'm supposed to keep the auditor from talking to me. In other words, I'm supposed to inhibit inflow."

Now, he could prohibit inflow by talking back at the auditor or inhibit inflow by getting the auditor to not talk. And it'll be one or the other of these and he's liable to resort to this type of trickery of some kind or another. In other words, the now-I'm-supposed-to occurs because of the running of the flow. And these beingnesses which are packed into the bank one way or the other activate and obey these flow patterns. Quite interesting. Very interesting piece of electrical buffoonery. Very intricate.

It's all done on flows. So you can sit there under Class II and deal with pure knowingness which is pulling withholds. You're getting withholds into view, withholds into view. And of course, as you do this, you are running hard aground every now and then on a flow and the flow tells him to withhold. Oh, he's busy withholding. He's got a flow. It's going this way, see. Now, he knows what to do. He actually doesn't have a withhold at all, see? You see them in session?

Audience: Mm-hm. Yes.

Then you plug and plug. You say, "We know this guy's withholding something," and it turns out to be the fact that he twisted a cat's tail sometime or other. He actually has to dig one up to account for the fact that he's withholding. He's doing a flow withhold as different from a

data withhold. But you can straighten this out by pulling a withhold. There's always a bit of a withhold kicking around someplace to ease this thing up.

But differentiate between these two actions: the datum which is wrapped up in the reactive bank, one little tiny tag of which may or may not be known to the pc and which you're trying to get at as a withhold. That when released, releases knowledge into view and makes the pc freer. And that is pinned down by flows. You're looking for the white pebble and you're getting all this, that and the other thing.

Now, actually, a datum can substitute for a thetan. It's done all the time. They do it *all through* modern education. The system is called the old school tie system. A datum is being substituted for a thetan.

I'll bet you the number of chaps – now I may malign them – that are hanging around Cape Canaveral with the proper old school tie, that are actually contributing to the space program at the present time, can be counted upon the fingers of no hands. The only birds I ever ran into that were doing anything in that field very progressively had old school ties, but they didn't fit the job they were doing. They were professors with – of English and other things.

In fact, some of the more modern electronic machinery has been designed by professors of literature and so forth. And the boys with the old school tie – you see, if they're a perfect datum, not a thetan but a perfect datum, see; see, they're a Doctor of Mud or something – then they don't have to know anything, do they? Because this thing, this datum knows everything and then there doesn't have to be any thetan there.

And one of the most serious mistakes that a society can make is confusing ability with a datum because you can't confuse a thetan, you see, with a datum. A thetan is alive and a datum isn't.

Now, if you look along the lines of the datum, you'll find out that the thetan in his bank has parked data which has become *bzzzzzz* fixed, rooted, *nrrrrrrr*. These are the now-I'm-supposed-to's, you see.

Now, the most basic datum that he can park, oddly enough and what he was withholding the hardest and which forms most of the flows on the case – the bulk of the flows on the case are wrapped up and are released by 3D Criss Cross, because the data is John Jones. There's John Jones. He's John Jones and he knows where John Jones is. John Jones was buried in a graveyard someplace and now he's forgotten. And he's now forgotten John Jones. But John Jones was a datum and John Jones was what was holding locations in space, see? No thetan, him, was holding this location in space, but a thetan which was a datum. We had a datum called John Jones. That's his identity and it held a position in space, he thinks. I mean, people get horrified at me because I actually have been known to almost forget my own name, because I couldn't care less about this particular phenomenon.

You possibly heard a lecture or two by me in which I have not approved of the old-school-tie system, to say it very mildly. And that's because I don't believe that you are you because your name is Pete. You see, I don't believe that. Nobody could convince me of that at all. I believe you are you because you're you, see. And I think you've been you for a *long* time

and you're going to be you for a lot longer. And you're sure going to be you a lot longer and have been you a lot longer than you have been Pete.

So, you see, I find it better communication to talk with you as you than you as Pete. Of course, my own identity's lines are fouled up by habit pattern, undoubtedly, as a writer. And most writers are trying to make a name famous or something like that and I didn't ever care what name I ever wrote under. It just didn't matter beans to me. As a matter of fact this has lost practically everything I've ever written. There are very few things extant, because I even forget what names they're written under.

But there are certain satisfactions in this. I wrote one of the stories in the *Arabian Nights*, for instance, many thousands of years ago and it's still in the collection very nice. It's the story of a lost prince. It's definitely me. It isn't by Achmed Mud or something. It's – I write it.

But you know, Bob saying last night, he says, "Well, in – now, in space opera, that's good, see. Because you – of course, all doll bodies are all alike, but you know the guy. You know the guy, you see?" And that's true. See, they know him. And there's a lot of argument about whether or not this can or cannot be done. And it's not real to people in some ways, but truthfully speaking, you get spoiled here on this planet because they build all the bodies differently and you get dependency on appearance. And you don't have to know the thetan. All you have to do, you see, is know the appearance of somebody and you get spoiled that way and you can get hooked on this way.

Now, it is true, I'm sure, that thetans on the track had made mistakes about the identity of people. I know people have walked up to me occasionally in various climes, spaces and planets and have accused me of being somebody else, but never to the degree that they have here on Earth. [laughter] Yeah, it's marvelous.

Anyway, you, a thetan, you see, are still carrying on very nicely and you are not a datum. You are a living thing and you are a creator and – of life and a being which is alive. And when you were John Jones, John Jones was a datum, you see. And there's that datum and it stays as a park place in the bank. And it forms the terminal from which the flow can charge and discharge, you see.

Well now, as John Jones, a datum, we also had enemies. Bill Smith, you see. And John Jones had the enemy, Bill Smith and Bill Smith, of course, has been approximated in the bank someplace by John Jones as an earlier time, you see. And now Bill Smith becomes a lock on the earlier identification John Jones has made with an identity and you get an electrical discharge between Bill Smith and John Jones because they're holding positions in space in the bank.

So you ask a pc, "What do you think of cake?" And all of a sudden he goes *zzzzzzzz*. "What was that? What was the matter?" you could ask with pretended innocence.

And he'd say, "Well, I felt dizzy," or "There was a little whir feeling in my head," or "I had a somatic in my back," or lots of other things. But it's the interaction of flows between these past *beingnesses*. And that is what causes all this nonsense and bric-a-brac that goes on in the mind.

Now, if you get – a past beingness – it itself is a mass because it has blocked flows so often. It has gained mass and its mass is dependent upon its different positions in space as it is moved around and the number of positions it has held in space. And it generates mass. So you actually run into one of these things and they look like a – oh, I don't know – a Guy Fawkes dummy or something of the sort, done totally in black or a pyramid or something like that. And you run into these beingnesses and you say, "What's this?" you see? It looks like a burned-out tar barrel that's painted black. But it sometimes has a shape. Sometimes it has a head and shoulders and feet. Sometimes has only feet and a head. It can startle lots of pcs because there it is and it doesn't have anything in it.

He tries to find something in one of these things, you see and of course there's nothing in it. He was in it. He's gone now. And its circuits and connections, however, are still susceptible to flows, so its thinkingness can still go forward. And it can still think and it can disintegrate and it can – has a time track. When one or two of them started to come apart here rather remarkably and it's very startling because it looks like you've got a machine going off which is making pictures or you've got a machine going off which is doing something. And that isn't all. Well, you're just looking at the disintegration of one of these old beingnesses that's suddenly no longer so fixed.

Well, that's why your pc thinks he's on Arcturus when he's here on Earth; that's why your school child is out of present time, and so on, are all contained in these various things. And all the handles of these are, of course, proceeding from points in space.

But I'll let you in on something about points in space: You can't process them. You can spot them and so forth. But they are stills. We had to make up our minds about this a few months ago – if we were ever going to process stills. And I've never seen anything but catastrophe attend the processing of stills as long as you didn't discharge them.

Now, you see, a body – processing the identity of a body is not really processing a still. This person was after all moving all over the place. But if you were to process dead bodies only, you see, you would find the pc after a while going *zzzz-whizzz-zooooo*.

Now, you could process living beingnesses very easily because, of course, they do have motion. They're only occasionally stopped. You can process those. But to process stills – "Look around here and find something that is motionless. Thank you. Now make it more motionless. Thank you. Now be as still as it is. Thank you."

I think if you ran that for an hour or two or four or five sessions ... I don't think the pc would be there four or five sessions to run it on. But anyhow, if you tried to run it for a while, you would produce, at first, an interesting gain for the pc and then the gain would all of a sudden deteriorate and go, see? It is – the person, at first would say – you know, you'd restimulate being powerful or something of the sort; holding a position in space, something like this, you see, by saying "stills."

Now, keeping something from going away is not quite holding something still. It is not quite the same thing. That actually brings about the generation of power and it'll discharge quite a number of flows.

But, in general, you want to avoid inerts in the bank and process actions. That's in general, in generalized processes. That does not apply to winnowing out beingnesses and that sort of thing, because they're not proper stills. They're fake livingnesses. They're data.

Now, having a datum there in the bank – a withhold – which is fixed in place... Perfectly all right to process it, you see, because it's just a datum. It tends to act as a pole on a motor. A very false one, but it tends to act that way.

So this individual has a withhold – been to prison; has never told anybody. This ceases to become just knowingness, withheld knowingness and eventually will take up a flow action. And having been to prison caused him to feel sort of fixed and will cause an interesting lot of electrical play around in his body somewhere, like his stomach or his throat or his head or something like that. He'll be trying to do something about this.

Now, he isn't going to give up this datum. So that anything you do to him has still not gotten rid of the pole of the motor which has got him messed up. See, he's not made this datum general, it's not been released, he is holding a piece of knowledge here which he must not tell anybody. And because he must not tell it – anybody, it of course becomes a duplicated pole for the anybody he mustn't tell.

You see, there you are, the auditor and you didn't know that in his bank he's got "having been to prison," mocked up exactly like you. Because he's withholding it from you, it duplicates you. So to some degree, we get this odd phenomena of a discharge going.

Guy has got a withhold. He cannot talk to you. Well, he doesn't dare talk to you. But, of course, while he isn't talking to you, he's producing flow phenomena all over the place. [snaps fingers] You release this withhold ... You are not processing a still because it's a datum and a datum is never a location in space, but a thetan believes it can be, you see. It goes [snaps fingers] out and he's got some kind of a circuit disappears at the same time, you see. It's gone. He feels good. It's quite mysterious to him. What happened?

Well, actually, what happened is, is he had this datum – which frankly didn't have a sixteenth of a grasshopper power in itself – restrained from all sorts of people and being restrained from all sorts of people, then, of course, must have been of as great a magnitude as the people it was being restrained from. You understand that?

So he sets up a motor. Just as nice as you please, he sets himself up a very interesting motor. And he's at the receiving end of it. So he's got all kinds of games going with everybody who doesn't know this. See?

In other words, it's the withheld datum which then operates as a pole which then generates an electrical flow which will then make a ridge and do all kinds of other things, you see? And you've got the mechanism there more or less – you've got the mechanism by which his valences have become solid in the bank. And when you recover these valences, they're all ridged and everything else. Of course, they've got withholds like crazy. Every time the thing had a withhold, of course, it had something then mocked up as big as it had a withhold from. And you've got motors set up. And when you start getting into the bank in general, wow, you know, you can really set up some currents and torrents as you already know.

3D Criss Cross makes going over Niagara Falls in a barrel, you see, look like a canoe ride of a Sunday afternoon on a placid lake. You really set up some currents. Well, recognize what the currents are being set up from. They're set up by old withholds and old intentions which are acting as false poles amongst themselves and against themselves.

Now, you see what a problem is, basically, electronically. I'm not really giving you anything that cancels anything I've said about problems. This is just the electronic look at a problem. Why do people fight when they have a disagreement? Well, they have intentions to fight and all that. We neglect that. Let's get in – for the moment. We'll get into the electronic or electrical phenomena. Don't call it electronic. Call it electrical because it's practically the same juice that goes through that light up there. Electronics – that's mostly how you get transistors to capacitate without rectifying them on the infiltrusions. [laughter] And that's pretty hard to understand and – [laughter] but if you stick your finger in a light socket, that's not hard to understand at all. You ever stuck your finger in a light socket?

Audience: Yes.

Have you understood that? [laughter] Well, that's all you have to know to understand Scientology electric – electricities.

Now, here we have John and Mary. And John says that we're going to have fish for supper and Mary says we are not going to have fish for supper. Well, you'd think ordinarily in any universe that a person could have the intention not to have fish for supper and another person could have the intention to have fish for supper totally independent of any kind of an upset. I know you could have an idea that you were going to have fish for supper and I was going to have an idea I'd be damned if anybody is going to serve me fish for supper, without us getting into a fight. But if we've got withholds from each other madly, it only takes this new little datum of fish for supper and no fish for supper to set up two opposite poles, which then discharge on the old withholds. See, they actually – that's why the prior confusion holds the problem, don't you see?

And then all you've got to have is some prior withholds and you get this little tiny thing – one is going to have fish for supper and the other doesn't want fish for supper and so forth – and the next thing you know, man, you look over the police records. How did the argument start? There lies – [laughter] there lies this fellow stone dead. Well, how did the argument start? And it'll start in some stupid way like that. Be all there is to it.

And, well, how does it discharge against each other? Why did they fight for three days and then she sued him for divorce? How come? Well, it took these other hidden poles. And the fight is actually, simply, the electrical sparks flying off of these two hidden poles – speaking electrically.

So he's got a bunch of hidden withholds, which is knowingnesses and she's got a bunch of hidden knowingnesses and these are hidden from one another. So they're already pulled back from one another. So they're all set up, you see, to be fixed positions in space. And then we get this one visible datum, this little tiny visible datum which doesn't amount to anything about have fish for supper or not have fish for supper. "Well, all men are alike. My father was just like that." I mean, we can get all sorts of irrelevant statements being made on the subjects, you see? "You men think you are the lords of creation." "Housewives never do

anything." You know, I mean, you can go on and on this way. [laughter] The power – the electrical discharge and the power and the violence on the whole thing, however, is based on former withholds.

So if you want to solve a problem between John and Mary, you find out what the problem is and it's "He likes fish and I don't like fish." Only the problem by this time won't have been anything that mild. It'll have blown up to something that they have justified having a fight about. In other words, they dream up eventually something that's big enough to have a fight about. And this action's tracked back and you look for the prior confusion and of course you find a little cotton-picking withhold here and one there and it all just blows out and they – there's no problem.

You could do it to both of them and they wouldn't have any problems with each other, and they – because the problem, of course, was never a problem in the first place. It's too picayune to have been a problem. So of course, the problem is only the visible evidence of hidden poles which can discharge against each other unknown to one and all.

It's very funny, you know. There's John and Mary and the fireworks is all going off and exploding all over the park and the grandstand. And somebody just threw a match in the residual magazine of supplies for the rest of the fireworks display. And we look at all this, you know and it really looks fantastic. And then we find out, well, she actually loaned his shoes to her brother once and didn't tell him, you see. And he stopped by a widow woman's house for a glass of wine a few weeks ago and hadn't bothered to tell her. And it's just made up a whole bunch of little poles, see. They're all hidden knowingsnesses. Data substituted for thetans, see. And all these things are all covered up and forgotten. And it takes the air on this datum, you see, "I like fish; she doesn't like fish," see. "I like fish; she doesn't like fish. Therefore, that's a problem." And he'll go around and he'll worry himself sick about this problem. Terrific consequences occur because of these withholds because they make up ...

Now, if you miss a withhold, you of course have activated one. That is the difficulty. If you – if an auditor cannot handle withholds at all ... Let's say you're training somebody and they have just – you've got to have a pc audited and the only auditor you can get to audit them has finished the first day of his Comm Course but nothing else of the HPA or HCA and so on, I advise you *not* to let him audit withholds on the pc. See, I – that's just friendly advice. I mean... You can go ahead and do it sometime. Just see what happens. But stand by with the sticky plaster because the results are actually very, very gory, see. It's horrible because all this auditor will do will be to activate withholds, see. He's asking for withholds and not pulling them and asking for withholds and not pulling them, you see? And asking for withholds and not pulling them.

Now, all he's doing is just charging up these hidden, with – strained, withdrawn poles, you see, of one kind or another. And all of a sudden, there's some dumb, tiny, screwy, little thing that has nothing to do with it, you know. The auditor actually makes a click with the E-Meter and that's enough, man, and the pc just about tears his head off. This is one of the reasons husband-wife auditing teams have so much trouble. Before they've pulled their withholds, of course, they can't really have much randomness between themselves without discharging at each other, see?

So the best way for a husband and wife to audit each other is, of course, have all of their withholds pulled by somebody else and then audit each other. But that isn't successful either.

Actually, the best way to do it is just lay in a good supply of bandage [laughter] and keep at it. That's the main thing It's the failure that busts it all up. It's not doing it all that breaks it up.

Now, here's the system, then, that goes to work. You trigger [snaps fingers] this withhold, you have triggered [snaps fingers] a live pole. You see, you've got this little position in space here, this datum and it's now gone *bzzzzzz*, and the pc doesn't even know what it is, you see?

And then you get – it triggers off another one, *bzzzzzz*, and another one, *bzzzzzz*. And by the time you've got some of these things going, you know, the pc is sitting there and he can just feel it start to throb, you know. And all of a sudden he tells you off.

Well, he just goes into an automaticity. And you're seeing there simply the *flows* start after the polarity has been set up. After the poles have been set up, why, you get the *flow* going. And that's why it is so dangerous to miss a withhold. You see, you'd have probably never been in trouble if you had never activated it in the first place.

But if you're going to pull withholds, you're going to do marvelous things for cases. But if you're going to pull them badly, get lots of sticky plaster because it's – the pc's just going to be blowing up in your face all the time.

Now, this is the electrical aspects of all of this phenomena that you watch, one way or the other.

Now, pcs have habitual flows. There's always a current running from *bzzzzzzt* to *bzzzzzzt*. And one of the eight attitudes is in full force on most cases. At least one of the eight will be stronger than the other ones.

In other words, he has to prohibit – pardon me, his outflows have to be prohibited. There actually is a whole nation like that. The Bantu. If you want to get in trouble with the Bantu... I don't get in trouble with the Bantu. They get along fine with me. But I've noticed this peculiar characteristic, that this particular flow is very strongly in force, that their outflow has to be prohibited and they're very unhappy unless you prohibit their outflow. You could work this out for almost any being.

He gets unhappy if something isn't happening with a certain thing – one of these flows. One of these flows must be treated reverently, in a certain way. He's got one of these points and it will be goofed up somehow or another, but it has to be handled that way and that's how life should be. And his now-I'm-supposed-to with regard to flows is that one fixed attitude. And one of those eight attitudes toward flows is going to be more dominant than the other.

Now, you know what I mean by a prohibited outflow. You have to make it clear to a Bantu that if he does something wrong, that he will be upbraided for it. You don't have to upbraid him, you know. You just have to make it clear that you will. This is what is so interest-

ing. I don't know if people down there in handling them have ever learned this. But you just say, "Well now, don't you worry about it because I will make very sure that you don't go away and stay away two or three days." And they're very happy. And they go ahead and then not stay away two or three days. They're very happy then because you're withholding for them. You see how it is?

You're prohibiting that outflow. And they don't believe they have the power to prohibit the outflow, so they feel nervous. I didn't mean to run the color bar in this, but I did want to say they're – that I've noticed this one characteristic on a racial line. I haven't studied any other lines to amount to anything, but I did study that one.

Now, you'll find a pc gets in a state of an inhibited inflow. He is going to hold off the inflow; he's going to inhibit the inflow. I guess from that standpoint it'd be prohibit the inflow. He's going to say, "Any inflow? No."

Of course, this goes to only certain classes of inflows, but actually can broaden out to a generality where any time he gets an inflow he has to classify it to make sure what it is, you see? And he gets very nery.

You have people who can be stuck on any one of these points and there are eight of them that he can be stuck on. This pc or any other pc can be stuck on any one of these points more than another one.

So therefore you could list these eight flows and assess a pc and wind up with the perfect Sec Check. Assess it in some particular way, you know. Just write down the flows and just call them off to the pc, see which one reads the most and then take a Sec Check. We were saying last night we might even have a series of eight generalized Sec Checks which each one of which matched this particular type of flow. So you could write them up yourself. You look it over and you will find, then, that during a session, when you are listing, if you've already spotted the pc's automatic flow, you can turn the rudiments on at once after, when they go out. You can get the rudiments back in promptly if you know that the pc is prohibiting inflows.

You ask him some question which adds up to "All right. What inflow did you prohibit just then?" You know, the rudiments go out.

And he says, "Oh-ho, well, I ... There's a bird singing outside," and you know, he'd stopped that. And of course, he'd parked the session right at that point. You got the idea? He does this obsessively and automatically. If you know which one of these eight is wrongest with your pc or most dominant, rather, with your pc, you can trigger it and get the rudiments back in with speed. So it has use. It has very practical use, all this stuff.

He starts withholding the knowledge that this flow has occurred. He withholds it from himself and from you. And then the rudiments fly out. He withholds all this knowledge. But I call to your attention, now, a withhold is a withhold of data or information; it's an unwillingness to talk to the auditor. It's not necessarily a flow.

Now, when a pc deteriorates, we get him into flows. He goes into flows very obsessively. Then he can't help but scold you. He can't help but be apathetic. He can't help but – you see. This flow just starts flowing, and he follows suit and he can't do anything about it, you know.

Now, you've got a pc who is prohibiting outflow. He's not inhibiting outflow. He believes outflow should be prohibited – make it that way.

In other words, if he outflows he believes some exterior force should prevent him from outflowing. And the pc will sit there *yow-yow-yow-yow-yow yap-yap-yap-yap-yap-yup-yup-yup-yup-yap-yap-yap-yap-yap-yap-yap*. Waiting, waiting, waiting, waiting, waiting, waiting, waiting for the auditor, for God's sakes, to please say, "Shut up."

He goes *yap-yap-yap-yap-yap-yap-yap-yap-yap-yap*. He's stuck on prohibited outflow, don't you see. He'll talk until stopped. In the middle of all of this, the auditor says, "Good. Thank you."

"Well," he says, "the auditor was on the job that time. That's better."

You mustn't get the idea that one of these is more social than another one, from person to person. Everybody has his idea what sociality is. And although the majority of a certain race might have a definite opinion of that inhibited outflow is the very best social presence, remember, that's not necessarily true of all races or even all people in that race. See, that might be just a social generality.

Well, you take a German knight. He knew what he was supposed to do: enforced outflow. That was it. He's got it taped. His social conduct. The Romans – Roman officers and men used to practically roll in the ramparts listening to these birds, you know.

They come out there shaking their spear, riding a horse and telling about all their great deeds, you see. And they ride up and down with all of their great deeds at full automaticity, you see. They had to enforce this outflow and knock anybody over the head that wouldn't listen to them, and of course the whole tirade concerned itself with knocking people over the head anyhow. [laughs] That was the way it fired.

So you get these different attitudes. They make different social conducts of one kind or another.

Of course, if you want to get a pattern of all social behavior, just apply the Tone Scale to the eight flows. They do fit one to another, you see. You get all sorts of ramifications. There's lots of use can be made out of this particular thing.

But you'll have a pc that knows what the auditor's supposed to do. See? The pc is supposed to enforce an outflow on the auditor. Now, you understand that location A can run all flows on location B or at location A. You understand that, see. So he can apply all of these things to the auditor and he knows what a good auditor is: A good auditor is somebody on whom he has to enforce an outflow. You may have even seen a pc like this. See, had to – enforced an outflow. And he'll do everything under God's green earth to make the auditor talk to him and sap at him and yap at him and bark at him and use heavy control on him and so forth. He knows a proper auditing attitude. He knows what it is. It's enforced outflow. So he enforces the auditor's outflow, don't you see.

Another pc has got the idea the proper auditing attitude, of course, is that the auditor should inhibit his outflow. And he finds the auditor is not properly inhibiting his outflow,

why, he thinks he's a bad auditor. Of course, this is just an automaticity firing off, that's all. Hadn't anything to do with reasonable considerations or how to audit, but he gets that notion.

Or some other pc has got the idea that – the – you must have and the auditor must enforce an inflow on the pc. He's got hypnotism or something mixed up with auditing. He says, "Well, the proper auditing attitude, if you just enforce an inflow on me, you see, you just shout at me and insist that I accept everything you say and so forth, well, then the session will run off beautifully."

Or you have another auditing – another pc and he says, "Well, the proper thing is for the auditor at all times to just have an okay inflow. And that's a proper auditor. It's a permissible inflow." In other words, "Everything I say and do is a permissible inflow. And the auditor must never acknowledge, never give an auditing command, never exercise any control, never stop anything, never do anything and so forth and I just sit here in the auditing session and talk. And that's a proper auditing attitude," you see?

Now, coupled with a proper auditing attitude, of course, have their own attitude as to what is a proper pc's attitude. And these are not necessarily the same one at all.

So you see, you take these flows and stack them up and get a fixed consideration on one point and the same point's consideration of what should be on another point and you get all these various complexities known as social intercourse. And when they get into auditing, you get into trouble because auditing, of course, is the delivery of an auditing command and making sure that it is executed and acknowledging the thing in proper flow; understanding the pc, keeping the pc talking to you and so forth.

Well, now let's suppose you have a pc who is just *horrified*, just cannot *stand* the idea of an outflow and so he is inhibiting all of his own outflows. He thinks it's very bad to have an outflow. And he sits there and you ask him a question and ten minutes later, he answers the question and you ask – you get so you just don't want to ask him a question because you know – you know that it's going to take minutes before this thing is finally replied to, you see.

And he's got an inhibited outflow. He knows the proper way to go about it – the proper way.... Maybe it's some beingness like a scholar. And you see and he knows that as a scholar he should look learned. And the way to look learned is to look wise and not speak much. In some old-school philosophy, you know. So you ask him anything and he says, "Mmm, well..." [long pause, laughter] because he's terribly learned. And do you know he isn't doing a blessed thing that whole while? He's actually not going – even going through a comm lag, you see. He's not going through a comm lag, he's not figuring anything out, he's not doing anything during that period of time. And you, of course, as an auditor sometimes sense this and you get very impatient about what this pc's doing because you see that it's corny. Something is wrong here.

Now, knowing about flows, you should of course be able to understand what the pc's doing. That's why I'm going to ask you to graph these flows after this lecture and draw a picture. That is to say draw a picture of each flow. You want to draw the picture for all the flows from one point where the pc is and then the pc's considerations of another point, don't you see?

You know, what should be the flows for another point and what is the point for his point. You got the idea?

So you actually draw them from one point and then draw them from that point's viewpoint for another point. You follow that? That point's viewpoint for another point.

Well, I'll give you an idea of it if you didn't grasp that in a hurry – most of you did – but and that is simply get the idea of, you are a driver and what should be a policeman's flows. See, what the policeman's flows should be, not what your flows are.

So you draw a picture for your flows. And then you would have a picture for the policeman's flows viewed by you, see? Get the idea? So there are actually, he's got a – you've got a whole bunch of considerations as to what his flows should be.

Well, draw all the flows for a second point as viewed from the first and it'll give you good understanding of what is expected and what is being done.

Now, as far as auditing commands are concerned, you can actually put together eight auditing commands in sequence that give you all the aspects of these flows. Just roll them off one after the other and the person will run these things.

Oddly enough, since flows are caused by withholds, running flows unburies withholds. Do you see? If the pole which the withhold is disappeared because of flows, then by running flows, of course, you uncover it. And it's very marvelous how many withholds the person all of a sudden finds as he is running a flows process.

So you can locate a process by assessment, trigger the automaticity of the flow, get rid of the flow, straighten it out. You can run a flows process, you can – and, as I've just mentioned, get rudiments in. You can see check by finding out which flow the pc has been most routinely stuck on, you see? All of his crimes are on inhibited inflow. Everything is on inhibited inflow.

And you just assess the eight flows and then you find out which one is the most active on the meter and then you just do a Sec Check for that one. You'll figure out what that one is.

You'll find out this is quite interesting from a standpoint of getting data and getting things released and getting the person's bank quieted down and everything down from the high roar that it ordinarily is.

But a pc's bank could not possibly be discharged rapidly by any machine or chemical. It couldn't be. Because the flows are intricate and the ridges are actually composited flows. And you've got to do something to let the flows straighten out, whether it's getting rid of the beingness that wanted that flow or by auditing flows or by pulling withholds – you've got to do something like this in order to straighten the bank out. Anything that just got rid of the bank as one whole block would, of course, never expose the understanding which is underneath because that is the second inversion.

Understanding, of course, is first above flows and electrical nonsense and masses and the sixth dynamic and then inverts and goes under it all. And electricity and so forth is capable of burying all the knowledge in the world in the pc's bank.

The pc would – by a sudden button or an electrical machine, would suddenly be staggered totally and completely into having to confront all of the knowledge of his whole track in a split second. I don't think he could do that. I don't think that would either be profitable nor pleasant. And I don't think it would result in anything. I think he has to take a look at some of the data.

I know that those people who inhibit inflows would rather have a pill and think that the best possible treatment that you could have would just be to slide somebody a pill and he'd be Clear. I think he has to find out something about himself before he gets Clear. But maybe that's just a peculiarity. Certainly enough, empirically, that is the only way a case makes any progress.

Okay? Well, you think you can make any use of this data on flows?

Audience: Yes.

All right. Good enough.

Thank you very much.

WITHHOLDS

A lecture given on 6 February 1962

Thank you. Well, what did you think of the TV, huh?

Audience: Great. Good.

Think that will work out?

Audience: Yes.

Did any of you shudder at the thought of your overts suddenly showing – [laughter] turning up on that circuit, huh? You did slightly, huh? Yeah. I think it will work out just fine providing we can find a totally indestructible pc. Yeah. ... [laughter]

Okay. And this is the what of what?

Audience: 6th of Feb.

Well, make up your minds. It's the 6th, the 13th.

Audience: 6th.

It is the 6th?

Audience: Yes.

You guarantee this?

Audience: Yes!

All right, 6 February AD 12, Saint Hill Special Briefing Course.

Now, I have some very interesting material here today, completely aside from everything else that's happened to you – some very interesting material. I finally equated why the missed withhold and the withhold is so interesting. So this is a lecture about withholds. What's a withhold? How come? And it equates right back to 1938.

Now, you should realize that any truth that has any distance or is going to get anything done with cases and so forth, actually equates against the dynamic principle of existence, Book One. The dynamic principle of existence is Survive.

If you look over Scientology and Dianetics, you'll find that that was the one breakthrough and although it was a rather elementary and simple breakthrough, it nevertheless is the basic pin of structure.

And I have found out over the years, it didn't matter when, that when a principle finally went back to Survive and all of a sudden it was an amplification of Survive, why, it suddenly worked like mad on pcs and was the cause of a great deal of this and that with pcs.

And all of this became very interesting to me when I put up my long ears and heard the back echo of this. Withholds equate to survive.

Now, this, at the same time, this is one of those points where a great deal of theory falls together and at the same moment, we have this – we have this: We have the reason why 3D Criss Cross works because we have the reason why an identity is aberrative. It could be said that an identity is that accumulation of withholds which make an individuation. Amazing, isn't it?

An identity is that accumulation of withholds which cause an individuation. And therefore, when you're auditing 3D Criss Cross, you're doing a Class II skill in gross lots. You see, you pick up an identity, you isolate an identity on which other identities are appended and pinned and you have at once gotten rid of 8,672,945 to the 21st power withholds all in one fell list.

Now you, right where you sit right here at this moment have an identity. So of course, you've got one part of 3D Criss Cross already done.

When we look at the pc and we say, "What's your name?" and the pc says, "My name, him Joe," you've got one 3D Criss Cross item, "Joe." Shocking, isn't it? There's a 3D Criss Cross item, "Joe." A hundred thousand years from now somebody will be auditing him. [laughs] Isn't that an entertaining thought, you know. They'd have to run you out of you. "Well, how come you're Joe?"

Rather high-toned space opera societies and so forth, do you know they don't even read the numbers on their chests? You see, these doll bodies are turned out in gross lots, you know? Like a high-toned department store turns out a bunch of identical dolls for the kids, you know? But these things are turned out just pocketa-pocketa-pocketa-pocketa-pocketa. They all look alike. All of them are alike. There isn't one shade of difference from one body to the next, not a hair.

And yet people in space opera recognize each other rather easily. Isn't that interesting? How do they manage that? Well, it must be they recognize a person from his beingness, not his identity.

So where you have to recognize a person from his identity, there can't be much beingness present. See?

So that's what makes a 3D item. A 3D item is maximal identity, minimal beingness. And every once in a while, you get identity crossed with beingness and you have an historic character. But remember, it isn't his identity that makes him an historic character. It's his beingness.

So an identity is always bringing up the rear. It's always a minor affair. An identity does not amount to a hill of beans.

I myself have erred in this direction time and time and time and time again. I used to have a standard operating procedure over in Europe. What you do is accumulate yourself a God-awful identity, see. You'd accumulate yourself an identity of this particular type of being able to go down to the lists and knock everybody's head off, you see. Or you know – and you

get yourself the current championship ladies' stocking for Europe, you know? They wore ladies' stockings then. They wear diamond belts today. I mean, about the same difference.

And just go down and every time there was any kind of a – of a tilt or anything like that, you see, accumulate yourself a little more identity.

You'd finally get it up to a point where all you had to do was ride up outside of a castle, something like this, you see, if you were for the Crown or something and you'd say, "Well, I'm so and so. Open up the gates."

And whoever the robber baron was that was resisting all law and order, you see, he would say "*Roow*." And all of his young squires would say, "Gee, John L. Sullivan's down there, you know." [laughter] Same atmosphere, you know?

They wouldn't do a thing for him. They'd go down and open up the gates. That's an identity. "Wild Bill" Hickok, Wyatt Earp. The television play this up to the nines. You get the idea? Identity. I've used it on other parts of track. Walk into the Senate, they say, "Now, shut up. That's so-and-so talking, see." And immediately you had silence, see?

Other people talked and everybody else was talking at the same time. No, *bang!* You see, identity did it. That's the mistake. That's a mistake. That's a mistake you've made and that's a mistake I've made on and on and on.

They didn't shut up because of the identity, ever. They shut up because of the beingness. You could reach further and influence more than other people around, so you did. And that's as simple as that.

But the identity side of it was to be more of a lump of than anybody else which totally defeats the reach. So if you conceive of beingness as the ability to permeate, pervade, communicate to, fill up an area and identity as a method of not having to – see, it puts it on automatic, doesn't it?

They say, "Well, he fills up an area because his name is Bill or Sir Tristram or something," so then as Bill or Sir Tristram, you don't have to go to any trouble. You're just lazy on the whole subject, you see. Because the eagle that you're known by painted on your chest or the typical cut of your toga or something like that is not going to fill up any area. That's not going to fill up any area. Only you can fill up the area.

So what you've done is get a substitute for communication, a substitute for reach so that you could qualify an identity as a substitute for reachingness and a beingness as a reachingness. So these two things are contra, one against the other, you see?

An identity is reach on automatic and a beingness is reaching, you know. And by this – by beingness I mean our Scientological aspect of beingness. That is to say you *know*, the fellow really does it. He is doing it. You get the idea? It's not because he *is* somebody that you do something. It's because he *is* doing it. That's entirely different.

Now, that's a current activity. Beingness would be a current activity and identity would be a past activity. This fellow climbed the Matterhorn, therefore, he is famous. His whole value is climbing the Matterhorn when he is climbing the Matterhorn. That is his beingness, you got it? But identity is "the fellow who climbed the Matterhorn."

Now, in view of the fact that the only thing that this universe punishes is being there and communicating – the only things this universe punishes is being there and communicating. Universe is incapable of punishment in the absence of those two factors. If a person isn't there, he can't be punished and if a person doesn't communicate, he can't be punished, you see?

So the universe is an anti-beingness universe and a pro-identity universe. This universe favors identity so it can punish.

All right. Now, let's equate a withhold. What is a withhold? A withhold is a not-reachingness. It's many other things. Don't make that into a technical thing because there's more here. That's not all of it.

What's a withhold? Elementary, my dear Watson.

A withhold, reversely, would be holding onto a piece of information which would damage survival. A preservation of identity. The self-preservation of an identity. Now, you have to remember that a thetan can't be hurt. A thetan can only get connected with something that connects with something that connects with something and then he gets himself onto the circuit.

So here is the thought involved in this: That a person withholds to preserve himself. You do not tell the police that you really did park three hours in the no parking zone, you see? You say, "I just arrived."

Now, why do you withhold that information? That is the police could lessen your *survival* if they found it out. Correct?

All right. The police could lessen your survival if they found it out. Now, therefore, the withholds which you have are things which you feel, rightly or wrongly, that if you let them be known, they would reduce your survival.

That is, they would decrease your reputation or identity; people would think less of you – this is all part of the same thing, you see – people would think less of you if they knew and so on. So that withholds go into that category.

We've made the step now above the idea of a withhold being totally a matter of mores. Now, we've gone a little bit further and we have a little bit better rationale. And that rationale is that a withhold is something a person believes had better be withheld because, if he didn't withhold it, it would reduce his survival as, of course, an identity.

If you were building an identity on repute – nothing wrong with this. It's a standard trick of the universe. Your credit is good. People think well of you, you see. All of those various things which go into repute. It's a standard trick of the universe. I mean, you can't even live in this universe without this trick – in a body. And if you're – if you are working to enhance your repute to be a good citizen, a member of the community, a person on whom people can depend, a person who has good job references, you got the – all of the rest of this sort of thing. You got your nose clean with the government so it'll pay your old-age pension, you know, that kind of thing. All of these things. You've never been known to vote for law and order. You always wanted what the government wanted. And – but what are you doing there?

You're building up a survival identity. All these things build up a survival identity. Nothing wrong with this, of course.

All right. So you withhold those things which would depress this survival identity. So you withhold such things as: You always upheld the government except that time you refused to go to the polls and vote, refused to pay your taxes, refused to uphold the government's desire to savage somebody. You see, all these things that you didn't do, you don't let the government in on, see.

You tend to tuck those in against your bosom because this would hurt your reputation with the government. You see?

In other words, it would injure your self-preservation, so therefore you withhold them. If these things were known, you wouldn't be worth two whoops in hell, you think.

Well now, a thetan goes on the cautious side of this, so he always withholds more than he has to. And naturally, all withholds, then, are built uniformly on the basis of self-preservation. The source and cause of any withhold is self-preservation. That's it. I mean, that's your technical fact. Withholds, self-preservation. Self-preservation, withhold.

Well, let's put it as graphically as this. You've got a body and you're facing a buzz saw. And you withhold your body from the buzz saw and you don't lose a body, see. But if you didn't withhold your body from the buzz saw, it goes *bzzz* and you haven't got a body. You got that? It's that elementary.

Well, it's built on the mechanical force factors of this universe. Trying to preserve form, trying to preserve the form of a body, trying to preserve these things about a body, you see; and therefore, you withhold and protect, take care of, be responsible for, all the other things stem out from that, that we're so accustomed to using in processing.

All these other things parade out from this fact: self-preservation. Now, self-preservation, of course, is a misnomer. A thetan doesn't have to preserve himself. It would be silly for a thetan to even try to preserve himself. A thetan is only involved in preserving an identity. So self-preservation is a misnomer in that it shouldn't be self-preservation. It should be the – identity preservation. Preservation of an identity.

So now let's cross straight into 3D Criss Cross and say with one fell swoop, then any identity which remains in suspension in the bank is the direct product of identity preservation. See, that's saying – well, it proves itself. It's there, isn't it? You can find this identity in the individual. You find this 3D Criss Cross item in the individual, so therefore the basic denominator in that item must have been it was preserving itself. If it was preserving itself, it's there. If it wasn't preserving itself, it isn't there.

In other words, the basic effort then of any identity is to preserve itself. Hence, we find these suspended 3D Criss Cross items starting with the person's own identity right now. Joe, Bill, Pete, Mary, Agnes. It doesn't matter what it is. This person is busy preserving Joe, Bill, Pete, Mary, Agnes, you see, right now.

To give you a reality on this, have you done anything in the last week – answer this question – have you done anything in the last week whatsoever to prolong your life?

Audience: Yes.

You have. All right. Now, what do you suppose is going to happen to the mental energy mass, which is this life, when you contact it? It will be prolonged, of course. Now, think of this last week as a section of time which somebody contacts a thousand years from now. Well, look it over now. A thousand years from now, they contact this little minute section of track. Of course, it doesn't amount to a hill of beans, you see. It isn't aberrative in any way, but actually those things that would be stuck – now, let's be very technical – would only be those points where you failed to preserve your life. That would really be stuck because it's the failed postulate. See?

But the postulate impulse, of course, was to preserve your life whether it won or lost. You see how that would be? Therefore, a death hangs up more than a life.

You see, here's a person's full integrity, his full power as a being, his full power as a thetan. Regardless of what this power could go into – . It's almost unthinkable right now to you that power could go into anything but self-preservation, if you're looking at it and I got this all restimulated with you, you see? Well, what would a thetan concentrate on if the thetan wasn't concentrating on the preservation of self or one of the dynamics? What would he be concentrating on, you see? Of course, he'd be concentrating on one of these things, you can say to yourself. But at the same time, only those points would hang up where the individual has postulated it and has failed. And those are always the hang-up. The failed postulate mechanism is, of course, senior to all of these mechanisms that I'm talking to you about at the moment.

It is much worse – you'd probably get no repercussion whatsoever for knocking a Gorgon's head off because, you see, that whole cycle of action came out. You intended to preserve yourself and not to preserve the Gorgon. And your intention, of course, was carried out in that you did preserve yourself and didn't preserve the Gorgon. See, so therefore, we try to find something wrong on the track when we collide with the knockout of a Gorgon. Find an incident knocking the Gorgon's head off and so on; it doesn't hang up at all. See, the expectancy is carried along the time track. One expects to knock the Gorgon's head off, he does knock the Gorgon's head off and that's all there is to it.

All right. Now, let's just get a little bit more complicated about this and one attempts to knock the Gorgon's head off and misses. And the Gorgon goes chomp and that is that. Now, that was not in the cards. That was an alter-is of the person's own postulate. And being an alter-is of the postulate, it tends to then make its own time track and so hang up in time.

Failing to knock the Gorgon's head off is the only sin, unless – now, let's go over and look at this other little mechanism – unless it was a sin to knock off Gorgons' heads. Supposing it was the king's private Gorgon and huntsmen are riding north and south and east and west, gamekeepers and so forth, wanting to know, who knocked the block off of the king's Gorgon because they're gonna 'ang 'im. They have a special piece of 'emp preserved for 'is 'ead.

And the person who knocked the Gorgon's head off makes the immediate survival computation. The immediate survival computation is, of course, to withhold. *"I will not tell him I knocked off the Gorgon's head because they will hang me."*

No, "They will hang this identity," was a much more accurate statement, "So I better not tell them because they will hang this identity," see? So that's that.

It doesn't hang up right now. Doesn't hang up one identity, but it sure hangs it up on the time track.

Now, you're galumphing down the time track as an auditor looking around for pieces to snufflicate and all of a sudden you get this odd picture of the head of a Gorgon, see. Individual goes up and down the time track and every time he comes around this section of anything, here's this Gorgon's head.

All right. There was nothing aberrative about knocking off the Gorgon's head. See, the Gorgon was going to eat you up or you were going to eat the Gorgon up and you wound up your strong right arm and you whopped the Gorgon and it knocked his head off and that's what you intended to do, and that's what happened and so forth. You see, there's no – there's no hang-up there. I mean, that will just slide right on through on the time track because it's the postulate and so forth.

One has to have considerations about the evil of knocking off Gorgons' 'eads.

Now, instead of running the incident, if you just did this, the whole thing springs free. "What was wrong with knocking Gorgons' 'eads off?"

Or we just find this head floating in space, we ask some nebulous question such as "Well, what would you withhold about that picture?"

That's all we'd have to say and all of a sudden the whole incident would just unreel. *Rrrrrrrr*. You'd have the king's huntsmen riding up and down the land saying, "Here's this specially treated piece of 'emp in which we're going to insert somebody's 'ead."

And you have the individual and this and that. And you'd get this whole identity hung up, because he's had to hide the fact, the new identity, the man who knocked off the Gorgon's 'ead.

Only this is now a submerged identity and he can't advertise the thing, you see. He'd love to go out and tell all of his pals, "Well, you fellows think you can strike a nifty blow. Some moments, I have no doubt, in the middle of battle and so forth, you have been able to assume certain strengths. I'm sure you've knocked off some soldier or man-at-arms' helmet, I'm sure, but myself, I was out in the woods the other day. I met a Gorgon." [laughter] "And *ppfft-ssa*, just like that. You try it."

See, he'd like to brag about it because it could be a survival point. All of his friends, he feels thereafter, would say, "'E's the man who 'it off the Gorgon's 'ead." See?

See, all kinds of value. Every time you go into the pub, somebody buys you a drink because you're the man that 'it off the Gorgon's 'ead, see. Sooner or later they call the pub "The Gorgon's 'Ead", you know. [laughter]

In other words, you've got all sorts of survival computations kicking around here on the whole subject of having done this fantastic deed, you see. You can't tell about them. You must tell about them, you see? You really shouldn't withhold it because it's a survival characteristic. You should compulsively outflow it to one and all. You should go down and beat

your chest at the crossroads and tell the passers-by, you see. At the same time, you mustn't tell anybody because if you did, the king's 'untsmen would 'ave something to put in that noose they have been preparing, you know?

So what do you do? Well, the thing to do is not solve it at all. Just hang it up on the time track and let some auditor find it if anybody ever finds out about auditing. That's about the way it adds up, don't you see?

It's an inadmissible fact.

Now, you get the withholds off of this and then you get the compulsive outflows off of this, you could – you could almost – this isn't absolutely factual, but you can almost free up the track by asking a person "What should you have told people about?" see?

At first they equate it on the basis of what they shouldn't have withheld and then they get into these brags. They get into a big brag sector, you know.

"Well, I was on this – in this war a couple of hundred thousand years ago and there were fifteen enemy fighters and they were coming down out of the clouds. And I was all by myself and I was flying this little triplane, you see. And it was up on this other planet. And as a matter of fact, they were flying more or less the same kind of plane I was. And I had a machine gun there and through superb acrobatics and through the ability to shoot, the like of which nobody has heard of before or since, I shot down all fifteen. And after that they called me 'The Plane Killer.' And I was an ace. And as a matter of fact, I was the only ace that emerged from that particular war. All the rest were killed." You see, brag, you know. Big deal.

But he just withheld it so hard afterwards because, you see, he wasn't supposed to be carrying a Mark 15 type machine gun. That was something he got out of the commanding officer's hut just before he left the field. And it was firing atomic type ammunition which wasn't supposed to be used in that war. They had a united spittoon organization on that planet, which said that "Everybody but us must not use anything that is effective," you see. "And we who are upholding civilization are going to destroy it as fast as we can."

And they had forbidden this particular type of ammunition. So he was using this type of ammunition and he stole the gun and also he never neglected to tell anybody about this, but the airplane he was using also was the commanding officer's. And the commanding officer was on leave at the time, you see and he didn't have any plane at the moment. His had been crashed, so if he admitted to having taken the plane up and the mechanics of the field admitted to him taking the plane up, he would have been courtmartialed, you see?

So this big mystery stands in the middle of this two hundred thousand year war, is how come all of a sudden fifteen enemy planes disappeared. They disappeared with no slightest explanation. There wasn't even anybody flying in that sector at that time. All official records show this. So there's big withholds on this subject while there should be big brags on this subject and you get a wonderful hang-up. And, you see, there's your – your facts of survival are equally matched. It's almost worth the same amount to brag about it as it is to withhold it. You survive, you see.

If you brag about it, your survival is enhanced. They make you a colonel and put you in charge of all of the flying girls, you see. And if you withhold it, why, you can go on holding your present rank of sub-captain to the subgroups, you see and drawing your pay and your old age pension, you see. So that's good survival. But, of course, if you did tell them about it, they would court-martial you, you see and you wouldn't any longer be a sub-captain even, far from being able to brag about it, you see? And you get the most preposterous hang-ups.

So that you could say that any difficult situation is an unequated or unresolved problem in survival. So any hang-up on the track is an unresolved problem in survival. Person couldn't figure it out. There were balanced factors involved. If he admitted it, he didn't survive. But it would be a good thing to admit it because then you really would survive. But if he didn't admit it, then he would survive. But it was a bad thing not to admit it because then, of course, this made a liar out of him, you see.

So it stands right in the middle of that little crossroads and you'll find each hung-up part of an identity are these things. And when you get one of these black bundles called a 3D Criss Cross item – which is some old former identity – it is all hung together and totally interwoven with just these computations. It should talk, it better not. And if it talks, it's nonsurvival. If it doesn't talk, it's nonsurvival. If it does talk, it's nonsurvival, you see. And if it does withhold, it's nonsurvival. And in fact, all things are nonsurvival at this particular point. There is no answer to how to survive. There is no answer to the – this problem. And these are the things which you find hung up. Naturally, by pulling withholds off of the case, you release all of these things.

Now, an individual withholds an identity and withholds and withholds and withholds an identity until it parks on the track. And when you find a 3D Criss Cross identity, you, of course, have got this tremendous *key* to a tremendous section of track. When you find one of these real items that proves out, you see. You've got an identity there that should have been known, that mustn't have been known and the fact that you found it, of course, takes a great deal of charge off the case because the identity itself is dedicated to 'iding. The identity has now gone into hiding and that you find it, of course, brings it out of that category.

So actually, disclosure of an identity destroys a withhold. And you will see a pc – you will see a pc every once in a while... You will be tracking down the line and all of a sudden the pc says, "*Oh-oh. Oh, oh, oh, oh. Hm-hmm.*"

You say, "What's the matter?"

"Well, *mmmm-mm*, nothing."

"Are you withholding anything?"

"Well, I was going to mention something."

"Well, what were you going to mention?"

"Well, I didn't want to really tell you."

You can go round and round on one of these things. And the pc will get some kind of a computation that will say, "Well, they're probably looking for me yet."

That is almost the cliché that goes along with each one of these situations. "They are probably looking for me yet. If they were to find me, then, oh, man. What would happen now?"

This pc has got this identity that he was trying to make famous, you see and trying to make it survive and trying to make it all polished up and a good citizen and then it didn't, see. So your intention was to become a good survival name that would go on and on and a total failure of that, of course, puts a person on a total withhold of something that's supposed to be totally surviving. So he should have been exhibiting it, he didn't dare exhibit it and so it gets hung up. And you come on the edges of this thing and this pc starts to get very alert.

The pc says, "*Ooooooooooh*. They are probably still looking for me someplace."

He gets the idea of his name being on sheriffs' boards and headquarters' bulletin boards, you know – "Wanted for moperly and dopery on the high seas," you see. "Shoot on sight. If ever found, don't bother to return except mangled," you know. This type of thing. "George Aloisious Preclear. Wanted for the moperly of the dopery at the left-hand sector of the right front cross of the second-hand universe." And he will. He'll all of a sudden "*Ooooooooooh, ooooooooooh*, I don't know, if I ... I don't know, if I ought to tell you or not," you know.

Oh, my God, this thing he's telling you, see, is three trillion years ago and it was on some little old second-rate planet that didn't have anything to do with anything and he was selling grain to troopers' horses or something, you know. It just works out it's just nothing. It's a horrible sensation, you know, of "I better not talk because they're still after me."

And of course, this "still after me" is this thing of guilt that everybody was trying to get into in the field of therapy. Of course, you couldn't get into it from the viewpoint of guilt. It does give the aspect of guilt. The person looks guilty. And they are. I mean, why, why not accept it.

But entering it on the basis of "What have you – what are you guilty of? Thank you. What are you guilty of? Thank you. What are you guilty of? Thank you. Now, just lie back on the couch. Take some more sodium pentothal. Very, very nice. Now, breathe deeply. Now, you're all amongst friends. Here, put these electric shock electrodes on you. Now, what are you guilty of? Now, are – aren't you guilty of something and so forth? All right. You feel like you're guilty of something. You think you've killed your father. Well, we're here to tell you conclusively you didn't kill your father, so therefore you are not guilty. Thank you very much." *Bzzzzzt*.

This is psychotherapy, you see and it isn't psychotherapy at all because this feeling of guilt is as much a brag as otherwise, so that's always throwing the psychiatrists for a loop. He wants to know why this patient is going around bragging, you see, about being Napoleon or something. While withholding the subject that he is Napoleon, he's bragging about being Napoleon.

No, it's the person's idea that he's still being looked for, he is still wanted someplace or another with exclamation points, that he is very guilty of something. And this guilt feeling is

simply that he should have talked, he didn't talk and either way he wouldn't have survived. There was no resolution to the problem of survival on any dynamic.

And when you've got one of those on a case, it'll come right straight forward to present time and it'll really knock somebody's head off. He really gets in a mess on this one.

"Ah, God. Well, I was supposed to have the regiment charge, you see. There we were at Balaklava and somebody issued the orders. And if you disobeyed the orders, you see, you would have gotten court-martialed, but if you charged, you would lose everything, so what were you supposed to do?"

Well, whatever he did was wrong, you see. He couldn't survive, no matter what he did, so any way he solved the problem equaled nonsurvival. And you'll get one of these computations coming up and the pc has an awful time. Now, when these things come off, the whole identities come off and withholds come off of identities. And when you're pulling the identity, you see, you will get a withhold at the same time. The withhold there, the person "*Ooooooh*" – I mean, when you have that type of thing coming up. Now, pulling any identity, you should realize – off of a case, you should realize there's probably a withhold connected with it. Otherwise, it wouldn't be hung. Well, let me show you.

It is surviving, isn't it? There is an identity in the bank and it is floating forward to present time. Right? All right. Now, if that identity is floating forward to present time, it must have a withhold connected with it, see. It inevitably has to have a withhold connected with it if it is in the bank and here now. And therefore, this is *true* of *all* phenomena to be found in the reactive bank. Each phenomena has a withhold connected with it. That's uniform.

These phenomena were prompted by efforts to survive. And of course, efforts to survive are very, very silly and a lie themselves because a thetan can't do anything else. How people work to survive, you see. They work like mad to survive. Well, actually, they're not working to survive at *all*. They're working to get an *identity* to survive. Of course, they try to get this identity to survive. They're sweating away at it trying to get this identity to survive and they can't do anything else but survive.

Now, of course, if there's any effort involved in this thing, it must be built around a lie which the person doesn't recognize or realize. And that's the first thing he doesn't recognize or realize: that his beingness is one thing and his identity is quite something else, that he is one thing and that this identity or body or designation – no matter if it's number 6077859 – that's still an identity. But this is something else, it is not himself, you see. So he has himself associated with the identity, you see. And then he's got the – also, he does another cross. He gets the beingness crossed with the identity.

He says, "My beingness is totally over the basis of being Joe Doakes. That's my beingness." That isn't his beingness. His communicatingness is not dependent upon being Joe Doakes. As a matter of fact, it is quite deteriorated because he is being Joe Doakes. Now, therefore, all things have a withhold connected with them.

Now, whenever you miss a withhold, a person is volunteering to tell you something or a person is ready to tell you something or a person could tell you something and doesn't, a person gets a restimulation of a withhold. The withhold restimulates and the individual then

gets the idea that he is in danger. There isn't any more rationale to it than that. Now, if you look any further than that rationale, you'll have difficulty understanding it. It is a Q-and-A, stimulus-response mechanism. If the person has a withhold that he must then withhold he, of course, is in danger. Do you follow that through?

You see, you can always enter one of these dangerous situations from two sides. A person must be in danger because there is a piece of hemp hanging over a tree. Now, that is restimulation. Has nothing whatsoever to do with anybody hanging him, but he knows a piece of hemp hanging over a tree is for hanging. So therefore, he can do this – he can actually think he has done something to be hanged for.

You see, any time – because the reactive mind is A=A=A, the conclusion can then put into action the causation. I'd ask you to grab this all in one minute. This is quite interesting.

We put George in a wrecked car. You see, the car has been wrecked.

There's blood all over the place – somebody else's from some other place. This car is pitched off of a curve and is lying in a ditch and we take George and we put him in the wrecked car.

Now, let's go a little bit further. Supposing George were dead drunk and just getting sober and were sound asleep and couldn't be disturbed and we simply picked George up and we took him down this bank and we put him behind the wheel of this wrecked car and scattered some dust over him and let him wake up.

His immediate conclusion is that he's been in a wreck. Isn't that right? Well it isn't – you could defy this all sorts of ways, you see. It wasn't his car. He wasn't out driving. All of these things don't have to be present at all. He's simply sitting in the car and he can actually sit there and be totally convinced that he has been in a wreck. He can even exhibit psychosomatic injuries to prove that he's been in this wreck. He'd argue with you about being in the wreck if he woke up in this car. And he'd explain to you how he had driven from home in this car. He'd even explain to you how he had borrowed the car. He would defend anything to try to make it agree with reality. This is an interesting fact.

The least he would get out of it would simply be a little shock about should he tell anybody. "What is this? Are there any consequences to having wrecked this car?" You see this? He needn't have been in the car wreck at all for him to think some of these thoughts to a greater degree or a lesser degree. You get an impression of having been in a car wreck.

In extremis he would argue with you, he'd tell you where he borrowed the car, he would give you the places where he was injured, he would show psychosomatic bruises. You see, that's *in extremis*. And the lightest thing is he'd feel just a little bit guilty about having gotten himself into that position although he had no responsibility for it of any kind whatsoever.

He had been drunk. He had been sobering up. You picked him up out of his bunk or off of a sofa someplace and took him down and put him in the car. And he'd blame himself for having gotten there. And he'd go back under a long chain of circumstances trying to figure out how he was to blame for being in that car. You find it?

So that you give a person any result of a chain of responsibilities, you give him the end product of any responsibilities and he will attempt to assume some of the earlier responsibility. I could give you... It's a very nebulous thing. I'll – let me see if I can't think up one for your particular case right at the moment.

Oh, I know. I know. You've got a picture of an army, so you assume you must have been in that army. See, you've got a picture of an army, so you assume you must have been in the army. Got that? You hardly even question it sometimes. And then you're very startled several sessions later to find out that you were a provision merchant and never had anything to do with the army, see. But you did have a picture of the army. You get the idea? That's jumping to a conclusion.

All right. Let me give you another example. Your rib aches, so you must have a psychosomatic picture of some kind. You got an aching rib, so you assume you must have a psychosomatic picture and then some of you girls sometime get home and find out that if you just loosen up the bra or something of the sort, that it was totally twisted and had been so all day. Did you ever have this happen to you?

You find out there was some actual fact of why you had a pain there and you had been going around trying – as a Scientologist, trying to explain this pain away. [laughter] Got the idea? You couldn't have had any pain because it was only a button and a totally twisted hook or something of the sort digging into your live flesh, you see. So you figure there must have been a psychosomatic incident connected with it, you see.

You know, that this is natural and that it should be this way and you normally – to get such a pain without cause – you see, naturally it would take something like a psychosomatic incident. So you get the rare one where you had the actual pain which is right here and right now and you say it must have been psychosomatic. You get the idea? In other words, because you've got B, you conclude A with no evidence. You see?

So you'll get spook factors on a bank – in a bank of this particular character. And because certain conditions are true, then the pc assumes that other conditions must have been true adding up to these conditions, you see? And, boy, can some pcs write script on this subject. And you'll find them tearing off in some direction, writing script all over the place and during the session their bra was turned, you see, in such a way that a hook was inserted deeply in the flesh, you know. And they've been trying to figure out the whole session on who they must have stabbed in the back.

Now, the reason a person does this is consequences. Just – that's all. And you can have the consequence occur and then have the person figure out what the act must have been as well as do the act and then figure out what the consequence must have been. You see, it works both ways. Now, individuals do this first one. We understand this and everybody knows about this first one, is you go to the store and you get a dozen eggs and on the road home, why, you break every single egg. Well, you know darn well when you get home, it's – *augh*, somebody is going to be upset with you, see. That's easy, you see.

So somebody is upset with you and you get to wondering about the eggs being broken, see and you weren't to the store. And this is very puzzling. You see, it can work both ways? So pcs get put into mysteries because of consequences, the accomplished consequence. And

some of the hang-ups on cases is the reverse of the withhold. And that is to say the pc doesn't know what led to the consequence, so he figures he must have a withhold from himself.

Now, everybody has betrayed everybody, see. He's betrayed himself, he's withholding from himself and all of that, so he doesn't know, now, where he is supposed to wind up and he gets into a tremendous puzzle. And you get withholds on the first dynamic as well as the remaining seven.

One of the most interesting things you can do is sometimes go over with a pc and find – if you could do this very directly, it'd be very nice – but you can actually find the material that he "must be" withholding from himself but isn't. You see that?

His anxiety about identity would cover the whole picture. If you ask something, "When have you contributed to ..." Well, let's say we find – we find this terminal "an angry man." Let's say we've sorted this out with 3D Criss Cross and we get "an angry man." Now, this will be a whole bunch of angry men – Joe, Pete, Bill and Colonel Stewpot and everybody else that he's run into, and so on. It's covered a whole series of identities that more or less came along in one chain.

And you could say, "What responsibility have you taken for the continued survival of an angry man?"

And you would see the package "angry man" just start falling apart into identities and into all sorts of bits and pieces and separate identities and so on. All right. We – let's say this individual is in a great deal of trouble with the gendarmes and so on.

Now, let's go further than that. If the individual can have any trouble with the gendarmerie, he must at one time or another have been identified with the gendarmerie. Some gendarmerie someplace, he must have been identified with it. You cannot have a motivator without having caused something. Now, that's the other point.

But the cause which you normally have – if you have been responsible for something and then ceased to be responsible for something, you can get your block knocked off. That's about the only way you can get your block knocked off. You take great responsibility for the welfare of the British Isles and then kick the bucket as prime minister or something of the sort and come back your next life, not caring, as a street cleaner. And you wonder why you're always being arrested.

It is perpetually you cannot park your dustbin on any corner of any street without getting a ticket, without being told to move on, without being threatened with this and that. If any bank robbers ever wished to get rid of the evidence of having robbed a bank, they'd drop it in your dustbin, you see and then you get arrested. And this is just fate at work, that's all. And guys like this, in this shape, can sit around forever and say, "Well, just fate is against me, that's all. I mean it's just fate is against me," you see.

You've taken a wide zone of responsibility and then ceased to be responsible for it by postulates, you see. So you've taken a wide identity and then have killed the identity by postulate. You got tired of being a prime minister or something, you see. You get tired of it, so you say, "All right. Next life I'm not going to be the prime minister. I don't want anything to do with it."

Well, this is the decline, of course – the declining days of being the prime minister is when this occurred, not between lives. All during the last five years of being the prime minister, a guy would rather have been shot than be the prime minister, you see. It was all fine for the first ten years, but then the Socialists got to work, you see. Well, we start tracing this back and we find out that the Socialists could get on his nerves because he had been a Socialist.

Being a prime minister could get on his nerves because he had been a revolutionary at an earlier time, you see?

And now, having been a prime minister and taken responsibility for the British Isles, he's a street cleaner and takes no responsibility for anything except one street of the British Isles. That leaves the entirety of the British Isles permeated but no responsibility for them, no matter what his identity is because it is only beingness after all.

People can try to shift their identities, try to change everything, but it is only their beingness that counts.

Now, if he's got a beingness hung up in his background which is associated with his identity and then he suddenly cuts his beingness down to nothing in order to limit his identity, he'll be in trouble every time. Every other street in the British Isles can be the enemy of this street sweeper. He gets – he gets Mott Street beautifully cleaned up. I mean, it's just slick as a whistle. And then the bordering streets and the crossroads and everyplace, anything intersects Mott Street blows dust and dirt into Mott Street and he's got it all to do again.

That's the way it looks to him. He cannot function on this limited sphere because he has already accepted a much larger sphere, so he's always in trouble. So we could ask him this auditing question... He's always, always in trouble with the British Isles, let us say – the government of the British Isles or anything. And if we by any means were able to isolate what he was really against, we could say to him, "What responsibility have you taken for the survival of (whatever the sector was; we'll call it the British Isles)." And he'll go *zoouuuuum, wog, thud*. And it gets very incredible to him, this tremendous zone of responsibility he's all of a sudden staring at. Because, you see, having been responsible for something he leaves an area in his reactive bank which is – which now, has an identity. And it can kick his head in.

I like these guys – they're – thetans are always doing this – having taken responsibility for the whole of Europe and having battered the whole of Europe to pieces in order to liberate it, all nations who took part in that activity, you see, now all draw back and say we're going to have peace and let the whole of Europe go to hell. They did that in 1914, 1918. They just skipped it after 1918. They told the British, they – pardon me, the Germans were told by the British and the Americans, you see, they'd all be patched up and the Weimar Republic was finally put together and nobody would take any responsibility for the Weimar Republic. And there was – every measure that was proposed in order to maintain peace in Europe was no responsibility for any of the Allies. But remember that the Allies had taken full responsibility for peace of Europe.

And then one fine day we hear a mutter of guns and we have World War II, which is just about twice, three times as violent as World War I and did occupy much more area.

Now, these powers, having done this and having... They did learn a lesson at Versailles and they got up to a point now, where they're totally supporting all of Europe. See, they're into Europe, they're afraid to pull out. See, they say immediately there'll be World War III if we pull out of Europe. Haven't you heard this? We get Kennedy standing up and saying "Well, Britain must join the Common Market. We're not going to join, but Britain can join the Common Market, you see, because we must have somebody take responsibility for Europe." And then pretty soon you will hear him getting anxious about it and say "Well, the United States must take responsibility for the Common Market and we've got to go into the Common Market, too, because we've got to take responsibility for Europe."

He knows better. They're now, dreading, you see, cessation of responsibility for Europe. They learned that in World War I. World War II came along, proved it. So they don't take any responsibility for Japan. And I think the – either the prime minister or the war minister – I think he's the prime minister of Japan – I think is the same officer that attacked the US Fleet at Pearl Harbor, which I consider rather interesting. And the president didn't dare visit Japan because it was too turbulent a few years ago. And Japan all of a sudden is on a full autonomy. So we must obsessively continue to take responsibility for Europe, you see, but we mustn't take any for Japan.

Where's the trouble going to come from? All of a sudden the United States Fleet gets up some morning at Pearl Harbor ... You see how it would be?

In other words, having taken responsibility and then taking no responsibility, we get a consequence. And actually, that's what a consequence is. We're withholding responsibility for, that we should take. And that, of course, is a withhold of magnitude because it's a withhold of ability.

So a withhold can be a withhold of anything that we have had a permeation into or a communication with, so when a communication is followed by a no-communication, the advent of the no-communication operating as a withhold, of course, reduces survival. And an effort to carry forward survival is knocked in the head.

So it comes down to survival. We've made a huge area survive. Now, we're only going to make a little part of it survive. Do you follow that? We're going to make all of Europe survive and all of Japan and Asia. Everything is going to survive except we're going to ignore China, Mongolia. Look at the fight they had in Korea because they wouldn't really take responsibility for the Japanese empire. See, there's war after war developing over in this quarter cause nobody's really taking any responsibility for it. That's pretty gruesome, but not in Europe. They won't let down that responsibility area in Europe.

So that'll go on, but there's going to be some contrasurvival. In other words, if you had a large responsibility zone and then you suddenly take a small zone of responsibility in that large zone, you tend to set up the area you've had full responsibility for as an opponent to what you are now taking responsibility for. That's your mechanics of individuation. And the mechanics of individuation are first, communication into and then refuse to communicate into.

Now, because it's "communicate into," you already have a commonness with it or a oneness with it. You have established a oneness with it by responsibility or communication into it. You follow that point? Do you see that?

Well, all right. I'll give you an idea. You live in a big house. You live in a big house and you take responsibility for every room in this house and the basement and the attic and everything and you're taking responsibility for the whole house very nicely. And then you decide to live only in one small room. Do you know, the noise from the remaining rooms as they pound against the wall of your one small room is going to be absolutely deafening. And do you know, eventually your little room will completely fall to pieces because nobody took care of the major house, you see? And as its walls fell down, so did your walls fall down. Do you see that?

In other words, you cannot segmentalize responsibility into a smaller plane or a smaller zone without consequence of some kind or another. You can't take responsibility for the physical universe and then take responsibility for one room in a boarding house in two successive lives and not have planets hit you in the head. It'd be the most mysterious thing. You'll be going down the street and meteorites always seem to land exactly where you are, you see. And there's hardly ever any air where you are and all sorts of wild things happen to where you are. All kinds of randomness is occurring. Weather – weather seems to be totally random all over the world. It is totally dry except right where you're standing it'll be raining. See, here's your huge sector suddenly cut down.

Now, if it's cut down by a sequence of withholds, which it always is, you of course have energized what you're not now taking responsibility for. And because that is now energized, it can kick your head off because it's right on your wavelength, man. You did it, see? See, you energized this whole house and now, you say, "Well, the whole house now energized and I'm only going to energize this little tiny room in this house." Man, the rest of the house is alive where you're concerned.

See, you could have walked into a brand new house that you'd never been in before and moved into one small room and you would have been all right, but thetans never do it that way. They usually get much broader and bolder. They usually walk in, occupy the whole country, then occupy a county, then occupy a town, then occupy a big house, then occupy a first floor room and then occupy a basement room, see and then eventually haunt the graveyard as a ghost and wonder why, if it is raining anyplace in the whole country, it is raining where they are, you see.

You know, it sort of looks to them like everything is agin 'em. That's sort of the way it appears. And it's absolutely true. It is. See, you've always been writing script on the basis of "Well, they're really not after me." They are, but only those guys who could cut your throat effectively, the only fellows – the fellows that could do it best – let me put it this way – is your own palace guard when you have stated, thereafter, that you will no longer occupy the palace.

You see, you were king for a number of years. Everybody was happy with you. You were happy with them. You were executing people and they were bringing people for you to

execute. And everything was just going along swimmingly and splendidly. And one fine day you said, "Well, boys, I'm going to retire."

And at that moment six spears sort of magically appeared in your chest. "Yeah, I'm not going to do this anymore." It's almost as though you pull everything in on you the second that you take that zone out.

So therefore, a survival process discharges all withhold processes. So therefore, the principle of survival is senior to all overt-motivator sequences.

In other words, the superior process is responsibility, as we already know and survival type processes – persistency processes, identity processes. See, these are all types of processes.

Now, you can take apart a fellow by the name of Joe, who is sitting in the pc's chair in front of you. You can take this person apart; you can make this person much more functional as Joe. But you keep wondering what's kicking his head in, why he's getting somatics, why three-quarters of his stomach is missing all the time, you know. He's got this hollow feeling where his ears should be. You keep wondering where these are coming from. Well, that's when – that's when he was Agnes. And he as Joe will now take no responsibility for women. Women is something he doesn't want to have anything to do with at all, thank you.

You see how that would be? In his last life, his name was Agnes. He was a woman and he was a very strong, powerful woman that hated men. [laughter] Because in his life before that he had been a man, you see, that hated women. Of course, any time you start to charge up or energize the bank or have him look at it in any way, he confronts nothing but opponents.

But the most horrible opponent a man can have or a being can have, of course, is himself because it's got his wavelength. Hasn't got his number, it's got his wavelength.

So you say with truth a man is his own worst enemy. And Scientology is that study whereby we're making a man his own best friend. That's true. Wouldn't you like to be a friend of yours?

Now, do you see what withholds are? Do you see what withholds are all about? A withhold is an effort to survive. If you find yourself withholding, you must be trying to survive, is the conclusion that you could reach at that moment. You see, you've done it so often this way, it's such a grooved pattern, that you must be trying to survive. So therefore you must be in danger.

Now, we have a pc, 1.5ing and tearing the roof off in strips. The pc has found himself or herself withholding. What are the immediate conclusions that run off automatically from that first conclusion? What are conclusions two and three? That they must be in danger. See, they found themselves withholding, so, (1) they found themselves withholding, (2) they must be in danger and (3) therefore that they must survive. That's sort of the actions that they take.

So you miss a withhold on the pc, he gets two and three automatically – *bang, bang*. It doesn't matter which we call two and which we call three. But those are the conclusions he comes to.

"Oh, I am sitting here withholding something and the auditor hasn't pulled the withhold." The instant reaction is "I must be in danger." And the immediate response is "I must survive" by which he means "defend myself." So he takes defending actions. He gets defensive actions at once.

You miss a withhold on a pc, you get a defensive action. Wild animals are savage for only one reason – because nobody ever pulled their withholds. Wild animals are not natively savage. They are – just happen to be in a state where they can no longer get off their withholds. That's all. See, they're individuated. A wolf is being a wolf. That he is being a wolf means he has withholds. So therefore, if he found himself withholding something, he would attack you. Or oddly enough, if he found you withholding something, he would attack you. Any withhold will restimulate a wolf. He goes savage instantly.

But do you know, wolves aren't necessarily savage? You know, they're the best fathers in the whole animal kingdom? They're rather interesting beings. But when they get the identity of wolf straight down the groove, they are very easily led to believe that they're withholding, that they are in danger and that they must attack. And these conclusions – it doesn't matter where you enter that triangle – they interpret almost anything that they're in danger. They interpret almost anything that they must attack. They interpret almost anything that they're being attacked and therefore they must interpret anything may kill them, so that they must withhold in the vicinity of almost anything. So you seldom run into them.

I haven't seen any walking down Piccadilly Circus for a long time. Along about 565 A.D., the total population of Rome was two wolves in the Forum. Total population. But it's been better populated since. And it was better populated before that.

But they just don't show up in public. They very seldom come in and say "How do you do." And that's because they couldn't say, "How do you do", if they had to.

Now, in order to handle a wolf so that he wouldn't bite you, you would have to demonstrate to him conclusively that he was not withholding anything. Isn't that interesting And do you know, that I handle wolves that way, very successfully? That there is no point in withholding anything, that there's just no point. They get into a very jolly frame of mind. They tackle you and you pick them up on both sides of their jowls and you throw them about twenty-five feet and you go over and pick them up and pet them. Well, it sounds absolutely incredible, doesn't it. But there's no point in withholding anything because they're not going to damage you any and also you're not going to damage them. It's quite remarkable, you get right down to it. You get an idea – there is a meeting ground at which nobody is hurting anybody. It's just jolly good fun as we wrap each other around tree trunks, you know. A wolf will take an awful lot of punishment.

You walk up to a wild animal as though you're withholding something and you've had it. You've had it right now. You walk up to a wild animal as though you're not withholding anything and he stands there and looks at you and wonders what you're doing.

So you show him what you're doing. You very carefully always show him what you're doing. You don't excite his curiosity so you don't have a withhold involved and you can actually walk right up to one, he'll never attack you.

It is – was not any magic that kept Daniel alive in the lion's den. It's just he never gave anybody the impression they were withholding.

All right. Now, you've given the pc the impression in Security Checking that the pc is withholding. And then you didn't pull the withhold to show the pc the pc wasn't now, withholding. What do you think the pc's going to do? He's liable to leap out of the chair with all fangs bared and does. Not that pcs are wolves, but the one-two-three applies to the pc.

If the pc is withholding then he must be in danger, then he had better defend himself. And that's how the missed withhold makes a pc so savage and what makes it such a deadly mechanism. And why you've to – you've got to handle this mechanism and stop fooling around with it.

If you're going to pull a pc's withholds, which is the only thing that keeps him – pulling his withholds is the only thing that keeps him from totally individuating, don't you see and he can now communicate and everything looks better and so on. But you just miss pulling the withhold and the fact that you are pulling a withhold or could pull a withhold restimulates the withhold, so he adds the consequences or the conclusions, you see, that he must be in danger and that you must be attacking him and that he must attack you. And he does, too.

He might not attack you from the auditing chair, he simply goes out in the hall, natters to somebody else about you. You see, but he's in danger. And that's the mechanism of the *missed* withhold. And of course, the *missed* withhold is far more deadly than the withhold. See, if you don't pull a withhold, that's pretty easy, so you don't pull a withhold. So you don't pull a withhold. You didn't ask for it. You didn't restimulate it. It wasn't important and you didn't pull it. The pc stays in there perfectly well. Otherwise, you'd have to pull all the withholds the pc has had in the last two hundred trillion years in one session. Otherwise, he'd tear your head off if that weren't true that I just said. No, you could – you can actually not restimulate or pull a withhold. Providing it isn't restimulated, you don't have to pull it and you can have a session.

Now, you've got reality on that.

But how about restimulating a withhold and then not pulling it? *Ooooooh*. That's what we're talking about. We're talking about a *missed* withhold. One that was restimulated and we didn't pull. *Oooooh*. Now, what do we see?

So when we talked about missed withholds, we're always making this one remark. We're asking the auditing question, "Have I missed a withhold on you? Has anybody missed a withhold on you? Has any withhold ever been available that nobody ever pulled in that session, E-Meters or no E-Meters? Were you ever in a session where some information was available from you and was not asked for by the auditor?" You get the idea? I mean, this is how far downstairs this can go, E-Meters or no E-Meters.

"Now, at any time in life were you in possession of certain information somebody else could have had by asking but didn't ask?"

And you will find immediately sources and areas where the person could have been angry at somebody thereafter? It's the *missed* withhold. It's *missed*. See, that's a different thing than a withhold. These are *different things!*

One of the hardest things to teach I think there could be because you say to somebody, "Well, did you pick up the missed withholds?"

And the person goes in and says, "Well, yeah, I picked up the missed withholds. Yeah. Of course."

And you say, "Well, what did you do?"

"Well, I asked him if he was withholding anything"

You have to say, "*No, no, no, no, no. No, no. No, no. No, no.* Did you pick up the withholds that had been *missed*?"

"Well, he – yes, yes."

"Well, how did you do this?"

"Well, I said was he withholding anything?"

You say, "*No, no, no, no, no.*"

The withholds that had been missed, that had been restimulated. The withholds that were available that weren't picked up. And the auditing question would be, "When you were being audited by Joe Doakes, did Joe Doakes restimulate any reprehensible activities or something that you were withholding and didn't ask for it all the way and didn't get the dope? *Missed* withhold. Joe Doakes' session with you *when he didn't pick up the information that he restimulated.*"

And you finally will get it through, but it – I'm sure that it's going to cause trouble. Because you say missed withhold, everybody knows exactly what you mean. Unless they've been here for training, they know exactly what you mean. Naturally, you're talking about a withhold. No, no, no. A missed withhold is a *missed* withhold. It's *missed*. It has been restimulated or asked for in some prior time to the time it is being asked for.

If you run a session on missed withholds, you never ask for anything the person is withholding during the entire body of the session. You don't ever say, "Are you withholding anything" You just say, "Has anybody missed a withhold on you? Have I ever missed a withhold on you? All right, who was the first person to audit you? The first person was Joe Doakes. Joe Doakes ever miss a withhold on you?" Got the idea?

"Did your mother ever miss a withhold on you? Did your father ever miss a withhold on you? Did your father at any time ask you where you had been after school? And if he had asked just a little bit more insistently, you would have told him where he was and you told him something different and you didn't tell him right and you told him wrong and you were thereafter mad at your father?"

"Well, I see what you mean. Yeah, oh."

"Yeah, some information that your father restimulated, in other words, on you, which he then didn't get."

"Oh, that's what you mean. Well, yes, we can ... Oh, yea, well, lots. Why didn't you ask something?"

Now, you say, "Well, were ..." – this is an entirely different thing – "Were you withholding anything from your father? Did you ever withhold anything from your father? Did your father not know something about you? What did you do? What was there about you that your father didn't know?"

See, you could ask all these questions and not get a missed withhold answered ever. "What didn't your father know about you? What didn't your father know about you? What didn't your family know about you? What didn't your father know about you?" You go on and never pick up a missed withhold.

"Now, at any time was it possible that your father could have found out what you really did in high school? Was there any period there when the information was available and your father didn't ask for it?"

And all of a sudden, why, the pc remembers having hidden the liquor – wine bottle under the bed suddenly before his father walked in the door. And the room was reeking with wine.

And his father never said, "What is that smell?" And he was always mad at his father afterwards and never knew why. Do you see how far this goes? See, the information was available, but Papa didn't ask for it. So therefore, Papa's guilty of a missed withhold.

Information available and not asked for. That is the thing which makes a wild animal out of a pc.

Now, I want you all to get a reality on it, that when a pc gets upset, you have a missed withhold, not that you have missed a withhold. That you have a missed withhold. You in the beginning rudiments said, "All right. Are you withholding anything? Oh, thank you very much. Good. Do you have a present time problem?"

And the pc was just on the verge of saying, "You know, there's something I've been doing lately that's out ... Oh, do I have a present time problem?"

Half an hour deep into the session, the pc says, "Why do you keep repeating the auditing question over and over? You're about to drive me mad."

What's happened here? You've restimulated him. You have told him that he is not going to survive. You have told him that he is going to have to defend himself and you've put him into the state of a wild animal. He can't do anything else but fight you. Asking for one and not getting it is the only real sin that you can commit as an auditor except not auditing. It's asking for one and not getting it, is what we mean by missed withhold.

We don't mean all those withholds that the pc has got. We don't mean all those withholds. He's got – I can guarantee you, ten to the twenty-first power binary digits squared, cubed and then after that, to the twenty-first power again would not begin to count the withholds he's accumulated in one trillion years. See, he's just got scillions of them. But restimulating one and not pulling it, you got a savage beast on your hands.

That's the whole source of ARC break and auditor upsets with pcs. Actually, your auditing poise and ability to handle the pc and so on is not anywhere near as bad as you think it is. It is better than you think it is in actual fact. But you believe that it is worse than it is be-

cause you've missed withholds and been chewed out by pcs so often. The pc was never concerned with your auditing skill. He was only concerned with your having missed a withhold that you might have gotten.

Now, you just put that down in your book and if I can teach you that and get you to audit by that principle and at the same time to get you to audit perfectly, wow, will you sail. Okay?

All right. Well, that's what there is about withholds. That's why they work and that's why they turn people savage. That's how they function and where they fit. Okay?

Audience: Yes.

Any value to you?

Audience: Yes.

Good enough. Thank you.

MISSED WITHHOLDS

A lecture given on 7 February 1962

Thank you. Thank you. Okay. It's the 7th of February, AD 12 and here we have a lecture. You've just seen a demonstration. Did you learn anything from the demonstration?

Audience: Yes.

Any question you'd like to ask about the demonstration?

Male voice: Yes. Should you always look for tone arm and needle action on the E-Meter?

Needle action. Havingness is all with needle action. Of course, needle action is compounded by the absence of tone arm action and you start running Havingness on somebody without a quiver on the needle – doesn't work, that's all. It compounds the felony. Now, you would have to look for tone arm action on somebody who had one of these flying needles that was a hyperagitated needle. You'll see these needles once in a while on manic-depressives, asylum cases, people who are very agitated and so forth.

You don't ordinarily audit this type of person. And you seldom audit one. But that is, you cut the sensitivity all the way down to nothing and the needle's still flying all over the place, then on Havingness you'd have to rely on tone arm motion. That would be about the only exception there would be to the rule.

Now, I made a couple of small errors. One error is not advancing the sensitivity knob before I asked the first rudiment question. Both for beginning and end rudiments, I did the same thing, all brought about through the mechanics of the demonstration. That is to say I'm trying to keep myself out of the road of the E-Meter while I audit. And you notice that shadow that came across the corner of the E-Meter a couple of times. Well, that's my shoulder and the E-Meter has to be moved over just a hair before I can be totally comfortable about it.

So I was sort of avoiding passing up the E-Meter and therefore didn't monkey with it. But that is not a standard review of the thirty-six Havingness Processes. That is to say, of how you get them or how you use them but would be a review of trying to patch up somebody's havingness. You're just trying to find something that works on the thing.

And very often, if you know your business – which there is no substitute for knowing your business – you figure out, "Well, there is something going on here that we're not quite sure what's going on." So we try to find out what's going on, quietly. Nothing very ecstatically or something; just quietly try to find out what's going on with this pc, see? And we're running a Havingness Process and we're getting no needle action of any kind whatsoever. You noticed that, didn't you? Did you notice that before I did something about it?

Audience: Yes.

All right. Well, naturally, I just started talking about the aspects of havingness, you know. "Is there anything around here," you know, "that would keep you from having something," and you know, that sort of thing And finally got on the subject of nothing reaching her and we had a drop, see? Well, that was enough. Then let's run "reach."

"Reach" would obviously produce some kind of a reaction, if "not reach" produced a reaction. Of course, if I had run "not reach" very long, we would have had her on the floor. [laughter] It was good enough for a test, you know?

And sometimes you can spring something the pc is terribly allergic to – you know, just [snaps fingers] *bang*, you know – on some kind of a havingness test in the room.

Okay. Well, that was a successful Havingness session in that we got the pc to get some havingness and repaired the pc's havingness. And of course, what you're watching here, of course, is a little bit different than an auditing session in that you are not running a pc who is in a calm state of mind at *all*. And pc is quite upset by an invisible audience and that sort of thing. And before you get them settled down, why, you have to do a little bit of work on it. And they settle down; they work all right.

But actually, it takes a considerable amount of auditor presence. It'd take more, much more auditor presence to get anything done on a session of that character than it would be in an ordinary session.

The difficulties of handling a pc under demonstration with everybody present are just almost insurmountable. And they are surmountable on this type of demonstration. Of course, I'm used to this type of demonstration. I've done it before many times. Produced some rather interesting results. I'm against demonstration auditing by the way. I'm dead against it. I don't audit that way at all.

What I like to do is I like to get an auditing session going and do something for the pc. And for me, the session is always for the pc. And if I can't run a session on the basis of getting something done for the pc, well, I'm rather – I get rather upset.

I did learn something in setting that up that you should know. And that is, all due respect to having meters around... I was up at five o'clock last night trying to figure out how in the name of common sense to hold a session together, you see, underneath TV conditions, and I found out something: that I never audit with a meter dial out of my line of sight with the pc. That's got to be a straight line. The pc, the dial, me, the dial, the pc. And just by lifting my eyes, why, I can look at the pc and just by dropping my eyes, I can see what's going on with the dial. And I just found out I just never, never audit successfully at all with the pc out of line of sight.

And because the pc's treated to this all the time. You see, your head's being kicked over and that is, of course, a signal that "I am not interested in your case."

So, of course, a pc wouldn't stay in-session worth a nickel. And possibly some of your session difficulties – I just discovered this – some of your session difficulties is having a meter out of a line – out of the line of sight of the pc. There's the pc, there's the meter, there's

you, see? And if you can rig it this way, it's fine. Actually, we have no such thing as an auditing chair. An auditing chair, as Suzie was saying last night, should have an arm that comes across and no opening on the – or no closure on the left hand side so that you slide out of the chair, you slide into the chair. And you got a bar or a plate or something between you and the pc. And then you got the meter on line of sight.

Well, I learned that and you put a great deal of stress or pressure on an auditing session, that you really have to observe what you're doing and analyze what it's all about and you're – undoubtedly will learn something about auditing. And I just found out I never do otherwise. I wouldn't know how to run a session with my meter out of my line of sight.

See, actually, the meter is an extension of the pc to me and if my head is pointed toward the pc, all I've got to do is just drop my eyes slightly. I'll show you here, see. All I got to do is – I'm looking at you and all I got to do is drop my eyes, see. See? There's no motion to distract the pc, don't you see?

Give you a feeling like you're kind of in-session? [laughter] All right. End of session. [laughter, laughs] All right.

But an interesting little mechanic. It's one of these stupid things. It's like Dick said one day, "You do something that auditors don't do. You acknowledge the pc when he does something." These little – little bugs come up every once in a while. And we find out there's variations of them.

All right. Here we are. 7 Feb. AD 12 and I'd like to talk to you some more about missed withholds. This is in vogue just now. And the crash program which you, when you get back to Central Organizations, will have – will collide with and which you ought to pay some attention to because it sets up some new check spots in organizations.

You make sure that students don't sit around with missed withholds. You make sure that HGC pcs at least once during a twenty-five-hour intensive, but preferably toward its end, are given a check by a very good auditor separate from the auditor, you see, for missed withholds. And all you do is turn the pc back to the auditor to be cleaned up.

And you've got to keep this checked up, that's all. I mean, that's got to be straightened up. And on the – and on the auditing program of staff auditing, you've got to keep missed withholds checked up on all of those cases going through. The first step of the crash program is to pick up all missed withholds. And that's being done in most Central Organizations at this very minute at a high rate of speed.

And the other aspects of the crash program are not as important to you at the moment. They exist, however. One is to get org rudiments in and... But this business of missed withholds is susceptible to the greatest misinterpretation and if I've had trouble teaching people about missed withholds, then you're going to have trouble teaching people about missed withholds. I guarantee it.

Because you say "missed withhold," and the auditor asks for withholds. You say, "Get the missed withholds on that case."

So the auditor says, "All right. Are you withholding anything?" And that is [pounds the table] *not-the-mechanism!*

You say to somebody, "Have you missed any withholds on the case?" – he'll go back in and ask for withholds. And that is *wrong*. Wrrrrrrong! W-r-o-n-g exclamation point, underscore, in Gothic.

Now, a missed withhold is this whole mechanism of what somebody should have found out and didn't. And it is what somebody *should* have found out and *didn't*. And that is the whole works. It isn't a withhold. It's a should-have-found-out.

So you possibly will save yourself a great deal of grief if you tell people to get the should-have-found-outs off the case. Rather than the missed withholds. Now, am I communicating? Should-have-found-outs.

"You and me was sitting here six months ago and we was doing a process and should I have found out anything about you, whether I asked for it or not?" That's a – it'd be almost legitimate to ask such a blunt question, you know. You could ask such a question like that. You know, you just – it just falls out of the hamper, you know. I mean, there's fireworks and small rockets go off in all directions and a great deal of relief comes on the case.

Well, look at somebody now. We could ask her – she's a nurse, all right? And you could ask her, "What should a doctor have found out about you, the knucklehead." [laughter] And you produce the most fantastic amount of case gain.

Evidently, it's practically an affront not to be able to find out about something. Any time you want to go around wearing a bath towel with a Woolworth diamond on it and be a swami reading people's minds, also take out a large insurance policy and get your burial arrangements straight. It's probably why they hung Christ, if they did. That's right. That's right. If he was the Son of God, he should have been able to find out about all the orthodox malpractices. And he didn't. And they hung him. They didn't hang him. They crucified him. Common practice of the day. If he existed.

It isn't true that he led a good life, so they crucified him. You see, that wouldn't be the right story. He should have found out about 'em and he didn't, so you see they had to crucify him and that's just about the way it would be.

Now, if you go around telling everybody you can read their minds – I know this might get you lots of pcs for a little while – be sure at the same time that you go down to the Bide-a-Wee Cemetery and get yourself a nice quiet lot because – probably you won't have time a little while later. It's very hard to buy a lot when you haven't got a body to pull money out of the pockets of. But that's about how it is, you see?

If you set yourself up on a basis of being able to read minds and all that sort of thing, it isn't going to be an everytime situation, but it is going to be frequent enough that you will wish, for God's sakes, that you'd asked for what you should have found out and didn't. Naturally, if you can read minds or you're up in that plane or you're supposed to be observing things and you don't find out something about somebody, hell hath no snowball able to resist the fury. It's going to be a mess.

Now, you sit down there as an auditor... You don't know how many times you and I do mean you, have done this with an HGC pc or a pc from the field – how many times you have done this. You have sat down in a calm, cool, collected frame of mind and have started up an ordinary session and two sessions later have had a God-awful ARC break with the pc that you couldn't spot what it was all about.

Well, now, this would appear even more mysterious if you weren't using an – E-Meters and if E-Meters weren't being used at that period of auditing. You see?

This person's upset because you haven't found out about him. That's what that person is upset about. You've been auditing there for two days and at any time he has expected you to suddenly come up and ask him, "Well, when did you rob the bank, Bud?" You know?

And you haven't said a word about it and he gets very upset. Well, frankly, we don't care about the theoretical mechanism. This is not discovered from the field of theory. This is totally empirical. This is something that I have scouted down and have found to be true. And it is becoming more and more alarmingly, increasingly true. And the further I look and the more ARC breaks I check up on and the more dissatisfied pcs and the more ARC broke field auditors and the more upset people who didn't go back to the PE Course and all of that sort of thing – it is just getting absolutely overwhelming. And it's empirical; totally, completely empirical. It is gained from observation alone. And I don't care whether there – any theory under the sun, moon or stars fits this or not.

I've given you a theory yesterday which accounts for it very well. But I don't care whether that theory accounts for it or not and neither should you. It just happens to be a fact that all ARC breaks, dissatisfactions with Scientology, upsets in sessions, blows from sessions, failure-to-gain profiles are all traceable back not to withholds but to *missed* withholds.

You can straighten people out by straightening out PT problems. You can straighten them out by straightening out ARC breaks. You can straighten them out in all these other things and that is all true and you can do it. But you can reach beyond all this. You can reach beyond this and straighten this pc out so fast, he won't know whether he's riding a streetcar or a jet plane by just finding out what you – what others should have found out and didn't or what you should have found out and didn't. Because a pc has some very peculiar considerations with regard to this. And these considerations are so peculiar that you would never, never, never be able to guess your way around them.

We don't care what the mechanism is or anything else. We just wouldn't be able to guess your way around them. So just stop trying to guess your way around these things and just overtly continue to ask for missed withholds. Ask for should-have-known's.

Use it routinely and regularly. Take one teaspoonful three times a session. Sig: 1 t-a-d. [laughter] That's the way the pharmacist would state it.

Now, that's the way the cat jumps. That's all. Pc comes in, sits down in session, you run off an almost letter-perfect session. Halfway through the session, pc blows up, says, "When the hell did you learn how to audit? What am I doing sitting here? You haven't done this, you haven't done that, you just dropped the E-Meter on the floor and what was the idea

of making the cans explode in my face? You've just evaluated for me and you've done this and you've done that."

Now, let me – let me make this very clear: You might have done all those things, but it would not be cause for an ARC break unless you had missed a withhold.

So you can miss a withhold in the session, just overtly. You say to the pc, you say, "All right. Are you withholding anything?" And it goes *clang*. And you're using a Pembry meter or something of the sort, or an old Mathison or something. And it doesn't go *clang*, but it should have. A Mark IV would have gone *clang*, you see. And you say, "Thank you. Do you have a present time problem?"

The germs of war are sown. The Four Horsemen of the Apocalypse have begun to ride. Because anywhere within the next five minutes or the next half hour or the next hour and a half, you're going to make some little fumble of some kind or another or you're not going to make one or you're going to make a large one or you're going to run a perfect session, but you're going to have a God-awful, screaming ARC break. And the pc, according to his modifier, will behave.

And for some reason or other, the missed withhold throws the pc's modifier of his main goal exactly and immediately into full cry. You can always tell what a pc will do when he has an ARC break, it will be the modifier of his main goal line. Now, whether or not you've fished this out, running 3D Criss Cross – if you've gotten to the point where you're getting a package and you're going in for the goal now to match up all the parts you've got – you will find the modifier on top of it and it will explain all of his session behavior.

Supposing the session behavior was – this would be very mysterious to you and you wouldn't quite know what an ARC break was if a pc had "and I'll cry and cry and cry and then afterwards go away and never come back." Supposing that were the modifier.

The auditor would sit there and say, "I got some nice grief charges off the pc, but he didn't turn up for the next session." [laughter]

You see, you could be very baffled. So you mustn't think that an ARC break simply climbs up with the smoke of the volcano. It doesn't. It follows the exact modifier of the pc and of course, as you know, if you care to look over a bunch of modifiers on assorted cases, you could see how varied this might be, how varied it would be. And it is very variable. But the pc's modifier goes into action and the pc starts to dramatize his modifier. And of course, from there on, you're just in trouble all the way.

And what starts this chain of material? What starts this one happening? Now, you can prevent it from happening by cleaning up ARC breaks as fast as they happen, by getting withholds off as fast as they happen, by making sure there is no present time problem. You get all these carefulnesses? Now, you can make sure that that is held in check. It's held in abeyance.

You can also, by the way, stop it from being dramatized if you know the modifier by repeating the modifier at the pc. This is rather poor show, but it's *in extremis*. You can always get a list to read again by chanting the modifier at the pc. It's a secondary action. It's not anywhere near as good as actually auditing the pc.

But something is going to happen here which is going to interrupt the session and you're going to have to do something about it. And as I say, there are many things that you could do about it. And of course you can't audit a pc with a present time problem and, yes, you shouldn't audit a pc with an ARC break and yes, this is all true, you see? And you shouldn't audit a pc with a current withhold. But if you really want to put all of these rudiments in, *clank* – wouldn't it be nice to have a weapon which would just put all the rudiments in, *swish, bang*, you know; I mean you wouldn't have any more trouble – you just run "should have known" to death and you'll have it all straight.

So in your beginning rudiments, "Are you withholding anything" – should undoubtedly be followed with a second line. I'm not going to necessarily insert this into any routine patter. It'd be nice to do so, but I'm going to say that it should be a technology which goes above patter because you should be able to use it at any time. And you should have it as a weapon which you will use, not park someplace back in a ritual, don't you see?

After you've said, "Are you withholding anything" say any version of ... And you see, there – one of the – one of the difficulties of putting a pat patter there is there are so many ways it can be asked. You'd have to ask it differently for practically every pc.

Let's see. Well, you could work it this way. You notice the pc's there and everything is fine and it's going along, but you know the pc is getting a Sec Check session by another auditor.

Now, you want to set yourself straight. So you say, "Well, have – has the other auditor missed a withhold on you?" See, you'd use that wording "Are you withholding anything?" all right, that's for you. Now, that's routine. But you understand it's not even a cousin to this other thing we're doing. You see, they're not even cousins. Let's just divorce them completely. They're in different families of action. You can say, "Are you withholding anything" and you're right on the line. But don't think you should drop out "Are you withholding anything?" because you're going to ask a should-have-know.

In other words, just – these actually aren't even cousins. "Withholding anything" is all new stuff, kid. See, let's get the new stuff on the line. Let's open up the stock room and let's find out how many paper dollies and pornographic comic books that we've got on file here, you see. And we're going to take new inventory and it's new stock and – get the idea? That's all brand new.

But this other – this other – this goes back to what people should have found out. And that's past. That's old stuff. So you say anything in – after that "Are you withholding anything?" that might fit the circumstances of the case.

All right. We know that we are auditing – I'll give you an example. We know we are auditing a girl who has a wandering eye. And she – she very possibly may have sinned against the twelfth or thirteenth commandment, whatever it might be, you see. And she might not have. But we know that we continue to get problems off of this girl with her boyfriend, see. We get problems all the time. Well, we're tired of these problems because they never lead to anything and they burn up about half the session. We just dispense with the whole lot. We get rid of this whole family of domestic, internecine warfares by simply asking, "What should your boyfriend, Ralph, have found out about you that he didn't?"

"Well, I was out with Joe last night, of course."

"All right. When was that?" All right. Good. Fine. You're not now going to have a present time problem to take care of. But omitting that, you see, at that point, the chronic favorite present time problem of the pc is going to pop up in the next rudiment. You've just short-circuited the whole thing by asking this.

You see why it can't be a pat rudiment. You note this girl's also getting Sec Checking. So you say, "All right. Did your Sec Check auditor miss a withhold on you? What should your Sec Check auditor have found out about you?" You know, clearing all these points. "Is there anything I should have found out about you in yesterday's session? Is there anything I should have found out about you when you sat down three minutes ago?" You know? All right. It's all clean.

I'll guarantee you that if you clean that across the boards, you won't have an ARC break or a rudiment out for the remainder of the session. You just sit there and audit like a little soldier.

Now, there's one reservation I would make on this. If you're all of a sudden tearing up tons and tons of new material and you're knocking the bank appetite over tin cup and you all of a sudden have a large area of track on which the pc has recall, you get right in there and ask it again. You got it? Because the whole thing is reversed. The condition of the case has changed.

Now, I know that an auditor who's being paid by the hour might occasionally, unconsciously with his Freudian subconscious, not his Scientological subconscious – he might possibly realize that if the pc got no change, he would go on being audited forever. That would be a very mean thing to even infer and the only reason I bring it up – not to be sarcastic, because I seldom am. What I wish to bring up is the fact that I sometimes am amazed by your lack of expectancy of change. I'm amazed by the fact that you apparently don't make a sufficient allowance for change in auditing a case.

And I've actually had auditors auditing me become very upset because my case was changing with too great a rapidity. Well, I was changing too fast.

No, an auditor should – is auditing to produce change. Now, of course, change will give him consequences. And the consequences are that the aspect of the case shifts. And you get a – you get this case and you're swishing along with this case and you're – and you'll – by the way, this never becomes more apparent than in doing 3D Criss Cross. It's very apparent in Sec Checking too. But in 3D Criss Cross, this could get quite dizzying.

You start out auditing a harlot in one session, you see and you wind up auditing a gleeful killer. And the pc will follow that terminal track through and you're auditing a different bank before you get through.

And if you've never noticed this, you better pick your eye up because at first, why, the pc is sitting there, [demonstrates something] you know, and at the end of the session, [changes voice, demonstrates something else, laughter] you've just shifted the bank.

Well, every one of those identities that you're going through has its own bank, see. You must realize that. It has its own bank. You are auditing different banks. You know? It's packages. It's whole packages of engrams and you got a new bank.

Now, when you're listing and if you're listing very effectively with the pc right practically coming straight through the E-Meter after you, you know – just right there, you know – man, that pc will be sitting awfully close to the terminal they announce.

And let's say you're listing at the rate of two new terminals a minute. That would be very slow listing. Two terminals a minute. All right. You've got two cases a minute if your pc is right in-session. Now, you talk about change, man. That's why I'm trying to boot you up the line and why I'm being so insulting and so mean and so vicious – which I'm not being at all, actually you'd be surprised at the number of withholds you give me in doing your pcs' reports, you know. Like, I never remark on it, "Oh, my God, not again. For the second day," you see. I just withhold it, and so forth. And it all has to be run out.

No, I'm trying to raise your level of expectancy of what you should get out of this, you see. And if you do it even vaguely right, you'll find... You think you've been running this old – this old Model T Ford, you see, you think you've been running this old Model T Ford down this back country road, you know. And it's going along at ten miles an hour and you're happy and so forth. And all of a sudden you slide into how to do it right and you find out that you're actually riding a jet plane that is outward bound for Arcturus, you know. And it's quite a shock when an auditor really starts grooving this thing.

You make 3D Criss Cross work for you and you're changing a bank, a bank, a bank, a bank, a bank, you see? You're going through these lock valences, lock valences. And they aren't very deep or they aren't very penetrating, but if the pc's getting any cognitions, the pc's shifting. The pc's just shifting all the time, shifting all the time, shifting all the time. And you've got a different bank – every time the pc goes through fifteen or twenty, you've got a *totally* different bank now, don't you see?

But every time you get an item, have you ever noticed the pc will dramatize the last item you found? Hm? In the next session, the pc dramatizes the last item you found. It'd drive you batty. You're accustomed to this pc throwing the cans down in the middle of the room. That's the custom. He throws the cans down in the middle of the room.

And all of a sudden with great shock, the pc carefully unclips the electrodes off of the cans and puts them very carefully on the windowsill before she blows, you know? [laughter]

But you'll see case changes if you're really pressing ahead on 3D Criss Cross. And you get into one of these case changes – which I'm trying to drive through in this lecture – you see, if you get into one of these case changes there's a whole bunch of should-have-known's. The whole aspect of should-have-known's has all of a sudden shifted. And you handle these in the sort of the sloppy fashion of the middle rudiments. You get the rudiments in, you make sure the rudiments are in.

Now, don't distract the pc all over the place. Just notice, just please, please notice when a pc goes a tenth out of session. Don't wait till the pc goes half out of session or three-quarters out of session or leaves the room. You start tuning your observational powers up to

knowing whether or not a pc is in-session or not. And I just won't settle for anything less than that. It's a human observation.

This pc has started to talk to you rather coolly, distantly and so forth. You're already too late. You should have noticed it ahead of that.

And at the time you notice this, the one you get in, basically, is "should have known".

Oddly enough, for that valence the pc is now in, there are some missed withholds that weren't missed for the pc that you had a minute ago. You see how this could be? So when a pc starts to slide out of session, that first tiny little slide out of session is the one I want you to get.

I tell you, the quality of an auditor is observable at the stage of ARC break that the auditor asks or acts. You know, it's the stage of ARC breaks which causes the auditor to act.

Now, an auditor who is – who is the rhinoceros-type auditor, you see, handles the ARC break as the pc is going down the stairs. That's the time that auditor handles the ARC break. Now, an auditor who's a little more alert, considerably more alert, handles the ARC break at the moment the pc stands up to leave the room. Another auditor a little bit better and a little more alert, handles the ARC break at the moment the pc throws the cans down.

Now, a little bit better auditor notices the upward flick of the wrist. [laughter] You see the gradient here. And now we're getting into a pretty good auditor. He knows that the pc has stopped talking. He notices the pc has not answered any question for a long time because it'll be a long time; the pc's gone on for a long time not really in communication, you see, before he starts throwing the cans down.

And then we get into the very, very perceptive auditor who notices that the pc is really not speaking sooth. He spake noteth sooth, he did. He – you ask him – I don't care what you're running; you're asking him for a list and he says, "A cotton picker. A cotton mouth." And he's been going on, "A cotton picker! A cotton mouth!" and now he isn't talking that way, you see? He's saying, "Cotton picker. Cotton mouth. Mm ... I um ..."

Along about that point it just – it takes just that much change of pace on the part of the pc for me to perceive he's gone out of session. I mend the session then.

And oddly enough, the pc doesn't ever recognize there's been an ARC break. I take a little bit of pride in knowing there's an ARC break before the pc finds it out. And, man, can you patch up a session in a hurry if you patch up the ARC break which has occurred but the pc has not found out about yet.

Now, you can be too anxious on this point and you can patch up nonextant ARC breaks and cause one. So you see, it's a very, very tight little dividing line which is very tiny. And the dividing line is: Don't patch up nonextant ARC breaks or you'll cause one; patch up extant ARC breaks before the pc finds it out. And it's right at that little barrier point that you should pick 'em up. And that is really expert if you can do that. You got it made.

Now, you start checking on this sort of thing, you'll find out that a should-have-known undoubtedly is the theory which lies behind what has happened – a should-have-known lying in there someplace. Case has shifted and a should-have-known.

So you could say, "What should I have found out?" Anything as blunt or stupid as this. Or "What should people have found out?" You could say anything like this as a question and it'll knock the thing back in. The session will go back in again. Go back in again right now. Clean it up.

For instance, a pc who is on an incipient ARC break, a pc who has a should-have-found-out is always on the verge of an ARC break. Always right there on the verge of it if he's got a continuous I-should-have-found-out, they-should-have-found-out, you-should-have-found-out, somebody-should-have-found-out.

And that is what you call the ARC breaky pc. He is riding on a should-have-found-out. And anytime you have called somebody an ARC breaky pc, just think of that person and then reclassify what was wrong with him on a "He was a should-have-found-out person" you see? "They should have found out about me" and they didn't find out about him and so therefore, he continues to be an ARC breaky person.

Anybody who is going to blow, who is going to give you any trouble, who is going to give you a bunch of upset, who is going to vilify the organization, who is going to all of a sudden become disinterested in auditing, who is going to be very upset by what you are doing to them – all of these various categories crawl under the heading of should-have-found-out. And a should-have-found-out in some category or another that may have relatively little to do with you, but you happen to join the mob that should have found out, you see? You happen to be classified in that zone. Anybody you're going to have any trouble with.

Now, this one principle, above and beyond all other principles, lies behind your ARC breaks and this one principle is that principle more responsible for loss of dissemination and loss of Scientologists and public to Scientology than any other single factor.

This means, this observational fact coming up means a considerable change of policy with regard to the functioning of PE Foundations, the functioning of co-audits. The reason you lose people on co-audits, the reason why you're having difficulty handling this zone and sphere, why they don't move over from PE to co-audit has nothing to do with recognized truth. The truth which you are trying to tell them is easily recognized. But the truth which they are wearing that you should have found out about, if you don't recognize that, *aah*.

So the way you could run – this is *in extremis* – the way you could run a PE Foundation would be simply on the basis that everybody in the PE Foundation is a professional finder-out-about. You know, they don't tell anybody about the ARC triangle and they don't tell anybody about auditing and they don't hardly mention the name Scientology and you'd have a tremendously overwhelmingly successful PE Foundation. I think that's your bug on PE co-audit.

Now, that still has to be tested and put in operation, has not yet been squared up. But I think you will find that it lies in that zone and field. Anybody who walks in for a PE Course should be – until you find out otherwise – should be classified as a should-have-found-out case. This is a should-have-found-out person. And the reason most of them come in is to find out if you can find out what you should find out. And that is why people come in to PE Foundations.

They don't come into PE Foundations to learn about Scientology or to be helped or any other of the reasons why we think they come into PE Foundations. The greatest bulk of them, apparently – subject to test and further figures – apparently appear to find out if you can find out about 'em. And if you don't find out about them, they ARC break, it is all the worse, they go out and tell everybody that you're fakes and frauds and there you've had it.

So that if your PE Foundation was totally composed of should have – of finding-out personnel – finding out about people who should be found out – and nothing else, why, you'd be very successful about the thing.

Now, if you take a profile, if you have a test department and you take somebody's profile and you take this profile and you draw it all up and you put him on the E-Meter and you ask them how they feel about two or three things and coordinate their profile and put this all on file and then you write them a big, long rundown on the subject of their profile and you get it into their hands, you think you're performing a considerable service. Quite a few of those people will be with you, but the largest lot of them are now missed withhold cases. How do you like that? And you have just created an anti-Scientology public.

Tests. You shouldn't be doing tests on these people. Put an E-Meter crew on the job.

"All right. Do you want to come down to this PE Course? Well, very good. There are certain requisites to this PE Course and we have a little form we have to fill out here. All right, Mrs. Zilch. Now, (sensitivity 16), just hold on to the electrodes there. There's a very small amount of current that goes through that won't shock you now. All right. Now, here we are, now. All right. What should we find out about you? Thank you." Then clear it.

"Now, what should the last group you joined have found out about you and didn't?" Clear it.

You say, "All right. That's fine. All right. Now, what should have been found out about you by your last group?" No reaction. "Good. We gotta go off now. All right. What should we find out about you? All right. We got that. Fine. All right. Here's your ticket to class." You'll never lose 'em.

That is what they mean by "You are the people who know." [*Audience: Aha! Mmh!*] You're the people who know. What do they mean by this? What about, what about, what know? Yeah, we know all about life. We know all about the mind. But the reason why we know is because we know about them. That's what their idea of knowingness is.

What is knowingness? That they robbed a bank. That is knowingness. Here are all the riddles of the human mind laid out here in a string. All you have to do is read on down the line. That isn't knowingness to this person. It's whether or not you robbed a bank. Whether or not you can find out he robbed a bank. If you can find out he robbed the bank, then you know. Now, you must be smart, you must be clever and you must know your business. And I don't think from that moment on you have to prove anything. Isn't that fascinating?

You go on and give them standard PE, of course, that sort of thing, afterwards.

Co-audit, unfortunately, becomes almost impossible under this particular line unless it's E-Metered. Then it would have to be Mark IV E-Metered. Then the people who were be-

ing run through co-audit would have to be checked out routinely on "What should have been known about you?"

You could possibly – you can always dream up the answers to this sort of thing, but I set up the impossibility that exists at the moment. If you continue to run a co-audit exactly as you're running a co-audit, you're going to lose more people off the co-audit than you keep on it. And that's why a co-audit doesn't build up. A co-audit builds up only if the should-have-knows are to be pulled off the case. If you were to pull all those off cases in a co-audit, then that co-audit would build up, up, up and you would get something done.

So that back of all rudiments lies the should-have-known. Therefore, we see the definition of knowledge to a person is knowledge about themselves in terms of their overts. That's hideous. But to the bulk of the public, the entirety of knowledge is just whether or not you know their particular overts. And if you know their particular overts, then you are a very, very clever person. And you are a true swami. And that's it. That's what knowingness is to them.

Now, we've been trying to climb this ladder backwards for a long time, trying to find out where bottom was. And that is the bottom definition of "knowing," the bottom definition of "knowledge."

Knowledge is overts. "If he knows about my overts, then he is a wise man. He is a typically wise man. He knows all the secrets of the universe because he knows that I routinely and customarily drink Gordon's Gin at work."

It's surprising, you see. You'd never really look for such an anticlimax on the subject of knowledge. But you see, that is the beginning of the ladder and after that, of course, you have to know. And the funny part of it is, you would have to know all about life and so forth to keep the ladder going on up. You'd have to know the lot of it.

And actually, apparently, knowing the lot of it really brings about this other datum which I'm just giving you, you know about these people in terms of their overts. You know what their overts are, then you are a wise man.

An auditor is always blessed who has pulled the pc's overts properly. He must be a good auditor. You ask auditors around, you ask pcs, "Who is really a good auditor around here?" And they say, "So-and-so," and this will be colored ... In a professional group such as this one, of course, it'll actually be who's a good auditor. But in a – in an HCA/HPA trainee level or something like that, you'll get a different aspect entirely. And it'd just be "who was able to get the should-have-knowns off".

Now, "get the withholds off" doesn't qualify. "Get the should-have-knowns off," that does qualify. You get the difference between a withhold and a should-have-known. You're a *smart* auditor. You are a *clever* auditor. You are an *expert* beyond all experts because you got this one pc's should-have-knowns off. Didn't get his withholds off, you see. That didn't count.

You put a lot of time in on him; you were very clever. And these are really what were making the pc well and climbing uphill and changing his case and everything else. Never notice those. You got off the should-have-knowns. Boy, are you a good auditor. You're a smart bunny. "That fellow is real clever. I don't know how he got that out of me. But he's certainly a smart auditor. He's really clever."

How did the auditor get it out of him? The auditor said, "All right, who are you having trouble with in life?"

"Well, I mostly have trouble with my family."

"Good. Well, what should your family have found out about you that it didn't?"

"Oh, that. Oh, really nothing. Yeah, well, well, if you insist, yeah. Well, there are a couple of little things. I used to throw my shirt studs – I used to throw them carelessly in the drawer. You won't – you won't buy that? All right. Let's see, uh – uh ..." And all of a sudden, why, you find out what his family should have found out about him.

Now, you know, you know life. You know life. You know. You know. You know what life consists of. I think that's the test that must be run on practically everybody as to whether or not they have intelligence or not. I think this is the IQ test administered by everybody on everybody. It's can they find out about me? If they can find out about me, man, they're a clever person.

So therefore, should-have-known does not dispense with but outranks all rudiments. Does not dispense with withholds but is much deeper and more profound than a mere withhold. It is a type of withhold in that it's a past withhold which has been restimulated. You've restimulated something and haven't pulled it. Well, you're in trouble right now. You've restimulated a withhold and now the person halfway knows about it and then you don't know about it. Well, now you're the most stupid person on Earth and preclears will gratuitously tell you you are.

Now, a lot of you – a lot of you and a lot of people who hear this tape will have at one time or another had their auditing mauled, damaged, pounded in the head, they've been scolded, screamed at, howled, decried, had their auditing confidence shaken and so forth, by ARC broken pcs. This is the lot of an auditor to a large degree.

I want to call something to your attention, is your auditing was never that bad. It was pretty bad, but it was never that bad. [laughter] The thing that was out during every one of those ARC break things and that caused this cascade of criticism of your auditing was a should-have-known. That was what was out in that session where you got reamed out. Your auditing skill has not been at fault. It was that little piece of technology that was sitting in there.

Now, knowing that, you should be able to come forward and do a much better job of auditing because you won't be going up against that unknown of "When is this pc going to ARC break?" and "What is going to happen in this session?" or "Can I steer this session right?" or "This person is a pretty mean sort of a pc to handle," or anything else that comes in, in that category. You can just jump that over.

Go ahead and improve your technology, your presence and your ability to audit. By all means, you should. But skill of auditing is basically speed of gain. This is what you measure skill of auditing on. The more a pc can be held into session, the more gain a pc is going to make in that session.

The better you are as an auditor, the more rapid your advance is going to be on the pc and the fewer things you'll have to patch up and so forth. And this can get down to a point of where your auditing skill is so poor that your pc makes no advance because, of course the frog is climbing two inches up the well and falling back two inches or three inches some-times. You see, and climbs up two inches and falls back two inches and climbs up two inches and falls back two inches. You never make any case gain because the auditing skill is so monkeyed up and wooden headed and double-fisted, you see? It's just poor.

We're now talking about skill, not what you run on the pc. We're talking about your use of Model Session, your ability to hold the pc in-session, your ability to handle your tools, your ability to get something done in a session, your ability to avoid corny mistakes of one kind or another. See, all of those – just auditing ability. Now, the better those things are, the better you are, you see, at handling all these things, why, the more gain the pc's going to make.

Now, over and above this, if you can hold cancelled and nullified all of your pc's jolts and no progresses and rudiments and so forth and particularly this button which goes back of the rudiments, what are you going to wind up with? Your pcs are going to fly. That's all.

I'm still sitting here waiting for you to make your pcs fly, you know. I don't settle for anything less than a sixty-five foot wingspread on a pc. And that's what I'm trying to get you to do, you see, is audit with such smoothness, such command of your tools and so forth, that you just go right ahead and make progress along the line. That's what I'm interested in your doing.

But now technically, we suddenly turn up this other tool that inhibits – doesn't wipe them out forever but it certainly inhibits ARC breaks. It keeps them from happening. It keeps your Sec Check sessions from turning out totally sour.

You've got this kind of a situation now. In this particular class before anybody is on 3D Criss Cross, there are certain basic preparatory things which should be done with the student. This is not necessarily retroactive, but we'll be working in this particular fashion.

We pick up all the missed withholds, the should-have-knowns, get those out of the road, get the last two pages of the Joburg and the shortened Form 6 – 6A. We square the person around on a flows process, get them flying in that particular line and then put them on to 3D Criss Cross and that's about the way cases are going to be graduated up here. There'll be some variation on what's done to them after their last two pages of the Joburg and their Form 6A – the little period in there. But this was – would be what is expected of a case. Not necessarily the auditing skill or what we're trying to train. Those things might be different, but that would be expected of a case. We expect him to make that particular line of progress.

Now, you see, that's enormously shortened the moment that you put the missed withhold ahead of the lot. So you tack missed withholds on to your rudiments, your beginning rudiments. Tack it on to the end rudiments in the form of "I – have I missed a withhold on you during this session?" you see. Now that's in addition to, you know, "Did you withhold anything?" or "Are you withholding anything" or something like that. And square up the whole of your middle difficulties with should-have-knowns of one character or another and get agile in

the use of this. Understand what it is and what you're asking for. And let me assure you that you will have a very smooth run of it with pcs.

I think all of you are getting some reality on this already.

Those cases which have a reputation for being rough to audit, out of session, disinterested or upset or anything else that you consider wrong with a case, the first thing you should try on such a case is to find some area of should-have-known .

I don't care whether it's familial, some other practice, medicine, we don't care what. Anyplace we could find a should-have-known, well, let's shoot it full of holes. And then let's take Scientology and let's shoot the should-have-known's full of holes with regard to Scientology and auditing sessions there.

And you'll find this person will straighten out. You'll find out this is quite remarkable.

And it's a weapon which I hope we don't lose sight of. We lose sight of even such things as Havingness for two years at a crack. So I can expect in 1965, why, we're sitting here and we've got five, six class members that are all ARC breaky and they're all upset, we can't figure out what's wrong with them. And somebody's combing back through the archives and they come up against this particular lecture and say, "Well, that's been dropped out since 1964. Something else came up that was far more important."

Let's hope that doesn't happen. But if we do get this kind of a condition rolling, let's hope somebody does break out this lecture.

Thank you very much.

you run out of paper over here, you know, and have to copy the list because you haven't got any room left to draw slants on. You got the idea?

And the rudiments keep going in and the rudiments keep going out and the pc keeps going out of session, and you have to keep getting the pc in-session. The pc, *hrhrhrh*, invalidates information. He's not in-session. And his mind isn't on anything, and so forth.

You want trouble? Write a short list on 3D Criss Cross.

Now, you can get away with a ten or twenty list on a Prehav level or something or other. I mean, other – other sources of 3D item lines. You can probably get away with it here and there as a short list. But not on a flows assessment. It's going to go on and on and on, that list.

If you have the pc on the meter while you're doing that list, you will notice that, as you are listing, you are getting tremendous rises and tremendous falls. Rise, rise, rise, rise, rise and then fall, fall, fall and tone arm goes down, the tone arm comes up. What is all this action? It's blowing charge.

And the main item that is going to be representative to the pc of that flow, that main item is so thoroughly charged that if it is not written down on the list, and that charge dissipated by writing it down on the list, you are going to wind up with that whole section of the Goals Problem Mass completely charged. And, of course, it won't differentiate and it won't null because nothing blew. You never got the central charge out of the flow.

It is something like fooling around with a fully loaded shotgun. You never emptied the chamber. So you have to handle it very carefully and you have to handle the pc very carefully and everything is going out and you can't get anything done and it's all a complete mess. And auditing is very complicated and such an arduous job and all that sort of thing.

Why? Because the charge isn't gone off that subject. You are auditing a pc who is in a restimulated area of charge.

Now, you have said, "An enforced outflow on others." That's what you said to him, and you kept saying this and it just kept charging up, charging up. You didn't charge it. The charge is residual in the bank. But you've restimulated it, ready to draw it. You're ready to take this charge off the bank. And then by writing an incomplete list you've failed to take the charge off the bank.

And of course, what happens? The pc doesn't get rid of any items. He doesn't blow any items. No items will null. He's all sitting there sort of tense, and you can see his fingernails sort of clawing into the sides of the cans. And nothing is blowing and of course your rudiments are going out and your pc seems to be interested but not really interested and sort of half mad at you and – get the idea? All this phenomena of a difficult session sets in from incomplete list. The rough session starts with an incomplete list.

Of course, I would say a rough session could start a little earlier with the symptom of no auditing. The auditor says in one fashion or another, "Well, I guess we've got to get through this session, so I don't care whether your case gets well or not. Oh, you got some

goals. Ha-ha. Well, who cares about them? Oh, let's see. Oh, isn't it nice outside. *Uuuuuuuuh, uuuuuuuuh.*" This communicates to the pc and you've got no session.

So I've said the trouble you have with an auditing session begins in 3D Criss Cross with an incomplete list. But of course, there can be earlier trouble. The trouble, however, is not with an auditing session. There's just no auditing and no session. See, you can sail into an auditing session without any auditing. Of course, then it ceases to – or fails to materialize as a session.

You'll find that, by the way, is your commonest point of trouble in Academy training and auditing, is they haven't a clue about starting a session so they just never have a session. And then, of course, if you can get this much trouble from an incomplete list, look at what the trouble you can get from a no session. You'll see Academy students in the second week sitting there, and their glazed eye, you know, and they don't know what they're doing and whether they should put their feet in the pc's lap or the cans in the pc's ear, you know? And this is not tense. If you struck one of them slightly, you know, they'd ring like a gong. [laughter]

And the pc says, "What am I supposed to do?"

And there's nobody to tell him. There's nobody interested in what happens to the pc. It's all "Am I doing the session right?"

See, the session doesn't have anything to do with the pc, so of course, his pc is omitted from the session. And if you want to get any *real* trouble in auditing, do that. Just omit the pc from the session. Don't have anything to do with the pc.

Just concentrate on – with all of your might on doing a session without any regard to the pc and you'll have lots of trouble. We're saying that if an auditing session exists, then the trouble you're going to get into from there on out, the most trouble you can get into is an incomplete list on 3D Criss Cross.

Now, of course, if we're dealing with sessions in general, the most trouble that you will ever get into is from a missed withhold. Just remember that. I'm talking about trouble with a process when I say trouble with 3D Criss Cross, you see.

Let me organize this for you for just one second. You'd say – all right, if you wanted to lay this out to HPA students, HCA students, and so on, you'd say, all right, the most trouble you can get into is by not giving an auditing session. Now, you're in lots of trouble. There'll be lots of complications, and everything is going to go to hell in a balloon. That we can guarantee. We don't include the pc in or give an auditing session. That's a condition we know as no auditing.

The next trouble you could get into in an auditing session would be a missed withhold. If you miss a withhold, then you really are in trouble, with exclamation points, because the pc ARC breaks, blows up in your face, throws down the cans, leaves the room. All of these non-sense activities that we associate with upsetting circumstances regarding auditing, all stem from having missed a withhold on the pc in one session or another or from somebody having missed a withhold in one session or another. And you have to pick them up as missed withholds, not as withholds.

All right. So let's get this in order. And then the most trouble that you can have with Security Checking would have to do with failing to security check the pc, but run some repetitive process that again doesn't include the pc in the auditing session. Do a Security Check, not of that pc, but try to do just a generalized – you know, say "I hope it'll all come out in the end," because inevitably you're going to miss a withhold. In other words, you got to security check straight on top of that meter crawling right down the needle, you know? And you got to security check against the meter. You can't do it a repetitive question or something like that.

The next trouble you get into is in all 3D items is to start a list in which the pc has no interest of the subject of. I've learned that. You take something out of your hat, an arbitrary assigned line. You say, "Well, we're going to have a line now that has to do with trees (comma), only God can make one," because the auditor is interested in trees, don't you see? And so he's going to do a list from trees. And the pc has never had anything to do with trees, plus or minus. Trees are just trees and you never get a list. And you go on and on and on.

Now, your like-dislike items have that liability. Your pc may be in a state where he doesn't like anything and he doesn't dislike anything and he doesn't hate anything and he doesn't love anything and it's all just *thing*. And then you get, of course, no list and you'll be in trouble. So arbitrary assignment of lines, from what we get lines.

An improper flows assessment will give you some trouble but nowhere near the trouble that you might think. An improper Prehav level will give you some trouble but it's the same trouble as the like-dislike. It's just you haven't got the level where the pc's interest lies. But any flows assessment almost picked out of the hat will find some interest in the pc. That's what's interesting about flows. The amount of precision with which you have to get the accurate flow does not equal the precision with which you have to get the accurate Prehav level.

You could just watch the pc for ten minutes before the session, and the pc is standing there rather quietly, you know, and he hears a door creak, and he flinches.

And you could say, "All right. Prohibited inflow," and list it and you would find that it would be quite an accurately interesting list, you see? So it's the lack of accuracy on this particular point is going to persuade some of you that you don't have to be accurate anyplace on getting a list. And don't let that fool you. It's only true with flows.

On Prehav you have to be right on the *bouton*. You have to be right on the *bouton*, perfectly dead center. If the pc is on "withdraw," my golly, you better have "withdraw." Don't for the heaven sakes have "kill." And the pc just won't ever give you a list. And so, of course, the pc is no interest and the pc's attention is wandering and the pc is going off in all directions, and so forth.

You have to have that Prehav level very positively accurate.

All right. Flows – sloppy. You almost pick it out of the hat. Look at the pc, figure out what the flow is, list it and you'll get someplace. Interesting, isn't it?

All right. An incomplete list on the Prehav assessment can be serious. It can cause upset, but nothing like the upset that an incomplete list on flows will cause.

Now, on some minor thing like O/W on self, and we take that and we get a list which is five items long and we differentiate it. What do you know. We'll be actually getting someplace on the case, see? And other methods of getting a list, like a dynamic assessment, we'll be getting someplace on it. We get a list of three items and we differentiate them and we null them out and then we oppterm it, why, well still be someplace with the case, you understand?

We won't really be in trouble. But of course, anything like a Prehav level is restimulative. So of course, if you don't get the complete list, you've got the case going *ngngngngng*. You hit him where he lives. All right. So that we'd better come right along with and get that list complete.

But you still can't be in as much trouble with a Prehav level as you can be in a flows level. Now, although you can practically pick the flow out of your 'at as what flow you're going to list on the pc, man, you've got to have a complete list. If you don't have a complete list, you're going to wind up with a charged list. The whole list will remain charged.

And flows, of course, as it indicates, the obsessiveness of the flow, the continuance of the flow, all of the other things with regard to flow indicate longevity or length, see? This flow has been going on and on and on and on and on forever and the pc just goes on with the flow. And to bleed any charge off of a flows list, it's got to be complete. And you've got to really have yourself a long, nice, arduous list. And while you're listing, it'd be an awfully good idea – it doesn't matter whether you have the pc on the cans or not on a Prehav list. It really doesn't matter unless you want to suddenly put him on the cans and bleed the list. You know, say, "Is there anything more? Any more items belong on here?" Something like this just to make sure.

But on a flows, you'd better have him on the list because it tells you how much charge is bleeding off the ruddy case. See, it wouldn't matter at all on the Dynamic Assessment list. Put him off the cans. Have a cigarette. It doesn't matter what you do, don't you see? Because you're going to get any kind of an item anyhow.

The Dynamic Assessment, any kind of an item, O/W on self, any kind of an item. It just doesn't matter. But on a flows, you're charging the living daylight out of the bank.

Now, why is this? Well, you've got two poles here and the flow is going from one pole to the other flow or backing up from one pole to the other flow, and you've got a flow going and that flow is exposing a certain amount of charge. It's also restimulating it. And while you have him listing, you've got a flow going. And if that flow is passing over the head of charged areas, you're just restimulating the living daylight out of the pc, that's all.

And if you don't blow the charge off the flow, why, your pc is all nerved up. He's in a wreck condition because it's only – it's just like he was – took a step and then he never got his foot down, you know, and that foot's still in the air.

So frankly, the trick is that you list as long as the flow runs. It isn't really how many items you have. It's the length of time you list. You just keep him giving you items, giving you items, so the flow will keep running, running, running, running, running, and somewhere in that you're going to pull the thing that is keeping this flow going. And the second you get the thing with the flow on it that kept the flow going, you see, *boom!* That – the whole thing

all dies. That's a dead mackerel now because you've located the pole from which the current was coming, you see? And as long as you have that thing still there and massed, *zhuuuuuu*. You see, it's still charged up, still charged up, still charged up and nothing will null, nothing will blow, nothing goes on at all. Don't you see?

And your differentiation – he leaves everything on the list, and when you start nulling it out, it's just on and on and on and on. Everything stays in, stays in, stays in, stays in, stays in, of course, because you've not discharged this flow. So you see, a flow and auditing of flows is a bit different than other ways of getting 3D lists and items and handling the Goals Problem Mass. There's a little bit of difference in here.

And one of the things about it is it's very, very fast. If done right, it is terribly, terribly fast no matter how long it takes you to list and differentiate and null. Doing a flow is faster case gain, very rapid, because you're pulling the things that keeps the bank cohesed. You're actually pulling the pins out of the reactive bank; the things that make it go together like a – like a bunch of busted glue pots. And you're pulling them apart. And you're taking the things that hold it together. There they are.

So doing flows, you're doing something just a little bit different than you're doing with other items. Therefore, I don't think that anybody should ever be started in doing flows from what I've – experience I've had here, as first bat. Let them get a little bit grooved in. I thought at first we could take almost an arbitrary item and get them started that way better. But the pc is inadequately seized up in the interest in the thing. The interest factor is not helping out the auditor there. So let's take the middle course and let's take a Prehav level as a good way to launch a case.

Now, this adjudication is not final by any means. But apparently there is evidence in favor of oppterming a flow item when found. There is evidence in favor of this rather than getting a second flow item. Oppterm it and then get. That's a slight change from your mimeograph sheet.

In other words, you find an item as a flow and now oppterm the thing and then you'll find another item. Now, that oppterming of the flow is simple because it's right there. Your oppterm list might not be three items long.

You say, "What would oppose a ring-tailed snorter?" And it's a square-tailed unsnorter, or it's a tailless unsnorter, of course, you know, and that's it. And you get a bunch of charge comes off the bank suddenly. So it's a good advance.

Now, you've got two items, and they make a problem. The pair makes the problem so if you've found one pole you can oppterm it and find the other pole of the particular piece of flow machinery and you can get a considerable relief on the pc rapidly, so that has value. So you might as well set it up that you do a flow and then get its oppterm and then do another flow the same way that you did the first one and then get its oppterm and do another flow and get its oppterm. Call each one of them a line, and you wind up with a whole packet of lines.

Now, it's not necessarily true that there is – that this is much better than continuing to do flow after flow after flow. You understand? There's just some evidence in favor of it.

Mostly on the basis that it apparently will blow a little bit more charge than doing the other flow right away. See, that's – we're not now dealing with critical points.

But 3D items can be found in one per line on and on and on and on and on. It keeps the Goals Problem Mass good and handy because in doing 3D, the Goals Problem Mass starts to depart and it starts to dissipate and it starts to fall to pieces. And it's very hard on the pc. He's so accustomed to living with this room full of sponge. You see, the room full of black sponge that he's accustomed to living with, it starts slipping. And it gets out of his view. And he misses it. And he knows he's supposed to audit it. And it keeps snapping back on the track and the track straightens out and things like this. And it's disconcerting.

So if you wanted to get an awful lot of lines, you would do one per line. You see, that's the other thing. I'm not now talking about flows. I'm talking about Prehav items. I'm talking about old type 3 items, I'm talking about Dynamic Assessment items, and so forth. Just rapidly get several line items. One, two, three, four, five, something like that.

You got the 3D mass good and close, pc's got lots of somatics, he's very uncomfortable that you've got this thing right up close to his chest and it's no difficulty trying to find items.

Now you oppterm each one of these things you've found. And you of course now have a problem and a problem and a problem. Every line now has two items on it. Well, if a line is opptermed, you now have a problem. You've got the valence versus valence that makes up a problem. You have the waterbuck and the tiger. You have the willow wand and the wind. And these things – each one of them – makes up the problem.

Now, there's some other things that you can do with this when you get a pair – when you get a pair. And you understand it really doesn't matter much whether you get one item per line and then go back and get a second item per line; or if you get one item on a line and oppterm it and then get another item on a line and oppterm that, and so forth, except the Goals Problem Mass starts to slide out from underneath you. Person starts going Clear and other embarrassing things. [laughter] So it doesn't matter too much.

When you start doing flows you start shooting this thing full of holes. It starts swiss-cheesing on you. And if you do, you possibly could inadvertently make a Clear this way. Just straighten the guy out. You know, he's had some – a lot of preparatory auditing. He's in pretty good shape. You're – easy to keep the rudiments in. Now, you find a flows item and then you find an oppterm to the flows item. And you suddenly find you can't read him on the meter and the needle is just floating.

Of course, that doesn't mean you disposed of the whole Goals Problem Mass. It's parked over someplace else ready to key in someday. But you theoretically might have that experience every fifteen or twenty pcs. You know, it'd be about the same frequency as we were clearing people with Routine 3. It just would *sstuuuh* – free needle.

Now, that's very easy to get back. That's very easy to get it back. I'll tell you how you get it back. You want to know how to get it back?

You find the goal for one of the terminals. You find out which is the pc's terminal by which one gave him a somatic and which is his oppterm by which one gave him a sensation or

a dizziness, you see? Sort that out. Repeat one or the other at him. Try to clue it in. But you might not be able to get it in that quickly.

And then find a goal for the terminal and an opposition goal for the oppterm. Sounds just like the old 3D package, isn't it? Well, that's just exactly what you're putting together. And then find the modifier for that goal for the pc's terminal and you'll have the Goals Problem Mass right back in your lap every time. He will unclear like crazy. See what I mean? Take the original 3D handout and simply fill in the sheet. Finish it all up, and you'll get the Goal Problem Mass back again.

Funny teaching auditors how to – how to get their hands on aberration after it slid out from under, but you to a slight degree face that problem now. We're into that area of Scientology where we have to audit carefully so as to keep the pc sufficiently aberrated to blow the lot. Because the pc is going to get very restive on us and want to get back into action, and the pc is liable to go momentarily Clear without having been made a Dynamic Clear on all dynamics and gone straight through the Goals Problem Mass. You see what could happen there? It would happen on you.

You want to make another kind of Clear. You want to make a Clear Clear. You want to make somebody who won't have any trouble with the Goals Problem Mass or any trouble with the bank from there on out, and all of his fondest hopes, and so forth.

And of course, if you keep doing that *in extremis* and then straighten out the whole track, and take up all fragments of the Goals Problem Mass in their turn and handle all them, you'll make an OT. You couldn't help it. So you probably could make a Dynamic Clear or a Clear Clear, a stable, a very stable Clear by moving straight on through the Goals Problem Mass and getting these valences parked in their proper places on the track so they're not troubling the pc, and so forth. And he'd stay that way. It's taken trillennia to get these things assembled into a black sponge. And it'll take him more trillennia to get them back together again because it's quite accidental that they remain in that weirdly balanced balance.

You mean somebody has got a package that comes from 10 trillion years ago, beautifully poised and balanced against a package that came from 110 trillion years ago, and he's got a 100 trillion year loop in the Goals Problem Mass. And these two things are opposing each other gorgeously. How does he do it? I ask you. Thetans are skilled, but I never expected them to be that clever. But they actually can do it.

Once you get these things unbalanced and unhinged, why, *heaaaaa*. There'd have to be a whole bunch more accidentals way on up the track for him to get these things matched up again.

All right. In doing a 3D Criss Cross, I want a case to be in this kind of condition before we say that we're very happy with the case. I'll give you the items that we would say we were happy with.

One, all the missed withholds available were off the case so it wasn't registering on any missed withholds. A Form 3, last two pages of the Joburg. That's a Form 3, last two pages. Missed withholds, last two pages of the Joburg and a Form 6A. That is the revised

eighty-question Security Check on pcs and so forth. We're talking mainly now about Scientologists as a case rundown.

And 3D Criss Cross in this kind of shape: at least five lines, at least two of those five lines flow lines and with an oppterm found for each line. That's only ten items, you see. Two of them are flows, and two of them are oppterms of flows and the other six could be from anything.

And if a case had all that done, and so forth, why, I would consider that the case was reasonably auditable without any special anything. I'd say the case should audit like a baby carriage. It'd be very easy to audit.

Now, you could go ahead and finish up from that. I'd know this character was on the road to Clear, you understand? I know he's well on the road. He's down there past the most crucial roadblocks and he's doing all right.

That doesn't sound like very much to do in auditing, does it? And frankly it isn't very much to do in auditing. And the results which you get on a case by just getting those things done on auditing are quite astonishing, however. And this is what I would consider – at this particular instant – what I would consider essential. And I'd call such a case, regardless of any – oh, regardless of any test or anything, I'd say the case was certainly a Release.

I'm not giving you a new definition for Release. I'm just saying he would have passed Release by like a jet car. Somewhere in his back track of auditing, the state of Release would have occurred. Probably nobody would notice it because he's too interested in pressing ahead.

But you'd say, "All right. Well, you used to sit in your room and quiver all morning and all evening and particularly at two o'clock in the morning when you woke up in a cold sweat talking to the black thetan in the upper right-hand corner of the bedroom. Now, are you doing that now?"

"Oh, did I ever do that? Come to think about it, I did. Yes."

That's the responses you're getting on the more severe upsets the person has been worried about in his lifetime.

A tremendous amount of aberration goes by the boards in the process of 3D Criss Cross. And you don't quite notice it going until the person does some kind of a fabulous back-track on the thing. You have to do a careful plot.

It's almost worth making a pc sit down and say, "Now, list all of the troubles that you have been having," so that you get this long and involved list.

"I always slam the icebox door on my hand when reaching for my stomach tonic that I take every night. And I'm afraid to go up broad stairs and I won't ride in tram cars. And every time I see a plate glass window, I look for a brick, you know, and have to stop myself," and all these various listings because these things are not going to be much in appearance. They're not going to be much in evidence.

They'll kind of slide by because they're whole package aberration, you see, and you get rid of a whole package and you don't get rid of a specific aberration. That's the trick. That's what will fool the auditor, see?

You actually don't get rid of the slamming the icebox door on their hand. You don't get rid of that. You get rid of some valence because it was – obviously you had gotten rid of because it was most available valence if they're dramatizing it.

Have you noticed that the pc will dramatize the valence which you're just about to find or have just found? Huh? Have you noticed that one?

Well, similarly, the valences which you get rid of with 3D Criss Cross are those which are most neighborly to the pc because they're the ones he's dramatizing so he must be right on top of them. So those are the ones which contain all the foibles and frugals that he has been worrying about. Those are right there. When you get rid of these on 3D Criss Cross, any way you'd audit 3D Criss Cross, these things would come up. In the process of getting ten of them, if two of them are flows valences, you're going to get rid of the most immediate difficulties of the pc no matter if you audit it or not. They're still going to haunt him a little bit, and he's going to work. He's going to find himself working some night.

He'll be sitting in a cafe, and he used to hate waitresses. And he's sitting in this cafe and he tries to work up a good, healthy hate for waitresses out of force of habit, you know, and he just can't make it. He's sitting there concentrating heavily on the waitresses and if you've run twenty 3D items out, why, he's heavily concentrating on how he should be hating waitresses. And one of them comes over and puts her arm around his shoulder. I mean, he's most surprised.

And then – then, of course, because he can't really make this aberration anymore, and so forth, why, of course he's had it right at that point, you see, because he gets friendly.

There's a liability to being sane, you know. You get friendly with all the people you used to hate. [laughter, laughs] Sometimes embarrassing when you're out with people you haven't been with for a while, and they know very well that you hate waitresses, you see? Embarrassing. And you have to tell him that you had some processing or something. Rough.

Anyhow, by the time you've got ten items, if two of the things are that, you've changed a person's pattern. You've changed his pattern of thinkingness quite markedly.

What you'll be impressed with is the fact that he was not all that influenced by that aberration. That's one of the things that you will be fascinated with. Yeah, he was worried by it. Yes, he dramatized it. Yes, it was throwing his whole life out of gear. Yes, he was walking on the – in the gutter when he should have been walking on the curb. But the guy is still the guy. That's one of the things which I find interesting. The guy is still the guy. His more charming aspects are still amongst us. And he evidently could function as himself. In spite of these aberrations, he was himself. And you run into somebody and you still know it's that person, only he's more himself. You see, he's more himself and less inhibited as himself.

And we get back to all of the endless arguments we might have had in Book One on the subject of what is insanity. What does a Clear do? Now, we really start opening Pandora's box, you see? "What does a Clear do? How does a person really behave? What would happen to me if I were really, really Clear-Cleared? Would I grow wings and so forth?"

Oh, I think they would find you very much yourself but a somewhat more charming self than you were. It's a disappointment, basically. Disappointment. Everybody expects you

to at once develop – you know, what they really expect to have happen is one of the most overwhelming valences they have in their immediate vicinity, you see? They think that they will get the attributes of it, like "magician", see, or something like that.

And they think that if they really got Clear, and then they immediately – you see, because they're going to get rid of it, the valence "magician" restimulates, you see? And they think, "Clear? Oh, I see what I would do. I would have piercing eyes." [laughter] "Piercing eyes and I would be able to hold up my fingers like this and long streams of fire would go out and blind any eyes I was looking at. I know what a Clear is. I'd be able to clear the hall by spitting. I could produce elephants out of spittoons. I know what a Clear is. Got it taped. Now, we're in communication. Now, I can talk to you about being Clear," you see?

And then you come along with 3D Criss Cross, and one of the first items you run across is "magician". [laughs] The guy ceases to worry about it, though. He doesn't have any difficulties with regard to it.

Now, 3D Criss Cross is more painful than any other type of processing we have. More painful. In terms of somatics and so forth, more painful early in its run. And you never saw a pc get so careless of these things after a while. But when done in the slower, older version of 3D, where you were just locating a goal and then getting a package from that goal, and so on, you unfortunately kept the pc hanging longer than he liked in the cold masses that are inevitably associated with a Goals Problem Mass. And everybody kept thinking that he was freezing to death all the time. And you go around and some pc would put his hand on you, and so forth, and the frost would gather on your coat sleeve. They were cold, man.

Well, don't think those entirely disappear on any pc that you do this on. In 3D Criss Cross it'll go through a little faster, but it'll still occur. The same things, the same somatics, and so on.

I would say that it would be enough for an individual to reject doing anything about himself, the somatics which occur in the very early stages of 3D Criss Cross, I'd say it would be enough for an individual – if he were operating on himself by himself, unsupported with an auditor, unaudited in other words – there'd be enough somatics and cold masses and pains and dizzinesses and sensations for him to, see, start in and say, "Oh, well, no, I don't think we'll go into that." Because he's been doing just that for trillennia. Every time he started to blow one of these things it started to hurt so he'd back right off of the thing and he's left them strictly alone.

Therefore, the task of auditing 3D Criss Cross is, of course, a precise task in that the pc has to be kept in-session. If you can't keep the pc in-session, the pc cannot on his own even vaguely face up to these things. He just couldn't do it, that's all.

You would just be *fascinated* at his inability to face up to them all by himself. It is just the fact that he's in-session. It isn't that the auditor has to work hard to get the pc to confront these things. An auditor running 3D Criss Cross doesn't have to get a pc to work anywhere *near* as hard as when running an engram. Running engrams, man, that, that was hard work. But the pc has to be in-session. He has to know he has an auditor, he has to know that the auditor is helping him out and pushing him along the line and that the auditor isn't on the side of the reactive bank. Therefore, be prepared for this to happen: for 3D Criss Cross to go gor-

geously in the hands of a well-trained auditor and for it to go splat in the hands of somebody who has just completed his third week in the Academy by being expelled. And then it will just lay the most gorgeous egg you ever saw. It'd just lay a gorgeous egg. It wouldn't matter if he went through all the motions or anything else because you'd have a no-auditing situation. And a no-auditing situation is frankly the only thing that could totally defeat 3D Criss Cross. Almost anything else could push it through. But a no-auditing situation, no.

A pc has to have a certain insouciance about the bank. He has to be able to feed himself to the lions. He has to be able to sort of – well, just as he gets down to the last rung of the ladder and sees that it's three thousand feet to the ground, he's got to have somebody there that persuades him to let go. And you say to him, "Well, it's all right to let go, Joe. Actually, it's just illusory, the three thousand feet down."

He says, "Yes, but those houses look awfully solid. And the air's blowing very heavily across my lumbosis here. In fact, it's getting worse."

And the auditor has to help him out; either gently free his fingers off the bottom of the ladder, or *stamp* on them. [laughter] But it's something that has to be done.

I don't wish to overrate the amount of skill that is required to run 3D Criss Cross. The actual skill – you can learn these technologies rather easily. The unseen, haunting factor back of all this is, is the session going? Is the pc in-session? That is the background music to all this.

And of course, to people who don't see this or don't experience it, they add all sorts of complications under what is meant by this. And in-session – well, that's just willing to talk to the auditor and interested in own case. I mean, it's as simple as that.

The demonstration you saw a little while ago, you saw I was taking up any little, tiny cross band here that might have been interfering with the pc's willingness to talk to me under those particular circumstances. I was qualifying it. In other words, I was being awfully careful of that particular point. Did you notice that? I was monkeying around with this point and I went back to it a couple of times and I wasn't doing it very smoothly. I was just being very certain that the pc could talk to me about the thing. And finally I didn't get any reaction on it and let it go.

But you see, that's very, very important. The pc there was obviously interested in own case, but was the pc willing to talk to the auditor under those circumstances? Well, if that had been missing, he wouldn't have gotten any differentiation on the list. Pc would have gone over the items and said, "*Mm-hmm*, and so on, and oh, yeah, take it off. Leave it on." Or he might have just said, "Well, take it off, take it off, take it off. Take them all off, take them all off, take them all off. Take everything off the list. Who cares? Tear it up for all I care."

And that wouldn't have been optimum. Pc wouldn't have been in-session. But it isn't difficult. It really isn't. It isn't even like walking a tightrope or anything like that. It's just making sure of these points. And undoing all the silly complications that you might be adding on top of it, that's all. That's as important as anything else. Getting rid of now the all – all the ought-to's and the now-I'm-supposed-to's, and things that you might just complicate the session out of this world with, you know.

Well, for instance, spend – find out all of a sudden that your E-Meter couldn't be balanced on set. And be very concerned about this sort of thing and be very, very worried about not being able to balance your E-Meter because you just couldn't get it to read on the Clear reads or something. You get very upset and very worried about this.

Well, what's that got to do with it? We're not testing anybody for Clear. Are we? We got some vague idea of where the pc is, and so on.

Well, naturally, we want that to be right. If we can get that right. But if we can't get that right easily, we're going to leave it alone. You follow the rationale here? We're not going to do any of these things that are relatively unimportant if they're difficult to do or get in the road of our session.

We're not going to get the whole session held up because we find that we can't put through the – we can't get our ballpoint to work and write the auditors report. In other words, something as goofy as this, you see? And have to leave the room and get a ballpoint, and *huh-huh*. Well, we can't get a session going because we don't have a ballpoint pen, you know?

Now, a ballpoint pen doesn't make a session, see? So just drop that out of the lineup. And it's almost knowing what you can get rid of as an auditor. And if you'd make a list of the number of things you could get rid of as an auditor, you'd also have a list of the things that you'd never bother to put in if it interrupted the session in any way. You'd never let these things get in the road of the session.

So your ballpoint all of a sudden had expired. These things were originally, you know, advertised as writing forever. And they don't. On some of your first lists on flows, you probably will use two ballpoints getting the list. But the point is that that wouldn't be something you'd hold up the session for. You're going to list and differentiate. That's what you're going to do in that session. And you find out your E-Meter leads is busted just before you begin the session. You're going to list and differentiate in that session.

Ah, well, we don't drop that one out because we could never get the rudiments in, could we. So we go and steal a lead out of the auditor that's auditing in the next room, so he has to find them – proper procedure there! So that would be important. Pc's chair is not a very comfortable chair, and creaks. The pc's called attention to this several times. All right. As far as I'm concerned, pc can go on sitting in that chair for the next forty sessions. I couldn't care less. Audit the pc sitting on the floor. Who cares about the chair? Don't you see?

Your relative importances of what are the parts of a session are something that some auditors could sort out with great value. What is the auditor trying to do? In the rudiments, he's trying to get the pc in-session. With Sec Checking he's trying to get the pc freed up so the pc can get even more easily into session. And with 3D Criss Cross, he's trying to find the items of the Goal Problem Mass that the pc is dramatizing, has given him all of his trouble and all of his aberrations. They're all contained in this mass and its various component parts. Well, that's all he's trying to do.

And he gets these things strung out and gets the relative evaluation. He knows what he can throw out the window and what he's got to keep in front of him. Therefore, it looks very relaxed when you finally finish up because it all cones down to getting the pc in-session and

holding the pc in-session, and getting the pc to write complete lists, finish up lists, get them absolutely complete, get the item out, get the thing differentiated with the pc's interest right straight on it with all twelve cylinders firing. And then get your nulling out of the way, and you know that you can actually go over and over on a differentiated list. You know, you can go over and over, differentiate over and over, and you know it all disappears after a while? Every time the pc tells you it's an irreducible minimum.

If you were watching today on items or remembering items, you saw me go over the same column twice. That was, I went over the whole list once, but I covered one column twice. The first column I covered, I went over again before I ended the thing. And the irreducible minimum of the first column I covered had become one-half its size the second time I covered it. In other words, these irreducible minimums keep blowing because they keep blowing charge, so there isn't anything to hold him in.

Charge is that which prevents the pc from thinking on a subject. Prevents him from thinking on a subject or getting rid of a subject or approaching a subject. Sum it up to handling a subject. Charged.

You wouldn't go over and pick up the live wires out of a 220-volt mains, would you? Well, neither will the pc much think about doing it or do it. Not until he's sure the switch is off. After you've turned the switch off, he says, "Well, what – what was this bothering me for?"

Well, that's what happens. You keep bleeding charge off the thing and it's always an irreducible minimum. At any given instant the whole list is an irreducible minimum. But then you blow a little more charge off and the irreducible minimum, of course, is reduced. And then you blow more charge off and the irreducible minimum is reduced again. And you can just keep on doing this and you can actually differentiate a list right on down to one item.

I'm not telling you to do this. I'm just saying you can do it. You can omit the nulling of the list. Not good auditing to do so, but on any pc that was hard to null items on, brother, would I make sure those lists were long and, boy, would I differentiate them round and round and round. And when I got all down through the end of the thing, then I know it'd null. Because I refuse to spend any time nulling. That's what I refuse to do because it's the least beneficial of any of the steps.

So being the least beneficial of the steps, let's make it the least time consuming. The other steps are beneficial so let's spend our time on them. The pc always gets someplace if you make him keep on differentiating. And just for fun sometime, take a list and reduce it to one item by differentiation alone. And you'll find it continues to be an irreducible minimum.

But you'll still get one or two off every time you go around and it's still irreducible. But you still get one, two, three, four or six off. Isn't that weird? You're blowing charge off the thing. And of course, the last one stands up, "Well," the pc says, "well, why am I worried about this subject? Why am I doing anything with this subject? Because it is absolutely inevitable that a ring-tailed snorter is the only thing could do that. And I could have told you that at the beginning." He actually has the illusion that he could have.

"I could have told you that. I realized that all of my life. A ring-tailed snorter. Of course, naturally. Well, why are you so bothered with a ring-tailed snorter?"

By the time he's handling this ring-tailed snorter – when he first starts discussing it you'll see drop, drop, drop, charge, charge, charge and after a while he discusses it and he says, "Well, what's this all about, and so on."

And he can say ring-tailed snorter, you can say ring-tailed snorter and you only get the tick of the bridge from ring-tailed snorter to the rest of the mass. You get no charge on ring-tailed snorter. You only get the charge on the next item that can bleed to ring-tailed snorter. And that's what keeps the item ticking. It's never the item. The item you've found never ticks. What you get is the bleed of current from the item you haven't found. And that's why you keep – these things keep going tick, tick, tick, tick.

So actually, 3D Criss Cross, that's why we've obviated running items because the item you found and proved out, of course, is never charged. Isn't that fascinating. But the item you've got is serving as a short circuiter to the bank.

In other words, you've got ahold of a connecter that isn't itself charged. Electronically, you've got ahold of a condenser that has nothing in it. It's all gone but you'll still find current in the condenser because the condenser is still connected up to something over here that does have current in another condenser, see? You get this other one bleeding through to the condenser you got hold of. See how the thing works out?

So you could keep on differentiating and differentiating and differentiating and blowing current and blowing current and he'd eventually say, "Well, why are we worried about this?"

Yeah, why are we worried about this? It drove his father insane. It put his mother in her grave. It's what makes him drive cars off bridges every time he sees a bridge and is in a car, you see. And it's what has kept him impoverished and broke and made his wife into a wreck before her time.

And he says, "Why are we worried about this?"

And sometimes it's such a negative gain that I wouldn't blame you at all sometimes to be slightly provoked at the pc not realizing how important that was in his life.

But I wouldn't advise you to try to sell him on the idea.

Bleeding charge is all you are doing on the bank whether it is Sec Checking or otherwise. There are ways to bleed charge well and there are ways to bleed charge poorly, but almost any auditing, if you call it auditing at all, will bleed some charge off the bank.

Now, the auditing only becomes upsetting and a nerve-racking no-Lloyd's premium-risk activity – no insurance, uninsurable, and so forth – when you are auditing in such a way as to stack up charge and let none of it blow. You never let the pc get rid of anything, you never let the pc throw anything away, you never let the pc blow off any charge at all. The pc hands you an item, you hand it back to the pc. Only he had an ARC break on it, see? The pc hands you a cognition. Put an ARC break on the cognition; hand it back to the pc, you see?

Pc gets rid of a withhold. Put an ARC break on it and give it to him and say, "Well, that wasn't a very nice thing to do, was it?"

I can think of so many joyful ways of keeping the bank charged up, you see? Now, if you made up a little list of the number of ways that you could keep a pc's bank charged up and not let him get rid of anything, you possibly would embrace all the auditing errors that could be made, but that would be a theoretical list. But that's how you would make the theoretical list, is figure out any way that you could keep a pc from getting rid of anything and keep the bank charged up and keep his attention off anything – and just make a list of that sort of thing, all of which sums up to not permitting the pc to bleed any charge off the bank – and you will find consistently that you would have the bulk of the errors that could be made with auditing.

And then I will let you in on something. Then you will have a bunch of Academy students and they'll fool you. They will invent some more. [laughter, laughs]

I don't mean that to be sarcastic about students. I don't mean that to be sarcastic about auditors. But I will comment on the fact that they can usually outguess me on these things.

I wanted you to get a look at – in these demonstrations particularly, because I knew you – many of you might have a more complicated idea of auditing than it merits. But you look at all the parts as they go together and look at the auditing as it proceeds and it is not a complicated activity by which you're balancing a bowling ball on the end of your nose while standing on the middle of a medicine ball, you see, with a blonde on each hand, you see, while drinking whiskey.

It's not that type of an activity. It's a rather relaxed activity. But nevertheless it's a highly precise activity. You could make two errors.

The newcomer, the auditor, the Book Auditor, he makes the first error. He said, "It's so simple that anybody could do it and you don't need any training in order to accomplish this thing."

So therefore, he sits down, and I'll be a son of a gun, every now and then he turns in a fine job of auditing. That's because he doesn't know enough to make any mistakes. You'll see this every once in a while.

But then, all of a sudden, he starts hooking into the rough because he doesn't know what he's doing, see. And he starts hooking into the rough and he starts hooking into the green and he starts hooking into the sand traps, and so forth. And he starts having himself a ball and then he doesn't know what kind of trouble he's in. And then he says, "Well, it's because I'm not sitting on my chair with my legs crossed, and I'm not having the pc regard his navel. Obviously, that's why the sessions are going wrong." Because he doesn't know enough about the subject.

From that moment he goes on to greater and greater complications.

So at first he starts out with too simple a simplicity. He bridges rapidly over into a progressively complicated complication. And this complication gets absolutely top-heavy and

the end result of it is he's so busy auditing that the pc never gets included in the session. And when the pc is not included in the session, no auditing occurs.

There are several ways that you could make a no-auditing situation exist, but I wish you to cultivate your sense of observation, both as an auditor and as an observer of auditing. Cultivate the ability to detect a no-auditing situation. Just cultivate it. Know when no auditing is taking place. Not because of meters or because you've got a circuit that tells you. Just realize when it happens. Know when the pc's in. Know when the pc is out. Be able to look at an auditing situation and know whether that pc is in-session or not.

I'm not asking you to do anything very difficult. I can look into the Sec Checking room in there just long enough to open the door, sweep one glance around the room and close the door, and tell you every pc that's in the place that's in-session and every pc in the place that's out of session.

And that is not a terrific high level of skill. It is just that obvious. It is not my penetrative eye or my ability to permeate situations. It's nothing extraordinary at all. It's just my ability to look, but you can look, too, and you can see it [snaps fingers] just like that.

And when you're sitting there auditing the pc, all of a sudden – you're going along with this and that, it's just some, slight change of inflection in the pc's voice. And you say, "Well, there went the rudiments, okay."

Don't bother asking are the rudiments out. "Do you think the rudiments are out? Are the rudiments out, to you? Maybe if I set it up at sensitivity 16, I could find out if the rudiments are out."

Well, man, if they weren't out when you asked, you've got them out by now. [laughter] Just look up at the pc, you're doing all right, and you ask that question, not to find out how the pc's doing, but to adjudicate from the pc's answer tone if the pc is doing all right or not.

Get the pc to say something to you. Is the pc willing to talk to you? So you ask the pc, "How are you doing?"

And the pc tells you or the pc doesn't tell you. And if the pc doesn't tell you, the pc's out of session and you better get him in.

Now, you can start cranking up the E-Meter. But of course, you might have been a little bit cautious. And you say, "Well, are you doing all right?"

And the pc says, "Oh, yeah, I'm doing fine. Now, so-and-so and so-and-so, and this list, and so on."

You don't bother with it any further, do you?

And you say, "Well, are you doing all right?"

And the pc says – any such phrase, you know, no pattern phrase. Just some attention to the pc to get him to talk to you a moment. Adjudicate where that pc sits, and say, "Well, are you doing all right?" – something like that, anything.

The pc says to you, [in a low voice:] "I guess so."

Mmm. Crank it up. What withhold have we just missed? What has the pc just invalidated? Is it all right to audit in this room? Why did your grandfather have to marry the girl? But let's get the pc back in-session because that pc is not in-session.

"Well, how is this list going?" See, you'll hear a stray question like that. What is this question? This question is interest in the pc, certainly, but it's something else, too. It's a test of the pc's response.

It is you the auditor, not rudiments, that hold the pc in-session. And when you the auditor have let the pc go out of session, it'll be one of several things that will get him back in-session. And this list is covered by the whole word *rudiment*. And you'll get the pc back in-session again.

But there's no substitute for auditing. There just isn't any substitute. It's indescribably simple. It is too elementary to be pounded on the head.

Some of your biggest difficulties in auditing is that you have done nothing to bleed any charge off the pc at which end of session the pc is, of course, out of session gorgeously.

The pc sat there a whole session. You bled no charge off the bank. You didn't do anything to make the pc feel lighter, better or anything of the sort. You must have, then, compounded the felony since auditing itself will automatically make a pc better unless it's interfered with. See, you must have interfered with it in some way, so you must have handed the pc back as much charge as the pc got rid of to keep the pc in status quo or worse.

Well, the rudiments, running down the rudiments, tells you how you did that. How did you manage that? ARC break? You gave him a present time problem? He was unable to get rid of withholds? Something of the sort. But I don't care what the form is; the actual *fact* is that he did get rid of some charge, but you gave it back to him. You didn't *mean* to, but you did. Therefore, the pc didn't get any better.

These things are all of the factors of auditing. Auditing is a relatively simple operation if you have already sorted out all of its complexities and chances. So therefore, there is no such thing as simple auditing. Auditing is only simple and only looks simple, and listing and 3D Criss Cross and anything else you're doing, is only simple when you know all about it. And then it becomes terribly simple, and you say, "I wonder why I worry about this. Why did I ever worry about this? This is awful easy."

Well, walk into an Academy one day and look around and you'll see why you worried about it once.

A student auditor is sitting there. He's got the E-Meter upside down. He has got one eye on the Instructor and the other eye out the window because he has an appointment. The pc has not been sitting in the chair for fifteen minutes and he has not noticed. [laughter] You go over and flick him on the left ear, and he rings like a gong.

And you'll say, "Gee-whiz, what's he so worked up about? Auditing is perfectly simple. All you do is keep the pc in-session and bleed the charge off the case and get things that are bothering the pc and straighten them up and let the pc get rid of them and the pc's all right."

And you tell him this, you know, and he says, "Yeah," he says, "but what process do you run to handle a present time problem? I'm sure Ron must have changed his mind about this. Well, what do you do to get a session started? Do you say 'START of session' or do you say [in a low voice:] 'Start of session' or do you say [in a solemn voice:] '*Start of session*'?" [laughter] "How do you do that?"

You suddenly conceive you're talking to a person who is in a large area of unknowingness. They don't know what's important, what's unimportant, or anything else. But they're just swimming, flying blind, compass busted, radar soaking wet, no ports in sight and a gale coming over the horizon. [laughter]

This they know and sense but they can't figure much of anything else out. But, as I say, it's very simple. But there's nothing like familiarity to breed that feeling of simplicity, and so my advice on the thing if you're at all worried about auditing is just audit and you'll come out of it providing the pc survives.

Thank you. [laughter]

PREPCLEARING

A lecture given on 13 February 1962

Thank you.

Thank you.

And this is the 13th of Feb. AD 12, isn't it?

Audience: Yes.

What do you know? Got it right, without telling me a word.

All right, now, listen here. You've just heard or seen a demonstration of what happens with an incomplete list. Did you begin to realize that was the case? Did you? Did any of you realize that was the case?

Audience: Yes.

The liability of letting a pc go ahead and write a list themselves without bleeding it down.

All right. But that doesn't matter. But the symptom – I just learned something, you could probably tell. You know, every time I said one was in or out, you know, I got the same fall. Did you notice that?

Audience: hm-hmm.

I said it was in or out, and then the fall would interrupt the next read. So I couldn't tear along on the thing the way I ordinarily do at all. I was having a slow go of it.

And then, of course, I had a pc who was helping. She was helping with the session. And of course, she very badly wanted to get an item to show you how good that was, you see.

And then she tells me afterwards that well, she thought, "a data gatherer," or what was it, "a knowledge gatherer," was it. And actually, when she talked to me about the list one morning at breakfast, I blurted it out quite automatically. She was counting on my item. [laughter] Now, that's an incomplete list. But I learned something there myself. And that was you probably get a surge of that particular type if you got an incomplete list. I mean I – that's not equivocal because we haven't proven the list as incomplete. But would seem that was likely. Interesting, wasn't it, huh? Yeah.

Of course, you realize giving a demonstration like that under pressure is a little bit hard on the pc. But I was quite fascinated just from the standpoint of – all of a sudden what

was I looking at here, you know. Well, I was looking at something that wasn't usual or ordinary. Well, I was looking at an incomplete list was what I was looking at.

Because you ask her, "Are any of those – is the item on that list?"

Female voice: No, I don't think so.

Well, is it or isn't it? Do you know that it was? Did you have the feeling that it was at any time?

Female voice: Not really.

Not really.

Female voice: I can't wrap my wits around the enforced inflow myself?

How do you like that? See? I think that's pretty good. That's a good example. When I first asked her, if you remember, the other day, she said the list was complete. But now she doesn't believe that she could enforce her wits around the enforce of the inflow on self.

Of course, it's been invalidated now to the degree that I've nulled it all out. But that is not a vanished list because of rudiments out. That you should realize. Rudiments were in. If the item had been on the list, it would have showed.

What I'm showing you is it was heavily charged. The subject was charged. See that? We had a *bzzz* every time we charged the subject. Okay? All right.

Well, now you see that if I can miss them occasionally on completing a list, why, you needn't feel so blushing sometimes. And don't you ever fake one just because, see, you want to make the pc look good or something like that. Don't ever fake one, you know, say, "Well, it was reading a little bit, you know, it was the last one in," something like that. Doesn't work that way. If you don't find an item, don't find an item. You hear me?

It would have been very simple for me simply to have kicked it with my thumb and said it's in. [laughter] Of course, that's very embarrassing, you know, in front of all of you experts, you know?

I thought that was quite fascinating just from the standpoint – I've – about halfway through the session I suddenly realized I was looking at a charged subject – that the subject was charged – but that I wasn't getting any action on any item like that surge that I was getting every time I said one was in or out.

Now, the toss-up is this: Do you stop and invalidate the pc across the boards and say, "Well, this list is no good, we're gonna have to do another list," or do you null it out to nothing and add some items and so forth? It'd just be what made the pc unhappy. Well, you wouldn't do that. You'd do what the pc is happy on, and so on.

Pc is not upset, I don't think, because we didn't find an item.

Female voice: No, I'd rather have the right item.

Yeah, she wasn't saying that just for your benefit. But the fact that she'd rather have the right item rather tends to indicate that she knew there wasn't one on the list. See? Tends to indicate it.

Well, all that, 3D Criss Cross to the contrary, let us get into something that is very vital to you. Let's get into Security Checking disappears, and Prepchecking rises newly born.

In the first place, the word Security Checking has never been very popular with the public and it renders itself very bad to understanding. We're not checking people because of security, see? We're actually preparing cases for clearing. And so if you called it Prepchecking, it sounds slightly onomatic – onomatopoeic. That will be a shilling apiece, please, for that one. [laughter] Slightly onomatopoeic – you didn't think I could say it twice, did you? [laughter] So we'll call it Prepchecking if that's all right with you. What do you think about that?

Audience: I agree.

All right. And then we will call the operation of – not the operation covered in this bulletin. The subject matter that I'm taking up in this lecture is HCO Bulletin of February 12th, 1962, which I believe you have. But not because it isn't covered in this bulletin yet, but because I haven't given you all the dope on it and won't give you the dope in this particular lecture on how you do it. We've got a whole subject here, and we could call this Prepclearing Prepchecking, Prepclearing. We got a whole subject here. It's a subject that'll take a lot of the snarls out of your wits on how you do this.

Now, I've been trying to teach you here and across the world for a very long time, how to do Security Checking. And auditors have been missing withholds and auditors haven't learned it very well, so we have to understand that this is probably something that is very, very hard to do.

Now, instead of blaming everybody and trying to make you all guilty – see, that's usual, you see, the fellow who's standing up with his thumbs in his braces, you know, and saying, "I'm the big I am, and I know it all," will naturally try to make you guilty and say, "Well, you're just ignorant and stupid."

Well, there must have been something missing in Security Checking. Must have been something missing, and it's some element or another missing. So instead of blaming you across the boards, I have been working since the first of the year, very hard on this subject. Now, of course, I've worked on this subject of overts for more than a decade. But there must have been something, something missing in the whole subject of pulling withholds, and there must have been something missing about withholds. There must have been something unknown about the subject, otherwise, one could have articulated it well enough so that you could do it easily.

Now, I've done some remarkable things in pulling withholds. And I've caused some cases to have some fantastic gains in pulling withholds here and there and now and then. But I might not have been doing it all. You know, there might be a better way to pull withholds, and there might be more to the mechanism of what withholds are all about and all of that sort of thing.

Well, anyway, I've been working very intensely here for a period of about well, since the first of the year, certainly.

And since the first of the year, I've been aware of the fact that if I couldn't teach you how to do this so that you'd get a resurgent gain every session and every time you did, that there must be a bug. There must be a bug here someplace. Either it is hard to relay or it's hard to do or there's some accidental – there must be something here because there's a variable. And so I made up my mind to get rid of the variable. And the first time you saw that was when I started jawing at you about missed withholds.

And apparently if you restimulate somebody's withholds, if you restimulate a withhold and then you don't pull it, you have the sole source of ARC breaks. Now, for God's sakes, when I learned that, when I looked at it, when I proved it out – and I had it proved out by about ten days, two weeks ago, totally to my satisfaction – you have the source of all of your ARC breaks, of all of the *yap-yap* against the organizations, of all the *yap-yap* against Scientology, of all of the *nya-yak-nyak-nyak-nya-nya-nya-nya*, of all the pcs that are going into propitiation and anger and upset, and so forth – you've got the lot in a missed withhold. It restimulates the withhold, you don't pull it, your pc gets mad at you, you know?

A pc in the HGC goes out into the field and all of a sudden goes *nya-nya-nya-nya-nya-nya-nya*. Well, somebody missed a withhold on that pc, that's all. Because listen, this is the proof. You get a hold of them, and you bring them in, and you set them down, and don't do a blessed thing with them but ask them what withhold has been missed on them, in some fashion or another. Ask them effectively. And they give it to you – you'll find it – and they say the organization is fine, and you're wonderful, and they go off, and all of a sudden they get a case resurgence and a case gain that they didn't have at the time they left. Interesting, isn't it? *Ha-ha-ha*. Now, there's something to be known about this. There's a lot to be known about this. And somehow or another I've got to get you to get a good reality on this. But I made two tests right here. We had two auditor blowups. Two auditor-pc blowups, see. Two pcs blew up and the auditor kind of blew up, one auditor didn't blow up. The auditor grabbed the pc around the legs and hung on like grim death. And you know that both of those incidents were traced back to having missed withholds. And we went ahead and we got them afterwards.

The auditor had missed a withhold and you had a big pc blowup. Now, I don't know how many times I have to tell you this, but you might as well accept it because I'm just going to keep on telling you this. This thing is, this thing is not one of these variables. It's not a variable. This is not susceptible to difficulty.

It isn't true that every time you miss a withhold you get an ARC break. That is not necessarily true at all. But it is true that every time you have an ARC break you've had a missed withhold. Now, that's what's true. See, so you've gotten away with it for years without recognizing what you were getting away with.

So some pcs had ARC breaks, and some pcs didn't, you see. And on both of them you could have missed withholds. It's not invariable that because you miss a withhold the pc is going to blow up to the roof. But it is invariable that if the pc blows up to the roof, you've missed a withhold.

Now, as Scientologists, for God's sakes, get a reality on this. Mamie Gulch from Sad Bottom is saying, "Oh, the Central Organization is terrible and it chews everybody up, and it ruins everybody, and it's just a death trap because if you go near the place, and so forth. And

you know that I heard and so forth and so on. *Nya-nya-nya.*" [fast mumbling] And they come around and they're talking to you like this, and if I catch one of you explaining to them that that is not what the Central Organization is about, I'll – I'll – I'll – I'll – I'll revoke a portion of your thetan. Now, listen – [laughter] the effective thing to do is just reach for an E-Meter, because listen, there's nothing under the sun, moon or stars you can do but reach for an E-Meter. Now, let me tell you this. It's a fact. It's a fact. Please get some reality on it.

This character is going on and on and on, saying, "Central Organizations charge too much money. Besides, besides I had a brother once and so on and so on and so on. And the Registrar wrote me a letter and do you know what it said? *Nya-nya-nya.*" You've got no business whatsoever trying to explain it to them or trying to heal the ARC break. Honest. Honest, I've tried, and it just doesn't work. It just doesn't work. They just go on. You can overwhelm them. You can shoot them. You can – there's various things you can do, but look, man has been overwhelming them and man has been shooting them, and man has been trying to punish them into line now for the last 200 trillion years. And it hasn't worked. That is the unworkable phenomena. So all of your control punishment phenomena stems from this one fact. That man did not have the technology to pull the missed withhold.

So why should we keep on punishing them if we know what's wrong with them? Now, this is what's turned up in the last few weeks – a very intensive study on this. I've been burning the midnight Ron [laughter] and I finally got this thing sorted out as an invariable.

No, it isn't true that every time you miss a withhold, somebody's going to blow up the universe. You can have lots of withholds missed on you and on somebody else, and nothing much might happen. But where dynamite has begun to explode, where the fuses are burning, where this and that is happening, that is what happened. A withhold has been missed.

Now, this means this. That you haven't any business whatsoever, sitting in an auditing chair letting a pc chew you up, trying to handle the ARC break or be nice about it. You just haven't any business doing that.

The pc is chewing you up. You should immediately equate what has happened because nothing else has happened. You missed a withhold. That's all. What are you sitting there letting the pc *yap-yap* for, see? Because they're going to *yap-yap* from there till the end of session one way or the other. And you're just going to blow the session up.

No. Look at a pc's ARC break and think in terms of missed withholds, that's all. Don't think in terms of criticism of your own auditing and criticism of what you're doing and that sort of thing because you're doing all right. You understand this?

Now, the withhold that you missed is most likely to have been right in the session you're running. That's the most likely thing because it's much more important to a person that he dropped a match on his toe a minute ago than to have an elephant step on his head a trillion years ago, you understand? Present time things are much more important than past time things. So it's – the probability is it's right in the session you're running. You're looking right at it.

And if that's not the case, it must have been in one of the recent sessions you ran on the pc, and it took that long to blow up. And if that's not the case, it's back down earlier on the

auditing track, probably with some other auditor, as far as sessions go, or somebody should have known something about them in the last day or two. You know, it's an out of session thing that you're looking at. But, by the way, that isn't really going to make them mad at you. That's just going to give them a PT problem.

Now, where the missed withhold occurs monitors – or what it's composed of – monitors what rudiment goes out. Now, all rudiments go out because of missed withholds. All rudiments go out because of missed withholds. Now, all the rudiments processes are true and everything is fine about rudiments. And you've got, now, I think, about ten rudiments – could have processes connected with them – beginning and end rudiments. And all those things are perfectly true, and you could handle them all with the rudiment that is right there that you're reading. But the truth of the matter is, is back of each rudiment, if you look back of each rudiment, you'll find a missed withhold.

So out-rudiments are caused by missed withholds. And I'm going to make a further study on it and find out just what type of missed withhold causes what rudiment to go out. But each one of them is traceable, and I've been tracing back out-rudiments to missed withholds here until I don't know why we're processing problems. I don't know why we're processing ARC breaks. I don't know why we're processing any of these other things.

See, all you have to do is find the missed withhold. Present time problem is a missed withhold in life, not in the session. An ARC break is a withhold in the session. Invalidation of the E-Meter or something like that is a withhold, a missed withhold on the subject of the meter. There's something going here, you see? There's a missed withhold back of each one of these ten rudiments.

All right. So we look down the rack of these things and we find out that there's different types of missed withholds. And these missed withholds are all very intriguing but they're all missed.

Now, a missed withhold is a special thing. It is *not* a withhold. It's a "should-have-known." And if we stop calling them missed withholds, we might get over the semantic mess that we get into when we say – well, we walk into this staff, see, walk into the HGC, and the auditors there – perfectly good auditors, everything's fine, and we say, "All right, now pick up the missed withholds on this pc." And so the auditor goes into the auditing session and he knows what he's supposed to do, and he says to the pc, "Are you withholding anything?"

Oh, no. And you say, "Now look, I mean *missed withholds*, see. Get the *missed withholds*," and so forth.

And he says, "Okay, yeah. Well, all right. That's what I was doing, you know." And he goes back into session, and he says, "And what are you withholding? What are you withholding? What are you withholding?"

And you'll get hold of him and you just back him up against in the hall, and you say, "Now look, son, look. We're talking about *missed withholds*. The withholds that have been *missed*. That's what we're talking about. The withholds that have been restimulated and missed."

And he says, "Okay. Okay. I – you needn't get so mad about it. I'll go back in and do something about it."

So he goes back in and he says to the pc, he says, "Now, what are you withholding?" [laughter]

Well, you can go round and round on this mess. You see, semantically, the thing is disoriented. Yes, it means missed withhold, but a missed withhold is not a withhold.

And he says, "Oh, well, you don't have to pull withholds anymore. You can miss them or..." Lord knows what kind of a scramble you're liable to get into, but it's not going to be pleasant. No, call them "should-have-knowns." Now, I'm not going to keep calling them should-have-knowns. I'll keep calling them missed withholds. I'm giving you the explanatory thing, you know? You say, "Well, what I mean by a missed withhold is the should-have-knowns."

You find out what you should have known, and what the organization should have known, and what his auditor should have known, and what Ron should have known, and what other people should have known about him at various times.

Now you pick up all those should-have-knowns, you understand? The fellow isn't on the subject of withholds now, is he. He completely moved off it. Actually, what he's picking up is missed withholds. See, you've explained this by should-have-knowns – the auditing command. You understand?

It doesn't communicate well, so in an Academy talk to students about should-have-knowns and so forth, as your side explanation. You can call them "should-have-knowns" if you want to. I will continue to call them missed withholds because there's no more direct appellation that you could possibly assign to it than a withhold that has been missed. Just because this is hard to relay at first is no reason why we should abandon the whole thing. The fellow's withholding something, and somebody didn't find out, and that's the whole study.

Now, right along with this, right along with this discovery, I found out that you had gone into quantitative – quantitative thinking.

Have I mixed you up some way when I say missed withholds and no missed withholds, and so on? You understand what I mean?

Audience: Yes.

We'll go on and call them missed withholds. I'm just showing you, oh my God, you explain this to some new auditor on the subject, you'd better say, "Now, what I mean by a missed withhold is a should-have-known," you see, and it explains quickly. You say, "Just go in and find out from that pc what you should have known about him."

"What he should have known? What I should have – should have – he should have known about me? Doesn't seem to make any sense to me, but I'll go in. 'Well, what should you have known about me? No, I mean what should, should I have known about you?'"

And the pc says, "Well, well, you should have realized, you should have realized that I've always been a pervert, and you didn't find it out. *Ha-ha-ha-ha*. And you should have known... Well, you should have just known lots of things. You should have known I didn't

want to be here. And you should have known processing wasn't doing me any good and I was just pretending that it was doing me some good and..."

This auditor has all of a sudden become a citizen right on the spot. He's been sitting there processing this pc and all of a sudden there's this whole bank of mystery that has been going on that he didn't know anything about. And he realizes something.

Now, let's look a little bit further on this. Let's look further. A should-have-known simply is an unknown. And we're back to unknown Sec Checking – the Sec Checking of the unknown. And I've pulled out of that quick as a bunny because auditors were putting people into engrams and trying to run the engrams with them and it wasn't running well. They were running "unknown" on engram, and although people were getting their first glimpses of back-track and that sort of thing, it was too much and I wasn't about to teach auditors at this stage of the game – all auditors who come along – how to run engrams with "not-know." You see? So I pulled out of that, even though that was very successful. That was a few months ago, remember? That was a very successful process. You really could turn the bank upside down.

That's all you're doing when you're pulling a withhold, is you're curing an unknown-ness. The whole subject of withholds equates into not-know and unknown. It's just... A missed withhold is a half-known, half-unknown. So you get a half-know, half-unknown, and evidently there's enough charge just in having everybody not-know while you know, or in you knowing only half, and your reactive bank is an unknow of the other half, don't you see, that it causes a polarity of some kind or another that sets up a God-awful agitation in the bank.

So things that are half known – known to me but not to you, known to you but not to me, known to you analytically partially, but half unknown to you analytically, you see, so that you've got an unknown reactive and a known analytical, and it raises all the devil with you and that tells you all that is wrong with the reactive mind. It's an unknown area.

Now, you'll greet this head-on when you start processing these items you're finding so happily with 3D Criss Cross. We won't go into that just now but unknow plays a very, very heavy role in this.

Now, the not-know that is most important is the should-have-known. That is what is the most important aspect. It – that is the tense that is the most important. I've been looking for that for a long time. It's should-have-known. That itself is *regret* and that is what bunches the bank. I refer you to a tremendous amount of material on the subject of regret of many years ago. And that's very good material.

But should-have-known is what gives you regret. See, you didn't know it then, you know it now, so that you've got the time track now with the upper part of the track is know and the lower part of the track is not-know. And you've got these two things, not-know and know, and they come into a Godawful disagreement and collision. Do you see how that would be?

So you get your distress in the bank and your distress from elements, and so forth, from this half-known, half-unknown factor. However this traces down electronically, we're not as interested as we might be, because it certainly is observable.

A half-known fact is about the wildest thing that anybody ever had to do anything with. We hear a twig fall in the quiet and hostile forest. We hear this twig, you know, we hear it go *clatter*, and then we hear it go snap. And then we – there's maybe a little *thud* immediately afterwards. And a person just freezes. Where is the bear? See, we half know there is a bear there, but we don't know there's a bear there. We know something is going on, but we don't know what is going on, and it's a freezer, you see? So that is a very good example of your half know, half not-know, you see?

Now, this mechanism of regret is what turns a 3D Criss Cross valence into a ball. This is what loops the time track. Now, the mechanism of the looped time track is totally due to just one thing and that is should-have-known. And that is the swan song that the thetan is singing. If he only knew then what he knew now. And you get as a result of this, you get a looped track.

So that's what makes a black ball, bunches all the pictures up and smashes everything into one time zone of a valence. That's how a valence gets in to be a round ball circuit. That's the exact mechanic of it. It's the regret. It's the should-have-known. Regret isn't a strong enough word. Should-have-known.

We don't care what he should have known. He should have known better. He should have known about her. He, you know, he should have known about parents. If he'd only known about the outcome of the battle he wouldn't have engaged in it in the first place. And of course, all this thing adds up to is a feeling that one shouldn't have confronted. One shouldn't have done, one shouldn't have confronted, one shouldn't have experienced. So the prior pictures of having experienced are invalidated at once. So he just tries to say they never happened.

And then we get the occlusion of the whole track. See, nothing happened is what the final analysis is. He should have known. He didn't know. You see, what he's saying about the past all the time is that he didn't know, didn't know, didn't know. You know? He's saying at the same time that he should have known, should have known, should have known, didn't know, didn't know, didn't know, should have known, should have known, should have known.

"We didn't realize when we took off that morning for Germany that..." You know, here we go, here we go.

"When I walked up the aisle with that brute, I did not realize that..." And of course, the storybooks of life are filled with nothing but what follows.

In view of the fact that it – most of it's invented and created, we then get all kinds of loopy factors going on in valences and dub-ins and all sorts, and you can explain all other – all types of phenomena with this. Should-have-known. Now, that's apparently the most important button in the bank because it's the only one that out of hand can... But look, an ARC break is the only thing that can prevent a pc from getting results. Yet that not only prevents him from getting results but reduces his profile. That reduces his gain. And the only thing that creates an ARC break in the final analysis is a should-have-known. So add it up yourself.

If the ARC break is so deadly that auditing can't even – not only can't exist but shouldn't have existed, you see, the not have – the should-have-known must be more powerful

than the ARC break, because you can remedy ARC breaks by running should-have-known. Do you see this? Well, that's the equation by which we've worked this out and by which we can demonstrate these phenomena at any time.

But it's the should-have-known. That is the main thing that you're knocking on the door of.

Now, at the same time I worked that out – some time ago, articulated it a little bit better in the last few days so I can tell you what I was thinking about – but another thing came up. Your quantitative thinking on the subject of withholds is just this quantitative button that this universe has. It isn't the number of withholds you get. Nor is it the *bigness* of the withhold you get. Nor it – is it the *gruesomeness* or the *antisocialness* or the *newspaperheadline-ness* of the withhold you get. It is just the thoroughness with which you get a withhold. It's the quality of your auditing and the thoroughness of pulling a withhold. One withhold well, thoroughly pulled will give you tremendous case gain. And a thousand withholds indifferently pulled, will give you a case retardation. Now, what's the answer?

Well, right up there in that auditing room where you see the thing – I've started to audit in that room just to get practice on it and so on. I turn on all the screens and everything, and go ahead and audit the pc. I ran a session the other night that old papa Freud would have been standing around with his eyes bugged. You could have knocked them off with cricket bats.

He was always looking for tremendous resurges, you see, on the part of pcs. He was a – pretty much of a one-button man. I respect this guy but he was pretty much of a one-button man. If he could just get this *one* thing on the bank, you see, you'd get this tremendous resurgence, the drop out of the psychosomatic illness, and so on. He must have done it two or three times. He actually must have or he wouldn't have had such faith in it.

And if he could just, just hit that one thing, that, just that little hidden something there, if he could just get a – fingers on that something and produce this, well, he couldn't do it invariably, and he never taught anybody to do it, by the way. He must have done it himself a few times. And he never taught anybody how to do it. But he must have had some success with it.

He was looking for a withhold. That's all he was looking for. And you can cover the whole of Freudian analysis on the looking for a withhold. And in his particular case, because he was operating to a large degree with Jewish patients, he had tended to follow that mores pattern. Nothing wrong with that. It's just that it colored his work by having grouped too tightly. So he was looking for that particular type of aberration. And he was looking for it to have occurred in childhood.

And so he circumscribed the dynamic and he circumscribed the area of the track so seriously that he must have made a mess out of things here and there. He kept looking in childhood when it was a, the seventy-year-old man, you see, and the incident happened when he was sixty-eight. He's been nuts ever since, you know. And so he would not look in that area so much. He would look back in childhood all the time, you know. And maybe there was nothing there.

What he was looking for was a withhold of some kind or another. And he didn't quite know what he was looking for. But the few times that this had happened was sufficient to give psychoanalysis the springboard which pushed it out across the world. And that it happened occasionally, accidentally elsewhere – you know, other psychoanalysts had accidentally pulled a withhold one day and not quite known what they'd pulled, and then they'd go over the hills and far away. That was what put Freudian analysis up in lights. Just that one little factor. Look how – what a tiny amount is known about it. I mean you read Freudian analysis, you find there's very little known. They don't know very much. They didn't know even how to pull one. And yet they could get resurgences once in a blue moon, and Freud must have had pretty good luck at it.

Now, what was he doing. Well, I'll tell you one thing he was doing – he was restimulating enough withholds to make a lot of patients commit suicide and kill Freudian analysis – analysts, or try to, because you've never heard so many people get so mad at Freudian analysts as patients do. And the only way they handle this is by overwhelming the patient. Don't ever adopt those tactics because all you have to do – now that you've got the technology, there's no reason to punish the person. Just find the should-have-known. Just find out what should-have-known you've restimulated, you see? Pull it and he'll cease to be angry with you.

It's very funny. When you get very expert at doing this it's a very quick trick. It's just a *bing-bing* to keep a pc from having an ARC break. The pc has an ARC break, "What should I have known about you?"

"Well," he says, "Well, you should have known I've been uncomfortable for the last ten minutes."

You say, "Thank you very much. Do you have an ARC break?" You've got no ARC break.

You can have a pc *raving* at you, telling, "Your auditing *yap-yap-yap-yapyap-yap-yap-yap*. And you should have... And *wow-wow-wow-wow-wow-wow-wow*."

Just say, "Has somebody missed a withhold on you?"

And he says, "As a matter of fact, they have."

"All right." And it's liable to pull that quickly.

But, on the other hand, on the other hand, there are many of them that won't pull that quickly. You can get the moment that they weren't pulled and flip it, and knock out the ARC break. But then it gets flipped again and once more you've got a missed withhold because the basic withhold has not been pulled.

So there would be two ways you could handle this situation. One, is with the dress parade, the Queen's guard riding down holding up all the traffic outside of Buckingham Palace. Everything, you know. And let's really break it out, see. Let's troop the colors and the lot, you know. Let's spread this thing all over the place, you see? Let's do with the whole thing. Or you're – let's just knock out the key-in.

See, you've got two choices that you can go. Either you can knock out all the should-have-knowns on that subject in this lifetime, or you can – and this lifetime is just a key-in – or you can knock out the last key-in that happened.

Now, when you want to get a rudiment in fast, knock out the last key-in and then don't take the rest of it. And you knock that out with a lightly should-have-known – just a light two-way comm, should-have-known. *Bang!* If that doesn't work, you've got a dress parade to go on.

Now, when we talk about this dress parade, we're talking about HCOB of February 12, 1962. And we're talking about a specific system called the "Withhold System." And we're talking about something which runs off just about like you pull the levers on the slot machine and it comes out, except in this particular case if you pull the levers on the slot machine often enough, it empties.

That's not true of all slot machines, you know. I don't know if you've ever had that experience. I like to own slot machines myself, you see. And when I play them I go around to the back of them, you know, and fix the number of give and take, you see, on the thing. Fix that up so that it's 110 percent, you know. That gives me a great deal of satisfaction. But after a while I have to put more money in it so I can keep winning.

Well, you can almost run with a terrific regular – you can with this Withhold System, you just pull the levers of the slot machine and the money keeps pouring out. I mean, that's as far as that's concerned.

Now, the reason I mentioned Papa Freud is because if you work this system – that has nothing to do with it, this is just your added bonus, you see – if you work this system, you'd be absolutely fascinated to discover that all the basic buttons that you and everybody else have been searching for on this case, and the things this case had been worried about, and so forth, are just going to roll out on the rug. That's your added gain.

Now, in Prepchecking, the only thing you're trying to do – and that's the whole system – is you're trying to get in the rudiments so that they never go out during 3D Criss Cross. And that is the mission of Prepchecking. Now, we go into that later.

But you do this Withhold System, and something very funny happens. If you do this thing exactly according to the book, by the numbers, and don't get fancy with it and don't get careless with it, and you be very careful with it and handle every withhold that comes up with this, with this little system, all of a sudden the pc's bum ear and other things of this particular type, are all of a sudden going to straighten out. You're going to get yourself some fantastic gains. People will look at you like you are a wizard or something.

Well, of course, this is nothing compared to what you can do with 3D Criss Cross, but it's fantastic. It is darn well worth doing. And that's what's most fascinating about it is you straighten up the case so the rudiments will stay in while you do 3D Criss Cross. *Voilà!* Marvelous! Good-oh!

And at the same time you get all these extra bonuses, you see, of the person's arthritis and that sort of thing tends to disappear. Don't get too hopeful. It'll all come back on again while you're doing 3D Criss Cross. But it'll make life livable for the person. It's not an im-

permanent gain because it straightens up their present time environment for them to a very marked and marvelous degree.

And you get all these resurgences that Papa Freud got two or three times so remarkably – oh, maybe more than that, certainly more than that – and that Freudian practitioners get maybe twice in their career. See? And you get these things as routine about every five hours of processing, if you're doing this thing hot and right, see. The pc really knows he's going someplace. And all you're doing is straightening out the person so he can be run on 3D Criss Cross. That's the only thing you're interested in.

Now, Prepchecking is the system of getting each rudiment in with a crunch. That gets each rudiment in so it's more or less permanently in during the auditing in 3D Criss Cross. And that's Prepchecking. That is a different system than the one we're taking up here in HCOB of February 12th, but it uses exactly the same elements. So this Withhold System is applicable to any and all withholds, and it has very broad application – this exact system. We're going to use it in the narrow confines of Prepchecking.

Now, you could do a Joburg, Form 3, with one of these things and I'll give you just a rapid-fire example of how you would do a Form 3 question.

We have five parts in this system. Now, the Zero is the difficulty you're handling. That's your Zero. Now, the reason it's Zero is that's what you're trying to tape in, that's from what you are departing so it doesn't have a 1 because it's the place you're departing from. And that would be any question, any question that appeared in the Form 3 on a broad thing. "Have you ever robbed a bank?" That's not even a Form 3 question, but, "Have you ever robbed a bank?" see. That's giving you an example.

But that's what you're trying to clear on this pc, "Have you ever robbed a bank?" so you would write that in for your Zero.

All right. You've got a fall on that, so you say, "All right. What's that?"

And he says, "Well, I broke open a piggy bank once and took the money out of it."

All right. That's what his withhold was, you see. Now, you can write that down or not. That doesn't matter. You've got your What. Now, your What, "What about that piggy bank?" Now, for God's sakes, write that on the auditor's report. "What about that piggy bank?"

If you were doing a Form 3 this way, you would just take this other question. That's the question you're working on, and you just work off the form. But this number 1, you've got to write down because that is your test question.

"What about that piggy bank?" Or, "What about robbing that piggy bank?" We don't care what the wording of it was, but it's a wording that matches up to the withhold.

Now, the pc says, "I robbed a piggy bank once. I broke it."

And your question then would be the most close approximation you could get to this with a What. "What about robbing and breaking that piggy bank?" And that's what you'd write down in your auditor's report. Now, that's your number 1. That is your What.

Now, the way to handle this system is to memorize it on this basis of – it's, "What, When, All, Who."

All right. Now, you say, "What about robbing and breaking that piggy bank?" And it gives you a reaction, of course. He can say something else, but we don't care what he says. We frankly, really don't care for what he says from here on, as long as he keeps talking and giving us data.

Now, I call to your attention that a pc never refuses to talk to the auditor. He never refuses to give up the withhold. But he often doesn't know what it is. And it's the auditor's job to get him to look. And I don't care how harsh an auditor has to be to get a pc to look, but I don't want to ever see an auditor harsh because the pc won't tell him. That is idiocy. The pc *will* tell him. If the pc is even basically, even vaguely in-session, he can think of the gummiest, slimiest, horriblest, most anti-survival data, and he'll tell the auditor. But he very often can't find out what it is. So your job is to keep him looking, because it may be so frightening and so horrifying and so charged that he won't go on looking.

You know, he doesn't want to look – he, and so on. No, you can be as histrionic as you like from that point on, but get him to look. And never start chopping the pc up because the pc won't tell you, because you've told him he's out of session.

No, the only thing you want the pc to do is look. The pc says, "Oh, I don't know anything more about that, and I'm going..." And you get a fall on the meter.

"Ah," you say, "there's a great deal more about this. Now look at it. Now just look at it and give me some more about this."

I don't care how positive you get about it. The only mistake you can make is telling the pc "Well, now, you've got to tell me. You *know* that you know all about it."

Oh, that would be a horrible mistake, because you're admitting the pc won't talk to you, and of course he goes out of session, the games condition enters at once, and the whole thing goes up the spout, and you don't get any further, and so forth. So you never admit that point. That point never comes into the session. The pc will always tell you if the pc can find out. And your job is to get the pc to look and the pc to find out.

And the pc's sitting there all fogged up one way or the other and, "*Blooeey*," he says, "*blooeey, blah*. Oh, that's just all there is to it. There's – that's all – I just know that must be all there is to it, because there isn't anything else to it." And so on, you see.

"All right. Now look, it's still falling on the meter here. Now, is it falling because of an ARC break? No, I don't get any reaction from that. I tell you there's more to it. Look! What is there? You tell me what's there now. You just look."

"Oh, well, it's so-and-so and so-and-so and so-and-so, and well, huh."

You say, "Good. Fine."

But in this particular system, we can be insistent. But we take anything the pc gave us as the answer to the question. You're getting data the whole while.

So you say, "What about robbing and breaking that piggy bank?"

Of course, that's going to fall. He just told you, and it is not going to be released. That's for sure. But if you say it, and it now doesn't react, you haven't got a number 1, have you?

So you'll have to ask him for another one, won't you, to get a number 1.

You say, "Well, have you ever robbed a bank?" And that doesn't react now. You've cleared the question. That was it. So he broke a piggy bank once, so robbing banks registered and he phrased it, and he gave it to you, and you can't get any more read, and you've had it. You understand?

That's why number 1, the whole system is dependent on: number 1 must be cleared. And eventually, number Zero must be cleared. But the 1's must all be cleared, and eventually, Zero will be cleared.

All right. Now let's say, "What about robbing and breaking that piggy bank?" And it fell.

All right. We immediately go into *when*. "When was that?" Now, you don't have to hit that very precisely the first time. The more times you hit it, and the more times you go over it, the more precise you're going to get, until you could finally take a meter and spot it into within a fifteen second interval in the middle of some precise day and month and year and so forth, and the position of the planets, you know. I mean you could really zero that thing in with an E-Meter if you had to. But ordinarily, "When was it?" You see?

But the more often you have to ask that – go over it the first time you say, "When was it?"

He says, "Well, that was when I was a little boy."

That's perfectly good enough. Next time you go over it, well, "How old were you?" See, "When was it?" See?

"Well, I mmm-mmm." Get it down to the year, you know.

Next time you have to go over it again, you'd better be suspicious that there must be something wrong with the When if it's not cleared yet. So you've – it's very, very precise. So the more times you go across When the more precise you get on spotting it. You see the idea?

If you had to cross it once, you can do it loosely. Twice, a little more precisely. Three times, a little more precisely. Four times, man, you better start zeroing that thing in. You better be getting on the E-Meter by this time and really finding out if it was earlier than 1936 or later than 1936, you see? Let's spot it in.

All right. And of course, 1 fell, or we wouldn't be going on with it, you see. "What about robbing and breaking that piggy bank?" So we're going to do 2, 3, and 4 in rotation every time that we find 1 reacting. We don't do a thing about 1 but run 2, 3 and 4. That's all we do about 1 is run 2, 3 and 4 until 1 no longer registers. And at that moment, we go back to our Zero and see if it's registering. And if it's registering, we get another What.

Well, we could get another little withhold. We don't care what the withhold is as long as he gives us a withhold. And whatever he gives us a withhold on, we run back to it. But right now we're involved in clearing up this piggy bank.

All right. "When it occurred, is that all of it? Is there any more to it?"

Now, we find out, well, he says, "I was – I was just a little kid" – the answer he gave us. We don't care, by the way, what 2, 3 and 4 do on the meter. We're not really very close to a meter here.

We only care about Zero and 1 on the meter unless we're dating for 2. And we can actually pull our head out of the meter and talk to the pc on 2, 3 and 4 straight, every time. And he'll much more tend to hold in-session that we don't care what the meter reactions are – 2, 3 or 4 – we're always going to cover them, regardless of whether they react or don't react. We don't care. We only want to care if 1 reacts. So when we get back – when we've done 4, then we get our nose back into the meter again, and we say, "All right. What about robbing and breaking that piggy bank?"

And we don't got much reaction here. Except we might get something on "robbing" because it's still hot. But we don't get anything on the whole question. The whole question is not reacting. So we desert it, and we go back to the Zero, and we say, "Have you ever robbed a bank?"

You always leave these things with the same line that you get into them, which is why you wrote this What question down on your auditor's report. We'd much rather have the What question on the auditor's report than all the gruesome details.

So as long as we get 1 reacting, as a whole question of course, we keep on doing 2, 3 and 4, and 2, 3 and 4, and 2, 3 and 4. As long as we got it reacting, we always do... If we've done 2 – if 1 reacts, we do 2. If we do 2, we do 3. If we've done 3, we do 4, you see? And then if we've done 4, we test. So it's a matter of 2, 3, 4, test; 2, 3, 4, test; 2, 3, 4, test; 2, 3, 4, test; 2, 3, 4, test. Test. It's clean. Cheers!

All right. Now we go back. "Have you ever robbed a bank?"

That's the difficulty, see. "Have you ever robbed a bank? It's clean." And we find another withhold difficulty to monkey with. We can't get any more reaction on that one. We go elsewhere. We get another difficulty.

You see how this works now? It's very precise, by the way. And it is not any strain to amount to anything on you. And it's quite magical. Because a 2, 3, 4 are the three elements necessary to blow a withhold from here to Halifax so nobody will ever hear of it again.

All right. Let me give you a very rapid, little rundown example of this robbing the bank. All right?

We say to the pc, "Have you ever robbed a bank?"

We got a reaction. You say, "All right. Come on, give." The pc has had a chance to answer before we start plaguing him.

And he says, "*Wha-heh-ha yuh-uh huh-hmm*. I robbed, robbed and broke a piggy bank once."

And you say, "Good. What about robbing and breaking a piggy bank?" That is your What, and you write that down on your auditor's report – what about robbing and breaking a piggy bank?

Now, here we go. You say, "When was that? Is that all there is to it? And who should have known about it? Who didn't find out about it? Who should have found out about it and didn't?" Of course, you remember that "should" is much more important than the "didn't." But you can play this for variation, you see.

And so he says, "Well, so-and-so." It doesn't matter what the pc says. The pc's talking to you. That's all a part of the session, see. Pc's giving you dope.

And you can run back up here to 1. And you say, "What about robbing and breaking a piggy bank?"

And it goes, "What about robbing and breaking a piggy bank?" *Clank!* You say, "Good. Now just exactly when was that? Oh, how old were you?"

"I was six."

"All right. Good enough. Is that all of it?"

"Well, no. Actually, as a matter of fact, I hid the pieces afterwards, and so forth, and so on."

And you say, "Well, who should have known about that?"

And he tells you.

And you go back, and you say, "What about robbing and breaking a piggy bank?" *Clank!*

And you say, "All right. Now, how old were you at that time?"

"Well, I was six. No, no, no, my little brother was six. No, I was twelve. I was twelve."

And you say, "Well, is that all of it?"

"Well, no, it was my little brother's piggy bank."

"Well, all right. Good. Now, who should have known about it and didn't find out?"

"Well, my mother and father should have. I've been saying before that they should have known about my robbing the piggy bank. But they should have known about the fact that I beat my little brother up when he said he'd tell them. *Ha-ha-ha-ha*. I prevented them from finding out about it."

"Well, good. Good. All right. Fine. Now, what about robbing and breaking that piggy bank? *Click*. All right."

"Now, just exactly when was that?"

"Now, you say that was – you say you were twelve. Let's see, what year would that be?" And let's just ride it right in on the E-Meter. As a matter of fact, we find out he was sixteen, and his little brother was eight. *Heh-heh-heh-heh*. And it's beginning to put a greater and greater complexion on this thing. That would be a horrible thing to have happen to him, you see.

"Now, all right. That's good. Now, let's find out, well, now, is that all of it?"

"No, not all. Well, no, as a matter of fact. [sigh] They found the pieces later and I said my little brother had done it, and they beat him." [laughter] "And I said, I said I'd seen him do it." [laughter]

"Oh, all right. Thank you. All right. Now, who should have known about that?"

"Well, they should have known I was lying because all I did when I was a little kid was lie, lie, lie, morning, noon and night, you know." [laughter] "I never told them the truth. I never told them the truth from the day I was born practically, and so forth, and made a liar out of my little brother, too."

"All right. That's fine." And you say, "Good. Now, what about robbing and breaking a piggy bank?" And the thing is just as quiet as it can be.

So we go back to – we say, "All right. Have you ever robbed a bank?" Now, if "have you ever robbed a bank" still falls, we might compartment the question into, "Have you ever robbed?" "Have you?" "Have you ever robbed? A bank?" And suddenly find out that, "robbed," is still hot.

Now, we might have found in the What question that "robbed" was hot, so we just dropped that, you see. So it just went at robbed, but it didn't go on the whole question, you understand?

So we drop here back to, and we say, "Well, have you ever robbed anything?" But remember, remember if we've done that, that the question, "Have you ever robbed a bank?" is now null, and we are working on a new difficulty derived from a compartment, and our Zero Question is now, "Have you ever robbed anything?"

And he says, "Well, nothing much. Filling station once." you see?

"All right. Now, what about robbing a filling station? That got a reaction. All right." And you write that on your auditor's report, and then you just go 2, 3, 4, test; 2, 3, 4, test; 2, 3, 4, test. Test is null. Go back to your difficulty, "Have you ever robbed anything?" Null. We got it. Scrub it. Get something new to clear. Okay?

Now, that's that Withhold System. And I think you will find it works like a dream. But it's more important – now get this – it is more important to handle one little, cotton-picking withhold well, than to handle thousands indifferently. It is not the quality of the withhold that counts. It is how much of it is submerged. How much of it has dropped out of sight. That's what counts.

It isn't that the pc has blown up the whole southwest quarter of the universe. If he knows he's done that, and there's no more to it, and the 2, 3, 4s produce no reaction on that

whatsoever, that isn't what's wrong with the pc, no matter how inviting it is to blame his condition on having blown up things.

And we find out one day he was walking down the street and he kicked a parson in the shins. And out of this little, stupid incident, we suddenly run back a wild dissertation of stuff, of things the pc actually did that you really recover recollections on that is all gone now. You bring them back to view. We plow them all out. We square them around. The pc confronts that fact, and there we go. And the way you get him to do all these things is just your – the Zero difficulty that you're trying to clear, which at the moment to you would be called any Sec Check question.

It'd be a very good thing for you to pick up any Sec Check question that a person has given you recurrently. He has given the same withhold to several pcs [auditors]. Just put that down as your difficulty and get your What from thereon, because your What will probably be the same as your difficulty in that case. And clean the living daylights out of it, and you're going to find something that will practically blow your head off. It's only half known or it wouldn't be recurrent. See? And it must be a missed withhold. That's all.

And any difficulty could be handled that way. It's a fundamental. It's a fundamental question. Well, let's say this way. The guy's got a bad head. Let's just go into it. Let's clear up a difficulty. Pc's got a bad head. Well, you say – "Have you" – this is our difficulty – "Have you ever done anything to a head?" Our terminology at that point might be better. But the question, the fundamental question was "Have you ever done anything to a head?" Not "What have you done to a head?" That's our fundamental. That's what we're trying to clear up. That's his difficulty, and we've got to put it in some kind of an overt tense.

So he says, "Well, no, not really, except, well, there was punching a little boy in the head once."

You say, "What about punching a little boy in the head?" and you've got your 1. Now, you treat it from there on out. You could treat psychosomatic – you could do all sorts of wild things with this. It has enormously wide application.

What I want you to learn – and those that are leaving here on Friday certainly have very little time to learn this – what I want you to learn is just the simplicity of the little drill and what it produces.

Now, the fact that you don't have to read, except when you're dating, 2, 3 and 4 on the meter, you give your undivided attention to the pc. The pc can really talk to you. He can really tell you things. He tends to stay in-session and so forth. And you only go back and test that, see. *Bang!* If it's still alive, well, you just got 2, 3, 4, 2, 3, 4 and you'd be surprised what you will plow up.

Now, for a little while on any one of these lines, you're liable to be – find that you're somewhat plowing bum ground. That is to say there's no cognition. There's nothing much happening. You clear withhold and nothing happens at all. And you go back to your difficulty and you find the difficulty is still alive, and you get another withhold, and you get another What, and you clear all that up arduously and arduously and you clear it all up, and it didn't amount to anything.

And you go back, and your difficulty is still registering, your Zero is still registering so you find another withhold on this subject, and you clear all that up with great ardure and arduousness and so forth.

And you do your 2, 3, 4, 2, 3, 4 and it doesn't amount to anything. And it comes out no place, and the pc is looking gray and beaten, no cognitions or anything. And you go back to your difficulty, and you get another withhold on this particular subject, and all of a sudden the pc says, "*D-d-d-a-a-ahhhhh*. I didn't know that. You know it did, you know. It's true."

And you go through your 2, 3, 4 and wow! What do you know, wow! And your 2, 3, 4 and your 2, 3, 4 and you can just see your difficulty – your Zero – blow. You can see the whole thing blow out as a charge.

Nothing will fall on an E-Meter that is not significantly charged. And nothing will fall on an E-Meter that is not unknown in part to the pc. Interesting, eh? And if you get an E-Meter registry, there must be something unknown. You saw a session today which tended to demonstrate that there was an unknown item on the list, because every time we said one was in or out, we got a surge. So there must be something unknown about the list. See how easy it is to read an E-Meter?

If you said an E-Meter registers every time the pc only knows in part or not at all about something – he only partially – it's an unknown. The E-Meter registers unknowns, that's all. As long as an E-Meter registers, there's something unknown about it.

All right. It becomes very simple if you handle it that way. I want you to become very adept at this Zero, 1, 2, 3, 4. And the only thing you're going to get into difficulty with seriously, is converting the Zero to the What, and then holding the What constant for test. Now, you're not going to have any difficulty with it because I have already gotten ahead of you. You didn't show me this difficulty. I showed you. All right, see, it's no victory for you on it.

You don't vary 1. You don't vary 1. You don't vary Zero. You can become a little bit yappy on 2, 3, 4, but try to stay somewhere close to the wording. Stay close to the spirit of the thing. You could actually do it by rote but you won't hold your pc very well in-session.

But the variation I'm asking for is, "Well, is there anybody else who didn't know anything about it at all. Well, should they have known about it?" You see? That's a variation of wording. "Well, now, are you sure you've told me all about that? Have you recalled all there is to know about that?"

"Well, there's this little scrap."

"All right. That's fine."

So what you're actually doing is using the E-Meter just to test Zero and 1, and you don't vary 1. And what we call varying the question is a point you have never been able to cope with easily. We've always had difficulty. Some of you can cope with it quite well. But on the majority, they don't cope with it, in varying the Sec Check question so as to get it out. Well, this gives you the system by which you vary the Sec Check question. So there is no further difficulty about varying the question because the question is the same question on 1

every time just for test, and the variation on 2, 3 and 4 is practically microscopic. It's just so as not to get monotonous.

Well, it's just, "Have you thought of anything more about that? Have you remembered anything else about it now? Is that all there is to it?" You get that as a variation.

"All right. Just about when did that occur?" That's a variation on when, see?

See, your variation is microscopic. You have to stay on that sense. You try this, you work with it and I think you're going to produce some interesting looking miracles. I think they will be very minor.

Now, there's one thing I must tell you, even though it is very late, there's one thing I must tell you – is you go out of this lifetime with this thing and you accept a past life answer from anybody using this system and I'll have the other part of your thetan. [laughter]

No past lives at all. *Nothing* to do with past lives. We're not invalidating past lives. Pc says, "Ooooooh. All this stems from the fact, it stems from the fact when I was a pogo dancer on the top of a southwest pyramid."

And you say, "Good! Thank you. I'm very glad about that. Now, in this lifetime..."

You hold him in this lifetime because pcs will duck into the unreality of yesterday to avoid the withhold in this lifetime or, or they're trying to run the whole bank on it and this process won't run the whole bank. So whether they're just trying to duck or trying to audit the whole bank with this Withhold System, we don't care. You'll find it will all register in this lifetime. If you've got a registry it's in this lifetime. Now, what you're doing is keying out. The time to take up past life is with 3D Criss Cross, not with the Withhold System. And you'll find out that if you let them go into a past life, you'll miss all the gain of the Withhold System.

They duck back, and they start to clean it up. Well, they don't know enough about it, and frankly you couldn't even reach it with this system. This system does not have the strength or power to reach back into the past and that much occlusion and that much unknown. It just isn't that, isn't that strong a system. Terrific system for this lifetime. It's the greatest system ever developed for this lifetime as far as that's concerned. So it would be valueless on past track.

What you need on past track is 3D Criss Cross, and all your Withhold System does is put the pc into some kind of shape so that you can run 3D Criss Cross on him and then is the time to take up the past track. Okay?

So there's the limitations of the system. There are its purposes, and there is its use.

Now, anytime you strike a withhold, if you're going for the dress parade, if you're going to do it lightly find out who should have known about it, see? That's just the light punch, that's to get the rudiment in or something like that. But if you're going to clean up withholds, and you're straightening up the case, you break out the Queen's guards, drawn sabers, troop the colors, you got it. And that's the system. That's all. *Brrrrrp-brrrrp-brrrrp-brrrrp*. Grind it out. And you'll find out you'll get there.

Now, undoubtedly, you're going to find some holes in this system, but I don't think you will find any holes in the system itself. I think you will find that by doing some additives,

you can make it clumsy or unworkable. Now, that's between you and your conscience and your use of it.

I want you to get good reality on this, not just a good reality on missed withholds because this, of course, takes care of missed withholds from the word go. Okay?

All right. That's it. Sorry we were late tonight.

Thank you very much.

DIRECTING ATTENTION

A lecture given on 14 February 1962

Now, what date do we have? What date do you have?

Audience: Fourteenth of February.

Fourteenth of February, Valentine's Day. Will you be my Valentine?

Female voice: Yep.

I didn't hear any volunteers.

Female voice: Yeah.

All right. All right.

I didn't put the year on it. AD 12. Saint Hill Special Briefing Course.

We just had a good example of distracting the pc out of session and collapsing the bank on the face. Did you notice that?

Audience: Hm-mm. Hm-mm.

Wasn't that an interesting example? And do you notice that it dropped the havingness right out. Hm? Interesting, isn't it? The pc's attention – flick, bang!

Of course, the patch-up is to get the ARC break off fast. If you can't get the ARC break off, run some Havingness and get the ARC break off. Got it?

If you can't easily release an ARC break or easily get a rudiment in, it's always safe to assume that havingness is out. I don't know if you noticed that example. Just the flick of some paper and bang! – the pc's attention is out of session.

The gimmick you saw about illustration: I should mention something about that. It'll probably be a part of your flows. You see, your 3D Criss Cross – how you get a list and that sort of thing – originally was designed before we had flows. So it'd be only a special gimmick for flows. But we could broaden it and say, well, you get the pc to define what you're going to get the list from so that the pc understands it. And that way you wouldn't run into the trouble you've run into earlier on "like and dislike" lists.

So the pc – you don't know whether the pc likes it or dislikes it or, you know – and the pc finally says, "Well, I don't dislike anything actually. I *hate everything!*" you know?

And read – right away you say, "Well, let's have a hate list." See?

But let's be sure that the pc understands what we're going to list from as an additional step. We would do a Prehav Assessment or a flows assessment or take an arbitrary item. And in any event, let's make sure that the pc understands thoroughly what we are listing from before we start to list. Okay?

Another sign that is very interesting is: If you have the right flow you will get some tone arm action; and when you have ceased to get tone arm action on the list, you don't have any more items.

If you leave the pc on the meter during a listing, if you're on the right track you've got some tone arm action. It'll be anywhere up to about the one tone arm division – 3.0 to 4.0, 2.5 to 3.5 or something like that. It'll be at least that. You'll have that area. And the tone arm will wander around and as long as you have tone arm motion, your list is incomplete. I had to do some work on this just because we needed some additional indicators. Slight change: leave the pc on while listing.

Now, if you leave the pc on while listing and leave the pc on while differentiation, you will see the item itself discharge. And you hit the hot item on a list, you may get a discharge of two or three dial drops. The item which you will eventually assess, by the time you begin to null, has already been discharged. It's quite interesting, if the item is hot, that you will get a two – or three-dial drop. It'll just go *zooooom, zooooom, zooooom*. And you all of a sudden – the way you'll probably notice it on differentiation is that your tone arm suddenly is way out. Your needle is hanging over here on the side of the meter; you possibly won't see it go at all, you see, and you – because you aren't watching the meter very heavily – and you'll suddenly notice that after we read that item, we'll have to move the tone arm down about a division or two.

You decide that the one you just did must have been a very, very hot item indeed if you don't see the needle go. You got the idea? Because nobody expects you to watch the needle, you know, like the cat to the mouse hole, while you're doing listing and differentiation. Just keep it centered and try to keep your needle up to set. Keep a very low sensitivity setting, because it doesn't matter much.

See, the lower the sensitivity setting, the more your needle stays somewhere on the dial – the less adjustment you have to make of the tone arm. Of course, doing rudiments – oh man, that needle is just all over the place with rudiments; all over the place. Get that thing set at sensitivity 16, you know, and *rrwow!* I don't care how corny you sound. You notice that I'd rather you sound corny than – and careless or something, and be careful, than to be imprecise. Don't ever neglect to say the rudiment twice. See? Always be sure. Always be sure.

There's probably some characteristic in my auditing that you've been picking up, because there's a terrific amount of carefulness with regard to reads and that sort of thing. If I don't get them the first time, I'll ask them the second time. You never invite an ARC break, because you're interested in the pc's case, of course. And if you don't get them the second time – you're still not sure – why, get it back there and...

Of course, at sensitivity 16 your needle is flying at such a wild rate across the dial that it sometimes gets to the left-hand side of the meter, you see, before you've finished the ques-

tion. And you're left with the great embarrassment of having uttered your question and come to the end of it and your needle is sitting over there parked and unreadable.

Don't worry about things like that happening. Don't strain at that sort of thing. What I want you to strain at is being *awful* careful.

It looked like the thing did a slight acceleration. You know, it looked like after – right after you said, there was a slight acceleration, but you couldn't quite tell, you know? It was so indefinable. Ask it again and see if there was something there.

Then you look at it, and the needle just is – you're asking on a fall or something like that. Work a flying needle – it's perfectly all right – but work it carefully. One of the things is, please, as an auditor, don't put looking good *ever* above being a good auditor. Please.

You know, you can make yourself look awful good sometimes, you know? Pc is very happy because you've found an item, and you haven't found one. Don't tell him you've got an item unless you've got one, you see? Don't give him any hope, because there must be something wrong. There must be something wrong there that needs patching up. And your pc will just ARC break on it, that's all. You say, "Oh, yes. Well, we're very happy. I – we got an item," and so forth.

But be very careful and always put accuracy above looking good. And if you fumble, fumble, for God's sakes. I don't care how hard you fumble, but just do a good job. Do a good, thorough job on it. Don't try to look good. Because the only person who loses, you see, is the pc. The pc really loses.

You can err in several ways in auditing, all in the direction of reputation, of looking good, being kind – that is the main thing. There was a lecture last summer about being kind which is as bitter as I think I'd care to state it. You can kill people with kindness, man; you can kill them dead.

Failure to direct the pc's attention, letting a pc run on and on and on – being kind, you know? "Let's be careful that we don't have any ARC break." Well, I'll tell you what causes an ARC break. It's no auditing. That's what causes the ARC break.

As long as you're interested, as long as you're doing your job and as long as you keep clearing up the "should have knowns," you're not going to have any ARC breaks with the pc. But the way to have ARC breaks with the pc is to be kind and then not do your job because you might upset the pc or something like that.

You haven't seen this yet in my demonstrations, but I have been known to tell pcs to *shut up, that is it*. Oh, you did see some? No, no, you didn't see this. No, because this was a demonstration; it wasn't on the air. Got fooled for a second because I remember all the sets were on. I turn all the sets on up there and get used to auditing under those circumstances. It's a little bit rough because the meter is never in – it's not in the position I ordinarily use a meter, and so forth and I'm having to adjust myself to exactly that auditing circumstance. And – pc said, "You know, this goes back to a past life of – and I know this has its foundation in a past life." And we were looking for a withhold, see, in this lifetime.

And I said, "Good. You just leave that alone for the moment and we'll get around to that later. Come on now." And so forth.

And the pc cheered right up and smiled. Pc knew when she was getting away with something. And sure enough, there was a hot withhold right there. *Bjoo-bjoo-bjoo!* We had it practically in the next twenty words. But we were going to get all about this past life, you know?

You look up Sec Checks, and at the point where – old Sec Check forms – and at the point where the person just about connected, but the auditor didn't make him connect it, they immediately went into a past life. It is not a dodge mechanism so much as of – the fact that that withhold is connected, but it is restimulating the past life. So the closest thing available is the past life. You don't want it. All you want it to do is key it out.

And you look it over and it's very, very amusing. You look it over and you'll see the missed withhold, the question which you're now have to – going to have to clean up with the withhold system, can be found on these old forms by just locating where the auditor noted down the pc dived into a past life. You take *that* question and you clean it for this life, and you'll have the hottest firecracker withhold you ever wanted to meet. That's an interesting little trick of the trade.

Now, it is perfectly true that withholds in past lives are causing all the pc's real difficulties, see? So you don't want to invalidate this and come down on it with a crash and say, "We don't care about past lives. We're not auditing past lives. To hell with your past lives." That'd be the wrong way to go about this, you see?

The right way to go about it is to say to the pc, "All right. That in its place and this in that place. And what I'm looking for right now is what you did to the cat – now, in this life. We'll take the other up later in 3D Criss Cross. But right now we want to know what you did to the cat in this life, the cat named Joe," whatever it was.

All right. Now, that is what we're interested in. Now, if you can keep the pc from diving, you can control a pc's attention. If you can control a pc's attention, you can keep them from diving. And if you're controlling a pc's attention, the pc is *uhrrr – crank, crank – hrrmm-hrrmm*. And he's – he's, "No, no. I don't want to look over there."

And the auditor says, "There it is. There it is. Look."

And the pc says, "*Hhrn*. No, no! Really, it's w..."

And the auditor says, "*Mnnn-nnnn*." And the pc says, "But that's much more attractive right now."

And the auditor says, "Mm-hm."

And the pc all of a sudden blows 15 milli-megatrons of charge on this thing. See?

And the pc never forgives you if you let his attention go out of it. It's not kind; it's suicidal! The pc never forgives you if you let him give up or let her give up. I don't care what the pc says in the session. I don't care what argument the pc advances. It is read right at the bottom of your right hand column on the auditor's report: "Goals" and "Gains." And if you didn't

direct the pc's attention, you'll see "Goals made: No. Gains: No." Every time. You've got to get the pc's attention directed.

Now, if you let the pc wander into a lot of overts... This sounds like a generalized lecture; it's not a generalized lecture. I'm telling you how to run a pc on Prepcchecking, how to handle the pc's attention in pulling overts and so forth – what's expected of you.

You think that you're going to get an ARC break, you see, if you're mean to the pc. You've actually – would believe this on first inspection – that if you're mean to the pc, you'll get an ARC break.

Now, listen. It has nothing to do with being nice to or mean to the pc. That does not have any monitor of the session. That does not monitor the gains of the session or the attitude after the session of the pc toward you. See? That has nothing to do with it. Just discount niceness and kindness and being mean to the pc, being kind to the pc. Your attitude toward the pc: just pretty well cancel it out. See, you can't wipe it out entirely, but you can – whether you're mean or kind to the pc has nowhere near the bearing on the situation as whether or not you're effective with the pc. You can have that pc screaming at high C in the middle of a session, apparently all ARC broke, chewing you out like mad, and you're saying not, "Oh, well, I'm sorry we got into it." And you are saying, "All right. Now, what withhold did I miss?"

And the pc says, "Well, you're the lousiest auditor I ever had anything to do with!"

You say, "Come on now, what *withhold* did I *miss*? *When*?" And the pc says, "Well, that's something else. You needn't be cross about it and so forth. Well."

You say, "Well, I'm not being cross about it. I want to know! What withhold did I miss?"

"Oh well, in the very beginning of the session, of course, you failed to find out that I have an engagement at 3 o'clock and it's now 3:30."

"Oh, all right. Let's continue with the session."

And that pc will go out and he'll just *swear* by you as an auditor. "Oh man, that – that's my auditor, you know? A terrific auditor. Oh, terrific. He won't let me get away with a thing! Hm-hm-hm."

But the auditor who's nice and doesn't direct the pc's attention, and the pc goes out of the session and says, "Natter, natter, natter. Well, he's all right. He tries." You'd be surprised. You could be the most gentlemanly or ladylike auditor in the world, you know, and never have a gain on the pc, because that isn't what makes the gain. It's whether or not you control that pc's attention.

Now, you'd just be amazed how far you would get. Now, I'm not asking you to overwhelm the pc, because you actually don't overwhelm the pc with mood. What you overwhelm the pc with is evaluation and invalidation: the fact of invalidation, the fact of evaluation.

You say, "Well, I don't think that's the list. I don't think that has anything to do with it. That item doesn't belong on the list. What your item is, actually, is 'a spendthrift.' I've watched you for days and I know that." [laughter] And that overwhelms a pc. See?

And, "Well, you actually don't know what you're thinking about, actually. That's what's the trouble with the session. If you just knew what you were thinking about..." You know, invalidation of some kind or another. That's what ruins a pc.

Mood doesn't ruin a pc. I've had a pc fly out of an auditing chair and I've taken that pc and slammed that pc down into the auditing chair and say, "Damn it, sit there and get audited."

Pc after the session: "Wonderful session." Didn't even clean it up as an ARC break. See, it's very fascinating. That's the one thing you should learn. Yeah, be nice, be your cheerful self and so forth, but *direct the pc's attention*. What I'm not – I'm teaching you to be a mean auditor – I'm teaching you not to pay any attention to that factor.

If you're an *effective* auditor, and you *do* what has to be done, and you *direct* the pc's attention, you will get further by directing it crudely and badly and misemotionally than by not directing it at all. I assure you of this. Naturally, after a while, you get to be an old smoothie. You see that pc start out in-session, go somewhere or the other – just go zing, bang, thud – and you do the effective thing and so forth, and there it is.

But even then, now and then, you will get caught out in a storm. You say, "Where the hell did this come from," you know? And that's going to happen to you on Missed Withhold System, Prepchecking, time and time again, because *every time the pc comes close to the key withhold, the pc is apt to get cross with the auditor*. Now, that's the liability of Prepchecking and this Withhold System.

You start sailing down the line – it's an *indicator*; it's an indicator. The pc, right there at that crucial moment, gets some kind of a – it's the missed withhold mechanism, but it's a little bit in reverse. Just a little – got a little more curve on it. And you say to the pc – quite innocently – you say, "Well, who didn't know about that? Who should have known about it?" Anything you're saying for that third question – you can, you know, you can say, "Who didn't know about it?" just to salt the thing down. You can say, "Who did you make sure wouldn't find out about it?" That puts it in the future, you see? You can play it on the three tenses if you want to. I'll give you a list of the permissibles, you see? Down at that end, you can ask any one of these. The standard one is just "should have known and failed to find out," see. But you can vary this song anything you want to in the same breath, you know, and you'll just manage to pull it off.

But anyhow, you'll be sailing down along about the thing and you'll be getting to the "Well, is that all of it?"

"Oh, pity's sakes, it certainly is all of it. I'm – matter of fact, I am getting *sick* of it. *Aren't you?*" No man, you're standing right on the threshold. You're getting right there. That's all that is. Doesn't mean ARC break; doesn't mean anything at all. Pc is going misemotional.

All right, got the pc headed right down that alley. And if you don't head the pc down that alley, the pc will wind up saying you're the worst, lousiest, bummiest auditor he ever heard of. See?

Well, of course, you didn't torture him to death by... He's got to be made to *face* that withhold, and that's your whole job.

Now, the pc is sitting there – I'll... Let me tell you some of the primary and early withhold flubs.

The pc said, "Well, I don't think very much of Joe. Joe – Joe will never – never has anything much to do with me and so forth, and I really don't think very much of him. Matter of fact, one day he dropped me out of his car and so forth. Didn't even – didn't even accompany me to the door."

Auditor: "What else did Joe do to you?"

"Well, he was insulting – often – very insulting."

On and on, see? Buy a motivator, buy a motivator, buy a motivator. And by the time that session ends, your goals and gains – my God, the poor pc is just plowed into the ground. What you've done is run up a bunch of new overts and the session was used just to run up new overts. So that is the broad classification of a bad withhold-pulling session. It's just permitting the pc to go on and run up brand-new overts on the thing. In other words, he's giving motivators, he's making damaging statements, or she is making damaging statements, and that sort of thing. He'll run up at the other end, you know? Well, that was a common – a common thing.

Pulling other people's withholds. Now, that's the one you will face every time you try to train a Class II Auditor. Sooner or later, as he starts into this thing, you will find him sitting there pulling other people's withholds off the pc: because it's so intriguing; it's so interesting; it's like reading a scandal sheet. You know?

And all so true. And amongst those is running you down covertly, you see, by saying what they have heard about you, what the pc has heard about you. So that's other people's withholds, you see?

And the pc has heard from Pete about how you – so forth. And that's a withhold from you – *heh-heh, heh-heh-heh-heh-heh* – and that's a withhold from you. Brother, I just wouldn't spend three seconds' worth of auditing time on it. You know? I just wouldn't spend any time on it at all. Because if you permit the auditor to go on and pull other people's withholds, including withholds he has heard about the auditor – any brand of this – you wind up with that right-hand column right at the bottom: "Goals: None. Gains: None." Every time. It's just a wasted session. You see, it's ineffective. So that is one of the old-time common errors.

And the other one – there's another one on this now – is the critical thought mechanism. Now, that was too thoroughly banished, because I will use critical thoughts – ho-ho-ho – in old-time-style Sec Checking. You give me a string of critical thoughts and I'll show you the prettiest array of overts you ever heard of.

It's just an indicator. So you say to somebody, "Now, have you had..." It's a trap, you know? It's a great big, dirty trap that you've laid right in the middle of the boulevard. And they're going down this boulevard at 70 miles an hour and they're going to go right on by and they're not going to get any goals and gains by session end.

Well, there's – one of the ways to stop this is to ask them a leader, such as, "Have you ever had any critical thoughts about anyone?" And they merely tell you, at once, about all the critical thoughts they have had about Angela. And the only critical thought you listen to about

You say, "Well, is that all of it? Did you do anything *else* to him?" See, that's a good one to slide in on the end of that thing. "Did you do anything else to him?"

"*Hmmmmmm*. Did you do anything else to him? Hm. No. I mean, you know..." The needle is falling off the pin with a ni... "Well, wrecked his – heh-heh – took his car without his permission."

And you say, "Good. All right. You took his car without his per... very good. Fine. Fine. Fine. Who didn't find out about it?"

"Well, he didn't find out about it, of course. *Heh-heh-heh-heh*."

"All right. Very good."

And well, why test it? Why test it. You're going to town here. And you just say, "Well, just form's sake, you know. Well, what about thinking that critical thought about the auditor?" and so forth.

"Well, I..."

And "When was it?" And: "Well, it was – not 1954, it was 1958."

"Oh, all right. Well, is that all of it?" and so forth. "You said you did something to him again?"

"Well, yes. There's something about – well, about the car. I didn't tell you about the car. But – I wrecked it. Ha-ha."

Now, if you want to keep your 2-3-4 going on some allied thing, where you set it up with a 1, with a critical thought, then that critical-thought thing is not really going to clear until you've got the other material from it. Do you see the difficulty which you've set up? It's an internal difficulty. Now having pulled the critical thought, you get a real withhold.

All right. Your 2-3-4 is actually working on the real withhold and your critical thought one is working on a critical thought. But actually, your critical thought one will not totally clear until you've cleared the other one.

So you have to be smart enough to realize that you – you're really not working on the critical thought one. You're really not working on it. It's simply a test item. You really are never working too thoroughly on 1. One is your tester. But other material will come up after 1 and if – if 1 is of the variation or variety of a critical thought, you should know that there's a real overt behind it. And when you get to "all of it," throw the "done" on the end of it.

Well, that's the commonest waste of time. But the failure to direct the pc's attention can come out along something like this: The pc goes on and on and on, and they tell you so. I mean, you go into a stenographic audit – totally stenographic audit. If you don't direct the pc's attention during a Sec Check at all, he just winds up with no goals and gains, because he's talked all of his havingness down, he's upset, he's upset with you; you've talked him into a hole, that's all. And you've let the pc run up a bunch of new overts of one kind or another. The pc has actually probably damaged someone in the session.

You have to really sit there and control that pc's attention; you have to control it hard. Now, your Withhold System does that to a marked degree for you. That controls the pc's at-

tention by putting the pc's attention on what the pc's attention ought to be on. Now – that's your 2-3-4. Your pc's attention is on this withhold and it didn't clear, it continues to fall: Therefore, your 2-3-4 situation on the thing is the right order of questions, see? You don't have to go out into a bunch of other random things. But these questions still have to be asked intelligently.

You can't just say, "Well, stole Joe's car. All right. When was that? All right. Is that all of it? All right. Uhhh – all right. When didn't – who didn't find out about that?"

"Joe."

"Okay. You stole Joe's car. Good. When? Good. Is that all of it? Good. Who didn't find out about it?"

"Joe."

"Good. All right."

"Did you steal Joe's car?"

You know, it will almost work that way. What is fascinating, is it almost works that way, see? But you're working here where there's a little more bonus to be gotten on the thing, see?

Now, if you're paying not much attention to the E-Meter, except to see out of the corner of your eye if it starts to surge like mad, or something like this, on your 2-3-4 – well, you're – you know you're working something hot, and your interest is on the pc and you're looking at the pc, you're talking to the pc – you're not squinted over a meter, you see? You're asking the pc. Well, please, put a little bit of invitation in it to give, huh? Put a little bit of – a little coax, a little assist. And add to that a little insistence that he look at it.

I have been known to say, "It's perfectly all right to sit here the rest of the night, because of course until we get this particular withhold, we're not going home. But that's perfectly all right, but I think it would be much faster if you simply looked and tried to see what it was."

The person says, "Sitting here all night." And they look at me and they say, "By George, he *would* be willing to sit there, the *blank* – he *would* be willing to sit there all night until I spilled this withhold."

"Well," in desperation, you know, "Well, let's get working on it! Let's get working on it!"

"All right. I'll look... Hey!" [laughter]

But you can let any session go to sleep, see? You can let any session go to sleep, so that it's just *daw-na-dy-yahng-nyah-nyah*. See, everybody went to sleep in the session. And I don't advocate this as good auditing.

What you want to do is you've got your What and you're trying to clear that What, and when you come to 2, well, "When was it? Just about when was that?" Well, get interested! "When was it?"

This is the difference, you see? If you want to know when it was – that's what we're asking you to do, you see – if *you* want to know when it was. Don't just ask it because of a form.

Besides, you want to know when it was, you know? Well, let's find out when it was. Hasn't cleared up with two runs on 2-3-4, well, there must be something wrong with the date. There was something here unknown someplace, and so forth.

Well, let's get *awful* interested by that time. Let's date it down to a fraction of a second on a meter. Oh, I haven't showed you how to do that? Well, just go ahead and learn it. People have known how to do it for years. Don't expect me to teach you everything

It's the over-and-under system actually. "Was it before 1936 or after 1936? All right. It was after 1936" – biggest needle reaction – you know, the trace-down.

Pc all of a sudden finds out that things which happened in 1936, he has thought happened in 1957. And they tend to get their track scrambled because withholds group the track. So you're apt to get almost any date out of one.

But if this is also done in the spirit of helping the pc to look, you'll find that you'll get a lot further. And your rancor ought to be only directed in the direction (if you ever employ it at all) of making the pc look. Don't ever direct with the idea of: "Damn it, you better tell me or I'm going to be real upset with you!" No. The pc doesn't know, you see?

What you want to know is – you can say that perfectly well. You say, "Well, damn it. Will you please look and find out?" See? And you get away with that.

But the other one, you see, is untruthful. There's a lie connected with it. Frankly, the meter is reacting but the pc doesn't know. Now, you can bung the pc right out of a session into a games condition at a heck of a rate of speed by insisting he *tell you* something that he *doesn't know*. And he winds up in apathy.

No, what you use the Withhold System for is to get him to look. And any spare chatter that you handle there should be in the direction of directing his attention so that he will find out more. Persuade his attention there. Direct it with an ax; direct it with honey; direct it with gypsy music – but damn it, direct it! I don't care how you do it – particularly some of you girls have enormous skill – on the direction of attention. Terrific skill. Employ every bit of it.

Well, there might be some little salacious bit there that might be interesting to hear. "Why don't you see if there's something a little more interesting there?"

Pc says, "You know, that's true. There might be something interesting in this?" [laughter] I don't care what trickery you use. You can use any trickery that anybody has ever employed. You can use any persuasion anybody ever employed. But don't let me catch you *not* directing a pc's attention.

If I see reams of withholds written out, not sequitur, not one after the other that have to do with the same thing, I know definitely the auditor is not directing the pc's attention. You want to clean up what you want to clean up. That's what you want to clean up. And you better decide the thing is cleaned up or is not cleaned up, and you better continue to direct the pc's

attention until you decide the thing is clean. Keep directing his attention. You're still getting a reaction on the meter.

Well, I check every once in a while to find out if there's an ARC break. That's about the only time I ever use an ARC break or the phrase "ARC break" anymore, you know? Just ask the pc, "All right. Is a repetition of this question causing an ARC break?" I use that fairly often when I see an irregular bang on the needle and I can't get anyplace with it. And I'll ask the pc, "Is this question causing an ARC break?"

In 3D Criss Cross, use it the same way as this: "Has this – I've asked you for more items. Is that causing an ARC break?" I don't get the same response. Then I don't get any response at all on the ARC break question – I must assume, you see? But the E-Meter can confuse those two things. It can confuse data in the bank with an ARC break. And it does have a confusion point, so you must straighten out that confusion point.

You ask for more about the withhold, and you actually can be so insistent on it – get a pc half out of session – that an ARC break is created and you get a fall or a rock slam or something starts up. And you say, "Oh well, on this third question here, he hasn't told me all of it." And yes, he has. That's just the trouble. He has told you all of it and you haven't bought it. So you actually are building in a missed knowingness, you know? So that's what you get as your ARC break. It's just your missed knowingness.

So you say, "All right. Have I failed to find out something here?"

And you get the same reaction that you were getting on "Is there any more to this withhold?"

And the pc says, "Oh well, yes, there is."

"Well, when did I miss that?"

"Well, several minutes ago." And so forth.

And you say, "That's fine. All right. Do we have an ARC break?" and now there's no reaction on the thing, and so on.

Now, you ask the same question. You say, "You don't mind if I ask it again just to make sure if it's clear? Is that all of it?"

"Hm-mm."

You're getting to there's no reaction on it at all – just be clean as a wolf's tooth. More people ran terminals and goals lists up to the hundreds and thousands mark because when – by the time they ask, "Is there another goal or "Is there another terminal?" don't you see, the pc was so ARC broke and so out of session on it that you'd get a needle reaction. And so they'd say, "Well, of course there's more items."

We learned that one the hard way. If you think there is any suspicion at all that your question itself – it's always a repeated question, by the way – a demand of more, has created an ARC break, you always try to clear that up, just *drrrrrr*. Just rapidly clear it up just to make sure that your reaction is not an ARC break reaction. And then you get a true reaction.

The usual thing about it is that the ARC break shows up, blows off and then there is more of it. Now, that's more to the point. That's far, far, far more to the point in this Withhold System.

Pc has an ARC break and more data, too. Because there's where you get over this little hump. The pc becomes misemotional when approaching a real hot spot in the bank. Has nothing to do with the goodness of the auditing. As a matter of fact, the better the auditing is, the more certain it is that the pc is going to hit an ARC break attitude. Not an ARC break attitude; it's a misemotional attitude.

He starts to get cross with the auditor, because the auditor at that moment is a substitute for all the people who should have known about it and didn't. Of course, you're asking for a "should have known about it" and you'll see that rekindle. And it won't be much. It'll just be a little bit of "*Myng-myng-my-mu-mu-m-m-mo-on*," and so on and so on, and there it is. Everything is beautiful and shining, you see?

It'll be there somewhat, even if terribly faintly. And it can come up to a roaring storm. You've asked for the thing. You've said, "All right. What – what don't I know?" or "What haven't I found out about you in this session?" – you ask this perfectly innocently – and the pc says, "*Roouoo-ow, roouoo-clack!*" And you say, "Now, *what* don't I know about you? What did I fail to find out about you? What anything? What went on here? What part of the session...?" And you just cut through somehow, all of this chop and get that question answered.

And you'll find out that that will become a sign of a routine action in doing the Withhold System. So you might as well learn to buck up to it and do it well. Don't ever back off from it.

Pc is upset with you: pull the withhold. Pull the missed withhold. Pull the "should have known." That would be ordinarily. But in the Withhold System, just be sure that you just better go right on doing the Withhold System, because in the next question or two it's going to drop out of the hamper.

And the pc: "Well, I don't see why you're asking that. You've covered that. You've covered it and gone over it and over it. I can't think of any more of it. There's nothing more to it. I knew the guy. So what? I – so what? I knew the guy. I told you several times I – I knew him! Isn't that *enough*? Of course I omitted to tell you that also I lived with him for five years without marrying him. You know, I never realized that?"

You watch – you watch this, and it's – you'll find that it's a fairly patterned curve for the pc. If it didn't happen at all I'd become worried about the pc. You know? Say, well, we're getting no place with this pc. Couldn't possibly be getting anyplace with the pc. Why aren't we getting anyplace with the pc? Well, we couldn't possibly be getting anyplace with the pc because the pc has never gotten mad at us once during the entire session, so we have never gotten anywhere near anything the pc never found out before.

We must be mining a mine that was mined out several hundred auditing sessions ago. And that mine must have been completely mined out to the bottom. The pc will sit there; they give you all the withholds, they would let you publish them in the newspaper – they're perfectly all right. Withholds, who cares about withholds? What's this? All right. They give them

to you. They tell them all to you again. Pc never gets mad at you, pc is perfectly happy with you, pc doesn't change, tone arm doesn't shift. [laughs]

You could go on like that, you see, for hundreds of hours probably. That means you must be mining a mine which has been dug up. There couldn't possibly be another speck of nothing in the bottom of it.

But that is not the state of a pc that does have something at the bottom of the mine, you know? That pc is "Rrrrrrrr." He feels "Uuuuhhhh." And the pc is starting to get gray; the pc is starting to get hollows under their eyes; they're starting to waste away in the auditing chair. They look it over, they finally come near it, they finally look at you, decide you must be the withhold or something or other. And finally say, "Well, I was the usual self and... That's right, I don't think there's nothing when I was there. I – I – I – I no, nothing right. Huuuhhhh. Zt-zt. Damn. And of course, had five children by him. Never mentioned to anybody. And by God, I never thought of that either!" [laughs] Well, that would be a pretty obscured withhold, but... [laughs] All of a sudden they brighten up and, "Heh-heh! What do you know," you know? "Heh-heh. Heh-heh-heh. Well, you know, I never thought of that. You know, that's the most amazing thing. Known it all the time, you know? But I was sure I knew it, but I – I didn't know it. Well, that's pretty clever of you. Ha-ha, ha-ha. That's pretty clever of you. You're an awful clever auditor. My God, that was real smart of you to find that. How did you find that? Ah – pretty darn smart. Ha-ha."

You look at him: the hollows are gone, the circles are missing, their skin texture changes, their eye color shifts, the gauntness which they inherited all of a sudden pads out very mysteriously. You watch it. And they suddenly get a cognition.

"You know, say I wonder – I wonder if losing all of my teeth, which I had forgotten – ha-ha! – I wonder if knocking all of his teeth down his throat had anything to do with my dental trouble. Say, do you know, I think it does. You know?"

And they just start cogniting all over the place. And of course you can milk these cognitions down just by running more Withhold System on them. You just run some more on the same thing and all of a sudden they'll blow some more off, because the – their intense interest means that there's just a little speck or two.

That will bleed off usually, if they come up to that state, in the next twenty-four hours. They'll think of it as they go to bed that night or something of this sort, but you can actually take it all off with this Withhold System. It's quite amusing to watch. But if you don't see that kind of a cycle going on, you know the Withhold System isn't working or something's going on.

Pc is sitting there: pc is bright, colored, everything is fine, there isn't anything wrong; you as the auditor are wonderful, they're answering the questions, they're very happy to do anything, there's no change of the tone arm. They get to the end of the thing – in the right-hand column they write "Goals: No, no goals. Didn't make any of them. Heh-heh, heh-huh." And their ARC break comes after the session. After you've said "End of session," they go out in the hall and they say, "Well, that was a wasted mess."

It must be that the auditor never directed their attention during the entire session, see?

You can actually have a very happy pc who, four hours after the session, is liable to go get a shotgun and shoot you. You know? Pc was not disturbed by the session at all. It's just something about the mechanics of what you're doing, you see?

Now, you should not expect in doing the Withhold System – you should not expect for a moment – that your pc goes on a gradient scale of getting better. Your pc does *not* go on a gradient scale of getting better. Your pc goes on a gradient scale of getting worse. They look worse. They look grayer. They are more worried. Things are grimmer. Life has suddenly started to loom as a serious proposition, not to be trifled with by amateurs. Life is grim.

And they may go into that curve and come out of it with a fast cognition, or they may go into it for three or four consecutive sessions. They may go into it and out of it in twenty minutes. They may go into it and out of it over this cycle of four sessions. It all depends on what you're shooting for.

And if you do the Withhold System using your Zero question – your Zero question is well chosen – and if that is a very beefy question, very ornery sort of question on the subject of – you've all of a sudden connected with something there that is a very hot button of some kind or another, and it fell off the pin, and your Zero question at – as a whole question has been very much avoided by the pc – then it's some one of these four session propositions.

In other words, the hotter the question, the longer the cycle of action of the run, see? The hotter the question, the longer the cycle of action of the run. That's, of course, there's that much more charge to be bled off the thing before they come to grips with it. Now, the milder the charge, the shorter the cycle of action.

Now, the cycle of action is not our cycle of action. It's a different cycle of action for the Withhold System. And that is: is alerted, slowly perishes, goes to the bottom for the third time, and then on no graph curve but total vertical. See, it comes down like this and down and down, and then just total vertical, and goes way up above it. Goes way higher than the beginning of the cycle. It's a funny looking curve, but that is the response of a pc who is having his withholds properly pulled.

They don't get cheerfuller and cheerfuller and cheerfuller and better and better and better. And if the pc is sitting there looking cheerfuller and cheerfuller and you're not getting any tone arm action or anything, you know that at the end of the session it'll be, "Gains: No. Goals: No. Nothing. Ha-ha. That's it. What a lousy auditor you are." And be the truth, too, once you got that low. Because the pc's attention has not been directed into anything the pc's attention should have been directed to.

Now, the entire force of an aberration is devoted to pulling the attention in while buffering it off. You actually haven't got to pull the pc's attention in to the middle of any aberration because it's *fixed* there. But every aberration has a buffer. And that is to say, while the pc has his attention fixed on A, the last thing in the world he'll admit to is having his attention on A.

In other words, he's looking both ways at once. To look is to bounce, you see? The reason the tennis ball is on the ground is because it's in the tree. You know, that sort of thing. The reason the bomb is falling down is because it is rising. See? It's a fixed thing.

In other words, he hasn't got an inflow or an outflow on this point. It's not a clean outflow; it's not a clean inflow. But he'll bounce off of this thing. And you get into those things – you get into the zone areas, and the pc will go bouncy, bouncy, bouncy. And if you don't keep him pushed on in to that, you're not doing what the mind is doing, which is concentrating on that a hundred percent.

Actually, the mind is totally a hundred percent concentrated on it. The closer he gets to it, the paler he's liable to look. That's one of your maxims. The more ARC breaky he's liable to look.

I don't want your expectancy to measure up to: You pull withholds, and the person has a little withhold pulled and they feel a little better. And they have another little withhold pulled and they feel a little better. And then they have a big withhold pulled and they feel a lot better. And they have another withhold pulled and they feel a lot better. And it is not that cycle at all.

But you get a hot question, they instantly start to get sick. And it just gets worse and worse and worse. And then they really – I've seen a pc sit there in the most baffled stage on something I knew all about the pc.

You know? "But could *this* have been me, you know? I mean, but there couldn't have been *anything* about it. See, we lived at Fordham and we..."

"All right. When was it?" and so on.

"It was at Fordham," and so on. "No. No. No, *nothing* happened at Fordham. Just *nothing* I could have – nothing could have happened at Fordham. I didn't know anybody at Fordham. In fact, I don't remember anybody at Fordham. There wasn't anybody at Fordham."

And this is all out of something – the fellow says, "Well, I stole a cricket bat once, you know?"

And, "Well, when was it?"

"Well, it was when we lived at Fordham."

"Well, is that all there is to it?"

And you're liable to get some fantastic – "Well, look – who could I – I stole a cricket bat, but from whom? Fordham, Fordham, Fordham. Who? No, it couldn't have been at Fordham. Couldn't have been. Oh well, it just doesn't amount to anything."

And you run into the not-is, you know? "It doesn't amount to any – cricket bat is very cheap, and so forth. And it's very ridiculous of me to do so, and I undoubtedly gave it back the next day." Dub-in, dub-in, dub-in, dub-in. "No, no. That's not right either. Fordham. It must have happened at Fordham. But nothing could have happened at Fordham. Look, I only lived at Fordham between the ages of seven and eight. And I couldn't possibly have. See?"

Get an answer. You got to get an answer to your auditing question. That's one of your basic maxims of the auditor. But your pc starts to go into these things... Oh, no! Well, help him out all you can. Don't suggest things to him – don't be that helpful. But ask him pertinent questions about it.

"Well, was it a big bat or a little bat?" you know? "What kind of a cricket bat? A cricket cricket bat?"

"Well – well, it was a – just a little cricket bat. I mean, it was just... It was just a toy cricket bat, you know?"

And you'd say, "All right. Good."

Well, that's enough. See, don't beat him to death at that stage. Keep the Withhold System rolling

"All right. Well, who didn't find out about that?"

"Well, I – I didn't. I completely forgot it was a little cricket bat. It wasn't a big cricket bat at all."

"All right. That's fine. Good enough. Good enough." Don't bother to do anything about it. "Well, how about stealing this – what about stealing this cricket bat," and so on, you know?

"I really can't tell you. It's – it's very funny. It's very hazy because it must have been at... Fordham? Fordham? It couldn't have been at Fordham. It must have been at South Chichester, but at South Chichester... It couldn't have been at Fordham," and so forth.

Well, help him out. And you say, "Well, when was it? When was it? When was it?"

"Well, it was in 1957. But it couldn't have been in 1957 because it must have been in 1932. No, I wasn't alive in 1932. It must have been 1941. Well, that would have been during the war and they limited the cricket bats," and so forth.

And you'd say, "Well, just give me an approximation of when it was."

"I – really can't tell."

"All right. Well, you just sit there for a moment and we'll date this thing on the meter, see if we can zero it in a little closer." And you get the idea? Help him out. Help him out. Help him out. Lead that withhold to its doom. Help it out of existence. And then, "All right. Now, is that all of it?"

"All of it? I don't know anything about it at all. We've now dated the thing as having happened in 1945 and I was in the armed services in 1945... Oh, my God! Oh, yes! Heh-heh." And you hit something – "Oh, no! No. Well, no. No." And then you're liable to get a resurgence.

Well, when you start down that steep trail toward those last few fragments, you really got to help the pc out, because he's stoned! He just can't force his own attention into it.

So letting the pc's attention ride all over the place, you see, is actually letting the pc be the effect of this withhold and this charge. And he never forgives you. See? You've got to get the pc's attention and you got to hold it in there, and you got to hold it in there harder. But he says, "Well, can't we take up something else? There are a lot of nice juicy withholds. I've got some on sexy – I've got a couple of sexy withholds here that are very good." [laughter] "Let's get over onto those. I was a mermaid once. I could give you a withhold from that." You know, anything. You know, "Anything. Oh, this cricket bat." you know? "Oh, me."

He gets to the "Oh, my God!" stage. The closer he gets to the "Oh, my God! Oh, not that!" or "That'd be terrible!" or "What do you know, you know? I never remembered that." Any time that this – the cognition stage is approached, attention is harder to get in. And he finally finds out that it was a cricket bat that he carved personally for a little Italian boy in an Italian village and then that was all that was left of the village was the cricket bat. Because he failed to order his platoon out of there, and the Germans shelled it to bits and killed every inhabitant in it. And he'd hold himself responsible for this, and all, ever since, he's had this all figured out that it must have happened to him in his youth. And the only tag he's got is a cricket bat, see?

You know, there's this – but a cricket bat, of course, fits with "when one was young." So he's logicalized this. He hasn't remembered any part of it. He's got a – he's got a beautiful script here. It has nothing to do with reality.

And of course, he just can't face that because he couldn't face it at the time, so he just occluded it, just like that. And he said, "Well, that's it! Now he can live."

See? He's been figuring ever since down someplace in his mind, though, "If I'd just ordered the platoon out of the village that morning; the Germans came in the next morning, they would never have bombarded and they would have left them alive. As a matter of fact, I should have left the old area there earlier. I shouldn't have dragged anybody into it because there was no sense in it. There was no point in it. The Germans retreated the next day anyhow. It was all in a day. And I couldn't possibly have pulled an overt like that. It must have been due to the high command and it must have been due – and it must have been a cricket bat in childhood." See?

He just backs out of all responsibility for it and of course there isn't anything left there. He can't face having caused the death of 150 noncombatants, and *fzzz*. Something he doesn't look into.

You see how it is? So as his attention comes in, his attention comes off. And he – a part of that coming off is getting mad at the auditor, looking ARC breaky, being upset and that sort of thing.

But you must differentiate between a pc who is really ARC broken because you've gone into a games condition with him and a pc who is simply introvertedly ARC broke and is snapping at everything. They look different, by the way. They look quite different, one from the other.

Direction of the pc's attention. If you use this Withhold System, you direct his atten – you help him to direct his attention; if you're on a hot subject, why you'll get yourself some fantastic resurgences. Nobody has ever put their fingers on buttons like this in this fellow's mind. Nobody has ever freed up attention, okay, the way you have.

But reversely, reversely, if you don't direct his attention, he's being put into misery because his whole bank is kicking him in the head because there's nobody there helping him hold it down, don't you see?

Well, you've got to work hard on this particular basis and you actually don't have to slave over it or sweat over it. What you have to keep your eye out for is the tendency of the pc

to go general on the whole thing – generalize things and never come up with anything specific and never give you any kind of data, and just keep glossing over the top of everything and so forth.

After a while, why, wake up and say, "Well, see here. There's apparently something here. We keep going over this ground. Let's look, shall we? Heh-heh. Let's look. Let's look."

Now, I said, "Is that all of it? Now, that's what I mean. I mean – I mean, is there any more to this at all? Just look at it and see if there isn't."

No, the only thing we've missed here is a Bedford truck – you know, something of that size. Because as sure as he gets in toward one of these things he starts to go: generalize, sweep on the thing, and you start crowding him to it, he gets kind of "*Hrrrrr*. Well, I don't know if I'd like the look of this Bedford truck. *Arhrhrrrrr*." That works out with any withhold. "Well, you needn't be so cross about it. You needn't be so insistent about it. I'll look. I'm a perfectly cooperative pc. Hm. No. No. *Hr-psss-sst-ssst* – there's nothing there. But there's nothing there. There's no – there's nothing more. That is all there is to it. That is all there is to it" – the needle falling off the pin. "That is all there is to it."

And you say, "Good. Good. What more is there to the 'All'?" "

"Nothing here but the Second Army Corps."

Some little detail like this just slipped his mind, you know? You got to get him to look.

And the job of the auditor is *not* to get the pc to tell. Yes, the pc will talk to you and the pc better be talking to you. And don't misinterpret that to this effect: that the auditor doesn't have to be told the withhold by the pc. Don't misinterpret that. But just frankly and overtly and directly, if the pc knows about it, the pc will tell you. And that is what you must realize and make up your mind to.

The reluctance of the pc to tell you, all stems from his not knowing about it. And your pc will have a very easy time of it if you grasp this one point of the Withhold System, because after that you will assist him to find out and you will help him find out things.

If he says, "Well, I just don't know," you say, "Well, let's find out."

See, he says, "Well, I just don't know."

Don't say, "Well, tell me." See, that's the wrong response. Get your responses different. He says, "I just don't know." you say – wrong response, "Well, tell me about it," see?

The right response is: He says, "Well, I just don't know and there doesn't seem to be any more," and so forth.

And you say, "Well, look. Let's look at it. Come on, let's dig it up a little bit more. There must be some pieces showing someplace. Aren't there an old pair of winged-foot heels showing out of this rubble here someplace? Where – where is this? Let's dig it up. Come on, here – dig it up."

And he says, "Oh, yeah, there's a couple of very nice people there. I didn't realize that. Yeah, well, there's something." Well, all right. Take that as an answer. Buy the pc's data and keep the system going. See?

Now, the mistakes that you can make is thinking the pc isn't going to tell you. The pc is going to tell you and the pc knows he will tell you.

And the other mistake you can make is thinking that the pc is really upset with you when he starts getting upset with the bank, and start chopping the pc.

Another mistake that you can make is failure to handle the pc's attention – to cut off the pc. The pc is going on and on and on and saying, "I had this dog, and his na – his name was Rover. And the dog used to run up and down the street all the time and he used to jump on and off the hedge and so forth. And I used to teach him to jump on and off the hedge and he had a big collar. And he had a wonderful collar and so forth. Then one day one of the boys stole the collar and I beat him up, and I got the collar back and we put it back on this dog Rover. Well, as I was telling you, this dog Rover, we used to keep him in the garage because he's such a big dog. We had a big garage there, so we'd keep him in the big ga – big dog in the big garage, you see? And we had this thing."

Oh, man! If you want a pc to get upset with you, let him do that – let him go on and on and on. How do you shut a pc off? Well, if you can't think of anything else, say, "Shut up." I mean, that will upset him less. See? That will upset him less.

You learn that. If you learn those little points and you put those points into practice, your Security Checking will become a song. I guarantee it.

There's nothing much to this. Now, we're calling it Security Checking loosely. It's actually Prepchecking now. You're going to get the rest of your materials for this – the little checks and so forth that you run for your Zero questions. Right now, as I've said before, the most fruitful source is to find – if you got any old form, any old form anyplace, the pc has been sec checked on, you'd find one of it's items is loaded (there's one question on there was loaded), use that for your Zero and just go over that and over it and over it.

And if you're – if you haven't got the form from the pc, because you're auditing a field pc and so forth, and you haven't got the records, you can say, "What withhold did you keep telling an auditor? What withhold have you continued to tell an auditor for a long time?" And then try to find out what question got this withhold and try to rephrase that question. And then you've got your Zero and you can take off from there. And, of course, you'll just mine the mine, because it'll go from there on out. And that's one when you're operating on HGC pcs that have been audited by a field auditor and you don't know quite where to start on something like this, you could start there very fruitfully if you didn't have a standard check form. But this person had received a lot of auditing and was – appeared to be very ARC breaky and so forth. Well, somebody has headed him into one of these things and they haven't gotten him off of it.

So the most profit that you could make on the whole transaction would be to say, "Well, what withhold have you told several auditors?" or "What withhold have you told auditors several times?" "That's a good one. All right. That's fine. Now, what question would elicit

this withhold? What question had been asked that did it?" And try to put some kind of a question together that would have gotten that withhold and then mine this question.

And boy, oh boy, you'll see the bank roar. Because people have sec checked this person straight into the middle of a – of a dead stop. They got him right there. They've restimulated something and they haven't pulled it. And that's what's known as your recurrent withholds. Your recurring withhold.

And a recurring withhold is very, very, very well plowed because it's already as though somebody has just set up a radar screen and a couple of compasses and some geophysical markers and the American flag with the eagle on top of it ten feet tall, see, and saying "Under this is an item the pc does not know anything about." And that's your recurring withhold as a sign or symptom.

The other one is a recurring complaint. You know, "Who have you complained about most? What have you complained about most?" And you finally zero that in and you'll find out they've complained consistently and continually about their family. Well, you could use it as a withhold question.

But there is one little word of warning on that. Knowing 3D Criss Cross, you will be very cautious about sailing in toward targets. And you don't sail in toward targets that you don't know whether they are terminals, oppterminals or whether they are on the 3D package at all, because you know that you can beef up the whole Prehav Scale by running a wrong terminal.

So the – one of the poor ways to go about it: This girl has always had trouble with her husband, so we immediately say, "Well, without any questioning at all, she must have withholds from her husband. So therefore, *bang!* – let's just sail in on this and let's use the Zero question 'What have you done to your husband?'" or something stupid like this, you see?

Let's use this – husband, see? Husband. Oh, oh, oh, wait a minute. She's always had trouble with the husband. The husband is either in the bank or not in the bank or should be in the bank, but there's something 3D Criss Cross wrong with this terminal "husband." So you of course don't follow that up at all.

Your generalized questions – your Zero questions – should be very general on the subject of doingness or knowingness, but they shouldn't have too much to do with beingness. They could have something to do with havingness. But you leave beingness alone in those Zero questions and you'll be all right, because this stuff is all being run – usually being run – prior to 3D Criss Cross and you wouldn't know anything about it.

By the way, any 3D Criss Cross item – this is not advised – but any 3D Criss Cross item that proved out as the pc's terminal could probably be moved in as a Zero question of the Withhold System. Now, whether it would blow up part of the universe or part of the pc's head or not, I don't guarantee because it's not been tested.

It's probably too much and it's probably too unreal. But just give you an idea that if you were going to do beingnesses, those are the beingnesses that you would do on the Withhold System, and you leave other beingnesses alone.

You can take up the whole subject – you could take up any subject, you know? But be careful with the beingness aspect of it, see? You could take up a subject of "marriage." But God help us, let's not take up the subject of husbands and wives, you got the idea? Or families. You see, that's beingness. We can take up the subject of being broke, but we can't take up any other. Okay?

Male voice: Yeah.

Thank you.

Male voice: Thank you.

PREPCHECKING

A lecture given on 15 February 1962

I thought you might be interested at first glance here – I thought you might be interested in the Auditor's Report notations on that. You saw Prepchecking, I didn't show you the Withhold System. You were looking at Prepchecking and the numbers are different on Prepchecking.

You've got here Zero, "Are you willing to talk to me about your difficulties?" which is just a good, solid Prepcheck question, which is a rudiments question. This is mostly what you'll be doing with rudiments anyway. I mean, pardon me, Prepchecking is just getting in rudiments so they are zeroed in a hundred percent, hence the number zero. It's an artillery term. I might as well just give you a lecture on this.

Okay. This is 15 Feb. AD 12, Saint Hill Special Briefing Course. And we're concerned here mainly with Prepchecking. We've got some people that are going; they'll be having a wrestle-around with this, and I'm sorry for that, but you can make it all right.

Did you learn anything from the demonstration?

Audience: Yes, yes.

Yeah. Did you notice that the questions were being given actually that appear on the Withhold System fairly repetitively? Pardon me, one after the other in sequence and not repetitively, but occasionally repetitive? Why was that? Why did I repeat one of the When, All, Who's? Why did I repeat When, All, Who's? At what moment did I repeat those?

Yes?

Female voice: You ran an extra incident that keyed in.

Yeah... The basic reason is the pc still looked puzzled. It's as elementary as that. You get how elementary it is?

You say, "Who should have known about this?"

And the pc says, "Well, Joe, you know. Joe should have known about this and..." See?

"All right. Well, anybody else should have known about it?" or, "Who didn't find out about it?" or "Anybody fail to find out about it?" any variation of the question.

But you're just looking at the pc for a little surge. Well, that will only go so far. Sometimes the pc doesn't surge. Sometimes the pc doesn't say, "Oh well, yeah. Well I shouldn't have known about it, you know," or something like that. He doesn't have a little cognition.

Just leave it. It comes under the heading of "fishing for a cognition." You want him to find out something, see?

So remember that pulling withholds is totally and a hundred percent...

You don't mind my talking about your session, do you Fred?

Male voice: No.

You remember that fishing a cognition?

Audience: Yes.

Remember the old TR, Fishing a Cognition? Well, that's actually what you are doing there. And I'll tell you something: your pc can go out of session if you were not auditing the pc, but auditing a system, you see? Pc'd tend to go out of session because they – interest, of course, wouldn't be on the pc.

Now, the system merely exists to get withholds. That's the first thing you should recognize in Prepchecking. The system exists in order to clarify difficulties. And Prepchecking in general – although it has a whole ramification of stuff – is compared to the rudiments and is plotted immediately and exactly against the rudiments. And you'll get a whole bunch of little questions which are Prepcheck questions, which are Zero₁, Zero₂, Zero₃, Zero₄, Zero₅. Do you see the numbering on this?

The rudiment that you're writing down here... I'm not going to say anything about your withholds, you can start breathing. [laughs] Just talking about the system. The Zero, of course, is the rudiment question. That is the Zero which you're trying to clear up. But to clean up this Zero you have to have a Zero₁, Zero₂, Zero₃. They're a little Zero-Sub-One, Zero-Sub-2, Zero-Sub-3. Do you see those? Huh? And this little – will simply be for this rudiment. They're different for every rudiment. You have a different panoply of and parade of questions, you see?

This rudiment happens to be the dynamics. "Are you willing to talk to me about your difficulties?" Now, if you want to put that together – if you want to put that together – you just take all the parts of the dynamics. You see, you take self, sex, children – all of this sort of thing. Well, what was very peculiar here, is all I was trying to clear of the first of these, the pc's withhold came up on the second dynamic, not the self, see? And we had a second dynamic withhold occurring here, but remember I started out to clear self because I had no other choice. At the beginning of this session, we didn't know anything except the pc knew it was a withhold session and was very happy about it, and said to get "the biggest present life withhold I have and run it out," see? All right. He said that so naturally he's going to give it to me.

But what I want to have done in the thing, is let's clear the auditor. And I wanted to show you the most fruitful rudiment in action – let's clear the auditor. That we almost skimp in auditing, and yet it is the most important one. Yes, it's important to get people's havingness together. Yes, it's important to do this, but there's nothing else in auditing clears the auditor but the rudiment!

See, other rudiments clear other things, but there are no processes we have today that clears the auditor. See? "Are you withholding anything from *me*?" you could say in the session. Yes, that tends to clear the auditor a bit. "Is there something you – I should have found out about you?" Yes, this tends to clear the auditor a bit.

But, actually there's this whole huge area that we've got to raise up to the highest possible pitch. We've got to get the highest possible relaxation on the part of the pc for the auditor. There is the weakest part of your auditing. You see? And it's not the weakest part of your auditing personally, see? But in auditing pcs, that shows up as the weakest point, is the pc hasn't much confidence in the auditor and you've got to build that confidence up.

Now, if that confidence is built up, the pc will stay in session come hell or high water. The pc will actually get mad as hell at you and still be in-session – do you see the difference – instead of being mad as hell at you and out of session, you know? The pc you've just – because why? This particular prepchecking activity is peculiarly liable to the pc going out of session. Why? Well, you're asking him for very intimate activities. It drives him out very easily.

But there's a more important one than that. It's just before he stubs his toe on one of these kingpin withholds; it's a missed withhold! It's been a missed withhold for several seconds, at the least, see? Even while it's a missed withhold for just the period he said, "Hmm, well – uh-hmm, well – uh-hmm." Just at that moment it's a missed withhold. You haven't got it yet, have you? And if he doesn't articulate it right at that second, he starts getting angry with you. He gets a little upset with you, and so on.

Well, it's worse than that. He starts running into it about five minutes before. And he doesn't know about it yet. And the only person he can locate that's badgering him – you see he's being badgered. He's something like a bull with banderilleros being shoved into him, see? And he doesn't quite know what's – what's kicking him. So he looks around to find the most likely target and, of course, it's the auditor. So he tends to be a little bit nervy on the subject of the auditor at that moment. And you will see this time and time again and please, please in sec – in all this Prepchecking, please recognize what it is. It's the pc is just coming up right on the edge of it.

Now, if a pc isn't tremendously well in-session, *zzhhhh*. See? So therefore it becomes very important to get the auditor clean as a wolf's tooth just as early as you can in Prepchecking.

Now, your rudiments aren't run 2, 3, 4 in order. There are some rudiments that it's more important to run than others. And this first one – the first one, the most important one – is, "Are you willing to talk to me about your difficulties?" That's your first rudiment and that's the most important one. So therefore you take that up. If you were doing an HGC pc, what you would do, would be to clear up, "Are you willing to talk to me about your difficulties?" as your kingpin Zero question, and then move over on to the last one: present time problem. And you do a Problems Intensive. And that's what fits under there – just your standard Problems Intensive complete with form, just as you've been taught to do it. You see?

That's the old 22 December, Problems Intensive, HCOB. Don't look at me blankly; you know of it. And you just do that whole thing from beginning to end. I don't care how much data you get on the pc before you get up to that – I think it's the O section. But when

you get to that O section, you get those self-determined changes in life and you go down there and you find out then what those self-determined changes are. You assess the self-determined changes. You get the one that is the hottest one and then you ask him, "What problem immediately preceded that change?" and it'll spit out if you've assessed it well. The pc it – it'll just sort of appear magically.

He doesn't have to grope for it. If he gropes for it, you've goofed. You haven't got the self-determined change. You assessed wrong; the pc didn't give you all – something crazy went on here that was just simply lousy auditing. It has to be that crazy. It has to be that bad for this phenomenon not to occur.

You find the self-determined change, "When you decided to go rowing as a profession on the Thames." Oh yeah, that's good. And that falls like mad. And you say, "What problem immediately preceded that in your life?"

And, he's hardly ever thought of it before, but it should just appear in front of him like a magic lantern is turned on, you know? And he suddenly looks at it and he says, "How to drown my wife."

And it surprises him almost as much as the surprising things that come out of it. I mean, that's the way it ought to pop. But if he's at all in-session, that is the way it will pop. If he's worried about session and he's – not any confidence in the auditor, it won't pop that way, see?

All right. Now, you just handle it just the way you handle it, that's all. You just go down the line and list all of the people of the immediate prior confusion. Actually you locate the immediate prior confusion to it. (Let me put this straight way to.) Get the prior confusion to that problem. And listen, it wasn't five years before; it was anything from five minutes to five days or something like that. It's closer. It's much closer. He'll give you an earlier one before he gives you the actual confusion. Don't just take the first confusion he gives you.

Well, he'll give you a confusion, "Well, immediately prior, how to drown my wife. Well, it was my childhood. My mother beating me and so forth every day, and my mother and my wife must have looked like my mother or something I read in a textbook, and so therefore, my – this – this must have been it. And the immediate prior confusion to wanting to drown my wife? Well that, that's it. We've got the immediate prior confusion – when I was three." Only he's forty when this problem came up. And you'd be surprised, that's your main – your main error in spotting prior confusions, see?

Well, you just walk that up and let's just spot – let's just spot the minutes, hours, and days and weeks immediately before that self-determined change for that problem. You just spot that. You can take it on the meter and you'll find it. God almighty! He found her in bed with another man and he completely occluded it. You know, it'd be something wild in here, see. Much more likely, however, this turns out to be a complete dub or something of the sort. And it's an entirely different situation as we turn out in Prepchecking.

All right. You take that zone – that prior confusion – and list the people who were present in that. You get a list of the dramatis personae in that area and then it was – you assess that list and you'll get the hot one. And you take that hot one and your – it get – it – you get a

Zero₁ that runs something like this. And the Zero₁ would be, well let's see... "What – well, what difficulty – What about your difficulties with Fred?" That's a perfectly good valid question. "What about your difficulties with Fred?" See?

And he says, "Well what about them? Nothing about them," and so forth.

Now you have at this point, you've got your – your Zero, of course, is the rudiment – present time problem. Well, that is narrowed down to getting this fellow's problems straightened up. So that's still your Zero.

Then you get a Zero₁, which is your Problems Intensive result. And that becomes, "What about those difficulties with Fred?" You got the idea? Hmmm? That's your Zero₁. And then you get, of course, you get 1₁, because he's going to give you a withhold and now you're going to run the Withhold System.

So your whole Withhold System runs off of 1₁ until you can finally clear about – "What about those difficulties with Fred?" You see, that is really your master question, is: "What about those difficulties with Fred?" That is your real 1 that you're trying to clear. But in order to try – in Prepchecking in trying to clear, "What about those difficulties with Fred?" he gives you a withhold – you even chitter-chatter, "What about those difficulties with Fred?" and you see that it's reading.

And he says, "Well, I don't know."

"Well, are you withholding something about Fred?" Give him a prompt, see?

And, "I was withholding, I guess that I've hated him for years, I've withheld it," and so forth, you see?

And you say, "Okay. What about hating Fred?" See?

Now, that is your 1₁. And you just clean up this, "What about hating Fred?" And you just clean it up with the Withhold System, see? Sounds very sloppy, but it isn't sloppy at all because your next line, of course, is, "When did you first start hating Fred?" or "When was that?" if he starts giving you hotter withholds, don't you see? And so on.

Now, frankly, that can go to a 1₂. See, you're sinking one stage at a time here off of this thing. What this is, is a German *schema*.

"What about hating Fred?" is awfully broad. Maybe too broad, you see? Well, certainly, "What about those difficulties with Fred?" is broad enough. God, that's – that's the Thames estuary-wide, you see? And then you get into this little tributary, "What about hating Fred?" and that's your 1₁, see?

But we find, now, he has innumerable withholds from Fred and, "What about hating Fred?" well, so forth, well you kind of have to steer him now. That's what I mean about steering the pc's attention.

And, "What about hating Fred?"

"Well I hated him for this – motivator, moti – "

"Well, what did you done to him?" you see? "What did you do to him at that particular time?" or something like this. Anything you can steer him into. You don't put that down, because that's just a spat. *Nah*, it's something or other. He's just going to give you tons of these things, see? And you will eventually get out of it. And finally you'll clean up, "What about hating Fred?"

But I said you didn't put it down. If it's "What about hating Fred?" and then he gives you one that is worth calling a new What, see, as soon as you've got a new What, is "Well, actually, all my life I have tried to undermine his reputation." And that is the withhold. That is a real withhold, see. Now, you've got your 1₂ and you carry on from there. And you clean 1₂ which is about his attacks on Fred's reputation, see? That all cleans up.

Each one of these, you see, is done by the Withhold System. But as – if you run down to the second 1 and the third 1, you see, you have to clean it up before you clean up the second 1, before you clean up the first 1. You've got the idea? So, I don't care how deep you go into the well.

Now, you could keep this far too accurately. That's one of the things you should know. You can keep it far, far, far too accurately. God, you could fill notebooks for one session, see? These things are simply indicators. We've got to know where we go back to. That's all we've got to know here. We've got to know where we go back to. If we've cleaned up "ruining Fred's reputation" and that Fred didn't know it and nobody knew it and we went over the 2-3-4 – we're going to get incident after incident, "What about ruining Fred's reputation?" you see, if that's your 1₂, that's – well, you've written that down – "What about ruining Fred's reputation?"

And he says, "Oh, uh – well, uh – I uh – actually planted a letter in the mails; it was a forged letter." Something like this, you know. This is very hot, see? Well, you don't go on with, "What about that forged letter?" you see, and get a 1₃, because this is just a whole cluster. This is going to – this is a big mess – across the boards, you see?

You must remember that a withhold is a mess, see? Now, you are applying a very neat, precise system to something that is totally gummy. See? You're putting on a nice pair of boots to weed and wade through the darkest of mud.

So, you start to get too neat and try to follow down every trend and everything the pc says and everything the utter – the pc utters, and make a sub-numbered What out of it and so on – you'll just run out of auditor report paper in the first ten minutes of the session, and you also will have gotten lost – lost your whole orientation on the case, which is simply: get this withhold good and slicked up. You see? And well knowing you could be mining very arid ground at any time. You see, it doesn't amount to anything. Nothing much is happening.

So the thing for you to do is to keep your orientation – to keep your orientation on what are you really trying to clean up, and any time you hit a central thing that you really want to clean up, you make a sub-numbered 1. But if you've got that cleaned up, now there's no more kick at all on having put this in the mails, you see, and this forged letter and so on. You've gone the 2-3-4, 2-3-4, 2-3-4 on this, you see? Well, let's come back up to ruining

Fred's reputation. And now we go at 2-3-4, 2-3-4, or something on this, and we get off a bunch of other stuff.

Now, just as likely as not, we're all of a sudden liable to run into his planting evidence in Fred's desk at school. Oh well, we've got a brand-new incident, haven't we? So we've got a new sub-2, a 1₂. All right. "What about planting things in the desk at school?" See? Let's clean this up 2-3-4, 2-3-4, 2-3-4. All right. We've got that all clean. Nothing more about planting the desk, but there's plenty on ruining Fred's reputation, see?

All right. So let's fish around and the pc gives you a lot of *boz-woz* and a lot of non-sense that doesn't have anything to do with the price of fish. He says, "Well," he says, "Well I – I, I – I nattered to him. I nattered to him – to the principal and I – I told his girlfriend actually that he sneezed, and I did this and I did that and all of..."

It, just – you're pulling withholds, you see – anything that's coming up. What you've got to meet here is the fact that every time you get off a hot one, you sort of take the lid off the boiling pot. And it boils over for a while and you clean up the mess and then you get back to this other thing, "Well, what about ruining Fred's reputation?" And all of a sudden, well – that's dead. That's a dead one. So you knock out that 1₁. You'd just knock that flat. That's gone now – ruining Fred's reputation.

But remember, we graduate upstairs again, "What about hating Fred?"

And he says, "Oh yes, my God! I certainly do!" and so forth, and "Not so bad as I did. He's not a bad man. He simply should be electrocuted and hanged, and so forth, and well..."

"Now, have you done anything else to him you haven't told anybody about?" You see, that's your incidental question. That's a leader, see, "What about this?"

And he says, "Oh, you know, mmmm-mmmmm. Well, I actually made an attempt on his life. *Ha-ha*. Three days before this problem. *Ha-heh-heh-heh-he-heh*." And it has been totally missing from view that Fred was included in the plans of killing his wife. He had never remembered doing that. It was just somehow out of view, kind of – but he, of course, has a sensation that he knew about it all the time, because he did. But he hasn't thought about this and it doesn't blow, you see, immediately.

"Well, what about threatening Fred's or – what about trying to take Fred's life?" You see, that's your new sub-1.

"All right. Well, it goes clear back to when we were boys and I just remembered this incident, and we were down at the old swimming hole and so forth and he was floundering in the middle and I stood on the bank and I didn't save him and now that's all cleaned up isn't it?"

And you say, "Well, that's fine, that's fine. What about the old swimming hole?" And it goes *clank*. It didn't clean. Well, that's your test. See? It didn't clean. So you've got to clean it up.

Now, what rocks – let's get a little rule together here – is after you've put down a What – whether it's the main 1 or the sub-1 or the sub-2 or the sub-3 – if you go back and ask

about it and it rocks, you actually have a subquestion that you've now got to write down. You get the idea? But remember not to ask it with a restimulative word in it.

You say, "What about the old swimming pool, or the old swimming hole?" You say that, see?

And the pc says, "Well, yeah. That's right. I stood on the bank and didn't save him."

You say, "What about the old swimming hole?" There's nothing on that. That's not a sub – a 1₂, see? We've cleaned it. See, because make allowances here, you see. You're really blowing things. And your incidental test – and not too precisely either, you know – your incidental test is when you repeat it, or when you ask him a What question and you don't get any rock on the thing, well he blew it! So let's get something else to ask a What question about. Let's not clutter up the auditor's report.

But every time you get a big bang after he's given you a withhold, he has not told all. So it's – really, should be a What question. That is your basic fundamental on which you're dealing.

All right. So anytime we put – anytime we write anything down, if we've written it down, then we go 2-3-4, 2-3-4, 2-3-4, on that question until it cleans. And we finally say, "What about the old swimming hole?" And there it is.

Now, by the way, you probably don't realize in this demonstration which you have just watched... And I want to thank Fred for that, that took a brave man, didn't it? What hasn't emerged from view is, is because it was only an hour session, I didn't run end rudiments as an interim action, I ran – didn't have time – I ran a skimped – they were adequate – but end rudiments in which I was hitting "half-truth" and "untruth" and "damage" harder than the devil, because those are the things that are going to give you trouble in Prepchecking.

Now, frankly, every now and then, if the going is getting very gummy and too rough, run that end rudiment. Or run as many end rudiments as you care to. And run his Havingness or anything else you care to, you see? But for heaven's sakes don't go more than an hour before you do your end rudiments because this question, "What about this incident in Rome?", cleaned. I didn't put it back on the meter because I didn't want to throw the pc back into session; we were already running out of time. But it cleaned on the end rudiments.

How do I know it cleaned? Well, I watched carefully the needle pattern that was still residual. And when I did the end rudiments, that needle pattern cleaned on the half-truth, the untruth and damaging himself. I won't ask you to do that kind of E-Metering because you don't have to do that kind of E-Metering, but there we went. And that was why we were still getting a knock on it. Which is why I closed it off with the speed with which I did. I said, "Well, there's nothing much left on this. This goes back someplace else." I would have left the pc with the feeling like it couldn't possibly be clean and he'd be hunting all over the place on a bare street, you see?

Of course, the thing knocks. Now, naturally I will go back and test it when I audit the pc again, see? I'll check it. But the odds are very much in favor of it being clean.

Now, do you see how an incident can be held in? A What question can be held in because your end rudiments went out. But the beginning rudiments go out in 3D Criss Cross and the end rudiments go out in Prepchecking. Isn't that fascinating?

To get rudiments in, you do end rudiments in Prepchecking. Do you want to do a bang-up job of getting rudiments in, why just do the end rudiments. And in 3D Criss Cross if you want to get the rudiments in, why, do the beginning rudiments. I think it's quite amusing – an entirely different aspect of it.

Anyway, you saw those exact needle patterns tend to fall on-off on the subject of half-truth, untruth and try to damage anyone in the session. Well, now listen, when you're doing – when you're doing a bunch of withhold pulling, let me call your attention to something: "Self" is the fellow he feels he is damaging because sometimes giving up a withhold threatens personal survival. That makes sense doesn't it? So he feels he might be damaging self. And sometimes pcs run themselves down and make themselves appear worse than they are, just as this pc did in a desperate effort to make it blow. See? We found out it wasn't quite that discreditable. And there it is. It all of a sudden came back into focus again.

You saw those falls that you – had been left on 1₁, "What about this incident in Rome?" See? There's that one. We consider that thing pretty washed. If there's anything on that it's going to be somewhere else, but will come up as another What on 1 here.

Now, what are we cleaning on 1? Let's take a look at this. We're cleaning "Are you" – Zero – "Are you willing to talk to me about your difficulties?" Zero₁, of course, we're starting out with the dynamics aren't we? All right. And Zero₁ is where we got to, and on Zero₁ we were cleaning 1, "What about these physical difficulties?" That was the kind of the withhold the pc had, see? You got the idea?

So we're cleaning up here Zero, "Are you willing to talk to me about your difficulties?" and go on cleaning that up for a long while. That's one of these broad, Atlantic-wide, questions, see? And then Zero₁, self: well, that's the mouth of the Mississippi or something like that. That's as wide as that thing is. And now each time he gives us some kind of a withhold on physical difficulties, we get out of this a 1₁ as a What. Now, out of that 1₁ – if we can't clear this 1₁ with the 2-3-4, 2-3-4, 2-3-4, and it doesn't clear up right away and all of a sudden some hotter subject shows up while we're doing this – we get 1₂, new What, because that will be a brand-new withhold, don't you see?

And he says, "Fred," he said, "Well, Fred, Fred doesn't know it but he was in the sporting goods store with me the day that *ohmmmmm*... He was in there the day I bought this shotgun I was going to shoot him with."

Probably won't become a What. Why? It blows, see? That blows right there.

But all of a sudden you press him a little bit further and he gives you another withhold, "Well, I haven't told anybody that I've always been looking for the perfect weapon with which to kill Fred, and still am."

You say, "What about the perfect weapon to kill Fred?" and you've got a new 1 sub-something. Now, we'll run this off, see? And we're still working on this thing about extinguishing Fred. See?

Now, we've got the subject of killing Fred and maiming Fred and ruining Fred in various ways. We've got – that's all out of the road. We've cleaned that back up. Remember we've still got, "hating Fred," you see? And now we go to town on the thing, because "hating Fred," at this point, he doesn't think of any other withholds right away and it's all – the needle seems kind of quiet and everything seems kind of quiet. Well, let's run the end rudiments, see? And the end rudiments will probably sweep out of the way what's left on it.

Now, as far as repeating the When or the precision of the When, you adapt your When, All and Who to the needs of the instant – just the need of the moment. Of course the more difficulty you're having with it, the less precise the pc has the When, see? So the more When's you use – the more often you come around the little squirrel cage – the more often you have to ask him When, the more precisely you ask him When. The more often – the more precisely. That is the rule. Until you get right down there to a point of where you're dating it, "Well, was it ten minutes of ten or five minutes of ten? Six minutes of ten?" You see, you could get down into it that precisely if this thing wasn't blowing. And every time you do this – you come by – you'll date it a little more precisely and get right on the *bouton*. And finally – that is all assisting in the blowing, you see?

All right. So you would date it, but at first, "Well, when was that?"

He says, "Well, that was when I was a child."

You say, "Fine."

If you're going by it again, "Well, about how old were you?" you see? You're asking him a When but it's with another phraseology. "You – about how old were you?"

You've already kept it in mind that he said with great generality, "When I was a child," you know. Let's get how old he was.

And he said, "Well, I guess I must have been about ten."

And you say, "That's fine. That's good enough."

And now you're coming by – you've done the others – and now you're coming by it again and you say, "What year were you ten?"

"Oh, what year was I ten? Let's see, that must have been 1941. No that must have been 1940. It must have been 1939. It must be no, no, no, no, no, no – that year I was twenty. Ah, let me see..."

And as long as he's willing to figure it out and he's making some progress, don't interfere with him, see? Don't let him run on – don't let him run on and on either, but don't interfere with him.

He says, he's figuring it out. "I was thirty-nine. No that's a, that's a – let's see, I was thirty-nine when I was well, ten and ten... Let's see, what year was I born? Well, that'll give it to me. What year was I born? I was born in 1921. All right, that's good, that was the year I was born. So, ten, this must have been 1930. Couldn't have been 1931. Why, I must have been twenty when this thing happened! Yeah, why, I was twenty! That's terrible, but I was twenty when this thing happened."

And you say, "All right. Well, what date does that make it?"

He says, "It must have been 1941. I was, well, I was twenty years old when it happened."

You say, "Good."

Now, you say – if he's gone into this much of a comm lag, kind of prime the pump a little bit. You know, you know what you're working on here. He just got through telling you that he threw a rock and you say, "Well, is that all about throwing a rock? Is that all? Is that all there is to that? About that? Isn't any more to it? Is that all there is to it?"

And he says something and answers your question. And then you want to find who didn't, and who did and "Was there any determination that never in the future would anybody ever find out about it?" You know, your not-knows can go that far. They can go past, present and future not-knows, you know? You can run the whole gamut.

The most fruitful ones is "Who tried to find out about it and failed?" or "Who should have known about it and failed to?" "Who didn't find out about it who had an opportunity to?" That kind of question is your hottest button, remember that. So don't fail to stress that. But at the same time you can say, "Well, who didn't know about it?" "Who decided never to remember it?" What – you can run a whole lot of postulates out of this, on the subject of memory if you want to, you see? Actually the stress with which you can do this far exceeds the need of it. You have far more tools than you need to pull the simple fact of somebody stayed in ignorance of this misdemeanor.

All right. You could get very fancy with this and very complicated you know. But it's kind of fun sometimes just to throw it around. You just play this off the cuff. It isn't the way it looks to you. You're not reading any crystal ball.

You just say, well, we've talked about – we've talked about his wife never found out about it for a long time, how about Fred, you know? Let's us just interject this thing, "Well, did Fred ever find out about any part of this?"

"Well, no as a matter of fact he occasionally – and so forth."

"Well, should he have found out about it?" You know? Press it a little bit. "Well, did he ever *almost* find out about it?"

"Oh well, yes." And you'll get some little peak on this thing. "Yes he, as a matter of fact, he turned around just as I was standing there, and I put the rock in my pocket. Yeah, the dumb fool. He could have seen me do that."

You know the way they blame somebody for not having discovered something is what is marvelous about the thing. You see what I'm saying?

Anyway, you run it down the line and you're back to your question, "Well, what about throwing a rock at Fred?" something like that. Deader than a doornail. Nothing to this thing. You graduate upstairs again, ask this upper one. Maybe you can clear that now, maybe not. And if you can't clear it, of course, you can run a 2-3-4 on it, if he gives you a new withhold. And you find yourself stuck with a new What. Well that What had better be written down with the 1₂, don't you see?

So you clean the lower ones and go back to the upper ones. You got the idea?

So you can keep this scale going on and on and you keep moving it upstairs. It takes an awful lot of withholds to make a single Zero₁. That takes a lot – there's an awful lot of Whats to make a whole clearance of self. See, that's pretty terrific. But eventually you graduate it upstairs and you've got that, "Are you willing to talk to me about your difficulties?" requires a sub-self.

Now, what is the exact question that you would ask to find out if you should move on to sex or something else? There'll be something else here. Yeah, well you've got a sub-question at Zero₁ and that question would be, "All right. Are you willing to talk to me about yourself?" you see?

And the guy is all set now. Yeah, you've cleaned these other things up so he says, "Yes."

Now, you've got your new one which is Zero₂, which is sex, children; Zero₃, family; Zero₄. Here we go, you see? And whenever you see these prepcheck questions you'll see Zero₁ and all that sort of thing, you'll know what that is, see? And you just move it out of that category Zero₁, into your 1. And that's the first big, broad, general, cracking withhold the pc gives you. And they usually are very broad. And this one is a perfect example: 1 is, "What about these physical difficulties?" For God's sakes, how much broader, see, do you want? Naturally you're going to run a lot.

You'll find it comes out pretty textbook, actually. It's not a difficult subject; just don't make a difficult one out of it. If the every – oh, some twenty percent of the withholds that you run across or something like that, are going to stick. The other eighty are going to blow the first time they're ever mentioned, because they're little tiny things, you know?

Now, there's another aspect of this I should mention, and that is that the pc gums the system up. Now, don't get impatient with the pc because he insists on giving you information that doesn't fit into your form. That is the way a government operates, not the way an auditor operates, you see? The government gets into a savage, roaring fury, you see, if what should be on line four appears on line two. The quartermaster will never issue it. The Treasury Department will never pay it. Well, don't get that bureaucratic on this because the pc insists on giving you the When, What and All in the same sentence. Just consider it an added bonus. But don't omit asking your routine, but not in such a way that it invalidates him.

He's just told you, "Well, I had a – I had a whole operation and I never told anybody about it, and – nothing about it. I had this whole operation when I was twenty-one and nobody at all knew about it. Secret from everyone."

Boy, has he fixed your clock apparently on first glance, you see? He's given you the When and he's given you – and he tells you, maybe very *in extremis*, you know – he tells you all the details and what he withheld from the doctors, too, you see? And it all comes out *brrrrrrrr*, see? And there is the situation, all laid out on a silver platter for you. So, what are you supposed to do? Well, don't let your system get in the road of the pc's withholds. That's why, when I was auditing, you saw an irregularity in the system. The pc's already given me the data. What was I expected to do? Invalidate the pc?

The pc says, "It was at three o'clock in the morning, the night of December the twenty-third, 3:01."

And you immediately say, "Well, when?" [laughter] You see the invalidative use of the thing. I wouldn't put that in practice. If he gave me that much detail, why I'd just let the system skid its wheels for that particular one and go on to the next one.

Now, it's interesting to use a system with fluidity and flexibility, because after all, all it's trying to do is keep your number on what page of the book you're reading, see? That's the only thing the system is trying to do. And let me tell you that bookmarkers never get in the road, or shouldn't ever be permitted to get in the road of the adventures of Don Quixote, you see? You don't ordinarily let a bookmarker stop the paragraph, do you? Well, that's all a Prep-check system is, is a series of bookmarkers. That's all you're recording here.

But the odd part of it is, if you omit it entirely, you find yourself reading the last chapter when you ought to be reading the first chapter and you get a lot of restimulated withholds.

Now, that's the only danger that you run – is not getting all of it and missing it. So you use, every now and then, "Have I missed a withhold on you?" or you certainly use it before you start end rudiments or something like that. Just throw it in gratuitously, not very often, because it's rather self-invalidative. Don't throw it in very often, but before you start running end rudiments or something like that – you know, you're just going to run a little bit of a punch end rudiment just to find out that we've cleaned up the half-truths and that sort of thing, kind of precede it with, "Well, have I missed a withhold here?" and watch your meter very carefully, and it'll flick.

But when you ask that question, "Have I missed a withhold here?" for heaven's sakes, don't put any restimulative reference into it, because of course it'll fall. And remember the pc is still working on withholds. You still have half-truths and that sort of thing. And if you can't clean that, "Have I missed a withhold on you?" go ahead and run the half-truths and so forth. Realize you haven't cleaned, "Have I missed a withhold?" and after you've got the half-truths, whole truths, so help me God, get the damage and then, "Have I missed a withhold on you?" Because, of course, that he was telling half-truths and untruths and damage, will also be a missed withhold. So don't beat that to death. Just keep your finger on it. Because after all you're pulling withholds all the time. I'm sure you – at the end of the session you won't have missed any withholds on him. But it's a good one to throw in occasionally, you know, just as a checker.

Now, you'll find that the system itself has a high degree of flexibility and it prevents you from sounding like a wound-up doll, providing you don't exactly codify the wording of every line.

I think you think that – I think you – the demonstration – I'm sure the pc was not even aware of really much of a system going on, and yet I was asking him the very salient points of exactly these things. And he didn't notice any system going on because these are the questions you ought to be asking, see? However, I'm sure that if somebody worked on this real hard, they could get that well obtruded into the situation.

"What - about – stealing - your - brother's - marbles?"

"Thank - you."

"When – was - that?"

"Is – that – all - of - it?"

"Who - should - not - have - found - out - about - that?"

"Thank - you."

And you know I think the pc would get a vague notion there that he wasn't really being listened to. I think that would be a little bit poor.

You've got a flexibility. So you have to keep the sense. What I'm asking you to do is keep the sense of what you are doing in your 'ead – the sense of it. *Whiz-whiz-bang*, you know?

And won't – it's just basically this. Well, right now it's When, you know? He's told me and he's given me some other remarks and it's When. "What's the date of that?" See? Anything that fits. It's what is appropriate to it. "When was that?" is fairly early. "What's the date of that?" "Now precisely when did this occur? Precisely. Look, I'll help you out here. All right."

And we go ahead and we just date it down. We take maybe three or four minutes dating the thing, you know. Ah, we found out it was December the 10th and 1941, 2:03 o'clock in the morning – 2:03 and 15 seconds. You can do that. "If it was, it couldn't have been. It couldn't have been. That's when I said I was – oh, oh, I get that now. Yeah, yeah." And you get another one falling out of the hamper.

So anyway, that is a preview of what Prepchecking looks like and sounds like and acts like. And I wanted you to have this so that it wouldn't look strange and peculiar to you. I think you'll find it very easy to use, because it sure do pull those withholds.

Now, I want to point something else out to you. At any time did the pc even look like he wasn't going to tell me?

Audience: No.

The pc protested the embarrassment of telling me a couple of times, but didn't ever say he wasn't going to tell me. It never entered his head. There's no reason why it should have. The difficulties of the session were very minor, very minor difficulties. The pc to some degree was braced in that session as an auditor and so forth. And he was watching the Model Session steps and he was checking it off very, very carefully, very. See? Challenging my right to omit a rudiment, things like that, and so forth. Well, all of that comes in – I'll tell you why that comes in. The pc's riding up on hot stuff, do you see. The pc's fine, and remember we're clearing, "Are you willing to talk to me about your difficulties?" so the withholds we're pulling are restimulative of having difficulties with the auditor, you see? But you can expect that sort of thing. Fine, three cheers.

Another point: In withhold sessions you can waste a lot of time by asking for withholds when you're not working with – when you're working withholds in the body of the session. Man, can you waste time, because you've started your session out without inquiring

about a present time problem. It's more important that you get the rudiments covered than you try to do the body of the session in the rudiments. So did you notice we omitted the question we were going to work on, "Are you willing to talk to me about your difficulties?" as far as cleaning it up was concerned. I asked it and saw it fall, and then I said, "Well, that's all right," I says to the pc. "This is what we're going to take up in the session," and we went on to the next one.

All right. We omit withholding. Why otherwise? See? Why waste time, you see, on that? And it was for your sakes that I tried to omit Havingness at the end and you saw my – you know auditing is what you can get away with. And you saw me miss, you know. But I – pc looked okay. His face looked bright and everything and so on. He said his havingness was down. I took a closer look at him and sure it was down. So I ran Havingness just before I ended the session.

But in lieu of finding his Havingness Process, and throwing your timing way out, I ran the surest one I know, see? And we didn't run any distance, see? We didn't have anything very far away. And I call your attention to that process if you're ever caught short on the – without a pc's Havingness Process and have to do something, I just call that demonstration to your attention; because it nearly always works perfectly. You see it's – the reason why it's "reach," see, with the hands, it's "feel." It doesn't tell him to do anything with it. And he becomes aware of the presence of something, you see? And of course, he's been aware of this desk straight away and then his chair. And of course he's been aware of the chair straight away, and just a table and a chair, and a table and a chair, and your feet on the floor. That is the – oldest form of that was, "Feel the floor beneath your feet." And you'll find out that'll bump up havingness. And that was an interesting thing. I had him clear down at 0 there on the sensitivity or close to, and we got a third-of-a-dial drop gain on the thing before we left that thing and we had how many commands on it? Twelve? Fifteen? Something like that.

So anyway, that is a – that is a good one. By the way, on some pcs that is only adventurous because it doesn't flatten in a hurry and it turns on exquisite agony. It just hurts like the blue blazes on some pcs. Some small proportion of pcs are so far out on their havingness, that this is such a positive enforcer – touching things – that when they touch things, they haven't touched anything. They've been carefully not touching things while they were touching things, and it turns on pain in their finger tips. And the pcs that are having the most trouble with havingness are most likely to turn on tactile pain with that particular thing. But if the pc does, my God, that was what needed to be run.

All right. Well, that's just comments, broad comments on the session. We're talking mainly here about Prepcchecking.

Blowing withholds, blowing overts – before they are finally cleaned up on the whole subject matter you are working on – will reduce havingness. You get your biggest resurgence in havingness when you blow a whole package. You've got a whole chain, and you've blown all these overts and that sort of thing, and the guy has got this all taped and straightened out and you'll find his havingness is in pretty darn good shape when he's done that. But before he gets to that point, his havingness will go up and go down and it's very irregular. And if he's been under considerable strain in the session, and you've gotten charge off of it – we only got,

I think a slightly less than a half a division of charge off that particular session, but did you notice he was walking back up toward 2.0?

And remember how hard we had to work on that down in Australia trying to get him up from the 0.0 out there? Well, Prepchecking brings them up and you just saw an example of it. I don't know if you noticed it. We watched something we've been trying to solve for years in that particular session. Prepchecking was bringing up the pc who was running at 1.4 on the meter and brought the pc up to 1.9 at the finish. I thought that was fascinating, huh? Since it's impossible – was impossible for a long time with old, earlier processes to bring the pc higher on the meter, when they were registering below – between 1.0 and 2.0. Remember? Well, did you notice that we did it in that particular session?

All right. This is Prepchecking and although you will see a lot of publications on this one way or the other, the complications of it are not very great. It's a sort of auditor shorthand on, "Where are we going?" And the system itself simply gives you the questions in the exact rotation they are to be asked.

Now, that is the basics of the system. Everything else that's added to the system is simply let the auditor keep track of what he is doing. And you'd hate to have to stop a session in the middle of the big withhold that has just tumbled out at one hour and forty-five minutes of a two-hour session. And the pc says, "Well, of course there was the time when I murdered my grandmother."

And you say, "Good. Thank you. What about murdering your grandmother?"

And you get a four-tone-drop movement of the tone arm. I think at that time you want to have, "What about murdering your grandmother?" on your auditor's report, numbered with its proper sub-numeral in the proper sequence of things to be cleaned up. I think it'd be very beneficial at that time.

And it would also be very beneficial to have the pc's confidence, both from having done a good job of auditing and because the pc was cleaned up on the auditor. And I think that would also be very beneficial because it means your pc will survive till the next session. And do you know there are those who might not believe this, but I myself am a person who favors the survival of the pc till the next session. I belong to that small, small band of die-hard auditors who believe the pc ought to live through it.

Anyway, so there it is. I hope you understand it. I hope it looks good to you and more basically than that, I hope it works for you like a mad thing.

Okay?

WHAT IS A WITHHOLD?

A lecture given on 20 February 1962

Okay. You have, by the way, seen an example of Sec Checking on rudiments as opposed to Prepchecking. And you had three or four rudiments live on the other session, the first session you saw, do you remember that? The earlier session, same pc. And the auditor just swept these by grandly. Do you remember?

Audience: Yes. Hm-mm.

Hm-hm. And you gasped with horror? You remember gasping slightly with horror? And you didn't use any sound. And today you saw me handling them with Sec Checking and going in and straightening up every rudiment, or trying to, and bypassing Prepchecking. We never got to Prepchecking, did we? Never got to our business at all.

If it's all right with you, Fred, we will now ask the pc. You understand this is not pre-ordained particularly. This isn't taped as to – so as to give you an example of which is which. It just turns out that you now have an example of which is which.

All right. Which session gave you the most gain, Fred?

Male voice: First one.

The first one? Mm. We handled the whole ruddy lot with Prepchecking, didn't we? Hm? And on the other one we never got any auditing done to amount to anything, and go ahead and tell them what you told me at the end of the session about having the areas confused.

Male voice: Well, he was asking me about a withhold on something. Had to do with money. And I had three different areas, if you noticed: the Center Theater, the American Theater Association, a big area there, and this area here. And I wasn't sure about which area the withhold was in. And on Thursday, in Prepchecking, coming around to "What about such and such," the number one question – you see, every time he came around to the number one question, I knew where I was. I could locate myself, kind of, on the track or what are we working on together here? You see, how you're working? I knew where I was every time the number one question came around. And we got a new number one question, we kind of narrowed down to one area and cleaned that up before it went on to something else. This time I wasn't sure, and so I kept saying, "Well, gee – where, you know? What?" or something like this.

Okay. All right.

Male voice: I'll keep prepchecking.

Good enough. Okay. You see this? You see this? Well, we learn what we learn. That was not scheduled, to teach you these two things. But you get out – you understand, these are live sessions, they are not demonstrations. And you learn what you learn out of something like that. Of course, I feel silly when I don't get a pc pressed on forward. I didn't intend, actually, to run onto this much crash on this. And frankly, an hour, an hour-and-fifteen-minute session is a very short session for me. I normally will audit three to five hours in a session. And I'm having to scale my sessioning down, see, to match the demonstration.

But frankly, it is my opinion after this session – it's my opinion after this session – that the more you monkey around with rudiments, except for Havingness, why, the less auditing you're going to get done. That's just what we sort of mean.

That does not apply to 3D Criss Cross. But, we've got Prepchecking now and it is a highly precise activity. And I don't think that Sec Checking even vaguely compares to it. That's my opinion.

I couldn't get it off the launching pad, see? If we'd gone on auditing, I would have given him a break. And I'd have said, "Well, none of this is clear, none of these things are null." I would have given him a break, and we'd had a cigarette and I would have brought him back into it and started a new session. See, I would have ended that session and started a new session instantly and I would have swung right into the rudiments. "All right. This one's live and this one's live." I would have told him, see?

And then I would have come down on Prepchecking, and I would have said, "Well, what about money?" See? Or "What about taking money?" or "What about this subject?" because this seemed to be the subject we were on. And then I would have gone ahead and cleaned it up by area and type of withhold, and so forth, and I would have cleaned it up properly. But I was trying to clean that up with the who and the when, if you will notice – just the who and the when – and, man, it didn't spring, did it? So scrub it. It didn't spring. If I can't do it, I can't expect you to. Okay?

There's no substitute, apparently, for just full dress parade, clean zone, troop the colors, Prepchecking. Get a 0, proceed from the 0, go to your 1, proceed from your 1 to your 1₁,³ you know? Whatever it is. There is no substitute for it. I've run a couple of sessions since I was – that, well, I ran another session particularly, I was just standing on my head. I could have been sitting there knitting like the children's tutor does. She teaches them school while knitting.

It requires no strain on the auditor. This was quite a strain on the auditor; wondering where the hell you were going, see? And this other, I ran a three-and-a-half hour Prepcheck

³ Editor's note: Spoken "One sub-one", term for a What question evolved from the first What question; One sub-two is the next one evolved from that and so on. Explained in the preceding lecture of 15 Feb 62, SHSBC-118, "Prepchecking". From the following lecture on changed to "One-A", "One-B" etc., see also in Tech Dic under "Zero-A".

session; terrific numbers of withholds falling off the line. And it was just dead easy. There was nothing to it. Sunday night. I woke up, you know, "Well, let's go to a dance," you know? There wasn't anything to this on the auditor.

Okay? All right. This is Saint Hill Special Briefing Course. What's the date?

Audience: Twentieth.

Thank you. What's the month?

Audience: February.

Oh, thank you. What's the year?

Audience: AD 12.

AD 12. All right. All right. We will let you away with that. Thank you very much. Special Briefing Course, Saint Hill.

Now, I'm going to talk to you about withholds. And this is all about withholds, so a rather – relatively brief lecture. But I have now found the common denominator of withholds. You didn't get an opportunity to see it in today's demonstration but that doesn't make any difference to that.

What is a withhold? A withhold is something that a person believes that if – if it is revealed, it will endanger their self-preservation. In other words, a withhold is something that endangers the self-preservation of the pc. Now, that is a very important definition. It's taken me a very long time to get that definition. It gives us a new line for 3D Criss Cross, although this is not about 3D Criss Cross.

And it, worked back and forth, is an absolute killer because this is the reason whole track is occluded. This is where your whole track memory went. And this is the button on which it is sitting.

So this is a very important discovery. Therefore, we would consider that that person who had very little whole track recall would consider themselves in a very dangerous position.

In other words, you've got a gradient here. The less whole track recall, the more the person considers they are in danger, and the less likely you are to get a withhold off of them. The more fantastic the whole track recall, the same thing we are dodging here, somehow or another, with that.

Now, that's quite important to you, because it gives you and gives me – ha-ha-ha-ha-ha – the exact reason – this is why you get off such as I am now going to say, and call them withholds. These are actual student withholds.

"I went outside and looked at the sky and felt strange." And an auditor bought it as a withhold and worked it over.

"I had a picture of my mother's bedroom and I don't know why." That is a withhold.

"I spoke crossly to an Instructor."

"George and Bill told me that they had heard that Agnes..." And that is a withhold. Why is that a withhold?

All right. Let's start with the first one first. Of course it's safest to get off other people's withholds. These are all safe withholds. They are so safe. And that is all students tend to get off on each other, is safe withholds. I'm sorry to send that arrow so deeply. They get off safe withholds. If they reveal these things, they – it'd be perfectly all right to reveal them, because it's perfectly safe to reveal.

Now, why do we get into a tacit consent of this particular kind? Very interesting why we do: overts on other people's withholds. We take somebody's withhold and we yap-yap at them and we trip them up with it and we make them guilty with it and we sort of punish them a little bit for having gotten off a withhold. We yip-yap on the subject. And after that, we are a little bit afraid to get off a withhold of ourself because we have an overt against the other person's withhold, so therefore, we don't consider it safe to get off a withhold. Do you see what the – what the rationale of the overt is? We have an overt on other people getting off withholds, so we don't get off withholds, you see? Because it isn't safe to get off a withhold.

Now, of course, the more unsafe you make it to get off a withhold, the battier it all becomes until you get a civilization like this one.

Now, the one thing by which the communist profits in [in very broad Australian accent:] Australia and Suid-Afrika⁴ are the laws against perversion. The state, of all means, is regulating how you are going to perform the sexual act. I think that's very interesting. I've seldom seen any police officers in my bedroom. And I'm afraid if I did they'd have short shrift. [laughter]

Of course, I have – I have had the people the police officers are supposed to restrain trying to crawl into my bedroom windows and a few things like that, you know, but that, of course, they wouldn't be interested in.

Now, what are they doing? They're just trying to invent some new withholds, aren't they? I think that's fascinating, because the communist uses blackmail of this particular kind as a means of controlling heads of state.

In other words, if the state itself lends its weight to punishment of withholds, see, it has just laid itself out to be crazy. Because now, anybody in the state can be blackmailed so as to overthrow the state, because the state will punish the overthrow of the withhold. Do you understand this, or any part of this?

Audience: Yes.

All right. Now, there it is on the third dynamic. The state makes it unsafe for anybody to confess to anything. So everybody is withholding from the state. What happens if you withhold from the state or the state misses withholds on you? Of course, you begin to hate the state, and that is the downfall of nationalism.

⁴ Suid-Africa: the name for South Africa, as it is said in Afrikaans, an official language of South Africa which developed from seventeenth-century Dutch.

Of course, this may be very fortunate. But nevertheless, they have sown the seeds of their own destruction by the number of great laws which they – arise on how a person shouldn't get off withholds.

Let's apply that to an auditing session. The auditor upsets the pc or tries to make the pc guilty every time the pc gets off a withhold. Therefore, the auditor is making it unsafe for the pc to get off a withhold. All right. Then therefore the auditor trains the pc not to get off unsafe withholds. The auditor then trains the pc to get off only safe withholds. And we read on an auditor's report, "I went out at night and looked at the sky and felt strange." And that is a withhold. Great day in the morning! That's a safe withhold, isn't it?

Well, of course, the funny part of it is, there it is. It's not a withhold. It's not a withhold at all.

So you can actually get into a games condition with your pc by punishing the pc for his withholds. You can actually get into a games condition where the pc will only try to get off safe withholds. And there you go.

Now, if a pc isn't giving me withholds, I'm afraid that I would become persuasive. A withhold is something that, if revealed, would be prejudicial to his survival.

Now, naturally, his individuation comes from his withholds. This hyper-individuation of the pc, this only-oneness, this withdrawal into only self – all of that – and withdrawal out of groups and withdrawal here and there and so forth, all of these things stem exclusively and only and entirely from, of course, withholds which, if gotten off, the person *believes* would injure their survival.

Now, the funny part of it is, is these – is this is not true. The person gets an aberrated idea of what would injure his survival if he got it off, don't you see? And it's this aberrated idea of what they dare get off that brings about the condition of aberration. I think that possibly you've got one, two, or three apiece – some kind of an average like that – that if you revealed it in the wrong quarter, your – it's factual that somebody would be likely to take action. See, if the state of New South Guinea, or something of this sort, found out about this, well, huh, might be a poor show.

You've all got some that were factual. There are some factual ones, see? Some real ones. And you get those real buried and they get very encysted. And the other aberrated idea builds up on those and we get a build-up of that.

Now, the punishment of our parents, of course, we feel offhand that – this comes from past life; 3D Criss Cross gets these areas cleaned up – but when we started this life, we already had the idea that if we disclosed certain things to our parents or we did certain things or we were – didn't withhold mean words and so forth from our father, or something like that, we'd find ourselves suddenly without food, clothing and shelter. In other words, we get this exaggerated idea. Well, it's built on our past life structure. But that's a bad enough basis.

Now, we take off from there and we move into areas and then do commit something which, if revealed, would be very upsetting, or would have been very upsetting. And then other little things start piling up on the top of that, and so on. And we get up to a point where

we become quite aberrated, quite individuated, and we get so we can't even communicate with parts of our body.

And the result of all this, naturally, is a feeling of high antisocialness.

And somebody comes close to these withholds and we believe implicitly, you see, that if we got off this withhold, naturally we could just see the police running in, my God, the sirens going in all directions, you see, and police by the squad coming bursting in the front door, probably with battering rams, you know? And they got handcuffs and they're all ready to put them on you, you know, and drag you off. And naturally the cell they're going to drag you to is not any of the modern jails, you know, which just dramatize withholds; it's probably one of the old-time dungeons, you know, where they bury you up to the neck in water and leave you there for forty years or something like this, you see? You get an aberrated idea of the punishment in a jail. And this all of a sudden rekindles, you know? The auditor gets close to one of these things, and this idea, *oooooh!* you know. *Oooo-oooooo-ooooo-ooo*, you know? At any minute this horrible series of circumstances are going to occur, and naturally we consider the auditor dangerous.

No, listen, the auditor is only dangerous if he doesn't pull the withhold. And that is a recurring phrase that is starting to happen here in this school. There are certain auditors that we designate as dangerous auditors.

Why are they dangerous? Because they will only tick and not pull a withhold. And we call those people dangerous auditors. Why? Their pcs are all going to be mad at them, they are themselves going to goof up and get lots of loses one way or the other and they're going to always be involved in ARC breaks of some kind or another and they're going to have people going around gossiping about how bad Central Organizations are and how bad they are and how bad everything else is and so forth. And they are dangerous.

But from the pc's viewpoint, the person becomes dangerous the moment they might find out whatever this thing is, you see? And the auditor appears for a moment dangerous. The auditor might find out. And the pc gets ARC breaky, however, only when the auditor fails to find out. The auditor has to go the whole way. And an auditor who won't go the whole way, an auditor who will only get off safe withholds off of a pc is dangerous. And that is today's adjudication on whether a person can audit or not: Are they a safe auditor or a dangerous auditor?

Oddly enough, it's a complete reversal. The auditor who gets off safe withholds is dangerous. And the auditor who will get off unsafe withholds is safe. You understand that?

Now, you've got to – you've got to bust through any feeling you have on this and look at this square in the teeth and follow it through, because your – actually – all of your activities as an auditor are totally, 100 percent, based on this *one little fact*. It all cones down to this: An auditor who will not pull dangerous withholds from the pc is a dangerous auditor.

You're going to have an ARC breaky pc, your pc is going to be upset with you. There are only two or three ways you could possibly mess it up, but how could you fail to do this?

One, you could fail to use an E-Meter. You could fail to make an E-Meter play any tune that was ever written by Bach, Beethoven and Brahms, you see? You could just fail to

make an E-Meter talk. In other words, you look at the thing and the needle falls off the pin, and so forth, and there it is, and the parts are all collapsing and so forth, and we say, "Well, that needle, that's null. Ha-ha. That's a null needle. Ha-ha."

Hm. God, man. Well, you don't have to clean it up in one session, but you have to make sure that you've got another session. You notice I had about two or three rudiments banging there in that demonstration today, and even missed a withhold as banging. And the pc didn't spit at me because the pc knows I know that they're missed. See, and the pc knows I know where we're going on this sort of thing. Pc has confidence in this.

All right. But you go a whole intensive and you never pull any of these things and you never ask for missed withholds and you never try to inquire any deeper into any of these things and that pc blows up in your face.

Every ARC break you *ever* got off of a pc *was* due to missed withholds. Although missed withholds is brand-new as a principle, it's been functioning this whole time. And every time you failed to get off a withhold – you missed a withhold on the pc, you ticked it – you had an ARC break. That accounts for every ARC break you have ever had with a pc. That accounts for every pc who never wanted to be audited again by you. That accounts for all of your own difficulties with pcs; right there in one fell swoop.

Now, you could accomplish it by not operating with an E-Meter. You could accomplish it by a very unreal or nasty auditing approach. Every time the pc said something, you say, "*Nyaaaaa*." You know, something like this. You could accomplish it by just having your technology all backwards and shuffled into another deck. You could accomplish it by just poor auditing. But in the final analysis, poor auditing only exists if a person is determined that they're never going to hurt a pc by getting off any *nasty* withholds. They're going to be *nice* to pcs and they're only going to get off *safe* withholds. *Uuuhhrrr!*

You almost have to use sjamboks⁵ and clubs on some auditors. I'm not kidding you. My method on the thing is just to stampede the auditor on the subject and there's more than one here who's already been stampeded by me straight at the subject. You know?

What – the only thing you want to worry about, the only thing you should really worry about, is when I give up on you. I've done that, too; just quit, you know? And then you get very nice auditor reports. You get an initial or something like that. I just won't do anything more about it. Why? I know you won't. But that doesn't include very many, and the other ones is you start missing withholds...

Pc goals and gains: "Well, I didn't make any goals and I didn't make any gains," and so forth. Well, it might as well have been printed in letters of fire! "Auditor has missed withholds on this pc. Auditor did not clean up things on this pc. Auditor read the E-Meter upside down." Something wild went on here. That's all. I mean, because frankly I have to tell you this. But I've got you in a box right now with Prepchecking. You're taped and targeted.

⁵ Sjambok: A strong, heavy whip made from thick, tough hide, such as that of the rhinoceros or hippopotamus, used in South Africa for driving cattle. (World Book Dictionary)

The auditor who cannot get a result with Prepchecking will not audit. *Uuuuhrrrr!* It's been weaving closer and closer to this point, see? We've been converging on this point. Technology has been getting better and better and better and better, and here we sit looking at Prepchecking. Well, Prepchecking gets a little better. There was a little change the other day in 3D Criss Cross.

As soon as I found out that this applied to 3D Criss Cross, I realized that you can't let a pc cross out anything on a list. Because – that's you, not me – because the pc says, "That's pretty dangerous. Let's see, that's pretty dangerous. Let's see, that's pretty dangerous. And I think this – this item, I think that's awfully dangerous. I think we ought to have that off the list and that off the list and that off the list," and we just cross the whole list off. It's all too dangerous. And then you have missed an item which actually amounts to a missed withhold and so the person gets upset with 3D Criss Cross.

So we can't allow the pc, once he has put it on the list, after we've blackjacked him, tricked and hoodwinked him into getting it onto the list, we can't let the pc take it off, even though that makes more work on differentiations. I found this is the case. I find pcs will take live items off the list if you don't watch them. So, there it is.

So some of your lists are disappearing into smoke, and some of your items are being crossed off because your pc has misgivings upon the safety with which they can be revealed since *all* of these items went out of sight to some degree or another because it was very unsafe at some time or another to reveal them.

I'm looking at somebody right now that was going around with a very, very hot terminal tucked under her arm in a family who believed *implicitly* that the exact *reverse* of this terminal was a way of life and how to be closer to God.

And this pc just had to withhold this one like mad. And of course the whole – more the pc withheld it and so forth, why, the hotter it got. See, the whole family – this would have been heresy. It's like the son of a priest, you know; he wouldn't believe in God. (Nobody gets that joke. Boy, you're slow today. You're very slow today. Wake up.) The son of a priest and he has a terminal called "atheist." See? That would be very upsetting, very upsetting. He'd have withholds. So would the priest.

But anyway, as you get this straight across the boards, we find that a hundred trillion years ago, why, well, let's take an example. We had one mentioned in the session today, something like, well, let's just call it out of thin air "embezzler," or something like that, you see? And this fellow was born in a banking family where *integrity* is all, you see? And he hears from his father and he hears from his mother and he hears from his brothers and sisters in the business and he – and so forth, and he's got a hot terminal. He's been one of the best embezzlers that the country has ever had, don't you see? Something like that.

And here he has to live in this atmosphere with this terminal. *Hot*, you know! So all the time he's pulling this terminal back. (I'm not saying that's the terminal but...) You get the idea? That's a withhold! Man, would it be unsafe to be that embezzler. Right? And he might dramatize it at any moment. And so he fights it and he fights it and he fights it and then one night he goes into the bank vault and he cleans out the whole thing and goes over the hill. [laughter] See, the wrong time, wrong place, wrong terminal, see, for his environment.

And when these things get badly restimulated and so forth, why, they've had it.

All right. Now some auditor is auditing him, see, and we get down to this terminal. And, "Who or what would enforce an outflow from others?" See?

And he puts down "An embezzler."

And he goes down the line, and the auditor goes down, and they – he had a little ARC break with the auditor, something of this sort. The auditor looked at him crosswise or didn't acknowledge him just right – and it's not really an ARC break; it was just that. And he clicks on that other one, you see? "You know this – I don't," auditor has already missed a withhold on him, and so forth, and he's a – he says, "I – I don't know."

We're differentiating the list, and we get down to "embezzler," and we – he thinks we better cross that off so he says, "Well, it – it really wouldn't enforce an outflow. Cross – cross that off the list."

Gives him a second thought, and we mustn't let the pc have that second thought. So there's that little change in 3D Criss Cross. You see why it is?

All right. Now you see that the pc – now let's take up Prepchecking. These two things, you see, suddenly go hand in glove. In other words, we have one straight line. We have Prepchecking as a basic for this lifetime that keeps the pc in-session and then we have its extension, 3D Criss Cross, and both of them are devoted to the same thing of letting the guy stand in the sun. They're both devoted to the same thing, you see? Getting him over all of his odd-ball notions about how dangerous it would be to reveal the fact that he had a crooked left ear. Nothing to it. I mean, he looks at this after a while and laughs. But he isn't laughing at the time you start auditing him.

You say, "All right, now. Okay. Now, what about that activity there that was going on in Tacoma?"

And, [sighs] "Now, let's see. If I think of something else or if I can get the auditor thinking or talking about something else..." you know, this is all reactive, you know? "So let's – let's – let's move it all over onto some other perimeter." Then he says, "Well, it has to do actually with Mexico City." In other words, he's trying to throw red herrings. He can get into a point of reactively regretting having mentioned it. And you'll see him pass through that little band of regretting he brought it up in the first place.

Now, if the auditing is bad, he does this often. If the auditing is good, he only does it once in a while. It is always present, no matter how good the auditing is.

"I'm kind of sorry I brought this up. Now what is going to happen to me?" Of course, all the time he's being sorry he brought it up, you're just crossing into the actual zone and area. You actually have tremendous unknowns left on the whole subject. And the pc does not know much and a great deal about this. That's what the difficulty is. In other words, he still has tremendous unknowns.

Now, in Prepchecking – in Prepchecking, also, there's been a little discovery here about when the pc – Prepchecking – when the pc equivocates, you know you're looking at the package; when he starts to explain. Watch when the pc starts to explain. At that moment add a

What 1₃, or whatever it's coming up this time. And let's find out what this little hot subject is he's going over right this minute. He's explaining.

Now, there's a rule. There's a rule about this, about asking What questions. And this isn't really about What questions but I'll just show you what this is.

The first rule is: When the pc gives you a motivator, you *know* you're on hot ground and so you always ask a What question that's rather overt. Says, "Well, my mother beat me every day."

My What question, I'm afraid, at the moment is "What have you done to your mother?" I would not even monkey with this motivator, see? I wouldn't fool with it at all.

The next gradient up – that would be – that'd be the most certain ground to mine. Motivator, motivator, motivator – man, that just takes the What question and practically writes it in legible script in front of your face, you see?

Your next one up the line from that is the person is critical. The person is being critical of somebody. Well, the criticalness – you can go on and pull criticism forever without getting anyplace. You want to know what he did, did, did, did, did, done, done, done, done, action, action, action. There must be action back of that criticism. Otherwise, we wouldn't have it, see? So, criticism is a sure indicator of an overt.

Now let's take the milder form of it which is explaining why it happened. The pc starts explaining – I don't let the pc explain very long without giving him a new 1 sub-something or other on the What question. I give him a new What question to clean up.

Pc starts explaining and says, "Well, actually, the truth of the matter was that I was on the ferryboat. I hadn't – I hadn't actually meant to be on the ferryboat, you understand, but I was coming down from the taxi rank, and I just saw the ferryboat there."

I'm liable to cut him off at that moment, on whatever we were talking about, and ask a little more pinched-in-close What. "What were you doing?" you know? Something like this.

And he says, "Well, oh-oh. Oh, that!" And it alerts him.

So you have these various indicators. They make a gradient. Pc gives you a motivator; oh well, that's an absolute certain indicator and you must pull the overt straightaway, just convert the thing into an overt without any slightest...

Person says, "Well, my – just my mother beat me every day, just on and on and on. And beat me every day and so forth."

It's just a lead-pipe cinch. "What have you done to your mother?" I mean, it just might as well appear – be printed on the auditor form, you know? I mean, it'd be that inevitable.

Your next one is criticism, criticism, criticism. Well, there's a real overt back of this, and so forth.

Now, we're not going to dignify getting off other people's withholds by even classifying it. An auditor who would do that, oh, man. That's very safe, but it's so safe that they're not withholds. They're not his withholds. What are you doing – what are you doing monkeying

with somebody else's withholds? They're not this pc's actions. Perfectly safe to reveal other people's withholds, isn't it? Or it might be, unless they find out about it.

But – then your area of explanation. And then there is the actual withhold. Now, of course, the actual withhold: the person says, "Well, I – I used to stand down on the Battery and bung paving stones through the windshields of cars," see? And you've got your tailor-made What question standing right in front of your face, because it's not "What about binging paving stones through windshields of car on the Battery on July 1st, 1962?" or something like this, you see? That's not the question. The question is, "What about damaging cars?" or something. But there's your What question. It's tailor-made because it's the withhold.

Now let's drop downstairs a little bit and we find the pc is explaining something so we get the What question out of the bulk of his explanation.

He's saying, "Well, I actually – I actually would never – never really liked – liked – liked my wife, and I really never liked her, and so forth. And this was easy to understand. I, of course, was – came home late and all that sort of thing, but she never kept herself up and she never really did anything for me around the house. And she never really paid much atten – ."

That's – actually, he hasn't given a motivator, you know, he hasn't given an overt. It's just an explanation of how it was all messy. And you could just cut him short on his explanation, get your new What.

Now, I'll give you an example out of your session today: we had two or three periods of explanation, when I wasn't doing Prepchecking. In view of the fact that I wasn't doing Prepchecking, I of course could never get to the bottom of it. It was just crippled, you see, because I couldn't slide in the What. See? Because in clearing rudiments, I was avoiding Whats, and I certainly wasn't Prepchecking, you see, I was sec checking. Doesn't work.

All right. So next indicator is the pc is being very critical about something or other. He's being very critical of you, the auditor. That's a very special case. If he's being critical of you, the auditor, you have missed a withhold and you better find out what it is. "What should you have found out about?" "When did you think I was a fool?" Anything that you could possibly mention that would throw a missed withhold into view – that would be the stage at which you pulled this particular one. But it's the criticism. You want to find out what has been *done*. The missed withhold, underlies all of these things, by the way. But you can find an actual *doingness* at the point of criticism. He's saying, "Well, I," natter, natter, natter, "and actually I always thought, always thought that he wore the wrong color ties. And that was why I didn't like him," or something of the sort, and so on. Well, he's done something to that person or done something to a person like that. So your What question is tailormade out of that.

And then there is your fundamental fundamental – is motivator. Man, red flag! Let's just find out what he's done to the source of that motivator or the type of beingness of that motivator. Just overtly find out what he's done. In other words, you're getting off overts and so on.

Now, if you look at this as a scale, you will find out that the withhold is measured by the degree of danger – the only reason I'm giving you this scale; I'm not talking about how

you ask What questions – the degree of danger the pc conceives to be present on the subject of getting off the withhold.

All right. If the pc doesn't think it's very dangerous, they give it to you directly and straight. If the pc thinks it's a little bit dangerous, they explain around the fringes of where it might lie. If the pc thinks it's rather confoundedly dangerous, it's getting just a little bit grim, maybe on the jail borderline on that chain, the pc will criticize. See, criticism enters.

And if it is so dangerous that the pc believes – you understand I'm saying pc "believes"; I'm not saying it's factual – the pc is right up to the point where, with a jingle jangle the patrol wagon arrives, the officers pick up the battering ram, they knock down the front door, they come crashing in with the handcuffs and leg irons, you see, and drag him screaming off, towed back of the Black Maria, you see? Something like this. And they can see *this* is going to happen if that withhold is missing; they give you the motivator. They always give you a motivator. Flat, flat, total motivator – a hundred percent.

Now, what – how do you use this? Well, it gives you the gradient scale and indexes of all cases. A case is *not* as bad off as he is crazy. A case is *not* as bad off as he is aberrated. A case is *not* as bad off as anything, except how dangerous he considers it would be if he revealed himself.

And so you have from the top to the bottom, all cases on that gradient. Just like you have the What questions and the degree of the withhold and the safety on those – that gradient, so you have all cases on that gradient. And the person who will die before he will reveal himself is also on that scale.

So you have them from the case that you could audit to Clear in twenty-five hours. See, bang! You sneeze, the person is Clear. Well, this person has not had any great idea that it'd be dangerous to tell people things. That's the index of that case.

All right. Now, the person who went 150 hours to a Routine 3 kind of Clear. Well, that person doesn't have very much he considers his – be all right. Pretty easy.

Now we have the case that we went 200 hours on without finding – only finding a goal and terminal. Well, ha-ha-ha-ha-ha-ha-ha, that case has got quite a little hatful. There is a nice little hatful of stuff that if the individual revealed any part of that, he thinks, he believes, that *hmmm*, it would be, well, it'd be rough. It would be pretty rough. He'd probably lose his family and he'd lose this and that, you see?

And now you take the person who went 500 hours with no goal and no terminal and no gain, and that sort of thing. Now, we know darn well this person has moving up into the perimeter of the police breaking in the front door, if it were learned about this person, see?

And now we take the case – the case that actually goes to the spinbin rather than reveal things. Well, man, that's *in extremis*. Because insanity is the last protest against punishment. See, "I cannot feel your punishment. I do not even know about it. I'm not even a rational being. You've driven me out of my mind." You see, that's a total motivator on the subject of punishment.

So, where we go. Then you've got your whole – your whole thing. It's just length of time in auditing. Your length of time in auditing is indexed by the danger the individual believes would be present if he revealed certain things. And danger to reveal is the direct index of length of time in auditing. There it is. Want to know how long it takes to clear somebody? Well, how dangerous does this person consider it would be to reveal certain things.

Now, how could you cut down this length of time in auditing? Well, I've given you the answer. Don't pull safe withholds. Just move in and pull actual withholds. Don't fool around with it. And use Prepchecking. And you've got that, all right. Now, that gets this lifetime's danger out of the way.

And I've even given you a new type of line and a slight change in 3D Criss Cross that does not permit the person to escape once you've got the item on the list. And the type of line is – the line for 3D Criss Cross, of course – is "What identity would it be unsafe for you to reveal?" or some such wording. See? And they will blow into view. And, "What identity would it be safe for you to reveal?" of course, could be a relief line, which would just be nonsense. But it would sort of balance the thing off and throw the other one into view; in other words, just be a trick line.

In other words, you could drag these things out, and you could – you know now what the pc is doing, so it becomes relatively simple. That is what the pc is doing. While he is there sitting in front of you, he would like to reveal himself. He would like to reveal this and he would like to get out of it, but he does not know how to get out of it. And the person is always hoping that somebody will come along and give him a shot in the gluteus maximus with some magic fluid by which he will not have to reveal a thing and become totally Clear.

And anytime anybody has *ever* proposed that to me, why, I've had an instinct on the subject. [laughter] Now I know why! I should go back through the files and find out who's proposed it because we would have an index of some of our roughest cases. It'd be the person who wants to be cleared without revealing anything.

Now, the people who get spinny in processing, you must be tripping right over – you must be falling right over something.

Well now, Prepchecking will get it for you. There is no contest about it. This is a very easy, easy activity, because a person moves right up into it. But the basic Prepcheck question that would get them all would of course be one of these "unsafe to reveal" questions.

Your Zero: "Have you ever – have you ever done anything that might have been unsafe to mention?" See, that would be your Zero. "Is there anything you've ever done that would be unsafe to you if you told about it?" "If you reveal certain things about yourself, would it be unsafe to you?" Some such Zero, don't you see? Doesn't matter how it expresses to the pc. Then you get your What off of what the pc said. Then you'd mine that down; you'd strip the whole bank. Interesting

"Safe to reveal." This is the index on it.

Now, you must figure it's awful safe to show up with a mest body, a meat body, you see; and then you get the idea that it's unsafe so you begin to take it down. That must be what old age is. That must be the only thing old age is. So take heart, girls. [laughter]

Now, you just look at this as the idea of apparence – apparence, appearances, disappearances, being there, not being there, well, it all passes over into the field of fact. Offering the fact is dangerous. Withholding the fact is apparently not dangerous. All it does is pull the person to pieces. That's the trick of the Body Builder. That is the basic trick of this universe. And the basic trick of this universe is, if you withhold it, it won't hurt you any. And of course, that is a stinking lie.

So they get everybody to withhold things. They invent codes of law and that sort of thing, and these things are all supposed to get everybody to withhold the thing, and then the thing – thetan gets to packing up mass and occupying less space. And he occupies less space and less space, and he can permeate less and less things, and here he goes. He's got it made. Yeah. But who's got it made?

Of course, that is a game nobody wins. Scientology is the only game where everybody wins.

Now, there's your – there is your index of withholds. There is your – what they're about. That is why your pc won't talk to you. That is why your pc reveals what he reveals. That's why you sometimes look very silly writing down, "Well, the pc has a withhold that the pc has a bent toe," and why, after you've prepchecked a bent toe for five or six sessions, there has been no gain on the part of the pc.

You see? You see how this might work? Does this straighten out anything for you?

Audience: Hm-mm.

Now, you could use this principle, but if I give it to you, you'll work it to death, instead of using it as a Zero, you can flip over, and you mustn't work this to death.

"Who would have been dangerous to have revealed that to?" could be a version of the Who question. But you get on some hot line and the person is talking about having robbed every restaurant in the entirety of New York – and he's robbed every restaurant in New York practically, and so forth, and he just keeps going on and on; you don't seem to clean this up. The Who that will clean it up is "Who wouldn't it have been safe to have told about that," and "Who didn't find out about it?"

And of course, he'd say, "Well, the restaurateurs." And he's been saying "The restaurateurs" all this time, and all of a sudden he looks at you and he says, "Well, all right. The police."

"All right. When did they fail to find out about it?" And we get the rest of the chain and it blows. Do you see that?

Now, there is – there is your gradient of the value of the withhold to the pc. I call very strictly to your attention that I have said the pc *believes* it would be unsafe. And that is what is most interesting: "believes" it would be unsafe.

And of course, these things – I think, I think the crime you committed – I think they probably run out of witnesses. I think the – I don't think the government would spend a cent trying to dig up enough witnesses, or even find the records, in order to prosecute you and so

forth, particularly if it was a real crime. The government is much more interested in minor crimes than real crimes.

And the essence of the situation, however, is one little thing like that gets stacked up on other little things and something else gets stacked up on that and the next thing you know a person believes it's very dangerous to put his nose out of doors. Can't! Can't go outside. And there's your "can't go outside" thing. God-awful things are liable to happen to this person if they go outside; liable to be recognized as the person who committed the murder, only they kind of vaguely think maybe they have committed a murder, which is quite interesting.

You have very few backtrack things on this that are hot, but every case must have a few on it. You suddenly say, "Oh man, I bet they're still waiting for me. I bet they're still looking for me someplace or another," and the pc is liable to have his hair almost stand on end for a moment when he hits one of these things. And then he suddenly, "Well, that's nonsense. Been a long time ago. Long, long ti... I wonder if they are."

But this equally applies to 3D Criss Cross and to Prepchecking but is most salient in your use of Prepchecking. And there is where you should use it. And I won't get nasty or mean with you, or anything. I will just forbid anybody to get off your withholds if I hear any more session being spent on "I went out in the evening and looked at the sky and felt strange." I wouldn't even try to make anything out of it except that some pc had a hot area someplace and had just thrown me a great big floppy, squishy red herring. And I don't like red herring, so I would let that one drop.

There are certain withholds you let go by. You just let them go by. You don't do a thing with them. And there are certain withholds that you hang to till grim death, until they are all revealed, and you'll just have to learn which ones. And the index of it is what is it – the pc consider it safe to reveal; what does the pc consider it unsafe to reveal. And that unravels the whole problem for you.

Thank you.

USE OF PREPCHECKING

A lecture given on 21 February 1962

Thank you. Thank you.

All right. Now, you've seen an example of Prepchecking and that is an example of Prepchecking. And that example should serve as *the* example for how you put these things down.

Now, if you had more than this on your auditor's report, you're nuts. [laughter] If you had more than this on your – the auditor's report which you wrote... The Zero from which we're proceeding is "Are you willing to talk to me about your difficulty?" – your Zero_A. We started using A because 1 is the number of a question and you could very easily get tangled on it.

So your Zero_A, self, and the 1 is "What about these physical difficulties?" We already had those from an earlier session. We're trying to clean those things up and our 1A is "What physical difficulty would it be unsafe for you to reveal?" which is a question in desperation, see. The pc has not given me a withhold, so you have to take off from some point.

All right. That's a very fine point to take off from, I assure you. And we immediately got a list. And, as the pc gave the list, if you were listening and watching the meter at the same time, you saw that the middle one was the one that fell, and we got 1_B – "What about this rectum trouble?" 1_C – "What about not keeping Jim clean?" Because we got that straight from a withhold.

And then 1_D, because that wasn't cleaning, we have to have a 1_D. And "What about doing something to Jim?" which is, of course, a direct auditor question. Let's get the overt. Let's find out what the overt is, see.

Boy, you look like you're all adrift. Well, after you've done this a few times, you won't any longer be adrift. You only write down what the auditor says on a Prepcheck report. As far as your auditor Zeros, 1, 2, 1_A, 1_B – that's only what the auditor says. You only write down what the auditor says. You never write down what the pc says. What the pc says, of course, reflected in what the auditor says.

But you don't do a stenographic job of auditing of simply sitting there, writing down everything the pc says and think you're prepchecking because you're not – on any relationship to Prepchecking.

Now, if you want to make a few little old comments, you come over here. Results and comments, you have in this column. And you have over here some – the goals, and you have some notes by the auditor, and of course, they're totally incidental to the auditor's report. And

I notice that 46 or 47 has something to do with the rectum trouble, but then heavy reaction on the word *damage* was something I noted, so I just put that down for future reference, see? So that has nothing to do with the auditor's report as such. Okay?

But there is that. This session served as no fantastic revelation. The pc, however, I think, felt better. Right?

Male voice: Mm, yeah, much better.

All right. And of course, I didn't want to hold you up, so I didn't take his goals or gains at the end, but that was purely by reason of demonstration and no other reason.

Now, in a Prepcheck you write down what the auditor says. And if you're going to write down anything about what the pc says, it's going to be some kind of a little notation of something you considered interesting, and you're going to put it over, way over on the right hand side that has nothing whatsoever to do with your Prepcheck Zeros, 1s, and so forth. You see?

In other words, the report is for you and for referral to keep you from passing up a question which you then don't clear.

Now, we've got to clear all these questions up the line. Now, because I audited this pc before and got some tone arm action on an incident in Rome – I got some tone arm action on that particular line – I got considerable amount of half-truth and untruth off the end of that but that was running relatively well. That whole series, I must comment to you, is in question whether or not that is clear or not. You understand? But we were only going back such a short and shallow distance in the pc's life that I thought, "Well, now, let's see if we can't get a little earlier and get a little more germane to our original question – 'What about these physical difficulties?' So what I'm going to do is run down physical difficulties some more and find out if there wasn't something else in the way of physical difficulties, find a chain ripping up here someplace, and now go back and clean up this other chain."

I figured I'd be faster to do that than to slug as we went on that. Do you see this?

All right. Now, there's another rule on Prepchecking and that is that you are only trying to pull withholds, and a withhold is held in position because of a prior overt.

If you can find a withhold, your Who, When, What – pardon me, your When, All, Who, to be precise, round and round and round, applies mainly to the overt, of course. It does not apply to the withhold. It applies to the overt.

Now, the steering of the pc merely consists of steering the pc into giving you a withhold and then steering the pc into giving you the overt. And that is the whole of the steering action. There is nothing esoteric about it. You are pulling chains. You are not looking for withholds. That's the next thing which you've got in crosswise. You are not pulling individual withholds. You are pulling chains of overts. And that is your target in Prepchecking: chains of overts. That's all you're interested in is a chain. You are not interested in a single incident. You want chains.

The anatomy of the mind tells us that we have incidents forming in chains which go down to a basic. And this basic, when pulled, pulls the rest of the chain. That is purely the

mechanics. That's Book One. That's been with us for ages. It's hardly worth going over again except to remind you of its existence. You have chains, which is a whole series of incidents plotted on the time track, and those incidents derive their force from the under, lower, earlier incident.

You are not looking for the hidden part of a single overt or withhold. You are looking for the hidden incidents earlier on the chain. That is what you are looking for in Prepchecking, period. You are looking for nothing else. I find you going *thud-thud-thud* on something of the sort – why, you're just going nowhere. Trying to take an engram which occurred yesterday and trying to find the unknown or hidden part of the engram which occurred yesterday in order to release the engram which occurred yesterday and after you have worked on that for forty, fifty or a hundred hours, I would love to be able to show you on the meter that it was dependent utterly upon a whole series of engrams, and any one of those engrams ticked would have done more than your hundred hours of work on that single engram. Do you follow that? You're pulling the underpinning out.

And if you could consider a chain as a whole series of steps on a ladder – looking at the ladder from the top, you only see the top step, right? The top step obscures all the remaining steps of the ladder clear to the bottom – you see that – if you were looking at a ladder from the top step down. So that is what the pc can see. He can see the top step of the ladder. And that's all he can see. And that's what he gives you as his withhold.

Now, your When, your All and your Who are directed toward finding the rest of the steps of the ladder. And this is a very peculiarly built ladder in that the top step of the ladder will remain inexorably in place until you pull the bottom step of the ladder.

And of course, you find the bottom step of the ladder by finding earlier steps than the top step. And you finally will get to the bottom step of the ladder. And when you get that, you suddenly have a stepless ladder. It is very mysterious. It just suddenly goes *zzz-dddh-zzzzz*. And there's no reaction on it.

The unknowns that you were looking for are the earlier incidents on the chain in this lifetime. Prepchecking has only to do with this lifetime. That is what Prepchecking has to do with.

Now, I have advisedly not used the word *basic-basic* with regard to Prepchecking. And I have not used this word *basic-basic* with regard to Prepchecking because the basic-basic of any chain of incidents is anchored in a valence, a beingness that you will find in 3D Criss Cross.

But you can find this lifetime's basic, and it'll rip up. It'll rip up. You do not have to find, in doing Prepchecking, the past life upset. And you'd better not.

You can, then, clear a whole chain of overts resulting in withholds in one lifetime by going back and finding the basic on the thing and by asking pertinent questions.

Now, therefore, your What questions do not apply to one incident ever. And your Who, All and When – your When, All and Who, to get it in the proper order – your When, All, Who, When, All, Who, When, All, Who, When, All, Who, on and on and on, round and round and round does not apply in any way shape or form to one incident. So therefore, you

have the greatest fluidity and flexibility in the asking of questions. You have enormous fluidity and flexibility in the asking of questions. You can ask about anything as long as it's on that chain.

Now, the stunt which you ordinarily employ is you try to clear the What you've got. And if you can't clear the What you've got, then there's a subsidiary chain. So you try and look for that chain, and if you can't clear that, why, let's find another subsidiary chain, and let's clear that. And if we can't find that, why, we clear the other subsidiary chain.

In other words, when your reaction is not dimming out by reason of asking When, All, Who, When, All, Who, When, All, Who, and our reaction doesn't go off the test What question, why, then we must have – this chain must be dependent on an earlier chain, or a different chain, slightly different chain, more or less on the same subject. So we finally get the pc to give us another withhold, so we mine that. But it's all on the same subject.

And we finally get this lower one, and we finally get the – I don't care how many I_C s and I_{DS} and I_{ES} and I_{FS} that you go to, you'll eventually get one of those that, when by asking, When, All, Who, When, All, Who, When, All, Who, When, All, Who – all of a sudden when you ask it again, you haven't any reaction on it at all. And that moment you've got a null What question. So that last What question that you were working on goes null. So you mark it null, and now you've got to work the one above it. If that was I_D , and it went null, you've got to get I_C . Now, you work over I_C a little bit more with When and All and Who, and When, All and Who, and all of a sudden it goes null. And then you go back and you get your I_B , and you got When, All and Who, When, All and Who, When, All and Who, and it isn't nulling, you've got to find you another subsidiary of the chain, get a new What question. You've got to now get a new I_C .

In other words, you clear these things by finding new withholds and new chains. It is not at all difficult to do this. It sounds actually much more difficult than it is. And once you get the hang of this thing, it goes like *zz-zoop-zoop*. There's hardly anything to it.

Then finally you'll clear this new one that you got. You'll come back and now you'll try I_B again with your When, All and Who, and you just test it. And you're liable to find out it has evaporated. Maybe you didn't ask the When, All, Who for it at all. You just test it. You ask it. No reaction on it. All of a sudden, you ask I_A – *bang*. That thing is no longer there, and then *boom*, you're liable to have your I gone by this time. And that is clean. It's a progress into depth of chain.

Now, let me show you the association amongst these questions. Our Zero is, of course, a rudiment question. That is all that is. That's just a rudiment question. So we got to have a $Zero_A$, and this particular rudiments question, "Are you willing to talk to me about your difficulties?" gets a starting point for you.

And you've got your starting point. And I'll go into that more in just a moment, but your starting point in this particular one is the dynamics. You have the dynamic, the dynamic breakdown. And we are working at the moment on $Zero_A$, self. Therefore, you don't find me taking up much sex because we are working $Zero_A$, see. We're working self. And what could he talk to me about himself? Well, he got a bad meter reaction. That is to say he got a nice fall

there the second that I asked him – he talked about physical difficulties and he got a pretty steep reaction on physical difficulties, so we are actually entering this case from the rougher side because we're going directly up against physical difficulties. And the physical difficulties, of course, depend utterly upon a tremendous number of withholds of one kind or another, so this is a heavy slug.

But you should be aware of the fact that the beginning of the case is when the case should be Clear; then the auditor would have a perfectly good time of it.

The hardest end of the case is always the beginning end of the case. This is when everything is wrong with the pc. See, that's always the rougher end.

All right. The optimum, of course, you can't have, so you have to take what you got.

Now, we have "What about these physical difficulties?" and we didn't have the pc volunteering any new withholds in this particular session. Pc volunteered no new withholds about his physical difficulties, so I had to prod him.

Well, that doesn't become a What question. So I had to talk to him. So I had to coax him, persuade him, accuse him, crisscross him, and he finally breaks down, and he tells me that he has some physical difficulties, and one was a rash on the ankle, the other's rectum trouble and the other one was sexual urges.

And just by keeping my eye on the meter at the time he announced these things, then I didn't have to make a further assessment because rectum trouble went *bang*, so obviously it was the most available subject, so I just take one out of thin air on the thing because this might go anyplace, you see.

And I took one out of thin air – "What physical difficulty would it be unsafe for you to reveal?" – he gave me this list. I got my list here a little bit crossed up a moment just talking to you about it.

Now, we got "What about this rectum trouble?"

Oh, he did tell us, didn't he? All right. This was actually our point of departure in the session. We didn't have a point of departure up to then. The auditor was simply working the whole way.

All right. And at that moment, why, we had it rolling and we find out all of a sudden that the pc has some kind of a reaction here on the subject of taking care of his little brother, keeping him clean. Well, let's see if we can't get away from this. Let's get out from under on this particular one, see. Let's see if we can't get that one, see.

Furthermore, it follows up the purpose very much better. Because we had an incident in Rome in an earlier session and it was very late. It's only two years ago, and we were having an awful time mining any earlier. Well, when somebody has a little brother who has been with him an enormous number of years, that is awfully good mining area.

But more, more importantly, you should realize that it is risky. You're asking about a valence. This might be an oppterm. This might be almost anything, see. So we – when we introduce an identity into a Prepccheck, we introduce it with a little catch in the breath, you know. We might or might not get away with this very easily, see?

We try not to use identities, but we've certainly got to start someplace here, and this was minor enough to try to plow up one way or the other.

Now, that didn't clean up, so the auditor simply got overt, and the auditor said, "Well, what about doing something to Jim?" Just out of thin air because we didn't clean up "What about not keeping Jim clean?" after we'd gone over it a few times with a When, All, Who, see? We didn't get it clean. It was diminishing, but we didn't get it clean, so what have we done to Jim? That's the inevitable question that we ask.

If we're not being able to clean some subject up, well, let's see if we can't find out what the pc did to him, see? What did the pc do to this person? There must be something there. Otherwise, the pc wouldn't have any antipathy on the subject.

You're using the basic rule of the overt-motivator sequence, which is what has been done to you has very little bearing on your psyche. But what you have up and went and did, brother, that's it. And they only clean up on what you've done.

Somebody here, by the way, ran an engram the other day which is a motivator engram because they couldn't find anything. All that person had to do was just ask for an overt to the subject matter and it probably would have cleaned right there. *Bang!*

So you always have this dodge which you work continuously, "Well, what have you done?" see. Natter, the person natters. The person says there's an upset, the person says this, the person says that. You always got "Well, what have you done?" you see, as a leading question.

Now, we notice that the auditor in this particular case didn't write down anything whatsoever that the pc was saying. It was just that the pc was saying these things, influenced the auditor's report because we were keeping a record of the Whats, don't you see? That was all you were keeping a record of, and we're all on the main line.

Let's see if this is on the main line.

"What about doing something to Jim?" and "What about not keeping Jim clean?" All right. This is starting from the bottom. Your 1_D; "What about doing something to Jim?" 1_C, "What about not keeping Jim clean?" 1_B; "What about this rectum trouble?" Is that all – this all pertinent as we go? 1_A; "What physical difficulty would it be unsafe for you to reveal?" Isn't this on the same line out of which, of course, we got a list? And isn't that germane to "What about these physical difficulties?" And your Zero_A – isn't that germane – at self it's certainly germane to this chain. And then our Zero, "Are you willing to talk to me about your difficulties?" Is that all of a piece? Well, you just make sure that any Prepcheck chain that you set down of What questions is all of a piece.

Now, if you write a new What question every time the pc gave you a new withhold, you'd go stark staring mad. There isn't enough paper manufactured. You would just go mad, that's all. You don't care about individual withholds; you care about the subjects of withholds. Therefore, the drill of the What question – What drills – Pc says, "(Specific withhold)." Auditor says, "What about this chain of withholds?" Interesting, isn't it?

Pc says, "Well, once upon a time in my life, the only time in my life I was up on the top of the Empire State Building, looked over the Empire State Building's edge, and I was terribly, terribly stricken about the whole thing because I had an impulse to pick up the companion who was with me and throw him over the side of the Empire State Building down to the ground." And the pc gives you some long, involved withhold like this. Well, you've got to condense it. What's the most likely chain that requires an auditor insight? What's he habitually do in life? This is – regulates the What question. What's he habitually do?

Is he always going up on the top of high places and trying to damage people? Is he always being afraid of height? Oh, that's motivator, isn't it? So we leave that one alone. We don't have anything to do with that one. Just skip that one. Any mention of the fact that he's afraid of something only would lead us astray, one way or the other. We've got to have something there that's overt, so we choose something out of this. And the widest thing that you could say, "What about damaging people?" That would take in the whole reactive mind and would be a no What question at all, and you see.

But this is a neat little one: "Well, what about wanting to throw people off things?"

See, that's a nice neat What question. There's probably a chain of these things here. And you understand, you mustn't let your desire to get it all done now, at this instant, interfere with your sensible What question – the sensibility of the What question – because everybody to some slight degree suffers from "It's all gotta be done this instant, now. And we haven't any time to repair it, because it's all an emergency anyway." Well, this all comes out of problems, don't you see?

He says, "Well, I wanted to throw this person off the cliff."

And you say, "Well, what about being aberrated?" [laughter]

Now, that's a good What question and would include all of his overts, and you would get nowhere with the Prepcheck.

No, your What question must uncover, if possible, a chain. And if that chain doesn't clear, you've got to narrow the chain. And if that doesn't clear, you've got to narrow that, all done by his withholds. And you'll finally get a What question, a subsidiary What question way down the column – it will clear. When that one's cleared, why, the next one above it will clear, and when the next one above it clears, why, the next one above that will clear. And if you're kind of having a rough time of it, you've got a question now that isn't clearing, so you've got to get a new subsidiary What, and a new subsidiary What to that one, and clear those two. And now that one that you hung up on, that will clear, don't you see? It's going back and forth, up and down.

Actually, it's a very neat relatively simple action. Nothing very pertinent to it. But if every time he gave you a withhold, you got a new What question, you would just be *blaaa*. You'd be nowhere, you know?

I expect a fellow to give me – if he's working well, he'll give me two or three withholds for every What question, see? So what? You say, When, and he says, "Well, which one?"

Well, tell him. Pick one at random. "Well, the earliest one or what about that one about – that you just told me about Keokuk?"

And "Oh, well," he says, "that was in 1960."

"All right." You say, "Good. Well, is that all there is to that one?" and so forth.

And maybe you've got three, four, five dates you're working under the same What question, don't you see? You just go on and on and on and on, and I don't care how long you roll one of these things around. Or how many overts come out under the heading of it as long as they're pertinent to that.

Now, where do you get your next one? Well, the pc jumps. You've mined the thing out, and all of a sudden, you're not clearing this easily, and he gives you another brand of withhold. It's on the same subject. You've been talking about shotguns very, very nicely, and he starts talking about rifles. Well, you're talking about breaking up shotguns, and he starts talking about stealing rifles.

Well, you've got a new subsidiary What question, haven't you. He changed the subject on you. So obviously he tells you that your shotgun chain went over here to a stealing-rifle chain, and then the stealing-rifle chain went down here to an insulting-quartermaster chain, see? And the insulting-quartermaster chain went down here to trying-to-please-his-wife-by-getting-her-money chain. That's all under the same series of Whats.

And all of a sudden that clears up. That was the reason he was trying to needle quartermasters into giving him more goods – because he could sell them illegally. And when that cleaned up, because that was a basic withhold, and the next one is – cleans up, and the next one cleans up, and all of a sudden shotguns all blow up, and there you've got it. You've got the lot.

But this is all dependent on the fact that a piece of hidden information, one or more pieces of hidden information, exist on a chain.

It isn't that one or more pieces of hidden information exist in a withhold. You see, we are dealing, not with my arbitraries or what I'm trying to make you do or what would be optimum. We're actually dealing with what we find in the mind. That is quite important, Scientologically, to understand that. And the datum which we have is a very ordinary datum. That datum is simply that on one chain, why, you have, usually, one long, involved, confused chain of stuff that has little hanger chains and that sort of thing

Somewhere down around this thing someplace, there's going to be something that's totally out of view.

The person didn't ever know that before. He didn't ever think of that before. Where did that come from? What is that all about? And you'll see these things start to dawn on the pc. In two, three, four or five hours of auditing, you'll, you'll see some one of these things start to dawn gradually on the pc and they – sometimes they dawn slowly, sometimes they dawn fast.

But, the pc all of sudden – I'll give you a typical one: "Well, I never remembered that, you know. I was in the doctor's office and I reached around at the cabinet, and I pulled a vial of morphine out and put it in my pocket, and that's where I got the morphine."

He's been telling you always before this, there was something else going on with this morphine, and so on, and he hadn't even remembered that he had stolen it, see?

That one comes to view; the whole chain pulls up. It's some little oddball scrap of information, usually an overt, usually discreditable, and it'll have this whole chain mired. It'll have the whole thing pinned down. The chain won't come loose till a piece of hidden information discloses. So you can tell about when a whole series of chains are going to pull. You can just about tell. Because the pc says he didn't remember that.

Now, early in a case you can mine for a long time before finding one of these. You can – you might go several sessions before all of a sudden, the person, you're doing Prepchecking, the person says, "What, do you know I didn't know about that. I didn't know about that. But do you know that I – I – I actually went and got the boiling water and poured it on him. He didn't have an accident at the stove. Yes, well, what do you know? Yes. Oh, well."

You see this preclear start to spark up. Well, cover that for your needle reaction and you'll find the whole chain. All of a sudden, you'll be able to run back that chain, *brrrrrrp-brrrrp. Brrrrrrp-brrrrp-brrrrp*. All of a sudden, the chain cleans up.

It may not clean up all the way on that one hidden piece of information. It'll clean some distance. And if you've been unlucky enough to string yourself out to eight What questions, you'll find the piece of hidden information and suddenly you go up the line, you'll lose maybe – at least four or five of those What questions will drop right out, see.

It's almost as though there is a hidden tent stake and you're trying to strike camp. The pc has been setting up camp here at the old water hole, and this has to do... And he's just been setting up his camp setup for a long time. Tells everybody about it, you see. Whatever it is. And there's a stake that is driven in the ground. And it is not visible to him, and it's not visible to you, and it's not visible to anything. And you keep trying to get this tent down, you know.

And you can pull on the tent. You can yank on the tent, and you can try to bind it up. You could try to burn it up. You – anything you did, it won't matter. I mean, because this tent is just *there*. And you could kick in its sides, and you can pull up some of its stakes, and you can drag its ridgepole down – you can make it look messy – but for some reason or other, the thing insists, utterly insists on remaining on the ground. And then all of a sudden, this mysterious tent stake – that, by the way everybody's been falling over – and you take a sledgehammer to it, and you knock it a couple of times, and all of a sudden it comes into view, see.

And there it is, *bang!* And the pc looks at it, and he says, "Well, I never knew that stake was in there."

Of course, you're in good company because neither did you. But you were at least looking for it and he was avoiding it. So we take the tent stake and all of a sudden the tent wraps up real neatly and we strike camp and that's the end of that chain.

And we – the pc can move on the track from there on. But every time he went back past that particular camp, man, there was the kettle still sitting on the coals, you know. And it was still erected. And it always takes one of these hidden tent stakes of one kind or another.

She was always kind of upset with the local library and didn't like to go into the local library until we all of a sudden find out that she made a practice of going into the local library. And anything – any poem or anything that she found that was real good, or something, she'd tear it out of the book on the shelf, you see, and put it in her pocket. And she's totally forgotten this.

This just seems to never come up. Only it might be something – it's not the, it's not much of an overt ordinarily. It's you – sometimes quite mild, quite idiotic. You can't look always for the big punch. It may be something like she forgot to take this child a birthday present, you know. Just didn't ever take the child a birthday present. Never wrote a thank you letter, and for some peculiar reason, wouldn't have anything to do with this particular zone or action, this whole series of overts. And she has never looked at this series of overts. This is ordinary in Prepchecking.

Well, that's why you're running down these chains is you're – you're actually mining whatever the pc gives you. And it's all valuable, and there's a little more being disclosed about all this, and the pc knows a little bit more about it. It's freer. It's less reactive. But you can sometimes go on for hours and hours and hours without falling over this tent stake. And of course, you're looking for a needle in a haystack, so the trick is don't look for it.

That's actually the trick in Prepchecking. You don't go looking for this tent stake because you'll just try the big effect. All you do is run the system; the tent stake will all of a sudden show up. You see, actually, the tent stake can't be found until you get those coils of rope off of it. Everybody knows the coils of rope are sitting there, but it's necessary to move them. You see?

Prepchecking has the facility of bringing to view incidental items that apparently had no bearing on anything but which in reality were holding down a whole chain of incident and were making it reactive and making the individual have a jolt on it.

Now, in laying out a pattern of this sort of thing, you of course can go in on all manner of wild questions. You can go in with any kind of a wild question you ever heard of. But the best way to establish a question is what you call Prepchecking. Now, the reason this is called Prepchecking and the reason it isn't called withholds system and it isn't called anything else but Prepchecking is it's preparatory to clearing. And that is not just a loose advertising phrase. That is a neat fact. You can't do 3D Criss Cross while Prepchecking.

Well, well, it's idiotic. You spend a lot of your time on your rudiments and that sort of thing. All I mean by that is not that it's impossible. But I merely mean that when you're doing 3D Criss Cross, you should be doing 3D Criss Cross. You shouldn't be Prepchecking, and so forth. You shouldn't be monkeying with rudiments. Let me put it much more strongly than that.

When we start a pc into 3D Criss Cross, we expect the rudiments will stay in for a little while maybe. We expect this pc can be settled into auditing. We expect this is a possibility that we will get some 3D Criss Cross done.

Well, the best way to guarantee that is to prepare the pc for clearing. We get, then, "preparation for clearing," "Prepclearing," "Prepchecking" – synonymous at the present mo-

ment. And you get the rudiments in with an ax. And that's what you use this for. You just get them in with an ax – with a mallet, with a maul. You knock them in and cement them down with concrete. These rudiments are not going to come out and the only reason you should do anything is just to get the rudiments in. So of course, your basic Prepcheck questions are the rudiment questions. There they are. They're just the rudiment questions.

Well, under Havingness, we have the 36 Havingness Processes and others. We can straighten out the pc's havingness, and so forth. So that could stand outside of these, but at the same time there could still be some Prepchecking done in this particular zone.

"Are you willing to talk to me about your difficulties?" Well, the pc who is sitting back there unwilling to talk to an auditor about his difficulties certainly is having a hell of a time when he's getting 3D Criss Cross thrown at him.

So that's a very good one to straighten out. Now, "Are you withholding anything" – you get your Form 3 and Form 6A. "Are you withholding anything" – you just don't sit there and say "Are you withholding anything?" You try to – you guide it. And when you get down to that rudiment, you put that in by running a Form 3 and a Form 6A.

Now, you've got present time problem, you've got a Problems Intensive. But you prepcheck the withholds that the pc comes up with in the prior confusion areas. You just use those as Prepcheck runs. That's all right. They're your Zero_{AS}.

Now, end rudiments, same way. You can go ahead and talk to him about – you can break that – Half-truth, Untruth, Impressing people and Damaging people – you can break that up into a four-segment question, each one with a Zero Question, and you'll get anything on this lifetime out that makes him impulsive along these certain lines.

You could go – the E-Meter influence, and you can take meters, electronic gear, influence, mind reading, allied subjects of this character. You could whip those things out and get that thing in so that you haven't got somebody trying to sell you an item all the time and doing a sell, being upset about the meter, get that thing squared around. Pc can sit there and look at the meter without having to do something to it.

Anyway, the difficulties of handling a preclear under 3D Criss Cross are sufficiently great that why do you want to buck into the lot of this, don't you see? Why do you want to have to handle the rudiments at the same time you're doing that. So just go ahead and get your rudiments in and you've got Prepclearing, and the activity – the broad activity of setting him up to be cleared would be to get his rudiments in hard.

And you've got his rudiments in hard with a *thud* all the way along the line, they're not likely to come out very hard. And a pc can then be gotten into session right at the beginning of the session for a 3D Criss Cross activity, and you can get him out of session at the end, and you've done a bang-up job of that. And you get a lot of 3D Criss Cross done on him, which is high validity processing. And that is very valuable processing. But what gets in the road of 3D Criss Cross? Out-rudiments. That's the only thing that gets in the road of 3D Criss Cross. Just out-rudiments. That's all.

So Prepchecking is totally devoted to straightening the pc out so the rudiments reasonably stay in.

Now, you've got your next problem with regard to rudiments, which is when you change valences by reason of 3D Criss Cross, you will bring areas into view by reason of having changed the valence of the pc. But it isn't true that just because you are finding new valences on the pc, the pc is going into a new valence every time.

They are still in all the old valences and they are also now in the new valences, but they have been in the new valences, and they have been in the old valences.

In other words, if you find a new valence on the pc by 3D Criss Cross, that does not mean that he abandons all of his old valences, throws away the old shoes out of the attic and moves into the new valence. As a matter of fact, the 3D problems mass pulls apart a little bit. It just pulls apart a little bit. It has less influence on him than before. But just before you find this, the pc will dramatize the new valence coming up.

So that dramatization, of course, influences the case and tends to some degree to throw your rudiments out. But if your pc is already capable of being kept in-session, then influence of this is minimal. You get less influence on this.

Now, actually you shouldn't have to pay much attention to this particular phenomena because the pc while he's running this and doing that will get a lot of cognitions, will give you a bunch of withholds and so forth. Remember that isn't rudiments. That's all incidental to 3D Criss Cross.

So if you could just get the rudiments in so he vaguely could be audited without thinking the auditor was going to shoot him down in flames, and he was – all of a sudden wakes up at nine o'clock in the morning and suddenly says, "Oh, no," and realizes all of a sudden that he, all of his life has done nothing but rob banks and this was totally occluded to him before this moment. He doesn't come into a 3D Criss Cross session with the session burgeoned with all this.

You've already more or less got this cleaned up in, in your Prepclearing. So your case tends to maintain a greater stability if the case is well prepchecked before 3D Criss Cross is run.

Now, it isn't absolutely necessary to do a Prepcheck before you do 3D Criss Cross. But you will find out that it takes you about four times as long to do the 3D Criss Cross as it would have if you'd also done a good Prepcheck. So it's in the interests of saving a tremendous amount of time. 3D Criss Cross can upset the person most gorgeously, and if you're upsetting the person with present time problem, out-rudiments and everything else going this way and that, you haven't much chance of putting the case back to battery.

Now, the way to put a case back to battery is put it in some kind of shape to move forward before you move it. That's the time to put a case in shape, not after you *have* to put it into condition. See, it's too late now to do the effective, so we have to do the urgent. And you'll find yourself in all kinds of heroic activities. Middle of 3D Criss Cross all of a sudden the person has a screaming present time problem, you're halfway through a list, and so forth.

Well, if your – the person isn't rather accustomed to handling present time problems, and so forth, the pc's liable to be far more worried about this than they ordinarily would have. So just by the fact the pc knows he can talk to the auditor and knows he has been able to talk

to the auditor, and knows that things aren't going to bite, why, he can get these things – you can get the rudiments in more easily. That is the least benefit from it.

Incidentally, Prepchecking looks to somebody in off the street as a fantastic activity. It's about a psychoanalysis – the complete psychoanalysis – every three or four hours. [laughter] And Papa Freud would just be in love with it if he ever saw it, man.

A well done Prepcheck and, man, fantastic. Wouldn't Freud have had a ball with that session I had today? Wouldn't he have? Wouldn't that have been marvelous. Psychoanalyst would be talking to the patient yet. [laughter] Explaining all this beautiful data.

Of course, I don't know why he'd explain it. There's a little pin worth of it – there's a penny's worth of data he – around there someplace we haven't collided with. And we'll collide with it and that will spring the chain and that's that.

Now, here's – this factor is confidence. When you're doing 3D Criss Cross, a person can get awful low. And a person can become very morose. And a person can become very upset. And the person can wake up at two A.M. and suddenly say, "What was that item they found on me today? Oh, no. Not 'a terrified louse'. [laughter] I wonder if that could be why I'm lying here shaking and sweating. *Mmm*. Is that why I – every time I get caught in a rush hour, I'm afraid of being squashed? Do you suppose that?"

And he goes over this. "Yes, by George, that's true. That's true." Cognition, cognition, cognition, you see.

And after he self-audits himself, incidentally and accidentally because he had no other choice, half the night, he gets up, stumbling off, while walking on both sides of the street the next morning – and he's so concerned about all this he doesn't really want to face up to any of his friends or meet anybody like this. That would be the wrong thing to do.

Well, he neglects to eat breakfast, you see, and comes in to get audited. And now if you're ever going to have any trouble with this person's rudiments, you're going to have it now. So it's a good thing to have the pc in a condition where you can put the rudiments in rather easily. Right? Good safeguard.

But if we just had that, we didn't have anything else, Prepchecking is actually more valuable than the – most any other process we have ever had. It is more valuable as a single activity. It is well worth doing very well.

I don't see any signs of it changing around. You'll goof up here and there, and I will have to make a few little minor changes because of whatever you're doing with it or something of the sort or make it a little more simple someplace or more explicable, but I don't look for anything to happen on it. Because actually I worked on this for months.

I worked on 3D Criss Cross for ages, and we've only had one change in 3D Criss Cross, I think, in about two months almost – a month and a half. And that's just to find out that – oh, oh, the one little change in a month; that's not much of a change – don't cross them out obligingly for the pc because he's going to all of a sudden realize that it's unsafe to reveal. So he's of course liable to take out the item. He's of course rather – abandoned.

He sees – he sees these tremendous lists, and he sees by their very length that a 'terrified louse' is being beautifully swallowed up and is meaningless on this long list, so he goes ahead and gives it to you, you see.

And then if you're asking him what these things mean, he can have a change of heart. And he isn't operating with that interesting feeling of confidence and abandonment he is operating with when he's just giving you the items one after the other. He – it lets him have an afterthought. And apparently, pcs are not entirely proof against striking their own list off. They really don't know it's theirs, you see, and they don't know it is, and they don't know that it's not. "But oh, well, no, a terrified louse, that wouldn't oppose an insecticide factory. Take it off." You're bound by the rule there. Off it goes. Your list will go null.

There's a phenomena of bouncing out of the 3D problem mass. People go into it and move out of it, and bounce off of it, and sit on top of it, and try to approach it, and the auditor pulls them down to it with winches and heavy oxen and so forth, and the pc's heels have made a furrow, you see, that can be traced back down the concrete highway, you see, two furrows clear back to Los Angeles, you see.

And you gradually got him, you see, to confront this point. And he's giving you some answers at this point, and of course you let him go at the end of the session, and he goes back to Los Angeles. And he says, "What uh, why ah, that list – put a new one on it. All right. Now, differentiation and so forth – well, I wouldn't have anything to do with it, and that wouldn't have anything to do with it, and the next one wouldn't have anything to do. .. And a terrified louse wouldn't have anything to do with an insecticide factory. Take it out, and so forth. None of those things would be," and so on. He's bounced.

You haven't had many changes and this thing is well worth learning. You had a variability. The – this came out of this interesting inability of the auditor to vary the Sec Check question. The auditors could never vary the Sec Check question sufficiently to get all of the data. Well, this is the system by which you do that.

And this is how you vary the Sec Check question. Now, I've had that – you've had that difficulty for many, many months, and I worked hard on this to get this thing shaken out so that we could get around that difficulty. And it does rather easily.

It looks tougher to you than it is. But by the time you've kept a few auditor's reports on a few demonstrations, it'll all of a sudden start looking awful simple to you.

By the way, if anybody gets an improper report, one mistake on the report, you know, gets four infraction sheets. I don't think you knew that. We tell you after the fact today, you see. And failure to turn one in, why, you spend the night in the dungeon. [laughs] Well, not that crude.

But anyway, you're working chains, and you're looking for the little scraps of data that evaded people's memories. And you recognize that if this little scrap of data could make this much change in a whole chain on a pc, why, then actually a fully, completely recognized valence from the past track, the whole package occluded, would make an enormous change in the pc. So you're actually getting those gains which are in vignette.

But don't be too hopeful that after you've got the person Prepcleared – by definition all rudiments in – and gotten the whole 3D Criss Cross and gotten all of the items of the Goals Problem Mass beautifully stretched out, beautifully opptermed, everything laid out on a line plot marvelously, don't be too sure that you have heard the last of Prepchecking. You haven't. Because it's very probable that a similar technique will be used to take these items to pieces. So it's what you start with, and it's probably what you will end with. Okay?

Therefore, you are not at all concerned, before you've got the Goals Problem Mass isolated, in establishing – in any past life activity. You don't want anything to do with a past life activity with Prepchecking until your Goals Problem Mass – because you've got the method of reaching those withholds. Those are the biggest withholds of a pc's life – a whole life.

Yeah, for instance, some of you come to England and you go *zzzz*, and you go *huuuuuuu*, and you say, "I don't know what's the matter with me," you see. And of course, you've probably been hung for a poacher or something like that. I think we had somebody who was killed down the road here just a few miles south. [laughs] But it's not very serious. It's just a restimulation of that sort of thing.

And some of you, of course, come to England and feel very relaxed. You think this is wonderful. England is very relaxed, very nice, and so forth. Haven't done anything to it for centuries. All of your overts are against France or Los Angeles. [laughter]

Well, anyway, the use of what you're doing is very broad, and all I'm asking you to do is to become very expert at it and watch your meter rather closely. Now, those things which are falling, of course, get some representation here on your Sec Check plot. And you'll find out they will all stop falling if you get the chain out of the road. That's all you do is if you get the chain's unknowns out of it, why, the whole chain will wrap up, and then anything that you've been hitting on in the chain will wrap up, and you'll finish that off. But of course the chain won't wrap up till you get the bottom of a chain.

So therefore I wouldn't work too long, just as a tip, on any What question if it seemed to be resistive – if the question seemed to be resistive. And in Prepchecking we've answered one of the big problems, is: "What is this continuously banging withhold?" The withhold bangs and bangs and bangs, always with the same intensity, always with the same intensity. You won't find that in Prepchecking because if you found it, you would go on and get the next What question.

In other words, when, you get a constancy of reaction on the meter and you're not cleaning it with your When, All and Who, it's time for you to find a subsidiary What. And don't just take it out on the pc; you just haven't asked the right What question yet.

Well, it doesn't matter how many What questions you have down. But remember these What questions must all be of a kind and they must all apply to the case. And they are in an effort to clean up a chain which starts in with concern, in this particular chain. You've got it there in your 1; is – that names the chain. You've got a chain here called "physical difficulties." It could say "What about these physical difficulties in this lifetime?" And that would be more pertinent to what you're doing but the pc isn't showing much proclivity to drift elsewhere, so there it is.

Okay? Do you understand this a little better?

Audience: Mm-hm. Yeah.

Well, I hope you have good use of it.

Thank you.

PREPCLEARING AND RUDIMENTS

A lecture given on 22 February 1962

Thank you. Thank you. Well, we made that one. All right. This is the what? Twenty-two.

Audience: Feb.

February, AD 12. All right. And Saint Hill Special Briefing Course.

We just had a demonstration of Prepchecking. Actually, we're not Prepchecking. We're Prepclearing. There's probably a vast difference. Nomenclature settling down a little bit. Give me that sheet. I'll show them a sheet. There's your auditor's report. Yeah. It's the same heading Zero, "Are you willing to talk to me about your difficulties." Zero 1, which is now changed to Zero A as "self," and 1, the 1 question is, "What about these physical difficulties?" And then your 1_A is, "What about this incident in Rome?" And your 1_B is "What about proposing marriage?" And 1_C is "What about this 17-year-old girl?" And 1_D is "What about this first girl?" And 1_E is "What about these earlier girls?" And then there's 1_F, not articulated. But I didn't ask him about this. It's "what about raft incident, 1935." We're running it down to the basic. And we must be awfully close to basic right there, you see? That's what this chain is stuck on. Now, do you see what a chain is?

Audience: Hmm-hmm.

Hmm?

And that's what I'm running down. Now, you notice there's still a – there's a tick-tick. Well, we got the tick two or three times, little tiny tick. Can you see that on the screen all right? Well, that little tick is what I'm looking for. And we're in the vicinity of that tick right now because the tick changed characteristic slightly. I didn't really see that it changed characteristic. I just know it was doing something else. And we're running it down at the bottom on the thing and then we will turn around and go back up this chain merely as a check. And we'll go up this chain and you'll find out they will all go null. They'll go over and take what I was working, on the other one, and you'll find out that that one and this one are tied in together.

Now, why I started working the other one hasn't anything much to do with it. You shouldn't consider it a model, but you shouldn't feel too abashed if you find yourself working a nonworkable chain to abandon the chain temporarily and come back on it later.

And you notice that this chain was working well and the index that this chain was working well is the fact the pc's havingness did not go down as far today as it ordinarily did. You see?

That is an index. The tone arm motion was there and the tone arm motion was doing all right because at that particular point tone arm motion is mostly read on the needle position on the dial rather than on the tone arm because at sensitivity 16, at that needle position on the dial with the tone arm, you can't even see it on one of these screens when you move it so microscopically.

But it was moving. We were playing it over on the right side of the dial and the left side of the dial and it was doing all right, but the index was the pc's havingness did not drop as far today.

And you saw a session that was run almost totally without rudiments. If you're good, you can do it. If you hold the pc in line with interest and auditor presence and you don't fool with anything much else. Of course, you realize this pc is working under – Fred's getting off the withholds like he said yesterday, you know. He's getting it off to whole Saint Hill, you know, whole world. *Crash!* Really getting a withhold off, you know. *Boom!* I hope he hasn't lost the ... At the same time, why, that's a rough one.

Now, let me ask you a few little basic questions about preclearing. One, did you see the pc unwilling to talk to me at any time?

Audience: No.

You didn't, did you? Well, I don't think that ever enters into it. Now, I don't know what trouble you have, but I never have any trouble having pcs talk to me.

Now, you understand this pc is talking to me over a TV network. Well, that's an awful hurdle. And if he can talk to me over the TV network, he sure should be able to talk to you as a pc in a nice, quiet room with everybody's ears stopped. Wouldn't you say that would be the point?

You go getting the idea that the pc isn't going to talk to you, you're in a games condition with the pc. I'm not in any games condition with this pc. This pc only faintly goes into a games condition with me. He has once or twice, just a tiny little bit when I wasn't mining anything that the pc was interested in. I got over into an area and I was plugging him and chugging at him, and pushing him just a little bit and then he all of a sudden said, "Gee, I'm being pushed." And he's recognized this, just a – just a shadow of it once or twice. And as far as you've seen, it's caused him to comment on other things that didn't have too much to do with the session. And that's as far as that goes. Otherwise, he's been running like a well-oiled dream, right?

All right. Now, you start – you start Prepclearing on the assumption that the pc isn't going to talk to you, you've assumed that you're not auditing a pc. Pc will always talk to you. But of course, that we are clearing up, "Are you willing to talk to me?" is actually, "Are you willing to talk to me about certain subjects?" you see, because he's perfectly willing to talk to me.

But I want him to have complete breadth and width before we start going into 3D Criss Cross. He shouldn't have the idea halfway through 3D Criss Cross that he'd better not tell me about a seventeen-year-old girl in Reno. Now don't you think that'd be the wrong time to have him suddenly get this idea? *Huh?* I think this would be the wrong time. And let me invite this to your attention that the time to put in rudiments is before 3D Criss Cross, not after you start 3D Criss Cross.

And the whole basis of Prepclearing is just to get your rudiments in. You're getting them in with a maul. I mean those rudiments are going to stay there. You see? That's the whole purpose on it.

Now, I should comment to you that on using havingness as an index and I'm not using havingness – a havingness Prepcheck, but I could very, very fortuitously and very fruitfully clear up the havingness environment rudiment with Prepclearing, see? Let me call it the Prepcheck is the operation and the whole operation is Prepclearing. Now, I could prepcheck the room. How could I prepcheck the room? Just by prepchecking rooms.

Let's locate withholds about games conditions. What has he denied people? What spaces has he denied people? What spaces has he pushed people out of? You got the idea? And we could – we could actually prepcheck that thing straight on down to the ground. And we'd all of a sudden find his havingness would stay in without any Havingness Process, providing while we were doing this, he was willing to talk to the auditor all the time. So you'll find the best way to handle this, however, is to use Havingness Processes while you're getting him – getting the pc to talk to the auditor.

All right. And then clear up things like the Joburg and 6A on an old-time Scientologist. Just clear these things up and run them down as chains. That's on the withhold section.

And then as far as problems is concerned, well, let's find out what problems he's caused people in this lifetime. That's all. It's just a Prepcheck totally devoted to the problem he's caused people to have, see, using problem as an overt. And we could prepcheck that out of existence and you'd find your pc wouldn't have any present time problems. And that – we could do that, you see? Your – your routine form is the Problems Intensive, see. You can do that with a Problems Intensive. And that directs you on to the problems, do you see? And that pulls you over on to the problem he's really sitting in and you could just take off from that point, clean up the prior areas of confusion, you see?

Now, that is the more stylized way to go about that, but I'm telling you a shorthanded way to go about it is, "What problems has he caused in this life?" Just use that as an overt. Instead of, "Do you have a present time problem?" you use as a Zero question at that particular rudiment, "Have you ever caused anyone a problem in this lifetime?" or "Have you ever been a problem to anyone in this lifetime?" Such a Prepcheck question cleared for this lifetime totally would leave you with that one in.

Now, we could take up telling people half-truths, we could take up telling people whole-truths – always a Prepcheck action. We could take up "impressing people" as a Prepcheck action. And we could take up "damage" as a Prepcheck action. And then we could swing on down into, "the meter," and we could take up the meter. And about this time we'd

probably be wanting to clean up missed withholds and that would be about it. I don't think you could go much further than this. The pc would be blowing things left and right.

There's a possibility that you could make a MEST Clear with Prepclearing. But of course, it'd be a preparatory sort of Clear, wouldn't it? It would just be a this lifetime Clear. And that's what we've been making and that was the target and goal of Book One.

So don't look on Prepclearing as being an incidental technique. Who did we run into today but a psychoanalyst, you see, a psychiatrist down the line. And this must have looked very restimulative to the pc because what you're doing is what they wish they could do, see? You're actually plowing right on down the line. If you could get ahold of a psychoanalyst who wasn't any dumb bunny, straighten him up himself and teach him Prepclearing, you'd find out he could learn it, you find out he could learn it.

You'd have to beat him over the head to make him keep the Auditor's Code and so forth, but he would find this is "Oh, my God. What have these Scientologists done now," you see? "They've gone and wrapped up psychoanalysis," which we have. And of course, it's so much more fundamental than psychoanalysis, there's hardly anything to it. And the psychoanalyst had no such goal for people. He just didn't want them to be neurotic. You want them to fly. Slightly different target.

And then you're just opening it up so that we can take this case over the jumps with minimal auditing upset. And it'll be a colossal joke on one of – one of the old boys to explain them all this, teach them all this. Show them what you could do, run it on him, get him a good reality on the thing. Give him wins and goals that he's been reading about for ages, you see and has never attained. Put him right through the lot and then when we showed him that we have gone ten thousand feet higher than any goal he had and so forth, we say, "Well, this is just preparatory to the basic skills of Scientology." [laughter, laughs] I thought it'd be rather amusing.

But now, you're liable to get lost watching a demonstration. You're liable to get lost a bit in wondering where the hell I connected things. And I am throwing a little bit of a curve on you because I won't downgrade what I can do just to give you a demonstration because I'm actually just auditing the pc. I'm not trying to demonstrate it.

And I'm using Prepclearing on a very unstrained basis. I don't shut the pc up so that I can ask him the next question, you see. Nor do I let him wander off of it very far, but I add things up. By watching the meter when he says things, I add up what he said. See, I got one eye cocked at the meter and he says, "Well, a proposed marriage" and all of a sudden I see the potential chain, see.

I say, "Well, gee whiz, maybe we've got a lot of proposals of marriage here, see? Maybe. Maybe. Who knows? So there's some kind of a subsidiary chain in the middle of the chain that we're running. Well, let's just ask him this as a What question and strip it down – and sure enough we found one. It wasn't terribly fruitful or very bombastic, but it was – it was, it definitely had to be asked.

Well, you say, well how did I get to this point? Well, I was auditing the pc, I'm afraid is the answer. And how many overts or withholds did you see me take off on one What ques-

tion? I just went on and on and on, didn't I, see? Got him talking and talking about it some more and talking about it some more. And asked him, "Is that all of it?" And sometimes I didn't ask him, "Was this all of it?" because he just got through telling me there was a lot more to it. So I just asked him Who, don't you see. And then you saw me shifting the Who question around a little bit so as to fit the circumstances of what we were talking about.

In other words, the system was being adapted to exactly what the pc was doing so it didn't matter how many What questions we were plowing. We could have a thousand What questions written down and trace them all back, but if we tried to get one per incident, we would quickly get lost. All you want is one per chain. You have this little subsidiary chain, you better have a What question there, see?

And frankly, we ended that session without articulating, as you will see on the auditor's report, the last What question. But there's a "What about" there, that I'm not sure what that question is about. You probably would have jumped at that point and you said, "Well, what about frightening little girls?" And very possibly that is the What question. But I want to hear this pc tell me a little bit more about this before I make up my mind, see? I'm not in any hurry to put down a What question.

What I don't want to have happen – and this is what is important – is for the pc to give me a bunch of different chained withholds that have no relationship to one another. And that I don't want to have happen.

The fellow says, "Well, I stole a car and ah – I, ah – ah – got drunk and ah, I made a pass at my sister and ah – let's see, is anything else I'm withholding from you? Well, ah – oh, yes and ah – I robbed a bank and ah – I always quit my job by parachute."

Now, there – that pc would have gotten the brakes put on him the second – first time he changed the subject. Well, I would have put the brakes on him. I would have guided that right back to the first one he told me or, if he – while he was going over this, I'd had my eye on the meter, I would have seen one fall like mad and I would have picked that one and I would have mined that one and I wouldn't have asked him another thing about the others, on the danger of missing a withhold or something like that, you see? I'd just sort of pretend I didn't hear about them and hope they don't restimulate.

But don't let a pc jump all over like a hot flea on a griddle, see. He's liable to be just impressing you or something like this. No, mine a chain, mine a subject. Well, what is a subject? I don't know. What's a subject? You can certainly define what a subject of withholds is.

Now, you can define it too narrowly or you can define it too broadly and defining the subject of a withhold is something like how do you ask a What question. And asking a What question is an art. That is an art. You can lay down the rules. I can give you a written paper about how to convert what the pc says into the What question that's pretty precise. But it is still a bit of an art. You still got to listen. You got to listen to what the pc said. That's important.

Now, I'll give you some of these rules on how to lay down a What question. As one, it must not be too general. It must not be too wide so as to miss a chain entirely. It must not be so narrow as to pin the pc on a single incident and prevent him from exploring a chain. That's

too narrow. It must be designed over the most, if possible, the most contrasurvival portion of the withhold, if you have a selection like, "What's most dangerous to the pc's self-preservation?" Not what's most dangerous that he has done to life, but what would be the most dangerous thing to him. So that's your too wide, your too narrow and that is the most important item in a What question.

Now, I've given you another definition similar to this and I'll give you another that's written, but there's more to it than this now. You must not take motivators, criticisms, other people's withholds or explanations, period. Now, those you mustn't – those mustn't be part of What questions.

Now, there is something you do to each one of these. Now, let's take the motivator. What do you do to a motivator? Now, this is a broader question. What do you do to a motivator? You always ask for the overt instantly. You don't – you don't monkey with the motivator. You don't do anything with the motivator except have the motivator indicate to you the class of person against whom the overt has been done.

"My mother beat me. My mother beat me daily, daily, daily, forever and ever. I was beaten every day my whole life, sometimes twice a day. And I often only got a delay in being beaten because she couldn't find a fresh place to beat me."

Well, if the pc has managed to say all those things without you asking something, you need your thetan examined because it's got a revving gear in it. See.

As a little point of amusement, I once explored, a long time ago in some of the early, early, early researches I was doing, I once explored, "Momma has beaten me" and I've also explored, "Papa has beaten me" and so forth. I've explored parental motivators. And by George, at the other end of the line we could just find one light spanking on the Momma case and we couldn't find any at all on Papa. That was when we finally got it all mined out. There hadn't been any such incidents at all.

Now, that's not really the reason why you shouldn't buy a motivator but it's a good reason not to ask for one, because you're throwing the rudiments out wildly and brutally, because you're letting the pc tell you an untruth. And of course, that stuff will go out.

Now, every time they start talking about motivators, you've got an untruth, right there, it's very close to. It's worth knowing, isn't it? You can throw your rudiments out taking one. You do anything about one, you've goofed with a capital G. A "G" is for, "Oh, my God."

You convert it at once into the overt. There's no hanky-panky with it at all. You find the pc never ARC breaks. Don't do it accusatively. Just do it overtly. If you're going to Q-and-A with anything, Q-and-A with your own overtness in asking for overts. But never Q-and-A with a motivator.

"My mother beat me." It's instantly, "What have you done to your mother?" or, "What about doing something to your mother?" if you want to be fair and neat and so forth. I don't. I just say, "What have you done to your mother?"

Pc says, "I was just beaten daily and ..." so forth.

And I say, "Well, who beat you?"

"Oh," he says, "Oh, my, my mother. My mother. She used to beat me every day and it was terrible."

"Well, all right. What have you done to your mother? Thank you very much."

And the pc comes right off of it and goes right on to, "Oh, I never did anything to my mother except, well, except pour scalding water over her feet one day and ah, matter of fact, I said I would support her and I don't now. I never sent her any money and ah – ah, I've never written to her. She doesn't even know where I am. Ah, there are no overts though." You mine that one out and you'll have it.

Now, what's the next one?

Female voice: Criticism – criticism.

Well, on the criticism. Yeah. The natter, natter, natter, natter, natter, natter, natter. That's the same rule that follows the motivator. That's identically the same rule.

Person says, "Well, they gave me seven infraction sheets and stood me on the head in the corner and made me eat *Dianetics: Modern Science of Mental Health* page by page."

And you'll find out if you accept a criticism it'll go into the motivator. Now, a criticism is a hope that they could damage. And that's what a criticism is – with an inability to do so. It's a little higher toned than a motivator. But that's all a criticism is and that applies to life in general.

I'll give you a good example – I criticize governments. That's because at the present moment I'm not in any position whatsoever to completely smash them. [laughs] I – I make no bones about this, see? This is not covert at all. Governments know what they're doing, not cooperating with me, if they're that smart. If they were very, very clever, they never would. And we'll have to cut that off the tape, you see. [laughter] But at the present moment – at the present moment – it's not that I'm in a position to – but it just doesn't fit the cards to make nothing out of all national governments, that's all. It just isn't in the cards at the present moment. I criticize them.

Now, you say, "Well, what have I done to governments?" What do you want? A costume historical? What do you want? Something the size of the *Encyclopaedia Britannica*? I guarantee you it would be entertaining. More entertaining than the *Encyclopaedia Britannica*. But if you even want to find out some of these, well, just go to the *Encyclopaedia Britannica* and read some of these sections. Of course, I've never done anything to France. That's different.

You want to know overts, man – man, you got them when you're into an area of this particular type. But criticism is not necessarily a covert action. Criticism is a confession of inability. It's also, on a broader scale, a confession of an overt.

It's higher toned. Criticism is higher toned by far than a motivator. Well, "They took me over in France and they threw me in a tower and they did this and they beat me and they did this and that," and so on.

But that of course, would convert instantly into, "All right. What have you done to France?" You see?

And the fellow says, "And I wish and ah, they – they just ought to have their head examined. Leave it to the ..."

I'll give you a comment I made the other day. "Leave it to the French." While trying to get rid of a piece of their empire, the French settlers of which don't want to get rid of it – France has a revolution from a third party. Leave it to France. If you want to know how to mess up a situation, why, just get some advice from the French government because they're experts.

Of course, in politics, they have gone mad on the subject of politics. Somebody commented "Every time two Frenchmen get together, you have three new political parties." [laughter]

Well, now, that's rather mild criticism and we're not talking in the same line, but you, nevertheless, the question is just exactly the same. "What have you done to France?" See?

It isn't necessarily true that all criticisms, however, are based on unknowingnesses, which is different with a motivator. Motivators are always based on an unknowingness. Criticism being a little higher toned, it's not based on an unknowingness. Person may know all about it.

Now, there's other people's overts. Now, on the basis of safety, this is the safest thing apparently to the pc to do. And actually, now, if you want to draw a scale here, I think you're below motivator. That is the safest thing for the pc to do – to get off other people's overts. "I heard that ..."

I'll give you – you hear this sometimes around the Academy or something like that. We used to hear it here. I hear less and less of it. Some reason or other, propaganda wins at long last. Training is reaching there. It's been a long time since I heard anybody work over, for any number of hours "Well, I heard the other day that such and such a student actually, in their own town, had met a girl and had ..."

And you know and I just don't hear people around here doing very much with those. But out in the field, that is practically all that ever gets mined. That is the whole mine. And do you know? Here's the proof. I could show you this on auditors' report forms over a long period of time here at Saint Hill.

Wherever you have a session like that and the person has listened to other people's overts or criticism or motivators – we have a "goals and gains," section of Zero, no goals made, no gains made. That is the test. After all, Scientology is an heuristic science and it is there because it is workable. And if you let people get off any one of these four that I just gave you, you get a no goals and no gains.

Now, I don't care if you run them as engrams or anything else, you just get no goals and no gains made. That's it. And I can show you just auditor's report after auditor's report. Even the auditor writing the report didn't notice the connection between these two things. Because, you see, maybe the next session they did the same thing again and got no goals and no gains, you see? And then maybe the next session did the same thing again and got no goals and no gains. And then an Instructor caught up with them before they were absolutely obliterated by Mary Sue. Because if anything stands her hair on end is this particular one because

she is very, very aware of this factor. That is the way to get no auditing done and even to retrograde a case.

Now, you get the other people's withholds, it's absolutely beneath contempt. The person has not done it and your proper response on such a thing is – they say, "Well, well, actually, I heard that John Q. Jones, when auditing so-and-so, said..."

"Well, what have you done to John Q. Jones?"

Well, if you let them go a little bit further, you're liable to find a more pertinent target.

"Uh ... said that somebody in Cape Town," blank name, you see, something or other.

"Well, what have you done to somebody in Cape Town?"

I would clear it up on this basis. I would say, "Well, which one of the – which of these people do you know?"

"Well, I – I – I know John Jones."

You say, "Good. What have you done to John Jones?" And you've got your What. That, in other words, converts. These are all convertive. These are – these disobey the rule of taking what the pc said.

Now, as far as explanation is concerned, when the pc gives you an explanation, you know you have an overt. So once more, you ask, "What have you done?"

Now all four of these conditions are answered by the same What. You convert them all to "What have you done?" Now, frankly, an explanation is perfectly innocent. And there's no reason to condemn a pc for explaining. But whenever I hear a long and involved explanation about how – "Well, you see I actually was a younger child in the family and I never really had the advantages that the older children had. And so I never really got to school and – the way I should have. And the reason why I had such a terrific amount of trouble on my first job was just this – just this lack of education and so forth."

I'm liable to say, "Well, all right. Your first job, who was that with? Who was that with?"

And he says, "Well, it was Burchiman Company."

And I say, "All right. What have you done to Burchiman Company?"

And it's another conversion, see. I find out carefully what my target is because in an explanation, the target is never given until some fifteen hundred words are exhausted on the situation. That is, it comes under the heading of extenuating circumstances. And if an explanation records on your consciousness as an auditor as an extenuating circumstance, we could realize then, at once, that it's an extenuating circumstance for an *overt!*

So whenever the pc gets too interested in explaining I will always put a What on – no matter whether that's a sub-A, B, C, D or E. And incidentally these are terribly important. Don't think I'm just forbidding pcs from doing these things. I'll go into that in a moment. But I can always be counted on to use one of those things in a What.

And sometimes, you see, you can't – you really haven't got a pc giving you any overts. He doesn't – isn't giving you any overts and he isn't giving any withholds. He's talking to you. Good. But he isn't telling you that he did anything. And you, why, lightly, without any challenge or anything of the sort, can't really – this is early, before you learn very much about the case. You see, you learn cases and your first few sessions on a case, just as these demonstration sessions, are a bit fumbly, don't you see, because you're learning exactly where we're going. We're learning something about the case. We're knowing where these chains land up. And after you've given two or three sessions, of course, you get these things so that you know about where they're taped. And you know what you can ask about and what you won't ask about. And these *four* things I just gave you are beautiful indicators. And you can play those things on a one string violin, an electric guitar, a chord organ. You can play them with one finger or like Bach. It doesn't matter.

But the pc who is defensive will always give you one of those. He's explaining something. Marvelous. These must be extenuating circumstances he's explaining. Well, what is he explaining about? That's all you have to establish. And that doesn't become a What question because you're trying to find a What question.

You're trying to get your toe in the door, you see. And these four are lovely because there isn't a humanoid alive that won't do them. See? They always do them.

You're trying to clear up the second dynamic on "Are you willing to talk to me about your difficulties." And by George, you just can't get anything much out of – the pc's going on talking about what a beautiful day it is, you know? Oh, it's not the pc's fault. The pc isn't withholding from you. You just haven't directed the pc's attention. Well, this is how to direct the pc's attention to a thing and so forth.

All right, you can say something as innocent, "Well, have your parents ever been mean to you?" [laughter] It's not very accusative. Doesn't sound accusative to the pc. It would to a Scientologist. [laughter] Even at this stage, see.

And he said, "Well, yes, my father's always very, very mean to me. Always very mean to me."

You got a What question. [laughter] You just instantly convert it and you say, "What have you done to your father?"

And you're sailing. Now, you got your foot in the door, you know you'll get some withholds of some kind or another. You know you'll get the case rolling, you see?

Now, if you want to go milder, you can vary the – vary the thing on the harpsichord. All you've got to do is say to the thing, "How is it that you went to – ." You just know a little scrap of something or other about the pc, you see. "How is it that you went to such an expensive school?"

And the pc says, "Well, I just did."

Well, that just leaves you exactly nowhere. So you say, "How is that you got married when you did?"

"Oh, well, that's – that's another thing. Now, actually – actually, the truth of the matter is that my parents contested this marriage a considerable degree, you see, yet the girl was very desirable and that sort of thing. They wanted me to marry another girl and I – I – I of course, had my reservations about this sort of thing, but, you see, I hadn't actually been educated very well and I wasn't making a tre--- "

Oh, well, what the hell. [laughter] You walked into it, you see? You can sort it out on the meter quite overtly in front of the thing. You can say, "parents," "girl," whatever it is. So, all right, "What have you done to this girl?" And you're off to the races, see? Very revelatory.

Now, the person who talks – who gives you other people's withholds, of course, you could always ask, "Have you heard any gossip lately of any kind like this?" And the gossip that sticks in their mind is always about the people they have overts on. So you can mine that one. And you can – you can also say – these are just – these are just hunting mechanisms at the beginning of a Zero question, you see – and you just can say such a thing as, "Well, what should be done about ... ?" And then just run off the gamut of the dynamics.

If the pc starts answering on any particular point, the pc at least will communicate on that point and let's take that point and mine it down. You could almost do it without an E-Meter. And you'd find yourself in a fruitful area. So, this is how to get into fruitful areas. So they're not really condemnations of the thing.

Now, as we sit there watching the pc going on and on, the pc, of course, is unconscious of these various approaches. And the pc can steer us with these things. Steer us very nicely. And you listen to those – that type of response and when you hear that type of response, convert it. Whatever these things have as a target, convert the response to that target. It's on your subject. It's on your chain, but your chain is getting wobbly. It's getting kind of ragged. You don't quite know where you're going. You're steering a course down a chain of incidents which the person considers relatively discreditable.

Now, because the person considers these incidents discreditable, they are not in communication with the subject matter. Therefore, they feel this subject matter, therefore, has them at the effect-point. And the subject matter is at the cause-point. And it actually is the source of the aberration with which they happen to be boxing, as far as one lifetime or one valence is concerned.

You follow how this is? The individual has certain areas he's chosen for his randomness. Well, of course, he has varying approaches to these things. Give other people's withholds. Well, he isn't even on the receipt-point. Motivator – he gives you motivators. Well, golly, he sure can't flow back against the motivator. He can't flow back against cause there, can he? Because he can just tell you about motivators, right? He's got a victim computation with regard to this subject, so therefore it's quite fruitful.

All right. Let's move up a little bit more. All he can do is criticize it. It shows that he has an impulse to destroy it. He's a little bit better off if he's just criticizing it. If he starts to explain one way or the other, it shows that the lines are in a dispersal. So that you've got your cause with your pc at the receipt-point and what you're doing is walking your pc back to cause again over these points by knocking out any reason he has to attack those particular points or defend himself or retreat from certain materials or subject matters he has on his

track. So therefore, he can communicate on all subjects. It's very, very simple. Do you see why that is?

You can actually draw these four things with the arrows with regard to cause- and receipt-point, then the pc is at effect-point. And you can draw how little he's backing up against the cause-point. Well, naturally, because he can't back up against the cause-point in any one of these cases, he doesn't know.

Now, if you want to find a pc in total ignorance as to what's going on, get the other people's withhold. Man, that pc has – doesn't even know he has a bank, see? That's the wild one. He doesn't even know he's aberrated on this subject.

On the motivator, he knows he's in trouble with regard to this subject, but there he is. Well, how did he get in trouble? Well, he can't tell you and so he doesn't know anything about what's causing him trouble. And he'll have the wildest fantasies with regard to this sort of thing.

And the pc who is criticizing, he may – he may even understand the situation a little bit, but he just wants to knock it out and make nothing out of it.

Well, it's not necessarily true that he – that there is an unknown at all on the channel; and as far as explanation is concerned, similarly, not necessarily true, that the subject matter is terrifically unknown to the pc.

If you want to find unknowns that the pc couldn't even vaguely confront, get other people's withholds and mine it. So you don't mine that one at all.

The pc is suffering from and tells you he's suffering from and therefore has motivators on certain subjects, well, you know that you're in your most profitable area of not-know. But you may be in an area which is so thoroughly unknown that the pc cannot penetrate it at all.

So it's what the pc gets a reality on. Well, a reality with regard to that is solved by your E-Meter. If you get a disturbance of the needle on any given subject, it is real to the pc to some extent. And if you get a disturbance of a needle on an E-Meter, it is the charge generated between the not-know and the know. And if you've got an unbalance between not-know and know, you get a reaction on the E-Meter providing, of course, that you've got the pc on the E-Meter and can read one.

Now, the pc must know something about it to be in a clash with a not-know on the subject, you see? Now, when the pc is at not-know and the subject is at not-know, you get no read on the E-Meter. Now, when the pc is at know and the subject is at know, there is no read on the E-Meter. When there's as much known about it as the pc knows about it and could know about it, you get no charge. If it's totally unknown to the pc and in the bank and everywhere else, you've got a not-know versus a not-know and the pc does not register on the meter.

There's possibly somebody here who burned down a cathedral sometime or another. And they don't even in this lifetime have any religious prejudices of one kind or another. You put that person on the meter and you ask him – you see, it's – the reason why you don't see this is because you can't test it, see, this is totally out of use so it's untestable – and we say to

the pc, "Did you ever burn down a cathedral?" and we get no reaction of any kind whatsoever, you see?

Everybody didn't know and he doesn't know and he's never heard about it and he doesn't remember it and nothing remembers it and it's just all gone and the not-knows are matching the knows, so of course, there's no flow generated. He doesn't know anything about it. You'll get a total null.

And then you're very surprised after a considerable period of time of auditing and so forth, you ask him the same question. You might remember this vividly because it's one of your favorite overts, you see? And you've asked the pc one of your favorite overts and you got no reaction and so on. And you were disappointed so that you remember this – you remember this vividly. And you go on and you audit this pc for two or three weeks and all of a sudden, why, one day you say, "Well, did you ever burn down a cathedral?" and the needle falls off the pin, in running something like 3D Criss Cross, you see? And now the pc knows something about it. He just dimly remembered something about this, you see? And that's enough against the unknow to cause a generation of current or charge. So it's a difference of polarity is what you've got. And postulatewise, it's the not-know versus the know that gives you a polarity difference.

All right. Now, similarly, the more a pc knows about his own life, the more charged up the bank will appear to be. So you're always pulling new withholds off of a pc that he didn't have last week. And that is the increasing phenomena of withholds on the case.

Of course, the no – more the person knows about his own life, why, the more the areas of occlusion can be located. So he knows now that he doesn't know about more areas of life and so you get many more areas of charge, so you get many more withholds after a while than you started out with originally, which is quite fascinating

Now, you can take somebody who is sitting calmly at 3.0, absolutely right on the button. You stamp on his toe, needle doesn't even quiver. You say, "How are you getting along?"

And he says, "Fine."

And you say, "How do you do in life?"

And he says, "Fine."

And you look it up and you find out he was fired that day. And you find a lot of other things were going on in life that he has never seemed to discover.

And this person's getting along well. And you say, "Could you. ..." You run your test on him ... "Well, could you help me?"

"Help you?"

"Well, how could you possibly help?"

"Yes, I guess I could help you. I could loan you a pound. No, no. I – I – that wouldn't be of any help to you. Ah, no, I don't think I could. Is it really true? Can anybody ever help anybody? Now, that – that's a philosophic question. Ah, does anybody ever really help anybody, you know?"

You get this kind of *blaaah*, and you got your dead thetan reaction. And by George, you can't get an overt to register. He doesn't know he's done anything. He doesn't know anything is wrong, he doesn't know that he doesn't know. He's almost a circuit which is a total not-know, you see, talking as a total not-know. And even if he says it, it isn't true that he knows it, you see? Something operated his mouth and some words came out, you know. And you just get no registry. You can be fooled by that case unless you know these tests for Help and other such things.

Ah, old Helen, she used to call some of these very, very statuesque, not even present people that she'd see around, "Operating GEs" an operating genetic entity. It described them wonderfully, you know? Honest to Pete, they could be standing there with a 13-inch bayonet dripping blood that they have just pulled out of the policeman's back and you say, "Have you ever stabbed anybody?" on an E-Meter and so help me Pete, you wouldn't even get a quiver on the needle. They haven't found out. And there's no know versus no not-know because they're just total not-know, don't you see? And you don't get any overts on this character.

Therefore, Security Checking as a means of business prevention could go down to the *reductio ad absurdum* of only selecting out as employable those people who are dead thetans – Operating GEs. Anybody who had any ability couldn't pass one, see? It isn't the operator. It'd be the mechanism of the bank. A guy that's halfway crazy is much better off than one of these birds who hasn't even found out whether he's crazy or sane, see. Operating GEs.

All right. You look this over on Security Checking type of activity for admission of personnel and it's a – gives you a very dangerous view. A person registers on nothing and so therefore he's employable. Ah, that isn't so. You'd only employ your worst-off people.

Anyway, the other side of this picture is much more interesting. As you start running – well, this has always been true of pulling withholds. The more withholds you pull, apparently, the more withholds the person has, so that on the first of Jul- August, you get the last two pages of the Joburg. And you got them slicker than a whistle. And they're just dandy. Everything is fine. You got these things clean, buffed up and shining, you see. Somebody could check them right after you. They'd all be null as null. Isn't that marvelous? And you give the person some more Prepchecking or 3D Criss Cross or give them some more auditing of one character or another and somebody says, "Well, I – you might as well give him a test on the last two pages of the Joburg."

And the person says, "That's fine, they're all null," he says.

And then they ask the first question and the second question and the third question. This person's going, "What the hell, you know? Well, that should be cleaned up, but actually what is this?" You know, he gets into a terrible puzzle. Actually, he's gone up into a higher state of knowingness. He's in a higher state of awareness and knowingness, so of course he bangs against these hidden areas. And you have the phenomenon of more withholds.

You'll think that it's endless and it's not endless because at the same ratio, their ability to find them and blow them increases. See?

Now, the other test of it is, is you'll find one withhold on this person at beginning of processing. And you'll find out that when they left, they forgot to lock the office door yester-

day. And this is a withhold and you get this and you clean it up and it takes you two or three sessions, but you clean it up. See, you get that withhold out of the road. It takes you quite some time, but you do, only to find out, after you've spent that much time on it that now they have more withholds and then more withholds and more withholds.

But they blow slow. Withholds are few and they blow very slowly at first. And as you continue to go on, withholds get more numerous and blow faster. And you can bring the person, just by auditing one lifetime, you can bring the person up to a state very happily. You can bring them straight up to a state of being able to blow when viewed. You find it, they blow it. And you get a pretty fast-acting needle when you do this kind of ...

Now, there's – I just got a report from HASI London, one of your recent fellow students up there now as Tech Director, and I got a report that they have found something new. They have found out that all you have to do – an incident's turned up on doing Prepchecking – and all you had to do was pick up these past life incidents and you included them in your Prepcheck and it all blew beautifully, and it all straightened up and it worked.

Well, I doubt the last part of the line, see. You see, that isn't what we're trying to do. We are not trying to blow incidents. We are not. We're simply setting up a person's alertness up to a point of where they can handle more in this lifetime. And we can show them very nicely that this lifetime can be cleaned up and we're getting them ahead so we keep the rudiments in easily. And you're actually not trying to do a great deal of auditing with pulling withholds. You're trying to fix the person up so the person can go into session.

Now, the time to pull backtrack withholds is after you have done 3D Criss Cross into a totally stable package. So they're trying to do what you do at the end of auditing at the beginning of auditing. And let me assure you that I could take any one of the pcs on which they have miraculously cleared something by finding a past track incident and I can show you that the things would just have cleared just beautifully if they'd gotten "Dropping a candy cane when they were five." See? Didn't have to go in for this kind of nonsense at all.

And if the auditor is going to reach for past track every time he wants to get the rudiments in, to 3D Criss Cross, where are you going to be? Because you're going to be nowhere. I can tell you why. Because the more – the more valences that become available, the more past track identities that become available, the more withholds become available and the pc has never been guided into the unit value of a valence. The unit value of one lifetime.

See, he doesn't think he can do anything about this lifetime. He doesn't think he can do anything about anything. He's never had any big win and you plow him into the bank after he's never had any big win and of course, he gets no big win and he gets no win and he gets no win. He could go all the way through ...

You'd probably audit him for two or three hundred hours without ever giving him a win. Just miring him down and miring him down and miring him down.

For instance, don't think I don't know some processes that'd take a pc's head off. Big effect processes are very easy to have. They'd be very easy to find, they're very... That's the easiest thing to do. I can give you – a – well, you've had one for a number of years – is R2-45. That's a big process. [laughter]

But you're not trying to establish – you're not trying to do anything with Prepclearing except straighten out this lifetime so the rudiments will stay in while you do an effective process on the whole track. That's the only reason you're doing it. See, if you do anything else with it, why, there it is. The pc – gradually a pc will get quite a few wins.

Now, oddly enough – oddly enough, if you're going for gain and you're going 100 percent flat-out and if you were a crackerjack auditor and everything was fine and so on, you could probably produce, probably – probably produce all of the gains that you could get out of Prepclearing, you could probably produce them with 3D Criss Cross. You probably could produce all of them with 3D Criss Cross. The real, real gains – cognitions in this lifetime, blowing incidents into view – you could do all these things providing you could do 3D Criss Cross.

Now, is there anything going to get in your road doing 3D Criss Cross?

Audience: Yes, yeah.

Yeah, yeah. In go the rudiments, out go the rudiments. In – they get them in, you get them out, *da-da-da*.

How about this little mechanism called a missed withhold? You're going to get your 3D Criss Cross one-tenth done and then hit a missed withhold on the pc. And the pc's going to get screamingly angry with you and blow. And you're never going to get a chance to finish your 3D Criss Cross, are you? That's really the end of that argument right there. There's numerous reasons why.

One of the things you'd accomplish with Prepclearing is just show a pc you could get his rudiments in. You know that some of you right now, particularly newer students and so on – there may be a lot of you – have a feeling of utter despair about ever getting your own rudiments in as a case.

I could prove it to you. I could put you on this meter and I could ask you one after the other how you feel about having a present time problem. You wouldn't like that, would you?

You come into a 3D Criss Cross session and you're all set to go there, and you're all set to list, and everybody's got the list and the auditor comes down the line and he says, "You got a present time problem?"

And your heart goes into your boots.

You say, "Well, there goes half the session. There goes half an hour of auditing. There's time up the spout."

So the auditor says – I'm talking about hard experience now, I'm not talking about any theory – the auditor says, "Well, all right, we'll ignore it."

Ohhhhhhhhh! Now you *have* had it. Let's ignore this present time problem. Let's not do anything with the present time problem and let's get on with this nulling so you – "Is it a weasel mouth?" [laughter]

And the pc is sitting there and the pc is looking sort of fixed and they start to look kind of green and you say, "What's the matter?"

diments, two-minute break, beginning rudiments and on back into that session again. And we find out what's wrong, see.

But I use rudiments a little bit differently than I advise you to use rudiments. I use rudiments to salvage a session which isn't going well, not to create a session, because I'm very cocky about this. I can always create a session.

I'm not talking necessarily about my auditing and your auditing or anything like that. Let's hope you can do that, too. But you can – you sometimes – I watch you sometimes destroy a perfectly good session, however, with a rudiments mess-up of one kind or another.

But I don't yet trust, on most auditors' parts, the ability to look at the pc and just listen to the pc two words and know whether the pc's attention is on the session or on something out of session. That's a sensitivity. And when the pc – when you can tell that "*bing*" why, then is your time to use rudiments or not use rudiments. Pc looks like they're out of session, use rudiments. Pc looks like they're in-session, why, don't use them.

As far as end rudiments are concerned, pc's happy, pc's talking to you, havingness is – might be repaired and so forth. They're happy with the session. Well, ask them what goals and gains they've made and get the hell out of there, man, see. But that requires you sufficiently confident unto yourself as an auditor that you're going to get results and so forth, that you don't have to keep patching them up all the time. I'm giving you another look at this sort of thing and that goes along with this.

That means that you've got to get wins. You've got to know what you can do as an auditor and you've got to be able to get wins. And I know nothing under God's green earth fit to make you cocky like two things we're doing – Prepclearing and 3D Criss Cross. And those things can actually make you cocky.

You do those things well, you will see wins, wins, wins, wins, wins, wins. So after you've had a lot of these things and you know where you're going and what you can do and you haven't got any little questions in the back of your mind about this and that, you'll start watching the pc and putting your attention on things that are important. Up to that time, follow the rote. Until I can show you the win, you sure got to use the rote. And then you'll use most of the rote to get the win. You see?

We're very fortunate right at this particular moment. We have Prepclearing and this procedure almost puts your feet on the path one after the other. It is so good a rote procedure that you needn't not use it. [laughter]

And the other great gain in Prepclearing, the other great gain in it is that an Instructor and a person reading your auditor report knows just like that whether you're doing it or not. And there's no doubt in anybody's mind on what you're doing. We know exactly what you're doing.

And you can be steered then until you're doing it right and then you're walking with your feet practically put on the path and the next thing you know, you happen to look up out of the session and notice the pc. And the pc's getting better. [laughter] That's how powerful the process is.

And then you'll all of a sudden come into a dawning someday of, "My God, how easy auditing is." Well, of course, a pc will occasionally nag you, you're just starting out a case and you don't know where you're going, something like that. You feel a little bit nattery about the thing.

And then all of a sudden, why, you realize you just sit down there and you get results. Cocky. You become absolutely overbearing and insufferable. But you won't be here, so I won't have to worry about that part of it.

Thank you very much.

PREPCHECKING AND BASICS

A lecture given on 27 February 1962

Thank you.

Well, this is what?

Audience: 27th.

Twenty-seventh of February ...

Audience: AD 12.

AD 12. Very good. Very good.

All right. We begin herewith, herein, amongst our battered selves, a new type of schedule simply designed on several basics. And one of those is that I'm perfectly willing to give you all the instruction time I possibly can and your schedule was a bit colliding with this particular fact and so I've stepped it up to eight hours of demonstration and lectures a week. And that's a bit better than you were getting. And I've tried to put it in that part of the day that you were least harassed. And I think you find this more satisfactory.

And the demonstration's going to work like this. The regulations on the demonstration is that you can leave at ten. You don't have to leave at ten; you can leave at ten, on a demonstration. But me, I audit for results and after I'd done some of this postage stamp auditing for you ... I audit for results, that's all and these results are scheduled on a – just that. They're scheduled on the pc's reactive bank. They're not scheduled on a clock. And I like to audit to a result and knock it off. Or audit to a point where I don't think I'll reach anything that session and knock it off. It's a different framework.

And trying to audit somebody in an hour, I was setting a bad example to you because I ordinarily *do* do beginning and end rudiments. And now, by the time you've subtracted beginning and end rudiments from an hour's session, you've got damned little auditing left. And I could fully expect – I don't say that it will – but I'd say on seldom occasions, one of these demonstrations is liable to run until two o'clock in the morning. And that's because I audit to an item, audit to a result, don't you see?

And nobody expects you to stay till two o'clock in the morning. You can leave at ten. Or you can stay until two o'clock in the morning. You understand?

Audience: Yes.

But doing it this way, why, then I can put in an extension of time. The only people that have any problems with this, is some of your Instructors have problems with this new schedule. But that's all right. We can – we can solve those one way or the other. We can get those.⁶

Now, one of the old-time students at this late stage of the game is coming up to Clear. And it's almost a shame to let her go. But I just received a letter from her – her true love down in South Africa – or down in Rhodesia, saying it was all right for her to stay this one extension, see, but I shudder to mention another one. But that's awfully tempting to see that there's a floating needle amongst us. The tone arm is too high, but that will come down with a – with a few more items. But it's awfully tempting just to hold this person over and clear her. Or let the auditor, Norman Wold, go right up to the point where the tone arm is unable to maintain its present height, you see. Let him go right up to that point and then take over with the last session, you see. And clip out the few W/Hs and terminals, you know, that are holding the tone arm up there, you see. And then tell everybody well, you see, I can clear somebody in one session. [laughter, laughs] I think this is very funny.

After he's worked, you see, for a couple of hundred hours on the project or something like that – that would – that would be a college professor's trick, wouldn't it? Yeah.

Yeah. They take all the students' inventions, don't you see, and patent them themselves. That's the California Institute of Technocracy. They specialize in that. As a matter of fact, one of the greatest names in American physics does nothing but that. He's never had an idea in his life.

But we don't work that way around here, so we won't do it that way. But it is very, very tempting to hold this person over until we get the tone arm down and then we say, "See? A Clear."

And then we could put her on a frame alongside the door and you could ...

Okay. Well, I forgot my notes and – you haven't heard that gag for some time, have you? It took you by surprise. I forgot my notes, so I don't have very much to go over with you aside from Scientology, Prepchecking, 3D Criss Cross, clearing, chains, engrams, secondaries, valences, circuits, reactive mind, the E-Meter, auditing sessions, Model Session. These things sound familiar to you? Any of you heard of these things before? [laughs]

Now, I will talk to you about – a little bit about Prepchecking. Because this is where you will find your biggest strength and it's sort of a knack.

Once upon a time, you were given a bicycle. Or you saved the money you had been stealing out of the church collection plate or something and managed to buy a bicycle. And you couldn't ride it. Or you had a sister or brother or the fellow next door had a bicycle and you couldn't ride it. Do you remember a time when you couldn't ride a bicycle? Hm?

And you may have some recollection of falling off the bicycle a few times, of steering it onto the grass plots and off the curb and narrowly missing various inanimate objects and

⁶ Editor's note: This paragraph is missing in the audio recording of 1991, but not in the accompanying transcript.

maybe not missing a few animate objects and you had quite a time with this bicycle and it was all in the matter of steering the thing and keeping it balanced.

And then all of a sudden – there was no transition period – all of a sudden, one day, you could ride a bicycle. There was never a period when you could almost ride a bicycle. You remember that? Then one day you all of a sudden could ride a bicycle.

Oddly enough, both Prepchecking and 3D Criss Cross come under this category. And you go on falling on your 'ead and falling on your 'ead and not riding the bicycle and then suddenly one day you'll be riding the bicycle. Then you say, "How is it possible that people can't ride bicycles?" And you will be very, very snide about this, I'm sure.

It's not possible not to ride a bicycle – if you can ride a bicycle. And one day you'll get the feel of this. But there's a certain amount of information and technology that is necessary toward the riding of a bicycle. And one, you must recognize whether by definition or merely fooling with it, that there is such a thing as gyroscopic action.

And gyroscopic action is one of the most complicated mathematical subjects you ever tackled in your life. If you ever wish to make life miserable, if you just feel in one of these masochistic moods, you know, don't go out and get yourself beaten with a club or run over by a taxicab driver, just study the mathematics of gyroscopes. They're fantastic. And that's a bicycle, see. And study the delivery of mechanical force from point A to point B and study mechanical advantages. The operation and construction of coaster brakes. The metallurgy of the frame. That's a nice, complicated one. The synthetic chemistry in the composition of tires. And as long as you're getting into tires, let us go into something worthwhile. Let's go into balloonostatics. Let's get further into the stress analysis of spokes. I never knew that spokes could be complicated till we put a coaster brake on a little 15-inch wheel for Quentin.

We put a 3-speed gear shift on one of these little, tiny bicycles. And of course, they're not made for that, you know. And this little bike, now, will practically – you could peddle it up a vertical wall, you know. But all of the – all of the spokes, since they don't make spokes small enough, you see, to go in that wheel on a coaster brake, they all had to be cut, hand cut and that was a mess because the wheel would thereafter not vibrate straightly. So they had to be cut and recut and bent and rebent and every wheel spoke had to be balanced in so the wheel eventually ran smoothly on its own axis. Very complicated business.

Well, you could go into all of this. And then because you're going to ride a bicycle mainly outside, you could go into and make a complete and exhaustive study of meteorology to know when the weather would be good or bad so that you could ride your bicycle, don't you see?

And then because you're riding your bicycle on ground, you could take up the study of materials of construction. This would give you everything to know about roads. And you could go just a little bit further than that – knowing more about materials and construction because you're going to ride this bicycle on Earth – you could take up geology. And then geology is influenced, of course, by electrical currents and that sort of thing, so you could take geophysical hydrostatics of various kinds.

You could take the influences of Earth's magnetic fields, you see, as it might influence matter, as it might influence the ground, as it might influence the sidewalk, in case you ever hit your head on the sidewalk and couldn't ride the bicycle.

Now, if you approached it from this very, very complicated sphere, you still wouldn't be able to ride a bicycle. You've made all these studies now and you still can't ride a bicycle. So you see, you could go around Robin Hood's barn on a perimeter of about seven miles away from it and wind up at a destination nowhere, even yet, couldn't you? Well, I'm just giving you this as an example.

Now, you could know all of your theory and you could know all these things very well and you could know exactly how to – well, not how to, you could just know the theory of practically everything in Scientology and still not be able to prepcheck. That's the only point I'm making.

You don't have time to steer the handlebars to the left or the right by calculation. The people who do this by calculation have remarkably knobby skulls by this time. [laughs, laughter] And if every time the bicycle had a slight impulse to go out of balance to the right, they did a calculation as to whether or not to move the handlebars to the right or the left, they would be full of dents after a while. You recognize that as a fact?

Well, similarly, the auditor actually never has any time to calculate in doing a Prepcheck. You ride a bicycle by instinct. And you prepcheck by instinct. Now, you can get the rules down pretty well and you can know about where you're going and so forth, but when you totally delete out instantaneous instinct out of the thing, you're in bad shape.

But if you read your withholds into the pc's case and call *that* instinct, you also will not ride the bicycle. You know, people do that. You know, we did that to you and I don't think anybody ever told you about it.

We asked you what withholds does your pc have and then did you realize you had been run on them immediately afterwards? We took the withhold the auditor was sure the pc had and had it run out of the auditor. It worked pretty well, didn't it? You found a few, didn't you? Just a corny gag. See?

It's a truism that auditors will sometimes assign all of their own withholds and misdeeds to the pc and then try to audit them out of the pc like mad. And of course they aren't in the pc. They're in the auditor's own case.

So if you ask an auditor at any time to list the withholds it's most likely the pc has and make a long, arduous list of this thing, particularly if he hasn't much experience with the pc, don't you see? And then you take that list and have it and check it against the auditor, you'll find those withholds.

I don't know that you are aware of that, but it's pretty rank. And if instinct is running your withholds out of the pc, why, then you're not again going to ride the bicycle.

No, you have to be able to sit in front of a human being – a being – and ride it down the line. You sometimes don't even find out what you're after till the session is over. Theory be damned. I mean, I did a session the other night and I found out after five hours and a half

of auditing or something like this, I found out I had been auditing a chain called "women." But I didn't know it for five-and-a-half hours. That was the only common denominator to the chain I was running.

I thought I was running another chain entirely, all stemming out of a channel of withholds and sure enough, I was following down the channel I thought was there and we were winning hands down all the way, but I never got the whole chain summated until the session was over. There was another deeper common denominator to the chain of withholds that I was running. And that was women. See? That was actually the basic common denominator of the chain I was running.

But nevertheless running a very successful Prepcheck. Running a terrifically successful Prepcheck with, actually, hardly the foggiest notion of what I was prepchecking. But I couldn't find out.

Well, it was, to some degree, my fault because I started the session without really starting the session and started away from a present time problem. And the present time problem was dead on the line, but the auditor was actually assigning the channel rather than finding out from the pc what the channel was and assigning it.

In other words I – if I had spent a little more time at the beginning of the session, you see, instead of getting myself hurled into the session with a present time problem... Actually, I had no subject left unflat on this, see. This was a new start on this case. It was a brand-new start.

And this brand-new start – it meant all the 1s and 1A, 1B, and so on it had before, they were all washed, you see? So I had to find a new departure point, so I just took the present time problem as a departure point and the case walked over from this present time problem right down a chain. And then after five and a half hours of auditing I found out what the chain was called. It was called "women." Interesting, huh? I thought it was very fascinating

So your basic orientation on the case of what you're doing and so forth is largely a matter of touch. It's finding out what the pc will give you as a withhold and finding out what runs nicely as a withhold and then going on down that chain of related withholds and carrying on with it without letting the pc's attention jump entirely off that to some other disrelated subject. You know, you have to keep the pc's attention on this and it's sort of interesting. You sort of keep the pc's attention on it without forbidding the pc from talking about other things or stirring up a lot of bank that you're not now going to pull and keeping the pc on a chain and you sometimes will find yourself unable to identify the chain.

But it's obviously all related, you see? You're just running it by instinct. So we could tell you all about meteorology, geology, the magnetic fields, gyroscopy, synthetic chemistry and we could tell you all about those things and you could still sit down and if you have no instinct whatsoever for the pc and no interest in auditing the pc, if your – if your point here is totally missed, if you're just studying and your point is not you're going to audit the pc, you see, why, we'd wind up not riding the bicycle at all. You follow this?

We could lay it all down with beautiful rules and you could memorize these rules and so forth. Well, you've already got a tremendous summation of information as contained in the

withhold system itself. See, a tremendous quantity of data have been summarized and synthesized into that very neat package, just as fantastic quantities of technical information and modern science have gone into the making of a bicycle. See?

And what's left? Well, you haven't got a bicycle unless somebody can ride the bicycle, you got the idea? Bicycles are not display objects. They are riding objects. And so it is with Prepchecking. It's something to be used and you can use it or you can't use it. And there's hardly, apparently, with 3D Criss Cross and Prepchecking – apparently no grays. It's black and it's white. And how it got from black to white is as sudden as can't ride a bicycle and can ride one.

And just how it got through that zone will probably continuously evade your eye. Once you've given an auditor – once an auditor can sit there and run a repetitive process, he can get his rudiments in somewhat – if he can do these things, see, you know – run a repetitive process on the pc and he can keep his rudiments in, then I think you could teach him forever without getting him any closer to prepchecking than just prepchecking.

So the best – the best way is, I think, is kind of make sure he knows all about it, you see, that if you reverse the turn of the pedals, you apply the brakes, don't you see, and make him learn these various things and make him learn all that. And then just let him prepcheck and keep him from going off the roadway completely. And one fine day, why, not too distant future, he'll all of a sudden say, "Hey, what do you know!"

Now, just as you have to be able to walk and move your arms and legs to ride a bicycle, so do you have to be able to use an E-Meter and have a fair command of the basics of auditing. That is to say, sit in a chair, repetitive question, these various things. Well, we *assume* that you're good at these things before you move over into it. But you'll find sometimes, when you're teaching somebody to prepcheck very industriously – you're gorgeously slogging ahead teaching somebody Prepchecking and they just can't prepcheck – you're liable to find out that they're trying to ride a bicycle but have no legs or something. And this is embarrassing.

They don't know how to use an E-Meter, see. Or they actually haven't ever had Op Pro by Dup flattened on them. And they can't repeat a repetitive question. They wouldn't be able to do this or they haven't a clue about Model Session or keeping the rudiments in and they're so busy doing all of these other things that their attention's not on Prepchecking at all, don't you see.

So the stunt is to get somebody into some kind of shape where he or she can audit – knows an E-Meter, able to sit in the chair and do the TRs more or less, do Model Session and so forth. And then be able to handle the E-Meter against rudiments. Be able to handle the E-Meter pretty well against rudiments, before you turn them loose on Prepchecking. That's basically what they have to know.

And of course, they have to know the withhold system and they have to know what that's all about. And they'll get that pretty straight and then next thing you know, why, there they are, running.

But you could learn all the rules and it'd still be to some degree, excusing your presence, ladies, fly by the seat of your pants operation. It is that. Because nobody could lay down what the pc's going to give you for withholds. Nobody could lay this down.

This is a variable just about as wild as – well, there's no telling what a state legislature or a provincial assembly or something like that's going to pass. That's about as wild a variable as you could think of. And it's sure as variable as that, you see? And since I one time was asked to congratulate – [laughs] I was asked to congratulate an assemblyman who informed me with great pride, expecting I would instantly pat him on the back, that he had just read the Ten Commandments into law in the State of Arizona. They were now going to be the law of Arizona – the Ten Commandments. It's marvelous. I don't know how the hell – I don't know what that had to do with the price of fish at all, you see? It's pretty good.

Oh, yes, I've seen some wild ones come through there and you're going to sit there sometimes and just absolutely drop your jaw at what the withhold is. You always tend to run by your own moral code. And the basic mistake that you make, once you can do all the mechanical operations and so forth, is assign your own moral code to the pc.

And if you could think of you being sec checked – not prepchecked – but if you think of you being sec checked, now, by an Ecuadorian headhunter, now what kind of questions would he ask you, see, and then think of this Ecuadorian headhunter becoming frantically furious with you for not having abided by his moral code, you'll get the frame of mind of the pc toward the auditor sometimes. This – this you can make a mistake on.

Now, you can also let yourself be talked out of pulling a withhold on the same grounds in reverse. See, you mustn't do that either. See, either way is a sin. You're caught. So sometimes it's right and sometimes it's wrong.

Now, let me give you an idea. Let us have a 3D Criss Cross. Let's take a look at 3D Criss Cross and we shake out of 3D Criss Cross an item which gives the pc pain, meaning it is his terminal. And it's an unmistakable item. It blew a lot of charge when we got the thing off, but let's prepcheck it. Now, that sounds funny running Prepchecking after 3D Criss Cross, but you're going to be doing just that, you see.

It hasn't got another name. You run it before and you run it after and so on and we're catching up with the aftermath because after you do 3D Criss Cross, you still have to do an operation which looks exactly like Prepchecking and is Prepchecking and possibly be called something else because it's a sort of a mop-up. And it's – you steer the pc's knowingness down these channels and blow them apart.

Well, I know, at the moment, no faster method of reaching the knowingness of the pc than taking a 3D Criss Cross item, which you've got – it's nicely isolated and you got a lot of the charge shaken off the case and so forth – and just enter a Prepcheck along these lines.

The item which we found and gave the pc pain was "a moral man." That's – not – would not be an uncommon or a strange terminal to find on a case. A moral man. That is the item and it is obviously a terminal of the pc's because it has pain on it. If it made the pc dizzy, it would be an opposition terminal to the pc – if he merely had sensation or misemotion or

something like that on it. But if he had pain, if it gave him real good aches and pains, it's his terminal.

All right. Obviously then, we could prepcheck this item and how would we pull the withholds that were holding this thing on the whole track. What would be our Zero Question?

Well, I'm not going to give you the perfect Zero Question from this. And I'm just going to give you some thinkingness on this subject. We know the pc has a terminal, a moral man.

Now, what is the obvious Zero for a Prepcheck? This is running it backwards. This is running it from the bank up to present time. Obviously, he has a whole chain of withholds on this right in present time that you've never spotted.

I don't care how carefully you prepchecked the pc originally. This is going to be a whole new chain. No matter if he almost wrapped Clear on the present lifetime. There's still going to be this buried chain because it's going to go completely in all directions on forward right up until now – a moral man.

See, there's still going to be stuff missing. You couldn't help it. What's the Zero? "Have you ever been moral?" Well, wouldn't that be the Zero? Wouldn't it be something like that? Honest, you'll find withholds on that line if you had that terminal – moral man.

Now, you think of all terminals as representative of some bloody-mindedness of one character or another, you know, like "A *vicious thief*" Ah, that sounds like a good terminal. Well, you could understand that one. Now, let's get that one. Now, we find that "the vicious thief" as a 3D Criss Cross item has pain on it. Every time you try to run "vicious thief" why, the back of his neck comes apart and his skull splits in half, and he has horrible shooting pains going through his stomach. Now, that's dandy, so it obviously is something like a terminal. Obviously. And it's all checked out very nice. Naturally you could run this one. "Have you ever stolen anything? Have you ever stolen anything just to be mean?" See? Nice, nice Zero.

Now, you can understand that one, can't you. That's an easy one to understand. Well now, look, "a moral man" as a 3D Criss Cross item giving the pc pain is the same confounded concatenation of what-not. It has exactly the same value as "a vicious thief" as a subject of withholds. Believe it or not, that is what it does. Now, you look that over and any question that you ask about "a vicious thief," substitute "vicious thief" or "thievery" for "a moral man" and "morality" and you'll get the same value of withhold. These withholds will come off fantastically charged.

Supposing this was a girl we had this terminal, "a moral man" on. "Have you ever been moral?" Oh, man, this thing falls off the pin. Just falls off the pin. "Have you ever been moral?" "Have you ever abided by any of the Ten Commandments?"

Big withhold. "I didn't kill Bill." See? Big withhold.

It's reprehensible in some fashion. Sounds weird, doesn't it? There could be just all that backwards.

Now, let's get a little more involved on the thing and let's get a terminal, "an immoral girl." That would be common enough as a 3D Criss Cross item. And if "the immoral girl" was being prepchecked up the line, you possibly would get the same package of withhold. "Have you ever done anything moral?" you could ask. You follow me now?

So it could fall on either side. This terminal has a different value of withhold. And you'd get into a whole chain of what people call laudable withholds.

Now, supposing we had a terminal – "a lady." Isn't that a nice terminal? We can just see the pc now sighing with relief at the end of the item, for her male auditor was sitting there and she was still trying to impress the auditor a little bit. And at the end of this long and arduous list of 3D items which contain some of the more interesting lines – it doesn't fall on any of those. It doesn't fall on any of those. And she's sitting there, *whew*, you know, because down at the end of the line the last item that was left in on the nulling was "a lady." Isn't that sweet. [laughter] Isn't that sweet.

And she's so happy about this. Gives her an awful pain straight through the ears and straight this way and that way. That's fine, but nevertheless it's a nice, pleasant, acceptable terminal. And now we start prepchecking this. And the Zero Question, "Have you ever been ladylike?" "Have you done ever – ever done anything that was ladylike?" Would oddly enough be quite responsive. Each one of them as a solid withhold. Why withhold? Well, the terminal, a lady, was withheld, wasn't it? So all the acts of a lady would be withheld.

Now, look at the lau – now let's look at the thing in reverse. Look at the laudable withholds of a lady. She withholds herself from drinking. She withholds herself from swearing. She withholds herself from rowdy companions. She withholds herself from dirt, you know and getting dirty. Withholds herself from getting sweaty. See, all the things a lady withholds herself from. Withholds herself from sex, from pleasure, from pleasurable excitement. This starts to look like a very interesting series of withholds. And we finally find out that "a lady's" primary mission was to hold herself from living. Not that that's – things I have mentioned are the total composite of living. [laughter]

Actually, then, you could just translate the terminal in two ways. Why can you translate it in two ways? Because if you were running an old 3D set of commands, it'd be, "What have you done to a lady?" see, "What has a lady done to you?" see and "What have you done to another?" Which of course puts the pc in the valence of the lady for the moment and so on.

So it's what the pc has done as a lady and what the pc has done to a lady. So we have the pc interiorized into this terminal, a lady, only because the pc has tremendous overts on a lady. But the pc not only has overts on a lady but also is being a lady, see?

So we'd ask, "Have you ever done anything ladylike?" would be the response to that 3D Criss Cross item. Or "Have you ever failed to be ladylike?" would give you another channel, all on the same terminal.

In other words, you'd have a string of withholds on the subject of being unladylike and you'd have a string of withholds on the subject of being ladylike, equally, wouldn't you.

In other words, these are two channels which would have moved forward into present time as a series of problems and they would have made all these problems. Every time she

powdered her nose, she knew she was doing wrong. Why? Because ladies don't use powder in most periods and ages. And this could be practically a trained mechanism.

But ladies look nice, don't they. So every time she didn't powder her nose, she was doing something wrong. Isn't that right?

A 3D Criss Cross item is simply an item with which nobody wins or has won. See, nobody's ever won with this item. This item is not a winner. It's only an apparent suppressor of other things and items, see?

So if you dramatize the item, you are obviously wrong and if you don't dramatize the item, you are obviously wrong, so it gives you two different types of withholds on the same case – the withholds of having dramatized it and the withholds of not having dramatized it. And you'll get the same thing.

In other words, you'll get all of the withholds of a moral man and all of the withholds of not being a moral man all at the same time, see, because it's a nobody wins situation.

Now, the easiest time and the easiest point of departure in the clearing of a pc, the easiest time to start the clearing of a pc, of course, is when the pc is Clear. And then you know all about the case. You've got adequate case records, then, with which to process the pc.

Now, you know how to process the pc. You know what all the terminals were, so what all the types of withholds there would be. You know what all the items were and so you know all the types of items to pursue and you know all about it.

Now, one of the things you want me to do is to give you the whole map of the case as cleared in order to clear the case. Well, the funny part of it is I fool you and I almost do. But you've got to apply this data and this know-how to the case you're auditing at a time when you don't know a blasted thing about the case but the mechanics of Scientology. And that's all you know about this case. All else is variable.

You have the stabilities of knowing about locks, chains of locks, secondaries, chains of secondaries, engrams, chains of engrams, the effect of the lock, of the engram holding down secondaries and secondaries holding down locks and you know that this is plotted against time. You know there's such a thing as the time track. You know there's such a thing as the known part of the mind and the unknown part of the mind.

All right. You know there's such a thing as a thetan. You know the various dynamics, and you know the axioms on which this thetan is operating and you know that – about ARC and the fact that the thetan is in bad shape when he is unable to communicate and he's in good shape when he is *able* to communicate. Not necessarily when he is communicating or not communicating, but is *able* to communicate or able to be, you see, not necessarily when he's being. You know these various things.

You know about be, do and have. You know these various items, see? You know the meter – you know what that's shining up to – and what a session ought to look like and from there on, the sky's the limit, see? You know these basic mechanics.

Now, you got a withhold system which will pull these withholds which are preventing the pc from communicating broadly. But what are the withholds? What chains do they form up? How do they associate in the pc's mind? That's your bicycle seat. See what I mean?

And after you've been prepchecking for a little while, you'll find out that when you give the pc a good controlled session that is going right down the groove of something the pc can talk about because it is on the line and channel of a chain of *withholds* the pc can talk to you about, that are real to the pc as withholds, you'll find out that if you keep the pc's attention directed and you make the pc go on and look and you carry right straight on through at a good heavy controlled session with the pc talking the whole time – I'm talking about the type of session I've been giving on demonstration on Prepchecking; no more witty or arduous than that, but very controlled if you noticed – you find out the pc at the end of the session gets his goals and gains. He makes his goals and he gets gains.

And when you give a sloppy, stupid session and you ride the bicycle all over the town and wind up on the cathedral roof without the least clue of how anybody got there at all and then just leave the pc standing there while you go home to supper, and then never find out where you left the pc thereafter, you're not going to get any goals and gains over on that right-hand channel. It's a question of course plotting, steering, understanding and so forth.

And I'm telling you very frankly the easiest point of departure for Prepchecking is, of course, naturally, when the person is Clear. That's the easiest point of departure. Then you know all the 3D terminals that have given him all the oddball withholds that he has. You know the whole composition of his bank. You know every incident on his time track that is worth knowing. You know what has been suppressing his second dynamic, his first dynamic, his third dynamic and why he and God are on swearing terms.

You know all about these things and therefore you could run a perfect case. But of course, at that stage, the person doesn't need any auditing, so the information is of no value. [laughs] That's the sort of thing you pick up *en route*.

Well, now, how *en route* can you get in a Prepcheck? I'll say that if you audited a pc for four or five hours without finding anything about where you were going, there was something wrong with the way you were attacking the case. So this is always a test of whether or not you are doing an accurate job of riding the bicycle. If every few hours – and I don't mean just every five hours – but every few hours you fail to know more about what makes this case tick, then you must be riding a tricycle or a velocipede, but you're sure not riding a bicycle. You understand what I mean?

If you can look back over the last session or two and find out – know pretty well where this pc lives and get some kind of an idea and anticipation of where this pc is going next – some kind of a prediction factor with regard to the pc, in other words – a higher understanding of the pc, let me put it that way, why this pc got that way, what made this pc that way, how come (the how-come factors, call them those) why, you're probably prepchecking well. Regardless of his goals and gains – that's the other test, of the pc making his goals and getting gains. That's your primary test, of course. But this other one is a test as far as you're concerned as the auditor.

And you sort of know what makes this pc tick. You get a better idea of which way this is going. And you got a better grasp of it. And not only of the pc, but a little bit better grasp of the human mind; a little bit better reality. That applies to me, too, see. I'm not saying a student should do that, you know. Why, man, you must be prepchecking like a wizard.

Now if you're getting his goals and gains and you're understanding the pc better and you're knowing a little bit more about the human mind, wow! See, I mean, gee-whiz. That would be your point of expectancy. That's what you would expect out of a Prepcheck activity. Pc's getting his goals and gains and you understand this pc better and you got a prediction about where this pc's going, you know. I mean, what this pc's done. You understand this better – what he – how he hangs together better. And you understand the human mind a bit better, too, just through having audited this pc. Man, you've just made it, see? And that's an excellent little yardstick by – of finding out whether or not your Prepchecking is pretty darn good.

And if your Prepchecking is pretty doggone good, then all of those things will be true. If your prepchecking is bad, it might first mean that your auditing stinks. You know, just as the matter of an auditor, you know, not auditing the pc, you might be auditing a chair. But this wouldn't be any small thing. This would be not having a clue about what an E-Meter read was. This would be not having a clue, you see, about how to run a session, having total intolerance of sitting there just being a complete *buaaaaah*. You know, first week, co-audit type auditor.

Yeah, well, that could be all wrong, you see and you couldn't prepcheck. But then there's this other zone and area. If you know how to ride this bicycle, why, all these other things will be true.

There'd be two areas wrong, you see, just the person couldn't audit at all. And the next – they can audit all right, but they can't prepcheck. Prepchecking is a specialized activity. And if they can prepcheck, then this is what they should expect out of the pc. They should just expect those things. Pc making his goals, making some additional gains. The auditor understands the pc better, what the pc has done and been, what makes the pc that way and a better understanding of the human mind.

And if you've got all those things taped, my, my, my, are you prepchecking. Wow, wow, wow. Good test. Good yardstick, huh?

You've possibly – I realize in saying that, you possibly for a long time may have been expecting the pc to suddenly grow wings or something if you were prepchecking well. Just as a pc will sometimes give you outrageous goals when he wants to get even with you, so does an auditor sometimes get even with himself by setting outrageous session goals of what he's going to accomplish in this session.

Well, if you can just relax to a point of accomplishing what I've just told you, you'll make Clears, see? You'll go on all the way up there because you won't be straining it and be very relaxed.

Now, there's one other test on Prepchecking. If you all of a sudden think Prepchecking is very easy and you're very happy to go on prepchecking people, then you can prepcheck.

And if you think Prepchecking is very arduous, then you probably can't prepcheck. Because it's odd, but Prepchecking is probably the easiest auditing which you ever did if you've really got the knack of it.

My goodness, it's just a yawn and a stretch for the auditor. There's just nothing to it because when he gets the pc running on a chain that's working, it's just pocketa-pocketa-pocketa-pocketa. The pc won't do anything else. It isn't a question of trying to get the pc to talk to you. There aren't any problems in this if you're doing it right. The pc will talk to you. And it's just *bong-bong-bong*. And you suddenly get the impression – there is a ride the bicycle sensation, you know? Just as you one day went sailing along the level, you know, "Wheeee! How come I thought this was hard, you know?" You get the same point in Prepchecking. That it feels just as exhilarated and just as easy as that.

It isn't quite like any other auditing you've ever done. It is just a little different. It's just a little bit different because it delivers wins into your hand per unit of time faster than any other auditing I've ever seen and it is easier in that it gives the auditor no strain.

And you can run rougher cases with it with wins. All of these things are true of Prepchecking. When you can do it well, why, you kind of feel like you've got it surrounded and made. And of course, to be able to do it well is worthwhile in accomplishment. And I notice that all but four students on their last Prepcheck session did it without a blunder. Got the chain, got the What questions, had the pc rolling just right on down the chain. Isn't that interesting?

So it must be that you can learn it. It must be doable. Partially due to demonstrations which you've been getting, as I'm sure this is a speed up factor in training – and due to the system itself and also due, of course, to the good instruction you've been getting and so forth and the good tips you've been getting, I've never seen anything catch on faster than Prepchecking. It apparently is not very hard to ride the bicycle and the criterion then is how fancy can you get with this bicycle.

So most of you, the largest majority of you, are in the interesting state this moment of how fancy can you get in riding this bicycle – and not whether or not can you ride the bicycle. As I say there are only about four of you are having any difficulty with it at all and that difficulty was relatively minor.

So it is a teachable process and it's a winnable process. That's why I recommend it to you very heavily.

Thank you.

AUDITOR'S CODE

A lecture given on 27 February 1962

Thank you.

Once upon a time there were three bears. No, that's this time of evening. [laughter, laughs]

All right. Second lecture. February 27, AD 12. Saint Hill Special Briefing Course.

Now, the – I want to talk to you about the basic activities of an auditor and call your attention to the standard procedures which have been invariable over a long period of time. And the first of those is the Auditor's Code. That is an invariable and it is a tool of the auditor. And it's had two or three additions to it over a period of many, many years; and you already know the additions. You think of them as the Auditor's Code, but I'm just saying it came out in its basic form, and it's been with us more or less ever since with just these few additions.

Now, why did the Auditor's Code come out? Why? It was to make auditing possible. If the Auditor's Code is violated, auditing becomes impossible. So it is a practical tool, and all of Scientology is built on practicalities. It has its own branch of theoretical gee-whizzes, of "What do you know ..." "What do you think might..." "Well, perhaps," and "Gee-whiz, if..." "Wouldn't it be very interesting ..." etc. See? It has its own branch of speculation – any zone of knowledge has. But it has a very, very heavy zone of practicality. And its foundations are the foundations of practicality, not the foundations of theory.

The Auditor's Code was compiled in Wichita, Kansas, in 1951 after a survey of pcs who had gone wrong in being audited in the Central Organization in Wichita. And I traced back each of these cases and found the elements which had caused a difficulty in auditing the case.

And I think it's the first twelve items, in the same numerical order as they exist today, were the results of that rather arduous survey. And those things are quite factual.

They come in little groups. The two shuns. And I found out that invalidation and evaluation, wow, wow! Oh, man. You run either one of those in on the pc, or the pc runs either one of those into a session – as you're learning in 3D Criss Cross you have to keep them cleaned up – the net result was no auditing gain. Actually, not as mild as no auditing gain, but actually a slump. The case was worse off. Got that? That was a slump.

Now, the matter of eating breakfast sounds like a funny thing to have in an Auditor's Code but let me tell you something about that. Every case that has ever spun in under auditing – (quote) (unquote) "auditing" – in addition to other things has had as a constant nothing to eat and no sleep. Those two are also present whatever else happened. And that's every case that ever spun.

And you get somebody there who just staggered out of an institution someplace and sat down. They were going to make progress all the way along the line and then all of a sudden you'll find that they are spinning. You trace back and find immediately preceding this that they stopped sleeping and stopped eating.

Now, all of these things, all of these factors of the Code – I'm not trying to cover them one by one – are empirical. That is to say they are the benefit of observation and the coordination of data, and they are there simply because they are practical.

The first theoretical code had greater appeal, and it was something on the order of when knighthood was in flower. Had greater appeal but it was not the practical code. But I still sort of favor that earlier code. I think that that's got some good beef to it. Every once in a while I feel like shoving that at somebody because one of its primary points was the auditor should be courageous.

Audience: Yeah. Yes.

And you just never let an auditor chicken out. Never. But anyway, these are just the practical aspects of things.

Now, we go into such a thing as the Axioms. They are very, very carefully examined over a long period of time. And the first Dianetic Axioms were written during the year 1951, and you will find that they're quite practical as auditing axioms. Not enough attention is given to those first Dianetic Axioms – those and the Prelogics. The Logics are very interesting as a synthesis of all education. The basic common denominators of all education can be found in the Logics.

But there you're on theoretical material. In the Axioms of Scientology, you have a condensation and a recapitulation of all of those early Axioms and Logics boiled down to a more practical, more fundamental, more forthright list. In other words, those fifty-five original Axioms and so forth of Scientology are more or less observed. They're pretty well observed. They are observed from the more theoretical Dianetic Axioms.

Now, as far as the mind itself and its constituency as covered in Book One, do you know there is hardly a thing you're doing right this minute that isn't somehow touched on or handled or mentioned in Book One – which is very fantastic, see? That's written the first part of 1950. That's very interesting.

And you have some data which was in *The Original Thesis*, 1947 – more practically brought up to date; that thing was brought up to date as of 1950 – 49, which is the present version. There's some data in there which is very, very applicable to auditing and has become very strong and more recently has not been mentioned. But I've mentioned it on this course several times but I'll give you a little synthesis of this.

The auditor as a thetan plus the pc as a thetan is greater than the pc's reactive mind. The pc as a thetan is less than the pc's reactive mind. The auditor plus the reactive mind is certainly greater than the pc as a thetan. Do you see how the equation works out? In other words, the auditor has got to work with the pc in order to overcome the pc's reactive mind. And the auditor cannot condemn the pc and expect to have the pc handle his reactive mind. See, if the auditor takes the pc out of the running as a thetan and as a being, you see – he in-

validates his beingness, you might say – you get no conquering of any reactive mind. You just get an overwhelmed pc.

Now, that set of formulas out of *The Original Thesis*, is what the Auditor's Code is set up to effect. You have the Auditor's Code, you see, because of these other formulas – these little basic formulas. Auditor plus pc, as thetans, greater than pc's reactive mind, see? Auditor plus reactive mind, greater than pc as a thetan, see? In other words, the auditor's validating the pc's reactive mind, you see, and invalidating the pc in some fashion, why, you get all sorts of interesting combinations on how these factors could go out.

Now, if the auditor is a reactive mind, you get all sorts of interesting things. And partially as a sort of a little moral code of auditing, it's a moral-technical code, you avoid all this trouble if you follow the Auditor's Code very thoroughly. But you're entitled to know what you're avoiding. You're avoiding the auditor invalidating the pc as a thetan and beefing up the pc's reactive mind and getting the pc overwhelmed by his own reactive mind. That's all you're – all you're doing. And those rules are laid down as a result of it.

Now, the formation of the reactive mind into circuits or valences – they were considered separate once. There are circuits, machinery and valences. Well, machinery – I could tell you very factually – is I don't know what happened to machinery. I don't know where machinery fits in all this, to tell you the truth, because I've audited pcs that have suddenly looked up and found some of the nicest, brightest, shiniest pieces of mental machinery you ever heard of. They go, "Watch!" you know. They have – sometimes have flywheels, and they have goo-jag-godgets that chump-a-chump, you know, and so on.

And I don't know where machinery fits in unless it's a valence of a machine. In other words, the beingness of a machine. The identity of a machine. The individual has been an engineer for so long that he's the engine, and this leaves a machine called an engine which is a valence. It could be that way, but I haven't inspected this any further.

But a circuit, as far as we're concerned, is a specialized function of a valence. A valence is an identity, but when this identity balls up and acts on its own initiative, it is a totally separate functional identity. And when this – when this valence – well, valence – John Jones, see? John Jones operating without benefit of thetan equals circuit. See, when John Jones is an automatic identity, he's all balled up and functioning, and this is very strange because – Lewis Carroll sort of an approach – " 'e 'adn't any thetan for a number of years," see? "And this is very strange because he hadn't any feet."

Anyway, you've got this kind of a thing. He's been dead now for eightthousand-jillion years so that the planet on which the body is – not only is the graveyard gone, you see, but the planet in which the graveyard stood is gone. And yet we have this John Jones – no thetan, see – but this identity, John Jones, totally functional, still giving the pc orders as to what to do. I think it's quite remarkable. Of course, the pc gave John Jones orders over such a long period of time that you get a reverse flow of John Jones, as a circuit, now giving the pc orders.

Well, it's the stuck flow. You throw baseballs at a wall long enough, and by George, you'll get the idea that the wall is throwing baseballs at you. It's inevitable. Just one way, you see? One way, one way, one way. You'll get a backflow there. Well, the pc at the time he inhabited the character known as John Jones gave nothing but orders to John Jones. Of course,

John Jones was not capable of anything else but receiving orders because he was just a meat body or something like that with a thetan resident in it. And as – the pc as the thetan was saying "Do this," and not articulating it, but you know, sort of "Pick up the fork with the right hand. Cut off a bit of the shredded wheat biscuit. Tilt the spoon," you see? "Hold the spoon level. Be careful not to spill the milk. Turn the wrist. Open the jaw muscles. Close the elbow. Close the mouth – not too far – withdraw the spoon. Don't drivel." [laughter] "Unjoint the elbow. Lower the hand. Tilt the spoon" – and this would be taking one mouthful, you see?

And that happens every morning for a long time, you see, in all of its dubious complexities. And don't think it is peculiar if the fellow gets the idea after a while that John Jones ought to feed him, a thetan. See? He's been giving all the orders that fed John Jones. So he sits there as a thetan – naturally, the valence becomes a circuit which gives him orders about eating. Do you see how the mechanism is? It's a stuck-flow mechanism.

Having proceeded only from the North Pole to the South Pole for seventy years, it is now peculiar if the South Pole doesn't proceed to the North Pole for a while. And that's a circuit.

All right. You're dealing with that with 3D Criss Cross. You're dealing with these things very directly. And everything that makes this life miserable made the life of John Jones miserable, too, probably. See?

You know, you have withholds, and you get in trouble with buying stocks and bonds, and you don't sell them right at the right time, and you should be buying a present for your wife and you're whistling at a blonde, you know? Or you should be thinking about your husband's dinner, and instead of that, why, there's a terrific urge to pick up the phone and call Bill, you see?

And there's as many complexities and withholds and upsets and economics and duresses and familial stand-on-the-heads and antisocialities and games of cops and robbers and so forth, going on, you see, in the lifetime of John Jones, as there has been in this lifetime, see? It was all at earnest, too. It was all at – in fact – perhaps because it's earlier on the track even more earnest, even more sincerely arduous, even more dedicated, even more this than the present lifetime, see?

Well, all of that, you see, has been lived, and there it is packaged as the accumulated engrams, facsimiles and ridges of John Jones, all neatly packaged and no longer parked on the time track, no longer parked but definitely mixed up in present time. It sort of floated free. There was nothing locating any time there anymore, is there? So it can very easily bunch up and float free. Well, just as this lifetime can get into a grouper – which is your black case; the no facsimile case is simply somebody whose lifetime, this present lifetime, has gone into a grouper – so you have a valence going into a grouper and becoming a round black-ball circuit which gives orders and does various things.

The thinkingness of John Jones is restimulated every time a little *bing* of energy hits this black ball, see? And we've got that mechanism covered in Book One. And inside this thing we're going to find, as it pulls apart, all of the pictures and all of the picture phenomena that you find in engrams, secondaries and locks and their chains. All of that phenomena is present in that circuit.

Now, that circuit belongs somewhere on a time track in relationship to other circuits, but if it's part of the Goals Problem Mass, it has totally floated free from its position on the time track and every moment of its time is now time; it's instant time. Hence, your instant read on the E-Meter.

In other words, this stuff is not timed anymore. It is "Now-now." You ask, "Did you blow up a planet?" and you'll get instantaneous crash on the E-Meter, you see? Well, how come he gets an instantaneous crash? He blew a planet up a billion years ago and if you were to ask him to travel to the point where he blew up the planet and back again, it would take several lightyears. So therefore, your E-Meter read would be a several light-year lag. It would be latent by several light-years. [laughter] You see that clearly, don't you?

But it isn't. You say, "Do you – did you blow up that planet?" and you get an *instant* read. Well, that doesn't mean that he's on the planet. That means that the pictures that represent this explosion of the planet and so on are here and now and all time is now time. So of course, you get instant reads on the meter.

Now, that data, plus all the phenomena of matter, energy, space and time, and the association of incidents and the confusions, and one of the earliest axioms there were, which appeared in the book, "Excalibur", about identities and similarities – life is composed of differences, similarities and identities.

In other words, you identify two things or two things are similar, or they are different. And all things become identity and then collapse on this same scale to becoming different when they are just alike, and go on an inversion, and you get the disassociation of the psychotic, and so forth. All that data is, of course, pertinent to everything we're doing right now. We get all time identified with this time and then we get all these identities giving the pc all these orders and dictating all these reflexes and so forth. And by George, you know, just the last few minutes here, I've stated everything you're handling, see? There isn't anything else you're handling.

I had a young fellow one time – I sometimes meet disreputable people who – I have been known to associate with disreputable people and so forth. I've heard afterwards they were disreputable. They never – people never seem very disreputable to me. They always seem like people. And it's always a great shock to me to having spent the afternoon talking with somebody that I am afterwards informed is a wanted murderer. This is supposed to make some difference or another. But it never seems to make much difference to me.

And in talking with disreputable people I have sometimes been given to believe that certain actions were bad. I've been given to believe that certain actions were bad and certain actions were good. I have. They actually believe this. Certain actions are bad; certain actions are good.

But having talked to an awful lot of disreputable people in an awful lot of strange and different areas, I find there's some conflict in their statements. This is often puzzling to me. So that – well, you go to Australia, for instance, and you talk to some of the people in Australia about law and order – and they give you some very different ideas. And you examine the law codes of Australia and they find out – if you examine them very closely – you'll find out that they are calculated to prevent the law from ever reaching anybody, which I think is very laud-

able. They mostly concern themselves – I'm not joking now, you'll find all strung through their laws very odd laws which prevent law from ever being applied. And the laws which they pass are to prevent law from being applied, which I consider quite interesting; not necessarily good or bad, but interesting, see?

And you get that law code, and if you took their law codes and asked them to be passed by as close a cousin as the British Parliament, I think there'd be quite a bit of discussion. I think there'd be questions in the House about some of these laws.

Well, there's little things like you've got to post the whole amount of a suit that you're suing somebody for before you can sue him for it, or something like this. I think that's fascinating, you know? And after you've sued somebody and waited for two years, you could lose the suit and forfeit all of your cash, and so forth. It sounds just about the way guys that were edgy about the law and had had enough of it would act.

And there's very curious things. But as far as their morality is concerned, it's comparable morality unless you get back into the bush, and you start talking to some of the aborigines. And I don't think they'd see eye to eye with the white man's law.

I've had discussion with Blackfoot Indians, for instance, on the subject of law. And I was perfectly open-minded about the subject. You're always – you always are open-minded about things that you couldn't care less about, see. [laughter] And I found out that the Blackfoot Indian has certain fundamentals on the subject of law that we would not completely agree with. We wouldn't agree that these were the best possible laws, and so on. But they always looked very sensible to me.

If you murder a man, you have to support his wife and family from there on out. That's the penalty for murder. Gives you to think, doesn't it, huh? [laughter]

Now, all these conflicts of morality, all of these various counterpoints of morality, of what's good and what's bad and what isn't good and what isn't bad and all the shades of gray in between, give us so many confusions and conflicts of *rightness of conduct* that we can then get people seeking right conduct until they go nuts.

Well, now, how do they do that? Well, you're an Egyptian one lifetime and then you're a Persian and then you're a Greek and then you become a Roman and then you become an Egyptian. And these civilizations are wildly and flagrantly different one to the next, but each one has its standards of rightness of conduct.

So if your rightness of conduct in Egypt is inexorably followed, you would be all right unless that got set up as a now-I'm-supposed-to circuit. Rightness of conduct? We always do the right thing automatically. See, training – social training, see? So that in Egypt, never had to think, you know. Just do the right thing, right then. Spontaneous. *Bang!* That is the thing to do. You all got it, see.

And then we become Persian with an Egyptian circuit. Decision of what to do in any given situation in Persia might be quite different, might be quite different than in Egypt. But we – our rightness of conduct gives us the automatic, now-I'm-supposed-to answer. But in Egypt [Persia], that has to be cancelled out first as the *first* impulse of what we're supposed to do so we can do the *second* impulse, see?

Well, that's all right, but we get to going in Persia just fine, and the warrior paints his face, and so forth. And you talk about makeup, I think that's where makeup came from: the Persian knight, the Persian warrior, and so forth. He's real pretty, you know? And – he looked like a Greek prostitute. [laughter] And they – so we just get along fine there in Persia, see, and we get along dandy and then kick the bucket, and now we've got an Egyptian circuit and a Persian circuit. And we pick up a body in Greece. So now rightness of conduct consists of stopping the Egyptian impulse, stopping the Persian impulse, in order to do the Greek impulse. That's very interesting, isn't it? And then we kick the bucket in Greece and get another body in Per– in Egypt.

Now we've got, first, an Egyptian conduct line that is now a century out of date. It's the moral codes of Ramses II or something, see. And then we've got a Persian one and now we've got a Greek one and now we've got a new Egyptian one. Well, that new Egyptian one, that's real easy, isn't it, because we're in the most restimulative country, except we're very old-fashioned in our courtesy at first.

Ah, but wait a minute. While we were being a Persian, while we were being a Greek, we stopped all the early Egyptian impulses, so rightness of conduct is stopping an Egyptian impulse. So rightness of conduct in Egypt now is being antisocial. Isn't it?

Now we're antisocial, you see, and the way to act properly like an Egyptian is to stop an Egyptian impulse. And about this time we sit down and wonder why we don't feel free. [laughter] And why we feel a little bit confused by our environments. And why we don't think instantly. And why our power of decision seems to be a little bit slow. And why we comm lag before we speak and other such mechanisms.

Well, now all this would be all right if rightness of conduct were given very light weight. See, if we had very little weight attached to rightness of conduct, you know? I mean, if we had individuality and some people acted one way and some people acted the other way, and there was nobody putting any pressure on it.

So having worn out numerous bodies in this Mediterranean circuit, we arrive in England in Puritan times, during the time, well, let's make it worse – the Roundheads – the time of the Roundheads, you see, where an insistence on rightness of conduct is the exclamation point of the day. Now we get some real good ones laid in. The penalty for unrighteous conduct is so fantastically huge that we go in danger of our lives daily. And we're coping at the same time with all these other circuits that tell us what rightness of conduct is. And some of those just as forceful, practically, as the Puritan one.

So we think, "Well, you know, I think the best idea – I tell you, Bill – I think there's a solution to all this. Let's just forget the whole damn thing. Let's just bury all these things and let's not pay any attention to them and let's get them safely out of sight and tucked under the chair and totally not-ised. And we'll say we only live *once*. And that will solve the whole thing" – except, of course, nightmares and the impulse of rightness of conduct in Egypt and all these other rightnesses of conduct coming up automatically as a dictation. Because now they're from a hidden source, we don't know the source from which these orders are coming, we can no longer stop them because we don't know from which they emanate and we go around with ideas racking around in our heads. And we feel peculiar, to say the least.

Now, if it was just rightness of conduct that we were worried about, that would have been all right. But rightness of conduct is usually enforced by somatics. And the somatic is most intimately connected in mental phenomena with rightness and wrongness of conduct – punishment.

If we drive a car correctly, we seldom get somatics. And if we drive it incorrectly, we are liable to get somatics, as one of our students can represent. That's just a matter of rightness of conduct, isn't it? It all goes under the heading of measurement and estimation of force, doesn't it? And correctness of action and all of these other things go along with it.

And if we don't do these things, we get the idea of punishment, from – and punishment from just the punishment of the physical universe for incorrectly estimating direction and effort. And it's no wonder that children spank their parents when they get into their teens, for having been spanked all during their childhood. We get a reactivity going here of magnitude. Punishment. Punishment. Make them guilty for punishing, and just punishing. And punishing to be punishing and punishment just to make people guilty so that they will have right conduct and the right conduct becomes punishing. So rightness of conduct becomes sadism and masochism. Rightness of conduct becomes, inevitably, an enforced conduct. We enforce rightness of conduct with pain and deprivation and that sort of thing. It becomes a considerable discipline.

So these various valences and circuits, because they are founded on rightness of conduct, enforce rightness of conduct on the pc. Because, of course, they are formed by pain and collision, they, of course, enforce with pain and collision. So every time we collide with one of these things, we get a somatic. That's all there is, basically, to the somatic phenomena.

And we try to run them out and we get somatics. And the somatics appear to be so formidable before we actually contact them – they appear to be so formidable – that we'd better not approach the valence or touch it or interfere with it. And of course, if we mustn't touch it or interfere with it while carrying it all the time, it just gives us – the total order flow comes straight from it. You would be surprised at the command value of valence.

If you want to witness this sometimes, get the list that you're making up in 3D Criss Cross, just note carefully what the pc is doing, saying and what the pc is thinking in the few minutes just before you nail the item. At that time you will have it in its highest level of res-stimulation. Its command value will be extreme at those few minutes. And then, of course, when it's found and identified, its command value drops off. But if it's also a very unsafe thing that had tremendous withholds in its own lifetime and tends to keep dropping out of the pc's sight so he keeps asking you, "What – what was that one I just gave you? What was that item we checked out yesterday? Oh, yes, buzz bomb. Yeah. Thank you. Um – what was it again? Oh, thank you." In other words, it's unsafe to reveal, and it keeps bobbing out of sight and into sight and out of sight. The pc will dramatize that one occasionally or feel he is.

Now, just that it's been put into view desensitizes it so he really can't capably dramatize it now. He doesn't ever do a good job of dramatizing one that's been brought to view, but he can still feel the impulses and feel upset about having the impulses. And that makes him feel very odd.

He actually isn't in any danger of suddenly going and blowing up the ... One of our dear students here – it very much looked like one of our classmates went around here for some time with the horrible thought in mind all the time how lovely it would be to blow up the East Grinstead bell tower. It was just to the shape and size that it just invited being blown up. And she'd regard that with some appetite every day, but know that she weren't really supposed to do it. Very appetizing. And that was on a terminal that was bobbing in and out and was being run at the particular time. And of course, it would come into heavy dramatization.

If you actually operate with a 3D Criss Cross terminal and you push this 3D Criss Cross terminal a bit under auditing and get it into a higher degree of restim and it's a long, strong one, the pc will go around all the time questioning the rightness of his conduct, wondering whether or not it isn't the conduct of this terminal. And he will do the peculiar thing of equating all of his most normal activities into the terminal, see?

It doesn't matter what the terminal is. He'll equate, "Well, that is the way, that is the way a vicious thief would eat. That's for sure." He suddenly catches himself eating, you know. [laughter] "Ha-ha... Nobody noticed. Close one."

He feels himself on the borderline of being found out in any given moment of the day or night. It's very funny, but it's sometimes, over a period of three or four days – when one of these things is being audited particularly, and continuously agitated and so on – how the pc passes through the strata of being it and then not being it and then deciding at length that he doesn't have to be it or obey it. These are all quite interesting as phenomena.

Of course, these are – 3D Criss Cross items are the items, the identities and the beingnesses which the person has actually been. Don't call them so much a beingness as an identity. And they are a package of conduct. They are a package of training patterns, and so forth, which are residual from that particular life. And oddly enough, every facsimile that they gathered in that life is still in that bundle. And you start taking that bundle apart, it looks like a stage magician producing cards from behind his back, you know. Here's a pack, you see, and here's a pack. And here's another pack. And then he reaches over into the girl's bodice and brings out another pack, you know? And here are these pictures, pictures, pictures, incidents, and so forth; that sort of thing coming up. And at first the rather disgusting thing is you really like to see the pictures, but they are a kind of a smudgy piece of charcoal with a white fringe all representing nothing really very tangible.

And when you try to audit them, why, they go in and out, and they don't go – they aren't in focus, and they're all improper, and if you really could see them, it would be so much better. And then you find out that they're laid in with terrific cold. There's enormous cold. A bad time to run 3D is during a wintertime. [laughter] That's a poor time to run 3D because one has a lot of chills that come off of this thing.

And it's very funny, sometimes you'll be running 3D, a pc who has been cold all his or her life has never realized they've been cold all his or her life until the cold wave suddenly departs. And they feel much changed now, and they're not quite sure what's changed. Actually, they were right resident in the middle of the iceberg, you see, because these black masses are drained of their heat energy factors. They don't have too much heat left in them although waves of heat and fever still come out of them. They're dominantly cold, occasionally warm,

occasionally even hot, occasionally even fevered, but those are just residuals. They're like burned cinders.

"I burn my candle at both ends. Some say it isn't nice, but, oh, my foes, and oh, my friends, it makes a lovely light," or something like that, whatever the poem was. Because they sure burned that life up. And that's the way the thing kind of sticks on the time track, you know? Charred. And when you get into it it's real cold.

Did you ever realize that the last time you died you probably didn't stay on Earth. You probably went out into the ionosphere and did one of these transorbital migrations that they're doing lately from the left to the right. Very often pcs yo-yo – I mean people yo-yo out into the outer dark. And it's cold out there. And they very often will go out there and get their whole track collapsed. And then they say they've been brainwashed or something of the sort. There's a lot of phenomena connected with this.

But all I'm stressing at the present moment is these are simply the items and the phenomena with which we are operating.

Now, every one of these bundles, a lifetime or a whole cycle, is composed of pictures in greater or lesser state of decay. And here are all these pictures and when you take one of these things apart, you start running into pictures. But because the pictures are already burned out and deteriorated to a marked degree, they sometimes don't show up as good pictures at all. And a pc is very, very disappointed sometimes. He runs into his life as the custodian of the bathing beauties or something like that and he thinks he's got a nice picture file in there, and he keeps digging for this picture file. Well, hell, he wore it out years ago, you know? In fact, he wore it out in that lifetime.

And he gets into a condition of where the item itself was scarce so he made a picture of it. And then, of course, because he didn't have the item but he did have the picture, the picture itself became scarce and therefore became very valuable and can become so scarce and so valuable that he can't have it at all. And that is the condition in which most of these circuits and valences are.

So these pictures show up. At the same time the pc wants them and has to have them, the pc won't have anything to do with them and can't have them. So you have a no-havingness of the pictures and views. So he uses the picture, he's dependent on the picture to orient himself and tell you what he is doing and he can't get the picture clearly to tell you what he is doing and so orient himself and tell you what he is doing, so he remains in a state of God-'elp-us.

Now, as you remedy his havingness and bring these things back and prepcheck it out of existence and get the withholds off of it, and get his overts off basically because a person's – a person's havingness deteriorates to the degree that he commits overts. This is the other part of the puzzle, is the overt-motivator sequence. And the overt-motivator sequence consists of when the individual has done something to something, he can then receive a similar action from the thing he has done it to. It's as elementary as that.

You cannot be run over by an automobile till you've run over somebody with an automobile. I mean, it's as positive as that. You cannot be hooked by a wild boar until you've gone

around hooking some wild boars, see. A girl can't mess you up until you have messed up a girl. This is something that a lot of fellows overlook.

Now, if it went quantitatively one for one, like the law of Hammurabi, God-'elp-us all because I was counting up the number of lifetimes I would have to live for – just to counter-balance the overts of World War II, see? I was counting them up, so on. Well, it seemed like an awful lot of nonsense about the thing one way or the other.

So it actually isn't a one for one quantity proposition. It's the sensibility of having done something. Because when you've done something to something, you have cut your havingness down. And the elementary sense of all O/W is just based on that.

You get individuated to the point where "It's their havingness and my havingness. And therefore, I can protect my havingness by destroying their havingness." And we totally overlook the fact that it's all your havingness.

Well, we've got – a little boy has four lead soldiers, and you have four lead soldiers. So in order to protect your lead soldiers, you teach him not to destroy your lead soldiers by destroying one of his lead soldiers. You now have seven lead soldiers. See? So then, because you've destroyed one of his lead soldiers, he's going to destroy one of your lead soldiers. You now have six lead soldiers. So to discourage any further incursions of him upon your lead soldiers, you destroy another one of his lead soldiers. You now have five lead soldiers. But because you have done this, he gets even with you by destroying one of your lead soldiers. You now have four lead soldiers. Two are yours and two are his.

Now, because you've both become that upset with each other you have a hell of a fight and break up the remaining lead soldiers. You now have *no* lead soldiers. See, the misnomer of havingness is personal ownership.

I have been up above a lot of real estate that has been owned by a lot of people. But while I've been up above this real estate looking at this real estate, let me assure you it belonged to nobody but me. I think you'll find that's the case in all cases: that you own that which you can perceive as far as havingness is concerned. And this is degraded down to the idea that you can only own that which you personally can fully use. Of course, if you just walked on some of this real estate you're looking at, they'd set the dogs on you. You're not supposed to use that item.

So freedom of use is the final idea of havingness to an awful lot of people whereby it isn't really the idea of havingness at all.

See what that is? If somebody debars you the use of something, and you say you don't have that thing. You can look at it, but you mustn't touch it. You mustn't use it. You mustn't do this. A lot of nonsense is entered in onto like this. That's why the communists, the socialists, and so forth, can make such large windrows on society, because he's talking on a mockery harmonic of what is basically true, is nobody owns nothing. See?

All ideas of ownership are postulated ownerships. They're not actual ownerships except those things which one owns by the right of having created them. And, therefore, some people fall back on creativeness as the only way of life because it's the only possible method of declared ownership. Do you see that?

"That's mine, I made it," which is unanswerable. But what they neglect to point out is what the other fellow made is theirs, too.

Now, the commie gets down into the point of, "Everything you made is mine." It belongs to – then they don't even own it. It finally belongs to the state. Everything belongs to the state and there is no thetan called the state so they got it taped. Anyway, that's a lower mockery, community property is a lower mockery of what is actually a fact.

Now, I don't even know that you own everything you create, see? You can continue responsibility for the things you create actually, without owning them, strangely enough.

Now, here's your problem in a nutshell in processing a pc, is to understand what fundamentals are important and what are not fundamentals – what things are not fundamentals.

Don't make the mistake of considering all data equally important. It is not. Sketchily it is true, but I have nevertheless touched on, in just the last hour, every important item that you are handling in Prepchecking and 3D Criss Cross and the mind.

I have mentioned these things and actually their behavior and their role and relationship in modern processing. And these are the important items there are. They're all developed items. You handle just those items.

Now, if we say that it's equally important across the boards, from one end of the scale to the other end of the scale, that the pc must not smoke cigarettes during the session and the auditor must use the Auditor's Code, we have approached most philosophic idiocies.

And you'll find out people will come along, and they will tell you, "But these truths of Scientology that you say, they have appeared in other philosophies." That's true, too. That's absolutely true. They have occasionally appeared in other philosophies. By the way, the enormous majority of them have not. But some of them have, see?

And you sa – if you wanted to be very cruel and shatter this person in their tracks, just say, "Well, show me the book." And they will show you the book, and they will look it up and they will find the line and they show you this very proudly. This book usually is about a foot and a half thick, you see, and so on. And you say, "All right. Now where's that line?"

And they say, "Well, look here. 'Man is basically a soul, and all of his beingness is contained in his soul.'"

See, they show you a piece of philosophy like that. You say – they say, "Well, there's a thetan."

You say, "Now read the next line."

And they read the next line, and they say, "And every man should be good to his mother."

You say, "Go ahead and read the next line."

"For the finest role of the being is making a family of which he can be proud."

And you say, "Where's the notation by the author that only that top paragraph has value?"

This slaughters them. They finally get it through their heads that, yeah, there's a piece of philosophy there, but it just happened that nobody had marked out whether it was important or unimportant.

And the importance of a datum in relationship to other data is the sole criteria of the value of the datum. You can utter truths and idiocies consecutively for hours, and some will look upon you as wise, but others would say you're only pretty confused.

Now, there's this story about fifty-five thousand monkeys or something like that could write for fifty thousand years on fifty thousand typewriters – I don't know. Some typewriter company must have put this out – [laughter] and they'd write all the books ever written. Well, I think that's very interesting. It's very interesting.

But I know one book they wouldn't write. And that'd be *Dianetics: The Modern Science of Mental Health*. [laughter] They couldn't write that without finding out what they were doing.

Anyway, it's the importance of the datum. And one of the things you must learn in all of your activities on study and so forth is the relative importance of what you are learning. How is this important to a session? How is this important to a pc? How is this related to the final goal of getting something done?

You could just memorize all of these things as just strings of words. And that's a valuable action, too. You would be considered learned if you did that. Yes, you could become very learned and still be as dumb as an ox.

If you never related any of your learning to any activity or evaluated any of the things you had learned, where would you be? You would merely become learned. And it is not enough to be learned. There have been lots of learned men. I have seen them neglected and thrown overboard and dropped in rivers along with unlearned men. In fact, sometimes a little quicker.

But to be wise, to actually be wise, you have to be able to relate data to activities and actions and evaluate them for their own sake and their relative importance to other data.

You can't go through a training manual and read the number of pints of water carried on a route march as being relatively important with the fact that you should always salute subalterns. These data are not of comparable importance. And yet you will find that most people tend to make data of a monotone value. Well, beware of data of a monotone value.

If you think of the hundreds of thousands of facts that have been developed in Dianetics and Scientology – the hundreds of thousands of them, because they actually exist and much of that data, almost all of it, is brand-new in the field of the mind – if you think of that vast body of data and then think that I was able to sit here in the course of an hour and give you a summation of the data that you're handling in processing, then it must be true that some of this data has greater importance than other of this data. And that's a basic role in study: To find out what you're studying and how it relates to what you're doing or intend to do. And you have to make that bridge, too.

Because in auditing you haven't time to think of a hundred thousand data. But if you know very well the basic and fundamental data that you are addressing, the basic and fundamental things which you are handling in the auditing session, you don't become confused at all. You can make very, very wise and smart decisions with regard to the pc. You know exactly what you're doing with regard to the pc. You can wade right into this one left and right. Why? Because you're handling only the important data. You're not handling the valueless and the unimportant and the merely interesting data. You're handling what has to be handled.

So it's not enough to know data. You must know the data's use and where it belongs and how it fits together and how it aligns with what you're doing and what you intend to do.

And I'd advise you when you're studying to try to align what you are studying with whether or not – with how it applies to a pc that you will be auditing, and how relatively important it is to pay attention to it in the pc. And if you ask the question of any data – of any datum as to whether or not it would expedite an auditing session, then you will quickly and rapidly align what you should be handling in an auditing session. And you suddenly will realize what you should be handling in an auditing session and you will cease to make any mistakes with regard to it. And you'll cease to be adrift with regard to pcs. Okay?

Thank you.

Model Session, Part I

A lecture given on 1 March 1962

Thank you.

Well, I'm glad to see you're so rested tonight. [laughter] I really am very happy to see that. But why are you so pale? I doubt it's the light.

All right. This is ...

Audience: One March.

One Mar. AD 12, the month of bad auditing. [laughter]

All right. Saint Hill Special Briefing Course.

I'm going to talk to you tonight about Model Session.* The genus of Model Session came about because auditors were varying patter to a point where a session was hardly distinguishable as a session from one to the next, and because, frankly, as early as 1954, I began to notice that Scientologists were quarreling between themselves as to what was the right way to go about a session.

I say this advisedly because actually, practically, fisticuffs and ARC breaks, and so forth, "You didn't run this session right," you see? And "Here you should say so-and-so."

We know now this was because he had missed a withhold. [laughter] But it became evident very early that a Model Session was necessary. However, the session sort of evolved and over a long period of time, why, a great deal of patter and so forth was used very variable. And the genus of Model Session itself very precisely was a discovery that if all sessions were on the same pattern, then subsequent sessions tended to run out earlier sessions.

And the value of this is not to be gainsaid. You have an auditing session today and if you get the same wording in an auditing session tomorrow and the next day and the next day, just by duplication, you get a predictability on the part of the pc because duplication is taking place and auditing becomes a better communication thereby.

Now, I do not pretend that Model Session in its present form is either perfect English or perfect form or anything else, but it is a usable form. It is acceptable and it's been agreed upon.

* *Editor's Note:* the Model Session LRH described in this lecture was from HCOB 21 December 1961. This HCOB was later cancelled. The full data on the points of Model Session are given in the lecture. The current HCOBs on Model Session are in the Technical Bulletin Volumes.

Recently the rudiments entered in much more heavily than previously, and the value of rudiments became extreme at the same moment that the first auditor had difficulty finding goals and terminals and going down lists.

And it was discovered that some people just couldn't have anything like a session unless the rudiments were in. As a result the need of rudiments became, well, just they were the difference between auditing and no auditing.

Of course, rudiments are quite early, but in its – 1955 – but in its present form these rudiments are less than four, five months old. And its present form has even been refined even a little bit further beyond your Model Session script – one end rudiment has been changed. But this is all in the line of evolution, and this end rudiments are your newest and they came about because assessments were not occurring in numerous sessions because pcs were doing peculiar things with the auditing session and that's where you get the end rudiments.

So Model Session is actually tailored against clearing. It is not so much tailored against Prepchecking or something like that. Beginning and end rudiments in Prepchecking might occasionally even get in your road, but they will never get in your road in actual assessment. They are *vital* in assessment. They are not quite so vital in Sec Checking, old Sec Checking and present time Prepchecking. They're not quite as vital as that.

Prepchecking, of course, takes up an awful lot of the things which are found in the rudiments. And as a result, there can become – come into being a confusion between Prepchecking and rudiments, and rudiments can actually throw the session.

The pc can use rudiments to throw the session on the auditor. All he has to do is have a rudiment out and his Prepchecking is parked for the day providing you use any form of O/W to resolve any of the rudiments. If you use any O/W of any kind whatsoever on any of the rudiments, regardless, you are instantly and at once in trouble on Prepchecking.

In other words, the preclear can throw the session over into a new channel of withholds while you are sitting there with 0_A, 1, 1_A, 1_B, 1_C, 1_D, 1_E, 1_F, 0_B, [laughter] 1, 1_A, 1_B, 1_C, and the pc comes in and all – your first chain had to do exclusively with candy and overts with candy or something of the sort. And your second chain that came off of this was overts against bathtubs. And your 0_A, your 0_B are very, very comfortably running on candy, and it went over to bathtubs in some peculiar fashion, and that connected up on glorious short circuits, and the result of this – the pc comes into session, and he has a present time problem on the subject of automobiles.

So you get a present time problem on the subject of automobiles, you use any withhold of any kind whatsoever to resolve this, and you are now over onto, whether you have put it down in that form or not, 0_C – And you're not going to see, during that session, any of your 0_A or any of your 0_B. You won't see any of those 1 questions at all. You have been derailed. That has happened several times, and it is a frailty.

That is why I tell you that rudiments can get in your road in a Model Session during Prepchecking, but only if you use any form of withholds to get your rudiments in.

Now, you possibly could use withholds to get the rudiments in on 3D Criss Cross or a clearing routine because you're not doing withholds in the body of the session, and so there is nothing to be thrown. So it requires two different looks at rudiments.

But until you have gotten into trouble with this, you won't appreciate how agonizing the trouble can be, you see? You had a chain on candy, just to be ridiculous, and a chain on bathtubs, to be more ridiculous, and the pc came in with a chain that he was all ready to launch all on his own volition, and because he sits down and tells you he has a present time problem against – with automobiles, you now are tempted to say well, what automobile have you withheld from whom, you see? And whether you've stated it or not, you are right there on a third channel. You've got two live and you've got a third one going now. And you're not going to get off that third one in that session. Why aren't you? Because you already fouled up the session, see?

Your disobedience of the Auditor's Code – you're running a new process without flattening the old. So it's too many processes. You see?

So therefore, there's different ways that rudiments are used. Basically, rudiments are vital to a session. They get a pc in-session. They will hold him in-session. They will keep your needle from suddenly springing up on oddball othernesses. They will keep ARC breaks out of the way. They have a lot of value but at the same time, particularly in Prepchecking, they can also throw the pc out of session just as fast as they can throw the pc into session.

Pc comes in. He's all ready to get off withhold A, B, C, D. He's figured it all out. He thought it up in his sleep during the night and he's all ready to sit there and say, "Well, I've just realized that I killed the girl."

See, he's all set to say this, so you say, "Well, are you willing to talk to me about your difficulties?"

And he says, "Well, I'm all *mmmmmmm-mmmmmmm*. Well, yeah. I can talk to you about the difficulties. Uh ..."

And you say, "Well, how's your havingness?"

And he says, "What, ah, well, it's all right, but you see, this *girl*, I mean ah, that..."

And you say, "Well, all right. Are you withholding anything?"

"Well, that's what I'm trying to tell you. I'm not withholding anything, you see, because I – I want to tell you about this girl."

"Well, do you have a present time problem?" He says, "God, yes! Trying to tell you what the hell this withhold is, you *idiot!*"

So the rudiments formed an ARC break.

In other words, the rudiments *created* an ARC break. See, rudiments can be used as a method of preventing the pc from communicating with the auditor. Do you see that? And an ARC break is only a prevention of communication by the pc from his viewpoint. Do you see then how rudiments can get in your road? Well, they definitely can get in your road, so therefore this is a matter of judgment.

The pc comes in, he's giving you all the answers to the Prepcheck questions you were asking him yesterday. Well, for heaven's sake, start the session and get the answers! Don't form and establish an ARC break. In-sessionness is something that has to be humanly detected. The E-Meter will do everything else for you but tell you whether or not the pc is in-session or not.

It will tell you the pc is in-session if you check the rudiments and find them all clear. But the process of checking the rudiments can establish an ARC break that will make all the rudiments unclear providing the pc is thoroughly in-session, interested in his own case, eager to talk to the auditor, quivering to get on with this situation.

Yes, your rudiments could all check out clear but you've established an ARC break. Why? You prevented the pc from talking to the auditor. Do you see this? The E-Meter will tell you everything then at a glance except one thing: whether or not the pc is in-session. Because you cannot use the E-Meter to find this out, for two reasons. The process of finding it out can throw the pc out of session wildly if the pc is eagerly in-session, and on the other side of it the E-Meter will not register that second point.

There's two points that aren't in *E-Meter Essentials*. And point one is the data on instant read. You only pick up instant reads for items and out-rudiments and that sort of thing. Only pay attention to instant reads, you know. The read right now. Don't bother with latent reads. You see me in demonstrations using latent reads to help the pc.

When his mind passes the charge, I can call it to attention – I'm not hounding him trying to get him to say something, but I call it to his attention as it goes by the charge on a latent read. "Hey! What was that?" See?

He's looking for something. That's only when the pc is sitting there thinking, "*Wha – wha – wha – wha – what is it?*" He's looking, you know, and he's looking, and he's got the garbage can turned over, and he's searching through the contents, you know, and so on. And the E-Meter goes *flick*, and you say, "What's that?"

"Well – I – oh – that. Oh, well, I just ..."

"That," you see.

And he goes over and he looks at it and tells you what it is, and "Oh, well, that is important isn't it?" You see? The E-Meter can find out before he does.

You don't use that to hound him with, see? You haven't seen me hounding anybody with this. But you see me helping somebody out. That thought or that thing you just looked at is important is what I'm saying to him. Now, let's have another look at it. Otherwise, it's all instant read. And the other thing – and actually that isn't for detecting anything, you see. That's just helping the pc. The other thing is this ARC break. An ARC break can be so extreme that the E-Meter does not read at all.

The auditor has no command value of any kind over the preclear so therefore the E-Meter does not read an ARC break. So therefore, in-sessionness or the presence of an ARC break must be humanly detected. You've got to detect it. Or, let's say, Scientologically, de-

tected by the auditor. Not humanly. That's probably a very bad phrase, and so on. I didn't mean to insult you, you're all – I didn't mean any of you were human.

All right. There's the limits of the E-Meter. The E-Meter does have that limit. The auditor must have some command value over the pc before the E-Meter will register anything. And the greater the command value over the pc, the better the E-Meter registers.

Now, this is not an extreme point. This is not a delicate point. This is yea and nay. This is black and white. How far out does a pc or a human being have to be that another human being cannot get him to register on an E-Meter? Oh, man, it's way out. It's in the cold dark of Uranus, you see? Because I can get a newspaper reporter who has come down to get a lousy story to register on an E-Meter, you understand?

You could probably get somebody who was all set to rob the house to register on an E-Meter. You understand? You must get the idea of what extreme condition it must be. What an extreme condition it must be to have no registry of any kind. And when you see the pc not registering on the E-Meter in any way, for God's sakes, assign it to a *very* extreme condition. It is *very* extreme. There's nothing light about this.

If the pc weren't so far south and so apathetic at that moment, if he had the energy to do so, he would probably cut your heart out with a very dull table knife with great glee. I mean it's way south, this condition where the E-Meter doesn't register. You see?

Some of you who have tiny reads on a list watching an E-Meter, some of you have very tiny reads of that character, very scratchy sort of tiny needle reads, needn't really think that it's command value over the E-Meter that you're registering. Yes, the rudiments are not in very well before you get this sort of thing, but they're probably in as well as you can get them in. It is just the list itself is not much charged, and it is reading over the top of a very heavily stuck item, which is continuing to read, which is giving you this scratchy needle effect.

In other words, you can take somebody with a flow stuck wrong-end-to and get a scratchy read, see? But it'll still read for you. See? It's microscopic, but it's still reading for you. That isn't what I mean by command value, see?

Frankly, if your command value over the pc were sufficiently great, you theoretically could overcome this sort of thing, but actually the pc is terribly introverted, paying attention to some very hostile terminal of some kind or another, you see, and the pc's attention is so much on the terminal he hasn't got any chance to pay any attention to you.

But you can still make the thing read. That's a different thing than an ARC break. That's a terrific introversion. You'll never ever see it anywhere else – or a terrific dispersion. And it's consequent to having a clearing process run. I mean it's ordinary. Don't consider this extraordinary. This isn't anything very weird.

Before you run a flows assessment on a pc, you could almost expect, well, some indifferent type of line. You just decide the pc is goofy, so you say, "Who or what would oppose goofiness?"

Well, you get that type of line, you're liable to get that type of read, you see? Just by the fate you occasionally find something that's out, and you start running a line on a pc and

you're very sorry you ever had anything to do with it because you watch down the line and that needle is doing nothing but scratch and tick. It's a dirty needle, you can't read through it, and so forth. And you say, "Oh, God, why did I ever start this?" Do a flows assessment and it clears up.

But this is the needle registering against the bank more than the auditor registering on the pc because you'll find out that the auditor does have an effect on the pc even though you have a little scratchy needle. The needle is electronically, internally inhibited is what this scratchy needle situation is, see?

He's got some kind of a mass of a terminal or something that's very much in the road of everything. It's constantly knocking. It's doing all kinds of things. Tiny little reads. Well, that is not your ARC break type of read. Your ARC break type of read is just blank. It's just blank.

You get the same thing, as I've just been telling you, of the pc was so introverted you couldn't get his attention. But where he overtly is not going to pay any attention whatsoever to the auditor, *none*, the auditor can have no command value on him of any kind whatsoever. And you can actually say, "Do you have an ARC break?" You get no read. "How's your havingness?" You get no read. "You withholding anything?" You get no read. "Do you have a present time problem?" You get no read. And all those rudiments are live as a cat. It has to be humanly detected. The pc won't talk to you, either.

Pc is sitting there with his eyes on the floor, the cans are over on that side, they've been thrown down sometime since. [laughs] It's just "No!"

And finally the pc musters up enough energy out of this well of despond that he has been placed in to answer the question, "Well, do you want me to audit you or don't you?"

And he manages to say, "No, God damn it, no. Please go away. If I had enough energy to walk, I would, but I haven't."

You know that's the way that goes. Well, you aren't going to get an E-Meter registry at that time. The time to detect what's wrong with the pc is before the pc gets into this extreme condition.

So just to make a – keep auditors from making a mistake at this point of the beginning rudiments, you give them that reservation. Your E-Meter may not have command value because somebody may be so stupid as to never perceive this condition on the part of the pc. So you make it humanly. So if you're going to find out anything about running the session, you look up and look at the pc. This is a very, very, very good thing.

Now, the first test of this comes before Model Session opens and that is, "Is it all right with you if I begin this session now?"

And if the pc doesn't answer you, or if the pc says "No!" profanity, exclamation point, the probability is that the E-Meter will not read on the pc for the remaining rudiments. You see how extreme this is, see? So that is your test way up at the top of start of session. That is your basic test.

You ask him, "Has the session started for you?" and, you know, and you've got another test. Makes another test. That's to find out whether or not the pc's going to read on the meter. That's why you're making these tests, as well as put him into session.

And you say, "Well, has the session started for you? Has this session started for you?"

And the pc says, "*Huh. What session?*"

I don't think – I don't think you should go on monkeying with the E-Meter. Don't go on monkeying with the E-Meter. Pay attention to the pc. Ask the pc what's wrong. Do anything you're going to do to patch this pc up and just skip the meter at that point because the probability is that the pc is not reading on it. So don't even take a chance that the pc is or is not reading on it. At that point use your skill to get the pc to talking to you.

Now, if you can get the pc to talking to you, you go on down the line here and you will find that the thing will read. So if the pc will talk to you easily, the E-Meter will read. And if the pc won't talk to you, the E-Meter won't read. You got that?

You should recognize this because the pc can be given an ARC break with the E-Meter as well as the auditor. And don't give him an ARC break with the E-Meter and the door and the floor and everything else. At least try to minimize the effect on this.

And how do you give him an ARC break with the E-Meter? Well, I'll give you a method of doing so. This is not recommended. You say, "Do you have an ARC break?"

And the pc says, "Yes."

And you say, "Well, it hasn't registered on the meter."

At that moment, the pc will question the meter and the probability is will never thereafter believe in a meter. And that is the exact test, by the way, that is the exact test that established this point – the E-Meter doesn't register on an ARC broken pc. See. I discovered this by inspection of the factors and actually saw it work.

The auditor says, "Doesn't read on the meter," and that was the end of the meter for the pc. Now, you had to patch up the meter and the auditor, but how could you patch up the meter because you didn't have the auditor patched up, and oh, God 'elp us. What a rat race. Do you see that? Do you follow that? You're all looking at me like you might not think it's true.

All right. Now, let's take up Model Session here just step by step. I've given you some preliminary music on the operational function of this sort of thing. We know now one of the reasons "Is it all right with you if I begin this session now?" is so that you could humanly detect an ARC break on the part of the pc.

And the reason you start the session is so that the pc knows that he's on a specialized section of track; that what goes from here on is not social relationship; that he is now a pc and you are now the auditor; that you are taking command of the situation as of this moment. And is a service of warning of the starting of a specialized section of track known as the session. And that the relationship between auditor and pc will obtain from here on out. It is the beginning of a contract.

And now, you want to know if the pc has agreed to this. Don't ask him after you've started session if he has now agreed to start the session. Because you've already taken the command of the situation. As close as you can come to finding out if the pc is in agreement with this specialized-section-of track situation is to ask the pc, "Has this session started for you?"

All right. Pc says, "Yes." You go on. If the pc says "No," you once more say "Start of session," and you say, "Now, has this session started for you?" And if he says, "No," you assume that it has started anyway and you say, "Well, we'll cover it in the rudiments."

In other words, you just bull on through, well recognizing at this particular time the pc is in possibly an ARC break. Not possibly. A pc *is*. Excuse me. It's an ARC break with life or existence or something of the sort.

Now, we get down to the beginning rudiments. Now, the beginning rudiments are designed for the order of logical progress of a session. But what do you have to take up before you can take up something? You see?

Now, if you put a present time problem first, in the rudiments, you would be running a session without goals and very often having to run the present time problem, you would be running a session without having cleared the auditor or gotten any goals or remedied any havingness or anything else.

So the most complicated action you can take up is a present time problem which is the last one. Now, the one just before that, "Are you withholding anything?" is a little less complicated than a present time problem but it is most likely to clear the present time problem which may follow it. And above that, "Are you willing to talk to me about your difficulties?" and if the pc realizes that he or she is, you are much less likely to have a withhold, and then again much less likely to have a present time problem. And then going higher than this, "Look around here and tell me if it's all right to audit in this room." If the pc's havingness is down and you remedy the pc's havingness, he's much less likely to have difficulty with the auditor, withhold anything or have a present time problem. Do you see this?

And then the least innocuous thing that you can possibly run that is calculated, if you are clever – and very few auditors ever use this as a point of cleverness, so I'm bringing up something that is rather new to you right now – if you cleverly enough run goals, you can put the pc sweepingly into session. You'll get him interested in his own case and willing to talk to the auditor. Because the most likely piece of conversation that a pc can be embarked upon is what he means to do or what he hopes will happen in life. And that is the most likely piece of conversation.

Even if it is "I hope I will die soon," that's still a goal, you see? And a goal like that is better than a pc sitting there saying "hm" to any goal, is better than no goal. That's the easiest one to audit. That's very easy to audit unless you're going to get a goals list and find the goal on it and that sort of thing. And that – people find that rather difficult.

But the easiest thing to audit then is, "What goals would you like to set for this session?" Now, that's, of course, your first rudiment then. "What goals would you like to set for this session? Are there any goals you would like to set for life or livingness?" both under the

heading of goals in two sections followed by environment: "Look around here and tell me if it is all right to audit in this room." Followed by auditor: "Are you willing to talk to me about your difficulties?" Followed by withholds: "Are you withholding anything?" Followed by present time problem: "Do you have a present time problem?"

Those are the beginning rudiments in proper order. But let's see how they are used.

All right. I said an auditor could be clever. You can always get a pc to talk about goals if your definition of goals is broad enough. And you can put a pc into session overtly with the subject of goals unless you have a specialized category of goals.

Now, I know of a case, not a pc, he's not been audited. I thought at one time I would ask somebody to audit this pc but the pc subsequently was electric shocked and given wet packs and, man, they got this pc from merely being apathetic to just being a frantic, sodden piece of catatonia, you see. So that's that. Let the psychiatrists have their meat. And we'll catch him next life. And if we catch the psychiatrist who did it, we'll know about that, too. We'll make sure that he has a withhold before we audit him.

Now, you can be very clever here. This pc, potential, at the time he was going to be audited, and even now, has got the same goal. And nobody will recognize it as a goal and it's stuck the pc with the goal because nobody okays this as a goal.

A goal is simply a hopeful postulate of future. That is all a goal is. The pc hopefully, not very positively, he just – it's whether by luck or it's going to happen because a roulette wheel turns up, or he wins a football pool or any other confounded thing, this is something that he hopes might happen in the future. And that's all a goal is. And when you take that broad definition and look at goals, you will stop shutting the pc up on the subject of goals because they don't fit your idea of your goals.

You're there to make him well. The pc says – this same goal this person has been giving now for a year and a half is "I want to die." It's a perfectly valid goal. Recognize it as such.

And nobody has cheerily said to him, "Well, I'll see what I can do to help you out with that goal." And you know, a pc will come right on up and out of that goal and give you another goal rather rapidly.

If you ever see a suicide hanging out the window about to plunge into the street and so forth, hand him an anvil so he'll fall faster or something. He isn't likely to go into the street – unless he thinks you're being sarcastic. [laughter]

So, here is a wild tool if you care to use it. And honest, when I see a consistent or blank – well, you know, a consistently reiterated statement as the only goal the pc has, or a blank no statement of any kind whatsoever, all I recognize about it is, is well, there's probably a little bit of an ARC break here. Yes, probably so if it cared to be detected.

But certainly the auditor is operating with a paucity of inventiveness. The auditor – it's just merely a stamp of the nonoperating auditor. That's all. He hasn't any pat process by which to get the pc to give him goals and he just doesn't bother, and so forth.

But I wouldn't leave a pc in that situation. The pc that wouldn't give me a goal I think would park me right there in the rudiments. That rudiment, too. Not any further rudiment than that. I would explore possibilities of future. I'd explore them one way or the other.

I'd find out such things as, well, what would the pc was sure was going to happen in the session. And you find out that you're probably sitting on a certainty that he's going to feel worse.

You say, "Well, good. Is that a goal of yours?"

"No. Quite the contrary."

"Well, what goal do you have?"

"Well, to feel better."

"Thank you." And you write it down.

The well-oiled auditor can always get a chain of goals if he cares to apply a little bit of cleverness to the situation.

Now, when you go upwards to twenty goals for a session, you're overdoing it. There's moderation in all things as the fellow said when he put down the empty five-gallon jug.

And if you get too many goals, of course, what are you doing? You're doing some kind of a Routine 3 activity. Well, that has nothing to do with rudiments. Two, three, four, something like this. This is within the realm of reason or even seven or eight. That's fine. That's fine. But for God's sakes, get the pc to make some even though you sort of trick him into making some.

I don't know what aplomb one or would not use. It'd all depend on the situation. If the pc said goal for the session, "I want you to drop dead," you know? Well, I don't know whether one would really with aplomb write down "To have me drop dead." But if I really wanted to get the pc squared away and under control, I think I would write it down.

Now, flying in the pc's face and saying, "Oh, no. You really don't want that, do you?" and so forth, is a refusal of goals and you'll throw him out of session. After all, he gave you a goal. Whether it's feasible or polite or socially acceptable or agrees with your basic goals at the moment, it is nevertheless a goal, see? So the least you'd do is acknowledge it. But you actually can use goals in far more ways than you have ever dreamed of. But don't audit the pc in the middle of a "no goals" because there's an incipient ARC break there.

I don't have to read the meter that the auditor was running on the pc in an auditor report. I look up there and I find no goals of any kind whatsoever. Then one of two things was true. Either the pc came into session at a high roar, totally in-session, spilling every withhold on the track, laying his case in the auditor's lap, and the auditor had barely got time to say, "Start of session" into one of the *hhh* [takes in breath], as the pc gasped for more breath, you see? The session evidently started a half an hour before or some time like that, you see? Well, there'd be no goals in the thing.

Obviously the pc's goal is being expressed in the fact that he wants to lay his case in your lap, and so on. He's living his goal for the session, so you'd have that. But that would be

accompanied over here by terrific successes in the session, see, if he really came into session, and so on. You could see all this stuff he got off and everything is squared around, and the auditor guided him over finally and got him onto the groove where he wanted him and kept him going on down that groove, a very expert method of handling it.

Or the pc is at the other opposite end of the spectrum, totally out of session and won't talk to the auditor, and at that time I'd like to see some work put in on the situation. See? And that's one of the best ways to get a pc into session is take it right at that rudiment. Of course, that rudiment's a sneaker.

Now, "Are there any goals you'd like to set for life or livingness?" sort of jumps up out of nowhere. But pcs, about their second or third session, begin to learn these rudiments, and this isn't for the first session that this has any bearing.

You want *session* goals. And this sort of disciplines the pc as he gets interested in it into having session goals. Possibly even it should be first, but it's a little bit too far out. It is one of these questionable rudiments. Is it vital? Is it necessary? But it's very useful and the pc seemed to like it, and you said it, but you never use it. You never check up on it. You never check up on it. This is as far as from the pc's viewpoint.

Now, I will tell you why it is there. It is to trap and locate present time problems of long duration. And the pc will set them right down like a little soldier if you spend a little time on this.

And you want to know the pc's present time problems of long duration, just ask him, "Now, are there any goals you'd like to set for life or livingness?"

And he says, "Well, to get over present time problem number one, and to recover from present time problem number two, and to recover from present time problem number three."

And this is a very interesting cross auditing report check – is you can find out whether or not the pc was operating consistently on a present time problem by finding out if this same present time problem continues to recur session after session. And after one of these things has recurred about three sessions, you begin to wonder when somebody is going to take up this present time problem.

But they will. They'll state it beautifully. So it is a bit of a covert way to get some data on your pc. And he will, he'll give you his present time problems under that line.

Of course, it looks like it isn't important. There isn't anything much to this, and so forth. If these do not contain problems – and in the majority of the time they don't contain problems; it's just interesting and shows the pc that you're interested in him and so there is no motion wasted here particularly.

All right. Now, that step handled well can get the pc in-session, see? Your next step almost any pc can run some version of and benefit from it, even if temporarily, and any auditor can audit. One of the easiest things to audit, apparently, there is, is Havingness, environment. And apparently, apparently, auditors will run Havingness, can run Havingness, on anybody. I've had auditors who would ordinarily have a terrible stage fright auditing me, be able

to sit there and just run Havingness just beautifully, you know, and not have any difficulties running Havingness or anything like this.

Then they have to run something else that takes a little bit of invested address to the pc and they just fall all over themselves, see, but they could run Havingness. So I just take it from a subjective reality on this fact and watching auditors audit, and that sort of thing, that they will and can run Havingness. This is an easy one. In other words, we've got our easiest process first.

Now, the other side of the thing, the pc for some reason or other will usually run Havingness. No matter what else the pc can run or refuses to run, the pc will run Havingness, so you of course got your easiest process first, right?

So the auditor's comfortable and the pc will run it and you could go on from there, and you get a little bit of a win.

Now, of course, there are Havingness and Havingness and Havingness Processes, and trying to find one of these Havingness Processes is a bit of a gymnastic activity, but everybody seems to be able to do that very easily.

You just take the 36 Havingness Processes and test them with can squeezes. Keep the pc squeezing the cans every now and then even though he has to lay them down and pick them up. Why, make him pick them up and squeeze the cans again. You saw me doing that the other day in a demonstration.

And keep testing your Havingness from time to time. Make sure it keeps working.

In other words, find your Havingness by the can squeeze test. If you've got the pc's Havingness, if that's his Havingness Process, you get more of a needle throw. And if that isn't his Havingness Process, you get less of a needle throw on the same sensitivity setting. You just get that sensitivity good and low there and test.

And while you're testing and it's starting to tighten up the needle or it doesn't loosen it, get out of there, get out of there, man, get out of there quick. Give him five commands, didn't loosen the needle, you say, "Well, that's it, son."

I don't care what form of auditing you're going to use at that point, that's exit fast and get on the next process. Because a Havingness Process is something you should find with a minimum of mistakes.

Therefore, Havingness test processes are published in the 36 Havingness Processes in a frequency table. In other words, the most likely Havingness Process that will fit the case appears earliest on the list. And that's only done out of class averages. This is an empirical finding. Whether or not it's theoretically true or not or whether or not some of our more recent Havingness Processes which aren't even on that list would go higher on the scale or not, I don't know.

But you get that Havingness Process, and you get that early in auditing and you're probably going to get a change of process before you go too far with this case. So you're going to have to find the Havingness Process much more frequently if you find it early in audit-

ing the pc. And it's a question of whether or not more time is saved by not finding it early and finding it later or something like this.

The safe thing to do in all such cases, is of course, find it early, even though it's going to change and then watch it like a hawk. See, early on in the case is the most complex and idiotic Havingness Processes will be found earliest on.

So you've got a pc that's liable to ARC break – well at any time when he is workable at all or even vaguely workable, find the Havingness Process, and you will have it here. But on a pc who apparently is auditing very well, it isn't so important. Got it? Early on it's not so important. That's a fact. It just isn't.

It's not whether I say it isn't or is, but you could audit 50 percent of the people you audit without ever running a breath of Havingness. You realize that? Providing you are a very skilled auditor.

Now, I would not be giving an HPA class the same advice. Because the havingness of the pc during the session is directly proportional to the smoothness of the auditor and inversely proportional to the roughness of the auditor. *Direct*, these are *direct* ratios. The rougher the auditor, the more the pc's havingness has to be remedied. The rougher the auditing, the more boobs the auditor makes, the more the pc's havingness has to be remedied.

If you have to remedy the havingness of your pc every three minutes during auditing, I would take a look at my auditing. It's probably rough. This is interesting to you, isn't it, and so on.

You can do a can squeeze test, find that the can squeeze has lessened – in other words the pc's havingness has dropped. This is negative testing. The pc at the beginning of the session was dropping a third of a dial very nicely on the can squeeze test without your touching the sensitivity knob whatsoever. Ten minutes later, just out of nowhere in the middle of doing something else, ask him to squeeze the cans. If it has dropped a half or is only dropping now a sixth of a dial, you could ask him at once, "Have I done something wrong?" And if you keep the pc pushed to this and get him to look at the earlier part of the session, he will find something you have done wrong.

And the second he has found what this is and you've cleared it up – you see, it wasn't even evident in the session – you ask him to do a can squeeze test again, and you'll get a third-of-a-dial drop. Do you see that?

It is ARC breaks which reduce havingness. Now, whether or not they're introduced by the auditor or the environment or restimulated or – doesn't matter where they came from, your havingness drops in direct proportion to the number of fancied or actual ARC breaks the pc has during a session.

So the smoother the session, well, the less havingness you have to remedy. The smoother the auditor, the less havingness you have to remedy. The rougher the auditing, the more havingness you have to run. So if it's geewhiz, God almighty, rough auditing, we start in and say, "Let's see, now, I think it says here – let me see. Just a minute. Let me find this piece of paper here. I think I've got a Model Session. Let's see. Start of, ah, the light is very bad. Move aside a little bit so I can see that. Ah, let's see, it says ah, 'Start of session.' Yes, 'Start of

session,' it says right there. Ah, is it all right, is-it-all-right-with-you-if-I-begin-this-session – now?"

If you were doing it this way, I think the can squeeze test just before the session started and just after the session, you see, would reduce in magnitude. You got the idea?

Auditor confidence may be very great, but if auditor blunder exceeds pc's expectancy of auditor confidence, you get a drop of havingness. You could probably draw up a lot of formulas about this. [laughs]

But here is your criteria of Havingness is that it is the easiest process to run, it is the most likely to be run by the pc in any ARC break situation. He may not run "What weren't you able to tell me?" and "What haven't I done?" He may not be able to run that process. He may not be able to run any ARC break process. He may not be able to run anything except Havingness. And he will, however, point at the floor and the door and the ceiling and so forth, and he'll go on.

And the commonest mistake that an auditor makes is not flattening it. When this is being used for an ARC break, for God's sakes, heavens on earth, realize that if you're using Havingness to heal an ARC break, and if it is the only thing that the pc will run, you probably had better run it for the next half-hour or hour. The various uses of Havingness dictate this as a fact.

The commonest auditor error in utilizing Havingness particularly on an ARC broke or breaky pc is not to run enough of it. And therefore, that being the commonest auditor error, auditors do not get a high level of reality on Havingness healing ARC breaks. They quit. They knock off. They say, "Well, now we've got the pc running Havingness, let's get on to something now and clear up the ARC break."

Well, look, the ARC break is clearing up through the duplication and mechanics of the auditing session. They're clearing up the ARC break and they would be guilty of a breach of the Auditor's Code – they would cease to run a process which is working and which is producing change before that process was flat. That's something to think about, isn't it?

And listen, you can give a pc one God-awful jolt this way. The only liability of running Havingness is not running it. You've got this pc and he was down, just down on the lower rungs of nowhere. You dropped the bottom out from underneath him, inadvertently or accidentally. He had a hell of an ARC break and you couldn't get him back into session; this is a desperate situation. And you finally do manage to get him to point at the room object – his current Havingness Process, you know?

So he points at the ceiling, and he points at the floor. He's all ARC broken, but he can do this. And he will do it, oddly enough. And he can point at the window and the chair and the auditor and the ceiling and the floor and the chair and the window, and he can point at the floor, and then you say, well, he's operating fine now. So you say, "Well, all right. If it's all right with you, I'll give you two more commands and end this process."

Now, man, you've handed him an ARC break on the process which is handling ARC breaks because he had just gotten to the point where he could have the end of his nose.

He was starting to come out of the ARC break. And now you've given him a new one on a Havingness Process.

So let me tell you something just as a general rule in the use of Havingness Processes. For God's sakes, don't cause an ARC break with a Havingness Process! I don't care what you cause ARC breaks with, do it with anything else. Do it with lists or do it with running present time problems or evaluate for the pc on how he ought to – not to beat his wife. Suddenly look up in the middle of his running a PT problem and say, "Well, I should – don't blame your wife at all for treating you that way," [laughter] you know.

I'm not kidding you. This has happened, you know. I mean this is not a – not even necessarily a rare occurrence. All of a sudden some kid auditor without very much experience behind him will all of a sudden get totally overwhelmed by all of this horrible social conduct on the part of his pc, you see? And he all of a sudden goes into the stern, puritanical lines of life in which he's been educated. And he steps out of the role of auditor into one of his minister valences or something like that, and says, "We must bring order here for the church," or something of the sort and makes some kind of an offball comment.

But even that isn't anywhere near as bad as ARC breaking a pc during a Havingness run. That is cruel. Because when you end the Havingness Process, before you even announce that you are going to run two more commands, before anything else going to do, and so that this announcement then doesn't serve as a pattern that when you ask this, you are then going to end the process, you got that as a training pattern?

You know, you can ask, "How are you doing" and if the pc says they're doing all right or says mm-hmm or something, the fact that you have said "How are you doing?" is now a trained pattern. Because you're going to say, "How are you doing?" then you're going to run another command. Then you're going to say "I'm going to give you two more commands and end this process," and so you've signaled the end of the process by an inquiry to the pc.

Well, look, unfortunately, whether you want to know it or not, you had better salt down all of your Havingness Process with questions about how the pc is doing every now and then rather than to have this thing become established as a signal. You get the trick?

So don't let that inquiry as to how he's doing become an established signal that you're going to end the process or you're going to hang the pc – this is particularly applicable to Havingness Process – you're going to hang the pc with a new phrase that operates just like a Model Session phrase to him.

You're going to say "How are you doing?" and he's liable to blast right straight in your face, "Well, damn you, I was doing all right, but now you're going to end the process." See?

You said "How are you doing" and he knows that this is an end of process, see? He knows that's the signal because you've always – you said, "How are you?" he says, "Fine," you say, "Good," and sometimes this crudely, "I'll give you two more commands and end this process," see? Inevitable pattern.

Well, you just start that pattern, and you ARC break the pc. You can't then find out how the pc is doing unless you have frequently inquired how the pc is doing and gone on running the process.

So part of every Havingness Process that is being run for any purpose whatsoever should be to inquire after what the pc is doing and how he is doing it. How is he doing? "What are you doing?" "Did you do the command?" Anything you want to ask the pc. And that should be part and parcel of Havingness Process.

Run a few commands and you say, "Well, how is it going?"

You know he says, "All right."

And you say, "Well, did you – did you have the wall?" and so forth.

And "Yeah. Oh, yeah. Yeah. I'm doing pretty good on the thing."

You see, that's making the pc talk to you a little more and actually wipes out some of the possible little, tiny unseen ARC breaks. You're not even using it to handle an ARC break, you see? But just by making the pc talk to you a little bit during Havingness Process, of course, uses this as a benefit to get the pc more into session. Those are the skillful ways of Havingness.

So it's the easiest thing to run, and run with an understanding of what you're doing is the most successful of the ARC break processes.

Havingness Process well administered by the auditor and actually run by the pc, if it's the right Havingness Process, will get your pc over some mighty tough ARC breaks and rough spots of the trail that you otherwise would find it very difficult to get over, and I personally believe that some of them you wouldn't get over at all. You'd just have to let it drop that day and skip it.

A very intelligent use of Havingness, an extremely intelligent use of Havingness would be, when the pc starts to look kind of walleyed and so on and he's talking to you a lot less and doesn't seem to be interested in what you're doing, and so forth, and any shadow of any of these things, just run Havingness.

And then inquire often enough and find that the pc brightens up and then follow it through because Havingness is marvelous stuff.

The proper use of Havingness is to patch up what you're doing. That's a very intelligent use of Havingness. But *not* to use Havingness to interrupt the pc's in-sessionness. That's also an intelligent use of Havingness.

The pc's going down the line, the pc said, "*Wog, wog, wog, a – a frog, a weasel, a dog, I think, ah, let's see, what else would inhibit the inflow on another? Let's see – a dog, a weasel, a ooooo oooooh. You know, God, I get groggy on this, a dog, ah, whewf! Ah, ah, let's see now. Ah, any, any small farm animal. A wog. Any small farm animal. Let's see now, anything else would inhibit uuuuuu. A sign. A sign. That would, and so forth.*"

Well, there's some point there where you would find it necessary to run Havingness, but there's some point there where if you ran Havingness, you would throw him out of session.

The rule for Havingness is *not* "every time the pc dopes off, run Havingness." That is not a good, stable rule for Havingness. You understand? It's when the pc is incapable of going smoothly on with the session that you'll run Havingness.

Now, as far as nulling lists are concerned, you get the same read on the list whether the pc is conscious or unconscious, so who cares? Did you know that?

Male voice: Uh-huh.

Doesn't matter what you do. I mean you get the same read. The pc can be out like a light, and you'll get the same read on the meter.

All right. There's more to this. There's more to this, and I want to go on with this and give you – cover this Model Session with you rather thoroughly, so we're going to have another lecture. But right now we're going to take a break. Okay?

Audience: Yes.

Model Session, Part II

A lecture given on 1 March 1962

Thank you.

Okay. And this is still the 1st of March, second lecture, Saint Hill Special Briefing Course, on the subject of Model Session, AD 12.

I was talking to you about Havingness. And the uses of Havingness are intelligent uses, and that's why it belongs where it belongs in the Model Session. And Havingness is the easiest to run and the easiest to audit of any process. So, therefore, it belongs right there. So if your pc is out of session, you can start immediately into Havingness and get them into session.

But if your pc is not in-session, you mustn't depend on the remaining rudiments to do a thing for you. If by this time you have not managed to get your pc into session, you've practically had it.

In the first place, you've got your first test, "Is it all right with you if I begin this session now?" A little two-way comm should have settled – "Well, at least let's begin the session, so that we'll just have this inside the session. Start of session" – that kind of a – of a response to a pc's recalcitrance.

You can go on down the line and get the pc to set goals. And by getting the pc to set goals, you should be able to get a pc into session. Just like that, with goals. Bang! You can't get the pc into session with goals, you've got Havingness and you should be able to get the pc into session with Havingness.

And if you can't get the pc into session with Havingness and so forth, the probabilities of your getting the pc into session with auditor section, "Are you willing to talk to me about your difficulties?" are quite remote. Because that confronts directly the reason they won't go into session. And it's almost too steep an incline.

So if you depend on "auditor" to finally get the pc into session, you will occasionally lay a nice, great big ostrich egg. Do you see that? Although it apparently could be accepted by you as, "Well, then naturally, you'll go into session, you know? Well, we'll work this out. We'll knock out the ARC break." See?

If you haven't got it handled by that time, you're not going to get a chance to run anything that will knock out the ARC break because the pc will just claw at you.

Now, O/W has a terrible liability. O/W was the oldest and at one time looked upon as the best method of getting the pc into session. And it has a hell of a liability. It can miss a withhold and throw the pc *wildly* out of session. Do you see that?

Now, you want to know why the pc occasionally – you probably have all felt this: "I wish to God – if I could handle an ARC break with the pc," see? "If I could just handle an ARC break ... "

Now, some – you've run into pcs that you possibly had difficulty handling the ARC break with. You understand? And that's because you depended on this section of the rudiments or the processes under it to put the pc into session. And that's almost a misuse of the rudiment.

The pc's got an ARC break, you don't use an ARC break process to throw him back in. See, don't use a process to throw a pc back in. Don't use an ARC break process to handle an ARC break if they're that incipient.

Your – there's a difference here – the pc won't be audited and the pc being made more auditable. You see, these two states of the pc. *Ah*, he's talking to you, but he really isn't paying much attention to you. Your command value's not great.

Well, if your command value is not great over the pc or there's a little thing went yickle-yackle, you know and the pc is still in-session but a little bit cooled off. They're just a little cool, you know and something or other on this and so forth. That's your ARC break. That's the old ARC break level auditor. That's the time you use that, see, anything you're auditing there.

You're improving, so that rudiment – the auditor, "Are you willing to talk to me about your difficulties?" is to improve the in-sessionness of the pc, not to create the in-sessionness of the pc if it's totally nonexistent.

Now, it's quite remarkable, the liabilities of healing the ARC break, they are numerous. And if your pc wouldn't talk to you to tell you if it was all right to start the session and if your pc wouldn't set any goals for the session and you think to yourself, "Well, we'll catch this pc." And the pc – you're not going to run any Havingness and you're going to catch all this under "auditor" – "Are you willing to talk to me about your difficulties?" You've already set up a hurdle that is almost unhurdable.

See, by that time, you should have handled the situation. How should you have handled it?

There are numerous ways of handling this situation. I've just been going over them and they all had to do with Havingness or a little bit earlier than that is setting some goals – getting the pc interested in getting someplace and so forth.

The ARC break, "Are you willing to talk to me about your difficulties?" is enough if the pc's in-sessioning is poor, you know. That's good enough if the pc isn't well in-session, and so forth, to put them better in-session, but not good enough to put them in-session. See, straight in-session. Requires a gradient, why? Because it is a process. And you have to have him in-session enough to run the process and if they're not in-session enough to run that process, oh, they'll point at the ceiling and they'll point at the floor. They won't point at you.

And if you've ever noticed, the last thing the pc is pointing at, if you're running Havingness to cure an ARC break, is the auditor. Have you ever noticed this?

Audience: Yeah.

Well, add that up. So don't use that type of a rudiment approach to heal an ARC break except *in extremis*. So let us say there's nothing else. Or if it's not very light at all – I mean it's not heavy enough not to – it's just a little bit, the pc's cooled off, they're kind of looking at you with a walleye. You could ask them, you'd say, "Well, do you have an ARC break?"

"No." And so on.

"Well, what weren't you able to tell me?" Excellent question. "What didn't I do?"

But now remember, you're in a Prepcheck area. If you use that, you're in a Prepcheck area. So that is feasible only in using it with 3D Criss Cross or some type of process like that. Not in a Prepcheck session.

So that is why you find your first level of action in Prepchecking is with this as the Zero Question. This is always your Zero Question, no matter how many Zero A or Zero B or Zero C you add after it. That is always your Zero Question for Prepchecking. Because it's an open invitation to Prepcheck, "Are you willing to talk to me about your difficulties?" It's a beautiful Zero. That forms the body of the session. So it must assume to some degree that the pc is in-session if you're going to use that as a departure point.

Now, this'll improve your pc's in-sessioning. Improve it and improve it and improve it and improve it. And pretty soon, why, they don't have ARC breaks with you, if you handle this thing well.

But to use "auditor," just to sit there and argue with the pc as to whether or not you should – you have to be somebody to audit them or something like this, you're not going to get anyplace. Not if the pc's got an ARC break. Don't you see that?

If the last thing the pc points at in, "Point out something" is the auditor, in healing an ARC break – so the last thing that you would run, if he had an ARC break, would be the auditor. Do you follow that? Hmm?

Now, you can carry that out to too great an extreme. Auditing, remember, is what you can get away with. I'm giving you just a basic, general rule. All right, pc has an ARC break. The pc has a bit of an ARC break, still talking to you. Well, you can use the rudiments process to go along with that.

But, I don't think that process would ever heal an ARC break down to a point where the pc will not talk to you at all. You see how far south it goes? Not very far. And that is why you have had difficulties in handling ARC breaks. Okay?

Remember, confronting is a companion to havingness. You did something so the pc – or the pc thought you did something, so the pc is left without an auditor. Now, what are you going to do? You going to say to the pc, "Now, that you can't confront me, confront me."

Is that what you're going to do? Because any process that you run that immediately addresses the auditor is also going to run that process. Do you follow that easily? So the only way I know of to get a pc in-session and hold it in-session easily if the pc is totally out of session – you know, just won't at all – consists of the upper parts of the rudiments. Never this one.

All right. How far out of session can a pc go and you can still handle "auditor" rudiment? Well, you can go this far out. The pc is saying, "Oh, you're the lousiest auditor in the world – I have never seen the like of you," and so forth and, "My God, the number of mistakes which you make are absolutely colossal and catastrophic."

He's still in-session. You miss that left and right, you see?

The person is – why is he cussing you? He's cussing you for only one reason: he *wants* auditing. All ARC breaks stem from no auditing. The only reason the pc ever has an ARC break. No auditing.

Let's take the ARC break of the fellow on the street. He must be in an awful ARC break if you say, "I'm interested in Scientology and Scientology makes you better. Wouldn't you like to know some more about it?"

And he says, "I never pay any attention to – what are you talking about – *grrrrr - grrrrrr - bowwww*. "

What's that? That's an absence of auditing, isn't it? [laughter] Scientology didn't exist early enough to put him in good shape, so that when you approach him with Scientology, he despises it. Perfect. No auditing. It's weird how fast you can put them in-session when they do that. They'll still talk to you.

But the fellow who just turns his back on you, he won't argue with you. You know, I've never had anybody argue with me about Scientology that wouldn't go at once into session? Do you know I've had psychologists and government lobbyists and oh, I don't know. I think I could even put a pig in-session. As long as they'll argue about it. [laughter] See? They're in-session.

The best thing for you to do is to adjust your definition of "in-session." You see, what is "in-session," don't you see? Well, he's willing to talk to the auditor and he's telling you he is not interested in his own case, he's in-session.

But oddly enough, won't even speak to the auditor and totally absorbed in own case: not in-session. See that? Or, not interested in own case, not talking to the auditor: not in-session.

But a pc who will sit there and say, "*I've never seen such terrible auditing in my life. Grrrrrrr-grrrrrr-grrrrrr. Why do you keep making these blunders? Grrrrr.*" He's in-session. And the auditor that thinks at that point that he has an ARC break to handle is making a technical error. He has no ARC break to handle. There isn't any ARC break. There's just an absence of auditing.

And it turns up very recently – which is why I'm giving you this pair of lectures on the subject – it turns up very recently that a missed withhold is an absence of auditing. You didn't audit it. You should have known about it. And you missed it. And all the pc's doing is accusing you of an absence of auditing. That's all. You weren't careful and you didn't pick it up and you should have known about it and he sits back and he festers.

And if you – if you think to yourself that it's because the pc is afraid you'll find out about it, you're actually making a bit of a mistake. Because if you notice, the most fruitful

tone arm responses, I mean the most active tone arm responses is to the most fruitful question: on the "Who", and if you play that "Who" up and down and watch that needle very close while you're running the Who section of the withhold system, you will see that that question which gets you the most frequent release of charge is, "Who should have known about it?" Not "Who didn't know about it?" "Who could have known about it and failed to find out?" And all of a sudden you'll get a resurgence of charge. And the thing tends to blow at that point.

Well, isn't that interesting? That's an absence of auditing then, isn't it. *Hmm?*

Well, if you're knuckleheaded enough to miss a withhold on the pc and wait and let the pc find it out by blowing up, you, of course, are – should have somebody blowing up in your face because it's damn bad technology, that's all.

When you're monkeying around with Prepchecking, when you're fooling around with rudiments, I don't care how many times you ask the question "Have I missed a withhold on you in this session?" See? I don't care how many times you ask that question in between ... I don't think you should go so far as to ask it in a 3D Criss Cross session between null items. "Weasel, weasel, weasel, thank you, it's in. Have I missed a withhold on you?" [laughter] I don't think you should run like that. "Cat, cat, cat, it's out. Have I missed a withhold on you?" I don't think that frequency is called for. But in Prepchecking, it's pretty confounded often.

You're sailing down the line... Because it's the only guarantee when you leave a What question down to a further-lettered What question – you know, you leave a What question because it isn't clear yet because you got to get something earlier on the chain, well, it's only sense that after you've done this once or twice or three times that you possibly missed a withhold. Because you're jumping off uncleared What questions hoping to get a lower What question that will unravel the whole chain.

Well, sure, you've missed a withhold, but has the pc at any time gotten the idea that you've missed a withhold? Has he confused your going earlier to clear the thing, with missing a withhold? Has he confused these points? He knows it's not clear. He knows it's not clean yet. He can still feel it kind of biting. Well, is he still holding onto something? Well, so every, every – every What question would be about as frequently as you would ask it. Once every What question. That is to say, you got the What and you got four or five withholds off on the same What question and you maybe twenty or thirty times – well, actually, five or six times have run through the "When? All? Who?" routine on each withhold, you see, if you've gone even that thoroughly at it. That's being very, very thorough. Yeah, after one of these What questions, why, it just very well might have established the idea on the part of the pc that a withhold had been missed.

Of course, you're setting up the ARC break. You're going to go on about three more What questions and all of a sudden the pc's going to get nattery and the pc's going to do this and the pc's going to ARC break on you and so forth, because you've missed a withhold.

The only reason you ever get an ARC break of that magnitude where the pc is climbing all over you ... Let's say you had the pc in-session and then all of a sudden half an hour later you find the pc shouting at you and screaming at you. The pc *was* in-session and has *ceased* to be in-session – please hear me this time because I've only said this about 500 times,

but please hear me this time – is because you have missed a withhold on him. It's the only reason that situation arises.

So the best remedy for that sort of a situation is "Have I *missed a withhold* on you?" And that is the best ARC break process there is because it's the only reason there is an ARC break. That is the only reason there is an ARC break occurring after an in-sessionness.

Of course, the man on the street who screams at you even before you audit him, why, the world's been missing withholds on him left and right. You could do the same thing with him. After a fellow's ranted on about you, about how he didn't want to know anything more about Scientology and it was just a fake and it was terrible and he wasn't going to – thought everybody in Scientology ought to be killed and he said something like this – well, you should just look at him very interestedly and you should say to him, "Well, what should Scientologists have found out about you and failed to? What – what should they have found out?"

I don't care if you've got him on the meter or not. Man, I tell you, the least that'll happen is he'll shut up. [laughter]

Oddly enough, he probably very often would simply tell you.

"Oh, well, if you put it that way, that's something else again."

Of course, it's a bad thing, I suppose, to put men in-session on the street, but I'd put them in-session before I would sit there and let them scream and rail and rant and rave. The guy's already said he's in-session because he's ranting and raving. You see? So you lower your sights on the subject of what in-sessionness is and you stop flubbing just because somebody blows up in your face and start running an ARC break process or something of the sort *late* in the session.

Ah, nah, you aren't going to get anyplace with it. Why not? Because it's all based on a missed withhold. But of course, if your pc won't have anything to do with you and won't audit and so forth; and is just totally ARC broke and won't talk to you or anything like that, and now you ask him what withhold has been missed on him, you're not going to get any further either, because the pc isn't talking to you. But you can get a pc into session with those earlier steps, but not at that point, "auditor."

So at that point – from that point on, you are trying to *improve* the session. From "auditor" level *on*, including "auditor" level, is simply session *improvement* and nothing else.

Now, the question, "Are you willing to talk to me about your difficulties?" perfectly all right. It's the perfect Zero question, but it sometimes is not the perfect "auditor's" process because it doesn't indicate any process.

So you say, "Are you willing to talk to me about your difficulties?" and you get an awful fall, well, it's the E-Meter that's telling you and you didn't possibly detect the pc was or wasn't in-session or something like that. I would advise you if you were prepchecking to totally avoid any withholds or missed withholds or anything of that sort. Just avoid that because the pc's going to throw the session on you.

You know, all of a sudden you'll be prepchecking something else and you – that you don't want to prepcheck. You've already got him on another line and so you run some of the old, moldy processes. "Who would I have to be to audit you?" Anything like that, see? The old, moldy process. Don't run any one of them that had anything about an O/W process in it. "What have you done to me?" and "What have you withheld from me?" and so on. You're liable to throw him out of session.

There is – there's some wheezy ones. That's one of them. That's one of them. A much later one is ARC '61. It will run to a high stuck tone arm but is nevertheless a pretty darn good process, and so on. A lot of interesting results have occurred to it.

Another thing that you could use at this particular level, "Are you willing to talk to me about your difficulties?" to get yourself in sideways is a very interesting process, but I don't advise you to use it on a member of the opposite sex when you're auditing them. Now, seriously, I don't. Because they get sexually restimulated, and that is, "Touch my knee, touch my other knee, touch my shoulder, touch my other shoulder, touch the top of my head, touch my chin." It violates to some extent the auditor using his body in the session, but it works. It works. ARC comes way up.

And one of the reasons I advise you not to use it is not that it doesn't work on a criss-cross like that, but sometimes, you frail creatures, you get into the middle of this thing, you know, and you skip it. You don't flatten the process. And it's a rather lengthy process and it is a process. It is a process. It apparently runs up – when it's done by a girl auditor on a man or a man auditor on a woman, it runs up the second dynamic channel. You got to clear it all the way.

And you've set yourself up then not to run a hunt and punch process. You've set yourself up to run the next two hours on it, but if you consistently had difficulty with this pc staying in-session with you, it's well worth doing. If you remember to flatten it and not fall in any second dynamic nonsense. Girl's a third of the way through this confounded thing, you know, saying – realize that she loves you desperately. Or the man, he realizes he's loved you all of his life and that he's known you in 18 past lives, and so on. [laughter] Man, flatten the thing. Flatten it. Flatten it. Don't leave it at that level.

Now, it oddly enough is the cure for auditor falling in love with pc, pc falling in love with auditor. You run it on the auditor on some other auditor. It does a nice transference. [laughter]

We have had problems with this. HGC – you get a pretty girl, a staff auditor in an HGC, she always has problems with this sort of thing. Get a male pc and my goodness, he's phoning his wife and getting a divorce and he's got the whole structure all planned up and going to town in all directions and so forth. And she has – the girl staff auditor hasn't even found out about it yet, you see. What's this, you know?

Well, you can pick it up at that point and you can run it on up and out because it's basically simply reactive. Something has gone into restimulation and it's gone into restimulation because of the proximity, that's all. So let's close the proximity; only let's flatten it. That's all I say about that one. Let's flatten it. And it is flat when there's no longer any misemotion, love, anguish, unrequited swearing coming off with it.

I give you that one with reservation. If you use it, why, for God's sakes, remember I give you the limitations of the thing is it has to be flattened, so it's hardly a rudiments process. But it could be used at that stage. And it is a specific. It's pretty much a cure of the pc falling in love desperately with the auditor.

You shouldn't feel too complimented on that particular line, by the way, because I never have had a psycho woman spinning someplace or another that wasn't also desperately in love with me. And it ceased to be complimentary to me. [laughter] I finally figured out that this wasn't so much due to my charm, but leaving something unflat. [laughter]

The difficulties that you run into are – contain that as an occupational hazard. And it's a good one to run. It's a good one to run. You don't go into the private parts of the body or anything like that. You just use the knee, the ankle, the head, the shoulder, the hand. You know, just ordinary, routine, casually. Go on and on and on with the confounded thing. Misemotion and emotion and love and then dying, God knows what, and the 18 times they didn't know you on the past track, all these things blow off.

In the first place, I don't know what your body has to do with the auditor anyhow. But evidently this is all associated one way or the other.

All right. Now, we get down to this interesting question of the rudiments, "Are you withholding anything?" And if you're running a Prepcheck session, you have to modify this particular Model Session question.

"Since the last time I audited you ..." sometimes you have to say this two or three times, even give its date – "have you done anything that you are now withholding?" And if you get a fall, you ask it again, stressing its date very *hard*: "Five o'clock yesterday afternoon, 28 Feb. 62. Since that date, have you done anything that you are withholding *from me*?" And the pc's various withholds from you sort of fall out and scatter around and then they finally say, "Well, no, no, no, as a matter of fact." And the needle goes clear.

One of the best ways to clear the needle is to clear it from the end of the last session until *now*. You just clear it for that period. And you don't get into any hot water at all. Do you understand? That's cleared rather arduously. Sometimes you have to be *awfully* ironclad and thump about that particular rudiment because your pc is withholding something for their grandma and they've got you vaguely associated with grandma for reasons we couldn't have a clue of, you know.

And you're a male auditor, so they've got you associated with grandma, you know? And they're withholding from grandma in the Prepcheck and they don't see who you are. And they don't see where the auditor is and so on. You just have to start emphasizing the *time* and the *date*, you know, of the last session *end* and *now* and, *me*. *Me*, *me*, *me*. And they finally say, "Oh, *ha-ha-haha*. Withholding something from the Instructor. Wasn't withholding anything from you."

And then, so you won't miss a withhold, you say, "Well, what was that during the period?"

And they say, "Well, ah, so-and-so and so-and-so."

"Well, all right. That's fine." And then *repeat* the question in that lengthened form and make sure that it's clear and go on.

You only want the interim period from the last auditing.

Now, that would vary if you restarted a session after a break. You note the time of the break and so you add from the moment, you notice that the tone arm is up. "*So have you done anything since 2:22 today that you are now withholding from me?*" It is now 2:32. Quite interesting. Quite interesting.

Don't pay too much attention to the tone arm going up on a break. We scouted it down here two or three months ago and actually did a little searchout on what this was all about and we found out that tone arms went up on very interesting things like pc who was just getting assessed on the terminal "woman," had actually talked civilly to a woman which, of course, was a total violation of his mores. [laughter] A lot of that stuff. So it isn't too important.

All right. That's your withhold question. Now, on a Prepcheck, you don't want that going anyplace but there because if you're going to ask this thing very broadly, of course, the pc now launches the session. He fires the cannon without you standing to and nobody at the flagpole and so on. And it doesn't turn out to be a shot to start the war, it turned out to be the sunset gun on the session. That's the end of that session. You might as well skip it and go home and go to bed because the pc is now going to give you a whole new chain that you haven't anything to do with and didn't want anything to do with and you have lost control of the session.

So, if there's any doubt in your mind, if the pc on former experience does not seem able to respond to what you're asking the pc, just omit it for Prepchecking, see? It's a little bit dangerous to do that. Just a little bit dangerous, but if you've gotten into trouble doing it, even with this positive way, I just wouldn't attempt it again. You got it? I mean on the next session, I just wouldn't attempt it on the same pc. Say – as we go across it, why, we say, "Well, all right. This session is mostly concerned with withholds anyway. So we're going on to the next rudiment." Don't even mention the rudiment beyond that point, see? You've heard me pulling this gag.

Now, it's a good thing to do that with new pcs if you're just sogging right straight into Prepchecking. If the pc's brand-new, they haven't had any time to have any missed withholds. See, first few sessions and you've not missed any withholds on her. You've been checking during the session for missed withholds? Fruitless question to ask.

Now, you can ask this, you can ask this at a time you were doing 3D Criss Cross. And your use of the rudiment in 3D Criss Cross definitely calls for just this rudiment exactly as it is. "Are you withholding anything?" By that time, we assume the pc has had a lot of Prepchecking and is pretty well in-session, and so on, and won't make a bunch of mistakes about the whole thing, so it's now safe to ask the question. You see the logic that follows that?

So you can just ask the question. It goes bang! And you say, "What's that?"

And, "Well, I was out with Joe last night and I didn't want to tell you about it – and ..." Withhold. Run a – run a When, All, Who on it. You know, just a little withhold system on it and *bzzzzt*. Because it'll clear up fast if the pc is in that advanced state of case.

Early on, during a Prepcheck period, a pc is *not* in any advanced state of case and they *can't* handle it and they *can't* tell one withhold from another withhold. It's all just sort of solid *thooooo*. So you ask her, "Are you withholding anything?" and they try to lay their whole case in your lap or try to keep from laying the whole case in your lap and you get a whole bunch of missed withholds and at that point, because you can't clear it up, you've set the session up for an ARC break.

All you have to do is ask that question and miss it and you've set the session up for an ARC break, so it's too dangerous to come near on a Prepcheck session early on, see? It's a dangerous question.

And now we get to *PTP* and pcs don't like a *PTP*. They don't like to find them. They don't like to run them. They like to avoid them. And if you audit a pc with one, you've had it. You make no session progress. It'll jump back up in your face, so it's vital that you handle it whether in a Prepcheck session or a 3D session. That's a *PTP*. Present time problem.

The way to handle a present time problem is not with withholds. Now, you could handle it and I gave you some advice earlier that you could handle, but experience has not borne it out that it could be handled this way in a Prepcheck session. You can't ask for missed withholds or anything like that. "Oh, I had a terrible fight with my husband last night," and so forth.

Well, you – in a Prepcheck session, you just don't *dare* say, "Well, what should your husband have found out about and failed to?" Early on and in a Prepcheck session, you wouldn't dare ask it because the pc will now throw the whole session into that channel and you've now got new Zeros and you won't be able to clear it up. You'll find yourself on new chains and here you go. So you avoid, again, O/W. Just avoid using any version of O/W or O/Ws or any version of withholds, in clearing a present time problem for a Prepcheck session.

Later on the pc's rudiments have been put in well, the pc's had quite a bit of auditing and that sort of thing, yes, you can ask the question if you're running 3D Criss Cross.

"Oh, I had a terrible fight with my husband last night," and so forth.

"Well," you say, "what withhold did your husband miss on you? What should he have found out about and didn't?"

"Oh, well, that's different. *Ha-ha-ha-ha*. Just so-and-so and so-and-so."

"Okay. All right. Thank you very much. Now, do you have a present time problem? Thank you very much. Well, have I missed a withhold on you? Thank you very much. Good."

That would be exactly how you would handle that. That's a rather advanced case that is auditing very, very well, don't you see?

Early on, "Do you have a present time problem? Do you have a present time problem?" *Clank!*

And you say, "Well, Ron said you didn't have to pay too much attention to rudiments, so I'll just let that be" and then the session doesn't get anyplace and the pc doesn't make any goals and gains and God almighty and it comes up in the middle of the session, you have to

handle it while your attention's on something else and the pc's down the channel. Oh, God. You can get in an awful lot of trouble auditing a pc with a PTP.

But we had some old processes that were lovely. The best of them, which was most generally runnable, even though it wasn't necessarily the shortest one, is "What part of that problem have you been responsible for?" Get him to state the problem. "All right. What part of that problem have you been responsible for?"

And you'll find out it'll fall out.

Now, as you're running it, you're not trying to flatten the whole process of responsibility. You're just taking the problem, so you ask occasionally for the present time problem again. "Do you have a present time problem?" And as soon as you can get *no* reaction on the question, "Do you have a present time problem?" you come off of it. You just stop running the process. You say, "I'll give you two more commands and end this process if that's all right with you. What part of that problem could you be responsible for? What part of that problem could you be responsible for?"

Now, you better define the problem in that auditing command, so it better be, "What part of that problem with Archibald have you been responsible for?" Something like that.

Or you could be much more definite about this present time problem. "What part of that problem about Archibald wanting the car and you wanting the car at the same time have you been responsible for?" I don't care how specific you get, but it's just so finally, the only reason you're running it is "Do you have a present time problem?" must go null on the meter.

All right. Now, I'll give you the reverse of this. Somebody did this the other day. I almost shot him right here. The present time problem didn't register and the pc said it still was there and the auditor ran it. Running a present time problem that doesn't register. That's amongst the high crimes of auditing. Because it's just a rudiment.

A session is *not* designed to make the pc anything but auditable. It is *not* to make the pc happy with life. The rudiments are not designed to give an auditing gain of any kind. They're just to make the pc auditable.

And you talk about a major Q and A, that's a major Q and A. Pc says, "Well, I've decided that we're going to clear up my grandfather in today's session and this auditor isn't going to have a word to say about it," so he says, "I have a present time problem with my grandfather."

And the auditor says, "All right. It didn't fall," and audits it. Not only is he auditing a rudiment into the session and God help us how, but he's auditing a dead line. It doesn't react. God help us.

He's auditing something on which the pc either has no reality or can't be audited or doesn't need to be audited or it's unassessed and he is probably auditing something that isn't even part of the 3D Goals Problem Mass. It may beef up the whole Prehav Scale. There are many wild things can occur on taking an uncharged PTP and auditing it. So you run it by the meter. And a session has rudiments to make the pc auditable and it doesn't have rudiments to

get any auditing done of any kind whatsoever. See, that's not the purpose of rudiments, to get a big gain on the pc.

If you get a gain accidentally by running rudiments, oh, fine. Nobody's going to argue with gains. We're not going to hit the pc because he's had a gain on the rudiments. But we're sure not going to bother to expect one.

All right. Now, we take the body of the session and let's slide down and inspect *end rudiments*. The *end rudiments* begin with the truth rudiment. "Have you told me any half-truth, untruth or said something only to impress me or try to damage anyone in this session?" Awful mouthful, isn't it?

So when you say this, you don't say, "Have you told me any half-truth, untruth, said something only to impress me or try to damage anyone in this session?" That is not the way you say that rudiment.

You say four rudiments with one suck-in of breath. And you halt at each fall and clean it. So you say, you – I'll give each one a split second to answer. So it's properly said, "Have you told me any half-truth? Untruth? Or said something only to impress me? Or tried to damage anyone in this session?" I gave you enough space to see if there was a fall.

All right. Let's supposing there was going to be a fall after "untruth."

"Have you told me any half-truth? Untruth? Well, what untruth have you told me in this session?" See? You didn't even bother to finish the sentence.

"Well," the pc said, "well, I just – it wasn't very much – ah – very much. I said I inherited eight million dollars and ah – as a matter of fact, I owed twenty cents and *ha-ha-ha-ha-ha*," so forth.

Say, "All right. Good."

Don't bother now to go back to the beginning of this thing because it was "untruth," see.

So you say, "Have you told me any untruth in this session?" And it goes *clank*.

And you say, "What was that?" And you finally get this thing all sorted out. There is no process goes with it. Except, "What was that lie you told, you dog?" And you get all that off.

Now, you cleared up "untruth," didn't you, see? So you finally got a null on "Have you told me any untruth in this session?" see? That's null now. So you say, "Have you said something only to impress me? Or tried to damage anyone in this session? Thank you."

And go on to your next one. You got it? That's the way you test that one out. See, if it's null, it's null. That's it. Don't go back and invite disaster again. [laughter, laughs] See? A rudiment is just to make the pc feel better and get him out of the session zone area and straighten it up, get the little additional charge off what he was telling you. That sort of thing. And verify you. And actually, these rudiments are just basically that, these end rudiments. To make the pc feel okay by session end. They're to clean up additional and residual charge left

by reason of the session. And they're to put the pc in a frame of mind to end the session. Those are the basic reasons you have those rudiments.

Now, let's take a subordinate reason: to correct the most common auditor errors made in sessioning. And although that's secondary, these things are there to hold these auditor musts in front of auditors' faces. Because these are a list of the most common auditor misses. The things which auditors most commonly miss on pcs.

And let me tell you, you can turn out bulletins and you can give lectures and you can scream and you can hand out infraction sheets and you can talk to Herbie until he gets mad at you, and these things will still go out if they aren't right in the frame of a Model Session.

These things will happen and they cause – most randomness caused in sessions is caused by these various items. This is all secondary, you see, once we've given these first reasons. They keep these things corrected. And they keep them held to view because, you know, pcs can make absolutely no gain at all and their case can be all loused up if any one of these end rudiments, except goals and gains, is out consistently.

Now, "Have you told me any half-truth?" My golly, if you're auditing a child someday, you will actually spend three minutes in the auditing session, including beginning rudiments and the next half hour cleaning up the half-truths. Just little prevarications that aren't really prevarications. They didn't tell you all or they're trying to safeguard or help somebody. They're wild, you know.

And if you let that pile up, the child, all of a sudden, would get an auditing time track that was just total black muck. And they just wouldn't want to be audited anymore. Same way with any pc, of course, but you'll find this most flagrant with a child. Their level of responsibility is poor on the exactness of the world and that sort of thing.

And they very often give you quite delusory activities just to entertain you and so forth. Their motives are not very bad.

"Oh, yes, I was walking down the hall and this old lady jumped out and frightened me, you see."

Well, you could spot that at once. But you don't spot "Well, ah, actually I slapped my little brother." See?

You can say, "Well, that's all right. He shouldn't be doing that, so that's a laudable withhold," and so forth.

You get down to "half-truth, untruth," you know, "Well, I didn't – I didn't really slap my little brother, as a matter of fact, I haven't seen him all day." [laughter, laughs] It'll be as illogical as that.

And this goes on with adults and children equally well. But if you let them pile this stuff up, it can get quite serious.

Now, "Said something only to impress me" is not really very important, but sometimes it operates as a missed withhold and the pc gets a little bit mad at you, or feels rough about you because he said something only to impress you, not because it was true, don't you see?

And if you miss the thing, he sort of operates to some slight extent as though he had a missed withhold. You see? It's a cousin and it can bring about a downscale attitude by next session.

And now we take, "to damage anyone in this session." And now let's catch the whole basket-load of pcs who use auditing to spread entheta and to downgrade and to – so forth and in short, dramatize. And it – it's getting – it's less these days around here. It's occasional. But brother it really roars in HGCs and far areas of the world. Oh, wow! And every time they do it, it's an overt. So their auditing sessions take on the complexion of a long concatenation of overts. They will give you all kinds of other people's withholds and data and weird, oddball things that don't give them any case improvement. They're just overts, that's all. Trying to damage someone. And if you let them get away with that continuously, they've stacked up their auditing track and the next thing you know, they become unauditible. Less for the pc than for the auditor.

The auditor very often develops a fantastic idea of the pc. The pc sits there and lies about himself. Tries to damage himself. But do you know that's the last person the pc knows about?

And listen to this one now. You quite routinely, if you don't clear it at once and it's still falling, you routinely have to point this fact out to the pc. It's not evaluation. Just say, "Well, did you try to damage yourself?"

"Oh *ho-ho-ho-ho*, well, *ha-ha-ha-ha*. Yes."

"In what way?"

"Well, so-and-so and the actual truth of it was such-and-such, you see?"

All right. Any time this whole thing is violated you get an alter-is, not an as-is. So that's why you get the session mucked up. And this is the prevention of alter-is, is what you could really call that particular clause. Okay?

Now, the next one, I don't know, I had the percentage once. What was it? Oh, somewhere between 10 and 20 percent. I've forgotten, but I had the exact percentage once. It's an impressive percentage of people will throw or sell items or sell charge or try not to sell charge and they get fixated on the E-Meter and they get in a games condition with the auditor on the subject of the E-Meter. I've known a pc, actually, the second you started to give them any withhold question or anything like that, skilledly, with great practice, be able to raise the fingers one after the other so as to get a needle rise just as that question is about to be asked. Interesting.

And an eight-year-old child has actually thrown or sold an item because she liked it and thrown a whole assessment just absolutely haywire and could have just been knocked in the head if that item had ever run. Fortunately the item was never run.

But it wound up, because she'd done it and this thing has not been cleaned up. Actually, the whole thing went out and everything went null, you see? And this could have all been mysterious if we didn't have this question. But influence of the E-Meter, influence of the

E-Meter is a very, very important part of this thing because the E-Meter hasn't anything to do with a pc. It's an auditor's tool. It isn't anything the pc should be interested in.

If the pc is interested in the E-Meter, we automatically assume one of two things. That the pc is afraid of revealing something or the pc has in the past had some type of incident where the meter was proven wrong according to the pc's viewpoint.

And the pc has no confidence in the E-Meter and therefore has lowered the command value of the auditor because the pc knows the E-Meter's a fake and so the command value of the auditor's poor, but that's because somebody's devaluated the E-Meter. And the most flagrant way the E-Meter is devaluated I already gave you earlier. I gave you that. It's just, auditor says, "Well, there's no fall here on an ARC break and you say you have one." That is the most fruitful source of evaluation of the E-Meter.

But the E-Meter has become invalidated in some fashion. Now, if that thing continues to knock, you had better take that up in the body of the session and clean the whole subject of meters, metering and E-Meters on a Prepcheck basis because there's something been missed on this pc and there's something wrong with this pc and there's something wrong on it.

Now, actually it'll fall, tick or a fall or react in some way. Well, "Did you try to influence the E-Meter?"

"Well, I really didn't want it to read when you said ..." certain 3D Criss Cross item and so on. And it blows. Just standard lines. See? Those things, they clean up as you go through the rudiments.

But if this thing is always out, session after session, you roll up your sleeves and you take it and make a whole session devoted to nothing but it, prepchecking that one as a Zero Question. And then just clean this up and find out when this E-Meter was invalidated and when it was wrong and what they have done to the meter and all that sort of thing.

And you'll find out there's plenty on it and once it's cleaned up, why, bang, all of a sudden, they'll operate just fine on an E-Meter. And the question will go clean.

All right. "Have you failed to answer any question or command I've given you in this session?" This is one of the earliest admonitions of auditing. There's one auditing command or question for one response. And it is the one which is the oldest and is the one which is most frequently forgotten. And pcs have not answered auditing commands and so forth and it's a great case foul-up, and for lack of attention on this one point, I had a pc who had been given, actually had had in hundreds of hours of auditing, had thousands of auditing commands on the subject of havingness and had *never yet answered one question on Havingness*. Therefore, no Havingness Process ever worked. Interesting.

You could run Havingness Processes by the hour and test them all and of course they never would have worked because the pc had actually had alter-ised every Havingness command, had tried to tell auditors, "But Havingness doesn't work on me," and that sort of thing. And nobody had listened. It'd become just a perpetual withhold so the pc just sat there and alter-ised every Havingness command and did something else. Whenever any Havingness command was given, the pc did something else. Interesting, huh? So that's why that one is there. That's a safeguard. That's to hold in the oldest admonition concerning auditing – that

the pc must answer the auditing command. And when it doesn't, you'll get a fall. When the pc hasn't, you'll get a fall, so you clean that up.

Now, "Have you withheld anything from me?" is all right for 3D Criss Cross but is not all right for a Prepcheck end rudiment. So a Prepcheck end rudiment you would say, "Have I missed a withhold on you in this session?" And you'd finally clean that up.

Your "auditor" question, "Are you willing to talk to me about your difficulties?" actually it isn't read this way, but it possibly is understood this way, "Are you still willing to talk to me about your difficulties?" And that is a second check on this withhold question.

By the way, I could give you a variation on that withhold question that is a very clever one that somebody had originated out in Seattle. "Is there any withhold that you would hate to have me write down in full on this auditor's report?" or any such question. "Is there any withhold you would feel uncomfortable about having me mention to anyone?" That is a good parallel view, a second test of the thing because the one they mentioned was not cleaned up and you've missed a withhold on it. There's always more on that withhold. Follow that? That's a trick. That's a trick end rudiment Prepcheck question. And you can use that and you'll find out there's more to clean up. You just go ahead and clean it up then.

All right. "Are you willing to talk to me about your difficulties?" is just an effort to make sure that we don't have an ARC break involved in it and as far as "Are you willing to talk to me about your difficulties?" and the pc said "Well, not so much," and so forth.

Just say, "Well, what did you find yourself unable to tell me?" or "What didn't I receive?" or something of this sort.

You ordinarily clear it up just that easily. Just a two-way comm situation. If this is wildly out at end of session in Prepchecking, remember, you are probably still cleaning up "Are you willing to talk to me about your difficulties?" in the beginning. So you would tell the pc it is not flat and you will now leave it, however, because we are working on it in the session.

Now, in 3D Criss Cross, you clean it up. Regardless of what you have to use, clean it up. Because you find the pc coming into session next time, it's not going to null well or something of the sort, so clean it up right then. Usually cleans up very easily. Follow that?

All right. Now, goals and gains. Now, well, "Look around here and tell me if you can have anything." Naturally, you have a Havingness Process ending the session as the last process out, the easiest one. If you haven't gotten something else, you've certainly got the Havingness Process.

One of the ways to do this, the safest way to run that particular end rudiment is have the pc give a – turn your sensitivity down and have the pc give a can squeeze. And then run five commands of the pc's Havingness Process and ask the pc to give another can squeeze. And between those two, if you see a broadening of the situation, probably the pc needs some more Havingness. Because remember, in the body of the session, you might totally have changed the characteristics of the E-Meter on the pc. Well you can't count on the fact that this... But if five commands loosen the needle, you're pretty well off to give him twenty more. Okay? Because his havingness must have been either down or improvable.

All right. And that lets him out and takes him off with anything you've missed in the rudiments – will usually come off in that little smidgen of Havingness.

And then your "goals and gains," and your "goals and gains" are basically for the auditor because an auditor wants to know if he has made any progress in the session. But secondarily, they are for the pc to point out to the pc that he did or didn't get someplace in the session.

Now, "goals" we have always had, but we add "gains." See, we've always said "Have you made any part of your goals for the session?" but "Have you made any other gains in this session that you would care to mention?" has been added in exclusively for the auditor because pcs very often want to tell the auditor they have made some other gains.

They might not have made all the specific goals such as "to have three children" or something like that as their session goal, they haven't made that one. But they have made some gains. They don't feel quite so pregnant or something of the sort. [laughter] Something weird or impossible is liable to come up like that where they have not actually set very real session goals. You never argue with these session goals, of course.

But they have made gains for the session and it gives them an opportunity to tell the auditor. In other words, that is the auditor's pay period. That's where the pay line starts. Starts right at the beginning of that rudiment. And you'll find out that since we've had that, an auditor feels better paid. That's right. And, because you'll find out it's amazing. Pc at the end of the session – say, "Well, did you make any of your goals?" It's all right, by the way, to read the pc's goals back to the pc if he can't remember them offhand. "Did you make this one, did you make this one, did you make this one? And what do you – what do you think about that?"

And then, of course, put it on the freewheeling and say, "Have you made any other gains in this session you'd care to mention?" And the pc will tell you they did or they didn't or something of the sort and you make your notation on your auditor's report and then comes end of session.

And of course, you end the session to end the session. And when you end the session, make sure that you end the session. Don't leave it in question. If the pc's still sitting there going kind of like you – like this and makes no motion or doesn't yawn or relax or you don't feel attention break on the subject of the auditing session, bust it. Go right in on it again and you say, "Has this session ended for you?" And I don't care what you do particularly, but say, "All right. Now, look at me. Look at me. Look straight at me now. Now, feel your feet on the floor. Look at me now. Feel your feet on the floor. Now, touch the table in front of you. *Pat it. Pat it.* Feel your feet on the floor. Look at me. All right. *End of session.*"

"Oh, well, yeah. *Ha-ha.*"

They're very often hung up in some fashion and you just *mustn't* end sessions with pcs in-session. You want to know how often you do it? You want to know how often you end a session with the pc still in-session? Is the pc talks to you about the auditing session right after you've said, "End of session." You want to know how often you have ended the session with the pc still in-session? Pc goes right on talking to you in the same way. Walks down the hall

with you in your same role as an auditor. Goes right on treating you as the auditor. The session has not ended.

That actually – no disaster involved with it because he shakes out of it after a while – but that actually is the most common auditing error is not to end a session. Because it goes unpassed. It's not a very serious error. Therefore, it becomes extremely common.

You expect time is going to end the session. Well, the old man with a scythe – I haven't met him for years, you know? I just haven't met him for years. And I don't think he comes around and says, "End of session" to your pc.

I know the pc's still suffering from what happened 200 trillion years ago and so I don't think anybody ended that either. I don't think time is very efficient this way.

I don't say there's anything wrong with time. I just say that the auditor should not rely on the old man with the scythe to come up and look fixedly at the pc and says, "Hey!"

And we have this other one which is terribly optional. It's terribly optional. Is "Tell me I am no longer auditing you." And that tends to end the thing. Okay?

All right. Tell me I'm no longer lecturing to you. [laughter]

Good night.

THE BAD "AUDITOR"

A lecture given on 19 March 1962

I see some of you have made some progress and some haven't. I don't see anybody has totally retrogressed, however – except you, of course. [laughter]

The – that clock up there is two-and-a-half minutes slow. Beg your pardon. Five minutes slow. Shows you. I go away two weeks you lose five minutes worth of time just like that. Five invaluable minutes. Now, you can think back down your time track when five minutes would have been a long time. Just before you ran into the brick wall. Another five minutes. Wouldn't that have been marvelous? [laughs]

Well, tonight we have a subject which I must approach with considerable diplomacy. A subject which, however, means much more to you than you would at first glance recognize and one which if you're ever going to train anybody, you had better know pretty well. It took me quite a while to work this out. I sniffed around the edges of it and finally hit it right on the button. The bad "auditor."

You notice the bad "auditor," the auditor is in quotes. Because there is no such thing as a bad "auditor" the auditor is not in quotes. Do you see? But frankly, before I go any further, do not expect me to do a condemnatory dissertation and spit my teeth out on the subject of how bad a bad "auditor" is. Because I'm not going to.

Frankly, people who have this combination wrong with them deserve an enormous tribute for auditing at all. It must drive them straight up the wall.

Now, this is based on HCOB of 8 March, supplemented 15 March 1962, AD 12. I notice these are two different time strata. It's HCOB of 8 March 1962 and HCOB of March 15th, AD 12. And so there are two entirely different time tracks.

Now, I am not at any time ever going to be found in a situation where I am ranting and roaring about how bad auditors are. This is not true. I have enormous confidence in auditors. And I always feel when an auditor is not able to make the grade with a pc that it is I who am at fault, not the auditor. Because the willingness and good-heartedness of auditors has been proven to me time and time and time again over a long period of time.

The difficulties which people have in learning to audit are two-fold. One is technology, adequacy of – that comes under the heading – and two, my lack of experience with their troubles in auditing. Now, those are the first and foremost difficulties with auditing. As soon as I find what you don't understand or I find out that you don't understand it, under the second heading, I can pretty well be counted on to remedy it rapidly, because I only have my auditing to judge by until I observe somebody else having trouble auditing.

Most of the modifications which you have gotten throughout 1961 and thus far into '62 have been modifications which have come directly out of part two of which I just gave you. They actually don't come out of the first part – technology, adequacy of.

But now we have a piece of technology which gives us the key to an auditor's having difficulty. So you see, we've got a number one boost in the first part I just mentioned to you – technology, adequacy of.

Now, this technology, of course, pervasively speeds up cases and does a lot of things. Every time you get a new piece of technology, it of course speeds up all cases. That's about the first thing you can expect of it.

But this does more than that. This tells you why people make mistakes. And that is all there is to it. This tells you why people have difficulty learning and so on. This tells you an enormous number of odds and ends about human behavior. And therefore if I weren't so interested in making you an excellent auditor, this would have come out under another heading entirely, advance, which it came out under March the 15th, you see. It wouldn't have come out under the heading "The Bad 'Auditor'." It would have come out under the heading of "Suppressors." But I wanted to call this to your attention and I was most interested in the fact that this does explain the diffidence and difficulty of an auditor.

And therefore, if you are ever a D of T, this data is absolutely priceless because this tells you why you're going to have trouble with every student that you're going to have trouble with.

This person that we're talking about who becomes a bad "auditor" would, of course, have rather an exclusive corner on this aberration. In other words, you recognize that all aberration is, is a concentration on a single ability. For instance, the communist is crazy because he is totally concentrated on the third to the utter abandonment of the first. That makes him crazy, you see. I mean, his concentration is so enormous that he looks insane.

Now, if you look this over, you'll see, then, that a person who is utterly mad, as viewed from a psychiatric viewpoint, is describable as sane. Let's look at this now. The psychiatrist collects madneses and when he's all through collecting all the madneses, one sample of each madness in his spinbin – they call them hospitals; they don't know better – when he's got one sample of each, he then actually has a chart of sanity, you see? And that's why the psychiatrist has never been able to understand sanity and that's what he can't understand. The psychiatrist can understand insanity, but he can't understand sanity. And this is the main difficulty that the whole society has with the psychiatrist.

You know, he never has a sane conduct. He has insane conduct and to him the absence of insane conduct gives us sanity. But by that same definition, the only sane man would be a dead man because he'd have a total absence of insane conduct, with one exception – catatonia. And that would throw that out, too, you see?

So the psychiatrist has nothing like sane conduct. He could not describe sane conduct. He has no observation of sane conduct. Therefore, any one of you or any citizen in the United States or England or France and particularly Russia, brought up in front of a psychiatrist to

find out whether or not he is sane or insane, could be taken with any response to be insane by the psychiatrist. You see?

And he said, "Well, do you eat?"

"Oh," the fellow said, "I eat. Oh, yes, I eat. I..."

"Crazy, he eats."

"Well, you – you think this is right?"

He says, "Well, have you ever eaten any strange objects? Or eaten anything odd? Or anything strange?"

"Oh," you say, "well, in the normal course of human events, I was out camping one time. We used to eat ants and dirt."

"Ah, well. You've had it."

Now, of course, what he should ask and possibly even does, is whether or not the person exclusively eats ants and dirt. Now, this person eats nothing else but ants and dirt, you see, he's perfectly insane. That's for sure.

You see that insanity is a nothing-else-than. That's what insanity is. It's a fantastic concentration on any sanity to the exclusion of all other sanities and then the fellow goes nuts. There's no reason why you shouldn't be able to eat ants and dirt. But if you never wanted to eat anything but ants and dirt and you felt you couldn't ever digest anything but ants and dirt and you felt it'd kill you to eat anything else but ants and dirt and you never thought about anything else except eating ants and dirt and you never did anything but go find dirt and ants to eat, you'd be crazy.

Do you see that it's the degree? Now, that's why you, time to time, have thought you were crazy. You see, because all sanity has its lower harmonic, its mockery. Every sane impulse, every sane action has its lower harmonic and mockery. It's intensity of and to the exclusion of anything else that makes something that is pretty nutty. Do you see?

We would not consider a person mad for drawing squares on walls, but now we get a person who does nothing but draw squares on walls and doesn't do anything else but draw squares on walls and doesn't want to do anything else except draw squares on walls and couldn't draw anything else on walls except squares and must fill up all possible walls with squares; we don't get an architect, we get a nut. [laughter] You see, it's to the exclusion of other things.

And so, with that small preamble, you must view this subject of the bad "auditor" as one of degree. Now, you are often leery of your own sanity, as I started to say a minute ago, only because if you ever read a full catalog of insanities, you would find you in it repeated several times. You see?

"Insane patients do..." And then we just list a whole bunch of things, you see? And then you look down this list of things and you say, "Huh, wait a minute, I do that. Huh, well, wait a minute, I do that. Huh, I do..." [laughter]

That puts you on a beautiful withhold because you go out in the society, you don't tell everybody you think you're nuts, you see? Inevitable.

This is one of the most generalized mechanisms you could imagine. The person – what does he do? All of these various things. An insane person, you see and what does he do, you see?

And actually, if you listed all insane things that all insane people did, all you would do – you know, without any degree of it mentioned – you'd just get a sane person, that's all. You're liable to do any of these things, see? There's no accounting for what people will do. It isn't even in an unguarded moment. They will do some of the wildest things, but if they don't do anything else, that's what makes it insane, see? I'm sure maybe sooner or later, you have had an impulse to join the army or something like that. Well, it'd just be degree of how you join the army. And of course, if you joined a new army every week, we would get it up to a highly insane level.

But you, reading this list of what insane people do – this "has impulse to join an army." And you've had an impulse to join an army, so you classify yourself, you see? And similarly, every auditor reading this bulletin, "The Bad 'Auditor'" – let me say this: Every auditor except those who should have thought this – said to himself, "*That's me. That's me.*" He wasn't even grammatical about it. Just that was it. We had him labeled now.

That wasn't true. That wasn't true. Everybody's got a little bit of this. Well, the last time you saw a buzz saw buzzing and didn't put your finger in it is easily explained. You didn't want to see your finger lying on the floor, no longer attached to your hand, you see? Well, that's perfectly rational and understandable.

Therefore, you would say to yourself, "Well, I must be trying to suppress things if I don't want to see my finger cut off lying on the floor."

Well, nobody does want to see his finger cut off and lying on the floor, at least until he can mock up a new finger in exactly the same place with the same mobility as his old hook. A little bit easier in space opera. You go down to the tin shop and they bang you out a new finger. But... That is if you've got pull with the commanding officer of the armorer or somebody, you can always get a new finger.

But these humanoid bodies are triggered to live only once. The philosophy of "live only once" the philosophy of "when you are dead, oh, boy, are you dead" gives you a superprotect, a superpreserve, a supersurvive computation with regard to the body and you get so that you mind losing fingers in buzz saws. And so you don't want to find your finger on the floor, so you tend to suppress actions which would lead to finding your finger on the floor.

Well, that doesn't mean that you classify under this heading. Anybody could run any of these processes and lines with a considerable benefit. Anybody could run any of them, see? And they'd get something out of it. Don't worry. But the case we're talking about starts running this thing – and this isn't even the worst case – and they start running this thing and they say, "*Agggghhhhh!*"

And you say, "Give me another one."

"Agggghhhhh! Oh, no, no."

And you say, "Well, give me another one."

"Agghhh. Oh, no, no. No thank you. *Mmmm.*"

And you say, "What's the matter?"

"Oh, I don't know. My God."

"Well, what's happening?"

"Well, my whole spine just turns into total, solid pain. Let's not think about it anymore, huh?"

You ask them a question and you get, "*Oh, no!*" And then they finally give you one, see?

That's the case I'm talking about. You see, that's the reaction we're talking about. Not, "*Ugghh.* Hey, what do you know? *Ooomp*, you know. *Ooomp.* *Haw.* My stomach feels funny. *Urp.*"

"All right. Here's another one."

"Oh-oh. There went a bullet."

See, we're not talking about that reaction. We're talking about, "*Oh, no, my God, please. Not another one. Oh, no.*"

You know, I audited a guy through a terror charge one time. He was lying on a couch. Tell you how I got that terror charge off of him one time. It might – it might amuse you. You might find somebody sitting on a terror charge and you might want to try this. I told him to, "Go to the beginning of track and scan all the way forward to present time. Thank you. Go to the beginning of track. Scan all the way forward to present time. Thank you. Beginning of track. Scan all the way forward to present time." Take him four or five minutes each time to come the whole track, see.

Of course, I was sticking him in the engram necessary to resolve the case. That's all. That's the only reason you do that. You're not trying to erase track. You just erase the illusion of moving on the track because the guy's been stuck in this particular engram for a very long time. And after about the third or fourth one of this, the terror charge turned on and he was lying on the couch. And I am not kidding you. The couch was perfectly even and its legs sat perfectly on the floor and there was nothing uneven about this floor. And the person started vibrating. He was shaking with such terror and such violence that the couch was picking up and banging against the floor. I've never seen this happen before. I watched it with some amazement. I told him that was very well done. [laughter]

And found him in an incident that he'd been sitting in since *mmm*, whereby he and his friend were out on scout and they got captured by the other tribe and he watched his friend spitted on a stake alive and broiled to be eaten. And then he went mad and they threw him over the cliff. They didn't eat him. And he had been stuck in that thing ever since. It isn't even much of an incident as incidents on the whole track go, see? Boy, he really must have been –

what we know now about him is, man, man, he must have really served it out of the deep-freeze every day: human steak, you know?

But he actually was in such a terror charge that that whole couch just beat against the floor at some low, droning note. Well, it was beating up and down just about an inch and a quarter, something like that. Just *banging!* I thought the whole couch was going to shatter. I ran him through it. I just sat there and ran him through it from beginning to end, having stuck him in it with scanning, you see?

"What's going on?" Ran the thing out. He was sure never the same again. It took a tremendous terror charge off of him.

Well now, if a person can contain this much terror on the whole track in a single incident, imagine – because that must have been free track or I would never have discovered the incident, you see – the amount of charge that's possibly there in a valence which is dictating terror, you see and which is all composited on terror and that sort of thing, which is terrified of anything appearing anyplace.

Well, now what is the exact action of a person who is terrified? It isn't just terror that this is in, but terror is a very good one to describe it with. Terror is as the result of something having appeared engrammatically and then later on threatening to appear again. Remember that a secondary or emotional charge can only exist later on the track than a physically painful incident – technology of 19 – late 1951, early 1951.

The only way you can ever get a grief charge or a terror charge or an anger charge or something like that is after the fact of physical pain. If you trace this back – if you find a loss of an ally. Let's say you find this girl and her father's dead. And you run off the death of the father. And you're bleeding tears off the death of the father and that's fine and you run this thing out and it looks like it's disappearing and so forth: do you know that you can ask them a question which drops them immediately into the similar engram which lies below that terror charge, see? You'll find that there's some similar physical pain engram, overt or motivator, which lies immediately and directly below that grief charge that the person is experiencing.

In other words, a person cannot, actually cannot experience a misemotional charge independent of having received physical pain.

In other words, your emotion is always lighter and is always secondary to actual physical contact and pain. That's why it's called a secondary. That's where the word came from.

So you – one day you're riding in the car. You're nine years old, you're riding in the car, the old man has had a few snifters too many and he goes off the edge of the road and you bung your shins up and you feel bad about the whole thing – physically. You're not hurt seriously.

You're twenty-eight years of age and you read in the newspaper how a little child has been killed in an automobile accident and you feel very sad. The very funny part about it is you wouldn't feel sad if you yourself hadn't had some pain connected with a similar incident. Do you see?

The way to knock out all secondaries, of course, is to get at the engrams and run them out and the secondaries pour off like mad. But sometimes the secondaries lock up an engram, so if you don't get the emotional charge off, you can't get at the engram. And that's very important. And a lot of auditors have noticed this. Before they got off a grief charge or six or eight or ten or fear charges or anger charges or something like that, they never did find the lower incident. But after that they found that after they'd run this grief charge or something like that off... And you realize any misemotional charge compares with a grief charge. You can run off terror, you can run off fear, you can actually run boredom off, you can run apathy, any of these things as well as grief. I don't know why the psychoanalyst only found grief as his tone scale. His tone scale consisted of just two things: apathy and grief. That's as far as he ever got up off the launching pad. Because he really didn't consider euphoria an emotion. That was life. But he thought euphoria was bad, too.

Now, when you got into a physical pain situation, you could later on expect to get an emotional reaction to a similar situation. Now, that is everything on which this bad "auditor" proposition depends. I mean you remember that relationship between the engram and the secondary.

After you've had a few automobiles wrapped around your head, you do one of two things: You either get used to having automobiles wrapped around your head and decide that you are now familiar with this phenomena and to hell with it and go on or you decide that the threatened appearance of an automobile or the threatened – well, anybody is in this state – a threatened accident must be instantly suppressed, you see?

You're going down the road and you see a fellow coming your way and he's weaving from side to side and you go '*Agggghhhh*,' and the passengers all try to put on the brakes and that sort of thing, you know? Suppression. They're trying to suppress something from happening. They're trying to keep something from happening. That's their action there because it's obvious that an accident might occur. Well, that's visible, isn't it?

All right. Let's take this person who has been in fifteen wrecks and hasn't become familiar with them yet. Hasn't lived along the M1. And this person – accident before last was with a red car. And they just look way up the road and they see a red car and it's parked. But that's enough. They instantly suppress the red car.

Now, you could ask them immediately afterwards, "What automobiles and what color were they, have we passed in the last five minutes?" and he'd tell them all, but he wouldn't tell you the red car. See, he'd omit the red car because that must be suppressed. Now, that person's pretty batty. He's not just around the curve, he's a bit around the bend.

Now, in earlier activities we called this a restimulator. The red car was the restimulator of an accident. And then car, any car, would be a restimulator... Well, car tire tracks would be an associative restimulator for a restimulator.

All right. These are all substitute, substitute, substitute. You have the real car in the real accident. Now, the person substitutes similar situations to the first accident. He associates those to the first accident. So every one of those he starts reacting to as though it were the first accident. Now, you call that a restimulator. So any situation or environment which is similar to that first accident in which he was really hurt he tends to suppress.

And the very funny part of it is if you ask him to spot everything in his environment at the moment of restimulation – you see him turn pale all of a sudden and you ask him to spot everything in the environment – just that way. You just say, "Well, now point out everything there is here." That's a good auditing command on somebody like that. Experimental I'm talking about – experimental auditing command.

You say, "Point out everything there is here." And you just keep that up, see? And every time he slows down, you tell him, "Go ahead, now. Point out everything there is here."

And he points out a few more.

And "Well, point out everything there is here," you see? And he'll point out everything and he'll point out everything.

Now, look. If you're what's wrong with the auditing session, do you know he'll never point to you. If you are a restimulator for this person, he will never point to you. He will always omit you. By the mere process of elimination, havingness and familiarity with the environment, he may very well, finally, point his finger at you and at that moment have a sigh of relief.

Well, you've all of a sudden ceased to be a restimulator for that particular accident. In other words, that is the action of keying out. The person without knowing what the earlier instance was has the lock vanish. That's a key-out.

The first key-in is the first time he ever got a restimulator for the original accident. This accident's been riding along just fine. All of a sudden, the same car's coming, the same circumstances, under the same situation, all from the same direction, at the same time of day, the same day of the year, you know, riding with the same girl, you know, with the same guilty conscience and all of a sudden, *boom!* He has an awful pain in his stomach and he goes on having this pain in his stomach. And doctors analyze him. And they give him barium meals. And you don't dine well on barium meals, you know. And they decide that he has to take bromides and listen to political speeches – anything – anything, you see? Put him to sleep. Get him quiet. And just nothing does anything for this stomach.

And then you come along one fine day and you say, "Well, have you ever had an accident to your stomach?"

"No. Never have." See?

That's a dead giveaway. He's given you the suppressor. Now, just think about it for a moment. A person walking on this planet in the space of any two years who has not had something give him a knock in the stomach or who has not knocked his stomach against something doesn't exist. Or who has not eaten something that slightly disagreed with him. You get the impossibility. Almost anybody would say to you normally (no somatic in the stomach, you see), "Well, did anything ever happen to your stomach?"

"Yeah, yeah. I suppose. Yeah, probably. Oh, yeah."

But not this guy, see. Not this guy. You say to him, "Anything ever happen to your stomach?"

"No. No. No. Never has. Never has. No. It just mysteriously got ill."

Here's the somatic, you see, which calls him a liar at once. You as a Scientologist know damn well something's happened to his stomach; he's got a somatic in it.

"Anything ever happen to your stomach?"

"No. No, no, no."

"Well, now, are you sure nothing has ever happened to your stomach."

"No, No. I couldn't think of anything."

Well, he's not going to try either. *Ha-ha.* You'll finally get him on the E-Meter and spot it on the time track. The person goes through horrible sensations, something is liable to appear or something like this. And then if you're lucky all of a sudden, this time he socked somebody in the stomach or time he got socked in the stomach suddenly turns on and this automobile accident, you see, turns on, whereby he hit his stomach on the dashboard or something like this, you see and there's the accident.

The person who says to you, "*No.* Under no circumstances has anything like this *ever* happened. *I tell you now! Never! It never did!*"

Of course, this fellow's lived for 200 trillion years. You know it's a damn lie. You see? Just on the law of averages. On the law of averages. Not with any degree of aberration. But you, as you sit, have certainly done to some slight degree practically everything that could ever be done anyplace with and to anyone, you see?

And this person tells you – he's sitting there. "Well, what kind of weather are you having? Well, you're having weather? Fine."

"Yes, I like to go fishing."

And all of a sudden you ask him, "Well, did you ever have an accident or ever have anything happen to your stomach?"

"*No!* No-ho-ho-ho. No. Never have. Never."

Sort of "What are you going to do about it?" you know?

You can find it with the E-Meter and suddenly present him with some interesting pictures and he can fit these into place and you can work these out and probably get rid of his somatic.

What you've run into is a suppressor. A person is suppressing restimulators using the original power of suppression in the original painful incident. And that is a suppressor. Just before he was hit with the car, he tried to unmock one car – *crunch!* You see, he's had a terrific impulse to unmock this car. It hit him anyhow, so that made him lose. But later on, it's that same *crunch*, see, that comes down and unmocks the restimulators.

Now, he finds out he can unmock the restimulators and because it's no longer there in the bank, the first incident appears to be unmocked. A thetan never gives up. See? There he is lying there, you see, squashed as a bug, you know. Green juice. I don't – some – on one planet or another it's different colors, you know. [laughter] Splattered all about, you see? And there is the car utterly triumphant, snuffing contemptuously through its radiator. Not even a slight

dent, you know. Not even any green stains on its bumper. Not even ruffled. But in this guy's bank, you have a totally wiped out car. There he lies stone dead, but his picture is of a totally wiped out car. Thetan never gives up. He couldn't mock it – unmock it in actuality, he will unmock it in the bank.

That's why it takes you so long to run an engram. You've run off the unmock. And then you can find the actual incident, don't you see and then you eventually can erase the incident and get the pain.

And you know how long it takes very often when you're doing a Touch Assist for the physical pain to turn on. You – sometimes you'll audit the guy for a half an hour before he gets any physical pain out of the incident. Well, you're running into the suppressor. And you have to get the suppressor all the way off before the physical pain is connected with and all of a sudden *ouch!* And there it is, you see? And then you get off little other pieces of the suppressor and you get these little flicks. That's why he doesn't get the somatic all at once. And that's why it didn't run out instantly after the accident.

Now, if he wasn't suppressing and if he wasn't in such a games condition with MEST, this is what would have happened: The car hits him, *splat*. Knocks him into a telephone pole, *splat*. He comes around and drops on the road again and gets run over by a bus, *splat!* And if he didn't feel so undignified, he simply would have said, "Well, *splat, splat, splat*. What's a few...?" [laughter] And he would have picked the body up and dusted its clothes off and so forth and it would have been totally uninjured.

In other words, the somatic would have run out as fast as it happened. But because of his not-is, the somatic stays in place. And this alone is disease, aberration, physical malformation and all the other difficulties he suffers from – are all contained under the heading of not-is.

Now, a person goes through various phases of not-ising – suppression – talking about the same thing. He goes through various phases of not-is. He not-ises slightly or not-ises more. And a person's impulse toward not-is, if failed, can turn into an alter-is.

Now, a person's alter-is can turn into a not-is and his not-is can turn into an alter-is. So a person can have a suppression stacked with a change. And that is dub-in. See, you get a – you get a suppression and he knew the suppression wasn't successful, so he alter-ised. He knew he couldn't suppress, so he alter-ised, you see? So you get dub-in. It usually happens below the level of unconsciousness, hence dreams. And they're just alter-ises of the things you can't not-is.

Now, when you get into a situation as an auditor where you feel a little bit leery about auditing somebody, you have entered a specialized field of suppression.

Now, some auditors have difficulty only auditing a certain type of pc. In HGCs this gets to be traditional. A D of P who knows his staff auditors very often will have to be very careful with one or two auditors. One, he doesn't dare assign a certain auditor to audit a young man because no auditing occurs. Or the pc will just be torn to ribbons or some mal-auditing activity will occur. You don't dare let a certain staff auditor audit an elderly lady. Something bad will happen as a result of the session.

And yet, these two staff auditors, one that can't audit the young man and one that can't audit the elderly lady, you see, can audit every other type of pc with perfect equanimity but can't audit one type of pc. Now, that's what you call the most selective condition of a suppression.

Their suppression on this particular type of being is the prevention of a restimulator. They're afraid something is going to appear. That is the only way you can state it adequately. They're suppressing something.

This person puts them into a certain frame of mind, so they have to *suppress* this person. And what result do you get? We get the immediate result that one way or another, in a – *ten thousand* different guises, this pc must *not* talk to that auditor. Pc mustn't give up withholds. Pc mustn't do an auditing command. Pc mustn't ever change. Pc mustn't ever originate. And how many ways can this be expressed? Well, they're just invariable, the number of manifestations we get out of a suppressor.

How many ways can we keep a pc from communicating? Well, we can let the pc go on forever without an acknowledgment. You wouldn't have thought of that at first glance as just a method of preventing the pc from communicating. You see, you never let the pc – you never direct any of the pc's communication, so the pc is just left to fish and wander, you see and steers all over the place and doesn't know where he's going. And the auditor says, "Well, if I just let him go get good and lost, he's not going to say a thing. *Ha-ha, ha-ha*. But if I got in there with a couple of smart questions, *ho-ho*. Oh, well. That's a different proposition. He might suddenly reveal something. Something might leap up about this that would be harmful to one and all, particularly me or him. Who knows?" But that's a good way to keep him from communicating – by never directing his communication. Don't you see?

Oh, there's many ramifications of this. Pc starts to answer the auditing question and the auditor instantly acknowledges. The pc doesn't answer the auditing question, you see. Pc says, "Mm-hm. Ah..."

"*Thank you!* (We'll keep him under control here real good.)" [laughter] "Now, have you ever seen any mice?" "Ah, yes. I..."

"*Thank you*. What are you upset about?"

"Well, I wasn't upset about anything."

"Oh, well, you look upset to me" and so forth.

"Oh, well, yes. I was a little..."

"Well, you – I don't see any ARC break registering here. *Thank you*. Now, let's see, let me see."

How many ways could you keep a pc from revealing something? How many ways? Well, there are just thousands and thousands and thousands of ways. And it's the composite, one or another or composites of one or another of those ways that combines every auditing fault. Once an auditor knows the form of auditing, once a person is trained into the form of auditing, if he persists along any of these ways, I can tell you now, since I've gone through

this with a fine-toothed Ron, to recognize exactly what he's doing. This took an awful lot of worry and work on this thing, of trying to sort it out and exactly what the conditions were.

No, he's just using a method of suppression and that's all.

I'll give you a method. If he doesn't ever learn how to audit, he won't ever get anything revealed, will he? But he's willing, isn't he? Perfectly willing to audit, but can't ever learn how to audit. You never get the pc to reveal a thing, do you?

Well, that is the slow freight out. See, that's the slow freight. You see that mostly in an Academy. A person grinding on through – can't do the TRs, *ha-ha-ha*. Just can't seem to get any of the TRs, you see? Can't sit there and look at somebody, you know. Just can't do it, you know? Can't do 1, 2, 3 and 4, you know? Just muffs one or another of these things. Goofs up, see. Does it for months and months and months. They actually have been.

Well, the actual fact is that if you keep a person at it long enough, he will run this out. He will find out – unless it is absolutely potty, you know, totally neurotic and psychotic in intensity – a person will eventually run it out.

Person says, "Oh, well, pcs. They don't – aren't going to reveal anything that's going to knock my head off, you know." They get used to it.

In other words, they get used to it by familiarization. Now, that's the only cure we had to the bad "auditor" in all former training. Some of them, however, never did get used to it by familiarization. There are two courses you can take about automobile accidents. You can either have enough of them so that you get familiar with it, you see and skip it. Or you get to a point where you totally suppress all automobiles. And some people, in studying auditing, take this other route. They are in a minority. They are only about 20 percent or something like that. But you just keep it up forever. You can train and train. And it's just taking them so *long* to get over this by the route of familiarity that it hardly counts.

Now, that's 20 percent. Now, about 30 percent get over it rather slowly. Well, it's a case of, "Well, another six or seven ACCs, we'll have an auditor." [laughter]

And then 50 percent of them, in varying shades of gray, get over it rather rapidly. Rather easily. Well, they're all getting over the same thing. Every one of them whether they're nutty on the subject or it only bothered them for their first week of training. We don't care which. But they're all on that band.

The length of time required in training is directly proportional to the number of suppressors you are trying to overcome in the student. And that establishes the length of time in training.

Now, I think, from what I've seen around here, that a person would be pretty darn well trained after about four months. A person should be pretty well trained. They should be putting up a pretty good show after about four months.

If they go into their fifth month or six month, we can consider them at least guilty of having a shade of gray, here. There must be a shade of gray. If they go into the sixth month

and haven't learned yet at all hardly, we'd say, well, that's starting to look suspect. That's starting to join up with the 20 percent, don't you see?

But it all comes from the same thing, is how – how much is a person going to suppress. What is this effort to suppress? How great is the effort to suppress? Because, you see, they're dealing with the root stuff of human aberration and of course there is likely to be revealed from the pc... Don't think of this now in terms of withholds and how somebody would spank them if they found out. Well, let's not worry about that.

Let's just take the idea that if they had an automobile accident and if another automobile accident showed up like that, they'd have to go through all the pain and agony of the automobile accident they had, they're not going to have anything to do with the automobile accident, that's all.

So they say to the pc, "All right, now..."

They were – they were fine. They were doing fine. Their first two weeks at the Academy, they just did swell. You'll find this, too, by the way. You'll find this abundantly. Just did fine. And one day they were saying, "Something you wouldn't mind forgetting " – they're running this as an exercise and they're sitting there all keen. And the person says, "An automobile accident with an E-type Jaguar."

They didn't even hear the answer. See, the suppressor is right there on automatic, see? They quit.

"Oh, well. Something you wouldn't mind forgetting. Where's the Instructor? Do you have an ARC break? Why not?" [laughter, laughs]

And they all of a sudden don't like auditing. The one thing they mustn't reveal and the one thing they were trying to get rid of in their own case without ever revealing it to them, you see, was an automobile accident with this type of car. And by *God*, the pc sat right there and handed it to him, you see?

And the person says, "*Brakes*, see, *scream*, you know. No, thank you. No. Ha-ha. No. Ha-ha." "Now, why don't you answer the auditing question?"

They frankly wouldn't even have heard the answer to the auditing question. Because they just would have gone *clunk*. *Gone*. Everything would appear rather dazed. If you run them through the session and tried to find that piece of the session, it'd be gone. And you'd know what it was, too. Because you went over it long enough, you'd at least get what the pc said, but you wouldn't be able to analyze what the reaction of the auditor was or why. You'd know it was because the pc said a restimulator of the auditor and the auditor's suppressing that.

Well, then you just check back kind of similar incident in the life of the auditor and – *bang!* – that would knock out that suppressor. But in view of the fact that several hundred trillion suppressors exist in every case, to run out each and every one of them, individually, would be very nearly impossible. Therefore, it requires a much better approach.

It requires drills of suppression, familiarization with suppression, not familiarization with incidents. Let's familiarize with the mechanism and the identity of who or what would

suppress. And we get these things sorted out and these things out of the road, we can start clearing up this particular mechanism.

Now, who is the person – who is the person with the field, the Black V, the invisible field and so forth? This is a person only in a tremendous suppression.

A person with a black field, of course, is more prone to suppress at night than in the daytime. It's natural. You go around walking around the dark streets of the town and you're liable to have things appear that you can't recognize because you don't have enough light to recognize them, so you just go walk around the corner and you go *oomph*, "Oh, well, that's a newspaperman," and you go past an alley and you *oomph*, and, "Well, that – that's a horse – old tie-up stand for a horse," and you go around the next corner and you go *oomph*, and you say, "Oh, that's a – just a restaurant sign." By the time you've finished a few blocks of walk, you've got a black field for a while, see, because you're suppressing all the blacknesses, see? Blacknesses are just difficulty of recognition, that's all.

Invisibility is rarer, but people who are suppressing glass objects, we learned a long time ago, will develop invisible fields. Yeah, you can actually put out a glass ashtray and tell them to, "Try to make it disappear. Thank you. Try to make it disappear. Thank you. Try to make it disappear," and their field will change.

"Make the window vanish. Thank you. Make the window vanish. Thank you. Try to make the window vanish." And you'll get a change in their field. Those are not good processes, but they give you an idea of an invisible field.

And of course, the person who is suppressing thetans has an invisible field. He has a total nothingness involved and other types of suppression. So you'll have suppression of visible things, suppression of invisible things, suppression of matter, energy, space, time. You get suppression of almost anything you can think of.

And anytime you suppress anything in a certain time stream, you, of course, are also suppressing time. So time becomes the primary suppression. And therefore, you get the instantaneous quality of the reactive bank, so that all time is *now* in the reactive bank because of the suppression of the reactive bank. And that is simply not-is-ness in the reactive bank.

All right. As we look this thing over, then, we see that almost anybody is trying to suppress something. That anybody is trying to suppress a lot of things, not just something, lots of things. I'm not now talking about trying to suppress bad things about their past or anything like that. They're just trying to suppress things, see?

They suppress the impulse to put their finger into a buzz saw. See, people just – normal human conduct calls for suppression.

And now we go from that into suppressing things which are likely to appear. And then we go from that into suppressing things which are likely to become known about them – we get the withhold. And then we get suppression of things that others are liable to think. You're really doing a honey then, suppressing other people's thoughts, you know? Man, I tell you. If you want a good failure, try that. It leaves more invisible fields scattered around and various things like that. And you get various complications of suppression and various automaticities of suppression.

Now, it's only the person who has suppression of banks on total automatic, completely out of their own control, utterly lost and completely nuts on it, that actually are damaging as auditors. And such people are damaging as auditors because they will not let a pc ever reveal anything. So therefore, the pc gets totally stuck in everything he utters. And if a process works today, that auditor is going to change it to another process tomorrow because if he kept on with a workable process, uuuuuu. That auditor will only run processes which are totally inactive on the case. He will only run processes that are flat. He will only change processes that are changing. There's the primary source of Q and A.

It's actually quite horrible when you look it over. If the pc is trying to get rid of a withhold, the pc is trying to reveal something, the auditor will totally Q-and-A with him and say the pc must never reveal this thing. Doesn't matter what it is. Just it mustn't be revealed, that's all.

So the auditor's attitude is to goof, ARC break, not find it on the E-Meter or only pick up something that he's well aware will be very, very safe, out of which nothing will occur.

"Now, do you have any withholds?"

Well, he just misses that one and that one and that one and that one and then picks up this withhold where the person says, "Well, yes, I do have a withhold. This morning I sneezed."

That's safe. That's all right. He can have that one. So he works on times the pc has sneezed. There's going to be nothing ever reveal itself on this channel and he'll work that channel endlessly because it's a perfectly safe operating channel, because nothing is ever going to be revealed out of it. Perfectly all right with him.

You come around to the back of this auditor and he's running the end rudiments, "Have I missed a withhold on you?"

Clang! the needle goes, you see and goes *spung!* and shivers on the side of the pin. This person says, "All right. That one's straight," and goes to the next end rudiment.

They'll do it. And that, of course, we know by present technology is a dangerous auditor. Now, that is a real dangerous auditor because that auditor, willy-nilly, all with the very best of possible intentions, doing their very, very best, will ARC break anybody that is ever audited by them and drive them out of Scientology. He isn't trying to do this, see? All he's trying to do is do a good, safe job that isn't going to upset anybody.

And they know how to do a good, safe job that isn't going to upset anybody: You just never find anything out. You never let anything be revealed.

Now, naturally, you refer this to the field of study. If the person looks at the paper and never lets the paper reveal anything to him, he never can learn, can he? And if he's hearing a tape or something like that and he never lets any of the sense or meaning of the tape ever come through to him, why, he never has anything revealed, does he? So that's a perfectly safe action. Funny part of it is he'll sit there and listen to hundreds of tapes. That's a fact. I mean, he'll sit there and listen to tape after tape after tape and never register anything off of any of the tapes because that's a safe thing to do.

Everybody to some degree is suffering from a staggeringly bad memory. I'd say if you'd killed as many women as you have or killed as many men as you have or something like that or disrupted as many lives as you have, normally you're going to have some slight suppression. So you listen to a tape four or five times before you've got it verbatim, you see? I'm talking about this as a – as a total thing, you see. A person sits there and listens to this whole tape and it's on the subject of how you should do the TRs, you see and listens to this whole tape from beginning to end and comes through at the other end and the Examiner says to him, "All right, now, what does TR 0 consist of?"

And the person says, "Well, it's like the twist, only different." [laughter]

And he really can't understand how he doesn't know anything about it. It looks like such an innocent activity. But the last person to notice this about himself is the person. That's what makes it grim. Because, of course, that person is in a total suppression.

So the one that you worry about when you're training people is the person that doesn't have this wrong with them and they know it.

"That doesn't apply to me. You see? It has nothing to do with my auditing. It's perfectly normal and natural that Isabel today, while I was auditing her and so forth, she had an ARC break. Any auditor auditing her would have had an ARC break. And when she left the session, I went and got her back, didn't I? How can you perfect – say that I was ever trying to suppress anything about Isabel? I've been trying and trying and trying to find out about why she drinks water." [laughter]

And this doesn't seem reasonable to you. You can assume that this auditor was suppressing something on the subject of Isabel because he won't let Isabel give or get rid of her case or get audited. And yet the auditor will audit Isabel, which is very fascinating.

So frankly, the person would help them out and this is the only exception to a person's helpingness – there's just this one exception to helpingness. A person will help another to the degree of his tolerance to stand something being revealed. And that's to what degree he will help another. Revealing something establishes the degree he will help, so that this works into blackmail and dossiers and everything else. "If you don't help me, I am going to reveal about you."

You get that mechanism. Well, it works the reverse. The person will help somebody unless that person is likely to reveal something. That would be the most natural thing in the world. That consists of the coordination of the suppressor and the bad "auditor." It also is a bad student.

But remember, I'm not saying these in any reproving tones. I am simply calling to your attention that we have the mechanism. And it's taken us an awful long time to find this mechanism and you'll find this mechanism will work like a bomb. Once you get used to using this mechanism, why, you will understand why auditors won't pull withholds.

In other words, this is what keeps people from employing the technology of Scientology. And I've been looking for that for a long time – the – that little point. Well, why won't they employ it even when they know it sometimes? And if I could find that button, why...

That actually is all the importance the button has. It's the importance of learning rate and the importance of application. It has, of course, vast case repercussions of one kind or another. It produces dub-in and various things.

But frankly, from our point of view and from the point of view of this lecture, we're only interested in the degree that it inhibits good auditing.

And I stand for that.

Thank you.

MECHANICS OF SUPPRESSION

A lecture given on 19 March 1962

And this is the second lecture. What's the date?

Audience: 19 March, 12.

Nineteen Mar. 12. And the first lecture that was not dated there was "The Bad Auditor." And this lecture has to do with the mechanics of suppression.

Now, for a long time you've had a lot of Axioms. You may have heard of them. And they actually contain the basic data on suppressors. The Axioms, of course, are way ahead of us. Always have been. Trying to get technology to catch up with the Axioms is one of my tougher jobs.

But the suppressor is already forecast in the Axioms under the heading of not-is. And it is simply not-is-ness and what is not-is-ness. And I for a long time have played with not-is-ness from various angles and you get a simple statement there in the Axioms – simpler than I'm making now, actually.

And that is you get the *is-ness* of something, you get the *alter-is-ness* of something and you get the *not-is-ness* of something. And a not-is-ness is, peculiarly enough, a suppressed is-ness and that is all it is.

And if you redefined not-is-ness as a suppressed is-ness: it is the effort to put out of existence energywise an is-ness. It is an effort to *suppress* an is-ness. Elephant is standing on the front steps, we say, "Well, elephants don't belong on the front steps, so there is no elephant on the front steps."

Now, whenever you find that running out lies out of a bank – has enormous numbers of applications and there are tremendous numbers of ways you can apply these particular Axioms – when you run lies out of a bank, you, of course, are running alter-is-nesses or not-is-nesses.

Now, a lie could simply say it was something else, that it's a child's toy on the front steps – it's a live elephant, you see – we could say, "Well, it's a toy. It's an advertisement," you see? "It's something made out of rubber so they're advertising something." Or we could say, "It doesn't exist," you see? And you'd get a lie actually covers an alter-is-ness and a not-is-ness.

Now, alter-is-ness is change. And it sits between an is-ness and a suppression. And therefore, we're getting nicely tied up with time here because time is basically, only mechanically so, but is change. Time is change.

Now, a cycle of action does run from a nonexistence to an existence to a nonexistence. That is a cycle of action. And if you look over the time track, you'll find that a cycle of action goes from: there's nothing there; there's a creation there; and then there's changes in the creation; and then deterioration-type changes, but they're nevertheless still changes; and then we finally get a nonexistence again. So we run from nonexistence to existence to nonexistence. And that is a cycle of action.

They are all types of creation and so on, as we know. We know a lot about this sort of thing. But let's look and see how this directly applies. The first material we have on this is Science of Certainty. The Something-Nothing Process. Process in England. You know, they don't work in England unless you call them processes.⁷ [laughter]

And the cycle of action was never entered into this. We just talked about, "Think of something. Think of nothing. Think of something. Think of nothing." You know, that type of alternate, to get out the maybe. And that was under the heading of the "anatomy of maybe." A maybe, an uncertainty, a guess or as most people conceive unknowns, an unknown – that isn't really what an unknown could be but it could be a mechanical variation of unknown – is simply the no-man's-land between the certainty that something is and the certainty that something isn't.

So we have these two things. The certainty that something is and the certainty that something isn't. And between those two things, we have the maybe. See, we have "It is," and then we have "It is... It is? Uh... it is. Uh... it isn't." And we get the cycle of action.

So you can stack a cycle of action alongside of maybe. And you could say change is maybe. These are approximations, not exact things, you see?

Now, it looks in the reactive mind, then, as though a cycle of action is a maybe – the middle of a cycle of action. So that all change is a maybe. And therefore, if anything's changed, maybe it isn't, you see? And you get all kinds of things.

If we change techniques in Scientology, a lot of people don't think Scientology exists. See? They say, "Well, he – Ron's just changing his mind again."

Oh, Ron hasn't changed his mind about this in a long time, see? But they never look at the certainties we have. They look at the middle, see? And we get something that's very peculiar. We get a new process. And this is a process.

Now, to show you how difficult it is to immediately approximate this semantically so that it can be run by a mind, I'll call attention to the fact that the Something-Nothing Process is quite limited in use. It has some value. It – you could do various things with it. And other types of processes all about not-is and so forth, had practically no use at all. There have been many of them. There have been processes about lies, processing lying and that sort of thing and their use put it off into the Step 6 phenomena – Creativeness. We started beefing up a bank and various other things have occurred by lying – the processing lies, you know?

⁷ Editor's note: LRH here plays with the different ways to pronounce "process" in England and in America.

That wasn't very successful. There've been a lot of efforts here. Only thing I'm trying to sketch out for you here is this has a long history and a lot of efforts involved with it.

Well, a lot of things come together at the same point, so we've been around the fringes of these things and a lot of people on the whole track have been around the fringes of us.

But the point I'm making here is I came across a process which is a runnable process, which is a Class I process. You're perfectly at liberty, by the way, to run this process on somebody. I don't care whether you do or don't. It isn't an exactly tailored process yet. You probably have to fish for the wording of it. But actually the process is, simply: "It is. It isn't. It is. It isn't."

After you've gotten the pc to do the "It is and it isn't and it is and it isn't" for a little while, he'll move on the time track, but he ordinarily will give you a direct application of this process to his case. And he'll deliver up to you the chronic automaticity of his case or the chronic present time problem or the chronic something of his case almost at once. This is quite peculiar.

What you're doing, of course, is running the cycle of action on him. You're running those two portions of the cycle of action which are important to him. And in view of the fact you have said, "It is" followed by "It isn't," you haven't said whether it was vanishment or not-is. And he'll always run it as a suppressor.

So you're running direct suppressors. And the thing which he is most closely and most immediately suppressing is the most likely to come into view. His hidden standard or the thing that immediately is wrong with him is liable to appear almost at once.

Now, of course, the thing he's trying to make up his mind about stems from the fact that he at some time or another had said that it is and then he didn't like that, so he has said that it *isn't*. And this has left him in the maybe of whether or not it ever was or is or ever will be.

See, there is – you wouldn't ever get anyplace processing a person this way: "Maybe, maybe, maybe, maybe, maybe, maybe, maybe, maybe." See, you would get no place processing this. "Get the idea of maybe. Maybe, maybe, maybe, maybe, maybe, maybe, maybe, maybe." A person will fog up, go out, go anaten, that sort of thing. Basically, there is no such thing as a maybe. See, there is only a creation and the conditions of the creation. Because even when a cycle of action has been run, it still stands there as a memory. The person remembered there had been.

See, he got married, got divorced. He actually doesn't get a nonexistence again. He gets a remembrance of having been married. And more deeply in the bank, he gets a recording of having been married. I don't care at what fabulously far-away time it was in time, he'll have a slight inkling of it.

In other words, so you don't get – ever get a pure nonexistence after you get any existence, see? The only pure nonexistence is prior to the existence.

So you get a positive assertion of is-ness followed by a positive assertion of it isn't, you will inevitably get memories and cognitions and various other mental phenomena will

occur. And oddly enough, this fantastically simple process – "It is. It isn't. It is. It isn't. It is. It isn't. It is. It isn't" – will produce practically every other phenomenon in Scientology. It stems out of existence and nonexistence, which of course stems out of perception and don't want to perceive – which, of course, goes over into creativeness and destruction. And all the time you're jumping across wild bands of change.

So you're getting the certainty that it is and the certainty that it isn't and the certainty that it is and the certainty that it isn't; and all of a sudden you get all this change boiling up and boiling over. Because, of course, change is simply the different conditions of an existence leading to a nonexistence or a new condition of positiveness.

The uncertainty of the case blows off. Now, the fellow with the open mind, the fellow who doesn't know, the fellow who isn't sure, the fellow who just grinds and never gets a cognition, this fellow who can't find out, the fellow who has no memory of the whole track, the fellow who just doesn't ever recognize that maybe it – "Well, I can say that it does and I can say, yes, I suppose I could assume. Uh-huh, maybe, uh, well, yes..." and all of his conversation is like this.

You ever read any scientific papers of the last twenty or thirty years, you know?

"If the universe exists..." They don't want to get stuck with any is-nesses. See, they don't want to be guilty of any is-nesses.

"I was sitting in front of the meter, of course. I was sitting in a Mark VI type chair using hung-over type lamps. And the reflective qualities on the screen were X970 and I uh-uh-uh-believe that I perceived uh-uh – apparently, uh – as the needle registered – uh – that is, if the machine were on, which would have to be verified by the machine operator – uh – that uh – if I uh – recall properly, uh – and if I am not controverted by the faculty or my immediate superior, there were 230 volts on the mains that day, I think."

That is a *forthright*, scientific statement. That's just about as flat out as a scientist these days could get without being shot by his brethren.

Most of the boys get upset about me in the field of science is because I will say something is or something isn't. And I don't qualify it. I don't say, "Well, if the faculty gives me permission," you see, or something like that, "then I could guess that maybe adjectival clause modifying paragraph B that adverbial phrase modifying verb G might finally turn out to be a guess," you see? And in view of the fact that I don't talk that way, they think I'm unscientific. You have to be doubtful to be scientific.

Well, it sure hangs these guys in an awful muddled mess, doesn't it? Now, the very funny part of it is you could take that exact frame of mind and have the boys say, "It is and it isn't and it is and it isn't. Get the concept that it is. Get the concept that it isn't."

Fellow says, "Get the concept of *what* was? What?"

You say, "Well, just *it*. It. Anything. It. It. It."

"Uh... I don't know what you mean by that," you see?

He might have quite an argument on this other. It'd be very laughable because, of course, he is trying to get the idea that it is and he runs into the maybe, see and he can't get a clean idea that is, see? Nor can he get a clean idea that it isn't.

You'd have to actually rehabilitate him into being able to get a clean idea that something was and something wasn't. You watch. The boys in charge of the A-bombs and the stuff we breathe right at the present moment⁸ are mostly in that frame of mind.

You know, the H-bomb marchers missed their bet, you know? They miss their bet all the time. If they wanted really to wipe out the H-bomb, they wouldn't worry about that. They'd just insist that all the atomic scientists and politicians that had anything to do with the H-bomb produce proper sanity certificates so that they could be – and that they should be examined by psychiatrists and so forth. They'd drive everybody batty.

But the funny part of it is none of these guys could pass, see? Because "It may be all right to drop it, maybe, see, but it might not be all right, but that's neither here nor there. That doesn't have anything to do with us." To even that they add irresponsibility, you see? They all stand in this middle ground. It's the no-responsibility attitude.

So you'd have a hard time on that type of case. That's very low scale as a case. You'd have a hard time getting that person to get positive idea of something *was* and something *wasn't*. And they could get no such clean-cut idea. They'd get "Something was, I guess," and "Something wasn't, *rrrrrrr*, perhaps."

So they're always on the verge of having something being revealed suddenly. And it would scare them to death. They make very bad auditors. They in fact won't talk to you about auditing anybody. They'd much rather jump out of their scientific boots and instantly and immediately hold forth with Pope Pius, who said that nobody should monkey with the human mind. I think that's a direct quote. "Nobody should monkey with the human mind." "You or I would not want somebody coming into his basement." I think that was a direct quote. I think it was. It's a papal bull. "And therefore, you shouldn't want to have somebody come into your mind." That's right. "In view of the fact that we got withholds, we don't want to be invaded."

Now, there's a frame of mind that is always on the idea of revelations. Only their revelations, let me call to your attention, are delusory revelations. Tremendous numbers of angels are going to sing on heads of pins, you see? You're suddenly going to get a vision of some holy messiah holding his head in a saucer or something of the sort, standing in front of him.

You're going to get a word which is going to come down from a shaft of light through the heavens, you see, and suddenly all is going to be well; only the shaft comes over the left shoulder. You get terrific superstition. You get all types of religious revelations.

So you get scientific revelations. Well, of course, our current scientific revelation is so out of control that it takes the form of an H-bomb. Now, that's a revelation. *Boom!* And of course, nobody can face that much revelation, so they say, "well, it doesn't exist." So people

⁸ Editor's note: This refers probably to the fact that at the time of the lecture there was a lot of radioactivity in the atmosphere due to the testing of nuclear weapons.

keep calling attention to the H-bomb, the H-bomb, the H-bomb, the H-bomb, the H-bomb, the H.

Nobody can look at this H-bomb, see? What they got to do is call attention to the fellow who pushes the button, the fellow who pushes the button, the fellow who pushes the button, the fellow who pushes the button. *Ha-ha-ha-ha*. People would look at him.

And you say, "Well, we want to see a psychiatric investigation of all the fellows who are going to push the button."

Immediately, the whole public is liable to get very interested, see? Because they can face the guy who's going to push the button and they can face a button, but they can't face the bomb.

So you see, the H-bomb marchers are trying to get too much revelation for the public to assimilate. So all they got to do is cut back the revelation. Very simple mechanism. Cut back the revelation, to ping, ping, see?

Now, you do that with Scientology. You say, "Well, we make the Clear, we do this and do that and you get healthy and all that sort of thing. And it's terrific and you get more intelligent," and so forth and it's just too much revelation.

Now, if you said to the fellow, you know, "Have you got an ache or pain?"

The fellow says, "Well, yeah, as a matter of fact I got a bad pain in the back of my neck – back of my neck, back of my neck."

Well, you say, "Well, Scientology would take quite a while to help that."

"Say, it must be pretty true."

Then you could do this weird stunt with him, see? You could say, "Well, I'll show you. I'll just show you. Now, get the idea there's pain there. Good. Get the idea there's no pain there. Good. Get the idea there's a pain there. Good. Get the idea there's no pain..."

"Ow!"

You'd say, "There, you see? That's Scientology."

The fellow says, "You just about blew my silly head off! That's Scientology?"

Well, you could say – you could say, "Well, can – is the pain still there?"

"No, as a matter of fact, it isn't."

"Well, there you are. No pain – Scientology."

"No pain; Scientology. There was a hell of a pain there a minute ago."

Nevertheless he could confront it because it's slightly on. Did you ever stop to think about that?

He may have an *awful* pain. His stomach may be in *absolute agony*, but he's got it totally suppressed. So he doesn't know that. See, he's going totally to pieces, but he doesn't ever find out about that until you started running just a general, "It is or it isn't" and he was functioning on this and was thinking the ideas. I'd check on this, "Have you followed the auditing

command?" or "Have you missed any auditing commands?" I'd do that about every six or eight commands if I were running this, you know. Just check the end rudiment. Do five, six commands. "Have you missed an auditing command?"

"Well, yes, I didn't get that one." I'd make him go get that one and then give it to you a few more times. Get him so he was really doing it. And you'll be amazed. Some of the most fantastic pains that people are totally unaware of will suddenly turn on in parts of the body where they're having malfunction.

"Nonpainful malfunction" is what drives the medico mad. This the medico can't understand. What is a "nonpainful malfunction?" You see, there's no agony connected with it. There's no pain connected with it. The person is just all out of gear. You see, he should be standing up straight and he makes a picture like a corkscrew. Doesn't hurt.

Now, you try to do something for this fellow and, of course, it doesn't hurt and nothing happens. Well, why does nothing happen? Well, he just suppresses you, too.

And you want to see one of these guys twisted up like a corkscrew and all messed up like a fire drill – you try to do something for that person, he lets you, he won't have any cognition and nothing will happen and he'll break your heart. The only thing that happens is he just suppressed you and the treatment, too.

Ah, but you get him to say, "It is, *ha-ha*, it isn't, *ha*, it is, it isn't." I don't care how you get him to say it is or it isn't. You could probably do it by "Feel it, is it there? Don't feel it, now. Don't feel it, feel something else. Don't – don't feel it. All right. Now, feel it, feel it. Good. Now, don't feel it." Probably something wild would happen.

I mean, there's various ways you could do this. It appears, it doesn't appear. It appears, it doesn't appear. You see, that's the "it is, it isn't." There's various variations. But you, oddly enough, don't have to go off into these variations. The mind tries to go off into dozens of variations the second you start to think of it because it gets into this obsessive change, see?

If you were trying to run this on yourself, I guarantee that within five or six commands you'd be running another command. See, I just guarantee it. Because you'd be running another command and you'd never really notice a change. You got on to something that was hotter. [laughter] That's how you'd explain it to yourself, right? How the hell did you get onto something hotter if "It is, it isn't" turned on the hotter thing. *Ha-ha-ha*. You get back to run "It is, it isn't, it is, it isn't." And the thing that you got on to that was hotter will blow off.

That's just the is-ness and the not-is-ness, is really what you're asking somebody to run. You're asking him to run directly suppressors.

You say, "There sits the object unsuppressed. Good. *Ha*. There it sits suppressed. *Ha-ha*. Good."

You're running this identically, you see? "There sits the object, freshly, beautifully created. That's fine. Now, there sits the object beautifully disappeared but still there. Thank you." Get the idea?

"Now, there it sits unsquashed by you. There it sits squashed by you. Thank you." That's what you're getting. And of course, you get continuous, consecutive appearances. Because you get all the appearances coming up that the guy has squashed.

And you get him moving on the time track and you get this cycle of action going. You start him completing cycles of action. We don't care which way he completes them. Some people complete them like, "It is, it isn't," see? And that's a cycle of action. But the other people are completing them, "It isn't, it is." Quite weird. Do you see how this works?

Now, there's only two things can happen to a person is to have nothing appear and have something appear. That's the only two things that can happen to a person, see.

See, even the consequences of having made something appear is just getting something else to appear. So the two conditions of any game are appearance and nonappearance. And we get the anatomy of games, which is where I studied this thing out originally.

I was studying games when I finally calculated down to a level of that. We don't have to know too much about games. We – *Scientology: Fundamentals of Thought* gives you about all there is about that.

But you get down to a more fundamental fundamental and you get down to this fact of that is a game. Something is, something isn't. And there are all kinds of ramifications of, "It is," you see? You don't have to say what *it* is, you know, but you can say, "Put anything in the game in it."

Take the opposite player. All right. He is or he isn't, see? He is behind your goal post or he is in front of your goal post or he is in front of his own goal post or he is in front of you.

You see, that's is-ness by location, which is a via. But now, let's just take the overall purpose of the game. And the overall purpose of the game is you were the catch-alots and he's the sharks. And "Up catch-alots and disappear sharks," see? So totally the end of the game is, "is catch-alots" that you want, you see and "no sharks." And he wants "is sharks, no catch-alots." And you get your basic disagreement which gives you a game.

Now, this, "It is, it isn't" is all that reads on an E-Meter. The middle between is what reads on the meter. The amount of "is" that the person can conceive compared to the amount of "isn't" the person can conceive finds the disagreement between the "isn't" and the "is" which gives you a read.

All the meter reads is disagreement and that is the basic disagreement. A basic disagreement – you're sitting in the room with a Presbyterian and he says an angel has just descended in that rocking chair. And you say there isn't any angel in the rocking chair. And he says there is an angel in the rocking chair and that's a basic disagreement.

Well, if you had two valences in one mind, an atheist and a Presbyterian – let's say these are two valences that have occurred in the Goals Problem Mass, see, there's those two valences – you get a terrific registry when you hit either one.

Well, why do you get a terrific registry when you hit an atheist? Well, that's because of the pressure over here from – the unseen pressure of the Presbyterian. And why do you get

such a tremendous charge whenever you hit Presbyterian? Well, that's because of the unseen atheist. Quite fascinating.

You know, you'll blow just as much charge off by getting the oppterm as you'll get the term. If you list the terminals, if you make a list of pc's terminals – they're giving him pain the whole way – and you get so much tone arm motion, so much charge and so much blowdown and so forth, if you oppterm that right away, you'll get the equal amount, if you get the exact oppterm.

Sometimes you get gradient scales of oppterm. In other words, you get associated oppterm that are out here some distance and gradually walk in and you eventually collide with the actual oppterm. So you can get your hands on one side of the picture and then get your hands distantly on the other side of the picture.

But you will eventually – if you blew a tremendous amount of charge off a case by assessing the case out to atheist, eventually, on some other line, some other time – maybe when you opptermed it – why, you got idol. But somehow or another, you got another thing and you finally wound up and you found out the thing, the package, that put that Goals Problem Mass, you see, the problem versus the problem. You'll all of a sudden find this terrifically *hot* other side, see, the other side. You know when they hit this atheist that it just blew *zooooom*, see? Well, you're doing – this is ten items later and on a totally independent line, you all of a sudden hit this Presbyterian, see? And it all of a sudden goes *squash! boom! crash!* And it's just the same amount of force and power there was in atheist because those things had to be equal to be in balance. And the whole mass goes out of balance when you discharge one, but that one won't discharge totally. It'd discharge the other one, then they all both go. They tend to go out of line when you discharge one and sometimes you don't find the oppterm at once because it's kind of slippery. I'm just giving you examples of the thing.

Now, why are those two valences counter-opposed and why do they get so much charge, one versus the other, on the E-Meter? Well, that's because one is saying certain principles are and the other is saying certain principles aren't. And the second one I just mentioned are saying certain principles are and the first one I just mentioned is saying certain principles aren't. So they're in *violent* disagreement.

And you'll notice this is the common denominator of every opposed Goals Problem Mass package, is the fact that you get the atheist versus the priest or something. You get the virgin and the harlot. You get the child and the mother. You get things that make problems, one's against the other. They'll be opposites in various ways.

So you have a saintly person versus the devil, devilish person, you see? Well, it's the disagreement between these two things. And one stands for certain is-nesses and certain isn't-nesses and the other stands for certain is-nesses and certain isn't-nesses. It isn't that one stands for "is" and one stands for "isn't." But it's practically everything that one conceives is, the other conceives isn't. And then that is reversed the other way, too. So that everything the second one conceives is, the first one conceives isn't.

So you have this *tremendous* number of items. All these is-nesses are opposed by all these not-is-nesses. And then we have all these is-nesses opposed by *these* not-is-nesses. And so it – everything is just *bthah*. And you hit these two, you get a heavily charged mass and of

course, it won't discharge and the person gets somatics and everything goes mad every time you hit the thing in the bank. And it restimulates and has total command over the person, and it's violent. Well, it's simply violent because of all these disagreements.

Well, how could you find it on the meter? Well, it's just because it's full of disagreements, that's all. And that's the "is" and "isn't."

The funny part of this is, is this theory could probably be put into any process. You could probably – I don't say you should – but you could probably prepcheck with this – with this type of a Zero question: "Have you ever considered another didn't exist?" Or "Have you ever insisted another didn't exist?" Use that as a Zero question. Well, it'd be rather hot and very lengthy, but it'd sure run.

I don't recommend it. As it merely would run. "Well, have you ever insisted something was?" You'd get a – you'd get a tremendous number of overts because, of course, every overt he's got either consists of asserting that something was or asserting that something wasn't. And there are only really two classes of overts.

When you damage something, you're trying to insist that it isn't. And when you're creating something, you're trying to assert that it is. And when somebody else is trying to create something, you may be trying to help him create it or trying to keep him from creating it.

And when he's trying to not-is something, you are either trying to assist him not-is it or you're trying to prevent him from not-ising it. And these frames of mind, I'm afraid, are very black and white, Aristotle to the contrary.

Now, Aristotle said that everything was black and white and non-Aristotelian logic is the favorite logic of semantics and modern science. And of course, it insists that they're fantastic numbers of shades of gray. And that there are no positives and no negatives. Well, that sounds to me like an awful big Goals Problem Mass. I admit there are lots of shades of gray. And I admit a lot of gradient scales and I admit a lot of these things, but to say that positives don't exist, from a standpoint of somebody's reality, is going pretty far. That's going pretty far.

You can say *ultimates* are unobtainable. That's a fact. That's a fact. It – course – that's telling you an infinite, an infinite, a total presence or a total absence of zero. These things are – but that would not be maintainable. But to say that merely positives, not ultimates but positives couldn't exist, that would just be pure nonsense. And I'm afraid that is the nonsense on which modern science is making its basic errors.

But you start dealing with positives – after all, you're positive. You're sitting in a chair right this minute, aren't you? Well, you are. It's a good enough positive. We don't say you're the ultimate. But you certainly are, see? And you aren't at home, are you? Right at this moment, you aren't at home, are you?

Male voice: No.

Well, that's fairly positive, isn't it? You're not at home. Now, to the degree that you've left something home or are going to return home, that reduces the ultimate of homeness, not

youness, you see? And to the degree that you're not going to sit here all night, that's no ultimate of hereness.

So what you get is as time drags out, positiveness reduces. The less concept a person has of time, the less concept they have of time, the less positive things seem. Get the idea?

So we get all of our concepts of present time, the hereness and nowness of it. Have you ever had Havingness being run on you and all of a sudden the walls got awfully bright? You know, I mean, common experience.

What you actually did was not having the walls get any solidier or brighter, but you became more aware of the nowness of the instant. That's actually what happened. All you have to be is very aware of the nowness of the instant and you get quite a lot of is-ness. And the odd part of it is you get a lot of not-is-ness.

But your not-is-ness goes from not not-is-ness to nonexistence.

Now, the person is sitting there and he's *surrounded* by these masses. There's just *masses*, *masses*, *masses*. You know, he's just got masses, oh boy, you know, just packed in *bthah*, and so on. Although he's a rather thin person, he has to have a truck move him, you know? And he got masses, masses. Those are all not-is-nesses. Those are all nonexistences.

The first thing he'd say about all of them is they're nonexistence. That's – that's what – his first declaration concerning them: "They don't exist."

So you see, as he came up to present time, the walls got brighter, these things would disappear, see? But when you're running some people on Havingness, it comes from not-is-ness to nonexistence on such a clear-cut track that as you run Havingness on them and make the walls more real, their bank *materializes* and they have people standing in the room, you see?

What you do is run off the not-is-ness by running on the is-ness of the wall, see? The wall gets very real to them and they're getting their time track stretched out, you see, and they're getting more here in this particular instant of nowness, you see, and they keep looking over at the corner and you finally say, "What's the matter with the corner?"

"Well, it's just that my Aunt Agatha seems to be standing there and I know she isn't there, but she's awfully three-dimensional."

A few more commands. "Well, how's Aunt Agatha?"

"Well, she's gone. Why – why are you worried about Aunt Agatha? I wasn't worried about it."

In other words, the not-is-ness which *pushed* this mock-up of Aunt Agatha into invisibility *released* as the person's reality on the wall increased. You ran out the invisibility of the is-ness. Here you understand that a person could actually conceive this – these sheets of paper to not exist while at the same time he was looking straight at them. Well, there's a funny mechanism in the bank where he can go kind of squash with energy, you know? And he makes the mental image picture just disappear. Well, you make the wall get real and of course you make this not-is-ness run out and what do you find the fellow beholding? He beholds this three-dimensional picture, *ulp!* He beholds Aunt Agatha in the middle of the room.

Sometimes in auditing somebody, if you're being very successful in running some process or another, doesn't matter what process – Havingness or bank or Prepchecking or anything else – he might have two or three dead bodies lying in the room at the same time, awfully solid. So solid that he's absolutely sure he can reach out and touch them and they'd be solid. But if the fellow's fairly well adjusted in existence and the auditor is running a smooth session and that sort of thing, you very often aren't told this fact.

He says, "All right," he knows what they are. They – it's a bank manifestation and they'll go away. And they do. And he forgets about it.

What you did is, they've always been there and he had them not-ised so that he never saw them. But my God, did he have to be careful in life. Every time he sat down in a room he'd have to make sure that this body, this body and that body were not-ised. Somebody would say, "Well, how are you, Joe?"

And he'd say, "I was reading the stock exchange papers today and I saw some very interesting things." People wouldn't ever notice that he'd never said it – answered how he was. *Ha-ha*. Well, monkey.

You say, "How about giving you a little auditing, Joe?"

"Well, I don't think I'd... well, actually, we don't have much time, you know."

You're liable to have a materialization of dead body number one, dead body number two and dead body number three. And he just doesn't like to look at them. I mean, after you've killed people, been responsible for their deaths, you don't like to stand around looking at them. Some people don't. They're peculiar.

I know I have at times gloated. Not like you on the track, you've always been social about the thing. I've actually been crass enough to stand there and say, "*Ha-ha*," but it's not the thing to do, you know? So I have to withhold that.

Actually, he knows, because he's learned, that if he sits down in a certain type of room, this thing starts to loosen up and he starts to feel sort of peculiar, so he has to get very interested and he has to get very occupied and he never can sit quietly.

A woman made a funny remark to me one time. I told her – I said, "Well, I think I'll sit down for a while and rest."

And she said, "Well, what are you going to *do*?"

And I said, "Nothing."

"Oh, you're going to read, huh?"

"No, no, no. Just nothing."

"You're going to think about something."

"No, no, no."

"Why?"

All of a sudden she practically spun in, you know? The idea of just sitting down and not doing anything and not thinking about anything and not having your mind occupied – this caused her to get a sensation of spinning in.

What was that sensation? Well, you had to keep yourself distracted. If you didn't keep yourself distracted, something would appear.

Well, the question is what would appear? It's actually a mental image picture that will appear. And that's all that will appear. And they're *deathly* afraid of mental image pictures or the *appearance* of something.

All right. The fellow that you audit and audit and audit and audit and audit and go on and on and on and on and on and on and audit and they never get any pictures – *oooh*, you're dealing with a classic. You got a total suppression. Nothing's going to appear. What's the matter with him? Well, what's he afraid is going to appear? That's a simple question.

You make a list of things, "Who or what would be afraid to find out?" You're asking for appearance, you see? Just to have him list that. *Ahhhhhhh!* That would be the most horrible thing you ever tried to do to that poor fellow. Ruin him. Ruin his case. The odd part of it is, as you went at this and went deeper into it and opptermend the terminals you found and found other analogous lines and so on, you would get appearances. Place gets haunted from time to time, you know, the dead bodies start to show up. Yeah. He's got them all beautifully squashed. And sometimes they bleed green and this is very startling.

Now, sometimes somebody has been in a weakened condition, has suddenly taken his attention off one of these things and it's materialized. *Auggggggg!* Fair slaughtered him, it did. Actually, practically scared him out of his wits.

He'll say he's been blanketed. I know of a case sat down in – well, this case absolutely shattered – sat down in a dentist's office, I think it was, something like that or away in a doctor's office and all of a sudden, this fantastic, terrible, dizzying series of cones turned on over the body.

Case went stark staring mad. Went home and never left home from that year to the next until finally audited on an engram in old Dianetic days. Now, that's not one – just one case, see?

The case for a moment, peculiarly, just didn't not-is this particular mass and it went into action. Case changed its mind in a certain way and got this thing materialized, see?

Well, it was always there except they took their not-is off of it and it went *zzzzzzt*, and then they *stopped* it, see, with a new suppression.

And they said something had happened to them. Yes, that's true. Something had happened to them. They'd stopped not-ising for a moment. Pretty desperate. So this case in being audited, of course, afterwards, would be – very carefully not-is and then answer the auditing question. Not-is and then answer the auditing question. Except they wouldn't do it consciously, so that it'd never wear out. Well, the case wouldn't ever really ever make any progress, would it, at all. *Ha-ha-ha-ha*. Case knew they'd better not let their mind change.

Now, actually, there are some pretty hideous phenomena occur. There are various sensations and motions and sick stomachs and terror stomachs and backs of heads falling off and noses disappearing and all of a sudden the pc looks down and can't see himself from the thighs down; you know, it's just all vanished. You get upset.

Well, the thing to do is to go on through, see, and not let the pc stop on such a thing or be upset about such a thing because you're just running into an "is" and "it isn't" type of manifestation. And if you can get an "it is," you'll certainly sooner or later get an "isn't." And this used to upset auditors once in a while in the old days, when we were running Not-Know – not-knowing people's heads and hats and so forth and "What could you not-know about this one?" And auditors would go mad on this, you know, every once in a while. That'd – you'd never hardly get anybody to run this cleanly because the pc would say, "Well, yes, I did that."

And the auditor would say, oddly enough and mistakenly, say, "Well, did what?"

"Well, I not-knew his head, all right. He's walking down the street with no head."

And the auditor would get so curious at this moment – this was the worst trouble with this process, why we don't use it anymore – the auditor would get so curious that he'd stop and question the pc as to what happened and how it happened and everything else and then walk around in circles and not finish the process and skip the whole thing. Well, of course, this was terribly restimulative on the subject of this "not find out" button, wasn't it? You were running straight into the not-is and the auditor all of a sudden had been running a process – he didn't realize that he was in that much danger but he was running a process which would turn off and turn on not-is-ness. *Oohooohooohoooh, oohoooh*. Maybe it'd all go the other way, you see?

Many people don't have a time track. They have a series of not-is-nesses. Many people don't have any present time at all; they just have a generality of comfortable not-is. They are the calm people, you know? Calm as a whiz-bang on Guy Fawkes, Fourth of July.

Anyhow, the manifestations you see as a result of this particular activity of not-is brings about an is-ness. Because when the not-is-ness disappears, the is-ness materializes. And of course, it can be guaranteed to occasionally scare pcs spitless.

And after it's happened to him once, after that they make sure nothing happens to their case. "Oh, it's not going to happen to me again. No. I want to keep that from happening again," which is a no duplication and nothing happens. You see that?

An is-ness appeared because a not-is-ness ran out. Then you get a manifestation. You get pictures. Actually, solid objects will appear in a room right with the pc. All kinds of wild things will occur.

I know what this is because one time I was running – being run through something and ran into something. And I ran into a European battle where the columns of soldiers and the grass and the soldiers and everything and the guns and the smoke and all perceptions were much more there than present time was there. They were all lined up firing at each other in volleys, you know? It was quite a surprise, do you know? Quite a surprise.

It didn't last very long. I didn't have hardly time to duck before the...[laughs] But it was startling to say the least. Now, much brighter than this room appears at the moment, you see.

Facing up to and exchanging volleys with other company – in company front formations, you see. What bigger overt is there. About twenty paces between the ranks. Slaughter, you know?

Well, there is a lot of is-ness there, man, because, you see, firing the gun is an insistence on beingness, see? Somebody comes along and says, "You're not so much."

And you swell up at once like a frog, you know. *Pooooof*. See? "I is," see? "Here I is. I is. I'm big. I'm big shot. I'm not this thing you're trying to not-is." You see? Get the idea? "Ooooo." See?

Girl immediately puts on more lipstick. [laughter] Men swell up or fire guns. It all depends on what civilization you're living in. Girls adopt bustles and falsies. There's no telling what they'll do in the manifestation. But that's representing an is-ness, see!

Somebody else comes along, says, "They're no good," see. "They shouldn't do that." "Paint's bad. Dresses are bad." These things. "Everybody should be natural." All kinds of campaigns.

"Oh, my dear, what a beautiful hat. I've liked it ever since last year." [laughter]

Various types and degrees and grades, you see, of is-ness and not-is-ness, you know?

Well, of course, where a person in the bank has been asserting is-ness and somebody else has been asserting not-is-ness or somebody else has been asserting is-ness and where he has been asserting not-is-ness, you get – there are various bank phenomena. And they turn on and they turn off and one hardly knows what's happening.

But it's where they get stuck that the pc gets worried. So if he gets into these things, he gets afraid to find out. Things will materialize, you see? Something is liable to materialize. Something is liable to appear. God knows what will happen. He's got somebody talking about his bank, so Lord knows what's going to appear. He's just shocky on the subject of things appearing. That is the only thing wrong with this bad auditor.

He gets leery having things appear. Pc is liable to materialize something. He's liable to get restimulated. No telling what might happen.

Well, the thing to do is get him over being scared of this sort of thing. As I say, you can get him over it educationally. You can get him over it directly with a process. Before we only had education to get him over it. Now we have a direct process to get him over it. You can get a person over not-is-ness in various ways.

"It is. It isn't. It is. It isn't." That's kind of lengthy.

3D Criss Cross, various types of not-is-ness in Prepcheck questions. And more important than these other manifestations at the moment is... you can go ahead and do this and I'll give you a bulletin on it. And if it doesn't work out, why, that's fine. But I know it'll work out because I gave it a little more testing and checking – and that is a change in the Withhold Sys-

tem that gives you this same manifestation. Now, your Withhold System goes What, When, All and Who. Isn't that right?

Audience voices: Mm-hm.

And that's the totality of the Withhold System.

All right. Now, let's buck the Withhold System up and have it take care of suppressors. And I think you will find – although I don't guarantee this; I haven't done as much testing on this as I should have – I think you will find and that you'll be on safe ground, that it will run an engram if you do this. So that you could prepcheck and if you ran into an engram... And that's the primary reason why you shouldn't go whole track with the thing; it might not run an engram, you see? I think with this additive, I think you will find it'll run an engram – that's just a good guesstimate. That's an expert piece of guesstimate by my part – if you add Appear before you add Who...

You've got your Zero question. You get your What question. I've been working on this trying to make Prepchecking a little easier for you. And I have some other little changes in Prepchecking I'll give you later, but you can use this one at once. Now, these are just how you get the subject of your Zero question, so it doesn't influence what I'm talking to you about right now.

And you say When, just as you have been, All, just as you have been, Appear and Who. Now, how do you say Appear? "Well, what might have revealed itself at that point?" Or "What might have appeared at that point?" Or "Is there anything that should have shown up?" Or "Is there anything that didn't show up?"

You see, any variation on this subject of appear. "What might have revealed itself at that moment?" And just run that in before you say Who and What.

You say, "Well, what might have appeared?"

And the pc says, "Well, *ha-ha-ha*, the cops."

"Well, who didn't know about it?"

"Well the *police* of course."

Yeah, here we go. And you took the suppressor off the police. See? So this is just removing suppressors. Just a little mechanism for the removal of a suppressor off of a withhold, which should make the withhold much more rapidly cleanable.

I'm aiming in the direction, however, of using the – this question system of running an engram. I haven't expected it to run engrams. I've just been expecting to run locks of withholds.

But I think beefed up to that degree, there's a possibility that it will *directly* run engrams. Not that you use it directly on an engram, but if your pc got into one, there it'd go.

"What might have appeared?" Do you see?

"Should anything have appeared?" Anything that makes sense and just use the word "reveal" or "appear," (question mark). You get the maybe off of the thing. And just run that

in. It's all right. You can go ahead and make a few mistakes first time, you're getting used to the When, All, Who. Well, it's When, All, Appear, Who.

"Is that all of it? Well, what should have appeared? Okay, and who should have found out about that and didn't?" And I think it'll take the suppressors off.

Well, now there is the constituency and the consistency of the mind as regards to auditing. Talked to you first in the other lecture about the inhibitions of the auditor. This has been more on the basis of what happens with the pc.

And if the pc has something materialize which then mysteriously disappears and the pc sits there comfortably forevermore, *ha-ha*. I think you must have missed. Do you see how it would be?

Pc says, "Awful pain in the – . Well, that's all right now. Go ahead with the next auditing question. It's all right with me."

He just suppressed the living daylights out of that one. Well, how're you going to work around it? Don't. Because if you're running on suppressors, the rest of it will run out. Doesn't require any particular or special handling if you're running an appearance.

So the suppression that you often got – you know on running early sessions – have you noticed that running some early sessions, a person repressed past lives or repressed this or repressed that and so forth? Well, now running withholds, you'll probably pull off those suppressors and the thing shows up.

Now, there are possibly other ways of handling suppressors. There undoubtedly are. There are possibly neater ways of handling this and so forth and they will be developed as they develop. I personally at the present moment consider the ways I've given you completely adequate to your purposes.

All I need to give you now to smooth out your Prepchecking completely is a method of finding the Zero questions and so forth, accurately and instantly on this particular pc and I got that worked out, too. But it's late and I will talk to you about that next time.

Thank you.

TV DEMO: 3D CRISS CROSS ASSESSMENT, PART I

An auditing demonstration given on 20 March 1962

LRH: Okay. Here we are.

PC: I'm not doing that to the tone arm yet.

LRH: No, not yet. It's only at 18. [PC and auditor laugh] Good enough. Pick up the cans, would you?

PC: Yes.

LRH: All right with you if I begin this session now?

PC: Yeah!

LRH: All right. Here it is. Start of session. Session started for you all right?

PC: Hm, yes.

LRH: Feel nervous on this proposition or anything?

PC: *Not particularly, so long as I don't get flunked for TR 0.* [PC and auditor laugh]

LRH: All right. All right. Okay. Now, what goals would you like to set for this session?

PC: *Well, I may come out with an inappropriate one if I don't know whether it's going to be 3D Criss Cross or not, you know.*

LRH: 3D Criss Cross.

PC: *It is. Well, I have a nasty one. I think it'd be fun if we found two*

items. Then everybody would have to strain every nerve to try and get two per session. [laughs]

LRH: All right. All right. Well, what goal would you like to set for it?

PC: *I would like that. I think two would be nice if it came in pairs, you know.*

LRH: All right. To get two items, huh?

PC: *Hm.*

LRH: All right. Give me another goal.

PC: *For rudiments not to take forever. Not to have thousands of nasty, little, critical thoughts that read.*

LRH: Ruds not to take forever. All right. You want not to have nasty, critical thoughts?

PC: *Well, that's – that's what takes time on them, it seems.*

LRH: All right. Okay. Any other goal?

PC: *I think that'd do for the se –. Oh, yes, not to get carried away with trying to entertain the audience. This could be a temptation, you know. Put on a good show.*

LRH: All right. Okay. Now, any goals you'd like to set for life and livingness?

PC: *Well, there is. And it's kind of peculiar.*

LRH: All right.

PC: *It comes in steps. If I could just get rid of this body in an honorable fashion, you see, and pick up an English boy.*

LRH: Yes?

PC: *Six years old or older. A good family*

LRH: All right.

PC: *... who would then get sent to a very good prep school ...*

LRH: All right.

PC: *... enter the Royal Navy at – at least, well, hopefully twelve and not later than fourteen.*

LRH: Okay. All right. Good enough. Twelve or fourteen.

PC: *Yes.*

LRH: All right. What other goal would you like to set for life and livingness?

PC: *That'll do it.*

LRH: That'll do?

PC: *Yeah, oh, yes. There is. You're right, there's another one. Uh – I would like to be a high enough state of Release at that point so that I could keep bad vision from keying in on it, and getting put out to pasture and not being accepted.*

LRH: All right. Good enough. All right. Now, look around here. Tell me if it's all right to audit in this room.

PC: *Yeah.*

LRH: All right. What Havingness was I running on you last?

PC: *Good old "Look around here and find something you could have." It's been working ever since.*

LRH: All right. Well, let's do that for a couple of minutes.

PC: *Yeah.*

LRH: All right. Look around here and find something you can have.

PC: *You.*

LRH: Good. Look around here and find something you can have.

PC: *Yeah, that thing.*

LRH: Good. Look around here and find something you can have.

PC: *Well, that cot.*

LRH: Good. Look around here and find something you can have.

PC: *The door.*

LRH: Good. Look around here and find something you can have.

PC: *Yeah, I can have that camera.*

LRH: Good. Look around here and find something you can have.

PC: *Couch.*

LRH: Good. Look around here and find something you can have.

PC: *I could very definitely could have that cot. It's the right sort.*

LRH: All right. Okay. Look around here and find something you could have.

PC: *That wall.*

LRH: Good. Look around here and find something you can have.

PC: *The top part of that.*

LRH: Okay. Look around here and find something you can have.

PC: *Yeah. At least the lid to the meter.*

LRH: All right. Look around here and find something you can have.

PC: *That shelf.*

LRH: Good enough. Look around here and find something you can have.

PC: *Well, the – you know – the marble part of the fireplace.*

LRH: All right. Look around here and find something you can have.

PC: *Your blazer.*

LRH: Okay. Look around here and find something you can have.

PC: *That wall.*

LRH: All right. I'm going to give you this command just two more times and end this process if that's all right with you.

PC: *Sure.*

LRH: All right. Look around here and find something you can have.

PC: *The glass in the doors.*

LRH: Good. Look around here and find something you can have.

PC: *Yeah. The couch.*

LRH: All right. Okay. Now, look around here and tell us if it's all right to audit in this room.

PC: *Yeah.*

LRH: All right. Good enough. Squeeze the cans. Now there – that's still

way too high. Squeeze the cans. That's fine. Okay. Good enough. All right. Are you willing to talk to me about your difficulties?

PC: *Good Lord, yes.*

LRH: All right. Okay. Can't find too much wrong with that. Let me ask you again. Are you willing to talk to me about your difficulties? Talk to me. Are you willing. Are you willing to talk to me about your difficulties? Yeah, all right.

All right. Are you withholding anything?

PC: *Well, I was withholding just then the comment that some of my goals are kind of an overt on you and the subject.*

LRH: All right. All right. Now, I started you out here at about 4.0 and for some reason or other you've come down to about 3.25.

PC: *Hm.*

LRH: And...

PC: *I've been living in more civilized regions of the tone arm since those first two items.*

LRH: Yes, isn't that interesting?

PC: *Mm.*

LRH: I've been looking at this. All right. Are you withholding anything That's too latent for me to bother with. Okay?

PC: *Mm.*

LRH: All right. Do you have a present time problem? Now, there's a tick on that. What's the present time problem? Do you have a present time problem that you might have a present time problem?

PC: *Well, it could be that. Yes. Yes.*

LRH: Do you? Could you?

PC: *Just a little bit, yeah.*

LRH: I get a little bang.

PC: *I could certainly round some up.*

LRH: Yeah, we're not trying to push it home.

PC: *No. I know. I know.*

LRH: I did get a fall.

PC: *Mm.*

LRH: All right. Do you have a present time problem? Yeah. All right. Something going on here?

PC: *I think it's auditing. I'm not really comfortable about it.*

LRH: All right. Well, do you know that the listing we're going to do on 3D Criss Cross tonight is directly in the – aimed in that direction.

PC: *All right. Very good.*

LRH: All right. Now, do you have a present time problem? All right. It's not on the question. Do you have a present time problem? Present time? I'm getting needle behavior but not in response to my question.

PC: *All right.*

LRH: All right. Very good. All right. Now, do you feel all right about auditing here?

PC: *Yeah.*

LRH: Now, you recognize, don't you ... You do realize that I am not extremely concerned with a demonstration here.

PC: *Uh-huh.*

LRH: I couldn't care less.

PC: *Yes.*

LRH: It's merely an opportunity to give you a little bit of auditing. And I'm very interested in this list on revelation. You know, the list on lines, 3D Criss Cross lines here.

PC: *I'm sure I'll be fascinated.*

LRH: And I'm going to do a line assessment on you.

PC: *Mm!*

LRH: I'm going to add one more line. We're going to do a little assessment here, and what I'm going to do is read these things down the line.

PC: *Mm-hm.*

LRH: And I want a dial drop proposition.

PC: *Yeah.*

LRH: Would you squeeze the cans? I'm trying to get a dial drop.

PC: *Yeah.*

LRH: Squeeze the cans. Squeeze the cans. That's better. Going to have to have just one more here. Squeeze the cans. All right. Squeeze the cans. That's it. That's fine. That's fine. That ought to read like a bomb.

I got a whole bunch of these things, and I would like to take up a read on them ...

PC: *Mm-hm.*

LRH:... and see which one of these lines ...

PC: *Is twitchenin'.*

LRH: ...you would like to have listed. Or on this particular type of line ...

PC: *Yes?*

LRH:... what line you would rather not have. [PC and auditor laugh]

PC: *I don't care. I haven't felt so gloriously irresponsible in weeks.*

LRH: All right. Okay. Get this range here so that I can assess them all right.

Now, these are routine 3D Criss Cross lines, and somewhere on this thing we might find one that's a little hotter than others. And that is the one we will list.

PC: *Mm.*

LRH: So now I'm simply going to read these lines to you.

PC: *Mm-hm.*

LRH: I'm just going to read these lines. And you're going to sit there in a glorious state of irresponsibility. Okay?

PC: *Yes.*

LRH: All right. Now, who or what would be afraid to find out? All right. One division.

Who or what would prevent a discovery? Thank you.

Who or what would startle someone? ... [PC laughs]

Now, we get about a two division – two division rock slam. I just remembered something. This is your old pal "surprise."

PC: *Yes, yes.*

LRH: I'm going to put that down as an additional line, knowing your case, man.

PC: *All right.*

LRH: Who or what ... All right.

Now, who or what would be unsafe for you to reveal? Mm-hm. Who or what

would be dangerous for another to reveal? All right. Who or what would suppress an identity? ... Who or what would suppress an identity? That's about one division.

Who or what would make knowledge scarce? That's two divisions.

Who or what would not want a past? All right.

Who or what would be unconfortable?

Yeah. Who or what would you suppress? All right.

Who or what would you surprise? Oh, you must have run that button out a long time ago. That had the least effect.

PC: *No kidding. Well, "startle" is sort of more so.*

LRH: Yeah. Yeah. It's much more the thing.

Now, who or what would make another realize he or she hadn't won? Okay.

Who or what should be disregarded when you're getting something done? All right.

Who or what would prevent another from winning. Mm-hm.

I think we've got it here on just a one-pass line.

PC: *Mm-hm.*

LRH: Let me check it, however. I'm not going to do this by elimination.

PC: *Yeah.*

LRH: This is just a sort out, you know.

PC: *Yeah.*

LRH: Who or what would be afraid to find out? All right.

Who or what would startle someone? That's interesting.

Who or what would make knowledge scarce?

Well, the most reaction I'm getting here: am I getting a reaction on just who or what ...

PC: *I just realized something. I just realized something on at least that last one, one fingernail of one hand was touching the other can. I hadn't noticed it got that close. And I don't know whether they touched or not that time when you were reading. Sorry.*

LRH: I didn't get any reaction on that.

PC: *Yeah.*

LRH: But I – who or what would startle someone? That's the only – that's the largest R/S that I've gotten. So I'm going to run it.

PC: *That's the most fun I can think of. [laughs]*

LRH: Ah, dear. But we get the same reaction now as "Who or what would be afraid to find out?" Now, who or what would startle someone? That's getting in there quite consistent. And we also got a nice action on "Who or what would make knowledge scarce?" We're not getting a similar reaction now.

All right. We're off to the races. That's what we're going to buy. And, "Who or what would startle someone?"

Yes, page 1, "Who or what would startle someone?"

All right. If I can find where I put your report here. We oddly enough are losing tone arm down the line here, and we only got about 2.6 on this tone arm.

PC: *Hm!*

LRH: Which is quite remarkable.

PC: *Don't tell me I'm going to have to give up my goal of being the only person with a female body ever to go Clear at 3.0. [PC and auditor laugh]*

LRH: That's a good one. All right. And we start listing here at 2.6 at 8:20. All right. And we're all set. Now, now, we're all set.

PC: *Oh, yes, I have the first three answers choked back.*

LRH: All right. All right. Give me number 1.

PC: *U-boat commander, of course.*

LRH: A...

PC: *U-boat commander.*

LRH:... U-boat commander. I'll bet he would.

PC: *Yes. And the "what" is a torpedo.*

LRH: All right.

PC: *That's very startling*

LRH: What's the next one?

PC: *Did you get "torpedo?"*

LRH: Oh, I didn't get the torpedo.

PC: *That's the what. That's a what. Yes.*

LRH: All right.

PC: *I don't know if there's anything else that's really startling, except a cavalry charge.*

LRH: All right.

PC: *But that's not a terminal exactly.*

LRH: It's "what". All right. Here's the question. Who or what would startle someone?

PC: *A joker.*

LRH: Okay. Good. Who or what would startle someone?

PC: *Wild animal.*

LRH: All right. Who or what would startle someone?

PC: *This isn't exactly someone. But I'm thinking of a horse and how awfully startled they get by blown paper.*

LRH: All right. What's the answer there?

PC: *I guess it's blown paper.*

LRH: All right.

PC: *And the horse isn't exactly a who, but it's almost. It's more of a who than a what. I mean someone.*

LRH: Well, is a horse there, too?

PC: *A sort of a someone. Yes. You know, you're asking here what would startle someone. Someone here would be a horse.*

LRH: All right.

PC: *They get awfully startled by blown paper.*

LRH: All right. Who or what would startle someone?

PC: *Well, something exploding under them.*

LRH: All right. Okay.

PC: *One of the most startling things on Earth is deep, cold water, if you suddenly find yourself in it.*

LRH: Deep, cold water.

PC: *Strictly for the birds.*

LRH: Very good. Who or what would startle someone?

PC: *Well, a polar bear.*

LRH: Okay. Who or what would startle someone?

PC: *A low-flying plane.*

LRH: All right. Who or what would startle someone?

PC: *The dog you didn't know was there.*

LRH: Good. Who or what would startle someone?

PC: *Something falling.*

LRH: All right. Good. Who or what would startle someone?

PC: *A car in the wrong place.*

LRH: Okay. Who or what would startle someone?

PC: *A burglar could.*

LRH: Okay. All right. I'm getting a little surge here.

PC: *I've got another one sort of sitting here waiting It sort of came up right ...*

LRH: Where?

PC: *... after the burglar. A murderer could be very startling*

LRH: A murderer.

PC: *A murderer.*

LRH: Ah, a murderer. Okay. Good enough. Who or what would startle someone?

PC: *Well, a spook or ghost.*

LRH: All right. You want both of those or only one?

PC: *Probably both. I'm not sure which seems better.*

LRH: Good. Who or what would startle someone?

PC: *These days, anything along the line of a fairy or an elf would be very startling.*

LRH: All right. Which is it?

PC: *Fairy is somewhat preferable.*

LRH: All right.

PC: *An elf would also be startling.*

LRH: All right. Okay. Who or what would startle someone?

PC: *God knows why, but a brick wall.*

LRH: Okay. Good enough. Now, who or what would startle someone?

PC: *If something dropped on his head.*

LRH: Okay. Who or what would startle someone?

PC: *A mouse.*

LRH: All right. Okay. Any more items? Yeah, what did you think of?

PC: *Something else white. Not quite a spook and not quite a polar bear. Oh, an iceberg. Oh, yes.*

LRH: Okay. All right. Okay. Who or what would startle someone?

PC: *I've already got one plane, but this isn't a low-flying one. Oh, this is one coming out of a cloud. Like several of them.*

LRH: How do you say it? Plane coming out ...

PC: *Plane coming out of a cloud.*

LRH: All right. Who or what would startle someone?

PC: *I don't know if it's called racing car or fast driven car. It's a car going zzzzz right by your nose, you know.*

LRH: All right. I don't mean to be critical...

PC: *Mm.*

LRH: Are you seeing pictures of these?

PC: *Yes.*

LRH: Are you picking these up off your pictures?

PC: *I think quite a few of them, yeah.*

LRH: You are.

PC: *Mm.*

LRH: All right, I just wanted to know that.

PC: *Yeah. They kind of pop up. You're looking at me shrewdly.*

LRH: Yes, I'm looking at you shrewdly.

PC: *Hm-mm?*

LRH: I'm not getting enough tone arm action.

PC: *All right.*

LRH: So here's the contest. How do I get more tone arm action ...

PC: *Mm.*

LRH:... without invalidating you or messing you up in some way here. But you're – you're doing something. You're looking at the bank and watching a picture come up and then you're giving me ...

PC: *Yeah, they kind of – they're popping up. They're, you know, kind of like flash answers. I'm not figuring on particularly.*

LRH: Now, this is a terrible thing to show in front of students and that sort of thing, because it's all supposed to go off ...

PC: *If you would like me to figure on them, that's okay.*

LRH: I don't want you to figure on them ...

PC: *Yeah.*

LRH:... particularly or otherwise.

PC: *Yeah.*

LRH: But you're calling shots that are appearing.

PC: *Yes, that's right. That's exactly it.*

LRH: Yeah, well, let me tell you something. This list is going to be about eight thousand items long if we continue to do it this way.

PC: *Yes, I imagine it might be. Yes.*

LRH: Because we would just go on and run through this automaticity.

PC: *Ah, yeah.*

LRH: Now, that's perfectly all right.

PC: *Mm.*

LRH: That's perfectly all right to call what you're looking at.

PC: *Mm. But it might get more tone arm action if I actually considered what might startle people. You mean, sort of.*

LRH: It just might.

PC: *All right.*

LRH: Quite in addition to that, those that are popping up are perfectly safe, aren't they?

PC: *Not all of them.*

LRH: Well, would you be able to confront most of these?

PC: *Most of them, I think. There are some I find hard to confront. Fast cars, icebergs. Well, it'd depend on what situation.*

LRH: Now, this is a terribly bad example ...

PC: *Yes, yes.*

LRH: ... of auditing I'm giving here. And have I invalidated you?

PC: *No.*

LRH: No, I haven't. All right.

PC: *No.*

LRH: That's fine.

PC: *No.*

LRH: But there – I know from the amount of rock slam I gave on that thing that this is charged.

PC: *Mm.*

LRH: And I'm not getting a representation of that charge here.

PC: *Oh. In other words, if I looked around me for something that was something really startling, you know, and figured on it a little what would really startle somebody.*

LRH: Yes, that's right.

PC: *All right. Yes, I could do that. Yes. Yes.*

LRH: All right. You go ahead and do that now. Tell me who or what would

startle someone? Yeah, we got a reaction to one there.

PC: *Well, this isn't very violent, but it is what I thought of – if you lean forward and suddenly clap your hands together right near somebody's face, you know.*

LRH: All right.

PC: *Usually flinch.*

LRH: All right. Good. Who or what would startle someone?

PC: *Arresting them when they haven't done anything is very startling.*

LRH: Okay. Who or what would startle someone?

PC: *Somebody suddenly throwing you into deep water. That was one I do have trouble confronting.*

LRH: Mm. That's right. That's right.

PC: *I find it most unpleasant.*

LRH: Okay.

PC: *Good heavens, yes.*

LRH: Hm?

PC: *Shooting someone's horse out from under them is very startling and very unpleasant.*

LRH: You see why I called this shot.

PC: *Mm.*

LRH: There's a difference here, isn't there?

PC: *Mm. Yeah. We're really looking for things at the moment.*

LRH: Good. Who or what would startle someone?

PC: *Cops are very startling if they show up at the wrong time and the wrong place, you know, when you don't expect them.*

LRH: All right. How do you state that?

PC: *How I found them startling was to find them at home one time when I didn't think there'd be any. There were cops in the home or in your home.*

LRH: Is it cops in a home?

PC: *Yes. The cops in your home. It isn't where they belong. They belong out in the street someplace.*

LRH: All right. Very good. Okay. Now who or what would startle someone?

PC: *A kidnapper would startle someone.*

LRH: Yeah, all right. Okay. Who or what would startle someone?

PC: *Well, a particular sort of prowler who would be somebody who was out in somebody's garden in the dark hiding behind the bushes and shot them in their own house through a window. Prowler would do.*

LRH: A prowler.

PC: *That's a prowler.*

LRH: All right. Good. Now who or what would startle someone?

PC: *Well, somebody who turned out to be totally different from what you expected, you know. You figured they were one kind of person; all of a sudden they turn out to be totally different.*

LRH: All right. How would you call this?

PC: *Yeah. Sort of somebody with a lot of different facets. It's not quite an*

unpredictable person though it comes close to it.

LRH: Well, can we put that down?

PC: *Yeah, yeah.*

LRH: Any other way you'd describe this? Could you say it a little closer?

PC: *Yeah, it'd be somebody you thought you knew through and through, and all of a sudden they were – you found out you were quite wrong. And it's not that they're a hypocrite.*

LRH: Well, just give it a name.

PC: *It's a sort of somebody with unexpected characteristics, you know, or traits.*

LRH: Somebody...

PC: *With unexpected traits.*

LRH:... with unexpected traits. All right. Very good.

PC: *And for some reason, that gives me a very faint pain in the eye.*

LRH: All right. All right. Now, who or what would startle someone?

PC: *Well, it's an awful late one. But a bad auditor, I guess because he's always dropping ashtrays. Bad auditors startle people.*

LRH: Okay. All right. Who or what would startle someone?

PC: *Snakes are startling if they appear suddenly underfoot. Snakes. When they suddenly appear underfoot, you know.*

LRH: Okay, okay. All right. Who or what would startle someone?

PC: *Hey, that can be really startling. Because if you pick up an animal body, then nobody knows a real person is*

running it. They think it's just an animal. Man, can you startle people.

LRH: How do you call that, now?

PC: *Somebody running an animal body. "A person running an animal body" would about do it, you know.*

LRH: A person running an animal body. All right. Yes, I imagine that would be very startling.

PC: *It was hilarious. I think I've done it from time to time.*

LRH: Okay. All right. Who or what would startle someone?

PC: *I just started to think of something, and it went away. It started to be something like one of those things you were describing when you take somebody who's drunk and change the furniture all around, you know.*

LRH: Mm-hm.

PC: *It's uh – well, sort of a totally changed milieu, you know.*

LRH: A what?

PC: *It's a totally changed milieu, you know. They think they're in one place, and it's – it's – it gets all changed on them.*

LRH: Yeah. All right. Describe it. Give me a word. Give me a descriptive term for it.

PC: *I don't think there is an exact one in the language. Total change of surroundings, but it's – it's – it's predicted. It isn't so startling*

LRH: All right.

PC: *It's your own place that's been all changed around on you. A changed around place, I guess, would do it. It's a place that's been all changed around.*

LRH: All right. A place that's been all changed around.

PC: *Yeah.*

LRH: Okay. Who or what would startle someone?

PC: *Somebody trying to murder you is often startling. It isn't always.*

LRH: Mm. Well, how would you call that? Just name it.

PC: *Well, we have it as murderer.*

LRH: Mm.

PC: *Attempted murderer, maybe.*

LRH: Attempted.

PC: *Yeah. Attempted murder. Somebody's trying to kill you. And you – particularly if you don't know why.*

LRH: All right. Somebody trying to kill you?

PC: *Mm.*

LRH: Is that it?

PC: *Especially if you don't quite know why. You know?*

LRH: Somebody trying to kill you, and you don't know why, huh?

PC: *Yeah.*

LRH: Well, all right. Very good. All right. Good.

PC: *Actually, the most startling thing I can think of is somebody who has really evil intention. It always surprises me.*

LRH: An evil intention.

PC: *Yeah. Somebody who has a – simply has an evil intention. They always startle the hell out of me.*

LRH: All right.

PC: *It's one of the things I can hardly bear to find out, that somebody really means harm.*

LRH: All right. Is that another one? That – "Somebody who really means harm?"

PC: *Yeah. Sort of outside of agreed-on circumstance. I mean, somebody shooting at you in a war doesn't come under that heading.*

LRH: All right. Who or what would startle someone?

PC: *I've gone kind of blank on the subject.*

LRH: Just give me anything that comes to mind.

PC: *Yeah, something – something out of the wrong time stream. You know, like a pterodactyl if you suddenly saw it in a modern bird migration. Something archaic. Something or other – what's the word? Anachronistic.*

LRH: All right.

PC: *Yeah.*

LRH: Good enough. Something out of the wrong time stream?

PC: *Yeah. You know ...*

LRH: Is that how to describe it?

PC: *You went out here in the road and saw something riding along in armor or something You know, you'd be kind of startled.*

LRH: Mm. All right. Okay. Now, who or what would startle someone?

PC: *Somebody suddenly springing out of hiding.*

LRH: All right.

PC: *An ambush. Meaning sort of the people in it, you know. The people in an ambush. They're very startling.*

LRH: Well, what do you call the people in an ambush?

PC: *I suppose "ambushers" or something like that.*

LRH: All right. Call them anything else?

PC: *Yes, but not printable.* [PC and auditor laugh]

LRH: All right. Okay. Now, are there any more?

PC: [giggles] *It's a little bit startling.*

LRH: What did you think of?

PC: *Civilians.*

LRH: Hm?

PC: *Civilians. Very startling.*

LRH: Civilians?

PC: *Yes.*

LRH: All right. Very good. All right. Is that all of these? Now, there's a little tick.

PC: *Well, that's – that's – I don't know how to describe it, but somebody that has a viewpoint utterly different from yours.*

LRH: Somebody...

PC: *Actually, it isn't they're so much startling; they're baffling. You know, it isn't a sudden startle. It's just you can't wrap your wits around it.*

LRH: So that – this one wouldn't work.

PC: *Not really. It's not really startling. They're baffling.*

LRH: All right. All right. Who or what would startle someone?

PC: *Well, somebody – if you're being carried, either because you're an infant or are injured, and some other person carrying you drops you, it's very startling. It's somebody who drops you.*

LRH: Is it "somebody who drops you"?

PC: *Somebody who drops you.*

LRH: All right. Okay. All right. Are there any more of these? Are there any more of these? Any more of these? Kind of non-responsive. You got others?

PC: *Not – not on the tip of my tongue, so to speak. I'm sure I could think of other ... Well, I mean the world is full of these. There's hardly a thing in the world you couldn't use for startling somebody.*

LRH: Well, yes, let me tell you – ask you this. Is the item on this list?

PC: *Well, I rather think so, somewhere along the line.*

LRH: You think it might be? Do you have ...

PC: *Well, I don't know which. I'm not really ...*

LRH: All right. Well, have you – do you have a feeling like you've given me an item? Or do you feel like – a feeling like you haven't expressed an item yet?

PC: *No. Right at the moment I feel kind of – kind of blank on the subject. I know I could think of more.*

LRH: Mm. All right. Well, just for kicks ...

PC: *Mm.*

LRH: Just for kicks ...

PC: *Mm.*

LRH:... we're going to take this now, and I'll ask you just one more time.

PC: *Mm.*

LRH: Who or what would startle someone? We've had a consistent reaction on Who or What, but it doesn't much matter with what follows it.

PC: *Mm.*

LRH: You feel all right about this now? You think – you think this might be on the list?

PC: *Yes, I do.*

LRH: All right.

PC: *I did think of one more when you asked then.*

LRH: What is it?

PC: *He's making my fingers twitch, and I've been going on for weeks now. It's somebody who uses a weapon in the other hand than what you expect. A left-handed person would almost do it.*

LRH: Well, what do you call this person?

PC: *I think "a left-handed person" would do it, though there are places where that's a custom – that somebody uses the wrong hand.*

LRH: It's somebody who uses the wrong hand?

PC: *Who uses the wrong hand. Yes.*

LRH: All right. All right.

PC: *Yes, indeed.*

LRH: Does that make your finger twitch?

PC: *I've been getting this finger twitching in the left hand on being asked withhold questions for weeks now. I don't know what does it.*

LRH: All right. Are there any more on this? It's awful quiet.

PC: *It feels quiet.*

LRH: All right. I'll tell you what we're going to do.

PC: *Mm.*

LRH: We didn't get too much tone arm action on this, you see.

PC: *Mm.*

LRH: So I'm perfectly willing to skimp it, see.

PC: *Uh-huh, hm.*

LRH: And perfectly happy to do that and carry on through. You had a goal to get a couple, and we might even get somewhere in that direction. Okay?

PC: *Fair enough.*

LRH: If we come along ...

PC: *Yeah, it's not a burning thing with me. It'd be kind of fun to.*

LRH: All right. Okay. Now, I'm just going to read you this list.

PC: *Uh-huh.*

LRH: And we're not these days differentiating by tearing things off the list.

PC: *Mm.*

LRH: You can have all of these.

PC: *Mm-hm.*

LRH: But I want you to say "Yes" or "Mmhm," or "Nm."

PC: *Signifying what? That it's appropriate or I changed my mind ...*

LRH: All right. Something of the sort. Just – no, actually, just telling me you considered it.

PC: *All right.*

LRH: I just want to know you considered it, that's all.

PC: *Oh, all right.*

LRH: If you considered it, that's good enough for me.

PC: *Mm.*

LRH: All right. Would a U-boat commander startle someone?

PC: *For sure.*

LRH: All right. Would a torpedo startle someone?

PC: *Mm-hm.*

LRH: Good. Would a cavalry charge startle someone?

PC: *Mm-hm.*

LRH: Good. Would a joker startle someone?

PC: *Mm.*

LRH: What's this joker thing?

PC: *Well, sort of a practical joker. Somebody who's witty, comes out with something unexpected.*

LRH: All right. Would a wild animal startle someone?

PC: *Mm.*

LRH: All right. Would blown paper startle someone?

PC: *A horse.*

LRH: Yeah. Well, does that answer the question?

PC: *Yes, yes.*

LRH: All right. All right. Would something exploding under them startle someone?

PC: *Yes, indeed.*

LRH: Yeah, all right. Would deep, cold water startle someone?

PC: *Christ, yes.*

LRH: All right. Okay. Would a polar bear startle someone?

PC: *Mm.*

LRH: All right. Would a low-flying plane startle someone?

PC: *Mm.*

LRH: All right. Would a dog you didn't know was there startle someone?

PC: *Someone.*

LRH: All right. Would something falling startle someone?

PC: *Mm-hm.*

LRH: All right. Would a car on the wrong place startle someone?

PC: *Mm.*

LRH: Okay. Would a burglar startle someone?

PC: *Mm-mm.*

LRH: All right. Would a murderer startle someone?

PC: *Mm.*

LRH: Okay. Would a spook startle someone?

PC: *Hm-mm.*

LRH: All right. Would a ghost startle someone?

PC: *Mm.*

LRH: All right. You got an ARC break?

PC: *No.*

LRH: Yeah, what's that? You had a little thought? There's some little tick. Somewhere along here.

PC: *Oh, heavens, I was just thinking. I'm still worried about, "officer." I was hoping, "U-boat commander" would stay in because I feel as if we almost got rid of "officer," and I liked it so much.*

LRH: All right.

PC: *That kind of train of thought sort of went through fast at some point, yes.*

LRH: All right. Okay. All right. That gave us a little change of line here.

Okay. Would a ghost startle someone?

PC: *Yeah.*

LRH: All right. Would a fairy startle someone?

PC: *Mm. It shouldn't.*

LRH: All right. Would an elf startle someone?

PC: *Hm-mm.*

LRH: Okay. Would a brick wall startle someone?

PC: *Mm.*

LRH: All right. Got any other ARC breaks here? Ah, what's that one?

PC: *I don't know. Body feels kind of peculiar. I feel as though I have kind of a ... It's hard to describe. It's a strange kind of – sort of this tight sensation in the stomach and kind of push in front of the body.*

LRH: Mm. Mm. Well, does this have anything to do with something I've done to you?

PC: *I don't think so.*

LRH: There's a little bang here. I must be doing something here.

PC: *Well, I'm thinking this. I'm not quite pleased with some of the items on it.*

LRH: Oh, yeah, yeah, well, have I done something you didn't like? No. Have you done something you thought I wouldn't like? What's that?

PC: *The closest to that was back there when I was taking them as they popped up.*

LRH: Oh? Do – now, do you consider that's still critical?

PC: *Critical? No. No. You hadn't given me any particular way of doing it.*

LRH: All right.

PC: *I did it whatever way seemed natural till you told me ...*

LRH: All right. All right. All right. Did it go better or worse afterwards?

PC: *I don't think it made a great deal of difference. I mean maybe it made a difference in the tone arm, because it didn't seem to make much difference here.*

LRH: Didn't make much difference.

PC: *I worked a little harder. That's all.*

LRH: All right. Now, do you have an ARC break? Do you have an ARC break? Have you got an ARC break with somebody else? Now, who have you got an ARC break with? Not just plowing up the ground needlessly. ARC break?

PC: *I don't feel tremendously ARC break with anybody. I feel an ARC break with the body, but then I usually do.*

LRH: Oh, you do have an ARC break? Yes. Well, who's this ARC break with?

PC: *With the body.*

LRH: All right. Good. Do you have an ARC break with your body? That's the one. All right. Now, the thing I'm trying to isolate here ...

PC: *Mmm.*

LRH: What? You just think of something else?

PC: *No.*

LRH: All right. Now, the thing I'm trying to isolate here is, do you have an ARC break with me? No, I don't find anything, unless it's just delaying your session at this point.

PC: *Very mildly. You didn't do anything that's put me at ... oh, I didn't know I was acting out of session when you first inquired about an ARC break.*

LRH: Oh. I see.

PC: *I was wondering sort of what the 1/20th slip out was that you noticed.*

LRH: It just all of a sudden – all of a sudden all of your items went cool.

PC: *Oh, all right. Yeah, all right. Yes, fair enough.*

LRH: All right. All right. I'll go over ...

PC: *Ooh, way back.*

LRH: What's that?

PC: *A slight mystery. At one point you said, "Very interesting," and I*

kind of felt an impulse to say, "What was very interesting," and I didn't.

LRH: Oh, I see. All right.

PC: *I don't deeply care but it just kind of popped up as a little unknown back there. I never did find out. I presume it was the needle reaction.*

LRH: All right. All right. All right.

PC: *That was a long time ago.*

LRH: Okay. Well, good enough. Do you have an ARC break? No. Good.

PC: *That feels colder. Cooler. Next time I'll ask.*

LRH: Okay. Well, let's carry on with this. Now, we got it at – third yawn here. Here we go. A brick wall. Would that startle someone?

PC: *Mm.*

LRH: All right. Would something dropped on his head startle someone?

PC: *Yes.*

LRH: All right. Would a mouse startle someone?

PC: *Mm.*

LRH: All right. Would an iceberg startle someone?

PC: *God, yes.*

LRH: Just reading about the *Titanic*.

All right. A plane coming out of the cloud. Would that startle someone?

PC: *Mm.*

LRH: All right. Would clapping hands together in front of somebody's face startle someone?

PC: *Yeah.*

LRH: All right. Would arresting them when they haven't done anything startle someone?

PC: *Yes.*

LRH: All right. Would somebody suddenly throwing you into deep water be startling?

PC: *Mm.*

LRH: All right. Would shooting someone's horse out from under him startle someone?

PC: *Yes.*

LRH: All right. All right. Would cops in your own home startle someone?

PC: *Mm.*

LRH: All right. Would a kidnapper startle someone?

PC: *Sure.*

LRH: All right. Would a prowler startle someone?

PC: *Yes.*

LRH: Good. Would an unpredictable person startle someone?

PC: *Mm.*

LRH: Good. Would somebody with unexpected traits startle someone?

PC: *Yeah.*

LRH: All right. Would a bad auditor startle someone?

PC: *Mm-mm.*

LRH: Good. Would a snake startle someone?

PC: *Yeah.*

LRH: All right. Would a person running an animal body startle someone?

PC: *Yes, indeed.*

LRH: All right. Would a place that's been all changed around startle someone?

PC: *Yeah.*

LRH: All right. Would somebody trying to kill you and you didn't know why be startling?

PC: *Yeah.*

LRH: All right. Would an evil intention startle someone?

PC: *Mm.*

LRH: All right.

PC: *That's sort of "an evil-intentioned person."*

LRH: You want to change that to an evil ...

PC: *I don't – I didn't intend it as just an evil intention. It'd be somebody with an evil intention, an evil-intentioned person.*

LRH: Well, you'd say an evil-intentioned ...

PC: *Yeah per – per ... Yeah. An evil-intentioned person.*

LRH:... person.

PC: *Or person with an evil intention.*

LRH: All right. Very good. That somebody really means harm?

PC: *Mm.*

LRH: All right. Would something out of the wrong time stream startle someone?

PC: *Sure.*

LRH: All right. Would somebody suddenly springing out of hiding startle someone?

PC: *Yeah.*

LRH: All right. Would ambushers startle someone?

PC: *Yes, they would.*

LRH: All right. Okay. Would a civilian startle someone?

PC: *Yes.*

LRH: Would somebody who drops you startle?

PC: *Yeah.*

LRH: All right. And somebody who uses the wrong hand startle?

PC: *Kind of.*

LRH: Yeah. Okay. So far, so good. Now we will proceed on to null this list, if that's all right with you?

PC: *Yes.*

LRH: Hm? All right. Let's set this up. Okay. See if we can get someplace with it.

PC: *Mm.*

LRH: All right. Okay. Here we are.

PC: *Mm.*

LRH: Anything you'd care to ask or say before I start in on the nulling?

PC: *No, it's just that it feels like I expected something very exciting to happen. Like rockets to shoot off out of my ears or something.*

LRH: All right. Okay. All right.

A U-boat commander. A U-boat commander. A U-boat commander. Thank you. That's in.

Torpedo. Torpedo. Torpedo. Thank you. That's in.

Cavalry charge. Cavalry charge. Cavalry charge. Thank you. That's in by the grace of its bits. All right.

A joker. A joker. A joker. Thank you. That is out.

A wild animal. A wild animal. A wild animal. Thank you. That is in.

Blown paper. Blown paper. Blown paper. Thank you. That is in.

Something exploding under them. Something exploding under them. Something exploding under them. Something exploding under them. And that is out.

Deep, cold water. Deep, cold water. Deep cold water. Thank you. That is in.

A polar bear. A polar bear. A polar bear. Thank you. That is in.

A low-flying plane. A low-flying plane. A low-flying plane. Thank you. A low-flying plane. And that is out.

A dog you didn't know was there. I'm afraid that's in. [PC and auditor laugh]

PC: *Well, at least you haven't got tugmate – tugboat – mate back.*

LRH: What's that? Is that ...

PC: *That was the one that wouldn't go away on a list once.*

LRH: Oh, yeah. All right.

Something falling. Something falling. Something falling. Something falling. Yeah, that's in. Thank you.

A car in the wrong place. That's in. [PC coughs]

All right. Give the cans a squeeze, would you? Ah, that's fine. That's looser. Everything's fine.

PC: *Good.*

LRH: A burglar. A burglar. A burglar. Thank you. That is in.

A murderer. A murderer. A murderer. Thank you. That is in.

A spook. A spook. A spook. A spook. That is questionable. A spook. Ah, that's in. Thank you.

A ghost. A ghost. A ghost. Thank you. That is in.

A fairy. A fairy. A fairy. Thank you. That is in.

An elf. An elf. An elf. Thank you. That is in.

A brick wall. A brick wall. A brick wall. Thank you. That is in. [PC coughs] Okay.

That's all right. Don't worry about coughing. Are you trying to restrain yourself from coughing so it won't show on the E-meter?

PC: *Well, so as not to put a peculiar read only in the middle of one.*

LRH: Oh, I can read through that.

PC: *All right.*

LRH: Go ahead and cough if you've got to. All right. Have you got an ARC break? Are you upset about anything? Got a present time problem? Got a present time problem? What's your present time problem?

PC: *I guess just whether I do feel all right about coughing or not.*

LRH: Yeah?

PC: *Yeah.*

LRH: All right. Well, is there a withhold on the subject?

PC: *Yes. I have an overt and a withhold. In lectures last night, I was coughing like mad in the first one. I managed to get it turned off in the second.*

LRH: Yeah, well, all right.

PC: *A long string of coughing in your lectures.*

LRH: All right. Okay. Well, what is this now? How about coughing? All right. Are you withholding anything? All right. Thank you.

Something dropped on his head. Something dropped on his head. Something dropped on his head. Thank you. That's in.

A mouse. A mouse. A mouse. A mouse. Thank you. That is out.

An iceberg. An iceberg. An iceberg. Thank you. That is in.

A plane coming out of a cloud. Thank you. That is in.

Clapping hands together in somebody's face. Boy, that is so undetectable. However, we'll leave it in.

PC: *All right.*

LRH: All right.

Arresting them when they haven't done anything. Arresting them when they haven't done anything. Arresting them when they haven't done anything.

Thank you. Arresting them when they haven't done anything. That is out. Thank you.

Somebody suddenly throwing you into deep water. Somebody suddenly throwing you into deep water. Somebody suddenly throwing you into deep water. And that is in. Thank you.

Shooting someone's horse out from under him. Shooting someone's horse out from under him. Shooting someone's horse out from under him. Thank you. That is in.

Cops in your own home. Thank you. That is in.

A kidnapper. A kidnapper. A kidnapper. Thank you. That is in.

A prowler. A prowler. A prowler. Thank you. That is in.

An unpredictable person. An unpredictable person. An unpredictable person. Thank you. That is in.

Somebody with unexpected traits. Somebody with unexpected traits. Somebody with unexpected traits. Thank you. That is in.

A bad auditor. A bad auditor. A bad auditor. Thank you. That is out.

PC: *Bye-bye.*

LRH: A snake. A snake. A snake. A snake. A snake. That's in. Thank you.

Okay. A person running an animal body. A person running an animal body. A person running an animal body. Thank you. That is in.

A place that's been all changed around. A place that's been all changed

around. A place that's been all changed around. Thank you. That is in.

Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Thank you. That is in.

An evil-intentioned person. An evil-intentioned person. An evil-intentioned person. Thank you. That is in.

That somebody really means harm. That's out.

Something out of the wrong time stream. Something out of the wrong time stream. Something out of the wrong time stream. Thank you. That is in.

Somebody suddenly springing out of hiding. Somebody suddenly springing out of hiding. Somebody suddenly springing out of hiding. Thank you. That is in.

Ambushers. Ambushers. Ambushers. Thank you. That is in.

A civilian. A civilian. A civilian. Thank you. That is in.

Somebody who drops you. Somebody who drops you. Somebody who drops you. Thank you. That is in.

Somebody who uses the wrong hand. Somebody who uses the wrong hand. Thank you. That is in.

Okay. Well, we got a few off of the list. The list shows every sign of not being complete.

PC: *Mm.*

LRH: But we're just going to bull it through.

PC: *All right.*

LRH: Because we didn't have the tone arm action there we ought to have.

PC: *Mm.*

LRH: we only had about 2.9 to 3.1 tone arm action. Just ...

PC: *Mm. Seems that something might be missing.*

LRH: Huh?

PC: *Seems as something might be missing?*

LRH: No, it's just that – it's just that – it probably has some kind of a – of a shallow dial on this sort of thing.

PC: *Mm.*

LRH: And I'll turn around and get another list ...

PC: *Mm-mm.*

LRH:... that was almost a companion to this list.

PC: *Hm-mm.*

LRH: And get the other list and get it functioning. And between the two of them, oppterming them, we should shake it up.

PC: *Should I kind of keep an eye out for anything else that might pop up on this as you're doing it?*

LRH: Oh, you can at all times. It's perfectly all right with me.

PC: *There's one thing I thought of perhaps adding in place of a mouse which is a rat. Rats are startling*

LRH: All right. Okay. We're going to bull this one through.

PC: *Mm.*

LRH: We don't have too many active terminals. There are not too many.

PC: *The only thing I don't know about is should I tell you when I get a sensation? Or doesn't that matter particularly?*

LRH: No. We already know what type of terminal you have.

PC: *Do we?*

LRH: We do. We know what types of terms and oppters.

PC: *Oh.*

LRH: That's the only reason you do that.

PC: *All right.*

LRH: We can spot that some other ... But let's get something that's – that's hotter than a pistol.

PC: *Mm.*

LRH: This one is not particularly hot.

PC: *Mm.*

LRH: Okay. Do you have an ARC break? Present time problem? Are you mad at anybody? Are you mad at anybody? Are you mad at anybody? Hey, what do you know. Who are you mad at?

PC: *I think it's sort of modern English.*

LRH: Modern English.

PC: *They've changed some. They've changed the place around too much. That's what I was just thinking of when we hit that "changed around places."*

LRH: Yeah, yeah. All right. You mad at somebody? I still get a tick. Who else are you mad at? That took some of it off. Now, what's the rest of it?

PC: *I don't feel particularly mad.*

LRH: Nobody said you were. I just asked you a question at random ...

PC: *All right.*

LRH:... and got a reaction. Are you mad at somebody? Now, are you mad at somebody? Now I get no reaction.

PC: *All right.*

LRH: All right. That was interesting.

PC: *Mm.*

LRH: All right. Are you withholding anything? Should I found – should have – should I have found out about something? What should I have found out about? Anything? Should I have found out about something in this session? What should I have found out in this session?

PC: *Yeah.*

LRH: You know something I should have found out in this session?

PC: *Yes. Yes. I'd do almost anything to get "officer" back in somewhere along the line.*

LRH: Huh?

PC: *I don't care if I assess from millions of years on 3D Criss Cross. If it doesn't end up back at "officer" again, I won't be happy.*

LRH: You consider this an invalidation of a terminal?

PC: *No, not really.*

LRH: Do you or don't you?

PC: *It's not that it's invalidating. It's just there's some question.*

LRH: What's the question?

PC: *Well, is it the proper one to run, for example. Is it the most central one? I just hope it is.*

LRH: All right. All right. Well, now, how do you feel about this now? Anything else that I should have found out about? What should – else should I have found out about?

PC: *Well, I got left with that, and a part of the Prehav Scale is kind of awkward, is "Failed Endures" has never been flattened on that terminal.*

LRH: Oh, "officer"?

PC: *Yes.*

LRH: "Officer" has never been flattened on "Failed Endure"?

PC: *It's the most – the most shameful item on the entire Prehav Scale from my point of view. It's never been flattened.*

LRH: Oh, dear. Oh, my. All right. All right. What else should I have found out? Nothing much. Anything else I should have found out?

PC: *I don't think so.*

LRH: No. Have I missed a withhold on you? I got a clink. Is that withhold? Yes. Have I missed a withhold on you? Have I missed ... a withhold ... on you?

You know, you bang on "you"?

PC: *I'm not surprised.*

LRH: Yeah, you. You. You.

All right. Have I missed a withhold? Latent. All right. Have I missed a withhold? What do you think about afterwards?

PC: *Oh! A whole slew of unexecuted auditing commands I never mentioned to you.*

LRH: Oh, yeah. When was that?

PC: *Union Station. I could never do that process. I was on it for several days. And I – they were all either half-truths or untruths. Every answer.*

LRH: Oh, yeah.

PC: *And I couldn't do it. And I had to give the auditor something, and it – and it just ...*

LRH: Who was auditing you?

PC: *Carol Hadley and Lydia Silvenstein.*

LRH: Mm. Okay. All right. Well, have I missed a withhold on you? Have I missed a withhold on you? ... Do you think of anything I'm not necessarily ...

PC: *I'm kind of blank at the moment.*

LRH: All right. Well, have I missed ... ? What have I missed?

PC: *What have you missed ?*

LRH: Not a withhold. What have I missed?

PC: *Going to sea, I guess.*

LRH: All right. All right. Good.

PC: *This is something I've always found difficult to comprehend.*

LRH: What?

PC: *How you could stop going to sea.*

LRH: All right. Well, have I missed a withhold on you? I don't get any reaction on this now.

PC: *Uh-huh.*

LRH: All right?

PC: *Mm.*

LRH: Here we go. Plowing on down the line. Is it all right with you if I continue this now?

PC: *Yeah.*

LRH: All right. What's the tick? You waited too long to continue it?

PC: *I guess I was wondering whether I'd taken too long or something, you know. I'm getting this same sort of doubt ...*

LRH: Do you feel guilty about anything

PC: *... that I'd get a wrong question.*

LRH: Well, do you?

PC: *I suppose I could go on for hours on the subject. Yes.*

LRH: oh, I see. All right. Is that going to interfere with us nulling this list? No. Thank you.

PC: *No.*

LRH: All right.

PC: *Yes.*

LRH: Do you feel all right now though, really?

PC: *Yeah.*

LRH: You more or less relaxed?

PC: *Yeah.*

LRH: All right. Here we go.

A U-boat commander. A U-boat commander. A U-boat commander. A U-boat commander. All right. A U-boat commander.

Having to make up my mind whether or not these things are actually falling on the item ...

PC: *Mm.*

LRH: ... or falling on a little random pattern I got here.

PC: *All right.*

LRH: That's what I'm hunting through.

PC: *Fair enough.*

LRH: So it's fine. We're doing all right.

A torpedo. A torpedo. A torpedo. A torpedo. Yeah, man, that's in. Thank you.

A cavalry charge. A cavalry charge. A cavalry charge. A cavalry charge. Yeah, that's in. Thank you.

A wild animal. A wild animal. A wild animal. A wild animal. Well, that's a nice, calm, wild animal. That is out. Thank you, all right.

Okay. Blown paper. Blown paper. Blown paper. Thank you. That is in.

Something exploding under them. Something exploding under them. Something exploding under them. Something exploding under them. Seems to be awfully undisturbed here. Something exploding under them. Something exploding under them. Something exploding under them. Ah, isn't that funny? That was out already. So our needle was ...

PC: *I thought it had been, yeah.*

LRH: Yeah, well, our needle is very ... oh, that's what you fell on in the middle of it.

PC: *Mm.*

LRH: I'm just crosschecking.

PC: *Yeah.*

LRH: We're doing fine. Not to give you any mystery on the thing.

PC: *Mm.*

LRH: I didn't particularly notice I had or hadn't, but I was glad to see that it was already null.

PC: *Yeah.*

LRH: All right.

Deep, cold water. Deep, cold water. Deep, cold water. And that is in. Thank you.

A polar bear. A polar bear. A polar bear. Thank you. A polar bear. A polar bear. A polar bear. Polar bear. Thank you. That is in.

A dog you didn't know was there. Thank you. That is in.

Something falling. Something falling.

Did you move your finger on the can?

PC: *Not that I felt.*

LRH: All right.

Something falling. Something falling. Something falling. Something falling. Something falling. Something. Something. Something. Something. Something falling. Something falling. Oh, that's in.

A car in the wrong place. A car in the wrong place. A car in the wrong place. Thank you. That is in.

A burglar. A burglar. A burglar. Thank you. That is in.

A murderer. A murderer. A murderer. Thank you. That is in.

A spook. A spook. A spook. Thank you. That is out.

A ghost. A ghost. A ghost. A ghost. A ghost. Thank you. That is in.

A fairy. A fairy. A fairy. A fairy. Peculiar. Latent tick on "a fairy."

PC: *Mm.*

LRH: A fairy. It's in.

PC: *All right.*

LRH: All right. Thank you.

An elf. An elf. An elf. Thank you. That is in.

A brick wall. A brick wall. A brick wall. Thank you. That is out.

Something dropped on his head. Something dropped on his head. Something dropped on his head. Thank you. That is in.

An iceberg. An iceberg. An iceberg. An iceberg.

Just looking at this needle pattern here. An iceberg. An iceberg. An iceberg. Thank you. That is in.

A plane coming out of a cloud. A plane coming out of a cloud. A plane coming out of a cloud. Thank you. That is in.

Clapping hands together in front of somebody's face. Clapping hands together in front of somebody's face. Clapping hands together in front of somebody's face. Thank you. That is in.

Arresting them when they haven't done anything. That is out.

Somebody suddenly throwing you into deep water. Somebody suddenly throwing you into deep water. Somebody

suddenly throwing you into deep water. Thank you. That is in.

Shooting somebody's horse out from under him. Shooting somebody's horse out from under him. Shooting somebody's horse out from under him. Thank you. That is in.

Cops in your own home. Cops in your own home. Cops in your own home. Thank you. That is in.

A kidnapper. A kidnapper. A kidnapper. Thank you, that is in.

A prowler. A prowler. A prowler. Thank you. That is in.

An unpredictable person. That is out, thank you.

Somebody with unexpected traits. Somebody with unexpected traits. Somebody with unexpected traits. Thank you, that is in.

A snake. A snake. A snake. A snake. A snake. Thank you. That is in.

A person running an animal body. A person running an animal body. A person running an animal body. Thank you. That is in.

A place that's been all changed around. A place that's been all changed around. A place that's been all changed around. Thank you. That is in.

Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Thank you. That is in.

An evil-intentioned person. An evil-intentioned person. An evil-intentioned person. Thank you, that is in.

Something out of the wrong time stream. Thank you. That is in.

Somebody suddenly springing out of hiding. Somebody suddenly springing out of hiding. Somebody suddenly springing out of hiding. Thank you. That is in.

Ambushers. Ambushers. Ambushers. Thank you. That is in.

A civilian. A civilian. A civilian. Thank you. That is in.

Somebody who drops you. Somebody who drops you. Somebody who drops you. Thank you. That is in.

Somebody who uses the wrong hand. That's out.

A rat. A rat. A rat. Thank you. That is in.

Okay. Now, you know what I'm going to do with you? I'm going to give you a couple of minutes' break.

PC: *All right.*

LRH: As a matter of fact, I'm going to give you exactly ten minutes' break till 9:30. All right.

PC: *It would be very pleasant.*

LRH: All right.

PC: *I can have a cigarette.*

LRH: Good. Good. Take a break.

TV DEMO: 3D CRISS CROSS ASSESSMENT, PART II

An auditing demonstration given on 20 March 1962

LRH: All right. And anything happen in this break that upset you in any way?

PC: *I don't think so.*

LRH: Anything happen in this break that upset you in any way? What are we getting a fall on here? You? Yes. What – what are you doing here? It keeps falling on "you." There it is.

PC: *If I knew, it wouldn't fall. [laughs] No responsibility, no responsibility, no responsibility. I'm not fond of my current identity.*

LRH: All right. All right. Good. Now, is it all right with you if I be – continue with this session now, huh?

PC: *Mm.*

LRH: We continue with the session? Anything wrong with the session?

PC: *We haven't got down the terminal I told you about yet.*

LRH: Well, all right. Now, that terminal is "being somebody famous."

PC: *Yeah, it's being a famous person incognito and then revealing yourself you know, some – having them find out who you were. It's letting an incognito slip. Something like that.*

LRH: All right. Okay. Is there anything else? Hm?

PC: *I don't think so.*

LRH: All right. All right. Let's get back to see if we can do some of this nulling.

PC: *Mm.*

LRH: Anyway, we're grinding this thing out the hard way. Now, did anything happen in the middle of the session during the break that you shouldn't have done? That we've got a tone arm rise here almost.

PC: *I used some toilet paper on a roll that was down rather low, and I always feel like a swine when I do. [laughs]*

LRH: Okay. All right. Anything else? Are you withholding anything else? No. Anything else? All right. Okay. Yeah, let's get back to this list. Okay?

PC: *Mm.*

LRH: Squeeze the cans. All right, that's a little much. Squeeze the cans. All right. Well, whatever it's doing, it's loosened up your tone arm.

PC: *Mm.*

LRH: Squeeze the cans. Oh, fine. That brought your tone arm down considerably. It just ...

PC: *Oh yeah, I sort of feel like I'm gettin' back in session.*

LRH: Oh, I see. And in addition to that, we've got your sensitivity well down for a one dial drop. Okay?

PC: Mm.

LRH: All right. Here we go. Here we go. All right. A U-boat commander. A U-boat commander. A U-boat commander. Now, I'm going through this list and sort these out.

PC: Mm.

LRH: A U-boat commander. A U-boat commander. A U-boat commander. Going to have to assume that is null. Thank you. All right. Torpedo. Torpedo. Torpedo. And that is null. Thank you.

A cavalry charge. A cavalry charge. A cavalry charge. All right.

Have you got an ARC break?

PC: *It sounds as if all the interesting ones are going.* [laughs]

LRH: All right. Are you losing something here? Is that what you're losing? Is it because you're losing something. All right. Let me check it again.

PC: Mm.

LRH: A U-boat commander. A U-boat commander. A U-boat commander. Oh, yes.

Well, you did have an ARC break there, didn't you? Any other ARC break? Yeah, what's that?

PC: *I guess anybody thinking anything else about me.*

LRH: Any ... what?

PC: *I guess anybody who thinks of me anything else.* [laughs]

LRH: Oh, I see. All right.

PC: *Small variations.*

LRH: All right. All right. You got any other ARC break here? I'm getting a little rock slam on an ARC break. What's this?

PC: *Well, there are things, I guess, on it that I would feel it was dis-creditable to be.*

LRH: And what's that?

PC: *Sort of to be an elf.*

LRH: Yeah?

PC: *Or a kidnapper or burglar. I'd rather be a murderer if I'm going to be something along that line.*

LRH: All right. Well, what's the upset here? Any upset?

PC: *No, just on those first three or the first couple of ones, I was sorry to see them go. I thought, well, I don't feel too much interested in the rest. I don't care what it turns out to be, much.*

LRH: All right. All right.

PC: *It won't be anything very interesting anymore.*

LRH: All right. A U-boat commander. A U-boat commander. A U-boat commander. Now, we get one out of three here on this.

PC: *Well, if it's going null, it's going null. That's the way it is.*

LRH: Well...

PC: *It can't always be what you want.*

LRH: Have you invalidated it? Yeah, well, when did you invalidate it?

PC: *After checking with the German Dienststelle to see if I had my records straight for the First World War, and I didn't. I've got the name wrong. The*

guy I thought I was didn't exist. I may have been somebody else ...

LRH: Yes.

PC: ... *but it was kind of a maybe on the subject.*

LRH: Oh, I see. I see. All right. Well, let's continue on with it here.

PC: *Mm. Mm.*

LRH: All right? Cavalry charge. Cavalry charge. Cavalry charge.

Okay. There's something going on here. I'm going to run this at a higher sensitivity.

PC: *Mm.*

LRH: Okay? See if we can't pick this out of the hat a little bit better and ignore this big sweep.

PC: *Mm.*

LRH: A U-boat commander. A U-boat commander. A U-boat commander. And that is out. Thank you. Torpedo. Torpedo. Torpedo. Thank you. That is out.

Cavalry charge. Cavalry charge. Cavalry charge. Thank you. That is out.

Blown paper. Blown paper. Blown paper. Blown paper. Thank you. That is out.

Deep, cold water. Deep, cold water. Deep, cold water. Thank you. That is out.

A polar bear. A polar bear. A polar bear. And that is in.

PC: *Mm.*

LRH: And there's my R/S. And I said I would pick it all up with an R/S.

PC: *You're kidding.*

LRH: And I will.

PC: *You know, I bought an Eskimo carved polar bear in a Washington book shop once, and I almost fainted while buying it. I wanted it very much – I started to buy it, and I almost passed out cold.*

LRH: All right. All right. All right. Now, here we go. Here we go. Doing a little bit better now.

PC: *I'm glad to see some of them nulling even if they're ones I like.*

LRH: No, it isn't, it isn't whether they're nulling or not. Frankly, frankly, I'm rather sorry, when I just don't pick this out on the R/S, and I think I will.

PC: *Mm. Mm-hm.*

LRH: Because I've got – only got R/S on about three or four items, but I haven't ...

PC: *Mm-hm.*

LRH: I haven't actually noted them previously, but that's just me.

PC: *Mm. Mm.*

LRH: I haven't noted them down.

A dog you didn't know was there. A dog you didn't know was there. A dog you didn't know was there. Thank you. That is in.

Something falling. Something falling. Something falling. Let's get that. Something falling. That's out. Thank you.

A car in the wrong place. Thank you. That is out.

A burglar. A burglar. A burglar. Thank you. That is out. It's not a burglar. Feel better now?

PC: *Yes.*

LRH: All right. A murderer. And that is out. Thank you.

A ghost. A ghost. A ghost. Thank you. That is out.

A fairy. A fairy. A fairy. A fairy. Thank you. That is in.

An elf. An elf. An elf. Thank you. That is in.

Something dropped on his head. Something dropped on his head. Something dropped on his head. Thank you. That is out.

An iceberg. An iceberg. An iceberg. An iceberg. Thank you. That is out.

A plane coming out of a cloud. A plane coming out of a cloud. A plane coming out of a cloud. Thank you. That is out.

Clapping hands together in front of somebody's face. Clapping hands together in front of somebody's face. Clapping hands together in front of somebody's face. Thank you. That is out.

Arresting them when they haven't done anything. That is out.

Somebody suddenly throwing you into deep water. Somebody suddenly throwing you into deep water. Somebody suddenly throwing you into deep water. Thank you. That is out.

Shooting someone's horse out from underneath him. Shooting someone's horse out from underneath him. Shooting somebody's horse out from underneath him. And I think I could develop that into an R/S with the greatest of ease. That is in.

Cops in your own home. Cops in your own home. Cops in your own home. Thank you. That is in.

A kidnapper. A kidnapper. A kidnapper. A kidnapper. Thank you. That is out.

A prowler. A prowler. A prowler. A prowler. A prowler. Thank you. That is in.

Somebody with unexpected traits. I'm going to leave it in.

A snake. Thank you. That is in. All right.

Have you invalidated anything? Bang. What's that?

PC: *Just I was thinking it was a weird combination. Fairies and polar bears, for God's sakes.*

LRH: Oh, all right.

PC: *I don't know why it should be sensible, but it seems remarkably miscellaneous.*

LRH: All right. Okay. Any other invalidation there? All right. Thank you. All right.

A person running an animal body. A person running an animal body. A person running an animal body. Thank you. That is out.

A place that's been all changed around. A place that's been all changed around. A place that's been all changed around. Thank you. That is out.

Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Some-

body trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Thank you. That is in.

An evil-intentioned person. An evil-intentioned person. An evil-intentioned person. Thank you. That is out.

Something out of the wrong time stream. Something out of the wrong time stream. Something out of the wrong time stream. Thank you. That is out.

Somebody suddenly springing out of hiding. Somebody suddenly springing out of hiding. Somebody suddenly springing out of hiding. Thank you. Somebody suddenly springing out of hiding. What do you think about that?

PC: *I was thinking it was mean – I gave you a tongue twister on that one, like "Peter Piper picked," you know.*

LRH: Is that so ... is that's ... we ware having ... I would rather ... I rather thought so.

PC: *Yes. It was a mild version.*

LRH: All right. I thought that was probably what that was banging on.

PC: *Yeah.*

LRH: Because I wasn't getting a read on it, but I was getting a read.

PC: *Mm-hm.*

LRH: Somebody suddenly springing out of hiding. Somebody suddenly springing out of hiding. Somebody suddenly springing out of hiding. Thank you. That is out.

Ambushers. Ambushers. Ambushers. Thank you. That is out.

A civilian. A civilian. A civilian. Thank you. That is in. Somebody ... [pc laughs]

PC: *Fairies, civilians and polar bears – too much!*

LRH: That's a little bit rock slummy, that one, by the way, "civilian."

PC: *Mm-hm.*

LRH: Mm. I mean, it was when I hit it previously. All right.

Somebody who drops you. Somebody who drops you. Somebody who drops you. Thank you. That is in.

A rat. A rat. A rat. Thank you. That is in.

Being a famous person incognito and letting somebody find who you are. Being a famous person incognito and letting somebody find who you are. Thank you. That is out.

Well, we're getting there, madam. We're getting there very nicely.

PC: *Good. Civilian one's funny.*

LRH: Haven't got too many of them. I haven't got too many left here.

PC: *Well...*

LRH: All right. Just let me – let me count them for you.

PC: *Mm.*

LRH: All right. One, two, three, four, five, six, seven, eight, nine, ten, eleven, twelve, thirteen.

PC: *Hm.*

LRH: All right. Let us carry on.

PC: *Let's roll.*

LRH: Have you thought of anything?

PC: *No, just the great hilarity of about last week – Herzog was coaching me, and suddenly in the middle of it I realized he was a civilian, and I got the giggles.*

LRH: Oh, yeah.

PC: *And what I was giggling about – and I said, "You're a civilian." And then for about a half an hour, all he would do was point to himself and say, "I'm a civilian," and I'd almost fall off the chair.*

LRH: Oh, yeah. All right. Okay. All right. Now are you withholding anything? Thank you. All right. Here we go. All set?

PC: *Mm.*

LRH: All right. A polar bear. A polar bear. A polar bear. A polar bear. I'm going to jack this up just a little bit on sensitivity.

PC: *Mm.*

LRH: A polar bear. A polar bear. A polar bear. A polar bear. Well, that's still an agitaty sort of thing, so we're going to leave that in. Okay?

PC: *Mm.*

LRH: All right. A dog you didn't know was there. A dog you didn't know was there. A dog you didn't know was there. All right. And that is in.

A fairy. A fairy. A fairy. A fairy. A fairy. So, we'll leave it in. Thank you.

An elf. An elf. An elf. Thank you. And that's in.

All right. What did you just think of so hard?

PC: *Polar bears. You know, they're white on white. They can be very*

startling because they're so well camouflaged, you know.

LRH: Oh, yeah, all right. Yep. All right. Very good. Shooting somebody's horse out from under him. Shooting somebody's horse out from under him. Shooting somebody's horse out from under him. Thank you. That is out.

Cops in your own home. That's in. Thank you.

A prowler. A prowler. A prowler. Thank you. That is in.

Somebody with unexpected traits. Somebody with unexpected traits. Somebody with unexpected traits. Somebody with unexpected traits. That's out. Thank you.

A snake. A snake. A snake. Thank you. That is in.

Something wrong?

PC: *I itched. I scratched.*

LRH: All right. You okay?

PC: *Yeah.*

LRH: All right. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. That's in.

What did you just think of?

PC: *I guess I was wondering whether you looked tired or not.*

LRH: Oh, dear no.

PC: *Getting busy again.*

LRH: Oh, dear. you got a nice big rock slam on it. All right. A civilian. A civilian. A civilian. A civilian.

PC: *Mm?*

LRH: A civilian. A civilian. A civilian. All right. That's in.

Somebody who drops you. Somebody who drops you. Somebody who drops you. That's an interesting latent read. Somebody who drops you. Somebody who drops you. Somebody who drops you. That's in. All right.

A rat. A rat. A rat. A rat. That's in.

All right. How you doing?

PC: *Fine. Goddamnedest collection.*

LRH: Yes, it's quite a collection, isn't it?

PC: *Yes.*

LRH: All right. Here we go again. Here we go. A polar bear. A polar bear. A polar bear. A polar bear. There's something weird about this polar bear. It reads, and then it rock slams, sort of. A polar bear. A polar bear. Yeah, that's in. Thank you.

PC: *Mm.*

LRH: A dog you didn't know was there. A dog. A dog.

All right. Very sporadic read. A dog you didn't know was there. Did you invalidate that?

PC: *Just that I don't like the ones that are long so much.*

LRH: Oh, you trying to get rid of the ones that are long?

PC: *Mm.*

LRH: Well, thank you for ... [pc laughs]

PC: *They always seem so untidy.*

LRH: Yes. All right.

PC: *Also a long string of overts: I'm always stumbling over dogs that I didn't know were there and treading on their paws and tail.*

LRH: Okay. A dog you didn't know was there. A dog you didn't know was there. A dog you didn't know was there. And that is knocking. Thank you. It's in. All right.

A fairy. Well, I can still get a rack on that.

An elf. An elf. An elf. An elf.

Which would be the most startling, a fairy or an elf?

PC: *I would be more startled by an elf. I would rather expect a fairy. I've always been surprised I haven't seen any this life.*

LRH: Well, they're two different types of surprises.

PC: *A bit.*

LRH: I see. All right. Let's take a look at this. A fairy. A fairy. A fairy. Thank you. That is out.

An elf. An elf. An elf. An elf. An elf. An elf. That is out. Thank you.

All right. This shooting somebody's horse out from under him.

PC: *Yeah, I was wondering what we did with something like that that isn't a terminal. You know, if it stayed in. I was wondering what happened to it.*

LRH: All right. You wondered what had happened to it.

PC: *No, I wondered what would – what you would do with it if it were the last one in on account of it's expressed as a doingness and not as a terminal.*

LRH: Mm. Mm. Well, it's out.

PC: *I know it is. Now I guess I'll never find out what happens unless I have a doingness that stays in.*

LRH: All right. All right. And what's this about cops in your own home, huh?

PC: *Well, that was very simple. That's a "this life" one.*

LRH: Oh, you got an incident that goes with this.

PC: *Mm.*

LRH: Cops in your own home. You got an incident that goes with this, when you were quite startled.

PC: *Yes. Would you like to hear it? Is that an apropos at the moment?*

LRH: No. I'm not ...

PC: *All right, just ...*

LRH: ... particularly interested about it. But you did, did have one.

PC: *I certainly did. And it was very startling.*

LRH: Oh. All right. Cops in your own home. Thank you. That is out.

PC: *Ha-ha-ha. Goodbye to the Elmhurst police force.*

LRH: Hm?

PC: *Goodbye to the Elmhurst police force.*

LRH: Right. All right. A prowler. A prowler. A prowler. A prowler. A prowler. Thank you. That is out.

A snake. A snake. A snake. A snake. A snake. All right, he's latent but he's in. Thank you.

PC: *Mm.*

LRH: Yeah, poor little snakes at the moment. All right. Now, what's this about somebody trying to kill you and you don't know why. What is about this? Give me some more data on this.

PC: *It is ... it is startling.*

LRH: Mm. Well, what's

PC: *...[pc laughs] There doesn't seem to be very much more to say about it, you know. I can probably dream something up.*

LRH: All right. But is it startling?

PC: *It certainly is.*

LRH: Mm. Where would this take place?

PC: *I should think a dark alley would be an entirely appropriate spot for this.*

LRH: All right. Okay.

PC: *Although it would be more startling if it were sort of an ordinary place. You know, like the hall of a public building or something of the sort.*

LRH: Mm.

PC: *You know.*

LRH: All right. Here we go. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why.

Somebody trying to kill you and you don't know why.

Now I'm getting a fall on "Somebody trying to kill you." Somebody trying to kill you. Somebody trying to kill you. Which is it? I'm getting a sporadic fall on one half of it, for some reason or the other.

PC: *I don't see why they both wouldn't read. It seems like a very reasonable thing to have read.*

LRH: Okay. You think – you think that's very reasonable.

PC: *Mm. It seems very reasonable it should react.*

LRH: All right. All right. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Thank you. Thank you. Thank you. That is in. All right.

A civilian. A civilian. A civilian. Thank you. That is in.

Somebody who drops you. Latent. We will leave it in. All right.

A rat. A rat. A rat. A rat. Thank you. That is out.

All right. We got a few left in here.

PC: *Mm.*

LRH: Let's chew them up.

PC: *Good.*

LRH: All right. Do you have any ARC breaks? Yeah, what's that? What's the ARC break?

PC: *Nothing in mind. Oh, I guess ... well, I didn't volunteer what I thought the latent was on on being dropped.*

LRH: What was?

PC: *A half a round ago.*

LRH: What was it?

PC: *"Stonewall" Jackson got dropped. And it kept going between "Stonewall" Jackson and babies.*

LRH: Oh, I see. Oh yeah. All right. All right. Here we go.

Got an ARC break? No. Okay. Fine. All right.

A dog you didn't know was there. A dog you didn't know was there. A dog you didn't know was there. All right. That is in. Thank you.

Okay. A snake. A snake. A snake. What's this with the snake?

PC: *Gee, I sure haven't had much this life. I keep expecting to have one turn up in the woods, but they never do.*

LRH: They never do.

PC: *I keep walking around leaves, something – the most reasonable thing on earth that sooner or later I'd step on a snake. But I never do.*

LRH: All right. A snake. A snake. A snake. A snake. Well, that's in. All right. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Thank you. That is in.

A civilian. A civilian. A civilian. A civilian. Thank you. That is in. Okay.

Somebody who drops you. Somebody who drops you. Somebody who drops you. Thank you. That is in. Okay.

You know, we've still got this polar bear here.

PC: *Mm.*

LRH: What's the matter?

PC: *I don't know. Seems ... It seems very reasonable it should be there, too.*

LRH: All right. Here we go. A polar bear. A polar bear. A polar bear. Well now, he's doing something weird here. A polar bear. A polar bear. A polar bear. Well, he's still in. Okay.

A dog you didn't know was there. A dog you didn't know was there. A dog you didn't know was there. That is out. Thank you.

PC: *Good.*

LRH: It began to fall on a dog you hadn't been introduced to. [pc and auditor laugh]

PC: *Please, yes.*

LRH: All right. Let's see what else we got here. Eh, here we are. A snake. A snake. A snake. And that is in. Thank you.

All right. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. And that is in.

A civilian. A civilian. A civilian. A civilian. A civilian. A civilian.

PC: [pc laughs] *I'm sorry. I feel really silly about ...*

LRH: We will have to assume that that is in. All right. All right.

Somebody who drops you. Somebody who drops you. Somebody who drops you. Somebody who drops you. Is this reading on this? All right. Somebody who drops you. Aw, it's still reading on that. Okay. That's in.

And now we are back to our old friend. A polar bear. Well, he isn't rocking. It's not on that.

PC: *I just got the silliest thought. I wonder whether polar bears are civilians or not.*

LRH: Are what?

PC: *I just wondered whether polar bears are civilians.*

LRH: Oh, dear. All right. Well, all right. All right. All right. All right. You got an ARC break? Yeah, what's that?

PC: *I was just wondering whether I had been trying to sell you on civilian because it's so beautifully opposed to officer and I'd like officer to come back in.*

LRH: Mm.

PC: *Perfect pair.*

LRH: All right.

PC: *Let the chips fall where they may.*

LRH: All right. A polar bear. A polar bear. A polar bear. All right. He's still with us. All right.

A snake. A snake. A snake. Thank you. That's in.

PC: *Sounds like the bloody Bronx Zoo.*

LRH: All right. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't

know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Somebody trying to kill you and you don't know why. Suppose I have to pass that one up. Somebody trying to kill you and you don't know why. Yeah. It's latent, sporadic, want me to grind it out?

PC: *I've never been very fond of it. It's one of those wordy ones.*

LRH: All right. I've got a terminal here that's rapping, and I'll just get rid of the rest of these things. I already got a terminal that goes bang, bang, bang. And we're not interested.

PC: *Mm. Will I wait and find out for dessert what it is?*

LRH: You'll get it for dessert. All right. A civilian. A civilian. A civilian. And that is out.

And somebody who drops you. Somebody who drops you. Somebody who drops you. And that is out.

Well, we still have a polar bear.

PC: *And also a snake, don't we?*

LRH: Mm-hm. Now, you must have been a very good three-card monte player. You can keep them in your ... All right. Here we go. Got an ARC break?

PC: *Wrong card game. The only card game I like is five-card stud.*

LRH: Okay. A polar bear. Oh, he is leaving these parts, man. He is not there very much. We'll try and keep him around for a pet. We got it here. We got it here. He's an instantaneous reading ... leaving. A snake. A snake. A snake. Now, what have you just invalidated?

PC: *I'm wondering about the Brothers of the Snake, but I've never been passionately fond of or passionately afraid of snakes. I'm more neutral to them than most people.*

LRH: All right. All right. You got an ARC break?

PC: *No, I'm baffled.*

LRH: About what?

PC: *I don't quite see where it fits. I mean, I know how a snake is startling*

LRH: Mm.

PC: *But that it's very significant surprises me.*

LRH: All right. All right. You got an ARC break? Have you invalidated anything? All right. Thank you. A snake. A snake. A snake. A snake. Every time that ...

PC: *Is that right!*

LRH: But we will check him against a polar bear.

PC: *Mm.*

LRH: We have actually had an item. But we still got an item registering here. A polar bear. Sporadically. A polar bear. We still got a polar bear. Still got a polar bear. He's in.

A snake. A snake. A snake. And he's in.

A polar bear. A polar bear. A polar bear.

A snake. A snake. A snake. All right.

Which is the most startling, polar bear or a snake?

PC: *I think a polar bear, sometimes. You know, they're bigger, and you're going to bump into them suddenly in the dark. My God ! It's startling*

LRH: All right.

PC: *But then I'm prejudiced. I like polar bears better than snakes. They make more sense to me.*

LRH: I see. I see.

PC: *But I have no idea whether that has anything to do with it. The fact that I dislike the other more might be more pertinent.*

LRH: Mm. All right. Well, you like ... dislike snakes more.

PC: *I wouldn't care to be closely associated one way or another, you know. I don't mind being neutral about them. I have an open mind on the subject.*

LRH: All right. All right. Let's check her out here again. Not that we're checking out at this time.

PC: *Mm-hm.*

LRH: A polar bear. Okay. A snake. A snake. A snake. Man, we've got both of these.

PC: *You know, I'm just wondering if there's one missing ...*

LRH: Such as?

PC: *... which I didn't have down. Just a horse.*

LRH: Hm?

PC: *A horse can do some awful goddamned startling things sometimes.*

LRH: Yeah.

PC: *A lot of the time they don't, you know.*

LRH: Yeah.

PC: *But I won't say I haven't been awful startled by them at one time or another.*

LRH: All right. All right. We'll check him out. A horse. A horse. A horse. And we will cross him out.

PC: *Mm.*

LRH: Okay?

PC: *Yeah.*

LRH: A polar bear. A polar bear. A polar bear. And he is out.

Now, would you tell me what a horse has in common with a polar bear?

PC: *A horse? Fur.*

LRH: You just discharged something here.

PC: *Oh. All right.*

LRH: All right. Here we go. Let's see what we got here now. A snake. Hey, you got an ARC break? Yes.

PC: *Well, just the thing, you know, one doesn't ... I mean, the Brothers of the Snake, all these weird snake priestesses and things. One doesn't ... I don't quite ... I don't quite see where this fits, and it's something I would rather not have too closely associated with me. But if it is, it is.*

LRH: Yes, go on. Would it be more gentlemanly to have ... [pc laughs]

PC: *Much more gentlemanly.*

LRH: Okay. All right. All right. You got an ARC break? All right. Fine.

A snake. A snake. A snake. You got another invalidation on him? Yes, what is it? What's the invalidation on a snake?

PC: *Just sort of ...*

LRH: In this session have you invalidated this snake? Bang.

PC: *Sort of like trying to make other ones more interesting and sort of hoping they would stay in more.*

LRH: Yeah.

PC: *I know every time it came around, I was sort of hoping it would go away.*

LRH: All right. All right. All right. A snake. A snake. A snake. All right. Is there another invalidation on a snake?

PC: *Well, mostly it's a feeling that anybody who knew that was it would get the wrong idea about me.*

LRH: I see.

PC: *I'm not tremendously afraid of ... and I'm not sort of vvvvvvv! about the subject so far as I know, you know?*

LRH: Yeah ... Yeah.

PC: *They are snakes.*

LRH: Yeah. Okay. Well, that's what we've got left.

PC: *Mm. We have a ...*

LRH: We're going to check this item out.

PC: *Fine.*

LRH: But we don't intend to tonight.

PC: *Very well.*

LRH: But that is what we got left.

PC: *They're certainly startling at times. I'll not deny that.*

LRH: That's right. I get a nice regular bang on it. So we will check this some other time. All right?

PC: *Very well.*

LRH: Okay. Now, as far as end rudiments are concerned, we're overtime here.

PC: *Mm.*

LRH: And so forth, and I know you of old. Would you ... And I'm going to ask you, do you have an ARC break in this session? Good. Have you withheld anything in this session? Thank you. All right. All right. Should I have found out something in this session that I didn't find out. What's that?

PC: *I guess maybe an explanation of what does a snake have to do with me. There's kind of a gap there, you know. There it is. And what's it got to do with me? I don't know.*

LRH: All right. All right. All right. Get it. Is there something else I should have found out? Thank you. Thank you very much. All right. Now, give the cans a squeeze.

PC: *Yeah. I didn't quite have a normal grip on them then when I squeezed them.*

LRH: All right. Squeeze them again. That's fine. That's fine. All right. How do you feel?

PC: *I feel rather good. A little pressed in on. A lot of this stuff, you know, kind of scrunched masses in.*

LRH: Mm. Mm. Understandable.

PC: *I mean, don't hurt or anything ...*

LRH: All right. Now how do you feel about your goals for this session?

PC: *Well, we got one.*

LRH: Mm-hm.

PC: *Which is, I mean, was a ...*

LRH: All right.

PC: *Oh, and, oh yes, we were marvellous on rudiments.*

LRH: Hm?

PC: *We were marvellous on rudiments.*

LRH: Mm. Mm. Mm. We got that one.

PC: *I had some other one, it seems to me, but I can't ...*

LRH: Not to get carried away with entertaining the students.

PC: *Yes, I don't think I did.*

LRH: No? All right. Did you make that one?

PC: *Yeah.*

LRH: All right. That-a-girl. All right. Now, is there anything you'd care to ask or say before I end this session? Yes. What?

PC: *I'm glad I got picked.*

LRH: Okay. All right. All right. Is it all right with you if I end this session now?

PC: *It is.*

LRH: All right. Here it is. End of session. Has this session ended for you?

PC: *Yes. Yeah.*

LRH: All right. Tell me I'm not now auditing you.

PC: *You're not now auditing me.*

LRH: Thank you. Very good.

OBJECT OF PREPCHECKING

A lecture given on 21 March 1962

How you doing tonight?

Audience: Good. All right. Okay.

All right.

Male voice: How you doing?

Bad.

Okay. This is the vernal equinox of AD 12. March the 21st for those who are un-Chaldean. If you've never had a past life in Chaldea, it's March the 21st. And if you've never had a past life in England ... You ever had a past life in England?

Audience: Yes.

Every time an American goes down to the Tower to sightsee, I always like to see them as they come out. They're always going like this, you know. [laughter]

I never knew they had that many executioners at the Tower. [laughter, laughs]

Okay. Now, you saw a demonstration last night. I'll make a comment on that before we get into the lecture. That was a very neat demonstration. Very neat. You saw the pc trying to give me a lose. [laughter] I – didn't even faze me, you know. That was fine. And I think the class thanks you, too. We're going to find the other item you wanted.

But let me call to your attention a phenomenon which is very interesting here. And if you don't mind my making a comment, it's just that a pc's attention on the Goals Problem Mass can become so tied up and so concentrated on some portion of the Goals Problem Mass that they don't recognize that it has forty or fifty combinations in it.

And trying to get the pc's attention off of the last combination you found and on to the next combination you found, sometimes has to be done with building jacks. And you saw that particular phenomenon. The pc did not like letting go of some units that belonged to the last part of the GPM we found. Don't you see?

Well remember, this is a characteristic of the GPM. It's areas of stuck attention upon identities. And the pc ordinarily runs through this cycle: They didn't want it, and then they think it's fine. See? Now, they're sometimes thunderstruck and delighted with the horror of it all, but it takes them a little time for their attention to settle down into these. But sometimes some items you get are hotter than others. Sometimes they explain more to the pc than others. But you have a tremendous number of items before you get down to the middle of the Goals Problem Mass. And that, of course, is the last one – the last ones that the pc finds.

And they will be twenty or thirty combinations deep. You see, 3D Criss Cross bypasses and cuts through the running of items and it simply goes on selecting items, finding items; and by the process of finding them, getting the bank down to the point of what's holding the bank together.

And that is a rather difficult proposition because it's sometimes almost over the pc's dead body. You see? In fact, I would go so far as to say it is over his last few hundred thousand dead bodies. [laughter, laughs]

Fortunately, there are only a few of these items which are remarkable. The pc has probably been, in actuality, any item he has – he ever puts on a list. Do you realize that? We're only trying to find the items he's stuck with. And by the fact of listing, you get rid of fifty or a hundred items at a crack, you see. Because they key out easily. But then you get the one that doesn't key out. Well, that's the Goals Problem Mass item, see? All these others are simply locks on that. Now, of course, what's holding the one in that's going tick-tick-tick-tick consistently? Well, that'll be a deeper, more basic combination.

So you can go elsewhere in the Goals Problem Mass, and you pull out a few more pins and hinges, and don't be too surprised if items that checked out, when you go to run them, haven't got a twitch in them. See?

Don't be too surprised. They're not going to go on ticking forever. Some of them are. Only when you run the central package are you going to get rid of some of them. But the most horrifying ones that the pc finds early on are liable to blow as locks. Oh, man, they really explain his whole case and he's right there, and everything is fine, and the masses move around, and the chills turn on; and if you were to run them, they would run quite satisfactorily.

And then you move on a little bit deeper in the case and these others cease to be that important. And you go on deeper, and you get these earlier items that were so important, deintensifying as importance.

But it's an interesting thing that the reason an auditor trying to do Routine 3 was trying to do it and failing so often, and that it was so difficult to do – sometimes getting thirteen-hundred goals and things of this character, you know – was because Routine 3 is a much better – in terms of quality but not in terms of length of time of running or accuracy or easy on the pc, and it certainly guarantees no accuracy. If you can't supervise the auditing and cross-check it and get the rudiments checked, and oh, my. It's a very difficult and complicated action to get a Routine 3 goal and then get its terminal.

But what do you know. If you get a Routine 3 goal that is really a goal and sticks there, and then the terminal and it really sticks there; do you know that after you've run or found ten or twelve items of Routine 3D Criss Cross, that you'll start colliding with the original Routine 3 package? That was how deep Routine 3 went into the bank.

In other words, Routine 3, if it could be done, was a very accurate method and reached very deeply into the Goals Problem Mass and reached very significantly deeply into the case.

Well, Routine 3D Criss Cross exists because auditors found this very hard to do, and if it was done inaccurately, it was absolute suicide for the pc to run it. It was deadly. It was

worse than taking arsenic. You get the wrong terminal, man, oh, wow! And then run it. *Wooh!*

Well, in Routine 3D Criss Cross, you can sort it out and sort it out. What I did actually – I won't go into detail because this isn't a lecture on this subject – but I just found about forty doors where we only had one door. There were several reasons – as you can learn in earlier lectures – there were several reasons why we stopped doing Routine 3. And Routine 3D Criss Cross, of course, keeps affording all these doors. I don't wish to discourage your accuracy, but frankly, if you're only indifferently accurate, why, you will eventually wind up in the middle of the Goals Problem Mass by just the law of averages, see.

And when you really got it all the way down, of course, it'll run like a startled deer and everything is fine, you see? It's a much handier one to use, much better to use and the pc shows continuous progress all the way through running it.

They're a bit different, they – but they oddly enough wound up with the same goal. I merely wanted to make this comment on old Routine 3. It was auditor accuracy or inaccuracy that defeated it, rather than it wasn't arriving. Because, man, that really "arrove" when it "arrove"!

Okay. So you take somebody who was done on Routine 3, and then you take Routine 3D Criss Cross, and they're always just a little bit dissatisfied with some of their items coming up. They haven't quite got the punch that their original Routine 3 package had. And that was to some degree what you were looking at last night in that session because, of course, we were in contest with a Routine 3 item which is much more fundamental on the case than the item we found, don't you see?

But by finding more and more items, we will eventually find one which is much more fundamental than the Routine 3 item that we found. We'll go that much further. See, just as in Routine 3, you had to do another assessment, you know, and find more items. Well, Routine 3D Criss Cross, you just keep on finding items, of course, and you get much more fundamental items than the original Routine 3 item just as you did in Routine 3. Okay? Help you to understand that?

I know you probably disagreed, most of you, with my meter reading. [laughter] But did you – I want to make a comment on that: If you'll watch me reading meters, you should be – notice one thing – that I'm not reading a meter on the basis of a bulletin. I'm being very careful of the pc. Have you noticed that?

Audience: Yes. Um-hm.

I'm very, very careful of the pc. And you should notice, too, that on a Routine 3D Criss Cross set of rudiments, and so on, I'm only looking for the instantaneous read. And if I don't get an instantaneous read on that rudiment, I don't fool with it. That's mostly for the newcomers. Yeah, don't fool with it, man. Because when you're doing Routine 3D Criss Cross, you're supposed to be doing Routine 3D Criss Cross. You're not supposed to be straightening out withholds and everything else.

Now, a way to defeat auditing is while doing a Routine 3D Criss Cross session, do nothing but prepcheck under the guise of getting in the rudiments. See? And then the other

way to defeat it, which is what we get to tonight's lecture is, when doing Prepchecking, don't ever find any withholds.

Now, if you can just manage this, nothing will happen with the pc. And nothing will ever be revealed. But if you – just as a further comment on that session – you should notice that I just don't take any chances with the pc from the standpoint of meter reading. If it *bings* 1 and 3, why I leave it in. And if I've got a question about it, I'm not so tied to the ritual that I don't find out whether or not it's still in or not. I go on and find out if it's in. You notice that? And you notice when we really found the item itself, it was going *pop-pop-pop*. This is nice. Wasn't that – wasn't that beautiful? *Pop-pop-pop*. And the pc saying, "Well, I don't know. It doesn't have anything to do with me, and so forth." *Pop-pop-pop*. Nothing else around there was going *pop-pop-pop*. Well, remember the horse came up and knocked out the griz – the polar bear. Thought that was interesting. We had a rock slam on polar bear up to the moment the horse came up.

Pc said, "I think there's another item. It's a horse."

Fine. That was the end of the polar bear. [laughter]

And it's just puzzled me ever since. The dramatic scene which I can pick up about horses and polar bears. [laughter] They don't quite mix up, you know. But anyway, that was the way it went.

All right. Enough of that.

This in essence is a lecture on... I could be very smoothly – and finish this off, you see, as a lecture on Goals Problem Mass, you see, and then do the other one on Prepchecking. But my mind right now is on you and the sins and crimes which you were committing under the heading of Prepchecking and I want to set you right in a hurry. So this is actually a lecture about Prepchecking, and I want to give you some data on the subject of Prepchecking which you probably do not have yet.

And one is: the object of Prepchecking is to find chains of withholds and release them on the pc's case. Now, I want you to get that datum, and so on. I don't think it's been in any bulletins or anything. I probably omitted giving you this datum. But the object of Prepchecking, you see, is to find chains of withholds and relieve them on the pc's case, you see. You got that? You got that? It's a new datum. A new datum.

Because when I look over your What questions or when I looked them over last night, after the air was no longer blue, I sat there and held my head in my hands for a few minutes, sighed deeply, and then threw it all overboard and audited Herbie. [laughter] That was after the session, you see. That was a good session. You missed the real good session last night. [laughter, laughs] That was the good one.

Anyhow, the datum which you're missing about Prepchecking is that you don't ask a What question until you have a specific withhold delivered into your lap by the pc. Your What questions are all your Zero A questions. Now, the way you're Prepchecking is your What questions – what you're listing as What questions – are actually Zero A questions or Zero B questions.

And in any folder I picked up last night, I did not find a single What question. I found nothing but Zero A – Zero B questions. Isn't that interesting?

And on a little further inquiry, I understood what was wrong, and that is: you're not waiting till you get a crashing, smashing, nice withhold right on the button before you ask the What question. Now, the Zero A – the Zero question gives you a huge generality. Your Zero A, why, it gives you slightly less generality. You could have a Zero B that gave you a little less generality, but I'll give you an example:

"I says to this girl once, I says – I says, 'I don't think you're beautiful,' so I've damaged the beauty of women and so on. And I think I did that, and so forth."

"All right. Well, what about damaging the beauty of women?"

Well, we probably don't even look at that first withhold he just gave us anymore, but go racing and call that a What question. "What about damaging the beauty of women?"

"1." With great triumph, you see, the auditor puts down, "1. What about damaging the beauty of women?" Oh, thank you.

No, no, that's a Zero question. A Zero A or a Zero B, don't you see?

Now from that, you get this generality. Let me give you a better example, more definite.

Well, the fellow says, "I've often disconcerted women." See? "I've often disconcerted women."

And the auditor hastily puts down, "1. What about disconcerting women?" See, these are all wrong ways of doing it.

"Well, I just did. I just disconcerted them, I did."

"That's good. Oh, you disconcerted them, huh?"

"Yeah."

"Well, all right. That's fine. When did you disconcert them?"

"Oh, the last few lifetimes."

"All right. That's good. Think that's flat now? All right. That's fine. That's null."

It isn't registering anymore. Wasn't registering in the first place. So we finally cleaned up that withhold, didn't we. *Heh-heh-heh*.

Well, now, I just wish to tell you: that is wrong. And I wish to plead with you, plead with you, to see the error of your ways and repent because the kingdom of heaven is not at hand for any pc that you do that to.

You haven't even really gone so far as to miss a withhold. [laughter] And you know, I think that's wading pretty shallow in the pc's bank. Now, let me show you this.

Through chitter-chatter, metering, analysis, assessment – anything of that sort; through anything of that kind – we find out that this person has been making a habit of disconcerting women. So that's a Zero A. "What about hating sex?" was the Zero from which we came out,

or something of this sort. Or "What about sex?" or "Why haven't you liked sex?" Well, we don't care what it is, but it had something to do with a *whole* dynamic, you know. And we pulled it down to the fact that he was disconcerting women. Well, that is just a Zero A. And you're going to have lots of those, and you could put that down by any way that you arrived at it; we don't care.

You can go ahead and do it just the way you've been doing it, but don't think you're yet into withholds of the bank. You're *not*. See, you're just at some high generality of some kind or another.

Because what you've got to do now is go ahead and get the pc into a specific overt: a specific, clawing, screaming, acting overt. Not a "I thought an unkind thought about God." No, we don't buy this sort of thing. No. Disconcerting women. All right. You've got to go at it this way.

This is not a What question even though it begins with what. "What's this – what's this about disconcerting women? You ever disconcert one?"

And the pc says, "Oh, I don't know. Lots of them, you know. I, just – thousands of them. And so on, over, the last few lifetimes, I've been disconcerting an awful lot of women, as a matter of fact."

And you say, "Well, good. Well, just – just one, just one now, just one, see, one – one time when you did."

"Oh, well, one time when I did it. There's lots of times when I did it, you see."

"That's fine. Yeah. Good. Well, just – just one time. Just how – well, how would you go about con – disconcerting one?"

"Oh, I don't know, scratching her eyes out or something like that." And so on.

"Oh, really?"

Now, you see now, there you'd go with a wrong What, you see? "Oh, well, this person, you see ..." You've got a suspicious What, you know. You've got just a suspicion there might be a What there, so you say, "What about scratching women's eyes?" You know, just because you've had tick on it. Oh, no, no, no, no. Lay off of it. Just – just put your paper aside until you've done some work! Then, then you can write it all up and brag to me about how good you are at this sort of thing, but only after you've done it, you see. Your paper – you haven't got anything to do with your paper or anything. You're just – you and the pc. We don't even really care whether we're doing too much with the meter at this stage, you know.

And he says, "Well, oh, well, that's just metaphorically speaking. I, as a matter of fact, probably never have scratched any, any women's eyes. That's just, you know, you know, that's the old cliché, 'Scratch your eyes out.' I could scratch her eyes out. I suppose I've said that a time or two. Or women have said it to me, and so forth."

You just leave that paper alone and leave your ballpoint alone. Don't come in close to this now. You haven't got a What question yet. You understand me now? And we finally say, "Well, now, scratching women's eyes," and it goes *clang*, you see. You say, "Any time when you have ever done this? Any time when you have ever done this?"

"Well, I've – some past lives somewhere."

"No. Now, any time you've ever done this? You know, scratching women's eyes. Any time you ever really have done that?"

"No. Well, I hit a women – I hit a woman in the eye once. I – I *hit* her in the eye."

"All right."

See, you weren't quite on, see, you weren't quite on with scratching eyes out or something like that. But *hitting* a woman in the eye. *Ah, ha-ha*, that was something else, see?

And you can still make a little notation. Well, if you're going to make any notations or you can't remember it, put it over here in the margin someplace that you did get a reaction on scratching eyes, but the only overt you can find on this, to which the pc will stand up before the judge and plead guilty, is: "punching a woman in the eye." But we want to find out if he can remember it and if it happened, and so forth.

So he finally said, "Well, yes, she was instructing in the Academy, and I punched her in the eye, and that's – that's right. That's right."

Now, "What about punching a woman in the eye?" *Now* you have your What question, and you write it down there: "1. What about punching women in the eye?" Which – which is probably the best phrasing for it, see. You're going to get a knock on that, too.

Now, you want to know *when* it was, and you want to know if that's *all*, and you want to know if – what might have *appeared* at that moment. (Your new 4.)

You want to know who didn't find out about it, who failed to discover it, so forth, who he was hiding it from. Any way you want to phrase it, and so forth. And then you ask him when was it. This thing is knocking like mad, you see. It's taming down now. And was that *all* of it? And what *didn't* appear at the time, see? Run your plus and minus "is-not-is," see. What didn't appear at the time? And then who failed to find out about it? And so on and ...

You know, this thing isn't cooling off worth a nickel. Now, this is how you *tell*, see. This thing is just not cooling off. Well, there's several ways to handle it. The more – most accusative way and probably the most needless, early on, is to find out if the pc is telling you a half-truth or an untruth about the thing. But that's relatively needless.

No, look. The anatomy of change demonstrates that if that thing didn't cool off on a couple of rounds of When, All, Appear, Who, *he has done it before*.

Now, get the idea of dramatization and habit pattern. If last year somebody socked a woman in the eye, you can absolutely guarantee that year before last he socked a woman in the eye. And you can also guarantee that it'll go clean back to kindygarten, because that's what you do. You see? That's natural and normal. And that's why that withhold won't free.

And now, you just put your *ballpoint* aside and leave your auditor's report over there as far as any What questions are concerned. You can put down all of your tone arm reads and your times and so forth, but don't you do anything to that "1" question, because you *haven't run it yet*.

You found one withhold before you got it, see. You found one overt and a withhold right there, bang. Now you're going to ask for an *earlier* one. Now, that's the magic word. You want an *earlier* incident when he socked a woman in the eye. And you're going to run that one back, and you're going to find that there's an *earlier* one, and so forth.

And he says, "Well, no. I really never socked a woman in the eye" – the needle is falling off the pin – "but I kicked one in the shins once."

Now, I will permit you at that time to pick up your overt, and if it's not working very well – ballpoint pens and overts. Have you noticed that they don't write on greasy auditor's reports and so forth? They're always letting you down.

So you can go over here on the margin and you can write "Kick woman in shin." Understand? "Kick woman in shin." You can write that down here over in the margin someplace. We don't care where you wrote it. It's just a notation to you. It has nothing to do with your Withhold System, because that's a Q and A to leave that What question you got because, look, you didn't *free* it. And I guarantee to you ladies and gentlemen, that if it falls on, "Hitting a woman in the eye," and you can't free it by finding, "1. Sock a woman in the eye," there is an earlier one last year when he socked a woman in the eye, and there's one earlier than that when he socked a woman in the eye. You got the idea?

And I don't care if there were five hundred and seventy-five times when he socked a woman in the eye, you're going to run them all under that What question. You're not going to put it down – any more Whats. You're going to run a whole chain, and that chain is going to consist of a hundred percent doing just exactly what you put down, which described a specific overt – on the ... Because look, if it only happened that once in this lifetime, it will *free* on two runs around. And if it doesn't free on two runs around of the "When, All, Appear, Who" – if it doesn't free – you got an earlier incident on the chain which is *exactly* the same incident. It's not some other incident. It's not kicking somebody in the shins, it's bopping somebody in the eye. That's all there is to it, see. And nothing more to it than that. You've just got to find that earlier one.

Now, true enough, pcs can all be mixed up and they try to get off this, and they try to get off that and they dodge this, but you actually can stand in there because every time you run a "When, All, Appear, Who," you've shaken up that chain a little bit and he can remember earlier, you see? And he all of a sudden will give you an earlier one and he'll give you an earlier one – that's all on the same What. See? He'll give you an earlier one, "pop a woman in the eye," earlier "pop a woman in the eye," earlier "pop a woman in the eye," earlier ... And we find this one in kindygarten. He forgot all about it.

What you haven't learned is that a chain can't stand there in any one lifetime unless it has a hidden beginning. And it will wash out at once on your "When, All, Appear, Who," if it has no hidden beginning. It'll wash!

You ask him, "When was that? Is that all there is to it? What might have appeared then? Who didn't find out about it? What about popping a woman in the eye?" That's your test question. You don't get a quiver. There was only one incident; there is no chain. You get a quiver, you don't get a substantial reduction of that needle read, *ah-ha-ha-ha-ha-ha-ha*, you've got an earlier incident. And that earlier incident is going to be part of a chain which

has its anchor point in the hidden unknown of his forgetfulness. Actually, not really out of this lifetime. And that's the only reason it's stuck!

Now, please get the anatomy of how a chain becomes a chain and how it gets stuck in the mind and how it gets charged up. And that is *because the first part of the chain is suppressed and forgotten*. It is totally out of view and therefore you get a chain. And you don't have a chain that will react consistently or go on reacting, unless it's a repetitive series of incidents which have the first incident this lifetime out of view. And *that makes a chain!* And nothing will hang up as a chain unless that is its anatomy.

Don't look at it in reverse. See, you're not putting these engrams in the pc's mind. You might think you are sometimes but you're not. He's done these things. And it's that earliest lineup that is missing. And if you're really running hot as a prepchecker, you're running on actual incidents only. Generalities, never! And you're running back down the same chain of the same dramatization, because remember, that dramatization, if only done once, will wash.

My God, you've just taken an eight-gauge shotgun and an eighty-eight-millimeter anti-tank cannon – put it up against its temples and blown its brains out. I mean, this is no light thing you're doing to this withhold, you see.

Well, do you realize that major engrams will key out on the early track by just finding exactly when they occurred? Fellow blew up a planet and right afterwards they put him in a box and squashed him slowly, and then they held him in a trap for a thousand years and... Do you know that on lots of cases you find this engram, you see, and you say, "When did it happen?" And you date it down to eight trillion, seven hundred and sixty-five million, nine hundred and fifty-five – you know – *zzaa-zzaa*, at two o'clock in the afternoon. And all of a sudden goes *phssst*.

So you're not doing any light thing when you're asking "When." And then you are asking him to confide in you, *all* of it, you see. That gets any hidden scraps out of the incident itself, and "Appear," well, and "Not Appear," that's going to get the suppressor out of the incident, too. And "Who didn't find out about it," and you can do a – you know, you can do a whole Sec Check on "not-know"! You know, "not-know" is one of the most powerful Sec Check weapons there ever was because it's the whole constituency of individuation. This fellow knows about it and the rest of the human race doesn't – you've got a disagreement on the subject of knowingness.

Now, two or three of these – any one of them – well, if you said all about it and then ran it as an engram a few times, it would erase. So any one of these things in the past – any one of that four has been powerful enough to take care of major incidents.

And you're leveling all of this, for God's sakes against one little, tiny pebble that's sitting there, you know. Thing is totally capable of sweeping a whole mountain away, you see? So you take this little pebble and you put it up there, and you range the eight thousand-ton gravel crusher above it, you see. And then you put fifteen, twenty sticks of dynamite underneath the thing, saturate it completely in nitroglycerine, you know, wire it up to electrocute it and then charge it with treason so it can be hung, drawn and quartered. And you go back over and you push the master button and there's a large explosion of one kind or another – it's gone.

You're using all the weapons necessary to shoot down a B-52 to hit a baby sparrow. And there it is. And look, ladies and gentlemen, if it only happened once, one pass through will find no charge on it. But if it happened before, *ah-ha*, we've got an earlier withhold. That's the only thing that can keep that thing reacting. So we get the earlier withhold. And we get the earlier withhold, and we get the earlier withhold. Well, if it's this much of a chain, it must have its tail – like a scorpion's tail – well hooked into the root in the sand. You see?

And the fellow says, "I don't know."

This is typical of your recurring withholds.

Every time this fellow sits down, he says, "Well, I had a – an unkind thought about Ron," see?

And he goes to the next auditor, "Had an unkind thought about Ron," you know.

Next auditor, gets off this withhold, "Had an unkind thought about Ron, you know."

Next auditor, "Had an unkind thought about Ron."

Sooner or later, somebody ought to get the idea that he must have done something to Ron at some time or another. Somebody might get that idea. See? And say, "What have you done to Ron?"

And then he – then he'd say, "Well, I didn't answer a despatch he sent me once."

And you say, "Well, fine. That's good. That's good. That's good. That's fine. What about not answering despatches from Ron?" That auditor was working hard, wasn't he? You could just see the sweat pouring off him. [laughter]

Now, let's not wade so shallowly. Let's find out some blood. And oddly enough, if you search hard for blood – this is another mechanism you should appreciate – if you search very hard for blood and you want to know about this, and so forth; the tiniest "what the pc has done" very often explodes in the face of he didn't do anything like that, you know. I have sat and asked a pc samples just to give them a horrible comparison, see.

Pc's saying, "Well, I ..."

Keep getting a fall on women, see. I'm trying to find out what he's done to a woman or something of this sort, you know. Anything, but I've got to have a specific one.

"Well, have you knifed any women? Have you strangled any for just kicks? Have you thrown any bodies in culverts? Have you stood by and seen a woman raped by four or five people?"

And the pc's going, "Oh-oh, n-n-nothing, nothing, nothing, nothing like th-th-tha-a-a-a-t. I lied about one once, and she got, got a divorce as a consequence. That's all."

"Oh," you say, "well, thank you. Now, let's see. When was that?"

In other words, we scare it out by order of noncomparable magnitude. [laughter, laughs] Blood running all over the place. You see. And the pc surrenders. Begins to look like a mighty small thing he's done there by comparable magnitude. Get the trick?

Audience: Yes.

So anyhow, if you're going to get a chain, the chain is all the same action and that is what a chain consists of. And a chain is not a similar generality; a chain is a similar action. In fact, it's not really similar. It's an identical action. And that's what makes it a chain.

There's a chain of scratching your head on the left side, and there's another chain of scratching your head on the right side. You get the idea? See?

And on some bruisers, there's a chain of kicking women in the left shin and a chain of kicking them in the right shin, you see? But ordinarily, we will simply accept "kicking a woman in the shin" as a chain.

And if you find one incident of kicking them in the shin, if there's a lot of earlier overts on the same woman, you'll have a little difficulty erasing it. The kick – the incident of kicking them in the shin – unless you go and Q-and-A with it and get off into Robin Hood's left field and forget to pay the rent, and so forth – just kicking them in the shin is going to desensitize. But that woman's name is not going to desensitize. See? Or beating her up isn't going to desensitize or something like that, but kicking in the shins, you're going to lose that.

All right. Now, after we've gotten all of the chain up, and we've gotten finally his sitting astride the little girl in kindergarten and pounding her repeatedly in the left eye – after we got this one up, which he had totally forgotten about – you'll find that that whole chain of hitting the women – woman in the eye is now gone and will erase clear to present time, because it's identical actions.

And then the pc is feeling so good, and he's all straight, and he's – everything is fine, and way back here, you found "kicking a woman in the shin." And you didn't take it up.

You then say, "What about kicking a woman in the shin, now?" See, he's all – everything's erased, you've got it all fine, and he's all straight, and he knows he's leveled with you, and will never have to take up being brutal to the female sex again, and you haul up this dead rat.

"So what – what about – what about kicking a woman in the shins?"

"Well, there was such an incident."

"All right. Well, all right. Give. Give." See, you're trying to make sure. You're not writing anything down yet. You're trying to make sure that there is an actual incident.

"Well I, 19 – 1952. Well, Josie Ann Marie. I kicked her in the shins, all right."

"Good. Now, what about kicking women in the shins?" See, there's a What question.

You haven't changed your Zero A, and you've gotten rid of that first What question, see? Now, you're going to find out they not only kicked Josie Ann Marie in the shins in 1952, but there's some earlier instance of this thing occurring and you're going to get a whole chain going on this thing. But, if this thing fell and then you ran your "When, All, Apppear, Who," questions, and asked the question again and it's gone, there's nothing earlier. There's nothing earlier.

You can take a little chapter out of my book and be very careful and ask that What question before you leave it, ask if *nyah-yah* and then ask if you've missed a withhold on the pc; and then don't buy anything he gives you because you're prepchecking him.

And they say, "Well, yeah, you – you – you missed the fact that I – I beat up my mother. *Ha-ha-ha-ha.*" Well, you don't sail in on this. You're trying to clear up this other chain.

You say, "All right. Well, do I know about it now? That's fine. Thank you very much. All right. Now, kicking woman in the shins. All right. That's very good. All right. Got that settled. All right. *N-U-L*, null, *L*. Now, is there an actual incident of your beating up a mother? I mean, you – you did beat up your mother?"

"Well, I think I did."

Keep that ballpoint off the paper, man. Get an idea of an electric shield getting in between that paper and the ballpoint. Don't you write any What question.

"Well, I actually didn't beat her up. She beat me up."

Ah, that's getting to be an awful sure sign, isn't it. *Ho-ho-ho*. Oh well, all right. We don't do anything with that yet. We don't write a word yet.

And you say, "You did beat up your mother? Well, how old were you?"

"About seven."

"All right. You did beat her up?"

"*Yup.*" *Clang*, you see.

"Well, what about beating up your mother?" *Heh-heh*. See, write your What question and you'll get a nice chain of it. Last time he beat her up, she was seventy-two... [laughs]

You can run a whole flock of withholds off that What. And I don't care what you write in to refresh your memory or keep yourself picked up, but look over your Prepchecking questions. And I look over this "I disconcerted my mother," not as a What question, if you please; if you please.

This – didn't have any incident. You see, it's only after you've got blood that you go down to the "1" question. There's already blood dripping on the floor at the moment when you go into that.

Until that happens, you're in the broad generalities of Zeros. And you can just call Zeros the world of generality. And I don't care how many Zero As, Zero Bs, Zero Cs, Zero Ds – I don't care how many Zeros you've got sitting up there. You're in the world of generalities. You have not yet found an incident. You're still in the field of assessment. You're still in the field of grope. I don't care what you write up there particularly.

But before you *leave* that area, may I please lay down the law on the subject of, "Don't you *dare* ever write a What question until you have an actual incident of the pc doing something. And don't ever leave that type of incident until it's freed up." And then you'll stop missing withholds and you'll get the benefit out of Prepchecking.

But you keep wading around in that little duck pond that you think is the pc's reactive bank, you see – here's this little duck pond up here on the beach, and you're going around there, and it's just damp on the bottom, you know, it wouldn't even support a goldfish. And you're wading around there very carefully, and you're being very happy because you found a leaf floating in it, you see.

I ask you to look over your shoulder because as you're wading around in this duck pond, that roaring, screaming, typhoon-ridden, surging, limitless ocean, that is just behind you, is the reactive bank you should be swimming around in. And I will state that it sometimes looks like that to you, and you think you'd better not go swimming under those conditions.

Sharks darting up in all directions, you see. Typhoons and waterspouts coming in from every horizon, you see. Wreckage strewn about, dead bodies, half-eaten women, you know. The thing is untidy. And you say, "Well, I shouldn't be swimming in there. My mother wouldn't like it." [laughter]

Now, if you're going to get the full benefits out of Prepchecking, why, you're going to find something the pc did, and then you're going to write a What question based on that something he did. And then you're going to clean up that whole chain before you leave that.

Now, this is sometimes hard to do and sometimes your luck is out. Now, I will add this: sometimes you're just – your luck is out.

You hit a chain just like you used to sometimes hit an engram that wouldn't erase. You will sometimes hit a chain that just seems to go forever and disappears into the Stygian deep of past lives and it just goes forever. Unfortunately, you probably have hit something related to the Goals Problem Mass, and it's just going to go forever. But that's no excuse not to run it because you could still run it all the way, but you might find yourself prepchecking the same question for three or four sessions.

And sometimes your pc throws you an awful red herring. Now, this is the other lesson I must teach you. The pc goes into control of the session with present time problems and missed withholdings and things of this character in the beginning rudiments. And you've got a nice chain running, of some kind, from yesterday's session. You walk into today's session and here are all these damned red fish lying all over the ground.

And you try to get into the Prepcheck session, and you can't because you keep slipping on these kippered herrings, see. So, you try to clean up the present time problem or the missed withhold or something of the sort and you find yourself on an entirely new chain that had nothing to do with yesterday's session.

All right. Tomorrow, you come in – it's now tomorrow. And you come in and you want to get this question – day before yesterday's question and yesterday's question flat – and so you go into the rudiments on this third day and the pc has an entirely different missed withhold or a present time problem and you find yourself now on a third chain.

Now, the fourth day of the week comes around and you try to get into it and the pc has a present time problem about something else. You now have four chains alive. Nothing is settled. And on the fifth day, of course, either you or the pc blow out your brains.

You see how the pc moves into control of what is being run. A pc almost does this knowingly. See? He's just gotten up to the point where he has to confess that he went to Leavenworth for five years for stealing automobiles, you know. He's almost there, you know.

And he says, "If this just goes any further, this one question that we keep running here about, 'Have you ever stolen anything,' goes any further, we'll – we'll get into that area."

He says this reactively. He hardly says it actively at all, see. He has a present time problem. *Ha-ha*. Has a present time – best thing to do then is have a present time problem about your wife, isn't it? *Ha-ha*. Nice and distant from the subject. It's a way to miss withholds, isn't it? And it's also a way to steer checking.

Now listen, aside from the fact that you must keep up – your pc has to be in-session, you do a minimal in-sessionness. You do a minimal requirement here of the rudiments. And if it looks like these rudiments are going to throw you over into the next county and on to a new chain and you've got to finish up yesterday's chain, and that sort of thing – you know somebody saw me do it in a demonstration one day.

"Do you have a present time problem?" *Clang!* Instant read, see. "All right. What's that?"

"Well, my girlfriend left me last night."

We're prepchecking "making saddles," see. "My girl left me last night."

We'll say, "Good. Do you have a present time problem?" It goes *clang!*

And you say, "Well, what's that?"

"Well, it's my girl. She left me last night."

You, fellow auditor, standeth there alone on a vast and limitless plain; a solitary intelligence with a large signpost. And on this signpost there are two pointers. And one says "right" on it and the other says "wrong" on it. [laughter]

Now, we know that you cannot run a successful session with a present time problem in full restimulation. We can prove it time and time again, that this is the case. And we can also prove that cases blow up and go *blooey* if you continue to leave Prepcheck questions – What question chains, you know – unflat. And the only thing wrong with that right and wrong crossroad sign above your head is, because you're straight under it, you can't read what either one says.

Actually, that is the end of the lecture. [laughter] Because you won't always win. Sometimes you're going to be wrong. Just try to be right as often as possible. [laughter] Don't be deluded or dragged out of prepchecking by a brand-new chain of some kind or another that the pc keeps presenting; otherwise you're going to go too far afield.

Sometimes it is better to ignore the out-rudiment and sometimes it is fatal to ignore the out-rudiment. And that's what I mean. But the best datum I can give you about this, that you'll find the most valuable, is don't use withholds to solve any of your rudiments.

"Are you withholding anything *since yesterday's session?*" And you get *clang!* You know – *clang! Ha-ha*.

"Now look. Since yesterday's session, yesterday's session – you remember when we ended the session yesterday? From that time until now, have you done anything that you're withholding?" Not a motion. "*Ha-ha. Grrrrrrw. That's it. Ha-ha. Good.*"

Because that's the only thing that can louse up your session. That withhold he's given you, if it occurred earlier, also existed in yesterday's session, too, and it didn't get in your road in yesterday's session, so it's not going to get in your road in today's session.

And when you do the present time problem, if you have to run it, Responsibility or something of that sort, or even Unknown, old Unknown – one of the older students here commented on to me that possibly it could be used in running a present time problem – the old Unknown method. And don't try to run it by withholds. Keep withholds out of those rudiments and you'll be all right in a Prepchecking session.

Now, a 3D Criss Cross session which has its rudiments out, once more you have the same thing, because the pc can continuously throw a 3D Criss Cross session into a Prepcheck session. And you just don't get any 3D Criss Cross done. And the rule is when you're doing 3D Criss Cross, do 3D Criss Cross. And when you're doing Prepchecking, do Prepchecking

And if you've had consistent trouble with the rudiments, then take off a couple of sessions and do *nothing* but rudiments – beginning rudiments, end rudiments, beginning rudiments, end rudiments. You know, just do nothing but rudiments. Just long, drawn-out proposition, you see. Just bang the rudiments in one way or the other. Take them all up and keep your Prepchecking sessions for prepchecking and your 3D Criss Cross sessions for 3D Criss Cross. And don't let the pc steer these things without rudiments, because it's been happening. *Hmm?*

When I see a 3D Criss Cross session of two hours narrowed down to thirty minutes of 3D Criss Cross and one and one-half hours of trying to get the rudiments straight, well, I say somebody is having trouble. That's what I say. I don't say they're doing wrong or something of this sort, but they're certainly having trouble. And I can always say this with great truth: They're going to have *far more trouble tomorrow*. And if they do it tomorrow, they're going to have *five times* as much trouble than they had today, day after tomorrow. And if they do it a third day, they're not going to have any pc at all, because it comes under the heading of no auditing. The pc's sitting there quivering, you know. He's gotta get that item, and one more thing, it's quivering, you know. And you start prepchecking him. Comes under the heading of no auditing. And the more you try to put the rudiments in, the further you go out.

The longer it takes to do and get a 3D Criss Cross item, the more difficult it is to get. The third day is the borderline. You go over to the fourth day, and you're in trouble, and you'll be in trouble from there on out. If you go four days trying to get a 3D Criss Cross item, at two-hour sessions per day, I can guarantee you won't get it on the fifth, sixth, seventh, eighth, ninth, tenth, or eleventh, twelfth, thirteenth, fourteenth or fifteenth day. You've thrown the pc out of session by just not delivering an item. The longer it takes, the harder it is to get.

When you're real slippy, you get one per session. That's really – that's really moting – one per session. *Poppeta-poppeta-poppeta-pop*. See, you won't get in any trouble at one per session. You actually won't get in any real trouble, one every two sessions. That's pretty easy. Now, you're getting – that's awful easy – one every two sessions. One every, see – three ses-

sions – oh, I don't know. You'd have to spend half your time sound asleep in the auditor's chair to do it that slow. But from there on, in actual fact, you're not going to get anything. See, the rudiments are going to go further and further out.

Now, I've handled a pc this way with some success. The pc says, "All right. I've had present time problem, *agraaa-agraaa*, missed withhold, and so forth. And I'm all ARC broken. I'm very upset with you," and so forth.

I've said, "Good. We happen to be doing a 3D Criss Cross session, and I'm going to get a list here, and we're going to carry on with this. How is that with you?"

Pc says, "*Huh?* Oh, you are?"

And I say, "Yes, that's right. That's what we're going to do."

And the pc said, "Well, that's fine."

In actual fact, if I at that moment asked the pc "Do you have a present time problem?" "Do you have a withhold?" or do you have anything else, I wouldn't have anything at all. I'd have a blank meter. See what the mystery of it is?

Because I've said very forcefully, "All right. Now we're going to give you some auditing." The pc then drops all of his excuses why he shouldn't have any. Do you see? There's more to this than simply the crude slug.

I have been known to make some rather interesting remarks in sessions.

You – on some of these you would have held your breath. But the funny part of it is, the pc never seems to get ARC broke. You saw me make a funny remark last night. Didn't you?

I said, "Come on, now. How are you getting these things? Well, that's for the birds. Get them some other way."

So I thought, "For sure, that would ARC break the pc." I asked for one right afterwards and I didn't have any reading. Did you notice that? The pc thought that was perfectly reasonable. Because if you're being truthful and factual, you could never ARC break the pc. It doesn't matter how mean or cross or otherwise you sound.

I've boxed with a pc sometimes for five, ten minutes, fifteen minutes trying to get them to get uncoy on the subject of withhold and finally said, "Goddamnit! Listen here. There you are. Here I am. I can sit here all night. Can you? Because we're going to until you tell me."

Funny part of it is the pc doesn't ARC break. It's maybe never warranted. Maybe that type of approach never does any good at all. You understand? Well, it keeps me from doing a withhold.

Thank you. Take a break.

PREPCHECKING, ZERO QUEST- TION

A lecture given on 21 March 1962

Vernal Equinox, Earth Colony of the Marcab Confederacy, Space Command, Planet 5. Let's be factual; stop this nonsense. Year of the Fox. Time tracks and time tracks.

Okay. 21 March – for those earthlings that don't understand – [laughter, laughs] AD 12.

All right. I'm going to give you a talk right now on the subject of an experimental method of establishing Zero questions in Prepchecking.

The first value of this particular method is that it relieves you from a lot of fish-around, at the beginning of a case and it also removes you out of those zones and areas which you're liable to be in, which the pc doesn't consider overts but which you do.

In other words, it takes you out of the zones of Sec Checking which, although you think they should be getting someplace, aren't really getting anyplace and the pc isn't really getting any big gains, and so forth.

In other words, if – you can prepcheck, you understand, on standard social aberrations that you consider social aberrations that the pc doesn't, and get a lot of withholds on this subject, which doesn't do the pc any good at all. Do you understand?

Audience: Yes.

Now, you are entitled to a tremendous amount of win and a tremendous amount of gain in any Prepcheck session. And I ask you first and foremost to put your sights up on the subject of what ought to happen to a pc in any one Prepcheck session.

Now, true enough, under training your sessions go two hours. In actual, professional practice they are much more likely to go five-and-a-half or thereabouts. Now on a five-hour-and-a-half session, on a Prepcheck, if you don't wind up with a tremendous resurgence on the part of the pc by reason of Prepchecking and so forth, you just don't know your business.

Now, of course, you can't always win. Don't expect to win always. But what do I mean by a win? You understand the pc better. You know more about the mind. This is from the auditor's point of view.

The pc has made some part of his goals and has made some progress. Now, that's your minimal expectancy, and if you've made that inspect- expectancy, fine, dandy. Call it a win.

The pc got some cognitions and knows more about himself and knows more about life and is better in-session. Yeah, that's a nice win. That's nice. The pc's gotten over something which he's always had around. That's a little bit phenomenal. That's a big-win-type thing. You don't expect those every session.

But you expect one of these minimal wins, certainly, every session. And it ought to look pretty good. And you – after a week's prepchecking of five hours and a half a day on a pc, you ought to be sitting there looking at almost a different being. You know, this pc should look different to you.

I can generally prepcheck up to changing the color of their eyes in a five-and-a-half-hour session – generally.

But how do you know whether a Prepcheck session is running? The tone arm moves. Just like any other process, Ollie. Just like any other process. If the tone arm, it then move, you makes progress. Ya. And if she don't move – I don't care how juicy the quality is; I don't care how marvelous this would sound from the pen of Lawrence or how forbidden and banned it would be in Boston – you're not making any progress.

Just as in any activity, the movement of the tone arm gives you the degree of change on the pc.

Now, you saw a tone arm moving last night in a demonstration session on the subject of 3D Criss Cross. And you saw that tone arm flicking about, but only going from about 2.8 to about 3.25 or something like that. There was an out of – between-session-break rise to 4.0, but that didn't have anything to do with the processing. See? And that was only about a quarter of a division.

And you saw the old man choke it down to a point where he could get one read, that there weren't any more, and you saw him get out of there, man, like hurry, and say, "That was the end of the list. And now we're going to null this list."

And the pc's still saying, "But there are some more items."

And then the old man says, "That's good. I know there are. Thank you very much. *Ha-ha*. Well, you can give me those in due course."

All this a part of understanding, "We're going on and null this list," crash! Why?

Pc's giving you a list that only moves that much, you're not on a very hot list. Now, the next list along this line is going to be hotter. The opptersms are maybe going to be hotter, and so forth. But that list wasn't hot. Did you see that? Yeah.

And you saw me bail out of there, man. I'll actually leave questions unflat if in the process of a – four, five hours or something like that we've got no TA motion on the pc. It isn't moving. He's given us data. It isn't moving. Get out of there. Skip it. Don't argue with yourself that you've restimulated anything. You couldn't have; no TA motion. See? See how simple that is?

And when you're prepchecking, if you don't get a – well, let's take the minimum amount – a half a division, from 3 to 3.5 to 3 type of swing, back and forth, half a division

swing ... Well, I'd say that would be absolute minimum that you would tolerate in a Prepcheck session.

You couldn't be mining anything very hot if you weren't getting a tone arm motion – couldn't be. That's no excuse to go off and leave it because it's only moving a quarter of a dial. But after you've been at it for two hours and it has only moved a quarter of a division on the dial, *ah-oh*, come off of it. We must be mining asphalt from a solid bank of asphalt which has nothing to do with anything the pc ever found out about. That's for sure.

The amount of case progress is directly proportional to the amount of tone arm motion.

Now, a two-division motion in the course of a two-hour session – that's a lot of motion: 3.5 to 4.5 to 4 to 3 to 5 to 4 – oh, my God. Wow! See? We're mining with both hands all day and all night, you see; up to our necks in the roaring stream, you see. Breakers busting all around us, you know. Four – comes in at 4 – goes down to 3.75 during the beginning rudiments, goes to 3.9, goes to 3.8, goes to 4, goes to 3.8, goes to 3.9, goes to 3.75, goes to 3.9, and this goes on for two hours. Well, that doesn't have anything to do with us. Well, does it? Couldn't have.

Pc isn't getting anything off that has anything to do with his case. He couldn't because it's not changing any mass.

Now, there isn't any interval of time specified for which you ought to look for this motion because sometimes it goes on like this for an hour and then all of a sudden you start to get tone arm motion. Don't you see? Well, that's fine. Well, I'd say if you went on for the whole session and there was no tone arm motion – there at the end of the session – I mean the next time you picked this thing up, you would – ah, I don't know – I'd do something else.

You couldn't have restimulated the case. That's for sure. It's on any – no line that he has anything to do with.

You see, this – all comes under the heading – this is brand-new; this is brand-new. This is auditing ... This is a brand-new way to audit: auditing by the Auditor's Code. You run a process only so long as it produces change and no longer.

Therefore, you're guilty of running a process which is producing no change and you shouldn't do that. Well, that's how you judge it. That's how you know whether it is going or not going as the case may be.

So, is there any remedy? Because the amount of tone arm motion in Prepchecking is directly proportional to the auditor hitting the chain the pc is trying to avoid. Isn't that interesting?

So if the amount of tone arm motion is directly proportional to what the pc is trying to avoid, if the auditor hasn't got any directional bearings – assistance toward what the pc is trying to avoid, they'll both sit there and avoid, won't they?

And then we find the auditor walking around in this little duck pond I was talking about. You know? Oh, he really found something – he saw a goldfish.

Therefore, many methods of assessment could be expected. Many methods of assessment could be expected to be developed which would orient what Prepcheck question to ask and what Prepcheck question not to ask. And the one which I'm giving you is just one of these methods.

You've got the scale already. It's the Secondary Prehav Scale for overts. Overts; Secondary Prehav Scale. I'll edit it and publish it again but it's right now available. It exists. You've probably got it. Scale for overts.

And what you do is take your ballpoint in hand and run a standard Prehav-type assessment on that Secondary Scale. You do an Assessment by Elimination on that Secondary Scale. And you'll find you're left there with one that is ticking faintly or banging largely. Very simple, hm? All right. Well, you've got that item now.

Now, the funny part of it is that you ... This is not necessarily the way this thing goes together, but I'll just give you a rundown on it. You do a Dynamic Assessment now on the pc. That gives you a terminal of sorts.

Now, you take that overt and that terminal and combine them into a Zero question and it's hot the whole way. Won't make any sense to you. For a while it might not make any sense at all to the pc, but that's why. See? That's what the pc is trying to avoid. It's "dusting." The overt – let's be corny about it – the overt we find is dusting and the Dynamic Assessment that we do on the thing; we get fences. Sixth dynamic, and it falls out to be fences. "Dusting fences." And I guarantee that the pc will consider that about the most awful overt he can do. Why we care not. But every time he's dusted a fence, he's practically plowed himself in and he's always dusting fences.

Now, what this has got to do with the price of overts – Lord knows what this goes back to! But it'll steer into some wild concatenation of events of some kind or another that will be quite aberrative and will give you quite a lot of tone arm motion. Well, you'll find out he dusted a fence day before yesterday, you see. You run this. This is the actual one. You've still got to get this What question, see? "Have you ever dusted any fences?" you know. That's your Zero.

Now, you've fished around and found an actual fence, see, and so forth. Your What question can almost repeat the Zero questions when this goes, but you didn't put it down until you found the actual incident. It's "What about dusting small fences?" is your What question. Now, you got the idea? You didn't put that down till you actually found him dusting a fence. It was day before yesterday and he did dust a fence, you know?

And you'll find that tone arm will rock around, and it looks like Big Ben – round and round, man. Quite amazing. Well, you pan that thing out, it's liable to go backtrack on you. So what?

The reason I redesigned the Withhold System with "Appear" in it was so that it would run a backtrack incident if you ran into it. I didn't want you to be running the backtrack incidents when you might stick the pc in them, but this Appear, particularly if you also run it as Not Appear, alternately ... You know, you go When, All, Appear, Who, When, All, Didn't Appear, Who, see. It'll knock out engrams. It'll blast them out of existence. So that's fine. You

won't get the pc stuck anyplace on the track. And you'll find the pc will scoot all around, and it sounds pretty wacky.

Now, that it can be – this has a liability – that it can be wacky, will sometimes wind you up in some kind of a situation where you've done a bad assessment. That has happened, you see. A poor Prehav Assessment and poor Prehavs Assessment are more frequent than you would ordinarily suspect. They're quite frequent. They're accidentals.

Because a Prehav Assessment is a very precisely done action and lately we haven't been doing very many of them, and you don't get much practice in doing one. And of course the way you do this is just to read the items over to the pc. He just sits there, and you don't put the rudiments in halfway down the list. You don't run Havingness halfway down the list. (God, what I've seen lately on some of these cases.) You don't do anything. If the pc fell out of the chair and snored, you'd still go on doing it because it'll still register on the meter oddly enough. You're not auditing a body; you're auditing a thetan.

All right. You go right on down the thing, and you just read each item once. *Pow! pow! pow! pow! pow!* And you don't read the item: Helped... Controlled. No, it's *Controlled*, then look at your E-Meter a minute or so later, and you don't do it that way. You don't look at the pc at all.

You just do, "*Bark, bark, bark, bark, bark, bark, bark.*" It only – if that thing isn't reacting, you see, it isn't reacting. And you're going to be able to tell that in a quarter of a second, so the devil with it. It – actually, saying "*and*" between them is too long! "*Helped and controlled.*" That's too long to wait between those things.

You just go right down; you read the whole list, "*Bark, bark, bark,*" one each. And you mark in every one that it looked like it reacted. Instantaneous reaction. You mark that in. Put a mark after it. You only mark those that reacted. You leave the rest of them out and then you go down those you marked only. And you only mark those that *now* react. And then you go over the remaining ones. There's only maybe three reacted and you go over those three.

Sometimes you're left with two, and one reacts and then the other one reacts and it takes a moment or two reading one and then reading the other and so on and you're left with it. And then you check nothing; you don't do another thing. And that is why you can get a lousy mess, because sometimes you check it and become unsure of it or you don't know or your last two readings were bad or something and you start quivering. And the only reason you ever do a bad Prehav Assessment is because you quiver and doubt somewhere along the line. You have to do those assessments boldly, brashly and come what may. And maybe the pc got some incidental reads on something else. He thought of something else and you got a read and that made it look like one of them read, don't you see.

Well, that's all right; you'll get it by elimination anyway. And you usually are down to two and you have to read one against the other and you could see that they're both reacting. There's not much question in your mind. And one of them drops out and leaves the last one and you only read it once. Well, you can read it, maybe, two more times and see if it reacts, but it wouldn't matter because if it stopped *reacting* on those two more times, doesn't mean you've got it wrong.

The primary cause of a bad Prehav Assessment is the auditor's doubt of what he's seeing on the meter; the lack of boldness and brashness.

This is one of those slap-happy, go-to-hell, flat-out sort of actions. You know, this one you do. There's nothing to one. But you start hunting around and being a little bit doubtful and trying to keep the pc awake while you're doing it and being superchecking and supercareful about the whole thing, and you wind up in the soup every time. The pc kind of goes out of session.

It's a remarkable thing how a pc will stay in-session at a brisk, machine gun, Prehav Assessment. You see, auditors that get all kinds of things and the pc will all of a sudden pop up and say, "You know, I'm still thinking about 'startle.'"

And the auditor – he's liable to do something about it or something like that. The auditor is liable to say, "Well, thank you," and go on with the assessment. Well, that's perfectly all right. I don't usually say – I just say, "Shut up!" [laughter] He isn't supposed to be talking "What you talking for? Now, let's see, where were we?"

But he only starts to help you if you look helpless. And if you want to get an auditor that gets pcs wildly out of session, why, always train the auditor to believe that the pc should help him, and then of course, the auditor will look helpless. You know. That auditor doesn't even have to exist in the level of Help as far as operating helpfully or something of this sort. If an auditor just operated briskly and interestedly, you'll find out the rudiments will stay in. You can almost take Help out of the soup.

Pc says, "Let me see. I don't know. Let me see. What date ... ?"

"Oh, come off of it. What date is it?"

You don't help him. But tell him to give you what date it is, you know.

"Well, let's see if you can find out what date that is. Let's see." Let's help him out and so forth, of course. And then this immediately is liable to go into being helpless, you know? Like, "Well, let's see, now if you think about it there I'll read on the meter here, and you think about it while I read on the meter and then we'll find out, and so forth, *da-da-da*. You help me out here." I never act helpless when I'm auditing a pc. Because he's the one that wants the help – I don't.

And there's where Prehav Assessments go completely by the boards – is the auditor acts unsure. And that's actually the only reason Prehav Assessments ever turn up as very wrong. It's just the auditor's monkey, you know, and he hasn't got much practice in doing it.

Well, you can always do a Prehav Assessment on somebody. See, you can always practice this thing. Now, you do this secondary overt list. You do that as you would do any other Prehav Scale. But you have to do it briskly, surely, snappily, on-the-bally. Then the pc sits there and he doesn't go out of session. He knows. Yes, that's right. *Bang!* You got it, see? That's the way you handle it.

But you start going, "Well, let's see, now. Is it kill? *Blah-blah, reow*. How's your hav-ingness?" [laughter]

You see, you're not assessing the pc's analytical mind anyhow. That's why you tell him to shut up and you get along much better. You're not assessing him analytically. You're assessing him reactively and, of course, he hasn't any control over the reactive mind or he wouldn't have one. So the more monkey business occurs around there, why, the more analytical mind gets dragged into the setup, you see, and the further out that assessment can go.

Well, that's – that would be one of the reasons it failed, and the other one would be a bad Dynamic Assessment or going too esoteric on the thing. The way you do Dynamic Assessment, of course, just read the dynamics to the person and see what – which one changes the needle pattern. If you got two, put down two, and assess two items. Then assess the two items one against each other.

All right. So you get second dynamic. Dandy. "What would represent the second dynamic to you?" And he gives you a few items, and you put those down. Well, assess them. Simple.

"What represents the second dynamic to me? Oh, coffins."

"Good." That's a very – that would be an almost usual response.

If that's really a nutty dynamic, the guy will give you something that hasn't anything to do with it, every time.

"Give me something on the sixth dynamic."

"Girls."

A person who assesses out on the first dynamic – oh, boy, that really leaves you in the soup. "What represents the first dynamic?"

"Me."

Well, you can always say immediately afterwards, "Well, who are you?"

And put down what he says. You can – it almost gets to be a 3D Criss Cross action if you let it go too far. But get something in that zone.

Now, you say, "All right..." You don't say, "How do you feel about – ?" *ever*, on these types of assessments. You just say the item. It's like in flows, assessing flows.

Somebody who took forever and ever and ever here – I won't mention any names – to get an item on a flows assessment. Well, the flows assessment was wrong. Must have been. Doesn't take you forever to get an item on a flows assessment. Pc doesn't have any difficulty giving you items for a flows assessment, for heaven's sakes – couldn't have. Because if you got the right flow, it's all on automatic.

"Who or what would enforce inflow?" See?

"Cheese, cats, kings, coal heavers, *da-da, da-da-da, da-da-da, da-da-da, da-da-da, da-da-da, da-da-da, da-da-da, Whada – what.* I don't know what's talking – something. *Da-da-da-da-da-da.*" [laughter]

Tone arm flies around and you say, "Is that all?"

"Well, *da-da-da-da-da.*"

"All right. Is that it?"

"Da-da."

"Any more?"

"La-da-da." [laughter]

"All right. That's fine. All right. Now, let's differentiate this list."

You've got it. That's the easiest one in the world to do if you got it right. But if you were to say to somebody, "Now, how do you feel... about uh – um – let's see, it says here 'enforcing inflow on self.' – and how do you feel about enforcing inflow on self?" Latent read. "Well, we got *that* one."

I mean, you could get just crazy, you know.

You just say, "Enforce inflow on self," you know? And read it, you know? *Bang*, the next one. *Bang, bang*. Just like Prehav Assessment. And the more rapidly you do it, the more accurate it is. And the more competent you sound and look, the more accurate it is. And the more helpless and stupid you look about it, the more stupid and inaccurate the thing is going to be. Works the same way in 3D Criss Cross.

You want to get a wrong item? Take four days to do it. Every time. I mean, it will be off somehow. The pc's out of session. You're boxing around somehow. It just means the auditor doesn't sound positive. That's all. Long time to get the item? Incorrect Prehav Assessment? Incorrect Dynamic Assessment? Auditor doesn't sound like he knows what he's doing. Period. To that pc he doesn't sound like he knows what he's doing.

That's why you find me punching you along to speed you up, because sometimes you don't notice that you have ceased to look helpless. You see? And you speed up, and you all of a sudden look calm, and you get it done, and you feel competent, and that makes you competent, you see. And so I just keep booting you in that direction, without giving you much mechanics about it.

I don't keep saying to you, "Look competent." Because, I tell you, that is susceptible to many interpretations. [laughter] But you have to be competent in order to be fast. So you can just stress speed, and you'll eventually get an appearance of competence.

So the faster you do one of these things, the more accurate it is. Now, it takes about twenty minutes to do the Auxiliary Pre-Have Scale all the way down the line and find the item and nail it on the button, not moving very fast, but not moving slowly either. That is a sort of an easy action. I mean, it still looks competent at that. It is not much of a rush. It can be done much faster than that. But if it's done any slower than that, you're in trouble.

You find yourself taking forty-five minutes to do an Auxiliary Pre-Have, *Oh-oh-oh-oh-oh. Mm-mm-mm-mm*. Probably is incorrect. Same way with the Dynamic Assessments. Same way with this Secondary proposition.

Now, the bark-bark-bark system of assessment is sometimes very hard to do through a scratchy needle. The needle is going *bzzzzt-n-bzzzzzt-n-bzzzzzt-n-bzzzzzt*, and the pc's thinking random thoughts, and the flow terminal that you haven't found is still going off and is like a

sparkler, and so forth. Dirty needle proposition, you know, and so on. And reading through that is very, very hard to do sometimes. But you'll find out that a Dynamic Assessment can still be done through it because it doesn't go *bzzz-bzzz-bzzz* when you hit the item. It goes *bthuth*. [laughter, laughs]

And you get a Prehav Assessment through a dirty needle. Ah, that's rough, that's all. You're looking for the change of needle pattern; that's all. You're looking for the change, whatever changed it.

If the item didn't change it, it hasn't got any charge on it. It's obvious. Pc is always reading at 1,000 ohms, and there it is. He's reading at 1,000 ohms and something makes him read all of a sudden at 1,500 ohms for an instant.

Well, it doesn't matter if the reading of 1,000 ohms is *bzzz-bzzz-bzzz-bzzz-bzzzt*. At the moment it reads 1,500 ohms, it'll be *thilllllop*. And it'll go on saying *bzzz-bzzz-bzzz-bzzz* again. So when you're doing these assessments, just make up your mind that's the way the needle reads and stop worrying about it and swearing at the pc and yourself because it's a dirty needle. Just say, "Well, that's the way his needle looks," and read it occasionally.

You saw a needle pattern last night. Every time the auditor spoke, you got a one to two division fall on the first session. On the first session it occurred on the first time the auditor spoke. And on the second session it occurred on the second time the auditor spoke, which then had nothing whatsoever to do with the assessment. So you just avoided them, ignored them.

You had to get something else than that before you had a read. It – actually, it didn't require any judgment. It's much less difficult than you would have imagined because after all you were reading the item three times. And if any one of the three had fell, you left it in and if you weren't sure you left it in – so what judgment was involved?

Your only – the only time you took it out is when you were sure it wasn't reacting. And you kind of occasionally made sure that it wasn't reacting by asking it a couple of more times.

Well, you don't have a chance to do that in a Dynamic Assessment or a Prehav Assessment. There's no verification, see, beyond the fact that you're going to cover the item again if it fell, so you see? So the more rapidly you do it, why, the less chance the pc has to dream up something between reads. That's about what this amounts to.

It's something like soldiers getting across an open field. The slower you move across, the more likely you are to get shot. And of course, the optimum way of getting across the field is to get across in instant time. And so that would be the ideal or optimum speed at which to do a Prehav Assessment.

See, the faster it's done, the less trouble. You know, that pervades all of auditing. You recognize that. The faster it's done, why, the less difficulty – the less MEST universe difficulty you get into while it is being done. See? So that is very true of a 3D Criss Cross item. If it takes you three days, your neck is way out, man.

How many present time problems can this pc get in three days? How much trouble can he get into with his girlfriend in three days, see? How many arguments can he get into in three days? Oh, wow!

Get it in one day – he didn't get a chance to get into any arguments at all, see, from the beginning to the end of the item. He didn't have a chance to get into a fight with anybody, to have a – meet a bill collector, to get sued, to pick up a missed withhold, to pick up a missed withhold. He didn't have a chance to do anything, see, except the way that he was.

See, so that's the optimum period in which to get an item. Well, the optimum period in which to get a – the absolute optimum in which to get a Prehav or a Secondary Overt Scale item, of course, is in zero seconds. Because this assessment can be interfered with by the strains and vagaries of the fellow's mind during a session. See, it can be interfered with to this degree.

Because if it took you thirty minutes to do the thing, he's got time to pick up some invalidations. He's got time to think some thoughts. He's got time to think his usual critical thoughts of you, the auditor, see. And if you did it in fifteen minutes, he's got only *half* the time allowed to do this. [laughter] See what I mean?

Now, therefore, you just put the throttle on the floorboard and go through that one. And you go real quick, and the quicker you go, of course, the more accurate it is. That's – it's no kidding I mean, you can frankly start with a clean needle, if you did it in an hour and a half – let's do an Auxiliary Pre-Have Assessment in an hour and a half. You can start at the beginning of the session – I mean start at the beginning of the assessment with a perfectly clean needle, and wind up with a very dirty one if it took you an hour and a half.

The pc has just accumulated and – *nyah* and *nyah*. See, you're auditing the pc plus the MEST universe. And of course, the less time there is in it, the less MEST universe gets into the session.

So your accuracy has everything to do with your speed where it comes to this. And the only place you get into trouble working this system in Prepchecking is making a *bad* assessment – completely unapplicable, in some way or another.

So therefore, we lay down the rule that if you can't find, after you've done an aux – a Secondary – a Prehav Scale Overt Assessment – that little section there on the Secondary Scale that's devoted to overts – after you've done that, and let's say, do a Dynamic Assessment, and after you've done that, and these two things add up, you put it down as a test Zero question and the pc can find no overt of any kind whatsoever – why, scrap the lot, get your rudiments in and do it again. That's for you, because the probability is your assessment is way out. But that's after you honestly tried and you can't get responses on the needle for any overts in that direction. Because if he's got overts on the subject, he's going to get needle responses when you ask for them.

In other words, if you wind up with one of these and you've got a dead needle – there's nothing happening and he can't give you anything about it and he doesn't understand it and he can't get anywhere near it and all that sort of thing – well, scrub it. Get the rudiments in and

do it again. That's your best answer. Do both of them again. Don't use either one of them. And then you're liable to land straight up.

If you're doing a 3D Criss Cross list on flows and it just doesn't go all *brrrrr-brrrrr-boom-bang-thud*, and there's your list – oh man, you didn't get the right flow; that's all. I mean, there's no answering to that. I mean if it didn't just – you know, pc saying, "I wonder what's giving you these items?" – you know, that kind of action. It's not going well. It's not going easily. You're having a struggle to get on with it and it's taking quite a while and all that sort of thing – you just must have had a bad flows assessment.

Well, similarly, you just have a bad overt scale assessment and maybe a bad Dynamic Assessment in order to make this thing go wrong. But expect that it will, occasionally. Don't worry about it if it does.

Don't keep arguing at the pc for an hour and a half to find the overt when you're not even getting a knock on the needle. You found out "strangling," "strangling God." [laughter] And the pc can't remember any time when he ever strangled God and you get no fall on the needle on the subject, I think that you'd better leave it and get another assessment.

Now, this is as experimental as it goes. It's mainly experimental because you haven't done it yet. And I don't ... [laughter, laughs]

There are probably many systems which would turn up types of withholds, but this is a particularly promising one which is pretty well set on the rock of experience. And if you can do the accuracy of it all, why, you can probably arrive with a type of overts that are really overts.

You might find out that "injuring cars"... You don't consider this as particular – you've been at it your whole life, [laughter] and it's never done anything to you. And you'll find out the reason the pc is always clearing his throat – *rrrrrrm-rrrrrrm-rrrrrrm-rrrrrrm...* [laughter] All of a sudden he has a hell of a cognition, "*Rrrrrrm*. That's a car, you know! Heh – *Zoooom*. Yeah. I didn't think I was getting into that when I took that hammer to that fan blade. See, adjusting the fan, you see, and I was adjusting the ..." It's fantastic overts. It's a whole channel of overts. You don't consider them overts. He does. If he considers them overts, you'll get TA motion. If he doesn't consider them overts, you won't. And that is all there is to that.

The pc very often runs along like this, and he says, "Oh, well, yes. Yes, I ..." This girl says, "Oh, I committed adultery with my first husband, second husband seven times, and so forth, and the third husband four times, and so forth. And uh... well, as a matter of fact, I was a prostitute down on the San Francisco docks for a little while between marriages, and so forth. And uh – let's see now. And uh – the specific overts you're looking for there is actually getting a man in an alley while I was pretending to be a frail girl, hitting him over the head with a blackjack and taking all the money out of his pockets. And then the police came along and picked him up and took him to the hospital. That's the one you want." you go All – When, All, Who.

And you take that specific overt and you work that thing over, and you say, "Boy, I'm really getting someplace," you know, and that tone arm has just been sitting here at 3.6.

And you say, "Have you told me any half-truths? Untruths? Tried to damage anyone?"

"No." There isn't any motion to that. It's 3.6. It's moved down here to 3.4, and it's gone to 3.6, and it's gone to 3.4, it's gone to 3.6, it's gone to 3... I don't care what good material it is for books. It's not doing a thing for the case. Do you see that? You'll get fooled this way, because every once in a while you'll buy that, and you'll say, "Boy, we're really cooking with gas," you know? You're not. Tone arm tells you so.

And then you get onto this chain – this chain: "Well, I shut off the water on the hot water tap and I kept on turning it off and the handle came off." One dial drop; [laughter] one division tone arm change.

And you say – you're liable to say, "Well, that's so ordinary and so stupid that we don't even work that over. It's not an overt, you know. Let's pick up something else."

No, no. You got a nice What question, you see and you say, "Well, *what about* turning off hot water taps so they break?" That's what it added up to.

He's got a whole chain of it. He's been at it ever since he was two. [laughter]

Find out he's had trouble with his kidneys and had trouble with his liver and had trouble... And it's a real series of overts. And if that's the case, then your tone arm is going to be moving, man. It's going to be flying. It's going to be moving, moving, moving, moving – back and forth, back and forth. That's your only test.

There'll probably be other systems developed as you come along the line. It all depends on what turns up, but I think we'd better give this one a whirl, and you better direct them in. And, for my sake, and just to save my disposition – you have an interest in keeping my disposition mild and calm, the way it always is – and just to save – just to save my disposition, why, please stop getting the – your big toe wet in a duck pond on Prepchecking. Let's find something the pc really considers an overt, and let's really plow on down the line on that and that, you will find, is what really moves the tone arm. And if you don't find a real tone arm ...

Now, I'll give you this. That for two, three, four sessions, learning a case and stumbling around on a case, and so forth, you may not get much tone arm motion, you know, and so forth and you can't really connect with anything. You don't quite know what makes this case tick. And all of a sudden, swing in on it, and you all of a sudden find it and it goes like an express train.

But if you didn't learn anything from – enough about the pc to finally make it go like an express train, it becomes unforgivable. Okay?

Audience: Yes. Okay.

All right. Well, I wish you luck with this particular one, and I would invite your attention to the fact that it's an actual overt before you write the What. And it is what moves the tone arm not what you consider antisocial or what you're particularly trying to cure in the human race that makes it an overt to the pc. Okay?

Audience: Yes.

Thank you. Good night.

PREPCHECKING DATA

A lecture given on 27 March 1962

Thank you.

I know that's all for Mary Sue. I know that's all for Mary Sue. Well, thank you, I won't throw away your applause.

Well, here we are at the what?

Audience: 27th of March.

It's the 27th of March, and the vernal equinox is five days, six days behind us, and it's as cold as ever! [laughter]

All right. Saint Hill Special Briefing Course, AD 12.

All right. This is a little longer lecture. We're going to finish a little earlier this evening. I'm just going to carry straight on here.

I'm going to talk to you about Prepchecking. It's just about time somebody talked to you about Prepchecking. And this is the inevitable lecture which follows the pleasant lectures. This is the lecture that goes after the lectures which tell you how to do something.

Now, you've had several lectures on Prepchecking, an awful lot of lectures on Sec Checking, which is quite a different proposition, and this is the "Oh my God how could you" lecture. The horrors of war sort of thing, you know? And you'll find this lecture is complemented by the HCO Bulletin of March the 21st, 1962, "Prepchecking Data".

There's some additive data in this bulletin. Inevitably when a technique is handed out, we find that there are holes in its use. And the primary hole that was found in Prepchecking was succinctly and definitely this: You do not ask a What question until you have found a specific and actual overt. Engrave that in letters of fire back of your prefrontal lobes no matter how uncomfortable it is, because that is an absolute necessity. You won't ever get any Prepchecking done unless you do that and nearly everybody missed that.

Now, here's what was going on. We had a Zero Question: "Have you ever stolen any white cross buns?" you see, or some good broad general question. "Have you ever been mean?" or "Is it all right for you to tell somebody else my difficulties?" Any – any Zero Question. These are generality questions. They are broad, broad generality questions. And what you have been doing is coming off of the Zero too fast. You have forgotten that there is a Zero, that there is a Zero A and a Zero B and there could be a Zero C and a Zero D and a Zero E and a Zero F. We don't care how many Zeros there are. You've been using Zero Questions for What questions.

Now, you've already gotten the word on this because you've had this bulletin for a day or two. But listen, looking over your folders, one stands his hair on end! And that is very rough because you've routinely been using this – the questions that should be in the Zeros for your What questions. And of course this tells us adequately that you are not finding a specific overt to write your What question; you are buying a generality. You can't run a series, a chain, from a generality. Let me assure you of this.

Oh, a number of chains can come out of a generality. But until you have found a specific and actual overt, you cannot, absolutely cannot, run a chain. And, of course, you've been coming up against the bumper in the railroad station and thinking the tracks went that-a-way. And all you did was keep hitting the bumper in the railroad station, hitting the bumper in the railroad station, and of course you got nowhere. Because you weren't on a chain, you were on a generality, and that generality belongs to the Zero Question.

Let's take a – let's take an example of this: "Are you willing to talk to me about your difficulties?" Zero.

Pc says, "Well, I wouldn't really like to talk to you about my difficulties with my mother."

Previously this is what you were doing; the What question, "What about your difficulties with your mother?"

And the pc said, "Well, I had some difficulties with my mother."

So you say, "Good. Well, when were those? Oh yeah, this lifetime. Very good." [laughter] "Is that all there is to that?"

And the pc says, "Yes."

And then the next inevitable question, "Well, who didn't find out about it?"

And – "Well, you didn't," would be the only possible answer.

And that's not Prepchecking. No.

That's a Zero A. See, that's a Zero A. You don't – it doesn't matter how it's worded. You could even word it with a "What," but it's a Zero A. And it is – that's all it is. And your Zero A would inevitably be – if the pc said that – would be, "Well, how about these difficulties with your mother?" You write it down Zero A.

This doesn't delude you into thinking you have run into anything, because you haven't. You haven't connected with anything but a generality. You've got to have a specific incident, specific incident. And it may take you five or ten minutes of steering and yammering and running into holes and getting out of them again, and so forth. And the pc is liable at this time to just steer all over the football field. I mean, there's nothing going on here. It's just they're just, "There you go," you know?

I mean, it's liable to go something like this, I'll give you an approximation of it, see. Well, you say, "Well, how about these difficulties with your mother?"

And he says, "Well, she was always beating me. And she hit me over the head. And she did this ..."

And you say, "Yes, yes, we know that. Well, now, did you ever do anything to her to give her any difficulties or anything like that?"

"No, no, I didn't. I was always as good as gold. The neighbors always used to say that I was a model child."

And you say, "Well, that's fine."

Your meter, you see, wouldn't – you wouldn't be on this if your meter hadn't fallen at the time you ran into these difficulties with Mother, you see. You wouldn't have written it down as a Zero A in the first place.

And you say, "Well, did you ever mess her up in any particular way? Something like that?"

"No, no, never did. Never did. Uh – always tried to be kind and thoughtful and she just used to kept – keep beating me all the time. Just beating me, beating me, beating me day and night."

Well, you say, "Well, that's good. Now, now, let's get on to this now. Do you remember your mother at all?" [laughter]

Well, the pc says, "Yeah, well, sort of vaguely."

"All right. Well, now, did you ever do anything to her?"

"Oh, maybe some little things. Something like that. Embarrassing her. Embarrassing her in front of guests. Little things. Didn't amount to anything."

"Well, did you ever embarrass her in front of any guests?" You haven't written another thing about any What question yet because you haven't got an overt yet, do you see? Do you get the idea?

"Well embarrassing her in front of guests. Yes, I – yes, I remember one time there was a tea party at my mother's house, and I came in and held up a dirty diaper in front of her, and so forth, and bragged to her about the fact that I had done a good job. I remember that was my... so on and so on. Yeah."

And you say, "Well good. Do you remember this or were you told about it?"

"Oh. I was told about it. It was one of the family stories, you know. I just always was told about it."

"All right. Well now, *ahem*, now do you remember ever doing anything to your mother at all?"

"No. Never did a thing to her." The thing is still falling off the pin and so forth.

"Well, now, do you recall ever doing anything that embarrassed her?"

"Oh, well yes. Yes, yes, there was one time, when I was in high school. I remember there was a girl in high school I was going with and her parents got very mad at me because of Mother, and so forth."

You say, "Good. Now, what's the extent of that?"

"Well, it's just the fact that I sure did embarrass her. I – I sure did embarrass her, because this girl, you see, I mean, we'd been fooling around you know, and she got pregnant."

"Ahhhhh. Oh, well, all right, now. What about embarrassing your mother about girls, or with girls?" And you write that down! And now you go, "When was it?" "Is that all of it?" "What might have appeared?" "What didn't appear?" "Who didn't find out about it?" and so forth. Let's get this thing pounded out, see?

Then, by George, you'll find that if that didn't clear up by the time you've gone through it twice, there's an earlier time that he did something like this. So you ask, "When's that earlier one?"

"What earlier one?"

"Well, is there another time when you did that?"

"Well ..."

Now that he's got that other one softened up a little bit, yeah, he'll give you the earlier one. All right.

Then you'll play that one and maybe you'll get four and maybe you'll get six. You haven't written another thing on your sheet yet, see. If you want to do any writing for your own benefit, write over here on the edge someplace, something. We don't care what you write, but it has nothing to do with these questions.

And "Oh yes," he says all of a sudden – this other series isn't clear yet. And you've now hit the third one. And you're working over the third one. And all of a sudden he says, "Yes. I beat my mother up once."

"Oh, all right. Thank you." And you go right on plowing the chain you're plowing, you hear me? I'm warning you. I'm warning you. I will materialize over your left shoulder. You put it over here in the margin – "Beat up his mother." And you go right on working the What chain that you are on and getting new withholds until it is clear.

In other words, you do not – for every overt on a chain you don't get a new What question. For every overt on the chain you'll get charge, and eventually that chain will discharge, and it is a chain, specific, and it itself will discharge if you get the earliest part of it. And it's the only thing that will hold that chain down.

Now, a chain is a series of similar incidents. There is a chain of hitting people with the left hand and a chain of hitting people with the right hand. You got the idea? There is a chain of being mean to Mother in the morning and there is a chain of being mean to Mother in the evening. You get the idea? These chains are very specific.

Now, you actually are working, maybe, two or three little chains, but they are very minor little chains. And these little chains will interweave. Well, embarrassing Mother about girls and so forth, there's probably embarrassing her about big girls and embarrassing her about small girls, you see? That's two chains. But it's definitely embarrassing Mother about girls. And that chain will discharge if you get the underpinnings of the chain. If you get the earliest incident on this, you're going to have a flat chain.

And you can actually work overt after overt after overt all on the same channel, providing you stay with that channel – providing you stay with the channel and don't go wandering all over the place about it, see?

The difficulties of handling a Prepcheck question are what you make them, or what the pc makes them and you flub on. But there are no real difficulties of getting the Prepcheck What question, as long as you remember you have to have a specific overt, and as long as you recognize that that specific overt is going to be a chain. And it mustn't be a very broad chain, it must be a pretty narrow chain. "What about being mean to women?" is of course a major chain, but "Being mean to Mother" is definitely a part of that chain, but is itself and would ordinarily clear by itself.

Now, a chain is going to clear if you get tone arm action. Now, let's go to this next one. Do you dig this first thing that I've been giving you here?

Audience: Yes.

Listen, I don't care how much *boz-woz* and yap-yap you go into with a pc. I don't care if you argue with him, sit there and argue with him for half an hour. They've given you a generality that gave you needle action. Now, it's your job to find one overt within the perimeter of that generality.

And that's the step where all Prepchecking has been breaking down. It's just right there. It's as simple as that. And the rest of it will work out on the basis that continuing to get off overts on the subject of that What question, earlier and earlier, will eventually plow up enough unknowns on it that it will desensitize on the meter. And that is all you're trying to do. And then you get the next What question.

You got that now? That – it's actually pretty easy. But it was just this little thing we were missing. All right.

Now, in steering down one of these chains, if you do not get tone arm action, you might as well just skip the whole subject, because it is buried in the land of never-never, or you're on top of a terminal that if you ran it on a 3D-type process would simply beef up the whole Prehav Scale on the bank. There's something wrong here or the pc – which is the basic thing – doesn't even vaguely consider it an overt. It sounds awfully juicy to you, but to the pc it is not an overt, whatever you're working.

This is the sin of auditing somebody against the Auditor's Code. You only audit a process as long as it produces change and no longer. You don't audit a process if it does not produce change.

Now, believe me, you can desert that thing in an hour or half an hour or ten minutes – it doesn't matter how long you have worked this with no change of the tone arm; it does not matter how long you have worked this – it is equally a breach of the Auditor's Code to work it ten minutes with no change, two hours with no change or ten sessions without any change. Do you follow me?

Now, ten minutes – this is cutting it a little bit fine, so we get a twenty-minute rule. If you're working a channel, and you work that channel for twenty-minutes – now, you under-

stand, you haven't been working the channel with tone arm action and then hit a twenty minute flat period, that's not what we're talking about, see. Well, you've been working this Prepcheck overt the pc has given you. You've worked the thing for twenty minutes and you haven't had any slightest – well, you haven't had any significant action on the part of the tone arm, call it a breach of the Auditor's Code if you continue it.

The way to get out of it is to ask if you've missed a withhold on the pc, clean up any missed withhold which turns up and drop it like a hot potato.

Several things could be wrong. You've gone through, you've found out that he has innumerable overts on his mother. And you go through and for twenty minutes you are running along with this What question. And he's telling you that he used to up-end the cookie jar over his mother's head and kick her out the back door, and right now why she's starving to death in a poorhouse someplace. And you haven't gotten any tone arm action of any kind no matter how juicy this sounds to you – no matter how much *you* think it ought to produce reaction, no matter how desperately you believe that this is a violation of the social mores which must be upheld.

You know, if you just stop upholding all these social mores, nobody would need any auditing. You realize that.

You've got an Auditor's Code breach staring you in the face if you continue it. But you *must*, if you're going to come off of this thing ... oh, you're going up and down the line, up and down the line, up and down the line. You're trying to get off overts. The person's actually giving you overts. You're running When and, you know, everything. No TA action. You do make sure the meter is connected. [laughter] And there's no TA action – the thing to do with it is to ask the pc if you have missed a withhold, and clean up any reaction you get on *that* question and get the hell out of there and find another subject. You're just going to waste *more time* prepchecking things that the pc doesn't consider an overt. That's the other thing which you're doing.

Now, maybe someday he will consider this an overt and maybe he won't. But remember, a pc does not prepcheck – I'll just extend this a little further now – remember a pc doesn't prepcheck all the way to the bottom of the deck. I don't mean by that, that – he does go back-track. But remember, not all levels of pc prepcheck. Prepcheck is not as broadly good an approach to all cases, no matter how low toned, as the CCHs or even 3D Criss Cross.

Both 3D Criss Cross and the CCHs go much further south than Prepchecking. Prepchecking takes a bit of responsibility for thinkingness. 3D Criss Cross takes a bit of responsibility for existingness. And CCHs take a bit of responsibility for mass and repetitive action. And you'll find out, responsibility for beingness and responsibility for mass or repetitive action equally go further south than responsibility for doingness.

And, of course, you've got three processes here and if you'll look it over again in the light of what I've just said, you've got a be, do and have breakdown of auditing, see. 3D Criss Cross, that's direct beingness. Prepchecking, that's direct doingness. And CCHs are what they always have been designed to be – they're direct havingness. And by some odd freak, the beingness processes go further south than the doingness processes. Why? We wouldn't care, but they just happen to by actual experience.

You can do 3D Criss Cross items on somebody who's practically rave, stark staring mad. You can do them pretty low. But not as low as the CCHs.

To admit to doingness... All right. We get some boy and he's sitting there – I'll give you why, see – sitting there and he's half way around the bend in the local spinbin, you see? And you say to this fellow – you say to this fellow, "Did you walk down the hall?"

And he will say, "Oh, *goo-goo, ga-ga, blah,*" you see?

And you'll say, "Well, are you Joe?"

And he will say, "Yes."

That get more real to you right there? Now, he'll identify himself, but he won't – he won't admit to doingness. Doingness is the main punishment factor in this universe.

Now, that's probably just a specialization of this quarter of the universe and maybe someplace else this might not add up this way. But it sure adds up this way here.

Now therefore, when you are running into trouble in Prepchecking, and that trouble is excessive, and you do not seem to be able to get any tone arm action out of Prepchecking, there is one place where you should send the pc – to the CCH room. That's for sure. That's the easiest thing to run on this pc, and that's the thing this pc's going to get the most gain on, per unit of auditing time.

Supposing under no circumstances could you find any type or line of action or overts on any dynamic, on any subject that would get you tone arm action on the pc. Let's say you fooled around with this for a couple of sessions. You could fool around with it for two or three sessions, but I certainly wouldn't go any further than that. And you have not yet produced a tone arm motion, a reasonable tone arm motion – a quarter of a division or more for every twenty minutes of auditing – you have no business wasting your time and wasting the pc's time.

CCHs, brother. CCHs. And you'll find out that that will work out much better. It's not particularly a comment on the pc, it might also be a comment on the auditor. Do you see that? The auditor, for some reason or other can't pick the lock and combination to this safe. Maybe another auditor could come along and pick this lock or combination, see? Maybe something else could be done here, some extraordinary solution entered in on the thing. I'm talking about the sensible thing to do. Instead of going on endlessly trying to pick a tricky lock to a tricky safe, don't you think you would get in more auditing by just running him into the CCHs?

I can tell you this by experience, if a pc is going to prepcheck easily, they will prepcheck within the first two sessions well. And you all of a sudden will have the pc flying in a couple of sessions. I'm talking now about two-hour sessions. And if the pc isn't flying in a couple of two hour sessions – ah, no. We don't care if it's wrong with the pc. We don't care if it's wrong with the auditor. We don't care if it's wrong with the environment you're auditing this pc in. We don't care what it's wrong with or what we're blaming it on to. Let's just recognize the practical fact that if you haven't done it in a couple of sessions, and you haven't got that TA wiggling in a couple of sessions, that you are now taking a gamble with your auditing time, and the pc's auditing time, and the much safer bet is just to run the pc into the CCHs.

Any number of things could be wrong, rather than case level, don't you see? Let's just take them all into action.

Number 1. The auditor may not feel he has sufficient altitude with the pc and is therefore a bit timid.

Number 2. Well, actually, it – a subdivision of 1. Part of this could be the pc is new and the auditor doesn't want to charge in there too hard and upset the pc and embarrass the pc or something of this sort. He wants the pc to keep on getting processed and therefore is hitting it with a feather, you see? And actually doesn't want to ask any embarrassing questions that will upset anybody. This – these factors all enter in to it, besides case.

The pc may have some God-awful PTP of long duration that the pc is just sitting right in the middle of, and the auditor hasn't gotten near it, and hasn't had anything to do with it. And an undisclosed PTP of long duration will discharge with the CCHs, even when undisclosed. So you could – pc wouldn't own up to it or something will happen to it. Those things, you see, could all be off, completely aside from case.

Or – now we move into case – the pc has an overt put-together which is entirely foreign to the social code of the auditor and the two just can't embrace each other's zones of action. In other words, the auditor just can't wrap his head around what would be the overts of a fireman or something, you know? And we just don't ever seem to be able to pick up any overts, and the pc is out of this world. We're talking about case now, because this would only be true if it were wrong with the case. The pc is running an out-of-this-world social mores. What are overts to this particular pc have nothing to do with the social code on which we're running. See, a lot of things. These are all little things.

Now, as we get down the line further from this, we could get into a situation where the pc just has no confidence in this particular auditor on Prepchecking.

And then let's go a little bit further than this and get the extreme case – the pc has inadequate and insufficient responsibility to respond to any doingness. That would be the extreme. CCHs will still work on this pc.

Now, under any of those conditions you can see that, rather than beat your brains out, it'd probably be much more successful for you to simply move over into the CCHs. That isn't saying that you can't do some extraordinary things. That isn't saying you can't get around most of these things. That is saying, however, I don't expect you to be able to in all cases, because that would be, to my way of thinking, an unreasonable demand. Because I've already run into a case or two where I wasn't getting tone arm action, see? I just wasn't getting tone arm action and I just slated the case for CCHs. Then we'll come on to it later.

The odd part of it is, the very things that you're prepchecking the pc on before the pc has CCHs – the very thing – after an intensive of CCHs will produce tone arm action. That's what's curious, and I think you'll find that borne out.

This pc's got overts, overts, overts. He keeps giving them to you and the tone arm is just sitting here. The tone arm just – just sits here statuesquely there. That's it. I don't care how much the needle is knocking around. That is to say the needle is – is twitching, you know? And the needle twitches. And you keep it very closely centered, however, and you'd

move it just that much, see, to keep your – keep your needle centered. You're getting falls on these things, you know? You're getting little rises and little falls, and it all adds up to less than two-tenths of a division on the TA arm. You're not going anywhere. You're wasting your time. Because whatever you're working at this particular time, you might be working the wrong channels, there might be a lot of things you could do about it, but let's just face up to it, nothing is happening!

You see, regardless of why nothing is happening, to separate these things, you see, separate the whyness that nothing is happening from the fact that just nothing is happening! Don't go on puzzling yourself about it till the end of time. Go on and do something where something happens.

If you feel embarrassed on some outside pc or something, let me assure you that starting in on CCH 2 is often less embarrassing. You know, old 8-C. Almost anybody could be run on old 8-C. Start 2 instead of 1. It'll seem to make more sense to them, and by the time you've run them a little bit on that and run 2 and 3, why 1 won't seem silly to them. It'll seem quite natural that they should sit here sticking their hand at you. Get the idea?

But it's a better approach, just between ourselves. It's a better approach. Because you're getting something done. The only thing that breaks an auditor's heart is getting nothing done! So you have some responsibility for yourself, as well as the pc. And you frankly just mustn't run things that get nothing done. You just mustn't do that, that's all.

One, you owe yourself training so that you yourself feel competent when you're doing something, you see? All right. That's for the pc, but that's for you, too, you see? And then applying what you know, you owe it to yourself to get some results completely aside from the pc. Because the only thing that can happen to you is a long concatenation of failures. You audit ten pcs in a row and get no results on any of those ten pcs, and somebody will be scraping you off the boards. You know that.

Oh, we could probably audit you up in – in theory, you see – we could audit you up to a point where it wouldn't matter to you at all whether you got results or not, and therefore we would beat this whole thing. Then the probability is, you wouldn't be auditing! So we better give this a more sensible approach.

Now, I frankly don't care what you run on a pc. I really don't care what you run on a pc as long as you get some results. That's an interesting statement. I don't care what you run on a pc. And as long as you *flatten it!* It's all I ask of you. I don't care if you say, "Get the idea – or mock up a little doggy standing on his head in the corner. Thank you. Mock up a little doggy standing on his head in the corner. Thank you. Mock up a little doggy standing on his head in the corner. Thank you. Mock up a little doggy standing on his head in the corner. Thank you." Thank you."

And somebody will come along and say, "What the hell are you trying to do?"

"Oh, I'm trying to cure his alcoholism, of course." "Mock up a little doggy standing on his head in the corner," and so on.

You see, it isn't anybody's opinion, if, while you were giving him these commands – "Mock up a little doggy standing on his head in the corner" – you get *clank*. "Thank you.

Mock up a little doggy standing on his head in the corner" – *clank*. "Mock up a little doggy standing on his head in the corner" – *clank*. "Mock up a little doggy standing on his head in the corner." Man, if you were getting wild tone arm action of that character, man, that case is going places, I don't care what you're running on the case. The answer lies in the tone arm, not in anybody's opinion. And actually not in the zone and area of what you've been told to run.

And the only kickback you would ever get from me, if you didn't run it finally to where it stopped at 2.3 – at 2.75 or at 5.5, or wherever it stopped, it stopped! And you went for twenty minutes and you didn't get a quiver out of that thing. I don't care where it stopped. You can say at that moment, "That is flat."

So you're justified in running any process that produces tone arm action. And you're justified in running it until the tone arm action ceases. And we don't care where the tone arm action wound up. And we don't care where the tone arm action went while it was moving, or stopped where it stopped. See, we haven't any argument with these things. These things are not as significant as you make them. You know? You make these things a lot more significant than they are.

This bird has been sitting over here at 2. He's been sitting over here at 2 forever, and you do ARC Process '61, see? And you finally park him up here at 6. And he said, "I've got a terrible headache, and I feel totally packed in and I can't move and I can't wiggle and life is horrible."

And you've run this process, and you've run it flat and it finally stuck at 6. I assure you the case is better off than the case at a dead 2. See? It's if you produced reaction and if you ran it until you no longer produced reaction.

The only weird thing you'd – adventurous thing which you do when you go off into the blue with a process is, you don't know whether it's going to produce action or not. And if it does produce wild action, it's liable not to be flattenable in any finite lifetime. That's about the only thing. You might be – you might run twenty-five, thirty... Not a lifetime – you might run twenty-five, thirty hours on this confounded thing. Having run twenty-five or thirty hours on the confounded thing, however, you would have produced more gain on the part of the case than any other thing that you could have run at the time if that was what you were running and it did produce tone arm action and it finally came to a stop.

But picking up these wild processes and offbeat processes and running them, you sometimes dedicate yourself to a longer period of processing than you actually should be administering.

Most of your errors, by the way, are just in not flattening processes, not running processes right or wrong. You know that. Your errors are in not flattening processes. And the brakes that I have put on you on processes, you very often will run a limited process when you pick them out of the hat, you very often run a limited process which will all of a sudden stack up fast. A backwards process.

"What effect have others had on you? Thank you. What effect have others had on you? Thank you. What effect have others had on you? Thank you."

Oddly enough it would – if it produced tone arm action, why, that's fine. But you only dare run it to the moment that it stops producing tone arm action. That will be fairly soon. It will probably leave the pc as gnawed out as a battlefield tank, but nevertheless you must have gotten rid of something if you produced tone arm action. Unbalanced processes are not all bad. But if you're going to do things like that, watch that tone arm.

Now, it's awfully interesting to watch the *True Romances* or *True Story* or "This is – Was Your Life Mabel" unrolling off ... Isn't that the famous program? "This is – This Was Your Life Mabel." I think it's given from Hollywood. They bring in the submarine commander she was in love with when she was two and then they fly in the native that he – who tied up his foot when he was five, and they fly them all in. And then the fellow comes on the stage and they furnish glycerin so that he has lots of tears as he faces all these fellows. And he's all overcome. Have you ever seen this program? "This Was Your Life Mabel." Well, you know, it's very engrossing. I'm told that people sit in front of TV and just watch it with great fixation. I'm told they even listen to it. [laughter] That's a fact. Fact! Actually people have not only sat and watched it but have actually turned the sound on.

And an auditor can get in that state. [laughter] He can! And completely overlook this TA motion. It just goes on and on and on. It's very engrossing, very engrossing, but no TA action. So engrossment has nothing to do with it whatsoever. In fact auditor engrossment has nothing to do with auditing. I know you won't believe me when I say that, but it happens to be true. It's just TA action. You get tone arm action while you're prepchecking, fine. If you don't get it while you're prepchecking, get off of that handcar, man. Unload into that ditch.

I know we've carried that guy on down until he's five and now he's spitting in the face of his big brother, and we got incident after incident where he spits in the face of his big brother, and where they tie him to a stake and roast him and that's why they withered his hand and that's how come it's all so horrible. And it's just going on and on and on and on and on and on, and you've just got it all fixed and you're down there to the age of five now, you see? And you know there's some earlier stuff.

Wake up to the fact the tone arm hasn't moved for the last half-hour, would you please? And let the pc run on a little bit further so as not to make it too abrupt and then ask if he's missed – if you've missed any withholds on him. And pick it up, square it up.

Now, frankly, if you picked up an awful lot of missed withholds, you might get the TA action back and you might even be justified in pursuing the chain. You understand there's that liability, too. But the final test even of that is tone arm action. Ah, just bail out of there. Unload off that handcar, because you want nothing but the *Twentieth Century Limited*, if you please. You don't want any of this handcar stuff. Pc sometimes will give you a bunch of lies, too. They feel so much better, they feel so relieved. Well, that's because you never got near any of their overts. [laughter, laughs] Tone arm action tells you the lot.

Now, there's a gag here about mores, that you should know how to crack a mores. I'll tell you now how to crack a mores. This is rather new to you. Let us say that we have isolated an item. We have isolated an item and that item is an elephant – that's 3D Criss Cross. And it is a nice big crash-banging item. And it's just got nice action, and the oppterm of it got nice action. The oppterm was "native." "Elephant" and "native." And we have isolated – because

native produced so much sensation while we were doing the list – we have isolated the fact already that "elephant" happens to be the pc's terminal, and "native" is the oppterm.

Now, you know that you could handle this in this weird way: You establish which is the terminal and which is the oppterm. While you were doing the opposition terminal list, which will give you the... You know there's – oppterm has a double entendre. You *oppterm* something is a verb which merely means you get the opposite's item. But an *oppterm* is something the pc ain't.

A pc becomes a terminal. In a loose phraseology you never find terminals with 3D Criss Cross. You always find *items*. You never find terminals, because a terminal is a specific type of item, and an oppterm is a specific type of item. And the terminal is what the pc is and the oppterm is what the pc isn't.

And the oppterm, when discussed, will give him sensation – grief, dizziness, staggerishness, that sort of thing. And the terminal, while you were listing the terminal, he had pn – pain. He got a little pain here or there. You got pains when you were doing the terminal list. So you know when you've finished it up that the pc is the elephant and the native is what opposes the pc.

Now, to be very, very precise, you could – I'll show you how to do a social mores on all this. You get the social mores of an elephant and just ask the pc – I was going to do this the other night and the pc acted up on me. I was going to get this item and show you how to do this. A piece of my planning went by the boards and so on. It's all right. It's not the pc's fault – exactly. [laughter, laughs] Actually, it was her Prepcheck auditor's fault. Anyhow, the thing about this is the elephant, you'd say, "Now, what – what would be considered antisocial amongst elephants?"

Make a list of it. At that moment, by simply reversing all of those, we get a tremendous number of Zero Questions. It's just as simple as that. "Well, what – what's social? What's social?"

Well, "Eating grass. Uh – eating – eat – eating leaves off trees. Uh – not picking up a wounded uh – failing to pick up a wounded – well, you're supposed to pick up a wounded fellow member of the herd and carry him along. And you're supposed to do this."

All right. You get out of this: "When haven't you eaten grass?" Sounds fantastic, doesn't it? That you – you ask this pc, well, you've got all of these – you ask this pc, "When haven't you eaten grass?" There you go. You'll get tone arm action.

"When haven't I eaten grass? Well, I'm not supposed to eat grass. I'm a human being now."

"Well, that's good. All right." You'd think you'd get that kind of response. But not this pc. "When haven't you eaten grass?"

"Well, that's – yeah, that's right. I haven't been eating any grass lately." [laughter]

And you can get over and clean up the Zero Question, "Well, when haven't you eaten the leaves off tall trees?" see? And, "When haven't you picked up a wounded teammate with your trunk?" And do you know all these things will register?

Now, after you've gotten the list, it's a good thing to survey the list for the biggest needle action and you've got the overt that he's carrying forward into present time. You might wind up with twenty of these things, don't you see? And you can kind of do a little assessment across these things, watching the tone arm action for each one. You could actually do Assessment by Elimination; find out which one he's sitting in. You'll finally wind up with one of these that you select out. Actually, you could just start at the beginning on number one. But you'll get more powerful action if you do an assessment of all of these things.

And you're liable to get this kind of a – of a thing on it, see? Because, remember, you do have an oppterm for this package. You've just – so far you've just ignored the oppterm. Pc's liable to come up with this oppterm himself: "Well, let's see, what would be antisocial for an elephant? Well, to fail to slay any natives."

And you're liable to find out it works out that *that* one – of course, because it's the dead center of the terminal/oppterm package – that one just sits right there, *clang!*

Now, this bird in this lifetime has been down in Arabia and Syria and Berkshire, and by God he hasn't slain any natives! And every time he has not slain a native was an overt! See, that's how you disentangle your social mores. Every time he has not slain a native. And you'll find out this will react beautifully on the tone arm. Do wonders for the case.

And you say, "Well, good heavens! The obvious overt is slaying a native."

Has he slain a native in this lifetime? No, he hasn't slain a native in this lifetime. Well, therefore, he doesn't have an overt. No, that's according to your mores. That's according to McCloud's mores. That's according to somebody else's mores. It had nothing to do with this pc's mores. Failing to slay one! You follow me on this? It's *failing* to slay the native that is the horrible thing.

You see how that's a direct reverse, and then how you could miss it utterly. That type of approach requires a 3D Criss Cross item. But sometimes you can smell these things out without the 3D Criss Cross item. You're watching the thing as you're discussing life, with a capital "L" with this pc and you notice it's sort of banging around on the subject of – well, let's say it's banging around on the subject of haircuts. Well, you see, by social mores you would assume that his failure to get haircuts would be the overt, or something like this, you know. That might be it. You make up your mind when you see the thing bang, and then you ask him a question and this is a big mistake. You don't search this thing out on both sides of it before you take your plunge.

What type of an overt are you looking for? Because it could be a plus overt and a minus overt. And if you take what you consider the overt would be, you will be fifty percent of the time wrong. Because it's getting a haircut that is an overt. This girl has a past life as Delilah, and cutting any hair ever since has been very restimulative. See? Something stupid like that is sitting in the lineup.

You see, these overts are formed on old now-I'm-supposed-to's and they have nothing to do with good sense, otherwise it wouldn't be this universe. It just strictly, entirely and only has to do with the – which side of the fence the fellow was on. Duck hunting. Well, what's an

overt for the duck in duck hunting is not the overt for the hunter, don't you see? That's – it's liable to be totally reverse.

So when you find a subject don't be so ruddy fast in plunging off the springboard. Let's find out what side of this thing is an overt.

Fellow says, "Oh, I've – I've made a lot of propositions to girls in my time. I used to stand down by the drugstore and I used to proposition girls."

And you say, "Good. That's – in my upbringing, that was always an overt to proposition all these girls. Good." All right. Use that as a Zero question, "Have you ever propositioned any girls?" and now we're going to get the What. "All right. Now, recall a time there you – you got a specific time when you propositioned a girl."

Now, the fellow says, "Oh, yes, yes, yes. Last Saturday night propositioned Amy Glutz."

You say, "Good. What about propositioning girls in front of the drugstore? All right." [laughter]

And after you've been working about fifteen minutes, why, what I've told you about the tone arm motion, you all of a sudden said, "You know I haven't looked at that lately. I'm going to look at it." ... [laughter] It's up the spout, you see?

The overt is "*Not* propositioning girls"! Your Zero Question... This is the way the thing really put together. The Zero Question is "How about doing bad things to women?" see? And your What question, after you've fished it around and so forth, is you find "What about not propositioning girls in stores?" And this thing falls off the pin on the tone arm action, you know? Well, he didn't proposition this girl and he didn't proposition that girl and he didn't proposition some other girl. And he's totally – he's totally mired into just this one fact – that it is a terrible insult to a woman not to proposition her.

I'll give you an example. I think I was thrown out of an English inn a few hundred years ago; I'd failed to kiss the landlady! Insult! I don't know what was wrong with me that day. I must have had my mind on something else. But that gives you an idea. They considered it an insult. Upset them!

Now, if you don't think this is general – I'll let you in on something. You girls needn't listen to this, but listen, fellas. The only time I have ever gotten in trouble with women was when I – well, you know! [laughter, laughs] Boy, I've been in trouble then. Wow! Grim.

So you see this thing isn't quite as obtuse as it looks. Maybe it might even go so far as to say that the social mores we are brought up in and taught, aren't the social mores on which we are actually operating at all. So I just plead your attention closely to just this one little interesting fact. Plow around awhile, and try the thing on both sides and scout it out a little bit before you take that What-plunge, because you're running into this social mores proposition. You may be square on – sitting on the middle of it.

Well, in view of the fact you probably haven't any 3D Criss Cross on this pc yet, or if you did have, it's not in the folder you're prepchecking him out of, or something of that sort. You're not paying much attention to this. You're keeping these things well separate. See,

there's no telling what you're running into. There's just no telling what you're running into – what kind of items.

Now, reincarnation doesn't exist as such because nobody ever went through a staged line of – became a beetle, became a cockroach, became a mouse, became a rat, you know, and then finally became a politician and then became a member of the human race, you know. Nobody ever went this particular channel.

The Egyptians used to try to lay in an I-am-supposed-to on the subject. And also the Lamas give you some interesting maps. And maybe some people believed them. I suppose there's some thetans who went around sort of remembering this map, and remembering "Now I'm supposed to become a cockroach having just been – so forth, and before I can be a temple priest again," and so on. Well, that's – merely was an interesting way to get a fellow from – keep a fellow from picking up a body and becoming your rival in his next life, too. Because that was a big problem in Egypt.

They had more problems about thetans picking up things. I know; I was there, and they had problems. They had problems. For instance, they dreamed up a good one one time, that whenever a Pharaoh died and when he came back to Earth, the possessions were st – his again. Man, you know that was unpopular at the Land Office and that was unpopular every place. But made it stick there for about, oh, I don't know, a couple of thousand years.

So naturally somebody would think up a now-I'm-supposed-to – "Well, after you die, really, you're supposed to become – at once, you see – you're supposed to go down this channel and then up this channel for this many lives." That puts you out so they no longer had – the Land Office had – any records, see?

These are just dodges. But reincarnation has gotten itself loused up with this very interesting progression that you're supposed to go through. And this progression has no regularity at all. A pc has actually been anything that he could pick up. In the lineup a thetan – a thetan goes on the motto of "Anything is better than nothing." And that extends to beingness – "Any beingness is better than no beingness whatsoever."

You'll find – sometime or another you'll be auditing a pc and he gets this little sensation; it goes *flick*, you see. He says, "What was that? You know I have a definite impression of having been a mayfly, but it just all ran out." He probably was!

It's awfully hard getting yourself into the head of a small dog. I will tell you that. It's a hard thing to do. I tried it one time. It didn't work at all. Cats – I generally save those for my randomness. Cats, they're very interesting things. You don't pick up cats – you steer cats. You do various things with cats. But anyhow, all kinds of attitudes toward beingness.

Now, every race has it's own fourth dynamic and it tends to fixate on this fourth dynamic and you get a predominance of continuance in that beingness line, you see, in any one race. If you've got gazelles, why, people will tend to – who – whatever thetans are running the gazelles will tend to go on being gazelles, you see? And they'll go on and on and on being gazelles, and they'll pick up gazelles as long as they can pick up gazelles. But what if all of a sudden the population of gazelles is too small. Well, they're liable to become almost anything. Capitalists, communists, anything, see? They go over into some other line.

The buffalo. There were at one time I suppose something – must have been in the neighborhood of twenty-five, thirty, fifty million buffalo in the United States. There are only a couple of hundred of them now. Every once in a while you're going down the street in the United States, you see some fellow with a long shaggy beard just going along. [laughter]

Thetans aren't necessarily stupid. There's no particular reason why you shouldn't have been an animal at some time or another. It's quite a relief. It's quite a relief. There's not much responsibility involved with the thing. You pick up the various now-I'm-supposed-to's very rapidly. Animals tend to stay with their now-I'm-supposed-to's because they can't talk about them. It's about the only thing that's wrong with that.

But it's interesting. In Rome for instance – of course, after you'd been voted out of office and voted out of the army and blackballed and beat up and sold into slavery and a few things like that, it would be quite natural to become a wolf and bite every Roman you saw for – for a lifetime or two, you know, just to kind of even up the score. And then go back to being a Roman, you know?

It – as far as nationalities are concerned, you get totally scrambled up politics on this particular planet. These poor nations! I mean, it's something you could hold your head in your hands about frankly, just hold your head in your hands about. They have absolutely no safeguard of any kind whatsoever from mixed politics by thetan transfer from one nation to another. They have no prevention of this whatsoever and naturally some Indian that wants to wreck England is going to pick up and is going to be terribly interested in promoting the fortunes of an Englishman. And he'll move on up into Parliament and he will move... "Well, let's see. Let's see. What could be the most destructive thing that could happen in England today? Oh yes, well, let's nationalize the railroads. And then raise their fares. Yes, yes. That's the proper thing to do," you know?

Just destruction, destruction, destruction. Everybody says, "Well, he always sounds so reasonable. You know? It must be true."

The United States is starting to get this now. Of course, they're getting Heinies. They're getting – they're getting Germans like mad. I mean German Germans. This isn't genetic line Germans. See? This was the Afrika Korps boys, and guys like this, you know?

Guy gets knocked off with a General Grant tank in front of El Alamein. You know? And he said, "Well, damn those Americans. If they hadn't come in we'd have had this thing whipped, see. *Natter-natter-natter-natter-natter-natter-natter.* "

He's too mad at the English. He isn't going to have anything at all to do with them. He goes over to America and he picks up a body. Next thing you know we see him around with an Afrika Korps black motorcycle jacket on. Imitating Rommel. There they are, going around, Hitler Youth movements, all over the place, you know?

Nobody has any way of taming this down or straightening this out, see? It causes political chaos. Because everybody's now-I'm-supposed-to's, his nationalities and so forth go by the boards and they're no longer fitted to fit in any nationality or any framework of government. There's enough people getting mad at the Russians, so God help the next crop of commissars. [laughter] See? Not quite enough time has gone by.

England has set up shop here, about 350 years, you see? They've had a lot of time to get that nicely mucked up. Russia hasn't been in the running that long. But the next crop! *Ha-ha-ha*. That will be something, see?

Quite routinely you used to go from Egypt to the Middle East to Greece to Egypt to the Middle East to Greece to Egypt to Rome to Egypt to Rome to Egypt, and then skip it all and go to Greece. By this time you've been an enemy of Greece, and a friend of Greece, and a supporter of Greece, and Greece is supposed to survive, and Greece is supposed to die, and Greece is supposed to do this and that, and don't wonder that you don't have a very interestingly complicated 3D Criss Cross package. Because it's all messed up. See?

Well, once you start to straighten this out, however, there are very straight now-I'm-supposed-to's which are dominant in spite of all this other. You get the idea, you see, that there could be no dominant now-I'm-supposed-to's on the case, that it just all goes into slush and soup, see. But there actually are, and they will be the most dominant 3D Criss Cross items. And they can be plus or minus on anything.

You can actually take the item at any given time and work out the mores of that person, and the violations of that mores will give you the hottest Prepchecks. It sounds pretty weird but they will, get it? It sounds weird only because you yourself, of course, aren't fitted in with that social structure at all. You sit there and say, "How could this bird be this upset and get this much charge out of 'not drinking chocolate'?" You know?

God! We got tone arm action from here to here, you know? It finally emerges when you do a 3D Criss Cross item, you've got a Dutchman, or something of the sort, and it's – it's a failure to maintain the East Indies or weird something or other going on. It's a hell of an overt! You find out the same time in this lifetime that he's committed every social crime known to man and he doesn't get a quiver on any of them. See, you can't find anything on what you consider social crimes, but you can find on this "Not drinking chocolate." Man, that really cooked it.

You sometimes get an item of "Failed to bite people" or "Bit people" or something like this. See, it could equally be either one, see? It's just because you believe that biting people would be an overt. You have forgotten, momentarily, the overt of omission. See? Overts consist of omission and commission. All right.

Now, don't forget "Guilty." Remember, "Guilty" is lovely. "Of whom and what have you made which guilty of?" And you can do whole Prepchecks on nothing but the subject of "Guilty." It's fifty percent of it, you see? It doesn't matter if... I'm not going to give you a long talk now on the subject of "Guilty." Just being a victim. You think of overts of "Whom have you victimized?" Well, there's a broader view: "Whom have you made guilty of making you a victim?" See? You could use words like "blame" and things like this but it doesn't quite register as sharply as "make guilty." You sometimes will find an auditor that everything seems – this is on your 6A, Form 6A – and there's this auditor and it's just nothing... He's – he's kept picking up E-Meters and bashing pcs over the head with them and he kept doing this and he kept doing that and he kept doing something else and he kept doing something else. Wild, you know? This thing is wild! And no tone arm action.

You say, "Well, he has no conscience of any kind about pcs. He's utterly conscienceless." Then all of a sudden you get on to that "Guilty" question. Oh man! He's been making pcs guilty, you see? Making them guilty. Any time the pc would say anything, he'd make the pc guilty and make the pc guilty and make the pc guilty and make the pc guilty. Tone arm action all over the place. Make the pc guilty, guilty, guilty. Of course, that principle applies to anything.

You get somebody, he has homosexual tendencies or something. Well, socially you're going to ride this into the ground. "Boy, we've really got something here. Man, this is really juicy. This is something. See? This is fine, and so forth." No tone arm action on it. So all of a sudden – guilty – ah, "Whom have you made guilty of homosexual tendencies?" and just *wham-wham-wham!* Because that's all he's doing, see? His idea of punishing, punishing, punishing, making guilty, upsetting, blaming, showing up, exposing. You see? Any type of wording that might fit in with the thing. But he's trying to make that other fellow suffer in a covert way. And this works out to this degree, that any What question, you can bleed it down of just a little bit more charge by putting "Guilty" with it. It's not necessary to do that. Nobody is even recommending that you do it.

"Have you ever let the air out of your father's tires?" See? And we've gone through this whole thing and we've got a whole chain of where he used to go out and let the air out of his father's tires and make his father think he had a puncture and that sort of thing. Something like this, and he did all that. That's fine, we got that all. Not necessary to do this. I'm not telling you, you must always do this or anything like that. But you could also ask, "What – have you ever made your father guilty on the subject of tires?" And you find out there'll always be a little more motion can come off the tone arm on that subject. Yes, because he's done overts, of course, he's made his father guilty in an effort to get a motivator. It's just the other side of the overt-motivator sequence. And it's always sitting there ready to be plucked.

Whatever side of the overt-motivator sequence you run, you can always bleed a little charge off the other side. You see? Not only doing it to somebody, but trying to get a motivator from somebody on that same subject is always hand in glove. The effort to get a motivator exposes at once a doingness. See?

All right. You already got "Appear," and as far as whole track is concerned, you should really go down the whole track. It doesn't matter where you wind up or where you don't wind up, interestingly enough. I knew there was something on a case here in class, I knew there was something on this case because it just didn't add up right. And I insisted that it be followed through, and it didn't appear in this lifetime. It appeared in last life, which I thought was interesting. I knew there was a bug there, and I just wanted that to be gotten out of the road if it possibly could and, by George, we picked it up in last lifetime. So these things will fall through sometimes.

Now, when a pc always dodges into a past life every time you try to get an overt off for *this* life, when the pc has overts for this life that matches the question, and so forth, we're posed a problem. But the odd part of it is, in the normal course of human events, if the pc gets it off on the dodge and then you clean up, "Have you told me any half-truth, untruth or tried

to damage anyone?" See? Clean up that rudiment and then ask him again, he eventually will give you the one in this lifetime if he's using that for a dodge.

Routinely in Prepchecking, you should use that "half-truth-untruth" question and missed withholds. These things are the – are the background viol that's going *hoomp-hoomp* in the corner, you know? You want to ask these things every once in a while. Don't get your pc waving madly around on the needle and the thing is all stalled and no tone arm action without asking for missed withholds, half-truth, untruths, and so forth.

And you'll get to know your pc. And some pcs require this to be cleared up about every ten minutes. You – you'll learn that from that pc. Others require never to be cleaned up. They just don't ever tell you any half-truths or untruths. But some of them, they give you three overts. You can absolutely count on two of them being utterly false. And if you don't pick up that falsity, the two falsities, why, the third true one will keep banging and your meter will just be all out of gear all the time. So the background music that you play all the time is your "half-truth," "untruth," "Have I missed a withhold on you?" You ask people these every – routinely, regularly. They're, you might say, your "middle rudiments," and you'll keep the case straightened up this way.

As far as going full track – whole track is concerned, let them go. Because as soon as your "Appear" comes up, that was what turned the tide. And "Appear" will send it whole track for you, and spit. But it can also plow the pc out of the whole track incident he gets into without it hanging up forever. So it's perfectly safe.

Now, if you were to do a 3D Criss Cross item and to do a Prepcheck on a 3D Criss Cross item – "When have you not eaten grass?" or "Have you ever eaten any dirty grass?" or "What about eating dirty grass?" "What about eating another elephant's grass?" or something, well, we've done some kind of a sort-out on a 3D Criss Cross item – and we've done this four-way run here of When, All, Appear and Who, you inevitably will go whole track. Inevitably, you just aren't going to wind up anyplace else. And you just grind it out, man, grind it out. It's all off one What question. You could make marginal notes about where you've gotten to, and so forth, but you're going to get down to the bottom of the chain.

Now, the chains are all pinned with an unknown. Unknowns appear in the incidents. Unknowns appear at the foot of the chain. The basic on a chain, for a chain to be active and charged, must be unknown to the pc. You are never plowing known material out of the pc when you are running a Prepcheck chain. All you're doing is preparing the pc to find something he doesn't know. And you'll find out that the most spectacular ones sometime are yesterday. He had yesterday mixed up with last week or something like this. You'll find his time is all loused up. Those are very spectacular and very noticeable, but they are not very significant.

The early ones are the most significant. A chain of similar circumstances occurring, reoccurring, happening, happening, happening, time after time after time, *cannot* exist in suspension in the bank without the earliest part of the chain being totally or partially hidden from view. This becomes very striking. This is so much so that I can – I know exactly when a chain will release on a pc. I know when to start going back up again, because the pc just released one big slogging "What do you know!"

We carried it down to a something or other and there was a totally buried something or other at the bottom of this thing. Boy, was it *out of view!* And we plowed this thing into view. I know now the rest of the chain will tear up. You should develop that particular sensitivity. After you've discovered enough unknownness on the chain, the chain will tear up. It's all in the pc's attitude. The pc gets very positive. The pc reacts very directly under these circumstances.

Recurring withholds – of course, the pc that tells you – tells Auditor A, "I kissed a boy last week," tells Auditor B, "I kissed a boy last week," and tells Auditor C, "I kissed a boy last week," that's a recurring withhold, you see? And that means that Auditor A, Auditor B and Auditor C did not get the withhold. They never got the unknown out.

A recurring withhold is caused by the unknown remaining unexposed at the bottom of the thing. The pc only continues to feel uncomfortable about withholds the bottom of which have not been pulled. So you could also find what would be a recurring withhold by asking a pc, "Is there anything you've told me that you would hate to have me write down and publish in the local newspaper?"

The pc says, "Oh, well, that little piece about so-and-so."

That's the one you haven't got all the chain on. The second you pull the bottom out of the thing the whole thing just folds up. But there's still an unknown piece at the bottom of the chain, if the pc still feels queasy about it. Got it?

Audience: Mm-hm, Yes.

All right. As far as missed withholds are concerned, we haven't missed talking to you about missed withholds. But if you ask the pc sometimes – sometimes this is true – if any auditor has missed a withhold on them and the pc says yes and you say, "What is it?" you very often have established yourself a beautiful chain if you work it right and if you ask the What question right.

"Well auditor after auditor failed to find out about my mother, *ha-ha. Ha.*"

All right, it's quite often – not always – but quite often quite profitable just to use that as a basis because he considers it an overt that somebody has missed, so it's already classified as a hot chain.

But this doesn't mean that it's going to be good. It's only as good as it'll move the tone arm. If it doesn't move the tone arm, why, unload into the gravel and let the handcar go putting along by itself.

"Have I missed a withhold on you? Good." Goodbye. Let that chain go by and find another one.

Now, rudiments. The main difficulty with Prepchecking that is constant, continuous, occurs over and over and over, is that Auditor A is auditing pc. Auditor A starts on a What question and a whole chain, and he's got this working very, very well. Pc comes in for next session, has a present time problem. Auditor asks the pc about the present time problem, finds himself in a new withhold chain.

Third session. He's now got the first chain and the second chain now in restimulation. Pc comes in and pc has a – an ARC break and the auditor goes into that and finds himself on a third chain! Now we've got the first chain, the second chain and the third chain all in restimulation and nothing cleaned up.

In this way, the pc, by getting rudiments out, can control the session. And you mustn't let the pc keep throwing the thing to the wolves without rudiments. The only way the pc can do this is if the auditor uses any version of O/W to handle any part of the rudiments. Now, that also, then, would apply to the missed withhold question – or the withhold question in beginning rudiments. It would also apply there.

So you translate that over to – I have – for a Prepcheck session you must use – "Have I *missed* a withhold on you since last session?" as a cleanup. "Have you done anything since the last session that you are withholding from me?" and you get a big fall. Well, don't explore the fall. Say, "Now – now look. Now, listen to me. Now, listen: Since the last session, that was yesterday at such and such a time, have you done anything that you are withholding from me?" and you all of a sudden don't find a fall. You say, "Good. Thank you," and go on to the next rudiments question. Get out of there – because it's dangerous. Why is it dangerous? By having a withhold at that juncture, the pc can louse up the whole session. And they do it consistently. I'm talking about troubles you're having and troubles I've had. And this is how you get onto chain after chain unfinished, see? You get onto chain after chain unfinished, always the same way. And it's just by using any part of O/W to clean up any rudiment.

So you could say, actually – you could say – "What's unknown about that problem?" Pc has a present time problem. You say, "What's unknown about that problem? Thank you. What's unknown about that problem? Thank you." All right. State the problem to him, don't get a reaction, get off of it. See?

Or "What part of that problem could you be responsible for? Thank you. What part of that problem could you be responsible for? Thank you. What part of that problem could you be responsible for?" You know? State the problem. Don't – no reaction, get out of there. Simple as that.

If you're working over, "Are you willing to talk to me about your difficulties?" there's no sense in asking it in the rudiments. But you could say, "Who'd I have to be to audit you?" See? And the reason you ask ... The way you do that is, you use as a rudiment question, "Is it all right if I audit you?" – the old, old rudiment question. That is – that's only if you're using "Are you willing to talk to me about your difficulties?" as a Zero Question.

And you clean up "Who'd I have to be to audit you?" Clean up any difficulty this way – or an ARC break. But my God don't say, "What have I done to you? What have you done to me?" Oh, no! Just leave your O/W in all shapes, forms, sizes and descriptions alone in the rudiments.

Look, you've got easily five hundred processes you could use in the rudiments from Scientology and Dianetics. You can run engrams in the rudiments. [laughter] But for God's sakes, don't touch withholds or overts in the rudiments, because the pc, every time, will throw you off into a new channel and two hours later you will be sitting there auditing something the pc has chosen and you won't be over into what you were running. And that way you'll just

leave the case unflat session after session after session after session, and it's lousy auditing. So that's how you get around it. Okay?

Audience: Mm-hm. Yes.

If you find yourself being thrown – you all of a sudden wake up a half-an-hour deep into a session and suddenly realize that you are on a new chain of withholds – this is liable to dawn on you all of a sudden – that you weren't on yesterday and you didn't clean up yesterday's, and yesterday's was producing tone arm action and today's is doing something else. Maybe producing tone arm action, but it hasn't anything to do with yesterday's session, yesterday's session isn't complete! No, just bail off that handcar, that's all. Just get off of it right now.

"Have I missed a withhold on you since yesterday?"

"Yu-du-hu-da-duth."

"Have I missed a withhold on you right now? Well, what was the withhold? Oh, well, thank you, oh, good, that's fine. All right. Well, that's all of that now and we're going to get over here onto this ..." And you ask yesterday's What question and get going.

You see just *thud*. If you find yourself that far drawn in, see? Well, break it off. I don't care how smoothly or how ungracefully or how stupidly you break it off – just get used to knocking it out, and stop falling for that. See?

Pc can come in with a new PTP every day and keep you ever from completing any chain or any What question or any Zero question. He'll actually just stay in a total state of restimulation all the time with no gains, nothing discovered, anything of the sort. You've already, I think probably every one of you, had a little trouble with that particular aspect. You sat there and found yourself an hour, you're still going on but it's some new chain that you're running. It's a brand-new chain. Hasn't anything to do with what you were running yesterday. Okay? Well, that's how to get around that.

All right. Now, I've taken up this bulletin with you in full. And I think you will find this – this is quite something or other. Your two Prepcheck bulletins, the two principal Prepcheck bulletins, are very concise and very precise and they're crowded in. They rank along, with – wording – with the *E-Meter Essentials*.

Writing a bulletin like that has two things about it, one of them advantageous and one of them very disadvantageous. When you start machinegunning data, as it is in *E-Meter Essentials*, you're putting the person on "every line is fantastically important." You're not appealing to his understanding whatsoever. You're just machine-gunning him. You're saying, "This is the data. This is the data. This is the data. Datum, datum, datum, datum, datum, datum, datum, datum, datum. You see? Produces quite a high strain. But at the same time, it's awfully easy to review, and unless it overwhelms you, awfully easy to learn. So there's something in favor and something against this type of an approach.

Well, where you get stuff as we have in these two Prepchecking bulletins – the earlier one and this one – it's fairly high tension. Every datum in it is of considerable importance. And they take a different type of approach in study. You have to read them over many more

times because there's much more there. You see, for the same amount of wordage there's twenty times as much there. We only have a few small publications that are in that classification. One of them is *E-Meter Essentials* and the other are these two Prepcheck things. And they're really crowded. And every datum in them is meant and meaningful.

Prepchecking, if you're having any difficulty with it, I recommend that you get these – the first bulletin that was written on it, very precisely, exactly how you prepcheck and this one that I have just taken up with you of March the 21st, and you just read them through several times, one right after the other and all of a sudden you, "Oh, oh, oh. Oh, that's what you do. *Ha-ha*. I missed that. You have the E-Meter on during the session." [laughter]

Okay.

Well, I gave you just this one short spurt tonight. Let you off just a little bit early and let you happily go home. Stagger out into the spring which is dawning here. And I wish you all better luck with your Prepchecking.

Thank you very much and good night.

CCHs

A lecture given on 29 March 1962

Well, you know it's very funny. The older students sit up front and the newer students sit at the back and you look at a gradient scale here, you see and it's... a very interesting gradient scale. People on the very front row look like they might possibly, some day, live. [laughter, laughs]

Okay, this is what date?

Audience: Twenty-nine March.

Twenty-nine Mar. 62, AD 12 and here we go. We are going to talk to you about the CCHs.

CCHs. And this is based on the bulletin of 29th of March – HCOB. The companion bulletins are HCOB of November 2nd, 61 and the HCOB of June 23rd, 61. Those are three of a piece and they fit together and the three bulletins, as you look along the line here, are inseparable.

Frankly, it would be not enough to know one of these bulletins. We finally determined when you run the CCHs. That's been a question which has existed here for many a millennia. In the first place, they didn't exist for many a trillennia. And I'll go into a short history of these.

Once upon a time I was in England, that's up north and at 37 Fitzroy Street, West 1, just after they had moved in, it was apparent they were having trouble with preclears. This was a fact. Some pcs, when they walked in, caromed off both sides of the door. Some pcs didn't hit the door at all. Some pcs didn't even have enough sense to hit the street and there were trouble with pcs.

We were having a hard time getting HGC results. Oddly enough, an HGC which is properly conducted, properly supervised, many, many, many years now, has been turning out pretty good results and turning out very superior results. HGCs were first organized to demonstrate that good results could be turned out and to serve as a model to field auditors and then the HGC became a thing in itself. And it was evident at this time, however, that we had hit an impasse in technology, where we weren't getting the results that we should have gotten. And I developed the CCHs. And they've been in the way, underway for quite a little while, little bits and pieces and fragments of them and so forth. And I finally put them together all in a bundle and we had the CCHs.

Well, this gave us a series of processes, which, if properly used, familiarized – now get the difference here: CCHs don't run things out; the CCHs familiarize the pc with control, communication and havingness, which is the source of CCH – Control, Communication and

Havingness. And the pc does an upgrade on the CCHs in the teeth of the adage that the pc must be at cause. Now you find out in doing these that the pc actually is at cause, to a marked degree, except perhaps in CCH 1, that's to the least degree he is at cause and then at 2 he's slightly less at cause, 3, he's considerably more at cause and 4 he is rather definitely at cause.

In other words, you get a gradient, here, of causation. CCH 1, "Give me that hand," he's hardly at cause at all, but these are not, "run out something" processes. The CCHs actually are a method of familiarizing the pc with control, with communication and with havingness. In other words, he sits there and looks at it and finally finds out he can confront it. You get the idea? That's an entirely different proposition. In other things, we adjust – we adjust the pc's thinkingness so that he can cope with communication, control and havingness and a lot of other things.

You see, you say, "Give me a time when you bapped somebody over the head and told him you were controlling him," you know? "Recall a time you controlled something," something like this. In other words we do an erasure process. We desensitize the thing in reverse. We get the reason why the pc is allergic to communication, control, havingness and numerous other factors, you see? And we knock out that and let the pc carry on. Well, we don't do that with the CCHs. CCHs are straight familiarization. Pc sees that it is occurring and finds out it doesn't kill him. That's about the whole modus operandi of the CCHs.

Now sometimes a pc can find this out in five or six hours and sometimes he finds it out in fifty hours and sometimes he finds it out in 150 hours. But somewhere along the line, he gets an idea that control, communication and havingness are not necessarily horrible. He changed his mind about the thing.

But there's some point of case where a case turns to predominately motivator, as you go down scale, your case gets to a level where it is predominately motivator and won't respond to anything else. Whereas a person has an inadequate idea of cause to be causative.

Now above that point, a person's cause can be increased easily. And below that point a person's cause can only be increased to the degree of getting him to confront something that is going on someplace else. Do you follow that?

All right, instead of letting him run motivators then, you see, what you'd normally get would be this kind of a rig. You'd have Prepchecking and you'd say, well we prepcheck the people as we go down scale, to a point where the pc is run on nothing but motivators. Well, let's look at this, see. We see this gets noplacement, because, if you want to make a test, if you want to wind somebody up in a bag sometime, prepcheck this Zero question, "What has been done to you?" And it's very remarkable, but we have – we have innumerable – we collected these quite by accident – but we have innumerable auditor's reports where this has been done and goals and gains is always "No." Made no gains, no goals. Isn't that interesting? In other words, if we run the motivator side of it, the pc himself decides, after he is saying how abused he has been for the last trillennia, he finally winds up and tells you that the session didn't give him any gains and it's true. It also follows through, to a marked degree, on profiles and that sort of thing.

So we can't run Prepchecking down from, "What have you done to somebody else?" and as we go down scale, reaching for the pc, as he is further south pc, you see, we can't get

down to that level and say, "Well, what's been done to you?" and get anything. In other words, we hit an impasse at that point.

Well, there's where the CCHs take over. Instead of letting him run up further overts by saying what has been done to him, you see, which is all accusative and critical and just runs up further overts, we get him to confront communication, control and duplication. Now I've often told you that the mechanics of auditing, all by themselves, carried out on the basis of, "Do fish swim?" would get someplace.

In other words, the actual actions of the auditor, without any guts to the session whatsoever, just the actions of the auditor, will produce a gain on a case. That is why it's pretty hard to understand how, here and there, it can be managed to get no gain on the case and those actions of the auditor must therefore, be interestingly absent. And that's the values of the TRs. You do good TRs, you sit there, just do good TRs and your pc – something is going to happen to your pc, that's for sure.

Well, you've got this factor of duplication. And you might say that havingness is reachingness. Havingness is the concept of being able to reach or not being prevented from reaching. That's an interesting definition and that's probably a fundamental definition. But then havingness is understood also to be continuous. So we get reach duplication of – duplication of reach and of course this fortifies havingness endlessly. The fellow finds out that it isn't a fluke that he could reach that time. He can now reach again. And he can reach again and he can reach again and again and again and again and again and again and again. All of a sudden he takes heart. He finds out there's a possibility here that he might be able to have. You see, he's still doubtful as he comes up the line and you're getting him to reach.

And now let's take CCH 1, "Give me that hand." It could have possibly also – I am not saying you should run it with this command – but you – "Reach me." "Reach me." "Reach me." you get the similarity here? See, pc really is at cause, see? You could just say, "Reach me." "Reach me." "Reach me." "Reach me." And make sure that he did and it would be quite interesting.

I don't advocate that you fellows do this, although once in a while, some squirrel auditor develops some technology by which he can use Scientology to make a girl more accessible.

Now personally, I find it difficult to understand this, because I myself, you see, have never needed Scientology! [laughter] I don't waste a brag, but I just want to point this out. Here you have a situation where that's a poor show. But you actually could take a girl and have her reach your right knee and your left knee and your right shoulder and your left shoulder and your nose and the top of your head and your right hand and left hand. And every now and then, ask her how she feels about you.

And if you don't flatten the process, just about the time this thing goes into the plus state, she'll tell you she's mad about you, she thinks you're wonderful. That's right. And you girls could do the same thing. [laughter] There's no use being subtle about this – being subtle about this. You don't have to make out that you knew them all of your past life or something like this, you see. Say, "Well, actually we were married once so it doesn't matter," that kind of thing, that's not necessarily right.

Suzie and I have known each other in the past track three or four times and we are both trying desperately to forget it! [laughter] Whenever I get real mad at her, I ream her out for the reaming out she gave me one time, you know? That kind of thing. I think we rode without food or water for three days and nights to relieve the garrison, then she says, "What kept you?" [laughter] I could go on and elaborate this sort of thing, but I wouldn't – I wouldn't found these relationships on past lives if I were you. I'd just be more direct about the whole thing. I give you this particular trick and if you don't flatten it you will find out that midway through, the pc thinks you're marvelous!

It's this Touch Process. "Touch my right knee," "Touch my left knee," "Touch my right shoulder," "Touch my left shoulder," you know, that kind of thing. You don't even have to be more personal than that, you know, you just do that. Now anyhow, if you flatten it, of course they think you're okay, but they're not in this – this super-emotional state. You ought to try this sometime and make sure you flatten it, because it gets to be very embarrassing. It's actually almost embarrassing if you only run it halfway.

Well, I'm just giving you an idea. Here is a change of relationship between the auditor and the pc and of course, "Give me that hand," run properly, of course, gets the pc to do the causative action and it is the most simple, the most elementary of the data I just gave you. That is elementary – "Give me that hand," "Reach me." And if you were to run this and understand the full sense of it, you would do this other test, that I just gave you and you would understand completely why the thing worked.

Person begins to realize they can reach you and therefore will talk to you and you're getting the "Talk to the auditor." That's what you're establishing with that.

Now, the next one up is this individual has been running a body on a machine for a very long time, CCH 2 – old 8-C – has been running a body on a machine. It's quite interesting then to what degree people do not move their bodies around. The body just ambulates and perambulates and walks and bends and sits down and the thetan is back there, saying, "Well, what do you know, look at that," you know? "It sat down, it stood up, I wonder where it's going?" It's fantastic you know. It's just as a total outside spectator, you know?

Sometimes, "Isn't it cute, it walks. It walks. It's talking now, I wonder what it's saying?" [laughter, laughs] And it sometimes comes as a considerable shock to a thetan, on CCH 2, that he is moving the body. And he has something to do with the body. That was why we put the you in there. "You look at that wall" and "You walk over to that wall" and "You touch that wall" and "turn around." That's why the you came in there.

We wanted to emphasize this thing. Wanted to get the fellow in the notion that he was doing something with the body. And there we'd get almost a purely control mechanism. You see your CCH 1 is a reach-me communication mechanism and your CCH 2 is a control of the body mechanism.

In other words, it's trying to assert to the individual that you are in control of that body.

Now CCH 3, Hand Space Mimicry, was developed originally to get the pc in the same communication time span as the auditor. We found out that a pc at this level only understood

tactile and they had to practically be touching something before they were in communication with it. And it's an effort to get a gradient. How far away can the pc be from the auditor and still be in a visual communication with the auditor? That's what this is answering. Can we introduce some space into this idea of hard and fast.

You'll get – you'll get some people working in an organization, you'll get some people that never can put a despatch in a basket and have it delivered. They've got to bring a body with the despatch. There's always got to be a body with the despatch. They've got something – if they're going to write to you and tell you that the laundry has arrived – why, they can't do that.

They've got to come in and present a body and so forth. That's just because there can be no space in a communication. That's all that is.

You see, their cause-distance-effect is minimal distance, see. So it's just cause-effect. And these things, they are more or less understood by them, to be occurring at exactly the same point, with no distance in between. Now, if the pc were in the auditor's head, the pc could be audited. See? That's for sure. Everybody would agree with that. Well, this is an effort to not have the pc in the auditor's head and still get some auditing.

Now we introduce the idea of communication by duplication. We've got some space in the communication. We've got some duplication going on and eventually what do you know, he finds out some more that he can talk to the auditor. Or better, at this stage, can understand what the auditor is telling him to do.

Now, the only mistake that could be made – all of this material, by the way, that I'm giving you here is coming out of the November 2nd, 1961, HCOB – the only mistake that could be made at this stage of the game, is to get too darned complicated.

You could get far, far too complicated at this stage of the game, you see, and give the pc some loses. So keep it – keep it real simple. You want the pc to be mimicking the motion. But it's a "contribute to the motion." See? We're just gradually bringing him around to the idea of *cause*, with that word "contribute." "Contribute to the motion," "Help it out a little bit," or something like that. And you ask him, you ask him now and then, "Did you contribute to their motion?" (hands, see?) "Did you contribute to their motion?" And the pc says, "Yes." And, of course, the odd part of it is if he says "No," that you don't do a thing about it. "Yes" or "No," it doesn't matter what the pc says, you're just planting that idea as you go.

Now, we get up to CCH 4 and we're actively asking if the pc is satisfied. Now, looking over this particular write-up of this CCH 4 – hmm. Yes, auditor asks pc if he is satisfied that the pc duplicated the motion. That's quite interesting because you keep doing it until the pc says he's satisfied and that is the only criterion. This is the only mistake you can make with CCH 4, besides making it too complicated.

Sometimes auditors make it so complicated that they themselves can't duplicate it. And this is a silly position for you to get into. And I do not advocate your getting into this position. There is a level of simplicity-complexity at which the pc finds comfortable, but sometimes – sometimes you have seventeen consecutive different motions, as the thing which

you want him to ... And then the pc says, "I didn't see that, could you do it again?" Of course you're sunk!

The other action which the pc makes here: It's the pc who is satisfied that he duplicated it and you know, that'll drive an auditor sometimes halfway around the bend. He picks up this book, you see. And he lifts the book up level, puts it back down again and he says, "All right, did you – you satisfied that you duplicated that motion?" you see, anything that he cares to say like that, 'cause these are not verbal commands. That is, it doesn't depend on verbalness. And the pc takes the book – has taken the book, you see, and he's gone... And the auditor said, "Well, you satisfied that you duplicated the motion?" And the pc says, "Oh yes." And the pc thinks he has. And now the auditor – and now the auditor falls into the pit of being sneering about it or being critical about it. And you know the pc can just roll up in a ball, I mean, he'll just quit right at that point. You can defeat that whole CCH. Carefully examined it in use and that is actually the only way it really defeats everything. Is if the auditor insists that the pc didn't and starts getting new motions to contribute and does it again.

"Well all right, you didn't do this, so, I mean you say you did it, but let's look at it a little more carefully here," and so on. What I normally do in running it, myself, is when I see that the pc is making some wild, wild duplications that he thinks are duplications, I try to find one that the pc will actually duplicate. And will duplicate sufficiently well that it doesn't make him a liar every time. And then I'll do this one sometimes, is I give him a motion, raise the book up and down or something like this and then he sits there and he scratches the back of his head with the book, you know. Puts it back on his lap and then you say, "Did you duplicate that?" And he says, "Oh yes." Why, I'll do two or three more and then I'll raise that book up and down again. And you know, the pc will eventually see it. It's not done in a critical spirit. I just know this is one he needs drill on badly. And he'll eventually improve it and you'll see him get a little bit better at it. But it's, is the pc satisfied with it? That's how you keep the pc at cause through the CCHs.
