Otherwise there's no reason, beyond what I have just told you, why they would work. It's odd that they work at all. It's odd that there are levels that you could audit, where the person does not have any opinion of what you're doing, thinks everything you are doing is bad, sees it all backwards, wants no benefit from it, would rather blow your brains out than follow any of the commands and that you can audit straight through and have the person come up with a gain. That is what is very peculiar about the CCHs. But it is true.

It actually doesn't even require the pc's permission. It's nice to have it, but if you haven't got it, so what.

Well back there in 56 – back there in 56, they were laid out more or less like this. There've been very few changes, except I think the "you" in CCH 2. And very few changes and yet by 1958 the CCHs weren't working. The CCHs weren't working by 1958 and they definitely weren't working in 1959 and they weren't working in 60. The technology had been lost and yet the auditors (one of whom I am looking at right now) that got trained back in 56 actually really didn't want to audit CCHs very badly. I made her run them on a doll, get ahold of a doll and shake the doll's hand, you know, and run them on the doll, and so forth, and she did real well. She got so she was getting fantastically good results on the pc. Just marvelous,

did marvelously. And as time went on, much less able auditors – even more able auditors, they made no results.

Well, where'd these results go on the CCHs? We're already old enough to have had a routine varied and buried and skipped and altered and messed up so that it didn't work. It's a good lesson. It's a good lesson. 1956 they worked and part of 57 they worked. And then they didn't work the rest of 57, 58, 59, 60 and so forth, until I all of a sudden said, "What's this all about?" And I realized that we used to do them differently. And people had stopped doing them this way. That is to say, they were doing each CCH perfectly. But they were not doing them as a combination.

In view of the fact they weren't doing them in relationship to each other, they didn't work. And these CCHs don't work if not interrelated to each other.

There's a certain way of handling the CCHs, in relationship to each other, quite independent of how each CCH is done. And that piece of technology is as important as the individual CCHs. How do these four work together? That was lost. So we get a reissue of that. Short, sweet and succinct. June 23rd, 1961. It's preserved in this particular form. It's taken from a telex sent to Johannesburg. It's not that Johannesburg has a harder time, but that this was – had just been picked up on course here and so was sent down to Johannesburg.

"You run a CCH only so long as it produces change in the pc's general aspect. If no change in aspect for twenty minutes, go on to the next CCH. If CCH producing change, do not go on but flatten that CCH."

"Run CCH 1, 2, 3, 4, 1, 2, 3, 4, 1, etc. use only the right hand on '1'."

We're not trying to clean his hands up.

See, all these complications entered into it, you know, all kinds of complications got born up out of these things. You are right back to their simplest form and this group use of them.

Any pc on Routine 1 and so forth, is completely irrelevant. And another point here: CCHs not run in Model Session – not run on E-Meter. I'll take that up with you in a minute. But it's a code break of Clause 13 which is, "You must not run a process which is not producing change" and "You must flatten a process which is producing change." Clause 13 of the Auditor's Code – not to handle the CCHs this way. By the way, on running a child – on running a child, three times is flat. There is a variation of this rule. They do it well three times – that's flat. Do the whole CCH three times. That's flat. Otherwise, a child will get loses. And this will also work out, you will find, with the worse off cases, so the twenty minutes that we state here, is a maximum time. Maximal time.

Sometimes a CCH doesn't bite for a few minutes. Runs for a few minutes and it doesn't bite. Well, this gives it an adequate time to do so. If you are running somebody who is having a hard time with their attention span: three times. "Give me that hand. Thank you. Give me that hand. Thank you. Give me that hand." They did it three times. Fine, that's flat. Got the idea? Otherwise, they start to think that you're punishing them and they start to think – you're getting loses. So the auditor has to make an adjudication on the state of the case and the attitude of the case, you see? Never less than three times, you know. Don't pull that down to

once, see. And never more than twenty minutes. That's in your reasonable range expectancy. And if the thing is running with ragged differences, it's not flat.

You can watch a person doing CCH 2 and they're doing these things very raggedly. They walk over to the wall, sometimes they look at the wall, sometimes they don't look at the wall. They shuffle their feet, sometimes they don't shuffle their feet, they lean on the wall, sometimes they don't lean on the wall. Comm lags in the length of time necessary to touch the hand, comm lags in the length of time it takes them to turn around. Differences of resistance to direction and so forth. These are all differences, so those are not flat. Then they finally do it three times in a row, three whole sequences in a row: flat. Go on to the next one.

It's the times through. And as long as it's producing a difference in timing, a difference of reaction in each time it's done, as long as it's being different, you want – you want to keep on running it, because it's not flat. But as soon as it smooths out, why, so that you get a – they are all about the same and particularly the person doesn't seem to mind doing it – that's an interesting factor. Probably a more vital factor than the perfection with which they do it.

Yeah, well, that's time to push on to the next one because you're going to catch this thing again anyhow.

Now it's quite interesting. You'll watch the CCHs behave in this particular fashion. You'll do CCH 1: "Person does it standing on their head." Yeah, yeah, yeah, yeah, yeah, yeah. Nothing to do with me, you know. CCH 2: "What wall?" Bang! *Ba-ba-bah*. Just all doing on the auditor's determinism. CCH 3: "Yeah, yeah I can totally do it." Everything's fine, give them a book. You raise the book, they raise the book. Raise the book... Go back to the beginning of the thing. You say, "Give me that hand." "*Why should I?*" Just now something is biting, *ooh!* Yeah. There ensues a wrestling match people would pay admission to see. [laughter] Not flat.

You go ahead and flatten it and go on and up and you find the next one is flat or not flat. In other words, you find these unflatnesses and flatten them, is what you're trying to do. Now frankly, if you attacked it from another way, from another approach, the approach they'd begun to attack it with in 58, this would be all messed up. You just get ahold of the fellow and you're going to flatten, "Give me that hand." And the individual has no peculiarities or differences in "Give me that hand" and you just run "Give me that hand," for the next 150 hours. There's nothing happening, just run it.

It goes on and on and on and on and on. There's not enough variation or randomness or different things being addressed in the case to make any difference at all to the case and the case just doesn't get anyplace. And nothing happens. So the CCHs don't work. You get ahold of some people, they actually can't tell anywhere from nowhere and you say, "You look at that wall" and they look at the wall. "You walk over to it" and they walk over to it and then, "Touch it" and they touch it. And they turn around. And they come back and "You look at that wall" and they just go on and on and on and on. And you give them a test to fill out, so that you can get their profile and you come back and you find these horrible pictures of waterfalls with bones at the bottom, you know. And you don't even find the answer to test, you know. This is very puzzling. I mean how come they can do this? It's actually just on the auditor's determinism. Doesn't mean anything to them. The wall isn't anything to them. They're

not touching anything. They're not walking. They're just, "Isn't it sort of cute? Look at it, look, oooh!" Hasn't anything to do with them. Very funny.

And you take one of these cases and you can make a terrible mistake. You can start to run "think" process immediately afterwards, you see. Because the person can do 8-C so well, we'll now run a think process and they should be able to get away... Think? What think? That's the trouble you get into. That's the trouble you get into, when you just tackle these CCHs, each one all by itself and make it an end-all. They have to be in this rotation. If you don't have them in that rotational sequence, not enough different things, you haven't got enough randomness and nothing unsettles. But you tackle it in that rotation in the bulk of cases you run – of course you don't – will go right on and get gains. You run into these sags and flat points and unrealities and so forth. But the person goes through them.

Now there's one exception to this. Is about the only thing that you can run on an unconscious person is CCH 1. You can't walk them around the room, so you're limited to that degree. And CCHs are workable on unconscious people to just the degree that they would be workable, if you ran just one CCH on a person, you see, not very universally applicable.

So therefore, if a person isn't recovering – an unconscious person isn't recovering consciousness – dream up something else, see, don't keep on. There's not a flicker of change or pulse beat or response or anything like that and you've been doing it for two hours and there's no change on it, you're not really getting a response. You're running against Clause 13 of the Auditor's Code. Run a Touch Assist on them. Sounds funny. Person's unconscious, well, run a Touch Assist on them. You also run an unconscious person through an engram. You can also run Havingness on them. Do all sorts of weird things to unconscious people. They very often follow through.

But do something else. In other words, you'd have to dream up a consecutive series of processes numbering about four in all, that'd fit this particular unconscious person. You've got a lot of processes to choose from. One is Havingness. And yeah, "Make that body lie on that bed" and Touch Assists and, "Feel this" or something like that. "Feel the pillow." "Feel your head." "Feel the sheet." "Feel the blanket."

In other words, lay out a pat four that would be the CCHs, simply because you can't run the CCHs on them. You got what I am talking about? Then go cycle through this same four, until you could get some changes. Because it's just – running one thing on and on and on, it's just running into Clause 13 of the Auditor's Code. You're running a pc – isn't producing – on which – whom you're producing no change of any kind whatsoever. And of course, that's just agin the Code. You've got to find a process that does produce change.

Now, the funny part of the CCHs is, once you've found a process that does produce change, *voilà!* The other processes which were apparently flat will now be unflat. The oddity is that one CCH unflattens the other three. Not always all of the other three. But it'll unflatten one or more of the remaining three. You get a change on a CCH, it'll change the other three. Even if you get no change on it, it tends to unsettle the remainder. It's quite remarkable to appear. That was the original way they were run; the original way that we got very good results with them.

Now, I'd like to call to your attention the fact that they're a Tone 40 process and that the Upper Indoctrination, good Upper Indoc is vital to a good handling of the CCHs. Putting that thought in the ashtray, man, that's very important. You lay these commands into the pc's head. The funny part of it is, that they're not necessarily even verbal commands. But you can overstrain this and wear yourself out. For instance I ended session for a pc, I think, last night and it possibly ended thirty or forty sessions or something. And it required no strain on my vocal chords and certainly didn't require any strain on my postulates. I just told her – just gave her a Tone 40 "End of session" you see. All right. It's not necessarily difficult for the auditor. An auditor hasn't – isn't trying to impress the pc with anything. It's just a direct lay-in of it. It's just directional. It's – you might say it's a command without reservation. And it's not necessarily a forceful command or an impressive command or anything else. It's just a command without reservation. You take the brakes off of the thing, you can practically split the pc's skull down the middle.

One other thing I'd like to say about the CCHs before we go on to the rest of "When?" One other thing I'd like to say about them is the fact that they are nonverbal. And you could run them on a deaf person. It actually could be, you see? It'd take a little ingenuity on your part to cut out the total verbalness, but factually, the verbalness is not the chief part of it. The chief part of it is the action. The solidities involved, the solidity of the reach and all that sort of thing. So the CCHs, the common denominator of the CCHs is solids, not thoughts.

That brings us to where we are on "When?" *When your pc does not get any tone arm action on Prepchecking or on 3D Criss Cross, you should be running the CCHs.*

Now the auditor could be at fault, the questions at fault, the list chosen at fault, a lot of things could be at fault. Don't worry about what's at fault. Just put the pc on the CCHs. That's when.

In the absence of tone arm motion on thinkingness processes, do the CCHs. And this will keep a lot of people from wasting time in processing. They all make better gains in processing if you do this.

Now we have a case in point. A list. I know we said on one of the Info Bulletins – you realize 3D Criss Cross is on Info Bulletins, don't you? Because it's not finalized. So when you finally get a finalization of "This is it" (Roman postulates you know?), why you'll get it in red ink, but up to that time it's in Info Bulletins. It permits one to reserve the right to change his mind. And we change our mind on this particular basis. That the pc ought to be on a meter during listing and differentiation. Except it shouldn't be, actually wouldn't need to be, but frankly, a new factor arises. You want to know how much TA motion the pc is getting. How much TA motion the pc is getting while listing and if'n the pc isn't gettin' any TA motion while listing, you have several choices.

One, if the pc does get tone arm motion while prepchecking, you had better continue the Prepcheck and knock off the list, even though you're just halfway through it.

Now, if the pc gets no tone arm motion, whatsoever, in 3D Criss Cross listing and in Prepchecking, you for sure should have been on the CCHs in the first place.

Now, if a pc has been getting good tone arm motion on Prepchecking, but suddenly just ceases to get tone arm motion, this just means you got – you've hit a bad question line. It means you should improve your question line. You know, but this is already against a history of tone arm motion. In the absence of such a history of tone arm motion, getting no tone arm motion of course, you have the CCHs.

Now if the pc on other lists has been doing beautifully on tone arm motion, you all of a sudden hit a list without any tone arm motion, of course, you could just skip that list. You say, "Well, this is getting us no place," and junk it. Start out on another line. Obviously doesn't mean anything to the pc. Don't you see? No TA action.

All right. This is saying when you run the CCHs and what you do, Prepchecking, 3D Criss Cross, so forth, according to the amount of tone arm motion.

Now, there are a couple of additional tests that you can make which are taken up in this bulletin of March the 29th, 62. And these tests are as follows:

Do not confuse a pc's settling-into-session tone arm motion with the tone arm motion being created with the body of the session. Now a pc can come in at 4 and you clean up some rudiments and you start listing or something and the pc settles in and goes down to 3, in the first few minutes of play. And just sits there at 3 thereafter. Well, that's getting the pc into session. And it's the mechanics of getting the pc into session that has brought him down there and given him that sinking arm.

See, the rudiments and so forth, were what was doing it, not the process you were running. And you'll find that that adjusts the tone arm. So leave adjustment of tone arm by reason of rudiments and by reason of the pc getting a bit used to the session, leave that out of it. Just be sure that the pc is getting tone arm motion because of what you are doing, not because of some other factor.

Of course, you realize you could sit there and kick the pc in the shins every three or four minutes during a session and possibly produce tone arm motion. You recognize that?

Now, that's a case of no tone arm motion. The pc has a – rather a history of it or has been going on for several sessions here with no tone arm motion. You can't seem to figure it out. Don't try. Just put him on the CCHs.

Now there is a case where, when you get tone arm motion, you put the pc on the CCHs. And that is every time a discussion of auditing produces considerable tone arm motion you had simply better put the pc right there into the CCHs and that's it.

That's a converse to the rule. I call it to your attention. But we've – already have obliterated that from the first tone arm motion, so it's not the same tone arm motion we're talking about, you see? We say the tone arm motion – the lack – if we get a lack of tone arm motion during the body of the session, that's a CCH.

You don't care why, it's just a CCH activity. You should put him over on the CCHs. All right. But that's the body of a session, isn't it? Now, if you get – always get – a tremendous amount of tone arm motion in trying to get the pc into session: CCHs. There's a case that if you get tone arm motion, you put them on the CCHs. You sit there and talk to this pc on the

subject of auditing and you get tone arm motion. You get three-quarters of a division, a division, a division and a quarter tone arm motion: CCHs, man, don't monkey with it. Why? Well, you should be able to work it out for yourself because the pc of course, has fallen into the classification and the exact category of why the CCHs should be running. The pc is insufficiently familiar with control, communication and havingness to be able to be held in-session. So you always find yourself in trouble trying to get rudiments in.

And you spend three-quarters of every session trying to get the rudiments in, in order to get one-quarter of a session done, during which nothing will get done. Won't get done. The person obviously is so concerned with the fact that there's a session going on that *durrh*, he's not getting anything done. You get why?

All right. Now the other one is – another one case where tone arm motion indicates the CCHs is, if you run tactile havingness on the pc and you happen to notice that you get tactile havingness and you get tone arm motion, but you prepcheck and you don't get tone arm motion: or you do 3D Criss Cross and you don't get tone arm motion, man, that's where tone arm motion directly indicates that you should do the CCHs. That's what you should do. It's obvious, isn't it? All right.

Now, here's the case where you run Havingness and get nice tone arm action and you prepcheck them and you get no tone arm action. Oh man, that's CCHs. Why? Well, it comes under the same heading as tactile havingness.

You read the tone arm, see. And the tone arm sits here – our tone arm sits here at 3.5, sitting there very nicely. And you say, "All right, put down the cans. Good. Now touch the table, touch the chair, touch your head," you know. "Touch this, touch that," and so forth. "All right, pick up the cans." Tone arm is reading up here, 4.25 – CCHs. That tells you their best avenue of improvement for the case.

Tell him to put down the cans, touch the table, touch the chair, touch this and touch the ashtray and so forth, pick up the cans – 2.5. Oh man, they need CCHs like the western desert needs water! That's what they're going to respond to. You see how you adjudicate. As a matter of fact, you'll find that same pc ordinarily, will go up to 3.25 on a Prepcheck question, then go up to 3.4 on a Prepcheck question and 3.2 on a Prepcheck question and 3.25 on a Prepcheck question. And this would be wild tone arm motion for that pc. But on the tactile havingness 4.25 – 2.75, man! You get this extreme case?

You'll find that's very common. You're wasting your time not to run the CCHs.

Now, let's get back to the bad old days when we relegated the CCHs to psychos. Because it's not a psycho process. That's all. It just isn't. Oddly enough, we're finding cases that have been passing for sane for a long time, even on this planet, do beautifully on the CCHs. And make faster case gain on the CCHs than they've been making on thinkingness processes.

Now, because only the CCHs can be run on a psycho that is an inarticulate, combative, noncooperative psycho and because we were so happy at that time to have something that *would* run at that level, people started to attach stigma to themselves because they were being run on the CCHs. And it took a – it was a bad thing.

The CCH level is not much lower than we suspected before, but much higher. See, it runs well up, well up. It runs in the cases that would get benefit from 3D Criss Cross and would get some benefit from Prepchecking. And they will get much faster benefit from the CCHs in the early stages. How do you like that? That's interesting, isn't it?

Now that's a recapitulation of an old process and this is time tested and very true and where the CCHs lost out was in a change of application. The application of the CCHs you have now is – aside from the "When," which we have never been able to answer until now – it is severely the first version of the CCHs. We're actually running the CCHs the way I was teaching you to do it and you were going back and forth on the tram and pumping the doll's hand. I remember that very well.

Very funny. Jenny Edmonds – she was in tears practically over this thing. She couldn't confront this person. She couldn't get through, just wouldn't do it and I thought – so I made her pump a doll's hand and make the doll do the CCHs. She had some time on the bus and so forth; and I imagine that helped her overcome a lot of her shyness, sitting there on a bus doing things with a doll with all the other passengers looking on. Imagine that scenery. And for two or three days her pc couldn't have been scraped up off the bottom of the Fitzroy Street sewers and was going down for the last count.

Now all of a sudden Jenny got the hang of this thing and that pc just soared, just as nice as you ever saw. And just came along fine, thank you. Never saw an auditor more proud of a win. Isn't that right? Yeah?

Female voice: Yeah.

That's all in doing them right.

Actually it isn't true that some auditors can do the CCHs and some can't. That's much too broad a generality. There is this: Some auditors will audit and some won't. I think that's about all you could say about it. But the CCHs done under these existing – these rules, they had no bugs in them other than that, if you just do just this and don't do anything else but this, contained in these three bulletins and you'll find out they work for any auditor.

You sometimes get the idea that some auditors can do the CCHs and some auditors can't do the CCHs, because you're not watching some auditors do the – (quote) (unquote) "do" the CCHs.

And where you get them parked back of a door and they haven't been too well trained into it and so forth, what they consider 8-C or something like that, has no relationship to any bulletin we have discussed this evening. So your – you see, in view of that fact, we got into a bad opinion. We thought that there was some mystic quality about this, see. Thought some auditors could do it and some auditors couldn't do it. Now it isn't true. Some auditors were doing it and some weren't. The gross auditing error was the omission of the CCHs.

You do the CCHs. They're written up here. It takes a certain degree of certainty. It takes a positiveness of action and so on. But frankly doing the CCHs is the most restful auditing that anybody ever did. You don't have to think of a thing! Except, please notice, when it's ceasing to produce change. [laughter] And please notice that it's still changing, if you notice those things.

Of course, you understand it's a natural thing to Q-and-A with the fact that the thing isn't changing to go on doing it. You realize that. You know? It isn't changing, it looks like you ought to keep on. You know? And if it is changing it looks like you ought to change. You know that.

Now, an auditor has to swim upstream against this. And if it *is* producing change, you don't change. And if it has ceased to produce change, you change. Which, of course, is going into the teeth of fate, the time stream and eternity. I mean, that's the exact reverse from the way you've been living. All right, now there's the CCHs. And you're doing them now. I thought you would like to have a very – a recapitulative lecture concerning them and be reassured that no vast changes have occurred in the CCHs since the last time you did it. I hope you are reassured and I already know that you're getting some wonderful results doing the CCHs.

Thank you.

Good night. Thank you.

QUESTION AND ANSWER PERIOD: CCHs, 3D CRISS CROSS

A lecture given on 29 March 1962

Thank you.

Lecture two, Mar. 29, AD 12. Lecture subject, blank. I'm giving this lecture to give you an opportunity to ask some questions. If anybody feels that they just can't help but reverse the flow, do so! Any questions, any questions? Yes Herzog.

Male voice: Ron, I'd like to know that if you have a case and you process him and the tone arm moves up ...

Hm.

Male voice: ... something about 3.5 or 4, and it stays for a long while there until suddenly he talks to you and, boom, it comes down. You know, in one fell swoop, without him necessarily making a cognition ...

Hm.

Male voice: ... or anything really happening. But this is a kind of a pattern.

The case always does this?

Male voice: That's right.

That's repetitive tone arm motion and is a peculiar phenomenon of where the tone arm goes to the same points and does the same thing without something happening. There's a thing called a stage four needle. Well, this is the equivalent behavior on a tone arm. And it's actually a circulation between two masses. And the individual has mass one and mass two. In other words, valence one and valence two.

And you'll find out that when a case is pretty heavily pushed in, you can almost hear the click when they go through these valences. And valence two reads at 3, and valence one reads at 2, let us say, and they go *click-click, click-click, click-click*. And it hasn't anything to do with tone arm motion. It is an odd phenomenon that you – you've seen there.

You shouldn't suspect that when you see – it creeps up to 2.25 and then it goes to 2.75 and then edges up to 3 and then comes back to 2.5. That's not the same action. It rises up and will get to about 3.25, and sometimes it's much worse than this, sometimes it goes up to 4.5 – more usual, even, and then, *clank!* All of a sudden goes to 3.25, 4.5, 3.25, 4.5, 3.25, 4.5, 3.25. And if you see any variation, adjust your trim knob! [laughter] There are – there are such cases. There are such cases.

You shouldn't confuse it with tone arm motion, because it isn't. That's just a direct read on valence one, a direct read on valence two. It's unmistakable, by the way, you – you wouldn't be wondering very long whether you had a case like this or didn't have a case like this. I mean, I've seen a case hung up in this for quite awhile, and then all of a sudden bust through and do something else.

But there are some cases, you get them in, get them on a meter, and they do nothing else but this. And the auditor sits there and happily thinks the case is moving like mad, and actually the case is going exactly no place. It's as bad as this: When the pc talks to the auditor, he's in valence one. When the auditor talks to the pc, he's in valence two. It will just go, *click-click, click-click*. And then the thing reads proportionately. Okay? Right.

Yes, Charles.

Male voice: In this bulletin on CCHs you mention you run the CCHs 1, 2, 3 and 4 until they're runnable without somatics or reasonably flat – and reasonably flat. Could you elucidate a little bit, on "reasonably flat"?

Well any CCH-type process, for instance "Notice that (room object)" is actually a CCH – it actually comes under that classification, because it's a direct havingness, straight observation process of the present time environment.

All right. If that turned on a somatic, you have to continue to run it until the somatic drops out. That is the fundamental of what you're talking about. See? The fundamental is that, in view of the fact that only a CCH will turn *off* the somatic it turns *on*, or a series of s- you know, running through, maybe the somatic will hang for awhile, and then it'll finally shift down – you're honor-bound, if you start the CCHs, to run the somatics flat off of them.

Now, if you had a case that the somatics came off, but they were still ragged in spots, you would continue to audit it until the pc didn't mind any of them. So, one, be sure and run them as long as they generate somatics. That's vital. That is a must. And then we have the nice thing to do, which gets the full benefit out of the CCHs, is run them so the pc can do them all willingly and do them all well, in sequence, in rotation, and it doesn't bother them, and so forth.

Take off the gross change that you get on the CCHs – the gross change is, of course, the somatic. And then the less gross change is the raggedness or the irregularity and the little unwillingnesses and that sort of thing that you run into on that.

Does that answer that question?

Male voice: Yes, thank you.

Right, right.

Yes!

Female voice: Ron, would there be any extra value in running the CCHs with the beginning and end rudiments?

Yeah, well, I didn't mention that until I was going over it again, because it – I said I was going to mention it, I'll mention it now. Thank you for bringing it up.

If you wanted the CCHs to produce the highest possible gain with the least possible blow, on pcs who are pretty sensible anyway, you'd probably put in your beginning rudiments and do your end rudiments on a meter. And do the body of the session on the CCH. It makes a different breed of CCH, which would of course be rather understood to come about if you started using the CCHs not on very low-scale pcs exclusively, but started using the CCHs on middle-range pcs.

You could possibly have a situation like this: The pc is sitting there with a howling withhold, you see, of some kind, and that's been missed, and the pc is blowy, because of the withhold, and then you get something going on one of the CCHs that causes him to blow, and your pc tries to blow ten times as hard. In other words, by doing this, you could soften up the blow factor, and the pc at the same time would tend to stay in-session a little bit better.

But I would still rather leave this in an auditor choice proposition because it has not been done. You see? It's a fact offered without experimental background. And I ordinarily tell you when this is, and if you want to go ahead and do it, do so, and we'll rack up a few of them and we'll look it over and see how it works, and then it would be whether you did it or whether you didn't do it. But it's certain that on many cases you can't do the beginning and end rudiments on a meter in the CCHs, you see. That's impossible.

But it's also become certain that if you're going to start running people, just because their tone arms don't move because the auditor is not running the right Prepcheck, or something of this sort, well, probably the case would make a better gain if you ran beginning and end rudiments. I don't necessarily say it would. I say it's not necessary to do or unnecessary to do it this stage of the game. This is something that will require more data about. I think there would probably be an additional benefit to the CCHs if it were done that way. And I think also an auditor could get so involved with the beginning and end rudiments, he didn't do any CCHs. So maybe the thing has blessings, and maybe it has curses. It is an idea offered, rather than otherwise. Okay? You bet.

Any other questions? Right!

Female voice: on 3D Criss Cross, is there any indication whether definitely we should oppterm each item as they come up, or get them across? You know....

Well, originally, we hit it in a sloppy way. In 3D Criss Cross we did – oh, several, and then start oppterming. Get several lines, and then start oppterming. And I don't know that this isn't the best method. Once again we're on a data question mark. I do know this, I do know this, that some items are so heavily charged, and the pc gets so momentarily and so tremendously fixated on the item, that you actually couldn't do much more than oppterm them. But on a little work I have been doing recently, I still favor the first method we were using – of getting several lines, and then finding out – and then reading down the items and finding out which one of them is particularly live today, and oppterm it. You know?

There's that possibility that if you did twenty lines without a single oppterm, that you would be running the pc into nothing but sensation. And the pc would just be getting dizzier and dizzier and dizzier. And now I can give you a rule by which you can follow this. The rule is a bit sloppy, but it is still a rule. And that is, if your pc, after you've done one, three, five lines, is starting to complain of dizziness – in other words, lots of sen – or is getting continu-

ally grievous or something – anything that is under the heading of sensation, you know, misemotion or dizziness or sensation; you know, everything is going far away and coming to them again. At that stage you have gone too far without oppterming. And the thing to do is to oppterm. That's when you *must* oppterm. When your pc is getting a lot of heavy sen. Then you *must* oppterm.

But I wouldn't do that just because the pc was getting heavy sensation on one line. Well, so he got heavy sensation on this line and at the end of that, and then you did another line and the pc is now *really* getting heavy sensation and between session is starting to go dizzy. Now, you've got to. Now, you've got to oppterm. The thing – the way to cure that is to oppterm.

So, within these tolerances, it doesn't much matter when you do it. But I can tell you when you *must* do it. Okay?

Female voice: Hm-mm.

All right.

Yes?

Male voice: And you do that by assessing your items, taking one which is pretty heavily charged ?

Yes. The first way we were doing this is probably the best way. That is to simply get a lot of lines, then read through several of items that you've already found – you've got maybe four, five, six lines. You read those and you find out that one is really knocking. That's the one to oppterm. Yeah. And if you're going to oppterm all of them at that time, you would read through the remaining ones and find out the heaviest one and oppterm that one, until you'd opptermed them all. You'd of course would really oppterm them all. You wouldn't leave one out just because it wasn't knocking. You'd oppterm anything that you'd ever found. Even if it was wrong.

Try and oppterm a wrong line sometime. That is really marvelous! That winds up back of nowhere faster than any other operation I could guess at. Because you've come up with a wrong item on an original line and now you're going to oppterm it. Pc goes way out into left field and falls in a gopher hole and that's the end of that! Okay?

Yes?

Female voice: Could you tell me, when you start doing the third line, how many lines to get to the person – oppterm – before you start to oppterm – you know, do your third oppterm.

Now ...

Female voice: I mean when you get your one item, then you oppterm, do you go down – further down the line and oppterm again?

Oh, well, oppterm smoothly. In other words, if you're going to start oppterming, you wouldn't get your third item until every first item had a second item.

Female voice: Yes, I know. I see.

All right, now, you get everything a third item. And, you wouldn't start getting anything a fourth item until everything had a third item. In other words, you'd fill up the lot.

It'd be perfectly all right to have – as far as I know, and from what I've seen of this – to have twenty first items with no second items at all, see, because you've got one item each, unless you run into this sensation thing I was talking about. And then your person starts going dizzy, and so forth, between session, you better start oppterming. Well, the moment you start oppterming, oppterm the lot, see? But take the first one that's the heaviest one. Now, don't get your third item until you've got the second item for everything. In other words, keep a balance to that degree.

The reason why, if you don't do that, is you start losing lines. You lose lines, inevitably, anyhow. Lines all start to cone in toward a limited number of items. But you start getting the third one before you've got the second one, and the bank gets all monkeyed up so that you get your second one over here as the third one and you've already – lose a line. See? That's real heavily charged and it appears over on the wrong line. And the next thing you know you're narrowing much too fast. Okay?

Female voice: Yes.

All right.

Yes, Fred.

Male voice: Would the sensation phenomena also apply to the pain phenomena, if you were getting only pain? Would ...

I'm sadistic.

Male voice: You would continue on if – you wouldn't oppterm it then?

It'd be almost impossible for the pc to maintain his terminal. You see, the mechanics of the thing, Fred, are these: that the pc *is* his terminal. And a terminal always has pain on it. And here is this terminal on which there is pain, facing outwards, always, against an enemy. So, you've given this terminal he's stuck in, an enemy, an enemy, an enemy, an enemy, and he gets dizzy because he just got too many enemies. But on the pain phenomena, he's simply being somebody else. You see? And you actually wouldn't get that kind of a phenomenon. You won't get 3D Criss Cross turning on constant pain, but you will get 3D Criss Cross turning on constant sen.

Male voice: Thank you.

You see why?

Male voice: Yes.

Yeah. All right. You bet.

Male voice: I just wondered why you left out the one side.

Yeah, well, that's – the reason why is the pc – the pc as his terminal is never opposed to the pc as his terminal. See? Now, you can give him too many enemies. He's stuck in being a cat. And you don't know what he's stuck in. You haven't found a cat yet, you see. You're

finding a lot of other parts of the package. But actually all this time he's being a cat, very obsessively – you've never relieved this one, you see. And you get a lion, and you get a dog, you see, and that's real cheerful. And you get a dogcatcher and – and then you will go along a little bit further and you get a housewife, and you say, "This is interesting here. We're finally finding his female characteristics, you know." And then we get a small house, and then we get a sandbox.

You see, up to this time we haven't added up why – what we've got there, you see. And the pc can actually start stacking up, and the phenomenon that he's stacking up is, "They're all agin' a cat."

And it's looking like a mighty hostile environment to the pc by this time, and he'll go – start going zzzzzz-zzzzzz, wog-wog and actually get dizzy enough that he can't walk up and down stairs. I mean, it can get that gruesome. And also, you've occasionally heard of the pc where the room – walls of the room went out of plumb? That's all part of the same sen, by the way. That's just sen. That's too many oppters, too many enemies. I didn't mean to beat it on the head, but it's interesting that the fact that – the second he's out of a cat, you see – so a cat has lots of enemies. Now – now he is being a warrior. That's his terminal. Well, all right, that's got lots of enemies, too. But one of its enemies is not a cat.

Male voice: Uh-uh.

Okay?

Male voice: Thank you.

Right.

The mechanics of the mind. They're very mechanical. They for sure are. Gets to be fruitless after a while to get lines when sen is on too strong, by the way. Because you're just getting opposition to the same thing, you're just getting more and more oppositions to the same terminal. Those lines are all going to disappear. So you're just overworking yourself for nothing. That's only when sen turns on.

Okay. You sure started one with that!

All right, any other questions?

Well, I'm glad you know it all! I'm peculiar in that I don't!

Yes, Jan?

Female voice: Are these two still correct from last spring? This is CCHs again. "If the pc fights you tooth and nail, steadily, for twenty minutes, that's no change."

That's correct!

Female voice: "Or weeps steadily for twenty minutes, you come off of the thing."

Yeah, that's relatively speaking correct. You can be too severe with this. Because the pc, you understand, would have to be in a very interesting state to have no change in the fighting, or no change in the crying. You know. For a pc to weep without change for twenty minutes, that'd be very peculiar. But by the definition, that is absolutely correct. The pc weeps for

twenty minutes, and he weeps the same for twenty minutes, you've reached a point of no change in that CCH.

Female voice: There's another half to it, and that was, the business about you don't count a somatic which the pc simply describes to you, but you can't observe it, on his body.

Oh yeah, that's right.

You can't see him twitching or clutching bodily parts in anguish ...

That's right, if you cannot detect ...

Female voice: ... if he had a splitting headache you can't see it ...

If you can't detect the somatic on the pc because of physical representations, the pc doesn't have one, as far as the auditor is concerned. The auditor never buys any statements of the pc. These are nonverbal facts about the CCHs. CCHs are nonverbal. You see that pc, and he's going this way, you know, and he, *oooooh*, and so forth, *hoooo*. All right, so there's something wrong and the pc's got some weird things going on in the cranium and it hurts. All right. Fine. Fine.

And the pc says, "Oh, I have a splitting headache, and you do this just one time longer and my head is just going to fall off and this is absolutely killing me. And I've never had anything kill me as hard as this is killing me," and so forth. It has no validity with the auditor. Just has no validity.

We've had too many pcs dream up somatics. That's where that comes from. They'll go into valences of victims and give you a long line of symptoms and so forth and they get at the motivator side of it. When that motivator thing starts running out, they give you victimization dramatizations. Of course, pain, factually speaking, is a victimization dramatization. Okay?

Female voice: Yeah.

All right. Yes?

Female voice: I wanted to add to, or to ask something about what Jan said. If the pre-clear, say, happens to be – I've never seen this particular thing – but if the pre-clear should be crying for twenty minutes solid, without change, just boo-hoo-hoo, the same type boo-hoo-hoo, but say that before you looked at your watch he began, or he or she began crying two minutes before your twenty minute period, so that in fact he had been crying twenty-two minutes, but without change – you know, I mean without any change in crying – so, on the basis of "The process that turned it on, if continued will turn it off," could you then make an exception to that twenty minute period? You see what I mean?

No, actually you can strain at these things too hard. Because for the exact same *boo-hoo-hoo* to carry on for twenty minutes, it's not going to run out. That's all there is to it. It just isn't going to. You're not likely to see any change in it at all. But, remember, for twenty minutes of exact *boo-hoo-hoo* without ever any change of note, or – or sniffing up and saying, "Well, we'll be brave now," and nothing like that happening, is quite unusual. And if the pc started, you know, *hmm-uhh* and so on. Well, all right, and went on for two seconds, and then *boo-hoo-hoo*, and then so on and so on. Those are all changes. We've got here, actually, an ideal situation, or a theoretical situation, as opposed to a practical one. Okay?

Female voice: Thank you.

All right.

Male voice: Ron, on the subject of pain, why is the pain on the pc's terminal ?

You tell me. Come on, Peter. Tell me.

Male voice: Well, he – he – he's in the victim valence.

All right.

Male voice: But this seems to – doesn't phase with the fact that...

I'm not being smart with you. I really meant it. Tell me. I'm not being smart. I don't know! [laughter] I just tell you that that's an empirical observation. It's the darnedest thing I ever saw in my life! Yeah, how come the pc only experiences pain when he's in a terminal? How come he experiences sensation when he's in the opposition terminal? The difference between these two things is fantastic. And reason it is so fantastic is, if you run the pc on the oppterm, you just wrap him up and put him on ice. You ruin him. And you run him on one of these painful terminals, he runs like a dream. Yeah. All right?

Female voice: There's an overt there kicking him in the head.

Huh?

Female voice: There's an overt there kicking him in the head.

Yes, yes, it must be – an overt. It possibly is in that field, you know? They possibly don't have any overts, except on what they're viciously in.

If you look this over, it doesn't seem too unreasonable that a person should experience pain as himself and sensation as being somebody else. Well, that's fairly obvious. But why is it obvious?

All right, it'd be an overt if, as his own terminal, creating pain with somebody else he would directly feel the pain only when he was in the terminal that had created the overt. That's highly probable. Highly probable. I won't go all out on the thing. It's just an empirical observation, as far as I'm concerned. And you really took the lid off, didn't you? You're sorry about it, aren't you?

Male voice: I'm feeling pain. [laughter, laughs]

Now, that's strictly, strictly an empirical fact, and undoubtedly it's explainable, and that's probably the explanation that you gave. But nevertheless that is peculiar. You can always tell which is the pc's terminal. That's the only thing we could ever find that would tell the pc's terminal. You pays your money and you takes your chance, you know? You start running the oppterm as the terminal, oh man! All hell will break loose. Pc almost caves in. The case gets some advance, oddly enough.

You know, I've seen an oppterminal run flat with the terminal still totally alive. It was – didn't seem to matter how long you ran the oppterm – it didn't do anything to the terminal. Backwards situation for some reason or other.

You can take an oppterm and run it overtly, and you'll see it go flat, and the pc will feel better. Or, God help you, if it's one of the beefier ones, he'll just go into more sen and more sen and more sen and finally the room is spinning, and the Prehav Scale starts beefing up and everything starts going to hell in a balloon and you wonder "why did I ever begin this intensive?" So does the pc.

So, you need some signal. You need some signal to differentiate the terminal from the oppterm. And the oppterm gives sen and the terminal gives pn. That's as far as we went with it until you opened your face. [laughs]

Okay. Yes Fred?

Male voice: You said before, don't buy any statements from the pc since the CCHs are not verbal. But CCH 3 and 4, we do handle preclear originations. Especially in 3.

Only out of courtesy.

Male voice: I see.

Ah, it's just courtesy. Keep the pc from being ARC broke. You couldn't care less. You really don't care. You don't care whether the pc talks or doesn't talk, or anything else.

Now, in ordinary auditing – in ordinary auditing you'd pay considerable attention to it as to whether the pc was advancing or not. You would monitor it to a large degree on what the pc was saying, and how the pc said he felt, and all that sort of thing. And oddly enough, you can trust none of that in the CCHs because the most fundamental and basic stuff is running off, and this fundamental stuff will cause the pc to do and say the damndest things you ever heard of and most of them are outright lies.

Now, anything – anything that will run off electric shock or Metrazol shocks, and so forth – that has as much power as that as a process – of course, will also run off all kinds of counter-creates of every description, and certainly runs off verbal counter-creates. And you're liable to get these weird statements on the part of the pc. And if an auditor wasn't fortified in advance, that they are not verbal, an auditor would change his approach to it. And the auditor's approach to the CCHs is grind on, grind on, grind on. Doesn't matter whether the pc says the moon has just become solid pink tea, he grinds on.

The pc will try every trick in the book. "I can't stand it!" because this is the thing they can't stand. Communication, control and havingness are the three things they cannot tolerate. So they'll actually think of all sorts of things to throw you red herrings and everything else. I never trust a pc when I'm running the CCHs. I don't trust them at all.

Pc says, "I feel much better now."

"I'll bet you do!"

It's almost so much so – I have an impulse to say, "All right, where does it hurt?" [laughs]

Because those processes will run off a fantastic river of counter-create. For instance, if a person's had a lot of – a lot of ridicule in his life. Supposing a person has been ridiculed, ridiculed, ridiculed – raised out in the Bible Belt, something like that – ridicule, ridicule, ridi-

cule. And you start running CCHs on him, you know the ridicule will run off. In other words, the counter-create comes off. So therefore, you're going to have somebody sitting there ridiculing you all the time. Just understand what you're looking at. You're looking at a counter-creation coming off of the pc.

And a pc doing the CCHs *never* originates. They *only dramatize*. Nothing is truer than that. You may, in having it done on yourself, get the subjective reality on it. All of a sudden you say, "What am I saying? You know. What the hell was that? Why am I doing this?"

Well, it's actually some kind of a counter-create and it's just coming off, that's all, and it comes off in the muscles. Sometimes it comes off in the vocal chords.

Yeah, yeah. Well, if it'll run off electric shock, it'll certainly run off mama's jeering. So therefore your pc will jeer.

All right. Let us suppose he was – had a parson for a father. And all his father ever said to him – he'd lie there with a broken leg – is "I'm sure everything will be all right now." See. And his father'd beat him, and say, "I'm sure everything will be all right now." And his father'd kick him down the stairs and say, "I'm sure everything will be all right now." And give him a new bicycle and say, "I'm sure everything will be all right now." You audit this pc, the pc will tell you, "I'm sure everything will be all right now."

He just can't help himself. He's going to tell you that, that's all. And you, you fool, if you believe him, you probably haven't vaguely run it out, you know? So you just don't pay any attention. You'll be on the safe side. You don't have to get into a games condition with the pc. Just ignore it and do the CCHs. Okay?

Male voice: Yes. Thank you very much.

All right. You bet.

That's a point I'm glad you brought up, Fred, because it's an interesting point. The process is so heavy, you know, the CCHs are so heavy that a person goes into these dramatizations and he just can't help but dramatize the doggone things. Sometimes he feels silly. Sometimes he feels this way and that way, watching himself dramatize these things. But if the pc is aware of the fact he's dramatizing, why is the auditor paying any attention?

Okay. Yes?

Female voice: Is there any reality factor to be established in the CCHs?

Any reality?

Female voice: Factor – at start of the session or after the session, if he inquires about changes or anything. Is that to be established then – talking to him? You know?

Oh, you mean get your R-factor in as to what you're going to do and that sort of thing?

Female voice: Or rather inquiries after the session.

And after the session answer his questions? And so forth? It'd only be proper for an auditor to pay attention to this. That's as close as you are – must get to rudiments, is you tell the pc what you're doing, you tell the pc why you're doing it, or anything you care to. Try to

get the pc's agreement to do it before the session begins. Anything you would care to do to get a session started, or anything you are able to do, and then you run the session anyway. See? And after it's over the pc wants to know this or he wants to know that, or he wants to know something or other, and so forth. Well, if you can tell him without evaluating for his case and so forth, by all means do so. And you'll find the pc will stay in a closer ARC with you.

Yes, the R-factor is established in all cases. In essence you do it by rudiments. But you notice these demonstrations I've been giving you? Usually before I start a session we'll get some kind of a rundown on an R-factor. Seldom after the session. But certainly before the session, because, just before the session ends, you have, "Is there anything you'd care to say or ask before I end this session?" See? And you get your R-factor questions at that time.

But I normally will talk about auditing to the pc or ask them how they've been doing or something of this sort, before the session begins. Give them time to catch their breath and brace up to it. Well, it's that type of R-factor that you establish in the CCHs, or you tell the pc what you're going to do.

Say, "There's a bunch of drills and I'm going to do them. We'll see if you can do them," and I'm not above leading the pc into a complete trick on the basis, you know, tell the pc, "Well, there are a bunch of drills and very smart people can do them, and very stupid ones can't. Now, let's see if you can." Anything, it doesn't matter what.

The CCHs become most trying to me when they start in at a high scream, and it's a high scream from there on out, and you're obviously just breaking a person to pieces bit by bit and leaving the chips and punks of flesh all over the floor, and the – and it's just a wrestling match from the word go, and no R-factor of any kind can be established. I always have the feeling when I see this is happening, that an R-factor could have been established. Inevitably I have this feeling. I always wish I had established the R-factor better. Okay?

Female voice: Yes, thank you very much.

Right. Yes, Jim?

Male voice: Referring back to dramatizations that occur when a CCH is run, how closely might these be connected to terminals and oppterminals?

Oh, very closely. Yes, very closely.

Male voice: I see. I wonder if you'd like to say some more about that.

No, no, not particularly, because nothing can be read out of it. The worst that the pc is sitting in starts to discharge, because the one thing this circuit can't do is duplicate. And another thing the circuit can't do is have. And the other thing the circuit refuses, of course, is control. So you start to give a person control, communication and havingness, and inevitably they start blowing in and out of 3D Criss Cross items. And these things will bang in and out most gorgeously. But normally you'll find your pc is usually sitting in no more than one. And this thing will try to discharge. And the pc will get these heavy masses beginning to occur around him, that he's never (quote) had before (unquote). They've always been there, but he's had them totally not-ised. And the CCHs knock out the not-is.

So, weird things show up that the pc has never seen before by the simple reason of the vanishment of a not-is. The communication, control and havingness run out the not-is and start to get an "is," of course, and it shows up this valence. It's inevitably a valence. And around him some opptersms will inevitably show up. Now, they very sel- occasionally show up as actual masses that the pc has never been aware of before. And he thinks they've been turned on by the CCHs. And he thinks they have been made tougher by the CCHs. Neither case is true. If anything, they've been slightly turned off, and his feelingness has gotten up to a point where he could feel them. These are true.

And you'll notice in doing the CCHs, these surrounding masses of the pc will tend to loom up where the pc has not seen them before. And he'll start to get somatics inside himself that he has not seen before and not felt before. And then these will discharge and very often he moves on the time track in the valence he is in, to a more comfortable position.

To run them all out by the CCHs would be impossible.

Male voice: Oh.

Yeah. It's quite interesting, but the phenomena which you see in the CCHs is the phenomena of a valence. And the phenomena which occurs around the pc is the phenomena of opptersms.

Male voice: It ties in with the familiarization, too, you know.

That's right!

Male voice: Because the preclear if he's pretty sharp, would get a familiarization with the kind of terminals he's going to encounter later on.

Yes. That's right. Very definitely true. Okay Jim.

All right, any others? Yes, Jan?

Female voice: Since Peter's question I've been wondering if there is or could be manufactured a pair of definitions that will cleanly distinguish between "pain" and "sensation." Practically, they're not hard to tell apart, but to put into words ...

Well, I'd say it is very simple. It's very simple. Now, wait a minute, it's very simple. Unfortunately it would be impolite of me to say, "Richard, shake her," and "Richard, stick her with a hat pin." But those would be definitive.

Female voice: Yeah.

Got the idea?

Female voice: Yeah.

Or, "Richard, disorient her." See? All right, that's sensation.

Female voice: Yeah.

Sensation is that which is produced by reason of other beingness and dislocations. And terminals are produced by direct contact between the thetan and an identity. The pain is produced by the directness of the contact. In other words, the pc is more intimately connected

with the terminals, always, because he is the terminal. And he feels more directly the pain involved in the thing.

All right, what is pain? Pain is heat, plus cold, plus electrical shock. That is pain. And if those three things are combined exactly, and somebody touches them, a thetan touches them, he gets that experience known as pain. It comes at the wavelength of 1.8 on the Tone Scale, is the sensation wavelength that he gets, and that is known as pain. He must be intimately connected with the mass. In other words he must be touching the mass with an idea that he is it, as a difference than "other is it."

All right, now, get the idea of you – you know this is your hand. And you put it down on your heat-cold-electrical shock gimmick, the response which you would get – knowing this was your hand – would be the sensation as pain. It'd be quite sharp and it'd have a very definite wavelength, and so forth.

Now, if, as you touch this table, somebody picked up the table and moved it around, or pushed the table up against your hand, or shook the table, see, you'd get sensation. Now, emotion is more intimate. Emotion is more intimate – like tears and apathy and that sort of thing – is more intimate to the person than ordinary motion, but is still within that band.

I wouldn't go so far as to say that emotion was exclusively an oppterminal action or exclusively a terminal action. But I would go so far as to say that sensation could include emotion, rather safely in your adjudication of the situation, and that a pain definitely determined the terminal. The sensation is what you get being kicked up 150 feet into the air, tumbling over and over, and let fall. Now, that would give you a sensation. Being taken out and hung over the side of a building and told you were going to be dropped, I think that would give you a sensation. Get the differences in these things? The sensation is inevitably dislocation of space, and pain is inevitably alteration of form. Where emotion fits between these two things is a question.

Yes?

Male Voice: Well, this isn't strictly a question, but with regard to Peter's question about why would a terminal have the pain end of it, we might have an attention factor, because I notice when you're hurt, your attention snaps inward. Now when you have sensation, your attention tends to snap outward.

I think that's probably a very reasonable answer.

Male voice: The oppterm would be over there, and the pain would be in, so it's ...

That's right, something like that. Of course this is a difference of why you have these things, as opposed to their existence. Yeah. They do exist.

Male voice: Yeah.

Yeah. Now, why they exist, well, there're some explanations could be given. You had a good one. Self always has the overts so therefore is the one that hurts, because therefore he's pulling in hardest on himself. Trying to keep from pushing out against the other ... I don't know.

Biggest mistake anybody makes, of course, is regarding a human body as self. That's marvelous. But, of course, you can regard anything as self. Just anything. I can think of some manufacturer regarding a factory as self. And somebody drops a wrench into one of the drill presses or something and smashes it up, and he goes, "ouch!" Actually is not the least bit peculiar. Might sound odd, but it's within the framework of it. He considers the factory himself. And you've seen mothers double up like jack-knives when little Johnny is hit in the brisket. And she regards little Johnny as not an oppterm but herself – an extension of self. I imagine if you smashed up an E-type out here ... [laughter, laughs]

So, that would be the way it is.

All right. Well, it's nice to have a question period for a change. I hope that you've enjoyed it as much as I have. And I also hope that your next couple of days' auditing will be as successful as it has been getting lately. Your auditing is getting more successful, have you noticed? Have you noticed that your auditing is getting more successful? Have you thought that it wasn't? Well. You're getting more successful? Is auditing getting dangerous? Dangerously successful?

Well, I want you to get these lower edges fixed up. I want you to get CCHs and Prepchecking, 3D Criss Cross all wrapped up, because the Class IV stage I've pretty well got worked out, and it's just about the easiest stand-on-the-head that anybody ever did. It's all in reverse. Prepchecking is actually harder than 3D Criss Cross. And apparently Class IV is much easier than 3D Criss Cross. So we run backwards on these classes. The easiest action comes at the highest class. That's the way it's happening. That's the way it is. But, of course, it's only easy because you can do the two lower classes.

I pretty well got that end of the game wrapped up. As a matter of fact I can see the goal post in the end of the line. And I've been studying for quite a while to find out the best way to handle terminals and that sort of thing. And I had to wind up with some new factors of common denominators of terminals. And that was one to wrestle with. And we needed that one before we could go on with Class IV, and so we wound up with that one. So it's all easy going from here on out. Probably. [laughter]

But all of you should be very good at these lower levels before you get onto the upper one.

I want you all to have twenty or thirty or forty items. I think that's not unreasonable – thirty or forty items on your 3D Criss Cross plot. I think that's easy. I think you should get your basic chain shaken out. I'm more eager now to make sure that you get any CCHs that are going to be flattened – flattened. And any 3D Criss Cross you're going to get done – done. And to learn how to do Prepchecking very, very well. *Learn* how to do it very well as opposed to putting your end-all weight on it. Because, actually Prepchecking can be used after the fact of 3D Criss Cross, don't you see, and it's most valuable after the fact of 3D Criss Cross.

So, I'd be glad to see you wrap up your CCHs, as an auditor and as a pc, and wrap up 3D Criss Cross as an auditor and as a pc. See, so we can get on with the rest of this sort of thing.

Okay? Thank you.

The Overt-Motivator Sequence

A lecture given on 3 April 1962

Thank you.

What is this?

Audience: April the 3rd. The 3rd of April.

3 April? By golly, you're right. One lecture, Saint Hill Briefing Course, 3 April A.D. 12, and I haven't got anything to lecture you about because I got a withhold.

Female voice: What is it?

Male voice: Tell us. Well?

Yeah, I got a withhold.

Male voice: What's it about?

Are you interested?

Audience: Yes!

Well, I haven't prepared it or revved it up, but I've been taping a Class IV.

Audience: A-a-hhhh.

And I finally just tipped it over – just tipped it over on Class IV, and so forth, and now I got it taped. I've been fooling with this for some time – what do you do with 3D Criss Cross items and that sort of thing?

And what do you know? (This is all I'm going to tell you. This isn't a lecture on the subject.) The only thing I was withholding is that the solution to what you do with 3D Criss Cross items, of course, is the resolution of what makes the overt-motivator sequence; and I've suspected this for some time. And I just got some processes and so forth, here, which undo the overt-motivator sequence. I think it's absolutely fascinating. And the withhold in this lecture would be the fact that I, out of my own interest and so forth, would normally talk to you garrulously about this particular action, because I'm terrifically interested in it – the overt-motivator sequence. How the hell did it ever get that way, you know? And can it be undone? I've been asking that question for ages. Instead of having to run it, can't you undo it? Because

I know it'd be a junior phenomenon, see? And sure enough, apparently you can undo it. And so that's a good piece of news.

So anyhow, I'm not going to give you any more about that in particular right now. End of withhold. I'm delighted, you see, because if you think of running out all the things which you have done and from which you are suffering at the present time, you see, when you run these out one by one, and selectively on the whole track, it becomes one of these things like running out every engram on the whole track. It's just an impossible action, it's so long and arduous.

You take Jim over there, for instance, or you take Dick or somebody like this, and you get all of these overts – you get the idea? We won't even mention Peter. [laughter] You get these fantastic numbers of overts. And if you're going to suffer from every overt you have ever committed – see, that's impossible. I mean, mathematically, on one lifetime, you'd be dead a dozen lives over, don't you see? And if you got a motivator for every overt, for instance, and so forth, how could you live?

So I've been fooling around with a lot of combinations that have to do with energy and MEST-universe ideas, and ideas and that sort of thing, and it's – comes out rather well. And apparently it's a very junior idea to prevent people from attacking.

And I have now told you about all there is to know about it, even though I would love to go on discussing it for a long time. It's just a mechanism to do just that one thing – nothing else. That's it. Well, end of withhold.

I'm terrifically interested in the Class IV. You have no idea. This has practically laid me in my grave trying to get this thing done, because you start going over the top of the whole Goals Problem Mass, and just not-is the lot, and sit around and look it square in the teeth, and reserve aplomb in one way or the other, it's something like living in the middle of the living lightning, don't you know? And like to got my head kicked off on this one. But that's about all it amounts to. It's fascinating, isn't it?

And it's just a mechanism. It is not even an axiom. See, it's nothing. Because every way you look at it, it can't be. It'd be impossible. And there wouldn't be any way by which this could be.

You see, if the only thing that ever affected anybody was you, in the final analysis – you get this now – then you would have a perfect alibi for everything you had ever done to anybody. Don't you see that at once you have never done anything to anybody? You see? So therefore, looking at that, that makes it look pretty specious, you know? You say, "Well, that's – that's kind of a gag."

And now, if nobody ever was affected by anything except what they themselves did, do you realize you have never talked to anybody anyplace?

Audience: Hm-mm. Yeah.

See? So from all these sides ... You know, I've told you for years, the overt act-motivator sequence was limited. You know, I knew it was limited, but I couldn't find the entrance point of how the hell you ran it out. And I imagine I must have tried at least, oh, I don't

know, fifteen hundred, two thousand combinations trying to blow this thing down just as itself, so – that is, that would run, that would run on a case. Just nothing would, except itself.

You look at it from numerous other angles, and it becomes impossible. If only you have ever affected you and nobody else has ever affected you, numerous things then apply. And amongst those things, you wouldn't even be able to keep the same time track. See, there's a lot of things wrong with the overt-motivator sequence. I've known that these things weren't reasonable. But I knew at the same time that everybody had fallen for this malarkey and that everybody responded to it.

Well, if everybody responds to it and everybody has fallen for it and it processes – you ask a fellow what he's done, and this immediately relieves things. And his withholds and all that sort of thing – these things are all pertinent to this. And they all relieve, don't you see? I mean, you can work with this; you can operate with this.

So it doesn't wipe out all processes which do things with it. Doesn't wipe out Prep-checking. You can sit down and prepcheck somebody, you know. And that's fine. But how about just knocking the whole ruddy computation in the 'lead? And now I have just opened up a nice, wide-open, twelve-pass express highway that does. It is just a mechanism to prevent people from attacking. That's all.

And handled in that fashion in processing, why, it all becomes very explicable – runs, in other words. Like to kill you, running it.

But I don't wish to leave you in mystery. I'll give you a specific process: "What shouldn't A attack?" "What shouldn't you attack?" That should carry you well enough. Of course, to keep in communication with the subject, why, you have to add attack, you know? And then because that won't be explicit to some people, you will have to get synonyms for attack. These are the usual complications which arise when you release a process.

So if you do an overt assessment of the Overt Secondary Scale, it'll probably give you a better word for your one particular pc. But it would be on the basis of "should" and "shouldn't." But this, of course, could be expected to be modified to "could" and "couldn't" and "have" and "haven't." You see the variations – these are the normal variations through which a process goes.

But if you just got somebody to list, who was sitting in a whole bunch of motivators and overts and so forth – just list what they shouldn't attack, just as easy as that ... That, you should remember, was the lead-in. It might not be the final process that you run, but that was the lead-in on the research level which gave the result and made, all of a sudden, the overt-motivator phenomena look, of course, as corny as Christmas tinsel. It's just a mechanism by which people have dreamed up ways and means to prevent other people from attacking. That is all.

Of course, you don't want people attacking you, so of course you tell them that you shouldn't be attacked. And you tell them how you shouldn't be attacked, and then you tell them what they shouldn't attack, don't you see? And what you overlook is, at the same time, they're teaching you what you shouldn't attack – the same time you're doing this. So eventually it looks like you have an overt-motivator sequence.

See, the most sensible thing in the world is, is there's certain things which you, in a human body, shouldn't attack. And the lesson which you learn from the physical universe: that if you attack these things you get hurt. And that is the basic mechanism and the learning-ness which underlies all the overt-motivator phenomena. See?

Well, then, if you don't believe me, take your fist sometime and start a buzz saw up, and – oh and let's not be quite that violent, lawn mower will do – and hit the lawn mower in the blades while it is running. Well, as far as that's concerned, just find a nice, rough stone wall and haul off and hit it, and you are immediately taught this lesson: that you shouldn't attack it. Because it reduces your havingness, of course.

So you teach yourself the lesson that you shouldn't attack, and then this goes into a philosophic wingding. And the philosophic wingding comes after this fact. You see, after you've learned that you shouldn't stick your paws into lawn mowers and shouldn't kick paving blocks, and various things – when you've learned all these things – why, of course you've learned the remainder: that is, what you do unto others will happen to you.

That's not true at all. That's a philosophic extrapolation from the fact of what you do you get recoils from. And it comes back to the basic law of inertia – Newton's law of inertia. It's a physical universe law: says what you hit hits back. It's as simple as that.

Now, you can build this up philosophically, that if you say something critical of Joe, Joe is going to say something critical of you. And if you say something critical of Joe, why, then you can be hurt by Joe's criticism.

But a withhold is basically nothing more than your unwillingness to attack or your unwillingness to be attacked. And that's all a withhold is.

You can take any withhold a person has got: if he gives you this withhold, you could ask him, "Well, what shouldn't attack you about that?" and run that off. And then, "What shouldn't you attack in this particular way?" – any phraseology you care to use. Your withhold is going to evaporate.

See, your withhold system also takes care of it, but there it is. It's quite fascinating.

I'm sure you will excuse my absorption with this particular scene, in view of the fact that it is the single complication that makes your case awfully complicated. You get so that you won't bawl out cops and you go around being good, and all kinds of wild things accumulate as a reason for this.

Personally, I've never learned this too well. It's not that I've been particularly bad in that particular thing, but nobody has ever really taught me I shouldn't attack. I mean, it's been rather hard to grapple with the thing. People have tried. People have tried.

But I'll give you a little hyster – historical note – a little hysterical note here, which you might find amusing. Hasn't anything to do with the price of fish.

One of the points where this broke down was, I was examining what on the track I felt worst about. I wasn't getting audited; I was trying to find out what I felt worst about, see – you know, that I had done. I was trying to bracket this thing, this overt-motivator sequence, you see? And it was necessary that I do this and get studying it, and I've been very reticent

about this recently for this reason: is it looked for a while that doing anything to anybody's mind was the most destructive thing you could possibly do. That's quite interesting. I was studying that, you know, and I got the bad auditor, and so forth. And I went on and looked at this even further, and taking responsibility for somebody else's mind, and that sort of thing, it looked like it was a pretty bad show, see? So that looked awfully bad for auditors.

Well, I wasn't trying to disprove this, and you can get quite a jolt out of this by running it on somebody – "Whose mind have you helped?" or something like that, you know. And you would think offhand that this would be what tangled up your wits, you see – would be helping somebody or doing something with their mind.

And I went through a little period there of looking this thing over, and it had a limited workability, and it did make some sense one way or the other, and fortunately proved to be not true at all.

It is the energy involved. It's the attack on the energy involved. It's the attacking of energy. And it's not even bad to attack energy. It's just that you have tried to convince people, and people have tried to convince you, that it was very bad to attack energy. So you become allergic to energy.

The definition of being good – as long as I find myself talking about this – the definition of being good is the definition of being overwhelmed, you see? A person who is good is overwhelmed.

I first began this study nautically in this life. It was a naval study with me. There's one thing: I'll hold something that bugs me, that I don't understand and I'll put it in a bull pen. And I'll put it over on the side. And I'll say, "This green puzzle doesn't fit with these pink pieces, you know? What is this thing, you know?"

Well, one of those things was the fact that every fighting man I ever had under me was always in bad with other people at a time when they needed fighting men. And the only people that were getting any pats on the back with the shore patrols and so forth were people who weren't worth a damn. I mean that – just weren't worth a damn. There was definitely something wrong here.

I'd have six or seven sailors out of a couple of hundred, you know, and they'd – man, action be engaged, one of those fellows (I don't think the period could have been longer than about a minute or thirty seconds, or something like that), he was at the wheel correcting the course, he was up on the gunnery platform correcting the training of the guns, he was down studying the chemical recorder, and he was handling the engine room telegraphs; and while he was doing all this, he was carrying on a conversation with me.

And on almost any ship I ever had in action, there'd not be more than four or five people on the ship that would help me fight her.

And you had this enormous supernumerary, you see, out there. That always bugged me, because these boys were the boys who were always in trouble. The people didn't like these fellows. They were always in bad. They weren't particularly bad people, but they were just always in trouble.

I've seen it now, you know? Some fellow – God, he'd have hash marks, and he'd have gold chevrons and eagles, you know, clear up to his shoulder, and he'd come aboard, you know, reading Horace or something, you know? He'd walk aboard with his package of laundry or something or other, and check himself in at the gangway and go below and put away his book and his nice, clean uniform. And his record would be beautiful and he'd always say "Yes, sir," and everything would be so nice. And he was a very pleasant fellow and not very obtrusive. Nice man, you know, and so forth. And he'd have all of the bonuses, you know? And he'd have all of the stuff that anybody ever awarded anybody. Service records, you know: "laudable," "terrific," "marvelous," you know, and just rave notices in this damn thing.

And in action you would just have to knock him out of your road. That was all. Always be in your damn road. "Go on up forward someplace and you know – stand down there with the damage control party. Don't get in the road." You know, some totally ineffective function. Get him out of the road. Ammunition passer – maybe you'd get the ammunition there and maybe you wouldn't, you see? But there'd just – oh! There'd just be dozens of these guys, see, just dozens of these birds, drawing all the pay, getting all the pats on the back.

And then here would be these madmen: always in trouble, always upset. When the ship was engaged, it would have sunk without them. Well, there's something here, see?

These weren't necessarily bad men. Looking them over, they weren't criminals, nothing like that, but just nobody liked them. This fact used to stick in my craw. I used to study this. I did an awful lot of studying of men and life and things like this, and it's something I didn't quite understand. But the shore patrol just loved these other fellows. I never knew what to do with them – use them for spare anchors or something like that? It wasn't that I didn't have their loyalty and affection; I did. But action would be engaged, they would be just as calm as they always were.

And you study men under stress and men in various guises and men under various actions of this particular character, and you find out that the world has built up a series of superstitions about people. And they're not facts – they're superstitions. They hardly even are dignified as findings.

Your animal psychologist has categorized the whole lousy lot. I mean, he's got them all. His textbooks are nothing else but the mirage of ought-to-be, see? There's no facts in there. It's just a bunch of ought-to-be.

He tells everybody, "Beware of anybody who is active." Isn't that interesting? "Beware of anybody who is active." You will find in the civil-defense manuals of the United States government, in that area delegated to (ha!) psychology, that the whole provision that they have made is for anybody who gets active: and if a citizen were to start flying around and talking about what should be done or what shouldn't be done or blaming the government or saying anything like this, he is the one you have the butterfly nets for. And this is why you have psychological units in civil-defense teams. They're the butterfly-net people, and they're supposed to pick up these guys who get active. And that's exactly what it says.

I'm not minimizing this or I'm not stretching it or – I don't have to. I mean, it's a marvelous example of "be good." You see, the whole U.S. civil defense system is based on the idea that there is a thing called the government which is composed of people (which already

is silly), and they're going to take over the country at the moment of an attack, see? They aren't there now. They're not part of the people, and they're not human, you see? And they're parked up someplace in Canada along the DEW line or down in Mexico or out on some island – and they don't exist there now. And at the moment of an attack, nobody is supposed to do anything but be taken over by the government. That's what you're supposed to do in an attack.

Consider it absolutely fascinating! It's just as bad as Eisenhower's design for the Normandy landing. I mean, there was nothing worse than that. I didn't know this until the other day. I'm going to write a book on it. I'm going to call it "The Great Myth." You see, I was a Pacific amphibious warfare officer before these Normandy landings occurred. And there are certain ways you're supposed to make landings. Well, they didn't make them that way at Normandy ha-ha! They killed men instead.

So anyhow, I didn't know it was that bad. But this is some more of your the-government-knows-all sort of a situation and "no individual is going to do anything." You got that? No individual – we're not going to count on any individuals. The government is going to do these things. You get the idea? The government is going to. Somehow or another, totally disassociated from anything that is made out of skin and blood, see, this is all going to be attended to.

So the government teams are going to take over in certain zones of the city, and so on. And it's all worked out. And the only thing they've overlooked is these people are people. And apparently, looking over the Normandy beachhead landing schedule, there weren't going to be any people involved and there was going to be no war involved. I think this was interesting – those two oversights that they made.

As early as 1941 I noticed something that probably nobody has noticed, that I might comment on, and – that war is the antithesis of organization. And if you organize in some dim hope that when battle is joined that organization is going to prevail, you're going to lose your war, because then it breaks down to the being, the person, the man on the job. And the other schedules never go off right. They just never, never go off right.

The fellow who is supposed to be there at 5:61, well, I can tell you from experience that he is never there till 5:00 and 61, if he appears at all. And if the whole intricate machinery depends utterly upon this man pushing a button at 5:61, man, you've had it. Because this – look, this fellow is flesh and blood. This fellow is die-able. And war is the antithesis of organization. War is chaos. And the only thing that you can organize for is chaos. And if you're going to organize it, organize for chaos; and that's the only way you can organize.

And if you're going to organize for chaos, there's one thing that you must count on utterly: the individual. There can be no great third-dynamic shadow which suddenly spreads out across the land and makes everything all right. Who are these beings that are going to take over the middle of these huge cities and set it all to rights after the bombs have landed? See? Who are they? Well, they're human beings. Well, by that very fact, you can count on the fact that some of them are going to be missing.

Now, in space opera we very often tape this better than they do on planets. Very often – very often – they have relatively indestructible dolls, relatively indestructible robots. But they're forced into building these things by this other factor: the extreme destructibility of

individuals and beings in areas of disaster. And even in space opera these fellows disappear. Oh, I love one of these. It's like the – I don't know what battle that was; I don't know what the Union called it. It was one of the first battles that Grant fought. The Confederate general was Johnston – very early, out in the West someplace or another.

But the only thing the poor Confederates did wrong was draw up a wonderful plan of battle; the most marvelous, intricate plan of battle you ever saw. At these times these regiments were going to be there, and this was going to be there, and everything was going to be there, and it was all going to be marked out this way.

And of course, they do all this for a battlefield nobody has been on yet, don't you see? They lost. We got clobbered.

This Normandy beachhead: Demolition teams had twenty minutes to knock out all the underwater obstacles on the whole of the Normandy beach. Pfft!

In the Pacific we used to spend three days and use certain tools, but they didn't do it over there. They had a schedule, and it ran off – bzzzzt! And for seven minutes this happened and then seven minutes this happened. No part of this schedule is pinned to an actual event, don't you see? No part of this schedule is pinned to anything having happened. It's only pinned to the clock. Do you see that?

You get how mad this will get after a while, see? Unless you pin something to an event and say "Seven minutes after this happens or has occurred, then you start the next event" – well, you can do that. But you for sure can't say "At 6:00 this happens, and then at seven minutes after six this happens, and at fifteen minutes after six this happens, and at 6:30 this happens." Well, you can count, you see, on whatever is happening at 6:15 has probably not quite arrived and is probably taking place at 6:35. So the team that is enroute to do this thing at 6:30 runs into the team that hasn't done what it was supposed to do at 6:35, and – ooooooh!

Don't you see what happens? A confusion is an untimed, uncontrolled area. Well, you've only got one guy. You've only got one guy. I don't care how many textbooks you write or how many psychologists you give degrees to, you've, in the final analysis, only got one thing. And that is a being, an individual being. That's the only thing you've got.

Now, he may have responsibilities, and he may have dynamics and he may have a lot of other things, but that's all you've got and don't forget it.

You know, I can see some South American reformer, some Simon Bolivar. A great guy, Simon Bolivar. No doubt about it whatsoever. And this is not what he did, but I can see some lofty, ivory-towered character, and he says, "Now, let's see. Our people should do this. And our people should do that. And the government should do this. And the government should do that. And then all will work out to a marvelous utopia. Yes. So here is the schedule."

Well, man, I'd let that poor fellow in on something: He is working with the individuals he is working with, and he is working with nobody else.

Now, every once in a while somebody runs an ought-to-be on me on organizations. And I noticed from an essay Peter wrote one day over a telex spontaneously – oh, it's a snide piece of thing. You can't mock up a thetan. But they run it on other people besides me.

And people are always saying to me, "Well, why don't you get some 'good people' in central organizations?" That's a hell of a slam, isn't it? People on the outside, "Why don't you get some 'good people' in Scientology?" you see?

Where's this fantastic reservoir called "good people"? [laughter] Where is it?

Well, I can tell you the last one to have a monopoly on it is the United States government or any other government. They don't even know that it might exist.

But all of their actions are based on the fact that in some mysterious way "good people" are suddenly going to occur without anybody doing anything about it, you know. Just from somewhere, "good people." It's as pathetic as the Greeks sitting down at a battle one time, as it talks about in Plutarch's Lives, sacrificing and making auguries until the right moment to repel the attack, you know? Greeks are just falling in windrows on all sides of this dumb bunny, and he's busy slitting the guts of birds to find out if it's all right to make the attack, you see? "No, that liver isn't all right. Give me another bird." Slit him up. "No, that liver isn't all right." Man.

It's what's known as being auguried to death. Even a private commented on it and went down into history.

No, there isn't any such reservoir. There isn't any such reservoir, and that's basically what everybody has got on automatic at this particular time. They've basically got it all on automatic. "Good people." That's what they got on automatic. All the systems are geared for "good people."

Government selection. Military selections. School teachers. Everything else. Any body that you can think of, it's all geared to the fact that from some mysterious reservoir someplace, some "good people" are going to come along and pass some examinations, and it'll all be all right.

Brother, one of these fine days, St. Louis or Chicago, or somebody ... The rest of their atomic plan, by the way, depends utterly on the fire engines coming from Chicago to take care of St. Louis, and the fire engines from St. Louis going to Chicago to take care of Chicago.

It never occurred to these dumb – ah, that ... [laughter] never occurred to them that any elementary atomic planning would cause the bombing of St. Louis and Chicago simultaneously.

So anyway, they got it all figured out that from some mysterious reservoir, why, these minutemen of steel, impervious to all excitement, are going to show up. And what are they going to do? What's their first instruction with regard to people? That to take anybody who is doing anything – see, any private citizen that isn't duly authorized, you know, isn't wearing the magic badge, Fifth Fire Brigade or something, or the Royal Atomic Defenders of the Gasworks, or something – if he hasn't got the right badge and he's trying to say to people, "Go

down that street there because it's still open," if he's standing there at the corner doing this, then the butterfly squad has orders to pick him up. He's the man they want – in the nearest hoosegow, quick.

And that is what the psychologist in an atomic war is being trained to do: to pick up the active person. I consider this fabulous, you know? I studied civil defense in the United States, and then my stomach gave out. Actually, there are probably only about five thousand people in the United States that know anything about disaster relief, and not one of those people has ever been called to the civil-defense department, which I consider very, very interesting. They were the people who handled civil defense in the various war theaters under chaos, and so forth.

But these beautiful organizations, man: "Yeah, George, Bill and Pete will go in Joe's car three and a half minutes after the first alarm, from the south entrance of the building." Oh, no, you know? You can see it now: They never get out of the car park. Just one of the things that happened: Bill didn't bring his car to work that morning. See?

You're dealing with beings, you're not dealing with punched-tape card systems and that sort of thing. You're dealing with individuals. And I don't care whether you're trying to make a perfect government or if you're trying to make a perfect civilization or a more livable world or anything else, the basic building block with which you build is an individual, and there is no other building block. God isn't a building block; government isn't a building block; the Society for the Prevention of Cruelty to Uniformed Cats isn't a building block. None of these things are building blocks. It all comes down to the individual.

Is he any good or isn't he? And that's the other question. Is he competent or incompetent? United States today – not roasting the United States, particularly – recently passed a rule that no officer could be promoted until his wife had been passed on by the admiral.

Well, I suppose I've been an admiral a few times in my past lives, but I never went that far to make ... [laughter] Honest. I never had to go that far. I didn't. I never had to go that far. You just look around: There's this pretty girl; it's a pretty girl. All right. And you used to say "Whhst!" you know, like that. You never had to pass a law under Congress that part of an officer's fitness report was the availability – I mean, excuse me – [laughter] the niceness of his wife.

I can just see that wife now, out there on the bridge of the destroyer, steering like mad during the battle, can't you? I can see it now.

Oh, man, how decadent can you get? What's that got to do with it? And yet I've seen officers and officials and organizational people promoted simply because they could slap better on the back and hold more liquor more asininely than anybody else around. So of course they get promoted.

No, it's competence. If you want to get something done, you depend on the competence of an individual, not his socialness or whether he's a good fellow. It's "Can he do his job?" That is all. Can he do his job?

Now, yes, it is true that an individual can be so mean and so vicious and so something or other that he gets in the road of doing his own job. Never met one myself, but I'm sure that can exist.

No, an individual is either competent or incompetent.

Now, when an individual ceases to be able to run his own life, you always can have communism. You can always have these group idiocies which take responsibility for conduct out of the hands of the individual and place it in the hands of some God-awful, God-help-us monster whereby everybody decides this. Everybody decides what he's supposed to do and what he isn't supposed to do, and whether he can spit, and whether he can breathe, and so forth.

But let me ask the burning question: Who's going to tell him? See? You get the point. This is the idea they never think. They never think this one other step. After you've destroyed all the individuals, who's going to tell them? They never think of that one.

It's a fascinating point. It's the automaticity of competence, the automaticity of this vast reservoir of competence, which somehow or another is always going to rise up someplace.

One of the ways they meet this is they've got everything all geneticized. You know, you raise good horses? You know, if you breed the right mares with the right stallions, why, you get an intelligent horse. I don't think anybody has ever been able to make animal husbandry work, but it's still a popular superstition. If you make being a horse so uncomfortable that no thetan – no self-respecting thetan – will have anything to do with it, you'll have a bunch of creep horses. [laughter] You will, too! You can see them at the horse show now, misbehaving.

All right. Now, the basis of the individual is his ability to observe and make decisions and to act. And that is ability: his ability to observe, to make decisions, and to act. He has to be able to inspect and know what he is looking at – what he is looking at. He has to be able to make a sensible summary of what he is looking at, and he has to be able to act in accordance to what he's inspected.

Now, I don't care if you go into the field of study. This is true of a student, this is true of a soldier, this is true of anybody: If he can't observe and can't make decisions about what he observes, why, he's in bad shape. He's in a bad way, very promptly.

Well, he couldn't help but be. I mean, if you knock out any one of those points ... All right. He can observe and he can make a decision, but he can't act – in any way, shape or form cannot act on his data: You've got a fool.

Now you take somebody who can observe all right and see what he's looking at, but is unable to make a decision before he acts. He's a nut.

Now you've got somebody that's perfectly competent to make a decision – perfectly competent to make a decision – and perfectly competent to act, but always does so without observing anything. You've got a catastrophe, man! That's a catastrophe.

You got Congress. Congress is always building a man-of-war. You know, in 1896 they were building a square-rigged, line-of-battle, wooden man-of-war. They actually appropriated money enough to build that thing. They couldn't observe where they were. They kind of slipped on the time track. So anyhow, you got these various things.

Now, the only way you could have a good country, from my point of view ... Well, you can have all kinds of systems. Doesn't matter how many systems you have. The world is system-happy right now. My God, the one thing we don't need is one more governmental system. They haven't got a good one, and they probably could use one, but actually they haven't got the fundamental on which you would build a system.

And the fundamental you'd build a system on would be an individual. I don't care how many communisms or "Engelsisms," or something, that you dream up, you're never going to have a utopia. You can Plato-ize day and night for years and never come up with a utopia that would work unless you have individuals who are able to observe, to decide and to act.

I'm sure that Mussolini, taking people who were – they had been pretty badly knocked around over a long period of time. He was making his way, but they were still having to make all the decisions in Rome. All the decisions had to be made in Rome. And the only trouble with a fascist government in a small town was they could maybe observe and they could maybe act, but they had to telephone Rome for the decision.

Well, the funny part of it is, you see, Rome wasn't there to observe and Rome wasn't there to act. So this got looking pretty weird, and their – a government like that gets pretty unwieldy. Nevertheless, they were making their way forward until they finally got knocked in the head. They got knocked in the head because individually they hadn't come up along the line into enough determinism yet to actually stand on their own two feet.

The main thing I'm trying to say is, here, that just if you haven't got the individual, you have nothing! And if you go in the direction of a system, if that system isn't designed to eventually make individuals, then it's a system which will fail. And it's the only kind of a system that you dare embark upon.

You embark upon any other system that ends up in slavery or ends up in the total subjugation of individual ability to observe, ability to decide and ability to act – if you impede any one of those three things – you're going to find yourself with a slave society on your hands. I don't care how many labels the thing has. So the only system that is justified is any stopgap system which pushes people forward in this direction.

I know I myself am rather proud of the fact that the dispatch traffic to me from any Central Organization of five years ago consisted easily of five hundred pieces of paper for every one I get today. Isn't that interesting?

The volume used to be fantastic! You know, "Ron, can I spit?" Man, it'd just be about that bad. And that has just cut down and cut down and cut down and cut down, because all the time we're working in the direction – we have this tremendous advantage. Of course, individuals are becoming more independent and more capable of observation, and so forth. I don't go on the basis that it's all right for them to make terrible blunders and knock everybody in

the head before they learn how to walk. But I would incline slightly in that direction, that it was better for them to make a few mistakes than to be guided every minute of the time.

Their cases are coming up the line, everything is coming up. From where I sit, we're making it just this way. We're getting more and more autonomy. Our communication lines are longer and longer. We are acting, oddly enough, more and more in concert, which is rather fantastic, you know? I mean, the further apart we seem to be moving, the more in concert we are seen to be acting; and the more we get good individuals, the more coordination and agreement we have. Isn't that peculiar?

The reason you have an organizational form and the reason I lay down organizational forms is basically (1) on experience, and (2) to get agreement amongst organization members so that they can move forward.

But I myself, in the early days, was the first one to scoff at any need of organizational form, as any old-time staff member can tell you. I used to say, "Oh, for Christ sakes, you're not going to make me define that!"

Well, yeah. So there's an interim in which a system can exist, but that system gradually goes out of the way to the degree that individuals are brought up to being able to observe, to decide and to act. And it's the only way you can make any progress, from my point of view.

Now I daresay, if I were to talk to some professor of "learnedology" in Spinbin U., who had a socialist penchant about it all, I imagine that I wouldn't talk this way. I would probably talk to make my point with him, because I amuse myself with those jokers. And he would be selling me the great value of the system, and I possibly would never even dare tell him what I thought or the truth, because his realm is in the never-never land of nowhere.

I well remember one debate that I had with such a character. He was one of the leading socialists of New York. And before the evening was over, in front of a bunch of intellectuals, he had admitted and declared, and had now begun to stand up for this one interesting fact; he had progressed from "socialism is wonderful" down to this interesting fact: that the only way that you could make socialism work was to kill every man, woman and child in the world. I finally got him to agree to this and was all set to go on forward on a program to put it into effect, when he suddenly found the garden path down which he had been led. But he still had agreed that this was correct.

How he got there was, of course, just by total specious spuriousness; you know, making him agree by shades, to agree by this, to agree by that. But it was all on this basis, that you couldn't have an individual. See?

Obviously, you see, you have a socialism, why, then obviously you couldn't have an individual. If you had to have the socialism, socialism must exist because you couldn't have an individual. And then, of course, I led him on, on this gradient scale, and then finally he realized that the only way it would really work was to kill every man, woman and child in the world. And then it would really work. You might really have a socialism. And he was quite sold on the program. That's known as brainwashing by gradients.

But you see whereof I speak here.

Now, if we have systems which depend utterly on making people good, we can never get out of the soup. But we can't have systems which make everybody good if we mean, by this, blind acceptance of a now-I'm-supposed-to without inspection, without decision, but only by action. If we totally concentrate on an action, an automatic action, and if we call that automatic action "being good" – see, you see an old lady crossing the street, so you're being good, you must help the old lady cross the street. "So now I'm supposed to help the old lady across the street." You get the idea?

She just got through shooting her daughter-in-law in the guts, you know, and she's carrying the .45 in the bag. But that's beside the point. "Now I'm supposed to," you see? Without observation, you're supposed to act in certain set patterns. That is what they call being good.

And the only way that is achieved is by overwhelming a person with energy. You overwhelm a person. You show him that he will get into too much action – more action than he can stand – if he does not concur with this action. In other words, he chooses to have this minor act or actingness, see; he chooses this minor actingness in lieu of all of this *rwooooooooooooowrwoooooowr*, see, of *krwow*, see?

You know, the way to make little Johnny eat his peas is to take a whip, don't you see, and to whirl it around in the air a few times and hit him across in the behind and scream at him real loud. Well, that is action he cannot confront, isn't it? So you get him to not confront this action in order to do the action of eating his peas. See how that works?

There are other ways you go about this, of total loss, total ostracism: "You're going to be expelled from school if you don't study ...if you don't study..." Oh, I don't know what they study in a school. I've never been able to find out, but, "If you don't study it, why, you're going to be expelled, and your father and mother will never speak to you again and they won't feed you, and you'll be thrown into the gutter, and socially you will be totally ostracized." And that's what an E, F or G grade would mean when you're in the fourth or fifth grade, see? You're ostracized.

As a matter of fact, this even works on you, see? I use it simply on the basis of you better get a rush on, or something of the sort. You don't take it that way. You take it on ostracism – "Ron is mad at me," and so on. I never feel that way at all.

No, it's the out-create of action which brings about the fixed actingness that we know as "being good." See, "We can create more action and energy than you can, so therefore your only choice is to fit into this small actingness and energyness pattern." You got the idea? Well, you get into this on the basis of coordination. You coordinate the actions of quite a few people. Yeah, you can snarl them into line and so forth; it has a certain workability. But it only works up to the basis where they know it works or where they know it should work that way, or something.

In other words, it'll only work in the direction of consulting their observation of things. If they can now observe that this is workable, or that they would do it anyhow, and they would have decided to have done it anyhow, and got on this actingness, then perhaps you would be justified for a while in saying, "Ra-ra-ra-ra-ra-ra, and I'm going to out-create you until you do so-and-so, and so forth." You get the idea? "I can shout louder than you can, so therefore you're going to do this actingness." You get that?

Ah, but that is not the road the world follows. The world follows a total different one. It's "Regardless of whether this is reasonable or unreasonable or anything else, man, you're going to do it and you're going to be blind to everything else from there on." We call it "faith." We call it "discipline."

They used to take a soldier who deserted from his post and stand him out in front of the rest of the troops and shoot him down, or spreadeagle him on a wheel and beat him to death, or hang a sailor over the gangway and slash him to death, or just, you know, something like this. A Sunday – you'd never go to church on Sunday three hundred years ago but what you didn't pass some guy in the stocks who had been doing something or other, been drinking beer or something like that on a Saturday night, or some other criminal action.

In other words, there were various actions by which more energy was thrown at the individual than he thought he could confront. This is the idea of making people good, do you see?

So therefore, he fixed in this pattern of action because it was a choice of either fixing in this pattern of action or trying to face all of this unfaceable and unfrontable energy. Do you follow me?

That's being good.

Now, when you have a totally disciplined nation, you have a total failure. A nation which would make everybody good and sacrifice every individual characteristic in it, sacrifice everybody's observingness, everybody's decidingness – you got a complete end product: complete failure. That's what you'd wind up with – a complete flop. And there's where every old civilization goes, and that is why they become *old* civilizations. That is why they decay, that is why they become decadent. Because people just become gooder and gooder and gooder, by which we mean they observe less and less and they decide less and less.

You have this fellow walking down the middle of the street taking a certain mincing gait and so forth, not because he thinks it's anything, but because he's supposed to do it because his ancestors did it.

Oh, you can think of thousands of examples of this sort of thing. And when you finally get a totally decadent, totally gone society, it gets licked up by any chaos that hits it. It can be overwhelmed. By what?

Well, if everybody in it was trained to be good by being trained that they couldn't confront certain energy masses, then of course any hostile energy mass that shows up can conquer it.

So an old civilization is set up by its own premises to become conquered, and you have the cycle of civilizations. And that is how they age and that is how they die.

Now, the way an individual ages, the way he dies, is to give up his power of observation and his power of decision, and acts on the basis that he cannot do as much as he used to be able to do, he can't stand as much as he used to be able to stand. And he attributes this to advancing age. He never attributes it to being able to stand less. The source of advancing age is being able to stand less. Advancing age is not the cause of being able to stand less.

In other words, aging is caused by a lessening ability to confront action. That is all. It's not because the person can't, but he merely ages because he believes that he can't. Do you see how that goes?

See, it's a reverse, look. Well, if the way age is regarded at the present time doesn't solve old age, which is that an individual gets less and less active the older he gets (do you see that one, the less active, you know, the older he gets, the less active he is) – if they follow that through uniformly, let me point out to you that this does not result in a knock-out of old age. So it couldn't possibly be true. See, if everybody believes this implicitly, it couldn't be true. Because, boy, they really believe that one. The medicos and everybody else believes that one.

The reverse is true: that a person gets as old as he is incapable of confronting energy, whether it's a civilization or an individual or anything else.

You hear of somebody coming off the beaches at Dunkirk with his hair turned white as snow. Yes, well, he aged. Well, why did he age? Well, he looked at a lot of fury and ran away from it. See why? See how that is?*

By the way it's now past – its about four minutes past your leavingness time. Do you want me to let you go on schedule? Cause we had the (line?)

Audience: No.

Are you being polite?

Audience: No.

Okay.

Well now, the age of the individual is established by his ability to regard action.

The concern of an individual with action is coaction or attack of action. You can act with or you can attack an action, or you can avoid the attack of an action.

In other words, you either have a lot of energy which you are merely utilizing, or you're attacking energy or being attacked by energy. See, I mean, turning the band saw on and off and sawing up some lumber probably never made anybody insane yet. But attacking everybody because they saw up lumber with band saws and going on a considerable vendetta on the subject, and then shooting all those people, or something like that, or being shot at in return – that will cause an aberration, because it singles one out from his natural ownership and responsibility of the universe.

An individual is first as big as the universe, and then he selects out half of it to fight, and so becomes half the size of the universe; and then selects out half of the remaining universe to fight, and so becomes one quarter the size of the universe; and then selects out half of the remainder to fight, and so becomes one eighth the size of the universe. And I could go on and enumerate these steps, but why should I when here you are?

* Editor's note: the following 6 lines are missing in the Golden Era audio version.

Your size in relationship to the universe is directly determined by only one thing: is the amount of randomness you care to confront in the universe, or the amount of attack you think you're subjected to or care to subject the universe to. That determines your thetan size. That's how big you are as a thetan. It's how much you feel you can take on, or how much you feel may take you on.

Now, let's look at the mathematics of a civilization. We have 100,000 people in this particular civilized strata – let's take some ancient civilization of no great size – 100,000 people in this civilization. And at first we say to these 99,999 people, other than self – we say to these fellows, "Well, I am as good as any of you and can take any one of you on. And maybe even take on two or three of you, or six or eight or twelve or fourteen. Who knows? In fact, I'm liable to take on anybody who messes me up." And they think this way equally, see? And they're liable to take it out on you, too, you see? But – so on.

And then one day somebody breaks his neck or breaks his brain or something – some other vital part – and he can't fight. So he invents justice. And then he gets some other fellows that are pretty weak, and they band together, and they invent this thing called "justice." And that is, justice consists only of this: that when the one individual, when the one individual errs, all other individuals in the society are banded together against him. And in the final analysis, that is justice.

You go out here and you lay your hand on a man's shoulder: that's an assault. So you have every member of the entire British Isles, collectively called the government, issuing a summons for your arrest. That makes you versus the government. Right?

Now, look. You were willing to take on one or two or three or four, or five or six, or when you were feeling good one morning, maybe ten or twelve. But now you're opposed with the idea of some tens of millions.

I love this gimmick: "The people versus John Jones." Where the hell are these people? Well, they're a collective nonsense that was dreamed up by a bunch of birds who couldn't fight. That's about the only thing you can say about it.

Now, we expect in a group of men you will get a leading order of hens. I'm sorry to mix the metaphor, but ... We expect this. We expect this.

You turn a bunch of knights loose in a tourney, and they're all going to wind up with a champion and a bird who disgraced himself, and between the rest of them, the rest are going to be stretched out on a gradient scale of who can lick who. But they very, very seldom form a council to go against all the knights of the realm this way, until they get into an order of knighthood or something like that. And they only get into orders of knighthood when a lot of them have been licked. And then you get orders of knighthood. Up to that time, nobody bothers, see? Do you see how this works?

But think over this proposition called civilization. It's rigged so that the individual, if he commits a fault, finds himself pitted against every other being in that whole realm.

And that, he conceives – I don't know really why he conceives this, by the way – but he conceives this a too-manyness. So he is overwhelmed and he is good and he obeys the law

of the realm – not because he thinks it's a good law, not because he observes that it is right or not because he's decided upon it; but he just obeys the law of the realm.

I used to always be able to put this into effect. You race out down the highways and you're trying to bring law and order to an area; you hang a bunch of guys to the nearest trees. See, you just catch some birds that have been cutting purses or burning farms, or something like that or – it doesn't matter much where you get the bodies. But hang them up on some scaffolds and trees, very visibly, you see? And law and order spreads in all direction.

That's because you and maybe four or five men-at-arms are more than any robber band. And you are law and order. You get the idea? And it's just simply the matter – it's this equation: "You rob somebody, without any reason, we will hang you as soon as we can catch you." You see, this simple, simple equation, simple arithmetic. So they stop robbing people. See, people who would rob people tend not to rob people because they figure that guy, and so forth, will overwhump us. You get the idea?

Now, when you get old and you get creaky, and the climate of France and England has at last entered your bones to the point of arthritis, you of course subscribe to justice, and you invent this thing. Instead of you there with a strong right arm, you see, you say, "Well, look, 'the people' will get after you." See, a considerable police force. But it's "the people" who will get after you, and you're being hung by "the people."

I never really bought that sort of justice. Any justice that I ever brought to an area was exactly this other type of justice, as crude as that may be.

"All right, you robbed the coach, we're hanging you."

And guy would say, "Well, my laws and my rights, and the Magna Carta, and so forth," and he'd go right on talking right up to the time when you pulled the rope check.

But I'd always let them know that it hasn't anything to do – "This is a peculiarity of mine. We have peace in this area. And we're going to have peace in this area. And we're going to have lots of peace in the area, not because you want it and not because the people want it, but just because I say so." And in that way may have escaped a lot of motivators and overts, because it was honest.

I'd always hated this other idea. I knew there was something wrong with this other idea. I couldn't quite figure out what was wrong with the other idea.

But isn't it a masterly gimmick? Look it over as a mechanism. You do wrong, and instantly you are going to have as your enemy several tens of millions of people. Isn't that a muchness? Huh?

Well, all "goodness" is brought about by force, whether individually delivered or delivered collectively. And goodness is never brought about by philosophic persuasion.

Three guys observe that they get a lot of planting and hunting done as long as they don't knock each other's heads off. They observe that one day they knock each other's around, and they don't get so much hunting done the next day, and they say, "That's a stupid idea. Let's have some peace and declare war on somebody else."

Well, all right. That's an incipient and a quite proper civilization, because it's based upon the fact that they have observed, they have decided, and that is the way they act.

"Ah, but, you see, law and order and justice actually are the best things, and they're the best principles, and you should be a very lawful person, and – or your father and I will hate you. And uh ... we uh ... And you see that policeman down the street. Well, he'll arrest you. And there are thousands of them." And I wouldn't say any duress had ever been brought against you to be good.

Now, and one of the oddities of it is that man is basically good. This is the oddity. But that he gets a synthetic bad valence. He gets a synthetic valence. He gets a mocked-up "baddy," see? And then he can get into this valence of being bad, and after that you have bad men. It's quite amazing.

If you don't believe this, process somebody someday on the basis of bad valences. And you'll find out these are the wildest synthetic valences you ever saw in your life. They're described to him, they are borrowed from him, they're his concept. You realize every 3D Criss Cross item is either some life that you yourself have lived, or its oppterm is merely your ideas of somebody else. There isn't a somebody-else in the whole bank. Do you see? There's never a somebody-else. It's only you and your ideas of. No oppterm of any kind whatsoever.

Now, what does this all add up to? Well, it adds up to the fact that if man is basically good the only thing wrong with him is his imprisonment in evil. But the evil is false. This is quite interesting. If the evil is false, what would happen if you set him free? He becomes good.

Ah, then what witchcraft has been worked here? We tell a fellow he is evil, and we convince him one way or the other that he shouldn't attack, because other things are good and he is evil.

And we just have another civilization mechanism.

And one of the ways of phrasing it is that everything done by you will be revisited [visited] upon you. That's karma.

"You will pay for everything you have ever done": that's karma. And a lot of people get the overt-motivator sequence mixed up with karma. They are not the same thing.

The overt-motivator sequence means that you have to lay yourself open to feeling bad about something – to a motivator – with an overt. That's true, too. But do you know how it's true? It says there's an area you mustn't attack. And that becomes the keynote and the whole swan song of a people: There are things you mustn't attack.

The only reason that wall is stably there for you and can trap you is because somewhere down deep you consider it sacred. Did you know you considered the wall sacred? But you do. You have certain sacred valences; they mustn't be attacked. You've convinced everybody they mustn't be attacked.

The priestess: She walks up the temple steps and turns around to the multitude, and she says, "Peace," and they serve her up for stew. She's a religious figure. She shouldn't be attacked.

The toughest valences you are holding on to in 3D Criss Cross are the same wool and warp of this civilize structure. They are merely mechanisms to prevent you from being attacked.

And that's why you have withholds. The reason you withhold something is to prevent yourself from being attacked. You've all done something at some time or another, anyone has done something at some time or another, in a civilization, where this civilization mechanism goes into effect. You would be attacked if it were known, see? You'd be attacked if it were known. You know that.

I can think of dozens of police forces, not only in this galaxy, that would love to have my name and address right now. As a matter of fact, they have it. Well, come to think about it, the shoe is slightly on the other foot.

But we've got a matter here of the sacredness of beingness. You got the idea? A good, nonattackable beingness. Hoo-hoo! That's the thing, see?

Only trouble is, we fall for the other unattackable beingnesses around us. People are horrified when they hear me giving the Christian church what-not. Every once in a while we get fantastic comments on this subject. I don't see it myself, although I've had ample reason to believe that people get upset about this. See? I believe people get upset about this; I don't believe you shouldn't attack it. I think all mechanisms of slavery should be attacked.

Now, the basic mechanism by which people are persuaded not to attack is to show them that attacking will hurt them. And that is the whole lesson they try to teach in war. You go over a parapet and across an open field up against machine guns, and if you're damn fool enough to have a meat body with you, you're liable to get some holes in it, you know? The air is liable to start going through where the bullets went. You see that? That's a bum thing you're doing, you know? You get punished for attacking.

But you kick a stone and you'll get punished for attacking. But why does a stone hurt you? Well, you must consider that it shouldn't be attacked. You must consider that the MEST universe should not be attacked. Well, look-a-here, it's here. Nobody has as-ised it. So obviously it's under the curse of no attack. See, you mustn't attack. It attacks you though, doesn't it? I think that's fascinating. Every once in a while a cliff falls on your head, something like that, but you mustn't attack it. Sounds to me like a wonderful mechanism for keeping a universe going.

But now we move into the overt-motivator sequence, having observed that if you attack into the teeth of spitting machine guns, you get your guts full of lead. Having observed this, it is very easy, you see, that any evil act you do to others will be visited on you. See, after a guy has had the first lesson – you know, he kicks the stone, the stone hurts him; he's charged the machine gun, and the machine gun has shot him – then that he will harm himself for knocking somebody's block off.

And the next thing you know, there he is with a withered arm. Didn't even hurt him actually. This bird was a totally defenseless goof, and he walked along and he went pow! you know? And the other guy's head fell right straight off, you know? The next thing you know, the guy has got a withered arm. You want to cure it as an auditor, you run out the knocking

off the other fellow's head. Well, I'll be a son of a gun, his arm all of a sudden works! Because you've created a miracle.

There's a further miracle that you could create. How come it got withered just by knocking off somebody's head? Now, it didn't even hurt his hand! Where did that mechanism come from? And that's the overt-motivator sequence. Where did it come from?

It comes from this one mechanism of "You attack things, you will be hurt." And if you can teach enough people that, you have a civilization. But they will all be enslaved, they will all be trapped; and none of them will be able to clearly observe, to clearly decide or to decisively act. And they will all sooner or later go crazy.

Now, when I have said these few choice words, I've described everything there is really wrong with the human mind. There isn't anything else. There's no other outstanding phenomena, in the final analysis. Once you know the basic phenomena of Scientology – that is, the as-ising and energy and pictures and what the universe is composed of, and the Axioms and things of this particular character – you get down to that as far as processing is concerned, the only thing that you've got in your thetan bank at the particular moment that is giving you an awful lot of trouble is something you know you had better not attack.

The consequences of attack overweigh you so heavily that you will not attack it. Otherwise it will disappear. If you attack it, it will disappear. That's one penalty, but it is the only penalty. There are no other penalties. All other penalties are totally imaginary, and at this stage of development of Scientology can be considered so, wholly and completely.

I'm not now giving you processes to run on this. I'm trying to get you to understand this philosophically – understand it, on the head end, that there is no liability for attacking anything, but there is tremendous liability for not attacking. There's tremendous liability.

That sounds like we're going to make a lot of vicious people. [laughter] Well, if they all become vicious before they come good again on the other end, I'll just have to live through it, and so will you, because that's the way it is.

But there is obsessive attack – people could no longer control their ability to attack; there's all kinds of species of wildness and gyratingness and upsettedness and so forth. They're all misemotional and none of it under control. Overt attack never got anybody in trouble. Never – really never did.

The only thing that you ever lose when you do that is some havingness or something like that. It's about the only thing. But if it's a havingness you don't want, what's the difference?

Well, that doesn't erase the fact that the overt-motivator sequence, you understand – that doesn't erase the fact that it works. You can take it apart, you can get withholds, you can do all these things which you know how to do. I have just been busily trying to get to the root of the structure and find out exactly how it stood, and so forth, to find out if it could be swept away when we reach into Class IV with 3D Criss Cross items. And I find out that it can be swept away, and the residuals and so forth of the bank have as their common denominator things that must not be attacked, reasons why one shouldn't attack, reasons why one shouldn't

be attacked, reasons why one shouldn't attack others, ways and means of restraining oneself from attacking others, etc., etc., etc., ad nauseam. You understand?

And out of this you get all kinds of minor things like criticism, and you get all this kind of thing. And you also get overt-motivator sequence. But it's just one phenomena amongst many. Okay?

Thank you very much for staying over. Good night.

Sacredness Of Cases

Determinism

A lecture given on 5 April 1962

Thank you.

And now we come to the crux of the situation – you. Why is your case sacred?

[part missing] [there is is also something to be checked in the middle]

This is a lecture of April the 5th, AD 12, Special Briefing Course, Saint Hill. A very late spring. But if you will notice we have some gorse or whatever it is, from Scotland, blooming. And we have a whole slew of daffodils. Brave flower. Spring won't take forever. And neither will our new quarters.

I was out slopping around amongst the plumbing out there today and find out the contractors have come out of hibernation. [laughter] Awfully nice of them.

Well, let's get down to the meat of the situation tonight, and let's find out why your case is sacred.

Well, why is it? Just contemplate that for the moment. Why is your case sacred? If it is. If it is.

Sacredity raises its ugly head. Sacred equals don't attack equals preserve equals protect equals survive. And now at last we understand the theetie-weetie case. If you notice, everything to a theetie-weetie case is sacred.

All right. Now, let's just add up that case – not to throw dirty names here or anything – but let's just add up that case.

Those equations which you just took down in your notes – you also ought to hear that, you know. You also ought to hear that, hear what I just said, too. [laughs]

If you'll look that over, just let's add up this case where everything is sacred. Mustn't attack it, mustn't be attacked, must protect, must preserve, must survive, and there's a final equals – equals no results in processing.

And frankly that is the only reason that anyone ever has, for a no result in processing. That is the secret of this universe. The secret of this universe is that it is a sacred universe and shouldn't be attacked. And this puts every poor thetan that comes into it on a shouldn't-attack which puts attack on, of course, automatic. So it's the universe of automatic attack.

Now, there are two states of mind – three, really. There's the state of mind of pan-determinism, of where one can see or fight or control or anything else on his own choice on

either side of the situation. Pan-determinism – either side of the question, either side of the situation.

I know it used to disgust my fellow writers. I took politics – politics to me are something on the order of jokes that you read in joke books, you know. Like Pat and Mike joke books or something like that. Or minstrel joke books.

And I could never really take this sort of thing seriously. After you've gotten too familiar with something and been mixed up in it often enough, you see – after that you get very familiar with it, you see?

And you'd have a bunch of fellows holding out violently, you see, for one side of the political picture, you see? And another bunch of fellows holding out violently for the other side of the political picture. And I would sit there and be violently, you see, on the side of the first blokes and then about halfway through the evening or a half a pint of rum later, something like that, why, I would become violently in favor of the former opposition, you see. It really upset everybody, you see?

Well, the symptom of this was – it didn't make this much difference. I'd just as soon have fought on either side of it as long as it was a good fight. But you see, these poor fellows were fettered. And they were hostile to this point of view because they were fettered. Because group A – the first group, violently "in favor of," you see – their principles were sacred, you see? And group B – violently opposed to them – their principles were sacred, you see? And so it was a matter of die or else, you see. I mean, this wasn't any thought of any change here or shift. And for somebody to come along as cavalierly as this and argue on both sides of the political situation, you see, with this much wild abandon, was a shock to one and all because neither side was sacred to me.

You see, politics is, at best, shifts and mechanisms of control, you see? And it's somehow the shadier side of control, if you want to really get down to brass tacks. But this – this is generally the attitude of this universe on the subject of pan-determinism, so pan-determinism gets into bad repute.

I think I've joked about the denouement of this particular bunch of fellows. I remember one time there was a socialist and there was a communist and there was a democrat and there was a fascist, and boy, they were having a ball, you know, and each one was taking his sides, and so forth. And finally I got them to argue on one thing. Got to argue in the direction of just one item and they finally came up and approached this item and they all agreed that there was only one government that was a workable government and to which each one of them could wholeheartedly subscribe, and that was a benevolent monarchy.

So after we'd approached this by very gradient scales and very small steps, and they found themselves, who had been at each other's throats on this particular subject, you see – they found out they were all royalists. That's what I told them. See, I just dropped a bomb in the midst. "Well," I said, "I'm in the middle of a bunch of royalists and I myself am not a royalist, so that's that." Disgusted with all of them. This is a terrible thing to do to people. But they'd actually all agreed on this subject.

There's only one thing wrong with a benevolent monarchy. You cannot choose its succession. So apparently every other form of politics is based on the inability to choose a successor. So we then have to – we have to ... See, all these forms of politics are based on the inability to choose a successor. Hasn't anything to do with the kind of action you take during the political action, you see. You see that? I mean the present time of politics is of no concern, then. You have to have these other shifts and dodges because of the successor, see. You don't have to... Apparently any one of these forms of politics – fascism, communism, socialism, anything it doesn't matter what – are only necessary because you cannot guarantee that a good successor will follow a benevolent monarch. So they're all out of present time, aren't they? They're all somewhere up into the future or something. So this becomes very amusing. You can go on this way but people don't approve of this. People frown on this. It's pan-determinism of one kind or another. You base it on this particular basis. A benevolent monarchy, of course, they could count on its being pan-determined. It would take up the right or the wrong on the basis of – you know, a good monarch, you know. He'd take up the justice of the situation, the points of the situation. But they could never guarantee that if he died they would get another one. So they have to become socialists or communists or fascists or something else, you see?

You see, all the – the only thing that afflicted the entirety of the Roman Empire was stability of government. The types of governments which they had could not guarantee that you wouldn't have choice of successor by civil war. So therefore they were in a terrible mess. So all of the ensuing fifteen hundred – or, I guess, about thirteen hundred years of monarchies by succession by birth, you know, princes and divine rights of kings, all came out of the failure of the republic called Rome, you see? So they found out they couldn't have a republic because they couldn't guarantee a successor, so then we had divine rights of kings and had it genetically.

Now, you and I know that if any thetan can pick up any body, that would be the total apathy of successiveness, wouldn't it. Yeah. The genetic entity is going to succeed to the rule every time. And this is practically what happened. He will have an awful lot of trouble. Every time you get into pan-determinism all kinds of conflicts arise as to how are you going to continue pan-determinism, you see? And people don't. They slop off into self-determinism.

They go for "for and agin." They get into this self-determined attitude, and that's your second state of mind. It's a state of mind of "pro me." And then you'll have vast philosophies growing up of the virtue of selfishness. "Well, whatever you choose, why, you'd better think of number one first," see. And you get a vast activity going on the subject of how self is all-important – by which they mean self-determined action is all-important. And this carries with it another thing: that other-determined action is bad. See, that's the other side of the situation.

Now we have enemies. And now in any given group, why, about the most that you could be would be 50, 60, 70 percent of it, you see, because you could never be the whole group. You've dwindled in size or force, you might say.

And now there's a third state. When people get into this state they're nuts, to be technical. I was roused up the other day about somebody in New Jersey was cursing me for using a very bad technical approach, you see, and using technical words, and so forth.

Isn't it funny? The last person that did that violently was also from New Jersey. You know, I think it must be in their drinking water. So I'm being careful tonight to being very, very technical. Anyway, a fellow who is in a other-determined frame of mind can be counted on as to be very technical; to agree with this New Jersey thing – nuts.

This person is only always for the other guy and never for himself. You start an argument in this person's vicinity and they get reasonable with you. They'll always be reasonable.

You say, "Well, those damned psychiatrists shouldn't ought to use 220 volts as their only procedure."

"Well, I think they are perfectly good-intentioned men," and so forth.

Now, you make the mistake of believing you are talking to somebody who is pro-psychiatric. And you're not. You're talking to somebody who is simply other-determined. And someday you should try this little excursion: As you talk to them and find out that every time you attack something they defend it in some way on the fact that it must be all right and it must be good and it must be – you know, there must be some *reason* for it, you see, just attack something else at random. Attack the sellers of apples at Times Square or something of the sort. And then you'll find they will immediately tell you, "Well, those fellows have to give money to the police, and they, you know, and to keep their license. And that is why they charge what they do for apples at Times Square," and so on. And then just choose your next tactic. Attack the Society for the Dissemination of Cats.

And say, "Well, they shouldn't disseminate all those cats," and so forth.

And they'll say, "Well, they probably have a good reason for disseminating these cats."

And you'll begin to wake up after a while that this person is really not *for* anything for himself. He's only for those things which are agin. And if you say agin to him, he has to be *for*.

Now, this one escapes your view. This one is a hard one to see because it's already entered into the lower-scale mockery of pan-determinism. You see, you're already just now entering into the lower-scale mockery. That's just the way it looks, however. This person is *not* pan-determined. This person is *never* self-determined. Now that's – that's what you fail to see as you speak with this person. This person is *never* self-determined. This person is *always* other-determined .

These people, peculiarly, get into politics. It's a lower-scale mockery. Peculiarly. And it would just drive you stark staring mad if you were running a country and you had these people on your military and economic staffs, and so forth, because every time you said something was against the country, they'd have something reasonable to say about it. And they would give this vast example of being impartial people. But they are *not* impartial people. They're only for what is agin. You see that?

All right. Now, of course, we go down into the lower, lower harmonics, and we get, of course, these things repeated over and over again. But it's pan-determinism, self-determinism and other-determinism. Those are the three grades as you go down. And it usually escapes

your view. Only thing new to you about this would be – probably would be the fact that other-determinism – a person who is totally other-determined – escapes your view because he looks reasonable and he looks pan-determined and he looks like he has good sense. It always sounds like he has good sense, you know.

You say, "Well, these fortunetellers shouldn't manipulate the stock market the way they do."

"Well, they probably have a – you see, they probably have some sincerity and some faith in what they're saying, and they have to live, too, you know. And ..."

You see, the question you never follow up. You just keep – you keep talking about fortunetellers to this person or something of the sort. So you never discover this other point. The person is not for himself.

Now, in processing, that is the first level of case that is really going to give you trouble. You can be sure that case is going to give you trouble, because if you prove to him utterly he ought to run out certain engrams to benefit himself, he won't. You got it? He's not for himself, ever. You run into all sorts of things.

All cases, you understand, at various parts of the track, get stuck in these various phases. I mean, any of you at some part of the track have been looped up at one or another of these points. Even me, you see. Even thee. See, at some time or another.

You know, you really got caved in. You went through two wars and an economic collapse and came out at the other end and found out you were sweeping out latrines as your highest dedication of life. And that the medicos have kept the body going and the only original part of the body which you have left is the left shoulder. And the rest of it's all artificial and yet you can't escape from it and you can't get away from it, and so on. You get low-toned. You get low-toned about this time.

And you're liable at that time to have found yourself very reasonable about the enemy. And what went along with this is you were agin you. You see, that's very easy because you looked around in the present time environment and found everybody was against you. And if everybody was against you, why, then you must be against you, too. Otherwise, you'd be out of agreement with the whole universe, wouldn't you.

So a person trying to stay in agreement with the whole universe will sooner or later at some phase of his track become momentarily or otherwise other-determined. You see? It's a defeated proposition whereby he goes into agreement with the fact that he ought to be defeated.

Periods of illness best demonstrate this – people who are ill or chronically ill. You'll see most people who are under heavy attack or who have been heavily attacked or carrying a very large level of responsibility will occasionally flick in and out of this state. And of course, that makes almost any political leader on this planet or in this universe – almost any political leader is liable to get into this state. And the next thing you know, he will only sign a reasonable treaty which is favorable to the enemy and never favorable to his own country. And he will not sign a treaty which is favorable to his own country and will only sign a treaty that is favorable to the enemy.

And you wonder how come, after these wars, you get such fouled-up, mucked-up treaties of peace. Well, you got weary leaders who have gone totally other-determined. See, they look at all the overts they've racked up during a war, you see. And they finally get to the point where the enemy should be saved and they should be defeated.

Now, you can be in this frame of mind on certain subjects without being generally or broadly. So a person on any given subject – that is not as a general mental attitude but as a specific mental attitude on any subject – is pan-determined, self-determined or other-determined.

And only in those areas where the person is furiously other-determined will you find a consistent and continuing somatic. That's the point of other-determinism – where the individual is assisting the attack on self. Of course, he's the only one there that can make the somatic, don't you see.

So now, what I'm talking about wasn't as scarce as you thought. Now, when we get to the point where the *whole* individual and the *whole* situation and the *whole* attitude is pan-determined, self-determined or other-determined, of course, we have states of sanity. These are the states of sanity.

Everybody, you see, on any given subject – well, there's people here that are pan-determined on the subject of women and there are people here who are self-determined on the subject of women and there are people here who are other-determined on the subject of women, see? Take any subject and you'll find a variety of generalized attitudes.

Now, when you find a terminal by 3D Criss Cross, that terminal will be, if pan-determined, undiscoverable because it will never have hung up. Self-determined – somewhat troublesome. And it'll be part of the Goals Problem Mass. Other-determined – it'll damn near whip you in trying to audit it if you really don't have the locks spotted and the right keys to open those doors. Because every time you hit it the pc attacks himself. See? You could never help the pc in the vicinity of this other-determined valence.

You see what happens? Instantly, the pc is the loser. You find this, the pc's the loser. It's the winner.

So you find people – I mean, don't shudder at this because it applies to me, thee, everybody, and so forth – but you find people are most likely to get hung up and seize onto and keep and perpetuate valences which are totally against their best interests. They're other-determined valences. You see that?

They may look like terminals, and it may be all fine, but you'll find it's very difficult to move the person out of the track. Why is it difficult to move the person out of the track?

Because every time you hit them, they survive, the pc doesn't. So you see, you have at that instant of that section of the track, you see, that you hit this in an auditing session... We're not talking about what went on that gave us this mechanic, we're talking about in the session. You hit this thing – "Bulldozer," see. All right. Bulldozer – terminal. You hit bulldozer. Bulldozer must survive, and it's all for bulldozer, and it must not be for pc, even though the bulldozer is the pc's terminal. We can call it that. But nevertheless, it's one of these other-determined valences, see.

So, my golly, the pc will just sit there and do everything he can possibly do to preserve that terminal. Bulldozer. You see, he'll build it up, and he'll fix it up, and he'll try to achieve its goals, and he'll follow its postulates. And wow, you know, there it goes. And you try to run this out, and at this instant of track when you find the pc, the pc is zero.

See, the pc has no force in this whatsoever. But bulldozer will attack the pc. So if bulldozer will attack the pc, why, he'll just keep attacking himself. And you'll find him trying to run this. The pc will do weird things. They get themselves all kinds of PTPs between sessions.

And they get themselves all mucked up, and they're having chronic present time – or present time problem of long duration maritally. And during the session, why, they'll go out and phone the marital partner two thousand miles away, you see, to – and start a hell of a fight. And it looks to you like they just got restimulated and they're just ... No, no, no, no. See, they're in the middle of this terminal and this terminal makes a backfire against them, you see. And they'll just keep on making the terminal backfire against them, see. It's the darnedest thing you ever saw.

And yet the pc may hit one of these that's sufficiently strong to make him look totally pan-determined on the same basis I was just describing to you. Pc will get very reasonable about everything. They get very reasonable about this terminal, see. They get very reasonable.

They say, "Well, that's not a bad thing. That's really a good thing, and so forth." And well, a vestal virgin collector or something like this on the whole track, you see. And they'll say, "Well, that's very reasonable. And that's a lovely terminal. And I had a lot of fun doing that." And they go on, "And it's a perfectly nice terminal. And isn't that fine?"

And you get whipped in about this. And you say, "Well, that terminal isn't very important, you see. It must be something else because the pc says so." No, that isn't true at all. That's the terminal that defeats the pc. He's not pan-determined about that terminal at all. He's being totally other-determined about the terminal.

The terminal is all. The pc is nothing. That's all it adds up to. Well, if it just stopped there, you'd be able to run it out easily. You'd be able to run it out very, very easily. But it doesn't stop there. You get into that area, the terminal attacks the pc. It's not just nothing. It's less than nothing.

So you have this funny thing of man, the object and picture of man, trying to destroy himself. You have all of these odd phenomena that you continuously encounter of the self-destructive aspects and impulses of man.

You have a bunch of politicians sitting around a peace table, and they rig it all up so they're going to have another war in twenty-one years, see. Good heavens! I mean, why, the idiots, you know.

And you say, "Well, why did they do that?" Well, why did they do that? They were being very other-determined. That's all. And each one of those politicians was sitting there trying to figure it out so he and his country would be defeated.

Every once in a while in administrative activities, some staff member will blink and his jaw will drop. I will give him a piece of paper to sign – that somebody should sign, you see? Something's giving us trouble someplace or another. Something's going over the hills and far away, and give him a piece of paper to sign. I always take this chance because there's a possibility it'll happen, you see. And as a matter of fact, it's quite – the odds are in favor that it will work out this way, because this person is already doing something very destructive in attacking Scientology or something of the sort, and so forth.

So you sign up a confession you know, or sign up a note or sign up a document – write up, rather – document taking full responsibilities for this or that or the other thing. Just a suicidal legal document, you know. I'll write it up and give it to the attorney and ... I don't give these to attorneys anymore. The attorney will sit there, and he'll be very other-determined about the whole thing, you know. How nobody would sign this and very unreasonable. It'd be very unfair to the person who's signing. Well, they're being very unfair to us, why not be unfair to them?

But the attorney couldn't possibly figure out this because it'd ruin all attorneying if this principle were broadly known. About eighty percent of their cases would just go *pfffft*. And you set it down in front of the person, and you say, "Sign it."

And the person reads it over. "I hereby guarantee to pay \$1,750,000 damages and fully and freely confess that I burned the house down and ..." – anything.

"Sign it!"

"Is that satisfactory?"

I don't know what the percentage is, but it's a very high percentage that whenever I've done that, the other person signs.

I only have trouble with our own attorneys. They're always trying to make a fight out of it, see. And they'll win the other person's case for them if you don't watch them. So you try to bypass them. Because the truth of the matter is that somebody who's so nonsurvival as to try some stupid, silly attack against us somehow or another, can usually be counted upon to be sufficiently nonsurvival they will also commit suicide from a legal viewpoint. And they do. It's amazing.

In other words, about sixty, seventy percent of the cases perhaps, that walk into court down here, the litigants involved, if either one of the litigants made up a document saying, "Well, I..." and you know, just made it terrible ... You know, there's a 50-pound debt involved and if he'd – if somebody would just write up a judgment for 200 pounds at compound interest (you know, 50 pounds and a 150-pounds damages) and then with compound interest, and then a jail penalty or something in it, you see, and draw it all up in this totally vicious document, you see, and just give it to the other person to sign; the other person – oh, yes, yes, they'd sign it. They know. They appreciate it because it's agin them. That's where they belong. [needs to be checked against the original]

You see, the world operates on the basis that everybody defends himself and that everybody is on the kick of self-preservation. And this is not so. The people who are causing trouble in this world are not on a kick of self-preservation. They're on a kick of succumb. And

our biggest trouble is they look to an auditor, or they look to an organization, or they look to me, to be an executioner.

And we only get in serious trouble when we refuse to fill the role. That is quite amazing. You'll see this work out in your own activities, I am sure.

I think you – some of you have seen it work out in organizations and so on. But you're trying to be reasonable. This guy walks up and he says, "The organization is no good, and everybody in it ought to be killed and so forth. And you're in bad, you're bad people," or saying something like this. Or he's going all around the neighborhood ... He's usually not anything direct like that. He's usually going around the neighborhood saying, "That's really a communist organization," you see, to all the shopkeepers or something like that.

And right away all your legal advice says you sue him for slander. No, you present him with a confession and an award of damages for having slandered. And just draw it up in a legal form and give it to him and he'll sign it, and you'll execute in court. And that's all there is to it. You don't sue him.

The guy has only one enemy. See, himself, exclusively. He just has one enemy. And he'll go on and fight until he finds a satisfactory succumb. You try to make a bargain with this fellow. You keep saying, "Well, all right. You pay \$200." And your ordinary bargaining is, "All right. And you – all right. Well, you won't pay \$200? All right. Pay \$150. Oh, well, all right. You won't pay \$150, pay \$100." See, you're trying to make a deal, see. Ah, that's the wrong direction.

You say to this person, "\$200."

The person, "Oh, no, no, no."

And you say, "Well, \$250? \$300?" You finally get it up to \$790, and that's how much he thinks he ought to cut his throat for. And he signs at that point.

This principle of other-determinism – I'm not driving it home to you as though we operate this way exclusively, and so forth. But if some guy goes on a psychotic spin and starts attacking the organizations or something of the sort, which happens rarely enough, our legal advice is normally and generally 100 percent wrong, because it's operating on the basis that those people are being self-determined. And if those other people that are attacking you are being other-determined, then they will not settle any reasonable deal that gives them a benefit.

You have to make a deal which is murderous to them. You just keep worsening the deal you make, you see, and they'll eventually square it up. That's how legal matters get hung up. Because this third state of mind is the one that gets in everybody's road – other-determined frame of mind, whether on a subject or as a general mental attitude. And that's the one that gets in your road in processing.

You, the auditor, try to get easier and easier processes, less and less condemnatory, less and less damaging, lighter and lighter, lighter and lighter Prepcheck questions, trying to go through an area of other-determinism on the pc. And you'll find out, quite ordinarily, that when you start going in the lighter and lighter direction, you'll be less and less successful.

I have watched you on Prepchecking get lighter and lighter and feather touched and more feather touched and so forth. Less and less arduous Prepcheck questions, you see. You drift off of the violence of them.

Always go the opposite direction. This type of Prepcheck question doesn't work, well, we toughen it up and toughen it up and toughen it up and toughen it up and toughen it up, and *finally* we get the one that the pc is sure will make them lose adequately, to go through one of these other-determined valences. And they'll buy that one. You'll get tone arm action and everything else.

It's a sort of a bloody-minded frame of mind if you don't mind my saying so. You would just – you would be very interested how this works out. I don't mean that you have to shout at him louder and louder. That isn't what I'm saying. What you do is, you just give him rougher and rougher questions. Not lighter and lighter and easier and easier questions. Our ordinary summation of it would be that we'd make the questions lighter and lighter. And that isn't really the way it works when we're trying to push through this area.

I must tell you this because you'll be pushing pcs through other-determined valences rather consistently when you're running 3D Criss Cross, you see.

They've got an other-determined valence. You found it. It's in full view. And on that valence they will only buy suicidal-type processes. Quite fascinating. They will only do suicidal things in processing. Quite interesting.

I don't mean that they're trying to kill themselves, but they'll only buy things that look like they could have a good chance of knocking them off.

You tell them, "Well, this is terrible. This is an awful process. And I hate to have to run it on you because it is just too murderous."

"Oh, well, all right."

And they run like a dream, see.

And you say, "Now, we're having difficulty here. Therefore, we're going to have a very – we're going to do a very light process." Bog. See? It doesn't fit the same frame of mind.

Pc has – well, let's see, "What have you – what have you done wrong? What do you consider you've done wrong? Well, you've ..."

Pc tells you, "I occasionally look at people."

And you don't get any tone arm motion at looking at people, so I ought to – just liable to go off into a spatter of question marks if I'm not getting anyplace with it. Just trying to set up a Zero question of some kind or another.

"Well, what do you do? Do you ever throw rocks at people? Throw rocks through windshields? Kick people? Stab people? Drag people down back alleys and slip a knife into them? Take them into basements and torture them to death? Some sort of a thing for which the police would arrest you instantly and come streaming in the door this moment? If the police did come streaming in the door at this moment, what would they be here to arrest you for?" And all of a sudden, they'll give you their – the chain.

Either on the basis of a protest, "Well, it's not that bad. It's just coercing women. I – it's – heh-heh. That's all I've done." See, or something like that. It's either – it's a little less than what you said – you've exaggerated it and made it too much – or it's gotten awful enough and dangerous enough that it is self-destructive enough from their point of view that they will own up to it.

And then you have to operate all the time on half-truth, untruth. Every few questions, get that half-truth, untruth rudiment straight, because a person going in this state will overstate the case and try to destroy themselves.

I was giving a demonstration here one night when you saw somebody doing this when we were pushing him through a certain zone and area. And all of a sudden he was trying to make things blow, he said, remember, by admitting to more things or making it worse, making it sound worse, remember?

We were pushing through a certain valence zone or item attitude, see – you don't mind my mention of that? – a certain zone of thinkingness, you see. And it was actually an other-determined zone of thinkingness. And frankly, there isn't much profit in processing anything else, because self-determinism isn't particularly batty. And pan-determinism certainly isn't batty.

So this relegates you, really, to the processing of other-determined attitudes. Self-destructive attitudes. It's the only thing that's giving the pc any trouble. That's what he's doing to himself. He's trying to destroy himself. And you're trying to help him out, to get him through an area where he's trying to destroy himself. And you're trying to help him through this area where he is trying to destroy himself. And frankly it takes a bit of auditing. Because the pc will take almost anything you try to do for him and convert it into a motivator.

You say, "Well, good chap, take a moment's rest. End of session." This is a screaming ARC break. Well, know what you're looking at. You ran into a zone of other-determinism.

Well, what is this other-determinism? Let's be very precise. I've shown you its application in processing. Now, let's take up this original proposition here again.

Well, other-determinism is a successful sacredity. It's a, "Shouldn't ought to attack." And the person has finally agreed 100 percent that that valence or identity is something that shouldn't be attacked. And the common denominator, therefore, of other-determined valences from beginning to end, are valences with this conviction of, "Shouldn't attack." They're sacred. They must be preserved.

Now, if you stop and do this mental exercise here for a minute or two – let's just think of this as a mental exercise – if you want to be perfectly safe in this society, what would you be? Let's think it over for a moment. If you want to be perfectly safe in this society, what would you be?

All right. Have you done that?

Audience: Yes.

All right. You have a sacred item. And if you look a little bit further, the item you just thought up, to some zone or area, is sacred to something. Do you add that up? That make sense? See, that's how that first equation I gave you in this lecture works out.

Mustn't be attacked. Of course, that becomes a formidable other-determinism. It inevitably and always becomes an other-determinism and never becomes a self-determinism. Figure that one out.

How could it be a self-determinism? Try to figure out how it could be a self-determinism.

All right. Take this item that you might or might not have, but probably did think of, you wanted to be. All right. Is that you? Is that really you? It isn't, so therefore it's an other-determinism, isn't it?

Now, you see what 3D Criss Cross is barreling at. To some degree then, *all* items in 3D Criss Cross are other-determinisms. Therefore, the Goals Problem Mass itself is an other-determinism and therefore is seeking to destroy the person who has it.

Sacredity. I think it's very amusing, if you like to laugh at funerals. I do myself. I do. The last funeral I saw in Kansas, I was perfectly willing. A dead wagon went by, you know, and it was one of these hearses, you know, with the great big plate glass side windows, you know. You could see the coffin in there. Flowers all over it. And here came limousines after it, you know, one after the other, after the other, after the other. More and more limousines. And there were people crying and people sobbing in these limousines.

And when the dead wagon – the first one, came by, you see, the hearse came by, why, I pulled off to the side of the road, naturally, and I took off my hat. And all this was just automatic, you know, took off my hat. I sat there and watched this thing go by. And car by car my risibility started getting the better of me, you know. I thought here's this bird, he kicked off, you know, and they shoved this body full of embalming juice, and this bird is sailing around here someplace or another. He probably already picked up somebody in a maternity ward or something of the sort, and he's long gone, you know, and here's these birds left with this piece of – with this piece of MEST, you know. And they're crying and sobbing, you know, and they're filling it full of flowers and embalming fluid, and going to take it out to the graveyard and erect some stone over the top of it, you know. And ... oh, what a ball, you know.

Car by car, the unreality of these people and their attitude and what they believed, and what I myself knew for a fact, you see, were so far apart that I'm afraid that by the time the last funeral car had passed, I was just doubled up with laughter. I just can't take funerals very seriously. I'm sorry. It's too silly.

I don't think there is a funeral anyplace around now, except maybe Ireland, where they have any thought for the guy. I think in Ireland they still throw the window up hastily so he can get out. [laughter] I think they still do that in Ireland. But I don't know any other part of the world where they do that.

In China they're on a reverse. They have all kinds of firecrackers and pennants and sort of thing to drive off evil spirits. Start thinking that one over. I haven't been able to take

funerals very seriously since that time. You would get the picture better if you really understood the seriousness of a funeral in the Bible Belt. Man, it is the most serious activity I have ever engaged upon in my life.

Sacredity. But what an interesting trap. You know, you're not supposed to speak evil of the dead? Did you ever hear that one? Oh? We're not supposed to as-is any dead? We're not supposed to attack any dead? Oh? What's that going to leave us with? Now where are we going to wind up? A bank stacked up with dead.

You're not supposed to be mean to the sick. Oh, come off of it now. If we're never mean to the sick and we're not supposed to communicate with the sick, we're going to wind up sick, man. Because we've set up a sickness sacredity.

You're not supposed to be mean to old people. Well, we got a new sacredity. There's a grand new way on how you get lots of old people in the bank, you see. And spirits and ghosts and that sort of thing, they're all bad. But there's a lot of saints around that you're supposed to be able to talk to, but you mustn't ever be mean to. You mustn't ever say anything bad about. And you must be reverent toward. Well, that sure sets up an awful lot of interesting attitudes and sidepanels on the subject of spirits, doesn't it. Other-determined spirits so that a thetan can't even be himself anymore. He's going to – he's going to be an other-determined thetan. You know, that's getting – that's really getting someplace now.

And then we have the big thetan idea. The big thetan theory. And you're supposed to talk to him, but you can't talk to him, but he won't hear you because he punishes you, because you mustn't say anything bad to him, because if you do talk to him, well, you can't talk to him, and you're totally at his mercy. And then they wonder why they have people around in spinbins saying they're God after having set up the mechanism overtly and directly.

Well I don't say there is or isn't a big thetan. I'm sure you were pretty big at one time or another. There may still be some around that are pretty big. Maybe you're still that big, you know. Who knows? Hasn't anything to do with size anyhow.

And then we get – we get all sorts of these things, so these valences look very peculiar, but now what are valences made of? What are valences made of? Well, that's another story. And let it be enough to say that wherever you set up a sacredity, you set up a shouldn't-attack, and you also tend to set up a shouldn't-really-look-at, shouldn't-really-communicate-at – conditional communication, and so forth. And the rougher this gets, the more the other-determinedness gets in the item.

So it goes in direct proportion, that the *less you* should communicate *with* and the more *conditional* the communication, don't you see, why, the more other-determinism will result from the item.

And you can take any 3D Criss Cross item and simply analyze it on the basis of how should or shouldn't, or could or couldn't one attack it, and establish its level of sacredity.

And the most sacred item in the lot is going to give the pc – that is, the most sacred item in the lot *to* the pc is going to give the pc the most trouble in the bank. There you have a direct index, then, of how to select out a 3D Criss Cross item.

If you were to have twenty lines – this is a lot – with twenty oppters or forty items in all, and were to combine these things up into various packages and inspect them all and discuss them all with the pc from a viewpoint of how sacred each one was, at that point where the pc takes on a totally benign look, you can absolutely count that at that point you have hit your highest level of other-determinism and your most self-destructive point of the bank. The least the person should attack this thing, why, the most destructive this thing will be to his own self-determinism, don't you see? Because this thing is an overwhelm. We look at it as an overwhelm angle. The thing must intentionally be overwhelmed, you understand? It must have an overwhelmingness to the pc.

It's level of sacredity, in other words, see, attackability of this thing, the deification of mother and all of this kind of thing that you'll run into – there are all kinds of things, you see, on the backtrack. And at different periods they've had different values. So taking these things into account, you would have to shake the thing out; but you do have a direct index: that thing which would be the most sacred, the least attackable.

And also it must carry this condition: the least actual guaranteed communication with. You know, insecurity of communication must also have this point involved. And reach, of course, that's the least havingness, the least havingness, you see, the most uncertain communicatingness, the greatest level of sacredness, the most overwhelming aspect of, combined up into threat from – how dangerous is this thing to the individual? This also must be taken into consideration very definitely.

At first glance, you'd say well, it's anybody's friend, and therefore "friendship" would be the greatest enemy. No, that I'm afraid is not the case. You see what it is? Oh, yeah, you don't want to knock your friends off, that's for sure. But you can talk to your friends. So that rules that out. And your friends aren't trying to overwhelm you all the time. So that rules that out, see. Sacredity – up-on-the-pedestaledness. That sort of thing.

Now, that gives you the key to the Goals Problem Mass. Some of you hearing this are liable to think, "Well, it's only sacred items like gods and spirits and that sort of thing" – oh, no, no, no, no, no.

Individuals worship in the most peculiar places. I am, of course, not unaware of this mechanism. And have never been totally unaware of this mechanism. That's why I make sure that you don't run up a bunch of O/W with regard to me and set it up so that you can communicate, you see, at the same time. So we don't want to get an overwhelm situation going, here. We set that up, but nevertheless some people are always – are going to come up straightaway, "Well, it must be Ron, you see."

They do. I watch these analyses every once in a while. The guy to whom they could communicate the most easily, you see, and who would help them the most – that's *safe* to have as an overwhelm, you see. That's very safe to have as an overwhelm. See, it isn't a real overwhelm at all. Oh, no, no. This one, the person *is it* while *it* destroys *him*. Follow that? That's a lot further. That's several mile posts or light-years down the line from what I just said. You got it?

The person *is it*. He doesn't exist in this area. That beingness *is him*, and that beingness *is all*. And there ain't no "him" there. And every time "him" there starts to emerge in the

slightest degree of self-determinism, he gets slapped back. That's the mechanism of the somatic and that is all a somatic is there doing. It slaps the guy back every time he puts his head up.

Now, you'll find the basic element in the bank which is the most sacred, you will find the pc being it and in that condition, and so you could separate this out rather easily. Follow me? Horrifying vista I have opened for you, haven't I?

Audience: Yes.

Horrifying. Absolutely horrifying.

Good enough. Well, take a ten-minute break and think it over.

As-Isness: People Who Can And Can't As-Is

A lecture given on 5 April 1962

Thank you.

Okay. Second lecture, 5 April, Saint Hill Special Briefing Course, AD 12. Now, we've been talking about what won't as-is. The things that won't as-is. First and foremost, of course, the things that won't as-is are the things you don't know anything about. Can't as-is it if you don't know anything about it.

And the next thing is something that you can't communicate with and that can't communicate with you. So that's a poor show as an as-is. That's just overtly can't, you see. A person knows something about the natives of upper Lombovia. It's very hard to as-is the natives of upper Lombovia if one simply has the idea that they might exist. You've never talked to them. They've never talked to you. But this is not in order of damagingness to the individual.

There is a reverse situation that you would never suspect, which is nothing there to do any as-ising. See, you'd never suspect that one. There simply is an operating GE. You get the idea? And of course, it won't as-is. Nothing will as-is with regard to this thing because there's nothing there to as-is it. That, of course, is the – basically the most obvious but the least discerned of the as-ises.

See, if you're not there to look, why, there it'd be. But it'd be something with nothing in it to as-is it. And of course – and that won't as-is, of course. Won't alter-is either. It won't do anything.

Therefore, any mechanism which makes nothing out of the thetan becomes non-as-isable. Do you see that? See, if something makes absolutely nothing – you see, a thetan really isn't nothing. If a somethingness must always have matter, energy, space and time connected with it, of course, then a thetan could be nothing, but a nothingness wouldn't have ideas and a personality and capabilities and creativeness and position ability and view ability and register ability and memory ability. You can't call this a nothing, you see.

Although it may be nothing with regard to matter, energy, space and time, it is not nothing with regard to its abilities. See, it can *do* things. Well, a nothingness can't do things, but then a thetan isn't a nothingness. So if you had something which made absolutely nothing out of a thetan's abilities and a thetan's existence and a thetan's lookingness and a thetan's creatingness and a thetan's doingness and a thetan's causativeness in all directions – you would, of course, have a not – a non-as-ising situation.

Only the not-is that exists there is in reverse. One is not not-ising the item. The item is not-ising the person. You see that is a reverse mechanism? And of course, that is your most dangerous valence.

A lot of religions tend to set up this valence. The campaign of most religion is to get rid of all the evil spirits. And they really go to town on getting rid of all the evil spirits. All early religions – I don't care how they become modern religions later on – or some – after they've gotten rid of all the evil spirits they usually become modern and benign. That's because they've done their job. But early they're quite militant. Any religion, whether Christian or Mohammedan, anything else is quite militant on the subject of the evilness of the spirit – the evil spirits that must be around.

So that you get the religion of the German woods is totally based upon how horrible all these things are that live in pools and trees and caves, don't you see? How they're liable to spring out at you at any minute. Earlier religions, less violent, less aberrative types of religions, admit the existence of beings which are not necessarily malignant. There you get the Irish. The Irish have a whole category of little people that do various things, not necessarily bad.

And it's very funny that that ancient religion would ride right alongside of the most violent, modern religion which we have – that these two things would go hand in glove. But they seem to have succeeded in doing so. And of course, we probably will see the day when we know nothing about – who was it that "driv' the snakes out of Eire-land"? we won't 'ear about 'im anymore. We won't hear about him at all, but we will still have leprechauns – the wee people.

And when a religion has been totally successful, utterly and totally successful, it manifests itself in a society where the spirit is totally unknown and there are no spirits. Now, beware of that society because it is the furthest south. There are no spirits. They just don't exist. Man is MEST. The brain is the limit of psychology. There are no spirits. Now you've achieved a total overwhelm.

Not only are there not even no – malignant spirits, but there just are *no* spirits. And you have a soul like your car has a spare tire. It has nothing to do with you. You're taking care of this soul. You see, it's an other-determinedness by this time. You're taking care of this soul. And if you were a good boy or you were a good girl, why, you can send this soul off at your demise to some pie-in-the-sky sanatorium [laughter] or something for souls, see.

Well, let's take a limit – a limiting view of this sort of thing. Now, how has this manifested itself in our present world. Well, let's take what they're called – the exact sciences. And let's see what these exact sciences are all about.

Matter, energy, space and time. Well, the first fundamental of elementary physics as taught in every school in this western culture is the conservation of energy. This is the first and foremost thing that is instructed. Energy cannot be created. Energy cannot be destroyed.

Along with this we have conservation of mass. You burn a candle and if you were to seize all the carbon and all the other gases and elements and compress them in fragments down again and to rescue all these things and put them together in the platter, they would

weigh as much as the candle of. See, once the candle is burned the residue which is left will weigh as much as the candle. I consider it very interesting nobody has ever done it. Interesting theory.

Well, we could see that this is perfectly *reasonable*. But notice how *reasonable* we all are on the subject of physics. Very *reasonable*.

We cannot destroy or create energy. And all mass suddenly turns out to be energy. Well, the weird part of all of this and the contradictoriness of all of this, if there's matter, energy, space and time and there's never going to be any more energy or any less energy and all – it's always going to be this much energy and nobody can do anything to this energy except maybe alter its condition – if that's the case, where do they come off having an expanding universe. See, they have conservation of energy, but they haven't gotten to a point yet where they have conservation of space.

See, they still talk today about the expanding universe. In other words, there's more and more and more and more and more space. Interesting way of overwhelming somebody, isn't it. There's going to be more and more space, you see. And there's never going to be less space, so it's expanding, expanding, expanding and expanding, see.

But you're not going to be able to do anything to energy. And space is just overwhelming you. Well, you wonder why a physicist goes nuts. The commodity which he is handling he is instructed that he can never do anything to. See, he can never destroy it and he can never create it.

So if he can never destroy it and never create it, of course, it's sacred. And, man, if you ever want to get into a religious argument, start talking to a flock of physicists. It's a religious argument. It has nothing whatsoever to do with the reasonableness of this or that.

They don't realize that religion itself has brought them to the pass of this, because these things consist of a series of postulates which are agreed upon and made. And having agreed upon these postulates, having made these postulates, we wind up, of course, with an agreed-upon situation and condition. But I think any one of you on the backtrack are liable to find out where you violate the principles of energy or the principles of mass.

I imagine you've been sprinting up and down the backtrack at some time or another and you may have run into, all of a sudden, well, I don't know, making things disappear suddenly and startling everybody or suddenly making things appear and startling everybody or making all the trees grow twice as big suddenly or half as big, or just as-ising things at a glimpse or overwhelming in general someplace on the track. See, doing something to energy.

I think somewhere, even if it's just stopping somebody, you've got a facsimile of doing something to energy. But of course, if you can't do anything to energy, time becomes inexorable because time is manifested by the change of space of particles – well, of course, is itself a postulate and is not monitored by the change of space of particles.

But one becomes aware of the passage of time because of the change of space amongst particles, even if it's just the tickety-tock of a balance wheel of a clock. It's still change of space of particles.

Now, the physicist, then, is actually a priest gone mad. That's all he is. And having imbibed all of his stable data and having sworn on the blessed Black's textbook on physics or something like that, to forevermore uphold these principles and to never turn away from any of them and to support them to the death, he then starts studying nuclear physics. And this is very difficult because he finds there's such things as holes in space and sometimes certain particles will shoot through in certain ways and become two particles and they were only one particle. And energy misbehaves. And the finite laws of elementary physics start to get foggy.

Now he's trying to hold on to a set of principles which tell him conservation of energy, while experimenting with a set of principles, of course, which tell him that there – something is astray about the conservation of energy and he usually winds up by saying, "Well, it – none of it violates the conservation of energy at all," with the attitude of a boy whistling as he goes by a graveyard.

And he goes mad about that time, so it's no wonder that the primary threat to this particular planet at this particular time is the explosion of bombs of nuclear fission. Because the first thing such a fellow would do would be to destroy himself.

We hear of the dedication of science and the dedication of science, of course, is all for science and nothing for me. All scientists should give all of their patents and developments to the club or to the university or to the manufacturing firm or to somebody or other. People should not, themselves, take out patents on their developments.

Nobody should have a right to his own developments. One of the most violent experiences that any physicist wants to have, will greet him or any chemist or something like that, if he's working for a university and happens to pour test tube A into test tube B and get molten student or something. If he were at this particular moment to take out a patent on this process in his own name he would probably be thrown out of the American Society of Chemists, the American Society of Physicists, the university and probably out of the house, too, as having been a traitor to the cause. He had done something to himself. It's quite peculiar.

If you think of the number of times you have tried to tell an educated person in the field of the mind or a psychologist or somebody, about Scientology, it would strike you as absolutely amazing that anybody could make the – this remark: "Well, I don't blame you for keeping it all a monopoly to yourselves." And yet that is the adjudication that the American psychologist makes about the Scientologist – that we are keeping it all secret to ourselves.

If you think of the number of times you have tried to disseminate and compare that with an attitude that we are keeping it all secret, it will look absolutely asinine to you. But of course, these birds are just asking for an executioner, that's all. You'll never have any trouble when you finally top the rise on this sort of thing.

The only trouble you will have will be trying to save the psychologist from his suicide. He will not combat you actively. He will only combat you in a direction which executes himself. That's the only way he'll combat you. And he'll probably make hysterical public statements – they do, you know – that make them sound discreditable or silly. Or they steal the wrong part of the technique. It's all theirs, but they steal the wrong part of the technique, you see or something like this, just to publish some asinine nonsense based on this sort of thing.

What's very peculiar and the only thing I'm bringing up here is, is here we're practically trying to force it down the guy's throat, you see and they're only mad because we keep it secret! That's from their view that's what we must be doing.

I've had one of them tell me that – accuse me of not publishing papers in the *American* – I don't know what they call them – the *American Society of Psychologists' Journal*. Why didn't I publish papers in the thing. It a – "Just – *just* one of these cases!" I had heard one fellow say one time, "*Just one of these cases! Just – just* look," you know. The guy..." The average gain in an HGC, you know. "*Just one of these profiles* published would *revolutionize* the whole of psychology!"

They'd never publish one of those things. You could walk in with Sten guns and they'd never publish one, see. The guy's very upset because you're not publishing, you see, in this magazine. And this magazine, of course, would never publish anything you gave them because you're keeping it all secret. Isn't this a fantastic spin? Well, I used to go round and round with arguments of this character.

At first, if you tried to talk to them and some of you will, sooner or later, you'll talk to such a chap and he'll be impudent or insolent with you at first and then just go into apathy. *Thud*. There isn't any gradient scale. He just doesn't go down like this, you see. He goes along insolent, apathetic.

Now, what he's trying to do is carry on something he thinks comes out of physics. See, he's trying to keep the sacredness of energy. He's trying to keep the sacredness of the brain. We've long talked about care of the body, care of the body, as one of the ills of our modern society, you know. "The worship of the body." Let's put it that way.

Care of the body, care of the body, care of the body. You got to do this with the body, you got to do that with the body. You got to get up, you got to exercise and you got to – got to do this and you got to do that. Well, maybe you got to but ... When a fellow starts telling you that the brain does all the thinking, of course, this is just an effort to get what's inside the brain – a thetan – totally overwhelmed by his immediate environment. See? Which will get a total survival of gray matter and the total nonsurvival of a – of a thetan.

See, when you try to teach a psychologist about Scientology you're going straight up against his basic stable datum, is that the thing which is there to as-is isn't there.

Now, therefore, those valences which you'll have the most trouble trying to run out or will give you the most trouble on a case are those valences which totally deny the existence of a thetan because there's nothing there, you see, to as-is.

That's different from – you look at a steel plate and look at it very heavily and you know you're looking at it and you'll – one of your first conclusions would be that looking at the steel plate would be – well, that would be a hard job of as-ising, trying to get a steel plate to disappear just by inspecting it. Now, you will – you would admit that this would look pretty hard. No, this is nothing. This is nothing compared to being a steel plate. See, at least the first situation, you're there looking at a steel plate trying to get it to disappear. But the second, there is nothing to look at it.

So that is the extreme case of not as-is. No as-isingness can take place in the absence of something to as-is it. See, you're not going to get any lumber sawed if somebody has hidden all the saws in the land. There isn't a saw in the land. How're you going to saw the lumber? You're not going to.

Now, being a steel plate and being only a steel plate, not being a spirit that is in a steel plate, but being a steel plate – "Me the steel plate" – is the least as-ising situation. See, as an auditor, you must know what the least as-ising situation is.

Now, if – therefore it gives you some wisdom in your trying to disentangle items. You look over a whole bunch of items. Let us say, we go over this list of items and we inspect them. Your E-Meter reading will give you the one most likely to as-is. It doesn't give you the most overwhelmed. See, it'll give you the one that *will run*. But remember there are some others after this has run and the individual has increased his beingness, his own beingness, you see, to the point of not being what you have just run out. Now, he will be in a situation where he can be assessed again and will become aware of the fact that he is not quite the steel plate. We – before, when you went across that, you got no reaction at all because you just got the reading of a steel plate.

He's being totally a steel plate, you see. Next time you run across and you read steel plate to him, you see, you've increased his ability to view, to be himself without being something else – and he'll register now on being a steel plate because he's not quite a steel plate.

A tree out here – if you put an E-Meter on a tree, you won't get much of a read because trees are really being trees. Boy, are they – are they ... Whatever spirit combination puts together trees is sure being trees.

But oddly enough tomatoes aren't really being tomatoes very hard. That's very peculiar, you know, because you can get a tomato to register. You can get corn to register – maize. A lot of vegetables, a lot of flowers will register and a lot won't.

It's the amount of *endure* connected with a vegetable which gives you the lessened needle registry on the E-Meter. In other words, the more endure the less registry. That's an inverse proportion.

The greater the effort to survive, the greater the endurance, the more mesty a thing is. And the less registry you will get of livingness.

So frankly, in the early stages of sorting out a 3D Criss Cross Goals Problem Mass, you will come across no reaction at all on those that should be run. Put somebody on the meter. You say, "Do you have a Goals Problem Mass? Do you – have you ever been anything else or anybody else?" The possibility is you get no registry at all.

He's in two conditions. He's in the condition of not-know about any of them and they're there but he isn't there. In other words, you get a total overwhelm involved here that includes a not-know and of course you should be able to see at this time that a total overwhelm is a not-know.

Of course you get no registry at all. But now, you start differentiating items and you start nulling them and you start getting items. All of a sudden *bing*, a fellow is this one and

bing, a fellow is that one and you've got another one and got another one. You're getting your various lines. "Oh-oh, there's a feeling along here someplace that these things have a peculiar beingness of some kind or another."

You at least have the fellow in present time exterior to the view of being able to say, "Yes. Somewhere on the track there's a whizzer."

Ah, well, that's much different. You see, up to that time, he couldn't say a whizzer was even on the track because, you see, he was a whizzer without being there at all. So all you got a reading of was a whizzer. Not a whizzer plus a thetan or a whizzer being inspected by a thetan. That – you didn't have that. You just had a whizzer.

And the fellow who is saying, "I wonder if I could have been a whizzer?" See, that's the period where he's sort of coming out of the morass – coming up to a point where he can inspect.

So your listing, differentiating, nulling, finding and proving an item, is leading a person further and further along the line of being able to inspect and is lessening his identity with MEST because *all* of these valences are composed of matter, energy, space and time and trapped postulates.

They haven't got thetans in them; they got trapped postulates in them. You can see the postulates come to view. The person doesn't see himself coming out of these things. He sees at first the ideas of them come alive. And then eventually, why, hell – he sees there's been a thetan in them, namely him.

So what you've got in 3D Criss Cross – a gradient scale of bailing somebody out. Well, of course, the extreme condition you're bailing him out of is you're auditing a brick wall. You're not auditing anything, except an object, an identity. You're auditing a plumber, see. It doesn't even register, see. The Goals Problem Mass has no registry on it of any kind whatsoever.

At that stage of the game, before any differentiation took place, if by some necromancy you had been able to look over the shoulder of Yahweh or Tetragrammaton or whatever the fellow's name was... Somebody keeps books on somebody. I think he has an angel that keeps books. And if you'd read the angel's books and not got that from auditing the pc and you found out he'd been a waterbuck and a tiger and a whizzer and a plumber, see, off the good books and you said, "Waterbuck, tiger, whizzer, plumber," you know, you would get no reaction on the meter at all.

It wouldn't do you a bit of good to know all the Goals Problem Mass on a pc if the pc didn't know any part of the Goals Problem Mass on him. Because you'd get no registry. Because you're reading those items which are there which are not as-isable because there's nothing there to as-is them. He's just in them. But he's not there in them. They just are. And they look to him like packages of MEST when he first begins to view them.

They're balls of energy sitting in space. They have mass. Sometimes some time gets connected with them and pieces of MEST when he first looks at them. Well, he is that MEST when you first encounter these things. And there's no differentiation of any kind at all in his mind. So you don't get any read on the needle.

No, you have to approach this from the point of view, not even of, "Could this have been me?" That will occur to him rapidly enough.

You say, "Who or what – ." You notice he scratches his left ear. Let's take some weird gradient here. This is not necessarily a proper approach at all. But let's take a lightest possible approach. And you notice he very often scratches his left ear. And so you say, "Who or what would oppose scratching an ear or a left ear?" We do a long list of this thing.

All of a sudden, why, the item that falls out of it is, "a doctor." And he suddenly has a picture of a doctor in school who used to tell them never put anything smaller than your elbow in your ear. [laughter]

And he gets an actual identity. And this actual identity falls out of the bank and there it is. Well, you know. Well. Suddenly the past track, you know, there's something a little more real to him here, you see.

Now, "Who or what would oppose the doctor?" you see. And if we did something like that, there's another identity that he was being obsessively in. It tends to come out just a little bit, you know?

You're getting something there which can as-is. See, we're moving from a not there and therefore can't as-is. Can't as-is because one is not there. These other things are there, but he is not there. You see, it's an other-determined condition entirely. We moved that on a gradient to these other things being more and more and more observed. And of course, on this gradient we get more and more awareness of self.

And of course, we have more there *to as-is*. Now, you've heard me tell you for years and years and years and years and years that the most difficult pc was the one who couldn't as-is, whose thought didn't have any effect on anything.

You've heard that one. All right. Now, put that together with what I've told you tonight. Of course, the least condition of having an effect on anything is not even knowing you were there to have any effect on it. So that sums that case up instantly. And that tells you why 3D Criss Cross has a constant, continuous gain. That – this is what I'm telling you is the therapeutic value of 3D Criss Cross.

Now, if you're not getting tone arm action during listing of 3D Criss Cross then you're not there and they're not enough there to have you there, so of course, nothing is as-ising.

Well, you've got some tiny action. Yes, you could probably keep it up. You could probably win from that tiny gradient.

But there's another way to approach this situation. And that is to use the CCHs. And when you do this the pc appears – pardon me, the beingness of John Doe and the beingness of the auditor – no thetans or other beingness – but those two *identities* appear. And out of all the nowhere-ness we've got an observation of identity. See, we've got an observation of present time identity.

Now, objects can – all cases go on this gradient of show up. This is items that show up. And they go on this gradient. But some cases are not as far south as others. But this would be the extreme gradient: Future items, present time items, present life items, past life items.

And as we go north from a case that's all the way south we would first pick up future items. Sounds crazy, doesn't it, but it's true. We'd pick up future items and then we would pick up present time items and then we would pick up present life items and then we would pick up past life items.

All right. Now, if a person isn't getting much tone arm motion, it's much easier to cut them into this scale suddenly, *clank*, with CCHs. See, without struggling around about it and monkeying with it, well, let's just cut them in to present time items, namely, an identity pc and an identity auditor. Let's not worry about where they're lurking on the track. Let's just cut them into present time and take off from there.

Of course, you get enough control, communication and havingness going in present time and the individual will sooner or later get the idea that the identity can reach this other identity called auditor and certainly that the other identity called auditor can reach the identity called pc and therefore they are two different identities. That is the first lesson that is learned. And that is the first CCH items that show up.

See, as when you're going – when you're going at 3D Criss Cross on this route you attain your first two items by CCHs. Sometimes the first one is auditor and sometimes the first one is pc. Sometimes the first one is pc and the – and the second one is auditor. But those are the first two items that show up.

In other words, they get a higher and higher ability to differentiate between pc and auditor and auditor and pc. You're not really differentiating that way.

We do have one of these CCHs that you're well acquainted with called Op Pro by Dup. which actually does *forcefully* show the individual... Oh, inevitably, if you run enough Op Pro by Dup smoothly enough you're going to have the pc sort of saying, "You know, I'm kind of out here looking at the body do it. You know, I mean..." It's a gradient. Their arms get *thin* or objects get *thin*. Something happens that they're not so cockeyed sure that they are an *it* and they get an observational point of view. That's if Op Pro by Dup is going to work, that's the direction it works. It's a great exteriorization process.

Of course, exteriorization is terribly violent. It's without a gradient scale at all. This is not saying – this isn't Op Pro by Dup exteriorization. That's not violent. But I'm talking about now, exteriorization.

We say, oh, well, you want to get this guy separated from items. *Ho-ho*. Well, that's easy. Try not to be three feet back of your head, you know. *Bang!* The guy's three... All of a sudden he says, "What! I'm not that? God help me." you see and *bang*, he'll go back in or fly into other valences or something like that. *Oh-oh-oh-oh*. Shakes him up. Gives him a – gives him quite a start. Quite a shock.

It was very funny. A few minutes afterwards it would be very vivid to him. And a day or so later, it never happened. You've had it happen to you as an auditor, I'm sure.

"No. Why, the auditor keeps saying he exteriorized me. Why, he didn't exteriorize me, no."

Person was outside saying, "*Gee, my gosh! Really! Oh no!*" And you know. "*Gosh,*" you know. "What about that, you know!"

Next day, "No, I didn't exteriorize. Nothing actually happened at all."

In other words, you can, on *your* determinism, blow him out of his 'ead. But that was n't on *'is* determinism. So you've blown somebody out of his head who is in no position to recognize that he is any different. And the only way he can survive is by being an identity, some other identity and being thoroughly enmeshed in it.

And that's good. That's good and safe and so forth and you give him no chance to get used to it. Well frankly, 3D Criss Cross is an exteriorization process. It does it on a tremendous gradient. It's a very, very gradient, gradient. Very slow. Item after item, mass after mass that the person has been in, the person begins to come out of. And they don't even come out of them very far, each one at a time, don't you see? They don't violently come out of them. Their attention goes on the things and as you increase though, the individual passes into an ability to as-is. And the last item that will come off is the one which was most *sacred*. And the one which was most sacred was the one that was *him*. Because he wasn't there and it was. And that would be the most extreme case on the bank of, "it was there but he wasn't there." And he wasn't there at all, not even vaguely was he present. He was it.

You ask any pc. He says, "Oh, well, I just want to be myself."

You say, "Well, good. What's yourself?"

He'll give you something, but it won't be really what he's being. He'll just give you a lock on it. He never gives you the real one and just gives you a lock on that thing.

But he'll finally be able to answer that question of what he is. And the one step out from that is he really is just – just "me," you know. He's just a "me." He is not a dandy with a three-foot top hat carrying a two-foot-nine cane, smoking Murad cigarettes, see? That is not what he is. It's just "me." And this is going to drive somebody batty someday when they're doing listing, you know. The guy keeps saying "me, me." you know, it's toward – way toward – you got about thirty, forty, fifty items, you know. Case has been progressing real well.

And, "Yeah and what would oppose that?"

"Well, just me. Just me. Just me."

And you finally get an item which is "me," which would of course be your last item. But of course before you get that last item that is really "me," you have thirty, forty, fifty items at the absolute minimum, all of which the pc knows are "me." But this last one, he finally knows, "That is me. That is just me."

"What would oppose that?"

"Me."

Well, that's of course, if you did the whole of whole track dynamic clearing with 3D Criss Cross only, assessment only, never running, if you assessed out, that would be your final item.

But of course, every item before you get there, each one is, of course, "me."

So there is the substance of the thing and there – how the bank sets together. There's the person who can't as-is. There is how you get a person to as-is.

Your CCHs cut into this very simply and very easily by simply slashing into present time and finding two items in present time – auditor, pc. Also, can find another item – wall.

And even if these items – a person knows he isn't these things, he becomes much less these things as he goes along.

One comment. How does all this happen? I mean how does a person get that interiorized? And I just want to make one comment here because it's now late and just one little comment.

How does a person get this way? By asserting a reaction of an identity or an object. He's asserting that it will react. That is the clue to all future interiorization.

Now, that – it sounds silly. If you wanted to set up this chain reaction you could say this piece of paper will react. And you've set up the overt-motivator sequence, you see. This piece of paper will react, you said. If you do so-and-so then this paper will do so-and-so to you. That's going even a little further than it just will react.

You see, a first gradient is this paper will react. The laws of reaction, don't you see. But then if you do something to this paper, this paper will do something to you. Now, you've got the chain well settled and that is the overt-motivator sequence.

See, if you touch a match to this paper and don't take your hand away, you will be burned. See, if you learned that lesson very thoroughly. If you set up this piece of paper to react in that particular way, you would have set up the sequence which would lead to a fully established overt-motivator sequence.

You say steel reacts. You go along and punch your fist into steel and it'll really fix your clock. Now, actually the resistance of steel depends to a large degree upon its conductivity and the fact it doesn't react. See, it doesn't react on itself and it does react on you. See, this is getting a little more complicated but it's all under the heading of react. If you do something to the steel, the steel will do something to you, but nothing will be done to the steel, don't you see? You made the steel sacred, in other words.

I can see it now. Some metallurgist wanting to make better armor plate for the Royal Navy. He knows how to do it. You just get everybody to sit down and pray down at the iron works and you'd have it made. That would work out just fine providing the enemy heard your prayers. But you'd have to teach the enemy that your steel would react and he would have to believe that.

A shell fired at this steel not only does not dent this steel, but instantly is catalyzed into a blow-back and sails in the same trajectory through the air and goes down the muzzle of the same gun that fired it and explodes therein. Now, that would be *real* armor. [laughter]

Well, that's how your overt-motivator sequence sets up. That's how reactivity sets up with regard to these items. It all comes under these various relatively simple rules, relatively simple laws.

How you get a fellow fished out to a point where he can look, well, that requires a considerable technical accuracy, but you should know in using that technical accuracy what you're trying to do. You're actually just getting an individual out to a viewpoint. And that's all you're doing. Okay?

Audience: Yes.

All right. Well, there'll be no lectures next week. You will get a chance to study. And I'm very happy about that because the number of passes you've been getting are terrific. But I expect you all to be classified by next Friday. [laughter]

So you needn't worry about it tonight. You can have a good sleep. And remember: sleep is sacred. [laughter]

Good night.

AUDITING

A lecture given on 17 April 1962

Thank you.

Thank you.

Are you making it?

Audience: Yes.

Listen to those. [laughs, laughter] That's what you get for getting yourself in such lousy shape. That's all I've got to say. What a dirty look. [laughter] Well, who got you in that shape? Yeah, that's it. That's just the whole thing. That's the whole thing. Somebody else is to blame. All right. [laughs]

All right. Good enough. Now, my auditor at the moment is probably sitting back there. Where is he? Where is he? Yeah, there he is there. He's probably sitting there nervously because he said to me last night, he says, "Well, that's something that you can tell the students." Actually, he's very nervous that I'll make a comment on his auditing.

I haven't gotten any hammer-and-tongs auditing for quite a while, straight on through and I'm going for broke now. And let me tell you, it's a terrific sensation to be audited by an auditor that knows his business. You know, will follow through and does do his business. You know, it's terrific. And absolutely nothing compares to it at all.

The standard of auditing – just from – just from a subjective viewpoint – the standard of auditing of a couple of years ago and the standard of auditing now, they're absolutely no comparison of any kind whatsoever. The auditor's predictable, the rudiments we have, when they're in, the person is in-session, so forth. The auditors are getting careful of the pc. They're auditing the pc, not the chair or something. And it's – just makes – it makes a heck of a difference. Terrific difference.

And this has been quite an experience last week and this far this week. And from a standpoint of subjective reality on just exactly what you are doing. Nothing very fancy. Phil was auditing me a couple of hours a day and it's pretty good. And I was impressed with this fact. I was impressed with this fact, that all an auditor has to do today is do exactly the processes, the Model Session, the exact routine that you're doing – and if he doesn't vary from these things, if he's careful on each point and so forth, that it's absolutely marvelous. Absolutely marvelous. We really got this thing grooved in and a pc could not help but be impressed with just good standard auditing. He just couldn't help but be impressed right down to the ground.

I was thinking it would be a wonderful experience if all auditing in Scientology were of that caliber. If it were all predictable. See, if it never got any funny business going on and if the auditors more or less stayed in two-way comm with the pc and carried on exactly what he was doing and never let the pc take the session out of his hands and so forth.

This – particularly a new experience for me because the auditing I've had has been pretty varied one way or the other. And auditors suffer from the fact that every time I sit down as a pc, why, they think I'm going to instruct them and they want me to instruct them. So halfway through a process or something like that, they ask for some directions or something. That's pretty grim, believe me, you know.

And I got so I couldn't – I didn't dare make a remark to an auditor, you see. They'd do something about it, you know. I mean, I say, "Well, I had a somatic there," you know and the auditor would do something about that. We wouldn't go on with what we were doing, don't you see?

And this – this in itself, just a non-Q-and-A in the auditing department is a fantastic thing to experience. An auditor never Qs-and-As. Pc can say what he damn well pleases. Gives you a terrific area of freedom.

You can say, "Well, you goofed," you know. You don't have the auditor all of a sudden blowing, you know. Auditor goes on with his business. In other words, you don't have to sit there carefully as a pc to keep the auditor in-session or something. [laughter] And it's really been a terrific experience. I really appreciate it very much. We're going right on with this at a couple of hours a day.

It's been about seven sessions, two items listed and found, the terminal and oppterm of a package on a discovery list and tone arm action through the two items has been 1.75 to 5.0, as a breadth of range, constant motion. And we're having a ball. That's no – that's no kidding. I really appreciate the auditing I'm getting.

And I'm here to tell you something. I'm here to tell you something. You probably have fantastic ideas of – particularly if you're just coming in new on it or if you've only been at it two or three weeks here or something like this – of, "Exactly what frame of mind do I get into in order to audit?" and so forth. And, "How do I best overwhelm this pc?" or some such questions, see?

And I can tell you that the most impressive attitude for an auditor is simply calm competence and go on and do his job. Come hell or high water, just go on and do his job. And the greatest certainty the pc can have is that the auditor will keep on auditing and not take up something else every time he starts in auditing something.

And when a pc gets that idea, why an auditor then has terrific altitude. An auditor, actually, in an auditing session, has altitude for no other reason at all.

All right. Well, let's see. What's the date?

Audience: 17th.

By George, it is the 17th. 17th April AD 12, Saint Hill Special Briefing Course, lecture on the subject of auditing.

We're only hitting two processes today – two packages of processes – on which we're going to count for steady, continued case gain. We're going to count on these processes. And that's the CCHs and 3D Criss Cross. And we're going to count on those processes. And the reason we're going to count on those processes is because those processes have been working and because they take a case all the way south. And because there are a certain number of skills which are packaged up into the CCHs and 3D Criss Cross which auditors have been able to learn, auditors have been able to apply. Auditors do well with these. They are very precise drills and they are carried out in a very precision manner. And auditors can do these things.

Now, that's the first test of a process, is can an auditor do it, not can I do it. 'Cause, Honey chil', I could audit things on you that would stand you upside down and hang the pc's thetan on the moon, see. But that hasn't anything to do with it at all. It has to do with my enthusiasms for certain processes in the past and it has to do for my misguidedness occasionally on certain processes because I could do them and somebody else couldn't. Something like that, you see. It'd be a limited number of auditors that would have success with it.

You look at these two and you will find out that they are broad success processes. The CCH and 3D Criss Cross. You'll find out that nobody's going to have very much trouble with these processes.

You have to be a terrifically well-trained auditor to run these processes. Don't kid yourself about that. The standard of training is way up. But there is no compromise. There is no lesser grade of processing that will get a pc all the way through and don't believe that there is. There isn't. Not that auditors will consistently do around the world.

Now, what changes my viewpoint on this is that I have had a great deal of success with some rather fantastically, razzle-dazzle processes at one time or another. I remember a girl stumbled into the office one time, didn't even know her right name, audited her, think a couple of hours or something like that and she turned clean and sane and went and got herself a job. And as far as we know never had any trouble afterwards.

Trick processes. Yeah, yeah, yeah, but these are spotty. Next psycho came along. You couldn't audit the same process on that psycho. You see, you had to dream up something else.

Well, this enters in judgment. It enters in imagination and judgment. It enters in a great many factors. And I will give you a resumé now of what can broadly be done. And this is no insult to auditors broadly, but I'm just telling you factually what's the truth about the situation.

An auditor can do any process – that is, any auditor can be trained to do this – which does not require of him more adjudication than can be given to him by an E-Meter. If you ask him for any further adjudication or judgment than he can read off the E-Meter, you're going to find a broad swath of disaster following that process. See, some are going to be able to do it, but the majority are not.

Now, these precision drills of the CCHs require that an auditor observe constancy or change. Now, there we're going to run into a little bit of trouble occasionally. Some auditors are going to look at a pc and say this pc isn't changing when the pc's changing wildly and so

forth. We'll run into a little trouble like that occasionally, but that nevertheless can be borne with and steered into adjudication of it.

In other words, as long as we've got Instructors that'll kick an auditor's head in while he's being trained for a change in processes while the pc is still getting change on the process, we can ride out that one. Auditors can be taught to do the CCHs. There is no mystery about why the CCHs work.

An auditor can be taught to list and read a meter against a list. In other words, he can do any of these CCH drills and he can do any of these listing, meter-reading drills. And those, auditors are having no difficulty doing. And fortunately for us all, it is the main route and the fastest route to Clear or OT or anything else you want to reach. That's very fortunate for us, you see. Now, what it requires is instruction of a precision nature. When you're training somebody to do this, don't yourself get into the idea that there's two ways to do it, because I can tell you right now there aren't. There aren't two ways to do any of these things. There aren't two ways to do the CCHs. There's only one right way to do the CCHs.

And in 3D Criss Cross, there's only one right way to list. There's only one right way to null. You could differentiate a couple of ways, but you'll lay eggs. It isn't a two-way proposition that you're dealing with. So we're dealing with something which is a studied, precise drill and a studied, precise drill which has been successfully, consistently taught to auditors now for quite a while – especially the CCHs. Right CCHs are easy to teach to auditors. Wrong CCHs are hard to teach.

3D Criss Cross – we've been very successful in teaching people to do 3D Criss Cross. Extremely successful. And this is marvelous. And the other thing is, we can train an auditor to do a repetitive process and that's your Class IV. It's just repetitive processes.

So as long as we get a high level of competence in exactly those spheres, you're going to see dissemination go by leaps and bounds. It's terrific. I mean, there isn't anything that you could say that would be an exaggeration, factually. From days of exaggeration when I shouldn't have been exaggerating, perhaps, on enthusiasm, we've gone to a level where we can't exaggerate it. You yourself should learn that and you will learn that in your line of experience, that you cannot exaggerate what you are doing. There's never been anything like it. Auditors can be taught to do this competently. And competently done, it makes a fantastic impression on the pc. He gets a level of security and interest and so forth. Terrific.

Now, you can do these drills without sometimes understanding everything there is to do in them. You actually can do them a bit in the absence of understanding. But it would be much nicer if you knew precisely all of the reasons which underlay these drills. That would make a much more intelligent auditor. And he would not be teaching somebody on the basis of that old, old saw that I have mentioned of the wise man who taught the neophyte all about it. And to keep the cat from running around, before he began the lesson each day, he tied the cat to the bed. So when the neophyte got to be the wise man, why, he got a student in and said, "Now, the first thing we do is tie the cat to the bed" you know. A lot of that bunk can get into what we're doing, you see. A lot of – a lot of magical monkey business, you know.

And fortunately for you, we know why. You see, that's even more important. We know why these things are working. See, and also you could find out why these things are

working. There isn't any reason to go around Robin Hood's barn to wonder why these things work, because it's only recently that I've gotten the facile explanation of why the CCHs work, after all these years.

Now, you're going to ask the question along about now well, what the hell happened to prepchecking? Oh, yeah, you've got to be able to prepcheck. You learn how to Prepcheck and you learn how to prepcheck just as best as you possibly can. Because if you can't prepcheck, sooner or later you're going to run a cropper on some person. They're withholding like crazy. They're – you're missing withholds like mad on them. They're mad at you all the time and so forth. You only got one answer. That's Prepcheck. And that's what Prepchecking is for. And that's all Prepchecking is for.

Now, Prepchecking has gone the whole evolution. It is quite amusing that with Prepchecking we wind up, 100 percent, the work of Sigmund Freud. That's it.

We've left the animal psychologist lying where he belongs in 1879, from which he never advanced. His idea was man is a brain. I, by the way, these days am never referring to psychologists. I only talk about animal psychologists because I want the beast to be known by his right name. [laughter] That's all he is and all he ever pretended to be. Any psychologist is an animal psychologist because the basic theory on which he operates is man is an animal. So we call him animal psychologist. And I think that will effectively take care of that as the years roll along.

Now, don't ever use that word psychologist after this. See, just use animal psychologist, always. And you'll get it around. You'll find the *Times*, sooner or later, will be talking about the animal psychologist. And people will be phoning them up to take care of their horses. [laughter] I wouldn't let them though. And I don't even like horses. I wouldn't let them take care of my horse.

Anyhow, the thing that – the thing that is newsworthy and noteworthy on this subject is that all of the work of Freud and any work by the faculty psychologist has been wrapped up in Prepchecking, which I consider quite wonderful. It's quite an achievement. Really, we ought to get very proud, you see and say this is really marvelous.

Do you realize you can find any of the childhood traumas that Freud thought were there. You can find them all. You can eradicate them. And worse than that, we've wrapped up the work of Freud's, ah, squirrels: [laughter] Jung, Adler. Well, I think it was Jung that traces everybody back to his stuck engram – druids. And we can trace people back to druids. Blow the trauma, too. Blow the whole tree up. [laughs]

No, any of the work that has been assayed in this, any of the work at all. Furthermore, we can probably turn it all around into black Pavlovianism and probably give people enough psychic traumas to make them "slaver." I think you could hit a guy long enough and often enough to make him slaver when he saw food.

Maybe I've got Pavlovianism a little bit wrong, but it seems to me like that has something to do with it that people are supposed to slaver. [laughter] Actually, all the work that has been done by Pavlov was swallowed up by communism. Pavlov's basic work is not available to the Western world and never has been.

And he treats of animal conditioning. The last days of his life he was whistled up to the Kremlin by Stalin and told to sit down and write himself a manuscript of everything he had learned about animals and how they could be applied to men. And he sat up there in the Kremlin for quite a while and he wrote a four-hundred-page manuscript which has never seen the light of day. But we see communism everywhere.

There was a film that was captured in Russia by somebody or another. And it's one of the basic training films on the use of Pavlovian work. And they show a young man going through all of the actions. They show a dog going through all the actions and a young man going through all the actions, you know – slaving over the bell ringing and coughing because of the food or whatever it is, you know.

In other words, they have a human being who was being conditioned the same way that the dog was conditioned in Pavlovian work and so forth. And this was a training film for embryonic Pavlovianists in the communist block. It isn't anything peculiar that people all lay aside the first dynamic in communism and assume only the third, you see.

Those techniques are used politically by the state. And if you were to take any communist and put him over the jumps with any processes you've got, his communism would blow because it's a lot of psychic traumas. He has himself terribly associated with the state. You see, socialism lets you own ... Well, actually, capitalism tries to let you have what you've got if they can't get it away from you. [laughter] A socialism lets you have about half of what you've got. You see. It lets you have about half of what you already own. That's a socialism. But a communism doesn't let you have anything that you own. Well, let's just get off the definition of state ownership, see. Let's just define it for what it really is. It is the *total* games condition between the state and the individual. See, the *total* games condition. And nothing for the individual to the point where he doesn't even exist anymore.

All right, so that particular field of psychology, not particularly important to us – could be, politically, perhaps – but that field is sufficiently vicious that it'd probably have to be undone with the CCHs or something like that. You probably wouldn't be able to get down to the ground with Prepchecking. And in animal psychology itself, the way they have been developing it since 1879, I don't know that you would be able to get down to the ground of *it* in Prepchecking. These are traumatic actions which are undertaken in these particular fields, you see. They contain injury, which they call conditioning and all that sort of thing.

It's efforts to do things to people. So that effort to do things to people doesn't classify with the Freudian and the faculty – early faculty psychology-type work. You see, that was designed to alleviate things *in* people, which is a different goal. You have to recognize that the Pavlovian and the animal psychologist in general, are trying to do things *to* people. So Prepchecking wouldn't cover that.

But all of the work of Freud is wrapped up in Prepchecking. And the outline of how you do Prepchecking in a recent bulletin, wraps all that up. That's it. That is what Freud was looking for.

Now, having gotten that, we put it over on the side of the desk and we say, well, whenever your pc gets upset with you, you know how to do Prepchecking and you address the Zero question of "Who has missed a withhold on you?" see, "Who should have found out?"

"Who failed to find out what?" That's this kind of a Zero. And you'll cheer the fellow up markedly and enormously. And as far as clearing is concerned, that's the sole use of Prepchecking.

You have to know how to do Prepchecking. But the end results of Prepchecking would only be the end results of – well, I don't know twenty-five, thirty hours of Prepchecking would be fifty or sixty years of Freudian analysis.

But the very funny thing – if you knew how to Prepcheck perfectly, you could actually hang out your shingle as a psychoanalyst to psychoanalysts and do nothing but prepcheck them.

Here's the way you'd do. You'd clear the withhold question and just take Form 3 and any other applicable Sec Check and use those as your Zero As. You see, your Zero would be "Are you withholding anything?" and then your Zero A, would be "Have you ever raped anybody?" You see. Any one of the Form 3s or any other applicable Sec Check. That becomes your Zero A. And you use that as a test Zero A. And then, of course, your What becomes the first withhold you get from the pc, if you get a reaction on that Zero A. Do you follow that? That would be the cleanest way to prepcheck.

But it has been demonstrated to me, several things. The first is condemnatory to auditors, so we'll leave that to later. The first thing that has been borne home to me is that it is a shallow approach. Later on, it might become adaptable in Class IV skills to the handling of actual items found in 3D Criss Cross. And be fully prepared to see it respond in that particular zone of action. But as far as clearing somebody is concerned, there is a probability that you could key everything out with Prepchecking. But this is the derogatory point to auditors; is auditors do not uniformly find good skill in Prepchecking. And that's what licks Prepchecking. You understand?

Auditors go in too shallow and they miss withholds. I tried for a long time to convince everybody that this was what they were doing. I worked on it hard. I worked on auditors personally with this and they still went on doing it. And if I can't teach somebody this particular skill a few feet away from me, how can I teach anybody in Perth? You see? They'll go too far.

Honest, I got so I was practically weeping, looking at the Prepcheck folders. Somebody gets off this terrific withhold that they tripped over the linoleum and hadn't told anybody. And your heart would bleed for the absolute blood and viciousness in these – in these Prepcheck folders. Well, that's too bad. I mean, you sit there and weep over the terrible agonies this person had gone through because he had borrowed Joe's necktie.

Pardon me if I seem to sneer sarcastically. It's just too much. I mean, my nerves couldn't take it anymore. It's just too bloody. I use that in an American sense. [laughter] I could just see the sanguine results of these sessions, you know. Gore all over the floor. And it's terrible. Auditor battles through and finally gets this *terrific* withhold off, you see, that once upon a time he had seen one of his mother's shoes mislaid. You see, I mean, gets right in there and pitches.

There's a terrific amount of skill between the Zero Question, the Zero A and the What question. And there's a terrific amount of skill between, particularly, the Zero A and the What.

Finding that exact specific withhold. It requires skill. And it requires more skill than auditors broadly exhibit. And that's my opinion of Prepchecking.

We've wrapped up Sigmund Freud. If you want to get to be an expert in Prepchecking, please do. You've got to know how to prepcheck to get missed withholds. You won't have any trouble getting missed withholds. You can't help but get the missed withholds that are making the pc unhappy. So you can get those, follow them through and clean them up because you're after a specific target: missed withholds. Fine. Cheer everybody up.

But withholds, no. Oh, it's very little skill in withholds. Plowing up new virgin territory in withholds, they exhibit too little skill. They settle for too much pale, skim milk. I mean, the quality of the porridge ... See, here you are sitting there ready to see the river of fire go tearing across the cliffs and destroy the cities, you see. And there's this little, little trickle of milk runs out underneath the door and this emaciated kitten walks for it. [laughter] You know that isn't what's wrong with the pc. You know it goes so much deeper than that. And auditors will settle for a null needle. And prepchecking for broke, if it's going to do anything with the case, has got to be a stirred-up case. You've got to stir up the case all the time. Stir up the case all the time.

Auditors will always quiet a case down. You see why the skimmed-milk effect? They will always quiet the case down. They will always get that needle null, only to get that needle null right now, see. That's fine. Shows considerable skill in getting the needle null. And that's just what you need to do in doing the rudiments. But Prepchecking is a reverse action. You've got to get in with a spade and pickax. You unfortunately got the question null. That's your attitude. "I must have slipped someplace. I got it null."

See, we got a nice, greasy fall, you see, on the subject of "Have you ever robbed anybody?" You know.

And the fellow says, "Well, I – I took a – ha, I got a knife one time and I got a penny out of my brother's piggy bank. *Ha-ah-ha.*" You know and it goes null.

And the auditor says, "Well, that's good. We certainly got that one null." See and they go off to the next one. Well, he got a null. He didn't miss a withhold. But what it requires in Prepchecking is an excursion about this point, you see.

"Have you ever robbed anybody?" You see?

And he says, "Well, I took a penny out of my brother's bank." And now it's gone null, you see. The auditor doesn't experience horror that the thing has now gone null. He experiences quite the reverse. He experiences relief.

No, no. About that time, "*Well, what else have you robbed?*" You see? Yeah. Well, all right. And it doesn't do anything.

"Have you robbed anything else? Have you robbed anybody else?" And so forth? "Ever robbed anybody else? How about school?" you see, "Well, how about school? How about the rest of your family? How about your father? Your mother? How about the church? How about God?" You know. "Your friends, companions. You were in the service once – you ever rob anything in the service?" – *clang!* "*What was that? Heh-heh-ha-ho-hor-ho.*"

It frankly requires a highly punitive and accusative frame of mind. And because you've got to use an accusative frame of mind this whole while, keeping the pc in-session while you ream him out for it, requires an enormous amount of skill. I would say that it can be taught straight up and with great ardure. But that does not guarantee that it will ever get as far as it may. Do you see that?

Now, there's no doubt about it. You've got to learn how to prepcheck by rote, to get up missed withholds and be able to sit down with somebody who is boiling over. You know, how bad it all is and how bad you've treated them and how bad everybody's treated them, how bad their families treat them. That's all you hear about in this pc, you know. How bad. How bad, you know. How b-. You know.

Well, we've got the absolute positive cure for it. "What did they fail to find out about you?" See, that's all you have to find out. Yeah, "What they – what should they have known and didn't?" That's all we've got to clear. And you clear that with a Prepcheck approach. And that's easy because you're trying to get the needle to null. And you're really not trying to stir up anything.

We've got the whole mechanism of the missed withhold and that's the most important mechanism. So just relegate for the moment Prepchecking to that, well realizing that we're just abandoning the fact that it's totally wrapped up Freud.

I mean, my God, the old man would be standing on his head. He's in school someplace. Let me see, what grade's he in now? Anyhow, if you – he'd actually, practically stand on his head. He'd say, "Wow!" You know, how that man worked. You know, how he worked to get out psychic trauma and find out how to handle them and that sort of thing.

And of course our technology is so extensive in this particular field that it makes Freudian analysis look almost in reverse. But the final analysis is, you've got all these basic psychic trauma keyed out by the time you prepcheck somebody.

You go for broke on Prepchecking, you could change their lives. There's no doubt about it whatsoever. But you have to be continuously *punitive*. And you have to keep stirring up the case and you have to work at it and you work real hard at it. And it doesn't happen to be in the direction of clearing because it's just key-outs. Key-outs, key-outs, key-outs, key-outs, key-outs. You got the idea? The hell with key-outs.

Don't forget we've wrapped up Freud and don't forget you should know how to do it. It'd be terribly impressive, you know. And any time you really wanted to put on a full parade in this particular direction it'd be shocking to anybody that knew Freudian analysis or something like this, to see you handling with ease, something in a – in an hour or two, that an analyst might very well require – *oh, God* – and maybe never get handled at all, you see. It's a superior skill, but it no longer belongs in your lineup as a process. See, it's a patch-up process.

If you don't know how to do it, then you're going to have pcs get mad at you and you're never going to be able to straighten them out. See, that's the – that's the penalty for not knowing how to prepcheck on missed withholds. See.

Sooner or later, somebody's going to get mad at you or mad at your family or mad at your organization or mad at something and you yourself are going to be powerless to do any-

thing about it. Because the *only* thing that you can do about it is a Prepcheck against missed withholds. And that is the only thing that works out of all the sun, moon, stars and firmaments. That's the only thing that works.

We have pushed it right up to the point where it's terrifically workable, too. Guys get mad over the darnedest, smallest, tiniest, little things you ever heard of.

But you're far more likely to find out what is basically wrong with the case – far, far, far more likely to find out what is basically wrong with a case – with the CCHs followed by 3D Criss Cross.

Now, you're assaulting the basics of the case. Now, you're assaulting *whole packages* called circuits, valences. You realize that it might only take you six or eight hours to find one of these items, see. Find the whole package. Another six, eight, ten hours maybe to find the other side of it. I'm talking about long lists and extreme jobs and all that sort of thing, you see.

Now, what's this make? This makes twenty, twenty-five hours. Oh man, by the time you have found one hot item on a case and opptermed it, you have gotten two personalities, *two* valences, *two* chains of lifetimes. You see, one of those 3D Criss Cross items is not just one life. That is not John Jones, the evangelist. See, we found the evangelist, you see. That is not John Jones, the evangelist. That is John Jones, Henry Smith, James George Wesley, you see. And that's in America.

Now let's take up the number of times he was an evangelist in Holland, you see. Now let's take up the number of times that he was an evangelist in the Marcab Confederacy. Now let's take up the number of times he was an evangelist earlier on the track, before he got out of the habit and then later on keyed it in and became an evangelist again, you see.

And do you know that any one of those lifetimes require about 150 hours to be prep-checked and cleaned up. Interesting computation, isn't it?

Let's just be casual about it. Let's thoroughly clean up one of those lives as John Jones the evangelist. A hundred and fifty hours, but then there's Henry Smith and then there's George Aloysius Wesley or something. And then there's the times in Holland. And we're getting 150 hours and 150 hours and 150 hours and 150 hours and a hun- . Hey, what the hell are we doing here, see.

Well, now we're up to a thousand, twelve hundred, sixteen hundred hours' worth of Prepchecking and we've – we've only gotten one item, an evangelist. Oh, well, there's the other side of it. There was the devil. Oh, well, of course, he was the devil on the early track. He was a devil in the Marcab Confederacy and he's been numerously a devil in Holland. And, of course, he was quite schizophrenic as George Wellington Aloysius Wesley, you see. And was an evangelist all day and a devil all night. [laughter]

Now you got two packages, so you just have to double the amount of time in Prepchecking. We're up to maybe thirty-two hundred hours. Well, if you could do it in twenty or twenty-five, I'd say you'd better do it. You better not bother with the thirty-two hundred unless you've taken to looking at the long track and gotten into the frame of mind that you have an infinity of time. Perfectly all right if you have an infinity of time and look at the long track. But it seems to me that something that could be done in twenty or twenty-five hours

shouldn't have thirty-two hundred hours devoted to it. Because the funny part of it is, is you wouldn't clean it up in the thirty-two hundred hours. Isn't that terrible?

It's purely the mechanics of postulate-counter-postulate, mass-counter-mass, see, goal-counter-goal that you find in the Goals Problem Mass that keeps it hung up in the first place. And if you've got it going *zzzzt* this way, why, of course, it starts spreading out along the track anyway.

I speak with good reality on that. I've mentioned this, but I didn't realize it till I walked away from the session, something very peculiar. Items three and two that went out on the list, were another package. And they were a package that was some collision out here. And they came apart and blew before we found the final item of the second list, which collided with the first item we had found which, of course, blew. I think this is rather fantastic, you see. I mean, there's – there's a bonus package. See, there was thirty-two hundred hours blew off while we were trying to find the first thirty-two hundred hours' worth, see. Took a couple of minutes. Anyway, hardly anybody noticed it passing.

But here's what you're into. You've got a bank that can't hang up. The mathematical probabilities of a Goals Problem Mass item hanging up against its opposition terminal and staying suspended in time and space are just a million to one, that's all. It's almost impossible for this accident to happen. By the time you found both sides of them, you get this kind of an effect. How can I do that again, you see. He hasn't got a prayer of doing it again, that's all.

And you've done it. You haven't pulled apart somebody's miserable sequences of lives and all the times he did kiss the landlady and all the times he didn't kiss the landlady, you see, and got that all disentangled one way or the other. Just his bank wouldn't hang together is what the horrible overt which you have performed at that particular thing, you see. So the reactive mind is blowing up. This other way, you're still going to have the reactive mind around. Interesting, isn't it.

So that's why you prefer 3D Criss Cross. And you will come to as you operate with it, why you will prefer 3D Criss Cross over Prepchecking. Of course, that doesn't forgive you for not knowing Prepchecking.

I would like to see anybody be able to do a good job of Prepchecking if he could. Somebody wants to get rid of his lumbosis or something of the sort, well, prepcheck it out of existence. You can try anyway. Somebody will get a 3D Criss Cross item on him, it will come right back, but that's all right.

You understand that in Prepchecking you *must* do an expert job of Prepchecking to handle the temper and temperament of the *pc* on the subject of missed withholds. Because you're going to run into missed withholds and I guarantee that a case that is really plowed in on this is going to get missed withholds tomorrow if you don't prepcheck them today.

In other words, you could just spot a missed withhold and spot another missed withhold and say, "Well, that's fine. He's happy." Oh, yeah, he'll be happy for hours. You get what I mean, because you didn't go in – you didn't go in down the chain of these. See, you just clipped off the last two – locks. Well, tomorrow those are going to key in again. Ha.

See, you, the auditor, are going to once more wiggle your right ear more than you wiggle your left ear and that is the key-in, you see. So that's an – then he thinks this thing again and then it becomes another missed withhold and you have to pull it all over again.

Well, by the time you get tired of doing this you will come to realize that Ronnie is telling you sooth. *Pull the whole ruddy* chain when you pull a missed withhold, see.

Well, you're gonna – you're going to handle missed withholds, handle them in two frames of mind. One, in rudiments, just to get them out of the road. When you're doing 3D Criss Cross, you're doing 3D Criss Cross. But the temper of a pc sooner or later is going to become recognizable to you as very *badly* needing some Prepchecking, by which you mean you want to get off the missed withholds and stop this nonsense so the rudiments will stay in.

You see, we found the common denominator back of all rudiments is withholds, see. And then the common denominator back of all withholds is *missed*. So prepcheck missed withholds. You sit down for a session or two with some pc and say, "Well, this guy's acting up. It's just hell to keep rudiments in one way or the other," and just go for broke on the Zero Question, "Who's missed a withhold on you?" you see? And then just carry on from there and develop these withholds – what people should have found out about, what they shouldn't have found out about and all that sort of thing.

You can cash in on a lot of processing this way. Case can't seem to get it going, it's having difficulty moving and even though you've done CCHs it isn't getting the sufficient tone arm action and his CCHs are apparently flat but really not and 3D Criss Cross and nothing much is moving and so forth. And all of a sudden – all of a sudden, like a *bolt from the blue*, this *terrific thought* will occur to you. "*This case has missed withholds.*" [laughter] "See, every time I put this case through the rudiments – 'What withhold have I missed on you?' – he's always had one, hasn't he? I'll bet there's a chain now."

Just take time out on whatever else you're doing and sit down and do a whole missed withhold session. And then maybe you have to do another session because you didn't get all the chain clean. You'll get all that type of missed withhold and you'll find out what he was missing withholds and who should have found out and God help us. And all of a sudden the case presents an entirely new aspect. And you get tone arm action where you didn't get it before. That is the one way I know of whereby you can promote a case into tone arm action with a strong arm.

Now, most auditors have been able to pick up missed withholds. And very few auditors have done a skilled job of Prepchecking on virgin, stir-it-up withhold type of mechanisms. That fact, that it's difficult to teach, is – already makes it a questionable subject. And then the other fact, that it only keys out and a 3D Criss Cross does so much more – the conclusion is that it becomes a junior process. One that an auditor must know how to do.

Oddly enough, this junior process is senior to all other processes. Show you where we've gone. See, we're now calling a junior process "Prepchecking," which is senior to any other process we ever had, you see. Well, where does that put the CCHs, run *right* and 3D Criss Cross done properly? Well, it puts them in the stars. That's really where they belong.

Now, you see how auditing stacks up? You see how it lines up.

A little advice. Once more I repeat this advice. If your CCHs don't seem to be just what they ought to be and the pc just sort of sits down and he's doing them all mechanically and they all appear flat and... Yeah, CC... Yeah, he hasn't grown any wings that you can see. You know, you haven't had a good change on the case. You know. No cognite. No cognite, you know. He's not said anything about it. *Let's get smart. We're dealing with a missed withhold case.*

And sit down for a session, check him. And after that do end rudiments on him. You'd be surprised. At least half of the pcs you're running right at this moment have their – on CCHs, have their end rudiments out on half-truth and untruth.

"Are you satisfied that you did that?"

"Yes. Yes. Oh, yes, yes, yes. I duplicate it. *Woo-woo-blyaa.*" Damn liar. You stack up enough of those and the CCHs become nonfunctional. You get your end rudiments ... Beginning rudiments aren't as important as end rudiments, frankly. And you get your – you get your missed withholds and half-truths and untruths stacked up in CCHs and your case will cease to gain because we're using the CCHs now on the sane people. Now, in the old days, yes, you could bull it through and go for two hundred hours and you would have gradually overridden it, you understand, Upper Indoc style. We're not doing that same type of CCH.

And I would say, on a person that could articulate and talk to you, that if they gave you any trouble or you really ever had to put your hand on them to guide them around or force them into a session, I would say their rudiments were wildly out.

I wouldn't spend much time wrestling. I don't mind wrestling. As a matter of fact I'm fond of wrestling. But it doesn't seem to me to be the thing to do in an auditing session. It seems out of place. The simpler way to go about it is flatten whatever you're doing or finish that session and come to the next session lugging a bulletproof E-Meter, you see. Let's find these missed withholds. And you're just going to do a Prepcheck-type activity. Get the idea? You find out a lot about it that way.

Don't keep probing when you're doing this. Don't keep probing for missed withholds because you don't have to probe for a missed withhold. The only thing you have to do is maybe guess who's been missing. See, who's been missing the withhold. Well, we know this fellow has a dog and a wife and has a Central Organization that has been near him and he doesn't like that very well. He's got a couple of friends and he has a mother still living, see. And he has a job someplace.

All right. Well, you've got these few items, see. Just very smart and do one of these – do a very careful resumé of the Preclear Assessment Form on him, you know. Go over that very carefully and so forth. And notice what makes the tone arm shift as you're doing it, you know.

List all these things and people up and so on. And then find out *who – who* amongst these people, you see, has missed withholds on him. What should they have found out? And you'll all of a sudden have a resurgence of case, don't you see? That's – it's an easy one to do. There's hardly any difficulty with it. But that will very often give you tone arm action which you're not getting any other way.

And the individual is sitting there. Boy, he's really braced. He's really braced. He eats with his knife, you know. And he never dares go into a nice restaurant because he eats with his knife, and so forth. And he actually never dares go to a restaurant because he eats with his knife. And he never dares take you out or be – let you invite him out to dinner because he eats with his knife, you see.

And this is pretty bad socially. And this is something that's pretty grim. And as you're doing the CCHs on him, you know, this really starts stacking up. He eats with his knife. And you mustn't find out about it. And on such shallow delicacies, you see, his whole case starts hanging up.

So in doing the CCHs on sane people, why, you ought to occasionally sit down and clear up them thar missed withhold. Clear them up on as much track as you can clear them off of. And you'll put the guy in a much happier frame of mind.

And a fellow who is showing no good increase on the CCHs should always ... You just start getting the habit of finishing up the session with the... Sooner or later we'll have to do it for everybody. Otherwise, you see, to those people that are not getting increase, it's an evaluation. So everybody will have to be able to do ... But I'll tell you, the truth of the matter is, is you only really need to do it on those people who are showing no increase of response.

And then you ought to do your end rudiments. And the most important end rudiments are simply the missed withhold question and the half-truth, untruth. And occasionally, when you've had a wrestling match, the damage question. He's been trying to damage you, the auditor. And this'll hang him up like mad.

Well, now, the extent of auditing as you see it there... Prepchecking and rudiments are something which are relegated to letting auditing occur. See, these are the tools with which auditing can occur. You permit auditing to occur with these things.

Keep your rudiments in, auditing can occur. Pick up your large gobs of missed withholds off the pc and smooth him out in his relationships with his family and of course your rudiments will smooth out. The only difficulties he's going to have is with his environment and if you cleaned up all the missed withholds with his environment – just sat down for a couple of sessions, you know – you're not going to have any trouble with out-rudiments.

It's very well worth doing. Instead of spending half of the 3D Criss Cross session everyday, you see, putting his rudiments in, just take *two* sessions and run *missed withholds* on him on any part of his environment you think might be out, you see. Get the idea?

It's much happier to do it that way because then you've got it done and it'll stay pretty well done, too. And then you can keep it in with ordinary rudiments. Do you follow the use of that?

Well, to get something done with the case – the CCHs, they will get something done with the case if they're done right. And 3D Criss Cross, well, my God, that just doesn't get something done with the case, that takes the reactive mind and pours it down the sewer. That's it. 3D Criss Cross well and accurately done – marvelous.

You recognize that the CCHs are a precision activity. You recognize that meter reading is a precision activity, that Prepchecking, even for just missed withholds, is a precision activity. And CCHs, more than ever, is a precision activity. That preciseness in it is simply your ability to give the auditing commands, to stay in communication with the pc, to ask the right questions for the Prepchecking. And as far as 3D Criss Cross, just *reliably make sure* that your *rudiments are in* and *reliably make sure* that your *list* is complete and that you differentiate it fine and that you null it perfectly and that you wind up at the other end with the item, that you check it out right. It's all very precise. It's all very precise. It's almost got the words and music all written down. I mean complete. And any auditor can learn those.

It's a marvelous thing that you could today, with such ease that it would hardly be worth mentioning, identify the well-trained auditor and the poorly trained auditor. The ease with which you could identify the well-trained auditor just by looking at his pc's progress you wouldn't have to look at his auditing at all.

You say, "Well, there he is." And actually a well-trained auditor really never gets in trouble with a pc. It's nothing extraordinary that's being requested of the auditor today except just an atmosphere of competence and accurate rendition of a certain finite number of things. He just has to do those things, make sure that he always does them and does them thoroughly.

You're not reaching for an unattainable, in other words. Nobody is asking an auditor today to do something that is impossible. That might have been true yesterday, but it is not true today. And it can be done and it can be done well.

And the results which you get for doing the exact textbook solution, see, are just fabulous. The results don't match the sudden divergences and brilliancies and new ideas, you see, that you get in the session and so on. The results don't match that. The results match the textbook solution today. Probably the first time in the history of this planet, that that has ever been the case.

If you ever fought a war, according to West Point textbooks, you'd lose it. If you built bridges according to the engineering school manuals they would all fall down. If you repaired machinery by the maintenance and operation manuals, that you're issued for engines and things like that, Lord knows *what* would happen. They have one grease cup going three years, but you have to change the oil in the crankcase every fifteen minutes or something, you know.

Well, I'll give you an idea. The car you drive – if you're driving a car – the oil people tell you, you should change the oil in that car about every thousand miles. That's what they tell you if you read their advertisements. Factually speaking, nothing *possibly* goes wrong with the oil for the first five thousand miles.

And you see motorists all over the place busy following these rules and regulations, you see, and changing the oil every thousand miles and they grease it every twenty thousand. And their cars just fall apart and they never can understand why.

Probably a car needs to be greased every thousand miles, but it doesn't get its crankcase changed every... It all depends on the climate you're running in, of course. How dirty and gritty the country is or something like that, has a lot to do with it. These things are practically done in reverse, you see. See, you're so used to the textbook solution not working, see, that

you tend to believe that something new and extraordinary and beyond this will be demanded of you.

Well, I can tell you straight from the shoulder right now, that that is not true of Scientology today. The textbook solution gets you the whole distance. And the only reason you won't get there is because you don't follow it. I know. I know. I just had about... I guess it's been about fifteen, sixteen hours of nothing but textbook solution. Working like a dream. Working like a dream.

Well, that's auditing today. That's what's expected of an auditor today. An auditor can do these things, fine. If he can do them with understanding, wonderful. But he won't get any results at all unless he does it with complete precision. And that's what it depends on. Okay?

Thank you.

How And Why Auditing Works

A lecture given on 17 April 1962

Now, this is still the 17th of *Abril* after the coldest March in seventy years. On twenty-two days last March, the thermometer was below 30. This seldom happens here in January. I'm sorry, maybe you won't see a display of rhodies that you would ordinarily see here on the grounds – most gorgeous sight you ever saw, rhododendrons, here – because we were out looking at them and many of their buds had been frozen. But we still have hopes that they will manufacture some more.

Saint Hill Special Briefing Course.

[part missing]

Now I want to tell you some very important facts of life. Now and then – now and then, when you're growing up... It reminds me of a Marine sergeant. Marine sergeant came home, and his little brother had been having a bad time. So his mother – Marine sergeant's mother – said, "Why don't you take your little brother out back and talk about the birds and the bees?"

The Marine sergeant says, "Okay." So he takes him out and he says, "Now look, Joey," he says, "you know," he says, "you get out your scooter, go along the street, you pick up a goil, you run her along back of a hedge, you know, you know, that kind of thing?"

And Joey says, "Yep."

He says, "Well, birds and bees, same way." [laughter, laughs]

And I want to tell you why auditing works. Reference: any publication or bulletin which discusses the two-pole nature of the universe.

There's a whole mathematics based on this, by the way, by a man that I was very happy to meet one time, Buckminster Fuller – Bucky Fuller. He invented Dymaxion geometry. He's a stress analysis-type man, pure mathematics and that sort of thing. Dymaxion geometry proves that the universe couldn't exist without two poles. Everything has two poles. There is not one of anything in this universe. You've heard me mention this before from time to time.

Now, in a recent lecture, I described to you the lowest level of observation. Or it get – it's so low that it's nonobservation. And that is "being something." Remember?

The fellow couldn't see it because he *was* it. That's your lowest level of observation.

Now, you see this in human behavior all the time. The fellow can't observe what he's doing. If he knew he was doing it, he wouldn't do it. But he actually can't observe what he is doing. And that's to a limited extent because he cannot observe himself.

Now, "know thyself" is an old philosophic saw. And I think it was basically and originally introduced as a trap for thetans. The only way you could know yourself, of course, would be to view yourself.

Now, the Goals Problem Mass contains in it anything you know about problems. Why does a problem hang up? Because it's postulate-counter-postulate, intention-counter-intention, goal-counter-goal. And these two things being of equal strength hang up. When they're not of more or less equal strength, they don't hang up. An overwhump occurs one way or the other and you don't get a hang-up.

It's never any problem to be shot. You're just dead, and that's that. You see? I mean, if you're going to be seriously shot. See, it's not a problem to be shot. It is a problem to be shot at while shooting at somebody. Now, that is probably a primary problem, and that is why war is protested against and why it stays with us – because it's a bunch of guys shooting at a bunch of guys.

Wars which happen suddenly on a total overwhump basis, one really never hears much about them. Probably they'd never be objected to either, and they certainly wouldn't hang up on the time track.

But these wars, particularly static warfare, hang up because you've got balanced forces. And it hangs up in time. And the more balanced the force, the more hung up in time. That's all.

You want to know how long a war is going to last? Just estimate the force of Nation A and the force of Nation B and of course, in view of the fact that we're dealing with general staffs when we're dealing with war, we have to equate the stupidity of one as compared to the stupidity of another. And this is a balancing factor. Now, if that stupidity were equal, and the forces of both nations were equal, and the destructions accomplished were equal, that war would go on forever. There must have been something like this occurring during the Hundred Years' War. And that must have been the way it was, you see, and so it went on and on.

Now, a Goals Problem Mass means that the intentions of a type of beingness oppose the intentions of a type of beingness more or less equally. To hang up and become part of the Goals Problem Mass, it must be *exactly* equally. That of course is nearly impossible which is why you have so few items in the Goals Problem Mass.

You have to have equal opposition, just as we've really only had one Hundred Years' War in the last many, many, many centuries, you see.

Why, it'd be very rare that you would get a type of valence exactly against and balanced against a type of valence. Don't look at this as a going-on-forever, don't you see? Because a person has been many more beings than are contained in the Goals Problem Mass – many, many more beings. And why aren't they hung up?

Well, they just weren't at that delicate opposition of one versus the other which gave us the fist against the fist which balanced it so as to make it drift in time.

And we get equal forces exerted one against another, and we get an illusion of no time. And so it just goes on forever in time. And that is why a Goals Problem Mass stays with the person, and of course all there is, all you've ever learned about a reactive bank, all that we know about mental energy phenomena and all the rest of it, it just is contained in this thing, Goals Problem Mass.

Now, there's free track where a person has not had an opposed lifetime and, running engrams, you run this free track. Of course, it's available, it's free and it erases.

But what he's up against is this non-free track. That's what's really rough – where the valences versus the valence. You see? The type of identities versus the type of identity. He has lived many lives as a waterbuck and has opposed in those lives the tiger and has lived a few lives as a tiger and has opposed waterbucks. And you get this kind of a *grep-rrrr-rrrr-rrrr*, and there's going to be nothing happens then except this stays there in the bank totally opposed to total opposition, you see? And it's just balanced in time.

Now, frankly, it is so difficult to make two of these valences bash up against the other, it's almost unheard of. You see, the chances against it happening are just fantastically remote that you get a hang-up over trillennia – trillions of years, you see, of two types of identity. Oh, it'd go away sooner or later, don't you see. It'd slip, it'd wear out, it'd get erased.

But those things in the Goals Problem Mass have not worn out, have not slipped, have not gotten erased, have never become overbalanced and are there in that delicate balance which maintains them in present time. And they're maintained in present time and they *are* the reactive mind.

Now, in view of the fact there are tremendous numbers of minds available for these – you see, each type of personality, of course, becomes a mind – you have tremendous numbers of minds in the reactive mind with tremendous numbers of retrained responses.

Then for each one of these that is hung up, you have an accumulation of locks. And these can number into the hundreds for every one of these items. Now, let's say – well, this is not an accurate figure, but let's just get some idea of it – let's say they're average two hundred items as lock items for each valence that was hung up. That would make four hundred for two valences, wouldn't it.

And let's say there were twenty of these packages. Do your own mathematics: any one of those is a mind. See, the locks are as effective as the keystones of the GPM. See, it's just the locks derive their power... Just because they've got – you've got two of these things hanging up one against the other, now the locks can become just as effective on the individual as any one of these hung-up things.

And before you get it straightened out, every one of those, see, in their thousands, are a separate mind capable of thought, capable of action and reaction, with set solutions and now-I'm-supposed-to's to all existing problems connected with them. And they can be pretty dopey. They got everything in them, in other words. And that composite lot is the reactive

bank. If you add to it the few areas of free track that hang on both sides, you've just about got the lot.

See, this lifetime has certain areas of free track and other lifetimes didn't happen to get mixed up in this, and you get free track, and the individual can run this free track.

Free track, oddly enough, explain a lot of things to him but never quite unravels it all. There is always that reservation. It didn't quite unravel everything. Do you see what this is all about now?

In other words, the fellow galumphed along, and he was very fine and he was doing wonderfully and he was a polar bear. And he went for a long time as a polar bear and he went swimming in the ice and everything was marvelous and he ate fish, and so forth. And you're not going to find that. He didn't have any trouble as a polar bear. He's never posed anything as a polar bear. He went on being a polar bear. Of course, he got engrams as a polar bear, but that's fine, and then one day, one day he decided – one day he decided all on his own, you see – to start being a seal. Up to that time as a polar bear, he had never eaten any seal because this is early on the track, you see.

And he accidentally knocked a polar bear, you see, off of an ice pack and this started getting very complicated one way or the other. So he decided, "Well, the devil with that. I don't want to be a seal. I don't want to be a polar bear. I'm going down into the warm latitudes and here's an interesting looking animal: a waterbuck."

Up to this time he doesn't have any reactive bank to amount to anything, see. Oh, there are incidents and oppositions and so forth. But here he goes.

Now, he's a waterbuck and he runs away from tigers, and he antagonizes tigers, and he has a hell of a time with tigers. And one day he becomes a tiger, and he eats waterbuck and antagonizes waterbuck and has a hell of a time with waterbuck. And one day he becomes a waterbuck and has a hell of a time with tigers and just messes up tigers. And pretty soon this is getting pretty gloomy to him.

And as a waterbuck, he's *blang-bang* concentrated on nothing but tigers. And as a tiger, he's *blang-blanc* concentrated on nothing but waterbucks.

He's been a waterbuck more often than tigers, but nevertheless he's mocked up the counter-emotion of tigers and the counter-force of tigers often enough so that this is perfectly balanced. And from that time there on, "waterbuck" can collect minds; "tiger" can collect minds.

This probably went on for a long time, and nothing much happened and he got into another sphere, and one day he became a priest.

And then he was mean to the vestal virgins, and the vestal virgins were mean to the priest. And he was a priest, and then he's a vestal virgin. And he got to be a priest some more, and he ate more vestal virgins, and then he was a vestal virgin and ate up more priests. And we've got another one. But there could have been – could have been millions and millions, hundreds of millions, billions of years between the time the waterbuck and the tiger got together up to the time he became the vestal virgin-priest package. You see?

But because these packages exist, they tend to lock up the rest of the track. Other pieces of track run into them, collide with them, and so on. So the whole track begins to look like a snarly mass of something or other, but right internally in the middle of it, why, you've got these two poles: the waterbuck and the tiger. And just up adjacent to those, you've got the vestal virgin and the priest. And then you have got the god and the devil and you've got all kinds of wild oppositions.

But these oppositions, each time they are perfectly balanced, make a new Goals Problem Mass package.

And then these perfectly balanced opposing forces or opposing identities accumulate to themselves any other identity that's hanging around and you'll get collapsed track.

Now, these are represented in the bank by spherical masses. Inside this spherical mass are compartments of thought. There is an internal compartment of thought because the fellow usually had a head, and he did his thinking in the middle of the head. So the Goals Problem Mass tends to approximate a head. And it's got a think-think-think in the middle of the head and it's usually empty. And there's a lot of little compartments all through the Goals Problem Mass which have ideas in them. And you have the idea of force encl – you have force enclosing ideas or force enclosing thought – the trapped thought, in other words.

And these can be dramatized. They are not stretches of track. They are crumpled up pieces of – they're crumpled up track in spherical shapes and that sort of thing.

Now, where these things are exactly counter-opposed against other spherical shapes – you see, you got the waterbuck, the tiger proposition – these things are hung up one against the other, *clank*, to such a degree that neither one can go away.

Now, all this comes down to attention, of course, doesn't it. It comes down to all of the other factors, you know, but this is the final material form which it takes, that we call the Goals Problem Mass. Of course, what's a waterbuck do all day long but look out for tigers? And what's a tiger do all day long but prowl around looking for a waterbuck? And it's just concentration, concentration, concentration, concentration. And eventually, these two identities just get smashed together by this fact. And you've got the dramatization of a problem. It floats in time all sorts of other dramatic – or dramatizing factors here.

The individual is – years, years later, he's busy selling – he's busy selling boats, you see, and – oh, oh, trillennia later he becomes a boat salesman – and he shows somebody that it is very, very easy to paddle this little ski contrivance, you see.

And he says, "You just slide over the back of the thing, you know and kick your hoofs, you know."

And he goes on, and after a while he – the customer says, "You kick your hoofs. What's that?"

And he says, "I didn't say anything like that."

But he did. See, it'd be a hangover. Just a momentary restimulation. They revert to this type of pattern. You will find some person's been a dog, and a dog and a cat. And they've got the dog-cat Goals Problem Mass package of some kind or another. Very equal balancing

there. If you've ever seen a cat lick a dog, why, you know that can be quite equally balanced. That's why they've always stayed foes.

And this dog has been a dog a long time ago. And he hasn't been a dog for ages; for trillennia he hasn't been a dog. And he's living a life as a human being and everything is going along fine, and he goes to bed.

And his wife thinks it's fine. He's fine. His wife thinks he's fine, but of course, he turns round and round and round and round and round [laughter] before he goes to sleep. He has various explanations for this. But these explanations are all just based on the fact he's been a dog.

Now, all of this is very obscure to the person and to the auditor and you actually would be amazed the intricacies you'd have to go through to figure out what the fellow had been by observing his behavior.

But after you find a few of these items in 3D Criss Cross, all of a sudden you say, "Oh, you know. Oh, I see. Yes. Ooooh, yes. It all now becomes clear." And it wouldn't be clear because, frankly, there were thousands of possible choices from which this sudden habit of [makes noises with his lips – laughter] came from, you see; been most anything.

Now, the two-pole character of the universe is something you should keep in mind. Electronically, no power can be generated in this universe in the absence of two poles. You have to have two fixed positions in space before you can have any electrical current of any kind.

That is something that you would learn the hard way in physics. You can take two poles and put them smash against each other or one inside the other, and you could grind away with little wheels and all sorts of things for, well, trillennia without generating any power. There would be no electrical current of any kind whatsoever. There'd be no electrical masses of any kind whatsoever, if there weren't two poles. There have to be at least two poles.

Now, maybe you could have a three-pole, five-pole, six-pole, twelve-pole type of arrangement, but remember the basic is *two* poles. You could add new poles. You could do all sorts of things, but you've got to have two poles and that's fundamental and basic.

Now, the mind is composed of energy which exists in space and which condenses down into masses. In the reactive mind, there is no time. All time is now. That's because of the poised character of these valences.

We must assume that if we have current, standing waves, electrical masses, flows and other phenomena which are very easy to demonstrate in the human being, there must be two poles involved. You're about to learn the facts of life here. There must be two poles involved. Otherwise, you'd never have any flows, would you?

A person would never have any ringing in his ears and, frankly, would never have a somatic. It requires two poles even to hurt. It's the two-pole nature of things that – from which all else proceeds.

Now, this sounds very intricate and I can see somebody now saying, "Oh, no! Not about electricity." Well, I'll tell you all you need to know about electricity: Take your two

fingers, shove them into the mains. You will learn all there is to know about electricity at that moment because you can actually put one finger in one prong. And you can sit there and hold it all night, and you'll never get a shock.

You don't notice any reaction there until you put *two* fingers in there, one on the other prong. And then you'd know all there is to know about electricity. You would have a subjective reality on the fact that it required two poles to have any electricity go anyplace or anything happen. And that's a fact.

All right. Now, what's this got to do with the CCHs? Well, it has *everything* to do with the CCHs.

Auditing is effective only in the presence of *two poles*. Effective auditing is two poles. Now, there can be more poles scattered around, but it requires at least two poles for auditing to occur. This doesn't say that it's impossible to self-audit. This doesn't say that it is absolutely necessary always everywhere to have an auditor. That is not the case because you yourself at one time or another have run a burn out of your finger and have done a Touch Assist on your left ear or something and had it work.

But in that particular instance when it worked, you were operating with two poles. You were observing something. You might have been being a mass while you were observing the other mass, but you had two poles going. Do you see that?

And one of the things that's been a bugaboo to auditors from time immemorial is the pc who never cognites. He just stirs on and *on and on and on and on and on and on and on*, and he'll run processes and processes and processes and if he was processing himself, he would go on and *chew and chew and chew and chew and on and on and on*. And he'd get ideas occasionally, and they would come and they would go and they would erase and they would go on and on. What an arduous activity.

The individual is running on one pole. Now, the pole that he's running on happens to have thought in the middle of it and energy – standing energy waves – outside of it. Well, he's in the thought area, and he keeps running through the energy as a thetan and he's just chewing on this energy, you see.

And he gets into the thought zone and he only gets the ideas that are packaged inside that thought zone. You see, he's *being* that mass. He *is* that mass. He is not viewing the mass. He *is* it. So, of course, he can't view it because he *is* it.

And being that mass he is not viewing another mass, so he's being himself and nothing else and not looking at anything else. And there he could chew and chew and chew and chew forever. You see how that would be?

Can you imagine this glass, now – now we're going to show you something graphically – now, just imagine this glass here as a mass of energy or a mass of mass or anything else, well, just as a glass.

And now we get the idea – get the idea of a thetan *being* this glass to such an extent that he would never say "I am a thetan," he would only say "I am a glass." You see, he couldn't conceive of being anything else but a glass.

And now let's say he's a very introverted glass and can never see you. This glass isn't looking at anything. Never see the table. Never see me. And let's say he went on chewing on this glass. Would he ever make any gain in processing? Well, the probabilities are he wouldn't. And there is the picture of the no-cognition case. That's your minimum tone arm, no-cognition case. The person is being something; observing nothing.

Now, it would be perfectly all right for this fellow to be this glass, providing he could also view, as a glass, something else. He doesn't have to view anything as a thetan. He could view something as a glass. He all of a sudden gets the idea, "Well, I – I can – rrr – glass – I'm a glass, you see. And I'm a glass and I can look at this cigarette lighter."

And here he is, see. Here's a glass and here's a cigarette lighter. Oh, well, we've got two poles now. And as a glass, he can look at the cigarette lighter.

He can as-is this cigarette lighter. Things can happen with regard to this cigarette lighter. He can do some control of it. He can do some other things. And you're sure going to get tone arm action. And there's also something going to happen to the cigarette lighter, that's for sure.

But, you see, as one pole, the glass and being only the glass, you're never going to get any tone arm reaction because you're never going to get any energy movement. How can there be energy movement?

For energy movement to occur or diminish or increase or anything else, you've got to have two poles. And if the individual only is one pole and he's *being* that pole – see, he isn't a thetan being a glass – he's a glass! Why, of course, he could chew forever. And if he was getting no tone arm motion while you were auditing him – of course, he would get no tone arm motion while you were auditing him because there's no flow. But as a glass, he is made to audit up against the cigarette lighter – ah, you get tone arm action. Ah, you get change. Because the cigarette lighter is also going to react against the glass, let me assure you. You see that? You're going to get case change.

You're going to get a change of these masses. Therefore, you're going to get a change of ideas. Do you see this?

You must never have in an auditing situation a one-pole situation. That's all. The individual is *being* a man, see. He's not ever – he has no masses. He has no ideas. This is your poor psychologist. The poor guy. He is a brain. Never looks at anything. Never does anything. *He* never does a thing, you see. He's – he's being a man, and that's all he is being. He couldn't be anything else but a man.

And if he's a relatively introverted man, why, he's had it because he never sees anything else. Never gets any changes of potential; never gets any anything. And that's why the psychologist concluded that man could not be changed.

He concluded this as a scientific conclusion. And several years ago, we were always being held up to scorn as Dianeticists or Scientologists because we said man could change. And now he teaches in his universities nothing else but that man changes. He's tried to disprove testing to get rid of us. He's tried to do all kinds of things to himself to get rid of us. He keeps doing things to himself hoping we'll go away.

And now, today he more and more realizes what he is. Well, he's a Scientologist. He hasn't found it out yet, but that's what he's being. You get the idea? We're probably terribly good for him. He's probably the first – we're probably the first thing he ever looked at since 1879.

Now, get the idea here of a glass. No action; one pole. The glass and the cigarette lighter. Two poles – action.

Now, we see this easily in the auditing situation. Here is the auditor; here is the pc – something on that order – or here's the auditor; here's the pc. See?

All right. Ah! If we can get the pc to look at the auditor, we've got a two-pole situation. Two-pole situation; that's all. So you're going to get change. But the pc who never finds the auditor never has any change. There's the CCHs at work. And they're only as good as that occurs and no better.

When you don't have a two-pole situation in the CCHs, if you don't have the pc observing the auditor, *ah-ha*, you get no change from the CCHs.

Has to be a two-pole situation.

All right. We'll go into that a little bit further. But let's go on, now, to 3D Criss Cross.

What condition must exist for 3D Criss Cross or some think process to exist or any think process to exist? Ah, the fellow is being one mass in his mind able to look at another mass in his mind.

The fellow – it's perfectly all right for the fellow to be a mass in his mind, but he also has to not only be that mass but be capable of looking at another mass in his mind. And then you get tone arm action.

Listing, nulling – you're going to get tone arm action.

But if he's only being one mass in his mind and can't view any other mass in his mind but this one mass, you're not going to get any tone arm action. It's as simple as that. Don't you see.

So at the stage of the CCHs, the auditor and the pc furnish the two poles.

Actually, the auditor does not have to constitute solely the other pole. There is the whole present time environment to constitute the other pole, or any other pole or many other poles. Once in a blue moon, we have taken a person who was having an awfully hard time and said, "Look around here and find something that's really, really, really, really *real* to you." And they looked around the room, and they eventually – one person found a silver teapot. And, my God, she went over and she grabbed a hold of the silver teapot, and heaven and earth couldn't get that silver teapot away from her.

That was a one-shot command. She turned sane on a silver teapot. She found out there was something in the environment beside herself – a silver teapot; so she got a big change. See? One-shot change. Do you see how – why that would be?

So it isn't just the auditor in the CCHs that can constitute the second pole.

Now, is there anything in the pc that can constitute the second pole? Well, there's two ways that the CCHs could be run: dumb-ox style, which is – well, a great deal of study of the steam engine would be about the best way to achieve this style, and all you do is observe this steam engine, and you observe the fact that it does nothing but have certain wheels go around and certain shafts move and a certain *hiss* come out the exhaust pipe.

And the auditor gets so that he can make his arms go around and his piston go and hiss at a proper Tone 40 and he thinks he's doing the CCHs. All right; that's fine. Odd part of it is, there's enough mechanics built into it that even then it'll work. The CCHs go from bright white to gray. They do not go from bright white to black.

So this flaw in the CCHs might not be observed. Some auditor might think the CCHs were absolutely wonderful and he was doing it at the lowest shade of gray that you could obtain. CCHs will always produce a change on a case one way or the other. So you never observe the fact that they can be done completely wrong. You see how that is? I mean there's a gradient scale of wrongness, and it doesn't ever get to black. You can't be absolutely wrong in the CCHs.

But the degree that you drift from white is measured by the length of time the pc spends under CCH processing. And the more gray it is, the longer the pc is under processing. Do you see that?

In other words, the less properly these are done – they can be done totally mechanically and in five hundred hours everything is wonderful with the pc, you see.

They can even be done totally mechanically and half-wrong most of the time, and you'll get some sort of a result. You see, CCH is, actually – it's almost – if the guy was as bad as shook the pc every now and then and said, "I like you," you know, occasionally, or something like this. Something's going to happen after five hundred hours – something. Because you got a two-pole situation. You're working with a two-pole situation regardless of what point of the Tone Scale.

Now, let's now do it right. This is how to really speed up the CCHs. CCHs are a matter of bringing the pc to present time. Now, why do you want to bring the pc to present time if what you really want to do is get him back down the track into the GPM?

Ah, that's because the GPM is upside down, backwards, locked in, crossed up and there's so much keyed in in present time that it takes you quite a while to get to these masses unless present time is more or less (quote) (unquote) "achieved" by the pc.

In other words, you can do a lot of keying out of masses before you do 3D Criss Cross and make 3D Criss Cross much more workable.

So do the CCHs for a while and key out several of those inverted loops. See, he's got stuff keyed in from the year zero, you know. Well, let's get that, you know, lined up a little bit. And he's got the vestal virgin where the waterbuck ought to be, and so forth, and it's all messed up.

In other words, locks are all curled over into present time and he's dramatizing some lock on the early track so hard, you see, that you can't even get to a real piece of the Goals

Problem Mass, you see? The locks are so active. He's got a lock terminal, you know. A murderous husband. Got a lock terminal, see.

It's just a lock! It hasn't anything whatsoever to do with the real terminal. But it's locked up on it. The real terminal isn't even a murderer, you see; it isn't even that close.

The real terminal is probably a bad wife. And he's got this keyed in and somewhere or another – a murderous husband. It's all keyed in.

Well, it's nothing that you would even want to come near in a GPM because it isn't even part of the GPM. You see, it's just locked up on it.

You do the CCHs, that'll fall into line. Otherwise, he's got a problem with his wife every couple of days, see. He's restraining himself from killing his wife every couple of days. So he gets a big GPM every day – every couple of days – he gets a big PTP. Every couple of days, he just has trouble. He's just having trouble all the time. Well, you do the CCHs, you kind of lay this stuff back on the track, you see. Get him up to present time. Get him out of some of these things.

Well, how do you do that? How – what's the expert, smooth way of doing that?

First thing you do is bring his attention over onto – you do the CCHs two ways at the same time – you get his attention over onto the auditor, and of course by utilizing communication, control and havingness of the environment, you, of course, attract the pc's attention to the environment because these are the mechanics of communication and duplication, and that sort of thing. The things that you're using, you see.

All right. And at the same time you're doing this, you handle the double-mass factor in his mind. See, you not only handle the double-mass factor in the environment – here's the pc being a pc looking at the auditor and looking at the environment – you also handle this in his mind. How do you handle this in his mind at the same time? By maintaining two-way comm with the pc, of course.

How do you do that? Well, you treat the pc's every twitch as an origin. Every time the pc does something – you'll notice that the pc doesn't notice most of these things that he does – you call the pc's attention to it, by querying. Say, "What was that?" you know. Any way you want to say – you could say "How does that feel now?"

"What?" the pc, is the common response. See?

Why did he say what? Why hasn't he noticed it? Oh, well, that's because he's being the single mass. He's being a somatic, for God's sakes. He's being a habit. He's not even being a being. See? And because he's *being* it, he *does* it!

And you say, "What was that?"

And the pc has to go back up here and look at what he's doing. And he says, "What?"

And you say, "That."

"Oh, oh, *that*. *Ouch*." In other words, you exteriorize him from this manifestation. Do you see? It's actually very easy.

Every time he does something, you exteriorize him from it. If you fail to do so, oh, pass it on. Catch it next time.

Now, what are you doing in the CCHs? You're setting up a two-pole situation between the pc and the environment, which includes the auditor. And you're setting up a two-pole situation in the mind by *insisting* that there is *something* there – except you'd insist very gently by asking, "What is that?" – that there is something *else* there besides the pc all the time.

And the pc has *no* choice but to slip out of the somatic so he can look at it. And then you get a two-pole situation going in the bank. And so you get change, change, change, change, change, change, change, change.

Now, what happens in 3D Criss Cross? This again is an elementary situation. You're finding what the pc has been. And when he sees it, he ceases to be it.

You recognize that when the pc is listing – oh, let's take a five hundred item list. You know he's been every one of those items – every single blasted one of those items. Just the business of listing.

You know, two hundred trillion years is a lot of years. If you don't believe it, why, just think back sometime. Anyway, he's been every one of those items that he's listed.

Well, let me say this: He's either been them or raised hell with them. He's had an intimate acquaintance with each one – that's for sure.

Well, look, how many – you've made him differentiate five hundred times. You made him exteriorize five hundred times. Oh, this begins to look like Route 1, doesn't it? You made him exteriorize to some degree from five hundred identities less the one, two or three he's being so obsessively, he can't see them. And the last one the pc thinks is it, is always it. *Why?* Because if he weren't being it, it wouldn't hang up and keep reading. If he knew which one it was, accurately, he wouldn't be in it.

That's where we get the idea of if the pc knows what's wrong with him – that isn't what's wrong. That's for sure because if he can look at it, he isn't in it. See? What's wrong with him is what he's *being* so obsessively that he cannot observe it.

So you've exteriorized him from five hundred items to some degree except the last – the last one. And when that finally exteriorizes – *ooh*. That was the one that had all the charge on it. *Ooooooh*. That's a bum one. He gets cold. He gets this and he gets that.

Of course, you've walked him back to what he's being. Now, you find the oppterm and that's what he's concentrated on. While he's being this, he's concentrated on that.

And you start getting this whole package start blowing up right in his face because you've got a two-pole situation sitting right there in the bank and it starts discharging.

Now, the thing that makes the GPM hard to tie down and 3D Criss Cross a little bit difficult to do is sometimes he is so obsessively being the internal items that are close in and so slightly being the first items that you find – you see, he's still being them – but not to that obsessive degree which you might expect later – but he doesn't come close sometimes – this is not always true – but he sometimes doesn't come close between the terminal and the oppterm.

You think you've got a package like this, but you very often don't get your terminal package like this. You get a terminal package – this is the commonest, early package – is you get a terminal and then a plausible opposition terminal, only there are twelve in between before they meet each other. See?

If you're lucky, you'll hit them dead on the nose and they just go *poof*. But when they don't go *poof* and they hang up, you've just got many more packages intervening.

I'll give you an idea. A pc finally finds the item "child," and then we opterm this item, and it's "badness." *Ooooooh*, see. That was right at the end of a long, long intensive on a pc, by the way. That's not quite what I said, but to protect the case...

Well, you see, we just fell short of getting the *phfft*. We had all the items all combed down here to where there's only about two items left holding the whole bank together, and we got the item *next to* the item that opposed the child. That was a sad day because it meant we didn't have time to give the pc any more auditing, and it meant that we had to do more lists to get in close, you see.

What we had was this kind of a situation, see. [demonstrates something] See? That isn't going to blow, because that is the package. See, just the – see, that's the package there, see. And we found this. Leave it there. What's there? Well, that's exactly what the pc's being, is what's there. You see this? You got to have a two-pole situation.

Now, anybody that knows anything about exteriorization should really roll up his sleeves.

When we were telling people to bop out of their heads and go sail about...

By the way, you're going to be about six minutes more, you're going to be about ten minutes late for this evening. Is that all right with you if I finish the lecture? Or should I stop right now?

Audience: No! [laughter]

[laughs] All right.

The pc has got a "no-knowingness," really, of his beingness. We look at this fellow; he's being a man. No, he isn't being a man. Actually, in the – way down deep in the reactive bank, the most reactive thing about him and so forth and it makes him do this, that and the other thing is a waterbuck or something, see.

And the reason a waterbuck is hung up is because it's a tiger. And sometimes he dramatizes the tiger, you see. And he – the last thing he'd recognize this... You say to little Johnny, "Why don't you stop biting your fingernails?"

And little Johnny says – his first reaction is – "Do I bite my fingernails?" see, "Wait a minute," you know. He's gotta – starts worrying about himself because he never noticed he was biting his fingernails before, you see.

He never asked himself who or what would bite fingernails, you know. [laughter] He goes around thinking there's something wrong with him because he shouldn't bite his fingernails.

Well, we don't know why he bites his fingernails. Somebody says it's an absence of calcium. I'd say it was a prevention from scratching out waterbuck's eyes. Splendid way to keep from scratching waterbuck's eyes out. Keep them all bit off, see. Real good. "Now, if I don't develop claws, I won't get that nasty – into any of these nasty situations whereby I suddenly get pulled into the water, you know, and drowned like last time I was a tiger or something." You know?

You got something wild going on, and Lord knows what the explanation will be, but a person starts worrying about himself... That is such loose language. [laughter]

What's he worrying about? Well, you have to step back to take a look. And all of the CCHs, straight through to the end of 3D Criss Cross, should simply be a succession of stepping back to look.

And early in the game, one steps back as a beingness or an object or something to look at another object. And later in the game, one simply steps back as a thetan to look at a mass. You still got a two-pole situation. You've got a thetan and you got a mass. In all of the processes you're doing, from CCHs right on up through to the end of 3D Criss Cross are exteriorization processes.

Now, when we originally told somebody to be three feet back of his head, do you realize how often he came out as a mass? He went back in, too, didn't he? The only thing we were doing was we were just overshooting his ability by about a hundred thousand light-years. We were exteriorizing a somatic. [laughter] We were doing all kinds of wild things.

In actual fact, your 3D Criss Cross from the word go is an exteriorization process. You're exteriorizing out of his past – his past identities, if you please; his past energy masses, if you please; his past problems, if you please – all of these things you're exteriorizing him out of – one after the other. He's not ready to come out of his 'ead! Why man, he hasn't been in a head for – well, incalculable.

So in CCHs, if you run the CCHs very smoothly, you'll have present time sufficiently quiet and inviting and orderly and positive, that the individual will start exteriorizing out of bits and pieces of the past. We don't care what bits and pieces of the past he exteriorizes out of or if – if he does no more than say, "Oh, that somatic. Well, I wonder what that was."

You see, he was being it an instant before it turned on. It's been there all the time, but he couldn't feel it because he was it. He can only feel it when he wasn't it.

Now, as your individual is processed on the CCHs, he goes through a sequence of exteriorizations. A little past this and a little past that and a little past something else and something else, and he keeps exteriorizing and exteriorizing. We don't care anything about what from. We're just trying to make him look at present time and it's going to shift the bank, that's for sure.

And of course, we don't get him really, basically, all of him, anywhere near present time. But it feels like it to him; it feels better to him. And when we've got him up as much to present time as we can make it with the CCHs, why, then we ought to kind of clean him up so his rudiments will stay in and get him over on to 3D Criss Cross.

And then, of course, we start exteriorizing him out of all the beingnesses he has been and all the whatnesses and so forth. Sometimes you get lots of whats and conditions that the person exteriorizes out of before you ever get a beingness.

And you get these things, and you exteriorize him out of them – wholesale lots. And of course, if you're hitting these things on the button, and you're doing a good job, why, he's just coming out of mass after mass. Of course, he's coming out of a mass as a mass. And as a mass, he is inspecting other masses.

You will only get tone arm action to the degree that the individual is looking at something and you won't get tone arm action unless the individual is looking at something. We don't care what he is being while he is looking, but he has to be looking at something.

Now, of course, a substitute for looking, a lower-scale lookingness, is a feelingness. And you can sometimes do a bunch of feelies and get someplace with the CCHs where you might not.

Now, knowing that, knowing what I told you there and so forth, you actually, you've got all this; you could dream up a whole bunch of CCHs. You dream up a whole bunch of them, you know.

You could take your various drills of communication and to the room, to you, to this, to that – you know, and treat them all repetitively, you know. Good duplication. You could dream up CCHs like mad. But of course, they wouldn't be any good if you didn't keep calling the pc's attention, not just to present time, but to his bank because he wouldn't come out of his bank, would he. He'd just lock up. He'd slide out of his bank accidentally.

No, you can actually kick him out of his bank, you know. You say, "Gimme your paw, mate." And "Thank you."

And he gives you his paw, and as he does this, he says, "*Oomp.*"

And you say, "Well, good." You thank him, you see. You finish your cycle. That's a moot question whether you finish your cycle and ask or just ask. But you say, "What happened there?"

"Well, what? Oh – shoulder. Oh, yeah, the shoulder. *Ooooh.* It – it – it raised hell just a minute ago. Yeah, it kicked. Yeah, it did, didn't it?" Big win, see. Exteriorize him out of a somatic.

Of course, these somatics will turn on and off kind of automatically without ever calling his attention to it, and to the degree that you never call his attention to it and keep him in two-way comm on the subject, and keep him calm about the whole thing, to that degree he won't progress. See, so you've got a five hundred-hour CCH staring him – in front of you.

You could extend the CCHs to the degree that you didn't make your drills precise and repetitive. And follow the rules of the CCHs in general – just the basic rules. And to the degree that you didn't keep present time attractive for the pc – all very important, see – he wants to do it for *you*.

And, keep his attention on what's happening to his somatics or twitches or something of this sort, see? If he did those two things, hell, those – the pc will just *sail* on the CCHs. They are *not a slow process*. They are a very *fast* process.

3D Criss Cross is a *fantastically* fast process if you get the idea of how many exteriorizations per unit of time the pc is doing, man. It must look like the telegraph poles going by, to him.

You can exteriorize him one after the other, one after the other, and exteriorize him, exteriorize him, exteriorize him. You do a list. Differentiate the list. Null the list. Well, you've exteriorized him very well out of 497 and indifferently out of two, and found out he was stuck in one. And he keeps forgetting the one. It's hard to remember the one. How does he re...? Yeah, yeah. Can't look at it. He's just remembering it. You told him, so he remembers it. Get the idea?

And then you find the other side of it, and maybe everything goes *clank!* you know or *smash*. *Ooooh*. Or maybe it's been going *smash* the whole time, you see. And he eventually is the one, he can look at the other, and so on, and he's – and you'll find him, for days he's likely to go around trying to be the waterbuck looking at the tiger and the tiger being the waterbuck, trying to say, "Well, I wonder how it really feels to be a waterbuck. Well, I wonder how it feels to be a tiger. I wonder how it feels. I wonder how a waterbuck would think of a tiger. How would a waterbuck think of a tiger – I can't conceive of being a waterbuck; can't conceive of it. And frankly, I can't make up my mind about a tiger." [LRH is mimicking something during the last few sentences, audience is laughing at it]

He won't even know he's dramatizing them, because he's obsessively being them. Well, when you'd get into that combination, why, you'd need a little higher boost, but again it's just exteriorization.

But to summate very rapidly, it's a two-pole universe. Unless you have two poles, you don't have TA action. If you don't have TA action, you don't have two poles, so you must be doing something wrong. That's simple! [laughter, laughs]

If you got TA action and you're getting items, and you're calling the pc's attention to it, and ARC exists – no matter what you're doing, you're exteriorizing him from things, and you're straightening him on up and bringing him on up the line as a case. That's for sure. And that's basically all there is to the theory and practice of auditing.

Now, if you did that very neatly, you could actually figure out ways by which this could be done. See, you could take almost any pc and exteriorize him out of something even if you had to kick him in the head.

Say, "Look at my boot," you know. [laughter] Kick him in the head, say, "Look at my boot." And I tell you, sooner or later he'd see your boot, man. [laughter] I'm not advising that sort of thing. It's much better – sometimes a pretty girl sits there and audits this fellow for five or six hours and all of a sudden he gets a kind of a dazed look on his face, and he looks across from him and he realizes a pretty girl is sitting in the other chair. First gain. Ten hours later he knows it's an auditor. Maybe that evening he finds out it's an auditor. [laughter]

Okay. Well, that's – that's what I wanted to tell you about this. That actually is the first time I've been able to phrase accurately and precisely as a communication unit, exactly what auditing does and exactly what you're doing as an auditor.

And it's a fairly brief, comprehensible summary I think you'll find out and it possibly will make your auditing a lot easier to do.

Thank you very much.

Good night.

Gross Auditing Errors

A lecture given on 19 April 1962

Well, how are you tonight?

Audience: Fine.

Well, you're progressing anyway. Some of the people who were sitting at the back are now sitting at the front. [laughter] Must be some progress indicated here.

[Part missing]

Well, we have a couple of interesting things to go into tonight on these two lectures. And the first and foremost of them concerns rudiments and the demonstration which you saw last night.

And this is what? This is the 19th – 19th of April, AD 12, Saint Hill Special Briefing Course. You can always tell it's a Briefing Course lecture because somebody's knocking at that door over there. [laughter]

Now, you saw a demonstration last night and most of you understood what it was, although one of you thought it was a demonstration of CCHs. [laughter] But it wasn't. That was a demonstration of checkouts.

Now, first and foremost you should recognize that one of those demonstrations was not a good pattern. That was the one I did on Wing. And that was not a good pattern because it tended to invalidate his items even though it instructed the auditor to get the invalidations off of his items, you understand? Going over his items at that stage, when he's just now beginning to win – where are you Wing?

Male voice: I'm right in back here.

Yeah. Ah-ha, you retreated. Going over his items at that particular stage was not an optimum action, you see, because the difficulty really did not lie with the items. But there were a couple of false items on the list. But it won't upset a pc all that much. You see? Couple of them weren't proper, because he's still in the state of getting items to join up with items, you see? And there's still a lot of things between, you know, and around, and he hasn't quite got the Goals Problem Mass item versus the Goals Problem Mass item that causes a fizzle down and a blow, you see? You see, when you get the two adjacent items, one against the other, it all tends to deintensify like mad, you know. It takes tremendous – thing to hang up. He's still getting items which are distant from items. You got the idea?

Now frankly, the recommendation I would have made to the auditor – and this is the one thing you didn't see last night – you see, you didn't see the recommendations I would have made to the auditor, nor the inspection of the sessions. Now, those are quite important.

The inspection of the session would have followed each one of those. And I could have gone in and asked the pc more of what was going on in the session. And the way I would have done that is after I'd found what rudiments were out, I would have made a searching inquiry, perhaps, into it. And possibly the whole thing could have been located that way. I would not prefer to do that however. On auditing supervision, I would prefer to observe then, the session itself.

Now, I probably wouldn't do it the first time I found all the rudiments out, you see. Following that inspection of the pc and the discovery that the rudiments were out, I would have tipped the auditor off. See, I would have told the auditor to do so-and-so and so-and-so and get the rudiments in, you know, before he went on doing something and I would have been very pleasant about it. See? Gentlemanly; pleasant – at that stage. And then I would have, however, kept this – the GAE list – see, if I were running clinical actions, and so forth – a gross auditing error – GAE, you see? We haven't got enough mysterious terms. We have to invent a few more, you see.

And I would have taken this and I would have laid it aside. And after a couple of days I would have seen if I was getting a recurrence, see – three, four, five days. You know, was I getting a recurrence of all this. How long was this person staying on the GAE list? See, are we still getting a no tone arm action? That's all I would have adjudicated about it. See, in studying the report – the next day's reports – I would have looked for tone arm action. I possibly would have been very nice and given him two auditing sessions in which to get the tone arm acting, see? And by the next session after that, if I didn't see some tone arm action on that case, then I would have gone further than to have been polite with the auditor.

The next thing I would have done would have been stuck my nose in that session. Because I don't care how covertly you stick your nose in a session, whether it's by a microphone situated in the room in a listening post or simply walking in and letting – while the session goes on, you see. Because I would have assumed by that time that the gross auditing error was so gross that no advice I gave the auditor had anything to do with what the auditor was doing.

See, I would have assumed by that time this is *terribly* gross, you see, this is enormous. Any of you can get a pc with the rudiments out. Pcs' rudiments go out. You know, session ended a little bit early, they were three-quarters of the way through the list, they felt like mad. They went out of session after that and they nattered about the auditor and they ran up some overts against this and that, and they cheat-cheat on something of the sort and that made them call up their ex-wife and give her hell, don't you see? And then they decided that night they felt so bad that they'd better have a few drinks, you see? And havingness went down, don't you see? [laughter] And by the time we check this pc, why we've got out-rudiments. All right, fine. Yeah, sure. But tomorrow you get the rudiments in and the pc gets to sailing again.

Now, I'm talking about when the rudiments don't go in. See, then we start to get police-doggish. Now, we don't have to bark and bite and gnaw their legs off just because one time this was slated for a possible gross auditing error, you see, because we weren't getting tone arm action. Any auditor is liable to run a session with no tone arm action. See, that's liable to happen to the best of us. But three in a row without doing anything about it, no, that's

not liable to happen to the best of us. One and one-half, maybe. Two – and certainly not three. See what I mean?

Audience: Mm-hm.

Because an auditor would be a perfect stupe, he'd be a perfect knucklehead, to sit there with no waggle tone arm, and just go on and away and away it was running and feet on the window sill, you know, and having the pc light his cigarette. The thing is – the thing that must be just totally crazy, see. I mean a – because, look, look – you audit the pc in front of you, you don't audit a textbook pc, you don't audit a pc I mocked up for you – you don't audit any pc except the one who is sitting right in that chair.

And you have an oddity today – a great oddity. This has probably never happened before on the history of Earth, where the textbook solution had anything to do with reality. See, I mean, in all training – you will find all training has the common denominator of the textbook solution is never met. I rec- remember training generals in Egypt. It was difficult. You say, "When fighting Numidians, you inevitably and invariably make very certain that your flanks are secure, because the Numidian – because of horses and that sort of thing – can very easily collapse your flanks. So one of the first things you do in fighting Numidians is make sure that both flanks are very secure. And the best way to do this is to put one flank against the seacoast. You see? And the other flank against a wadi. You see, that's the best way to do that." No general you ever taught ever fought any Numidians on the seacoast. [laughter] You see, you run into these small difficulties in training.

That's typical of Earth. They're always telling you in navigational schools that what you do is go out on the bridge and you take a shot of the star, and then you take a shot at another star. And then you come back in and you put down accurately the times and angle, and then you figure it out by some navigational system, and then you've got a position. And it's always a textbook solution. The only trouble is, they never bother to tell you that the horizon can vary at various times because of heat mirage, you know, and it can vary because sometimes you have big waves, and if a fellow isn't terribly experienced in all this, he can get as much as a thirty-minute, fifty-minute error. Oh, just like that. And that, you see, is thirty to fifty miles. And – and that's on a good day. And on other days, when – that aren't so good he can get an error up to three and four degrees, and every degree is sixty miles. This is something on the order of finding yourself in the middle of the Sahara when you're going through the Straits of Gibraltar, you know?

Textbook solutions. They're marvelous. It disgraces all training on Earth actually, on practically every subject known to man. Because the guy on the job is always meeting conditions which are entirely different from the conditions which he has been taught to meet. Wars are full of these sort of things. All men's pursuits are full of these things. Women in all of their varied actions collide with these things.

You take a cookbook, you go into the kitchen, and it says – and somehow or another they just never – well you get this thing about a "pinch." I saw some textbooks on cooking once and you had "pinches." Please tell me how much a pinch is, you know?

Now, out in the gold rush days they used to hire bartenders with big thumbs because a drink went for a pinch of gold dust, you see? And the miner would put his poke up there to

buy a drink and the bartender would reach in and take a pinch, you see, of gold dust and serve a drink. So they always got a bartender there with a thumb like a spade. [laughter] How much is a pinch, you know? It comes down this far. And you get all these variations of one kind or another.

Well, it happens at this particular time and state in Scientology that you are actually up against this same textbook-solution proposition. You're not up against the same solution. The textbook solutions do. It's actually when you depart from the textbook solution that you get in trouble.

Now, in view of the fact your total experience on this planet is: God help you, if you use the textbook solution. The Marines had a song of somebody – I think Toby McFlynn, or something like that, he died with a grin, because he'd used the textbook solution, you see. And he was a great man, this is very – made it – heroic death, you see? Nobody else had used the textbook solution.

Now, here's your bone of contention. You always expect to encounter something different. See? You always expect to be – have some variation in front of you, from the textbook solution, see. And you really don't expect it to work out. And because you don't, you approach all such solutions with a little bit of variation and deviation – just a little bit. And you're always looking for something else. And that's about the only mistake you can pull in auditing today. You've got to audit the pc in front of you. That is to say, when he has cognitions they're his cognitions; those are all different. When he originates physically, he originates physically in his own peculiar way. They will all originate differently. You see?

When you get a string of 3D Criss Cross items, these items all have different names, see, they – from the next pc. See, they go together differently. It takes them longer to get a gain on some particular process, you see. One fellow, he really gets somatics on CCH 1; somebody else gets somatics on CCH 3.

This tends to give you the idea that you are looking at differences. Yeah, every pc's different, see. But truth told, what the auditor does is always the same and you miss that looking at the differences of the pcs. And you start varying much from the auditing which is being done right now and you will get into trouble because it's a tightrope walk. It's a tightrope walk that's been mapped now for a great many years. We've been getting closer and closer to walking the exact tightrope. And you've got now a situation where there are textbook solutions to everything that comes up – doesn't matter what you meet. You follow through the same way.

The amount of imagination which is required is minimal, actually. The amount of ability to communicate, almost, is the only thing that regulates the difference amongst auditors. One auditor, he's heard by the pc better than another. He's got a better ability to reach or something like that and a pc will receive these variations.

But, let me make my point here, very cleanly. We're used to having to think up some unusual solution in our old-time processes. See, get bright. You know, exert some real hot judgment right about this point. And man, you're going to be wrong every time you do. You take my word for it; you apply the textbook solution and you'll come up on top every time. And this is – makes it quite different from any training that's ever been done on this planet. See what I mean?

We're going against a series of invariables and these invariables probably look much more variable to you than they are, you see? Because you see them in different guises. Auditors wear different colored suits and pcs come up with, you know, different origins and they get different items, and so forth.

Now, it used to be we'd say, well, every pc is different. That's right. Every pc will have a different set of items and he'll have different things that he reacts on. But today we're up against the fact that every auditor has actually a limited number of things to do. And you just learn – one of the first things you got to learn – is that it's those things that you do. See?

Now, I put 3D Criss Cross out to grass. I wrote it to somebody who's ordinarily a very good auditor, on class what-do-you-call-it – Class I Auditor – always been getting good results and that sort of thing. And I put 3D Criss Cross out to grass by just writing it to this person and having this person have a crack at a pc. You know, how well could this thing be done by minimal information? Well, oddly enough, this auditor did splendidly. That's quite remarkable, you know? Did splendidly. And the pc wound up very satisfied. Auditor got about six or eight items on about three lines and the pc did splendidly; wrote a very congratulatory letter concerning all of this and so forth.

However, you get a report of these sessions, you know, and it stands your hair on end. The only thing that went wrong is the auditor did practically everything but 3D Criss Cross. I don't know when they found time to do very much 3D Criss Cross. But the auditor sat there inventing processes to cope with the pc. And the pc kept getting ARC broke and bitching around about this and that and being upset about this and that. And the auditor would just sit there and in the middle of everything keep inventing processes and doing different things in order to cope with the pc. Well, of course, this is the reason the pc was ARC breaking.

This was one of the processes that was used. This is not derogatory of this auditor; I'm just showing you this auditor was perfectly willing to do this but didn't get the idea that you didn't do anything else. See, that idea was not communicated. Don't do something else, too. See, it's like the pc always sitting there – he'll do the process alright, but he's doing seven other things, too.

All right, and one of these processes was, "Invent a worse way of baiting an auditor." Oh, these processes were off theory of one kind or another, kind of cross-pitched one way or the other. "Invent a worse way of baiting an auditor," to run out an ARC break. And there's apparently – the thing is salted down with dozens of these processes. I may exaggerate, but there's just dozens of these processes interlarded amongst the 3D Criss Cross all in an effort to keep the pc in-session. But, of course, the auditor never realized she was driving the pc out of session.

And probably none of these goofball processes are flat. They're all sitting there amongst 3D Criss Cross, all of them gorgeously unflat and everything else.

Now, even the best of auditors will all of a sudden do the banana peel. You know? He'll say to himself, "What the hell did I say that for?" You know, "Why don't I cut my own throat?" You know. He did something or other. The best of auditors will do this. See? The commonest difficulty amongst auditors is they don't realize that when the pc has said it, it is

blown. See? They take up – this is the commonest difficulty – they take up what the pc said and that is very bad.

And that is why you think you're always up against something else than a textbook solution, you see, if you're doing it.

The pc said – you say, "Well, what is this present time problem?"

And he says, "Well, my mother-in-law is coming to stay with me."

And the auditor, God help him, says, "Well, how do you feel about your mother-in-law?" See? *Oooh*. No, no, his question was present time problem – did the pc have a present time problem. The pc told him the present time problem. Now, the auditor's only job at that stage of the game, whatever the pc says, particularly in rudiments, whatever the pc says – it's just whether it blew then. You see? Auditors don't give pcs credit for blowing something on mentioning it. They don't know – always are underestimating the power of two-way comm. See?

"Do you have a withhold?"

The pc says, "Yes, I was out with your wife last night." Well, that's startling enough, you see, for the auditor to go over the hills and far away, but usually it isn't quite that pertinent or peculiar.

It's usually something very innocent as, "Oh, yes I have a withhold, I – uh – as a matter of fact – I'm not supposed to be drinking during this intensive and when I killed a quart of Scotch and I – last night, and I ..."

Hm. Now, the auditor doesn't go back and ask the meter, see, "All right, good. Do you have a withhold?" See? The auditor comes in and says, "Well, what about drinking Scotch?" Now, he's wound it up so it won't blow! See, he's killed his own release. See, that's the commonest difficulty in rudiments. The auditor won't let them blow.

This is commoner than you'd think. You've got to have something whereby the pc says what it is. The auditor has to assume, until he tests it, that that has blown it. It's that simple. You get yourself in more trouble assuming anything else than I could very easily count in terms of hours of processing and so forth. See, you get yourself in endless trouble with this thing. It all comes on this one basis: You ask the pc if he has a present time problem and the pc says, "Yes, I have a present" – of course it fell off the pin – "Yes I have a present time problem."

And the auditor says, "Well" – he can prompt the pc – and say "Well, what is it?" You know?

And the pc says, "Well, I don't know how I'm going to pay my room rent."

"All right, fine." The auditor should acknowledge that extremely well, because his acknowledgment is part of the blow mechanism, you see. And then he should ask the pc again if he has a present time problem. *Not* can he think he'd pay his room rent now! [laughter] See, what we got going here is the pc gets rid of it and the auditor keys it in again!

And that's really the chief reason why you're not cleaning rudiments easily. You're keying them in faster than the pc can key them out. You follow me? That's a commonest auditing error. I don't care whether you call this Q&A or whatever it is. But actually it inhibits the pc from blowing anything.

Now, the correct procedure is this:

"Do you have a present time problem?" Clang! goes on the needle here. Clang! All right.

"Good. What was that? It fell – what was that? Anything you care to say there?" That it ... "What was it?" See?

And the pc says, "*Yow-yow-yow-yow-yow*," and that is the present time problem.

And then the auditor says, "Good. Thank you. Swell. Fine."

I don't care if he feels like he blows the pc out of the chair with acknowledgments – acknowledge the hell out of this thing, you see. Ends the comm. And the auditor should look at that moment satisfied that he's handled the whole thing. That's the little schoolbook tricks of the trade I'll probably never let you in on. I say there are no tricks of the trade and then I give you one, see?

But, let's sound awfully satisfied along about that time. Just acknowledge the living daylight out of it, even relief that you've gotten rid of this present time problem. See? I can put a pc over the roly coaster on getting rid of out-rudiments so fast he doesn't know what happened.

You saw me beat one pc to death on a missed withhold here last night. I bet that pc right now knows she got rid of that missed withhold. I was – sat there because I was very happy she got rid of the missed withhold. Did you see that last night? Did you?

Audience: Yes, hm-hm.

Well, she actually did tell me what the missed withhold was. We did actually go over it. But we didn't spend any time on it, did we? Part of getting rid of it was communicating it to her, that I'd got it. And she got real convinced about this. And I must have gotten it in full, otherwise I wouldn't be so satisfied with it. Get the idea? See that? That's just auditor presence.

So, we say, "Oh, good!" Don't repeat the present time problem after him. Don't say, "Oh, well good, so you, can't pay your room rent this week. Oh, well that's fine. Good." [laughter] Don't do that, see. Just say – you've got to impart it without repeating it. You see?

And the pc says, "Well, I got a present time problem, I can't pay my – don't see how I'm going to pay my room rent this week."

And you say, "Well, all right. All right. Good. All right. Now, we're going to start a brand-new..." Another use of the acknowledgment – "Well, we've gotten rid of that." See? "All right, now. Now, we're going to – we're going to get on to the next thing here. See? Do you have a present time problem?"

And you find out ninety percent of the time it's gone – ninety-five, ninety-nine percent of the time. There's no ghost of a clip on that thing.

If you expect it to be there, if you expect it to go on being there for the next hour or two, it'll stay. This is how you do that: "Do you have a present time problem?" And the pc says, "Uh – uh – uh – yes, I do. Room, room rent – I don't – I don't know how I'm going to pay room rent."

"Oh, your room rent. Uh, well now," – the auditor is worried about it, too, see? – "Well, now – yeah, well, all right, now. Do you have any particular solutions on this? I mean, been thinking..." and so forth, "Who's that problem with? Oh, yeah, yeah. How much – how much money do you make? Oh, well, uh – you ever had this problem before? You had difficulties with it? Oh, yeah. *Hm-hm-mm-mm*. Did you ever have trouble with money?" [laughter]

Man, we can go on by the hour! Don't you see? See, fix it up man, you can just hang up there and you'll never get any auditing done, you know. You can go on and on and on.

Well now, that one percent, that one time out of a hundred, and you say, "Do you have a present time problem?" You get a knock, and you say, "Well, all right, what is that? What is your present time problem?"

Fellow says, "Oh, well, I can't pay my room rent this week."

And you say, "*Hm-mm*. All right. Okay. All right. Thank you. Thank you. All right now. Do you have a present time problem?" Clang. "All right, what's that?"

"Well, it's my room rent." [laughter]

That's the one time out of – out of a hundred. See? All right, well now, don't let that defeat you so the next ninety-nine times you run into the trick you run into the same chasm. No, the thing to do at that stage of the game – I'll give it to you absolutely right this time – "Do you have a present time problem?" Clang! "All right, and what is it?" And he tells it to you. And you say, "Well all right, all right. Good. Thank you. Fine. All right. Now – do you have a present time problem?" Clang! "All right, what's that?"

"Well, it's my room rent."

And you say, "All right. What part of that problem could you be responsible for? Thank you. What part of that problem could you be responsible for? Thank you. What part of that problem could you be responsible for? Thank you. What part of that problem could you be responsible for? Thank you. All right, now, do you have a present time problem?" Tick. "Good. All right. What part of that problem could you be responsible for?"

And the pc says, "Oh, most anything," so forth.

And you say, "All right. Now, what part of that problem could you be responsible for?" And you notice you're not getting much kick, see. And you say, "All right, now. Thank you. Thank you. Now, do you have a present time problem?" Nothing. You say, "Thank you very much. Is it all right with you now if we get on with this listing?" – or this Prepchecking, or whatever else we're doing. You got the idea?

Don't start a process. Don't have the Horse Guards come out, and then the Queen's own, and then marshal the Coldstream, you see? And then get a band. And then write a letter to the Times because the Queen didn't come down and – and inspect the troops. You get the idea? That's not the place for it! That's not the place for all that. That all belongs in the body of the session.

See? So let's not start and end, and mess up and so forth. You can give the last two commands for Havingness or something like that; because it isn't something you have to catch on the fly. The reason you could do that best as a present time problem or something like that, and just – you just start the process, you just end the process – that is all there is to that, is you're not giving it very much importance, don't you see. It's downgrading, and it's something you just say, "Well, this is – hell with this, we'll get it out of the road. It's good, it's important, yet at this particular time we got onto something else we're going to get. That's good."

You know, that's the whole atmosphere under which this thing is audited. Not, "Oh, well, gee-whiz you've got a present time problem. Oh, well that's too damn bad. I mean, God almighty, how am I going to get on with this session here, you see? Oh, I don't know whether I ought to take it up with you or not because, you see, we've got an awful lot of listing to do today for 3D Criss Cross. And I hate to get detoured by this present time problem, you see, because it's going to cause us so much trouble!"

If you're going into it with that frame of mind, you're going to have trouble. I can guarantee you will have all kinds of trouble, have it by the bushel-basketful .

But by just downgrading the whole importance of the thing, you see. Ways of downgrading importance is just to brush off process. You get the idea? If you're unlucky enough to have that process not work, I don't know, you must have been doing something else in the session that would be wildly out. I mean, it'd be – have to be some invented-something-elseness, such as not reading the E-Meter in the first place to find – or trying to run a present time problem that isn't there, or something like that.

Now, you could get that all involved, you see. Now, that's the simplest form, "What part of that problem could you be responsible for?" Well, I guarantee he's got a different problem. You know and I know he's got a different problem on the second time you ask the question. And the third time you ask the question he's got a different problem than that. And the fourth time you ask the question he's got a different problem than that. And then sooner or later he comes up to present time and has the problem of getting on with the session.

All right, well clip that one out and get going. But you see, you don't have to give it any importance. Weight: the way the auditor puts weight into the processing – w-e-i-g-h-t, you see, not: w-a-i-t – the way you weight the processing. You know what you're supposed to be doing in the body of the session. This is weighted, this is heavy, this is what we are doing. Oh man, dress parade, you know – plumes and cuirasses. Let's go on with this. Let's start that process and let's keep it going, and let's keep a terrific auditing discipline the while and get in your middle ruds once in a while when you have to and give it two more commands before you end it, and – you know what I mean? Oh, that's all just as precise as hell, you see? Very important.

Get to your end rudiments, see? You've ended the body of the session. Make damn sure that those rudiments are null. See? "Have you told me any half-truths? Untruths?" You see? Make sure each one is null. It isn't, "Have you told me any..." Somebody was doing it this way the other day, "Have you told me half-truths? Thank you. Have you told me any untruths? Thank you. Have you..." That's too much importance. See, "Have you told me any half-truths? Untruths? Said something only to impress me? Tried to damage anyone in this session? That's all straight." You tell the pc, "That's all straight." Got away with it; that's all straight.

All right, "Have you deliberately tried to influence the E-Meter?"

"No."

"Good; clear."

All right. Get the idea? "All right, have I missed any withholds on you? Have I missed any withholds on you? No. Good. Well, let me ask that again: Have I missed any withholds on you? Oh, I haven't. All right that's fine."

You can actually con-game the pc straight down to null end rudiments, you know?

All right. "Now, don't wiggle your neck but look around, just wiggle your eyeballs." [laughter] "Good – I got no reaction!" [laughter] "Fine! All right! Good! Ah! Good. That's fine."

Now. We ask about the goals and we ask about the gains, and we slide it out of session, and that is the end of it. Get the idea? And you know, you, the auditor, can actually sort of hold the rudiments in, but only, only if you do this, only if you do this: give a flawless session.

Now, all of us make goofs in session sooner or later. And they're always regrettable. They're completely forgivable. They only become *unforgivable* if you *continue* to make goofs. See, nobody's too interested in the absolute perfection. But we are very interested in an infrequency of goof.

Now, we want – we want confidence on the part of the pc. And confidence on the part of the pc is born by consistency on the part of the auditor. And any time an auditor becomes inconsistent, any time an auditor Qs-and-As, any time an auditor all of a sudden puts an odd, weird, cock-eyed variable into the middle of a set procedure, confidence goes down because consistency has dropped out. And those two things are blood brothers – Siamese twins. Confidence is born out of consistency.

You give the same session to the pc over and over, he will become very, very confident. He'll be very happy with you. And that happiness drops every time you vary the situation, every time you Q-and-A, every time you refuse to let him blow something.

See, here's a mousetrap sitting there and the pc comes along and he says, "There's a mousetrap." Well, ordinarily this mousetrap just moves away. He'll say, "Well, there's a mousetrap," and he's happy about it and he goes on in his session all right.

When you Q-and-A and insist on going on and on, in rudiments, over this same con-founded mousetrap, you're insisting he put his fingers in it and trip it. And then he does and then you're in trouble and then you never seem to be able to straighten out rudiments.

And the reason you can't get rudiments straight on the pc has very little to do with the pc and has everything to do with the auditor. It is actually the tone and attitude of the auditor.

An auditor's lack of consistency brings about a lack of confidence; and then your ru-diments start out.

Now, there is nothing like consistency of the exact procedure which we are doing at this moment – not subject to any changes to amount to anything – consistency in exactly what you're doing will breed confidence. So actually in along about the third session, the rudiments would just go in – just like that.

A pc notices the care that is taken with him. See, he notices this. "Do you have a pre-sent time problem? Good. Let me check that again. Do you have a present time problem? Thank you. All right, that's clean." See? That's the auditor being real careful. That really makes an impression with a pc.

You're not sure this item is in. We're talking now about bodies of sessions rather than rudiments we – at this moment. This item, you're not sure of it, you know? And you say, "Cat whiskers. Cat whiskers. Cat whiskers. Let me look at that now. Cat whiskers. Cat whiskers. Cat whiskers. Yeah, well, that's out. That's out. Okay. All right. Mules. Mules. Mules. Dogs. Dogs. Dogs. Dogs. Dogs. Dogs. That's out. Okay."

Care. Get the idea? He isn't saying, "Cat whiskers, cat whiskers, cat whiskers." [laugh-ter] For some peculiar reason the pc gets the idea that the auditor doesn't know what the hell he's doing.

So you can put another "c" on your confidence. And confidence is aided by careful-ness. It depends absolutely on consistency, but it is certainly helped by carefulness.

Now, rudiments go out when unconfidence is born. You get this pc nervous about what you're going to do next. You do the unexpected. You suddenly rip a new process out of your whip – hip pocket in the middle of the pc's run. Oh, no. You do this two, three times and, my God, you couldn't keep the rudiments in with bulldozers! I guarantee it. You just couldn't keep the rudiments in. That just couldn't – wouldn't work.

In other words, we all of a sudden we're running along, we're running along and say-ing, "All right. What part of a government would you be willing to attack? Thank you. What part of a government would you be unwilling to attack? Thank you. What part of a govern-ment would you be willing to attack? Thank you. What part of a government would you be unwilling to attack? Thank you. All right. Now, how do you feel about my auditing there? Got an ARC break or anything of the sort?" The pc went a little groggy for a second there. "Got an ARC break? All right. Now, invent another method for baiting an auditor." [laughter] "Invent another method for baiting an auditor." See? And then the pc says ... [laughter]

And I tell you, the more you drive rudiments out the harder they are to get in. And they are driven out just by inconsistency, that's all. Now, I don't care how carefully you ended

the process off – that you had run it at all... See? And we find out that isn't working too well and the tone arm has gone up to 6. So, of course we'd better shift it over and so forth, and say, "Well, have you ever tried to make an auditor guilty? Ah, good. Thank you. Well, have you ever tried to make an auditor guilty? Good. Thank you. Have you ever tried to make an auditor guilty? Thank you. Thank you very much. Have you ever tried to make an auditor guilty? Thank you very much. All right then. What government have you been unwilling to attack? Thank you." [laughter]

Pc will get jarred, man! And I don't care what pc it is, after a while, after you've done this, just in a few sessions – it's best done at different times for different periods and sometimes for a good reason and sometimes for no reason at all. That's what's best. And then nobody can get the rudiments in on this pc. The pc is a bundle of nerves. He's run up against a – you know, what the hell? What's going to happen next? He doesn't know what's going to happen next.

You give him three sessions of Model Session and they're all nice and consistent and everything is fine. There's a few little surprises in there; he didn't know you were going to ask things in that order. By the time you give him a third session, he expects them to be asked in that order. And oh, dandy, great. And along about the fourth session, why, those rudiments are awfully in. And the fifth session the rudiments are, well, they're just in, that's all. And the sixth session, well they're very well in. Seventh session, beautifully, beautifully in. What's happening? It's just the consistency is putting the rudiments in for you, that's all.

I don't care how normally... You've always thought the rudiments as being out natively in the pc. [laughter] And the auditor has everything to do with it. And you can get the most nervous and flighty pc in the world and if you were to audit the pc perfectly with perfect consistency, making no gains that would amount to anything, you know, but not getting upset about it, and just go on and give him that perfect routine. It's the auditing routine itself which is smoothing him down. After you've audited him for a little while, all of a sudden, auditing session? Well, that's dead easy, do that standing on his head, see? When he comes into the auditing session he's got tone arm action, but you didn't do anything to get him to get tone arm action. You just went over the rudiments and took up the routine process and always ran the same process with him for the out-rudiments, you see, and ran it briefly, and got him... And then you ran the body of the session just the way you're supposed to. By the time you've done this a few times, you don't hardly have to put them in. You check them; they're in. You see?

That's the magic of the game. That's where the textbook solution is the solution. And you'll find these rudiments do cover almost everything that can happen to a pc.

Now, of course, a pc's rudiments go out in the middle of the session. Well, actually, you want to know if he invalidated anything, and you wanted to know if there are any half-truths, untruths or tried to impress you or damage someone or if he's trying to influence the E-Meter. And that's just about all you want to know about him in middle rudiments and that's to get a list to start reading again, see?

But normally, you're the one that kicked it out. You did something. You're doing something. Either he can't understand what you're saying or he feels he's doing something

wrong, or something or other is going on in the session that he doesn't just get the grip of. You see? But the auditor has done something flagrantly wrong, I'll guarantee you, every time, if you have to keep putting these things in. If you have to keep using middle rudiments, there's something haywire here. See, there's a lack of confidence on the part of the pc.

Well, of course, what I say is taken within limits. There's some pcs that go scrambling off the walls and a pin drops a quarter of a mile away and you can see their scalp rise. They dramatize an old scalping incident amongst the Sioux or the Blackfeet, you see. And their whole scalp lifts off, you know, a pin drops. They can hear this. That's because environment keeps going out on them all the time, environment keeps going out.

Well, actually, environment will sort of habitually start to stay in if the auditor is consistent about what he does. Because more and more the pc will permit the auditor to take responsibility for the environment, and the pc will realize that if something bad happens in the environment, the auditor will do something about it. Don't you see? He gets the idea that this environment is not a threatening environment because the auditor is auditing him.

In fact, you could get him so that the only time of the day he's calm is when he's in session. Got the idea? And then he gets less and less uncalm out of session, but the first calmness he ever discovers is in session. You see what I mean? I mean, this gradually spreads around and he's calm regardless of whether he's in-session or out of session, about the environment. See, because you've remedied a bunch of things about his case by that time.

No, rudiments aren't something that natively out with the pc. They stay in as well as the auditor is flawless. That's all there is to it. You do a perfect job; you'll have a perfect pc. You can't help it, you see? The pc has had it as far as you're concerned. You're sitting there with all the weapons ...

If the number of factors that are being crisscrossed on the pc in an auditing session, you know – the number of factors that have to do with the human mind, contained in Model Session, were counted, you'd probably get up in the hundreds. And every one of them is a powerful factor. And if you do all of these things consistently, of course your pc responds accordingly. He can't help it.

It's something like shooting sparrows with sixteen-inch guns, let me assure you. He'll stay in session and then he'll improve and come up along the line and his case will get straightened out; everything will get very, very fine.

Now, the auditing which you saw last night was research auditing, to that degree. I showed you how to interview a pc, yes. But as far as I was concerned I had a piece of research on this thing. I'm always discovering things. And isn't it interesting that there wasn't a person there who didn't have the rudiments out? Did you see how wildly the rudiments were out? Oh, yes, well probably they were exaggerated in their outness. Very probably exaggerated in their outness by the fact that the pc was on parade. But they weren't exaggerated in their outness because I was auditing them. If anything, that tended to slow it down a little bit. It would only be to the degree that they thought they might have to protect their auditor that would get an influence and I don't think any of these people were trying to protect their auditor.

So it wasn't any more exaggerated in the final analysis – maybe a little bit – beyond what you actually would have seen if you yourself had taken one of the pcs in session and asked them these rudiments questions, see. Did you notice I didn't ask them the rudiments questions with a consistency? Consistency belongs with auditing, not interrogation.

So I just asked them, "How do you like the room?" You notice I didn't use any of the rudiments wording. That's to keep the pc from going into session to me. Because these things become a signal, "In-session." See. So we ask about the room, and, "How did you like your auditor?" You know, that doesn't sound anything like, "Are you willing to talk to me about your difficulties?"

You see. It isn't the same thing. You follow that? So you – I didn't use rudiments on these things.

But I showed you something. Well, I showed you how to interview a pc. And I wish to call to your attention that this – just the asking them the rudiments in some different phraseology, checking them over and asking what they thought about it, and looking at their folder and so forth, that's what you did, you're – originally were inspecting the case because it had no TA action, not because of complaints the case was making – never listen to complaints. It's just no TA action; minimal TA action. All right, so therefore the case was inspected. How come? How come no TA action?

Well, that's why you would interview such a case if you were supervising a lot of auditing. And the next action you would take would be a consultation with the auditor. "What are you doing, mutt? See. What's cooking here?" And very often he'll come down with a violent vituperation as far as the pc is concerned – you know right there that there's no ARC from the auditor. One of the best things to do is pull his overts on the pc and send him back into session. That's right.

And here you can pull all of an auditor's overts on the pc, particularly under supervised auditing, because very seldom are these people of long acquaintance. And you get yourself next day's report and you look at that and see if there's tone arm action yet, and the next day's report and see if there's tone arm action yet. And now, there's no tone arm action the next day, well, God almighty. This is auditing which is being done by the auditor hanging by his heels from the middle of the ceiling.

I mean, the gross auditing error is just by this time so magnitudinous – given any kind of a trained auditor at all – a gross auditing error is so gross that you yourself will not believe it. And then, of course, the only way to find it is not talk to the auditor, talk to the pc. But you actually have got to look at this session to find out what the billy-o is actually going on in this session. You have to look at it; there's no substitute for it at all. Because they can't imagine it. You see? Because it's – this is standard. The auditor thinks he should do this so he's not going to tell you he's doing it. And the pc probably is insufficiently in present time to find out what the auditor is doing, don't you see? You can't get your data there, you've got to get your data by a microphone inspection or by an actual visual inspection. There's no substitute for that because you find the damndest things man, *oh-ho-ho-ho-ho-ho*, wow. Oh, I needn't tell you to. But there's some wild ones will go on. I mean it's gross auditing errors.

But I want to point out something to you. This was the research aspect of the ... Well, gross auditing error is the auditor just isn't looking at the E-Meter; never looks at the E-Meter. You know, it isn't that he has something wrong with the way he looks at the E-Meter – I don't mean there's a – the auditor just doesn't ever look at the E-Meter! See?

There's something like this: "All right. Do you have a present time problem?..." [laughter] "Well that's clean." See? It'll be something wild! Unbelievable. Well, the auditor's sitting there all the time eating candy bars, you know? And the pc's out of session because the crumbs and that sort of thing keep getting on her white skirt, you know? [laughter]

It gets so wild – by the time it's gone four days, there's something going on there that's so wild that I guarantee you, you will not be able to imagine it. You have to go see it. It's like Barnum used to say about a circus. By that time it's getting up into the freak-show class.

Because it's too easy to do this. So a lot of new, different, strange things are happening, you see, that you wouldn't really realize were happening at all. And early in training auditors, they don't realize these things have any wrongness to them at all. So, they just go on doing them until somebody actually spots it.

But I wanted to show you something – in general, completely aside from that. These cases were selected for only one reason: no tone arm action was now occurring that you could call tone arm action. No really good tone arm action was occurring on any of the cases you saw interviewed. Although some of those cases had *had* good tone arm action, but suddenly wasn't occurring. And I ran down the rudiments and did you see how the rudiments reacted? See? All right.

This checkup disclosed to me this fact: that tone arm action does not necessarily take place just because the rudiments are in. But if rudiments are out – this is true, you see, that other isn't necessarily true – but if rudiments are out your tone arm action will not take place, and that *is* true. If the rudiments are out, your tone arm action will not take place. You could get them far enough out so that you could just have a still arm.

This means that tone arm action is proportional to the degree rudiments are in – not proportional to the case. Tone arm action is not proportional to the state of the case. Tone arm action is proportional to the degree the rudiments are in.

Now, of course that's monitored by what is being run on the case, which is the only thing that would make a liar out of this statement because you can run some line that was utterly unsuited to the pc, or some Zero A question on Prepchecking that was utterly unsuited to the pc, or you could go on running CCH 1 twelve hours and a half after it was flattened. You understand? So that's not an unlimited truth. But it's to this degree, that the tone arm action will cease when the rudiments go just so far out. You see. The further the rudiments are out, the less tone arm action you will have on the pc, regardless of the case, but with the understanding that you're running an effective process. Do you follow this?

Now, you sat there and looked at it last night. Now you've got to take my word for it because I haven't shown you the folders on these people. But tone arm action was minimal. It was your quarter of a division in twenty minutes. See? And look at those rudiments, man; they were wildly out. Now, you'd think you had to get some wild and unusual and peculiar

and fantastic solution to handle any one of these cases. And that would be the natural bent. Let's find something new, strange and peculiar to handle these cases. The newness and strangeness and the peculiarness should consist entirely of the auditor doing a very consistent Model Session and getting the rudiments very nicely in. And that alone would have restored the tone arm action on any case I investigated last night – just as simple as that.

That's what I mean by the textbook solution is the solution. Now, the textbook solution of returning tone arm action to a case is to get the rudiments in. You have a reality on this. Probably any of you – many of you have seen a list go null because the rudiments went out. Well, translate that over into, "The tone arm went null, because the rudiments went out," you see, that makes it the same breed of cat. That's a little piece of research auditing you saw there. I just thought I would check across this and see if I could find a common denominator of this particular set of cases.

They aren't consistently no tone arm cases, you know. They were just taken as of that day, why, they were the low men on the totem pole. They had all gone numb just the last day or two, you see, as far as the tone arm action was concerned. Previously they may or may not have had tone arm action. You see that? They were not strange cases in other words, they were just cases of – with the tone arm motion didn't exist on. And we found the rudiments *thuuuh* ...

To restore the tone arm action you would – should have – might have said, "Well, the best thing to do is to – let's see if we can't audit this person with two auditors, yes, two auditors. And let's see if we can't run, uh – CCH 14 – uh – that's really best," and so forth.

And you see you could have gotten a whole bunch of unusual solutions and you could have said, "Well, invent another method of baiting an auditor," or something like that, "Invent a worse method of baiting an auditor," something like this, you see. You could – all these unusual solutions.

Where, as a matter of sober, sober, sober fact, all you had to do was get the rudiments in and the cases would have gone off like a bomb. In other words a greater consistency, not a greater randomness, would have given motion to any one of these cases. Okay?

Thank you. Take a ten minute break.

DETERMINING WHAT TO RUN

A lecture given on 19 April 1962

Thank you.

Here we are, second lecture and this is Saint Hill Special Briefing Course, 19 April AD 12. And we're going to talk to you now about processes, recommended – recommended processes. Now, I haven't actually issued an authoritative statement on this – recommended processes – for some time. And it's about time that we did a summary on this particular activity.

Now, you're always going to run into difficulty on an interpretation. Interpretation gives you lots of difficulty, particularly if you do something else that isn't said, but something that is apparently understood in the statement. And nobody else understands it, but – that way and so forth.

But nevertheless, in the absence of a recommended procedure, of course, you could make a lot of mistakes of one kind or another. Now, I'll tell you an optimum method of auditing a pc, more or less, as of now. There's some data through on this and I've inspected quite a few cases in the last two or three months and several things show up. Now, I told you that Prepchecking, we dropped Prepchecking out and we only drop it out in the line of a permanent gain. See, we don't rely on Prepchecking for a long, permanent gain.

In the first place you could make a long permanent gain, perhaps with Prepchecking, if auditors would go deeply enough. And it isn't that the Prepchecking will not produce results, it's just that the auditor isn't producing a long, permanent gain with Prepchecking.

Nevertheless, this does not drop Prepchecking out of your lineup, a long way from it. Let's use Prepchecking at the depth the auditors are using it and that they're being successful with it. Now, this is the basic formula on which I would audit a pc today. I would establish whether or not the pc was getting tone arm action and then would adjudicate my future course on that basis. I'm not even telling you how you would have established this, don't you see? And get into 3D Criss Cross as soon as I was sure that the pc would get tone arm action and that his rudiments stayed in easily.

In other words, I'd get on 3D Criss Cross as soon as I auditorily could. See, I'd get to it as soon as I could. I'm talking now as though you were auditing a pc in an HGC or in your own practice, something or other. That's the way I'm talking right now. I'm not talking about, necessarily, how we would audit a pc here or how you have to audit a pc.

I'd establish this fact and if tone arm action was liberal and present I would get into 3D Criss Cross at once and sail from there, doing just standard, flawless, 3D Criss Cross. And I would get myself at least twenty lines. And in case I forget to mention it, 3D Criss Cross items are most beneficial, apparently, if opptermed at once. In other words, if you get a line, oppterm it so that you don't have lines without two items. In other words don't keep letting them slide. Apparently this thing goes together better and runs better if it's done this way.

That is almost an opinion, don't you see? I mean, that it – it's better that way. All right, it can easily be done the other way, but apparently it's much easier on the pc, gives the pc much better gains. His attention is right there on half of it so therefore you can get the other half rather easily and so forth. And it'll probably save you auditing time, make the pc more comfortable and there are apparently quite a few advantages to doing this. Okay? That's just as almost an aside.

But you get about twenty items – twenty lines rather and then you've got twenty lines, you've got forty items, haven't you? So you'd wind up with forty items. Now, somewhere along this line with this many lines, you would undoubtedly have reached practically every part and parcel of the bank one way or the other.

Now, I'd go back and get the third item for the lot by assessment. See, I'd just go over these twenty items. I'd just read them off to the pc and see which was bouncing the hardest and I would oppterm it. Neglecting that one now I'd see which one was now bouncing the hardest and I'd oppterm that until I had a line – a third rack for all of them. See? Now I've got three for all. See? And then I'd get four for all. Then I'd get five for all. You got the idea how it could go on?

Certainly, with that liberal spread, I guarantee that along about this time you'll be finding the pc. That's a very broad look in expectancy of what would be a complete 3D Criss Cross. It'd get complete along about that time. You'd wind up – you'd wind up with a crosscut saw and it opptermed timber. And then you would get timber oppterming a crosscut saw. And everything would start to cone down to this is what you got. And these were the items. And the pc was being the crosscut saw. And about that time he'd exteriorize from the crosscut saw and he'd be able to get into his body and the... You've got various things that could go on from there, don't you see.

But actually you're getting down – what you're doing is looking for the thing which the pc has been and which he has been interiorizing into as. See, he's been this thing. He's been this thing for ages. And really, it's the first thing he's been. Shades of the Rock. See, the Rock was the first thing the pc had been. You got the idea?

So, of course, if you get the thing – first thing that the pc had obsessively been, that is the last thing the pc will look at and exteriorize from.

Now, that's a theoretical map of 3D Criss Cross without doing any auditing of the items.

Now, you'll find that sooner or later your situation is going to change and your early items will deintensify. They'll start to drop out and the bank starts to fall apart and things that were reading now aren't reading, you know, you get that idea? Only your last lineup reads.

The early lineups no longer read. There isn't enough charge left in the bank to make them wiggle. See?

Now, to do that I would use, basically, Prehav – the Prehav Assessment and lines from the Prehav Assessment. I would use all the suppressor lines – pardon me, then I'd use the flows lines and then I would use the suppressor lines. Any other kind of a line that seemed to have worked out as being a good line, I'd just get a good sampling of others – a lot. But they would be dominantly suppressors, flows and prehavs. See, they'd mostly amount to those three lines – those three types of line. That'd give you lots. That'd give you lots to work on. I can fully expect that I'll come up with some even hotter lines, you know, that you say, "List this," and the pc disintegrates in the chair. [laughs]

But nothing would change with regard to the procedure. The procedure is the same, what you're doing is the same and that's all standard, see. Where you get your lines from, this could remain a bit of a variable, without disturbing the whole lineup at all. All right.

Now, that's – that's like this, see. We set the pc down and we look it over and the needle's live and it isn't scratchy and the pc's rudiments go in and we ask him some questions about this and that and he gets some tone arm action, and we say fine and we just go right into listing and we're off to the races and we get twenty lines and oppterm each line that we get. And that would be the way we would clear somebody, see?

All right, that's fine, that's the way I'd do it. I'd make the test to find out which way this thing went. I wouldn't particularly depend on profiles and I wouldn't depend on anything else. I'd just want to see that tone arm wiggle.

Now, I'm not telling you at this time the best method of finding out if the tone arm will wiggle. Because I wouldn't – I don't know it. I haven't investigated it on a whole bunch of pc's that have never been audited before and found what was the best way to test whether or not the line was wiggling. But fortunately you're not faced with that very often. You generally have a bit of history on this pc that you're doing and if you don't have a bit of history on the pc, why, you could do several things. You could give him a – start to give him a Problems Intensive or something like that. And you're going to find out if that thing is going to move, see? Anything that will establish whether or not the rudiments can be put in and the tone arm will move. See, any way you could establish that would tell you, "That's fine, we'll go on and do 3D Criss Cross," or, "Now, let's get to the crux of the situation – *heh*, we'll do something else, *heh-eh*."

It looks something on the order of a fixed beam. It sits there and it goes beautifully from 4.75 to 5.0 and drops *all* the way back to 4.75 and then goes *all* the way up to 5.0. And this continues on, but as the session progresses the tone arm gradually drifts down so that it's reading a bit lower. But at no time is it moving. Do you see how you'd get the idea then that movement is different than drifting? Well it is slightly. A constantly rising needle, for instance, will get you a constantly increasing tone arm, you see? You can also have constantly dropping needles. It isn't motion. It's just gradual, there's nothing happening.

You might say it's tone arm action without needle read, if you can imagine this thing. These things will drift. During the course of a two-hour session, why, the pc drifts down one division of the tone arm scale. Or he drifts up. That's not what you would call motion. Motion

is regulated every twenty minutes and is usually in different directions. It's going up and it's going down and it's going up a little and it's going down a lot and then it's going up a lot and down a little, you got the idea? It's not just falling, falling, falling and then it finally – this falling needle finally just sits. And if you were to continue the session to four hours it would have sat the last two hours or something like that, do you see – this is needle behavior, tone arm behavior.

The – you can tell, you can tell – it takes a little bit of observation. You can tell whether or not somebody is going to have a moving tone arm, whether their tone arm moves. It's not a very hard thing to figure out. You get used to it. You observe it. You say that's it. That's a moving tone arm and that isn't. That's all.

All right. What happens? What do you do? Well, frankly, it's not enough to just give it up. I wouldn't say, "Well, he's had it." Because we have a much better solution. And that's a combination and an alternation between Prepchecking and CCHs.

Now, you've got CCHs which all by themselves, if you observe the pc's physical origin and take it up as an origination and query it – you can make mistakes on that, you know. I found out an auditor sometimes can't see the pc's physical origins, you know. The pc's head falls off and rolls across the floor and the auditor says, "Give me that hand."

So, there is no vast shift of case while doing the CCHs, because the auditor isn't really doing the CCHs, you know. He isn't taking up the physical origins of the pc and isn't getting the pc exteriorized out of these little somatics and so forth – isn't doing a good job.

We feel a certain delicacy right now because everybody isn't doing this uniformly all that well. You know, it's something you got to get the hang of. I'm sure you can learn how to do it. But you haven't all got the hang of it yet, by a long ways.

But even if you didn't have the hang of it, you would eventually win. You get the idea. So we're operating kind of with a lead-pipe cinch here – if you combine it with Prepchecking. Now, if you combine good CCHs with good Prepchecking, man, you've got a winner! See. But, if you combine indifferent Prepchecking – providing you miss no withholds, providing you don't run up a bunch of missed withholds on the case – and indifferent CCHs, you still got a winner. That's what we've got to count on, see. We unfortunately can't count on a perfection all along the line.

See, even indifferent 3D Criss Cross gets you some gains. And similarly, in not-too-perfect and not-too-searching Prepchecking, plus not-too-good a CCH combination will still get you wins. In other words, you – we haven't got losing processes here which is a good thing.

But it looks to me that the CCHs have to be handled as CCHs and Prepchecking has to be handled as Prepchecking. And you don't combine a session of CCH and Prepchecking. It looks to me like this is clumsy. This apparently is clumsy.

Now, a person who can't as-is things because he is being it all – you know, he's being the whole universe and he can't as-is anything – it looks to me like this person really isn't going to as-is very much on the Prepcheck and at the same time isn't going to as-is very much on

the CCHs. But both of them will have some tiny workability. And they have a greater workability if interplayed.

Now, you needn't be so mathematical as Prepcheck one session, CCH one session, Prepcheck one session, CCH one session, you see, because this ratio would vary from pc to pc and therefore you can't lay it down as a textbook solution beyond this: Just what can we get done in a session? That's the whole thing. What can we get done in a session?

Of course, it'd be a terrible mistake to prepcheck – remember now, I'm talking about somebody you would audit, not here, just – you know, you sat down and you handed them the cans and you started the session and you did something, whatever, to establish what kind of tone arm action they were going to have, even get their past history and illnesses, see. That will establish tone arm action. You know, do your Preclear Assessment Form and keep a good record of the TA action on it – whatever you're going to do. And you said, "This isn't much, man. This isn't very much. When we're talking about the past and his thinkingness, it isn't very much."

Now, you might get good TA action as long as he was talking straight to you and you were doing some kind of a two-way comm basis where he was trying to tell you about something and his attention was totally on you. You might get more TA action than you really deserve to get. So the TA action test would have to be taken on the basis of "think." It's TA action while he is thinking of something, not TA action while he is talking to you. See. So your TA action while he is talking to you doesn't mean a thing except he might have to have CCHs run, see. But TA action while you're asking him to think – that's the important action, you know?

"How many times have you been sick in your life?" You know.

Now, he says, "So-and-so and so-and-so and so-and-so." And you've been getting this kind of TA action, see.

You've been saying, well – he's been saying, "Oh, well uh... Let's see. Would I – would I mind talking to you? Uh – well, I – I guess I could talk to you all right. You – you seem to be – you seem to be very – very sympathetic" – the attention square on you. All right, that tone arm action – do – hardly bother – you can note it down for the record, but don't take that as your adjudication.

"Now, let's see, what uh – what – what have you – how many brothers and sisters do you have?" See.

"Well, brothers and sisters – yes, brothers and sisters, brothers and sisters, yes – uh – brothers and sisters. Oh, you want to know how many brothers and sisters I have. Let's see. *Hmmmm*, brothers and sisters, *hmmm-hmmm*, *hmmm-hmmmm*, brothers and sisters – well I haven't got any." [laughter]

"Well, all right. Well, how many times have you been sick in your life?"

"Well, let's see – been sick in my life, sick in my life. *Mmmmmmm*, been sick – oh – been sick – long time ago. *Mmmmmmm*, I'm very healthy. I've never been sick in my whole life."

"All right. Well, good. Now, what goals have you had?", and so on.

"Well, oh, I've had quite a few goals... Not – not many recently."

It doesn't matter a damn what he's saying. Watch that tone arm, you see, when you're asking him introverted questions. That's what will count. And man, if you didn't get any more than that 3 to 3.25 to back to 3 again or if it was just a big drift up, with no confront, you know, just going up, up, up, up – the more you ask him about think, you know and so on. And you notice you have to keep setting the thing and so on. Twenty minutes have gone by, you've gotten 7.75 in twenty minutes, you betcha you have – it's rising. And he's getting out of there. He's just gone past Arcturus by about now. [laughs] And you audit him for an hour and he's up to here someplace, and so forth, and gradually comes on up. See, that's not tone arm action, that's drift. See, tone arm action is this way. Drift is just consistently up or consistently down. See.

All right, you would say: "Brother, we've had it." That's what you'd say because you know several things. One, you know the rudiments are not going to stay in. That's what you know. And if you have to put them in, my God, it's like driving stakes with a candy stick, you know? Trying to lay railroad rails, you know, with chewing gum. *Psssst*. You know you've had it there, see. So you're not getting adequate tone arm motion.

And so you would say that we is going to do two things with this pc. We're not necessarily going to go off and do nothing but slog CCHs. We're going to do CCHs and Prepchecking on this pc. That's what we is gonna do. And we're going to do CCHs and then we're going to prepcheck in the direction of trying to get his rudiments in. And a session of CCHs is a session of CCHs and a session of Prepchecking is a session of Prepchecking and neither the twain shall mix.

I told you a little while ago I didn't know anything much about this. Well, I've seen a little bit about it, I haven't gain – haven't gained an awful lot of information concerning it but it just looks clumsy. I don't know that it's bad. But I have found out that the TA action on the CCHs at first test, appears to be very good in spite of the fact that TA action is probably lessened by the tester jumping in with the E-Meter every few minutes. Apparently it's very good on a case that ordinarily wouldn't get much TA action. We haven't finished that study either, but the first indicators on the thing are that it's very good, your TA action on the CCHs. You don't get a chance to observe it, you know, because you haven't got a long enough lead.

The auditor down in Joburg who kept coming back to the Dir Mat and asking for a longer lead on his cans. Finally they blew up. "Longer lead? What the hell! How many feet do you need?" You know?

"Well, I have to have enough feet, because it's going to have to reach across the room, you know, and so forth. When the pc's doing 8-C he moves across the room, back and forth."

Nobody up to this time – nobody had ever told this poor auditor that he didn't use these, see? He'd just assumed that if it was auditing you had an E-Meter and that was all there was to it. They sure were baffled around there, while he was asking for these longer and longer cords, though. Imagine it was embarrassing when the pc did a turnaround, you know, wrap them around... [laughter]

But anyway – anyway this indicator is here. We've been just handing a pair of electrodes and getting the tone arm position of the pc and then he goes on for a while. And we've been doing it against an arbitrary time period, you see – every three minutes, I think it was. And whatever the pc was being made to do, we just interrupted and handed him the electrodes. And the TA action's pretty good.

Well, that's fine. That's fine. But I have found this out about the CCHs; that if CCHs turn into a wrestling match, the auditor's missed a withhold. Simple. Interesting thing to find out, isn't it? If it becomes a wrestling match, the auditor's missed a withhold. Well, so there you are. How are you going to get a withhold off a pc who is doing the CCHs? Well, you're going to do it by doing the CCHs. If it becomes a wrestling match in that session and you go out of two-way comm with the pc and you can't talk him back into it again, it's a wrestling match, that's all. You finish up the session. And then you go and next session, why, you're going to do Prepchecking – particularly on the Zero question, "Have I missed a withhold on you?" or "Has a withhold been missed on you?" And you go ahead and straighten this out.

Now, supposing you can't straighten this out in one session? Supposing you're leaving him way down the track and all hung up? Well, then you, of course, do Prepchecking for two sessions. And then if you're – got the E-Meter cord all wrapped around your neck by that time and you can't get out of that and it just seems like you're hanging yourself, you'd better go back to the CCHs if you didn't clean it up in two. I wouldn't go running a marathon, here. I think the zenith would be about three before you went back to the CCHs, because you're handling somebody who probably has a poor ability to as-is, see? And you can bury him deep, man. You can really push him down for the third time by doing or making him think, think, think, because he isn't getting much tone arm action.

Of course, you're prepchecking against no tone arm action to amount to anything, so you're liable to be in trouble. But nevertheless, you'll pick up enough missed withholds so he isn't all that mad at you and he'll make enough gain toward present time in the CCH – next CCH session you run on him, so he isn't all that out of present time and that seems to be going along very smoothly. And now your CCHs seem to be pretty well flattened out on this pc. You've done maybe three sessions and they all appear to be kind of – a little bit more even, you know, and so forth. And it looks like you get minimal change. Right? So, let's go back to Prepchecking. See? Let's prepcheck him. And we get something a little bit flat, feeling a little bit easier about it and so forth – actually running the Prepcheck through a change to a no-change, same way. Let's go back to CCHs after that.

Optimum, would be of course, to follow the Auditor's Code and to prepcheck him as long as he was producing change – to CCH him as long as he was producing change. And if you get too involved or too upset on making up your mind *when*, well, just follow the Auditor's Code on it and it'll be all right.

That, by the way, may not be optimum. You may be burning more time up than you should be burning up, but in the final analysis that would get you there, you see. Because if you did that to – *in extremis*, you might find yourself doing 60 hours of CCHs and then 50 hours of Prepchecking, whereas you might have been able to make the whole gain in 50 hours of Prepchecking and CCHs, instead of the 110, you see? It might be that much faster.

In the first place, you're treating them independently, not as two different processes. I say, the theoretical method of doing it would be to flatten the CCH approach and then flatten the Prepcheck approach and then flatten the CCH approach, and so forth. And if you're – if you get too much in a quandary about what to do with the pc, fall back on that one, see?

But you could also run it this way. Pick up a gain – here's another way to adjudicate it, rather than arbitrary times – pick up a gain on the pc in Prepchecking and be happy about it and pick up a gain on the CCHs and be happy about it and pick up a gain on the Prepchecking and be happy about it – making a whole session, do you see? Not running half and half, but making a whole session. If you're going to CCH, do a whole session of CCH, you see. If you're going to prepcheck, do a whole session of Prepchecking. But try to bring the thing up to a gain. And I don't care if it tapers off and he's kind of restimulated at the end of the session or not.

But nevertheless he had a win in that session, see? That's fine, well, let's do some CCHs. In other words, gain, gain, gain, gain. You know, alternate on the thing. You'll probably get it fine. You find yourself sometimes doing two consecutive sessions of CCHs and three consecutive sessions of Prepchecking and one session of CCHs and two sessions of Prepchecking and you see how – what I mean? But you're processing him toward a gain and a win.

Now, what direction are you processing him? You're actually processing him into rudiments in. And that is your goal. Now, if you get rudiments in, you're going to get tone arm action. And that's the secret of it all. Not rudiments beaten in, you see, you're not going to get tone arm action. But, if the rudiments are actually in and he's really happy about being audited and he's happy about the environment and he's happy to have you as the auditor and so forth, you're going to get tone arm action. Because you're not getting tone arm action because the rudiments aren't in.

His rudiments aren't in in life. He can't talk to people, he can't – including you. And he can't be in a room, he can't – including this one! See? And people have missed withholds on him, they have. Not only his boss and his wife, but you, too. See? And also the cops sometimes.

In other words, the rudiments of life are so wildly out that the person never really can slide into session because they're so out in life. So of course, he can't ever relax enough to as-is anything. You know, he can't look at anything else except what he's in.

He's walking around in a mass and he's so fixedly and so constantly in this mass that only the problems of the mass are the problems of life. The problems of life are the problems of the mass, don't you see. He has a certain number of problems. Dogs bite you, wives desert you, walls fall on you, you see? And you've got to tell half-truths, you see, because untruths are vital to the situation, you see? And if you don't impress everybody with the fact that you're sane, why they'll know you're crazy, see. And this is life, to him. And his difficulties are simply a long parade of out-rudiments.

See, they aren't just out in the session, they're out on the street and on the bus and at work and at home and so forth, you see. They're just out. Well, it'd be a pretty good trick if you got the environment quite real to him and got him feeling friendly toward people and so

forth. And you'd say, gee, you know, you've just posed, really, the highest goal – actually higher than any psychotherapy has ever had on this planet. They've never really had that much goal. "Get rid of all of these bugs crawling on me", you see. That's about the highest goal psychotherapy has ever had, you know.

He'll go on believing his wife is putting poison in his coffee. And that sort of thing is just a normal course of human events, you see. But to not only get the bugs off of him, but to get the poison out of his coffee, you see and let him actually sit down to a table, you see, instead of having to stand up at a buffet and a few little things like that.

You never thought about this. That would be awfully high for formal psychotherapy. And now, we're posing this – that rooms, environment, people – he's going to be comfortable in all of this? He's going to be comfortable in space? And he's not going to be bugged up all the time, every time he goes anyplace. And he's going to feel all right in crowds and... Hey, wait a minute! We're getting up to a higher goal than psychotherapy has ever had. Aren't we? And yet you know you could do all those things with the routine I'm laying down for you here, you see, the CCH and the Prepcheck. You could accomplish them all, not even going very drastically into the case, just doing it by textbook.

Take your Prepchecking and take your Zero questions – are simply your rudiments questions. And any subdivision of them that you happen to care about as your Zero A. And then actually find a withhold before you go asking him the What. And then ask the What as a chain and clean it as a chain. You'll find out this will work pretty good if you do it that way, see. I'm not asking you to do some extraordinary piece of this and that.

Now, of course this person is not going to have very much tone arm action the first time you do the prepchecking on him. It's going to be very small. But you're going to follow this with the CCHs. You're going to put in that first rudiment with the CCHs, but good! Going to get him used to his environment, you see? That's one of the rudiments. So you got to get that one going. And then you're going to get these other Zero questions sort of cleaned up, particularly missed withholds. But missed withholds is not really part of the rudiments. Missed withholds is actually something you introduce in at odd intervals.

Now, let's look at this. Let's look at this. We take a pc. We don't care if he's been audited or not been audited, except for this: If he's been audited and you've got accurate session sheets on him, you can look at these session sheets and make a guess at whether or not he gets tone arm action on think processes. And if he doesn't get lots of tone arm action on think processes, we know where this case has got to go. This case is going to go into Prepchecking and CCHs right away. But when I say lots of tone arm action, I mean *lots* of tone arm action. This tone arm action is *good*. See what I mean? He really got good, nice, tone arm action. No monkey business about this thing, you see. It's not mediumly fair tone arm action I'm now talking about, you see, 0.5 divisions. Oh, by the way, in doing his past 3D Criss Cross, he might have had times, let's say, in the fourteen sessions he has had on 3D Criss Cross that you have a record of, in eleven of these sessions he got no tone arm action and – to amount to anything, but in three he got good tone arm action. CCHs and Prepchecking for that boy. He got eleven sessions with good tone arm action and three sessions with no tone arm action, proba-

bly continue him on 3D Criss Cross and see how it goes. You see? Because you sometimes have cases hanging on a certain line.

The line – you're taking it inopportune. There's no motion on that particular line to amount to anything. It's unreal to the pc and so forth. That could cause minimal tone arm action. But, of course, this wouldn't happen very often, would it? So just to the degree that that wouldn't happen very often that's acceptable action for a 3D Criss Cross, you see? Eleven in which he got fine tone arm action and three in which his tone arm action wasn't worth looking at. See, well that's probably 3D Criss Cross. Let's keep it going. For sure 3D Criss Cross – fourteen sessions he has had with lovely tone arm action on all fourteen. Obviously we do the fifteenth session with 3D Criss Cross. You see? The 100 percent would be the lead-pipe cinch.

Now, this is – this is adjudications of what you run. But I'm talking now about somebody that you would run where you are – are out, just auditing a pc. Pc comes in and signs up, you turn him over to a staff auditor. You expect the staff auditor to audit this on him, see. You'd adjudicate this. You'd see the pc had no tone arm action worth beans. Now you'd say, well, let's get real clever here and let's pull this pc up, first by lifting the right side and then by lifting the left side and then by lifting the right side and left side, even though it's one millimeter at a time. We're going to lift it in a somewhat balanced fashion. We're going to get the think rudiments in, balanced against the environmental rudiments, see? Exterior rudiments are going to be balanced against the interior rudiments.

See, extrovert-introvert – the old formula of ACC 1. And they pull up kind of equally. And you'll find out that they'll both come up then. Of course, his havingness will run down if you make him think only. And his rudiments will start going out more and more furiously. You realize that the more a pc is having difficulty, the more difficulty he has. That's a hell of a thing, but it actually snowballs like mad. You realize the longer it takes you to get a 3D Criss Cross item, the longer it's going to take you to get a 3D Criss Cross item. See, the longer, the longer. Works in reverse – the shorter, the shorter! But the longer it takes you to do a 3D Criss Cross item and the longer it takes you to get an overt or something like that in Prepchecking, the less likely you are to get it. And the more likely you are to have the rudiments go out. See, the longer it takes the more the rudiments go out, is what this is all about. That's because length drifts in the direction of no auditing.

You see, it's more auditing to get an item a week, you see, than to get an item a month. That's obvious, isn't it? Well, if you look at an item a month session going – unthinkable enough there have been them – an item a month session – you never saw such a cat's breakfast in your life. It's the most ghastly looking mess. Down toward the end of the last two, three – about the last two weeks or ten days of that the pc's – the auditor knows the pc's rudiments are out because the pc has picked up the chair and splintered it with a crash, all over the auditor's head, you see. He'd say, "Oh, the rudiments are out."

It's a fact! The longer it takes the longer – the more they go out and the more violently they go out. In other words the longer it takes the less chance you have of getting it. This will become recognizable to you some day. You'll get a big reality on this thing. You all of a sudden do an item up in three days. They're all items with long lists, yes it takes a while to do an

item in a long list and so on. Pcs also go *bang* and other things happen and the bottom goes out from underneath them on some things and so forth, all in the line. It slows it down, you see.

Well, when this stretches out to a couple of weeks, you're already in bad trouble. That's getting nasty. That's getting real bad. Because from here on after, I'd say eight or nine days, the rudiments just go progressively out because you're approaching a no auditing, see.

And rudiments are most out on the least auditing. And they're most in on the most auditing. That is to say, the more the pc feels he's getting audited, the less the rudiments will go out. And as a session approaches this no-auditing thing, the auditor's sitting there and the pc's sitting there but nothing's getting done. And as the session begins to approach that *reductio ad absurdum* of no auditing, why of course, similarly, the rudiments go out in proportion to no auditing, see, until the rudiments are – go more wildly out than they are out in the normal operating life of the pc, see? You know, a session can go – rudiments in a session can go further out than they are out on the person. You see?

The degree of responsibility he's accepting for an environment shows that he has to put on a good show while he's walking down the street and riding in the bus and that sort of thing. And in a session he hasn't got that degree of responsibility restraining him and the rudiments go out further than they're out.

Now, if you inspect this carefully, you'll see then, that there is every reason to audit in the direction of wins. The pc at first is giving you extraordinary and extravagant goals. You can almost tell the state of a pc by reading the goals he sets up for the session. Not the goals for life or livingness, the goals he sets up as his session goals. Sets up as a session goal "Well, I'd like to be able to make the sun spin faster." Yeah, that's his session goal. That isn't an LOL, it's a session goal. Perfectly all right as an LOL, but that's what he's set up for the auditor to do! Now, this pc has got the *overt* of setting up *loses* for the auditor. Do you see that? And the pc *equally* will absorb loses from the auditor. See, it's the overt-motivator sequence at play. Not that he has set up a lose for the auditor, but that he would, as represented in the goals, you see, shows that you have somebody who is just a sponge for loses. Now, we get down to the feather brush for the win. This person would at first believe that a good effect, you see, would be the basis of the house dropped on his head. Then he'd know that happened. And he actually will beg to have the house dropped on his head. He wants the big effect. He wants it all to happen now. Got to be instantaneous and it's got to be big.

And do you know, when you get a pc like that the only effect he can have is the feather brushed gently back of his head; not in front of his face, but brushed gently back of his head. He can – he can just get the effect of the wind of that feather. And that will be all the effect he can have. But the funny part of it is he can have that effect.

In other words, the worse off the pc the tinier the gradient of win. And you're actually raising him up little by little. And be perfectly content to raise him up little by little, because you'd be surprised what they consider wins. But they won't actually – you could change the pc that he had the form of an angel. Wings complete! Halo in neon! Just give him an *utter* complete change in the session, where he was in *terrific* euphoria, everything else. Pc would never find out about it. You think I'm kidding, but the pc couldn't have that much effect.

The pc's told you that he has to have that much effect. Don't ever buy it, because he couldn't have it. Pc at the end of the session is absolutely glowing. He has some feeling in his elbow and he hasn't had any feeling in his elbow for some time. Feeling in his elbow. He can feel his fingers on his elbow. Terrific. It's a big gain. You'd be surprised. Terrific gain.

He has actually remembered back below the age of twelve. He has actually remembered something before the age of twelve – terrific win. Of course he tells you he wants to clear up the whole track in just this session. He can't have that effect. Just the fact that he has said that he's got to have that in this session tells you he can't have it as an effect. It's before the age of twelve. And he finally remembers a car that his father had when he was eight. And he comes out at the end of that session, Prepcheck session, absolutely glowing! Marvelous session, you see!

You – you were trying to find a missed withhold on him, you know? You were trying to get something done! No, no. It's that little tiny effect, but he could have that effect. Ah, he's winning. It's all confidence. Confidence. Confidence. And if you continue to be consistent and not surrender to this demand for the tremendous effect. And go on and get – give the pc the effects you know the pc can have and go on and give the pc his wins on the environment and go on and give the pc his wins in his thinkingness, why, man, they'll come up by those tiny little gradients. Millimeter on the right and a millimeter on the left, millimeter on the right and that's how you build the Empire State Building You've got to put up one block at a time.

Pc comes in and says, "I want this building sitting here 13,764 feet and 3 inches high, in this session!" And you get a broom and you sweep off one corner of one sidewalk block. And he says, "What do you know, maybe someday there will be a building here." He didn't ever think so before.

All right, so the best adjudication is win on the one, win on the other one, win on the one, win on the other one.

Now, the worse off a person is, the longer it's going to take to get a win. But I sure wouldn't try to prepcheck the pc session after session after session and then CCH him session after session after session. See, I wouldn't stretch it out real long. I'd settle for little tiny wins, you know. And it might be – amount to a session of Prepchecking to a session of CCHs or a session of Prepchecking to three sessions of CCHs or two sessions of Prepchecking to one session of the CCHs, you see. That's what it would maybe settle down to. But it would be what it would be for that pc. You'd see these little wins stacking up.

Next thing you know, there's two things going to happen. The pc's going to get tremendous confidence in his auditor if his auditor is consistent. He's going to get tremendous confidence in this auditor. And then you're going to see tone arm action. Because he's going to get confidence in his environment. He's going to get some hope that something can happen. What you've done actually is sell him some hope. Done no more than that. He sees that the auditor's consistent, he sees the environment doesn't all of a sudden go out of plumb. This pc's been expecting all of his life for all the corners of the room, you see, to get into a rhomboid tetrascrewdrone! [laughter, laughs] And he knows that it probably won't happen as long as the auditor's there.

Whatever it is, you build this little thing up, stack by stack by stack and the next thing you know, why, your pc has got enough confidence. When you see he's got enough confidence, he'll actually start to look around. He will see that he doesn't have to be all of the things he is being in order to survive; that he can look at one of them. See, out of the 8,000,000 things he is being he can now look at one, while being only 7,999,999 things, you see. That moment you will start to see tone arm action.

See, your tone arm action occurs when he's able to observe. He'll find out that it's safe to look at the auditor. So you'll see tone arm action. This isn't as – isn't either difficult nor complicated and you can make it easily much more difficult and much more complicated than it actually is, because the processes you're using are absolute killers!

I mean Prepchecking just used as Prepchecking, I mean – I mean you're – all you're going to use it for is to build up a little bit of confidence of talking to you about his difficulties. Thing is totally capable, if you dug deep enough and so forth, of practically resolving his case. And you're going to use it to straighten it up so he can talk to you about his difficulties, huh?

And the CCHs which can blow a psychotic straight through electric shocks and bring him up the other side bright and smiling and so forth – you're going to use them so that they can tolerate the auditing room. That isn't asking very much of the process, is it? Something like shooting grasshoppers with atom bombs. You see? And all you have to do is do the processes right.

Now, in this particular class we have not had the consistent case win going up the line that we had while we were doing a lot of Prepchecking. See? We were getting more gain proportionately, while we were doing quite a bit of Prepchecking. There's two reasons for that. Prepchecking gave the auditors a great deal of experience with the E-Meter and getting rudiments in. It had that virtue as a training mechanism. And it also tended to give the pcs a lot of wins of the very small win nature that they could accept. Now, you're running into the difficulty that the pc doing the CCHs is getting his rudiments out. So you better fill that gap with the Prepchecking. That isn't just for training reasons, that's for the case's reason, don't you see.

Now, how often you prepcheck this pc and how often you do CCHs on this pc on this course, we won't adjudicate totally at this moment. But the auditor's suggestions on any particular pc he or she is auditing, you see, are definitely invited on the auditor's report – what they think they ought to be doing next. Be monitored perhaps by space, by room – tend to get routinized more than it ordinarily would be.

The reason we get off of that sort of thing, is we like to have a unit for what is going on. We like to have a CCH unit and we like to have a Prepchecking unit and we like to have a 3D Criss Cross unit, don't you see? But the difficulties of this is, is some people are all ready to do, as cases, 3D Criss Cross. And some people are all ready to grind along, you see, on a – on a Prepcheck-CCH routine of some kind or another.

If we could just get this person's missed withholds off on the number of things which they've done to pcs, you see, and other auditors have missed on them, he'd straighten out and run like a bird, you see, on the CCHs or something. You know? It's the case put-together. Or he'll actually straighten out and run like a bird on 3D Criss Cross. So you can't have a total

relaxation of this thing, because all auditors have to have some reality on CCHs and 3D – and Prepchecking as well as 3D Criss Cross, you see?

You're going to run into tougher cases off this course than you will find on it. So therefore – therefore, it's actually comprised of two auditing units. And the two auditing units consist of the CCH-Prepcheck unit and the 3D Criss Cross unit. So that people are – can be in those grades and pushed from one to the other. And regardless of whether they had tone arm action or not, could be expected to find themselves in the Prepcheck-CCH unit early in their trainings.

Now, what would happen if a pc went all to pieces on 3D Criss Cross and we got no tone arm action? They were all tied up and we didn't know which end this thing was going, we couldn't keep the rudiments in. This would be in your own practice or here in this unit, so forth. The only one thing that you could do with him is put him back on the other routine, isn't that right? You could transfer these things around.

But if you remember the lectures on interior-exterior, introvert-extrovert and so forth, you will see that there is good reason in theory and apparently in practice here, to use the CCHs and Prepchecking as a pair. There's good reason to do this. And I think it would speed up the progress considerably.

Regardless how it's used on this unit, regardless of what you'd walk into on this unit in this particular direction, that is, at the moment, how I would recommend that a pc be processed in an HGC. That's without any training considerations involved, without any auditor skill considerations involved. If we had all that perfect and set up, I would see that pcs were audited just the way I have described in this lecture. Okay?

Thank you.

RUNDOWN ON 3D CRISS CROSS, PART I

A lecture given on 24 April 1962

Thank you.

Well, what is this? The twenty what of which?

Audience: 24th of April.

Twenty-fourth of April? Is that all the further you've gotten along the track? Gee, I've gotten clear up to the 28th today. [laughs]

Yeah. It looks good, too. It looks much better. It looks much better for all of you.

All right. Saint Hill Special Briefing Course, 24 April AD 12.

Well, tonight we have a very important lecture which I will sail into at once, which is 3D Criss Cross, a complete rundown including patch-ups, everything else. This is all at one fell swoop.

Once upon a time there was a preclear. And he wasn't getting very Clear, so a routine came along known as Routine 3, the history of which went back to maybe '57, '58 – goals, importance of. And by listing a tremendous number of goals – at first just listing a few goals but finding the person's goal, and then listing a tremendous number of goals and not finding the person's goal – we struggled forward to finding the person's terminal, first by listing a few terminals and then by listing a great many terminals and again seldom finding them.

Now actually, old Routine 3 is the – is really the pappy of all of these processes which come afterwards. And the simplification of these processes took place because Routine 3 was too hard to do.

The first thing we found out about Routine 3 is that auditors couldn't run E-Meters. This became alarmingly apparent and so a whole technology of Sec Checking was developed in this direction as first and foremost a method of cleaning up the overts of the individual and secondarily to get people to use E-Meters properly because this is very easy to read the reads of an E-Meter on Sec Checking

That has become Prepchecking merely because of two reasons: One, Security Checking is not popular with the public and it is not an embracive term. It doesn't really say what it's supposed to be doing so this is changed off to Prepchecking and Prepchecking is a distinct, precision system and a very good system. You use Prepchecking properly and you will find

your pc will fly, but only if you dig. You can't get in Prepchecking like you get in rudiments and expect anything to happen.

So Prepchecking remains a vital process and the only process that can keep the missed withholdings from swamping the early sessions a pc has, and becomes a companion process to the CCHs. So that we have CCHs and Prepchecking simply as a preparatory action to the routines – the Routine 3 processes – whatever they might develop into.

In other words, everything today is headed in the direction toward preparing the pc to be run on some Routine 3 Process. And everything in training is channeled today to get the auditor up to running a Routine 3 Process.

And it must be very fully understood that there has been a great deal of difficulty in both clearing pcs on Routine 3 Processes smoothly and in teaching auditors to do it. There's been a lot of difficulty in both of those channels. And now those difficulties are very well ironed away and it comes into an area of: you can do it or you can't. And it's very like, as I've said in another lecture, riding a bicycle. You go out and get on a bicycle even though you haven't done any bicycle riding for a number of years, you'll find out you can still ride a bicycle.

But early, early, why, one morning you couldn't ride a bicycle and one afternoon you could. That was just a mysterious action. It just suddenly took place. You could suddenly ride a bicycle.

Oddly enough, the CCHs, done with mechanical perfection do not necessarily prove very effective on the pc. You understand? You can do them with perfect mechanical perfection as you go along and stay just as an auditor, no pc there, see. And you can go along, and you swell up the length of time it takes to get any result with the CCHs, you see, by a factor of about twenty-five times, which isn't slight. You'll still get some results, you see, but it's – you only get about 1/25th of the result.

You can do Prepchecking in this mechanical fashion. And you again will get a time factor involved, see. You can do it mechanically perfect and you get a time factor involved. You're not really in communication with the pc. You're not really auditing. You really don't know quite how to ride the bicycle but you're going through all the motions. You got that?

And it's similar with Routine 3 Processes. You one day learn how to do it all mechanically. You learn all the mechanical points that you possibly could learn of whatever kind or description. All these mechanical points you know. And it takes you one God-awful length of time to get any result on the pc. You understand?

And then one fine day, you really get your hands on it. And you all of a sudden, on the CCHs, can ride a bicycle. The last bulletin I put out is a good idea of this. It's arrived in Central Organizations here and there through the world and my morning mail for the first time, contained a very small flood of people who, all of a sudden after all these years, could ride a bicycle. Apparently just last week or so, they all of a sudden started doing the CCHs and getting terrific results on the CCHs. And this was revelatory to them.

Well, of course, they had been doing it mechanically for years and they tried this other way, and of course, the other way is just starting to audit with it. And there have been – there's a big resurgence on that.

Well, it's less noticeable on Routine 3 – much less noticeable. One day you are sitting there mechanically grinding it all out, trying to follow all of the rules and trying to do it all exactly right and nothing much is happening but you're making some progress. *Ha-ha-ha*. You've only been two weeks on this list and you're making some progress, and then, all of a sudden, why, everything is going beautifully.

So there is still this factor of integration within the auditor of the applications of the tools of his trade. It is a factor which occurs, so it is not a factor which can be neglected in handling these techniques.

The fellow is all thumbs and then suddenly he can do it. And what that is actually is the auditor integrates what he knows sufficiently so that he is not introverted with trying and becomes extroverted sufficiently to be able to stay in two-way comm and address and audit the pc immediately in front of him. And you'll see this in an auditor instantly. It's a recognizable factor, whether on the CCHs, Prepchecking or Routine 3.

But the good news is that I don't know of one single portion now of the CCHs, Prepchecking, or Routine 3D Criss Cross – which is the final development of this – which needs a sudden and fantastic interpretation or an enormously clever solution. See, I know it all by simple rules now. And these rules are very simple.

You see a gray check mark and you put a white check mark opposite, not a gray or a green or a blue. You see, they're not a bunch of multiple responses. In other words, you don't get situation A and then get a multiple series of choices, see. You get the solution for A – situation A, solution for A, see. And that makes this very easy to learn. So basically, what it comes down to is once one has the fundamentals of Scientology under his belt and his TRs and that sort of thing, he gets an integration of all of these processes. He integrates them within himself. That is to say he's not still trying to remember the rules as he goes, don't you see. He's still not saying, "Well, let's see, when the bicycle starts to fall that way, to the right, you turn the wheel to the left. No, you turn the wheel to the right – is it the right ...?" Crash! You see.

Now, that is the main barrier you have to cross. And you cross that barrier as well as you get the exact mechanical parts of any of these things exactly right. See, as long as you've got these mechanical parts down, then you will find that you can integrate them. See, the mechanical parts are there. They're quite mechanical, too. But an auditor makes them alive when he integrates them.

You could still get someplace, you see, by just doing it mechanically, you see. But after a sudden – suddenly it's integrated, and you know what you're doing sufficiently well that all of a sudden you have a pc in front of you. You know, he just appears magically.

And you aren't saying, "Well, gee, let's see now. Do I do – I memorize this line and then I look at the E-Meter over here, and then I say the line there, and so on ... All right. And memorize this line, and so on ..."

And you all of a sudden find that you can do this particular process – action sufficiently well that if that is the item, you null it on the pc over there, you see. You get the difference?

Well, it's a matter of knowing your business so well that you can extrovert from the mechanics of things and apply what you know without thinking about it. And that's what it comes down to.

You're very fortunate at this time because you're not learning through a tremendous amount of change and hullabaloo in development.

Now, it is not necessarily always good to learn plain facts. See, it's not always good. It is sometimes very beneficial to learn that facts are only relatively stable. Through that you get an understanding of life and you're always auditing livingness. You're not auditing from a bunch of fixed stable data to which you can accumulate an enormous amount of confusion, see.

Now, the auditor was very lucky who went over the jumps as we graduated from Routine 3 to Routine 3A to Routine 3D to Routine 3D Criss Cross. He knows where these things can falter and fall by the boards and he knows their relative workability and he's got enormous skill.

And similarly this group right here, for the most part, the students who have been here for a while, are very lucky right now to have in circulation so many erroneous line plots. That is, actually, you're very fortunate. You're very fortunate because you're going to get an opportunity to see what a straightened – what a – one, you'll get a tremendous reality on what getting a wrong item will do, and you'll get a tremendous reality on the enormous resurgence that you can get by getting the right item instead of the wrong one. And you – a lot of you will get that subjectively and objectively.

And I would say this group right here will probably never have any difficulty after this in straightening out a 3D Criss Cross activity if it's gone wrong.

Students maybe six months from now – well, they had a line plot go wrong and it gets straightened out instantly, and then they teach somebody in Bushville. And the difference is that one of you will say to this fellow in Bushville, "Listen, you bloody idiot you got a wrong item. Have you any idea what that will do? Have you any idea at all what that will do? Now listen you, *GET IT RIGHT!*" And the student six months from now will say, "Well, it's – you just straighten it out and nothing much to getting a wrong item because you straighten it out at once, and so forth."

And the auditor he trained won't be convinced because he's never been subjected to the capital importance of it all, of it all, of it all. Probably won't have any people around who are all gimmicked up. See? You won't have any horrible examples. For instance, right where I sit, I can find one, two, three, four horrible examples of what happens when you run off a line plot wrong way to, and get a wrong item. Probably another one. See, there's something awry here, see. And the net result of that is a turn on of some psychosomatic – "Oh, God, last week I thought I was dying and this week I hope I do." [laughter, laughs]

And an auditor six months from now will go out and you'll see he'll be auditing somebody and they all of a sudden come down with jaundosis-lumbosis of the limburger and he'll – he'll say, "Well, he got sick." So he'll knock off the auditing perhaps till the person recovers or something, you know. He'll have that as a thought. Of course, he will learn, too, eventually.

But that's the net result of any of these three processes run wrong. I can tell you – I can tell you directly how to spot an error in the running of any of these processes without going near the E-Meter or even talking to the person on whom the error has been made.

The CCH error is "touchy." He's touchy. Doesn't like people coming near him. Doesn't like people bumping into him. This is somebody who's being audited. He's being audited on the CCHs, so he's being audited wrong. He doesn't like anybody to bump into him, touch him, or come near him. You brush past a student and he flinches. Well, you say, "All right, CCHs are being run into the ground." See, this is very interesting to spot when you have quite a few pcs around.

Your next one is Prepchecking. A misprepchecked pc is truculent, tough. They're enduring. They're tough-minded. They tend to be more forward and brassy.

You know, you're seeing some fellow and he's standing there and he's sort of hard-boiled about the whole thing, and so forth. And you say, "Well, somebody really dropped the bottom of the E-Meter on this character on Prepchecking." You can spot it just exactly. You'll get used to this.

And on 3D Criss Cross, when it's being run wrong, the fellow's going around and he looks like an action shot of somebody doing the twist, you know. [laughter] But it's frozen. It's 10,000th of a second exposure of somebody doing the twist, you know. They're just all *blaaah*, you know, *mmmmm-mmmmm*. And he looks old. And if he's not in motion you can't examine him very closely. He just looks squashed and old.

You watch. You mind my indicators on that. Isn't it interesting that these three processes pick up three different aspects. You keep an eye on this and you'll see I speak sooth on the matter because it's really – they're quite different.

You notice I always look over a class when I come in and sit down. I always thank you for your applauses and then look you over. And I take – I know just about where you're not, you know, or what you've not gotten at.

Now, we're dealing, really, for the first time in Routine 3D Criss Cross on something that can be run wrong. We've got some material now that is so beefy, it is so capable of overthrowing the normal balance wheels of what people laughingly call their minds that it can throw them wrong. And that's one of the reasons behind this tremendous insistence on doing it right – is because auditing has always been "Any auditing is better than no auditing." Don't you see? And we're slightly over into the fringe here now of "some auditing shouldn't have happened." Do you see that? I don't know that it's true that it's worse than no auditing at all, but I do know that it can get pretty miserable.

When you attack a Goals Problem Mass, and you attack this thing head-on, and then you flagrantly pick up the wrong piece and then you oppterm the wrong piece and get another wrong piece, and then you industriously get another wrong piece and then you oppterm that,

you're way out in the middle of nowhere, and the pc, well, he's certain that it would be better if the world did come to an end, because you're handling such tremendous charge. That charge is residual and it bleeds off the case permanently. It isn't something that charges back up.

But remember if you're bleeding off basic charge off of a case – this thing called charge actually is electronic currents or suppressions or potentials. We use the word charge to represent force. And the interchanges amongst masses inside the bank constitute charge. And if you have a positive and a negative plate on a battery, you've got amperes and volts and stuff, you see. And sometime, if you – you're just fooling around connecting up a lamp or something like that, why, put your fingers into the two prongs of the mains, you know. And it goes *b-z-z-z-z-t*.

And if you're very good at this you'll notice that there was mechanical force involved in this thing. It wasn't anything weird. It was real mechanical force involved in this. Well, that mechanical force is residual in the bank. And you start picking up the wrong pieces of a Goals Problem Mass, and it isn't that you create new charge but you throw into existence old charge. You restimulate charge, in other words.

Now, there's two things that could happen – now, we're talking about 3D Criss Cross – there's two things can happen. You can bleed the charge off or you can dam it up and generate more. Now, this would be the difference between letting the air out of a tire and hooking it up to the compressors and just not disconnecting it. That would be uncomfortable. Now, when you've got the tire up to a 110 pounds when it is calculated to wear 60, you pick up another wrong terminal and put another 20 pounds on the tire. And then you pick up another – oh, unfortunate part about it is, you being thetans, you can't explode. So the analogy breaks down at this point. We can just put another 20 pounds on and another 40 pounds on and then put 100 pounds in the rim. And you see, we're just getting this more pressure, more charge, more potential, until the person feels like he's an animated lightning bolt with no place to go.

And the funny part of it is that these charges are on various terminals, what you call terminals. You call these things items, oppterminals, terminals, the generalized term is item. It's an item in the 3D Criss Cross mass, the Goals Problem Mass. And you find the item by 3D Criss Cross. And if you find the right item, good-o! You've deleted charge. And if you pick it up and find the wrong item you could add charge. And the charge will stay there until you do it right. It doesn't bleed off because of breakfast and a good night's sleep and the doctor's prescription that you should go to the beach and rest for 120 days. You come back, why, the rim's still got 100 pounds in it and you're still going 130 pounds on the tire. You see? The only thing that will undo it is Scientology.

Now, you understand there were part – times on the track when the person did have this much charge going. All you've done is yank it all into PT. And you can keep on finding wronger and wronger and wronger terminals, you see, and pulling more and more charge into PT. And the aspect of this looks like psychosomatic illness and other odd things.

So there's a liability to each of the processes we have today. And the first liability is the CCHs. By making the pc lose through overcontrol, that is to say, we just scream at him and hound at him and overwhelm him and never ask him anything about what's wrong and

never carry on any two-way conversation, and so forth. We do such things as we make a circle with the book and he makes a circle with the book, and we say, "Well, did you duplicate that?"

And he says, "Yes, I did."

And you say, "Well, I don't think you did. I think you better do that square again."

And he says, "It wasn't a square. It was a circle."

And you say, "No, no. It was a square."

I mean you can muck this up so the fellow starts feeling very overwhumped. There's not any great liability to this. He'll come out of it.

Prepchecking, the liability is missing withholds. That's really the only real liability to Prepchecking. Doesn't matter much what you restimulate. For God's sakes, don't miss a withhold.

Missing a withhold is not the pc has a withhold and you fail to pull it. You understand that? A missed withhold is a "should have known." The pc feels you should have found out about something and you didn't. Now that is the liability of Prepchecking, getting into that kind of situation. You should have found out; you didn't. Hell hath no fury like a pc with a missed withhold. All your ARC breaks and so forth boil right to the surface right there. Missed withhold. Bang!

That has a liability. It actually doesn't have the potential of lousing up a pc particularly, except if you miss withholds and miss withholds and miss withholds he'll simply get more antisocial. I don't know there's any liability to that particularly. But that's about all that would happen. He won't like you and he's liable to leave Scientology or something like that. That's – I mean, as far as his personal health is concerned, there is no terrific liability. As far as his behavior's concerned, and as far as his future progress is concerned, yeah, there is a liability.

There's something very easily done. CCHs: very easily done. Just run the same CCHs right, properly, and it'll all come off, see. Same way. Prepchecking: Get off the missed withholds, and it all straightens out.

Now, Routine 3D Criss Cross has its own package of liabilities and those liabilities are: picking up the wrong end of the Goals Problem Mass and pulling it to the wrong end of the Goals Problem Mass and pulling the charge up to present time.

The thing that you can do wrong is start the wrong line and get a wrong item. Now you've exceeded, "Missed withholds are the source of all ARC breaks." Missed withholds and wrong items are the source of all of your 3D Criss Cross ARC breaks.

Your pc under 3D Criss Cross who gets ARC breaky, should be suspected first of having a missed withhold. But if that doesn't instantly pull, then that somebody has gone over the lines and gotten a wrong item and there's something wrong with the line plot. Or you're just knuckleheadedly oppterming something that is wrong. In other words, there's something wrong with items.

You can create an ARC breaky, nattery condition because he's damned uncomfortable. He can get pretty ARC breaky and pretty hard to hold in session and so forth. Well, don't blame the pc and don't expect him to know what's wrong. The probability – the – not only the probability, this *is* what has happened – is he has got – somebody's gotten a wrong item on him or your line plot, in other words, is wrong. And the remedy for it, of course, is straighten up the line plot; and the method of straightening up the line plot is complete the list for which the item was wrong. That's the whole answer, the whole answer.

There is no, no other action. I mean, it's comp – the thing you do is, if you find that an item is not reading even when you get the invalidations off of the thing, you know at once that the list on which it came was *not complete*, and that is all there is to it. And the only action you take is to get the rudiments in and complete the list. That's the invariable action. That's your situation A, solution A. See, it's very neat.

And the rule is that to straighten out a case on 3D Criss Cross, you take the earliest wrong item, get the invalidations off of it, check it, still a wrong item – make sure it's wrong if it's probably wrong, you see. And then complete the list that the item came from – the earliest wrong item that you can find on the line plot and complete the list. That's all. And that's it. This is one of the most magical actions. The pc will think he won't quite know what hit him. It was all so horrible and it's suddenly all so nice.

Now, if it doesn't straighten out it's because in patching it up you – you didn't get the earliest wrong item. If this didn't bring very quick, instant relief to the case, you didn't get the earliest wrong item. That's all. That's it – simple. So there's another item earlier that is wrong. And then you take the list on which that item was wrongly gotten and complete that list and the magic will occur. Simple. In other words, this is about the simplest remedies that you could possibly have.

CCHs go wrong, run them right. That's all you have to do is run them right, see? Let the pc win, keep in two-way comm with the pc. You know – all of those things. But just run them right.

Prepchecking goes wrong, get off the missed withholds, see. That's simple.

Next – 3D Criss Cross. Find the earliest wrong item and the remedy is always complete the list and find the right one.

Now, those are – those are very – it's very easy for me to tell you this. You, in doing this the first time, are going to be all thumbs. That I can assure you. But you have lots of fruitful ground because there isn't a line plot in the shop that is right. They run something on the order of fifty percent wrong items. Think that's pretty good, huh? Fifty percent at least – wrong items. Not very good, was it. Huh? Oh, no.

There's no blame connected with this. There's no blame connected with this with thee or me or anything else. We're on the line and finding out this data and you're getting the data and we're straightening it out as fast as it can be fed. That's all it is to that.

All information on Routine 3D Criss Cross was carefully released on HCO Information Letters. That's because until tonight, you might say, there was never a moment when you

could say, unswervably, that this, you see, is it. And this is what goes wrong with it and this is what you do. You see. So that's just the way it is.

I can tell you now exactly the steps that you go through – one, two, three, four, and exactly what you do with these steps and how you straighten these steps out and all that sort of thing – with one exception. Because of the horrors I have seen on the subject of goals lists, I hate to tell you that if the goal originally found on the pc does not check out that you have to complete and find the right goal on that pc, because I've seen people work for two months. I don't know that it's true. So we will just leave that little question mark sitting there.

But I do know this. Where the person's terminal found from the goal is wrong, you have to check the goal to make sure that it's right. Now, what you do exactly if you find that goal wrong is a little bit out of our province because 3D Criss Cross deals with items, not goals.

Now, how much charge is going to accumulate because of a difficulty of that nature I am not going to go into at the moment. What I'm saying is that we know for sure that you complete the list of the earliest wrong item, and a goal is not an item. And I do not know that you have to complete a goals list.

Now, how do you do 3D Criss Cross? Well, actually, it's quite elementary – one of the most elementary processes or activities anybody ever had really gone into. This is a very easy bag of tools. And there's some of the finest-tempered burglar's tools ever manufactured. They can open the vaults of minds which have been closed for the trillennia.

Well, this is a very fancy bag of tools, but they're actually very simple tools. Now, we have to be absolutely sure that a person can use and handle an E-Meter, is flawless in his Model Session, is excellent in his TRs, before we let him near it. Because all difficulties in the Routine 3s that we've had, have stemmed from just those things.

The person didn't know how to read an E-Meter. That's simple. The person's TRs stunk. Their Model Session was too poor to command any confidence.

Because you mustn't really get in the road of the pc's attention while you're doing 3D Criss Cross. You're going to be fooled because it's not like the old-time repetitive processes, but the pc actually is more deeply introverted than he was on the old-time repetitive processes. And therefore, your application of Routine 3D Criss Cross must be flawless so as not to distract the pc or upset him.

Now, we're going to take pcs who have been prepchecked and given CCHs until they got tone arm action. Tone arm action was easy. And CCHs and Prepchecking will give you tone arm action regardless of what's wrong with the case, except when the tone arm action is arrested because of a wrong 3D Criss Cross plot. And then we cannot absolutely guarantee that the CCHs and Prepchecking will restore the tone arm action. Isn't that interesting? 3D Criss Cross is more powerful than either the CCHs or Prepchecking. The remedy for 3D Criss Cross is 3D Criss Cross.

But for raw meat in off the street, yeah, you got your CCH and Prepchecking. And let's establish the pc so he gets tone arm action and so his rudiments will stay in, because you don't want to be doing 3D Criss Cross while you're trying to force the rudiments in.

The result of this – I mean the auditor is just all thumbs. He's trying to run every kind of a session, you see. When he's trying to do 3D Criss Cross he's running Prepchecking and oh, my God, what a mess. See, what a mess – just terrible.

Instead of that, he should go back to his CCHs and his Prepchecking until he gets the rudiments so he can keep the jolly old rudiments in. But remember this, your rudiments can start flying out because of wrong line plots. So there's actually only one source of out-rudiments, but you don't have them in the CCHs, and that's the pc is never let have a win, see. And there's only one real source of out-rudiments in Prepchecking and that, of course, is missed withholds, see.

But in 3D Criss Cross you have, "Pc overwhelmed and not permitted to have a win," must be included in this. Missed withholds must be included in this. And wrong item can cause the pc to be ARC breaky and forced out. And the pc won't know what the hell's wrong with him. He'll assign it to the Prepchecking he's had, he will assign it to this, he will assign it to that. No, it's a wrong item, see. He's still all stacked up with charge. And he's got charge to the ears and somewhat higher. And he just can't spot, of course, what is wrong with him because what is wrong with him is because nobody let him spot what was wrong with him. Do you follow that?

He never saw the terminal that was bitching him up, to use plain Anglo-Saxon. See, he never saw this, so of course, he doesn't know what the hell it is. Well, that's the trouble, you see. He doesn't know what it is.

He knows though, it isn't what he got. See, they handed him a catfish and he'll go along with this catfish to be polite, but you see, he knows it isn't a catfish. And he feels there's something missing here. There's something wrong somewhere in this porridge. And he looks through the porridge in vain and he can't find where any catfish has anything to do with it, see? Catfishes don't eat porridge, and he goes around and around. The next thing you know, why, he's – he feels totally adrift. He's got a lot of residual charge and the stable datum in the middle of the charge is the stable item in the middle of the charge, and the confusion won't release because nobody's found the stable datum that's holding the confusion in place. It's an incomplete list.

So this is what's got him goofed. So he looks all over the place to find out what's wrong and he assigns it to the auditor. He says the auditor must be wrong. The auditor isn't holding his little finger straight, you see. He assigns it to the auditing he has had. His Prepchecking – he must have been misprepchecked on something. You see, he assigns it to this and he assigns it to that, or he'll goofily assign it to the next line he hasn't done yet. Now, we're going to get catastrophe because if he keeps plowing on further in 3D Criss Cross with a wrong line behind him – it is something like a ship which has gone up on the beach that is trying to get off by running its engines full speed ahead. And of course it just keeps banging harder and harder into the rocks. And it gets more and more roughed up.

So he says, "Well, we ought to find a new item. We ought to list this. We ought to list that."

He'll get frantic. He'll start giving his auditor tremendous numbers of lists and all kinds of things, anything, you see, to straighten out this thing, and the truth of the matter is it

was a wrong item. It isn't necessarily the wrong item that that auditor found. It might be a wrong item that was found earlier than that, you see?

So you see the liabilities of these processes. They are actually very easily, easily healed. But the first way to go about healing them is to learn how to do all their parts right. The first way to get into a state where you can integrate these processes is learn how to do each part of them right.

Now, anybody who can successfully prepcheck can learn 3D Criss Cross. See, that's followed through very nicely. As a matter of fact, it looks to people as though 3D Criss Cross is easier to run than Prepchecking. That's because they've forgotten that the liability of doing Prepchecking was the liability of reading a meter and of sitting there and doing Model Session and other things, you see.

So they've got those things kind of whipped. You know, they're over the jumps on those. So all of a sudden they sail into 3D Criss Cross and they learn these little routines of 3D Criss Cross, and they look so simple. They look very easy compared to how hard it was to learn to prepcheck.

Actually, it's not... If you were to teach somebody meter, Model Session, TRs, and all the parts of 3D Criss Cross simultaneously and never teach them any Prepchecking, see, never teach them anything else with the meter, they would have more trouble than we have been able to heal. And I can tell you by experience that students have been taught, or we've tried to teach, and the teaching has been by experts – people trying to get their goals and terminals and things like that which is a Routine 3 Process – without the benefit of the experience of Prepchecking. And it has been the most unsuccessful activity we ever cared to have anything to do with. It was a *mess*.

While they're doing the process to clear the case, they're trying to get the rudiments in – that should have been gotten in before you started, don't you see. So they were doing everything at once and it amounted to just one awful mess. And it was a bad mess.

Now, wherever we look in auditing today we find out that there is no substitute for a result. There's no reason today you shouldn't have a result. You do your auditing splendidly, perfectly, and of course, your result is tremendous. And you do your auditing poorly and sloppily and your result will be 'orrible.

The process isn't what's doing it, don't you see? It's the skill with which it's being applied that's doing it.

In other words, the processes are there. The activities are there. And all you'll have to learn is these activities flawlessly and you will get the results. Let's not worry about the thing otherwise. It's too easy.

Now, my basic feeling about any auditor has always been that he is perfectly willing to do a darn good job on a pc. He's always been willing to do this, you see. And I feel that we've been moving forward sorting out of the way the unnecessary bric-a-brac and getting a clear view of it and getting better processes – at the same time getting a better parallel of what the mind was all about and what the mind was doing – and we have been moving now for

some little time. Hence, the Saint Hill Special Briefing Course in a zone of flawless application.

We're actually teaching flawless application. It's rather fantastic. People go from here into various parts of the world and so forth, and I routinely just receive the most horrible shocked notes and despatches and so forth, first on their case – they see them get off airplanes and things like that and they make some – somebody makes a startled remark about their case, but this is usually followed through by some sort of a remark on the subject of what they're – being audited by this person or watching this person audit, and they didn't know anybody could do this.

The truth of the matter is the auditing which was being done in the area before that person went into the area was far more complicated. He's actually doing a much simpler job of auditing. And people look at this smooth, simple job of auditing that's going forward, and the pc's sitting there in session as though he's clamped in steel vises, you know. And the guy's mind running off exactly as it's supposed to run off and they – it looks absolutely magical to them. Well, it probably is absolutely magical. The number of items which go into making that final result are numerous, but they are not variables the way they have been.

So we have some invariable processes and some variable applications and we do get invariable results.

And here's the first thing we should know about auditing right at the present time: If you don't get a result, then look over what's been going on – what you've been doing or what has been done with the case – because you could put the case back together again. You see?

If you don't get the expected result, then there's been a departure. And the whole of case patch-up today is the spotting of the departure. See, I've given you the remedies for each departure. We did CCHs on the guy and he never had a win, see? And we screamed at him the whole time or something like this. All right, we run him CCHs in good two-way comm, and the other CCHs run off. That's all there is to it.

We sec checked the guy or did something of the sort, missed a whole blooming stack of withholds, and so forth. Well, the thing about it is, just get him back into Prepchecking and get the withholds.

Similarly 3D Criss Cross: we've got to take his line plot, any item that has been found on him, and we've got to go over those and we've got to get some kind of an order of sequence of when they were found, and we've got to check those things over by getting the rudiments in, the invalidations off – check those things, in other words, over to find out which of those items are right and which of them are wrong, and any early item that's right, we take the earliest and we simply do it right.

In other words, you know, let me show you something here. Any error in auditing today is then repaired by doing the same process right. Do you see?

Now, that's very tricky. See, because we sewed up a pair of snippers in his abdomen, we don't have to take out a molar. See, we – you get the idea? Now, notice that we never undo any of this auditing. You notice we're not up against erasing auditing. At no time in anything we're doing, do we bother to erase auditing. See, we just do it right and that erases it. It's

rather marvelous. If you understand this ... You'll get a good reality on this when you're patching up a case.

Somebody down in, oh, I don't know, south, north, Port Elizabeth, something like this. They've been doing 3D Criss Cross. See, they got the bulletins and so on, and they're doing 3D Criss Cross, and they're just having a good time, and they've got a whole bunch of items, and they've got everything all stacked up, and the pc is in the hospital. And you see, weirdly enough, you don't have to do anything extraordinary to this pc to straighten this pc out.

You get from the pc – we've also bypassed having to have any of the lists. If your pc's lists have been lost, we can still trace up the items one way or the other. And all we've got to do is find the earliest item we can find that doesn't check out and then we do that one right. We don't care if he's in the hospital or the spinbin. This is the same thing we would do, you see. And we don't have to erase Joe's auditing and get Bill off the case and run O/Ws on his Aunt Agnes, see. If his case went totally wrong under 3D Criss Cross, we just find the earliest item and complete the list, that's all, and find the right item. It'll look absolutely, frantically magical to you when you do this a few times.

You won't believe that anything could right – first, that anything could go this wrong or right this fast. And it's quite interesting. So therefore, our processes, as they sit, are precision packages. They are done in exact ways and they are remedied by doing the same process right. So you should certainly be able to learn that. There's nothing very tricky about it.

Now similarly, all past auditing remedies with 3D Criss Cross. See, you're not going to worry about a bunch of auditing flubs or blunders. Past auditing can't be remedied, by the way, interestingly enough, with Prepchecking. It'll only partially remedy and then, with a great deal of imagination on the auditor's part. Interesting.

Of course, we could prepcheck him on his past auditing and his past pc'ing, and we could get the rudiments in easily, you see. And we could set him up to run 3D Criss Cross better, but the whole thing will come back to battery and go right when we get into 3D Criss Cross. We'll find out why he's always had trouble as an auditor. We find out he's always had trouble. We find the 13th item on the case is, "horse doctor." [laughter, laughs] After that, why, there's no more trouble with his auditing.

So now, there is the broad picture, the very, very broad picture of the processes and where 3D Criss Cross fits in and its relative value with regard to other processes.

Now in the next hour, I'm going to tell you exactly what each step – how each step is done bit by bit *painfully*. Okay?

I'll tell you with great, great precision. Okay?

Thank you.

Rundown On 3D Criss Cross,

Part II

A lecture given on 24 April 1962

Thank you.

Second lecture, April 24th, AD 12, St Hill Special Briefing Course and here we are on the particulars of 3D Criss Cross, continued from the earlier lecture.

3D Criss Cross is a process which addresses the Goals Problem Mass. The Goals Problem Mass is constituted of items, beingnesses that the person has been and has fought. And the anatomy of a problem is everywhere present in the Goals Problem Mass, meaning that you have item versus item. And these become suspended on the time track because they are in direct opposition, one to the other, and so tend to suspend themselves in time since there is no motion in the conflict.

So we have a situation where the beingnesses of the person have accumulated unto themselves, mass – accumulated in that series of lifetimes or that lifetime, and are actually composed of masses of energy. We formerly called these things "circuits" and we call them very properly "valences." But they aren't necessarily valences only in the Goals Problem Mass. Actual items would be valences, but these of course, have accumulated unto themselves things that he's been temporarily, people he has known momentarily – appended valences.

In other words, there are a bunch of other valences mixed up in the Goals Problem Mass. These other valences will never show up as items. Just the things he has been, the things he has fought, the things he has avoided will show up as items but these, of course – it's like so much taffy. And they accumulate to themselves all the other beingnesses associated. Any associated beingness to this has added itself to the Goals Problem Mass so that it becomes very large. And it becomes fantastically complex. There are probably tens of millions of valences and lock valences in a Goals Problem Mass. They are just innumerable. That's just a loose figure – that's to give you the impression of lots, you see. I don't think anybody will ever be able to count them.

Now, each valence is composed of a lifetime or a series of lifetimes and has complete within it all of the pictures and energy and standing wave accumulations of that lifetime.

Now as we run back over this lifetime, we find in this lifetime, a time track – at least some of us do – and it contains recorded experiences, conscious or unconscious, of this lifetime. Now, when a person has had this lifetime collapse on him, he's got a sort of a black ball which is all made up of this lifetime's facsimiles. And you have, in essence, the past valence

condition occurring in this lifetime because all of his past 3D Criss Cross item valences are in that condition. They are totally collapsed. It's a collapsed time track – crunch!

Now, we've got a collapsed time track which is fighting a collapsed time track. Interesting, isn't it? And these things usually occur as a couple of black balls or some shape or color or size. They are opposed to each other. And in a Goals Problem Mass, we have the exact opposition for every item. Every item has its exact opposition. If you think of these items as a round, black ball with pockets of thought all through it and made out of energy, you've got a pretty accurate picture of it.

And if you look at the terminal-oppterm combination, you've got two black balls, one pushed against the other one. And they're hard fought. They are avoiding or attacking but anyhow they're enmeshed. And you've got two black balls. It's the basis of the universe – it's the figure two. So it takes two valences to make a package.

Now, to the outside of these black balls you have all the other valences that have accumulated, which makes it very interesting. And in view of the fact that the person may have been this identity for many lifetimes, you've got all of those lifetimes composed into one black ball and then appended to it, all the other little black balls that he has been in collision with in that series of lifetimes and we start getting a large number. And then, of course, the opposition has a whole series of little black balls like warts on the frog that are appended to that. And you've got your two big ones and then each one of them has a few hundred or a few thousand little ones. See. So, let's say that the figure was – the average figure was about five hundred – for auditing purposes you'll find out this is somewhere in the vicinity of correct. There'll be somewhere between two and seven hundred lock valences.

Now, oddly enough he has sometimes been these lock valences, see, as well as the main valence, but it just wasn't all that important and it simply became a lock on the other valence.

So we have every identity the person has ever been somehow or another mixed up in the Goals Problem Mass. In other words, we have these – oh, these big figures of identities you know – just tremendous numbers – and all the identities of the things he has fought are mixed up in the Goals Problem Mass and all the little identities that had been impinged upon are caught in that – these are all appended into the Goals Problem Mass. And when we finally get ourselves straightened out on this, why, we'll find out that at first look, it would just look like a big, black mass. Or it looked like a bunch of broken splinters or it just looked, you know – it was an unsolvable mess. It's pretty ghastly. It's like – it looks like a pile of coal that somebody has melted. It has that much identity.

Now, 3D Criss Cross takes this thing apart. The first thing it takes apart is by listing. And when you list, you're going to get the main item and you're going to get its locks. And the main item stays and becomes your 3D Criss Cross item and your locks, of course, blown, more or less, and they are part and parcel of the list. Do you follow this?

Man! Come up to present time!

All right. Now, I know these things squash you out of present time. Well, what you do, if you can get the idea of two spheres – let's get the idea of two black spheres. Let's take it down in its essentials and elements. Now, I'm not – I've given other lectures as to how they

got to be two black spheres, but let's just take down pure mechanics. Let's take down two black spheres the size of bowling balls and push them into each other so that they are partially interlocked. Because they are held this way against each other, they become timeless. See, they have their own time track and all that but they actually are floating – they're capable of being in present time.

They haven't got any time in them, see, they appear to be timeless. We won't go into it any further than that they appear to be timeless and they float in time independent of time.

Now around each one of these are the lock valences. Now, one of these balls we will call the terminal and the other ball we will call the opposition terminal. The opposition terminal turns on sensation in the pc: grief, misemotion, sensation, coughing – that's right – all that kind of thing. Those are all turned on and are the symptoms of the oppterm, so called. That's one of the balls. You know.

And then the first ball we call the terminal and that will contain pain. What the pc experiences from that will be pain. Both of these balls contain coldness and heat. And one can get awfully cold bucking into a pair of these. They're very cold. And the – each one of these balls can be tremendously encrusted in these lock valences and they look like little balls, little black balls plastered around and impinged upon the two big ones, so we've got this tremendous number of warts. Now, those are lock valences and the opposition terminal can have its lock valences and the terminal can have its lock valences.

Now, the bulk of the charge, of course, is on the terminal and the opposition terminal and the reason the charges remain charged is because they're locked against each other. See, if a person had never opposed anything or had never been in opposition to anything anywhere on the track, then none of these valences would ever be impinged against any other of these valences and you wouldn't get a cross transfer of current.

Now, what are these balls made out of? They're standing waves of electricity which take the form in the mind of actual mass and they appear to have mass. It's measurable mass. And this carries certain potentials. One ball versus the other ball. And then all the lock balls against all of the main ones. Now, you've got that picture? There is – that is not an allegorical picture, by the way.

Now, if we take a hacksaw and saw one of these balls in half – if you could saw this much light-massed guck and junk – it would appear to have some holes in it and particularly in the center and that hole is full of thought. It's full of ideas which are encysted in the mass. These are the now-I-am-supposed-to's, these are behavior patterns. Here's the survival ideas – all of it compressed from the engrams of which this whole thing is composed. But it has a hole in it and that's got ideas in it. And then there's a whole lot of little pockets around through the thing like little air bubbles and each of those has got ideas in them – that's if we sawed one of them in half.

That's why a person can be inside of one of these things and keep chewing and getting ideas from it but nothing ever happens. See, he can chew around inside one of these things and get ideas, and get ideas, and get ideas, and get ideas, and get ideas but nothing ever happens. And he's not disturbing the mass or the balance between these two items. See, he's just

getting the ideas out of them. Now of course, when the pc is being one of these things, he can't see it.

Now frankly, he is being the terminal and is ignoring the opposition terminal and that is exactly where the pc is located. But he doesn't know at the time you address this *which* of these things he is. He could be any of the locks – in his thinkingness – he could be any of the locks, he could be the terminal, he could be the opposition terminal or he could be any of the opposition terminal's locks. He could be something on the order of a thousand to fifteen hundred different identities – just on this one pair. He wouldn't know the difference, one to the next. Now remember though, he is *being* one of these things and that which ye be, ye can't view.

You have no point – viewpoint of those things you're in. So, oddly enough, he will have an idea of this but he will not have a view of this. He's much more likely to see the locks or he's much more likely to see the opposition terminal than he is to see the actual terminal. Now that is *one* package – one 3D Criss Cross package, which is the two opposed whole track valences and their accumulated lock valences – those additional identities. Of course, if we cut one of these little raisins in half, we are going to get the same picture as the big one. See, you cut one of the warts, you're going to get a hole in the middle of it full of thought, and so on.

It's by the business of living that this has occurred. It isn't that anybody has mocked these things up. It isn't anything that made these things. You go charging around through space getting yourself beautifully dislocated and being something, gorgeously, and attacking something and supporting something, protecting something and running ought-to-be's on other people and running overt-motivator sequences all over the place and having a ball. And around where you are at, during that lifetime you is going to get an accumulation of electric energy and that's all there is to that!

Now, if we, by some magic, were to be able to disintegrate this mass, strip by strip, we would find out it was composed of engrams and locks. You see? Let's take one of the little raisins now and let's start taking it apart and we're going to get pictures. They're going to be kind of lousy pictures, but we're going to get pictures – they're engrams. It's like one of these magician's things where you keep pulling pictures out of it, see – pictures and pictures and pictures. Of course, we take one of the big ones out of this mass and we start pulling pictures out of that thing and *whoah!* See? This is going to go on and on, because they may be pictures of a hundred consecutive lifetimes. See here – would have all crunched down and become it.

See, it's not just one lifetime to one big mass, you see. There could be a hundred lifetimes eventually condensed themselves and in that hundred lifetimes you've accumulated even more lock valences. See. So the idea of the unit terminal and the unit opposition terminal and the unit locks for each, do not comprise the idea that that was one lifetime – that's what happens to you in one lifetime. No, fortunately, that's not the case.

All right, that's just one package. There are quite a few of these packages. I would be adventurous to give you an exact figure of how many there was in each bank. That's a complete package. Fortunately, the number of such packages is quite finite. It is not unlimited. That's very fortunate because it's quite tricky.

You get the exact forces of a terminal, exactly balanced against an opposition terminal, it would take some doing. So we haven't done this very often. You haven't gone on doing this every lifetime, you see, it just happened now and then. This, we're fortunate in. And so, for all the trillennia that one has lived, he hasn't accumulated too many of these things which are exactly balanced which are exact packages. But the ferocity and balance of these things is such as to give the whole aspect of timelessness and he's most likely to be associated with, plagued by or upset in or behaving according to such a setup – such a pair of spheres and masses.

And he's liable to think that's the end-all of everything, see, that's the end product to the lot. Concentration will be on that very heavily. Characteristics will be established by that very much. But actually, he's been a lot of things. Let's say a billion years existed between the last time he had a pair and this time he has a pair. See, there's been a billion years of free track. It's not balled up. It's not even crunched up particularly – doesn't even get picked up. Well, you go back and run whole track engrams and you're on free track and you're gorgeously missing the GPM. See, you can just run all the whole track you want to and your case isn't going to get anyplace. Be interesting! It'll alleviate some psychosomatics but it's in the lap of the gods whether you – when you're going to run into one of these GPM valences.

And the probability is, is while you are busy erasing whole track engrams, you're erasing them from the viewpoint of one of these masses. Quite interesting. You're being one of these masses all the time and you keep wondering where that odd somatic is coming from. That odd somatic has nothing to do with anything you're erasing. It has to do with the GPM terminal or oppterm. All of a sudden you'll hit a dizziness or a sensationness somewhere.

And where does this come from? And you could run engrams and run engrams and engrams and you'll still be dizzy. Why? Because you're sitting in the middle of the dizziness and you're erasing the engrams while being the dizziness. You see?

Now, this is actually quite an accurate mechanical picture I'm giving you of the Goals Problem Mass.

All right, let's take – just for a wild guess figure – let's take a hundred of these. I mean, a hundred complete units, you know – the two big ones and the little ones – let's take a hundred of these things and let's put them all in a pile and hit them with a pile driver and then move in on them from the side and so forth, and it would be kind of a ruddy mess, wouldn't it? And that's what you call a GPM.

Now, why is it called the Goals Problem Mass? Well, each one of these things had a purpose. It had something it wanted to do and one of the basic methods of locating these things was to find a goal the person had and by finding the goal the person had, one could then trace down one of these terminals. So, Routine 3 became a process of identifying one of these terminals by first finding the goal and then finding what would represent the goal and we – it would turn out to be one of these terminals. This is quite remarkable. But of course it often turned out to be the opposition terminal. It wouldn't run. you weren't running the right item. The other was right alongside of it – so it had its limitations.

So I began to look around and study this a little bit more. We call it a *problems mass* to keep it plainly in view that a problem is postulate-counterpostulate – valence versus va-

lence, beingness versus beingness. You see? There are two things. You can't have a problem without two masses or two things or two ideas, opposed. So we say *problems* just to keep this idea in mind and so that anything you know about the anatomy of problems – how they suspend themselves in time and all that sort of thing – applies to the GPM.

And then we call it *mass* because it is mass. It's actual mass; it's not imaginary mass. It's quite measurable. Wait till you run into one if you haven't. They're quite measurable mass. All right.

The difficulties of – auditors were having was in trying to find the goal and then trying to find the terminal that located the goal because if anything, that process is too good. That does its job much too well. And the pc goes slithering out of these things and into the mass and around and about it and so forth, in a very dizzying and dazed fashion. He is really upset by this because he's colliding with these things, one after the other. In other words, this is a hard entrance.

Now let's talk in the subject of entrances. How could you find out what these things were? Well, you could observe the pc and find out what he was doing and then figure out what would do that. That would be the lousiest method. Many auditors use this method. I want to point out to you that this *is* a method and that it *is* used. People use it on themselves and auditors use it on pcs. They find this pc galloping down the street on all fours barking every few leaps, see, and they say, "Ha-ha, that's obvious, we'll just run him on a dog, see, because it's pretty obvious that he's in a dog's valence." No, he wasn't in any dog's valence. He was being a frogman. It wasn't the right terminal, was it? In other words, that would be the lousiest method of approach because it's susceptible to the most inaccuracy.

Now, why do we have to be accurate? Well, there's tremendous, tremendous liability to running the pc as one of these lock valences because, of course, it is appended to this great big heavy valence and the amount of charge which you bleed off against the pc is rather fantastic, without *doing* anything. See, it's not going to unlock the real reason this thing is hung up in space. It is only going to unlock, to some slight degree, its impingement against other locks. And he can just chew on this and chew on this and chew on this. All right.

There is this method, as I've just mentioned, of the fellow and you see him going down the street on all fours, leaping along, and so forth. Well, very possibly, there is a dog someplace in it. In fact, it would be hard to find a pc who didn't have all valences – either as main valences or lock valences, you see? But every pc would have different main valences. See? They all have them all but you wouldn't have the picture of the main valences and that's the picture you've got to get. And you mustn't get the pc in one of these lock valences because it will blow off and won't read and that'll be that. It won't stay there, see? Because they're just – pc's really never been them to amount to anything They are not very important in his lifetime.

What you've got to find and what I had to do was find a lot of doors. I had to find doors which would let the pc straight into the Goals Problem Mass, but easily enough so that he didn't get his silly head knocked off, because it's very easy to get your silly head knocked off with a Goals Problem Mass.

Now, there are a number of ways you can open it. It was very difficult to get in by goals. It was very difficult to get in by goals terminals. You couldn't at all get in with a guess

and an assignment. This is – all this is very difficult. You've been finding these for years, by the way. you found them with Dynamic Assessment and you found them this way and you found them that way but, very often you landed on a lock, you see, that didn't audit.

Now, how did you – how can you reliably collide with one of these items? And that is 3D Criss Cross. Any method by which you could get a test item, which would then lead to a main item, would wind you up with this system on one or the other side of a dual-opposed beingness. Now, this is very, very tricky – it's very tricky. It's actually getting an entrance that the pc can be and do, at that time, that he can stand up to and that will blow charge.

Now, the methods of entrance of this are many but the best methods and the worst methods, alike, all consist of certain steps. And these steps are roughly: list, differentiate, null and check. Those are your basic steps. It doesn't matter how you go about this – you still list, differentiate, null and check. And each one of these items is precisely done. There's a precise way of doing each one of these items. "Item" is used carelessly there – doing what each one of these operations – a precise way of doing each one.

Now, these doors, these entrance points, could be many but the best entrance points are established by first establishing some test point by an assessment. So, you have such an assessment as the Dynamic Assessment. Let's make a Dynamic Assessment. Now, whatever – the old-time Dynamic Assessment. Now, whatever we get out of that is just a test item; it's not a 3D Criss Cross item. It won't be until we oppterm it, but when we oppterm it, we will find out – all of a sudden we'll land square in the Goals Problem Mass, see? Bang!

All right. Now, ways of finding these test items are as I said, many. The Dynamic Assessment method: quite valid. Pre-Have Scale: the Auxiliary Pre-Have Scale that was developed for Routine 3D is very successful. Now we can't say, however, that we wind up with a test item when we get that first list item. No, that's a 3D Criss Cross item. Let's see what a test item would be in a Prehav Assessment. We go down the line and find that our level is Control. The pc responds on Control. All right. Very good. We want to know "Who or what would control?" Or any way you wish to phrase it so that it makes sense to the pc. And of course, the test item is "What would control?" No, no, not the result of what would control – no, it's just those words, "What would control?" is your test item. See? You understand that?

It isn't the *result* of what you'd get of all this, you see? It is it, you see. See, you've done a Pre-Have Assessment and you wound up with Control and although you're going to list from "Who or what would control?" and so forth, you've already found a test item and that test item is "What would control?" "Underscore" (quote) (unquote). "That which would control" is your test item. Of course, that's not part of the Goals Problem Mass but that will lead you straight to the Goals Problem Mass because the pc rocked on it on the meter.

So, we're going to go charging down this line, by listing, and there's our first action. We're going to list. Now, what exactly happens in a list? Well, I'll give you that fast enough. We're going to list. All right. "Who or what would control?" Well, we can say, "Things," or, "You," or we can put it together – just so it makes sense to the pc, you see – this seems to be better to him and it seems to be better on the meter, too. It reads better when we say, "Who or what could control you?" It seems to read good. "Who or what would control things?" That doesn't seem to read so good. you get the idea? You kind of dabble this one out so that your

test item there reads a bit. And then you say, "Who or what would (whatever your test item was)," see?

And we list, and we list, and we list and we list and as we list, this tone arm should be moving – ha-ha-ha. And that tone arm should be moving and that tone arm should be moving for every twenty minutes – *optimum* movement would be at least – I mean this is – this is very good movement: three-quarters of a TA division every twenty minutes. Ah, that's real hot movement. Poor movement is .25 of a TA division every twenty minutes. That's poor. Rotten, of course, is zero movement every twenty minutes. There's something real wrong there and so on. you actually, probably wouldn't play along with this 2.2 – this .25. You'd probably start listing and you'd find out that's all that was happening and you'd say, "Skip it."

You'd do something else. you would ask the case some more questions as I will go into in a moment. And you would do some other things – chief of which is if the person has been run on 3D Criss Cross or Routine 3 – any Routine 3-type process – you would complete lists and straighten this case up, but if the case has not been, you would of course, promptly put him on the CCHs and Prepchecking until you established tone arm motion. Okay? Those are the remedies.

But let's say we found Control as a Prehav Assessment, not to get involved with this, and we found this Control and we listed, "Who or what would control you?" and we wrote items. Well, that just consists of writing items. At the top of the page we put: "Number 1, period. Who or what would control you? date and pc's name." you will learn that when you haven't done this, you're going to have trouble because this list may someday be of considerable use.

And you just list. Well the best way of going about this – some pcs try to get economical and they like to give you only six or seven items – and very early on, if you're very ignorant indeed, you will take the six or seven items and you will put them on the page there and you will null them and then – well, this is the wrong way to go about it all. Now, you want – you want lots of items. And this is a paper-consuming activity. It's a paper-consuming activity.

Now, the auditor who writes – tries to write three columns on the same page eventually won't be able to find what he has crossed and what he hasn't and what he's marked and what he hasn't, and so on. And the best thing is just give up – just skip that terminal you have, "paper saver" and just go for broke and start right on down and list one column on the page. Then you turn the page over, and of course, you don't have to write all that data on the backside of it but you do have to write: "2 – page 2" and you'd list on that. It's best to use legal length paper, 13 inch by 8 inch or 8 1/2 inch paper. All right. Now, we come to the next sheet and we write: "3. Who or what would – ? date and pc's name."

Why do we do that? Well, they sometimes get separated, that's why, and we don't know what we're listing. See? So we make sure that every independent piece of paper on which we are doing a list has the *name* of the pc, the date, and in particular the exact question from which the list came. And we turn that one over and write: "4." (and we don't have to label that) and then we take the next sheet and we write: "5. Who or what would control you? John Doakes, 24 April 62." See?

And we go on this way and we finally wind up – we have wobbled the TA fresh out of motion, more or less. It's usually gone to a blowdown and the pc says it's on the list. We ask the pc, "Is it on the list?" But we ask this as though it's a repetitive question. Now this is important to you. I'll go over all these points.

You say, "Who or what would control you?" and the pc answers. Now sometimes he gives you three items without running down, you see, sometimes he gives you five without running down so don't keep interrupting him. See? Don't keep – and stop barking a Tone 40 acknowledgment. Don't you know the purpose of the acknowledgment is to shut the pc up and finish the cycle of action? Well what if you Tone 40 acknowledge every item he gives you? You've ended his list for him every time, haven't you? No, I'm afraid that a "good," is much better than "Good!" I'm afraid that sort of stops the flow.

Your idea is to get a list, see, not to stop the list. And it's not really a cycle of action of an auditing question that you're doing You're just helping him get the list. So everytime he stops talking or slows down, you shoot him the question again, "Who or what would – ?" and so forth and you thank him. But actually, the fact that you're writing it down is acknowledging the hell out of it. He – it must be important, you must be getting it because he can see your pencil wiggling

All right. When we finish up this list, the pc is asked – well, it's slowing down, the pc says, "Well, that's all." First test is: "Well, is the item on it? Is 'Who or what would control you' on this list?"

And the pc says, "Well, I don't know."

And you say, "Well, come on, give me some more." you see? You don't monkey around with the meter or anything You bleed it down.

All right. And he eventually gets down to "Who or what would control you?"

Well he says, "Yeah."

Well, you ask him, finally, you ask him again, "Well, is the item on the list now?"

"Oh, yes. Yes, that's it."

Well, that's great. Now you turn over to the meter and you ask the question on the meter and see whether or not you get a rap. you ask him, "Are there any more items that belong on this list?" And if you get a rap, you first ask him, "Is there an ARC break?" See? That's modus operandi absolute. Make sure he doesn't have an ARC break, an invalidation or an out-rudiment because you can keep stretching a list on the ARC break of stretching the list. This is a big frailty that you run into. If you haven't got any fall on that, then there's always more items so you keep listing until your meter is null on the question, "Are there any more items on this list?" Okay? Make sure that that knock however, is not coming from an ARC break. All right?

Now your list is complete – possibly. It's a pretty good average that your list is complete at this stage. The pc has told you that it's on there, you've asked the meter, you've squared it up, you've added everything to it that you can. Now whether you number them or not, I couldn't care less. I don't care whether you number these things or not. It's all right if

you do, it's all right if you don't, but there's no use for the numbers particularly, unless you want to cross-referral, of something or other. But there's no real purpose for the numbers.

Now, now comes your first actual test. You've asked the pc, you've asked the meter. Your first actual test is contained in the first twelve items. Of course, you make sure your rudiments are in before you start to null. But, look-a-here, the differentiation step is the next step which you do, but let me point out something to you. The differentiation step was done in an effort to minimize the number of items on the line and then tests demonstrated that when you asked the pc whether or not you should keep the item on the list, the pc very often crossed the item off the list because of the suppressor factor.

In other words, the item that you would have gotten on the list had been crossed off by the pc before you got a chance to null. This was too much. So differentiation would consist of, "Would (blank) control you?" (whatever the list item is). And the pc says, "Yes" or "No." And that's all. "Would (blank) control you . . ." Yes or no. See? You don't do anything with it. you just read it. you just ask the pc, staying in communication with him. That would be a differentiation of the whole list. Let me call to your attention something: that it becomes an optional step, because if the list is complete, there is no more charge to be bled off. Do you see?

There has been that alteration. Now we're going to keep differentiation in the lineup. And we're going to do it or not do it to the degree that the pc wanders and the amount of charge you can get off as a result of it. you want to go through a whole list and differentiate 450 items, why, fine. Ask him that question 450 times, that's fine, you might find it beneficial. But if you don't find it beneficial, you'd better not do it. You'd better just go straight to "nulling." Follow this?

So nobody's saying you've got to differentiate at this stage of the game. Nobody's saying this at all. It might look like no auditing to the pc. There have been many complaints from pcs about differentiation – ARC breaks because they were differentiating. They weren't getting closer to finding the items. They had a limited number of auditing time and they thought it was useless. You understand?

But a pc who's getting muzzy and foggy and that sort of thing, you might find that it's a very good thing to differentiate the list in some fashion or other with the pc, but you might not find it's necessary to differentiate every list. Because all it is, is an orientation point. It blows a little more charge. Remember, that a complete list bleeds all the charge off anyhow. You follow this?

Audience: Yes.

All right.

Now, this has left you up in the air – Do I differentiate or don't I differentiate? Well, you'd better learn to make up your mind up about something I don't care if you differentiate or not differentiate. You'll find many a pc goes out of session during differentiation. And similarly, many a pc doesn't know what the hell you're talking about during nulling if you haven't differentiated. Furthermore, you might read the list to the pc back again and all of a sudden the pc thinks of a bunch more items.

You start differentiating and the pc thinks of more items, so differentiation can be used to extend your list. If the pc is being very balky, differentiation could be used as a mechanism

to extend the list. If you did that, you would say, "Would (blank) control you?" You'd ask the pc and the pc says, "Well, really not." Slide one in about that time, "Well, is there anything that you haven't got on the list that would?" See? You make him think about the subject, pull him into the session more.

You could use it this way. I'd differentiate every pc that gave me twenty-five items and said, "That's it." And then I would use it very cunningly in exactly this fashion:

"Would catfish control you?"

And he'd say, "Well, yes, yes. Catfish would control you."

"Anything else there might? Any other item you haven't got on there that might?"

"Control me, control me – well, it was one of those – yeah, one of . . ."

"Any other item that might control you?" And so on. We coax him into that nice, long list. you could use this, you see. So differentiation has its uses. But I do not think it is a must. Okay?

Audience: Mm-hm.

All right. Our next item then is nulling. Now, if a pc tells you that it must go on the list, you put it on the list – during listing, differentiation or nulling. At any time the pc says he wants an item on the list, you put it on the list. you understand? I don't care what it is, you put it on the list. And every time the pc says he wants an item off the list, you leave it on. That's all you need to know about types of items. You don't have to know anything about whether it's proper names, do they or do they not go on the list. It's an item, you put it on the list. Is it any other type of peculiar item, a present time item or anything like that, do you put it on the list? It's an item, you put it on the list. That answers *all* the questions. If the pc wants it on the list and if it is an item, you put it on the list. you see that? And there is no adjudication on the part of the auditor as to whether it is an item or not.

There aren't any items left off the list. If it has occurred on another list as "the item" and the pc wants it on this list, you put it on this list. Okay? In other words there aren't any items you keep off the list. you put everything on the pc wants on the list. That's it. Period.

There should be no question about that. But if the pc mentions something and doesn't know whether he wants it on the list or not you don't put it on the list until he tells you to put it on the list. That's also quite clearcut isn't it?

He says, "Well, I don't know – catfish, catfish *uhh-hmmm*. Catfish? And so on and so on and so forth – No I don't want that on the list – that wouldn't control anybody."

You haven't put it on the list yet, 90 therefore you cancel it. Your response to this sort of thing is to the pc, "Well, do you want that on the list?" And if the pc says "yes," you put it on the list and if the pc said, "no" you don't put it on the list. But once it's on the list, only the E-Meter and the auditor can take it off. Got it? See? It goes on the list quite indelibly. You won't have any trouble. Pcs are very adventurous in putting things on lists. Then they think. They almost never think before they put it on the list.

All right. Now, here's your first test of the completeness of a list. Take the first twelve items and null them. You'll find if you have – you shouldn't be repeating each item more than

about seven times. See? You want to get three null reads in a row to call a thing null on that first list. Okay? That first twelve. And if you've got four or five alive, your list is not complete. The symbols which you use are an X and a slant.

If the item is null for three consecutive reads – catfish, catfish, catfish – you put an X. And if the item is alive, constantly or sporadically, but doesn't go null for three consecutive reads, you put a slant. And you put a slant for every time you test it. In other words, every time you come past that section, you put a slant. If you put an X down, you don't go back over it again except on the checkout step. So, here we go:

We say, "Catfish, catfish, catfish." Here's the way it ought to look: Catfish – read, catfish – read, catfish – didn't read, catfish – it didn't read, catfish – it didn't read. "Thank you. It is out," is what you say to the pc.

In other words, "Catfish," read. "Catfish," read. "Catfish," didn't read. "Catfish," didn't read. "Catfish," didn't read. "Thank you. It is out." Okay? All right. "Dog' next item. "Dog, dog, dog' – three reads. See? "Dog," not much of a read. "Dog, dog, dog," all three of them null. "Thank you. It is out." See, you're trying to get three nulls. See, you've been reading before, only against kicks. Well, this time you can do it three times on a null and you'll come up with a final result. See? In other words, you try to scrub those first twelve and if you can't scrub, oh I don't know, ten of them, you haven't got a complete list, that's all.

So you just put aside the nulling and you say to the pc, take up your pencil, look at it, square it all up, "All right, let's complete the list now." And he's so dismayed by all of this that he gives you items. Okay?

If four or five are alive, oh my, that list was not quite complete. If six are alive in the first twelve you read, oh man – that is nowhere near complete. If ten are alive out of the first twelve, you haven't begun. You just haven't begun to list, that's all. The whole thing is charged up.

Now, before nulling, always check your first two of the end rudiments, and invalidations, and missed withholds. In other words, let's get the half-truths, and the meter, and invalidations and missed withholds. Let's just check these items over and make sure that they are out. That's before you begin nulling in general. Well, let's make sure we got our rudiments in, in other words.

I should call that middle rudiments. But you can always tell whether or not your rudiments are in. Two things are going on if the rudiments are out: (1) all the items are flat or they're all firing equally. I think it will be a long day before you see them all fire equally but I have nevertheless, seen a pc actually so far out of session that every time you, the auditor, said anything, you were charged, so therefore you got a fall on everything, equally. I have actually seen this, so beware. You'd get something like this: "Catfish," half-a-dial drop. "Catfish," half-a-dial drop. "Catfish," half-a-dial drop. See? Routinely, right on the instant read. See? It's because you were speaking. But then you will see this.

There are ways to determine this and you needn't clutter your mind up with them but I'll tell you one just as an amusing thing You say – you say, "Catfish that can't swim." Let's say that's the item see, that you're testing, "Catfish that can't swim," see. Well, it falls on "catfish," and "that," and "can't" and "swim." It falls on everything, see.

Now, if your rudiments – the other way is, if your rudiments are in, the first time you read an item, you're going to get a bark on it. There's some charge on it or it wouldn't be on the list. See?

It's when you don't get any read at all that you start worrying See, what you get is a reducing read. In other words, the first time you read it, you got a reaction, second time you read it you got some reaction, third time you read it you didn't get much of a reaction, fourth time you got none, none, none. you understand that? Your rudiments are obviously in. See, the thing is reading and then not reading. If your rudiments are out, you get a monotonous similarity of the meter that had nothing to do with anything you're doing. See? Usually null. So you got catfish, catfish, catfish, you see – that's null. Dog, dog, dog, that's null. See? Each one's null. you say, "Catfish, catfish, catfish, that's null." "Dog, dog, dog, that's null." "Cat, cat, cat, that's null." "Room, room, room, that's null." "Light, light, light." Improper – improper needle behavior. See? Proper needle behavior goes: catfish, fall; catfish, fall; catfish, tick, no fall. See? You know your rudiments are in if you're getting any reaction. They're always instant read and they always fall immediately on the end of the item. Okay?

All right. You pursue that on down. Frankly, the way your list ought to look is one strike on the twelve – first twelve items and eleven Xs. That would be just dandy. That's very good. That means a very thoroughly discharged subject. And, now your next action – see, is getting very particular, we know how the meter looks on these things better. All right, your next action would be to go over the thirty-seven remaining Maybe we had 450 items, we covered them in one scrub. See, we went over it just once and we had thirtyseven left. All right, so we went over the thirty-seven, we wound up with five. We went over the five, wound up with two. Went over the two, wound up with one. The last two or three surrendering the most arduously. That would be a proper nulling See? You did 450, covered them once and had thirty-seven left. you do the thirty-seven, you wind up with five.

See? Thirty-two scrubbed on just one cross. You understand that's following the system of about no more than seven reads but with three consecutive nulls to be satisfied. Hm? You'll find that's quite a good system.

There's several systems involved with all this, by the way. I'm now using this system because you need a cross-check system for a complete list. And that's why we're departing and using this other system. I think you also – you'll find it a little faster.

All right. Supposing you did the first twelve items and you found that ten of those items were live and you couldn't scrub ten of them. Oh well, brother, you've got two out and ten alive. That list is incomplete and so we are now going to continue listing.

Now, we'll use the next twelve items as the first test. We'll use items thirteen – twenty-four, inclusive, and we found out that five of those items were alive and seven were null. Your list is not yet complete so we're going to complete the list further and now we're going to use twenty-five to thirty-six inclusive, as our next test. Got that?

We're sneaking up on the thing. In other words, we're winning all the time. We're getting more lists done while we test which is pretty clever. See? Always take a fresh sequence. You don't go over the same ones you've gone over. To hell with those. Catch those the next time through. They'll be flat because your charge is bleeding off.

Now, what actually is this list composed of? The list is composed of: a terminal or an opposition terminal and all of its locks. It's one or the other, and all of its locks. Not all the locks of both, just the locks of one. And that list is more or less, a list of all the locks of this thing. And the individual, as he looks around, if he spots them all and the terminal itself, will blow all the charge out of the area and nothing is left in there to do anything.

Now, you optterm – well, now you check. Let me tell you how to check. Way you check is you get your rudiments in. Get them in quite thoroughly and then read the item and then read every item that has kept banging earlier. You can tell them because they've probably got – they should have a slant and an X after them. Where everything else has an X, you've got thirtyseven items maybe in this list that have a slant and an X. So you read this item and the slant and the X item, see, and this item that you found and the slant and the X item – and this item you found has to keep on reading.

What happens if it stops reading? *Huh-huh!* Well, there's two things could be wrong Your rudiments have gone out and the pc has invalidated the item, one way or the other, and you have wrongly knocked out one of these – one slant, X items. And you'll find that the item is one or the other items or you missed or something goofed. But the usual thing is, is the list was not quite complete.

So you complete the list and you only bother to null and check out what you completed, but then you check it against everything that stayed live more than one pass through. You see how you check? You take the item, get the rudiments in very thoroughly and then you check the item against everything that was resistant on the list. And you can tell what was resistance because it's got more of your pencil marks after it. If you've got anything on the list that goes twenty-five pencil marks after it – oh no – my God, that list wasn't even vaguely complete. What are you doing? You know?

But the item itself, when you're checking it, you don't bother to keep slashing it. See? You just check it against these other items. That means your whole list is discharged and the one item is left. And that is what is necessary before you say, for sure you have an item. With rudiments in, that item remains, and there is no other live item on the list. Now, of course, there's no other live item in these ones that went out the first time but there might be some ticks or kicks left in some of these other items. And, if there's too much kicks left in these other items, your list, again, is incomplete. All right.

That list is composed of the names, assignments and generalities that the pc assigns to all these raisins and the big bowling ball. you are going to be left with the big bowling ball. And let me tell you something – the pc gets certain that it is on the list, he will tell you which one it is and he is always wrong Why is he always wrong? Because he is being the one that is right and although he has said it, he usually can't even remember saying it. He never selects it.

If the pc tells you it's it, and that is the item, and he knows that's the item, and that is it – if you were fool enough, without nulling, to take that as an item, then you'd wind that pc up in more hot water than you could easily cool off. Why? You see, the pc least sees that which he is most being. Of course, that tells you that the item is submerged. The pc knows about it, it isn't it. So, you get down to the end of the line and he says, "Well, it's on the list all right. It's that catfish. Ha-ha! Right there at the end. you know – I know that's it." you say, "Thank you very much." you appreciate the fact that he has told you the list is complete but

you don't pay any attention to the fact he says it's a catfish because it's *not a catfish*. Not even vaguely. It is a fallen leaf that occurs eighteen from the end. Fallen leaf – and the usual reaction is, "Did I put that on the list? Is that on the list?" You know? It's that type of reaction. Now, do you see how to check them out? Hm?

Audience: Yes.

All right. Now, those are the entirety of the actions of 3D Criss Cross, except how do you patch up a case? Now, if you've got somebody who ambitiously has a long line plot already done – I've just learned this in the last twenty-four hours, this particular item – you immediately suspect that the earlier items found by a Routine 3 are not on the line plot and these have been omitted. So the first thing you do is find out if there are any earlier items found by any process. Okay? Any Routine 3-type process, goals, terminal, that sort of a thing – we're not too interested in earlier Dynamic Assessment items. See? We only want to know those Routine 3 items. See?

That's the first thing we suspect – that the line plot was started out with 3D or 3D Criss Cross and was not started out with the first career of the pc on a routine that headed him toward clearing. "Any item been found with a goal and terminal? Any item been found running to Clear? Any item been found? Any item that might be important? Has any item been found? All right." Then, we check the validity of the line plot. And you can put that down in letters of fire as your first action, is (1) check the validity of the line plot. I have seen line plots that didn't have a third of the pc's items on them. I have just seen a line plot within the last hour, which omitted the first four items of the pc.

Four items were found and then the person was run on Routine 3 because it now had a name. He was run on Routine 3, more or less, earlier than that. Four items were missing so the line plot is the first thing you suspect. Therefore, you make up the line plot as accurately as you possibly can. And any time you find an item that has been found and run in a Routine 3 manner on the pc – not now reacting – you discover the source of the list and complete that list. And that is everything You find the earliest item that was supposed to have been alive but wasn't, find out what list it came from, complete the list and find that item and then *oppterm*. You always *oppterm*.

This is the other rule with Routine 3D Criss Cross. This rule was sloppy. That's why these things were on Information Bulletins because they were not finalized. That is the rule. If you find an item, you *oppterm* it. In other words, any time you find an item, find the reverse item. you find "catfish" as a result of "Who or what would control you?" You finally find "catfish." All right, that's a Routine 3D Criss Cross item. All right. Now we want, "Who or what would oppose a catfish?" See, we list: "Who or what would oppose a catfish?" So, any pc that had four earlier items before somebody started running a line plot is missing eight items before the line plot even begins. Wow! Horrible, ain't it?

You'll find that any case will patch up and repair if you find the earliest item that wasn't right and then complete the list, and having completed the list, make sure that item is right and then *oppterm* it and the charge will bleed off that case the like of which you never saw before. Marvelous to behold.

If a case doesn't immediately come back to battery by this type of remedy, if it doesn't immediately come back to battery, with this type of remedy, and I do mean right now, just listing it, you see. Just in the session and listing it – oh no, there's something wrong with the line plot or you haven't got the earliest item and so forth. It only takes you about an hour and a half or two hours to find out if the case is going to come back to battery. Because you find the earliest one that was wrong and start making it right and the case will snap back.

Now the reason for that is the Goals Problem Mass is stacked, not in order or in consecutive sequence on the time track but in order of entrance by the pc and hell enter those corners most easily entered and it proceeds from that point. And you'll find there's a squashed whole package between something and something every time you've missed one. And it gets to be the muckiest mess you ever saw in your life. you found – you found this first item and it was all right and then you found another – didn't oppterm it – but you found a second item, and it was all wrong and then you found a third item over here. Well, already you've got a wrong item against a missing oppterm. Well, that's enough to upset any case. The pc will be ARC breaky and so forth.

Now, what if a case has found a wrong item that won't checkout with you – you just check out all items the same way, you see. The checkout, when I say, "check out," I mean this operation of taking the item and checking it against the list. you understand. You'll find out that you don't have to do that ordinarily. You look at the list and it's got thirty-five slash marks after every other item. you say, "Oh, *bluah*," and just start listing again. You don't bother to go over these items that have already been nulled. Two things you can do with a list: You can suppress one or you can null one. And when there's twenty-five items – slash marks after every other item, you've suppressed items. You haven't nulled anything. You've just ground it in. you see. Takes much longer to do that, by the way, than to carry out a complete list. Because a complete list just nulls just like – oh, I don't know, it nulls like brushing down cobwebs. See, it's much, much faster to complete the list even though the list is terribly long than it is to try to grind out a short list.

All right, in the final thing – there's only, maybe, one other thing that you really have to learn before you develop some new mistakes is – one other thing you have to learn and that is: If a list has a wrong item on it, the line has a wrong item, and that wrong item has been opptermed, of course the pc has really been wound up in the soup because you've now done a whole oppterm list to a lock, you abandon that second item on the line.

In other words, it was "catfish," only – catfish is the right item, see, but he's got "dog." It's line A – dog, is right, see, but he had line A – catfish. And then somebody – "Who or what would oppose a catfish?" do you see, and he got a "fisherman." So we have line A reading, "catfish-fisherman." And we find out "catfish" won't check out so we just complete this list, whatever line A was (who or what would control you), we just complete that list, but we've got this item, "fisherman." What do we do with this item? Well, you just chuck it back in the bay, that's what you do with it. you don't do a thing with it. It will all erase and blow off and all will go gorgeously because the next line – it'll all disappear, there's no liability. It was hell – it was hell on the pc to oppterm a lock valence but this doesn't mean it won't blow off easily because now you just find the oppterm to a "dog" and you find out that's a "master" and the "fisherman" disappears and everything else blows. See? Everything is fine. you understand?

Audience: Mm-hm.

All right.

Now, I've told you very rapidly what amounts to, basically the essential operations here, of 3D Criss Cross and I have kept you a little bit overtime but I wanted to cover the whole thing.

Now, I have not told you how you do a Pre-Have Scale assessment. And I have not told you how the E-Meter is set to be accurate for Clear reads. Well, what I have told you is very surprise – surprisingly precise approach to 3D Criss Cross and frankly, you needn't add anything else into what I've told you. There isn't much else to be known that I haven't mentioned. It's terribly easy, but the first thing it requires is that your Model Session is good, that you can keep in these things and that you can read an E-Meter. If you can't do those things, you can't do 3D Criss Cross. That's all there is to it. Beyond that, those answers are precise. Everything you do from there on is precise. Okay?

Audience: Mm-hm.

All right. Well, I wanted to put it all down in one place, all in one gulp.

Thank you for bearing with me.

Good night.

TV DEMO: CHECKING LINE PLOTS

An auditing demonstration given on 25 April 1962

All right. And I've got five people to straighten out line plots for. I'm going to work on this. And we're going to have a sort out to find out what we do to make the biggest possible gain on these cases. And that's the whole extent of what we're doing here. Okay?

LRH: All right. Have a seat over here, son. A little further up. That-a-boy. Grab the cans. E-Meter might even work. All right. That's good enough. All right. And here we go. Okay here. Now you-uns – you had some of this, huh?

PC: *Uh – some of what?*

LRH: What do you mean from some goal?

PC: *Well, it was obviously from some goal, but I'm not quite sure which one it was.*

LRH: All right. Well, here's what I'm going to do with you, Jack. I'm going to try to track this back and see what we run into here and get the best method of straightening out this thing that we can tackle the mostest and best here, okay?

PC: *Very good.*

LRH: I understand you've already listed something here.

PC: *Mm-hm. "Who or what would fail to endure?" or "had failed."*

LRH: All right. And you found "a loser" here.

PC: *Uh-huh.*

LRH: All right. When was that done?

PC: *Last week.*

LRH: Done last week. All right. Be all right if I do this rundown on you?

PC: *Oh, I'd be very pleased.*

LRH: All right. I don't guarantee any results, particularly. Somebody walks up to you and says what goal ... ?

PC: *I have a vague idea what it was but I ...*

LRH: Well, what's the vague idea?

PC: *Oh, it was a sort of a double thing. One of it was to be your right-hand man ...*

LRH: Right.

PC: *... and the other was to be a good administrator or something like that.*

LRH: I see.

PC: *And it sort of fitted in together.*

LRH: All right. Now, how many goals are on that list?

PC: *Um – I don't know for sure. Uh – couple of hundred maybe.*

LRH: Something like that? You know where the goals list might be now?

PC: *Uh – Cape Town. It should be.*

LRH: In Cape Town.

PC: *Um-hm.*

LRH: Did you have any hard time going over that goals list?

PC: *Huh-uh.*

LRH: I mean, go over it many times or ...

PC: *No, we did it all in a day and a half.*

LRH: ... did the whole lot.

PC: *Mm.*

LRH: In a day and a half.

PC: *Mm.*

LRH: Well, it was kind of a double thing.

PC: *Yeah.*

LRH: Mm. A TA action on the goals list, discussion of.

PC: *Oh, I'd better cable for it, hadn't I?*

LRH: Hm?

PC: *I'd better cable for it.*

LRH: Hm. I don't think that'd be necessary.

PC: *All right.*

LRH: All right. First thing we're going to do is finish your goals list. Just for the hell of it. Mean of me, isn't it? It's still charged.

PC: *Mm-hm.*

LRH: Still charged here on a goals list. And it's heavily charged. I'm swinging here two and three divisions.

PC: [amazed] *What?*

LRH: On the ...

PC: *Oh, on the needle.*

LRH: Four or five divisions. That was a body motion. It's swinging enough on this to be interesting. Just a discussion of the goals list. And this terminal is a "3" terminal, Routine 3 terminal. That's a – "dynamic genius" is a Routine 3 terminal. And it doesn't look very promising.

PC: *No, I didn't have much faith in it myself.*

LRH: Hm. A dynamic genius. A dynamic genius. A dynamic genius. Have you invalidated this terminal? Yeah.

PC: *Yeah. I didn't ...*

LRH: All right. What's your first invalidation of it?

PC: *Well, I thought it was a bit strange because Allison's was found at the same time, and hers was a "dynamic visionary," so I thought it was a bit weird that I should even have the same word in mine, you know.*

LRH: Oh, I see. All right. Any other invalidations on this?

PC: *I just don't care for it very much.*

LRH: Oh, all right. When did you first think that?

PC: *Oh, about ten minutes after it was found.*

LRH: All right. Okay. On these goals – this goals list – on listing those goals, were there any more goals you should have put on that list?

PC: *Oh, I don't know. I don't think so. It seemed complete to me.*

LRH: It seemed complete to you at the time, huh?

PC: *Mm-hm.*

LRH: Well, what are we doing with all this reaction? Well, this terminal – we're not going to worry about this terminal. We're going to scrub that.

PC: *Good.*

LRH: I'll say it just for formality here. A dynamic genius. That was sporadic.

PC: *Mm-mm.*

LRH: It indicates that the list from which it came is very heavily charged. And that is all it indicates because it's got a sweep and a swing and a dive, and it hasn't much to do with my saying it.

PC: *Mm-hm.*

LRH: Okay?

PC: *Fair enough.*

LRH: It addresses the subject.

PC: *Mm.*

LRH: For your information, when you see one of these things, when you say an item to somebody and it goes off on *dyn* and *amic* and *genius* and then after you've said it, it – it didn't instantly react, but you got a lat – latent reaction, and then you come back to the subject, and you say it again just for your information, a kick of that particular character is definitely a charged list. But this is not the item from it ...

PC: *Mm.*

LRH: ... from that list. This isn't the item. It's – I'll say it again here. A dynamic genius. Also, the reading is occasional. We're getting it about two out of three.

PC: *Mmm.*

LRH: But it's – it fires on both sides of the read. And it fires tick, and it fires a dial – a division. And it fires a tick of – at two. There's no ...

PC: *Yeah. He turned it up as a genius first. I remember it now. It was just a plain genius first. Just a – just genius.*

LRH: Who added the "dynamic"?

PC: *Well, he wasn't satisfied with the read he was getting on that, so he asked me to scout around and when I got that one, he got a five-division drop.*

LRH: Okay.

PC: *So...*

LRH: Yeah. All right. A genius. A genius. A genius. A genius. A genius. A genius. That's very funny, you see. It's sporadic. Now, it's late, it's early. It – well, it's just charged. It's charged. It's got a firecracker worth of charge on it. But that's list charge coming up underneath the item. All right. Now, these goals. What did you say those goals amounted to? What was the goal?

PC: *Well, basically, I think, to be a good administrator.*

LRH: Was that the goal that was found?

PC: *Mm. Basically.*

LRH: Basically.

PC: *I don't – I can't – I can't remember the wording of it.*

LRH: To be a good administrator.

PC: *Mm.*

LRH: To be a good administrator. To be a good administrator. To be a good administrator. Oh, "to be a good administrator" was part of the list because it's bumping and diving.

PC: *Mm-hm. Oh, it was definitely part of the list, but I'm not quite sure where we ended up.*

LRH: Mm-mm. To be a good administrator. To be a good administrator. To be a good administrator... The thing goes tick, then it goes fall. All right. Now, I'm going to make a test on this just to be sure, see. To eat pudding. To eat pudding To eat pudding. To eat pudding. To eat pudding. To eat pudding. Well, did you have such a goal on the list?

PC: *No, I didn't.*

LRH: You didn't, huh?

PC: *No.*

LRH: You didn't, huh? All right. All right. Floor. Floor. Floor. Floor. Floor. And we stopped the response to my voice.

PC: *Mm?*

LRH: It's on any goal.

PC: *Oh.*

LRH: So your most charged item, son, is a goal.

PC: *It could be. Very well could be.*

LRH: Yes. So number one, this is a survey of the line plot on 25th April and number one, we're just going to complete

the goals list, whether we have it or not. We're just going to run ...

PC: *There should be a goals list in that file from last year. There's one there, too.*

LRH: Got one there, too? All right. You had one last year?

PC: *Mm.*

LRH: You didn't take that one down there?

PC: *Mm-mm.*

LRH: He was already doing an extended goals list then. And you've still got one here.

PC: *Well, as far as I was aware of the goals that I put on the one here were a repeat of what were – of the other one.*

LRH: Well, we'll just go and complete that anyhow, huh?

PC: *Right.*

LRH: Going to bleed that down and just to give us a little more clue of how we would go about that. Are there any secret goals that didn't appear on that list? Secret goals that you didn't bother to impart?

PC: *Mm-hm. There was one embarrassing one that sticks with me a bit, but it was on the list.*

LRH: It was.

PC: *Mm.*

LRH: All right. Is there any anti-social goals?

PC: *No.*

LRH: Antisocial goals? Antisocial goals? Antisocial goals?

PC: *Got one vague sort of thing, but it wasn't ever a goal.*

LRH: All right. Okay. We get a nice tickety-tick on that.

PC: *Okay. Well, it was to murder somebody without being found out.*

LRH: All right. That's good. All right. All right. Any time you care to, in your own time, to just go start writing a goals list, not trying to remember what you write. But just start writing a goals list, why, that would be perfectly admissible. Okay?

PC: *Yes, surely.*

LRH: All right. Now ... And then we're going to find the modifier for that goal.

PC: *Mm-hmm.*

LRH: Good. And we're not going to let the auditor take all year doing that either, you know. We're going to find the modifier for it, and then we're going to find the terminal or the G plus M, for the goal plus modifier.

PC: *Mm-hmm.*

LRH: And that's how we're going to start you as you were started in that direction. And that's still charged.

PC: *Ready to go.*

LRH: All right. So that's what we're going to do. Now, as far as this one you found, you could actually call this, you know, a Routine 3A Criss Cross. Would be technically correct, wouldn't it? All right. Now, look-a-here, Jack. You found this "failed endure," and you got "a loser."

PC: *Mm-hmm. That's right.*

LRH: All right. Now, we're going to check out this "loser." Okay?

PC: *Good.*

LRH: Oh, you got a nice packet of goals on here.

PC: *145.*

LRH: All right. We're not going on with this "loser," you understand. This time we're going to do this one first.

PC: *Mm.*

LRH: Just to keep your line plot straight, all right, we're gonna scrub that one. 145?

PC: *I think so.*

LRH: That's right. 145. Nulled not too badly. In fact, it wasn't gone over many times. It was gone over a totality of 1, 2, 3, 4, 5 times.

PC: *Yeah, well, most of that was on the last six.*

LRH: I know. For the final items.

PC: *Mm.*

LRH: And just let me check these final items, huh?

PC: *Mm-hm. Sure.*

LRH: All right, we will ...

PC: *The only thing that disturbs me about that was uh – um – in your talk last night you said the preclear doesn't know, and I ... that's the one I thought it was a couple of days before we got it.*

LRH: Well, we won't hang you for knowing about it. But that probably isn't it. It's a good thing you're not in-session, you know. I invalidated that.

PC: *Oh, that's all right.*

LRH: We're going to check this goal now. See if we can find something else to check it against here.

PC: *"An unsuccessful person" stayed in until the last. And "an angry man."*

LRH: Yeah, that's what I was looking at over here. "An angry person" was staying in like mad. All right, let's check out this 3D Criss Cross terminal. Okay. Have you invalidated this?

PC: *Not much, I don't think.*

LRH: All right. Is there any ... There's a little slow up there. You invalidated that? When did you invalidate it maybe? There's a tick on that.

PC: *Uh ... I'm not sure. Thinking of it as an oppterm maybe? Does that invalidate it? I don't really think so.*

LRH: That falls.

PC: *Oh, well, that's what I thought of it. And it gives me a sensation.*

LRH: All right. Is there anything that should be found out about this? No. All right. Okay. Any other invalidations on this? Yeah. There's another invalidation on this.

PC: *Mm. Well, it's something I'd hate to be.*

LRH: All right. All right. When did you decide that?

PC: *Uh – well, when we were listing it and I found out what the hell it was before this new one, I thought, "Gosh, no."*

LRH: All right.

PC: *Can't have that as a goal for life.*

LRH: Okay. All right. Good enough. Any other invalidations on this? Ah, that's looking a little bit ... There's just

a tiny halt now. Very tiny. Doesn't amount to anything. My invalidation of it?

PC: *Not really, no.*

LRH: All right. Any other invalidation of it?

PC: *No, there hasn't been. Not that I'm aware of.*

LRH: All right. Let me check the question again.

PC: *Sure.*

LRH: Have you invalidated this? Have you invalidated ... Hey, wait a minute. The word *invalidated*. Invalidated. Invalidated. Invalidated. Invalidated. I have an instant read on invalidated.

PC: *Well, stick it down on the line plot. [PC and LRH laugh]*

LRH: All right. Let me wear it out. May I?

PC: *Mm-hmm.*

LRH: Invalidated. Invalidated. Invalidated. Invalidated. Invalidated. All right. That's cooling it. Now, let's see what we've got here. Have you invalidated this terminal? There's a tick.

PC: *Oh, yes. Yes. I don't know quite how I do it, but I seem to scrunch it down somehow.*

LRH: Ah! Oh, yeah. All right. When did you do that?

PC: *Oh, I was doing it all the time while it was being checked out and while we were ...*

LRH: Oh, all right. All right. All right. Okay. All right. Now, let me ask you again. Have you invalidated this terminal? Good. Latent now. So that will check if it ever checks. It will check now. Okay?

PC: *Mm-hm.*

LRH: A loser. And the list is incomplete. Okay. Therefore complete line B list "failed endure." Okay?

PC: *Very good.*

LRH: All right. It's probably not very incomplete. Probably. Every time you get a, two or three hang up, you know, at the end, you know, and you're having an awful time tangling it apart, skip it. The list is not complete. I just am scouting through something. It's very interesting. Apparently, if you got three items left, why, you may have two – you may have three masses, but you certainly got also an incomplete list, and you could complete it to a single one with far greater profit. Interesting, huh? Well, all right, Jack. Now, I'm very happy about this because I think this will go very nicely, and ...

PC: *I'll do the goals list tonight.*

LRH: Hm?

PC: *I'll do the goals list tonight.*

LRH: Go ahead. Go ahead, because you didn't get much TA action.

PC: *No, I haven't.*

LRH: Where our TA action I think is held up very well may be there. I'll just take a guess, but that's probably held up on your goals because the second I start mentioning goals here, why, you get lots of stuff, and you've sunk away here to 1.75 and – which is probably very unusual.

PC: *It is. Doesn't usually go below 2.0.*

LRH: Yeah.

PC: *In fact, I don't think it ever has been below 2.0. Oh, yes, it has, couple of times.*

LRH: Yeah. Find out what this is all about, shall we?

PC: *Yeah.*

LRH: Squeeze the cans. All right. Hold them up there, now. Good enough. Squeeze the cans. That's better. Once more. Squeeze the cans. Squeeze the cans. Now, what – you're relaxing them first and then squeezing them, that's what this is all about.

PC: *All right. Let me get ready. Right.*

LRH: All right. Now squeeze the cans. That isn't bad. Third-of-a-dial drop. At zero. Your havingness seems to be all right. All right. Now, has anything happened during this little check-over here that's upset you?

PC: *No. I learned a lot.*

LRH: No. Clean as a wolf's tooth. All right, Jack. Thank you very, very much. That's the end of this checkout.

PC: *Thank you, Ron.*

LRH: You can turn that into your Instructors and you can go downstairs now.

PC: *Thanks.*

LRH: Thank you.

LRH: Good enough. Charles, come over here and take the hot seat.

Okay. Now, we're – all I'm going to do here is check out your line plot, find out what the score is with regard to that. Okay?

PC: *Right.*

LRH: All right. Now, you've been audited at some time or another, assessed at some time or another back here, and he found a couple of goals and items on you, huh?

PC: *Yes. After a fashion.*

LRH: After a fashion. All right. And you've already had "disregarded when you're getting something done" – you've already had that line pulled out here. Well, you seem to be making progress. Well, you won't be losing any ground. You won't be losing ground here simply because of the – of a cross-check. I'm not trying to take anything away from you.

PC: *Right.*

LRH: But let's see if we can salvage any part of these early goals, shall we?

PC: *Good. I'd like to.*

LRH: All right. Is it all right with you if I do this little check-over on you?

PC: *Mm-hm.*

LRH: All right. That's fine. Whoever is auditing you is getting your rudiments in.

PC: *Peter.*

LRH: All right. Okay. He'll probably charge you for that commercial. You'll probably be asking him. Let's see. Your goal was "wanting to control things" is that what this goal was all about? All right.

PC: *Well, I couldn't remember the first one for sure whether it came off of "wanting to control things." I think that was the Prehav level. I thought about it since that was found and I think it's the second one about wanting to be more creative, get more done. Ah, get more done. It*

was only about a goal – ah, a list of about eighteen. We did this in about twenty minutes, the whole Goals Assessment. And oh ...

LRH: I'm looking at the meter. It says it's live.

PC: *... and oh ... the whole thing was done very quickly. And then later on, last November, he did another one – and that's what you see on line B – much more carefully.*

LRH: All right. All right. It's still a charged subject.

PC: *Well, as far as item concerned, the goal list was never really finished.*

LRH: Mm.

PC: *Although the goal did seem to read on line B rather – rather well.*

LRH: Mm-hm. All right. Any invalidations on this first terminal, "commander"? Any invalidations on a commander? Yes.

PC: *Um, well, the Prehav level livened up after that and so I figured it was wrong.*

LRH: That's a very good reason. Very good. Mind if I check this?

PC: *No.*

LRH: I'm just going to check it without monkeying with it too much, you know.

PC: *Sure.*

LRH: Because it looks like one. A commander. Well, it's falling a little bit early and a little

bit late, and so forth. And the list it came off of is hotter than a pistol.

PC: *Mm. I'm sure the list is.*

LRH: But it isn't giving a nice, orderly read.

PC: *Mm-hm.*

LRH: All right. All right. Well, I'm not going to do anything with line A. We've got it marked here. Not going to do a thing here. We got line A, and we are going to scrub the lot because it's an incomplete goals list and the item here is not a good item – it isn't bang-bang-bang. You know, a good item just goes bang-bang-bang, regular as a clock.

PC: *Right.*

LRH: Looks charged. But he had a second item here. I might as well check, which is line – now line A. And that second item was "to have" – the goal was "to have my body feel good all the time." That was the goal he found on that. All right. Any invalidations on that particular goal?

PC: *No. I don't think of some on that one. Uh ...*

LRH: Well, there was one on something.

PC: *Well, the – well, the item that was found off of it didn't prove out, so that might be – reflect back as a invalidation of that goal.*

LRH: All right.

PC: *Now that I think about it.*

LRH: Okay. All right. Any invalidations on this goal? That sprung up. Any invalidations on this goal?

PC: *I don't think of any.*

LRH: Let me get the word *goal* cleaned up here. Shall we? Goal. Goal.

Goal. Goal. Goal. Goal. Goal. That is reading hotter than a pistol.

PC: *Mm.*

LRH: "Goal" is reading. Doesn't mean anything particularly, but anybody trying to check this, of course, the last word in any sentence ... Just for your information, if you've got the last word in any sentence hot, it'll look like the item is hot.

PC: *Right.*

LRH: To have my body feel good all the time. To have my body feel good all the time. To have my body feel good all the time. To have my body feel good all the time. It doesn't read too badly. To have my body feel good all the time. To have my body feel good all the time. To have my body feel good all the time. Well, if it weren't banging on its parts, it's banging on "good". See, good.

PC: *Well, I think it – it's a goal plus modifier. I don't know whether that would change the read. "All the time," I – I think, this is my idea, is the modifier.*

LRH: Could be. To have my body feel good all the time. To have my body feel good all the time. Floor. Floor. Floor. Floor. Floor. Floor. Floor. Floor. Ceiling Ceiling. Ceiling. Ceiling. Ceiling. Ceiling. Ceiling. Getting a certain amount of needle response here regardless. This goals list was never finished, was it?

PC: *Uh, probably not. It ran about 120 or something.*

LRH: Mm-hm. When did this dirty needle turn on? Just now?

PC: *Perhaps. I don't know.*

LRH: Talking about goals?

PC: *Well, I think there was the subject of goals when you were repeating it.*

LRH: Mm.

PC: *And I couldn't make out, oh – what about goals? And I began to think about it.*

LRH: Yeah. Well, all right. Yeah, we get a response. It's the same response I was getting. Goals. Goals. Goals. Goals. Goals. Goals. Floor. Floor. Floor. Floor. Floor. Ceiling. Ceiling. Pencil. Pencil. Pencil. Goals. Goals. Goals. Goals. Goals. Ceiling. Ceiling. Ceiling. Ceiling. Well, they're getting different responses.

PC: *Just don't say wall.*

LRH: All right.

PC: *That's one of the found items.*

LRH: Ah, this is – this is just kind of rough here. People been missing withholds on you?

PC: *Mm. Not so much in session.*

LRH: Latent read.

PC: *Out of session.*

LRH: Out of session they've been missing withholds on you?

PC: *Yeah.*

LRH: How can anybody miss a withhold on you out of session?

PC: *You certainly can on this course.*

LRH: Huh?

PC: *On the course a little bit.*

LRH: Yeah?

PC: *Not too much.*

LRH: Yeah. All right. Have I missed a withhold on you? Have I missed a withhold on you? Well, I don't get anything about that. A little bit latent read. Something there.

PC: *Yeah, something there to talk about.*

LRH: Yeah, but I don't see anything very serious here. Have I missed a withhold on you? Mm-mm. Have I missed a withhold on you? We could develop one.

PC: *Yeah, I could – I could start thinking about it and get one.*

LRH: Mm. Mm. It was latent. I can get it more instant. What did I fail to find out that I should have? ... That doesn't register very much.

PC: *Well, I thought it was a good Zero Question.*

LRH: Huh?

PC: *I thought it was a good Zero Question.*

LRH: Oh, yeah. All right. Okay. We're not going to bother with that right now.

PC: *No, I don't feel upset with you, and any missed withholds are minor.*

LRH: Mm. Yeah, there doesn't seem to be – there doesn't seem to be too much of anything.

PC: *I don't think that's the problem.*

LRH: Anyhow, I'm just curious here... Who just did this item on you?

PC: *Oh, the item was found by Reg. Here. As far as I can tell, it belongs to the goals found on my – the other line. But I've been on Prepchecking this week. But before that, last week, Reg was ...*

LRH: This was last week?

PC: *A couple of weeks ago. A couple of weeks ago, Reg was auditing me on 3D Criss Cross. And uh ...*

LRH: This is what I'm looking for. Reg ran you last week on 3D Criss Cross.

PC: *Couple of weeks ago. Couple of weeks ago.*

LRH: A couple of weeks ago he ran you on 3D Criss Cross? Good. He ran you on 3D Criss Cross a couple of weeks ago.

PC: *Mm-hm. I was taken off of it.*

LRH: Was it an ARC break to come off of it?

PC: *Yes.*

LRH: All right. Is that registering here? Is that what the registry might be?

PC: *That's the only major ARC break I've got, about the course.*

LRH: You have got that.

PC: *Yeah, I thought it was a – was a misestimation.*

LRH: Mm-mm.

PC: *Maybe I wasn't getting a lot of tone arm action, but uh – uh – it was an ARC break about – uh ...*

LRH: Good!

PC: *I had gotten tone arm action the last two sessions and a good deal of it once I got my teeth into that – that line. It was a pretty rough line.*

LRH: Mm-mm.

PC: *Once I ran it, it was going good, and then to be taken off of it was a – was different from what was real to me.*

LRH: All right. This line's pretty hot. It's pretty hard to get.

PC: *Yes.*

LRH: Yeah.

PC: *It was a rough go, but Reg did very nicely, I thought.*

LRH: Oh yeah. All right. Good. Good. Thank you... Yep. Now, let's see. Where's the first list out of which we got ...

PC: *Yeah, I think that's it.*

LRH: ..."disregard." All right. Good enough. That's everything I need to know. All right. Well, think you made any progress with your 3D Criss Cross?

PC: *Yes, I got a great reality on what differentiating items in the line would do.*

LRH: Oh, yeah.

PC: *Tremendous, you know.*

LRH: All right. We're going to complete your goals list because it's charged. We're going to find your modifier on top of that, and then we're going to find your G-plus-M terminal, and then we're going to complete the list for a goal, and we're going to discard "an orgiast" because that obviously is too ...

PC: *That's what the first item was, right?*

LRH: Yeah. You probably came back and maybe you gave it again. It doesn't matter. I'm going to point out something to you, Charles, rather than leave you in the dark. Now, this is no discrediting of any auditor because what we're doing is we're pointing 3D Criss Cross goals, see. And as tough as it's been for people to have terminals, find goals, and that sort of thing, their ordinary difficulty in finding

goals was incomplete lists or listing against ARC breaks. Listing with the rudiments out. You know, your standard flub methods of auditing. And there isn't any particular reason why a perfectly smooth goals list can't come out. You've been started on a goals list. All right. Let's continue the thing, see. And then let's go ahead on this. I'm going to call off this terminal here, just for fun. Oh, I'm not going to pay much attention on this particular adjudication ...

PC: *Mm-mm.*

LRH: ... because again, this terminal might come up on some other line. The Goals Problem Mass, of course, is what it is, and it's composed of what it's composed of.

PC: *Mm-hm.*

LRH: All right. A body electrifier. A body electrifier. A body electrifier. A body electrifier. And it shows every symptom of being on a hot line, see. It's belonging someplace on a hot line, but it doesn't go *bing-bing-bing*, see.

PC: *Mm.*

LRH: So if we complete this thing, we've got then, we'll get that charge off there, see. And then one thing here is right there, make sure, and then we oppterm it. And then "(5)" that, now, "if dirty needle continues, we complete the line B list, but only if dirty needle fails to fall out doing goals." See what I mean?

PC: *Mm-hm.*

LRH: Now, what we've got here in essence is going to take a salvage here from the beginning of this thing. And you should have been feeling very heavily pressured. I imagine there's been quite a bit of body pressures and that sort of thing.

PC: *Yes.*

LRH: Oh, yeah.

PC: *During this, a great deal. It turned on some of the same ones that were on these lines.*

LRH: During this?

PC: *Yes.*

LRH: Yeah. Sure. All right.

PC: *I was just wondering about those last two items.*

LRH: What about them?

PC: *Whether they were still reading or not.*

LRH: Oh, you want me to check them?

PC: *Mm-mm.*

LRH: I'll check it for you. Oh, it's probably reading. A wall. A wall. A wall. A wall. An orgiast. Oddly enough, an orgiast is reading less sporadically than a wall, but neither is reading like an item.

PC: *Thank you.*

LRH: Let's just get ourselves a good running jump at it, and you will find yourself fixed up. If you want to do some action of some kind or another, mental exercises, we don't care whether we've got your goals list or not, you can go ahead and write up half a thousand goals if you want to.

PC: *All right.*

LRH: Okay.

PC: *I will.*

LRH: Something's – the reason for this departure is just case speed-up. That's

all. Make it easier on the case and run it faster. We'd eventually get the charge off of that. We can pull all the charge off of that simply by doing a list. It's charged, so there we go.

PC: *Of course.*

LRH: All right. And the GPM will come apart faster. I'm trying to go in the direction of pulling the GPM apart now with less items found there.

PC: *Do the job on some ...*

LRH: ...on less found, you know. That'd be two different ways to go about the same job.

PC: *Right.*

LRH: But sporadic reading is always caused by a charged list. And you have nothing there but sporadic reads. You want something that goes pop-pop-pop every time you say it, you know. You say it and you go pop-pop. And you say "cat," and it goes pop-pop-pop. And it always goes the same amount. It doesn't go fall. It doesn't go cat, cat, cat, cat, see. You don't get any of that kind of action. So you're all right. You're doing okay. Of course, any listing of Goals Problem Mass and so forth is beneficial of blowing something. I'll show you for your benefit – I started to show you this once, before I let you go here. I didn't complete it. You see this – the amount of strikes on this goals – on this terminal – this item list.

PC: *Yes, some of – some of them are pretty long.*

LRH: See, there are a lot of strikes on that, you know. All right. Well, we can wear it down. We can oppterm it, and we can get something else, don't you see, and we can go on through, and eventually by just sheer numbers, the theory is – and it

works this way; it works out – you can fall down to the bottom, you can get a clean list because you've blown the charge and so forth. Sometimes it's quite hard on the pc, but it works. Now both of your item lists found here are like this.

PC: *Yes, they are both similar.*

LRH: That's right. So that is what we will do with you, Charles. We'll (1) complete goals list, (2) we'll find your modifier. And we'll find the G plus M terminal, and we'll oppterm it, and then we'll complete the line B list and find whatever terminal that is, and well just X these out, you know.

PC: *Good.*

LRH: And that will blow the maximum amount of charge off of your case in the minimum amount of time, the way you're going. Understand these other terminals, they turn out eventually anyhow. I'm not trying – don't get the idea I'm invalidating everything you've got.

PC: *Mm-hm.*

LRH: But, you see, the auditing has been started. And we have an unflat process on a Routine 3.

PC: *Yes.*

LRH: Caught a little "What goal have you had?" That's right. An interesting process, too, isn't it?

PC: *Yes, it is. I'd like to finish it off.*

LRH: Mm.

PC: *Uh – especially if that word "goal" keeps reading. And it means to me what goal have I got, you know. Goal. Goal.*

LRH: And here we got it, too ... Goals true and goals, goals, man.

PC: *Okay.*

LRH: You know, actually, the goal you find is the thought pocket.

PC: *In the uh – in the goal ?*

LRH: Mm. In the mass.

PC: *In the mass.*

LRH: So you could try – you could find it first as a thought pocket, identify it as a goal, its intention and purpose.

PC: *That's right. It would be a thought in one of the ...*

LRH: And then you identify the mass when you find the terminal.

PC: *Right.*

LRH: That's the old kick around over there.

All right, Charles. Thank you very much. Anything you care to say before I end this coffee shop, here?

PC: *No, just thank you very much, and uh – I'll be right at it.*

LRH: All right. That's the end of check-out. Thank you.

PC: *Thank you.*

LRH: ...Okay. Pick up the cans, and ... All right. See what you're reading here. Squeeze them. All right. You'll do. And is it all right if I do this?

PC: *Yes, it is.*

LRH: All right. Let's see what you've been up to here. You haven't had very much 3D Criss Cross, have you?

PC: *Not a great deal.*

LRH: What you been doing?

PC: *I've been on CCHs.*

LRH: Are they working?

PC: *Yes.*

LRH: All right. Anybody missing withholds on you on the CCHs?

PC: *I don't think so.*

LRH: Been missing withholds? Missing withholds? What gives with this word "missing withholds"? It was instant, and now it's momentary.

PC: *Oh, I guess I just feel a little guilty when somebody starts in – what's been missed.*

LRH: Missing withholds?

PC: *Yes.*

LRH: Oh, you had a lot of trouble finding them? Have I missed a withhold on you?

PC: *Yeah.*

LRH: Have I missed a withhold on you? You. Have I missed a withhold on you? Has your auditor missed a withhold on you? Well, what withhold have I missed on you, Ruth? Huh? There it is.

PC: *Well, I've been busy copying the lists from my folder because I expect to go home next week.*

LRH: All right.

PC: *And uh – uh – so I have looked at a couple of the auditor report forms in my folder.*

LRH: Oh, a couple of the what?

PC: *I have looked at the – some of the data in my folder.*

LRH: Oh? What's that? You mean some of the auditor – some of the supervisor comments?

PC: *Occasionally. I get too busy to read much, but I was reading – read a couple.*

LRH: All right. And what was that? I missed the fact that you had done this? Is that right?

PC: *Yes.*

LRH: All right. And what should I have – what did I fail to find out about that? What exactly did I fail to find out?

PC: *Well, I understand that pcs aren't supposed to look at their folders, see.*

LRH: All right. You had a rough time here. All right. Did any of those rough you up? Did any of those comments?

PC: *No.*

LRH: Oooh. Oooh. What comment roughed you up?

PC: *Well, I had a rough time.*

LRH: Mm?

PC: *That I've had a rough time.*

LRH: All right. What else? Anything?

PC: *I don't think so.*

LRH: All right. And you're going home next week.

PC: *I hope so.*

LRH: You hope so. So do I. We're going to look at these modifiers here. All right. Have I missed a withhold on you? Yeah. What was that one? It's cleaner now. All right. What other – what other withhold did I miss on you? There it is.

PC: *Well, there's a – letter from – or part of a letter from a girl that audited me last summer in the back of the folder.*

And I read a paragraph or two in it, in this letter that she wrote. And it confirmed the suspicion that I had when she was auditing me.

LRH: Which is what?

PC: *Well, that she was using somebody for a Director of Processing without my approval, and even having denied doing it.*

LRH: Ah, I see. All right.

PC: *It upset me a bit.*

LRH: All right. Now, how did I miss that withhold?

PC: *Well, I guess you – I thought you just should have known it.*

LRH: All right. Okay. All right. Now, have I missed a withhold on you? That's getting better. That's just a little latent. But what was it?

PC: *Well, I'm a little bit nervous sitting here. I don't know how that's a missed withhold, but it's all I think of.*

LRH: Okay, honey. Well, have I missed a withhold on you? That's getting minimal now. Let me ask this again. Have I missed a withhold on you? Yeah, we're getting a dirty needle sort of a characteristic here. It's starting to dance around now. Now, what have I failed to find out about you?

PC: *Well, then, that there's been a dirty needle in the great majority of my auditing since I've been here.*

LRH: There's been what?

PC: *A – a scratchy needle.*

LRH: Oh, yeah, all right. Okay. Good enough. All right. Have I missed a withhold on you? All right. What's that one?

PC: *I don't know.*

LRH: We just say, "missed withhold," and you take off. Now is it I who has missed the withhold? Is it I who has missed the withhold? I don't get any reaction on that. Who's missed the withhold? Well, now, what are we playing around here with? Have you missed a withhold on some pc or something

PC: *Well, that's possible.*

LRH: Yeah?

PC: *Mm-hm.*

LRH: Yeah, very probable.

PC: *Mm-hm.*

LRH: On whom did you do this?

PC: *On Doris.*

LRH: Huh?

PC: *On Doris. Doris.*

LRH: Yeah? And what withhold did you miss on her?

PC: *Oh, I don't know. I have a lot of trouble with the meter going null.*

LRH: Oh, it's a failure to find the missed withhold. Is that what this is?

PC: *Mm-hm.*

LRH: Hm? All right. Now, let's get back to the original question. Have I missed a withhold on you? All right. That seems to be clear now. Null. All right, honey. Now, I see we've gotten here a whole bunch of modifiers. A terrific number of modifiers, and they're all very heavily charged. Right?

PC: *Mm-hm.*

LRH: And we had a goal on you "to be different from other people." Right?

PC: *Yes.*

LRH: All right. The original goal that was checked out. And I'm just going to check that goal if that's all right with you?

PC: *Sure.*

LRH: Okay. Okay. To be different from other people. Okay. To be different from other people. To be different from other people. To be different from other people. Now, that's got a bit of a reaction on it. Have you invalidated that goal at any time?

PC: *Well, uh – to a little extent when we couldn't get a modi – an oppterm to stay in.*

LRH: Mm-hm.

PC: *And uh – we went on and on and on with that.*

LRH: Mm-hm.

PC: *And uh – I began to doubt it a little bit.*

LRH: Mm-hm. To be different than other people. To be different than other people. All right. Have you invalidated this goal at any time? Yes. What? When? Crash! Find it. It falls off. You know.

PC: *Mm-hm.*

LRH: When have you invalidated this?

PC: *Well, what comes to mind is that um – the feeling sort of that we were abandoning it when um – I was put on Sec Checking full time instead of working on this package.*

LRH: Oh, I see. I see. And that was an invalidation of it.

PC: *I felt a little.*

LRH: All right. When did you invalidate it? When did you invalidate it. That's it. What's you think of? That's it.

PC: *Oh, it was – uh – who was it?*

LRH: There it is.

PC: *Somebody asked – oh, I know. Uh – my auditor was asking me one day whether this would be "being different from Scientologists" or whether this was any different of – whether I meant being just different from everybody or different than special groups or different groups.*

LRH: Mm-hm. All right. And what – what did you do then?

PC: *Well, I sort of decided that I didn't want to be different from everybody, see.*

LRH: Oh, I see. I see. All right. That's what you did.

PC: *Yes.*

LRH: All right. Okay. Let me ask some more here. Have you invalidated this goal? Have you invalidated this goal? Oh, I don't know. I got a sort of a dirty needle on this thing. All right. Let me read it off to you here now. To be different from other people. Did you have a Goals Assessment done before this one?

PC: *No, I didn't.*

LRH: All right. Did you have a terminal found in any way, shape or form before this one?

PC: *Uh – I was run on the terminal a couple of years ago.*

LRH: What was it?

PC: *I believe it was "a man" or it was in this area. Um – yes, it was "a man." And he was assessed on the Prehav Scale, and a level run. This was before Routine 3 came out – in that period right before that.*

LRH: Mm-hm. That was "a man."

PC: *Yes.*

LRH: All right. Let's take a look at this. All right. A man. A man. A man. A man. A man. Well, catfish. Catfish. Catfish. Catfish. A man. A man. A man. A man. A man.

PC: *I want to say something. This wasn't assessed out on a list.*

LRH: No, I know. I know. That's just a terminal. It doesn't have any value as far as that's concerned on your case. Don't worry about it. All right. Now, on the subject of goals, is that the first time you listed anything?

PC: *Yes, I started making this list at home last summer.*

LRH: Right.

PC: *And – whenever I'd think of something else, I'd just add it to the list, and then I brought the whole list over here.*

LRH: Mm-hm. Yeah, I got it. Good. What about this list? You got an incomplete goals list, honey.

PC: *Mm-hm.*

LRH: That's the earliest I can find that causes a needle reaction on Routine 3. I'm looking around here for this goals list.

PC: *Ah...*

LRH: Where is it?

PC: *It's in there, I think underneath those papers. It's in all odd-shaped pages.*

LRH: Well, had an awful time – transfer to this final goals list. Yeah, lookit, lady.

PC: *Mm-hm.*

LRH: See, strike, strike, strike, strike, strike, strike, strike, strike, strike, strike.

PC: *Story of my life.*

LRH: Huh? Look at these Xs. Look at the tremendous numbers of strikes on this goals list. That was the trouble you've had, Ruthie. No, you're not going home, by the way.

PC: *Oh, I'm not?*

LRH: No.

PC: *Okay.*

LRH: I'm not turning anybody out of here with a dirty needle.

All right. Now, I'm going to find the rest of this, going to check out the rest of this. Okay?

PC: *Yes.*

LRH: And we had a line here. We have several items so far. Let's see if any of them have any validity although at this stage of the game, I wouldn't X them or not X them. See? Because they've all been found quite independently of all this.

An insincere person. All right.

A race driver. A race driver. A race driver. A race driver. All right.

A failed opponent. A failed opponent. A failed opponent. A failed opponent.

And ...

A wicked person. A wicked person. A wicked person. A wicked person. It's kicking it.

A vindictive winner. A vindictive winner. A vindictive winner. A vindictive winner.

Well, honey, we're going to see how all these look when you have had a goals completion.

All right. Who's auditing you just now on what?

PC: *Um ... Millie – she's auditing me on CCHs.*

LRH: She is, huh? All right. How you feeling on these CCHs? They making any sense to you?

PC: *Well, uh – the one that bit the most was CCH 3, and it's getting quite flat, I think.*

LRH: It's what?

PC: *It's getting quite flat, and oh – smoothing out.*

LRH: All right. How are you feeling about it?

PC: *Fine.*

LRH: Yeah. Is it making you feel any better?

PC: *Yes, it has.*

LRH: All right.

PC: *It's helped my duplication on tests and things, too.*

LRH: All right. But you basically had a lose here, didn't you, in failing to find a modifier or a terminal?

PC: *Yes.*

LRH: It's a big, big lose. All right, honey. All right. And we have 25 April 62,

and number one, we're going to complete your goals list, huh?

PC: *All right.*

LRH: "...Until no charge is left on any item." And then we're going to find the modifier, and that's going to take somebody just about, I don't know how long, but it won't be very long. And then we're going to find your G plus M terminal. And then we're going to oppterm it. And that's the least I'll settle for before you get out of here.

PC: *Okay.*

LRH: All right?

PC: *Fine.*

LRH: Okay. Now, then we're going to – "(5) we will test 3DXX items found that are not reacting well. After above is done, we will complete the lists." Okay?

PC: *Fine.*

LRH: All right. How do you feel about all this, huh?

PC: *I feel real good.*

LRH: You feel pretty good about it, huh?

PC: *Yes.*

LRH: You'd like to get that goal.

PC: *Yes, I sure would.*

LRH: All right. Well, you're a pretty good auditor. You've learned lots about auditing here. And you're lucky we'll be able to straighten this out. But we'll probably come off of whatever we're on here. And you go ahead and ... I don't know where your goals ...

PC: *It's in there. I – uh ...*

LRH: Auditor's form here, I don't see it.

PC: *Up in amongst some of those yellow sheets. The small sheets of paper.*

LRH: Yeah. All right, honey. It's up in here someplace... Shades of – I guess this was Rae Thacker. Yeah, Rae Thacker. She said, "This is not checked again," something like that. This seems to be different from other people. So they're having trouble checking it, see. "This is not checked again although it gets the most reads most consistently. When I read it, her needle was loose and free and behaved beautifully, but by the time it was checked out, everything had tightened up again. Everything goes live after a while then. Should I bleed down for more again and so forth." Should she bleed down for more again. And her note – see Ruth, it says. So oppterm didn't check out. I don't know where the note is for that, but that's quite interesting. I see you were having trouble with the goals. What's historic here is they were – on 21.11.61, the 21st of December. They were having trouble with this goal. And then they got into tremendous amounts of trouble when they tried to find the modifier.

PC: *I know they did.*

LRH: And then they got into an awful lot of trouble when they found lots of ... You get the multiplication of all that? Apparently, your needle was free when they were trying to do it. And your needle needs washing just now.

PC: *I'll send it out to the laundry.*

LRH: All right, honey. You know, we'll take that early correcting action. Okay?

PC: *Fine.*

LRH: And well finish that off and I think everything will be fine. Probably I will ... You got your CCHs flat?

PC: *It's getting very close to flat.*

LRH: Very close to flat. Probably flatten that and flip you over onto the other at once. Okay. Put the cans down.

All right. Thank you very, very much.

PC: *Thank you very much.*

LRH: You betcha.

LRH: Okay. *Sitzen Sie.* I have to learn to speak Sherman now, you know, because I've got a Sherman E-boat. We shust had a German E-boat inspected, and it's in beautiful condition, and of course you can't handle one unless you can speak Sherman.

PC: *Of course not.*

LRH: Of course not. It's obvious, isn't it. All right, Ann. Now, we've been – we've had a resumé here, and the goal assessed is "to see and have things as they really are." And the terminal was "a master craftsman." And the levels run were these, and so forth. Couldn't have been too far off.

PC: *Uh – Mary Sue asked me just to point out that – uh – there's ...*

LRH: ... "at level 'faith,' above, 'a pharaoh' and 'an electric shock machine' were also run on the level 'faith' before going on to 'prevent knowing' on 'a master craftsman.' Then a 12-way bracket was run on 'shock on a body.'" Why?

PC: *Mm. I think that was after the first uh – Clear check when the um –*

shock treatment engram hadn't yet been run.

LRH: The what?

PC: *The shock treatment engram hadn't yet been run.*

LRH: Well, why would somebody do that? I know the fellow that did it is sitting amongst the students right now, but he has provoked my curiosity. Why would we do that? I mean where – who got these terminals? Where did they come from?

PC: *Mary Sue just asked me that, and I don't actually recall where "pharaoh" and "the electric shock machine" came from except that I was running a lot on electric track stuff and then – we somehow got the electric shock machine.*

LRH: Pick up the cans. All right. Are you protecting somebody on this?

PC: *No.*

LRH: You protecting somebody on this? Would it upset somebody if you said why or something?

PC: *Uh – well, my main difficulty was that I couldn't remember where "pharaoh" and "electric shock machine" actually came from.*

LRH: I'd say it was not an item. I wouldn't know where they came from. We found the goal, and we found the terminal. And all of a sudden here's two more terminals show up, and maybe they were assessed out. Were they assessed out or weren't they? Did you go down the list of new terminals or anything like that?

PC: *Yes, I seem to remember doing a list for "pharaoh."*

LRH: Yeah? Oh, I'm not trying to invalidate anybody, I'm just trying to get to

the bottom of it. And what do you think it was? Do you think you made a list ...

PC: *I'm not ...*

LRH: ... out of which we got "pharaoh" and "electric shock"?

PC: *Um – well, if I made a list, it was in a session. I didn't go – go quietly off and make one on my own. And the main one was certainly "master craftsman."*

LRH: All right. All right.

PC: *The goals list [not understandable] been sent back to Sydney*

LRH: Mm-hm. The goals list has been what?

PC: *Sent back to Sydney.*

LRH: Why?

PC: *I don't know. I just heard it had recently arrived in Sydney.*

LRH: Well, that's just where we need it. I doubt that. There are extra copies or something. These people downstairs are pretty hard to separate from paper. All right. I'll tell you what I'm going to do, Ann. I'm just going to check these things over here a little bit if that's all right with you. Is it all right if I do this?

PC: *Yes.*

LRH: All right. You're sure it's all right if I do this?

PC: *Yes.*

LRH: Oh, there's a tick on this that's answering up. Well, what would be wrong with my doing this?

PC: *I don't think there'd be anything wrong. In fact, I would like it very much because um – after one item, I had a lot of winds of space and deafness for about two and a half weeks. And if there is*

something there that needs sorting out I'd very much like it sorted out.

LRH: All right. Okay. And is there anything wrong with my finding this thing straight and so forth? All right. Good. Have I missed a withhold on you? All right. That's a bit latent. Can you think of anything offhand?

PC: *No.*

LRH: All right. You sure? Have I missed a withhold on you? That's reading everything. All right. Have I missed a withhold on you? Oh, I don't know. I'm getting a little halt and a fall here.

PC: *Well, what I'm thinking of is the item ah – "psychiatrist" which I got, which is after that that I got lots of this um – winds of space. And uh – oh, to a degree I did invalidate myself on Criss Cross because I didn't feel that the optterm we got to it seemed to be strong enough to take this – this feeling away.*

LRH: Ah-ha.

PC: *And I'd gotten a bit disturbed from that last week of processing.*

LRH: All right. And what should I have found out about that time?

PC: *...Um – well, when the item came up, I – I felt um – that I oughtn't to be auditing ...*

LRH: Oh, I see.

PC: *... an electric machine.*

LRH: All right. All right. Okay. All right. Now, have I missed a withhold on you? All right. So just a little tickety-tick. What – what is that?

PC: *Um – well, that time the thought was that I was – I was feeling better because we had started to run out um –*

all right. Doesn't matter. How many goals were listed here, honey?

PC: *I would say over 200. Probably 250.*

LRH: Oh. All right. Well, we've got a bucketful of items here of one kind or another. Were these things found in sequence?

PC: *Yes.*

LRH: I'm not going to find any particular fault with your goal. We're not going to be terribly interested in this, but nobody has opptermed "a master craftsman."

A master craftsman. A master craftsman. A master craftsman. There's still a little boot left in this. Microscopic, but so on. It's reacting. Did you get a good case gain when you ran that?

PC: *Yes.*

LRH: Did you? Did you feel much better after you ran that?

PC: *Yes. I did on that.*

LRH: A master craftsman. A master craftsman. A master craftsman. It reads. Marvelous. Gosh, whoever then started to run "a pharaoh" and "an electric shock machine," of course, needs training at Saint Hill. That's fine. Now, madame, mademoiselle, you got a nice terminal here called "a master craftsman."

PC: *Yes.*

LRH: Mm-hm. How did you feel about this terminal?

PC: *How did I feel about it?*

LRH: Mm-hm.

PC: *Um – very real to me. I...*

LRH: It was a very nice terminal?

PC: *Oh, well, well. Before I started to run it, you understand.*

LRH: Yeah. Yeah.

PC: *Yeah, it was very real to me. I mean on this particular life with all to do with it.*

LRH: Mm-mm, mm-mm. Well, we're just going to oppterm that. And that is your next action. It stayed nice. It's a tiny, little tick. *Pang-pang-pang*, you know. Just as nice as you please. "25 April 62. (1) Oppterm line A. And make sure it's a full list. Maybe so – 500 items?" All right. That's fine. I like that. That's good. We had your case in the bag. All we had to do was oppterm line A, and it's sitting right here. And nobody has ever opptermed line A. People have gone on and opptermed nothing – oh, well, they've opptermed line G, and line H, and line I. That's fine. I suppose that was by – by test, huh?

PC: *Yes.*

LRH: Of course, we don't know that these were found in this sequence, but let's check these over. Shall we? A fanatic. A fanatic. A fanatic. And that's: "To see things as they really are." That's an oppterm to this goal. Oppterm to the goal "To see things as they really are"?

PC: *Um – well, I did Routine 3 on this one. And then later on, uh – I was told to do uh – I was doing Routine 3D in November. And we got a modifier to the goal, and uh – we came out with "a teacher" and "a fanatic."*

LRH: This is the G plus M terminal?

PC: *No, it's the oppterm.*

LRH: I see. It's an oppterm to what? "A master craftsman"?

PC: *Um – we got the goal plus modifier and came up with "a teacher."*

LRH: G. plus M, we got a teacher.

PC: *Yeah. And the thing that would oppterm a teacher was a fanatic.*

LRH: All right. They're backwards. All right. A teacher. A teacher. A teacher. A teacher. A teacher. A teacher. Who knows? Might be. Fanatic isn't. Scrub it. All right. "(2) Oppterm line C, 'a teacher,' this time with a complete list." All right. Because "a fanatic" is not thriving and is not correct. All right. "And when we have these done, thoroughly and well, we will check the remaining line plot." Okay?

PC: *Mm.*

LRH: Good enough. Well, that's pretty good. Whoever assessed your "master craftsman" did a very nice job. Don't know how he did it, but he did it. Nice job. It's evidently all right. Pretty plain tick. See?

PC: *Mm.*

LRH: Every time. Just right. And by leaving it non-oppterm at this time, you're heading up trouble so that as you do other oppterm ... And about two-and-a-half weeks ago, somebody did an incomplete list on you.

PC: *Yes.*

LRH: So which, of course, has given you ear ring and that sort of thing, but "master craftsman" should straighten that out.

PC: *Good.*

LRH: Good. If it does, there'll be a small fee. [laughs]

PC: *Alrighty.*

LRH: Okay, honey, that's all here. Go down now.

PC: *Thank you.*

LRH: Thank you very much. Good.

Okay? Have a seat, Jenny.

PC: *Thank you.*

LRH: We should dispose of you rather easily here. That sounds ominous, doesn't it? [laughs]

All right. We've got a line plot here which is a real staggerer. Oh, I remember this – the horrors we had – trouble finding "a sphinx." And nobody let you have "a sphinx." And nobody wanted you to have "a sphinx." Right?

PC: *That's right.*

LRH: All right if I check all this over?

PC: *Yes.*

LRH: All right. And nobody let you have "a sphinx." "A sphinx." And we wrestled around most gorgeously on that. Now what was your early goal, "Not wanting to be found out"? That's right. And we got "a sphinx," right.

Now, we're going to examine that if that's all right. Pick up those cans. If it's all right with you, we're just going to examine this area of track, huh?

PC: *Okay.*

LRH: In this auditing. All right. Here we go. What do you think about goals? What about goals?

PC: *Well, I guess not wanting to be found out.*

LRH: That's very interesting. What about goals? That's fascinating. It's a charged subject.

PC: *Hm.*

LRH: All right. Now let's take a sphinx. Good. Sometimes it is here and sometimes it's not here. It gets a nice read.

PC: *Oh, yes, I'm sure it does.*

LRH: It does. It gets a good read. But sometimes it's here and sometimes it's not here. A sphinx. Latent. A sphinx. That's right. It gets the same read latent. A sphinx. Now it gets a nice read. Not a steep read. Very interesting.

Your goal's – goal's all charged up. Maybe never did do a complete goals list. I imagine it's in here someplace.

PC: *Yes, we had a lot of this.*

LRH: Where is this sort of thing

PC: *"To make a perfect sound" was another goal we found.*

LRH: Yeah, I know, honey. "To make a perfect sound."

PC: *I didn't know whether that was the modifier or whether it's ...*

LRH: And then they got mad at you because they said obviously that that was Rae Thacker's goal and you were going up town on Saturday with her and therefore you had her goal.

PC: *Ah.*

LRH: Ah, now you find out. I don't have a withhold from you. Well, actually, this goals list sort of came out ... Maybe this was back in the days when we weren't cutting the slash and slosh out of it.

PC: *Why I thought it was "a perfect sound" was that, you know, I – I had wanted to sing, but if you're going to sing you had to sing perfectly – one time.*

LRH: Yeah, all right. Let's see what list we've got here. Oh, there's where I made probably a nasty remark to your auditor and then cut it off the sheet. Where is this? I don't find much of a goals list here, lady.

PC: *It should be there.*

LRH: Oh, I found a piece of it.

PC: *You make goals and goals and goals and goals.*

LRH: Here's a Dynamic Assessment. Back here somewhere there's goals. What a messy list. That's some kind of a Sec Check. "Sphinx," ah. "Open umbrella." "False teeth." Your folder's gotten reversed. There is somebody sometime or other has gone that route. Well, I have found a piece of this, and I don't find much evidence to support the idea that your goals list is not complete. But our next action on you ... Were you satisfied with these goals? Here's a goals list. I only find about 35. I only find about only 35 or 40 goals here.

PC: *No, I think I made more than that. Because we had a lot of goals with difficulty going on. And that was where they came.*

LRH: Now, you see this kind of thing. That's too much. The terminals list is incomplete. We're going to complete your goals list, maybe. All right?

PC: *Yes.*

LRH: Mm?

PC: *Yes.*

LRH: I'll look at this again here. Goals. Not wanting to be found out. Not wanting to be found out. Not wanting to be found out. Man, that reads now, and it doesn't read now, and so forth. It keeps reading, but there's no uniform read. "Not wanting to be found out." That's undoubtedly a goal. "Not wanting to be found out." See? It falls on "not," "not wanting to," "to be." Then doesn't fall.

PC: *So it isn't my goal.*

LRH: We're getting a nice, long, big charge on this.

PC: *I see. Could it be the right goal with more goals to be done?*

LRH: It's a nice charge.

PC: *Mm.*

LRH: There's a half-a-dial drop here on the subject.

PC: *The safest thing I've ever found out. "Not want to be found out." I'd never let that one go.*

LRH: That would be very nice, wouldn't it?

PC: *Mm.*

LRH: Yeah. What makes you – would that make you feel happy?

PC: *Mm.*

LRH: Mm?

PC: *Mm. It would. To really let it go. Yes.*

LRH: Well, what we're going to do is we're going to complete that goals list on you just to get the charge off of it. Okay? And "(1) Complete goals list, and get all charge off of it by listing."

PC: *Good.*

LRH: See, we're doing – we can do something new now. You know, we can list the charge off of the things.

PC: *I've seen it work. Gosh, I've seen it work.*

LRH: Marvelous, isn't it?

PC: *Yes.*

LRH: All right. And then we're going to find the modifier.

PC: *Mm-hm.*

LRH: And then we're going to find the G plus M terminal, and then (4) we're going to opterm it. Hm? Good. And when we've got all that done, we're going to then check the line chart.

PC: *I'm quite sick with relief.*

LRH: You feel relieved? Oh, no. All right. Okay. All right. That's just a charge situation, I'm sure. All right, honey.

PC: *I don't have to pretend anymore.*

LRH: Hm?

PC: *I just don't have to pretend anymore.*

LRH: That's right. Put them up there. Put the cans up. Now, is there anything else you'd care to say?

PC: *No, just thank you.*

LRH: All right. Good enough. So here you go. And thank you very much.

PC: *Thank you.*

LRH: You bet.

Okay! That is all! Good night.

Rundown On Prepchecking Professional Attitude

A lecture given on 26 April 1962

Thank you.

Well, here we are. At least some of you are going to live.

Well, now, this is the 26th of April AD 12, Saint Hill Special Briefing Course.

[part missing]

Well, anybody got a bulletin on Prepchecking. Get me a bulletin on Prepchecking, Herbie.

All right. I'll say a few words while that's transpiring, on something that you should find very important. This is just a very little short lecture all in three seconds.

They found one, all right. Thank you. This is it? All right.

I'd like to comment on something. There are several things that monitor the success of auditing. And one of them is something which has remained more or less understood amongst us, and that is a professional attitude.

The reason healing professions, even when they couldn't heal, have survived is centered around that one fact: the professional attitude. And the substance of a professional attitude is it doesn't matter whether a man is red or black or white or whether he's a Democrat or a communist or a Republican or belongs to the I Will Arise Church or is an atheist or whether he's a friend or an enemy. It's just – that doesn't matter. A professional attitude requires from a practitioner that he is a professional. He is healing and his attitude toward healing is: there is a being and he heals him or her. And that is all there is to it. A good professional attitude simply betokens the fact that somebody is in need of healing and somebody is healed. And there are no additives.

This is a very hard-boiled professional attitude, actually. And it can possibly get you into trouble when you yourself have caused the injury because it'll do a tone curve on you, you see. You hate the man and then you come down to evident propitiation because you're now healing him. That's one of the things that gets this attitude in trouble.

But an auditor is as good as he can assume a professional attitude toward the pc he is auditing. It does not matter whether that pc has overts against him or withholds from him or if there is any personal equation of any kind whatsoever here. That has nothing to do with the auditing session. The auditor is a professional and he applies his profession to that individual, regardless of that individual's condition, opinion, race, color, creed, anything else.

Now, let me call to your attention that that fact alone has brought healing professions through the trillennia. They didn't even have to be able to heal. Witness the doctor today. That poor sod, man, he doesn't know a bacteria from a bacterial, you know. He's got camels and bugs, he wouldn't know which, you know? He's just adrift.

He comes in, if penicillin, sulfa won't cure it, he's had it. He sets bones and breaks them again and he doesn't know what he's doing. The amount of brutality and psychic trauma which he causes in the process of his healing should alone, actually, require that he be hanged. And the field of psychiatry, that isn't – it isn't a medical or healing practice at all. It's a practice of mayhem, pure and simple. It's the practice of mayhem and incompetence, combined. It's not even competent mayhem. [laughter]

The psychiatrist is far more prone than the medical doctor to depart from the professional attitude of the healer. Far, far more prone, because he himself is less mentally stable because he's a fake! He's pretending to be able to do something about something and he hasn't a clue. And the medical doctor can tie up a finger but the psychiatrist can't tie up a trauma, that's for sure. All he can do is create them.

And yet, these professions are respected. Why are they respected? There are many sub-orders of healing. There are many splinter groups of healing that if they ever amalgamated under the one group and laid down a code, professional practice would get a long way. But they don't seem to be able to do that. And these groups are far less professional. But many of them have healing methods which are superior to those of the medical doctor, but they are not respected. Well, that hasn't anything to do with the old school tie, it's just they are not that professional.

What do you mean professional? Well, they fall from grace all too often. They take personal attitudes towards this and that. They sometimes take advantage of their position. And they're not generally as trusted, oddly enough. That's not any condemnation of any of these groups particularly, but I'll just tell you from the ground up, that they have not built this one thing into the public consciousness – that there is a professional attitude. Public cannot send them, their fellow public, to them with a completely free heart. There's liable to be some personal attitude in this. Certainly this is true of psychiatry. I mean, that's not one of the minor groups but it's certainly very true of psychiatry.

A husband cannot send his wife there and expect the home to be preserved, if you get what I read between the lines, you see. There's liable to be personal interest or personal conflicts develop under the guise of professional application. We're very young, we're very new, and we point out to you that there is one blunderbuss that has blazed a wide-open path for all healing activities, whether they're Aesculapians or British Medical Association people, and that was a professional attitude. And they stuck very hard by this professional attitude and made a lot of noise about it. And they stayed by it. So that you find on a field of battle in North Africa, you find the British doctors and the German doctors, after a tank battle, equally treating British and German wounded. See, all mixed up. See, their professional attitude protected them.

Now, that is something you could well acquire. But it is far deeper than this. This is the reason a husband and wife team doesn't work. They don't work well. Oh, they work. You

can get something done. But they don't work *well* because the husband has too much of a vested interest in the mental condition, attitudes and so forth of the wife, and the wife has too much of a personal interest in the attitudes and actions of a husband. There is too much personal concern. There is far too much pitch on the processing session.

The husband processes the wife to get her over some things which he, as a husband, objects to, and vice versa. And they will very often stand squarely in the road of each other's progress if they're covertly mad at each other. There's too much personal attitude, too little professional attitude. Therefore husband and wife teams have a hard time of it. The wife tends to Q-and-A or the husband will tend to Q-and-A with this, or slant the processing in some particular direction, and all of a sudden it is always – the husband has always objected to his wife's cold feet, you see. And this is what they will do. They start running down the list and it's got, "cold feet" on it. And the husband, by calling it out, will weight it. And the wife, by feeling guilty about it, will weight it. And you all of a sudden get a wrong item. It had nothing to do with the case. And then because they're so sure, they won't check it out, see, they know it fits, see. That's the personal attitude entering into a professional activity.

This boy is processing this girl in order to go to bed with her. Now, I myself have been going around with girls and – when I was a boy and with boys when I was a girl for some trillennia – and I never had to use processing to accomplish this particular end goal. [laughter] I've sometimes had to use hospitals to cure myself of the gunshot or dart wounds that – or something like that, but we never needed processing in order to accomplish the fact, you see. We sometimes had to remedy the consequences of the act, [laughter] but never the reverse. Personal – personal curve, personal onus.

Now, there are auditors around HGCs sometimes that the D of P can never trust to audit a young man. Well, not because any sexual activity takes place, just because all you have to do is put this auditor sitting there confronting this young man and he goes mad. He cuts him to ribbons, ARC breaks all over the place and so forth. They very carefully never let this auditor process a young man. See, he might be an old man or something like that, you see. He just can't do it, see. Some other auditor, we don't let – dare let this auditor process an old lady. Cut her to ribbons. You know, won't put up with anything.

Well, you say, "There's case entering." No, there's more than case entering. There's personal like, personal dislike, and it just hasn't anything to do with auditing. There sits a person to be audited. There doesn't sit a young boy or an old lady or anything else, there's just somebody to be audited. And you will find out that as soon as you train yourself into that attitude exclusively with regard to pcs, you all of a sudden start to produce tremendous wins. Because the funny part of it is, is Judy O'Grady, the colonel's lady, young boys and old ladies, they're always the same under the skin. See, it's a case is a case, and that's all you can say about it.

And that's very important to know. And a Scientologist is now coming of age, not that he is particularly a professional on whom the world is leaning, but nevertheless, it's long enough on the road now to lay that one in hard and to handle that factor because failure to do so will get in the road of your processing results. Just for that reason alone. And then push it

home and try to keep it up as far as the public view is concerned. Stand by that one and you will immediately inherit the whole world of healing.

See, where many splinter groups have not, you will, providing you have a professional attitude. That doesn't particularly mean professional appearance. You know, that doesn't mean a mock-up of some kind or another. It just means that this fellow is in need of processing and whether he's red, blue, green or white it doesn't matter, a Republican, an atheist, even a psychiatrist. He's sitting there, he needs processing, you've got enough answers now that you can process him. You can process him you see, directly. There isn't any special treatment needed. And you just sit down and you process him. And all of a sudden you will find that you have a very relaxed frame of mind, because this, too, can become a familiar thing to do and a familiar attitude to wear, that of just strictly a professional attitude.

That's all a professional attitude consists of. Now, don't try to swell it up to a bunch of other things. See, it's just whether or not when you sit down to process somebody you are capable of expressing a totally professional, wholly uncolored attitude toward the pc. So that your attitude toward the pc does not partake in any way of your personal penchants. It isn't that you have to withhold your personal penchants, it's just the fact that you just process the pc, see. We don't even process him *because*, you see. You never process anybody *because*, you just process somebody.

You see how easily we can put additives onto this thing, see? We process him *because*. We process him, in order to – and all of that. No, no, just process him. And you all of a sudden will find your wins go up on a steep climb. And if that is broad and well-handled by Scientologists, you'll find that all by itself, being the sole tool and weapon of older healing societies and so forth, will bulldoze a wide channel through the public to such a degree that you are the only people they trust.

And that is all that trust amounts to professionally. The public doesn't even demand results. They just demand that they can trust a fellow to take a professional interest in the patient. That is all.

How many of you have gone to an oculist or an ophthalmologist and had this ophthalmologist then try to sell you glasses. It's almost impossible to go to an oculist without – and get your eyes tested without them shoving glasses down your throat, see? Well, he's got some kind of a professional pitch right at that moment. You may have had this experience. And right at that moment you feel all is not well. This man has a vested interest in you wearing glasses. And at that moment you cease to trust him. See? He cannot maintain his professional attitude to the degree that if you need glasses he will give you glasses, if you don't need glasses he won't give you glasses. See, he never reads the meter, you see, on the lenses as to whether or not you've got sufficient aberration to need glasses or not need glasses, see. He looks in the till and finds out if he needs some money for a pair of glasses. You see that? And the public doesn't trust them.

That's all, it's just – it's processing without a pitch. Yes, there are commercial arrangements in processing. Those take place before and very well may take place after. But they have nothing to do with the session. I did make a test one time. I may – had to get a man to recover from his aberrations concerning money before he would get well because process-

ing, he thought, was too costly, you see. And because he thought the processing was too costly then he couldn't get well because he couldn't afford it. It was very, very remarkable. It was a test case. Usually has very little to do with it. Somebody isn't paying something for your processing, they don't consider it worthwhile.

That sort of thing has very little to do with it, see. That's something that takes place before, something that takes place afterwards. But during that session it is nothing but a session. The professional attitude is to make sure that it is nothing but a session.

And then if you're very good you can put on a professional hat before the session, run a session, and then put on a livingness hat and not go on being an auditor after the session. You find people will appreciate this too, because your going on looking like an auditor after the session sort of puts the pc back into session. Sometimes it's a good thing to swat them between the shoulder blades, something like that, you know. Anything. Just don't act like an auditor after a session. Act like an auditor during the session.

You see, but there's all kinds of additives that you can put on this thing. If you're going to get people to recover from aberration, if you're going to handle pcs, if you're going to handle ARC breaks, you mustn't have opinions and curves about the case before they are demonstrated in auditing.

See, you mustn't have items selected before the item occurs. You get the idea? I mean you're auditing that case. And then do a very reliable job of auditing. Never pretend that you've seen something or read something that you haven't seen or read on that case, you see. Never give him an item because he expected an item, give him an item only because it checks out, see? You do a professional job, do a very good technical job and you're always all right.

Now we've arrived at a level where a technical job today is marvelous. A person who can do good Model Session, good TRs and so on, is marvelous. One could never complain about this at all. A person is doing a good Model Session, reading the E-Meter well, TRs are in good shape, and he sits there and just gives the session and goes straight through with what he's supposed to do, man, that pc is impressed. Wow! It's the most impressive thing you can do, is to be technically letter perfect today.

Now, Prepchecking is the first moment that you really collide as an auditor – whether in training or early activities as an auditor – really collides with whether he knows his business or not. And Prepchecking is harder to do than Routine 3-type processes. To do an accurate job of Prepchecking and to get good results with Prepchecking is infinitely more difficult than to do a Routine 3 job. But oddly enough, if you can't do a Prepchecking job you will never do a Routine 3 job. There will always be something missing.

Prepchecking is that skill which keeps the pc in-session and which frees up the attention of the pc so that he can be audited. It also transcends this by making enormous differences in the health and presence of the pc. It'll make enormous differences if it's done right and done well. But we're not really demanding that of you. We're only demanding of Prepchecking that it sets somebody up to be in-session and be able to stay in-session without having tremendous number of present time problems and withholds and all the rest of it.

Now, the facts of the case are that Prepchecking today is possible of transcending every result ever dreamed of by Sigmund Freud in a tiny fraction of the number of hours dreamed up by Sigmund Freud. It actually completes the work of any personal catharsis-type therapy, whether that's clinical psychology or anything else.

I was just reading in a clipping somebody sent me – I get lots of clippings and I appreciate them – and this clipping was very amusing. It's a long dissertation on somebody from the University of Florida or New Mexico or northern North Pole or someplace, on the subject of – this will kill you – it's on the subject of making the person create the difficulty he has. And they get him to create – the man is afraid of dying, they get him to imagine and create the idea of dying. And when he can do this enough ...

This is, of course, your Johnny-come-lately psychologist who is desperate. His university has said, "Good God, Higgenbottom! You've never, never, never turned in a paper? Do you realize that you – you've brought no credit to the university. We expect all of our professors to turn out learned papers. They've got to turn out learned papers at least every three months. [laughter] And – and you never turn one out, Higgenbottom. And haven't any publicity. The football team's losing everything this year. Why don't you turn out something on psychology?"

And so he goes over and picks up some book on Dianetics or Scientology, sighs, and puts this thing out in the public press, you see, and turns out a monocatharsis or something that he thinks will get him... And they give him his gold star, you know, and Higgenbottom has still got a job. That's how they do these things in universities. You think I'm kidding. Those poor illegitimate sons are always in trouble. They haven't turned out enough papers.

They've gotten so buggy on the subject that you're a scientist if you've turned out papers, you know? I'm never quite sure what kind of paper it's supposed to be. [laughter] Some of you got that. And look, look at this poor sod. He's got a whole bunch of bright-eyed students sitting down there in Florida or the North Pole or wherever this silly university is, and he's running Creative Processing on them. And he hasn't found out anything about creative processing. He doesn't know what he's going to run into. He didn't bother to read the next book, you know. [laughter] Step Six phenomena here we come! [laughter] Marvelous.

But, you see, these birds are monkeying. These birds are monkeying around. He doesn't know anywhere near as much about it as we did at the time we were... He didn't know anything about engrams or facsimiles. He knows nothing about what the person's liable to get into. If the person got stuck in a picture he'd never even be able to tell him to go to the end of it or come up to present time or anything because he's not ... You know. *Whooh*. You know, turn a kid loose with a .45 and say, "Cut your teeth on it, sonny. Here, I'll get it at full cock for you." It's about that sensible.

These birds are going off and riding off in all directions, trying desperately to achieve something. And it's been achieved and you mustn't overlook the fact that it has been achieved.

Prepchecking. Prepchecking is a rounded off activity. I'm never going to look at it again, just do it, see. It's a nice, rounded off activity; a very smooth activity. It's not something that's going to shift and nobody is going to change it, because I know exactly what its ceiling is. The ceiling is a total psychotherapy of this lifetime. It's a total psychotherapy of this life-

time. You can make it go back into former lives and you can make it do other things, but you actually have exceeded the purpose and limit of Prepchecking because the pc has got so many hundreds of thousands of other lives that it will take you a little too long by this process to do something about them, you see.

So its practical limits are the limits of this lifetime, and it winds up the work of Freud, Jung, Adler, any clinical psychology hopes, or anything like that. You should be able to do this. Because if you ever set up – let's say that you've got – all of a sudden a Saudi Arabian oil company came along and wanted you to be a part of their team for lower Kingville or something, and they were going to have all of their people set up and you were supposed to go through some motions of some kind or another that were – that was something like the practice of psychology, what they would recognize, you know, as psychotherapy and so forth. This is all you'd have to do. I mean, just prepcheck people. They'd all be very happy with you, providing you did a good professional job of it.

You could sit down there and do a good professional job of Prepchecking, and you'd pull everything this guy was really – really thought he was worried about. It'd all straighten out. Fellow would feel nice and everything would be smooth. But the funny part of it is that it does, it accomplishes more than man ever hoped of psychotherapy. See, there's more here than has ever been hoped for in the field of psychotherapy. It is a junior process, as far as we're concerned. But it is very comprehensible to the world at large. And they're scientific, you know, they've read the papers of Freud and this and that and they know which direction psychotherapy's supposed to go and this oddly enough covers the direction psychotherapy's supposed to go.

You know, you sit there and you're supposed to pull up the traumatic experiences of the person. And of course the traumatic experiences of these people are just locks. See, you're not running engrams or anything serious like that. They don't know anything about engrams.

And you say, "Well, you've been having trouble with your wife, you see. Well, all right. Let's see, we'll take that up, take that up. Very good. Very good."

Look it over and get some kind of a Zero that fits in here someplace and – like, "Have you ever done anything to your wife?" Or "Have you ever had any trouble with your wife?" He'd buy that very well, you see. And you start fishing around to find out what he's *done* to his wife, don't you see. You'll eventually get your incident and you work it with your Withhold System, and you know, got your What question that gives you a chain. Work it with your Withhold System. Go over this thing, finally recover the lowest dregs of it all, and get it on up to PT and all cleaned up slick as a whistle. He won't have anywhere near the trouble with his wife that he used to have.

You could also do job orientation with this sort of thing, you know. People having a hard time working for the company. They're considered valuable in some respects but they're a liability in others. Well, you could pick up what this is and straighten it up with Prepchecking. Rather rapidly – a few hours. And it looks very professional. You sit there and drag over what they laughingly call a psyche. If they only knew what lay below what they think the unconscious mind is, you know. If they had any idea, you know, they wouldn't go puttering

around that swamp. They'd run like a bunch of startled cottontails, you know, that had just seen a snake.

But, you can take all the froth off the top of the swamp and the bubbles and so forth. And as long as you don't show the guy that it's just black from there on down, you see, [laughter] why, everybody's very happy with this thing. And it's a process activity that you really don't expect to pull the pc's toenails with – right up through his gullet. You don't expect it to do this, you see. Maybe polish up his teeth or get the fur off his tongue, you see, but that's about it, see. That's what you expect of the process.

Now, if you expect too much of Prepchecking, why of course you're going to be rather upset here and there. This fellow is a total arthritic, he's in horrible condition, he can't walk, he can't sleep, he's on his death bed, and you walk in and you start to prepcheck him. And he dies. And he's still so curled up they can't even get him in a standard coffin. They have to build another kind – a corkscrew type coffin [laughter] in order to get him into one, you know. You'd be very happy with Prepchecking, you'd be very happy with Prepchecking if you didn't expect too much of Prepchecking.

Well, what the public expects of psychotherapy, Prepchecking more than delivers. And what you expect of it is very simple – you just want it to get this pc into some kind of shape so he'll sit in session without getting his rudiments wildly out – so that you can handle his rudiments and you can do a process that does pull his toenails.

And you get him – you get a person prepchecked up to the point where the rudiments will stay in. Well, of course, he's had to tell you most of his basic withholds that he'd sit there dodging with, and you'll have pulled quite a few somatics – they won't get in the road of your listing, and he'll come into session, you'll get a few missed withholds. If you're on an off-line, you'll have a little trouble. I mean, if you're pushing around on some line that is a rugged line to the pc because some other line, earlier than that, is out. If there's something basically in error with the Routine 3 activity, you'll have – always have a little trouble keeping the things in, but it'd be minor. It'll be picking up last night's withhold, you know and – at the beginning of the session, you know – these little things, the missed withhold, the thing he didn't find out about. And all of a sudden the thing settles out.

You can handle the pc because you can keep it all picked up, because you're not trying to pick up everything in this lifetime while you're doing 3D Criss Cross. Now, the basic thing that has been wrong with Routine 3 processes is because the auditor, in doing a Routine 3 session, was also always trying to do a Sec Check or a rudiments session. He was trying to cross two breeds of cat. And it was something on the order of trying to mate an eagle, you know, with a shark. And you just couldn't get them to recognize each other's sex appeal. [laughter]

Here on the one hand, you see, you're supposed to be listing, and the pc is sitting there, and really, he says at least, that he really is – he's all ready to go man go, you know. He's all ready to make that list, you know. He's getting interested in all this and he's ready to – you know, and so forth. And you read this thing and he's got a present time problem and missed withholds and so forth. And anytime you say anything, the E-Meter almost jumps off the pin by the impact of your voice, don't you see. And, you start to list and you say, "Well, maybe

it'll all get all right." Then all of a sudden he goes out like a light, and you say, "Have I missed a withhold on you?" which is what you should say, to pick him out of his boil-off, and so forth.

"Well, yeah, you missed a withhold on me. Well, let's see, while I was waiting to pick up this body I thought that my father was an ugly man."

You say, "All right, that was good." [laughter] "And have I missed a withhold on you?"

"Well, I never told you actually ... But that's too embarrassing."

What the hell kind of a session are we doing now, see? Well, we're doing a cross between an eagle and a shark, and he can't live in the sea and he can't live in the sky. And if an ornithologist ever saw him, why he'd have a hell of a time. [laughs]

And you'd be surprised, that's the commonest error in doing the Routine 3 processes is that you start in to do a Routine 3 process and you wind up doing a rudiments session. Well, that accounts for most of the breakdown. This also accounts for the fact that people couldn't find goals. And that's going to get very important to you very shortly so you better know all about this. You couldn't find goals because rudiments were out. Well, you can't do a *goals finding* session while you're doing a *Sec Checking* session and a *Prepchecking* session and so forth. You see, it's all crossed up.

Now, you can always tell a green auditor here that hasn't – nowadays – you can always tell one, because you send them up to do a Routine 3 session and they come down and they hand you a rudiments session and he spent the whole session trying to get the rudiments in. And you send him up again to do a Routine 3 session. And they always come back and give you a rudiments session. And damn little Routine 3 ever gets done because, of course, the whole ruddy lot is wound up in a – out-rudiments.

See, they start to do one kind of session and they get another kind of session. And it gives the auditor at once the idea that he has no control of the pc. And his sessioning sort of collapses at this point, you see. He's all set to charge in there and get the list, the pc's all set to charge in there and get the list, except the rudiments have busted the needle. The pc shouldn't be doing a Routine 3 type of a session, that's all. Should be doing a Prepchecking session.

So you don't cross the eagle and the shark. You reach into the Stygian depths and you get yourself a Prepcheck session going and you pull the withholds and things like that necessary, so that the pc can be comfortable being audited and always isn't sitting there with a pair of boxing gloves on to defend his favorite misdemeanors, you know. You get that straightened out, if you're giving him CCHs at the same time, why, you're getting the pc good – under good control, getting his havingness so it's straightened out and so forth. You're getting his withholds pulled. You're just grooving him in.

And with Prepchecking of course, you're already grooving him in to being model-sessioned. He's getting used to being audited without being thrown for a loop, see. And he eventually gets his prediction up on this thing and he can stay more alert in the session and so on.

So Prepchecking is vital. I don't care whether it produces a result beyond simply getting the pc to stay in-session. I just couldn't care less. Anything that you get beyond that is a terrific bonus. And it's remarkable that you get these bonuses quite routinely if you're a good Prepchecker. You just keep getting bonuses, bonuses, bonuses. But all you want is just to get the pc so he'll stay in-session. That's all.

So every time a stray thought hits him from someplace or another you don't have sixteen rudiments go out. And in view of the fact that there aren't sixteen rudiments it makes it very difficult, you see. It's hard to get in sixteen when you've only got a few, you know.

The difficulties which you encounter in Routine 3 are adequate and sufficient unto themselves without adding the difficulties of Prepchecking so if you get *all* of these it's somewhat like trying to play a barrel organ, some bagpipes and so forth while on roller skates on some slippery ice. It's embarrassing. You just haven't got that many hands and E-Meters. You begin to consider that auditing is terribly difficult, very difficult to do. Well, yeah, well, of course, you're doing an impossible job when you're trying to prepcheck while doing a Routine 3.

Now, the whole reason why Routine 3 got varied and moved around is because the rudiments kept going out on people and they weren't able to find items. They couldn't keep rudiments in. Here you'll find Prepchecking. And that is the remedy to those difficulties that were encountered heretofore in clearing.

These Prepchecking activities will set your pc up so that when you get a list you are getting a *list*, not getting a bunch of worries about whether or not you'll encounter his withhold, see. You're going to get a list. You're going to get a chance to do some Routine 3. Then you can find goals, find terminals, find items, find oppters. All this becomes easy because you've already set the case up so the case can be audited. So don't skimp this. Terribly important.

You're very lucky in that this is designed also to be very interesting to the pc. Hm, pc, yes. He's like the hypnotized bird when he gets himself ... He sits there in great insouciance you know. He's going to sit there with his rudiments all out, defending himself appropriately in auditing, and so forth. And you sit down and you open up on him with Prepchecking.

And you say, "All right, are you willing to talk to me about your difficulties?" That's your Zero Question. "Have you been willing to talk to auditors," or "Have you been willing to talk to people about your difficulties?" Any kind of a way that you want to vary this particular Zero to get, "Are you willing to talk to me about your difficulties?" We don't care how you state the Zero, it's got to be something that's real to the pc.

"But of course. Absolutely." *Clang*, you see.

You say, "What's that? What aren't you willing to talk to me about?" and so forth. A little buzz-wuzz and a discussion here of one kind or another. And he turns kind of a beet red and ... Believe me, at that point he starts getting interested. You eventually get a withhold off of him of some kind or another. And you – out of that withhold, why, you're in business. You've got a withhold and you bang it into a What question that will give you a chain. And he thought he could get away with just telling you about Mary Belle. And imagine his surprise

when he has to tell you about ... [laughs, laughter] And eventually he gets over these pieces of nonsense and after that he isn't in this dodgy state. He can actually sit there and be a pc.

Without Prepchecking we had a hell of a time. I don't mind telling you. It was rough, rough all the way. So Prepchecking is very well worth learning.

Now let's take up Prepchecking from the viewpoint of auditor training. Routine 3 processes are too hard on a case to be done wrong. You cannot do a training activity safely with a Routine 3 process. Can't be done. You cannot set somebody to learn how to run an E-Meter while he is trying to find somebody's oppterm. That would be pretty grim. And some of you have seen this. We've set somebody out to find somebody's goal when they couldn't yet run an E-Meter, sit in session, nothing. And man, that doesn't get to be a picnic. That gets to be – that makes the Roman arena, you know, look like a Sunday school picnic. It's gruesome. Absolutely gruesome. And they wind up with a mess.

So you mustn't use Routine 3 or Class III processes as training processes. Even though in the final analysis they are easier to do than Prepchecking, you must continue to use Prepchecking as a training process even though Prepchecking has a tremendous liability. You can blow somebody right out of Scientology with bad Prepchecking. Oh, it's dynamite. But you won't kill him. It's dynamite. All you've got to do is miss a withhold and you've had it.

On some cases when they're still in their early edgy states just miss a withhold or, God help you, get a case where they're walking around with an, "Everybody knows all the time." you know, this is the theetie-weetie case. That's what distinguishes the theetie-weetie case – everybody knows all the time. They run around – it's on a standard, total, "Everybody should know." And the missed withholds you pick up off of them is when you ask them a question. Any time you, the auditor, ask them a question then you should know, so of course you have missed a withhold. So we have, let us say, three auditing questions in a minute, we have then missed three withholds in a minute. I think this is very well worth looking at.

You see somebody's graph crushed right straight across the top and the case is a perpetual missed withhold case. Somebody walks up to him and says, "What time is it, Joe?" See? Everybody should know, you see. And he has now found out that you don't know what time it is, but he knows what time it is, so you should know what he should know, so therefore you've missed a withhold on him and he gets quite cross with you. Doesn't tell you the time, either. [laughter] Do you understand that phenomena?

The person has the idea that everybody else should know anything they're thinking. When you get that combination, man, you've had it. The only thing that will crack a case like that is something like Prepchecking. You'll run into this sooner or later. You can break this down. You'll notice everything is reacting. Of course, what you really do is clip it out with a Routine 3 process. Eventually, why it's "swami" or something, you know, it will come up as an item and after that the circuit ceases. But not until then. But you can take the edge of it off with Prepchecking.

But they are hell to prepcheck. You practically have to sit on their chest and box their ears to get an answer to anything because they're sitting there, "What are you asking them questions for?" because you know it, you see, you must know because they know. That's good enough. They know. So they don't have any withholds. So they have never done anything.

You get desperate with a case like that unless you know there can be cases like that and what the common denominator of that case is which is, "Everybody else should know what they know." And they've got it to a psychotic extent.

So you sit there and the – eventually break it down and you suddenly realize, well, "Have I missed a withhold on you?" You've always missed them by the ton. You find out what withhold has been missed: you asked them a question. All right. So you just start cleaning up a chain called, "Questions they have been asked," see, or "Questions they have had to ask," since this put it all to shame, you see. You eventually will plow in on this thing one way or the other and you'll find the case will start straightening up. They are the hardest cases in the world to prepcheck.

Now, that's the rough case to prepcheck, not the sinner, not the fellow who has done a great many antisocial things. Just change your sights. It's the *good* people who are hard to prepcheck. They're tough.

And nobody says that Prepchecking is an easy thing to do. I wouldn't try to sell you this for a minute. You've got to be able to develop your sensitivity for recognizing a case for what it is, getting a proper Zero Question in there, getting a Zero A Question that hits the case right where it lives. And then you've got to develop the facility of yibble-yabbling around finally until the case actually owns up to a withhold of some kind or another, an overt of some kind, around which you can build a What question. And use that What question, use your withhold system, clean up the chain. And there's a lot of disappointments in the line. You get this, and you say, "Oh God, he burned down a church. My, my we really got something here," you know. And it just sits there, it just sits there at 2.4. And you go through the whole chain, not only one church but just dozens of churches. [laughter] And it sits there at 2.4. You get a needle knock on it, but the tone arm never moves and you're not doing a thing for the case.

And then you eventually, accidentally find out that he gets a bad fall on buying all-day suckers. And he finally, after much embarrassment and twisting in his chair, owns up to having purchased one that very morning. And it's, "What all-day sucker have you purchased?" that is your Zero Question and you get tone arm motion from 2.0 to 4.5. Those are overts. You finally get down to the fact that every time a kid in the neighborhood would buy an all-day sucker, he would sit down on him and beat the living daylights out of them until they gave it up. And maybe killed somebody doing it. And it got associated in this way and he'll finally – he all of a sudden triggers this, you get the basis of it, you pull at the big unknown strip of it that he never has known, comes to light, your tone arm motion quiets down, up to present time. Man, have you really done something for him. Now he *knows* you're a wizard – because that's one of his terminals, too, that he will learn later on. [laughter, laughs]

But there is what you expect, if you prepcheck. Nobody's trying to tell you Prepchecking is easy. But Prepchecking is precise and Prepchecking, more than anything else, has to be done in a very professional way. Because your differences of expression, your "*m-hm*," your expression of "yes," your personal reaction on the thing and your personal interest on the thing interjected into the session, your shockedness, your forbiddenness, all of these things coming up, just wreck Prepchecking. Just bzzz. That's gone. You won't get any others. Pc will sit there. And this is so prevalent that it causes a pc only to get off little tiny featherweight

overts. And then lie like mad. He tells you he feels so much better having gotten over the fact that he dropped a pin that morning.

Now, that's totally traceable to the auditor's nonprofessional attitude while auditing. If you expect to get overts off a case, you're going to have to be very professional in your handling of it. If you're very professional in the handling of it, you're not trying to make the pc guilty, you haven't got lots of greed to hear more of this salacity – hu-hu – then you've got it made. And your pc will just sit there and he'll just get more and more stuff off. More and more stuff off. More and more stuff off. Sometimes he even will get into a contest to see if he can shock you. By the time he finds out that he can't, he will have gotten rid of all of his withholds and doesn't care. [laughter]

But the training crucible of the auditor would be Prepchecking. It's a more difficult skill than Routine 3 to really get results with Prepchecking. Its topmost limits is to be able to get the pc in-session and keep him in-session. It gives you far more bonus than that. It will do remarkable and wonderful things for cases, far in excess of any psychotherapy that's ever been known here on Earth, and that makes it fine. But you're doing a terrific thing from the pc's point of view.

Actually, what are you doing? You're clearing up one grain of sand off the Rock of Gibraltar of grains of sands. One lifetime is about all you're cleaning up. Nothing wrong with him this lifetime. He's alive and sane. That's better than he's been for billennia.

But he gets a grip on being a pc. He gets so he can talk to an auditor, his rudiments stay in, and then eventually he is now – gets courageous enough that he can embark upon more *heh-heh-heh-heh-heh* difficult journeys across far rougher seas. And that's the value of this. So this is the make-break point of the auditor. And the training emphasis should be on whether or not an auditor can do good Prepchecking.

There's the liability of the auditor missing withholds. That's the main liability – missed withholds, not withholds. You can miss a withhold on the pc by not asking for it and the pc doesn't know about it. Well, that isn't what we mean by missed withholds. It's what he feels you should have found out, that is a missed withhold. *Heh-heh*. He sits there and all of a sudden he realizes that you should have found out about something. You haven't found out about it and out of session he goes. And he's mad at you and he's all upset. And if you're an expert Prepchecker all you have to do is say, "What withhold have I missed on you?" find it and get it out of the road in a hurry.

Very few auditors learn rapidly this interesting datum: That if the pc has an ARC break or is upset or is misemotional or in any way, shape or form is having trouble in the session, it stems from missed withholds. I mean auditors have the awfulest time learning this. Honest. It's so evident that it's in neon signs all over the billboards, you know. All you have to do is do it once or twice. Like magic. It's the most magical magic you ever cared to see. You know, here's this pc, and this pc is just about to tear strips off the ceiling. He's mad. He's solid. And he's going to blow session, everything else, and you say, "Have I missed a withhold on you?"

And he says, "Oh, oh, well, yes, I guess you have."

And you say, "What is ...?"

"Well, I don't know what it is. It's probably something or other."

You say – you notice all of a sudden you've got to guide his attention in and give him a spotlight of attention. And he thinks about one thing or another. And you say, "That – that – that one there. Yeah."

And he says, "Oh, that. A-huh."

And all of a sudden, why, he's back in-session. And he's being calm and nice and everything's fine. Damnedest exhibition you ever saw.

All you have to do is a time or two get a subjective and objective reality on it, and after that you'll never have any trouble with pcs. But do you know auditors have a hell of a time learning this at first? They'll think it's everything under God's green earth. They'll say, "Have you got an ARC break with me?" You know. And, "Oh well, all right. Now, what have I done to you?" and "What have you done to me?" And so forth, and trying to smooth it all out, "What responsibility haven't you taken for this session?" You know, anything they could think of. And they get all nerved up and the pc's getting nerved up and everybody's going unhappy and chairs are breaking finally. [laughter]

Two days before you told this auditor, "Now look, if a pc gets upset it's because you've missed a withhold on the pc. Just ask him, 'What withhold have I missed?'"

The day before this session occurred you've said to the auditor, "Now look, if the pc gets upset on you, all you have to do is ask the pc, 'What withhold have I missed on you?'" And yet at that time when the pc gets upset he'll say, "Do you have an ARC break? Let's see, what responsibility haven't your grandmother taken for this session?" [laughter] Honest, he looks like a fighter plane crashing into everything in sight. Down in flames, man. Quite remarkable.

So there's evidently at some times, tough to learn Prepchecking. It's tough to get in there, to probe deeply, to really scrape up the muck on the pc and get him to talk to you and so on. It's a terrific test of an auditor, whether or not he can prepcheck. Terrific test. An auditor who can prepcheck well, marvelous. He can do anything. He can do anything from there on. And of course, a pc who's been well prepchecked runs Routine 3 processes just like that, nothing to it. They have no trouble with them at all.

A pc is not prepchecked, auditor can't prepcheck, auditor runs Routine 3 type process, auditor sees pc going into spin, auditor goes into spin, pc goes into spin, floor falls in, the ceiling falls in. You see these lumps of charcoal years afterwards and you wonder what happened? [laughs] They've become their own Goals Problem Masses. It's murderous.

So although Routine 3 looks very easy and the motions of it are very easy and it's very easy to do, remember it's only very easy to do if you're an expert in handling a meter, an expert in handling a pc, and you can take it all like a breeze. And you know how to set a session back together again, bang, you keep the rudiments in, bang, there's nothing to this, you just handle the whole thing of course you can do Routine 3. And therefore after that Routine 3 will look very simple to you.

And you'll look at student auditors and you'll say, "Why can't I teach them Routine 3?" You see. "It's just so simple. There's nothing to it. I can do it." And all of a sudden, why, one day you're passing the classroom where they're sitting in there co-auditing, and you see this little trickle of blood coming out from under the door. [laughter, laughs] And you go in, and the place is full of smoke and all there is is some few charred chairs. [laughs] And you say, "Well, what possibly could have gone wrong? I prepcheck easily. I run 3D Criss Cross easily. Pcs are very easy to audit. What could have happened?" Well, what happened is you tried to get them to run 3D before they could do a perfect Prepcheck. And any time you do it you'll have trouble thereafter.

Prepchecking demands far more of the auditor than Routine 3 ever will. But oddly enough you can never do Routine 3 unless you can Prepcheck. You see how that is? And it's perfectly safe, by the way, to teach people to prepcheck. Teach them to use a meter while prepchecking. Perfectly safe, because what they stir up anybody can handle. You see some student bolting through the door madly. He's on his way to Arcturus or something. You grab hold of him and say, "What was – what was just happening?" And he says, "Oh, it's terrible. That auditor is butchering me," and so on.

"What withhold did he miss on you?"

"Well, I ... *Heh-heh-heh.*"

"Why don't you go in and tell him."

He'll go back and sit down. Now that we have answers of that type in the handling of beings, we can afford to be a little heroic in this level of training

So actually I expect you to know Prepchecking and CCHs very well, because they establish sessions while getting terrific gains from the pc's point of view. And when you're teaching auditing please teach CCHs and Prepchecking. And don't turn anybody loose on Routine 3 type activities until you're absolutely certain that they're just a fine Prepchecker. And then you'll never have any trouble.

Okay?

All right. Take a break.

RUNDOWN ON ROUTINE 3: ROUTINE 3A CRISS CROSS

A lecture given on 26 April 1962

Saint Hill Special Briefing Course – a lecture, on the subject of Routine 3 and company.

History! The discovery that goals could locate terminals and that terminals could be audited out of existence was followed by a discovery of the identity of the Goals Problem Mass. It was followed also by several pathetic efforts of numerous auditors to find a goal, and more pathetic efforts to find terminals.

Meantime, research continued forward. We got Routine 3A. Routine 3 consists solely of finding a goal. Then finding a terminal that matches the goal, and running the terminal. And then finding another terminal for that goal and another terminal for that goal, till that goal disappeared. And then finding that the goal probably had disappeared, and finding another goal then, and finding a terminal for that goal and so on, and finding and auditing that, and then finding another terminal and auditing that, and finally it disappeared. And eventually you got into a situation where you'd find a goal and it'd blow up and you find a terminal and it'd blow up, and then you just couldn't find anything and you got a free needle.

What you've done in essence was to pick off a number of pieces of the Goals Problem Mass so the pc was floating free of the Goals Problem Mass. Condition of Clear which is attained by this particular process was a very desirable condition.

Now, on many people when it was well attained has been quite stable, but contained the liability of a key-in from the remainder of the Goals Problem Mass which had not been touched by this auditing. And this was the reason Clears caved in. That's because there was still a Goals Problem Mass less just a few of its terminals, kicking around ready to kick the pc in his teeth.

All right. So there was an effort made, then, to find the goal and a new piece was discovered: the modifier. And you took the goal and the modifier, and you found the terminal with the goal and modifier. That was Routine 3A.

Now, the goal plus modifier ended up in a terminal which was much more intimate to the Goals Problem Mass, and because we reached time finding the modifier, we did not lose the Goals Problem Mass. The Goals Problem Mass can be keyed-in at any time, merely by repeating the modifier to the pc.

Why? The modifier ordinarily lies in the oppterm – new data for you. You find the goal then you find the modifier, and of course, you're going to find the oppterm. And that is a

mass which is more intimately connected with the Goals Problem Mass, so although you find a terminal, all you have to do is chant the modifier at the pc a few times and you pull the Goals Problem Mass right in on the pc. Why?

Well, you've got your two big balls. Freud by the way would have – I'm sorry, girls! [long, loud laughter] But the truth of the matter is that that is how Freud thought it was all sex! [laughter] That's right. That's right. He probably spotted some of these things someday and he says, "Aha! I know what that is!" Invented the libido theory.

Anyway. All right. Here you find the goal and then you find the terminal for that goal. But if you found the goal and the modifier, the modifier will have something to do with the oppterm. See? So, although you try to audit out this terminal, every time – you could audit it out, see. And then you just say the oppterm and you get that again – and you say the oppterm and you get that again, you see? So the Goals Problem Mass is over here quite fixed and you could always swing it in.

You can take any Routine 3 Clear and you can find their first goal, and you can find the oppterm for that goal, and bang – they're about as Clear as mud. In other words you can yank them straight into the Goals Problem Mass by merely finding the modifier.

Routine 3. Well, Routine 3 was designed to be processed. You found the terminal and then you found the goal and then you found the modifier and then you found the terminal, and then you processed the thing and of course it wasn't too terribly successful – it's an experimental process to that degree – because you were always kicking away at an unidentified modifier. You were kicking away at an unidentified oppterm.

So then we got 3D, and 3D – we skipped B and C and – they went by in a half an hour of research and – actually didn't go by at all, just skipped them – and we got to where you found the goal and the modifier and a terminal and then the opposition terminal. You did this in a sequence of finding the goal, finding the opposition goal, then finding the modifier to the goal – that isn't quite right ...

Female voice: The oppterm.

No, you found the oppterm to the goal, and then you found the modifier, and then you found the terminal – and of course that gave you a package and that package was designed to be audited.

All this material is available in bulletins as I'm just giving you a fast historical review of Routine 3. It has never ceased to be Routine 3, by the way – if you notice that carefully – it never became Routine 4, 5 or 6. All right.

Now, then came Routine 3D Criss Cross. Routine 3D Criss Cross came about because auditors had so much difficulty in finding a goal and in finding a modifier, in finding a terminal, in finding an opposition terminal – had so much trouble finding these parts, that I looked very carefully for numerous new entrances to the Goals Problem Mass.

Various entrances were found; the first of them were merely arbitrary entrances. You said, "Make a list of the things you like." "Who or what do you like?" "Who or what do you dislike?" You had lists, in other words and these lists came on down the line and were nulled

and you got items then on these lists, and then you opposed these – got the opposition item to these lists – and you've got a package – right there, bang. In other words you're dealing totally with terminals. So you'd get any – first it was an arbitrary assignment. You just told the pc "like," and then you got a line for "dislike" and then you got a line for something else. All right.

And this was succeeded by Prehav levels. You take a Prehav level and – which is assessed on the pc – and then you would list a large number of terminals for this Prehav level.

Prehav level, let us say is Badly Control. "Who or what would badly control?" And you'd make a long list, and you would assess that list out and you'd wind up with a terminal. And then you would say, "Who or what would oppose –," whatever terminal you found or whatever item you found. "Who or what would oppose that?" And you've got a pair of these things.

And you kept doing this on several lines, and then you got the flows, and you would assess all possible flows. And you would say, "Who or what would enforce inflow on you?" or something like that. And you would make that list and then you would make – after you had found that item – then you would make a list for the opposition terminal.

And the object of Routine 3D Criss Cross was to continue to do this until the Goals Problem Mass was totally shaken down to a point where you were only getting a few specific terminals which were constantly repeating. And this, of course, would be a package. And then that package could be audited. That was the basic intention on which this was developed. Very good.

A new concept of Routine 3 Processes has just arisen and that is an understanding of what we are doing. Several solutions have been found. I found several solutions to problems which opposed the original Routine 3, and what was the matter with original Routine 3? You see? What was the matter with it, basically, is that we were *trying* to do Routine 3 when we should have been Prepchecking. See?

We were trying to do both things at once. We couldn't keep the pc in-session, and God help us, it was all over and splattered on the ceiling, you see? Couldn't keep the rudiments in. We found out that it takes *forever* to find an item or a goal if the rudiments are out. I can prove that to you over and over and over again. If the rudiments are out, you will find nothing. If the rudiments are out, you will find nothing. If the rudiments are out, you will find nothing. I mean, it's been proven and proven and proven. I mean there is no fact that is harder driven home than that fact.

Of course we have Prepchecking. You give CCH and Prepchecking to a pc, he'll get into a condition where the rudiments will stay in and then it becomes very easy for the auditor to do a proper job of auditing.

Furthermore, auditing skill and the skill of an auditor has been tremendously upgraded. And that skill is tremendously higher this year. You realize that this week finishes a year of the Saint Hill Special Briefing Course? Actually it was Tuesday night, and if I hadn't been so busy getting audited and research and trying to tie this sort of thing up for you, why I

would have given you a cake. But we will wait until we have a proper place to give a party and I will give you a party and we will just give you all a rain check on that, okay?

Audience: Okay.

Now, Routine 3's difficulties were basically that a pc was not in any condition to have anything found on him. And auditors were not in any condition, as far as auditing skill was concerned, to find anything on a pc. Let's just face it, we stunk. Pick up an auditor from lower South Amboy and say, "All right, show me how to operate this E-Meter."

And he'd say, "Well E-Meter operation is very easy, very easy. You set it up like this ... You make sure this switch is at 'off.'" It's almost that bad.

One Saint Hill graduate went back to California and actually had tremendous numbers of auditors and was giving special lectures on just one thing: What is a null needle. Nobody knew what a null needle was. We had people coming in here, as original students last year – they would arrive here; they had never been on any courses or anything of the sort, and – from various parts of the world – and they'd strike the *E-Meter Essentials* and we would say to them in *E-Meter Essentials*, question on "Show me a null needle." And they'd say a null needle goes this way. [demonstrates something] And you say, "How does a null needle go?" and they say... [demonstrates something] Fantastic! The auditors didn't know anything about this box. I don't know what they thought I was trying to do. Maybe they thought I was kidding them – that it worked at all!

Actually we were... This is not too mysterious. Of course they didn't think an E-Meter worked. The E-Meters of Australia, South Africa and America, as well as New Zealand, would not demonstrate a mental charge. They demonstrated electronic charges. They were perfectly good electronically and they had nothing to do with the pc's thinkingness.

The last meters before that, that were of any value whatsoever, was the 1957 US. And I thought it was a very competent meter, until I was looking at one just a few months ago when I was over in the States at a congress and I found out, I found out that a Mark IV just runs rings around them. There's no sense in repairing those old meters; they've got delayed actions. They've got everything else in them they shouldn't have. It's marvelous.

You know, sometimes you turn your meter over to a repairman – he will build a delay into the circuit to keep the meter action from being injured. I think it's so sweet, the knuckle-head! In other words, you ask the question and one second later the meter responds. *Kaw!* How gruesome can it get? It's grim.

Well, with no meters – and actually at that time no textbook on meters – and a few other things lacking, and with about half of the rudiments that are vital to keep a session straight up lacking, of course it was impossible to do Routine 3. How could anybody do it?

So, it was very important to realize that a tremendous number of things have happened in the last year. One of them was the Saint Hill Briefing Course. You take somebody; you set them up, and show them how it works and that sort of thing. They get an understanding of it. They go back and they don't waste any time telling people how to do it right, believe me. Returned students can always be heard in here, clear to here, you know, they scream so loud. Auditing looks terrible to them when they get back home; it just looks grim. It looks too

ghastly. I mean they always thought it was all right, you know, and they go back home and oh, it looks terrible. Inevitable, we get in those responses.

Developed the technology of an E-Meter; put it down in a very precision stated book. The book is very precisely stated. Frankly, made sure that the E-Meter stayed very stable. Wiped out all corny E-Meters that we couldn't count on. And somebody said well that was a smart commercial move. Hell, no! That wasn't any commercial move – that was a move toward the survival of Scientology. These meters, people going on using these meters – wow. And particularly when we started to get other data; how dangerous it was to audit with these meters. Wonder we ever kept anybody anyways.

And then we developed Model Session out with many more rudiments to keep things smooth, and we developed various technologies of how to straighten this out. And then more importantly, proved conclusively that it was out-rudiments that made it impossible to find items. That was – that was a very important thing. And then developed the technology of keeping rudiments in by Sec Checking, and then eventually developed Prepchecking. And, brought it on up to where we sit now. And it's an awful long jump – just twelve months; it's an awful long jump. But it's a jump that had to be taken.

Now, there are many important discoveries in this past year. One of them is the instant read. Don't pay any attention to anything that isn't an instant read, unless you're trying to spot something for the pc. He doesn't know what he's withholding and every time he goes zzzz, he thinks something, we say, "that." That helps him spot it because he looks at what he's looking at at the moment he – we said "that" and he said, "Oh, that," and then he spills it and it cleans the needle. It's just helping a pc out. Little tricks of this character are only assistive tricks. Remember there's tremendous vital data as run before this.

We have now a session that looks like a session. We have auditors that look like auditors. The thing runs well. This – it's a tremendous jump for an auditor to take, particularly when you've been auditing for years to all of a sudden be crushed into this much precision. It's a horrible thing, perhaps, to do to them, until they start getting some wins through having been pushed there. And they wonder how the hell they audited before.

Now, you've got this – you've got all of these developments and out of this comes new data now on how to clear a person all the way through the Goals Problem Mass. The matter is being given to you and on the research line, as a research activity, should be accepted as such. But nevertheless it's sufficiently good that you should do it.

The latest finding – I haven't enumerated all the findings which have made these things possible – but the latest finding on the thing is easily stated: Listing is auditing. Listing is not finding; listing is auditing. And that changes the whole orientation of Routine 3 – just like that. I mean, all great discoveries along these lines are in the directions of simplicities, you see? Listing is auditing.

Now, early on, on Routine 3 – there are some here that have seen this happen – you started getting an assessment and you would assess a goal, and then you'd assess a terminal and you didn't get a chance to run it, because it blew. And then you'd get another terminal and it'd blow. And then you'd get a goal and it'd blow. And what the hell do we have our hands on, here? Person was just assessing out through the blue.

All right, and my effort at this time is to move assessing all the way forward and dis-pense entirely with the Class IV activity of auditing anything found. That is the direction we are going right at the present moment. That is what we are trying to do. I don't know that we'll be tremendously successful in this, but we certainly will be more successful in finding a final package that will run. So therefore, whether we accomplish this in its final state or not, is un-important. We will have a more valid package, and we will have a more comfortable pc.

Now, not the least of the reason for these discoveries along this line, and the reason for my address to this is the pcs get – have gotten terribly uncomfortable running 3D Criss Cross. Man, it can really rack you up. Now, you'd run out into the clear, you would run straight through this thing, but it's pretty gruesome. It's pretty hard, and it gets very difficult to hold the rudiments in if the pc is being run too far after a line is not discharged.

If we fail to discharge line B and we start to do line C, we're in trouble. The pc will have a hard time staying in-session; we'll have more and more difficulty with the pc. And if we then continue the error and finally get line D going, and then we oppterm the wrong terminal on line D; you get the wrong terminal on line D and we – oh, now it's just a dog's breakfast. Of course sooner or later all this will discharge. Sooner or later we get all this down. We get enough terminals. We discharge enough, and so on. We're not going to audit any of these things till we get a final package; the possibility it'll all come down to the end, but why have the pc caved in all this time?

I'm not kind, I'm nowhere near as kind as you are. It's a dirty word in Scientology, "He was a kind auditor." But it isn't just kindness; it's very hard to keep a pc in-session. So I've been studying how you patched up a case that had started going out of session because he'd had some wrong items found and what you do about this and I ran into this other fact: Listing is auditing.

We sort of went through a period where we understood this. But we didn't state this, see. So listing is auditing.

All right, now, there's another point about this, is the item – a wrong item found is only remedied by finding the earliest item that was wrong on a case. That's worth knowing.

You got D wrong. You opptermed it and the case is lying in splinters. You actually are not going to remedy it very well by getting D right. If D could go wrong, A is probably wrong or B. This is the discovery of what is a dirty needle.

A dirty needle has two sources. Both sources are missing withholds. Well, you haven't gotten the item from the pc, so of course you've missed a withhold. But, you've actual – and you will start to get the pc dramatizing missing withholds. And you get a dirty needle, you pick up a missed withhold, you'll straighten out that dirty needle. And you get a dirty needle and you pick up a missed withhold and you'll straighten up that needle. That's just current session withholds. You can always straighten up a dirty needle by picking up enough missed withholds. But let me tell you, if you've got a wrong line sitting on that line plot earlier than the line you were doing, you're going to – liable to get a dirty needle, and you're just going to spend half your time picking up missed withholds, missed withholds, missed withholds.

What do we mean by a dirty needle? We mean a needle that's shivering and shaking and whizzing and it's got a pattern, and you can't read through the pattern, and so on. It's just hell trying to do a Routine 3 on a pc with a dirty needle. Well, you create a dirty needle with Routine 3 by getting a wrong goal or a wrong terminal; oppterming something that wasn't factual. In other words we've got line B and we – what we've got down there is "an acrobat." And what should be down there is "a dog" so we oppterm "acrobat," and by the time we're three-quarters of the way through or less, maybe a quarter of the way through oppterming "acrobat," we've got a dirty needle on our hands.

The way to solve this dirty needle is to go back and find the first error in Routine 3 – any Routine 3, you see? Find the first error in Routine 3 and correct it and you'll find out your dirty needle will disappear and all of these later blunders will tend to blow off.

In other words it's like pulling basic-basic on a chain of engrams. You find the earliest improper Routine 3 action and you will get a relief of the later improper actions. Now, that's very well worth knowing, see? So that tells you sweepingly how to patch up a case. To patch up a case that has been misrun on Routine 3 of any kind, it is only necessary to find the earliest incorrect item and correct and complete it. That's the formula.

How do you set up a Routine 3 case that is running around the bend? Well you just find the earliest incorrect item that you can possibly lay your hands on – not the item that you said – not the item where his headache turned on; don't pay any attention to that item – not the item that was – he's having any difficulty with currently; don't pay any attention to that. Don't go getting all scrambled up. The best way to do it is go back and find the *earliest* incorrect item – the earliest incorrect action. Any type of Routine 3 action that is incorrect – find the earliest one and correct it, right then, and you'll find the rest of the liabilities will blow away. Then you progress forward from that point.

In other words you audit the case all over again. Interesting. You're liable to find things that were in, not in anymore. And you're liable to find things, so on. But you'll nevertheless find a lot of charge blowing off the case because it's been stirred up.

Now, do you get that as a solution to the situation? Now, you saw me doing it last night on your television demonstration. I was just taking cases, and I was just – that's all the formula I was applying to the thing. It – do you recognize it now as a formula? I'd find the earliest charged lists, where I was doing it, and squaring this around.

And listing is auditing. That's very important, because it at once tells us when we have a complete list. All the questions of a flat process can be asked of a list, and if that list is flat then all these questions will go together.

So a flat process no longer produces tone arm action. Okay? So that's your first conditional. You understand, this has not been broadly proven. That's a conditional test. We don't know if that will hold true forever. But flat process – flat list. When is all the charge off of this list? When we get no TA action on the list, of course.

So theoretically you would list to no TA action – that's theoretical. Next is you'd ask the meter if the list was complete. Next is by differentiation. You differentiate the first twelve items of the list and see if you have tone arm action. If you have tone arm action, the list is

incomplete. This could be fascinating, couldn't it? I mean, so you just read the first thing; you read the goal and you say, "Would a (whatever item you've written down) do (whatever the goal or line you got it from)." You see? See?

Should it – let's say the item you'd written down is "cat" and the... "disregarded when you're trying to do something," you see, so you'd say, "Well, should a cat be disregarded when you're trying to do something?" And the pc says yes or no, we don't care what he says, but we watch that tone arm and we see that it has motion, and our list is not complete and that's all there is to it. So we don't do anything about nulling, we just go back and start listing again – carefully keeping off the ARC break for asking for more and more and more. You understand? The pc gets to understand that listing is auditing and therefore he doesn't get so anxious to find.

All right, your next test is – consists of a *nulling* test. We null the first twelve – the first new twelve, because we can do this several times on the same list and if we find any items in, we complete the list.

What was that? What did you say? What did you say? If you find any items in, you complete the list. I mean if they don't null out instantly – they can tick, and that's all – you complete the list. If you have one item in, you complete the list. Simple, huh? I just dropped a grenade amongst you, didn't I? [laughter]

All right. Here's another test. If you find more than one item alive on the list, you complete the list. You understand, we allow you – we allow you up to five chants of the item. Interesting, isn't it?

Supposing you found three alive that we're going to check out? When there's three, they'll – they stay alive. *Bing, bing, bing*, you know. *Bing, bing, bing*. They just go *bop, bop, bop*. *Bop, bop, bop*. Nah – complete the list. Complete the list. It'll complete down to one. See, that's what charge means on a list.

We're regarding now listing as auditing, you see. You – regarding it in a different viewpoint than you've been regarding it before. You've been going forward to find something and get on so that you could find something, and eventually having found a bunch of some-things you wind up with a package that you can audit. You see, that's another intention. Well this is *not* our intention, as will become very plain to you in about 2 minutes.

Remember, I told you Routine 3 would assess out. All right, that's what we're *trying* to do here. And you understand that I've got that "trying" underscored. You're trying to do this. So, when we complete the list, we'll find there's one item on it. It ought to be very rapid. Although listing may seem to take a long time, you're not going to spend any time nulling because they're all null. You're going to null the thing, you see, but if they're all null, well, they click and they tick and they click and then they're gone or they're not there at all.

Now, this makes you have to be pretty sharp on, "Are your rudiments in or out?" So you have to run your rudiments fairly often because a lot of these items are just going to be flatter than flounders. They were hot while you were listing them but they're not hot now. You see, that's the theoretical approach that we're working on.

So, we've got "Cat, cat, cat, cat," all null, "Dog, dog, dog," all null. "Catfish, catfish, catfish," all null. "Aviator, aviator, aviator," all null. There isn't a tick. *Heh-heh*. This becomes spooky ground. But remember, you're expert Prepcheckers. See, you know your business by this time. Is your pc in-session or out of session? You had one last test, is did it tick once in a while? See, well that might not be present on a complete list. See, you might not even get a single tick, theoretically. We'll see how it works.

All right. Now, when you've got your complete list, you're going to null it. And it should all null down like hot butter leaving you one item which will go tick-tick-tick. It won't go tick-tick-tick sporadically, that I guarantee you. It'll probably go microscopically tick-tick-tick.

Did you see "master craftsman," on that last night?

Audience: Yeah.

Could you see the microscopic tick on that? And that was the sweetest tick I ever saw. It was meticulous, you understand? It wasn't doing anything unless I said "master craftsman," and at that moment it went tick. Did you see that? Instant tick. Tick-tick-tick-tick-tick-tick-tick, it didn't miss, see? It's the way an item ought to look. Not necessarily that tiny, but somewhat in that order of magnitude.

Of course the thing had been audited. But that's the way your items are liable to look on a complete list. Just one item, and it just goes tick-tick-tick. Very interesting. All right, that means you have to be pretty sharp-eyed, because if they're going to tick that microscopically you're really going to have to be looking. There's only one item in these five hundred and eighty-five that's going to tick at all, maybe. You see what a steep chance we're taking on this?

All right, so we find this thing. Finally we've got this item. We've got this item on this completed list. And we take this item, which, let us say, is "barrel." "A barrel." And now we're going to oppterm "a barrel." And all the rules of our oppterming "a barrel" apply, as I just gave them to you. When we get the list complete, why all of the tests I gave you, they will still apply, theoretically. See?

All right, we get down to the end of this thing – you understand this is theoretical approach I'm giving you. This actually is probably 3A Criss Cross – because you're going to use goals. I haven't gone into that. You've got this one item and theoretically what should happen, if you've done your job perfectly, you find out that "bungstarter" is the oppterm. You null it down – you got your list complete – and you null it down. It nulls down just as – probably even more gruesomely flat, do you see, like handling a dead fish, you know? And you find that it is "bungstarter."

Now, theoretically this could happen. This has already happened in auditing "Barrel, bungstarter," *Psssswww*. "Barrel" won't go, "bungstarter" won't go. That's your theoretical approach. There would be no purpose in auditing them, would there?

Now, there's several ways we could get our foot in the door on the Goals Problem Mass, but the way we're going to try to get our foot in the door, having confidence in you all, is we're not going to try to discharge the Goals Problem Mass by door – by, pardon me –

we're not going to discharge goals lists to that degree that we discharge items lists. That's very conditional. I have to learn more about this before I give you too much more about this, you see?

It might have to happen that we have to take all the charge out of it. But listen, taking all the charge out of the goals list is pulling all of the little holes out of the balloons in the Goals Problem Mass and I don't think you're going to be able to do it. See, it's not an item list. It's a bunch of think. It's giving you the intention of masses. The intentions of valences is what that goals list is. And it's good enough to identify things with, but believe me, I don't think it's good enough to discharge a bank with; I don't think so.

So theoretically, we do not at this stage of the game – subject to amendment – care whether the goals list shows charge or doesn't show charge, as long as we could find a goal that goes tick-tick-tick, tick-tick-tick, tick-tick-tick and doesn't do anything else. We're going to grind it down to a point to where we've got a goal, and that goal really sticks with us. And it goes tick-tick-tick just as nice as you please.

Now, that may take a much longer goals list than we ordinarily have been writing because the goals list may discharge to a better degree. But it's certainly going to take a goals list long enough that we can identify the goal.

Now, the goal was appearing in about the first hundred and fifty that the person listed. That was quite interesting. The goal seems to appear early; your items always appear late. So it obviously isn't the same breed of cat. Listing goals and listing items is apparently different.

Anyway, the way we're going to tackle this, from a Routine 3 action, is going to tackle it from the goal. And we're going to isolate goal. And then we're going to find, if we possibly can, a modifier. If it is too difficult to find the modifier we will skip it. I don't say this will be routine procedure but we is certainly going to find a goal, and we is certainly going to find a terminal. And we're going to find a terminal on a totally discharged list. We're not going to find a totally discharged goals list, see. We're going to find a totally discharged item list, see.

We've got this goal, "To smoke cigars." And that list is not well discharged. That goals list is still punchy. Things are still happening in that goals list, you see. So we make a list, "Who or what would smoke cigars?" see? And we finally make an item list out of that. Now, that item list has got to be complete and that's got to be discharged. That's flatter than a flounder when we finally finish it up by this theoretical approach, here. When we finish that thing up we really have got that thing finished up. And we get it, "Cigar smoker," whatever the item was, and it's going tick-tick-tick-tick-tick and it doesn't do anything else but go tick-tick-tick. Do you see? And that's all.

And then we're going to oppterm it. "Who or what would oppose a cigar smoker? And we're going to run that list down and we're going to exhaust that list. We're going to run it down flat as a tire. And we should find – we should find a condition at the end where either the terminals are very weak, or whether they blow at once. That's theoretical on its approach.

All right. Then what are we going to do? How are we going to get our next line? *Ha-ha* – we're going to list goals. Going to list goals. Obviously the pc has changed like the North Star to the Southern Hemisphere, see? You can get new goals off this pc now. So you ask him

to list a few more goals and be happy about this sort of thing, and you'll find out that some of the goals that are – weren't kicking might be now kicking. You're going to add some more goals and then theoretically again, we're going to approach this thing by nulling the whole goals list all over again to find out what we've got now. Because goals lists pump up and slow down and do peculiar things that items lists don't do.

Now, we're going to find a new goal that goes tick-tick-tick. And we're going to find a *complete* terminals list for that goal, and then we're going to find a *complete* opposition terminals list for that.

Now, this doesn't destroy any of your ability to do 3D Criss Cross. I could look upon 3D Criss Cross as a marvelous training exercise. That's worth much more than that but I could look on it now as a marvelous training exercise.

We let this person do a Prehav Assessment and we let him find an item. You know, when he's getting new on this and we don't pay any attention to what he's found. See, we find an item and we oppterm it. And he – we cuss him out, we say the list is not complete, and he tries to complete the list. And he learns – he learns on something he can't hurt much with, see? See? Pc might feel uncomfortable but nothing compared to how he would do if you mucked up a Goals Assessment, you see? See the training approach on that?

All right, but the actions are always the same. It doesn't matter what Routine 3 you've got, I call to your attention, you've got the same actions. You've got these certain steps and we haven't changed any of those.

Now, because we've put so much artillery behind it now, and because we've found out so many holes in the line, and if we know exactly where Routine 3 was falling down – remember Routine 3 was your most positive clearing process but that it didn't extend to the many. But Routine 3D Criss Cross can be done on anybody. Therefore if you use a Routine 3D Criss Cross but do Routine 3, you of course, got something which is extending to the many. See?

Now, if we do this right, and keep this remedied along the line, and if all this works very smoothly, and you don't develop a whole bunch of bugs that I haven't foreseen, which is always possible, because you see Routine 3 itself was thrown overboard only by auditor bugs. I can do Routine 3 to this day with the greatest of ease. If you don't develop a bunch of bugs and if there aren't a bunch of bugs in the thing, we may have our hands on, here, ample evidence, demonstrating it today, we may have our hands on a fairly rapid clearing thing. So the guy gets clearer and clearer. See, we don't have to push him straight through the knothole. Get the idea? He just gets clearer and clearer as we go, and therefore, ought to get easier and easier to audit.

See, its basic advantage would merely be as every other development has been here, in terms of speed of final result. That's our basic advantage. Speed of final result is quite important. Auditor's tied up over one pc – even an hour saved by someone becomes important.

All right, well that's your theoretical approach, of what we will call, just for the interim, Routine 3A Criss Cross. The reason I've back-graded it is after we've got the thing totally ironed out, why, we will assign it its final designation and probably there will be a little

bit of jostling around; there always is. I have learned to expect that as part of the randomness of it all. Doesn't matter how solidly you lay down these fundamentals, they can go astray.

Now, what I have just given you, by the way, aside from the fact of oppterming things, is contained in all the do's and don'ts of some of the earliest directions of Routine 3 – to show you how un-new this is. But we have the wherewithal now, so that those earliest directions can be followed. We needed things like a textbook on meters. And we needed a splendid meter like the Mark IV. We needed this data about instant reads and we needed to know without any doubt whatsoever that you cannot find anything on a pc with his rudiments out. And you see, we needed this and that and the other thing as we've gone along the line, and furthermore we needed this data about complete lists. I've given you several tests for complete lists. And, we just had one, just a few days ago, see.

We needed these things, you see, in order to carry the thing through. But the way you're going, the only mistake which you are making and which you will have to remedy – and this mistake has been *uniformly* made. Even I, last week would not have called any list I have recently inspected on your 3D Criss Cross, as a complete list. This – these lists are – man, I've gone over the number of times you've been going across a list and it is many. Why, you have to cover one item four times in order to get the thing – the whole list null – I'd say right then the list was charged.

Now, earlier, there was something else we were doing to take charge off of a list. We were differentiating a list to take charge off of the list. Well, there has been a technical discovery, and that is that a list does not discharge except by being complete. Do you see?

So you add up all the mistakes that you could make, actually come under the heading – except a goals list – is an incomplete list. Incomplete list, incomplete list, incomplete list. So you just get used to it.

What are the phenomena of an incomplete list? Well, the meter will respond to "Are there any more items on this list?" Sometimes, however, the meter doesn't respond to that question. Probably your tone arm action will be out of the listing, see, and those other tests which I've given you.

Now, you can relegate differentiation to a test step because it'll be your most reliable test step. Just differentiate the first twelve and see if there's tone arm action. I would say off-hand this possibly won't prove out to be the case broadly. But it – apparently tone arm action would be caused by charge. So the list is still charged heavily if you have heavy tone arm action by differentiation. And tone arm action by differentiation would betoken the fact that nothing is going to null. So you wouldn't have to start nulling at this stage of the game because you say this list is too heavily charged up.

Now, I'm totally prepared to have to do something else with a list in order to discharge it properly. You're – I told you at the beginning of this lecture you're way up on the assembly line – I mean you're way up on the research line. You're not on the assembly line at all. See, that's about where you're sitting right now.

But because we have to patch up Routine 3D Criss Cross errors here and there – I've had to study those errors very carefully. And the errors which I have found in the session tests

which you saw me take last night all add up to the conclusion that you might as well straighten up all the Routine 3D Criss Cross which you are doing. But if you're going to have to do that, you might as well learn this Routine 3A Criss Cross. Because it's the same as straightening up what you're doing right now.

All right. You've got to do it anyway, so let's go ahead and tackle this thing called Routine 3A Criss Cross, which is really at this stage merely a patch-up of your 3D Criss Cross, plus the fact that nearly all of you have had some action on Routine 3, so we have to take that into account, see. We're in an optimum position where – just to straighten them out and take all the charge off – well let's do this other process and see what we get out of it, okay? That's where we sit, right at the present moment.

I want to see faster clearing than I have seen. I don't want pcs having to be pushed through the knothole. There's too many hours being stacked up on auditing. There are many errors being committed, but all of those errors sum up to rudiments out, which we won't make a criticism on your Routine 3D Criss Cross – that's a criticism of Prepchecking. See, if the rudiments are out that's a criticism of a person's ability to Prepcheck. So just omit that. And the other error is incomplete lists and improper items.

So, you've got to straighten up your incomplete lists and improper items anyhow, so let's do Routine 3A Criss Cross, find out where we land up and see if we haven't got a faster clearing process, okay?

Audience: Mm-mm.

Sounds to me that this might possibly give you an easier run of it with a pc.

I've been studying this hard, and I've – now I'll give you a few of the little items which have given us the gen on this.

Number one: I have discovered the dirty needle phenomena to stem from missed withholds. And at the same time an improperly procured item, that is to say an improper item, gotten and labeled and handled by the auditor gives the appearance of a huge missed withhold, which gives us a dirty needle. Now, this is one of our main difficulties, don't you see, with all Routine 3 Processes. That's a very fundamental discovery.

The next discovery is that listing is auditing.

Next discovery is that cases that have been started on Routine 3 are still continuing to dramatize their goal and modifier in spite of a great deal of Routine 3D Criss Cross run on the case. So that tells you, as I told you in a lecture – a couple of weeks ago I guess it was – it's the one found by Routine 3, the item found by Routine 3 was more fundamental – which I think is quite, quite remarkable – more fundamental than the later items. So these later items must be shallower than the Routine 3 items, because at no time has Routine 3D Criss Cross knocked out, to my knowledge, the goal and terminal activity and dramatization of the pc. In other words we have quite a long way to go before we come around to the initial results of Routine 3. So that looks to me to be a very fine area to shorten up processing. That looks to me to be very splendid.

And then, that the earliest items found are capable of spoiling the reaction and sequence and response of all following items. If you have one – items A, B, C, D, E, F, and an error, and it's found to be consistent in F and we can't keep the rudiments in on F, we look to G in order to correct F. And we only correct G – we'll find all of a sudden that there's going to be something a bit wrong on G. And we will find ourselves straightening out C – that we found something wrong on – and then spending quite a bit of time straightening out C. And then we find out the person didn't get the proper goal in the first place.

And we find ourselves right off the 3D Criss Cross graph, and find ourselves back assessing for a – an earlier error on a Routine 3 Process, which has apparently been able to terribly influence all the Routine 3D we were doing – 3D Criss Cross that we were doing, you see, was influenced by the earliest error.

This is quite remarkable. In other words, you're going to run into people who have been assessed on Routine 3.

Now, here's the other – here's the other item that makes this vital to you: You're going to find people all over the place who have been assessed on Routine 3 Processes. And then they heard there was something new, later, so somebody dropped their assessment at that point – and it's lucky they did because it probably was for the birds – and we run on down the line here and you're going to run into somebody and he's going to say, "Well, go ahead and clear me, everything's fine, and go ahead and clear me, go ahead," and you say, "Well, all right." And you're going to prepcheck them, and get them into line, and you do some CCHs and so forth, and you get all set. And if you were just going to do Routine 3D Criss Cross you're going to be sitting there looking – the second you start listing you're going to be looking at a dirty needle.

You're going to say, "It was all straight on Prepchecking, particularly when I got the mud pies out of his mother, so, and here's this dirty needle." And you say, "Well, I'll carry on; I'll get the missed withhold," and you pick up four hundred and sixty-five missed withholds. That's an exaggeration, there's probably only fifty or sixty. And you get the dirty needle all beautifully cleaned up and you start listing again, you see, and there's the dirty needle again. Why, you're going to be baffled, unless at that moment you've been trained to ask the magic question: "Who assessed you on what? When?" and follow it down with the meter. "When was your earliest Goals Assessment?" or something like that.

"Oh, well, that was a long time ago. I remember Charley Gilpen came in from an Academy course that he'd taken – I think he was expelled – and he came in from uh – uh – uh – uh – Central Org and so forth, and he did a complete assessment on me. And uh – actually it took him about half an hour, and he found that I was a moped." [laughter] "And this is very peculiar, because his had just broken down." [laughter]

And you say, "Well, what was he doing?"

"Well, he was – he was – he was just listing goals, just listing goals."

"Well, how many goals did you list?"

"Oh, I don't know."

"What happened to the Goals Assessment?"

"I don't know."

You've had it, you see, you'd think, otherwise. But if you just sat down there and listed his goals again, this goal will appear again. If you know this little additional question – and this we went into, *oh-ho*, my goodness, this must have been ten months ago – something on the basis of invalidated goals. So you have to add – if you're going to do a patch-up list – you have to ask for what goals have been invalidated and clear up every tick you find.

See, it's kind of a funny little process of Prepchecking. "Have you ever had any goal invalidated?" See? And we don't care whether his mother did it or his school teachers or it was done in a session or he's done it out of session or anything else. We've got to take every tick off of that. If we haven't got the man's list, we can get his list back, only if we take the invalidations off the goals because he's not going to give us the invalidated goal. And that's the only one he's not going to give us a second time. Isn't that interesting?

When you're redoing missing lists then, pick up invalidations of that type of list and clean that needle slicker than a whistle on invalidations of that type of list, and you'll be able to get the list back. If you don't do that you won't be able to get the list back. See how?

So, we also had earlier trouble in that everybody's goals lists were getting lost, and nobody could find their goals list, and we're having to ship them everyplace. And this did make a barrier, to Routine 3. It's just too much administration. I mean auditors couldn't keep track of all of this that – that well. And we lost too many of them. Well, without this little gimmick about invalidation and getting the list back again and working it over, you'll find enough goals doing it that way to carry on. You'll certainly find the important goals. But only if you've gotten the invalidations off of the goals. That's the only one he won't give you a second time. That's too invalidated.

Somebody halfway found on him that he wanted to murder his father and then they had looked at him and said, "*Tsk-tsk-tsk*. That's a terrible goal," you see?

And then he said, "Oh, my, that's a terrible goal," or before that he said, "Oh, I wouldn't want to have that goal." That's going to be missing on the redone list, don't you see? That will be suppressed, in other words.

Well, all right. Now, what you learn in doing this, you can apply to straightening out any case. Whether this works all the way through as a clearing process in your hands or not is totally unimportant. Recognize that. You certainly have got to know all of these things in order to straighten out a case that's gone off the rails on 3D Criss Cross, you see?

I'm giving you the added bonus that we may be pioneering a little new way through on an easy route through the GPM, see? But you've got to be able to do all these things. You've got to be able to take all these steps to patch up cases, because you're going to find them that need patching up. And you've got a lot of them right here that need patching up, at this present moment. They're not in particularly horrible writhing agony, and they'd all come out straight in the end, and all that sort of thing, but you might as well learn to patch up a case fast, early, and know how to do it.

Now, I've given you two – I gave you a demonstration two weeks ago, I gave you a demonstration – yeah, a week ago, and I gave you a demonstration last night on just reviewing cases.

Now, I wouldn't bother to try to pattern my advice to these cases and try to apply it to all cases – I mean what you saw on the screen. Because I was just talking to these people, I was interviewing, that was a research session, is what you saw. Nevertheless, that's what I would do to straighten up these cases, see? And if they don't straighten up, I'd do something else. Do you understand?

But certainly, straightening up the first item that went wrong is the inevitable step which you would take in any case. You try to find the first item that went wrong in this person's Routine 3-type processes, and make it right. And you'll find out, I'm pretty sure, uniformly, that a case will continue to hang up until you either got clear to the end of the Goals Problem Mass, and had about sixty or ninety 3D Criss Cross items, you see – pc in misery all this time, see, till he's getting down toward the end. And you find out your best shortcut – because all that time you're going to have a hard time keeping the rudiments in, see – your best shortcut is to find that first item in.

All right, if you're going to have to find that first item in, you might as well learn this process we call Routine 3A Criss Cross and it makes a patch-up in any event, whatever else it does. Okay?

Audience: Mm-mm.

All right?

Audience: Yes.

All right. Thank you very much.

ARC BREAKS AND MISSED WITHHOLDS

A lecture given on 1 May 1962

Thank you.

Well, from a survey of this I would say *some* of you can audit. And the rest, why, we're pretty good at training. Fortunately.

All right. This is the 1st of May. This is May Day. Mayday. That's a radio signal for "SOS." And if you feel in an SOS frame of mind ... First of May, AD 12, Saint Hill Special Briefing Course.

All right. I might as well start in giving you hell. So you think you can audit? Ha! You know the hard thing that we have doing? The very, very rough thing we have doing? Is getting an auditor to ask the simplest question. I don't know, maybe there's some vocal selector on "missed withholds." Maybe there's some vocal impasse. Maybe it is absolutely impossible for most people to say "Have I missed a withhold on you?" Maybe there's something in the onomatopoeia of that syllablization. Perhaps the phonetics of it are insurmountable. But that's the hardest thing we have to do. That is the toughest thing to do. It is utterly wild!

We have had more than one case of somebody letting a pc die before they would say it! That's pretty fantastic, isn't it? "Have I missed a withhold on you?" It's simple, isn't it? Now, if – the syllablization can't be the reason because there's another way you can phrase it. "Is there something I should have found out about you?" *Ho-ho-ho*, that fooled you. You can't keep telling me, "Well, because of my – because I was Japanese in my last life I can't say it." Because you can say it, because there are several ways with which to say it.

Now, you needn't be taken so aback. But it's only that you haven't heard me. See, on this one I am forced into an involuntary withhold. See, I feel like somebody screaming in a soundproof room. Pc comes down out of session – *duhuh* – caroms into one wall, caroms into the other wall. The auditor comes down beaten to pieces, you see – just absolutely – face utterly flat, you know? And says, "That certainly is an ARC breaky pc. He just has ARC breaks all the time." Obviously the auditor cannot utter these words: "Have I missed a withhold on you?" It is fabulous!

People will actually let a pc sit in front of them and yap and scream and go out of session and have his list all mucked up and his brains knocked out, while the auditor sits there and says, "Well the pc really ought to be controlling the session anyway. And what do I have to do with the session?" It must start with that kind of an attitude, you see. "I have no respon-

sibility for what this fellow is doing because he – look at him – *ha-ha-he is-hrrr*. Well, what could I do about it?"

Well, you couldn't have done anything about it without Scientology. And perhaps you would have had a rough go of it even a few months ago when you didn't know about missed withholds. But in the few months we have known about it ...

You ever see a boa constrictor in a zoo? You ever see these? They have glass fronted cages and you look through the glass fronted cage and see this boa constrictor. You ever see this? You know how they feed them? They have a machine and every six months they pry open the boa constrictor's mouth and start the machine going and it puts hamburger – six months' worth – into the boa constrictor. That's the way they feed them. That's actually true. Now, don't make me get one of those machines to teach you this – please! [laughs] Now, please learn it for the importance that it has.

Let me read you a list of some of the things which a missed withhold cause – and *only* a missed withhold causes these things. Now, don't get the idea that there's a – see, I think maybe you're not hearing me because you think there's a lot of other things. And there are not. There are *no* other things that cause these things. The fundamental cause of this long list I am about to read you is missed withholds and *nothing else*. There isn't *any other manifestation* from here to the other end of this universe, if you've ever been there – and I'll send you, if you don't learn this – that causes any of these things, except missed withholds. You have *a GPM because of missed withholds!* Now, that's how important the missed withhold is. You'd never have a single item if people hadn't kept missing withholds on it and you haven't kept missing withholds with it. Now, that's something to know. This is *very* important.

It is almost as if the basic principle of existence is: thou – when existence is good – "Thou hath not missed a withhold." And when existence is bad, "Thou hath mithed a withhold." [laughter] See? Now, that's how important that can be.

Now, let me read you the list of the things which *only* a missed withhold cause. And which are caused *only* by missed withholds and which missed withholds, asked for, heal – bang. Just like that – bang. There is no monkey business about it. A missed withhold properly asked for, the meter properly cleaned on missed withhold, remedies each one of these fifteen things and many more. The number is almost infinite but these are the best ones:

One: Pc failing to make progress. Now, we used to say that was a present time problem. Well, a present time problem comes into existence because somebody has missed a withhold on him. That he's missed a withhold on somebody else and after that they have problems. You understand? A pc in the presence of missed withholds will not get any graph change. All right.

Two: Pc critical of or angry at the auditor. Pc critical of or angry at the auditor. Now, do you know that you sometimes make a flub. And have you made a flub and the pc didn't protest? And have you made a flub and the pc did protest? Well, now, listen, don't get hung in this mess. You made a flub; the pc protested about it. So therefore you were wrong and he was right. So therefore, it's reasonable. And you know that's why you don't pick up missed withholds? Because it's so reasonable. I spit on reasonability. It's so *reasonable*.

One auditor said, "Well, the pc sat there and kept calling me a coward and saying I was a coward and I was afraid to audit him and that sort of thing and it was true. So what could I do about it?"

Now look, look, get this real straight. Yes, it's true. Absolutely. That was perfectly true, that the pc was uttering these words and that the auditor was guilty of the charges. But that wasn't what the pc was upset about.

Do you know, it's not what's known that's wrong with the pc, you see? No. The reason the pc protested and got upset about it, is because the pc has a missed withhold. See, it doesn't matter how reasonable the pc's squawk is. You know, you dropped his goals list into the spittoon. [laughter] You know, and when you got up to fetch it, dumped the E-Meter over his head, you see. And he says, "What the hell are you doing?" Now, if he says, "What the hell are you doing?" it's because a withhold has been missed earlier than that. Do you follow this?

See, don't get so doggone tied up in the reasonability of it. Very often the pc's complaints are correct; very often the pc's complaints are incorrect. It does not matter whether the pc's complaints are correct or incorrect. The pc is complaining because you have missed a withhold on the pc. And that's all there is to it. There isn't any more explanation to it than that. Do you see? This bypasses reasonability.

Now, of course, you can take an auditor who can't do a Model Session and doesn't know an E-Meter – one end of it than the other – can't follow on any TR, and he's stumbling and fumbling in all directions, and trying to end the session with no rudiments. And before the session has started he said, "Well let's see, I'll do my Model Session. Now, let's see, what part of it is ...? Let's see. Have I ...? Let's see, where is it here? Oh yes, 'End of session!' No, no, I mean – uh, I mean – uh ..." [laughter]

And do you know the only reason the pc gets upset is because a withhold has been missed on him. You search it out sometime. You go into this thing, you know, and you'll see that's a fact. See, the missed withhold might be such a thing: "Well, you schnook, why the hell did they ever let you out of the Academy?" Still a missed withhold. See, for a few minutes, for a few seconds, the pc was – tried to be nice about it. Tried to be patient about it. Tried to, you know. Get it audited anyway. You know, try to get the session going so they're stonily not saying anything. Oh, you've been there, have you? [laughter]

Look, I told you a long time ago that it took a half an hour to an hour and a half for the pc to blow a session. This is just empirical observation. This betokens the fact that something must have happened that much earlier. And the something that happened that much earlier was a missed withhold. But you can see it; you can see it on a pc. You can see it growing and growing and then the pc finally blows.

And a real dumb auditor with no observation of the pc, auditing the meter instead of the pc or something, see, auditing the – his memory or something, doesn't see this, and all of a sudden the pc explodes and tries to blow session and the auditor tries to put this back together again. And if the pc is halfway out the door, that is not the time to try to patch up a session, see? See, it had already happened a half an hour to an hour and a half earlier. So this is not the time to patch up the session. The time to patch up the session is routinely and regularly, earlier.

And the way you patch it up – now this is, it's very complicated and I know it's very hard to understand, and I know there – that it's almost impossible to utter these words – is to say to the pc, "Have I missed a withhold on you?" Not when he leaves the session. When he's going out of the door, I want to point out a physical fact to you: the E-Meter cans are no longer in his hands. They are lying dented on the floor, see. So you don't ask him that at that time.

No, the technical way to go about it, you see, the real professional attitude, is to ask him the question while he is still sitting in the chair. And now if you're a real pro you will notice that the pc is not in good comm with you when he ceases to be in good comm with you merely by the tiniest inflection of voice. And at that moment you will ask, "Have I missed a withhold on you?" And it goes *glang*. And he tells you what it is and then you clean it up properly. Do you know how to clean one up properly? Well now, now just a minute. You say, "Have I missed a withhold on you?" And he says, "Yes, I had a fight with my mother this morning."

Now, a huge crossroads yawns before us. And there's a tremendous boulevard which has magnetic attractors laid into it all down the left. And the little, tiny straight path on the right is not at all attractive, see. And most auditors drive down this tremendous wide highway by saying, "What was the fight about?" *Ohhh-ohh*. Oh, no. Oh no, we've had it now. We're on the M1 at a hundred and twenty-five miles an hour with no brakes and can't find the ignition switch. There isn't any way of stopping now because things just go from worse to worser.

No, that little, little path on the right is the one we want. And we say, "Good," or "Is that all of it?" or "Good, thank you. All right. Is there any other withhold I have missed on you?" See. And that steers us right back into the session again, see. That's all we do. Trouble with it is it's too cockeyed simple, you see? You see? It's too – much too simple. And as long as you keep getting knocks on missed withholds you keep asking for them. And when he gives them, you don't develop them. You just understand and acknowledge them. That's all you do with them. Don't do another thing. And the pc just sinks back into session beautifully. He just goes right back into session. It's gorgeous. It's marvelous. It's such magic, nobody ever heard of such a thing. It's unbelievable until you've done it.

Pc is screaming his head off. You can't even be heard above the high-pitched roar, see. But you manage – he finally takes a breath, and as he takes that breath you say, "Have I missed a withhold on you?" [laughter]

Now, oddly enough, "What are you trying to make me guilty of?" is not palatable to pcs. It isn't. It's a piece of technology but if – pcs don't like it. And the next one is, "What have you done to me in this session?" The pc doesn't like that either. But pcs for some reason or other always take this like little lambs. "Babies cry for Castoria," you know? And, "Have I missed a withhold on you?" You see, you've already accused yourself. See? And very often this strikes him that you're being terribly clever. "How did you know?" [laughter] See? He doesn't connect it with roaring at you. Very interesting technology.

I'll read you another one of these conditions:

Three: Pc refusing to talk to auditor. That happens ordinarily fifteen or twenty minutes before the blow. So that's just a little closer to the end of session and the final blow, you see?

But the conditions are the same. Up to fifteen, twenty minutes, half an hour before that refusal to talk to the auditor there has been a missed withhold with magnitude. Ordinarily the session started out with a missed withhold, continued with a missed withhold while twenty or thirty new missed withholds developed. And then the pc goes into a total withhold.

See, there's such a thing as an involuntary withhold, too. The mechanisms of the ARC break – if you really want to promote an ARC break with the pc, you can, by hanging him with withholds which are involuntary. The involuntary withhold is something else. The pc says, "cat," and you don't acknowledge it. And he says, "dog," and you don't – you don't write it down or acknowledge it. And he's giving you list items, you see, and you just sit there and gaze off into space or something like that. And the next thing you know, he gets the idea that he's withholding. Naturally he is because he's not communicating. The funny part of it is, the same question serves. "Have I missed a withhold on you?"

"Yes, goddamnit. I said 'cat' and I said 'dog' and so forth. And you missed these as withholds."

Now, the thing to do is acknowledge these things. And you just acknowledge the fact that you've missed the withhold. That's all you have to do about it. Straighten out the situation with the pc if it's the fact you actually didn't put a couple of items down on the list. But honestly, it cures it up right away.

There are many types of involuntary withholds. Do you realize that most of you have all – are out of ARC with the Marcab Confederacy at this time because you're not saying anything to them. Somebody who is very Christian, extremely Christian – you know, has to have permission to eat breakfast and has to have permission to eat lunch and then forgiven for the evening. You know, their life wholly turns on these little pivots – will sooner or later in one lifetime or another listen for a moment after the prayer, you see, or something, and the circuit they've been using hasn't – hasn't spoken for some time. They get no acknowledgment. And they realize they've been talking all this time to the Big Thetan, you see? And nobody's ever said a word. And they get madder than hell at the Catholic church, you know. And they start revolutions and burn popes and ... It's marvelous.

The most adventurous activity you could possibly engage upon would be to start something that couldn't ever have any acknowledgment. See. Because sooner or later that's going to bust everybody up into a screaming fury. Because it's going to add up to nothing but one long chain of missed withholds. You follow that?

Now, this refusal to talk is the realization that one can't because one isn't being heard. Well, there's two ways to go about this, is acknowledge the living daylights out of the pc and give him about twenty or thirty acknowledgments in a row, one way or another. Or just ask him if you've missed a withhold. And he'll come back into communication with you, because of course these all seem to him like withholds. See, although he isn't withholding anything he can't communicate anything, so therefore he is, you see, withholding, in his opinion. You got it?

Now, of course we covered number four: pc attempting to leave session. That's what happens after the pc refuses to talk to the auditor or the reverse of the flow is scream at the auditor. See, there's a reverse side of the same flow. He's not talking to the auditor then, ei-

ther. In fact he's practically unintelligible ordinarily. And by the way, auditing can get a pc – I will tell you something – auditing can get a pc into this state when the auditor himself is being technically very bad. When his TRs are very bad, and so forth, he can just stack up, stack up, stack up, stack up, these involuntary withholds. And just keep stacking them up, stacking them up, stacking them up. And eventually the pc gets into a screaming fit.

There are – is no such thing as "an ARC breaky pc," you understand? There's only auditors who can't acknowledge, you see, and won't audit the pc, that's all. Because you could take any – I could take any person in this room and in the course of fifteen minutes of a session that they would think was letter-perfect, have them absolutely screaming enough to break plaster off the ceiling in an ARC break. You could do it to any pc, so don't think this is a specialized pc condition; it is not. You can get any pc into this state. They go out of – you can just drive them out of their minds. It's a liability in auditing. So don't classify one pc as ARC breaky and another pc not ARC breaky, because they could all be made to ARC break. There isn't a person here I couldn't do this to.

Just by asking you a question forcefully and then never acknowledging anything you say. Just be doing just that, see. And I'll say, "Well come now, come now, have you ever been to school?"

And you say, "Well, yes, I've been to school."

"Have you ever been to school!"

"I have *been* to school!"

"You're not answering my question. Have you ever been to school?"

And if we just kept up this thing – man, *boom!* That's all you have to do, you understand? Because you're creating a missed withhold every question. And you just stack them up, *bing-bing-bing-bing*. Actually pc's can faint, have heart attacks – almost anything you can think of under this kind of treatment. You can do anything you want to to a pc in the way of making him thoroughly ill just with this kind of treatment. Never acknowledge anything he says. Every time he says something, say something else. Don't ever acknowledge it. Just follow that course. You say, "Well, we're going to list this list. What should be disregarded in order to make people sick?" You know, whatever it is, you see.

"All right. Is there anything that should be disregarded to make people sick?"

And the pc says, "Well, medicine."

"Yeah. Well, I know – but uh – is there any uh – get the question, now: Is there anything that should be disregarded to make people sick?" You see, you haven't written down anything.

And he says, "Well, uh, ... medicine."

And you say, "Now, listen to the question carefully this time."

Honest, you can just blow them right straight up. They'll scream, man! Take them maybe fifteen minutes to work up to it, but if you do it adroitly, he'll – even though the guy doesn't – even though the guy might start out knowing what you're doing, he'll still scream.

See how you can stack them up? Those are all just missed withholds. And if you turned around after that and said, "Have I missed a withhold on you?" he'd say, "Yeah, you refused to say anything about medicine." [laughter] You clean this all up, and he comes right back to battery just like that.

In other words you can create and dissipate an ARC break just as easily as that. Just refuse to receive anything from the pc and then afterwards find out if you've missed a withhold on the pc. By refusing to receive anything from the pc you'll get the ARC break and all manifestations. They'll scream at you or they eventually refuse to talk to you. They go into complete apathy. They go into such apathy by the way, that they can't talk. They're not being unwilling; it's unable! And then they eventually know it's for the best that they get out of that room. Well, they might walk out howling and they might walk out absolutely mum, but they feel like hell.

All right, you – so you can turn the manifestation on by missing withholds and you can turn it off by asking if you've missed any withholds. In other words, an old pal of mine who did most of the helicopter work other people have gotten credit for in subsequent years, sits there and argues with the whole University of Kansas at Lawrence. He takes them all on. It's just a small pastime with him. He told me one time, he says, "Well, if you really knew your business," he says, "you could make – if you really knew anything about the mind, Ron," he said, "you could make people laugh at will and cry at will." And he said, "Then that would be a good test whether you knew anything about the mind. You know?" Well, I won't say it went so far as I immediately made him laugh and cry, but here is something: If you really know the mechanism of something, you can turn it on or turn it off, you see? And you sure know the mechanism of an ARC break. You can turn one on; you can turn one off. You can create them and you can vanish them.

Now, in view of the fact that you can be sitting there acknowledging the pc perfectly every time he speaks and taking care of everything he says, and you're doing all this perfectly, and so forth, how does a pc still have an ARC break? Well, the withhold that you've missed just has been ticked but hasn't come up, see? It could be something like this – it could be as vague as this: he read in a magazine – he's read in one of the Scientology magazines that one won't make any progress, you know, if he's thought evil thoughts. You know, or something. You know, something weird like this. He's got some misinterpretation. You're busy auditing him and you're going down the line. And you say, "Well, are you withholding anything?" And at that moment why, you're auditing with a Tasmanian meter or something. Something, something's going on, you know. I mean, it hasn't got anything to do with auditing; you miss this entirely. Or at that particular moment he's totally ARC broke or he's so scared of you he's not in-session or something happens and you don't get any register on this meter, see. You go by and all of a sudden you find out you're getting no place fast. You should sense that something is wrong with the session.

When you sense something is wrong with ... One of the ways of doing it is the needle bobs and then you ask a question or while you're asking a question the needle does something or the needle does something during and after you ask the question. Regardless of what you're saying the needle is active, see? There is no timing between you and the meter, let me put it that way, see?

You say, "Do you eat catfish for breakfast?" see, and the thing falls on "do" and "breakfast" but not on any timing that has anything to do with you, you see. You say – apparently, you know, it looks like it fell on "do" and "catfish" or something like this. And then you look up at the pc – one of the things to do is just stop talking to the pc for a moment. And you'll see it's doing the same thing. *Heh-heh-heh-heh-heh*. What do you know? *Hoo-hoo*.

And you say, "Do you eat catfish for breakfast?" And the needle goes *dip-bob-dip*, you know. *Hmmmm*. "Do you eat catfish for breakfast?" and it goes *dip-bob-dip* – latent this time, you see. "Do you eat cat- ." It goes, *dip-bob-dip*. Just don't ask anything for a moment. It'll go, *dip-bob-dip*. It's haunted. [laughter] You watch that sometime because that's the commonest thing that happens on one of these things. It's called a needle pattern.

All needle patterns are caused by missed withholds – all needle patterns.

Number five: Pc not desirous of being audited or anybody not desirous of being audited. Grandma is sitting there and she's going natter-natter-natter-natter-natter-natter. "The idea of little Johnny getting audited," and so forth. Johnny, little Johnny, is forty and married, see. But, "Little Johnny shouldn't be getting audited. Why are you interested in that sort of thing? What's the idea of doing anything about that? *Nyah-nyah-nyah-nyah-nyah*," she chews some more snooze.

You go in there to audit John, you see, and she's sitting over there in the chair. And she's going vitriol, vitriol, vitriol, vitriol, you know. Make up your mind. You've missed a withhold on her.

How could you? You've never talked to her? Oh, but you're the one who's supposed to know. So you see, it's automatic. It'd startle her half to death if you walked over and put a – E-Meter cans in her hands and said, "Have I missed a withhold on you?" you know, "Is there something I failed to find out about you, Grandma?"

"Well, I should say there is, son."

She'd probably tell you, too. It's quite remarkable. It all depends on how good your presence is. You have to hold her in that first couple of seconds to get over the rage surge. Then she'll talk to you like a canary bird, you know. She'll just sing, sing, sing. Well, you prompt her a little bit, you know, and away they go at it. They'll argue for a little while and then there they go. It's – she says, "I would never be audited." Why would she never be audited? Because somebody, including you, somebody else and other somebodies and also you have missed withholds on her, that's all. That's simple, see.

There is no other reason people don't want to be audited. You see, these are all on the bracket of, "There is no other reason," don't you see? There isn't also the fact that the libido often comes into confluence with the lumbosis, you see, and makes a censorious subconscious. See, that has noth – that explanation isn't there either, see. It's just missed withholds, that's all. Nothing – nothing more.

People try to make so much out of this, you see. And then they all say, "Well, the ARC break is so terrible. This person is so vitriolic." They've gone down to the police department and they've told the police there that everybody in that Scientology office should be arrested and everything else, and – and so forth. You say, well, it's because they're a member

of the Communist Party. Well all right, they're a member of the Communist Party. That's reasonable. And you say it's because they have an uncle who's a psychiatrist. That's reasonable. It's because they've been in an institution. That's reasonable. These things are all true, don't you see. Everything's all true. Nobody argues with any of these things. But the reason they did it was because somebody's missed a withhold, see.

And this reporter comes in to get a story from you for the newspaper. He sits there the whole damn time with a missed withhold. See, what you should know is he's going to clobber you, man. The way to start in on some guy, he's – guy's sitting down there with a hell of a sneer on his face, and say, "Well, all right. I'm quite aware of what you're going to do. You're going to go – you're going to treat me nice, and then you're going to go back to the paper and write a hell of a thing. You've already got orders of the kind of story you're supposed to write on the newspaper. You're already – city editor's been telling you. I wonder why you came down here to get any details because you've got the story all written in your typewriter already, huh! That's right, isn't it Jack? Ha-ha!"

The guy goes, "*I-huh-hoo-oooh ...*"

"Well, let's find out something about your personal life now that we got that established and you don't know anything about the thing. Let's see, what withhold has your wife missed on you?" Put him on the meter. "Well, take a hold of the cans!!" [laughter] "Take them! All right, now, what withhold has your wife missed on you?" *Heh-heh huh!*

"Oh, well, I ..."

Hold him back to the – against the wall until you get them cleared. And he'll walk out of there saying, "God damn them people, why don't they mind their own business!" He won't dare write a word, man! Marvelous.

All right. Now, this is a new one to you:

Number six: Pc boiling off. Oh, you thought it was from some other things, didn't you? Oddly enough a stuck flow is the basic cause of the actual mechanics of boil-off, but apparently a stuck flow is only caused by a missed withhold either way, too. And all boil-off is a missed withhold. So you say to the pc, you say to the pc – you're nulling, you know – and you say, "Cat, dog, catfish, waterbuck," and the pc goes *zzzzzzzz*, see. Well oddly enough, if you went on and read the list you'd still get the proper reactions on the thing – doesn't matter whether he's boiling off or not. But you should at that stage of the game say, "Have I missed a withhold on you?" Particularly when you hear him snore. [laughter]

Listen. If you let a pc even go fuzzy, you've missed a withhold on him. See, they go a little bit fuzzy and then they get a little bit dopey. And then they go into a *zzzuhhhh*. And they go all the way on out. Every one of those stages is caused by a missed withhold.

You understand, when I say "missed withhold" it isn't something about they have murdered the cook and stuffed her body in the dinner dishes. We're not looking for any blood here. It's just the fact that they came into session and wanted to go to the bathroom and didn't. Now, that makes a corking withhold. [laughter] And you didn't find out about it. And that's enough to make a pc completely boil right out in the session. Anything you try to do with the pc, the pc boils off. *Bing-bang*. And you finally better find out what it is and straighten it out.

That's all boil-off and all fogginess and all stupidity. It's all low IQ. That isn't mentioned in there, but it would be a section under six.

The next one is: The pc is exhausted. How many of you have wished that you didn't feel so exhausted? All right. Let your auditor wish right now that he'd picked up a few withholds off you – missed withholds, you understand. Pick up the missed withholds. Entirely different subject, you know, than picking up withholds.

Withholds you pick it up with Prepchecking, you can even pick up missed withholds with Prepchecking. But withholds are withholds. You have to develop withholds. What has he done that is contrary to mores and all this kind of thing. A big subject, withholds.

But missed withholds is a very tight, narrow subject. It's something you should have found out and didn't; something he should have found out and didn't; something it should have found out and didn't; some something they should have found out and didn't; something the pc should have found out and didn't. Don't you see? All of these things classify as missed withholds. "Should have – should have found out." Exhaustion – exhaustion and the sensation of tiredness and all the rest of that, pin right down on the subject of missed withholds. The pc finishes the session feeling very exhausted – some withholds have been missed. It's as simple as that.

And there's an awful lot of pcs come into HGCs and they come in because they're so exhausted and never have any pep or energy. And this is one of their prime examples. Well, it's just missed withholds. Simple. I mean, something that makes that much fuss in life, you see, to be that simple, is why everybody overlooked it. You see, because this little drop of water called a missed withhold couldn't possibly cause that avalanche and explosion called Vesuvius. But it did.

All right. Your next one, eight: Pc feeling foggy at session end. You actually, in going over your end rudiments should notice whether or not the pc can talk to you. I mean, that's interesting – it's all right for you to go in consultation with the meter and ignore the pc. You actually should only handle things in end rudiments which knock on the meter. But as you're sitting there – I'm not asking you to do this routinely and all the time, you know. You know, I'm not – not to put your attention on it or anything like that, but just the way you'd up your own havingness, you know, by noticing the settee or the ceiling or something; notice there's a pc sitting in the other chair, you know. And notice the pc is sometimes *mmmm-mmmm-mmmm ...*

And you say, "Is it all right if I end the session now?"

"Yaaaaahhhh."

Well, I know it isn't – I know it isn't absolutely necessary to – according to Model Session, in order to do this, but he might have been asleep. Something else might have happened when you passed "Have I missed a withhold on you?" in the end rudiments, you know? Pick up a few just for fun, you know? Not for any reason – yeah, just for fun, noticing that you have a pc, you might pick up some of the missed withholds at the end of the session and notice the pc brighten right up and cease to be foggy. It's quite an interesting thing to watch.

Pc starts into a boil-off – pick up the missed withholds right in the middle of the session, you see. End of session the pc says he feels real weird. You know, he doesn't know whether he's here or there or otherwise. Pick up a few missed withholds on him. He's always got some. They're little cotton-picking withholds. They haven't got anything to do with anything broad or expansive. Big missed withhold: You didn't find out that he wanted a cigarette and a break. But he knew he had better not have a cigarette and a break because he is also very interested in getting his goal found so he doesn't mention it. At session end he's going *blah*. "Have I missed a withhold on you?" "Is there something I should have found out?" Well, he thinks. And you say, "that, that," you know.

"Oh, oh that. Huh. Oh, it's nothing very much. I didn't tell you that I wanted a break and a cigarette about an hour ago. I didn't tell you I wanted a break and cigarette about an hour ago. *Heh-heh*. Nothing to that." He's all cheered up. He's all alert. Didn't take anything at all, don't you see? These things are little, tiny, damn, fool things, you know.

If you always put "in this session" ahead of your question, why, you find yourself keeping the pc quite alert and quite capable of being audited without ever plowing up any backtrack. When you're doing a Routine 3 Process you don't particularly want to be plowing any backtrack. And you'll find that it's a pretty good thing to do that.

One thing argues against that is once in a while you pick up not a missed withhold, but sometimes you will pick up something that wasn't known about the goal or something like this and it'll be backtrack. But that's not as valid as asking for an invalidation – when you're doing with items and goals you should ask for lots – you should ask for invalidations, you see, and things like that. That's not a missed withhold.

But "In this session have I missed a withhold on you?" Actually, if you did no more than that, if you never picked it up any earlier than this session, you'll still keep the pc alert. And don't think by finding a great big avalanche of the thing stemming all from the basic-basic a hundred and eighty trillion years ago – you pick up one missed withhold a hundred and eighty trillion years ago – he's going to stay bright in the session. No, he's not. See, it's the session missed withholds that are important to your auditing and doing Routine 3, is all I'm trying to tell you.

All right. Number nine: Dropped havingness. Can squeeze at the beginning of the session, a quarter-of-a-dial drop. Can squeeze at end of a session, eighth-of-a-dial drop.

"Have I missed a withhold on you?"

"Yes. So, so, so and so-and-so. Yes, and ..."

"All right. Thank you. Now, let me clear that. Have I missed a withhold on you?"

"Yes. *Yap-yap-yap-yap-yap*." "All right, all right. Let me test that out. Have I missed a withhold on you? Yeah, well that's clean. Squeeze the cans." Bang A quarter-of-a-dial drop. No Havingness run.

You'll find the havingness will go right back up, and even improve. Particularly if you're picking up missed withholds on a little bit broader basis you'll find that havingness improves all over the place, not just "in this session." You just say well ... If you're prep-

checking, particularly, on some missed withhold Zero Question. Man, you'll find that havingness picks up and picks up and picks up and picks up. Because what it is – what is it? It's a not-reach, isn't it? And havingness is a reach.

All right. Number ten: Pc telling others the auditor is no good. "Joe is really a schnook. He really can't audit worth schnooks." You're passing at this moment on this list out into the outer perimeter of life. We've gone out of the auditing session. That's why that is marked there as number ten. It isn't these are all of them; it's just those that most concern the auditor.

And what is known at once about this pc? Well, that the auditor missed a withhold on the pc. That is actually all there is to be known about it. Of course, it is bad auditing now that you know about it.

Now, in earlier auditing, earlier than two or three months ago, it was possible for a pc to be pretty badly cut up by never being acknowledged to what he said. And a whole bunch of withholds stacked up and the guy got into a lot of ARC breaks, thrown into an apathetic state and all this kind of thing, because it was rocked-up auditing. Yeah, he'll argue about this auditor. But that doesn't – even though we didn't know the technology, that doesn't say it didn't exist. You see, people studying Scientology only – only people who study Scientology really don't know anything about it, you know. They haven't really done anything with it, you understand that. They make this mistake. They think that every time we come out with something new, old things cease to be true, you see. The ARC Scale went out because we've just said there's an Effect Scale. Yeah, oh, you'll find that rather consistently. Of course, they never had any reality and didn't understand the ARC Scale in the first place.

You'll find these people hanging around PE Courses and things like that. And they say, "Why is Ron always changing his mind?"

Ron isn't changing his mind! See? The thing's still true, you know? Well similarly, just because we have learned of a datum doesn't mean it didn't exist before we learned of it. See? It didn't materialize at the moment we learned about it. It had been there all the time. Well, this was the cause for all of these ARC breaky sessions and all of these prior upsets in auditing. See, whatever the score was.

Now, formerly it was simply an index of how well, really, how perceptive an auditor was, and how well he acknowledged the pc. And if he was not very perceptive and he didn't acknowledge the pc, and if he also ran a lousy session, of course, his pcs had a hell of a time. And the pcs would all go around saying, "God, that was a lousy auditor." Well, they might have been right.

But today, under this understanding, see, all right, you just – auditor's missed a withhold, that's all.

Now, what do you say about this pc. They said, "Well, this fellow, this fellow Schnooks up in the Northwest" – or something like that – "My God, was he a terrible auditor."

Your instant response is, "What withhold did he *miss* on you?" You understand?

Now, instantly you – you see, it just doesn't matter otherwise than you've got a snarl up of auditing track. So if you're auditing the person – I'm talking about in an auditing session and he says, "Well, Schnooks was terrible. And he just about cut my throat from ear to ear."

"What with..." If you're clearing up by Prepchecking and past auditing and that sort of thing. You don't do these things while you're running Routine 3, you understand. Prepchecking, you're trying to straighten out the pc so the rudiments stay in. You'd ask some question, "What withhold did Schnooks miss on you?"

Oh, you'll get the Seattle phone directory. [laughter] God, it'll be that thick. But they'll mostly be little things. Don't look for any big home runs. And they'll basically be fundamentally that he didn't acknowledge well, see. The auditor didn't acknowledge well and the auditor wasn't very perceptive. Pc stumbles into session, falls in the door, exudes alcohol fumes to the point where if it got as far as the gas stove in the kitchen the whole house would have blown up, you know. And the auditor takes him in session and audits him, you know, never noticing that he's three sheets to the wind with the demon rum, you see?

And the pc gets along fine and then all of a sudden says, "You know, I'm not supposed to be audited while I'm under the influence of alcohol." And then immediately concerned, and says, "You know, that auditor probably didn't notice I was under ..." so therefore what hasn't been acknowledged is his alcoholism, so therefore that has no chance of blowing and he feels stuck with the alcohol, see.

It's all on the basis of... Actually the whole thing is explainable on TR 4. You need no more technical explanation than TR 4. That which is not acknowledged continues to exist. Remember the old, very interesting old processes we had, something like the "Great Okay." You know, that kind of thing? Gee, I bet that about blew some peoples' heads off, man. It must have been fabulous. The "Great Okay."

If you were to look at some girl – if you were to look at some girl and give her a terrific acknowledgment of one kind or another, you know she might vanish. But knowing women, I don't think she would. She'd have other withholds that would hold her together. [laughter, laughs]

All right. Eleven: Pc demanding redress of wrongs. Now, that applies to a – pc is saying you ought to audit them 195 more hours free and demanding redress of wrongs – saying they're going to sue somebody over auditing or something like this. Well, you know, anything, it doesn't matter. And it doesn't matter if it happened and it doesn't matter if it's reasonable, and it doesn't matter if it's absolutely scurrilously antisocial – this occurrence – it doesn't matter! The fundamental of it is, and the cure of it is all contained not in court, but in missed withholds. "What withhold did the auditor miss on you?" "What should the organization have found out about you?" You understand? It blows; solves the situation. Simple, once you look at it.

Twelve: Pc critical of organizations or people of Scientology. Just the same that I just said. They say, "Natter-natter-natter. Oh, those people up in Johannesburg they're absolutely no good," and so forth. Well, what did Johannesburg fail to find out about them? That, that's the only thing. Bang! See? Johannesburg must have failed to find out something about them.

Get this kind of a situation: Now, George, George writes from Cape Town and he says – to Johannesburg, he says, "Please send me a book and here is – here are ten rand" or something, and, "apply the rest of it to any research funds that you have." And the book department credits them with this for new books. And you know that person will get very upset and critical of Central Organization? It won't have anything much to do with this payment they sent in. As a matter of fact trying to locate this will take a moment or two. He obviously has not been acknowledged. He actually was trying to give you some money. And you didn't take it. See, you applied it to his account or you did something else with it, you know? You've missed a withhold of some kind or another, you see.

He's tried to say something and it hasn't been acknowledged. He's tried to communicate something and it has not occurred. When people write you a letter and they say, "Is it true that Ron uses boats for roller skates?" or – and so on and it's that sort of thing. And "Is it true that – uh – do auditors have to wear gumboots while auditing pcs?"

And you look at this long list of questions, you know, and you say, "Oh, for Christ's sakes," you know. What a ... And you say, "Why don't you come in and see the Registrar?" Oh, no, man. No. Every question you didn't answer becomes a missed withhold. *Noooo!*

Now, these things can be very, very weird. Three years after a lady wrote in and asked for any data we had on processing children, I found the letter in Central Files. It had been answered several times. No second letter had ever come from this lady. But several Letter Registrars had written her letters. And none of them had answered her question do we have a book, you see, on child – on auditing children, you know? So I was – I used – very often every few years I'll be in some organization, I'll pick up a bunch of stuff out of CF and write some letters just to give some examples, you know? And every now and then why the HCO Communicator will up and mail them. This has been known to absolutely send a Letter Registrar into fits because he'll suddenly hear from people enthusiastically that they haven't written to. Because I will invariably sign their name, you see? You know?

The Letter Registrar is Dorothy Jay, you see, and something like this. I'll sign the letter Dorothy Jay, don't you see, and send it out. Just answer the question. "Yes, we – yes, we have a book called *Child Dianetics* that tells all about..." No preamble, see. "Yes, we have a book called *Child Dianetics* that tells about auditing children. We are sending you a copy in return mail and you can pay us for it if you wish." Terrific enthusiastic response from the lady, see. Three years we've been missing a withhold on her, see. So she's never communicated to us. Well, we go back and we say patiently – on some of these letters – we say, "No, auditors do not have to wear gumboots while giving sessions." And all of a sudden we get a vast burst of enthusiasm.

This is so much so that if you were to simply go through a Central Files or your own files and pick out every letter you'd ever received from anybody on the subject of that and checked it over very carefully to make sure that every question in those letters had ever been answered, you would all of a sudden be inundated with mail. It's quite fascinating.

This is – people all over the place pick up missed withholds very, very easily on organizations and on private auditors – very easily. Now, people critical of Scientology broadly go on the basis of, "They should know what I am thinking." They're usually kind of nutty.

They're not going outside the realm of Scientologists and "they should know what I'm thinking. And they don't know what I'm thinking because they haven't written to me, and they don't know what I think and we think something else and they haven't found out about it, and therefore they're no good and we ought to mow them all down!" Just as elementary as that. We failed to find out about them.

One of the best ways to knock out a complete entheta campaign against Scientology is just describe everything that you do know about the people who are attacking you. One of the most effective ways of doing this is to send this detective around to investigate them and then they know that you haven't missed a withhold. And you know, they shut up just like that. The most fantastic magic you ever heard of. Detective never finds out a thing.

They've been living an exemplary life, a totally exemplary life working for Russia in the American Foreign Office and there they are, you know. And – but they hear a detective has been around and now they know that you know, see.

If they're still unsure that you know, why, they will still be upset. So if you were to stand in front of one of these Joes and you could say, "Well, now that we know all about you, there's nothing much more we could say is there?" The guy will go away absolutely crushed. He actually would fall for that. Weird. But as long as you really don't know about them you're in trouble with them.

And of course, there isn't anything that substitutes for auditing. But you actually can put up a facade or you can find out the information so that it ceases to be a missed withhold. One of the effective ways is not only find out the information, but publish it. A-r-r-r-g-h. We're talking about somebody way outside; you say immediately that'd be libel suits.

Isn't that interesting that all these years I have never had a real libel suit ever filed against myself or a Scientology organization for publishing the absolute facts learned. Don't go into any fancy monkey business, just publish the facts. Say, "Well, most of the communists in the University of Australia are – amongst the professors – are shackled up with students and they're held under blackmail. And so are the Roman Catholic fathers connected with that particular university and they are held under blackmail for perversion. And that is why communism and Catholicism seem to be hand in glove in Australia – because of the same blackmail racket."

"Well, God" you'd say, "breathing anything like that these people could execute you at dawn, you know! They'll just yank you up in front of court and take billions away from you."

Well, they were going to take all kinds of things away from us up to the time we really put the blocks to them with it. I don't think we've ever heard anything since. The only entheta we've got now is in Brisbane. And that's pretty easy to dispense with – Brisbane. Just go up river a little bit and let them float on out to sea.

But, there's the missed withhold in operation in the society.

Now, fourteen: Lack of auditing results. And we go back actually a cousin to number One. We would say broadly in any organization that is there because we say, "broadly in any organization." If that organization is getting into trouble it's lack of auditing results and that's

all, or of practice. That's just lack of auditing results. And those lack of auditing results rest on the cornerstone, not of other technology, but the missed withhold.

You want to clean that up, just clean up missed withholds wherever you can lay hands on a pc and all of a sudden your organization will soar. That is the most magic method of repairing an organization's results, income, public presence, lack of buildings or anything else. It would be right under that heading. Quite important.

Joburg have to learn that right now and they haven't learned it too well. Washington is living down some of its sins and crimes. This is what you have to do to set it all back up again. You have to pick up all the missed withholds.

And, number fifteen: Dissemination failures. You're talking to somebody, you're trying to tell him about Scientology and he can't seem to understand about it and he argues about it, and he says, well it – "The I-Will-Arise Holy Rollers to which I belong are far superior and we've had that answer for many years." The answer is, "What have I failed to find out about you?" So he tells you and then he says, "Yeah, I'd like some auditing."

The trouble is it's too pervasive and it's too magic. It's too simple. And for that reason auditors miss it. So this bulletin on which this lecture has been based and which is not at all in – there's a lot more in this bulletin than there is in this lecture – May the 3rd, 1962, HCOB, "ARC Breaks and Missed Withholds" and that sort of thing has a certain design. And that's a how-to-use-this-bulletin. And it's a very funny thing that it is headed with, "How to use this bulletin."

Every time you hear any of these things taking place in any branch of a Central Organization or an auditing session or anything else, you hand the person who is at the receiving end of the upset a copy of this. That doesn't matter if he's a student, he's a preclear, he's an organizational executive, anything else.

Pc comes down, he looks all busted up. The auditor comes in and says, "My God that's an ARC breaky pc." Just reach in the drawer, get one of these, and hand it to him. Tell him to read it and tell him to report to the HCO Sec to take an examination on it.

Honest – it's the only answer. There isn't any point in doing anything else. Now, naturally, the person has to know his Model Session, his E-Meter and so forth. And has to be able to handle the tools and weapons of his business in order to even fetch up and get off the missed withholds, don't you see? So it goes without saying that people have some skill in handling meters and Model Sessions and that sort of thing. Beyond that point there is nothing but missed withholds that cause upset.

This is a fantastic principle. And it comes right back to the fourth TR. And it goes right into the communication formula. And it goes right in to not-knowingness, and it goes in at – it finds a birth or a cousin, in almost every factor we have ever handled in Scientology one way or the other. The person with missed withholds has the idea that he can't reach so it goes into havingness, and on and on and on. You got the idea?

So it's very important technology. And listen, you don't need to have, ever, an ARC breaky pc. You never need to make a flub on a list. These things are archaic. They belong to

our Stone Age, see. We're into a much higher level of technology today. As well as requiring new auditing precision, we've got this particular tool.

Why should you ever have anything but a session that was smooth as glass?

And if you don't have, it's just you really don't believe this: That ARC breaks are only missed withholds. Okay?

Audience: Yes.

Thank you. Take a break.

Routine 3G (Experimental)

Preview Of A Clearing Process

A lecture given on 1 May 1962

Thank you.

Okay. Here we go. Second lecture of 1st of May.

I suppose after that first lecture some of you will be calling Mayday! Mayday! [laughter] But remember, if you do, the response will be, "What withhold has been missed on you?"

All right. I'm going to talk to you about HCO Info Letter April 29, AD 12, "Routine 3G (Experimental), Preview of a Clearing Process".

And the first thing you should know about this is it is complete. And that's your first miss on it. You're going to read this and you're going to be sure that it is incomplete – that there's much more to be known. Because all the comments I've had on this to date – there will be other issues on this material, of course – but all comments I have had is on the basis of additive, additive, what do we do about the additive? You know, somebody says, well, what do you do about all the – you know, we got this – we got this right away and everything's fine and we think this is beautiful and this straightens out everything, but now, what do you do with oppterm of the items which have already been found? Unfortunate, you see, but it happens to be covered here. You don't do anything with them, you see?

It really – if it doesn't say it here ... This, of course, doesn't cover precisely Model Session. It doesn't give you – it doesn't – it doesn't give you a lot of the procedural actions. But as far as the – as the technology itself is concerned, it is jolly complete. So you in studying this, you see, what you should do is read what's here, not add something and worry about it.

You can do that. You can add something and then worry about it. And if it isn't here, don't worry about it. That's the first message, you know, you got. You say, "Well, what – what – what about a pc, what about a pc who had a goal and – he had a goal all right and they found this terminal, you understand? And the terminal was audited on – 'what have you done to' – 'what couldn't have happened with' or – or something. And it was audited that way for 269 hours and so forth. Now what do we do?" You know, you do ...

That hasn't anything to do with it. It says the way you patch up and go back and back-track is you check out the goal. It doesn't say a thing about doing anything with a terminal. But we couldn't care less about the terminals. Forget the terminals.

Why? A broad survey of everything done on 3D Criss Cross is it's been done wrong. It's horrible to behold, but it's absolutely my observation. I haven't seen a complete list yet. So

I'll tell you if you want to finish off a 3D Criss Cross, your best stunt with this... This – this isn't – this doesn't concern – it gives you the steps of 3D Criss Cross, but it really doesn't concern itself totally with repatching up 3D Criss Cross.

I can tell you how to patch up 3D Criss Cross. It is just, take the source items, you know, what should we disregard, you're trying to get something done the fellow had and he had the Prehav level, "God Almighty" and something like this – it doesn't matter. You just take that line and take the original list and complete it.

You don't do anything with the terminal, see; you can take the list source and complete it. And it's very odd, you know, but you're going to be able to get – apply these tests. But none of these tests would apply to any lists you've done yet – they wouldn't apply. Well, just experimentally, take any list you have done on a pc. I don't care, even if the items checked on 3D Criss Cross. Take the list and just read the first twelve items to the pc and watch the tone arm move. *Uuuuhhhh*. It didn't go down as fundamental as it could have gone. Right? So therefore, even though the terminal checks out very nicely and is sitting there very nicely and everything like that, you can still bleed charge off the list and you can get deeper into the Goals Problem Mass with the same type of list.

See, you can go further every time and the funny part of it is, is all the 3D Criss Cross you have done, of course, has blown charge off the bank. None of it is in vain.

Now, the rationale of 3D Criss Cross that you went on and found items and opptermmed items and found items and opptermmed items and they eventually come down and you get more and more fundamental items. In other words, we are blowing off charge on a gross basis of taking many items and the charge would eventually bleed off the Goals Problem Mass. See, that was the rationale of 3D Criss Cross. Well, this makes a pc pretty uncomfortable, experience has shown.

Now, we can also get into the Goals Problem Mass more deeply and more fundamentally by getting a goal. In other words, a goal is a better thing to operate with on each one of the line plot lines to find a Goals Problem Mass. It's – it – you know, it's all in the interest of shortening up the auditing. You'll always get a more fundamental item by going off from a goal. Always. It goes deeper. Why does it go deeper? Well, the pc isn't being asked to confront any mass. He's only being confront – asked to confront ideas and so he can go into the Goals Problem Mass and he can confront more and more and more ideas. He can rack around – and of course, he's basically confronting the idea in the mass he is stuck in.

So a goals list is only asking him to confront ideas, not asking him to confront any masses. And then you turn around having found that he is trapped on the fourth basement floor – you found this by ideas, you see. Now, you get him to list the items and he'll eventually list the item which surrounds the idea you found. See, it's all on the basis that it's easier to find the idea than it is to find the mass.

Pcs will confront ideas endlessly, but will not very often confront masses, which are painful to them. All the technique of war is based upon this fact. Somebody can confront and snarl and quarrel with the ideas of the enemy. And then he walks out and bares his bosom to some mass – shells, flame throwers, something of that sort – and he loses himself a body.

He could argue about their counter-philosophy, you see, all day and all night, you see and he'd still have a body, you know. So he's accustomed to being able to confront ideas. He can argue with ideas. He can confront ideas. He can do this with ideas and that with ideas and so forth. Do almost anything but change his ideas. And therefore, in the Goals Problem Mass, in racking around, the person is, of course, confronting more intimately the idea which is encysted in the terminal which he is actually in. He can confront that and he can tell you what that is without being able to tell you what the mass – terminal – see, what the mass of a terminal is or identify the terminal. He can tell you about the ideas of a terminal before he can tell you about the terminal. You see that?

So therefore, a goals entrance, taking the goal as your departure point each time, reaches more fundamentally and more deeply into the GPM. This is the theory of it. And now, having reached the goal of this mass, why, of course, you go ahead and identify the item. And the item you identify will have that goal. And that's – that's all there is to it. Now, that he's identified it, however, he's got to differentiate it and separate it. He thought many things had this goal, but only one thing had the goal per the list that you did.

And you got down to the bottom of the pot and, of course, there he was and he's mixed up with this particular – this item. It's a mass, you know. He's in the middle of that bowling ball, not in the other five hundred. And the reason the bowling ball is hung up is, of course, it is opposed against another bowling ball and which has exactly opposite ideas. Now, by oppterming the item which you have finally found, of course, it is hoped – and this is theoretical and experimental, of course – it is hoped that these two bowling balls will just go *whumphh* and that will be the end of that.

Because it's fantastic that they could be suspended in space and time and be so timeless because they happened so long ago. How are they still there? It's a freak. It's a freak. The GPM is composed of these accidentals and there are not very many of them that are poised. It's something like how do you – how do you take a boulder as big as a two-story house and balance it upon the exact pinnacle of a windblown mountain peak, you know. It – you could stand there for a long time and study this and say, "How the hell is that thing balanced there?" you know? It couldn't happen! See?

Well, down basically in the Goals Problem Mass, how could – how could you get such an exact balance between a terminal and an oppterm that they hang up in equal force and perpetuate themselves for trillennia. Man! That takes some doing.

You mean you found a waterbuck who is just as strong as a tiger and a tiger who is just as strong as a waterbuck. And a waterbuck who has just exactly these antagonistic ideas to a tiger that make the tiger's antagonistic ideas to a waterbuck hang up. And now that hangs up in time and the pc is still creating it. It's still persevering. It is still hung. If he was – just had an identity and he was still creating this identity, he long since would have ceased to create it. See, there just isn't anything – for a reason, for him to go on creating it. He's just saying, "It must survive." Well, that's kind of odd. Well, of course, it survived and now it isn't surviving.

Well, why must it survive? Well it must survive because it is opposed. It is *always* opposed, so it *always* must survive. How the devil did he arrange that in his reactive bank?

That's marvelous, you know. How – you get down to figure out how in the name of God could you have these two cannonballs fired from peak one and peak two directly at each other with the exact balance velocity that they hit each other exactly in midair. You see, that would be an artillery freak to end all artillery freaks.

I think in World War I, in the whole of World War I, they eventually found an unexploded shell that had been hit by another shell. It had a shell in the side of it. And everybody thinks this is marvelous. As a matter of fact, it's in a museum someplace over in France.

I don't know how many billions of bullets and shells were fired in World War I, at what close range and almost never did one shell hit another shell, see.

Well, it's just that kind of thing. And all these – all these billions of lives and identities a person's had, how does he have one that hangs up against another one that exactly, so that afterwards it will accumulate other identities and then accumulate other balances and accumulate and accumulate and he's still, weirdly enough, creating all of these things simultaneously and so forth. You just couldn't do it.

Just get the idea right now of creating simultaneously 585 different identities all at the same minute, each with all of its own particular... Well, you're doing it. Well, how do you do it? Well, that's because there's just a couple down at the bottom of it and that's what you're creating. And the rest of these things, of course, just accumulate and accumulate and accumulate and, of course, they don't uncreate. You got the theory back of this?

Well, therefore, it is of interest in terms of (1) shortness of auditing time and (2) pc comfort, to achieve the most fundamental grip that you can get on the Goals Problem Mass as soon as you can get it.

In other words, the earliest grip, the deepest – the deepest grip, the earliest. This is what you're trying to do. You're trying to get there mostest with the firstest and when you got that, why of course, you're that much closer to doing something about it.

Now, there's a couple of phenomena which have been observed and one of them is that later on, after proper terminals have been found and goals and terminals have been found in Routine 3, that later on you get nothing but constant blow of terminals. In other words, you try to find the terminals for that goal and you no more than find them and they blow. And then eventually you'll take a goal and you'll no more than find the goal than it will blow. Some of you have seen this happen. Some of you have experienced it.

Now, I'm trying here with this approach to move that phenomenon right up to the beginning of clearing, see. So we're doing nothing but blowing and we're never auditing, see. We're never auditing a *process* on these things, see. Just knock out auditing a process and just do it all by assessment. Well, that's the definite theoretical approach to this thing and that's what's hoped for.

All right. We know definitely that these things do blow. Well, all right. Let's move that up to the beginning of the case instead of experiencing it at the end. That's the effort here. And the other one is this: That a pc never feels better than when he has his goal and his first terminal. He just feels marvelous and many of you will agree with that. That's a marvelous

sensation to have those two things beautifully and accurately spotted and everything is fine. You feel great.

Well, now the second that you find a modifier and the second that you find an opposition terminal, you really never feel worse. You've had it right there at that point.

Well now, why is this? It's because you were coming away from the Goals Problem Mass in old Routine 3 clearing. You see, we're trying to push Routine 3 clearing straight on through the Goals Problem Mass, then there's no relapse of clearing. We're trying to push it through the lot, you see, so that you don't get a Keyed-Out Clear state but you get a Clear state that is absolutely straight through. All right.

Now, the modifier apparently has a lot to do with the oppterm, so why find it? You're going to find the oppterm in due sequence anyhow and it'll have to do with the modifier anyway, so why bother with it, see? It is associated with – I'm not saying that it is – but it's associated with the oppterm.

In other words, you find this terminal. You find this goal, you find this terminal. All right. It's the opposition terminal to the terminal you find that is going to turn up with the modifier. So the second we find the goal, if we then find the modifier, we key in the Goals Problem Mass and key it in hard.

Well, there's theoretically an easier way to key in the Goals Problem Mass and that is simply by finding the oppterm itself without finding any modifier. Because we don't need the modifier in order to find the oppterm. We're going to find the oppterm by complete listing.

Now, therefore, we've blown a piece off the GPM of magnitude. Now, if we find a new goal and we find a terminal for this new goal and then we oppterm it, we again snap the pc back in against the GPM, but we do it gently. And what we're doing is consistently chipping chunks off the GPM while clearing the person and theoretically, he shouldn't hit these heavy, steep dives.

Now, these items, when they start disintegrating and so forth, are hot and cold and electrical. And they are quite – quite an experience. And you can get somebody on a hot summer day shivering so his teeth rattle. These things are *cold*, man. Well, why are they cold? Well, why are they painful, why are they this, why are they that? Well, there's a lot of reasons, but to get an electrical standing wave into that condition takes some doing. It's hard to do. And it's got to be intolerably cold and intolerably hot and intolerably electrical and actually has to be all those three things to hang up. That's why they all don't hang up.

A person who's living his present life in southern California at this time is never really too hot and really never too cold, you see? And if they stay away from the mains plugs, why, they're seldom too electrical.

So if you were to go back in the future and find this life in southern California at all, it would simply be because it was hung up and associated with or keyed in, was keyed into a GPM that was too – an item that was too hot and too cold and too electrical, you see? In this lifetime, none of you have frozen to death. You haven't. You've been pretty cold, but none of you have frozen to death. I guarantee that. The best proof is you're here. See?

None of you have ever burned up. Well, you've been singed around the edges here and there, now and then, but the fact that you're sitting here right now shows that in this lifetime you haven't burned up, see?

And you haven't been killed by heavy voltage because in this lifetime you are still alive. But you have lived many lives, I assure you, in which you did freeze to death and in which you did burn up and got shocked in the bargain. It must have been fun.

You take a doll body, for instance, you consider rather precious. It goes 200 centigrade and a minus 175 centigrade. And you thought it was your old pal, Bill, as you walked around the corner and it wasn't. It was a Fourth Invader and at that moment, you got, oh, a few megawatts in the brisket. That kind of thing, don't you see?

You were minding your own business in this civilization and everything was fine and somebody dumped an atom bomb on you. See?

That's the kind of thing this sort of thing takes. It takes duresses. Duresses of magnitude. Now, you sit here and you know the limitations of the body you've got. And you know that if the temperature drops to 56, you shiver and if it goes to 82, why, you start getting too warm. Not much of a margin there, don't you see?

And somebody slips you 240 British volts, you say, "Yipe!" And you say that's a lot of jolt – 240 volts a jolt! Nonsense. I was holding onto 240 volts the other day and mostly had muscular kick to the thing. But with this body, I don't think I would take it up as a pastime. But it – you get hit sometime with a – oh, about two or three million volts and you'll see the difference.

Gormley Castle used to be down here. I was riding over to a tourney one day and was half-armed in a rainstorm – I had half steel armor on in a rain storm. The rest of it slung on the back of the horse. Brother with me and a groom and they had the rest of the armor. And so 'elp me, lightning 'it. And you know armor on wet ground makes the most marvelous conductor. Knocked me plumb silly, it did. Plumb silly. It's happened to me several times. But it – it's always you go sit down after a while and you say, "Oh, no," you know. You think about it. It preys on your mind. Some – that's something – it upsets you. It makes you absent-minded. It makes you flinch, and so forth.

I remember at that particular instance I rode right on to the castle and the grooms went out and got the bodies and my brother was still alive, but the groom was awful dead and laid the body on the bed. I stood there, you know and thought that was okay and went back over to Europe and walked in and – just shows you a guy goes *hnhh!* You know, I walked in and I fell over the old mither who was busy scrubbing the floor and of course, wet, you know, wet floor, you know and God! volts were coming up me like that, you know – and I step in her scrub bucket and walked through her and she gets a 'ell of a shock, you know. She says, "Coo, what's that?" you know or words to that effect. And go over to the table and sit down at the table and pick up my fist and look around and there's no mead, you know. Not a bit. It was about 1495, something like that. And so I pick up my fist and I start to say, "*Godderdammerung*, bring me in some mead," you know. And I go bang, you know and my fist goes straight through the table. And I say, "Wait a minute, boy... Oh, *no*, I'm dead." [laughter] Bright, moonlight night and there's a dog howling outside, so I walk out in the moonlight and decide

for the next 55 years I'll have to be a ghost. Well, it was a very shocking experience. [laughter] But you could get discombobulated and upset and not know what you were doing. I didn't. I went and picked up a baby or two, but ...

Anyhow, the point is, is it takes a lot more than you're even aware of confronting in order to pick up electronic masses and then keep mocking them up because, you see, they're so dangerous because you have to keep them mocked up, you see, because they're so dangerous, you see?

It's very logical. If you didn't keep them there, they're liable to get away, you see and blow your 'ead off, you know. So therefore you have to keep them created. You figure it out. You're the one that's been doing it mostly. But you see, if you didn't have that mass then some other mass would get you. Well, now, when you figure out that this particular incident I've been telling you about, which I consider rather amusing – I'm going to have to go down and – Gormley Castle one of these days and look and see if the old tilt field is still down there and so forth. I'd better not tell any of the Englishmen about it because they just used to raise hell around there, you know.

I committed enough overts that one day I was riding through there in about 1600, fell off the back of my horse, stone dead. Overt-motivator sequence caught up just like that.

There's no mass connected with that lightning. That's free track. You got an idea what I'm talking about? See. Well, look. If *that's* free track, what the hell is one of these masses? Well, they're that way.

Of course, earlier on the track, you had more horsepower. And you could keep more mocked up. You could stand up to more, so the violence is pretty terrific. And a pc hits these things and he turns ice cold, on the masses and hell keep telling you how cold he is and turn on the fire and you – God, you look at your watch and find out it's 90. And you – pc all of a sudden, he gets roaring red-hot. He is awful hot, terribly warm. But, the odd part of it is he less often gets warm than he gets cold because he's used the warmth of the mass time and time again. He's bled the warmth off of it, don't you see? But the coldness is less motional, so what's left as residue is the most motional mass so he is more likely to be cold. Now, he also gets electric whiz-whizzes going around one way or the other. You call these things somatics. And they'll come in odd patches of some kind or another. Well, that's all the GPM and its manifestations.

Now, the more gently you can pick this thing apart, the more comfortable the pc is. You can also drive the pc through it as though you were a Sherman tank leaving El Alamein, but you – it can be done, don't you see? But you get dented fenders. It's – it's one of those things, you know? And it can be sufficiently duressful. It wouldn't do anything drastic to your pc, but he gets very uncomfortable.

Now, 3D Criss Cross short-listed, improperly itemed, opptermmed the wrong way to and so forth, turns on such phenomena as ice-cold, red-hot and all you – you can't really bring yourself to go over and touch the light switch because it's liable to leap at you. You're sure of that.

So all of these data add up to the fact that we want a faster gain more comfortably for the pc. Now, you – the more sectionally you pick off the term and opterm of the GPM, the more comfortable the pc's going to be in the process. Okay?

Elementary – so far. Right?

But there's some more gains that come with it. And that is that you're going straight through to Clear because you'll be picking up the hearts of the masses in which the pc is stuck, most reliably. And you're going straight through and your improved gain will come out at the other end. Whereas that's not true of 3D Criss Cross. 3D Criss Cross is a roly coaster. Sometimes your lines are right and sometimes your lines are a bit off. And nevertheless you're making it, but at what cost – sometimes, you see. You – and an auditor can be dead wrong in this. He – the auditor can get awful knuckleheaded about this kind of thing.

The funny part of it is and – that apparently – and this has to be born out – that errors in 3D Criss Cross are probably most remediable by rerunning Routine 3 as 3G. Let's say you picked up "Who or what have you liked?" and you got no tone arm action, you list it as a short list and nulled it out with twenty-five repetitions of each item, ARC broke the pc into having only one item left and put that down and then optermed it. Well, you'll find out that this is less fundamental than the GPM and when you get a goal, theoretically, when you get a goal and you find its terminals, all of a sudden these others will blow off as locks. You'll run into these errors sooner or later and plow them out with a Routine 3G.

Now, what we have needed in doing Routine 3s – let's go into whys. What we have needed is for the auditor to know how to do it before he'd done it. And that has been very nearly impossible – because the weak end, the difficult end, the end he's going to have trouble with, is the end he starts on, i.e., a goals list. Goals lists are hard to do. Because this person's goals have always been invalidated and because the GPM is only hung up because the goal has been invalidated, the invalidations of goals is almost the common denominator. It is one of the common denominators of every item in the Goals Problem Mass. And the common denominator of it, of course, attracts the overt-motivator of it.

And you're sitting there and you dare look cross-eyed while you're reading off "I want to wear hats," you see. You say, "I want to wear hats" and you all of a sudden look a little odd for a second and that invalidates that, you see. And the pc – you've got a missed withhold right there – and there we go, see. Now, you can list hundreds and hundreds and hundreds of goals with the rudiments out and you can null and scrunch and batter and with the rudiments out and rough auditing and so forth – go around just trying to find a goal.

Now, we've had a number of units over in the States and in Australia and so forth which were trying to find goals on one another. And they were making it within about six weeks on some of them. This was an heroic performance. It was rough! But it was only rough because the auditors were rough. We were having to train the auditor to do it on something that can only be done if the auditor's perfect. Well, it gets idiotic, isn't it, you see? It's one of these things – you only get one chance. See, you can bust a pc up eight ways from the middle and it takes a real expert to put the pc back together again.

You string this wire from the Empire State Building to the Chrysler Building. And you hand the person – the auditor – a wobbly-wheeled bicycle. And you see, he's never had any

other wire. There's never been any wire on the ground. As a matter of fact, he's never even had a bicycle on the ground, you see. And you say, "Okay, son. Now, just – just ride along that wire over to the Chrysler Building. You'll find it's very easy." And, you know, he shakes. He – he does. He – and very often picks himself off of Madison Avenue or somewhere as a spot. I'd say 95 percent of the time he picked himself off the lower avenue as a grease spot.

They just don't do it. You say, "Find the goal." *Nyuuuh*. See, it takes terrifically smooth, letter-perfect auditing. Where has he had a chance to accumulate a Routine 3 perfectly smooth, letter-perfect activity? Well, he hasn't – in the past, but he can now because we can do a Routine 3D Criss Cross and he can make mistakes and makes pcs uncomfortable and find out what complete lists are and how the meter operates and get practice running Model Sessions, getting off missed withholds and invalidations and making everything run at once and he feels less like a one-man band who's had its arms and legs cut off. He can get used to it.

So the pc blows his stack a few times. All right. Let him find out how to patch things up with missed withholds. He's doing a lousy job, the auditor is, but still the pc finds out eventually. "Hey, what do you know, I found the wrong item and opptermed it and so on and picked up the missed withholds and the pc said it was all right. What do you know about this?", you know? And he gets on top of auditing.

Now, Prepchecking is a good school to learn how to do the meter and so forth, but it still doesn't prepare you all the way to go through all of the one-man band actions, of finding a list and nulling it and finding the item and checking it out and all that. It just doesn't. That's a specialized activity. Well, you've got 3D Criss Cross which in itself is quite valid as an activity, if done right. Yeah, just let the – let the person go on.

Now, the best way to get somewhere near the GPM is with the Prehav Scale. The Prehav Scale will get you shallowly near the GPM. A goal will get you much closer in to the GPM, you see, but a goal is not something you're going to let the fellow tamper with till he learns how, see? So we're going to eliminate our little Abe – can't go swimming until he learns how – out of this thing, you see and turn the auditor loose on 3D Criss Cross.

We have a perfectly valid process then which can be used as a training procedure, which I think is wonderful. Because there's really no difference to nulling a goals list than nulling any other list. There is no real difference, except that the goals list is fantastically vulnerable to invalidation and bad auditing. It requires tremendously adroit listing and handling.

Well, the toughness of a – of a 3D Criss Cross list will stand up to it. You've only got one chance at the pc's goals list. Of course, you've got lots of chances at 3D Criss Cross masses. You can get item after item, you see?

You understand now, that if you get the right Prehav Scale – that's all these Auxiliary Prehav Scales – you get a right level, if you list that properly. If you get the practice of completing the list and then oppterming it and completing that list and so forth, you're liable to get a blow occasionally. I mean a blow of the two items. It's liable to be all smooth as grease. But if you missed, you're just going to make the pc uncomfortable – total liability. You haven't done any irremediable harm because you could probably either straighten out that, that you did wrong or eventually you take the pc over into Routine 3G type of assessment and it blows

the whole thing out. In other words, all those items and everything are all going to be appended to this and that and the other thing and that's all going to blow out anyway. So you got a remedy which is below the level of intermediate remedies.

So you can teach somebody to do 3D Criss Cross and the case will make progress and everything is fine and so forth. And you get a chance to look at them sadly and say, "Well, Betty, do you think five items is going to make a complete list?" you know? "See if you can get six." And the auditor is saying, "Four or five hundred items on the list. How could you ever get through that many items? I mean look at the paper, you know, and – gosh!"

You know, well, goals list of six or seven hundred goals. Well, so what? The – you get to that point finally where you're used to doing lists and so on. It doesn't matter how long the lists are. You can take a six hundred goal list. So what? See? That's nothing. Null it down – not ARC break it out and null it down. And it goes astray, put it back together again, hook it up right and so forth. In other words, he's able to do it, now. He's able to swim after he's learned how. He's able to ride this bicycle from the Empire State Building to the Chrysler Building quite easily since he's been riding it only a couple of feet above the ground for some time, see? That's just the difference of approach.

And we're very rich in having a training process which gets benefits for the pc and which will only make the pc too cold or too hot or too damned electrical. Or it'll sometimes turn on a chronic somatic and the pc will go around with an awful cold – easily explained – because, of course, everybody is having a cold these days. And you get a mass half in-out of his ear or something of the sort and he has a horrendous earache. Well, try to keep him from going and seeing the osteopath or something. He's not suffering from oral lumbosis. He's simply suffering from – he – all – all he's suffering from is the wrong item oppterm, complicated with missed withholds. That's exactly all he's suffering from.

Well, the end product of this is a trained auditor and a working procedure.

Now, you'd be surprised how adroit you have to be to get a goal. Only when you can do listing easily and do a complete list, a nice complete list and get all the items properly off of it and find the final item and oppterm that nicely. Oh, when you can go through all those operations, because it is very easy to take a complete list of goals and go down the line and knock that off. But you will find even then that it requires a little more adroitness. Goals go out like that.

Before you – well, Prepchecking gets you heavy reads. You're very often a quarter-of-a-dial on a fall, you see and sometimes even a dial and I've seen stuff struck on an E-Meter which was 16 consecutive dial drops, see. So there's heavy drops.

All right. Now, on 3D Criss Cross you get used to reading something that's – that may be as little as a quarter of a division. Oh yeah, a tiny little division like that and a goal could very well come out reading a 32nd of a division. We're reading with a microscope. It can read very little and go in and out just *bing-bang, bing-bang, bing-bang*. Just in and out like that. It's reading very nicely. You're saying, "To sell apples. To sell apples. Is there an invalidation on this?" *Ping!*

"All right. What was that? All right. Thank you very much. Have I missed a withhold on you? Oh, yes. Well, thank you. All right. Thank you. Have I missed a withhold on you? That's clean. Yeah, all right. Fine. To sell apples. To sell apples. To sell – Is there an invalidation?" [laughter] Man, it's like sorting yourself through – through the labyrinth, you know. You've got to be pretty good.

And before, with any Routine 3 process, you took an auditor totally green and you threw him into the soup and the pc went into the soup right after him – 1350 and they still haven't found the pc's goal. How he ever found any is miraculous.

Now, therefore, Routine 3G is 3G because of goals. It's a Routine 3, employing goals. But it also employs several different principles. And the principle is that listing is auditing and that we're going to do our auditing by listing. So we cut out the impatience of it all. "Well, let's find something so we can audit it." This we're not interested in. The listing is the auditing.

When we find the item, we're going to oppterm it. And when we oppterm it, we hope if all is well, that we will get a small ping and perhaps we will. This is still susceptible to a bit of speculation. Perhaps we'll get a bit, perhaps this will become invariable. And, we get *ping* and the oppterm – we found it and then all of a sudden we can't find it. And there's no charge on the oppterm list and we can't find the terminal and we can't find the goal. And, of course, we turn right back and find a new goal, a new terminal and a new oppterm. Just that repetitive cycle. That's the cycle we hope for. We'll try everything we can to make that come true.

But here's this "listing is auditing" as a principle. Now that's a brand-new principle so you shouldn't really care how long your list is. But that your lists are so long – remember, don't lose your speed and adroitness. You've got to be able to list rapidly and handle the pc rapidly and keep the rudiments in rapidly and all these things have to be done. Otherwise this becomes an activity of months and months and months because you're handling tremendous numbers of items. So its – you have to pick up the adroitness and facility by which you can sit down and list 300 items, keep the pc talking, keep the missed withholds off, so the – three quarters of the session isn't blown because of the pc's boiling off. You can even knock out a comm lag probably with missed withholds. And you're not stopping the pc all the time, you know and you'll get down to where you developed a knack of making a pc give you a list – staying broad awake and giving you a list and plowing right on down the line. Well, that would make good auditing, see? And then you get the knack of a – of testing. How do you test this thing – how do you find out if it is complete and so forth. How do you get used to that? And now nulling it ought to be as easy as pie. A list ought to go out *bzzzt*.

When you're able to do all that and oppterm it and do all that sort of thing, when you're able to do that with 3D Criss Cross, when you get over to 3G, you'll find out that it isn't all that easy to get that goals list. That's all right. The pc can write it out of session and all that sort of thing and you can complete it in session and you can go through those ramifications, but you'll find it's far more susceptible to shift an invalidation – than to – and it's greasier. It's greasier. Now, it's here and now it isn't here. It's more susceptible to sporadic reads and all of that kind of thing. And, you spend more time, "Is there an invalidation on this item and..."

thank you. Now, Ill check that again. Is there invalidation on this item? That's clear. Thank you very much."

All right. And now you go ahead with the item and so forth and all of a sudden why, this has gotten a needle pattern. "Have I missed a withhold on you?" You see? You pick up the missed withhold. "Thank you very much." Needle pattern disappears. "Ill ask that again. Have I missed a withhold on you? That's clear. Thank you." And you go on from there. Don't you see? And you work at it and it takes pretty – it's pretty slippery. It requires a pretty slippery auditor in order to get a goal easily and hold it there. This is what I've learned about Routine 3 activities.

Routine 3 was never defeated by its own successfulness or its own potential – its own technology. The technical facts of Routine 3 are still technically accurate. They are – they are there. What defeated Routine 3 was lousy metering, incomplete Model Sessions. We didn't have all of the rudiments necessary. We didn't have missed withholds to hold the thing in-session. We didn't have the Mark IV meter, tremendous item there – all in one piece. We had meters that were reading electronically but were not reading the mind. Marvelous, you know. And we didn't have a lot of things that we have now in order to punch this thing along. And basically we hadn't grooved in and insisted on the auditor doing a perfect procedure.

And now today we can say what a perfect procedure is and an auditor can do a perfect procedure, so therefore Routine 3 would be as workable today as it ever had. The Routine 3 did have one technical liability. It is that you could tip into the Goals Problem Mass and then separate one item off the Goals Problem Mass and then blow it out sideways and you'd get a key-out without having approached the remainder of the Goals Problem Mass.

Well, by oppterming, we continually prevent this from happening without caving the pc in. So this thing has become feasible. Auditing this is very simple and all I actually expect an auditor to know how to do perfectly is his TRs, Model Session, his E-Metering and to know exactly what he's supposed to do as he comes down the line with listing and testing and so forth. That – that's all, you see?

That is not very much in actual fact. If he can do these things perfectly, then the – he can read a meter perfectly, he'd soon get used to finding out what an invalidation looks like and what it doesn't look like and what a needle pattern that suddenly turns on looks like and how to turn it off. He'll learn all of these things rather easily. Then learning through Routine 3D Criss Cross, how to handle lists, why, he should then be able to turn over to the Tartar of all Tartars – goals lists. Be able to find a pc's goal and really sail.

That's the approach. We're rich in a tremendous amount of technology. Basically, if we had just used the technology or been able to use the technology we had when we were doing Routine 3, that would have been quite successful, too. But not realizing the amount of flub there was on the existing technology, of course, I went for broke and straightened out all the rudiments and got a little complete Model Session and figured out all the elements and added up anything that could go wrong and what caused ARC breaks and you know, just solved a tremendous number of technical problems in order to make it come out straight. This ought to be like falling off a log, if you – if you learn how to do it.

And it doesn't require any freak solutions. You don't have to get very imaginative about this. But you have to be very precise and you have to audit the pc that's there – right there in front of you. That's the pc you audit. And if you do all of that, why, you'll make a good show of it.

There's no sense in trying to do any of these things if you're still having trouble with a meter – obviously. If you're still gagging on Model Session, if your TRs are wildly out, if you don't know how to conduct a two-way comm, if you – inevitably he says, "Well, I don't know. Yes, I do have a present time problem. I had a fight with my mother this morning."

And you say, "What was the fight about?" And you wonder why you never get anyplace with a case, you see? It's these little things. And it's being able to audit the pc who is sitting right there in front of you. You be very careful and double check everything, you know. You're not quite sure that the – "Yes, is there invalidation on that item?" you know? And "Let me check that again. Is there an invalidation on that item? All right. That's clean." See?

In other words, an auditor first gets terribly obsessed with making an awfully good show of it. You know? With something like the drum majorettes from the University of San Antonio, you know – or something – he's going to make a terribly good show of it. Hasn't anything to do with a pc, you know. But he's going to make an awfully good show of it and he knows he's only supposed to ask once, he thinks, you know and his "Now-I'm-supposed-to's" catch up with him, you see. And he'll actually fake through. You know, he says, "Well, have I missed a withhold on you? Thank you. That's – that's clear." [demonstrates something – laughter]

And he thinks it'd look awfully clumsy on his part or revelatory or something if he – if he said, "Have I missed a withhold on you? I'll repeat that. Have I missed a withhold on you?"

"Oh, well, yeah."

"All right. What's that now?"

See, he didn't catch it the first time. He thinks he'll look – he's so anxious to look good that he stinks. You get somebody coming into session there, man, you can just hear the high tension going through his power lines, you know. Hasn't anything to do with the pc. And all of a sudden then, he starts – he finds out he can ride the bicycle. And after that, why, he audits the pc in front of him. He does it rapidly. He does it well and he knows what he's doing and so on. But we've got the processes necessary by which he can integrate his knowledge without killing the pc. And who knows, he might even someday do the pc some good. So that's quite valuable, quite valuable to have a training routine for a senior routine. And it's what we've needed for some time. And I'm very happy about it.

I don't say that Routine 3G will remain exactly as it is under the gun and under inspection as you've done it because you haven't yet begun to make mistakes. That's always a necessary part of it, you know? You haven't yet begun to make mistakes. There are certain things – will get explained. The only thing I try to have happen is let's not – let's not have to explain so many things that nobody can recognize Routine 3G when we get through, see. That often happens.

I found out that auditors in doing lists, so very often – short lists – so very often pick up a sporadic reading item. That it is the commonplace, not the oddity. It is the commonplace for an item that is finally found to be reading three times out of eight – three times out of five, I'll be kinder. "Well, I've got the item. Yes, it reads, reads every – *hauh*. Well, it's because of course he has overts on you, Instructor. The reason it didn't check out is actually I didn't really clean his overts off on you. You – it's all clean with me, you see and so it worked out with *me* all right, you see, but when *you* checked him out, then, you see, the rudiments were out with you and that's why it was reading sporadically, you know?"

That's all part of the auditor trying to look good. After he ceases – tries so doggone hard to look good, which is symptomatic though of the process of learning, he starts all of a sudden to do a whale of a job. It – all that counts to him – it's not whether he looks good or not. It's whether or not the item is the item. See, that's what's important. It's whether or not the list was complete. It's whether or not the oppterm fitted. It's whether or not the pc wound up at the end of session bright and sassy.

You see, all these things are the important things to him. But he gets out the importances first and of course the first important part of training is to get the, just the standard action of being able to sit there and look at the E-Meter – down, you know? Sit there and look at the E-Meter without putting yourself on the cans instead of the pc or something like that, you know? "I had a wonderful session today. A wonderful session today. It was the pc held the cans, see. And we got – we got the session really started. Eleven o'clock at night and it's still going, but we got the session really started. I really got him in-session, you know." Big game. Big win.

"This pc was willing to talk to me after the session. This is the first time this ever happened to me as an auditor." You know wins, wins of various kinds. Now, I'm not really being sarcastic. Auditing can get that grim. Auditing is terribly simple. There is a response for every situation that you can get into in auditing today that will get you out of that situation. We are not grasping in the dark and we don't require freak solutions. It isn't now that we're trying to wind everybody up like dolls, but we've actually got it there and when the auditor gets certain that he has the answers, he can sit there in a relaxed frame of mind and he really sees things and he really audits and everything whizzes.

Auditing, by the way, around the world is succeeding. It's much better, infinitely better after a year of training here at Saint Hill than it has *ever* been in the past without any slightest doubts whatsoever. And the Saint Hill graduates who have gone back home and raised hell and for the most part have brought tremendous gains in, in auditing. And the stuff coming through on the lines today – the reports coming back from HGCs and so on – are much superior to what they had been in the past. But there is still tremendous room for improvement and of course you're the crew who will bring the next big surge of improvement, so work well on it.

Thank you.

TV DEMO: PREPCHECKING, PART I

An auditing demonstration
given on 2 May 1962

LRH: Okay. Have a seat. Shut the door.

There we go.

PC: *They can see me?*

LRH: Yeah, sit forward. Way up. Attagirl. Attagirl. Now, here we are. Make sure I got a pencil. Now, a little bit over here – puts a strain on the situation. I hope that's all right with you.

PC: *Oh, sure.*

LRH: You probably wonder why you are here.

PC: *I am consumed with curiosity.*

LRH: Well, actually, you are here because you've had a continuing present time problem.

PC: *O-o-o-oooh.*

LRH: And a bunch of alleged – . What's the date? 2 May.

PC: *Alleged?*

LRH: Alleged prepchecking was done on you, and I've just given a lecture on missed withholds...

PC: *Mmm.*

LRH: ... and I just want to show people how awful easy it is. You know, if people would just relax about the thing, you know, and just do it, it'd all be all right. But they don't. They manage to do everything else. Well, here we are at 8:24. Now, see what your tone arm is reading here. Oh, it isn't very bad. That's about 2.4, at sensitivity 16. All right. Now, what we're going to do is very, very simple. All I'm going to do is locate some of the missed withholds everybody has been playing tag with, you see, and that they've been having a marvelous time with.

PC: *That's fine.*

LRH: And we're going to straighten this out. But the truth of the matter is that – apparently, whoever was giving you a Prepcheck was missing on most cylinders. I mean, I don't care if whoever sits there and hears me, you know? I mean, there's a – this is, you know, I mean...

PC: *Mmm.*

LRH: ... this is just an oh-my-God situation, see?

Now, there's more to all this than everybody is doing, you understand? And

it's also simpler. So we're going to straighten this out if we can. We'll see what luck we have.

PC: *That's fine.*

LRH: All right.

PC: *I want to find out, too.*

LRH: Why, you – you'll find out. All right. Okay. So, here we go. Is it all right with you if I start this session now?

PC: *Yes.*

LRH: All right, here it is. Start of session! Okay. Has the session started for you?

PC: *Mm-hm.*

LRH: Very good. What goals would you like to set for this session?

PC: *Well, to find the missed withholds!*

LRH: All right. Good. Any other goal you'd like to set for this session?

PC: *Yeah, to get the PTP handled.*

LRH: Hm?

PC: *To get the PTP handled.*

LRH: All right.

PC: *That's enough.*

LRH: All right. Is that enough?

PC: *Mmm.*

LRH: All right. Any goals you'd like to set for life or livingness?

PC: *Yeah. I want to get through the – make a concerted effort to study and get through this stupidity ridge I'm sitting in on the...*

LRH: All right.

PC: *... material.*

LRH: Any other goal you'd like to set for life or livingness?

PC: *No. That's enough. Mm.*

LRH: All right. That's it. All right, good. Now, here we go. Now, look around here and tell me if it's all right to audit in this room.

PC: *Yes.*

LRH: All right. I got a little tick there. What do you...

PC: *I noticed the picture. Everywhere I go, I see that picture.*

LRH: Oh, yeah. Yeah. All right. Okay. Now, look around here and tell me if it's all right to audit in this room.

PC: *Yes.*

LRH: All right. There's just one little tick left there. Anything else about this room? That's it. That's it.

PC: *Mm. Just noticing the bed.*

LRH: Hmm. That's it.

PC: *Not anything special about it.*

LRH: All right. It's going kick on it.

PC: *Is it?*

LRH: Yeah. It did. What's about that bed?

PC: *Rather out of place in this room.*

LRH: It's out of place.

PC: *Yes.*

LRH: All right. Good enough.

PC: *Belongs in a bedroom.*

LRH: All right.

PC: *Yeah.*

LRH: Very good. Okay. Look around here and tell me if it's all right to audit in this room. That's fine. Thank you very much.

PC: *Mm-mm.*

LRH: That's clear now. All right. Are you willing to talk to me about your difficulties?

PC: *Yes.*

LRH: All right. There's just one little slightly latent tick on that, you might say.

PC: *Mm. Well, I – I – it's difficult for me to reach for you.*

LRH: Oh, there is...

PC: *Yes.*

LRH: ... oh, it is. All right. Okay. Are you willing to talk to me about your difficulties?

PC: *Mm.*

LRH: That's fine. That came out. That's clear now. All right. Are you withholding anything. I got a tick there.

PC: *Just more of the same. I've got so many overts on you that I tend to individuate, is...*

LRH: Mm-mm.

PC: *My ineffectiveness on dissemination.*

LRH: All right. Okay. Well, right this minute, are you withholding anything?

PC: *No.*

LRH: All right. Thank you very much. Are you – now, let me see if this is clear.

PC: *Mmm.*

LRH: Are you withholding anything? Well, that's pretty good. There's just the tiniest tick there now.

PC: *Hmmmm.*

LRH: Just the tiniest tick. You might – what's that? Right – right now, just right this minute, are you withholding anything?

PC: *No, there isn't anything I'm not willing to talk to you about. There's a whole gob of stuff, of course, that I...*

LRH: Mm-mm.

PC: *... got rattling around.*

LRH: All right.

PC: *But not withholding anything from you.*

LRH: All right. Very good. All right. Let me test this again.

PC: *Mm.*

LRH: Are you withholding anything? Well, we've got that clear enough. It's nothing but a latent read on it.

PC: *Mm. Good-o.*

LRH: Okay. Now, do you have a present time problem? That's –

PC [giggles]

LRH: I get nothing – an equivocal registry on this, very latent.

PC: *Mm.*

LRH: But what are you laughing about there particularly?

PC: *Well, just, I've got a chronic PTP.*

LRH: All right. But right now, aside from that chronic PTP, do you have a present time problem?

PC: *No.*

LRH: All right. There's a little tick there. There's just a little tick there. What is your problem right this minute that...

PC: *Well, a little bit of a hope that this session comes out so it's real instructive for the students.*

LRH: Oh, well! I'm not – we're not running this session, you know, for the students. That's all right.

PC: *I – I know. But I – they feel very close right now.*

LRH: All right. Very good.

PC: *They're almost in the room.*

LRH: That's fine. And that's what you...

PC: *Mmm.*

LRH: ... what you thought of there.

PC: *Mm-hm.*

LRH: All right. Very good. Thank you. All right. Do you have a present time problem?

PC: *No.*

LRH: That's dandy. That – that – oh, I don't know. There was just – there's just one little other tick there. I said "dandy," but a little bit too soon.

PC: *Yeah, well, I do have a problem with the course. I could put my attention on the course at this time and uh...*

LRH: Mm-mm. Mm-mm.

PC: *I just – an awful difficulty in passing material.*

LRH: All right. Okay. Now let me check this again.

PC: *Mmm.*

LRH: Do you have a present time problem? Well, there's an infinitesimal flick. We're getting it cut right down now. There's just an infinitesimal flick before a latent flick.

PC: *Mmm.*

LRH: There's two flicks here.

PC: *Uh – well.*

LRH: All right. Now, what might that be?

PC: *Well, am I going to be terminated next week without a classification? That...*

LRH: Oh, I see.

PC: *... that's the problem.*

LRH: No, you were already extended, I think. That's uh...

PC: *Oh, was I?*

LRH: Yeah.

PC: *Oh, good-o.*

LRH: We weren't worried about that.

PC: *Yeah. Well, that...*

LRH: All right. Instructions were that people that this caught with only two or three weeks to go, and so forth – they got extended.

PC: *Mmm.*

LRH: It was automatic. All right. Let me check this again.

PC: *Mm.*

LRH: Okay? All right. Do you have a present time problem?

PC: *No.*

LRH: All right. Well, we've got this awfully, awfully cut down, but there is just a little hair there.

PC: *Well, this could go into the chronic PTP, actually, because this is what I've got keyed in.*

LRH: Mm-mm.

PC: *It's how do I get effective enough to do something about my marriage and do something about dissem – dissemination. It's just the whole ball of wax.*

LRH: Hmm, hmm, hmm. All right. This is a constant worry to you?

PC: *Mmm.*

LRH: Hm-hm. All right. Now, aside from that PTP, which we're going to take up here anyway...

PC: *Yeah, I know. That's...*

LRH: ... do you have a present time problem?

PC: *No.*

LRH: All right. I still get a tick.

PC: *Well, see, the course is part of this one because...*

LRH: Mm-mm.

PC: *... this is where I hope to get effective enough to do something about my livingness.*

LRH: All right. All right. All right.

PC: *And that's the only thing that is worrying me.*

LRH: Mm-mm. All right. Okay. Let me check it again. Do you have a present time problem? I've got a tiny flick. Right this minute. Now, I'm not talking

about – . Now, we're going to take up your...

PC: *Yeah, I know.*

LRH: ... husband and the course and dissemination.

PC: *Mmm.*

LRH: We're going to take all that up. But, right here, right now – right now – do you have a present time problem?

PC: *No.*

LRH: That's it. Thank you. All right. I'm going to let that ride...

PC: *Okay.*

LRH: ... because we got it clean as a whistle. [PC sighs of relief] Okay?

PC: *Yeah.*

LRH: Now, I would like to do a little Prepchecking on you, if that's all right with you. What would you say to that?

PC: *That's fine.*

LRH: All right. Here we go. First thing I've got to do is look at your folder.

PC: *Mm.*

LRH: And we seem to have been racking up a lot of O/Ws on the course and O/Ws, O/Ws, O/Ws. Well, O/Ws aren't missed withholds and they aren't problems. Well, you got a lot of stuff here about snakes. No, nothing marked null on that. And destroying plants, and snakes and – Somebody is having a ball here one way or the other. Wonder how far afield you can get. That hasn't anything to do with it. Let's get into something here. Let's get into something here, shall we?

PC: *Mm.*

LRH: Now, you got a present – chronic present time problem about your –

not trying to upset your auditor or anything like that, if your auditor is hearing all of this. It's not he. This started with your auditor earlier.

PC: *Oh.*

LRH: And it's been going adrift, and all I'm going to get into is I understand you have a chronic present time problem now that has to do with your marriage and your husband and so forth. Is that right?

PC: *Mm. Actually, part of it is Bill and Donna, too, of the Scientology Center.*

LRH: Yeah.

PC: *It's all one big ball of wax, really.*

LRH: Hm?

PC: *It's all big bunch – big – one big bunch of wax and glue, like.*

LRH: All right. Now, were you having trouble with your husband before you had trouble with this Center?

PC: *No.*

LRH: Oh, you only had it since.

PC: *Actually, it all started at the same time. You see, I met my husband through the – Bill and Donna.*

LRH: Oh, you met your husband through here.

PC: *It all started...*

LRH: I see. Well, we get a fall here on the Center.

PC: *Mm.*

LRH: We don't get much of a fall on your husband.

PC: *Yeah. But that's the problem.*

LRH: How about your husband?
No.

PC: *Well...*

LRH: All right. And how about the Center? Well, you're thinking about something else, now.

PC: *I am?*

LRH: Yeah.

PC: *Well, I actually don't feel that the problem with my husband is acute anymore because oh...*

LRH: Mm-mm.

PC: *... I can separate this one out.*

LRH: Hm?

PC: *It's actually Scien – Scientology is my problem.*

LRH: Oh!

PC: *How do I disseminate effectively?*

LRH: All right. All right.

PC: *You're part of it.*

LRH: All right.

PC: *Yeah.*

LRH: Okay. And how long has this been a problem?

PC: *Mm, actually, it's been a problem since 55.*

LRH: Hmm? 55. Earlier? Earlier than 55? Yeah.

PC: 50.

LRH: 50? Was the problem in 50?

PC: *Yeah.*

LRH: Yeah. We're getting a fall now.

PC: *Mmm.*

LRH: All right. This predates this Center, huh?

PC: *Yeah.*

LRH: All right. What about 50?

PC: *Well, that...*

LRH: Spring of 50?

PC: *No.*

LRH: Summer?

PC: *It was in late September, early October when I met – read the first book.*

LRH: All right. September, October. Okay. Did you have some auditing sessions at that time?

PC: *Yeah.*

LRH: Mm-hm.

PC: *That's when I went into Jack-ins', because he was my first Instructor.*

LRH: Yeah, yeah, yeah. Well, I well know this particular combination.

PC: *Mm.*

LRH: All right. Now, what we're going to do here is we're going to operate on a Zero question. And let me just test two or three Zero questions here.

PC: *Mm.*

LRH: All right?

PC: *That's fine.*

LRH: I'm going to say, has an auditor ever failed to find out something about you? All right. That's not it. What should have been found out about you? All right. What should have been found out about you? Have you ever failed to find out about something? What should have been found out about you? Well, that seems to have a little reaction there. All right. So we're going to put that down as

the Zero, in spite of the fact that it starts with *what*.

PC: *Yeah.*

LRH: And what should have found – been found out about you? What should have been found out about you? That's it. [writes something down]

All right. Now, we're referring clear back to September? Something like that? October?

PC: *October.*

LRH: It's October.

PC: *Yeah.*

LRH: October 1950.

PC: *Yeah.*

LRH: All right?

PC: *Mm-hm.*

LRH: And what should have been found out about you at that time?

PC: *Hm.*

LRH: That's it.

PC: *Well, that I was – actually didn't have – well, I – I was – I was stupid. That's – that's my biggest problem, is my stupidity.*

LRH: All right. Okay. Very good. And did your stupidity get you into some trouble at that time? Nope.

PC: *Uh-uh.*

LRH: Well, who failed to find out about this?

That's it.

PC: *Well, Jackins.*

LRH: Jackins? Jackins? Oh, you'll have to come again.

PC: *Mmm.*

LRH: Who was it? Who was it? You've got him. Who was it?

PC: *Well, I'm looking at Jimmy.*

LRH: Hm?

PC: *My – my first husband, Jimmy.*

LRH: Jimmy? All right. Was it Jimmy? Jimmy? We got a little halt on that. Jimmy? Jimmy.

PC: *Mm.*

LRH: All right. Anybody ever ask any Prepcheck question on Jimmy?

PC: *Overt-withhold on him.*

LRH: No.

PC: *Not Prepchecking, no.*

LRH: Anybody ever ask you any Prepcheck questions about Jimmy?

PC: *I – "a husband", actually. Not Jimmy. Yeah, I think they did. I think Ava did.*

LRH: Mm-hm. When was that?

PC: *When Prepchecking first started here.*

LRH: Mmm.

PC: *It generalized into "what have you – What did you do to a husband?" "What have you done to a husband?"*

LRH: Well, what did he fail to find out about you in October of 1950?

PC: *Well...*

LRH: That's it.

PC: *Yeah. That I was uh – hmm – using, actually, Dianetics to uh – I – I – I...*

LRH: You got it.

PC: *... I get real confused what I did.*

LRH: All right. Come on.

PC: *Um...*

LRH: You got it. Using Dianetics...

PC: *Well actually, to establish – a beingness that couldn't be made less of.*

LRH: Mm-hm.

PC: *This.*

LRH: All right. All right. What did he fail to find out? What did Jimmy fail to find out there?

PC: *Well, that I didn't consider myself anything.*

LRH: Ah, I see.

PC: *That's what I'm hung up in. I...*

LRH: All right.

PC: *... I totally make nothing of myself...*

LRH: Hm-hm.

PC: *... really.*

LRH: All right. Is that October of 1950?

PC: *Yeah.*

LRH: All right. There we go. Hotter than a pistol. Okay. Okay, now, well, who was this an overt against?

PC: *Well, Jimmy.*

LRH: All right. And just what did you do to Jimmy there?

PC: *Well, I learned Sci – Dianetics at that time. I got to understanding it better than he...*

LRH: Yeah...

PC: *... and using it as a – "I am smarter than you are."*

LRH: Hm-hm.

PC: *I do that to Charlie, too.*

LRH: Yeah, yeah, yeah. All right.

PC: *But I did that to Jimmy.*

LRH: Okay. And what did you do there specifically?

PC: *I took the first course under Jackins and learned about Dianetics. Learned to audit.*

LRH: All right. All right. All right. But what did you do to Jimmy there, specifically?

PC: *Well, I made him take the course with me.*

LRH: All right. That's it. Go on.

PC: *...oh. But just a feel that – was using, then, Dianetics to solve him.*

LRH: To do what?

PC: *To solve him.*

LRH: Oh, I see. Well, now we're back to what didn't he find out there?

PC: *Well, he didn't find out that I – that I thought – that I thought he was more able than I was. I would always put out that I was – was more able...*

LRH: Yeah...

PC: *... than he was.*

LRH: All right.

PC: *And I never let him know that I considered myself inferior to him.*

LRH: All right. All right. Good enough. Good enough. Now, what did you do that he failed to find out?

PC: *Nm.*

LRH: That's it. That's it.

PC: *Well, I read the first book.*

LRH: Hm-hm.

PC: *But then he found about – out about that later.*

LRH: Yeah, but what did you do, specifically? Come on. What did you do specifically? You must have done something there.

PC: *Mmm.*

LRH: The needle isn't falling on...

PC: *Reading the first book, you mean?*

LRH: ... nothing. No. I mean, the needle isn't falling on nothing here.

PC: *Yeah.*

LRH: This needle is falling on something. And it's doing rather steep, repetitive falls every time you think over this situation. So what did you do? You must have done something. Now, what did you do?

PC: *That he didn't know about.*

LRH: Yeah!

PC: *That he didn't find out about it.*

LRH: That's right. He never found out about it that time.

PC: *Well, see, this is why it's difficult for me because I would do it and then it was a get-even-with?*

LRH: All right.

PC: *So he – he always knew what I did, but I – well, he didn't know it was a get – yeah, he knew it was a get-even-with, too.*

LRH: All right. Good. Good. That's fine. But what – what did you do? You see, you're mostly telling me attitudes...

PC: *Yes, I know.*

LRH: ... you've had, do you understand? I want to know something you did that he never found out about. That's it.

PC: *Any time? You mean later than...*

LRH: I don't care when it was.

PC: ... *when? Well...*

LRH: Tell me what it was.

PC: ... *well, okay. I – I did stuff that he didn't find out. Later, though. You see, I went into a promiscuity bit later, after I left him, that he didn't find – ever find out about.*

LRH: All right. All right. All right.

PC: *But this was later than...*

LRH: All right. And earlier, what did you do that he didn't find out about? I want a specific instance here.

PC: *Earlier.*

LRH: I don't care when. You just give me one.

PC: *Yeah.*

LRH: A specific thing that you did – that *you* did, you know...

PC: *Mm.*

LRH: ... *did*, actually did...

PC: *Mm-mm.*

LRH: ... with your paws and your head and your hands and you. You know?

PC: *Yeah.*

LRH: You know, that you did that he never found out about – that Jimmy never found out about. That's it.

PC: *I don't have anything. I'm just...*

LRH: Da-da-da-da.

PC: ... *looking.*

LRH: That's it right there. Right there.

PC: *Oh?*

LRH: That's it.

PC: *It is? I've got an area of time, but I don't have a doingness.*

LRH: Hm?

PC: *I've got an area of time, but not a doingness.*

LRH: All right. It's right in that area of time.

PC: *This is in Oklahoma, in 1943, when I – before I married him.*

LRH: All right. Go on. Go on.

PC: *Hm.*

LRH: You've got it taped. What did you – that's it, right there.

PC: *I did. Something I did. I had...*

LRH: Mm-hm! That's it. You – you're right on it. You're right on it.

PC: *Well, I had some intentions to – well, I did – trap him. I gonna – you know?*

LRH: Is that something you did?

PC: *Yeah.*

LRH: All right.

PC: *Did he find – I don't think he ever found out about that.*

LRH: And he never found out about it?

PC: *I don't think so.*

LRH: All right. And now, go over this further. What did you specifically do?

PC: *Well, I slept with him, as a trap.*

LRH: All right.

PC: *I actually, I used up my virginity at that point to trap him.*

LRH: All right. Okay.

PC: *This is – this is the – the biggest overt I have on Jimmy.*

LRH: And what's the overt there?

PC: *Just, I was a virgin and this flipped him. You see, he seduced me at that point, and I – and that hung him up.*

LRH: I see. I see. All...

PC: *I intended to use it, you see...*

LRH: All right.

PC: *... as a trap.*

LRH: What did – how do you state this now? Exactly what did you do?

PC: *Hm.*

LRH: Do, you know. Not thought or intended. What did you do? What did you do, specifically?

PC: *Well...*

LRH: That's – you're getting there.

PC: *Yeah, I...*

LRH: That's it.

PC: *Well, I don't know how to state it so that it makes a good One question.*

LRH: Well, you let me make up the One question.

PC: [laughs] *Yeah. Let's see.*

LRH: You make – you let me audit this, huh?

PC: *Okay.*

LRH: Just because you haven't been audited lately, why, this doesn't say you're not being audited now.

PC: *Okay.*

LRH: All right. Let's go now. What did you do?

PC: *Well, the – the – the nearest I can come to it – and this sounds maudlin – but like I saved myself, you know?*

LRH: Mm-mm.

PC: *Like, I stayed a virgin...*

LRH: Mm-mm.

PC: *... to trap a man.*

LRH: All right.

PC: *I had every intention all this life to do that.*

LRH: All right. Okay. All right. You're getting – you're getting there. It's ticking in.

PC: *Yeah.*

LRH: I acknowledge you did that.

PC: *Yes. Okay.*

LRH: All right. I acknowledge you did that. I'm just driving it down...

PC: *Mm.*

LRH: ... in time, in a specific instance, at a specific moment.

PC: *Yeah.*

LRH: An act. An actual act, not an intention. I want an act. What did you do?

PC: *Mm.*

LRH: That's right. Now you're rocking on it. That's it.

PC: *Well, that isn't very much of an act, though, you know? I mean it was...*

LRH: I don't care. What is the act?
There it is.

PC: *Well...*

LRH: That's it.

PC: *... to use this. I've come out like a doingsness though. It's an intention.*

LRH: I don't care how it comes out like.

PC: *Well, just – I – I...*

LRH: You just tell me what you did and I'll take it from there.

PC: *Okay. I spotted Jimmy in the environment, and I decided he was the man I was going to trap by sleeping with him, and then I was going to marry him.*

LRH: All right. Very good.

PC: *Was an intention to marry him.*

LRH: All right. Good. That's fine. And you got the tick there. And what did you do?

PC: *I slept with him.*

LRH: All right. Very good. And you slept with him with what intention?

PC: *To marry him.*

LRH: To marry him?

PC: *Mm-mm.*

LRH: Or to trap him?

PC: *No. It just – that's the same.*
[laughs]

LRH: Oh, is that the same?

PC: *That's the same to me, yes.*

LRH: That's the same. All right.

PC: *Marriage is a trap, yeah.*

LRH: All right.

PC: *It's a trap.*

LRH: What about sleeping with a man to trap him, huh?

PC: *Well, this is fine except he's the only one I did this life.*

LRH: All right. That's all right.
[writes something down]

PC: *Well, the earliest one I did, I should say.*

LRH: That's my girl.

PC: *Yeah, that's the earliest one this life.*

LRH: That's a little more honest.

PC: *Mmm.*

LRH: All right. And we've got our What. All right. And that isn't – nobody is doing anything accusative here. But you see, I operate very funny, Dorothy. I think it's what people do, not what they intend to do, that makes a Prepcheck.

PC: *Yeah.*

LRH: And, of course, I know that's novel.

PC: *Yeah.*

LRH: I know – I know that's a novel theory. Look-a-here now. You've got an incident here. Is that right?

PC: *Mm-hm.*

LRH: All right. Now, when was that exactly?

PC: *Uh – that was in uh...*

LRH: That's a girl.

PC: *... well, May...*

LRH: That's a girl.

PC: *... of 1943.*

LRH: All right. That gives a nice little bing there.

PC: *Mmm.*

LRH: Very good. May of 1943.

PC: *Mmm.*

LRH: We're back here in 43. Right?

PC: *Mm-hm.*

LRH: All right. And where was that specifically?

PC: *Norman, Oklahoma.*

LRH: Norman, Oklahoma.

PC: *Mm-hm.*

LRH: All right.

PC: *I was in the navy.*

LRH: Hm?

PC: *I was in the navy.*

LRH: Is that a girl? All right.

PC: *Yeah.*

LRH: All right. Very good. Now, what should have appeared there and didn't?

PC: *... Hmm ... I know something that shouldn't have appeared.*

LRH: All right. What was that?

PC: *Well, my girlfriend.*

LRH: Aha. She did appear, huh?

PC: *Hm.*

LRH: Hey, now. Very good. Very good. And who didn't find out about it?

PC: *That she – you mean about her appearance or the incident?*

LRH: Well, no, just who didn't find out about the incident?

PC: *Oh. My mother!*

LRH: Ah, your mother didn't.

PC: *My mother.*

LRH: All right. That's my girl.

PC: *Yeah.*

LRH: All right. Now, when was this?

PC: *It was in the evening, in May – I think May. The summer.*

LRH: Mm-hm.

PC: *Well, you can't tell about Oklahoma. It gets summer there fast.*

LRH: All right. And just exactly where was that located? That's it.

PC: *Well, that was a hotel...*

LRH: Uh-huh.

PC: *... out in the outskirts of town.*

LRH: Good. Good. All right. Bing-bing.

PC: *Yeah.*

LRH: You got it. That's bing-bing.

PC: *Yeah, I, yeah, I can – I know what hotel it was.*

LRH: All right.

PC: *I liked it, the hotel.*

LRH: All right. And what didn't appear there?

PC: *Hmm.*

LRH: There it is.

PC: *Mmm. Well, I'm getting more what's – what is beginning to appear there is more the misemotion.*

LRH: Mm-mm. And what didn't appear?

PC: *Hm. The room! I can't find it.*

LRH: Mm-mm. All right. That's good enough.

PC: *Is there a – hazy picture.*

LRH: All right. Now, who failed to find out about this incident?

PC: *Jimmy's mother.*

LRH: All right. What didn't Jimmy suspect there? That's it.

PC: *Well, he didn't suspect that I was going to hold him to this one.*

LRH: Hm-hm.

PC: *Actually, what he didn't suspect was that he would get that totally entrapped on it. Oh, I know what he didn't expect!*

LRH: What?

PC: *Well, he didn't expect me to be a virgin, of course!*

LRH: Well, all right. Okay.

PC: *That's what he didn't expect me to...*

LRH: All right.

PC: *That's what he didn't expect. Yeah.*

LRH: All right. Well, that's a very interesting...

PC: *Mmm.*

LRH: ... thing for him to find out at that moment, huh?

PC: *Yeah!*

LRH: So how did he take on about that?

PC: *Well, he flipped.*

LRH: Oh?

PC: *He flipped*

LRH: He flipped?

PC: *Yeah.*

LRH: And what did that mean for him?

PC: *That mean he – means – that meant he was trapped.*

LRH: Yes sir.

PC: *Mmm. That was a dirty trick!*

LRH: All right. Very good.

PC: *That was.*

LRH: All right. Very good. And when was this again?

PC: *Hmm.*

LRH: That's it.

PC: *Oh, you know, it – it was just about this time of year? Mm – early May?*

LRH: Hm-hm.

PC: *It was in the evening.*

LRH: Hm-hm. What time in the evening?

PC: *Oh, about – I should say about twelve o'clock at night.*

LRH: That's it. There it is. There it is.

PC: *Yeah. Because we went out first, and then came back.*

LRH: Hm-hm. Hm-hm. All right. Is there any more about that? Is there any more to that?

PC: *Well, just – it was messy.*

LRH: How do you mean, messy?

PC: *Well, I got blood all over my clothes.*

LRH: Oh, yeah.

PC: *This is what Betty discovered.*

LRH: Uh-huh.

PC: *And an unexpectedness on Betty.*

LRH: Hm-hm.

PC: *This – this was rather an uncomfortable situation for me.*

LRH: All right. Very good. And what failed to appear there?

PC: *Mmm. Well, there's something very interesting going on here. There's Bob in the background, but somehow he's there and not there.*

LRH: Who?

PC: *Betty's boyfriend.*

LRH: Yeah?

PC: *Bob? Was that his name?*

LRH: There was somebody else at the hotel with you?

PC: *Yeah. Bob.*

LRH: All right.

PC: *Betty's boyfriend.*

LRH: There – there was somebody there?

PC: *Yeah.*

LRH: Oh, I see. Had they put up at the hotel?

PC: *Yeah. They were in another room.*

LRH: Oh, I see. All right. Then they knew all about this?

PC: *Well, I don't think Bob did.*

LRH: I see.

PC: *Unless Betty told him, which I don't think she did.*

LRH: Hm-hm.

PC: *I didn't tell him.*

LRH: All right. He didn't appear there.

PC: *No, he didn't.*

LRH: All right. Now, good enough. Now, who failed to find out about all this?

PC: *Bob.*

LRH: Bob did.

PC: *Oh, actually, the – what keeps popping up is the navy personnel out on the base didn't – failed to find out.*

LRH: All right. Did you go into a vast withhold from all those people?

PC: *Yeah.*

LRH: Should they have found out about this?

PC: *Yeah. Actually, my – my senior officer should have found out about it.*

LRH: Hm-hm. All right.

PC: *This was a betrayal on her, actually.*

LRH: All right. How was it a betrayal on her?

PC: *Well, she had a solid postulate that her girls did not do these things.*

LRH: Oh, I see.

PC: *It sort of made this one stick with most of the girls.*

LRH: All right. That's fine. That's fine. All right. That's very good. When did you try any of this earlier with a man and it didn't work out?

PC: *Well, didn't...*

LRH: That's it.

PC: *I get the earliest – no, this is – I think the earliest one is when I was eighteen and uh...*

LRH: That's it.

PC: *... I chickened out.*

LRH: Aha. We got the tick-tick there.

PC: *Yeah. I chickened out on that one.*

LRH: And when was that?

PC: *That was in 38.*

LRH: Hm?

PC: *1938.*

LRH: 1938.

PC: *Yeah.*

LRH: All right. And what – is that all there is to that?

PC: *Well, no, because I did have this same intention there to trap him, but I couldn't – I wouldn't go through with it because I – he – I didn't know what the myst – there was a mystery on Cleveland. I would have had to have lived in Cleveland and I didn't know what it was about, so I chickened out.*

LRH: All right. Okay. And what appeared there?

PC: *Hm. Blackie. My friend.*

LRH: Oh, yeah.

PC: *Yeah.*

LRH: All right.

PC: *This was an older man.*

LRH: Very good. Very good. In what wise did he appear? How did he appear?

PC: *Well, he interfered.*

LRH: Oh, he did, huh?

PC: *Yeah.*

LRH: Was this a knockdown-drag-out?

PC: *No. Just he raised hell.*

LRH: What did he do?

PC: *And he made me sufficiently guilty so that I blew off of him. Actually, I solved the whole thing by going to Seattle.*

LRH: I see, I see. This is your departure from where?

PC: *From Fromberg, Montana.*

LRH: I see.

PC: *My hometown.*

LRH: What town in Montana?

PC: *Fromberg, south of Billings.*

LRH: Yeah?

PC: *Yeah.*

LRH: Attagirl. All right. Now, who failed to find out about that whole thing?

PC: *My mother.*

LRH: All right. That's tick-tick, bang. Now we're really getting there.

PC: *Yeah. Mother and Dad.*

LRH: Hm-hm. They didn't find out about this?

PC: *No.*

LRH: Do they know about it to this day?

PC: *No.*

LRH: All right. You've never had anything to say to them about this.

PC: *Oh, no. They – they wouldn't have dug this game at all.*

LRH: They wouldn't have, huh?

PC: *Oh, no.*

LRH: All right. And what did you do? Did you tell them something else? That's it.

PC: *Well, yeah. I told them that I wanted to get married. This was perfectly reasonable. But I didn't tell them that I had – well, see, the one I've got there is that this is the only thing I had of any value.*

LRH: What?

PC: *My virginity.*

LRH: All right.

PC: *It's the only thing I ever considered was valuable.*

LRH: All right. Very good. Very good.

PC: *I already knew I was no good.*

LRH: All right.

PC: *You know?*

LRH: Okay. All right. Now, is there any earlier incident? That's it.

PC: *Well, that's when I was only thirteen.*

LRH: When you were thirteen.

PC: *Yeah.*

LRH: Very good. And what did you do when you were thirteen?

PC: *Well, this one was sort of inadvertent. Some guy spotted me, and turned on a big admiration deal for me. I never could understand that one.*

LRH: Hm-hm. All right. What did you do there?

PC: *Well, I was just sitting in the park minding my own business...*

LRH: Uh-huh.

PC: *... and he came along.*

LRH: Uh-huh.

PC: *Yeah. I did do something there. I did uh...*

LRH: That's it.

PC: *... try to force – like I must be something if I attracted him, and tried to force the relationship.*

LRH: Oh, all right. Very good. Okay. And when was that?

PC: *That was in 1933. That was in – on Labor Day, 1933. September.*

LRH: Labor Day, 1933.

PC: *Yeah.*

LRH: Very good.

PC: *Labor Day celebration.*

LRH: All right. And is that all there is to that?

PC: *Uh – no. I kept that one going. Tried to foster some sort of a romance out of it. I couldn't make it, though.*

LRH: All right. Good enough. But right there at that instant. Right there at...

PC: *Oh, that...*

LRH: ... that moment. Is that all there is to that?

PC: *Yeah.*

LRH: Yeah. All right. Very good. All right. What failed to appear there?

PC: *... Well, sure enough, uh – the – whatever I had mocked up as a desirable male failed to appear there, because he sure wasn't.*

LRH: All right.

PC: *You know?*

LRH: Very good. Very good. Now, who didn't find out about this incident?

PC: *His mother.*

LRH: His mother?

PC: *Yes.*

LRH: Oh, all right. How old was he?

PC: *Uh – fifteen. No, I guess he was only about fourteen – thirteen, fourteen, too.*

LRH: Oh, I see.

PC: *Yeah.*

LRH: And she didn't find out about it, huh?

PC: *Oh, no. You see – .*

LRH: Was he upset about this?

PC: *Well, later, I introduced him to my mother, you see? And then later he had a compulsion to introduce his mother to me. This is...*

LRH: All right.

PC: *... a real funny one on it.*

LRH: That's bing-bing. We're getting somewhere now.

PC: *Yeah. She – she disapproved, you see?*

LRH: Did she tell you she disapproved?

PC: *No.*

LRH: Did you tell her?

PC: *No.*

LRH: All right. Very good. Now, is there anything earlier than this?

PC: *Good heavens, no!*

LRH: Well, was there anything earlier than this?

PC: *No.*

LRH: I don't get much of a rack-around here on it. Is there anything earlier here about trying to sleep with a man to trap him?

PC: *Hm-mm.*

LRH: Well, now, we just had that go counter to what you just said.

PC: *Well, I'm looking at some...*

LRH: Come on. Come on. What could there have been earlier?

PC: *Well, there was some sex play with my brothers, but that wasn't wanting to sleep with them to marry them.*

LRH: Oh, all right. All right. But how about trapping them? Would this trap them in some way?

PC: *Oh, well, yeah. That – that – there was some wanting to be close to my brothers. Actually, this is interesting. That's – that's that "I want to be close to a man."*

LRH: Yeah.

PC: *And I did want to be...*

LRH: All right.

PC: *... close to my brothers.*

LRH: All right. Very good. And when did this sexual activity take place?

PC: *Well, it's my brother Eddie.*

LRH: Hm-hm.

PC: *That's the incident there with uh – it – it was just straight together, his masturbation – me letting him...*

LRH: All right.

PC: *... do it.*

LRH: Good enough. And now, when was this?

PC: *Uh – oh, dear. I got to guess on this one. About 1928-9.*

LRH: All right. Good enough.

PC: *Yeah.*

LRH: Good enough. Is that all there is to that?

PC: *Yeah.*

LRH: All right. And what appeared there?

PC: *Well, this – the...*

LRH: That's it.

PC: *Yeah, it was too much misemotion. I mean, I – I – I couldn't confront – easily confront his emotion on this one.*

LRH: There we go.

PC: *Yeah.*

LRH: We're right there. Right there now.

PC: *Yeah, this is...*

LRH: You couldn't confront his emotion.

PC: *Mm.*

LRH: Hm-hm. Emotion appeared there.

PC: *Yeah.*

LRH: Mmm. Mmm.

PC: *It's actually sexual sensation on his part.*

LRH: Mmm. And you weren't able to confront that.

PC: *Uh-uh.*

LRH: Okay.

PC: *Interesting.*

LRH: All right. Very good. Now, who failed to find out about that?

PC: *My mother.*

LRH: Right. All right. There it is. Bing-bing. Very good.

PC: *My mother. Oh, wow!*

LRH: All right. Fine. How did this trap your brother? There it is.

PC: *Well, was – there was that emotional tie there. Something in – we had experienced something in common. Um – this actually is a – huh... Just the misemotion is what's the trap. Sort of a goopy misemotion that...*

LRH: All right.

PC: *... couldn't – couldn't ever have just as a clean-cut type relationship. There was always that withhold there – on his part. It's actually still there.*

LRH: What? On his part?

PC: *Yeah. It's still there.*

LRH: To this day?

PC: *Uh-huh.*

LRH: To this day, he's still afraid people will find out about this?

PC: *Hm-hm.*

LRH: Is that so?

PC: *Actually, he's afraid I'm going to mention it. One of these days I am. I'm going to pull that withhold off of him.*

LRH: All right. Very good.

PC: *I think that would help.*

LRH: Okay. All right. Now, is there any earlier incident here? There's a little slowdown.

PC: *Well, this is the picture that I don't have any – any recall on. Just a stuck visio.*

LRH: Picture of what?

PC: *Of running to Mother and telling her about a sexual experience with my brother Jake. But this one was...*

LRH: Writing to your mother?

PC: *Running to my mother.*

LRH: Running to her? Oh, running to her?

PC: *Yeah.*

LRH: And telling her about a sexual experience with your brother Jake.

PC: *Yeah.*

LRH: When was that?

PC: *Well, I'm sure I was only four years old, but I don't know why this comes out then in the place where I was – didn't live until I was six.*

LRH: Well, that's good.

PC: *I mean, I've got some confusion in it.*

LRH: All right. What is this? An overt act on Jake?

PC: *Yeah. It's actually an overt act on Mother, too.*

LRH: Uh-huh. Both of them?

PC: *Yeah.*

LRH: Both of them.

PC: *Yeah.*

LRH: All right. Was it true?

PC: *Yeah, it was true.*

LRH: What was true?

PC: *Well, the experience, uh – well, no, I shouldn't say that because I*

don't remember the experience. I only remember running to my mother telling her that Jake had uh – uh – taught me all about uh – well, I – I said, "Mom – Mother, Mother, Jake told me all about fucking," you see?

LRH: Mm-mm.

PC: *And my mother almost dropped dead!*

LRH: Mm-mm. All right. Very good. Now, what didn't appear there?

PC: *Well, what the hell ever happened there?*

LRH: All right. Very good.

PC: *Yeah.*

LRH: Well, who hasn't found out about this?

PC: *My dad never found out. My other brother – my other brothers and sisters didn't find out.*

LRH: They didn't find out.

PC: *No.*

LRH: Your father didn't find out.

PC: *No.*

LRH: All right. How about Jake?

PC: *Yeah, well, he found out about something because Mother beat him up.*

LRH: Oh, I see. Was he punished?

PC: *Yeah, he was punished.*

LRH: All right. Now, when was this?

PC: *Hmm. Well, boy, sure seems like 1924.*

LRH: All right. Very good. 1924.

PC: *Mm-mm.*

LRH: What time of the year?

PC: *Well, it co – . See, that's where I get confused, because it was in the cornfield. And I was six years old in that place, but the corn was – actually it was high, so it must have been in the middle of summer.*

LRH: Okay. Very good. And is that all there is to that?

PC: *Mmm.*

LRH: Mm?

PC: *Mm.*

LRH: What else is there to that? There must be something else to it.

PC: *Well, hmm. Bunch of confusion, like uh – it seems like it's the same incident where I was sitting in the hallway or in the side porch with this – Mother had told me that – well, she – it was more of an attitude of I was totally unacceptable to her. And just sitting in the hall there thinking, you know, things will never be the same again. But I'm not sure it's the same incident.*

LRH: All right.

PC: *It just seems like it.*

LRH: Very good. Very good. And what appeared there? All right. What didn't appear there? That's it.

PC: *Well, Mother didn't. I have a just a real funny feeling there of being all alone.*

LRH: Mm-mm.

PC: *That somebody else should have been there and wasn't.*

LRH: Mm-mm.

PC: *I don't know.*

LRH: All right. Now, who hasn't found out about that four-year-old incident?

PC: *Hm. Well, I sure haven't found out parts of it.*

LRH: All right. All right. Anybody else hasn't found out about it?

PC: *Mm. Well, Mother didn't find out other parts of it.*

LRH: All right.

PC: *The one that Mother didn't find out, actually, was I don't think she realized what – how – I Q-and-Aed with this. I mean, I just straight decided I was no good...*

LRH: Mm-mm.

PC: *... on her consideration that I wasn't.*

LRH: All right. Now, what are we talking about here that she considered you were no good? When did this enter into the situation?

PC: *Well, it was uh – later in that incident – I think. I don't – it looks like...*

LRH: Did she tell you you were no good, or what?

PC: *Well, she – yeah. Just...*

LRH: What did she say?

PC: *Well, she gasped like this was the most horrible thing that anybody could ever do.*

LRH: Hm-hm. All right.

PC: *I mean, it was the attitude...*

LRH: What did she say?

PC: *... and the misemo – . Well, I think she appealed to God at that point that this happened, this horrible act had happened. I don't remember what she said. She*

was talking in German anyhow. I wouldn't remember German.

LRH: All right. What had you just done there?

PC: *Well, I told her that I was – that Jake and I had – I don't even remember what we – what – what we did. I do remember telling her that...*

LRH: Yeah, but what did you tell her? That's what's important.

PC: *Yeah. Yeah. Well, I told her that Jake and I were fucking.*

LRH: All right. That's what you told her.

PC: *Yeah.*

LRH: Very good. Very good. When was this?

PC: *I don't know, 24 or 26. 1924 or 26. I can't decide on this one.*

LRH: Well, all right.

PC: *It must have been in 1926, because we were living in Fromberg. But then everything that happened to me I put into my barnyard anyway, so this could be another thing I just put into my barnyard.*

LRH: Into your barnyard?

PC: *I drag all my pictures into my barnyard. It's the only safe place I had in my childhood.*

LRH: Oh, I see.

PC: *So every picture I – every time I get audited I drag all the pictures from all over the place and I'd go into the barnyard to look at them, while I was in the auditing chair.*

LRH: Oh, yeah.

PC: *This...*

LRH: Now, where – where did this incident with Jake happen?

PC: *Well, it was in the cornfield...*

LRH: That's it.

PC: *...so that – that had to be the farm.*

LRH: Well, what did you do?

PC: *I don't know.*

LRH: Nothing? Something? Anything?

PC: *Well, I'm sure it was something, yeah.*

LRH: Well, was it nothing? Something? Had you done anything? Or is this just an outright lie on Jake?

PC: *No.*

LRH: Did it get him in trouble?

PC: *Yeah. It did get him in trouble.*

LRH: All right. Who wouldn't want you to find out about it?

PC: *Who wouldn't want me to find...*

LRH: Yes.

PC: *... me to find out about it.*

LRH: Ah, that's an interesting thought, isn't it?

PC: *Well, Mother wouldn't want me to find out about it, I would think.*

LRH: That's it. All right. Mother wouldn't want you to find out about it.

PC: *No.*

LRH: Would Jake want you to find out about something?

PC: *No.*

LRH: All right. Is there a big agreement there you shouldn't find out about this?

PC: *Well, an agreement there that something like that would be better forgotten, which would be something we would have had in – in our childhood.*

LRH: Everybody would agree that that...

PC: *Yeah.*

LRH: ... should better be forgotten.

PC: *It should – should be forgotten. Sure.*

LRH: When did you all decide to forget it and be friends?

PC: *Uh...*

LRH: That's it.

PC: *Hm. Well, just sort of oozed into forgetfulness there.*

LRH: All right. Very good. But there was an agreement there.

PC: *Yeah.*

LRH: All right. Very good. When was that? That's it.

PC: *1926.*

LRH: Very good. And what exactly happened there? Exactly what happened?

PC: *Well, I get an impression only, now.*

LRH: Oh, you can tell me what happened. Don't sit there reading your pictures. Tell me what happened.

PC: *All right. Actually, he did try to put his penis in me.*

LRH: All right. Very good. Was this with your agreement?

PC: *Mm-mm.*

LRH: Or your connivance?

PC: *Well, it was oh – actually, it was – this was all right to do. That's what I was...*

LRH: All right. That's – that's fine.

PC: *Yeah. That's what I was trying to communicate to Mother.*

LRH: It was your idea?

PC: *No. I had learned a new experience.*

LRH: Oh, all right. Very, very good. Excellent.

PC: *Yeah.*

LRH: And what appeared there?

PC: *Well, my mother's shock, because, you see, I wanted to communicate to her that I had discovered something new.*

LRH: Oh, I see. All right. Very good. Excellent.

PC: *I didn't expect my mother to be shocked. I thought she would be pleased because I had found out something new.*

LRH: All right. Very good. And who should have found out about this in later years?

PC: *Dad.*

LRH: All right. Who else should have found out about it in later years?

PC: *Well, Jake should have found out about it, that I was this knuckleheaded.*

LRH: All right.

PC: *I didn't know that this was something should be kept secret.*

LRH: Very good. And who else should have found out about it?

PC: *Uh – well, my whole family should have found out that I was knuckle-headed.*

LRH: All right. Very good. Very good. Okay. Now, when was this incident, exactly?

PC: *Huh. Well, it was in the summer of 1926. Actually, this one does feel more in place now, in 26.*

LRH: Very good.

PC: *Mm-hm.*

LRH: All right, fine.

PC: *It was in the summer of 1926.*

LRH: Excellent. Excellent. And is that all there is to that incident now?

PC: *Mm. Yeah.*

LRH: All right. Very good. And what shouldn't have appeared in that whole incident?

PC: *My mother.*

LRH: All right. Excellent. Excellent. And who didn't find out about it?

PC: *Schoolteachers. Townspeople.*

LRH: Oh, very good. Excellent. Anybody else?

PC: *You know, the one that's the real shouldn't-have-found-out is my stupidity there. Mmm, my brothers and sisters, particularly, shouldn't – should have found out about this one. Well, I don't know. They still shouldn't know about this.*

LRH: Yeah.

PC: *This stupidity.*

LRH: Should they have found out about your stupidity?

PC: *Well, it still isn't all right with me for them to find it out.*

LRH: All right. Okay. Now, what we're going to do here – how do you feel about this now?

PC: *Mm, better.*

LRH: You feel a bit better?

PC: *Mm-hm.*

LRH: A lot better?

PC: *Yeah, it's...*

LRH: You got something a little more in place?

PC: *Yeah, and it doesn't seem as hung-up.*

LRH: All right. Good enough. We're not – we're not through worrying this one – that one, probably, but we're going to look some more on this line.

PC: *Oh, that's fine.*

LRH: All right. Now, would it be all right with you if we took a very brief break?

PC: *That would be wonderful.*

LRH: Ten-minute break?

PC: *Mm.*

LRH: Would that be all right with you?

PC: *Yes.*

LRH: And is it all right with you if I just asked one more question here? Now, have I missed a withhold on you? Yeah, that's all right. Latent.

PC: *Mm, yeah. You didn't.*

LRH: Very good. Very good. There was a latent...

PC: *Mmm.*

LRH: ... but that's all right. I'll check it again.

PC: *Okay.*

LRH: Have I missed a withhold on you? There's a slight slowdown.

PC: *Well, just I didn't realize it'd be this comfortable...*

LRH: Oh, you didn't?

PC: *... being audited by you.*

LRH: Oh, all right.

PC: *Yeah.*

LRH: All right. Thank you very much. Let me check that once more. Have I missed a withhold on you? No, that's fine.

PC: *Mm.*

LRH: Very good. We got that. And is there anything you care to ask before I give you end of session for this break?

PC: *No.*

LRH: All right. Here it is. End of session.

PC: *Okay. Thank you.*

LRH: You bet.

TV DEMO: PREPCHECKING, PART II

An auditing demonstration
given on 2 May 1962

LRH: Pick up the cans. Okay, honey. We been getting a TA action here of 2.0 to 1.3, well 1.6.

PC: *Wow.*

LRH: Oh, now I don't know this is enough TA action to amount to anything, but it's worthwhile.

PC: *Well, the one – I was – didn't realize it was going below 2.*

LRH: Hm?

PC: *I didn't realize it was going below 2.0 is why I was going "wow" about it.*

LRH: Oh, yeah. That's been wandering up and down there very nicely. We're in a zone of where you haven't taken too much responsibility.

PC: *That's the one that had occurred to me.*

LRH: All right. And 10:33. All right, honey. Is it all right with you if I begin this session now?

PC: *Yes.*

LRH: All right. Here it is. *Start of session.* Has the session started for you?

PC: *Mmm.*

LRH: Very good. All right. Now how're you doing

PC: *Well, I'm fine now that I'm back in the chair. I was a bit dispensed down in the hall.*

LRH: Oh, yeah. All right. Now, very good. Have I missed a withhold on you?

PC: *No.*

LRH: Well, there's a little latent tick here. There might be something on it. There it is.

PC: *Well, yeah. Just I was pretty – pretty far out of present time when you ended the session.*

LRH: All right. All right.

PC: *That's...*

LRH: Okay. All right. Did I fail to find out about that?

PC: *Yeah.*

LRH: All right. When was that?

PC: *Well, when I went clattering down the hall by myself I couldn't find Suzy's bathroom.*

LRH: All right. Very good. Okay. Now, have I missed a withhold on you?

PC: *No.*

LRH: All right. Is there anything else there? Any other thing I might have missed a withhold on?

PC: *Mm-mm.*

LRH: Okay. Now let me check this.

PC: *Mmm.*

LRH: Have I missed a withhold on you? All right. That's going independently.

PC: *What does that mean?*

LRH: Now, you listen to me.

PC: *All right.*

LRH: Now, you listen to *me* now.

PC: *Okay.*

LRH: To me. To me. All right. Have I missed a withhold on you?

PC: *No.*

LRH: That's right. You're absolutely right. All right. Now, we were going great guns here on something that happened in a cornfield.

PC: *Mmm.*

LRH: All right. Now, is it all right with you if I get on with this?

PC: *Sure.*

LRH: All right. Now, apparently you've been packing an awful lot of they-should-have-found-out-about-me's here, on this subject.

PC: *Mm.*

LRH: Hm?

PC: *Mostly Mother, yeah.*

LRH: Well, has this been basic... Yes, it's Mother all right, because I've got a double tick here I'm following down.

PC: *Mmm.*

LRH: It's a – I'm getting wider. The closer we get in to the base on this, why, the more we're getting close to this little double tick. Okay?

PC: *Mmm.*

LRH: And that's what we're looking for. We're looking for something... Apparently every time you say something about your *mother* or his mother, or something, we get this double tick.

PC: *Yeah?*

LRH: See, I can turn this on here. All right. What should your mother have found out about you? See, and there it is – little one.

PC: *Yeah, I know. This is...*

LRH: See, I say something on that order. Now, you want to answer that question?

PC: *Well, sure, she should have found out that I wasn't as pure and perfect as she thought I was.*

LRH: As who was?

PC: *As she thought I was.*

LRH: Oh, all right. All right.

PC: *Or that she insisted that I should be...*

LRH: All right.

PC: *... is more in line.*

LRH: All right. Now, we're following down the track here about sleeping with a man to trap him.

PC: *Mmm.*

LRH: And we're mining gold all the way. But I think there is an incident before 1926.

PC: *I think there is, too, but I haven't a clue.*

LRH: And where is it? You said two years earlier.

PC: *Yeah.*

LRH: And you didn't know whether it was or wasn't. Well, what happened two years before this time? Where were you living?

PC: *In uh...*

LRH: That's it.

PC: *Park City.*

LRH: Hm-hm.

PC: *Montana.*

LRH: Park City what?

PC: *Montana.*

LRH: Montana. Park City. All right. And is there some sort of an incident there where you got all mixed up with somebody or something?

PC: *Mm-mm.*

LRH: Is there any incident in Park City? I don't know here. I'm getting a little bit of a rough line. This...

PC: *Well, there could be, but...*

LRH: Is there some incident in Park City? No, it isn't Park City. Is there some...

PC: *Is it Glen Ullin – Glen Ullin, North Dakota, then?*

LRH: Is that earlier?

PC: *Well, that would be in – when I was four, we moved from...*

LRH: Yeah.

PC: *... Glen Ullin to Park City.*

LRH: Well, haven't you any memory back of...

PC: *No.*

LRH: ... that at all, huh?

PC: *Just splotchy pictures.*

LRH: Hm-hm. Just got some pictures?

PC: *Mm.*

LRH: What pictures?

PC: *Well, I've got a picture of a – a stone house that I assume is my birthplace.*

LRH: All right.

PC: *Then later in Park City, I've got a couple or three pictures.*

LRH: Hm-hm. All right. Is there any other incident here with your brothers? I get a little slowdown there.

PC: *Well, there is the one incident with my brother, Bob. But this is not on sex-line stuff.*

LRH: What about that, just roughly?

PC: *Well, I was supposed to care for him, and...*

LRH: And you didn't.

PC: *Well, there's some mystery on this one. I don't understand my reactions in that.*

LRH: Well, what is your reaction?

PC: *Well, a little girl tried to take him away from me, and I got panicky...*

LRH: Hm-hm.

PC: ... *and it's way out of proportion to the situation.*

LRH: Well, what happened?

PC: *I hit her in the stomach with a rock.*

LRH: And what happened with that?

PC: *That's all. Just she – I – it hurt.*

LRH: Hm-mm.

PC: *And I got my brother back, but uh...*

LRH: Hm. How old were you then?

PC: *Four.*

LRH: About four. Is that the incident here on the 19 – ...

PC: *1924.*

LRH: That's the 1924 incident.

PC: *Mmm.*

LRH: That's it. Tick, tick.

PC: *Mm-hm.*

LRH: All right. This have to do with a man?

PC: *Hm. Took my brother who was a...*

LRH: All right. Well, was he...

PC: ... *he was younger.*

LRH: What was he? A boy?

PC: *Mm-hm. Two.*

LRH: All right. It had to do with a boy.

PC: *Mmm.*

LRH: All right. What about this boy?

PC: *Well, I was supposed to take care of him.*

LRH: Right?

PC: *Mother said I should look out for him.*

LRH: Mm-hm.

PC: *And I had agreed to care for him.*

LRH: Hm-hm.

PC: *But this little girl was just teasing, said I was – she was going to take him away from me. And just – I got panicky.*

LRH: Hm-hm.

PC: *And I just – it was just a – almost a reflex action. I picked up the rock and threw it at her to stop her...*

LRH: Hm-mm.

PC: ... *from taking him away. I don't know where the hell she would have taken him.*

LRH: Yeah.

PC: *She was only four, too.*

LRH: Yeah.

PC: *You see?*

LRH: And where did the rock cut her?

PC: *In the stomach.*

LRH: Uh-huh. She bleed much?

PC: *It didn't cut her. It just went pow! in her stomach.*

LRH: I see. It just went pow! in her stomach. Did she bleed much?

PC: *She didn't bleed at all.*

LRH: Are you sure?

PC: *Yeah.*

LRH: You're sure?

PC: *Well, no. Of course, I'm not sure. But I don't think so.*

LRH: Come on. How seriously was this little girl injured?

PC: *Well, she uh – she cried. And I just imagine because it hit her in the stomach, that it was awful painful. It is when I get hit in the stomach.*

LRH: Huh?

PC: *It's...*

LRH: What else did you do to her?

PC: *That's all – I think.*

LRH: All right. Did you hit her in the stomach?

PC: *Mmm.*

LRH: With a rock.

PC: *Mmm.*

LRH: That's it. With a rock.

PC: *Mmm.*

LRH: All right. Who else did you hit with a rock?

PC: *Oh, well, heavens, I...*

LRH: Oh, well, now we're onto something else.

PC: *Now, yeah. But not earlier. I mean, I used to throw rocks at my brothers. I don't think I ever hit them though.*

LRH: Uh-huh.

PC: *I was a lousy shot.*

LRH: All right. But which one of them did you blood?

PC: *How'd blood get into the act?*

LRH: I don't know how blood got into this.

PC: *Oh. Well, well, there's my brother, Bob. There's the incident when I hit him into a rock. I mean, it was concrete. It wasn't that I threw a rock at him, but I hit his head into a rock – into concrete.*

LRH: Hm-hm, you did.

PC: *Yeah.*

LRH: And that bled?

PC: *Yeah, that bled.*

LRH: That bled.

PC: *That bled. Yes.*

LRH: All right. Fine. How old was he?

PC: *Uh – he was older then. He was – oh, I should say four and I was six. That's roughly.*

LRH: All right. And what did you do?

PC: *I made an airplane out of him. I was swinging him around...*

LRH: Yeah.

PC: *... me.*

LRH: Mm.

PC: *I was going around and had him by the feet, you see...*

LRH: Mm. Mm.

PC: *... and I was swinging him round, and I hit his head into the concrete block.*

LRH: Because you were dispersed.

PC: *Yeah.*

LRH: Yeah. Go on.

PC: *Yeah.*

LRH: And what happened, there?

PC: *Well, I injured him very seriously.*

LRH: All right, how seriously?

PC: *Well, he's still got a knot on his head which he...*

LRH: Uh-huh.

PC: *... assures me every time I see him that I did it. And I did.*

LRH: All right. What did this do to him mentally, at the time?

PC: *Hmm. Well, he – I think he was almost out cold.*

LRH: Hm-hm.

PC: *I was going to say it cold-cocked him.*

LRH: Well, did it?

PC: *It stunned him. It did. Yes.*

LRH: Mm. Mm. What did you think you had done at that time?

PC: *Well, I thought I had injured him beyond repair, really.*

LRH: Yeah.

PC: *Like his head was pretty wide open.*

LRH: And when was that?

PC: *Uh – 1926, I would say, roughly.*

LRH: Mm-hm.

PC: *I'm not sure.*

LRH: All right. When was it? Have you been told about this or do you remember it?

PC: *Oh, no. I remember it.*

LRH: You remember doing this.

PC: *Yeah.*

LRH: All right.

PC: *I was having a ball.*

LRH: All right. And?

PC: *And I slipped, actually. I mean, I got his head too low, and it cracked up against the concrete.*

LRH: Uh-huh.

PC: *And he uh – he was stunned. I don't remember whether Mother uh – patched him up or not.*

LRH: All right. Well, what might have appeared there?

PC: *Well, the wound.*

LRH: Hm-hm. Very good. And who didn't find out about it?

PC: *I don't think Dad did.*

LRH: Hm-hm. Who did you withhold that from?

PC: *Well, from Dad.*

LRH: Hm-hm. Anybody else fail to find out about it?

PC: *The doctor. I don't think he was taken to the doctor.*

LRH: Took him to the doctor?

PC: *They didn't take him.*

LRH: They didn't.

PC: *Mm-mm.*

LRH: Doctor didn't find out about it.

PC: *Mm-mm.*

LRH: Well, who else didn't find out about it?

PC: *I'm not so sure Mother did. I think it was my sister patched him up.*

LRH: Hm-hm.

PC: *I don't remember, but I don't think she did.*

LRH: Was there a big secrecy involved in this?

PC: *Well, just uh – occlusions more than secrecy. I don't remember.*

LRH: Oh, no, no, no, no, no, no, no, no, no. Now, now, now you weren't carrying any banner signs around there...

PC: *Oh, of course not!*

LRH: ... telling everybody "I busted my little brother's head open."

PC: *No, no, no. No.*

LRH: All right. Who did you keep this from?

PC: *Oh, well, I kept that from the kids at school, and teachers, and...*

LRH: Hm-hm. And your father and your mother.

PC: *Mother, and anybody that would have made me guilty.*

LRH: All right.

PC: *Like the townspeople.*

LRH: Very good. Do you actually remember now suppressing that?

PC: *Yeah. Sure. You wouldn't uh – that's a now-I'm-supposed-to, actually. I mean, you wouldn't go around saying you'd bashed your brother's head in.*

LRH: Yeah, but did your mama know about it?

PC: *I don't think so.*

LRH: Now, how did she escape knowing about it?

PC: *Oh, well, my sister was very effective in patching up wounds.*

LRH: Mm-hm. Mm-mm. She helped you suppress this.

PC: *Yeah. Well, actually my brother did, too.*

LRH: He helped you, too.

PC: *Well, we protected each other from my parents.*

LRH: All right. Very good. And did you get your brother to agree not to tell?

PC: *No, it was a tacit agreement.*

LRH: I see. You didn't tell him not to tell.

PC: *No.*

LRH: You just knew he wouldn't.

PC: *Yeah. I just knew he wouldn't.*

LRH: And your father didn't find out?

PC: *No.*

LRH: And your mother didn't...

PC: *I know my father didn't.*

LRH: Your mother didn't find out?

PC: *I'm not sure...*

LRH: Mm-hm.

PC: *... about my mother, whether it was Mother that patched him. Mother would have protected us...*

LRH: Well, did your sister even know?

PC: *Well... I don't know. I don't know. It was either Mother or my sister Agatha that patched him up. And if it was Mother, my sister didn't know.*

LRH: Hm?

PC: *If it was Mother that patched him up, then my sister didn't know.*

LRH: Well, which is it that didn't know?

PC: *I don't know. Must have been my sister because I think my mother would have beaten me up, and I don't remember getting beaten up by my mother. I'm just assuming now though.*

LRH: You got this figured out that way.

PC: *Yeah!*

LRH: Yeah.

PC: *It's just logical.*

LRH: But here's a head injury – here's a head injury that remained a secret to your family.

PC: *Hm.*

LRH: Is that right?

PC: *Mm-mm.*

LRH: All right.

PC: *That's not unusual.*

LRH: All right. It's not unusual, but I'm just pointing out that here is...

PC: *Mm-mh.*

LRH: ... an incident of that character. What else did you do to bloody your brothers up?

PC: *Well, I've got the later incident with my brother Jake when we got into a fight.*

LRH: Mm-hm.

PC: *I didn't bloody him up though. Oh, I guess I did. I scratched him.*

LRH: Oh, you guess you did it.

PC: *Yes, I did.*

LRH: Now come on. Did you or didn't you?

PC: *Yes, I did.*

LRH: All right. When was it?

PC: *Oh, that was way later. I was about fifteen.*

LRH: All right, honey. And what did that consist of?

PC: *You mean, you want all of it?*

LRH: Well...

PC: *Well, I was supposed to fix his lunch, and I didn't. So he tried to get me to fix his lunch, and I fought back.*

LRH: Yeah. And what did you do?

PC: *Well, I just uh... See, I was littler than he was. And I just fought like I wasn't.*

LRH: All right. Okay.

PC: *And I – he got so mad that he forgot I was littler, and we had a fight like we were evenly matched.*

LRH: Yeah. What did you do to him?

PC: *Oh, just uh – it was pretty dispersed, but I – I kicked and clawed and bit...*

LRH: Hm-hm.

PC: *... in any part of the body that I could get ahold of*

LRH: All right. Good. And what did you do?

PC: *Uh – shhh... well, mostly w-w-w-w – scratched him and bit him.*

LRH: All right.

PC: *I kicked... yeah, I kicked him, too.*

LRH: Did you bloody him up?

PC: *I don't have a picture, but I assume if I – if I scratched, I would have bloodied him up. Sure.*

LRH: Mmm.

PC: *I mean, I...*

LRH: Well, what do you know you've done there?

PC: *Just that I fought tooth and toenail...*

LRH: All right.

PC: *... with all the strength I could conjure up at fifteen...*

LRH: That's good.

PC: *... with this body.*

LRH: All right.

PC: *That I know.*

LRH: All right. And who did you both keep that from?

PC: *Mother.*

LRH: All right. Anybody else?

PC: *Dad.*

LRH: All right. Okay. That's all?

PC: *Yeah.*

LRH: Seems like you didn't seem to enjoy the confidence of your parents anywhere along the line.

PC: *I didn't.*

LRH: You didn't, huh?

PC: *Oh, no.*

LRH: What did you do? Has this lifetime been a career of keeping things away from your mother?

PC: *Mm-mm. Mostly Dad.*

LRH: Mostly Dad.

PC: *Yeah.*

LRH: Mother? Keeping things from Mother?

PC: *Well, yeah. There would be some type things I'd keep from Mother, and there'd be other type...*

LRH: Sex.

PC: *Yeah.*

LRH: Sex you'd keep from Mother.

PC: *Yeah. I'd keep from Mother.*

LRH: That's good.

PC: *And anything that would provoke my Dad's temper, I would keep from Dad. And fighting would provoke his temper, you see?*

LRH: Mm-hm. All right. He'd get mad, in other words.

PC: *Oh, he'd get... Yeah.*

LRH: He'd get furious.

PC: *Yeah.*

LRH: All right. So keeping things from Dad. That's bing, bing. Now, what type of thing would you keep from Dad?

PC: *Well, I keep breakage...*

LRH: Yeah.

PC: *... getting into trouble with uh...*

LRH: Good.

PC: *... the school authorities.*

LRH: All right.

PC: *And beating up the guy who tried to beat us up for stealing his watermelons.*

LRH: Right.

PC: *These things.*

LRH: Go on.

PC: *Just if I would get into trouble...*

LRH: All right.

PC: *... I would keep it from Dad.*

LRH: Any trouble...

PC: *Yeah.*

LRH:... would be kept from Dad.

PC: *Yeah.*

LRH: So he's the symbol of no communication if in trouble.

PC: *Yeah.*

LRH: Is that right?

PC: *Well, he's more than that. He wouldn't let us talk to him, actually, either.*

LRH: He said, "No," huh?

PC: *He just said "Don't talk! Just talk when you're spoken to."*

LRH: Oh, I see. All right.

PC: *And we had that one and then the other one, we don't talk if we got into trouble, because why invite more trouble?*

LRH: All right. How did you trap your father?

PC: *Oh! Gee! I did that with ARC.*

LRH: All right. How did you do that?

PC: *Just uh – uh – mmm – uh...*

LRH: Go on.

PC: *Well, I just wouldn't let him keep this game going. I moved in, got close to him.*

LRH: Hm-hm.

PC: *Got him off of this German "I am the father and you are the child, so*

therefore you must never speak to me unless you're spoken to."

LRH: Mm-hm.

PC: *I just would speak to him.*

LRH: Mm.

PC: *I would demonstrate affection.*

LRH: Mm-hm.

PC: *And it worked.*

LRH: All right. What didn't he find out about this?

PC: *Hmm. Well, mostly what he didn't find out was that he didn't have a prayer with our family after he got off of that one that he used to control us.*

LRH: All right. And what didn't he have a prayer with, now, exactly?

PC: *Well, he didn't have a prayer with me or – or the rest of the family.*

LRH: Good. Now how did you trap him specifically and exactly?

PC: *Well, I don't remember exactly when it was, but I know there was the first time when I kissed him.*

LRH: I see.

PC: *You know?*

LRH: All right. Very, very good. When was that?

PC: *Uh...*

LRH: That's it.

PC: *Well, that was, I would – should say 1938. But, actually, what I'd – happened is I stumbled onto this earlier incident of violence.*

LRH: Of what?

PC: *Of violence with him...*

LRH: Yeah?

PC: ... *which was not an answer to your question.*

LRH: With – what – I didn't get what this earlier incident was of...

PC: *Well, I've got an incident when I was sixteen when I stopped him from beating Mother.*

LRH: Oh, I see.

PC: *And it got into a violent – violent incident rather than...*

LRH: I see.

PC: ... *an incident of affection.*

LRH: Oh, all right. That's perfectly all right.

PC: *Mm.*

LRH: Nobody is worrying about this.

PC: *Yeah.*

LRH: Now, you trapped him with a kiss. Is that right?

PC: *Mm-hm.*

LRH: All right.

PC: *That was affection there that actually trapped him.*

LRH: An affection. Did you feel the affection?

PC: *Yeah.*

LRH: All right. Very good. Something wrong with affection here, honey?

PC: *Well...*

LRH: What is this all about?

PC: *Well, you don't demonstrate affection to a German father!*

LRH: I know, but what about affection in general?

PC: *Well, youuuuuuuu – well, actually, it's a trap.*

LRH: Uh-huh.

PC: *It's – that traps men.*

LRH: Affection is a trap.

PC: *Yeah.*

LRH: That's the way it equates.

PC: *Mmm.*

LRH: That's the way it equates.

PC: *Yeah.*

LRH: All right. Very good. All right. Who doesn't know about this?

PC: *Charlie doesn't know this.*

LRH: All right. How about Jimmy?

PC: *Well, yeah, Jimmy doesn't know about this. Actually, that's what's – goes on with me with the students here, too.*

LRH: All right.

PC: *I want to get close to them, but I already know it's a trap...*

LRH: Yeah, go on. Go on.

PC: ... *to be affectionate. Go on what? Who else doesn't know?*

LRH: Tell me. Go on. Who doesn't know about this?

PC: *Oh!*

LRH: Let's get the roster out here.

PC: *Well, my dad didn't know it.*

LRH: All right.

PC: *My brothers.*

LRH: That-a-girl.

PC: *My...*

LRH: That-a-girl.

PC: *Any... I've got it: it's a trap if you have affection for a man.*

LRH: I see.

PC: *Yeah.*

LRH: I see. All right. And who doesn't find out about this?

PC: *Uh... well, none of the men I've ever known.*

LRH: Just the lot.

PC: *Yeah!*

LRH: All right. Very good. Very good. That's all I was trying to check into.

PC: *Yeah.*

LRH: How about the little kids that you were around?

PC: *Well, it's all right to feel affection for kids.*

LRH: Well, come on. How early did this start?

PC: *Well, it started uh – real early with me with my father. But like it was all right for me to feel...*

LRH: There we are. There we are. The tick-tick. Started very early with you and your father.

PC: *With my father.*

LRH: Did you – what – how old were you? Four, two, three, what? Four? Two? One? One?

PC: *Probably.*

LRH: But did you know at that time that it was a...

PC: *No.*

LRH: ... action? Well, when did you overtly use this to betray him?

PC: *Well, that time when I was eighteen.*

LRH: All right. And what happened there exactly? Now, we got onto that a moment ago and got off of it.

PC: *Well, just I intended to get him off of this other one he had on. You know, where he's totally individuated. So I demonstrated the affection for him...*

LRH: Hm-hm.

PC: *... and then – hmm – like he was trapped and I was trapped, both, on this one.*

LRH: Hm-hm. Is that so?

PC: *Yeah.*

LRH: All right. And what didn't appear there?

PC: *Hmm. This one flipped... I have trouble with it because I don't ever know whether it's – oh – what's supposed to. You know, like the thing that didn't appear there was just actually a warning of things to come.*

LRH: All right. All right. Very good. What things to come?

PC: *Well, like he was vulnerable then. Mother used this one on him particularly.*

LRH: Hm-hm.

PC: *She would withdraw affection from him.*

LRH: All right. Very good. And who didn't find out about it?

PC: *Well, actually I didn't find out about it at that point. I didn't realize that's what I was doing.*

LRH: All right. When did you decide this is what you were doing?

PC: *Well, jus – I didn't really connect it up until now...*

LRH: Oh, all right. Very good. Very good.

PC: *... that this is part of the thing that goes on with me.*

LRH: All right.

PC: *That used to bug me.*

LRH: All right. This seems real to you?

PC: *Mmm.*

LRH: I haven't forced any cognitions on you, have I?

PC: *No, no, of course not. See, this – I have got a late incident. It happened here on course – is the last incident.*

LRH: Yeah? Yeah. Well, there's a whole series of these incidents.

PC: *Yeah.*

LRH: And they consist of "trapped with affection."

PC: *Mmm.*

LRH: Trapped with affection.

PC: *Mmm.*

LRH: All right. All right. Very good. Okay. Now, how far back does this go?

PC: *Well, it doesn't go... Just to trap with affection doesn't go. I just wouldn't do it. I never would do that, I don't think. I don't remember any earlier incidents. I mean, I would try not to.*

LRH: Try not to trap with affection.

PC: *Yeah.*

LRH: Then what does that do? What's the result of that?

PC: *You're lonely.*

LRH: Oh, I see. So if you use affection, you trap.

PC: *Yeah.*

LRH: And if you don't use affection, you don't trap.

PC: *Mmm.*

LRH: I see. All right, honey. All right. And uh... That's very interesting. When is the first time you really trapped a man that way? Or a boy?

PC: *Oh, wait a minute. I do have some incidences on this. Actually, I've got an incident with a priest.*

LRH: Hm?

PC: *With a priest...*

LRH: Oh, yeah.

PC: *... this life. Yeah. Father O'Sullivan. That's what happened there; it was just...*

LRH: All right. What life was that?

PC: *This life.*

LRH: This life?

PC: *Yeah. Huh.*

LRH: You were a...

PC: *I was a Catholic this life, you see.*

LRH: Oh, yeah. All right.

PC: *And I was, oh, fifteen, sixteen, when Father O'Sullivan was our parish priest.*

LRH: All right. Good. And what happened?

PC: *Well, it was just uh – I got – just got real close to him.*

LRH: Good.

PC: *Got to liking him.*

LRH: Good.

PC: *And he – it was a – a real close, affectionate situation. Nothing sexual.*

LRH: I know, but uh...

PC: *There was a lot of affection...*

LRH: All right.

PC: *... there – me for him and him for me.*

LRH: Okay. Now exactly what occurred? Something must have occurred.

PC: *Well, yeah. I was actually... Thisssss is – this is interesting in view of the fact Dad said I'm stupid. I was the outstanding student in the catechism class.*

LRH: Ah! Very good.

PC: *And uh – got just uh... Well, just uh – by being outstanding and smart in catechism, I attracted his attention.*

LRH: All right. Good.

PC: *And I just got a real pull for the affection for him.*

LRH: Hm-hm. Go on.

PC: *Well, this one was pretty disastrous, because you don't really get that close to a priest.*

LRH: Yeah, all right.

PC: *It violates the...*

LRH: All right.

PC: *... "all that's holy in the Catholic Church," you see?*

LRH: Right.

PC: *But that's all that happened. There wasn't any uh...*

LRH: Well now, what was disastrous about it? That's it.

PC: *Well, for one thing, I don't think he's any longer a priest.*

LRH: Uh, really?

PC: *I don't think so.*

LRH: What did you do?

PC: *Well, I don't think I did... I think I just contributed to this one.*

LRH: Yeah, but what happened? There's a...

PC: *Just that I – I got closer to a priest than a girl...*

LRH: All right.

PC: *... is supposed to get to a priest.*

LRH: And then what happened?

PC: *Then he left town.*

LRH: Well, why did he leave town?

PC: *Uh – I don't know, but I do know that he was moved to an Indian mission, which is a reduction in status for a priest.*

LRH: All right. Well, what occurred? What happened there? You got a – you're leaving me with a blank.

PC: *Mmm.*

LRH: All right. You're very bright in class, and you get next to this priest, and then he leaves town.

PC: *Well, there – actually, there wasn't anything else did happen.*

LRH: Well, what did you do that was an overt?

PC: *Just got that close to him.*

LRH: And that what?

PC: *Just to form uh – that much of a personal relationship with him.*

LRH: Yeah.

PC: *To get on that ah – ah – just on the same basis with him rather than as a priest – girl in the parish.*

LRH: Good. Bing, bing. Now what... There's something there, see?

PC: *Yeah.*

LRH: There's something there. There's something more there than just that.

PC: *There is?*

LRH: What is it?

PC: *Well, there's – there was an incident there when...*

LRH: Yeah, that's what we want. What is it?

PC: *I went into a game with him that you don't – you shouldn't play with a priest. Like I got mad at him and told him I was never going to speak to him again. And then he got me to speak to him again. I was walking down the street one day and I saw him, and I just had my head – I wasn't going to speak to him.*

LRH: Hm-hm.

PC: *And as he passed me, he put his face into my face and said "Hello."*

LRH: Hm-hm.

PC: *And we got back into communication again.*

LRH: Hm-hm.

PC: *But there really... That's about all...*

LRH: Nothing else happened?

PC: *No.*

LRH: Was there anything happened there? Was there anything happened with that priest?

PC: *Mm-mm. That's an – that's...*

LRH: Was this kind of charged?

PC: *Well, that's enough!*

LRH: What's enough?

PC: *Well, to get that close to a priest! You're not supposed to get close to a priest. Now – uh?*

LRH: What did you do to the man?

PC: *I don't know.*

LRH: Would this ruin him in some way? What's the overt here? Showing affection?

PC: *Well, it's – it's knocking him off his priest uh – priestliness. I mean, he was a man instead of a priest.*

LRH: All right. All right. But what happened here, exactly? Did you set out to plan to do this?

PC: *No.*

LRH: Did you know this was bad?

PC: *Yeah.*

LRH: You did know this was bad?

PC: *Mm-mh.*

LRH: Well, you went ahead and did it though.

PC: *Mm.*

LRH: Uh, you knew it was bad...

PC: *Mm.*

LRH: ... and you went ahead and did it.

PC: *Well, sure.*

LRH: All right. Who didn't find out about it?

PC: *Uh, well, hell, my mother didn't find out about that or any of the church people.*

LRH: All right. Very good.

PC: *Besides that, if they'd have found out about it, they'd have said I was uh – trying to sleep with him, which I wasn't – I don't think.*

LRH: All right. All right. Okay. And what appeared there then?

PC: *Well, a man instead of a priest!*

LRH: Uh, all right. All right. And who didn't find out about that?

PC: *Well, he didn't.*

LRH: All right. Very good. Now, when was this exactly?

PC: *In '36. I was sixteen, I think.*

LRH: Over what period of time was it? How many weeks? Months? Days?

PC: *Uh – it was that summer when I was being prepared for confirmation.*

LRH: Go on.

PC: *Was in the summertime – was in summer school. I was being prepared for confirmation, so it was over a period of weeks.*

LRH: Over a period of weeks.

PC: *Yeah.*

LRH: Very good. And what didn't appear there?

PC: *Hm. I'm hung up on a occurrence there, too.*

LRH: What is the occurrence?

PC: *Well, he flipped me one time when he was testing us finally for our uh – whether we were fit to be confirmed. And he tested all the other students on the catechism...*

LRH: Mm-hm.

PC: *... but he asked me questions out of the Bible. That was a betrayal, 'cause I didn't know anything about the Bible.*

LRH: Uh, I see. All right. Good enough. And who didn't find out about it?

PC: *What...*

LRH: Who didn't get any answers?

PC: *He didn't. He didn't. I hit a blank.*

LRH: All right. You hit a blank.

PC: *Uh.*

LRH: That's quite interesting. Before that, you were bright. Is that what you are saying

PC: *Yeah.*

LRH: And after that you were stupid.

PC: *Yeah.*

LRH: All right. How do you account for this?

PC: *Why, that I was just – I was going to cogitate on this. I was wondering if this had any connection with...*

LRH: Well, is that correct?

PC: *Well, yeah. It's just after that I had...*

LRH: Am I rushing your cognition?

PC: *Yeah. You are.*

LRH: All right.

PC: *Yeah.*

LRH: Good enough.

PC: *'Cause it was just that feel there of stupidity.*

LRH: You ever spot this before?

PC: *No. Not really.*

LRH: All right.

PC: *But I – there's something else there.*

LRH: Yeah, what is there?

PC: *Well, I feel there that I betrayed him.*

LRH: Mm-hm.

PC: *And...*

LRH: Did you?

PC: *Yeah.*

LRH: How?

PC: *I was supposed to be smart. I was supposed to know about the Bible.*

LRH: uh, I see. You were supposed to know...

PC: *Mmm.*

LRH: ... about the Bible.

PC: *Mmm.*

LRH: All right. And what happened?

PC: *I didn't.*

LRH: Uh-huh.

PC: *I didn't ever...*

LRH: And who didn't find out about it?

PC: *Well, he didn't find out it soon enough to not ask me the questions.*

LRH: I see. Well, when did this examination – did this examination take place in front of witnesses?

PC: *Uh, yeah. Up in front of the other students.*

LRH: uh, I see. All right. And that was a source of what to you?

PC: *Well, a source of failure on him, like I've supposed to...*

LRH: All right, what were you trying to cover up in front of these students, Dorothy?

PC: *Huh?*

LRH: That area must be loaded with missed withholds.

PC: *Well, did try to cover up that I was his favorite.*

LRH: Yeah. All right. What else didn't they find out there?

PC: *Well, you know, what I have a feel of here is – that they failed to find out – was that I didn't consider myself smart because I knew catechism. Catechism is a cinch.*

LRH: Mm-hm.

PC: *I mean, there's non – a knucklehead could learn about catechism.*

LRH: All right. And they didn't find out about that.

PC: *Mmm.*

LRH: All right. Very good. Now, did you do anything to this priest?

PC: *Well, I sure let him down that day.*

LRH: All right. Very good. This make him feel foolish?

PC: *Yeah.*

LRH: Hm-hm. Did he look confused?

PC: *Mmm.*

LRH: All right. And what did you do there?

PC: *Mm. I was noticing something else there, too.*

LRH: What?

PC: *Well, he expected... This has happened a lot in my life. He expected me to be smarter than I was. I didn't come through, you know?*

LRH: Mm-hm.

PC: *I did an incident like that on you.*

LRH: Yeah, yeah. All right.

PC: *In '55.*

LRH: All right.

PC: *Yeah.*

LRH: Okay. And your brightness failed to appear, is that right?

PC: *Yeah! It sure did, man!*

LRH: All right. Very good.

PC: *That's right. It...*

LRH: Yeah.

PC: *... let me down, boy. It didn't appear.*

LRH: All right. Very good. And who's been in the dark about this?

PC: *You.*

LRH: All right.

PC: *It's failing to appear here, too, you know – my brightness. Yeah.*

LRH: All right. Okay. All right. Very good. All right. Then what's the missed withhold?

PC: *"I ain't as bright as people think I am" is actually the missed withhold.*

LRH: Hm-hm.

PC: *I'm not.*

LRH: Well, what uh – is that the thing that everybody misses on you?

PC: *Mmm.*

LRH: Hm-hm.

PC: *Mother and all.*

LRH: Everybody misses this.

PC: *Yeah.*

LRH: One and all.

PC: *Yeah.*

LRH: All right. Let's go back to this incident in the cornfield.

PC: *Okay.*

LRH: Is that a piece of it?

PC: *uh – I...*

LRH: Is that part of the same picture?

PC: *Yeah.*

LRH: Yeah? Well, how is it part of the same picture?

PC: *Well, my brightness didn't appear there, because if it had – have, I would have known that Mother – this was not one of Mother's acceptability's. She – that she – just... Sex was something she just couldn't confront.*

LRH: All right.

PC: *Yeah.*

LRH: All right. Okay. Now, is there any earlier incident when they – somebody should have known this?

PC: *No. Not that I remember.*

LRH: All right. I don't get anything clicking on the meter.

PC: *Uh, good.*

LRH: All right. Now, there seems to be there are a whole chain of incidents here.

PC: *Yeah.*

LRH: Something on this order.

PC: *Yeah. There is.*

LRH: Describe this circumstance to me here just what we've been finding out and plumbing into here, and so forth.

PC: *Well, what I've got straight is that any darn fool can learn anything that they have – you know, that's easy to learn.*

LRH: Yeah.

PC: *But if it's hard, I'm not bright. I can't learn anything hard.*

LRH: All right. Good. Click, click. There it is.

PC: *Yeah. Sure, I mean, Scientology auditing is hard.*

LRH: All right.

PC: *Like, I can sit down and get a preclear to talk to me.*

LRH: All right.

PC: *But I can't do a heck of a lot with Class III stuff*

LRH: All right.

PC: *You know?*

LRH: Click, click.

PC: *Mmm.*

LRH: Hm-hm. Well, how does this all add up?

PC: *Well, it adds up to "I am not acceptable to people as soon as they find out I'm not bright." That's how it adds up.*

LRH: Now, what proved this to you when you were four or six or something like that? What...

PC: *Well, because Mother told me I was not acceptable to her.*

LRH: When did she say this?

PC: *When I was four.*

LRH: Hm-hm. What did you do?

PC: *I...*

LRH: What had you done?

PC: *You mean because she said that?*

LRH: Mmm.

PC: *uh, I had communicated to her about an experience.*

[Please note: At this point there is a gap in the original recording. We now re-join the session where the original recording resumes.]

LRH: Is there another sexual incident when you were – there. Bing, bang What's that?

PC: *Well, I've always had a – a horror that one day I was going to get something un – unoccluded and find that my father had sexually...*

LRH: All right.

PC: *But I – I have no recall on this.*

LRH: All right. Very good. We got the same tick-tick on your father here a while ago.

PC: *Mmm.*

LRH: Now, what is this? Did something happen with your father?

PC: *Mm.*

LRH: Was there some sexual incident with your father?

PC: *No, except that he was capable of it.*

LRH: Bing. Bang. Is there a sexual incident with your father?

PC: *Before? No.*

LRH: Well, at any time.

PC: *No. The only thing that I have on my father is that one time when I was taking a bath I didn't pull the curtains, and he watched me through the window when I was naked.*

LRH: All right.

PC: *That's all he did.*

LRH: When was that?

PC: *Uh, I was eighteen – seventeen or eighteen by then.*

LRH: All right. All right. Good.

PC: *And then, of course, the other thing I have is I've always been afraid of – my father was going to sexually molest me, ever since I was a child. I was afraid...*

LRH: Thought what?

PC: *Huh?*

LRH: Ever since you were what?

PC: *A child.*

LRH: Yeah. You always were afraid of that.

PC: *Yeah.*

LRH: Well, who told you this?

PC: *Mother told me.*

LRH: What did she tell you?

PC: *Well, she told me that he wasn't safe to be around. Girls weren't safe to be around him.*

LRH: Uh, I see. And who didn't find out about her telling you?

PC: *Dad.*

LRH: All right. Who else didn't find out about it? Anybody else?

PC: *I doubt it. She used to scream this one to the high housetops whenever she was...*

LRH: Well, what did she used to scream to the high housetops?

PC: *That he was a monster and beast and all this type thing I...*

LRH: Is that so?

PC: *Mm.*

LRH: All right.

PC: *My mother never did uh...*

LRH: All right. Did anything of this character ever happen?

PC: *With Dad, you mean?*

LRH: Yeah, mm.

PC: *Well, not that I know of. I've heard of incidences where he did. My mother... Actually, I'm sure it was true, but I didn't know about it until later.*

LRH: What was true?

PC: *Well, that he had molested my aunt when she was nine.*

LRH: All right.

PC: *But this was way before my time.*

LRH: Mmm.

PC: *And I didn't find out about that till I was sixteen.*

LRH: All right. Is any of this an overt against your father?

PC: *Well, now it is because I can – I have a – better understanding what was going on with him. Now, let's see, was it at the time. It seems like it was, some feel there but not any...*

LRH: All right. Well, what's this four-year-old incident we're looking for?

PC: *Hmm.*

LRH: Tick-tick. What is it? Tick-tick, what is it? Come on. There it is.

PC: *Yeah. Well, this one's been plaguing me ever since '50, and I don't know what it is.*

LRH: Uh, you've had something plaguing you since '50.

PC: *Yeah. This turns up quite often.*

LRH: What?

PC: *Just that there... I get four and six mixed up.*

LRH: Is that the only thing about it that plagues you?

PC: *No, just I feel like something did happen, but I don't know what it is.*

LRH: All right. All right. Very good. All right. Now, just think about this for a moment. What happened to you when you were four? That's it.

PC: *Well, what I thought of is I moved from North Dakota to Park City, but that happened to me, but...*

LRH: Mm-mm.

PC: *... that doesn't seem very significant.*

LRH: All right. What did you do? What did you do when you were four? That's it. Tickety-tick.

PC: *Now I have a stuck picture of the granary – when I was sitting in the granary.*

LRH: Granary.

PC: *Mm. But I don't know what I did.*

LRH: What granary?

PC: *This, I think, is in Park City. I think.*

LRH: All right. Well, who hasn't found out about it?

PC: *Most auditors.*

LRH: All right. Who else hasn't found out about it?

PC: *Well, Mother didn't... I don't think Mother found out about it.*

LRH: All right. Who else hasn't found out about this four-year-old incident?

PC: *Well, I haven't found out about it.*

LRH: All right. Very good. How long haven't you found out about it?

PC: *Sheesh, ever since 1950, when it got dredged up somehow in engraving.*

LRH: 1950.

PC: *Mmm.*

LRH: Very good. Now, who missed that withhold in 1950?

PC: *Mildred.*

LRH: Hm?

PC: *Mildred. One of my first auditors.*

LRH: All right. And what did she miss? Tick-tick.

PC: *Hm. Just missed that I feel there is something there and I don't know what it is.*

LRH: All right. Did you tell her there was something there?

PC: *Well, it was more like she was making – you know, having me go earlier and earlier, and I would – I bumped into it.*

LRH: And what did you bump into?

PC: *Just uh – uh – more of a – a impression that something happened.*

LRH: What's the impression? What do you mean, impression?

PC: *Uh, all I get is just a picture flashes that I'm on this granary – I was sitting in the granary – and I'm sure I had something that I had stolen, but I don't know what it is. And I'm sure it was something that belonged to the neighbor gal, and I don't – I'm sure I was hiding.*

LRH: Mm-hm.

PC: *But that's all I can get on it.*

LRH: All right. Is that what you bumped into when you were – in 1950?

PC: *The impression. It didn't really...*

LRH: Uh, you know more about it now...

PC: *Yeah.*

LRH: ... than you did in '50.

PC: *Mmm.*

LRH: All right. Has this sort of haunted you, this little four-year-old period here?

PC: *Yeah.*

LRH: All right. Well, who's missed it as a withhold?

PC: *Well, Mildred missed it.*

LRH: Who else?

PC: *Paul.*

LRH: Good. Who else?

PC: *Actually, Donna is the one that dredged it up. I got more on it with her than in – any other auditor.*

LRH: Uh, people have been looking for this?

PC: *Yeah.*

LRH: I see. Good. And who's missed it?

PC: *Um – Juanita.*

LRH: Good. Who else has missed it?

PC: *Hm. I was looking at the '55 auditors – Hazel Hart.*

LRH: All right. Good. Who else has missed it?

PC: *Actually, Dick missed it here on course.*

LRH: All right.

PC: *Yeah. He was...*

LRH: Good. Good.

PC: *... poking around in that area.*

LRH: All right. Who else has missed it?

PC: *That's about all. The one I'm looking at here is just a long – all these auditors poking around trying to uncover this one and never being able to...*

LRH: Hm-hm. .

PC: *... get it.*

LRH: Did you think there was anything there originally?

PC: *Uh – not uh – no, not really.*

LRH: You didn't think there was anything...

PC: *Yeah.*

LRH: ... there originally.

PC: *Yeah. It's just that uh...*

LRH: Just a...

PC: *... there should be something when I – I should have a time track when I'm four years old, shouldn't I?*

LRH: I see. All right. All right. Why? Is it because the time track is missing there?

PC: *That's partially it. The other one is that I've got the confusion there. I've always had the six-year-old picture...*

LRH: Mmm.

PC: *... and I always got it confused: it's four, it's six; it's four, it's six.*

LRH: Mm-hm. And is this what they usually take off on?

PC: *Mmm.*

LRH: And so forth. And you usually bring this up.

PC: *Mmm.*

LRH: Is that right?

PC: *Mmm.*

LRH: Now, how do you always bring this up?

PC: *Because they ask me questions on it, and I never know what to do with it. I mean, how am I supposed to answer up to something I don't remember?*

LRH: All right. But how come this turns up in the first place?

PC: *Because my attention just goes that way. I go "bloomp" on this picture, and then I go four, six. There must some – have been something happened at four.*

LRH: Mm-hm.

PC: *I keep figuring on it.*

LRH: Mm-mm. Well, who basically is missing this withhold?

PC: *Well, I am, basically.*

LRH: All right.

PC: *Yeah.*

LRH: All right. Fine. Is there anything there that's withheld?

PC: *Just...*

LRH: Did anything happen when you were four?

PC: *I don't know. You see, there must have been something happened, but I don't know.*

LRH: Well, good. Well, why do you want auditors to look there?

PC: *I don't, particularly.*

LRH: Look, look-a-here. We're going over this ground.

PC: *Mmm.*

LRH: How come we're sitting there?

PC: *Yeah.*

LRH: That's fascinating...

PC: *Yeah!*

LRH: ... isn't it? Now, is there something on either side of this that you want an auditor to avoid? I'm not asking you a dirty question.

PC: *Mm, I don't mind you asking.*

LRH: But is there something there that you want an avoidance on? Is there something there you're trying to avoid? Is there something there you're trying to get auditors to avoid?

PC: *No.*

LRH: Nope. That's right. This is clean.

PC: *Mm.*

LRH: See, I've got to ask these questions to straighten it out.

PC: *Mmm.*

LRH: All right. Did anything happen when you were four? I don't find anything on the meter.

PC: *Well, that's fine with me.*

LRH: Well, who insisted there was something at four? I just asked you if there was something at four. I haven't insisted there's anything there. But who, amongst your auditors, insisted there was something there?

PC: *Well, I don't know why they...*

LRH: There is something right there.

PC: *Yeah, well, I'm not sure that they insisted; just like it came up and they would poke.*

LRH: They'd what?

PC: *They'd poke on in that area to see if we could open up the track.*

LRH: Yeah.

PC: *You know? I don't think they insisted on it, however. Like I would do the same thing I did tonight: It's six, it's four; it's six, it's four.*

LRH: Well, what do you do? Cut your throat on the subject of sex when you were about six by telling on your brother? Is there some regret involved in this?

PC: *Well, sure.*

LRH: Yeah, what's the regret?

PC: *Well... Actually, the most regret I have on this is Mother. Because, I mean, I didn't cut my brother's throat on this one. I mean, Mother beat him up, but then that isn't particularly disastrous. You know?*

LRH: Well, what's disastrous there?

PC: *That my mother had uh... well, had her ideas of the way a little girl should behave shook.*

LRH: Mmm.

PC: *I hadn't intended that.*

LRH: Mmm. Do something to your mother?

PC: *Well, sure, I jus-ss... I did... I indulged in sex play that was totally something she didn't want me to do. Yeah, she's got something like "you're ruined if you do," you know?*

LRH: Mm-mm.

PC: *'Course, I have, too.*

LRH: Mm-mm.

PC: *You know? And like I... I didn't ever intend for her to get this one shook up.*

LRH: Get what? G...

PC: *Get this idea of hers shook up.*

LRH: Mm-mm. Well, did she talk to you about the commercial value of all this?

PC: *That was later.*

LRH: Uh, yeah. But at that time there was something about this, hm?

PC: *Yeah. I didn't actually know she was sitting that strongly on – on it.*

LRH: I see. All right. Now, let's skip what you don't know. Let's take a look at what you *know* in that period. Now, what do you *know* in that period?

PC: *What period?*

LRH: Anytime. Four, six – somewhere around in that lifetime area, in that life area.

PC: *Well, I know that incident.*

LRH: All right.

PC: *I know the incident when I was four when I hit that little girl. I was four then.*

LRH: When you were four...

PC: *Hm.*

LRH: ...you were what?

PC: *I hit that little girl. I know about that.*

LRH: You know about that.

PC: *Yeah.*

LRH: All right. Is that an overt?

PC: *Well, sure.*

LRH: All right. How long have you known about that?

PC: *Well, I've always known that one.*

LRH: All right. Good. And what other incident do you know in four-six period?

PC: *Uh, wait a minute. I – I – I know why auditors would go off on this one, is because I still have that one there*

that is the divided thing where I was sitting in the hall. I can't account for that.

LRH: What hall?

PC: *It's a side porch.*

LRH: Yeah, what about the side porch? You mean you had it... What about this picture? You mean you've got a picture there...

PC: *Mm.*

LRH: ... and auditors keep hitting it?

PC: *Yeah. It turns – it just automatically comes up when I think about that six incident.*

LRH: I see. At four you get a picture of the side porch.

PC: *Yeah. And it's all...*

LRH: Six and four.

PC: *Mmm.*

LRH: Uh-huh. Did it...

PC: *Like...*

LRH: Is it this lifetime?

PC: *Hm?*

LRH: Has the picture anything to do with this lifetime?

PC: *I can't be sure about that.*

LRH: Mm-mm. So you got a picture.

PC: *Mmm.*

LRH: Interesting. How many other pictures you got? Bang! What's that.

PC: *Well, I bumped into that one where I saw that man sitting in the rocking chair. He was a monster.*

LRH: Hm?

PC: *Uh, I saw this monster sitting in the rocking chair, and... But this actually is an actual... I don't know whether I slapped a picture over it or there was actually a man sitting there. But he was there and I called my sister and she came out, and he wasn't – he'd disappeared out of the chair.*

LRH: Yeah...

PC: *I got that picture.*

LRH: All right. All right. Okay. All right. Now, what do we – what *don't* we know about this period?

PC: *Mmmmmmmmm.*

LRH: What is unknown about this period?

PC: *Well, everything – my whole chronological events of my life in that period is unknown to me.*

LRH: All right. Very good. And who's been missing all these?

PC: *Uh, well, all the auditors missed that.*

LRH: Well, good. What's the withholds in this area? What are the real withholds in this area?

PC: *Well, my whole – my life is a withhold there. What did I do? What was I like? You know?*

LRH: Hmm. All right. And who's been missing it?

PC: *Mostly me.*

LRH: All right.

PC: *Yeah.*

LRH: Very good. Very good. And any other data you'd like to tell me about concerning that right now? All right. We got a little halt – little click, little click.

What's that? What are you going over? Bing. Bing. What are you going over there?

PC: *Mostly, I've – mm – come into present time and noticing it was getting late, is all.*

LRH: All right. Good. Is that what you're noticing.

PC: *Mm.*

LRH: All right. Very good. Now, what about sleeping with a man to trap him?

PC: *Jimmy is the only one I'd want to be and Charlie.*

LRH: Hm?

PC: *Yeah, Jimmy and Charlie. No, this isn't true. I had some promiscuity...*

LRH: Hm?

PC: *I had some promiscuity occurred in between Jimmy and Charlie. But I wasn't intending to entrap.*

LRH: All right. Very good. All right. Just let me ask you that question now.

PC: *Okay.*

LRH: All right. Let's find out what the reaction we get on this is.

PC: *Mmm.*

LRH: All right. What about sleeping with a man to trap him? Seems peculiarly uncharged now.

PC: *Mmm. This feels uncharged.*

LRH: Well, do you suddenly feel better about it?

PC: *Yeah.*

LRH: Did you feel worse about it than you do feel?

PC: *Well, I did during the break – felt worse...*

LRH: Mm-hm.

PC: ... *than I did. I feel all right about it now.*

LRH: Mm-mm. Do you think anything has occurred here, then?

PC: *Yeah.*

LRH: What?

PC: *Well, feel more uh – uh – well, actually, less frantic about the whole thing, and notice a lot of connections between my present behavior and past stuff*

LRH: Mm-hm.

PC: *You know?*

LRH: Mmm.

PC: *Like it's what's going on with me with this chronic PTP is just the story of my life.*

LRH: All right, honey.

PC: *Yeah.*

LRH: All right. Nothing too new in this then.

PC: *Mmm.*

LRH: All right, honey. Now, we got a null on this What question.

PC: *Uh, good-o.*

LRH: And so if it's all right with you, why, I'd like to end that Prepchecking and bring us down the line.

PC: *Mm.*

LRH: Okay?

PC: *That's fine. Fine.*

LRH: All right? All right? Okay. Anything you care to say or ask before I end that Prepchecking?

PC: *No. Just...*

LRH: All right.

PC: ... *thank you.*

LRH: All right. All right. Here we go. Okay. Let's walk into these end rudiments, huh?

PC: *Okay.*

LRH: All right. Have you told me any half truth? Have you told me any half-truth? Untruth?

All right. Come up to present time.

PC: *Mm. Okay.*

LRH: All right. See if we get this thing a little bit better here.

PC: *Mm.*

LRH: Have you told me any half-truth? Thank you. Untruth?

PC: *Mm-mm...*

LRH: All right. Said something only to impress me? Uh, what have you said only to impress me?

PC: *Well, I always get the impression when I'm sitting here talking that I am impressing.*

LRH: All right.

PC: *Yeah.*

LRH: All right. You doing it on purpose?

PC: *No.*

LRH: All right. Have you done it on purpose just for me?

PC: *No.*

LRH: All right. All right. Have you said something only to impress me?

PC: *No.*

LRH: All right. Not anything particularly?

PC: *Mm-mm.*

LRH: All right. Let me clear that again.

PC: *Mm.*

LRH: Have you said something only to impress me? That's all right. Have you tried to damage anyone in this session? Tried to damage anyone in this... Boy, you sure stop on *damage*, don't you?

PC: *Yeah.*

LRH: The damage kid, huh?

PC: *Yeah.*

LRH: All right. Okay. Now listen to me: Have you tried to damage anyone in this session?

PC: *No.*

LRH: That's so right. All right. Have you deliberately tried to influence the E-Meter?

PC: *No.*

LRH: All right. That's in this session?

PC: *Mmm.*

LRH: All right. In this session have you deliberately tried to influence the E-Meter?

PC: *No.*

LRH: All right. The subject of E-Meter seems a little rough with you here.

PC: *Yeah, that's a lot of uh...*

LRH: What's the matter?

PC: *... never can tell what the meter is reading on. You know?*

LRH: Don't auditors tell you?

PC: *Well, yeah, they tell me, but they say, "Well, have I missed a with-*

hold?" and I say no, and they say, "Well, it's clicking," and then it's unreal to me because I don't feel like I've failed to tell an auditor something. Then I dig, and it does clean up.

LRH: Mm-mm. Mm-mm. What do you answer them for?

PC: *What do you mean?*

LRH: Just what are you answering them for?

PC: *Well, they say, "Have I missed a withhold on you?" and I say no.*

LRH: They're actually just talking to the meter.

PC: *Is that what goes on?*

LRH: Well, sure. And you say – they say, "Have I missed a withhold on you?" you see, and you say no. And they say, "uh, yes, you have," and so forth. What are you talking for?

PC: *Ha!*

LRH: They're just rudiments.

PC: *Oh!*

LRH: You don't have to say anything.

PC: *Well, then I feel like if I don't do that, then I end up with – it will read when it says "have you failed to answer a question or a command?" See? [PC and auditor laugh]*

LRH: All right. You're going to be caught three ways from the middle.

PC: *Yeah. You're trapped any way you do it.*

LRH: All right, honey. Well, you go ahead and answer it or not, as you please.

PC: *Okay.*

LRH: Okay. All right. Have you failed to answer any question or command I have given you in this session? That's clean. Thank you. You see, you didn't get a chance to answer me, did you?

PC: *Mmm.*

LRH: All right. In this session, have I missed a withhold on you? There's a tiny, latent slowdown. Is there a little bit of something that...

PC: *Just uh...*

LRH: That's it.

PC: *...I'm sure if I dredged, I probably could find a lot of things, but like you haven't missed anything.*

LRH: All right. But in this session...

PC: *Yeah.*

LRH: ... in this session...

PC: *Yeah.*

LRH: ... what we have done...

PC: *Yeah.*

LRH: ... have I missed a withhold on you?

PC: *No.*

LRH: All right. I got a tick. I got a little latent tick here.

PC: *Yeah. Well, I'm afraid if I take a look and I ever find something, then it's going to be missed.*

LRH: Go ahead and take a look.

PC: *Okay.*

LRH: I'm running this session. You relax!

PC: *Yeah. Okay.*

LRH: All right.

PC: *Let's see. No. Nothing.*

LRH: All right. All right, let me check that again. In this session, have I missed a withhold on you? I got a click.

PC: *Mmm.*

LRH: That's it. That's it. That's it. Right there.

PC: *Well, just uh... see, this didn't turn up in this session.*

LRH: Hm?

PC: *It didn't turn up in this session, but it's here now.*

LRH: What is it?

PC: *That's what I don't understand.*

LRH: All right. Well, all right.

PC: *Uh... well, like I've got some discreditable habits that I don't particularly like to talk about.*

LRH: All right. All right.

PC: *You know?*

LRH: All right. Have I failed to find out about those?

PC: *Yeah.*

LRH: All right. Good. Good. All right. In this session, have I missed a withhold on you? Well, it's just a latent tick now. Now, what did you think of on that latent tick?

PC: *Just wondering, well, are you going to – if it's going to click again.*

LRH: Click, click, click. There it is.

PC: *Yeah. Just wondering, is it going to click again?*

LRH: Well, no, it's latent.

PC: *Mmm.*

LRH: It's latent. I'm just being mean. I'm just cleaning it up hard...

PC: *Yeah.*

LRH: ... see? All right. In this session, have I missed a withhold on you? Yeah. Tick.

PC: *Hmm.*

LRH: Tick.

PC: *Well, what you're – what you've missed is I get – just my – my mmm – I'm thinking thoughts, and now it's a missed withhold, and damn it. You know?*

LRH: What is this?

PC: *Just, well...*

LRH: Are you sitting there trying to run the session?

PC: *Uh...*

LRH: Trying to keep yourself from thinking things and thinking things and...

PC: *Yeah. Actually, I'm trying to not to dump all my case in your lap.*

LRH: Well, thank you. Are you trying to keep me from missing a withhold?

PC: *Yeah.*

LRH: Yeah. All right.

PC: *Yeah.*

LRH: You're working much too hard, you know?

PC: *Yeah. I am.*

LRH: You know? That's my job just now.

PC: *Yeah. Okay.*

LRH: All right. But what I've asked for and what I've looked into, you've told me, haven't you?

PC: *Mm-hm.*

LRH: Right. All right. Now, let me ask this question again. In this session, have I missed a withhold on you? There, that's very latent, and we're just going to leave it that way.

PC: *Good.*

LRH: All right. Because I think that one came up from anxiety of "is it going to be clean?"

PC: *Yeah. It did.*

LRH: You sure have a hell of a time with the meter.

PC: *Yeah, I do.*

LRH: Yeah. You're not used to an auditor like me. I just maul you around and say you're supposed to do this and that.

PC: *Yeah.*

LRH: All right. Look around here and tell me if you can have anything. Click!

PC: *I can really have that picture. It reminds me of the Outrigger picture, the one that's in The Outrigger in Seattle.*

LRH: All right. Good enough. Let me check this again.

PC: *Mmm.*

LRH: Look around here and tell me if you can have anything. Tiny slowdown. What else did you run into?

PC: *I was staring right into the face of the camera.*

LRH: Uh, all right. It isn't on, that one.

PC: *Uh, good-o.*

LRH: All right. Let me check it again.

PC: *Okay.*

LRH: All right. Look around here and tell me if you can have anything

PC: *That telephone.*

LRH: That's my girl.

PC: *Mm.*

LRH: That was quite late.

PC: *Yeah.*

LRH: So we're just going to leave that one right *there*.

PC: *Good.*

LRH: You might give me a can – wait a second now. This...

PC: *I've got them clutched awfully hard.*

LRH: That's all right. Let me make sure that you've got some havingness here. Squeeze them. Man! Man, who runs you with havingness that far down? What's your ordinary havingness run?

PC: *Point out something*

LRH: Hm?

PC: *You mean the process?*

LRH: Yeah.

PC: *Point out something.*

LRH: Yeah? Well, here we go. We're going to run a few commands of that. All right?

PC: *Will it be... can I just do it like this?*

LRH: Just do it right like that.

PC: *Okay.*

LRH: All right. Point out something.

PC: *You.*

LRH: Thank you. Point out something.

PC: *That lamp.*

LRH: Thank you. Point out something.

PC: *That picture.*

LRH: Thank you. Point out something.

PC: *That thing on the mantel.*

LRH: Good. Point out something

PC: *The camera.*

LRH: Thank you. All right. Squeeze the cans, just like you did before.

PC: *Mmm.*

LRH: Boy, that's certainly not much can squeeze. How are you holding those cans?

PC: *I'm clutching them.*

LRH: All right. Give 'em a squeeze. Uh right. Point out something

PC: *The telephone.*

LRH: Good. Point out something.

PC: *Those curtains.*

LRH: Good. Point out something.

PC: *The radiator.*

LRH: Good. Point out something.

PC: *The televisions.*

LRH: Good. Point out something

PC: *That chair.*

LRH: Good. Point out something

PC: *That camera.*

LRH: Good. Point out something

PC: *Uh – that cabinet.*

LRH: Good. All right. Squeeze the cans. Well, that's – we're gaining tone arm on it anyhow.

PC: *Mmm.*

LRH: All right. Point out something.

PC: *The couch.*

LRH: Good. Point out something.

PC: *That fireplace.*

LRH: Good. Point out something.

PC: *The fire.*

LRH: Good. Point out something.

PC: *The model on the floor.*

LRH: Good. Point out something.

PC: *That glass.*

LRH: Good. Point out something.

PC: *The lights.*

LRH: All right. Put your cans in your lap now. All right. Squeeze the cans. That's better.

PC: *Mmm.*

LRH: All right. Point out something.

PC: *That case.*

LRH: Good. Point out something.

PC: *That chest.*

LRH: Good. Point out something.

PC: *Uh – those wires.*

LRH: Good. Point out something.

PC: *The curtains.*

LRH: All right. If it's all right with you, I'll give you two more commands and end this process.

PC: *Fine.*

LRH: Very good. Point out something.

PC: You.

LRH: Good. Point out something.

PC: *The sign.*

LRH: Good. All right. Is there anything you care to say before I end that process?

PC: *Just I feel more here.*

LRH: All right. Excellent. End of process.

PC: *Okay.*

LRH: Okay. Now, have you made any part of your goals for this session, which was "find the missed withhold"?

PC: *Yeah. That one doesn't seem very real to me somehow. That uh...*

LRH: That goal? Yeah?

PC: *Yeah. It just what's more real to me is that the chronic PTP is more handled.*

LRH: Uh, all right.

PC: *Yeah.*

LRH: Well, did we find something about this, and so forth?

PC: *Yeah, did, on that one.*

LRH: All right. Then you say "to get this PTP handled." Do you feel better about this PTP?

PC: *Yeah, I do.*

LRH: All right, honey. Very good. All right. Is there any gains you'd care to mention?

PC: *Well, just feel much more comfortable about you. That's a big gain.*

LRH: All right.

PC: *Yes.*

LRH: Okay.

PC: *Yes.*

LRH: All right. Anything else?

PC: *Uh – there's another gain here, but I don't know how to put it. Yes, I do, too, know what it is. More willingness to communicate freely in front of a group. I didn't realize I'd be this comfortable about that.*

LRH: Uh, all right. Very good.

PC: *I didn't have to not-is them either. I was sort of on the edge of awareness that they were there.*

LRH: Well, I must say you came through excellently well with that little warning and that...

PC: *Yeah.*

LRH: ... much of a surprise.

PC: *I was totally uuu-uh when I came up.*

LRH: All right. And then, is there anything that you would care to say or ask before I end this session?

PC: *I would like to know the tone arm actions.*

LRH: Your tone arm action is not quite back up to 2 now. It's been down to 1. You've been varying between 1.5 and 2.

PC: *Mm-mm.*

LRH: Running a half a tone division.

PC: *I see.*

LRH: Okay?

PC: *Okay. Thank you.*

LRH: All right. Anything else?

PC: *No. That's all.*

LRH: All right. Is it all right with you if I end this session now?

PC: *Mmm.*

LRH: All right. Here it is. *End of session.* Okay. Has the session ended for you?

PC: *Yes.*

LRH: Very good. Tell me I'm no longer auditing you.

PC: *You're no longer auditing me.*

LRH: All right. Very good.

PC: *And thanks again.*

LRH: You're certainly welcome.

CRAFTSMANSHIP, FUNDAMENTALS

A lecture given on 3 May 1962

Well, how are you doing tonight?

Audience: Good.

You're looking better. Anyway, I'd like to make a few small comments on the session you saw last night.

Let's see, this is what? Three Mar. [May] AD 12, Saint Hill Special Briefing Course, first lecture. Where is the pc? Is it all right if I make a comment on that?

Female voice: That's fine, yes.

All right, very good.

This lecture, in general, is what I expect out of an auditor. That's what this is. But before we go into that too broadly, I want to make a few comments on that.

There's apparently a considerable amount of surprise expressed here and there that one would stop buying skim milk. And if you were to replay that tape, you would find out at the beginning that the auditor spent something like five or six minutes getting the pc to say something she had done, not something she had intended. Got it?

A missed withhold picked up in a session is anything the pc thinks, anything the pc is withholding. That doesn't matter. That's a session missed withhold, you understand? Pc didn't tell the auditor he was uncomfortable. That's all right for a session missed withhold. But we were prepchecking, and Prepchecking means meat. We only buy meat in Prepchecking, see? We don't buy skim milk. See, we want meat. Preferably with blood dripping off of it. Get the idea? We want some meaningful acts; we don't want meaningless acts. That's a big difference, see?

We don't want antisocial acts, particularly, like "I picked my nose," you know, just because this is seamier – the seamier side of life, you see? An auditor can actually start specializing in just the seamier side of life. And they have nothing to do with anybody, didn't do anything to anybody, don't you see, and specialize in picking up weird and peculiar practices on the part of the pc. He didn't do anything to anybody, you understand, he just had a weird and peculiar practice, you know? It doesn't mean shucks! Heh! Worthless.

For instance, you could take some of the Book One subjects, like masturbation, something like that. Oh, this is embarrassing. Yes, it shows up as something of the sort; it's the

human race, you see? And it's not really doing anything to anybody, unless it is doing something to somebody. You get the idea? A lot of auditors specialize in embarrassing things, see, as the very thing you must pick up. To hell with them! You know? Well, pick them up, but *thathathabooh!* No, we're interested in things people have *done* to people. See? We're interested in *overts*. We is not interested in a withhold because it is simply seamy. Do you get the difference here? There's a considerable difference. He'd done something to somebody. He has an accusative attitude toward somebody, and we want to find out immediately afterwards what he'd done to somebody. Accusative attitude – so what? It merely means he's done something to this person, that's all, see? He's critical of Joe. Well, why is he critical of Joe? Well, he's critical of Joe because he's done something to Joe. See?

Heh, you pick up a missed withhold, "Well, I was critical of Joe." Balderdash! Nonsense! You can pick up 8,762, see, and the pc won't be any better. And all of a sudden somebody gets bright, and say, "Well, what have you done to Joe?"

And he, "Oh, this is nothing – slept with his wife. Didn't tell him. She committed suicide later. He always thought he did it. I realized all the time I had, you know?" Oh yeah. This starts getting something, see? This is more the comparative side of existence, don't you see? I mean, this is more factual. *Done* something, see?

Now, in this session we found out something – and a good auditor could have extrapolated from this – we found out affection was trapping people. See, it was a bad thing. Affection was a bad thing.

Now, if you reach way back into your fundamentals: Auditors either audit by fundamentals or by music. And the best auditors audit by fundamentals. But the job can be done auditing by the words and music, see? You know, just auditing by rote and ritual. Fundamentals. There's an old triangle, and if you think real hard you might be able to remember it. It's called the ARC triangle. And we have found the A triangle was an overt. So therefore, things must look pretty unreal. So therefore, communication of any kind is an overt; so therefore, the thing to do is withhold. And withholding is a virtue, not an overt.

So my next Zero question, having cleaned up the Zero question we went in on, would have been, "What communication, in some portion or another, added up to an overt act?" Got the idea? As a matter of fact, we were picking some up. "Hit a girl with a rock in the stomach." Communication, overt act. See?

Now, part of the present time problem was the dissemination of Scientology. If affection – let's just audit by the seat of our pants here, see? – if affection is trapping people, then communication of Scientology would be reprehensible reactively. You got it?

Audience: Hm-mm.

I'm sorry, pc.

Female voice: That's fine.

That's an evaluation.

Female voice: Thanks.

All right. But there it is. See that? She had two PTPs and we were cleaning up two chronic present time problems. And one of them was a continuing present time problem she's having all the time with her husband which enters into a communication battle all the time, see? See? Letters and telephone calls, and then she has an upset and can't get into session, see?

How could anybody sit around and look at this for a long time, you see, without doing something about this? See, at this point I should get cross with you, because obviously, obviously, there's something else. See? Must have been. But you didn't have the technology. You didn't have the technology down pat.

All right, let's get the technology down pat. I understand you had the technology down pat today, and that is it must have been a missed withhold of the magnitude of a doingness to cause a continuous present time problem – the withhold missed by the person with whom we had the present time problem. So that cleaned it up, huh? In the process of doing this, we didn't have a second session following immediately after this, but the second session we would have cleaned up the other side of the PTP, which is "can't disseminate Scientology." And we had the answer, right there, see? Got the answer gratuitously. See? ARC. If affection trapped people, then communication must do them up in a ball. See? All right, so we'd have to clean up communication withholds. That is, things that she had done with communication that were reprehensible. See? We clean some of those up and we find out, all of a sudden, the whole problem falls apart. We also find out any IQ difficulty that she kept complaining about – the IQ would soar. Do you see why it'd soar? See, it must be down, because she mustn't communicate, which in itself is a continuous withhold. And stupidity equals withhold, you understand? So she feels stupid, so therefore it's the area of withhold. Okay? That make sense to you?

Female voice: Yes.

All right.

That's auditing by fundamentals. See?

I wanted to call something else to your attention, which you might have found very, very interesting, is that we had twenty or thirty incidents on that chain that we never touched. The old man just went earlier. Do you realize I picked up the first incident on the chain? Huh? And went earlier? What was I doing going earlier? If the first incident on the chain showed that there was no sexual activity prior to the first incident on the chain, what were we doing going earlier? Well, I just went earlier because you go earlier. And did you see that the question nulled? Nulled beautifully. Do you realize there are twenty or thirty incidents the pc probably never recounted? Well, where were they? What happened to the charge? See, that's the mystery of it all. What happened to that charge?

Well, you pull basic-basic on the immediate chain by pulling all the underpinnings out of basic-basic, if you want to get it that way. Anything that added up to why she would do this, we pulled. The rest of it must have just gone brrrzt! See?

So if you go at it on the basis that you're running engrams called withholds, and you run every engram, do you see – if you're going at it on that basis – it's going to take you for-

ever. See? I think the pc will tell you we had a nice win last night. See? Yet we never did touch the upper part of the chain. We never even touched the subject of the PTP. Isn't that fascinating? There was only one comment on it and then from there on we cleaned it up. You see that? Audit by fundamentals. Get the earliest on the chain and release it. And if you can get the earliest on the chain, you can pull it out of the mud, and all the later ones go.

There was one oddity about this case that you might find real odd: is that basic-basic was a not-knowingness about a nothing. Fascinating, you know? That was fascinating. There was no basic-basic. The pc thought there was. And we looked in vain. And why did we look in vain? Because every auditor had always looked in vain.

How come you're always looking for a somethingness? This was a trick case. This was very trick. The whole trick about it was, is there was nothing at the basic. And she hadn't done anything but thought she had, and must have because auditors had kept her looking for it. But we must also add into the fact that she must have kept handing it to auditors. See? And then we must have had the auditor never look at the E-Meter.

Now, did you see this last night? I said, "What happened when you were four years old?" And we had some ticks and tocks, and we cleaned that up. Now, "What happened when you were four years old?" And eventually we could find nothing. There was no charge on anything happened when she was four years old. Obviously nothing had happened. That was very tricky and very freaky. But how come I found it? Well, I found it simply because I audit by fundamentals. A not-knowingness is a not-knowingness.

Wrote a story once called *Fear*. A guy lost four hours and his hat, you know? All you have to do is lose four hours and your hat sometime and you've had it, see? Particularly if somebody keeps insisting that something happened. I'm sure some of you, in college or around and about, have tried to convince some compatriot of the terrible things he did while he was drunk, or while she was drunk. Of course, it adds in a not-know because they can't say they did and they can't say they didn't. So you'll get a not-know basic which serves, mechanically – it is a not-knowingness that begins the chain. So, of course this chain stood hooked in because there was a not-knowingness about it. But the not-knowingness was in reverse at this time – there was nothing had happened. Right? It's just crazy.

You by the way won't find that ordinarily in auditing pcs. That was just freaky. But you audit by fundamental, and of course a not-knowingness at the bottom of the chain of course is just a not-knowingness at the bottom of the chain. It doesn't have to even be a not-knowingness about something. It doesn't have to be anything about the bottom of the chain. That's elementary. Well, enough about that.

This should give you some kind of an idea of what I mean by auditing by fundamentals. You just never give up on the fundamental. Now, I'll give you an idea here, see? Pc: "Yap, yap, yap, yap, yap, yap, yap, and I am tired of listing!" See? And "I can't think of any more."

Now, the reasonable auditor says, "Of course you can get tired listing." And it is true, he couldn't think of any more. This is absolutely true. But the auditor says, "Have I missed a withhold on you?" See, he audits not by reasonableness, but by a fundamental. When the pc gets nattery, he has a missed withhold. He doesn't care whether this missed withhold is justi-

fied or not justified, understandable or not understandable; he just audits by the fundamental that a missed withhold must be present, and you ask for it and pull it, and the fellow keeps on listing again. That happened today, and I was very, very interested to hear about it. See? You mustn't be reasonable, you must be fundamental.

There are certain basic truths and laws about the human mind. They are not very many. They are astonishingly few. You audit by those, not by how reasonable it is that something else would be the case. You actually have to isolate out for yourself what is true and what is fundamental. I could give you a list of things here and punch it down your gullet and get you examined on this thing until you were green in the face, you see? And I'd say, "These are the truths and that's all there is to it." Well, that's something like feeding this boa constrictor I was talking about, see? And if the auditor is unable to regurgitate the proper datum at that instant, why, he'd be sunk in any tough situation, you see, in an auditing session, wouldn't he? He'd be sunk, right there.

Well, actually, a stable datum fixed in by a confusion, and not by understanding, doesn't happen to be available in a tight spot. So you don't audit by fundamentals, you audit by being reasonable. So you must recognize a fundamental for what it is. A fundamental is a fundamental. I can go this far: I can say to you, "This is a fundamental. Damn it all, find out about it!" And tell you eight, ten, fifteen times, "It's a fundamental; find out about it!" See?

And then one fine day you say, "Well, I haven't got anything else to do; I think I'll find out about this. Oh my God, it is a fundamental." At that point it becomes a usable tool.

You can go on believing these fundamentals are fundamentals and never using them or never spitting them out at the time they're required and you'll go on being a ritualist. You go right on being a ritualist. All of a sudden, pc after pc you'll miss on. And you say, "Why am I missing on this pc?" It'll be something on this basis – since here was a pc we hadn't been missing on one way or the other – be on the basis of the auditor does not feel free to recognize that a fundamental applies here.

We're always asking this question, "What is an overt?" To one case it's one thing, and to one – another case it's another thing. But we had this gratuitously offered, see, on this case I audited. Case described an overt. Well, we're not much interested in sensation – auditing sensation – so therefore affection, see, traps people. All right, great. I can tell you a secret, that it isn't going to move very far in Prepchecking. Why isn't it going to move very far? Well, because you're just auditing straight sensation. You're saying, "Have you ever grief?" "Have you ever grief?" "Have you ever grief?"

"No."

"Have you ever – have you ever used communication so as to harm somebody?" or something like that. Oh well, now we're on real fruitful ground, aren't we? See, by taking the ARC triangle and moving around to another corner of it that does apply, we've got it. Well, that's fundamental.

All of you have ARC down real well. Well, it's fundamental. It exists. When the R goes down the A goes down, the C goes down; when the R goes up, then the C goes up, when the A goes up, you know, they always go up – all of them, all together.

So there's an opportunity to improve communication. And of course, lack of communication or jammed communication (withholds equals stupidity) – we could have made the case brighter. This is by fundamentals, you see?

One day you yourself will be puzzling around. You will be puzzling as to why a withhold makes people so stupid. And after you've sat there being stupid about it for some time, you will suddenly realize that it has something to do with something that has nothing to do with communication; that the reverse of communication must be happening here. And you'll eventually think the whole thought out all by yourself and look back on it and say, "Oh, well! Heh-heh! Huh. I sure been feeling stupid for the last five minutes! I wonder if I was withholding something? Well, I was withholding the answer to it," or something like this. And you suddenly add it up and say, "Ha-ha-ha! Withholds equal stupidity. Heh! For sure!" See? So therefore, lack of communication equals stupidity, you see? Quite fascinating.

But you can take these things, and because these data are known, you can get a hopped-up, speeded-up, enormously increased look at the things. You got a chance to look at these things and you will eventually see that they knock out other things. And you don't need these 8,655 superstitions like "I must not stand under a karo tree because it's what gives women babies," you know? I mean, other true data of the human race. I imagine there's girls right here that have been Polynesians or something like that, and have been part of a taboo-ridden society, and they don't realize why they always flinch alongside of lampposts, or something like that. [laughter]

And on the other hand, some of us have often lived a canine life. [laughter, laughs] But these are superstitions. And when you get down to the bottom of the pile, why, all these superstitions become understandable.

But what I expect of an auditor is to audit the pc that's right there in front of him by the most fundamental fundamentals that he can command and understand. And if he does that, he will always get wins. See, this auditor will always get wins. He won't go around in any kind of a fog about it. And he'll see that the Prepcheck system is put together very adroitly. But it becomes totally nonfunctional when you take off from a Zero question, get no overt, put down any What that should have been a Zero A or something, get no overt on it, buy a lot of "thinks" and "supposed-to's" and that sort of thing, go on down a whole long chain of meaningless stuff – you know, not even getting the soles of the shoe wet. And nothing is clearing up and it's all very arduous and just goes on and on.

When you've done that a little while, you get the idea "I wonder if there isn't some better way to go about it?" And you go for broke about that point. And I can put your attention forward to this point: that unless you get something the pc has done, you see, for your What question, a specific incident (I don't care whether you're asking for missed withholds because it all depends on the Zero, what you're asking for), but unless you get a specific incident, and it actually has doingness in it, and you make a chain at that point – you just spot that there's a chain here at that point, and word it at that – that you're not going to get anything happening. You will see this and then the mechanics of the mind sort of start unraveling, "Oh well, yes, of course!", you know? And after you've run some of these chains down to the bottom then you'll find out that all chains are anchored because of not-knowingness in the bottom incident.

I point out something to you: on two or three demonstrations you have seen that my What question was not on the button. See? It was close enough to have created a breeze past somebody's ear. See? But it was not dead center. Because the only time you know enough to ask the exact What question is when you've finished Prepchecking! See? And then you can ask the exact What question. And if you want to appear a genius to an instructor, why, never write the What question down until you've finished the session, see? [laughter, laughs]

The What questions are never quite on. They're just sighting questions, that's all. They're never quite on. Because you really don't quite know what's on that chain, you see?

So you should realize that if it's that unknown to the pc, what God-given, turban-wearing prescience do you have that you're going to know all about it when the pc doesn't, and you haven't found out from the pc yet? Well, you can't find it out that exactly. But because when you're auditing by fundamentals, you know something about it – you know about what's going to turn up – you ask a What question that will probably turn up something that resembles this. And I'd say it's the sheerest luck, one out of a hundred, that a What question is dead-on. We had a What question of "What about sleeping with men to trap them?" See? Oh, that's pretty good. That was pretty good. Served our purposes beautifully and went null gorgeously. But it wasn't the chain. The chain all followed that What question. We had a chain that went on from there, but we were actually taking it back from an incident and were asking questions which relieved the What question which wasn't described by the What question, which I thought was quite fascinating. But I never expect your What question to be any closer on than that.

Pc gave you an overt, you actually did get an incident, and the pc actually did something in this; and then you put your What question to it, so as you get a chain of that type of incident, and then go earlier, you'll almost always find yourself out in the blue if that was the first incident. But it doesn't relieve; there must have been a lot of other factors. And you find yourself asking questions about other types. They're almost on, don't you see?

They'll be on the same dynamic. They will be the same type of personnel, you know? And you get those erased and all of a sudden the rest of the chain will blow. Your What questions are almost never dead on.

You would be a swami beyond all swamis if your What questions were absolutely accurate every time, see? So you just get a What question which describes the incident, in its workably general – not too general – terms and 'ope for the best! And fire from there. And you'll work it out every time. And that's all you're bound and determined to have to get null, is the incident you found. And sometimes the incident will go null. Well, if you notice, in working a Prepcheck question, I will only go over these things a couple of times, with me eye on the meter – and nothing was dying down. And that told me loads. Because I tell you, one withhold system, you know, I mean, one "When," "All," "Appear," you know, and "Who," and it didn't blow, well, it's something like the curiosity: "Well, we fired an 18-inch shell into the middle of the jam tin and it still sat there!" There must be some other thing holding down this mirage called a jam tin. We couldn't possibly have fired at the jam tin. We must have an image of the jam tin. Now let's find the jam tin. See? And the jam tin always lies earlier. Nothing ever locks up because of a later incident.

And you all of a sudden, when you go down, you finally pick up this pebble, and you don't even use the withhold system on it; it just kind of goes *whhh*. And you go back up the line and maybe use a withhold system on something else that was a little bit hangy and then come back to your What question and just ask the What question again, and it's null, see?

It is an inexact activity. Prepchecking is not an exact activity. It depends on the pc in front of you. I expect you to be able to audit and understand the pc who is in front of you.

Now, here's what else I expect of you: because Prepchecking itself is an inexact activity, I ask you to do it on the framework of total exactitude. See, just groove that in madly. That sounds weird, doesn't it? But give it in a Model Session, God 'elp us! You see? Your TRs, marvelous. Your E-Metering, superb. And when you've got those things all down so that you don't think any more about them than you think about your coat while you're eating dinner, man, can you prepcheck. You see? Got an exact frame: You got the withhold system, that's exact; you got your Model Session, that's exact; your E-Metering is exact; the fundamentals on which your chains are stacked up in the pc's mind will be found to follow those exact rules – always held in at the earliest incident; it's a cousin to the chain – and you take your exactitudes and just play by ear from then on.

There's probably nobody plays by ear better than a symphony soloist. There's nobody better trained in music, you see? These jam sessions – you hear some of these boys whoopin' up down around N'Orleans. Huh! Got a record upstairs that tells how that impromptu jam session was put together, you see? They worked on it eighteen or twenty hours and managed to get its impromptuness to sound imprompt. But the upshot of this is, is – well, you take a symphony orchestra drummer. I don't know how come they get these guys into symphony orchestras, unless it's the high-class or snob-level something or other. And then they get them into symphony orchestras and they must trap them there in some fashion, because these guys make Krupas look awfully, awfully dim! They're technicians. Man, they're marvelous.

One guy, one night ... You know, your jazz orchestra boys, they all have to use these whiskers, or something. These whisks, you know? And they get one of these whisks and they go over the top of the snare drum, and it says *snif, snif, snif, snif, snif*, you know, that sort of thing. Symphony orchestra man does it with a pair of drumsticks, and it goes *whisk, whisk, whisk, whisk, whisk*, you know? And where's his whisker? It isn't anyplace. You know? I swear those guys could play snare drums with their kettle drums if you asked them to, see? They're marvelous.

But they are precision musicians. They really can play by note, you see? They really can do their stuff. And after that, why, hell, they can do anything, you see? But let's get some high-school kid and before he learns how to back up Wagner, why, let's let him extrapolate with some jazz. It sounds that way, too. Never seems to – . It's just noisy. See, it's just noise. And actually, at any – this is always the illusion of any craftsman, is that he can do it offhandedly. It looks as though there is terrific ease. There's just nothing to it, you see? You see Weller out here whittling a block of wood. And you say, "Well, anybody could do that" – or look at something he's built, or something like that – and you say, "Well, anybody could do that." Go ahead, see? It looks so easy.

The mahogany despatch boxes that sit on the back ledge of my desk back there – he didn't cause any fuss building those things. They're all hand fitted and hand carved, without any tools to amount to anything, you see? The guy is a craftsman. He's been at that for a long time. And you give old Jenner out here a pile of stone. You see, nobody can work stone. Give old Jenner a pile of stone and you say, "Build me a wall." Well, you can give him specifications about the wall, but somehow or another a wall happens. It's all so easy. You see him working out there and you see stuff going up and there's nothing much to it.

Well, now and then he makes a mistake. But the only mistakes he actually makes is when he and me come into a planning or design disagreement. And once in a while, why, we won't see eye to eye on some planning or design thing – something else is going to go up after that that he doesn't know about or something like that. But as far as actually doing it, it looks awful easy. It looks awful easy till you get somebody else in who calls himself a bricklayer. And the guy goes out, and my God, you know? He *works*, and he's got *bricks* stacked up, and he's got *mortar*, you know? And he picks up bricks, you know, and he puts them *down*, and he *smooths* them out and he gets the mortar on top of them, and it falls all over the drive and we've – . There must have been such a bricklayer at work around here, because one wall that we found out there was plumb. And he makes a lot of work out of it, and you wind up with no wall. Well, it's just basically because he just doesn't – the guy wouldn't know really how to handle mortar with a trowel. It comes down to little, tiny fundamentals, you know?

You take the fellow who does a great job of sculpture: He knows his clay, and he knows this and he knows that. They're not something he's trying to learn while he is making the sculpt, see? He's all set, and then he sculpts. He knows how to do these things.

Your old-time painters had this down to perfection. I know; I was kicking around over on that side of the channel, back in them thar days – I mean, the real old-timers around 1350, 1360 – the real Flemish school that the other fellows just hah! you know, came along afterward and *pspt!* you know? Rembrandt – *pfhooh!* Well, he – copyist. [laughs] But in those days you couldn't run down to the paint store. You could have run down but there would have been no paint store. [laughter] And the way you learned how to paint is you went and found a master someplace and you ground color for him. And your little girlfriend would be saying to you, "Jan, how come you is so blue tonight?" [laughs, laughter] And you'd mortar and pestle his color. And you finally found out all there was to know about drying and color and pigment and what pigment did and what pigment didn't and how it was blended and how it was put together and what constituency of it is – and the darned paintings painted with it are still there.

Fascinating. They must have known something, huh? When you got all through, you knew how to – you'd find out how to spread the stuff and how to work it, and so on. And you actually go on for years. And someday, one day, why, the master would give you a brush, an old used brush of some kind or another, and say, "Well, you see the wall over there; well, make a paint stroke on it." And then you'd go over and you'd make a paint stroke on the wall, you know?

And he'd say, "Oh, my God! Give me that brush," you know?

You'd say, "What have I done wrong?" you know? Well, he couldn't find out what you'd done right! That was ...

You look at the Japanese work with brush and that sort of thing. They don't do it overnight, you know? It looks so easy. You know, you look at a Jap and he paints his bamboo, you know? He paints it all up and so on. He paints. And when it's all finished here's a beautiful free sketch, you see, of a bamboo.

You say, "That's easy." You take some charcoal or something, you know; you take a big piece of paper and you say, "Well, now let's see." And go *bzupt!* and *bzupt!* [laughter]

Well, the little Jap, he knows where to get the ink-stone, you know, and he knows how to grind it up, and he knows how to mix it and he knows how to handle brushes. And he could probably write with a brush as fast as you can write with a pen. Amazing!

And all of those things, however, are built out of a great ability to do a small detail. That's the common denominator of all great art. It's great ability to do a small detail. And out of that you get great art. And that's why these schools of drawing that you see down in Greenwich Village – well, they're all lined up along the board fence and so forth, and why in fifty years nobody can find those pictures around. They're definitely not going for 285 thousand pounds for one sketch. More likely you find them filling a mouse hole someplace to keep the draft out. And that's because those boys went on an entirely different idea: They see the ease with which it is done and mistake the tremendous skill in the tiny detail. Because the tiny det- it looks so easy, you see?

They see one of these boys painting, they see the results of the painting; it all looks so natural, it all looks so easy. So they use the same abandon with which the master works, you see? They use the same abandon with which the master works to paint their paintings or sculpt their sculptures, and it's mud. It's mud. And the only thing that's missing is "How do you take a small brush and flip it across a palette to bring it out to a point, and paint an absolutely straight line?" How do you do that?

Give you some idea of this: Michelangelo used to go calling on his friends, and if they weren't home he'd take a piece of chalk and he'd draw a circle on the door. And they always knew Michelangelo had been to visit them. He was the only man in all of Italy who could draw a freehand circle that was perfect. He'd draw a perfect circle. All of his friends recognized it as a badge, you know? Craftsmanship is built out of these – the exact skill, the exact response, the thing. I don't care how great the man's name is, or how splendid the accomplishment he's trying to accomplish, or how tiny or unimportant the thing is. The factor is still there. It's still craftsmanship. And craftsmanship is built out of tremendous expertness on the tiny detail. That's all you really have to know.

Now, our tiny details consist of a meter. One of the reasons we can clear today and get further today on cases, and get Goals Assessments and find terminals on cases, is because we have a better meter. All right, that's all right. That's neither here nor there. It still takes an auditor who is absolutely fabulous on reading a meter.

I went through a session this afternoon that I – . Yesterday my auditor said – he sort of wound up the end of the session and he was sort of stunned because he thought – sudden

thought struck him which was: "What if some beginning student had been trying to do that goals check?" It whumped him for a second. He suddenly realized how far he himself had come. He was reading a microscopic clean needle, but it was microscopic. And he was reading some that were going sporadic and some that were going unsporadic, and were going naturally and well, you see? And it was a job of work, you see? And because he was centering in toward the center of a goal, of course he was getting suppressions and invalidations left and right because already he was stirring up its oppterm, you see? He was stirring up both its terminal and oppterm. He was picking off missed withholds, invalidations and suppressions, and getting the read, and getting the read off suppressions and missed withholds and invalidations, and getting the read back on the goal. Then he had to test all of the goals that had been there to make sure that each one of those didn't have invalidations or suppressions, do you see, or missed withholds on them and about them, you see? And then he had to check those to make sure that they weren't still reading – make sure they were null.

And he was working around on this for about an hour or so – well, more than that – checking out this goal line, you see? And the thought afterward struck him; all of a sudden he realized how far he'd come. I guess what thought really occurred to him is what would he have done a year ago? See? The guy was doing it very easily and very naturally, see? There was nothing to it. Meter was talking all the way. Now, he didn't have time to do that and worry about the meter and worry about rote and ritual, and so forth. He didn't have time to worry about these other things. He had to have a lot of things down pat, didn't he?

He had to know this meter backwards. He had to know exactly what this meter was capable of and so forth. In other words, his attention couldn't be on the meter; his familiarity had to be sufficiently great that he could take the meter for granted and it still wouldn't knock his head off. Furthermore, his Model Session had to be absolutely perfect; he didn't have any time to worry about his Model Session. He had to know the exact fundamentals of what he was handling; he didn't have any time to figure out what he was handling, see? The whole thing was wrapped up in the fact that he was right in the middle of a Goals Problem Mass goal, and all of its little masses and so forth were just kicking the living daylights out of the goal because he had them stirred up like mad, do you see?

And he read the thing out and the end of the line, why, perfectly fine about it. And as I say, it suddenly struck him that what if he'd been trying to do it a year ago? I think that's what hit him. But it was all made out of little pieces. It was all made out of little pieces; the tremendous ease with which he could run a meter, the no worry of any kind on Model Session. He didn't have to fuss around with his TRs, don't you see? He didn't have any worries about these things whatsoever. He was totally relaxed. He knew those things backwards. He knew them forwards. And he knew he knew them. So he had at no moment any worry about them.

Now he could think of fundamentals. And the fundamentals are – is goals get invalidated and rudiments go out in any session, particularly a Goals Assessment. So all he had to do was just outguess the next missed withhold, you see? That's all he had to do. And keep checking and keep rolling. And it was dead easy. But it would have been un... insurmountable, utterly insurmountable, if he had been – had any worry about his meter; if he'd had any worry about his sessioning, you know, his TRs; or if he didn't know for sure that if the pc starts doping off all you did was pull the missed withhold. You know, it goes like this: He

sees the pc start to get dopey, he pulls the missed withhold, see? And bang! the pc is right back there again. Get the idea? And he suddenly sees that the goal is not reading, and it was reading a moment ahead. Well, he doesn't say, "Thank God, we have nulled it out at last." He says, "Is there an invalidation on this?" Pang! "All right, what was that?" Clean it up. "Is there an invalidation on that? That's clean. All right." Now, he repeats the goal again, he gets no read on the goal. Now he says, "That's null." Careful workmanship, see? Pays off, all the way down the line.

How do you get to be a superb auditor? It's just by knowing all those little parts. That's all. And just knowing them perfectly. And if an auditor finds out that he is apparently creaking on one of these infinitesimally unimportant skills (you see, he'll be creaky on it) – if he ever is sitting there auditing and is saying, "I wonder – I wonder if that pc is getting my acknowledgments" – if he finds himself worrying about this or wondering about that, you see, I swear he'll never have time to do anything else. But what he should do, at this particular time, if he finds himself worrying about these things, ah, he ought to practice with some TR 4, get somebody there until he really gets that TR 4 in there, you know? Really gets it going good – or 3, or 2, or whatever else he's out on, see? That's the smart auditor.

The smart student of auditing would make himself a checksheet of these various parts of auditing. I'm talking now about the parts of mixing the pigments, you see? Grinding the lapis lazuli – that stage of the game. Well, just make himself a checksheet on these things, and go over that checksheet very carefully, wondering if at any time, in any recent session, he has worried about any part of his checksheet. See, make a checksheet which includes the various parts of the E-Meter. You know? The sensitivity knob, the trim, the dial, tone arm dial, something like – that he's had trouble with, or worried about. Just go over this checksheet which has all of these various parts and items and TRs and things like that. And go over that, and just ask himself honestly, "Now, in the last few sessions have I had any concern with this?" See? "Well, then, how about this one? I have trouble confronting pcs lately? Oh, yeah. All right. Well, we'll cross that one." And then just take those points he's crossed and just go ahead and drill them. Just drill them. Just treat it like a parade-ground drill, that's all.

A dancer: he finds out that he usually stumbles on his exit. You'll find him going out on the stage and practice that step that gets him exited until he doesn't stumble on his exit.

Only then will you be free to be a craftsman, be a master of what you're doing. Only then will you be free to audit the pc in front of you. You won't be free to audit the pc in front of you as long as you're enslaved with don't-knows amongst your auditing tools. Because you've got a chain of error which mounts in the session on the basic not-knowingness. And your session errors just mount like mad. "Oh my God, what am I doing?" And you eventually, checking these things off – and the chances are you might not find out what you're doing wrong for a little while, until you've cleaned some of the garbage off. And you suddenly find out, "You know, I – I really have never dared ask anybody because of embarrassment, but what is a null needle?" *Hmm-hmhm-mm!*

Well, that's what it takes – that's what it takes – to become a master of a craft. And don't think that you're going to get results, real honest-to-God results, if you're anything less. And that's the discouraging point of auditing.

Today's auditing is not aimed at the repetitive process: No attention on the pc; you just run a repetitive process on the pc and you hope for the best. Now, the funny part of it is, is that system circa 50 on – started to develop in 50, was best developed along about 52, 53 – that system actually does make a lot of people well. And you could be fooled by the fact that it does make a lot of people well. So does engram running.

See, there's a lot of things you can do with the skills of yesterday. And if anything, we are victimized slightly by the tremendous workability of what we have been able to do here and there. And any auditor who has audited consistently along the line – this person and that person and so on – well, has had some rather interesting wins. He gets hung on his own wins. Because we have never had techniques, before 1962, which reached all cases. And that's something we haven't all learned yet.

And the other thing about it is, is these techniques require a master's touch. They are that strong. They are that powerful. You can unman the pc's mind. His reactive mind doesn't have a prayer, you do these things right. You have broadly, broadly workable technology that's been going in that direction. But at the same time, we inherit along with it a precision of application which knows no second-class or "just as good as." All of the various points which make precision in auditing must be actually precise.

When you sit down across from an auditor who does his E-Metering so well that he never worries about an E-Meter; he does his TRs so well that he never worries about his TRs; he does his Model Session so well that he never worries about his Model Session; he knows what he's supposed to do with the processes he's given, whether they're a Routine 3 or a Prep-check or anything else, you see, and he does just these things. And honest, the pc, as a pc, he'll just say, "Gosh!", You know? "Gosh! It's so easy! I am so comfortable sitting here being audited." How come? What makes this? How did that combination of events take place? Is it because the auditor was born as the seventh son of a seventh son? Is it because he gave a present once to the Witch of Endor? Is it some fantastic prescience of some kind? Is it because his thetan can read your thetan? Well, it doesn't happen to be a single one of these things. It would be because the auditor knew the little points of auditing absolutely perfectly, did them as a whole, with perfection, so that he was under no tension by reason of auditing because he knew all the parts and could then apply fundamentals to what he was doing

When you will sit down, someday, across from such an auditor, you'll all of a sudden say, "Whew! Uhh!" And you yourselves, if you learn your business here, will go home and you'll sit down and start to audit somebody – somebody that you used to audit – and they'll say, "My God, what happened to you?" And there really wasn't anything happened to you except you are doing less and you're doing it much less arduously than you used to do. And the results just fly. Nothing to it. You finish up a two-, three-, four-hour session. You're perfectly calm. So what? You'd just as soon audit another two or three hours. Because you're under no tension. You're under no not-knows.

But first and foremost, in order to attain any result requires a technology. Well, we have those technologies. And you have to also get a confidence that when you sit down and audit somebody, he is – by these technologies – he is going to get a result. So that that takes out the last not-know out of it, is "Is the pc going to gain or win?" And what you're doing to-

day, you do it right, the pc keeps winning. That pc just wins, that's all. The pc goes on winning and you all of a sudden get confident in the fact the pc is going to win. If you audit him, the pc will win – bang! That's all there is to it. You'll win, the pc wins. Everybody wins. And that's the final tension that goes out of it. And after that, my God! The results you can get in auditing are just fantastic.

And frankly, that's what I expect of you here. That's what I expect you to learn how to be able to do: to audit like a master before you get out of here.

Thank you.

PREPCHECKING

A lecture given on 3 May 1962

Okay. Here we go.

Saint Hill Special Briefing Course, 3 May 12. And it's lecture 2 and I haven't got anything to lecture to you about at all. Nothing, nothing to tell you. Everybody flinching. Oh, that's a fact. I haven't got anything to talk to you about, practically, nothing.

So I might as well give you an incidental lecture that doesn't have too much to do with anything, called Prepchecking. [laughter]

There's an alternate title on this lecture: "Oh, My God." And there's a subtitle below that: "How *could* you."

The art of making Prepchecking work. There is no science in the art providing – well, I'll tell you how to make it not work. Let me put it that way, see. Ignore the pc. Don't pay any attention to what the pc's doing and omit this interesting datum: Why do you suppose in Routine 3 it is easier to get deep in the Goals Problem Mass with a goal than with an item? You'll find out this is true. You can get much deeper into the Goals Problem Mass with a goal than an item. Now, why can you do that? Figure it out. Why? Why can you do that?

It's much easier for a pc to confront a think than a mass. And an item is a mass. And a goal is a think. And therefore in the mass he can pluck the think out of the middle of the mass without having to confront the mass.

So there he sits in the GPM comfortably, sometimes not quite so comfortably, but he's undisturbed because he knows the goal has nothing to do with it. He can confront that. He can confront the goal. Well, you could probably go all the way through a GPM confronting all the goals in it. I suppose. It'd be a horrible mess by the time you got through, and the pc would be splattered all over something, but it's theoretically possible.

You see, a GPM item is a thought chamber surrounded by mass. And the pc is perfectly happy to look at the thought chambers, but he is not happy at all to look at any of the mass. Do you see that?

So having whizzed him down into the GPM and had him pick up the mass item without confronting any of the mass – you know, he's got his goal now; he's actually sitting in the middle of "God help us," see – we then have him confront the mass on a gradient scale. So he confronts all the little locks which are the items and he confronts those little locks and the next little locks and then a little bit steeper. And how – why do you think it is that the goal usually shows up, and oddly enough, the goal starts showing up toward the end of the list, providing you haven't overlisted and got a lot of invalidations on it and that sort of thing. I

mean a smoothly taken rudiments-in goals list starts containing the goal toward the end of the list. It will be somewhere down there. That would be the ordinary practice.

It wouldn't be true if you were running a rough goals list. You know, with the rudiments kind of out and all this kind of thing. Lord knows where it'd occur. Sometimes by some freak it might occur toward the beginning, but that would be a freak. In the ordinary course of events, it starts occurring toward – late on the list.

Well, of course, why? Well, you're going *huh-huh-hu-hu* and he finally goes down to a point where it's – it's sticky, and that's why the goal keeps ticking. See, we've arrived in the peat bog. You see, and it goes tick-tick-tick-tick-tick. Well, you know it's part of a GPM.

Why does it tick? Very interesting. It ticks because it's surrounded by mass. And the pc, in confronting the goal, isn't altering the mass to amount to anything. And now we start listing the item. And when we list the item all the way on down we'll find the item will appear at the later end of the mass. Why is that? I mean at the later end of the list because it's mass. You're actually asking him to confront more and more powerful mass. And he does it sort of on a gradient and he kind of gets used to it. And he finds out he doesn't get his head knocked off by announcing the thing and so he announces mass down into the GPM and will finally give you the item. See?

You went there on the wings of thought. And you follow through with the ugly burr and buzz of heat, cold and lightning. See? It's something like the fellow who takes a trip in a jet plane from here to South Africa. See, and it's – you've got hot and cold running stewardesses, and everything is being served so very nice, and it's all so sweet, and it's comfortable, and everything is fine, and you don't hardly have to look out the window, you know. Everything is scenic. All right.

Now how about walking? How about walking from here to South Africa? Or taking an automobile from here to South Africa? I think you'd find – I think you'd find you'd get certain sensations on the route.

Well, that just gives you some kind of a comparison. Of course, the jet plane is, you get there with a goal. That's easy. Anybody can do that. And the funny part of it is, you don't know where you are when you get there. But then you walk or take a car – it all depends on what type of auditor you have.

Now, why do you suppose – why do you suppose it's like that? That's because pcs would rather – this is why 3D Criss Cross is more arduous and harder on the pc, you see, because you're not sending the pc anywhere much with thought. You're going down the Prehav Scale and you go that little shallow distance that you get with the Prehav Scale, you see, and take the first level that keeps banging and you list for that. And of course, you're – that was minimal travel by thought, you see. And then you make him travel by item. And traveling by item is much rougher. You don't get anywhere near the distance into the GPM by that system. It would all come out all right in the end. I'm sure of that, but there's the – there's the difference.

All right. Now this is not a lecture about this, although you might profit by some of that data concerning Routine 3 Processes. He does the same cotton-picking thing with his withholds and his missed withholds.

Pcs is built that way. They will confront any God's quantity of thought, particularly if it's a God's quantity of thought for which they have no responsibility of any kind whatsoever. They can confront an infinite amount of thought and ideas.

So you'll find that without the auditor pushing, shoving, getting out gunnysacking and put it under the wheels of the truck, getting out long pieces of timber and prying them against the rear axle, shoving bulldozers up against the tailgate every once in awhile, you'll find the pc will go no place except on the wings of thought.

And if you sit there and watch a pc wing his way around the bank and never follow it through with anything, your pc will never get anyplace.

Now, in 1956 I put this proposition up. I had noticed that a lot of think-think and figure-figure and a lot of confronting of thought and a lot of stirring up of thought and that sort of thing, didn't ever particularly improve a graph. Or if it did, sometimes it did, and most of the time it didn't.

So I had to say, "What do you confront? Do you confront thought or mass?" And that was the question I asked at that time. Do you confront thought or do you confront mass? What is this all about?

Well, it's taken a long, long, long, long time. I finally found out, oh, I don't know, a year or two or three ago, that you had to be able to confront the mass before you would get any pc anyplace, don't you see. But it took quite awhile to become absolutely sure of that answer.

No, it's confronting mass that gets the pc places, not confronting the thought, because the pc is working on second-hand thought. The pc is actually not thinking his own think. He is pulling think out of locks of the GPM. So he can pull these inevitably and forever. He can confront them for always. Sometimes they change. Sometimes this and that occurs. But unless these thinks are attached in some fashion or another to some mass, nothing much happens to give a permanent change of case.

The funny part of it is you – you will get fooled with this one because of such adroit processes as Rising Scale Processes. You do a Rising Scale Process and obviously it's all think. See, it's all postulate, you think. But really, if you did it and had a lot of good luck with it, it's because the pc accidentally confronted some mass, too. Even though you are asking him to think thinks, he winds up confronting mass. Or he changed his position in the GPM. Or there's a lot of little freak things that could happen there. But it gives you – it gives you an impure observation.

See, you do the Rising Scale Processing See. All right. You ask the pc to get the idea you can, get the idea you can't. See, "Get the idea you can drive, you get the idea you can't drive. Get the idea you can drive, get the idea you can't drive." And every now and then, so help me, Pete, the pc all of a sudden says, "Boy, I sure can drive!", you know. This is what fools you. This is a fooler.

You can get results handling thought – sometimes. But it's sporadic. And it's just accidentally, "What did you do to the mass while you were getting the thought think?" That theoretically is what happens when you do get a result with thinking thunks. See?

So don't say that you will never get a result if you always just buy the pc's thunk. See, you'll never get a result if you just have the pc pick up his own thinkingness and that sort of thing. Don't say you'll never get a result because you will – every now and then. And because a pc or a thetan is much happier confronting think, you are then given evidence which proves to you that it's all right just going on thinking thunks.

See, you've proven the wrong thing because of your willingness – your own willingness – to go on thinking thunks. See, it will happen often enough that you'll get this accidental rearrangement of mass that gives you a tremendous change on the part of the pc. This will happen often enough with Concept Processes, Rising Scale, getting ideas about this and that. It'll happen often enough that a pc has a considerable resurgent and drops his lumbosis or loves his wife or some other unlikely – or some other probable activity. And you get yourself – a beautiful red thunk goes across the path, you see.

And you now say to yourself, "Aha, aha. Thank God. Thank God." You'll say, "It's perfectly, perfectly okay. *Haaaah.*" And all we have to do is to get the pc to go on thinking thunks and I don't have to confront any mass and you don't have to confront any mass, and we go on from there. And the next time you do it, it doesn't work. You lay an egg. And think about it. [laughter]

Now there's why it was a hard problem to solve. Do we get there on the wings of thought or do we get there by shoving the heavy masses about? I'm afraid we get there routinely by shoving the heavy masses because that is what shifted when we went on the wings of thought. And it'll happen accidentally often enough to give you data which you then can prove the wrong point with. It's quite important to realize that because every once in a while you're going to get this subjective reality on the situation.

You said, "I had him think a thunk and he thunked it and he thunked it and he thunked it, and then so help me Pete, he now has absolutely no trouble drinking vodka. And it's marvelous. And so obviously we should have him think thunks."

So we say, "All right. What other problems does this pc have? This pc has problems? He beats his children daily. All right."

"Now, get the idea of beating children. Get the idea of not beating children. Get the idea of beating chil--- " Seventy-five hours later: "Get the idea of beating children. Get the idea of not beating children. Get the..." you can't audit the pc, you see, because his hands are too bruised to hold the E-Meter cans, you see, because he just goes on beating children. And you get a big – you'll have – this is a tricky one. This is a tricky one.

But actually, if you'd gotten ahold of the mass, which was the circuit which had to beat children and blew it – he wouldn't. And that happens every time, see. That is your constant. If you move the mass you get a constant gain. And if you just think thunks, you don't.

Now, it's like this in Prepchecking One of these days you'll be prepchecking somebody, and because it's so easy to confront a thunk, the pc will tell you he thunk a thunk, and

you, if you're too willing to confront thunks and too unwilling to confront actions and masses, will go on – let the – and let the pc do this.

And every few pcs you'll get a terrific Prepcheck win – every few pcs – every few sessions. And you'll keep on prepchecking because you say, well, it's not in vain, every once in a while we get a nice win. See, Prepchecking is not a complete waste of time, is the conclusion you will come up with, see. If you have that opinion right now that Prepchecking is not a complete waste of time, it is allied to this other fact, but you're letting the pc think thinks. See. You're buying thinks off the pc, not masses, not doingnesses, not flows, not actions. See?

You've got to get the doingness – the action, in order to get the pc to push around the masses. You got to have action to get a mass to move.

"Have you ever criticized anybody?" I don't ask you to make a test of this, but if you did, use your Zero question, "Have you ever criticized anybody?" And then find a time when the pc actually criticized somebody and put that down as a What: "What about criticizing women?" And then go the chain. And then work for that session and the next session and the next session and the next session and then run into the pc out in the hall criticizing women. Because that's a think. See? That's just pure thinkingness. It's all you're doing is running thinkingness. And you can go on get – getting up his thunks. And let me call something to your attention. It's like letting the frog walk up two inches and fall back two inches every night. Because a pc can add thunks to his case faster than you can pull off thunks. And if you don't believe it, find a goal on some pc sometime who is a bit disturbed and his rudiments are a bit out. And he can think more missed withholds than you can get them unthink.

Now, you have to pull thunks, you understand, when they're going on as thunks. You have to keep a session cleaned up. And remember there's nothing going on in the session but thinkingness on the part of the pc. He is not leaping, see. He's just thinking.

And if you say, "In this session have you – have I missed a withhold on you?" of course, you're going to be repaid with a thunk. And sure enough, your meter's going to read again. But remember that in that session he didn't have any opportunity to do anything but thunk.

And you're dealing in your most delicate sense with items which are closely allied to thunks until you get down to a final item on a complete list. You go in on the goals line and of course it's all thunk! So any think that the pc thunks, of course, will cancel out the thunk that you're trying to record, naturally. See, he can cancel out the thunks in present time.

Frankly, getting a pin stuck in your finger in present time is more important than losing your whole civilization a hundred trillion years ago. In other words, present time is far more important by emphasis in the pc's mind than the past. But of course, the past is far more important in creating aberration in the present, you see.

You got these two things always at work. It's much more important to the pc, this present time problem, see. You're trying to get off the blasted civilization of a billion years ago, see.

He didn't do anything there. He really didn't mean to. He was flying over it in an airplane and it was all by accident, and some mechanic – some mechanic back at the base there –

they had a bunch of bad mechanics at the base – hadn't fixed the trip, you see, on the bomb release. And he just happened to be flying across the capital city at that particular time that it tripped, you see. And the plane actually happened to have a warhead in – actually, shouldn't have had at that particular time, and he didn't know that it had any bombs in it. But it fell and actually wiped out the whole technical library and all the scientific center and the remainder of the capital and so forth – the bomb did.

On the second run you'll find out that he had some inkling that the plane was loaded with a bomb. And on the third run across this you will find more and more responsibility, see, gathering up, and you'll eventually find out that he was ordered to do it. And he went over and threw the lever and blew the place to smithereens, and then you'll find out that he was the fellow who gave the order. [laughter] See? You see your responsibility rise.

It's very wonderful watching these things. "Well, it was totally accidental," and – and so forth, "And there was – nothing was meant by it, but – " you're going to see develop into: "Well, I did it." See? It goes up the scale.

Well, present time the pc is being terribly responsible for everything. The pc's responsible for sitting in the chair and being in the body and all that sort of thing. So you're closer to the present time responsibility of the pc. So therefore the pc thinks a think in present time, it has tremendous importance on the meter. Actually not however, in his aberration.

Ah, that's nothing – the aberration. See, his present time thought is not aberrative. It's merely interruptive. It's terribly important to *him*. That's why your rudiments go out, you see. How can a rudiment knock out the read from blowing up the civilization? Well, it's just terribly important. His responsibility is very high for PT. Present time – responsibility high. Past time – no responsibility. You reverse this state of affairs, but the rudiments can go out.

Therefore, his difficulty taking a wrapper off of a candy bar in present time is far more important to him than something that happened a billion years ago. So you have to clean up the PTP.

The PTP is far more important. It outweighs every other consideration. It's quite amusing. And of course, this PTP has the power of aberrating him not at all. It has no power of aberrating him. In fact, I'll let you in on something. Nothing that's happened to him in this whole lifetime has had any effect upon his degree of aberration – not a single thing.

But auditing, let me call to your attention, is being done in present time. And therefore the pc is always trying to sell the auditor two things: One, that is his – it is his think that has got everything awry – his thinkingness has shoved everything awry. That's one of the first bill of goods he tries to shove off on the auditor. And the other one, that present time is far more important than anything the auditor is trying to go into.

He always tries to sell these two bill of goods. Why? Because they are built in just like the plates and grate on a stove. They're just built in to the pc. He isn't doing this maliciously or viciously.

Now, the auditor may not Q&A with his own grate and plate. See? What's got to be built into the auditor is the other consideration entirely: "The longer ago it happened the more important it is to the pc's aberrated state." That's quite different, isn't it, than: "Present time is

more important than the past.", you see, pc says that. The auditor says, "The longer ago it happened, the more influential it is to the case."

And then the auditor has to say, or has to work on the basis, that the doingness and the havingness are much more important than the thoughtingness. See? He's got to have doingness. That's as close as an auditor can usually push a pc to heavy mass short of a Routine 3 Process. So he's at least got to have doingness. And he's got to skip thinkingness. Well, the pc is selling the auditor thinkingness and he's selling the auditor presentness.

In the session the pc says, "Oh, what you are doing to me. You just missed a command. This is absolutely fabulous and fantastic. And besides, one week ago I something or other, something or other and something or other. And I have come to the conclusion that ..." and so on. And he fires off in some direction or another and actually thinks that this charge is prompted by something that has happened either today or in the last week. And of course that charge is not from today or the last week at all.

Now, it all depends on what an auditor is doing. An auditor can Q&A with this – just – not Q&A with it – but an auditor can pay attention to this and buy think, of course, if he's trying to keep the pc in-session. Because what he's doing in session has the relative value of what the pc is thinking in session. You get the idea. I mean the pc with a think in session can momentarily outweigh the pastness of things with his present time think. See?

You've got this – you've got this situation going and the pc is having a hell of a time, and the rudiments are out. And you ask the pc, "Missed withhold? Invalidation? Missed withhold? Upset? ARC break?" Anything else you care to ask the pc, and it goes *clang*. And you say, "What was that?" And he says it was so-and-so. And you say, "Thank you very much." And your rudiments are back in, and you carry on.

But the only reason you carry on is not because the pc is getting aberrated by these out-rudiments, but because auditing is being done in present time. And the pc's invalidations and out-rudiments are occurring in present time. And you do not have time or inclination to go back and clear them up on the whole track, because you are doing something else. So therefore, you clear up rudiments as close to present time as possible and prepcheck as far from it as possible. You get out of this a natural rule, you see.

The pc gives what's happening right now in session tremendous value. It has nothing to do with the price of oranges.

So you can pick it up as easily as it's going in. Now, if you think it has undue importance, you will try to pick it up too hard. You'll be like the phony strong man, you know. He's got five-hundred pounds written on both ends of this barbell, you know, and it's made out of balsa wood. And you'll go over there and you'll try to pick this up and you'll struggle – reading five-hundred pounds on the end of it, you will know that you have to exert five-hundred pounds worth of strength in order to get it off the floor. You're liable to throw yourself through the top of the stage.

But you can approach the subject as arduously as it's advertised. Then you find it blows up just like that. Bang! What happened? What happened? Where did it go? Where did it go? Mmm. Bzzzz. Oh, he has a terrible present time problem. You're only getting a little

tick on the missed with – I mean on the whole track withhold that you're trying to get off of it. Whatever it is. You're only getting a little tick on that. And yest – as of yesterday you didn't have it cleared, got a little tick. And today he comes in – he's got a half-a-dial drop, man!

He's agitated. You can see the physical agitation and so forth, and *huhhhh* and so forth. And you say, "Well, what's the matter?" And you go down the line and you read your rudiments in. "Present time problem?" Oh, there's that half-a-dial drop, you see. You say, "What happened?"

He says, "Well, Agnes didn't speak to me this morning."

All right. Now, if you think that weighs five-hundred pounds, see, you'll roll up your sleeves, you'll sigh deeply and you'll struggle out there, flex your muscles and biceps, you know, and pick this thing up as though it weighs five-hundred pounds. Actually, all you have to do is say, "Well, all right. Thank you." [laughter] "Do you have a present time problem? That's clean."

What happened? Where did they go? You'll notice that. You'll notice that phenomenon. But that little tick that you were working on that happened when they were seven years old keeps going *tick*, and it keeps going *click*, and you say, "Well, what happened there?"

And they say, "Well, so-and-so and so-and-so," and it keeps going *tick*, and it keeps going *tick*. You apply the withhold system to it again, you see. It ticks a little less and a little less, and it's wearing out a little bit slow. And then you find a little earlier basic on it now that you've worked it over enough for the pc to get earlier. You find a little earlier basic on it, get the unknownness out of that, and *bing*. And then it'll blow. But it took you a half an hour or so, see. It took you an hour. It took you an hour and a half. Do you see why this is?

Now, if you continue to believe that by pulling the thinks – you see, because you can do so much in the rudiments by pulling thinks, don't be so fooled – you think you can pull thinks off the pc and get anywhere in Prepchecking, you're going to be very badly mistaken. You can only get anywhere in Prepchecking by pulling "do's." "Whatcha done, Bud?" "Okay, Mac. Where'd you hide the hammer?"

He says, "Oh, I just didn't do anything to my wife. I didn't do anything to her at all. I never laid a hand on her much. And – I've been awfully critical of her. I-I actually had some uh, uh – really, when we got married I had some reservations. I thought to myself..."

See, you're liable to buy this if you notice how easily those thinks go out in the rudiments. You see how you can handle those thinks in the rudiments. You're liable to buy this as aberrative.

And then he said, "And actually I criticized her once to a friend," you know.

Well, you start soaring in on the line and you say, "Ah, you criticized her once to a friend. Well, very good now. What about criticizing?" you see.

Ah, pack it up. Everything from there on is just a waste of time. And it's, "Whatcha do, Mac?" See. "How'd ya splint up the broken bones?" "Where'd ya 'ide the corpse?"

He's done something. And unless you pull doingness, you of course, make no permanent progress. And he squirms around, and he says, "Well, as a matter of fact, I never did anything to her." And it goes *clank*.

And you say, "Well, what was that?"

"Oh well, that – that – *heh-heh*. It didn't have too much to do with it, but the night before we got married I slept with her best friend."

"Oh, what about sleeping with your wife's best friends?" It's your Prepcheck. Now let's soar.

Now, odd part of it is, it runs down to sleeping with his sister's best friend, see. And it runs down to having something to do with his mother's best friend or something like that, see. It won't stay on this groove absolutely, but you'll pull it all out down to the bottom. And you come back up and you find out that's null, and that's that. All right. And you may have pulled a major charge off the case, you see. And you'll get a resurgence. This person will look different and act different. It's "What'd ya do, Mac?"

Now, he will mark those dumbbells one ounce. And you go out there to pick up these dumbbells marked with one ounce and you give one yank, you see, and you go through the planks. [laughter] Got it?

We're working basically with a basic disagreement of evaluation between the auditor and the pc. Things that are actually heavily weighted are given minimal weight at first by the pc. And things that actually have no weight at all are given tremendous weight by the pc. Because the pc would like you to stay in present time and pull all the aberrations of yesterday.

He lived through yesterday. He remembers yesterday. Yesterday's safe. Furthermore he didn't do anything yesterday but think. And that's perfectly safe to think yesterday.

And furthermore, it actually seems to him to be tremendously important what he thought yesterday. So he's got all these sells. One, yesterday. Ah, that's nice and close to present time so therefore it must be tremendously important. And I thought, and actually I can confront thinkingness, so therefore thinkingness must be terribly important.

And the auditor knows very well that thinkingness has no importance whatsoever and that if he hangs around yesterday he will get a lot of nowhere.

So your auditor goes counter to what the pc would like him to go counter to. And if you continue to Q-and-A with this and do exactly what the pc thinks is important, hm-mm, you'll get nowhere with Prepchecking.

You have to drive with Prepchecking. You cannot hand the wheel over to the pc, because the pc will drive in the beautiful flight of thunk. He will soar through thunkingness and thunkingness and thunkingness. He'll fly with great beauty through this thunkingness. And he will stay marvelously close to PT because everything that's important in his life is important in PT.

The great saw that he will give you is, "Well, it happened a long time ago and therefore isn't very important. And we have forgotten all that now and we have laid it to rest." A psychoanalyst one time gave me that as an argument.

She said, "Well, now we had this psychoanalyzed two or three years ago and we put it all aside. And so therefore it happened quite a long time ago and it hasn't any value anymore, and so forth. And I'm over that. Now, what is really wrong with me is the way I was jilted last week and stood up for a dinner date by my boyfriend. And we haven't spoken since." See, this kind of thing.

So I had this psychoanalyst lie down on a bed – 1949 – and go back to the first moment that the death of the relative was imparted and go through it step by step. And man, you would have thought it was made out of solid sponge rubber the way she kept bouncing out of that. I put her through that and she cried several buckets full of tears. And we got the secondary off of it beautifully. Utterly changed the appearance of the pc. "But it had all been handled, and it was all a long time ago. And what was important was last week." See?

So if you had let the person drive, where would you have wound up? You would have wound up – after a long route through the world of think, you would have wound up at, "Thoughtport." And it would have been very, very close to where you were sitting right this minute. So you can't let the pc drive. You have to make it very clear to the pc that the wheels are being guided and the throttle is being handled by some other person.

And if you don't have a pc under good control, Prepchecking is almost impossible. You've got to have good auditor control. And you've got to direct the pc's attention to doingness and to yesterday. And that is what you direct the pc's attention to. To what he has done, done, done, done, done – a long time ago.

And the pc says, "Let me think, think, think, think yesterday, because yesterday is important." And if you let the pc drive and if you haven't got a solid grip on the wheel, the pc will stay with think and stay as close to now as possible. And of course you will plow nothing, you will get nothing done. The pc will not resurge, nothing will happen at all.

The funny part of it is you can often key things out by getting a yesterday, but it's a sort of a shallow job. You can get tired of plumbing the track sometime and kick out a lock that occurred last week and brush it off, but it all depends on what you're doing.

If you just try to get a pc's rudiments in, well for God's sakes, handle it that way. Handle it shallow. Just handle it shallow. Rudiments – buy think, buy close to PT – absolutely. That's perfectly all right. But that's rudiments. Now, the body of Prepchecking.

Well, he says, "When I – when I was thirty-two I had some difficulty with my father's business associates and so forth. Let's see, that was two years ago, and so forth. And I said some very nasty things about them as a matter of fact. I told some of my friends that they were old – I hate to tell you this – but I told some of my friends they were old fogies."

And although I am never this blunt unless somebody has circumvented me in all directions for about fifteen minutes, if they had been doing so I would say at that moment, "Well, did you – after you had stolen the money, did you take it out the front door or the back door? That's all I'm interested in. When you were six – we'll just shoot for six. Just – just ..."

They sometimes look at you and say, "How – how the – how the – how the – how the hell did you know? I used – used to r – r – rob the cash b – box."

"All right. What about robbing your poppy's cash box?" See? "*Do*" and "yesterday," and you got it all set.

And you say, "What about your father's business associates?"

"Oh well, what – what about them? Were we talking about my father's business associates?"

It's absolutely magical, you see? It looks magical to the pc because the pc knows that it was yesterday that was important, and he knows that thinkingness was important. And you went on the range of "way back" and "do." Now, with that artillery you blow him out of the water.

And he'll be stonied. He'll be quite astonished very often. He'll just sit there marveling. "How the hell did you get into that?" You know.

Now, the equation on which you operate is that the chain is long and has a bottom which is unknown to the pc. You always operate on that basis – the chain is long and has a bottom which is unknown to the pc. So the basic is there. You also operate on the assumption that it is totally available to you. It all depends on how quietly you climb down that ladder. You climb down and keep polishing up the rungs and by George, he can see a rung below it, and so on. You take him back as fast as you polished up the rungs, by the way. I don't get all the grit off the rungs. I make pcs work on awful dirty ladders just as long as I can get that basic. You see, by taking locks off the top you can arrive more positively at the basic.

It's true that the pc couldn't go back there originally, but by taking a few overts off the chain and polishing them up somewhat and differently, he can get to the bottom. See. Astonishingly. But he can only get there if he's under heavy auditor control. And you've got to have heavy pc – you've got to have heavy control of your pc. You tell him where to go. And you tell him where to go because if it happened once it happened before. And you operate on that as your magic formula. "If he is thinking about it now, he did it then," is your other formula.

And then you have a magic biblical maxim: "If thy pc is making a stink about somebody yesterday, he done him in two years ago." Whatever your pc is being critical of in present time he's done something to in the past. You'll find it's an infallible formula.

Of course, to reach ultimate depths – to reach ultimate depths on this thing requires that you go into the Goals Problem Mass. And in Prepchecking it isn't – that isn't your course. You don't go into the GPM with Prepchecking. But you can go a hell of a distance with Prepchecking. You can go back two, three, six, eight, ten thousand years. You might wind up in the most unlikely places.

And just remember that you are getting the pc at your behest to climb down a chain which he doesn't, as you started, think has any validity at all, has no R because he has no C. And you just ride him down this chain and you just get things scrubbed off, scrubbed off, polished up, scrubbed off, and he can see just a little bit deeper, and you dust this next overt off lightly. I don't care if it still reacts or it doesn't react. We're going down this chain because it isn't that the charge isn't there, see, because everything that is charged is dependent upon an early charge. And the charge is all on the earliest charge.

But you can, nevertheless, point his vision past something if you sort of show it doesn't have any individual charge on it. Any charge that it seems to have on it tends to disappear with your withhold system, you know?

You're saying When? All? Appear? Who? Do it once. Do it twice. He'll all of a sudden say, "Yeah, yeah." And he expects to – he's in a profession now. He's got a profession that is, "Wiping out my blacking my brother's eyes when we were seven." See? That's his professional ... He's perfectly willing, by the way, to work on this for the rest of the session because it's got lots of charge on it, and it's this and that and the other thing.

And you say, "What did you do to him when you were six? And five? And four? And three? And two?" Maybe your What question is, "What about blacking people's eyes?" you know?

And he's all set now. He's safe, see. He got down to years where they were both in diapers and they're both in separate couches, you see – cots. And they couldn't possibly have blacked anybody's eyes, you see. It was good.

"Whose eyes did you block – black in your last life?"

There's no charge. I mean you're down there, obviously, to a point where the thing is still charged and the charge isn't erasing, so you couldn't possibly be at the bottom of the chain. And the whole test is, is does it go *phssst*. It doesn't go *phssst*, so let's just scrub a little charge off of it and go south, man.

And the funny part of it is the pc can actually remember it. The pc can actually go there. Doesn't matter whether you think he can or not. He – he'll go. He'll go. If you find out he's still got charge on blacking his little brother's eyes when his little brother was one and he was two, we're getting at a margin. That's marginal. It must be leaving this life. And we can't go any earlier because he didn't walk until he was one year, eleven months.

And all of a sudden, why, we find him someplace and he's standing on the sands of Smyrna or something. And he used to have a nasty habit when he was a legionnaire. *Heh-heh*. He used to take a copper or a bronze ball on a chain, you know, and he used to always hit for somebody's eyes with it somehow or another.

Here's all these busted corpses lying around. And you think this is perfectly all right, but you find him doing it to his commanding officer. Something like that. And then you drift back – that – he's all set to make a profession out of this. Christ, he's never been there before, you know. *Heh-heh*. "Look at this," you know. "Palm trees, you know. Where the hell am I?" you know.

You see this thing isn't discharging, well, "Whose eyes did you black earlier than that, man?"

"Whose eyes did I black? What do you mean?", you know. "What earlier ... Oh, well, there's this ... Yeah, yeah. *Hmm*. You take a space gun and if you set it up on high gain, and you shoot somebody in the eyes, their eyes char. *Hmm*, I never realized that before." [laughter, laughs]

Go over that one. Go over that one, man. And by golly, you can make Prepchecking work that way. I'm telling you an extreme example now, running whole track. You wouldn't believe it was possible. And you scrub the overt enough so that you can see earlier. And then you scrub that overt enough so that you can see earlier, and it's all there on the chain. God 'elp ya if you go completely *clang-bang* into the GPM with it. But persevere. Find an incident that happened before the GPM. [laughter]

Memory is occluded by the charge on the last overt. That's what occludes memory as far as running a chain is concerned. And if you can get some of that charge off he can remember earlier, and if you get some of the charge off the earlier overt, why, he can remember earlier. And you get enough charge off so that he can see earlier, and that's all the charge you get off because actually all the charge is residual on the earliest one.

I'm not telling you, by the way, that you must run whole track with Prepchecking. But I'm telling you that the rule applies unrestrictedly. See, the rule applies.

You don't try to rub the charge out of every overt that you encounter. That would be nonsense, man. Be nonsense. Because all the charge is held in place by the first unknown incident, see. Of course, there can be seven hundred interim unknown incidents but they become known fairly rapidly. They become known rather rapidly. The incident that you're gunning for is the basic on that particular chain. And you'll find out that one will pull.

It's incredible that it will pull. You'll take people back into the backtrack who would sit there and swear that there is no past lives. Well, you want to rub out just enough to make it feasible.

Incidentally, a recovery of memory of who one was in the past life has a tremendous case resurgence connected with it. Quite fascinating to somebody – has practically no therapeutic value.

But it's fascinating. And the pc will stay with it. And it's a very interesting thing. And he can feel very good. He thinks this is good.

For instance, your pc finds out he was clubfooted in the last life and has always had trouble with his foot in this life. And you think we're all set now. We find out the last death and some of his overts in the last life, you see, and you get this all cleaned up, that whole clubfooted life, you get the whole incident out of the thing. Everything is just fine and polished up, you know, even to catching his foot underneath the carriage. And *aaaaah-yah-ah*, oh man, you're just excited, and he goes right on having trouble with his foot. That's because you, too, fell for the idea that it must be important if it's close to present time.

Well, as a matter of fact, the – he was the fellow who invented the lead boot. Something like that. That's eventually where you'll find his clubfootedness.

But Prepchecking has to be approached within this realm of understanding in order to produce interesting results. I don't want you to go on being afraid of stirring something up and not finishing it off. I want you to get the idea of working on a chain. And I'd like you to finish the chain up. Get the idea that you should finish up the chain. But don't get the idea you should finish up incidents.

Now, with Prepchecking today, you're prepchecking chains of similar incidents. And all charge, actually, is built up out of the first unknown. In Routine 3 you are not dealing engram by engram with the track. You are dealing with packages of engrams called identities. See? So Routine 3 deals with whole lives of engrams, all in a bundle.

Similarly, Prepchecking doesn't deal with incidents. It deals with chains of incidents.

Now, to get a Routine 3 item to blow, it has to have had all lock charge bled off of it, be totally identified and opptermmed in theory. If you got that package pretty perfect, why, you've got a chance of having the thing blow, because that's the mechanics of it held in place. And Prepchecking, all you've got to do is get the earliest unknown into view and you'll find the whole chain will blow up, see. These are the mechanics on which you're operating and these are the things which occur.

If you do your Prepchecking in that frame of mind you won't be making many mistakes. You won't be asking the pc ...

The pc says, "I got a big – a big withhold. I picked my toenails last night. I'm pretty ashamed of it. That's a doingness." [laughter]

"Well, all right. All right. Let's find out about toenails, huh? *Heh-heh-heh-heh*. There's no telling where we'll wind up."

"I thought my mother's hair didn't look good yesterday," probably winds up with, "So I struck this box of matches and set her hair on fire."

You know what I mean. That's the way it develops, you know. But has no importance on what I thought yesterday, of course, until he connects with the bottom and then it's all related.

That's Prepchecking. Don't expect anything out of Prepchecking except the pc understands his case better, sees where things come from, and feels better about life and the people and environment around him. Expect that will be a perfectly permanent gain and it is worthwhile attaining. There's no doubt about that. Don't expect it to solve the whole case from one end to the other. But adroit Prepchecking is very impressive to a pc. But it's only impressive when the auditor is going for the earliest and the doingest, and keeps the pc from staying with the thinkingnest and the most recent. And then you'll get yourself some good results.

Of course, I have heard that Prepchecking done in good Model Session with the TRs in and a considerable expertness on the meter is more effective than Prepchecking which is not done that way. But of course, this could only be rumor.

Thank you very much.

NEW TRAINING SECTIONS

A lecture given on 15 May 1962

All right. Here we are 15 May AD 12, Saint Hill Special Briefing Course. And we got a lot of territory to cover. I've had a week "off". Did any of you see the quotes around the off? I ought to take a week off one of these days.

All right. A new thing has happened after a year of teaching the Special Briefing Course at Saint Hill. Anniversary, you know, passed a couple of weeks ago. We always celebrate anniversaries. We haven't got our patent serve-it-up-in-a-hurry copper kitchen out here going, so that we can serve up a party real fast, so I had to change everything around to celebrate it.

And this is quite interesting as an occasion because it lays down a brand-new pattern for all training courses in Scientology and this course is laid down in the Academies.

Now as is usual, when you get a course overlap of this type, you get advanced material being taught at the fundamental level then it is up to advanced students to learn the fundamentals. And there's about where you fit right now. Oh, it doesn't do very much. It just makes it necessary for you take a whole HPA course while you're here. But you're doing that anyway, so what's the difference.

Frankly, no course materials have been altered. Course materials are the same as before, but a whole new section has been added and a tremendous number of checkpoints have been added to the course. And this is the advent of the Practical Section.

Now, as we have learned, people can confront doingness. They can confront doingness, when you kick them in the back of the head, hard.

With what glee will people confront thought. It's marvelous, you know. It's a – they go around and there's a thought and they'll confront that and there's a theory and they'll confront that and there's another thought and they'll confront that. And they're happy as clams and they'll just go around confronting thoughts.

Now, don't mistake it. I'm not running down Mike's section here. Data is very important. But there is something a little harder to confront than data. And that is its application and doingness.

And right away with the advent of the Practical Section – it ran fine the first day. You see, it's a little bit harder to confront the doingness of it all. You can get somebody to pass a bulletin that says, "At the given instant when the pc screams 'I do not want to be audited by you,'" you promptly say to the pc, "Shut up." You see, whatever the bulletin says, you see.

And you get the fellow in session. See, you got – you got the bulletin down pat. I mean Mike gave you the okay on it and everything. And you got that all set, so you... that was easy. And you sit down in session and the pc rears back and says, "I don't want to be audited by you."

And you say, "Uh – uh ..." [laughter] See, that's – that subtle difference. There's a lot ... [laughs, laughter] It's a very important difference, too. And sure enough, we put in – well, we put in a whole Practical Section to take care of this difference. It's the third pin of training. It's always been there more or less. You had the Comm Course, you've had Upper Indoc courses. You've had various doingness activities. But now this puts it in as a parallel section to actual auditing with a bunch of new TRs and a lot of other things.

But this doingness – people will confront thinkingness before they will confront doingness – is quite marvelous because the first day the Practical Section ran beautifully. See, there was quite a few people being checked out and everybody was happy about it and so forth. And I came down today, in the afternoon and there were four students with two Instructors.

In other words, not only will people do this, but the course started to dramatize it. Here were ten people in here studying theory with great avidity and only four of them had moved over into the Practical Section to brush up on their TRs and things. That's quite marvelous, because let me tell you, there's not a single one of you here could pass the Practical Section. And every one of you have got to go all the way through it. I know somebody who's just about ready to leave, you see. [laughter] You've had it, see.

But anyhow, and here were four students, see. Four students were sitting there, getting checked out on body motions to the E-Meter and so forth. And here were ten sitting in here listening to tapes happily and reading bulletins happily, you see and then the practical room was practically empty.

Now, this can go too far and you can get to a point where you won't do any theory. That's not what we want. We want a decent balance in these things. But right now at this particular stage of the game, those of you who can do practical, of course, would check out on it rapidly. See. And those of you who can't certainly better learn it.

And here's the background music back of this new course design.

You yourself could learn a great deal about the constitution of the human mind and reaction of pcs if your technical application of procedure was perfect.

If your procedure was perfect, you would never get any of these wild varieties which you think sometimes exist in the mind. They don't exist in the mind. They exist in your procedure. You see?

So a lot of your understanding of the mind is blurred for lack of an absolutely perfect application of Scientology to the pc. And you'll see these things just whir off, just whiz-whiz-whiz-whiz-whiz, see. And you'll see all the wheels and where they turn and – and so forth, you see? Because at no time is the pc being distracted by any oddball activity on the part of the auditor. See, at no time – at no time.

But let's look at this now. Let's take an auditor and every time the pc ... Well, the rule is that when confronted with the unusual, do the usual. And that is one of these nice, large, solid stable data that you can hang onto that will get you over more falls and slumps and crashes than you ever heard of.

Now, you see, the pc has a different case than any other case in the world. We admit this. We agree with this completely, except today there's not one iota of difference.

Yeah, but the pc, he thinks he's got a different case than everybody else in the whole world. Well, he hasn't. Not in terms of basic fundamentals. His case is – runs exactly on the same fundamentals as everybody else's case. He's a thetan. He's here. So all the fundamentals must be the same or he wouldn't be that knuckleheaded. You get the idea?

He's right here in this universe, see? He's here in this universe, so he arrived on the same course as all of his cohorts, buddies and fellow thetans. So it's obvious that he must be running on the same fundamentals. But everybody thinks they have a very unusual case.

So they sit down and give you a sales talk of unusuality. And you – I don't care what you expect from a pc, sooner or later the pc is going to sell you the unusuality of it all.

In other words, you look on the pc as a salesman of differences. A pc will always come up with the unusual. It's always different. It's always unusual. He's always going to do something else. Well, that's his privilege. Nonduplication might be said to be the common denominator of his whole case, so why shouldn't he come up with unusuals? Every time he starts in dramatizing, he comes up with something different, doesn't he?

He comes up with a nonduplicate of the human race. Well, that's what his case is – a series of nonduplicates. So he's sitting there and of course he's nonduplicating. What else can he do with the bank he's got?

And God help the auditor if he ever does anything but the usual.

The second the auditor buys the unusualness, the auditor teams up with the pc's reactive bank and the reactive bank of the pc and the auditor then process the thetan called the pc. See, after that there's nothing else happens. We've got a reactive bank busily processing the pc along with some help from the auditor. *Ha!* Happens to be the last checkpoint here on HCO Policy Letter 3 May 1962, PRACTICAL AUDITING SKILLS. There's a long checksheet here and on the last of it, it says "holding constant against adversity."

Well, adversity is just being solely unusual and holding up against it is just doing the usual. I mean it's as simple as that. It's terribly simple once you get the grasp of it.

But as long as everything looks all different to you, too, you're going to get the wildest ideas of the human mind you ever heard of if your auditing procedure is wild.

If your application of auditing to the pc is wild, inconstant, variable, wobbly, then you're going to get the wildest ideas of what the human mind is all about. And you get a lot of help in getting these ideas, too. You sit down and one day, why, you're auditing this – this well, this cop. And he's going *yippety-yap-bop-bop*, something of the sort and – and "The world really doesn't understand me. I am sweet and kind and good and every time I shoot

somebody, an innocent bystander or anything, people get down on me. And they're mean to me," and he's going on like this, you see.

And the auditor says, "You know, this – the world really is being mean to this fellow, you know."

And he's prepchecking or something and he says, "Well, who's been mean to you?"

And all of a sudden the cop makes a terrific resurgence of case. That's not according to the rule book. How do you make all this resurgence suddenly? Graph does a jump. He loses his lumbosis and his pistolitis – dreadful disease cops get. What happened?

And you say, "Well, you know, you really had better run motivators on the pc because if you don't run motivators, why, look it there. I would have missed this cop."

Of course, you don't notice in two months he fell on his head and shot the Chief of Police. But that's beside the point.

You totally misinterpreted what happened. See, you Q-and-Aed with the situation. You didn't hold up against adversity and you said, "Oh, you poor fellow. You mean to say these criminals groan and scream when they're being shot and you just – so that – you just – and it affects your migraine. You poor fellow. Now, what criminals have groaned and screamed at you?"

No, the only resurgence you got in the case is it's the first time anybody had ever gotten acknowledgment through to him. You see, you got the same case resurgence that you get if you acknowledged anything or anybody. It's pretty hard to punch an acknowledgment home, but in this particular case, what he did was interpret sympathy or something like that as an acknowledgment and he won in spite of the fact that you ran a motivator. See. And the motivator had nothing to do with it. And Prepchecking didn't have anything to do with it. You would have gotten the same effect if you had been sitting in his office, see?

So right away you say, "Well, is there something about this overt-motivator sequence?" you see and you go astray and so forth.

Well, now look, if you really, really knew your auditing head-on, the situation would have been something like it was, "Well, this guy keeps on going like this, he probably never been acknowledged, you know." And you say, "Well, gee-whiz, all right. Well, doggone. All right. And go on and scream. All right. *Mm*. Good. Bothers you, huh? Good. All right. *Hm*. Yeah, I got that. Yeah, I got that. Somebody really ought to give you a hand. Now, let's see. Now, what have you done to a criminal?" [laughter]

You see and you would have gotten the effect of the acknowledgment followed by the effect of the Prepcheck. You see how it could be misread?

Now, there's a terribly broad example, a rather nonsensical example but who would do anything but vary their procedure if they didn't have a good, tight, standard thing called standard auditing? See, if they – if they didn't know that existed, then who could ever blame them for varying their procedure?

In other words, they're moving on both sides of a highway and they don't know it exists. They're driving in both ditches and out across the plains and herding the ponies up in the hills, you see. And they don't know there's a highway there.

Well, instead of blaming auditors, I should say that it's only recently that I finally corralled all the factors that make up an auditing session. I've been watching auditors for a year and I know now that, thanks to the data, the final data that came home on this was missed withholds.

And I know now that for every action of the pc or everything a pc can do, no matter how unusual, there is a standard auditing response that handles it.

Now, you see, you couldn't call it a standard response unless it actually handled it, see. But if it actually handles it, now you can call it a standard response. You see, because Scientology is totally dedicated to being workable. I know this is not popular in some parts of the world. You'd never get a job in the US State Department with that type of a – of a motto. You know, "be effective." You never would.

And Scientology's peculiar that way. Our index rule is, "does it work?" Not, "is it true?" but "does it work?" Oddly enough, it has to be true in order to work, but that's beside the point.

Now, if these auditing responses work and work in all cases, then I have a right to lay them down and say this is what they are, you see. Only because they work. And then say, "Well, you go ahead and learn them. You learn these responses because they'll work for you. See, I know they'll work for you."

And then I've got a right to bite Quirino's head off and so forth – he's in charge of Practical Section – if he doesn't make the thing work, don't you see? Because there is something there.

Now, one of the favorite methods of teaching in universities on this planet is teaching against the hidden standard. You walk into class and there's students there and there's somebody lecturing and they give examinations and you can even get expelled from the college for flunking the course, don't you see? And the only thing they've overlooked is the fact that there's no course material.

You know, there – it's just growing in universities today. Most of you've been out of universities too long to appreciate the fact. But there are more and more courses taught in universities which have a hidden course. It's a hidden subject. And the student is there. He's very wise. And the professor's very wise. And it's a whole bunch of double talk, you know.

Did you ever meet a friend and there was somebody else present and you met this old buddy of yours and you started double talking with this old buddy and the friend had to stand there and he thought you were both saying something to each other. You know? And of course, you weren't.

Well, the student is an innocent bystander to this double talk and he sees the professor and he sees students and everybody is doing well, so he says there must be a subject here, you see. Must be one. And everybody is so sincere about it, you know.

Subject like art. You should read some of the late curriculums that have come out. Very, very interesting, art appreciation, music appreciation, domestic relations. Can you imagine somebody daring to teach a course on domestic relations who had never even heard of a corner of the human mind? What a dog's breakfast that life must be afterwards if led off these principles. The textbook is invariably written by somebody who murdered his first eight wives, you know. Something like that. And it's a hidden subject. And the world is getting used to having hidden subjects.

And everybody's got his re – trained response to the hidden subject. And the trained response to the hidden subject is, you look alert, you're agreeable, you go along with it, you memorize everything you're told to memorize, you take your examinations, everything. But actually it's just all a sort of a – an agreement because, really, we know there's no subject there. You know, Art Appreciation. Who the – who the – how the hell could you teach Art Appreciation? Yet they manage it. They manage it.

I ran into somebody one time. You should have seen that girl's home. She had taken Art Appreciation at the University of Southern California, LA. It was marvelous. The place was just full of books on the subject of art. Everywhere you looked, here they were propping up the bureau and bright maroon curtains, you see and scarlet table cloths with green pimentos on it. She sure had art appreciation. The person was wild.

She was taught this subject called Art Appreciation and it was the wildest double talk you ever listened to in your life, you know. "The *rigiflubit sallpupilob*" you know.

Yet obviously, hundreds and hundreds, thousands of students have been taking this course. Obviously, they were all in perfect agreement there must be a course there without anybody ever demonstrating a course.

Well, do you see, actually – actually, I'm being a little bit *mean* on the subject. Of course, you know, mathematics is an exact subject. Do you know there's a swindle called calculus that's been going on ever since Newton – I think he did it for an early issue of *Punch*. [laughter] It's marvelous, you know.

You go in there. The professors are teaching it and students are figuring out things with it and you go up to a senior and you say, "How many times have you used calculus in your calculations of various things since you had calculus in your freshman year?"

"I never have."

"Well, why don't you use calculus?"

"Well, it's ... " [laughter]

And of course, you get education's just become some fantastic grim practical joke.

But most people confuse education totally with thinkingness. So they get into a habit pattern of two things. One, they can be in perfect agreement that there is a subject without ever coming near the subject, see, because that's an automaticity in school. You can go through school without ever understanding anything. Give back the right answers, you're all set, you set out of school and at the other end people let you live. I think that's the reward of graduating from school. You got an old school tie on, you get issued your rations.

Now, that's combined with the fact that all of your earliest training is classroom-type training that is all based on data. Data, data, data, data, data. In the early days of engineering it used to be a joke. Engineers that came out of school could not compare to engineers that were out practically functioning and operating in the field. It'd take them three or four years to close that gap. Oddly enough, they close the gap much more rapidly than the practical engineer. They closed it much more rapidly, but they still had a gap to close because they had everything on think, see. They weren't – hadn't done anything practical.

Now, engineers in the last thirty years and so forth, they get things like testing machinery and they get a little bit of doingness mixed up with the engineering school. You got chemistry labs and physics labs and things like that, that is coming in stronger and stronger, but it is nevertheless not really doingness.

So we break up when we give doingness an equal part with theory, we tend to break up an automaticity on which everybody is sitting. And that's the idea that education is a confront of think. See, education is a theoretical process.

So in adventuring this new division of Scientology training, I know we may have a little bit of difficulty without my postulating it. It's going to be hard to keep in. Because it had only been in here 24 hours before it was out. You see? Now, there's – there's a parallel.

Now, when you stop and think that there are three sections and one is the Theory Section and the other's the Practical Section and then there's an Auditing Section. We've got two-thirds doingness for one-third confronting thinkingness. That's heavy, isn't it?

So you see, it'd be adventurous to make it 50-50. That would be adventurous enough. But we haven't made it 50-50. We've made it 66 and 2/3 – 33 and 1/3. So skin it down to one-third of an investment of your time on theory and two-thirds of it on practical and auditing and you should be able to get by.

But that's about what it takes. That's about what it takes. So this is a very heavy emphasis that we've embarked upon here. Much heavier, you realize as you sit there right this minute that this is – this is crushed. I don't know, I have not counted up how many drills have to be compounded according to this May 3rd Policy Letter, how many actual drills. There are a lot of repetitive things on the E-Meter that all come from one drill, but – two drills, you got your Model Session, you got various things of this character and you've got your practical process. But it means quite a few new TRs. Quite a few new TRs. We get a TR for each one of these pieces of doingness.

Now, this is actually quite a technical achievement. You might not – you might not grasp the thing at first glimpse, but after you're auditing one day up here three or four months from now and you're back home or something like that and you're auditing somebody and you suddenly look back on it and realize you haven't had any trouble with any pcs. You haven't had any trouble at all with any pcs. Nobody's ARC broke and nobody's busted up and some of the students you're teaching aren't, aren't that lucky. They open up their E-Meter and stick their foot in it. [laughter] And your reality on this will be shockingly great. Toward the end of your course, when the auditor across from you is auditing flawlessly and you all of a sudden recognize something fantastic is going on here, do you see? It's a tremendous thing.

And when you yourself are delivering this, you all of a sudden find that you have terrific altitude with the pc. And where the hell does altitude come from because you're not grunting or straining – you're not holding your mouth in some peculiar way. Haven't got your tongue out between your teeth or anything, you know. And there's no grunt, you know. And you say, "I've been sitting here, just got through auditing for five hours" and you feel fresh as a daisy. "What's going on?"

Well, only those things – those things would only happen if it were true that for every action on the part of the pc there is a proper response on the part of the auditor. And for everything you want the pc to do, there's a proper causation. There's a proper way to cause it. And if you cause it properly and respond properly and it's all very usual and these things are well done by you, you understand – well understood, well grooved, you will get this other result. And the other result will be just – it looks very, very relaxed. It's very easy and very satisfactory type of activity.

Now, there's a lot of these odd bits, but they're countable. And if you look over this sheet of May the 3rd, perhaps, of 1962, one of the – possibly your first reaction as an old time auditor was what? Is that the totality of auditing skills? You might have had a surprise that there were that few things could be put on both sides of one piece of paper. See, there were that few things that made up the actuality of handling auditing.

And you think it over. That's quite remarkable that on two sides of one piece of paper you could write down everything that you did in terms of a coded system, of course, and that they'd only amount to two or three dozen – a very finite number.

I bet a lot of people that first early on with auditing, they think there must be thousands and thousands of responses. They just must be uncounted responses. You have to be so clever. You know? And they count on their cleverness. And they hope they can be clever enough to handle the pc. There's no cleverness in handling the pc. There's standardness of handling the pc.

You start getting clever while you're handling a pc and you'll be up the river quickly. No paddle either.

No, that's – it's remarkable that there are these few practical auditing skills. There are not many.

Now, the way a student ought to move into this is on this basis: There are certain definite stable data of theory – if you did not know these things, you wouldn't even know where you were going or why – and those are the fundamental bits of theory. The very fundamental bits. And they, of course – and now we are talking about the HCO Policy Letter of May 14th, Issue II, CLASSES OF AUDITORS. And the – there are a few bits which are inescapable – theory. You really have to have those in order to proceed at all.

And then there are certain practical actions, which if you can't do them, the pc is liable to wind up in a tight ball of yarn.

And then there are certain auditing skills – that is to say auditing, you know, just straight auditing the processes – which if you did them on a pc, you would find somewhat successful or unusual in some cases.

And you can tie a bundle of these things together. You can tie a certain level of theory and a certain level of practical drills and a certain auditing activity, you can tie them up so they don't come into conflict and they tend to complement each other to some degree.

Now, there'd be many ways of doing this. And the way which we have laid out here on May the 14th, 1962, may not be the best and most refined way to go about this. Any old D of T looking this over has probably said, "This should go there and that should go there and if we just had the Auditing Section lag a bit behind the other two sections, everything would be much better." And yes, there's no doubt about it. That there – this will stand a small amount of shifting.

It'll be mostly the shifting of what we do when, rather than the shifting of the whole doingness, you see. There'll be some juxtapositions and that sort of thing. You can expect those.

But this thing is based on several things. And let me give you a very fast resume on which it is based. That if you took an auditor and you were going to make an auditor and you grabbed him by the scruff of the neck and ran Op Pro by Dup on him and SCS – that's all you did, see. We didn't give him any other auditing. He didn't have a chance, you see? We just ran some Op Pro by Dup and we ran some SCS of one kind or another. He'd get the idea that there was something to control. And you would knock out the two principal things which upset an auditor.

Op Pro by Dup. You know, was invented just for training. Didn't have any other purpose in the world. It isn't even a cousin to CCHs although it's included in that, in some of the lists given. Just invented for training. It's how long can you make him grind. How long can you endurance it until both the auditor of it and the pc of it find out that it – duplication – won't kill them. And they eventually find out the hard way that duplication isn't going to kill them and after that and *only* after that can you get this type of an action – Do birds fly? Do birds fly? Do birds fly?

Actually, with no Op Pro by Dup. You get something like this. You get tremendous, overwhelming necessity to say, "Do birds fly? Are our feather friends airborne?" [laughter] They won't duplicate an auditing command. And the – a D of T can go absolutely around the bend listening to this because it's so easy for him to do.

He doesn't ever realize he ever had any trouble with that. And yet you listen to these birds. It's – they know how to do it right. You change it. They just go on to obsessive change. Until you run most auditors on Op Pro by Dup.

One of the things which auditors to this day do very well is give a repetitive command. You can see somebody sitting in a session, why an auditor any day of the week. He's happy to sit there and give a repetitive command. "Look around here and find something you can have. Thank you. Look around here and find something you can have. Thank you. Look around here and find something you can have. Thank you. Look around here ..." Gad! You'll go on for five hours. And do you know that before he actually studied auditing or anything like that, do you know he just would have gone *bzzzzzzz* at the idea of repeating that single phrase twice.

So you forget how vital it is to have that one under your belt. Now, you understand these classes are laid out for Scientologists, not just for the Saint Hill Special Briefing Course. So naturally, we have to start in our auditing with what an auditor needs most.

Now, it's all right to say well, maybe we ought to start him with a Straightwire. And maybe that's best. And they sit there. The fellow's probably already been in co-audit. He's probably done a little bit of this nonsense, you know.

Well, let's just drive him into the wall. Let's do it the hard way. You're going to have trouble with this, let's pick up what you're going to have the most trouble with at the beginning of the course and just give it to him.

As far as SCS is concerned, you do him very much SCS, you'll wind up with no allergy to controlling or being controlled. And you find out that runs out the badness of control. Most people you meet out on the street, you say, "Control good or bad?" They say, "It's bad."

You ask a motorist he passes in the road, "Is control good or bad?"

"Oh, it's bad." *Screek*, crash!

Number of automobile accidents has nothing whatsoever to do with the highway department. The better highways they build, the more automobile accidents they have. Has to do with the feeling people have that control is very bad.

Well, of course, they have been miscontrolled since birth in the society in which they find themselves and they've been busily miscontrolling themselves. And they get ahold of a piece of machinery and you miscontrol of a piece of machinery and you're a statistic. About all there is to that. It's simple.

Now, an auditor who will not control a pc has a hell of a time. Man, he just gets run over every day of the week. He comes out of a session, he's got tread marks all over him.

Pc says, "Well, I actually have an awful time with windows. Let's run some process about windows."

And the auditor says, "All right. Look at a window."

And the pc says, "Well, I'm tired of that process actually. I object mostly to those andirons over there."

"All right. Look at the andirons."

Never seems to get anyplace, you know. I think you will agree with me out of your own experience, those are the two worst hurdles for an auditor to get over – Control and Duplication. Long since, it's been learned in training that those are – those are the mean points. So, well, let's put them first. Let's put them first.

Now, that means that a student auditor in HCA courses in Academies is actually going to be run on Op Pro by Dup before they have a chance to do anything, see. That's a funny thing to be doing. Well, I don't know, you might as well crowd them and if you've got an Auditing Section, there's somebody going to stand over them with a whip, you can crowd them into doing Op Pro by Dup. Stand there and say, "Come on, come on. Give them another command. I know you're falling in. Give them another command."

"Oh, what is its weight?" [laughter] Aw, you can bull them through it.

By the time an auditor, a beginning auditor, has had it and received it, why, something will have changed. Something will have changed. Now, the only reason that we would include it here and try to run anybody at all on Op Pro by Dup here, is very many of you have never had it flattened. *Ha-ha*. We refer to case repair, of May 14th, HCOB. Maybe you've never had it flattened. I don't know how many hundred hours it takes to flatten it. But I'm perfectly willing to set up an experiment. [laughter, laughs]

Now, along with that, assists. Now, I will say this. That's probably written backwards. It should be assists and Op Pro by Dup and SCS. And how do you get somebody to do an assist when there's nobody hurt? I think a D of T can probably get over that problem. [laughter] But I'll bet you there are very few, very few HCA/HPA courses that teach very much about assists. They're quite spectacular. I've had more people absolutely swear by Scientology and they've never had any auditing but an assist. I remember a down-at-the-heels, that's what you'd call a tennis bum. You know, a professional hanger-on of country houses, gentlemen-type character, you know. He never has a penny in his pocket. Cynical, hard-boiled, everything. Nothing was true. Nothing existed anyplace. He one day thoughtfully closes his hand in the door.

And he comes in. He's holding his hand up, you know. Blood dripping, you know and "Oh, oh, oh, oh. I don't know what I'm going to do about this."

And I said, "Well, go back and touch the door until it doesn't hurt to touch the door."

And he – I made no effort at all, see. I didn't particularly care whether this pc went through the bottom of the earth or what happened.

"Oh," he said, "that wouldn't do any good."

I said, "Yeah, I'm not kidding you." I said, "After all, I'm the man who knows the subject of Scientology and that's Scientology. And you just go back and keep touching the door where you hurt it."

"Oh, I couldn't do that."

And I said, "Well, you're going to do it. Go on!" I said, "Do it!" So he walked back down the hall and I could hear him back there. Thud, thud, thud. Thud, thud, thud, thud, thud, thud. "Ouch," he says. Thud, thud, thud.

He came back in and he said, "It's all right." He said, "What happened?" He says, "That's Scientology?"

I said, "That's right. That's Scientology. Give me a cigarette there." [laughter]

The guy was practically climbing the walls to have auditing, you know. I would just – I didn't even give him an assist. That's the point I was making. [laughter, laughs]

So it's a very good thing for somebody to know. And you can get a good reality on giving assists and receiving assists and so forth. Very peculiar things happen sometimes. Touch assists and so on. But look it, that's all physical action, isn't it? That's sort of getting people's bodies used to bodies.

Now, if we're going to cut out the Upper Indoc, which has been teaching people erroneously to do CCHs too ferociously, we certainly had better have body mauling here someplace and where better to start than in the first unit.

See, the first activity. Let's body maul them. Assists. Op Pro by Dup. SCS. Let's get it off their chests right now.

And there's another point about this – is those are the least likely to goof up the pc if they're done wrong. Nothing much going to happen if you do those things wrong. Because they're self-correcting. Good Op Pro by Dup corrects badly done Op Pro by Dup. Good SCS corrects badly done SCS. And any kind of auditing will correct an assist. So what's the – what's the difference, see? So it's the most corrective kind of auditing because it's self-corrective auditing. Not all processes, you know, are self-corrective. Engram running isn't self-corrective.

You run the engram of running the engram and then you run that wrong and then you run the engram of running the engram and then you run that wrong and then you run the engram of running the engram of running the engram and the pc by that time is so looped up, he doesn't know whether he's "graming" or "eming." And the only thing that you can do about that time is start back and find something more fundamental and run out auditors. And look at the complication you're in, see. Not so Op Pro by Dup, SCS or assists. You just do more of them and it corrects what you're doing, see – self-corrective processes. So that gives us the auditing level.

Now, we're talking about auditing auditing – auditors. We're not talking about auditing the public. But anybody could be started that way. That's Class IA we're talking about as an Auditing Section and we get Class IB, we get ARC Straightwire done in Model Session and Havingness. That also could be reversed. You could have the Havingness first and then ARC Straightwire. Wouldn't matter much which way you had them.

But now you've got a sit-down type of process and it's not going to ruin anybody excessively because ARC Straightwire is actually not self-corrective, but Havingness is.

But why ARC Straightwire? Well, it gives them an idea of doing the repetitive process verbally, having done repetitive duplication physically. But, once more, it's not wasted auditing for the auditor.

Do you know every now and then through a unit, somebody is suddenly going to turn sane that didn't know he was nuts. And that process, ARC Straightwire, still has that power. A few commands of the thing and the fellow says, "Oh, it's fantastic."

But it gives an auditor a reality on a bank. In general, it'll give reality on a bank. Very few cases won't see something, contact something. They have to be pretty much of a black, black, black five, you see, to not get some reality on ARC Straightwire on the time track – the cyclic aspect of the time track and so forth.

Well, that teaches them volumes about time tracks, doesn't it and so on. But once again, the therapy value of it is, is every few cases you're going to get somebody who is really stark staring mad. He's at least basically neurotic. All mixed up, messed up. And you run a

little ARC Straightwire and he comes out of it. That process still has tremendous horsepower. A little bit of it, so on.

There is, by the way, just to bring you up to date, there's a later ARC Straightwire which is positive-negative. I really needn't say anymore about it. You just run the positive-negative versions of each one and of course it just – you can feel the bank just coming apart. *Bssssssah*. You know, communicate-not communicate. Real-unreal. You know. Affinity-no affinity. And you get all the seamier side of life tied up in it and these fellows that every time you try to run a pleasure moment on them they give you a moment of agony. Can't run ARC Straightwire very long without being in the middle of agony. Well, this keeps that from happening.

All right. Now, your next step up the line of processing, we would be into Prepchecking and CCHs. Just Prepchecking and CCHs, done preferably by form. You know, the old Form 3 and Form 6A. And supposing – supposing you had done those things, the first ones kind of badly – the first level Op Pro by Dup and SCS and assists, you know – kind of badly. And the next one you've done is a little smoother. Kind of bad. By the time you got that up and had these people so they could audit and they started auditing this, they would be coping with something. They would – you would start to get actual good case advances.

And that would be a fairly logical progress for a case. In actuality, if you knew all this and you were just auditing the public, of course, you'd just go into Prepchecking from scratch. But you can mess up people like fire drill with bad Prepchecking, so it isn't, of course, in the lower classifications. You can miss more withholds than people can count if you turn it loose in an Academy without any fundamental auditing. They're learning to prepcheck before they've learned anything about auditing and that's pretty crazy.

Now, of course, your next classes, as far as classes goes, goes up to your Routine 3 processes.

Now, how would you get somebody from Prepchecking and CCHs up to a Routine 3 process without doing any 3D Criss Cross? He'd have to do assessments of some kind or another. Well, that's quite a little puzzle. It's quite a puzzle. It may not be fully solved here. But we get to Class IIIA and we get here Havingness, getting rudiments in, Dynamic Assessment, Prehav Assessment, Problems Intensive and I could add any kind of an assessment you could dream up. Anything that gives them experience in assessing. And none of that has any therapeutic value except maybe the Havingness and getting the rudiments in.

But of course, if you just sat down and spent a lot of hours just getting rudiments in on a case, why, the guy would feel lots better. So it could be called processing. But get him to do a lot of assessment. You know? Get him – get him used to the idea of running down a column of things and finding out if they react or don't react.

And of course, a Problems Intensive is lovely for that. You can do a Problems Intensive, find the prior confusion to what hung up, scrub the whole thing, add to the list and do a new assessment. You can do Assessment by Elimination on a Problems Intensive list, see? See, you can do all kinds of things with it. But just practice in assessment before we turn loose on Routine 3.

And then as least as current processes go right now, you'd turn him loose immediately into a Goals Assessment when he got to a Class IIIB and you wouldn't monkey with anything else. That's because cases can be a bit loused up by doing a wrong 3D Criss Cross and whereas I can straighten out anything you've ever had happen to you here, this is also going to be done in Port Darwin. There is nothing in Port Darwin. You get the idea? See? Because this is set up, of course, for the world. Not just here.

All right. So that would be your progress in auditing. Now, let's take – let's back up a step here and let's take this Theory Section. Now, at a Class IA, you've got the Auditor's Code, *E-Meter Essentials*, basic scales and dynamics. That's your Theory Section. Well, that just gives some background music to the fundamentals of Dianetics and Scientology, doesn't it? That's all.

A fellow can't proceed very far without knowing these things exist. And you got your Practical Section and we hit that heavy.

We teach the fellow how to do some CCHs. You know, just drill, see. His zero, one, two, three. We teach him about Model Session. We teach him complete E-Meter check items. We're hitting him with an E-Meter. He's not even going to use one in his Auditing Section, don't you see. Because at this stage of the game, we couldn't – we couldn't hope that he could use anything. He'd just goof with it. He's not going to do CCHs at that particular level. But we look over here and we find the CCHs, *heh*, include Op Pro by Dup and two-way comm in the CCHs and that sort of thing.

And we're not going to try to teach him that, as he's auditing in that section, at all because we're not going to do Op Pro by Dup and SCSes with any two-way comm. We're just going to do it on the heroic level. See? There's several auditing styles amongst which there is the heroic.

And he's going to have enough to worry about trying to do his Model Session and ARC Straightwire up in his next class. And then finally he's going to have too much to worry about – about Prepchecking to learn anything about CCHs at a higher class. These are basics and CCHs – we teach him how to do the CCHs early. And then we've assuaged his curiosity and then he can do it the hard way later.

All right. And that's – so Class IA consists of this Theory Section with some of these fundamentals. Practical Section, whole bunch of stuff. TR, give him a Comm Course, give him various things that we ordinarily give him, you know. And teach him something about Model Session. We work him over at this level and then give him Op Pro by Dup and SCS. I think a student at that level, by the time he had reached the top of Class IA, would feel that he had achieved something.

He might be battered and I think he would be unbowed. But I think he would be in pretty good – pretty good idea that something was happening and that he knew something for the time.

And then we move him up into IB and we get the Theory Section and of course, the old comm formula. Well, that's taught alongside of ARC Straightwire. And if you'll notice here and after, your Theory Section is combining at Class IB and Class IIA. Your Theory

Section and your Auditing Section are hand in glove. They're happening both at the same time. And you say, well, the optimum way to handle this, of course, is to teach your theory in one class, you see and your practical in one class and then later on audit the things in the next class up.

Yeah, well, that's all right, but we're auditing students. And you're not going to be – you're not going to get a subjective reality on the doingness of this thing unless you audit at the same time they're studying it on these upper classes.

And they're going to say, "Gee, what do you know," you know. And their interest is going to be on it. And if you kept repeating this thing of Class IA of teaching early and auditing at an upper class, if you didn't stay in parallel with IB and IIA, your students would get confused because their interest, the interest of a new student when he starts – first starts running into ARC Straightwire, this stuff kind of, kind of – fabulous. Particularly if you were running on a plus-minus version, which you probably would be.

This is very fabulous. He'd get very interested in the communication formula. He'd get very interested in other things that goes along with that level, don't you see?

He probably would reach back and study some more scales. He heard of those in the class below. Well, what do these scales have to do with it? And he'd see some of these things in action. He'd think this was pretty good. And you get your Class IB would be your communication formula and E-Meter tapes and tapes on the theory and attitudes of an auditor and Code of a Scientologist, basic materials on ARC and ARC Straightwire and basic materials on havingness.

Your Practical Section is just drills, drills, drills on Model Session of the May 3rd HCO Policy Letter and your Class IIA, of course, is your HCOBs and tapes on Prepchecking and tapes on CCHs and Axioms. That's a sort of a knife in the back that you suddenly shove in there.

You'll be treating theory lightly right up to that point, you see and then you show him it has teeth in it.

And then you give him handling the pc, the Practical Section and pertinent items in the practical processes and then your auditing session which I've already given you.

Class IIIA, why, you give him the various tapes and bulletins on assessments and so forth. Well, there's one point I must mention here is the theory checklist – the checksheet must go to the most *fundamental* check item first because he's going to be auditing on this stuff and as he's auditing, he can then get the flowery ends of it. You get the idea?

In other words, right at the *first* of his theory checklist and right at the *first* of the practical, you give him the *most* fundamental that he is going to use in the auditing of that section or that class. See?

You give it to him hard – and right away. And then while he's doing the auditing, give him the fancier versions, the more expanded versions, the supplementary material, the lectures on the subject. You know, all of that kind of thing follows in while he's actually doing it and he finally finds out there's quite a bit to know about this. See, at first it looks terribly sim-

ple to him. Then it looks terribly complicated and he can't do it. And then he gets supplementary lectures and it finally brings it back into focus. That's the theory by which this operates.

Now, this course will be operating on the basis of a *checklist per class* which carries all three sections. In other words, all three sections for one class. You get one sheet of paper and it's got a class and when that thing is finished, you've got that class. And you get another sheet of paper and you get a class. Don't you see, with that? That's the way these things should be issued in the Academy, too.

And it's got all the materials on it ready to be checked out and so forth. Oddly enough, with maybe only tiny variations, as far as we're concerned here at the Special Briefing Course, your checklists are the same as they are. Oh, you know, we haven't changed the checklist. Your checklists aren't going to be changed any. But they'll be juggled as to where they belong in the classes, don't you see?

What you've passed, you've passed. What you have to pass, you still have to pass. But there's just – we'll parallel it with the classes not change the subject matter, so don't be getting the idea that you will now have to pass all of them all over again or something like this because that's not true. But you'll have to pass them for various classes.

Now the auditing – this I should mention – the Auditing Section has "done well" and "received well" certain processes, so it's got a check-off too. In other words, he's received Op Pro by Dup and he's given Op Pro by Dup. He's given SCS and he's received SCS. We're talking about just a worldwide checksheet, you see?

He's given ARC Straightwire, he's received ARC Straightwire. He's given the – a Havingness and had found a Havingness Process and audited some and he's received some, don't you see. That's just all part of the checksheet.

And then we get down and we're not interested in that for you guys. See, we're not interested in those two Auditing Sections for you because you're quite advanced as auditors. Although I might find some of it if I see – don't see better duplication.

Anyway, what you're mainly interested in is this Prepchecking. You actually get off the launching pad with Prepchecking. That's your first hard auditing assignment. And that is occupied with the form type of Prepchecking, particularly the last two pages of the Joburg and the Form 6A done in Prepcheck-Sec Check form as released recently.

You'll be getting off the launching pad with that as having given it and having received it, don't you see?

But actually, your pc will have to be checked out for unflat questions before you have passed it. In other words, we're getting your final examination down into your practical auditing so it doesn't take you so long to get it passed. Okay?

And similarly, your auditing given and received and so forth is checked out for your IIIA and your IIIB. I think you'll find this very easy to do on this particular class. It's very simple to carry through because you're doing exactly this except you've got some new TRs, and you've got your Practical Section which is going to be harder and tougher than it has been in the past.

But you're getting by very easy on the thing. At HCA/HPA level, of course, those two first grades will be very tough and they will look very tough and they'll look like a very high hill to climb for people. And you, frankly, are not even climbing either of those hills for a hill of beans because it's minimal as far as we're concerned. But we're very interested from Class IIA up. We're terribly interested and terribly detailed as we go on up.

Now, that doesn't say we're not interested in the *whole* of the Practical Section because I expect all of you to get a total checkout on all of the TRs of the Practical Section because I can't miss this opportunity of swinging you into line to a vitally important activity which is the delivery of highly standardized auditing. And you deliver that, you'll find out more about the human mind than you ever thought existed because your own errors introduced into the session aren't giving you false data about the mind all the time, see. And you all of a sudden will find you are looking at a very relatively easily understood set of mental mechanics. Water is never muddied up by something else going on. More basically, your pcs will be very happy.

This is – we are very interested in this and I want every student who is here to get a good cracking on this practical. I'd be very interested in doing that. And students who are well along had better just start sweating on it. You know, just get into the Practical Section and get checked off as fast as you can. Shouldn't take you too long to do that. Things will look much happier when you get there.

Right now the only thing that is wrong with your auditing at all is here and there you wobble. And every time you wobble, you get a session tied up somehow or another. And you – one zig and the pc hands you a zag and after that you're zigzagging.

But I think you're doing remarkably well and we're at a culmination point. And we're going for broke now. We're going for broke now. I'm trying to make Clears. And I said yesterday, I told a couple of people that I hadn't been trying to make Clears. That actually is not true. I have been trying for the last year. But I have been trying to make dynamic Clears and finding the road through to a highly stable, highly permanent state of Clear.

I'm not interested in any other state. And we could have been making other types of Clears and everybody would have been much happier with us. People would have been going out of here and in a month or two falling on their heads, but – and some of them remaining very stable and so forth – but as long as there was any question mark in it at all, I wasn't interested in approaching that hill at all. I'm just interested in making auditors, and pushing straight through the GPM, finding the road and the way through the GPM. I'm pretty sure we've got that very well taped.

We've learned a tremendous amount about auditing and we're going for broke right now to make some Clears. And who knows, maybe in the next four or five years we might produce one. [laughter]

And if you're not Clear in a few months, I'm going to be mad at you.

Thank you.

NEW TRs

A lecture given on 15 May 1962

Thank you.

Now, this is 15 May, lecture 2, 1962, Special Briefing Course, HCO WW. And we are taking up HCO Policy Letter of 3 May, 1962.

This is a fairly important lecture because I'm going to give you the first data on some of these TRs and this data will have to be used by you, because there isn't any written data on the more advanced TRs. And I will also shorthand this and get this stuff out in a mimeographed form. But you won't have the pat TRs yet, either. They have to be developed and you can normally describe an auditing action and then you have to work with it a little bit before you can erect a TR around it and say that's it, set in concrete. Otherwise, why, you've got some people learning something that is a bit false here and there, you know? And it doesn't agree with the reality of the situation.

So, I'm just giving you here a shorthand account of what I expect of an auditor, from my experience, in these various given reactions or situations.

Now, we look over this May 3rd, which was first released as a self-appreciation chart so that an auditor could take this and check off these various columns as to whether he was sure or unsure on it, but you still notice that accidentally we left lots of space over here on the extreme right for check marks to be made as to whether you could do them or not.

Now, there's no use going in TR 0 to 4. There's just no point in going into those. They have been terrifically well-covered in lectures; you have TRs concerning them, and none of you can do them. But – I mean, that after a while is the – is the sort of feeling you get about these after you've been drilled on them forever. Nobody can do these things, you know? But nevertheless auditors do that surprisingly – do them surprisingly well.

Now, let's take off above this point. And let's not bother to put TR numbers in, although TR numbers will be filled in. There is another TR which is "Auditor query." Now, this comes clear down – and also, we're not going to take up the CCHs for the same reason, as they've been terrifically well covered. Also Op Pro by Dup has been the subject of many bulletins, and so on, and written materials, and no point in wasting time on that. And we get to this first item which is actually a TR which is probably TR 5T or some such number. I won't even say that is its number. But it's the Two-way Comm TR.

And it's Two-way Comm in CCHs and oddly enough it's the same Two-way Comm, but will have a different number for use in Model Session. There isn't any difference between these TRs except one – the one we're – we have under discussion here – Two-way Comm and CCHs, considers a physical reaction on the part of the pc to be a pc's origin. And then of

course we do TR 4 – with this exception: The pc has originated. The auditor asks him what that was. See, the pc jerks his head and the auditor says to him, "What happened then?" or "What was that?"

And the pc says, "Oh, what?"

And he says, "That jerk of your head that you just did."

"Oh, that." Pc, "Oh, well, well I just had a – had a somatic."

And the auditor goes on and simply acknowledges that fact and he doesn't go any further than that. The whole object is to get the pc to notice that he jerked his head. And that is the only comm used in the CCHs.

Now, one of you the other day was running on and on and on and calling it Two-way Comm in the CCHs. And of course, there was no gain. The auditor – here's the fault. Here's the faulty one. The auditor says, "Well, what happened – ." Well, actually one auditor had reduced it to a system so that every time they did the drill the auditor says, "What happened that time?" The pc said something. The auditor said, "That's fine," or something like that. That is *dead* wrong. That is just wronger than wrong, you see? It's not a system; it's a specific pc origin.

Now, here's another example of a wrong one: The pc says, "I've got a terrible burning sensation in my stomach." Now, that's handled with TR 4. So we don't care what the pc said. We just acknowledge it. That's just TR 4. That isn't – that has nothing to do with this Two-way Comm in the CCHs.

Pc says, "Oh, I had a terrible burning in my stomach that time." And you say, "Good. Thank you." You understand that he had a burning in his stomach and you tell him so. And that's all that happens and that's just TR 4, see? No, no, that is not your CCH Two-way Comm. The pc actually originates with a physical action. You see their eyes start going. You see their – something happening. It's his shoulder – you see, shoulder goes suddenly, you know. Well, one of the questions – the only question about this TR is do you ask them then or do you complete the cycle? Well, actually by asking them then, you tend to put the pc in charge of the session, which would be wrong.

Pc is permitted then to interrupt your cycle of command, see, and that would be wrong so you wait till after the cycle of command is finished and then you ask him about it. But unfortunately, a large percentage of the time he will have forgotten about it. But that is not unusual because he usually didn't know he did it. So if he doesn't have any recollection of having gone [shows something] – well, that's – that's it. Just let it go by. Just let it go by.

Now, your two-way comm is a funny two-way comm in the CCHs – it's very funny, because the pc doesn't say anything; the pc *does* something we don't care whether he does it painfully – it's a painfully slow reaction. It's a questionable fumbling on the duplication. We don't care what it was. We don't care whether it was a quiver of his nose or a twitch of his cheek or the wiggle of his right ear or the hitch of his shoulder, but he *did* something. Now, remember this: CCHs are physical processes, not thinkingness processes, and our two-way comm is calculated to do only one thing with the pc, and that is exteriorize him from that somatic. And by getting him to look at it, we will exteriorize him from it in most cases.

And the usual reaction is he didn't know he did it. The only two-way comm you engage in then is to ask him what happened – and if he doesn't immediately tell you – you know, the origin was the twitch of the shoulder – if he doesn't immediately tell you about the twitch of the shoulder – he says, "My ear burned," Uh-huh. You say, "All right, thanks."

"But what ... ?"

"Thank you. Thank you. Good. Now, what happened to your shoulder there?"

"Oh, my shoulder. I don't know. Oh, my shoulder. It's – yeah. Yeah. Yeah, my shoulder. Well it's – funny, feels numb."

And you say, "Good."

Now there's the basic outline of that CCH. And you'll find out that it has only one purpose. And that is not to establish two-way comm with the pc particularly, but to get the pc – one: to keep the pc in session with you and to get the pc basically, however, to exteriorize from and notice what's going on and notice what he is doing, instead of dumbly grinding on through. Now, if the pc can actually dumbly grind on through and never notice what he's doing, then you'll make very, very slow progress.

Now, that is one specific drill and the most important one. That is the most important one. It is allowable, it is allowable to whistle the pc back into session or encourage him a little bit or something like that. You see, you're not a – you're not a dummy sitting there auditing him. Pc – he doesn't want to do it again and you say, "Oh, come on, come on." You know, cheer him up; push him on. "That's better," something like that. That is after, however, you finished a command cycle. Those comments, those statements, the "how's it going," cheerily, that sort of thing, can go on.

But the basic two-way comm in the CCHs is the origin by physical action on the part of the pc, the query of it by the auditor, and the action of the auditor to make him view it. If he can possibly get him to view it, he does so. That's all.

All right. Now we take up the E-Meter. The E-Meter is written up in all ways from the middle in *E-Meter Essentials*. There are certain drills by which the coach sits behind the auditor, (quote) (unquote) "auditor" and gets him to study body motion, which is at the bottom of the page there. Now, there's one point I'd like to make on that particular point which is not in *E-Meter Essentials* and I'd like to add the data to it. You must – give him all kinds of body motions, yeah, let them accustom themselves to seeing what a needle looks like with all kinds of body motions, just as given in *E-Meter Essentials* – but since *E-Meter Essentials* was written we have had brought to notice, "the selling pc." The pc that sells you things. The pc that influences the meter and you should learn those tricks. And those are the specialist tricks. You can – those things should be hit heavily – very, very heavily.

There is lifting one little finger off the can and replacing it to get a twitch on a certain item. Well, you say, pcs never do this. No, only twenty-five percent of them. They'll sell you a goal by lifting their little finger off the can and putting it back on. And if they're holding their cans this way, you can't see their fingers, you see. Hold the cans with their palm – with the palms up, you know, toward the can – the can up. You can actually – they can actually make the thing read. Twitch. And frankly, it looks like a finger-twitch. It does not look like a

tick on a goal or an item or anything like that. It looks like what it is. It looks like a finger being lifted and putting back on the can.

Another one is the way some pcs keep you from finding out anything in the rudiments is to gradually loosen their grip on the cans. And they can actually do a beautiful needle rise. Beautiful! You never even see their hands move. It's absolutely – all you have to do is just lift some of the skin surface of your hand off of the can at a very gradient scale and you get the most beautiful needle rise you ever saw. And any reaction to the rudiments is smothered in that rising needle. Pretty good.

Also, you can squeeze the cans – putting a little more and a little more skin on the cans – and get a gradual falling needle. They're unmistakable for what they are, once you know what they are and you've seen them. But those are selling techniques. There may be more of them, but those are the ones which have come to view.

One pc's rudiments was always in, except they were always wildly out. And the pc always had a rising needle whenever the rudiments were touched. One day Mary Sue got tired of this because she knew the pc's rudiments must be out by just looking at the pc, and detected the fact that this had been going on for a long time. This pc also responded to embarrassing Prepcheck questions with a constantly rising needle. It was the most beautifully masked thing you ever wanted to see. Why a man would want to cut his throat by falsifying E-Meter reads is – well, that's a subject for the Catholic church. We're not interested in it. [laughter]

Now, as far as the rest of these things are concerned, they're rather easy. When I say on-off switch, and that sort of thing, it's almost being sarcastic, isn't it? But, do you know that nearly every auditor I've ever seen monkeying around with it early on, fumbles for the on-off switch? And me, I've been auditing between a Mark III and a Mark IV. I've got the prototype Mark IV which is actually a Mark III. And it's different than the Mark IV; it turns on in a different place. I always turn each one on in the wrong place. You'd think fifty percent of the time I would get the right one. [laughter] But somehow or another it's always a hundred percent.

When the – you say on-off switch – in trimming, we want a smart setup of the E-Meter. On those two, see – whether they're in correct order there or not – this is trimming and on-off switch. We want a smart setup of the meter. In other words we want this person actually to be able to set up an E-Meter without bad, you know, knocking his brains out trying to find the plug, or whether the plug is in or out, or half in or half out, you know? Let's let him get used to this and find out where the controls are and how you hook it up and so forth, so that he can do it just brrrrr, and his E-Meter is set up and ready to roar.

Sounds like an elementary thing. It makes a hell of an impression on the pc. I'll tell you, a pc who watches an auditor say, [fumbles with the e-meter] "Heh-heh – I haven't got any leads here at the moment but..." It does something to his confidence. [laughs] He doesn't at that moment feel in an outpouring state toward this auditor. He catches the uncertainty of this moment. And actually an auditor may know his meter perfectly as far as operating a meter's concerned and just be very unpracticed in setting one up. You get the idea?

Another thing is – another thing to watch on this, is learn to set up a meter quietly – not with a snap. Don't set up a meter noisily. One of the ways you do that is let one of your

fingernails grow long and snap the jack with the plugs, down on your fingernail, and then ease it down. But you would be surprised. I myself have been knocked half out of session by a very, very loud and boisterous setup of a meter.

You know, you're sitting there all ready and you've got some data, and you're all – you're just – you know, waiting for – to get into session and all of a sudden there's these wild explosions going on in front of your face and your attention comes out on the auditor. And if you want to start a session with all the rudiments in, you will know how to get an E-Meter into action smoothly and quietly and very effectively and efficiently, so the pc doesn't even realize you've started to use an E-Meter – he's just sitting there with the cans in his hands. How did they get there? He wouldn't know. See what I mean? It actually has a – there's a purpose that you might neglect.

Now, we say sensitivity knob – you'd be amazed how much difficulty people have getting the sensitivity knob up for the rudiments and down for the can squeeze, and all of that sort of thing. And then they'll start with a third-of-a-dial drop on the can squeeze which they have run the person's Havingness Process on and tested it, you see. And then they'll run the next rudiment with the sensitivity knob set at the third-of-a-dial drop setting, don't you see? And then say, "Oh, excuse me." And then move it on up. A drill could be done to make that much more smoothly. I myself have made the mistake. You have made the mistake. Why make the mistake?

Tone arm handling: Well, at least know that you can handle it with your thumb. You don't have to cover up the whole meter with your paw and juggle it around and wave red flags in front of the pc's face and everything else just to set the tone arm. Actually, this whole tone arm can be handled with the thumb, with the hand underneath the E-Meter. Pc never notices that you're handling a tone arm. Can be done very quietly. Can be done very smoothly. You always ought to be able to handle an E-Meter in that particular fashion.

This – not so good, see? [demonstrates something] See? Get the difference? See, you don't even know whether I'm doing – what I'm doing with the tone arm. Because if you start doing this [demonstrates something; laughter] – the pc will come right out of session. He'll say, "What did the tone arm do?" And you say, "How did you know it did anything? I must be wearing a mirror in my tie."

Now, needle pattern reading is kind of new. We talk about a needle pattern in *E-Meter Essentials* but we don't talk about what a pattern is. Because at the time *E-Meter Essentials* was written we didn't know what a pattern is. A pattern is a series of missed withholds culminating in a constantly active needle.

A pattern can be a big dirty needle or a little dirty needle. In other words a wide-dial dirty needle, or a small-dial dirty needle. And you sure better know what a dirty needle looks like and what a pattern looks like for the excellent reason that if a goal comes up – whenever you say the goal, "to catch catfish," and you get a *bzzzz*. "To catch catfish," *bzzzz*. "To catch catfish," *bzzzz*. And it's a dirty needle, that goal isn't in. That goal is kicking simply because there's a missed withhold in connection with it. You get the missed withhold off and that goal is deader than a mackerel.

Now, if you're good at this you can tell whether or not the pc has a missed withhold or an invalidation. You can read it straight off the meter. Missed withhold always gives a dirty needle. And that's needle pattern. The pc's needle that goes – the stage four needle – the – any other needle pattern – constantly moving needle and so forth, is a missed withhold, one or more. It's actually the net product of too many missed withholds if the thing is wide and chronic, don't you see?

But you can correct that needle pattern. And you'd better get used to a needle pattern being correctable. Because the person's got missed withholds, they're going to be hard to audit. You know then when you've got your Prepchecking up to a point where everything can go along rambunctiously with Routine 3's, when the pc no longer has a needle pattern. Hasn't got a needle pattern – well, all right, you must have the bulk of his missed withholds. Therefore you've got a chance of keeping his rudiments in.

Don't you see, it is going to be very difficult to keep somebody's rudiments in whose rudiments are perpetually out. In other words, you never have a chance at current rudiments because the rudiments have been out for ages. And you'll find your Routine 3 sessions on such a pc are constantly and continually carried into Prepcheck sessions. You never really get a chance to do any Routine 3, because you're always correcting the pc. And that will always happen when you have a needle pattern. So you better get used to what needle patterns are and spot them for what they are, because, the – well, not the bulk of people that you audit – but, I don't know what the percentage would be, I'd say just at a wild guess about 50 percent of the people that you suddenly put on a meter have a needle pattern.

There are various types of needle patterns. There's the little tiny, *bzzz*, dirty needle. And there's the – it's not a nice tick, see, it's not a nice little clip. Pop-pop-pop – that's not a needle pattern. It's a – it's an instant read needle pattern. It's fantastic. But you say, "To catch catfish," *bzzz*. "To catch catfish," *bzzz*. "To catch catfish," *bzzz*.

And you say, "Boy, that's really something We've really got a goal, yeah. We got a goal. Who should have found out about this goal and didn't?"

"Heh-heh. My father. Heh-heh heh-heh. Heh. Heh-heh. He should have found out about it."

You say "All right, very good. To catch catfish." Where did it go? It's released that easily. That's very rare that you will find an instant read on a goal or an item. Very rare. But when it does happen, you're in trouble. And it can cause so much trouble that you sure better know all about it no matter how rare it is.

Now, you can sometimes get a goal on the list of goals reading on a missed withhold, that *you* missed. Or an invalidation that *you* missed. And the goal actually isn't in. The invalidation reads with a nice tick.

And you ask, "Any invalidations on this goal?"

And the pc says, "Oh, well yes, last night I was sitting up and I said that a man would be a fool to have such a goal."

"Is that so?" And you say "Good, to catch catfish?" All right. You say, "Were there any suppressions on this goal?"

"Oh, yes, I'd rather not have it. I can remember saying that to myself"

"All right. Is there a missed withhold on this?"

"Well, yes, you didn't find the goal originally when you were nulling."

"All right. Good. To catch catfish," tick. "To catch catfish," tick. "To catch catf.." Happened just as often as it vanishes forever.

Now, you get the test question, "Is there an invalidation on this goal?" Tick. You get it off. You either have a goal or you don't have a goal. But you certainly don't have an invalidation.

In other words, goals and items can be held in and made to look like goals and items from suppressions, invalidations and missed withholds. And this all comes under the heading of needle reads in general, but needle pattern is the wildest of these. That is the most interesting. Because you can get good enough that you sit right down, this person's got a wide swing and a tick-tick. And a wide swing and a tick-tick. And a wide swing and a tick-tick. Any time you ask him, you say, "Cows." And you get a wide swing and a tick-tick. And you say, "Well, do you ever comb your hair?" And a wide swing and a tick-tick. You say, "What's going on here?" Missed withholds is what's going on here. Who missed it? It's probably been going that way for a long time. Maybe his mamma missed it, or his schoolteacher, or somebody else. It's past. It'll be well back.

All right. It's the dirty needle that has given Routine 3 the most single amounts of trouble – the dirty needle. So I've already found out what the dirty needle is, so therefore it gets included in here. It's always a missed withhold.

All right and we come down the line here on a null needle. And that is horrible that all the auditors that were consulted on this in southern California were able to describe a null needle. I think that was the greatest achievement I have ever heard of. Everybody down there could describe a null needle.

Saint Hill graduate went back there and gave a lecture. Tremendous lot of data in this thing. How to run all the Routines, how to prepcheck, sec check, how to tear pc's upside down – one thing registered with the auditors who came to the lecture. "So *that* is a null needle!" Everybody came around afterwards and they were very intrigued. And that was a starting point of a reality on what needle reads are.

I've seen people sit in here when they first arrived from someplace. And you say, "All right, what's a null needle?" Mike would say. And they'd say, "Well, a null needle is – that." Give you a pattern, you know? Wave their arm around in the air like they're sending semaphore signals to somebody. That's a null needle. Interesting. Interesting

And of course, null needles, theta bops, rock slams, falls, rises, speeded rise, speeded fall, slowed rises and slowed falls, are the new ones that you normally don't see too much of. But here at Saint Hill, why, the older class that was here, my God, could those fellows read speeded rises and speeded falls and slowed rises and slowed falls. And before people were –

people who were – just been here for a short time, you know, they would watch these guys doing Sec Checking. The needle flying around at sensitivity 16, you know? And it just looked like the same needle, you know? It looked exactly like – just a fast flying needle. They – unable to detect the fact that at one little point the rise speeded on an instant reaction. And it's that degree of skill we're asking from a Saint Hill graduate. That – it's swinging up – it's swinging up like sixties, you know, it's coming right on up. But at what point did it suddenly move faster as the instant read? Reading a flying needle – it's quite tricky reading one of these things.

We're not doing as much Sec Checking as we were and I don't see so many people doing that. Furthermore, because we haven't been doing a heavily effective Routine 3 Process, sensitivity is not as loose as it was a few months ago. It will be shortly. And you'll have this problem where at sensitivity 16 you actually have to keep the needle moving yourself. You have to keep the needle moving yourself while it reads because, you see, you can't get the whole sentence out before it's traversed the entire dial. So of course you have to read – move your tone arm – I'm joking now; almost that bad though.

So, that's real – real postgraduate needle reading, when we get into speeded rises and speeded falls and so forth. And the darned thing flying through the air like sputniks.

And then tiny reads: How tiny can a read be and still be a read? Break out your microscope, Sherlock Holmes, because you – this is the way it's going to be sometimes. Sometimes it's this way the whole session. And sometimes you get enough invalidations off and get the reads so that people can see it.

And then testing for a clean needle: And there we get into a TR. And this TR is already described in HCO Bulletin – no, it's the H – it's an HCOB that just came out – it's a – TR is actually in there complete. It asks if something is free and then repeats the same action. It's around someplace. I haven't got a file of them here.

I will describe this one to you. It is going out by the same door you came in. And this is not one little TR that it only applies to this TR. This applies to all auditing. You go in the same door you came out. Otherwise you never leave there. I'll make this practical experiment. Find a room that has one door and windows which are not passable. Go into the room, close the door behind you, and don't leave by that door. And look around and you will find you're still in the room.

By "door" in this case, we mean the exact phrase you used must be the exact phrase you leave with. You want an invalidation. You say, "Has this goal been invalidated?" Not too good but, "Has this goal been invalidated?" Tick.

Pc says, "Yeah, well I think it has."

And you say, "That, that, that."

"Oh ye – oh yeah. Yeah, it has been. It has been. I invalidated it."

"All right. Thank you. I will check that. Has this goal been invalidated? Thank you, that is clean."

Now, let me show you the errors of your ways. This is how to get into endless trouble. This is you find this one room and it has one door, see. And so you enter by that door. You say, "Has this goal been invalidated?" That's the door you entered by. And then you leave with the phrase, "Are there any more invalidations on this goal?" Don't blame me if your pc gets ARC breaky and starts to blow session, and you can't find the goal, and so forth because you're still in a room. You never left that room. You're still there – as far as the bank is concerned. You never acknowledged the pc; you never found out if it was clean.

"Has this goal been invalidated?"

The pc says, "Oh yes, I invalidated it last night."

You say, "Good. Are there any more invalidations on this goal?" You're going to be still in that first room. Oddly enough, you're going to be still there. "Any more" – How the hell do you know if that one cleared? What are you doing asking for any more?

The pc goes berserk under these. Now, if you don't believe it try this one sometime, as far as the acknowledgment is concerned. You can almost make a pc go round the bend.

You say, "How are you today?" You can even do this and tell him it's a stunt. And he'll still go right down the chute on it.

You say, "How are you today?"

And he says, "Fine."

I – you say, "I asked you how you were today." And he'll say, "Oh, I said I'm fine."

"Yes, but how are you?"

Now that isn't quite as bad as this:

"How are you today?"

"I'm fine."

"Yes, but, how's your wife?"

"Well, she's fine, too."

"But, your boss, how's he?"

And the person gets a weird idea of, "It's going to go on forever." [laughter] It's pretty weird. The pc will ARC break on that lack of duplication. That's true of anything you ask the pc that you're – that is up against a meter, see. You're trying to find out if this goal is suppressed or invalidated, or if in this session there's a missed withhold. This applies to rudiments. This applies to anything that you're trying to find out about. You always enter by the same door you – leave by the same door you entered by. And let me give you this as a little tip here. When you check something, tell the pc you're checking it. See? Don't tell him you're disputing with him. And this is a terrific acknowledgment, you know? "Oh, well, that was really it."

This is the kind of illusion he gets:

You say, "Well, has this goal been invalidated?"

And he said, "Yeah. You know, well, I thought last night, something or other about it and I thought it wasn't quite right."

"Good. I'll check that now. Has this goal been invalidated? All right, that's clean."

Well, the immediate reaction of the pc, "Heh. Oh good! Heh-heh! Oh, good. What do you know. Heh-heh. Good." See. What he's saying is he had some attention paid to him.

So that is that type of drill. And any TR that compares with this would just be something that made the guy say the same thing twice. Which people almost never do. Particularly on this.

"Have I missed a withhold on you?" is followed by "Are there any other withholds I missed on you?"

And the fellow says, "Well, no."

And you say, "Yes, but has anybody else missed a withhold on you today? Well, how about yesterday? How about tomorrow?" And pc just feels like he's nowhere. He's moving in the nothingness of nowhere. And you never find out, and you just lose more withholds, and you miss more invalidation, you miss more meter data on that one single trick. That's just – that is an invariable. If you're asking something against the meter, you always ask it again exactly the same way that you asked it the first time.

So you can get yourself very easily into trouble. You will say, "When Bill and I were outside talking about your case just now and Mary Ann was in the room, too, did Mary Ann miss a withhold on Bill?" "Yeah, that – that – that – that."

And pc says, "Well, yes he did."

"Now let's see, when Mary Ann was in the – Bill was outside – uh, that's it. I'll get it in a minute. Let's see, when Bill and I were outside and Mary Ann was left in the room, did Bill miss ... No, that's not right."

And you know, you'll get some – it – you won't look positive to the pc. [laughter, laughs]

So it's very easy to get yourself all in foot tangles, you know. Get bird snares all over the big toe, you know, just by being too – too sloppily something or other, because it's just unrepeatable.

You get yourselves into the same tricks when you're handling old CCH 4 or something like that. And you take a book and you throw it up in the air and you sit on it, and you pound yourself on the back of the head and then open and close it three times, and then hand it to the pc, and he says, "But what did you do?" You've had it, you see. [laughter, laughs] Can't duplicate yourself. You can get caught the same way on one of these verbal clearings, see. Very important. Testing for a clean needle. It's always done the same way. And you'll find out that most – a lot of your ARC breaks, a lot of your pc restiveness in session stems from that one single error.

Now, as far as beginning rudiments are concerned and end – and in body of session, end rudiments, two-way comm – of course, these things are basically just drills on Model Session, done with TRs 1 to 4, but also done with this clean needle test. You see?

And then there are ways to make these things a little more effective, such as, "Since the last session, did you do anything you are now withholding from me?" or something like that. Don't you see? And it – narrow your rudiments down. Get your rudiments – to get the pc into present time. In other words there's ways – things you can do with these rudiments to make these rudiments more effective and keep yourself from running a full Prepcheck session in the beginning ruds. And then get onto the body of the session.

It's sometimes embarrassing when you intended to do Routine 3 in the first place. One hour and fifty-five minutes later you've just finished prepchecking the pc. Pc gets very uncomfortable because you didn't do any listing in that session. In fact I've heard pcs say so. You've helped them out endlessly, you've done marvelous things for their cases and all this sort of thing, but they just never seem to appreciate it. Because you didn't do any real auditing in the session. You got yourself tangle-footed with the ruds.

Now, getting out of the rudiments the other way with the end rudiments, there's ways of narrowing the withhold question. "In this session, have I missed a withhold on you?" Tick. "*In this session* have I missed a withhold on you?" No tick. Oh, what do you know? And you say, "Good." And finish off. Yeah, you've missed withholds on him, but that was – Prepcheck session, and you're going to take that up tomorrow, and you could go on till three-thirty and the auditing session's supposed to end at one. You know?

But, there's – these nice drills of getting *in* to the session rapidly, getting *out* of the session are basically based on the fact that auditors mustn't get tangle-footed in the rudiments. The rudiments are something you grease over and get into the session on so the pc can be audited. They're not something that you spend a session on in order to flub.

So as far as the auditing part of the Model Session is concerned, as far as just learning it parrotwise is concerned, yes, and then there's the other thing of actually using it. How do you use this Model Session?

Now, as far as handling the pc is concerned, we get this section – detecting missed withholds, we again have the same type of drill of course, as we had in the – testing for the clean needle. We used the same type of drill on this thing but there are other ways that you can indicate missed withholds – such as a dirty needle. Pc is getting restive, pc stops listing, pc boils off. Well, that whole missed withhold bulletin comes in here. And that could be driven home on a practical basis, you see. You could have the coach sitting there and the coach could do a number of things, see – all of which are in a doingness sector, and the auditor's merely supposed to look for a missed withhold, that's all. That's all. It's all very simple, you see. The coach could boil off, and the coach could get mad, and the coach could refuse to go on, and this is the triggering mechanism, see.

All right. Now, the ARC breaky pc, of course that's the same thing.

Getting off missed withholds. How do you get a missed withhold off? All right, there'd be two ways of getting off a missed withhold. They're both dependent on testing for a clean

needle. That's the same TR, you see. There would be two ways – one is right and one is wrong.

"In this session, have I missed a withhold on you?"

Pc says, "Well, yes, as a matter of fact, I had a small headache at the beginning of the session and you missed that on me."

And the auditor says, "Well, how is it now?" Now, he's just laid in more than he took off. See, he took off one wagonload and brought back two and dumped it on the pc. And actually, most sessions, when they start miring down, just mired down on that one weird button.

"Do you have a present time problem?" This is all under the same – same type of action. They're all classified as the same thing – the auditor makes the same mistake, see.

"Got a present time problem?"

"Yes, I had a fight with my wife last night."

"Well, all right. Did you patch it up with her?"

See, you've had it. The – and the drill is, you just mustn't ask a second question. See, the discipline is, is don't ask a second question. Only ask one question. You ask one question and find out if it's clean, is what you do. That's the correct way of proceeding with any of these things. Ask one question, then find out if that one question is clean. And it better not be a question, something on the order of, "When Bill and I were out in the hall and Mary Ann was ..." Better be something that can be cleaned, you see.

Now, getting off invalidations – that's – depends on this other – there's a specific way to ask for invalidations. And of course you get invalidations on Scientology, on auditing, on auditors, on listing, on processing, on nulling, on goals, former goals. You can have invalidations on a whole lot of things. And the odd part of it is they translate into the – they look like goals, and they look like everything, and it was that factor that made it so difficult for people to find goals a year or two ago. That was very difficult for people to find these things, because their invalidations and missed withholds were sliding all over the place. And something was reading and it was just reading because of an invalidation. Got the invalidation off and so forth.

Well, the drill is to get the invalidation off and find out if it reads. That's the way that TR would more or less go at the present planning. In other words, let's get the invalidation off and find if the original reads. That's the drill. We're interested in getting something to read, not just getting invalidations off. The stress of it is to get something to read. Read or not read, that is the question. Not whether it was invalidated or not invalidated, see. So you've got to get the invalidations off to find out if it'd read. Makes a slightly different type of drill.

Q-and-Aing with the pc: Now, the basic Q and A with the pc – I've just given you the example of. You say, "Do you have a present time problem?" and the pc says, "Yes, I had a fight with my wife last night." "Well how is she now?" See, that is the most elementary form of Q and A. Pc's worried about something so the auditor worries about it.

We had an old Q and A drill but it wasn't basic – it wasn't that basic. I think a coach in this particular line could have a lot of fun baiting the student into actually detouring, by being

terribly interesting on the subject of the buttons that the student might have. Something the student just couldn't help but ask something more about. You know, just try to make the student ask twice. Just try to make him ask twice. Do anything to get the student to ask twice, you know? "But this is still worrying me." See? The coach, you see, "But this is still worrying me. I still feel dreadful about this." What is the student supposed to do? Well, he's supposed to clear the exact rudiment that he is clearing. That is what he's supposed to do. In other words, we're going to face him with the usual.

Now we get into practical process; we get PTP processes. And the best PTP process is, well, frankly, there are a whole lot of them. The best of the PTP processes and so on, as a process, is simply Responsibility Process – the old one. It's fine, perfectly fine – works.

There's a slippery one, asking for the missed withhold on the other person. Auditors try to move in on this thing, however, and find out that it's nothing but liquid asphalt underneath their feet – they're stuck there for the rest of the session. So we kind of stopped monkeying with this thing. But I can sure get out from under it. Because if you're going to clear one that way, it better be a Prepcheck type of session. And as a matter of fact, just two weeks ago you saw me give a demonstration of the use of the missed withhold in handling a chronic present time problem – present time problem of long duration on a pc. That's the way you do it, but not in a rudiment. The rudiment PTP process is simply, well, "What part of that problem could you be responsible for?" until it's been – don't go stating the problem. Ask the first question. That's the door you're leaving by, except you're leaving just a little later.

See, your first checkout, it didn't disappear. So you're going to have – you run the process and then you leave by the same door. And it isn't, "Do you have a present time problem now?" That is wrong, you see. It is "Do you have a present time problem?" And the second that is null, no matter if the pc screams, no matter if the pc says yes he does have, doesn't matter, anything else. If the meter says he doesn't have, that's it. You stop running it right there. That's how long you run it. And that's all the length of time you run it. Various wordings have been on that old process; I don't know which the favorite one was. "What part of that problem have you been responsible for?" is the one that I've been using lately.

ARC break action: What do you do with an ARC break? Now, this is – we're getting practical here, see. What do you do with an ARC break? Well, of course, you run all kind of things don't you? Not today, you don't. You get off the missed withhold, check it and get out of there.

Finding overts: This is a whole drill. Now, you get it on this basis: The coach says – the pc says, "Do you have an overt?" or any kind of a leading "Do fish swim" type of question, see. "Do you have an overt?"

And the coach could say, "Well, I thought ..." And of course the correction there is, "What did you do?" See, it's – that – the whole purpose of that would be a TR which steered the pc into giving you a doingness whenever a think was offered. A criticism, a think, an evaluation – you need that one very badly. There was a session going on today – in which what – a person was actually getting aud- there were four things that you mustn't do in Prep-checking and all four of them were being bought by the auditor. You know what they are –

you know: mustn't take somebody else's withholds, mustn't take another person's thinking-ness, mustn't ... No, these things were all in full bloom in that particular session.

And yet at no time was the auditor saying, "What did you *do* to that person?" See, at no time. This person bought thought and – had other – there was explanation, the person was explaining why, you see. All of the various clues were there. They were all present, and so on. And that drill would be formed up to get around that.

Forming What questions: Now we've already seen something of that drill. We give an overt, "My sister ran away – I – scolded my sister, and scolded her and scolded her until she ran away with a policeman." And we just give that as the overt, as the coach gives it. And the student says – forms the What question. "What about running away with policemen?" or whatever it is. [laughs] See, you don't know it very well or you would've laughed. Proper What question is "What about scolding people?" See, the person's got to be able to form the What question out of the overt given. So we get a whole list of very involved overts. And the person's got to give the proper What question, or none of them. See?

We have – also this goes into this other drill of finding overts, because we have think replies in there, don't you see. And, "What have you done?" is the basic question.

The student says, "What have you done?" and just to – to say something.

And the coach says, "Well, I thought about chasing my sister one time around the house so that she would run away with a policeman."

And the student is supposed to form the What question. So, "What about chasing women?"

"*Flunk!*"

See, I mean that's – you get how that is done so that you get – he gets practice in forming these What questions, right now, right now, right now. What we need is a long list of involved overts from which you could form the proper What question.

You see, a What question can be too general, it can be too specific and it can be asked. Something else can be wrong with a What question. It can actually be asked. He actually did ask a What question. *Flunk!* See.

"I thought – I thought one time, about closing the door so that my sister would have to walk around to the backdoor."

And he's supposed to form the What question. So he says, "What about closing... ?"

"*Flunk!*"

See. Let him have it, good and echoing, you know. Really drive that one in.

The proper response – there's no What question about it and you never write it down at all.

And you say, "Come on. I want something you did to your sister." We're already working on familial Zero or something, you see. "I want something you did, did, did."

And then these things would be so arranged that you got the proper "did" immediately afterwards. The coach furnishes actually a did.

"Well, I just beat her a few times."

"All right, what about beating a ...?"

"Flunk!! You didn't get a specific overt." Get the idea?

"Oh."

See the type of drill it is? Eventually the auditor can sit there, and he says to the pc, "All right, we're trying to find out what withholds your family didn't find out about you," or whatever the Zero is, you know.

And, "Well, I was often very critical of my family."

And the auditor, "I got a reaction there. What did you do to your family?"

"Oh, I was often very critical, terribly critical. Used to go around the neighborhood being very critical."

"Yeah, what did you do to your family? Good. I know you went around the neighborhood being critical. What did you do?"

"Well, I denied them money lots of times."

And the auditor doesn't fall into that, you see. He says, "All right – one time there, one time. One time?"

"Well, it actually wasn't denying the money so much; it was stealing it."

"All right. But, what did you do there? One time, now."

"Nothing I never did anything to my family... *except* of course, I was very cruel to them. Very cruel to them."

"Look, I'm sitting here to find out what you've done to your family. I'm getting a reaction on something. Now, what have you done to your family?"

"All right. If you must know, I took them out for a ride in the car and I was drunk and I wrecked the car, and I killed three of them."

"Good! Good. What about ..."

And what is the What question? What is it? Come on, what is it? Come on, what is it?

Audience: "What about killing people in cars?" "What about drunkenly killing people?" "What about drunken driving?"

Come on, what is it?

Audience (gives different answers)

Male voice: "What about killing the members of your family?"

That's the biggest overt. And then you can move over in the margin, "What about drunk driving? What about this, what about that." But actually the chains you'd go back on –

you'll probably run all those chains back before you blew that because that's such a hell of an overt. But you at least are working on something.

You know, I think the dock strike, and everything else points in the direction of refusing to work. But I don't think auditors should go that far and ask the What questions I sometimes see on reports, just in an effort to not work, you know? We found – somebody here the other day asked the classic What question about paper clips. Somebody thought about stealing a paper clip. [laughter] Actually was asked by an auditor – horrible.

You see what that's – what these – what these forming the What question, you see how that would be designed? You see?

All right. Now, the drill, just the basic drill, of the When-All-Appear-Who system – just getting that drill down, till the person knows what to ask on that. Easy one. Finding the bottom of the chain rather than trying to find the later incidents on the chain. You know, the "go earlier" routine. Perhaps no TR, but we certainly ought to have an understanding of it and do it well.

Finding the Hav Process: Now we're off into another field. This is quite an activity – finding a Hav Process, covered by bulletins of a couple of years ago, and very involved and interesting bulletins they were. Exactly how you go about finding a Hav Process. There's no point in going over it, but a person has to be able to do that whole drill. And the best way to do it, of course, is to check out these various processes on pcs and find the one that works.

Of course, you actually can do this on a coach because the coach usually has a Hav Process. Some auditor has found his Hav Process already, you know. He knows what it is and what it isn't. Somebody's trying to find other Hav Processes and he knows that this better be checked into by the Instructor. You know, his Hav Process is, "Spit in that corner," or something of this sort. And the pc comes up with – I mean the student comes up with a Hav Process, "Look around this room and find everybody that's in it," you know. He's turning around – it's not even on the list.

Prehav Assessment, of course, is a very specific drill and is also covered by very specific bulletins and surprisingly few people can do these. You never know when one's going to come up and so forth. Prehav keeps fading away and dying and coming back to life again. So I'm beginning to consider that is one of the basic tools of an auditor.

Listing: How do you list? How do you test completenesses of a list? These are all doingness actions. That's very easy, by the way. You just take the pc's folder and read – take the coach's folder and read a few items to him, and you can tell whether the list is complete or not complete. Tone arm moves or it doesn't. Of course, the Instructor probably would rather not go into that case that level, but that is one way to do it.

Then nulling: How do you null? And then this comes – the doggonedest, mixed up, most impossible and difficult one of the whole lot – how do you check an item? And of course, it's composited of getting withholds off and invalidations, and going in the same – going out the same door you went in and everything else. I mean, if you do a good check off, that's a real good check off, and auditors are poorest at that single action right now in Routine 3 Process – not finding goals, because they do find goals – but by golly, they have trouble

checking out things. And they very often won't believe them when they are checked out. Had a case of that myself the other day. Auditor wouldn't believe it.

Checking: checking something out. How do you do it? It's a specific, direct drill. Very easy, but my God you'd think it was difficult, the number of checkouts that are wrong.

Getting off missed withholds is in here actually twice. And probably should be struck at that level. Getting item invalidations off – well, that means goal and item invalidations. There's a specific way to do this. You have to give somebody the idea of what it looks like. Actually an item will read, because it's been invalidated and an item will read because it is reading. You see? And sometimes when an item has been invalidated it reads and sometimes when an item has been invalidated it doesn't read. It's nice and constant.

And then we get into the next one here: getting suppressions off. Done the same way, but they're a special breed of cat – then cleaning a needle reaction – of course, that's a whole Prepcheck, pardon me – no, cleaning a needle reaction is very simple. That's just the same one that we had up here at the top. But cleaning a dirty needle, that is a whole Prepcheck. I was reading one line ahead of myself here. A script I'm carrying in the back of my head.

Getting more goals or items: How do you do that? Of course, you get off the missed withholds. You get off the invalidations on the subject of Scientology and listing. And you have to get off the invalidations sometimes on the subject of goals, listing goals, or listing in general. Get the missed withholds off on these things and you can always get a fellow rolling again. A specific drill, very specific.

Getting the pc into session: Now we get into something terribly, terribly, terribly fundamental. How do you get a pc into session. And you just do. You just do and you start the session. But how do you get the pc into session? What is used to do this? There's no trickery here, but people have trouble with it mostly because they think there's a lot more to it than there is. Getting a pc out of session, almost nobody knows how to do that. Hardly anybody will work end rudiments until the pc is actually out of the session. Most pcs leave sessions grogged, not cleaned. You can have a pc flying at the end of a session if you do your end rudiments well.

Controlling the pc's attention: This is a specific drill – a specific drill of controlling attention, that is all. You want the pc to look at a bottle and he won't look at the bottle. You get the idea? The coach won't look at the bottle. The student wants him to look at the bottle. Coach wants him to look at the bottle. Has to do it verbally. Coach sits there and gives him every reason under the sun, moon and stars why he won't look at the bottle. And the student has actually got to get the coach to look at the bottle. Got the idea?

And creating the R-factor: Hardly anybody does that. You've heard me do it practically every session that I've ever demonstrated. And yet I don't know how many of you are doing it yet. Creating the R-factor is telling him what the session is going to be all about or any ramifications to the session – describing the whole thing from your particular viewpoint. Even what you yourself are going to try to do regardless of what goals they're going to have later. They all – you create an R-factor before you begin the session.

You can also create an R-factor in the CCHs every time you start a new CCH. But create the reality of the situation for the pc – quite an important step.

Handling the p – holding up against pc suggestions: Now, doesn't that have a marvelous field of TRs? You know, the vista just opens before you there. Creatingness can run wild when it comes to a TR on that particular level. Holding up against the pc's suggestions. "Let's leave the room." What the pc – what the student is supposed to ask is, "Do fish swim?" And the coach is suggesting they do other things first. And I'm sure that a coach could be very good at this and could get to a point where he actually could trip the student into doing something else besides asking, do this. "Do fish swim?" "Could I adjust my chair slightly?"

You know. It's very funny, if you do this well, you can disarm – you can disarm a student in one of these TRs very, very easily. But this is again a beautiful contest there. You could figure out tons of TRs around that particular thing. Holding up against the pc's suggestions. Of course, the coach is there making suggestions and the pc – the student is trying to get something done. And of course the TR is that the student must get it done and *not* follow the coach's suggestion. A very wily coach using his tone modulations properly and so forth, can get anybody who is inclined to not hold up, to not hold up. This is quite amazingly easy, to get an auditor to do something else.

Now, holding a constant against adversity is learning to answer with the usual when the unusual is being demanded of you. And that is all there is to that one.

So you got an unusual situation – an unusual situation such as, "Well actually, to meet anything at all I have to list my goals in Sanskrit. *Heh-heh*. Sorry, you can't write Sanskrit. As a matter of fact I can. So I'll sit here and write some of these goals down. I will write down these goals in Sanskrit, you see, and then I'll tell you what they are and then of course, you can null them out."

And that sort of thing. How does an auditor get out of that situation? Well, leaving you with that puzzle see, because if you invalidate him obviously, you invalidated all of his goals, haven't you?

Well, leaving you with that puzzle, as to how you get that done – well, we've already shot over my time.

Thank you for your extra time. Good night.

TV DEMO: PATCHING UP 3D CRISS CROSS CASES

An auditing demonstration given on 16 May 1962

LRH: Now, if you just pull that chair a little bit closer.

Now, what we're going to do here – We're not terribly concerned with the auditing just now. I want to know how you're getting on, that's all. Going to check over your 3D Criss Cross, check over this goal, find out what you're doing. Okay?

PC: *Yes.*

LRH: All right. I'm just mainly checking up on the 3GA – getting you well started from this.

PC: *We haven't started the 3GA yet, Ron.*

LRH: No, I know you haven't.

PC: *Yeah.*

LRH: I'm just making sure we're – we're okay here. All right. Now, the main thing which I'm interested in ... Come on, stop looking so scared. What are you upset about? You upset about something? Huh?

PC: *Well, the strangeness of it and uh ...*

LRH: Oh, well. You let me worry about that, huh?

PC: *Okay.*

LRH: It's the strangeness of the room, huh?

PC: *And the situation.*

LRH: What's the situation?

PC: *I've seen all the others up here but I haven't been up here myself yet.*

LRH: Oh, I see. All right. All right. And, when you saw others up here – have you got any overt acts on seeing anybody ... Have you?

PC: *No, I think I've been very good, actually; I've shushed the others when they've been laughing.*

LRH: Oh, you have? You've suppressed some overt acts.

PC: *Yes.*

LRH: All right. Okay. How you feel about that now? Ah, you still got a little bit of charge on it. Something might go wrong here some way or the other? Yeah. What?

PC: *Well – well, I – I feel not so awfully good about my own auditing actually. Not as a pc but as an auditor.*

LRH: Okay.

PC: *And I feel that I've got such an awful lot to learn yet.*

LRH: Got some overts. Is this because we threw some practical course right in the middle of you?

PC: *Partly.*

LRH: Partly.

PC: *Yes.*

LRH: Yeah. Yeah. Yeah. You were getting all smoothed out and there you went.

PC: *Well, I don't know. Last week I had rather a rough – a rough time with my own auditing.*

LRH: Yeah.

PC: *Everything. I was all thumbs and thumbs and thumbs.*

LRH: Yeah. Well, you recognize, don't you, for the lack of these little parts and pieces that it can go that way.

PC: *Yeah.*

LRH: Right?

PC: *Yes.*

LRH: So I think it's a good thing you got an opportunity to straighten those out. I don't know what you think on it.

PC: *It is.*

LRH: All right.

PC: *It is.*

LRH: Well, how do you feel about being up here now? Well, there's still a bang on that. What's the matter? Is it me? Is it being checked over by me? No. Students? Kind of latent. This room? This room.

PC: *I have wondered where the television camera is. I ...*

LRH: There it is.

PC: *Yes, that's it. That's the one.*

LRH: There it is. That one is on now.

PC: *Oh, I can see my own reflection in there yes. That's the one.*

LRH: That's it.

PC: *Yes.*

LRH: And then there's the room.

PC: *Yeah.*

LRH: Okay.

PC: *Where's the room ... ? Oh, that's the room one.*

LRH: Yes.

PC: *Ha-ha.*

LRH: That gives you the lot there.

PC: *Yeah.*

LRH: Okay?

PC: *That's a bit better now.*

LRH: All right. Now, how are you doing on this now? That's fine. That's clear. Okay?

PC: *Good. Good.*

LRH: All right. Feel better now?

PC: *Yes.*

LRH: All right. Is it all right with you if I check over your line plots here and goals and other things and stuff?

PC: *It is.*

LRH: All right. Now, you recognize that sometimes there's a sufficient amount of charge on a line that you can't go into a Goal Assessment ...

PC: *Mm-hm.*

LRH: ...sometimes. I'm just making sure here tonight that is not true or is true, and if so, what one do we have to list. So I'm going to have to do a little bit to you here to get this needle quiet.

All right. Catfish.. Ah, you're not responding to my voice, so that's okay.

PC: *Oh, good.*

LRH: I want to check out these various lines that you've had here. You seem to have done a lot of listing on "hide."

PC: *Yes, we have done uh – a lot.*

LRH: All right. Hide. That is an instant reaction on that.

PC: *Hm.*

LRH: Now, did you get many somatics when you were listing that?

PC: *Yes.*

LRH: You did!

PC: *Mm. For – for – for – for weeks. For weeks it – uh – for a number of weeks – two at least – it seemed to be all uh – sensation ...*

LRH: Mm-hm.

PC: *... and then this last week, oh, it's been beautiful, with really good pain. But at least it was some pain I had, you know, I could feel.*

LRH: Hmm.

PC: *It was something solid.*

LRH: Hm. Hm. All right. Okay. Well, you got reaction on that line. All right. That's the main test. That's the only thing I really want to know.

PC: *Mm-hm.*

LRH: And we get a – still get a reaction on the Prehav level "hide." There's no damage done on this. It's just what was getting near the person.

PC: *Yeah. Very near.*

LRH: And let's test this next line, shall we? Who or what would be afraid to find out? Who or what would be afraid to find out? That looks awfully cool. I'll check it just once more. Who or what would be afraid to find out? I'm afraid I haven't got any charge on that at all.

All right. Let's take this next one. Who or what would suppress an identity? That looks very cool. Who or what would suppress an identity? I get no reaction on that.

PC: *Mm-hm.*

LRH: Now, in listing "Who or what would be afraid to find out?" did you pick up a lot more somatics?

PC: *Yes.*

LRH: You did have quite a few somatics? How heavy?

PC: *Yes.*

LRH: How heavy were they?

PC: *They kept – they were – yes, they were heavy – uh – heavier than any I've had before anywhere in auditing.*

LRH: Is that so! Is that so.

PC: *Mm-hm. And they moved, strangely enough, from behind, seemingly, out there to the back of the body, to the middle of the body and then they came out in front here. And they appeared as – uh – forget how I described them to my auditor, but sort of mechanical things like dolls.*

LRH: Mm-hm.

PC: *They were not dolls but they had the mechanical appearance, the deadness of dolls.*

LRH: All right. All right. Well, that line doesn't seem to be very charged.

But you say you had heavy somatics on it, huh?

PC: *On "hide."*

LRH: No, no. On "Who or what would be afraid to find out?"

PC: *I beg your pardon.*

LRH: Oh, I see. Oh, yeah.

PC: *I was referring to "hide."*

LRH: Oh, "hide."

PC: *Yeah.*

LRH: All right. But "Who or what would be afraid to find out?" – did you have somatics listing that?

PC: *Very, very slight, light ones.*

LRH: Yeah, that's what I thought. And "Who or what would suppress an identity?", did you have any somatics listing that?

PC: *Hardly at all.*

LRH: No. All right. It's all over here on "hide."

PC: *Yes.*

LRH: You had me going there for a minute. I...

PC: *I – I do beg your pardon. Yes. Yes.*

LRH: Oh, that's quite all right. It's an overt that shall be forgiven. All right. What did you find the elephant on?

PC: *Uh – "Who or what would hide?"*

LRH: Ahh.

PC: *And a cardinal, too, before the elephant ...*

LRH: Yes.

PC: *... and I've never known anything like that happen before. It came to sight and it blew with violence.*

LRH: All right. Well, let's straighten out this line. Now, somebody, I think, started you listing on goals (which is perfectly all right; that can be skipped because you didn't go very far on that), and ... You'll have a good subjective reality on this, as somebody who was run on some earlier line – whether it was a goal or anything of the sort, that produced somatics and reaction and that sort of thing – the line has to be completed.

PC: *Yes.*

LRH: But, if it were not a true line of some kind or another it wouldn't have to be completed – no somatics on it.

PC: *Yeah.*

LRH: What were you going to ask me?

PC: *There was something I'd like to say, is that uh – towards the end of running "hide" I noticed, or I felt, that the um – question, uh – as a process question, was beginning to, shall I say, skid; it wasn't gripping.*

LRH: That's all right. It would. It would. Three sides to the flow are all missing.

"Who or what would hide?" Well, that's a nice one. Let me work this out. Okay?

PC: *Yes.*

LRH: Your listing was "Who or what would hide?"

PC: *But, Ron, would it go on and on and on and on and on like this?*

LRH: Oh, yeah. Oh, yeah. Sure would. Not if listed four ways.

I'm going to take an experimental check of this, if it's all right with you.

PC: *Yes.*

LRH: I'm just going to take several here at random, and I'm going to read them to you and see what TA action we get out of this. Okay?

PC: *Yes.*

LRH: All right. Now, give those cans a squeeze, would you? Thank you. Your havingness is down. Give those cans a squeeze. All right, thank you. That's good enough. All right. Just hold on to them now.

A man hunter.

A man killer.

A man eater.

A stalker.

Anyone who stalks.

A stealthy stalker.

A stalker by stealth ... so forth.

There's still some reaction on this.

A masked man.

A highwayman.

A pope.

A statesman.

A subverter.

That particular aspect of it seems pretty cool.

PC: *That was the elephant part. The animal part.*

LRH: He blew, huh?

PC: *Yes, he blew.*

LRH: All right. Now, "Who or what would hide?" All right. Now, let's see if we can make a four-way flow out of this, okay?

PC: *Hm.*

LRH: That was what was listed. Now, the way we get this is we want – it's want, not want, oppose, not oppose. That isn't the order of listing, but that's an easy way to remember it. Okay?

PC: *Mm.*

LRH: Let's change this into the order of listing: Oppose, not oppose, not want.

All right. Now, which one is "Who or what would hide?" Is it want? It's not certainly ... Is it want? "Who or what would hide?", "Who or what would want to hide?" Is that right? That translate?

PC: *Not quite. Who – would you please give it to me again, Ron?*

LRH: Hm?

PC: *What it was – what – would you give it to me again – what it was, what you asked me.*

LRH: "Who or what would want to hide?", "Who or what would hide?" Is it the same?

PC: *Huh. It seems to be "Who or what would hide?"*

LRH: All right. So let's change this over to – we've got: "Who or what would hide?" And then we've got, obviously: "Who or what would not hide?"

What's the matter there?

PC: *Now I've gotten all uncertain.*

LRH: Yeah, I know you would be uncertain at that point. But it'd have to be,

to be opposite that, wouldn't it? I think we'll get a kick out of this on the meter. Let's take a sound at this. Who or what would not hide? That isn't too close. Who or what would not hide? Who or what would not want to hide?

PC: *"Not want to hide."*

LRH: Who or what would not want to hide? I'm afraid so. Who or what would not want to hide? There's a little better reaction on that.

PC: *Yeah. A bit more kick in it.*

LRH: All right. "Would not want to hide." Okay.

Now, putting these things together which are oddball lines is sometimes a little bit tricky.

PC: *Mm. Hm-hm.*

LRH: All right. Now. The next one would be "oppose hiding," wouldn't it?

PC: *Yes. Yes.*

LRH: Would it be "oppose hiding" or "oppose something that hid"?

PC: *"Oppose something that hid."*

LRH: It would be: "Who or what would oppose ..." I'm afraid it'd have to be "something or someone," wouldn't it? "Someone or something ..."

PC: *Mm-hm.*

LRH: "... that hid."

PC: *Yeah.*

LRH: And "Who or what would not oppose someone or something that hid?" Hm?

PC: *Yeah.*

LRH: Let me try those on the meter now. Who or what would oppose something or someone that hid? I just get a tiny little jolt out of that. Who or what would oppose hiding? Who or what oppose hiding? Who or what would oppose something or someone who hid? Something or someone that hid?

I get a kick out of it. I got a little dirty needle here. Is there a – a missed withhold on something like that?

PC: *Uh – yes.*

LRH: Yeah, what's the missed withhold?

PC: *The third one that you said back, uh – "would oppose," uh – did you say "hiding"?*

LRH: Uh-huh.

PC: *That one gave me a little just a little jolt, and I didn't tell you about it.*

LRH: All right. All right. Thank you. Let me check that. Is there a missed withhold on this? That's it. All right. Clear.

Okay. It's – Who or what would oppose hiding? That's tame now. Who or what would oppose hiding? Who or what would oppose something or someone who hid? Which one of those seems right to you?

PC: *The last one.*

LRH: Yeah. All right. See if you can wrap your wits around this one: Who or what would not oppose something or someone who hid?

PC: *I'm in total apathy on that one.*

LRH: Who or what would not oppose something or someone that hid?

PC: *I – I – I've wrapped my wit – wits around it, but it just sends me into total apathy about thinking about an answer.*

LRH: That's a boy. That's a boy. That's right.

PC: *Yeah. Yeah. Oh, Lord knows.*

LRH: Well, then that's fine. And that's just exactly correct. Because these "not oppose ..."

PC: *Oh!*

LRH: ... is out there into the nowhere, see?

PC: *Whew!*

LRH: All right. There is your listing. And this one is listed One, and this is Two, this is Three, and that is Four. All right.

Now, let's see how these things are. Okay? See if we get a little knock on these things. Who or what would hide? It seems to be awfully clear that you've listed the living daylights out of it.

PC: *Seven hundred, I think.*

LRH: Yeah. All right. Now, who or what would not want to hide? All right.

Have I missed a withhold in this session? Yes. What?

PC: *I wondered what you were looking at through there.*

LRH: Oh, all right. Good enough. Let me check this. Have I missed a withhold in this session? That's clear. Thank you. All right. Wild, man.

Who or what would not want to hide? This thing is cool. Who or what would oppose something or someone that hid? Who or what would oppose some-

thing or someone that hid? Well, there seems to be something on that. Is that the one your attention hung up on?

PC: *Yeah.*

LRH: Yeah. All right. Yeah, that's a gruesome one, isn't it? Yeah. All right. And who or what would not oppose something or someone that hid? Ah, there's a little tick on that. All right. That seems to be all right.

All right. Now, how are you doing on that?

PC: *I feel as if I'd like to get my teeth into that – those two – those two last ones.*

LRH: Yeah. Yeah.

PC: *Especially the third one.*

LRH: Well, we haven't got a good checkout here on "Who or what would not want to hide?" or "Who or what would not hide?"

PC: *Mm. Mm.*

LRH: Is that better?

PC: *Mm.*

LRH: Who or what would not hide?

PC: *Yes.*

LRH: Yeah. There we're getting a jolt on it.

PC: *Sounds rather like oppterm.*

LRH: Yeah, that's good. "Who or what would not hide?"

PC: *That lets the floodgates open.*

LRH: "Who or what would not hide?" Yeah. You're thinking about that now?

PC: *Mm.*

LRH: It's going round and round, too. All right. That's the way we will do that then: "Who or what would hide?" "Who or what would not hide?" "Who or what would oppose something or someone that hid?" and "Who or what would not oppose something or someone that hid?" Okay?

All right, Mike. Now, how do you feel about this check over? How do you feel about this check over?

PC: *Good.*

LRH: Good. All right. Is it all right with you if we bring it to an end?

PC: *Yes.*

LRH: All right. End of check.

PC: *Thank you.*

LRH: You bet you. You're welcome, Mike. Put them down. You can go back downstairs. You're all set.

PC: *Thank you.*

LRH: Okay, Jim. Have a seat.

PC: *Thank you.*

LRH: We'll see what you're up to here and into.

PC: *Yeah, let's do that.*

LRH: I was particularly interested in this one, Jim ...

PC: *Mm-hm.*

LRH: ... because of the level that was found on it.

PC: *Yes, I was ...*

LRH: Seem to me to be quite disastrous if we didn't get that level straight.

PC: *Mm.*

LRH: All right. So I want to find out how good that is or isn't. All right, pick up the cans, would you? Is it all right with you if I do a check over on this?

PC: *Yes, sir.*

LRH: All right. Here we go. Give those cans a squeeze. Ah, that's good news. Give them a squeeze. Give them a squeeze. Your havingness is a bit down, isn't it?

PC: *Hm, I don't know.*

LRH: Why?

PC: *I'm shaking like a leaf.*

LRH: What are you upset about?

PC: *Hm.*

LRH: I don't get any reaction here at being upset, particularly.

PC: *Okay.*

LRH: But...

PC: *Havingness is down.*

LRH: Your havingness seems to be down. What's your Havingness Process?

PC: *"What's the condition of that (so-and-so)?"*

LRH: I see.

PC: *At least that – that was up until today. And Jan said I'd outgrown it. And now we have something like um – yeah, just "Point out something around here you can have," or something like that. Fairly – a straight process.*

LRH: Oh, yeah?

PC: *Have I made this clear?*

LRH: Mm. "Point out something you could have?" "Look around here and find something you could have."

PC: *"Look around here and find something you can have." That worked this morning. Up until then we have been using "What's the condition of that (so-and - so)?"*

LRH: Hm. You don't mind my doing something about this, do you?

PC: *No. Be delighted.*

LRH: Is it all right if I give you a very short session on this?

PC: *Yes, of course.*

LRH: Not in Model Session?

PC: *Any way you like.*

LRH: Is it all right?

PC: *Sure.*

LRH: All right. Let's check this one over here. Give me another can squeeze. All right. When you squeeze the cans just let them sit there ...

PC: *Yeah.*

LRH: ... relaxedly.

PC: *Mm-hm.*

LRH: All right. Now just press on them. That's good. Fine. That's good. All right. Here is the first command.

PC: *Okay.*

LRH: Look around here and find something you could have.

PC: *Your wristwatch.*

LRH: Good. Look around here and find something you could have.

PC: *This ashtray.*

LRH: Good. Look around here and find something you could have.

PC: *That camera.*

LRH: Good. Look around here and find something you could have.

PC: *Um – the balance.*

LRH: Good. Look around here and find something you could have.

PC: *The jacket on the bed.*

LRH: Good. Look around here and find something you could have.

PC: *Yes, I like these curtains. I could have those.*

LRH: All right. Look around here and find something you could have.

PC: *Feels better already. Um – that door.*

LRH: All right. Squeeze the cans, would you? All right. Let's try it again. Squeeze them. All right. Look around here and find something you could have.

PC: *Your necktie.*

LRH: Okay. Look around here and find something you could have.

PC: *Your binocular case.*

LRH: Good. Look around here and find something you could have.

PC: *The frame of that picture.*

LRH: All right. Squeeze the cans, would you? Yeah. You're getting a little more extension on this.

PC: *Good.*

LRH: All right. Look around here and find something you could have.

PC: *This lamp.*

LRH: Good. Look around here and find something you could have.

PC: *Mm – that – uh – wire-robe thing.*

LRH: Good.

PC: *Pin. Right.*

LRH: Good. Look around here and find something you could have.

PC: *The telephone.*

LRH: Good. Look around here and find something you could have.

PC: *The green vase.*

LRH: All right. Squeeze the cans, would you? All right. That's fluky.

PC: *Mm.*

LRH: That's fluky. That contracts and expands your havingness. It loosens it for a moment and then contracts it for a moment. Have you got any invalidations on a Havingness Process? Yeah, what is that?

PC: *Well, this has been used and turned down in favor of "the condition of that thing."*

LRH: Oh, I see. All right.

PC: *You know, when we ran through a couple to see which would work; and the "condition" one loosened up the needle, and those that Jan tried prior to that tightened the needle, and this was one of those that had previously tightened the needle.*

LRH: All right. Okay.

PC: *But not this morning.*

LRH: Good. Let me check that.

PC: *Okay.*

LRH: Has this been invalidated? Thank you. That is now clear. Have you ever failed to answer Havingness Processes? Thank you.

PC: *Well ?*

LRH: No reaction. You can answer it if you like.

PC: *No, but I thought that I had failed to run them well.*

LRH: Mm. Mm. All right. Have you ever failed to run a Havingness Process well?

PC: *Yes, indeed.*

LRH: Yeah. Thank you. Let me check that now. Have you ever failed to run a Havingness Process well? I still got a tick on that.

PC: *Mm-hm.*

LRH: Can you shed some more light on that? Can you tell me when and where, and so forth.

PC: *Yeah, it was with Mary.*

LRH: Hm?

PC: *Mary.*

LRH: Mary?

PC: *It was subjective: "Mock up something. Shove it into your body." she couldn't do it.*

LRH: Oh, I see.

PC: *We tried it on the gradient scale.*

LRH: Was this an overt?

PC: *Well, it was a failure.*

LRH: It was a failure. All right.

PC: *In the process of trying to do it I was insisting that she did it.*

LRH: I see.

PC: *It became – uh – I became rather overbearing I suppose. It was way back about seven years ago.*

LRH: All right. All right. Okay. Anything else you care to say about that?

PC: *Not especially. No.*

LRH: All right. Now let's check on this again. What was the first question? I wanted to know if you had ...

PC: *Yeah. The question we were just looking at now was something about invalidated process.*

LRH: Mm-hm. All right. Have you ever invalidated a Havingness Process? Thank you. That's clear.

PC: *Good.*

LRH: All right. Okay. Let's try this just a few more times. Were you running that exact process at that time?

PC: *No, it was a subjective one. "Mock up something you can have and shove it into your body" was the failed one.*

LRH: I see. That's the failed one.

PC: *Mm.*

LRH: All right. Were these cousins up till just a moment ago?

PC: *Well, they're both Havingness Processes, but one is quite different from the other. I never really cared for Subjective Havingness anyway.*

LRH: All right. Good enough. Okay. Let's run a little more of this Havingness now.

PC: *Right.*

LRH: All right. Look around here and find something you could have.

PC: *There's a little baby chest in there I like the look of; I could have that.*

LRH: All right. Look around here and find something you could have.

PC: *This carpet.*

LRH: Okay. Squeeze the cans, will you? Well, for some reason or other that went wider. All right. Look around here and find something you could have.

PC: *Hm. The bedspread.*

LRH: Good. Look around here and find something you could have.

PC: *That camera.*

LRH: Good. Look around here and find something you could have.

PC: *The lamp.*

LRH: Good. Look around here and find something you could have.

PC: *Well, I could have the expanse of the ceiling.*

LRH: All right. Good enough. Squeeze the cans. All right. Now, that process is still tightening things, and so forth. And I'm now going to shift gears to another process. Okay?

PC: *Right. Yes.*

LRH: All right. The process I'm going to run on you here is "Look around here and find something you could reach."

PC: *All right.*

LRH: All right?

PC: *Mm-hm.*

LRH: Here's the first command.

I don't mean to invalidate that process, and so forth, but it is still going through a cycle of tighten-loosen.

PC: *Hm! Okay.*

LRH: It's all right. All right. Nothing very catastrophic.

PC: Mm.

LRH: But I think this "reach" thing possibly would do better. Reach. All right. I thought it kicked on it for a moment.

PC: *Hm.*

LRH: All right. Anything you'd care to say to me there?

PC: *Yes, I'm sitting on something here.*

LRH: What?

PC: *If that process I told you was the one Jan ran this morning, it'll be on the top of this morning's report. If I've made a mistake it'll be some other Havingness Process. That is, if she made a note of which process.*

LRH: By George, I don't find that process here.

PC: *Hm.*

LRH: Maybe yesterday?

PC: *You know, I take very scant notice of what she does in session. So I may have been mistaken about this.*

LRH: I don't see any notes on the havingness end of it.

PC: *Mm-hm.*

LRH: So I'll just take a shot in the dark here, and we'll see what we've got.

PC: *Right.*

LRH: We'll just take a shot in the dark. All right. Let me check something here for a moment. All right. Have I missed a withhold on you? There's a little bit of a throw there.

PC: *I thought of the – this being televised. This whole procedure.*

LRH: All right. Thank you. Let me check that. Have I missed a withhold on you? Thank you. That's not clear yet.

PC: *Oh.*

LRH: All right. Let me ask you again. Have I missed a withhold on you? Bing, bing.

PC: *That was about Jan's auditing. I seem to be talking a great deal about it.*

LRH: All right.

PC: *But uh – how would this be a mith – uh – a with withhold ?*

LRH: Yeah? Yeah?

PC: *Um – not since we sat – not since I sat down in this chair can I think of anything that you've missed .*

LRH: All right. Okay. Let me check that. Have I missed a withhold on you? All right, that is clean now.

PC: *Good.*

LRH: Thank you. All right, let me run some of this reach process. All right?

PC: *Okay.*

LRH: Look around here and find something you could reach.

PC: *That lamp.*

LRH: Good. Look around here and find something you could reach.

PC: *The door to the bookcase.*

LRH: Good. Look around here and find something you could reach.

PC: *The hook on the back of the door.*

LRH: Good. Look around here and find something you could reach.

PC: *The light switch.*

LRH: Good. Look around here and find something you could reach.

PC: *The pen in Fred's pocket.*

LRH: Good. Look around here and find something you could reach.

PC: *Your tiepin.*

LRH: Good. Look around here and find something you could reach.

PC: *The receiver of the telephone.*

LRH: All right. Look around here and find something you could reach.

PC: *This triangular block of wood.*

LRH: All right.

PC: *Good one, yes.*

LRH: Right. Right. Look around here and find something you could reach.

PC: *Knob on the door – drawer.*

LRH: All right. Okay. Squeeze the cans, would you? All right. That's broadening. I'm going to give you two more of these commands and end this process, if that's ...

PC: *All right.*

LRH: ... all right with you. Look around here and find something you could reach.

PC: *The lens in the camera.*

LRH: Okay. Look around here and find something you could reach.

PC: *Mm. The glass in – the glass pane in that door.*

LRH: All right. All right, one more test. Squeeze the cans. All right. Thank you. Okay. Now, that's the end of that process.

PC: *Good.*

LRH: All right. Now, quite interesting. We'll get your auditor to go into this havingness proposition with you. I'm not going to at this particular time. That is sort of a broad, shotgun process ...

PC: *Mm-hm.*

LRH: ... that generally does these things – because I'd say you needed quite a few – quite a little bit of that.

PC: *Oh, yeah.*

LRH: I would like to see you get quite a little bit of Havingness run.

PC: *Good.*

LRH: Okay?

PC: *Right.*

LRH: All right. Now. Let's get over into this scramble here.

PC: *Mm-hm.*

LRH: And you've been doing some goals.

PC: *Yes, sir. For three days we've been doing goals.*

LRH: All right. And have you been successful in ...

PC: *We have a list. We've nulled about 35 percent of them.*

LRH: Yeah, you seem to be coming along all right. Nothing seems to be upsetting this. Hm?

PC: *No. The session is mostly auditing. Very little time is spent now in end – end and – beginning and end rudi-*

ments. Which was the case in the beginning with auditing. We were spending a lot of time on rudiments and less time on auditing ...

LRH: Hm. That's peculiar.

PC: *... than we are these last few days. I mean ...*

LRH: Oh, you mean you were before spending more time on rudiments.

PC: *Yes.*

LRH: But not now?

PC: *No. No. We're just whizzing through beautifully.*

LRH: Oh, all right. All right. All right, well, let me check up and just make sure with you, Jim, that we're not all fire-drilled on the subject of ... Has nobody ever done a line plot for you? Guess there was no need to, the only level you ever listed was apparently "drive crazy."

PC: *Right.*

LRH: And what was the question?

PC: *"Who or what would drive something or someone crazy?"*

LRH: "Who or what would drive something or someone crazy?" That is a nice tough one.

PC: *We have a list of something nudging on a thousand items there.*

LRH: "Who or what would drive something or someone crazy?" All right. Now, while you were running that, Jim ...

PC: *Mm-hm.*

LRH: ... did you get a lot of somatics?

PC: *No.*

LRH: You got no somatics?

PC: *I got two ...*

LRH: Two. What were they?

PC: *... distinct ones, and I've still got them.*

LRH: What are they?

PC: *One was a pain in the shoulder blade of this side ...*

LRH: Yeah.

PC: *... and the other was a twitching nose. Right at the end. It looked like a rabbit. Like that rabbit we gave the kids.*

LRH: Yeah.

PC: *His nose twitches. And it goes on twitching in the most uh – I mean, unexpected moments.*

LRH: All right. Did you have a lot of big – cognitions or something of the sort on this?

PC: *Not big ones. But quite a lot of cognitions. It got realer to me. It seemed to me I went back to the very core of being, so that any departure from native state was the beginning condition of craziness ...*

LRH: Oh, I see.

PC: *... and it was a progression on from there.*

LRH: All right. Well, that doesn't sound to me to be very violent. But you say you still got those somatics.

PC: *Mm-hm. But they're not worrisome somatics.*

LRH: Mm-hm. In doing this goal did you find yourself distracted or anything of the sort?

PC: *Not by those. Certainly not.*

LRH: Your attention is very nicely on the subject of goals?

PC: *Mm-hm.*

LRH: All right. Well, let me test the question. Who or what would want to drive something or someone crazy? You've still got a react on it.

PC: *Mm, yes. Well, your question was a little different from the one that Jan was asking.*

LRH: I've got "Who or what would want to drive someone or something crazy?"

PC: *We didn't have the "want" in there when we were listing.*

LRH: Just "Who or what would drive someone or something crazy?"

PC: *Mm-mm.*

LRH: All right. All right. Let's see. I'll check that. Who or what would drive someone or something crazy? Who or what would drive someone or something crazy? This looks awfully quiet, but the needle gets very still when I start talking about that. I'll tell you what we're going to do in your case: we're just going to let you go right on with a Goals Assessment.

PC: *Fine.*

LRH: And we're not going to be upset about this.

PC: *Okay.*

LRH: But, if after – what? – a complete 3GA ... Now, I'm writing here, "But if after a complete 3GA, nose and shoulder somatics continue, do a complete line ... "

PC: *Hm.*

LRH: "... listing on Prehav level 'drive crazy.'" All right?

PC: *Mm. Sure. This shoulder pain is uh – you know, I'd be pleased to be*

rid of it, but uh – it doesn't seriously interfere with anything.

LRH: All right. Well, I think it'll probably blow off ...

PC: *Mm-hm.*

LRH: ... or something of the sort. You seem to be getting along all right with your Goals Assessment; everything seems to be fine.

PC: *I'm very pleased with it.*

LRH: All right. Is there anything you care to say before I wind this up?

PC: *Beyond thanking you very much, no.*

LRH: All right. Okay. Now, let me check just one thing.

PC: *Mm-hm.*

LRH: All right. Have I missed a withhold on you? All right. Thank you very much. That's clear.

PC: *Good.*

LRH: Okay. Put your cans down.

PC: *Thank you.*

LRH: Thank you very much, Jim.

PC: *All right, sir.*

LRH: You bet you.

LRH: Come on, Tom... There you go.

PC: *Thank you.*

LRH: Pick up the cans. Shove it a little closer there and pick up the cans. Okay. Now, let's take a look at where you're sitting here on the meter. Squeeze the cans. All right. That's pretty loose. Now, is it all right with you if I do a check-over of what you're doing here in listing?

PC: *Sure.*

LRH: All right. Now, we have a Prehav level here, "convince."

PC: *Mm-hm.*

LRH: And you listed on that and we left the list incomplete and went to 3GA. How long did you list on that one?

PC: *Oh, not very long really. Maybe three sessions or less. Very possibly less?*

LRH: Hm?

PC: *Oh, it weren't too long – about three sessions' worth.*

LRH: All right. And what happened during that listing?

PC: *Um – I did experience some somatics – uh – not very terrible ones – in the ears.*

LRH: In the ears?

PC: *Yeah. Just uh – they didn't last long. I had a – a jolt in the side. Um – eyes got a bit sticky – one eye. I had a slight somatic in the right eye.*

LRH: Mm-hm.

PC: *Just minor somatics actually. These are – these were new ones ...*

LRH: Hm.

PC: *... as far as I was concerned. Now, I have a – a chronic head ...*

LRH: Hm-mm.

PC: *... that I've had in since uh - '56 - since we ran solids.*

LRH: Mm-hm.

PC: *And it's kind of stayed with me on and off.*

LRH: Well, did that turn on while you were doing this?

PC: *Well, I've had it so long, I mean, it's kind of a cousin of mine now.*

LRH: Yeah, but ...

PC: *It – it – it varied a little bit – little bit but it doesn't ...*

LRH: Did that line vary it?

PC: *A little bit. I think it did a little bit.*

LRH: Oh, it did, huh? All right. Let me find out what wording was being used on this.

PC: *"Who or what would want to ..."*

LRH: I just wanted to know, mainly, if it turned on something.

PC: *Well, that – they were. I got a jolt in the side. These were new ones.*

LRH: Yeah.

PC: *You know ? Ears. Little somatics ...*

LRH: Do you have any – are any of these still on?

PC: *No – uh – not – no. I've got the head . It's like uh – like I've got a woolen hat on all the time – pressure.*

LRH: But since when has that been?

PC: *Oh, I've had that for, oh, years, I guess.*

LRH: Now, Tom!

PC: *Yes.*

LRH: I am talking about a line that you just listed ...

PC: *Yeah.*

LRH: ... for three or four sessions.

PC: *Yeah.*

LRH: Now, did that line turn on anything new? Now, you be a good boy now.

PC: *New. Uh – those somatics I mentioned were new ones.*

LRH: Now, this woolen head one?

PC: *Ah, this – that varies on processing. It eases and increases ...*

LRH: But it has always varied on processing?

PC: *Yeah.*

LRH: All right. So that is not new.

PC: *That's not new, no.*

LRH: Now, I'm trying to find out one thing here. Now, it'll make you much easier to answer. And I don't know what your auditor did with the list but it seems to be missing. I find no lists. I got some lists here.

PC: *They're already-done-with lists.*

LRH: Well, what are these lists?

PC: *These are – these are what we did.*

LRH: SOP Goals.

PC: *Prior to coming. Yeah. Yeah. Last year.*

LRH: Did you ... Oh! What is this?

PC: *That's a goals list. I think they came – the two together.*

LRH: Ah, yes, here we are! "Who or what would want to convince?" Now we're talking! "Who or what would want to convince?"

All right, Tom. Let me say this one to you. Who or what would want to con-

vince? Now, there's still a tick on this. It's still alive. But it's just a tick. But it's a little bit of a double tick so do you mind if I ask you another question?

PC: *Yeah. Sure.*

LRH: All right. Have I missed a withhold on you? Yes.

PC: *Uh – well, I thought then, when you looked at a goals list, this was contrary to your orders. We ran it, and I wanted to see what it did. Those – on running those goals – when we looked at those lists just now. Um – Conner and I had a bang at it.*

LRH: We what?

PC: *We ran those goals. They weren't touched here; this is something we did in LA.*

LRH: Yeah.

PC: *And uh – it was uh – contrary to your orders. That's all.*

LRH: Oh, that you ran them?

PC: *Yeah.*

LRH: Oh, all right. Thank you. Thank you. Let me check that. All right. Have I missed a withhold on you? Seems to be clean.

PC: *Very good.*

LRH: Thank you. All right.

Now, let me take one more look at this. Who or what would want to convince? Well, it's kind of latent.

You see, now, here's what I'm trying to do, Tom: I'm trying to make up my mind whether or not you should continue this listing.

PC: *Mm-hm.*

LRH: And you yourself will have to know how to do this. Whether you continue listing something that has been listed in the past or whether you can go on to a current Routine 3 process. See?

PC: *Mm-hm.*

LRH: There's a possibility, you see, that if a fellow got some somatics – and why I was scolding you a minute ago is, I only want to know if this turned something on which hasn't been turned off.

PC: *No, I wouldn't say so.*

LRH: I didn't put it right, see? You wouldn't say so.

PC: *Well, while you were talking earlier I was looking at these things and they were light somatics, they'd jolt you when they turned on. I wouldn't call them heavy ...*

LRH: Mm.

PC: *... but they were there ...*

LRH: Mm.

PC: *... and they turned off.*

LRH: Well, is this quite new to you to get some kind of a somatic or a sensation?

PC: *That type of somatic – the way it turned on and off – I – I would say yes.*

LRH: Kind of new.

PC: *It was quick. It hit me and turned off.*

LRH: All right.

PC: *See, when I get into anything, it usually is pretty heavy and it usually stays with me, you know ?*

LRH: Yeah. I get you. All right.

PC: *But this was short, sharp and sweet.*

LRH: Well now, look here, Tom. You have listed – well, there's maybe 150 of these.

All right. Now, let's bring up something here. You obviously have done something here, and there has been a goal found ...

PC: *Yeah.*

LRH: ... and obviously a terminal must have been found.

PC: *Well, uh – we did; we found a goal and a terminal. We ran it. It was probably a present time situation. We ran the ter – the goal was "to be wanted." And the terminal was ...*

LRH: What was the goal?

PC: *"To be wanted."*

LRH: Right.

PC: *And the terminal was "a boy."*

LRH: All right.

PC: *We couldn't knock it out so we ran it.*

LRH: All right. Okay. Then you have listed prior to 3D Criss Cross.

PC: *Yeah.*

LRH: Yeah. Well, all right. Now, that's all we want to get to.

PC: *Now, that goal when it was found it – it – it – it rock slammed for about three quarters of an hour – nearly blew the meter apart. So we guessed it was worth running.*

LRH: All right. But I just want to know now: It was on this list here someplace, huh?

PC: *Mm-hm. Yeah. Still blitzing me.*

LRH: All right. Do you remember the number?

PC: *No. I'm afraid I don't remember that.*

LRH: Don't mind my looking for it here, do you?

PC: *No. Not at all.*

LRH: I can't find it on this list. Everything has been nulled.

PC: *Well, it uh ... Well, we ran that goal .*

LRH: Well, yeah. I'm trying to find it on the list.

PC: *Mm.*

LRH: That is the wording of it?

PC: *That's it. Mm-hm.*

LRH: "To be wanted."

PC: *That's it.*

LRH: All right. I'm going to check this goal out. Okay? What's your auditor doing right now with it?

PC: *We're not touching it, actually. We went on and just got those lists through. And uh – we're just um – completing goals lists.*

LRH: You're completing a goals list.

PC: *Yeah.*

LRH: But there was a goal found.

PC: *Yeah.*

LRH: Well, was it found as a regular goal?

PC: *What do you call a regular goal?*

LRH: Well, was it found and checked out and it stayed in and ...

PC: *Yeah. We couldn't knock it out. That's why we ran it. And it blew the meter apart. It was a terrific thing.*

LRH: All right.

PC: *So we ran it.*

LRH: Okay. All right. Good enough. Sixteen May '62. And the goal was "to be wanted."

You listed a terminal for that thing, too, didn't you?

PC: *Yeah. "A boy."*

LRH: Mm-hm. "To be wanted." All right. Is it all right if I check this goal?

PC: *Yeah.*

LRH: All right. To be wanted. All right. Okay. To be wanted. Okay. To be wanted. All right. Now, have you invalidated this goal?

PC: *Oh, sure. Yeah. I sure did.*

LRH: All right. How is that?

PC: *Well, I doubted it. And I thought when you issued the bulletin about present time problems and things like that ... Uh – this is a thing in the bank – I've got a whole thing I've been running for years, with women and boys and all sorts of things like that.*

LRH: Hmm.

PC: *And I figured on that. And when you issued that bulletin, I thought, "Well, this is a present time problem." It came up when we were running problems.*

LRH: Mm-hm.

PC: *Flashed across, and I said, "Put that down."*

LRH: Hm-hm.

PC: *And we couldn't knock it out.*

LRH: Hm-hm. All right.

PC: *That's how we got it.*

LRH: All right. Thank you. Let me check this. All right. Has this goal been invalidated? All right, I still get a bang That's it.

PC: *Well, actually, it came straight out of an incident, I'm pretty sure. I dramatize it.*

LRH: All right.

PC: *And I wondered whether it was out of a – a – some kind of an engram ...*

LRH: Mm-hm.

PC: *... quite like this. But it was very real, and it lasted a long time.*

LRH: All right.

PC: *I didn't think it was a real ... There might be a more basic goal, I thought.*

LRH: Mm-hm.

PC: *But this was so good I thought that we – we – we could run this with advantage.*

LRH: All right. Okay. Let me check that now. All right? Has this goal been invalidated? That seems a bit clearer. Okay?

PC: *Mm-hm.*

LRH: Now, has anybody missed a withhold on this goal? Yes. That's it.

PC: *Mother.*

LRH: That's it.

PC: *Mother.*

LRH: What is it?

PC: *I thought of Mother.*

LRH: Yeah. Bang.

PC: *Carmen.*

LRH: All right. That's it.

PC: *Carmen's mother.*

LRH: All right. There's one.

PC: *Well, I – what I thought then – that all the people that I consider didn't want me ... I looked – uh – that's what I thought then.*

LRH: All right, then. Okay. What's that one?

PC: *Well, this is – uh – what I thought then was a kind of a game.*

LRH: Hm.

PC: *Um – you reject them and they consider they don't want you.*

LRH: All right.

PC: *That's what I thought.*

LRH: All right. All right. Thank you. Thank you. I didn't mean to keep feeding you more and more there.

PC: *Hm-hm.*

LRH: I just thought maybe I could run this one down. All right. Has anyone missed a withhold on this goal? Yes.

PC: *Well, I thought of Father then.*

LRH: Okay. All right. Let me check that. Has anyone missed a withhold on this goal? Yes, it's still live. Think of another one? That's it.

PC: *Um – well, I thought of the priest – Roman Catholic Church.*

LRH: Mm-hm.

PC: [coughs] *Excuse me.*

LRH: All right. Thank you. Has anyone missed a withhold on this goal? Yep.

PC: *I thought of nuns then.*

LRH: Okay. Thank you. Let me check that. Has anyone missed a withhold on this goal? That's getting cleaner. There's just a tiny, little tick left. Can you think of that one? That's it.

PC: *Well, what I thought of then – um – when I brought up some pictures on birth, they had nuns around the bed praying over me, apparently – by the bed ...*

LRH: The what? What?

PC: *Nuns.*

LRH: Yeah.

PC: *I didn't know about this.*

LRH: Yeah.

PC: *The priest came in to visit me – we lived next door to the convent, you see ...*

LRH: Right.

PC: *... and I didn't know about this. But apparently I was giving them a kind of a game and probably was expected not to stay. And they were just – they were trying to keep me around, I suppose.*

LRH: Oh, yeah. All right.

PC: *That's all. That's what I thought of.*

LRH: All right. Thank you. Let me check that, Has anyone missed a withhold on this goal? Still bangs.

PC: *Now, I just ...*

LRH: That's it.

PC: *... thought of a bishop then.*

LRH: All right. You got that?

PC: *Well, I'm wondering ...*

LRH: You thought of a bishop you said.

PC: *Yeah – who the hell the bishop is.*

LRH: All right. Okay. Let me check that. Has anyone missed a withhold on this goal? Now, we still get a tick.

PC: *Well, there'd be the family.*

LRH: There's one. Huh?

PC: *Family.*

LRH: All right. Okay. It's getting quieter. Let me check it again. Has anyone missed a withhold on this goal? It's clean.

PC: *Thank you.*

LRH: All right. Okay. Now, let me check this goal again. To be wanted. To be wanted. To be wanted. All right. I get a sort of a dirty needle and a sporadic read here on this thing so there's apparently some more on this thing. Now, have you ever – have you ever suppressed this goal? Yeah, there's a tick-tick.

PC: *Yeah. Yeah, I've suppressed it with practically everybody.*

LRH: Hm-hm.

PC: *Anybody that showed me any – uh – any interest in me, I – I used to turn this on.*

LRH: All right. Okay. Thank you. Let me check that. Have you suppressed this goal?

PC: *Continuously.*

LRH: Still a little tick. All right.

PC: *Well, this would apply to practically everybody I knew.*

LRH: Mm-hm.

PC: *I've suppressed it.*

LRH: All right. Good. Let me check that. Have you ever suppressed this goal? Get a fall, but it's getting cleaner. That's it.

PC: *Well, I thought about the army then. I left the service when I was wanted.*

LRH: Hm-mm. Hm. All right. Thank you. Let me check that. Have you ever suppressed this goal? All right. There's nothing but a bit of a latent on there now. But let's see if you can think of that one.

PC: *Mm.*

LRH: That's it. That's it.

PC: *Thought of Mother.*

LRH: All right. That's it again.

PC: *Mother.*

LRH: All right. Thank you. Let me check that. Have you ever suppressed this goal? Still get a bang. Not clean yet. That's it. That's it. That's it.

PC: *Carmen – I would suppress it with her. And ...*

LRH: That's it.

PC: *... this – this would apply to everybody I've known, actually.*

LRH: All right.

PC: *And everybody that has shown any interest in me, to help me, I've kind of taken off.*

LRH: Okay. All right. Let me check that. Have you ever suppressed this goal? Still a tick. That's it.

PC: *School.*

LRH: Okay.

PC: *Um – yeah, College of Science, I think I was uh – I think a professor there was trying to help me and I backed off of that, too.*

LRH: All right. Thank you. Let me check it again. Have you ever suppressed this goal? It's getting cleaner. I'll check it one more time. Have you ever suppressed this goal? I don't think that's this reading; there's something reading here. I'll check it one more time. Have you ever suppressed this goal? Still a tick.

PC: *Well, I suppressed it as far as you're concerned.*

LRH: Oh, all right.

PC: *When you reached at me I didn't respond.*

LRH: All right. Good enough. Good enough. Let me check it again. Have you ever suppressed this goal? Yeah, that's getting clean now. That's getting clean. Let me make sure. Check it one more time. Have you ever suppressed this goal? I got a latent tick that time, just a little bit of a latent. That's the one. That's the one. That's it.

PC: *I thought of Iceland then.*

LRH: Hm?

PC: *Iceland.*

LRH: Oh, yeah. All right. Okay. Let me check it once more. Have you ever suppressed this goal? I've still got a bang here. There it is. There it is.

PC: *Well, I suppressed it in the first job I was in. Uh – when help was offered to me ...*

LRH: Mm-hm.

PC: *... um – I refused the help there – took off from there ...*

LRH: All right.

PC: ... without much explaining.

LRH: Okay. Okay. All right. Have you ever suppressed this goal? Still got a tick on it.

PC: *Well, there's another family that were very friendly toward me.*

LRH: Mm-hm.

PC: *I cut adrift from them.*

LRH: Mm-hm.

PC: *Same way.*

LRH: All right. Okay. Let me check on this. Have you ever suppressed this goal? Got a tick. That's it.

PC: *Sisters.*

LRH: Hm?

PC: *Sister.*

LRH: All right. Sister. Okay. All right. Let me check it once more. Have you ever suppressed this goal? Still got a fall.

PC: *Yeah, that's with uh – uh – Vera – another one that uh – another person trying to help me.*

LRH: All right. All right. Okay. Good enough. Let me check this again. Have you ever suppressed this goal? Well, I got a swing that time. Let me check it. Now, we're just talking about this goal.

PC: *Mm-hm.*

LRH: Have you ever suppressed this goal? Still get a little hang here. Getting much cleaner; we're changing this.

PC: *Mm-hm. Um – well, this seems to be the – right the way throughout life actually; it's the thing I've done apparently.*

LRH: Mm-hm.

PC: *Uh – soon as anybody showed any interest or wanted to help me I just um – took off. That's all.*

LRH: Hm. Hm. All right. All right. Let me check this again. Have you ever suppressed this goal? I still get a bang on here.

PC: *Mm-hm. I thought of an aunt then that tried to help me in the art field.*

LRH: Mm-hm. All right. All right. Let me check it again. Have you ever suppressed this goal? That's getting clean. All right.

Now, let me check the goal itself. Just let me say the goal a few times. To be wanted. Now, the read is a little more consistent here than it was. But you get a couple of responses and then a no-response, so there's something else on this. All right. In this session have I missed a withhold on you?

PC: *No. Well, I thought I didn't – I thought of and didn't tell you was uh – I thought of a singing career that I was offered, that I refused, too.*

LRH: Yeah.

PC: *A singing career.*

LRH: Hm-hm.

PC: *I thought of that.*

LRH: All right.

PC: *I thought of that and didn't tell you it.*

LRH: All right. Good. Let me check that. In this session have I missed a withhold on you? Still got one. That's it.

PC: *Well, I – I seem to be suppressing the goal now, to some extent.*

LRH: Suppressing?...

PC: *The goal.*

LRH: Oh, yeah? Yeah? Right now?

PC: *Yeah.*

LRH: All right. Okay. Let me check this. In this session, have I missed a withhold on you? Clean. Okay.

PC: *Thank you.*

LRH: All right. Let me check this goal again. To be wanted. To be wanted. To be wanted. All right. We got two slightly latent and one no-read on this particular activity.

Now, is there an invalidation on listing? Ah, that's clean. Have you been upset by a Goals Assessment?

PC: *Well, we certainly had battles on it um – when we were listing.*

LRH: Oh, you did, huh?

PC: *Oh, yeah. We fought ...*

LRH: Was that here?

PC: *Yeah, we – no, not here, no.*

LRH: Oh, on the goal?

PC: *Yeah.*

LRH: Originally.

PC: *Yeah, we really fought our way through that.*

LRH: Mm-hm. All right. Let me check that. Have you had any upset on a Goals Assessment? All right. Clean. Okay.

To be wanted. To be wanted. To be wanted. Now, frankly, we do get a tick in this. It does tick; slightly, just a split late but it's checking out better. Now, without any recourse to the meter, is there anything you care to say about this?

PC: *Uh – no. Well, I felt it was probably uh – something worth running. I didn't particularly feel it was the goal.*

LRH: Oh, you didn't?

PC: *No, I felt it was kind of far down the track a little bit, in the right direction.*

LRH: Hmm.

PC: *I felt there was something below it.*

LRH: Hm. All right. Okay. You remember listing the terminal for it?

PC: *Well, uh – uh – yeah, I remember the terminal, yeah – "to be a man." You mean the list?*

LRH: Listing on it.

PC: *Oh, there wasn't many on the list.*

LRH: Very few.

PC: *Mm-hm. Wasn't many to it.*

LRH: All right. Now, I still get a slightly dirty needle here on occasion, from time to time. Now, did the auditor who did this assessment miss a withhold on you?

PC: *Well, if she did, um – I didn't know about it.*

LRH: All right. What was it?

PC: *Well, I – I figured uh – that I wasn't giving her the terminal ...*

LRH: Yeah.

PC: *... and I figured I wasn't giving her the goal.*

LRH: Oh, all right. All right. She didn't find that out?

PC: *Um – well, I told her that.*

LRH: All right.

PC: *But the terminal, I felt, I was withholding.*

LRH: You did?

PC: *Mm-hm.*

LRH: All right. All right. Did the auditor who did this Goals Assessment miss a withhold on you? Much cleaner. All right. Was this done in that LA course?

PC: *Nuh-uh. No. That was done off bulletins.*

LRH: Yeah. Well, was this before the LA course?

PC: *Yep. Um – yes.*

LRH: Done before the LA course?

PC: *Yeah.*

LRH: I see.

PC: *Before the rudiments were gotten clean.*

LRH: All right. Okay. Now, is there an invalidation on this goal? Seems to be clean. Has any auditor missed a withhold on this goal? I have to check that again. Has any auditor missed a withhold on this goal? The word "auditor" seems to start a dirty needle here.

PC: *Yeah. Well, it doesn't mean that – it kind of means something else to me.*

LRH: What's that?

PC: *"Auditor." Well, it kind of um – um – I'm kind of uh – mixed up with auditing – books and papers and accounts and things like that on auditing. It doesn't mean what we consider an auditor is.*

LRH: Oh, I see. Got it.

PC: *I – uh – I have difficulty with these things.*

LRH: Okay. All right. Has any auditor missed a withhold on this goal? I'm not getting any read on that particularly. I did get a dirty read on the word "auditor." Let me check this – yeah, I still get it. Auditor. Auditor. There's something going on, on that – on that word still.

PC: *Well, I think, myself, it's a – something I've never really been fond of as a ...*

LRH: As a word.

PC: *... title, or...*

LRH: All right. Good. Let me check this now. Has any auditor missed a withhold on this goal? That is clear as far the question is concerned. All right. Let me check it out once more here. To be wanted. To be wanted. To be wanted. All right. All right, in this session, have you suppressed this goal? Yes.

PC: *Mm. Kind of.*

LRH: Mm-hm.

PC: *Yeah.*

LRH: Well, all right. Okay. Let me check this again. In this session have you suppressed this goal? Still got one.

PC: *Yeah, I was hoping that um – the goals list wouldn't be touched, you know? I kind of thought that uh – maybe we'd get on the – maybe the other list and forget about that.*

LRH: Oh, all right. Very good. All right. Let me check that now. In this session have you suppressed this goal? Clean. All right. Once more. To be wanted. To be wanted. To be wanted. To be wanted. All right.

How do you feel about this goal?

PC: *Well, it means something. It's something I've tried to do.*

LRH: Mm-mm.

PC: *Um – I got it.*

LRH: Mm-hm.

PC: *I came up with it.*

LRH: Hm.

PC: *It made sense to me.*

LRH: All right.

PC: *Something that I was trying to prove ...*

LRH: All right.

PC: *... in order to take off. It was very real. I've done this all my life.*

LRH: Hm-mm.

PC: *so it meant something to me.*

LRH: All right.

PC: *Felt we had to do something with it.*

LRH: Okay. Now, let's take another look at this "would want to convince." Hm?

PC: *Mm-hm.*

LRH: Who or what would want to convince? All right. We get a nice read on that, by the way. Now, how would we four-line this? "Who or what would not want to convince?"

PC: *Seems less positive. Um ...*

LRH: "Not want to be convinced?" What would it be?

PC: *"Would," I think.*

LRH: Hm?

PC: *"Who or what would ..." without the "want" in it.*

LRH: Yes, I know. But that's what you've gotten listed here. You listed "Who or what would want to convince?"

PC: *Yeah, that seems all right.*

LRH: All right. How about the line "Who or what would not want to convince?"

PC: *Seems less positive. The other one seems more real.*

LRH: Mm-hm. All right. Who or what would oppose being convinced? Who or what would oppose being convinced? [writes it down] Who or what would oppose being convinced? And who or what would not oppose being convinced?

PC: *Yeah. Seems right.*

LRH: Who or what would not oppose being convinced? Who or what could be convinced?

PC: *Seems real.*

LRH: Yeah. "Who or what could be convinced?" [writes it down]

PC: *Mm-hm.*

LRH: All right. And we've already listed [writes it down] "Who or what would want to convince?" And you actually preferred that to be "Who or what would convince?"

PC: *That's the way I felt when you read it out.*

LRH: Mm-mm. Well, let me check these two. Who or what would convince? Who or what would want to convince? Which of those sounds best?

PC: *The first one.*

LRH: "Who or what would convince?"

PC: *Yeah. Feels more certain.*

LRH: Hm-hm. Well, actually, as a person could continue this listing, they could just translate that line already listed to that point over to this other thing, and you'd get the same thing. All right. And we've still got one more. "Who or what would opposed being convinced?" "Who or what ..."

Now, "Who or what would not want to convince?" Make any sense to you?

PC: *Yeah.*

LRH: "Who or what would not want to convince?"

PC: *Yeah.*

LRH: [writes it down] All right. Let me test this out. Who or what would not convince?

PC: *Seemed like on the other side when you said that. Either of those are over there, you know, kind of separate from me.*

LRH: Where are they – oh, yeah, yeah ...

PC: *The opposition.*

LRH: ... yeah. Oh, they're definitely in opposition.

PC: *At least that's the way it feels.*

LRH: "Who or what would not want to convince?" All right. Or "Who or what would not convince?" Which is the best line? "Who or what would not want to convince?" Is that easy to answer?

PC: *Yeah.*

LRH: All right. "Who or what would not convince?" Is that easy to answer?

PC: *Well, that, you have to be more certain. I feel you have to be more certain about those answers than the other one.*

LRH: Very good.

PC: *More positive.*

LRH: Hm-hm.

PC: *I think the other one is broader. The other one seems more narrow to me at the moment.*

LRH: "Who or what would con – would not convince?"

PC: *Mm – that's broader.*

LRH: That's broader ...

PC: *Mm-hm.*

LRH: ... than "Who or what would not want to convince?" Huh?

PC: *Yeah.*

LRH: "Who or what would not convince?" Well, what we're going to do [writes] – we'll continue – continue existing line with "Who or what would convince?" and then run "Who or what would oppose being convinced?"

PC: *Mm-hm.*

LRH: And "Who or what could be convinced?" and "Who or what would not convince?" Okay?

PC: *Seems fine.*

LRH: They're all hot.

PC: *Good.*

LRH: Okay? And as far as your Goals Assessment is concerned, you can go on and get your goal – perfectly all right. But I sense on the meter here that there's something in between you and this former goal. And so let's list this thing out;

it shouldn't take forever to list it out, you know?

PC: *Okay.*

LRH: Let's list this thing out and then go on and get – with that out of the road, go on and get a goal. Huh?

PC: *Mm-hm.*

LRH: All right?

PC: *Yeah, fine.*

LRH: Because you did get somatics. They were changing somatics. You do have some chronic somatics. Okay.

PC: *Mm-hm.*

LRH: All right. Is there anything you care to say about it?

PC: *No. Thank you.*

LRH: All right. No other comment? Anything you'd like to say about this? All right. Perfectly fine. All right. That is it, Tom. And thank you very much.

PC: *Thank you, Ron.*

LRH: That's the end of checkout.

PC: *Thank you.*

LRH: All right. That's okay.

Okay. Push your chair forward there a little bit, Fred.

PC: *Mm-hm.*

LRH: A little more. A little more. Thanks. Chair! All right. Pick up those cans. Okay. All right here. Now, give the cans a squeeze. All right. Thank you. Is it all right if I do a check-over on this situation?

PC: *Yes.*

LRH: All right. Okay. Anything wrong with my doing a check-over on it?

PC: *No.*

LRH: I get a bang there.

PC: *Well, I'm just nervous.*

LRH: There it is. You're nervous about it, huh?

PC: *Mm-hm.*

LRH: All right. Is it all right if I check over this situation?

PC: *Yes.*

LRH: All right. Nervous about the TV?

PC: *No.*

LRH: No. What is it you're nervous about?

PC: *No, the – I feel I'm down to waterbuck/ tiger level on this here, and I'm all mixed up, heading in both directions at once, it seems.*

LRH: Oh, I see.

PC: *Goal and opposition goal, and terminal and opposition terminal, and I seem to have been hanging there for a long time.*

LRH: All right. Now, did you ever list a goal earlier?

PC: *No.*

LRH: Have you ever had a goal found on you?

PC: *No.*

LRH: Okay. And you've only got one line here – the only line you've listed, apparently.

PC: *No, I've had another one. It's a Prehav line also – "civilize." I think it's ...*

LRH: It's right here.

PC: ... *it's not – and the suppressor line "Who or what should be disregarded when you want to get something done?"*

LRH: Well now, what do you think about all this? Which is the first one that was done?

PC: *Well, "Who or what would civilize?" was done and abandoned. And when you brought out the suppressor line, that one was started and "civilize" was not completed . Peter Williams got the oppterm on that first, on the suppressor.*

LRH: Hm-mm.

PC: *And Dorothy Broaded did the other side of it and got the terminal. And uh ...*

LRH: On what, the "civilize"?

PC: *No. On the suppress line.*

LRH: Oh. Oh, on this Line A that's already here.

PC: *Yes.*

LRH: All right. Now answer ...

PC: *And then. ..*

LRH: Yeah. Go ahead.

PC: *And then she assessed – Dorothy Broaded, my present auditor, assessed me on another Prehav level and came up "to make unconscious." And – well, that's one of the things I've been complaining to you about for years that I dope off, dope off, dope off.*

LRH: Yeah, I know.

PC: *And that didn't run too well. And apparently she got instructions from Mary Sue to finish the line on "Who or what would civilize?" The one that Ellen had started. We did about a thousand on it all together.*

LRH: All right.

PC: *We did come up with "a reformer" and it didn't quite check out.*

LRH: All right. But tell me this ...

PC: *Mm.*

LRH: ... the earliest one you did is "civilize."

PC: *The earliest one that was started, but not finished. And we ...*

LRH: Yeah. Well, that's "civilize"?

PC: *Yes!*

LRH: That's the earliest one.

PC: *Yes.*

LRH: All right. Now, in doing that "civilized" one, whether the first time or the second time, did you get a lot of somatics? Heat, cold, pain, sensation – any of these things happen?

PC: *Not the first time. No. But the second time I started to get somatics on it. When we really listed it out to completion. When – until tone arm action was no longer in it.*

LRH: Hm.

PC: *Then I started to get somatics on the left side of my body; all on the left side, including teeth that were no longer there.*

LRH: All right.

PC: *And I think that's probably why I lost them – because of whatever was sitting there.*

LRH: All right. Now listen, Fred.

PC: *Mm.*

LRH: You've apparently had "civilize" and then "to make unconscious"

and then "Who or what should be disregarded when you're getting something done?"

PC: *Well, not in that order. It was ...*

LRH: Let me get this order straight here.

PC: *..."civilize" first. Uh – the first assessment I've ever had in 3D Criss Cross was "Who or what would civilize?" That was run by Ellen Carter, and we got a list of about six hundred.*

LRH: "Who or what would civilize?"

PC: *That's right. And that was never completed.*

LRH: Good. All right. And your next line for listing?

PC: *The next line was "Who or what should be disregarded when you're getting something done?" And that came out as – you want the item? No. Okay.*

LRH: And your next line?

PC: *And the next line was "Who or what would make unconscious?" on the Prehav.*

LRH: Mm-hm. And the next?

PC: *And that was abandoned and we went back to "Who or what would civilize?" and finished that one.*

LRH: Got it. Thank you. Right now are you looking for a goal or ...

PC: *Yes. Right now we're looking for a goal.*

LRH: All right. What luck are you having with looking for a goal?

PC: *Well, it's tremendous auditing just to list for the goal. I'm again*

amazed that we're right down in the basic area of – well of – of what I want to achieve and the opposition to it immediately.

LRH: Hm.

PC: *I seem to be on both sides of the fence all the time. And uh ...*

LRH: Hm-hm.

PC: *... it's very, very uncomfortable.*

LRH: All right. Answer this now, Fred: If you yourself could choose what was going to happen or were going to choose, what would you do here? Which one of these lines? Or what would you do?

PC: *Oh, I'd finish the goal listing, by all means.*

LRH: You'd finish it off, huh?

PC: *Oh, definitely.*

LRH: Yeah.

PC: *Not that the other was not uh – not productive, but I can see where the goals listing is – is definitely right down the ...*

LRH: Mm.

PC: *... center line. And why, just listing the goals is tremendous auditing for me – cognitions galore.*

LRH: Hm. Hm. All right.

PC: *And I seem to be exteriorizing from my difficulties, seeing both sides of the problem.*

LRH: All right. Good enough. Good enough. All right. Let me check over this list and just read these down the line. Okay?

PC: *Yes.*

LRH: And let's see what readings we get here. In the first place, let me give you a null word. Just put your cans in your lap there. All right, let me give you a null word. Floor. All right, this is not going to get in our road.

Here we go. Who or what would civilize? Okay.

Who should be disregarded when you're getting something done? All right. Thank you.

Who or what would make unconscious? All right. Thank you.

Who or what would civilize? All right.

Goals. Okay. Goals. All right. Thank you very much.

Goals gets a read. The rest of these get a dirty needle.

PC: *Hm!*

LRH: So, what we're going to do is ...

PC: *There was a lot of – in the first listing of "Who or what would civilize?" – Ellen just said, "Well, anything that comes to your mind," and all sorts of – of the seamier sides of life just came to my mind and sort of boiled off.*

LRH: Hm-hm.

PC: *She listed down everything and – and there is a circuit of some kind having to do with stuck pictures of birth and sex, and ...*

LRH: Hm-hm.

PC: *... and this, whenever I'm getting audited, auditor gets a dirty needle and then – now I've – I've gotten toward*

getting them off on missed withholds. But these have been very embarrassing.

LRH: I see.

PC: *Yeah. But that – we finally got that off now. We used to – horse wrangling for an hour to get rudiments in.*

LRH: Yeah.

PC: *Epecially with a female auditor.*

LRH: Right.

PC: *But now we can get them in, in a few minutes.*

LRH: All right. Very good. Oh, I feel that there were some missed withholds on that whole subject. You probably didn't say what you wanted to say or about running it or something of the sort?

PC: *Mm. No, I don't think I could get away with anything; especially not with Dorothy now.*

LRH: Yeah. Yeah. Well, I didn't mean that.

PC: *Oh, I see.*

LRH: I meant on the earliest run on "Who or what would civilize?" Yeah, there it is, but ...

PC: *Well, it's quite possible, because we didn't know about the missed withhold things yet.*

LRH: All right. Well, did your first auditor on "Who or what would civilize?" miss any withholds on you? I don't get a reaction on that particularly.

PC: *Oh, no. No, I – I'm not bashful. I get them off although it may be painful to get them off. You know?*

LRH: Yeah. Yeah.

PC: *But I get them off.*

LRH: Well, you're getting your bulk of your session going on goals.

PC: *Mm-hm.*

LRH: Right? And you get a bang here on the subject of goals. Well, you get a reaction on the subject of goals. All right. We're going to go on here with goals, huh?

PC: *Mm-hm.*

LRH: Good. Fine. [writes] And we're just going to complete a Goals Assessment. And sometime clean down all of suppressions, invals on the subject of listing. All right, that's fine. Okay. We got that now. All right. Is there anything you care to say before we end this up?

PC: *No. Thank you very much.*

LRH: All right. You bet you. End of checkout.

PC: *Thank you very much.*

LRH: There you go, Fred. See you later.

AUDITING ERRORS

A lecture given on 17 May 1962

Thank you.

Okay, I hope after this lecture there will be an upgrade in your auditing. I only hope.

All right. What are we here? This is ...

Audience: 17 May.

17th of May 1962, Saint Hill Briefing Course and ...

[Door is going, Audience voice: Sorry.]

... that's all right, we'll give you an infraction sheet. [laughter]

And, I already gave this lecture at dinner, so we can skip it! [laughter, laughs] And Mary Sue was going on about what you were doing and not doing. And I feel pretty grim, tell you the truth. I mean, that's terrible.

Well anyway, this is lecture one, 17 May 1962 and I'm going to talk to you about the sins that you can commit while prepchecking. And there's some vague feeling that because we have some drills, that the ability of the auditor to talk to the pc is reduced. Now, if you saw this in the demonstration last night, I was doing one of these drills very consistently. I don't know if you noticed that, you might not have recognized the drills being done right. [laughs] Snide tonight! Snide.

I myself was aware of the fact when first employing this, very harshly and so forth, that it did cut down my tendency to ARC break the pc with a bunch of meaningless conversation. I noticed this, in passing, that the – and so on. But I think all those people I checked over last night, I think they were perfectly happy with that checkout, weren't they?

Male voice: Yes.

Well now, did you feel better after the checkout, than you did before?

Male voice: Yes.

Hmm? I wonder why! Must have had something to do with the fact that the pc was acknowledged and the pc knew that was square and pc had some certainty on it – in spite of the fact I did – wasn't auditing last night, I was just doing a checkout. But in order to check out, of course, I had to do a small amount of auditing.

Now, you'll find that's inevitably and invariably true.

And when you first start using this, just as I noticed last night, using it very rigorously and harshly, yes, you feel sort of, "Oh, well, I can't go on and on talking to the pc – ha-ha!

What am I going to do now?" And that's because you have mistaken, as I recognized very readily, the drill for the fact of auditing.

There are two types of activity in which you engage in auditing. There's just two types of activity. And they're both very definitely different types.

And one of these things is the rudiments type of activity. Now, this is the type of activity where you're not really trying to dig anything up. You are trying to straighten something out. And you're trying to straighten it out right now. That is a rudiments-type activity. And you have beginning rudiments and you have end rudiments. But remember, you also have a nebulous thing called "middle rudiments." Middle rudiments do exist. And every time you are asking the pc for a missed withhold you are running a middle rudiment. It is just a rudiment.

The other type of activity is an auditing activity. Now, just as you have the body of the session and you have beginning, middle and end rudiments, you see, there's a difference here. This is "body of the session" auditing. And it is done against a tone arm, it is not done against a needle. You do your rudiments against a needle and you do your body of the session against a tone arm. They are two different items on the E-Meter.

Now, some of you might have noticed that when you move a tone arm, the needle moves. I don't like to put that that... bluntly, but anyway, if we were to set this meter up here, so that it were... Now, there sits the meter. But here supposing – now just look at the needle. We get that much motion on the needle. Do you think that's tone arm motion or isn't it? Hmm? That's tone arm motion, isn't it?

Audience: Yes.

Now, when we say how much tone arm motion is your pc getting during Prepchecking, we see that this thing can swing all the way over there and all the way back again and we have about a quarter of a – of a division of motion here, on the tone arm, which ordinarily isn't recorded. We don't, in recording tone arm, record these fast responses of the needle. But they do mean tone arm motion. Your long, wide swings of the needle you can classify as tone arm motion. You can classify those as tone arm motion.

We're interested in a stability of tone arm motion when we're recording it. We center the needle, we record it. In other words, we center the needle on set. Put the needle on set. And we record the tone arm. That's for a needle read.

You see, you're dealing with a relatively sloppy action. This is not a precision action. The recording of a tone arm motion is not a precision action. Because your needle can fly around considerably without ever your recording it. You understand? It – you're stretching at gnats. You're trying to shoot down butterflies with sixteen-inch guns or something like that, when we say, "Oh well, if we kept a tone arm record and the needle was at set all the time, all the time, all the time and so forth and we had this quarter division..." Well, you'd work yourself silly and it's to no purpose.

When we say tone arm motion, we mean you centered the thing and read it. But a needle that drops like this – that's just one swing, see. We don't call that tone arm motion, really. It isn't anything that we record. For the purposes of the body of the session, by definition I'm

just giving you, we do notice that as tone arm motion. That's what's known as "tone arm motion read on the needle."

We know we're getting tone arm motion, we know there'd be tone arm motion there if we kept centering the tone arm. I'm just calling your attention to something you know already, that if the needle is flying around, you're getting tone arm motion. It is not significant as far as items or anything else is concerned, because you're not going to read a needle flying around like this for items or something of this sort and for an ARC break or something like that. You're going to read the thing, it goes *clank*. You're going to read this type of reaction, see. *Clank*. See? Or this type of reaction. See, the little reactions. You're not going to pay much attention to this reaction. See, there's a wide reaction and you actually read while that thing is doing a wide reaction, you read its interim reaction, its internal reaction.

You say, "Do you have an ARC break?" and it – you know, it's swinging down like this and it goes – you got the idea? It interrupts itself or something like this. Or it's swinging back up. You don't read from a motionless needle, by the way. Some of you can always tell a brand-new auditor, he sits there and waits for the needle to stop moving so that he can read it. The only time you get embarrassed on this is when the needle slides by the end of the pin. And you've started your question and it all of a sudden goes by the end of the pin before you can finish your question and of course then you've had it, then you have to repeat your question. Which is perfectly all right.

You'll see on these demonstrations, I'm fairly careful to give you a read. That is to say I'm fairly careful to ask my questions with the needle more or less slowed down or motionless, so that you can see the thing. I'm not reading a needle as fast as I would ordinarily read a needle. But I'm not straining at it too hard even in that direction.

Now, the point I'm trying to make here is this motion that's going like this or the needle was coasting here at the end of the dial for a while and then came back up here and was here for a while and then was here, that's tone arm motion. Those are not needle *reads*, really, you see. They're tone arm motion. It's tone arm motion read off the needle.

Now, of course, if you're sitting here with your thumb on this tone arm motion, if you're sitting here with your thumb on that, yes, you could keep it centered all the time. But the trouble is while you are talking or asking questions of the pc, you're liable at the same time to be moving it with your thumb and that's very difficult to read. In fact I've never seen anybody do it yet, me included. You see. So there's no profit made.

Now, let's classify these two things. There is the rudiments-type read and the body-of-the-session-type read. Now, the body-of-the-session-type read is done on the tone arm. And the rudiments-type read is done on the needle. Already we have those two very broad distinctions.

All right, they are treated in an entirely different way by the auditor. The auditor's handling of these two things is entirely different. And what you've got to get into gear is slipping from one to the other and back again without upsetting yourself, God help us. And sliding from one to the other without continuing the other when you're doing the other.

All right, I'll give you an example of this. We're going along here, needle – needle is ... We're getting sweeps of some kind or another, so we know whatever we're talking about to the pc is sort of hot, you see, because it's swinging around, you know, and this says, well, the subject – the subject is pertinent to something or other. And the pc says suddenly, "That's the list. That's complete. That's it. That's all the items there are. No good to ask me if there are any more items, because that's all the items there are, the list is complete."

Now, I don't care if at first you crash your gears. I just don't want to see any gear teeth flying off. But go ahead and crash your gears in trying to change from one to the other. Because at this moment you've got to go into a rudiments-type question. And this is an entirely different presence. So he's had it now, you've said – you've said, "Are there any more items?" or something. You haven't even tested for it, you know.

And pc says, "No, no, that's complete."

And you say, "All right. Good." *Clank-whirr-crash*, you see.

Now, "Have I missed a withhold on you?" I don't care what you say, do you see. You're going to get a middle – a middle rudiment, see. All right, now that middle rudiment is handled with great precision. "Have I missed a withhold on you? Yeah, what's that? Yeah, that. That one there."

"Oh, well, ha-ha. Yeah, well I didn't tell you I'm bored stiff."

And you say, "All right, all right. Thank you, thank you. Let me check that. Have I missed a withhold on you? All right, that's clean. All right, fine. Okay, now. Now, we only have thirty items on this particular list. [laughter] And on all of your other lists you have three hundred and ninety-seven. So I think we'll have to do something about this. Now, how about another item?"

See, you've shifted your gears back again. There was no "Up, Fido" drill on here, you see. You did a *tsk*. You're right back at it again.

And he says, "Well, I don't want to list anymore."

"Well," you say, "you can think of another one. Come on, think of one. Think of another one. Repeat one that you've already given me."

"Well, there is one."

And you say, "All right, that's fine." [laughter] And you're off to the races, see. And you get him going a little more and then all of a sudden you happen to be noticing this over here and this thing appears awfully still. Appears very still. No TA action. Just looks awfully still. Or he gets a dirty needle once in a while when you speak or something, see. All right, you shift your gears, you see. And you ask once more for a missed withhold, invalidation.

You know – there – this is – this is just a note I will interject into this thing – did you know there are negative – negative middle rudiments? "In this session, have you tried not to withhold something?", "In this session, have you tried not to invalidate things?", "In this session, have you ref – have you been trying not to suppress anything?" See, they're done exactly the same way as any other middle rudiment. Same drill. Whatever you ask the guy, you leave by the same door.

And you find out there are two reasons why your pc starts picking up and getting more and more and more and more and more withholds. So finally every item you're picking up missed withholds. See, there's two reasons. One is, is you've *missed* a withhold, but good. See, that's one. And the other one is the pc has now become very alert to the fact that he mustn't have withholds, see. And he's busy there running the session and keeping his rudiments in.

I don't care what kind of a middle rudiment you do. "In this session, have you tried to keep the rudiments in?" Pc says, "Oh, yes, my God!" The same drill, you see, no comments from the auditor.

And you say, "Good. All right. Now, let me check that again. In this session, have you kept – tried to keep the rudiments in? That's it, that's clean." Go on about your business, you see. It's just this little shift of gears.

Now, it doesn't matter then what you use for a middle rudiment. Do you realize that you can bring a middle rudiment in like this: "In this session, have you deliberately tried to influence the E-Meter?" Perfectly valid middle rudiment, see. Sec Checking-type questions where you're running lists: "In this session, have you told me any half-truths? untruths?" see? You just use your end rudiments, see. Clank! You say, "Well, come on, what's that?"

He says, "Well, I have, as a matter of fact, I've been stringing a longbow here for some time on the subject of my sister. And I've been trying to damage her, too."

And you say, "Good. Thank you very much. Now, let me check this question again. In this session, have I missed..." And that's your shift – your shift over. It's very simple when you get down to it. When you do a rudiments-type question – now, let's get the other difference going here – when you do a rudiments-type question you're trying to get something out of the road of the body of the session. You're trying to keep the body of the session from getting upset. That is the only thing you're trying to do.

You're not trying to help the pc a bit, even though it very often helps the pc a bit, as the people I was checking last night undoubtedly felt helped by the number of missed withholds and so forth which I picked up off of them so as to carry on a check, see. But you're not trying to really help the pc with that – an – that rudiments question. You're trying to keep the body of the session going.

And don't you ever get going on a body of a session or even on the beginning rudiments and let the pc detour you on to doing something else. You clean up a rudiment. If you're cleaning up a rudiment, you clean it up as a rudiment, you clean up that rudiment and you get off of that. And by definition, the shortest, quickest brush-offs are the bestest rudiment processes. It's what gets the rudiment in fastest – that is the ideal rudiments process. What gets the rudiment in fastest. We want the rudiment in.

Because *all* the action – you understand, it's terribly important to have the rudiments in. But all the action you take in getting the rudiments in is robbed from the body of the session. You're running on robbed time. So don't ever set yourself up to straighten out a rudiment the *long* way to. Don't start in on the thing and get down to "Are you willing to talk to me about your difficulties?" and the pc says – it says, clank! And the pc says, "No," and "I'm not

willing to." And you all of a sudden say, "I guess we'll have to prepcheck this." Oh, cut your throat, man! That is really the clumsiest piece of stuff and that is the favorite trap of auditors. They get stuck in this every once in a while. They find a beginning rudiment out and they immediately haul out the chessboard, the IBM computer, you see, roll up their sleeves, get three or four new extra sheets of paper to list things on. No, all you want there is a feather duster. And preferably a dustpan. See, that's the most equipment you want at that particular time. "Are you willing to talk to me about your difficulties?" Clank!

Well of course you can say, "Well, what's that all about? What's this all about here? What's that – that one?"

"Aahhah – so forth and so on."

"Oh, come on, give it to me."

"Well, so-and-so and so-and-so and, well, last night I was having nightmares about you auditing me."

And you say, "All right, thank you very much. Let me check that. Are you willing to talk to me about your difficulties? Well, that's still falling off the pin. All right. If it's all right with you – and even if it isn't [laughs] –I'd like to run a little process here, 'Who would I have to be to audit you?'" First question – *bang-bang-bang-bang-bang*. "All right, let me check this."

Pc has heaved a sigh or he has done something that looked like he had a cognition, or something like this. He didn't tell you anything, you know, you say, "Let's check this." And you say, "All right. Are you willing to talk to me about your difficulties? That's cleaner than a wolf's tooth. That was the last question. Thank you very, very much." Get the idea? Just a feather duster, you know, and get it out of sight, put it under the corner of the rug.

That's all you're interested in, is a clean needle. You're not even interested in how long it'll stay clean. That's the reason you prepcheck, you get a needle clean so that it will stay clean. That's the reason you do body of session. You expect body of session to linger. The effect of body of session is going to be with us for a while. But a rudiment, a middle rudiment, we don't expect it to be with us, maybe it won't – it'll only be with us ten seconds. It was still clean, so we leave it. It'll become apparent if it goes out. Something won't be happening right so you can go in and patch it up again.

This rudiment-type question is the "sticky plaster" type of activity. And if you go and try to build a case out of rudiments you're going to be in trouble. You're going to waste time. That time is all robbed from the body of the session.

Now, if you wanted to set up a pc so that his rudiments would stay in forever, you would get that session's rudiments in and then take one of the rudiments questions and use it in the body of the session to put it in there with brass nails and tape and mahogany and anvils – you get the idea?

You can prepcheck a rudiment question and that's where you may get mixed up. But you would – you're trying to put it in forever. All right, put it in forever. But you'll only do that in the body of the session.

Now, in the body of the session it doesn't matter how gabby you get. And this is where basically you're going to get most mixed up – is shifting gears on a list-type Prepcheck. Because here the rudiment-question rule of ask it once is being used a little differently. And it's only because this Sec Check-type question is being treated kind of like a rudiment that you're going to get mixed up. It actually isn't treated the same as a rudiment. But you're going to shift gears somewhat along this way: "Have you ever stolen anything?" You're busy – you're in the body of the session now – your rudiments are more or less in. Your pc is rolling along and you get him this list and, you come to this question, "Have you ever stolen anything?" and the thing goes *whip!* You say, "Yeah, that. Yeah, that one."

"Oh, well, I, uh – used to have nightmares about being a thief." Well, he's said it. You're not going to correct him at this stage of the game. And you say, "Good, thank you very much. Let me check this. Have you ever stolen anything" *Whip!* Now, shift your gears. See, that's a gear shift the same way. You're now under no discipline of anything under the sun, moon and stars, except to make him give an overt on that Zero Question. That is now a Zero A. The first action is, after you've checked it and found out it's going to respond like mad, is get it writ down as your Zero A on your auditor's report. I don't care if you write it down by number, but put "Zero A, 16."

You say, "All right, now, let's get down to business here. This is reacting like mad on this. Now, have you ever stolen ... ?"

"No." The person says, "I remember in Sunday school, I mean they even – even thought of me one time as the Bishop of Algiers and never stole anything in my life. Well I don't know, the meter can't be wrong, you can't be wrong..."

"Good, think it over, now think it over very carefully, have you ever stolen anything? You know, purloined something that didn't *belong* to you, you know? Acquired equipment to which you had no title. You know, stolen anything?"

"Ah, well, you put it that way, let me see, have I ever stolen anything, anything at all...."

And you say, "It keeps clanging, see? That one? That one? Yes?"

"Oh." He says, "You're talking about that one?"

"Yeah."

"Well, I thought one time that it'd be a good thing if my friend had his car stolen."

And you say, "All right, all right, that's very good. Now, very good, thank you very much. All right, now. Let's get down to cases here. Have you ever stolen anything? That's what I want to know."

"Oh, well, you put it that way, I mean, well, it'd be very humiliating to have to tell you because it didn't amount to very much. But, uh – I once stole my sister's bicycle."

He said it. All right. You say, "All right, you stole your sister's bicycle. Very good, thank you very much. That's very nice, all right. We're going to take that up right now. Now, what about..." Just, just test questions – "What about stealing bicycles? What about stealing

from children? What about stealing from your sister? What about stealing toys? What about stealing vehicles? Vehicles? What about stealing vehicles? Does that make sense to you?"

"Aaaah-haaa." [laughter]

"All right. One: What about stealing vehicles? Good. All right, now this sister's bicycle of yours, all right. When was that? Is that all there is to it? What might have appeared there? Who didn't find out about it? All right, good. Now, when was that exactly? Is that all there is to that? What appeared there? Who should have located it or who should have found it? All right."

This thing is going crazy, see, and not diminishing, you've gone through it twice, you still get – out of the corner of your eye you can see that needle swing, which is tone arm action, see. That thing is swinging around. And you're saying, "Boy, this is – this is a hot line," see. And you say, "Is there any..." It's always earlier – "Is there any *earlier* incident where you stole something?"

"Well, yes, when I was a little boy, I once – I once – used to say my prayers in church all the time, you know, hoping I would never steal anything."

And you say, "Good." See. "That's real good. All right, we're glad about that one, that's fine, we like that one. All right, now, what'd you steal? Come on."

"Hmm! You mean you want to know?"

"Yes. What did you steal? Yeah, come on."

"Oh, well. I used to empty out my mother's cookie jar and give it to the other kids every once in a while."

"Thank you, thank you very much. When was that?"

"Well, that was lots of times."

"Good, just give me one. Just one."

"Oh, well, that one. Well, that was when she beat me so badly."

"I don't care which one it is, but how about that one? When was it? All right, good. Is that all of it? What might have appeared there? What was never found out about it?" just for the hell of it, see. "Good."

This thing's going crazy. You say – well, we're not going to waste any more time on that particular one – "Well, is there any earlier time when you stole something?" And we finally run into his robbing banks. We don't care what we run into, but we're going to run into the hot line here, and steer it back into vehicles, because that's what we want. And we find out that this individual – we don't care – we don't care when it happened or what it was all about – we find out he used to steal all the kids' toys in the neighborhood, their tricycles and things like that, and sell them to the junkman as a pastime, you see. And they used to get beaten for losing their toys and, you know, the thing finally builds up like mad. And he really had no clue of it.

Now, you make a mistake when you think the pc knew about this, by the way, just as an interjection. He didn't know about this. You've got to fish him into this, you've got to persuade him into this. He's getting into areas he doesn't know anything about. If you let the pc – weak Prepchecking is sitting there waiting for the pc to tell you and blaming the pc because he doesn't tell you. Well, the person to blame is the auditor. That's because the auditor isn't crowding the pc at it. You see, there are various ways of doing that.

All right, that's fine. And we finally get this thing where he was selling all these toys to the junkman and the kids were all getting beaten and everything of the sort. And then he used to tell people that he saw them throw their toys into the lake and he got them all in trouble and we get this, "Gee!" You know, he says, "I never remembered anything about this."

Well, I bet he didn't. And he got that all cleaned up. It's a nice significant basic on the chain and that sort of thing and you come back to your question, "What about stealing vehicles?" you see, whatever it was.

"Well," he says, "Well, there's a lot more of those, because actually I put myself through college stealing cars."

You say, "All right, that's fine. Okay, now" – change your hat, see, – "now, let's test this. What about stealing vehicles? All right, that's fine, that's clean." And you write, "null." "Now, let's test this Zero A. All right? Okay. Have you ever stolen anything? Ah, that's null. Thank you very, very much. Okay, now." We take the next question on the Sec Check list and just give it the business. All right, so he gives you one.

Now, here's a horrible mistake. Let me – let me show you a mistake. You can be all thumbs, you get that? I've given you the whole of it now but let me give you some things about – you can be all thumbs about this sort of thing. Well, you can actually drive yourself and your pc half out of their minds. One, by not thoroughly acknowledging everything the pc says. See, he says, "Well, I – I thought once about stealing a paper clip once."

Well, man, you're not going to use that for a What question; you're not going to have anything to do with it, but you certainly better say "*Good!*", so the pc really knows you heard it. Don't go at it like this: pc says, "Well, I thought about stealing a paper clip once." And you say, "Well, have you ever stolen anything?" *Ohh*, because your pc's going to go halfway around the bend before you get very far, you see. Whatever the pc gives you, give him a cheery aye-aye about it. "All right. Good. Good. Now, we're looking for a doingness here. That's fine, that one you just gave me, that's fine. But we're looking for a doingness. We want a doingness. You know? We want something you've done, done, done. We want a doingness on this thing. All right, now, I'm going to ask you again." Now that we've already found the thing wouldn't clear, you see.

All right. You know, I mean pound him into it and he eventually gives you one. And then you get your What question sorted out here and your administration. You actually – the second you transfer over from this one-shot, you know, on the list – second you transfer over from this one-shot on the list over onto your Prepcheck – oh, hell – that requires administration and writing and figuring it all out and getting your What question and running it down the line, talking to your pc, getting him to go earlier, cleaning up everything. You talk about individuality, you're certainly going to use your wits in full gear during that whole activity.

And the only thing you're interested in over here is – on the meter – is how much needle swing you've got. You're still getting needle swing, in other words potential tone arm swing, you're still getting it on this thing. You're getting change as you go down the line and you're getting into areas that are going to shift this case around. Is this thing getting any cleaner? You're right on – you're right on the "qui vive" all the time you're doing this. Actually you have to be good.

One, you can't accuse the pc of withholding from you. Throws him out of session at once. You got to help the pc find out about it, but if you're not very militant in helping him find out about it, he also is going to get pretty wishy-washy on you. In other words, you've got to be clever while you're prepchecking. But a Prepcheck is an activity that takes place on something that won't clear. By definition, it's something that takes place – you ask the guy, "Have you ever stolen anything?" He says, "Yes. I stole the ..."

"Now, let me give you the next question."

"Yes. Once – time I stole the whole contents of the vault of the Bank of England. *Heh-heh!* Yeah. Um!"

And you say, "Boy, magnitude of sin." you see, "It's tremendous here!" see. So we never bother to check it with the second question. And you say, "What about robbing the Bank of England? What about robbing the Bank of England?" Well there's no reaction on that. Of course there isn't, you goof. He blew it. Have faith! Have faith! Your pc does blow things!

The magnitude has nothing about it whatsoever. You say, "Well, have you ever raped anyone?" and the pc heaves a terrible sigh and, "*Ahhhh-aaaah*. Yes. Well, actually my sister and my mother and my grandmother. Yes."

And you say, "Boy! That's really a juicy line!" you know, and put your E-Meter aside – you just haven't carried out your drill, see. Because all too often you say to him, "All right, thank you. I got that. Now, have you ever raped anyone? That's clear, thank you." You never vary the drill. You see how you can make the error? So you're trying to form up What questions on things that have blown.

Doesn't much matter, doesn't much matter what the magnitude is, is did the pc blow it? Because let me tell you, if he let you in on the exact point on the chain, it has no underpinning. See, he didn't steal part of the Bank of England when he was two and steal another part of it when he was six, you see. And falsified checks on it when he was ten. And then steal the whole thing when he was twenty-two. This wasn't the way he went about it. He just robbed the Bank of England! Boom! No chain. If there's no chain, it'll blow. This is your pc – has never made a career out of missing – getting you to miss withholds on him.

See, it's a this-lifetime activity, last few years. Doesn't – isn't going to make any chain. There's nothing unknown about it, particularly. You get in, prepcheck this thing on the basis, "Has anyone ever failed to find out anything about you?" That's the last two hundred trillion years. Oh, I think that would be very fruitful. You'll get all kinds of wild things. As a matter of fact you'd go on and on and on, prepchecking with a Zero of that particular type. After a while you're liable to blow it, too, but it'd be too gruesome. It's too wide.

You see, now, where middle rudiments are handled one way and how beginning, middle and end rudiments, bear some resemblance to that Sec-Check-question-type procedure? Don't get the two mixed up, though. Because you're always willing to do something about a rudiment if it was wildly out. But you're going to do the shortest, quickest thing and you're only going to do something about it if you can't get it to blow right now. It's perfectly – perfectly valid, to find the thing's still alive and not want to spend any more time on it. You've checked it, you say, "Was there a little more to that?" It's still knocking, see.

"Are you willing to talk to me about your difficulties?"

The guy says, "I had a nightmare all last night." Well, yesterday this thing was clean, so it couldn't – couldn't be very much. And the fellow says, "Oh, well, yeah, well, I criticized you all during dinner last night to one of your fellow students."

And you say, "All right, good. All right, I'll check that. Are you willing to talk to me about your difficulties? Thank you, that's clear." You understand?

I mean you could ans – I'll go through the drill: "Are you willing to talk to me about your difficulties?" Clang! See. You say, "What's that? That? That? What are you thinking of there? There?"

"Oh, well, I had nightmares all night last night about you."

And you say, "All right, good. Now, I'll check that. Are you willing to talk to me about your difficulties?" Tick, tick, the thing has still – still got something on that. "Is there a little more to that? Little something else there?"

"Oh, yeah. I talked to a friend of yours last night at dinner and told him how terrible you were as an auditor."

And you say, "Good, thank you very much. Now, I'll check that. Are you willing to talk to me about your difficulties? That's clean, thank you very much."

That's all you do about it, see. Got the idea? You can ask it twice if you do the drill twice. You could actually ask it five times if you did the drill five times. What I'm trying to get – drive across to you is you always do the drill. The drill has a complete cycle. These are the errors you could make. This would be an erroneous – an erroneous action:

"Are you willing to talk to me about your difficulties? Now, that? That? That? What is that?"

And the fellow says, "Well, I – I had nightmares all night about you last night."

"Well, what might they have proceeded from?"

It's, what mousehole? See? It's which – which way did he go? The pc gets this odd feeling – [laughter] "Where is it? Where'd he go? Where's the auditor?" See? That's a totally incorrect drill. If you've asked an auditing question, you expect it to be answered. And you see how antique this drill really is. If you've asked an auditing question you expect it to be answered. Now, the only thing you're doing with the meter is making sure it was fully answered. See? You ask an auditing question, you expect it to be answered. You're going to find

out on the meter if it was answered. I mean, what's – what's simpler? But you did it with a drill, so this drill is your beginning, middle and end rudiments.

Now, you're perfectly willing to shift over into a process. Now, here's the other one. If you're doing a beginning, middle and end rudiment-type question, it is with some trepidation that you shift over into a process. You're not going to process it unless you're practically beaten with a club. You're going to do this precise drill. You're going to do this drill at least twice before you give up all hope, see. And then if it was diminishing, on just what you were doing, for God's sakes, don't get in and do something else then, just repeat the drill again. And all of a sudden it's as clean as a wolf's tooth. Pc's satisfied, you're satisfied, everybody's satisfied. So don't lightly shift into a process when you're doing a beginning, middle and end rudiment.

But when you *do*, shift in *fast* and get out *now*. Don't hem and haw about the thing. Don't go rolling up your sleeves and giving the pc... You know, don't – don't say, "Well, all right, so you've got a present time problem. All right, present time problem, let's see here, now. Just a minute, present time problem. Now what'd you say it was about? Oh, that's the one. All right. Now, let's see. Let's see – well, we don't need that. What – is it all right with you if I run this process on you? What part of that problem have you been responsible for? All right, that's what we're going to run. That's what we're going to run. Is that all right with you? All right, good. Now, what part of that problem have you been responsible for? Thank you. What part of that problem..." And on and on and on.

Now, you get toward the end of it, "Now, I am going to give you this process two more times and end it. If that is all right with you. Is that all right with you?" [laughter] "All right. What part of that problem have you been responsible for? Thank you. What part of that problem have you been responsible for? Thank you. Is there anything you would care to ask or say before I end this process? Thank you. Thank you. Well, that's all right. We won't take that up just now. We'll take that up later. All right. Now, now we're going to go into the body of the session." [laughter]

Now, that is entirely the wrong auditor atmosphere. The way you want to handle is quite different. See, now, you're just doing your rudiments, you're going right on down the line. You say, "Do you have a present time problem? We've got something on that. That. Yeah, that. What are you looking at now?"

"Oh yes, I wonder how long the session is going to last, because I have an appointment ..." so forth.

"All right, thank you, thank you very much. Do you have a present time problem? That's – still getting a read on it. That."

"Oh. Yeah, well, I had a row with my husband last night about Scientology."

"All right. All right, thank you. Check that now. Do you have a present time problem?" You see, the thing is not diminishing. It's not diminishing. And you say, "Well, have you – have you – are you satisfied that you've made a statement of this problem? Is this problem satisfactorily stated to you?" so forth. "That. Yeah, that one. That one. All right, now we're going to check this. Do you have a present time problem? I'm sorry, but that is still

reading – about having a fight with your husband about Scientology. All right, that's – that's it. All right. What part of that problem could you be responsible for? Thank you. What part of that problem could you be responsible for? Thank you. What part of that problem could you be responsible for? Thank you very much. All right. Now, do you mind if I check that now? Do you have a present time problem? That's clear, thank you very much, that was the last question." *Pssswww!* He went that-a-way! [laughs, laughter]

Pcs will actually very obligingly get rid of things, by the way, that they don't think you think are very important. [laughter] You can actually do a tremendous, you can do a tremendous amount in weighting – w-e-i-g-h-t-i-n-g – a session. You can weight the thing up like mad. You know this pc has got scintillion overts of some kind or another on the subject of "vimenk" because every session he has come up with a goal for life or livingness, "To kill all the women I've known." And you know that he has some overts on this subject in this lifetime. Something has told you this. In other words your most fruitful sources of adjudicating whether your pc is getting there or not is check over his life or livingness areas for his PTPs. Because that isn't life or livingness goals, that's his PTPs. A wonderful list of them. Only never called them to his attention, until all of a sudden, you see, that's really getting there and you're into a Prepcheck of some kind or another, that's your body of the session and all of a sudden, wonder of wonders, he says, "Well, women. Yeah, I suppose I have done a few things to women in my time. I suppose." You can weight it.

"Ah, you have? Well, all right. Very good now. Let's – let's see if we can't check into it a little bit more here. All right, what was the Zero Question?" You've already seen the thing didn't clear. But you weight it, you see. "Women, all right, I think we'll be able to do something about this, now." You look at this very carefully, you see. "Been waiting to get to something like this on your case. All right, now. All right. Now, we want an actual overt. We don't want any of this thinkingness stuff. Now, we want something you've actually done to a woman. Now, give me, give me a good one. Something that's really significant, here. A good one. Good one. What have you – what have you done to a woman? All right. Oh, you soaked one's head in a rainbarrel. All right. Very good. Very good. All right. Uh – what – uh – what women have you drowned? What about doing something to women's heads?" [laughter] "All right, that's it, brother. And we've got it now! What about doing something to women's heads? All right. Now, you've got this rainbarrel thing, now. All right, when was that? Yeah, that's good. All right, let's get, let's really get this now. All right, when was that?" you know, important.

The pc will say, "God, I guess I'd better dig on this, you know? That guy is all ready to fire, you know? No telling what's lying underneath this! Maybe – maybe I'd better get interested in this subject after all these years! I thought it was a natural thing to drown women and – apparently there's some social mores has been introduced since I came from Saturn!"

And he all of a sudden starts rolling it off and his responsibility level changes. In other words, by apparently taking responsibility for the pc's overts, just to the degree of being terribly interested and thorough about getting them, when they really got on a hot line, it throws an element of responsibility into the session. They all of a sudden will come up with more data. These are just tricks of the trade. That's just trickery. But it works!

Now, you'll find that your greatest difficulty is shifting from the one-shot over to the process. Now, in a rudiment, you shift – you one-shot, you've checked it out, it didn't check out, for God's sakes, ask it again. Newly. Not on the checkout question. But you know, press it home. Say, "Well, it's dirty," you know. "What was it? That one?" You see? Check that one out. You got the idea? Take three complete cycles at it, at least, if it isn't cleaning before you surrender. And then move over into the process that you're going to do on it, like a startled rabbit and move back in again, you see, as though you have a complete allergy to it and it's totally unimportant to go on running it, you see.

All right, that is quite distinctly different from the one-shot question of the Sec Check form list, see. There you're going to ask him once, it is not clean and, boy, that's the one you've been waiting for. That's – your whole atmosphere is built up into *that* is the one. We've been sitting here the whole session waiting for you to come up with this one, see. Now, we take that down, we prepcheck it, we check our What question, boy, this is dress parade, see. And we really clean that chain from one end to the other. And you get terrific resurgences on your pc if you do that. So they slightly bear resemblances to each other but they're different, they're different actions entirely, do you understand that?

Now, what you want to do, is get your pc flying. Now, the thoroughness with which you do these various drills gets your pc flying. At first, perhaps you find yourself a bit tongue-tied in doing it. You feel terribly restrained. "Oh my God, I've got to ask the same question as I asked in the first place and the first question I asked was, 'In this session or any time during the last twenty-four hours...!' What the hell did I say?" You know? [laughs] If you didn't ... Why, I pulled a gag on you last night, I asked the pc what I said, just to give you an idea. He told me and I asked him and he was satisfied. Even though it looks like you make a fool out of yourself, come out right – come out right at the other end of this thing.

And get that down. But a drill is a drill. It is done with great precision, it is done without any variation. But that doesn't say that your ability to talk to the pc is totally curtailed. When you want to find out something from the E-Meter, when you want to get a certain specific thing done in a session, well, for God's sakes, your direct address to the situation with the drill that does it is certainly your best way to make it happen now. Not to vary it off, but that says don't – doesn't say anything about don't talk to the pc. This doesn't say don't ever coax the pc. It doesn't say anything about, "Rule A is to get as inhuman as possible." It doesn't say anything about that whatsoever. Of course you can gib-gab with the pc far too long and you can evaluate for the pc and suggest things to him and wrap him up in knots. But, as long as you don't do it in the middle of one of these drills, when you're trying to find out something, it'll still be all right. You won't upset anything.

And the amount of talk which you have to do to get a pc slid over into the right What question, may be considerable. The amount of histrionics which you sometimes have to exhibit have to be considerable, too.

Pc says, "Well, there isn't anything on that at all. Never had anything to do with little boys in my whole life."

And you say, "Well, this is rocking. What's it knocking on? I'll check it again. Did you ever have anything to do with small boys? It knocks. Here we go. I can sit here as long as you

can. What is it? In fact I can sit here longer than you can, because you're worried and I'm not." [laughter] "Dig up something, I don't care what you dig up. And I don't care how phony you think the E-Meter is, just dig up something! Ever done anything to small boys, that's what we want to know, man. Go on, talk. I'm waiting. Now, there's nobody under the sun, moon or stars that you could tell this to better than to me. Have you ever done anything to small boys? That's all I want to know. Now, I'm waiting."

"Mmm, oh, all right, you've told on one once. That's pretty good. What'd you do just before that, huh?" "Oh, all right. Very good. Now, thank you. I told you, you could. Thanks a lot. Now, let's get busy on this one right now. Here we go," see. We're off to the Prepcheck races.

Takes a lot of steering, takes a lot of doing. You think a drill cuts down. No, a drill leaves you more mind with which to handle the pc. There is the best definition. Okay?

Audience: Yes.

Thank you. Take a ten minute break.

PREPCHECKING AND ITS PURPOSES

A lecture given on 17 May 1962

Thank you.

Okay. Here's lecture two, 17 May 1962, Saint Hill Special Briefing Course.

I'm going to talk about Prepchecking. This is a general lecture on the subject of Prepchecking and its purposes.

A rudiment is that which is used to get the pc in shape to be audited that session – just in shape to be audited that session. And the body of a session is for the purpose of letting the pc live in that lifetime. In other words, he can – the pc can be audited in the session because of the rudiment. It's just that session, nothing else, you're not interested in anything else. But the body of the session, that's setting him up for this lifetime.

In other words, you've got duration. Whenever you have duration you have to get thoroughness. Therefore a rudiment is unthorough. A rudiment has to be clean. Don't ever make a mistake about that. But it is only as clean as it has to be. Of course, it is clean. But you have not cleaned up any fundamentals on it.

Let me give you an idea of a wrong way of going about this. "All right," you say, "Do you have a present time problem?"

And the pc goes *clank*.

So you say, "All right. Now do you always have present time problems in auditing sessions?" "What's the first time that an auditor failed to resolve a present time problem for you in an auditing session?" "Things always been grim this way in auditing sessions? Well, let me see if I can go back through your auditing reports here for the last few years and let's see if we can pick up something here that's a clue to why you always have present time problems in an auditing session."

Well, of course you've just transferred the permanency of it all from the body of the session to the rudiment. And having transferred it you're going to find the pc will stay there, with the permanency of it all, in the rudiments. And after you've put the pc into the permanency of it all in the rudiments, you're going to pry him out of there with crowbars, blasting powder, everything else, don't you see? You're not going to get him out of the rudiments.

Why aren't you going to get him out of the rudiments? Because you put him in the rudiments, with a *thud*. You said the rudiments are a permanent activity. You're going to make a lifetime profession out of cleaning up today's present time problem. That was the way you

weighted it and that is the way the pc's going to respond. And of course you're not going to clean up that present time problem for his whole life, not 'arf you're not. You're just going to waste time, that's the only thing you're going to do. Because in the first place the processes available to you are insufficiently fundamental to correct this thing all the way up the line.

So, rudiment, whether it's a beginning rudiment, the middle rudiment or an end rudiment, it's only for that session. That's all.

Now, the end rudiment has the additional apparent thing of bringing the pc back to the world of the living. But remember, you put him into session, it's up to you to take him out of session. So the rudiment is – the end rudiment is still just for that session, isn't it? The end rudiment is not for yesterday's session. Therefore I laugh every once in a while when I see somebody saying, "I didn't have time for the end rudiments. Is it all right if I put them in next session?" [laughter] Yes, you'll see that in auditor's reports in here quite frequently. Of course, that is idiotic.

They must have a tremendously heavily weighted idea of how long it takes to do rudiments and how arduous it is to do rudiments or they wouldn't be reserving half of next session to do the end rudiments of today's session. And then by the time they've done the beginning rudiments of tomorrow's session, of course it'll be the end of that session. And then they'll have to do the end rudiments day after tomorrow, won't they?

No, even the end rudiments are just for that session. And that's all they are for. Your middle rudiments are even more temporary than this. Your middle rudiments you might learn by experience are only for the next five items the pc is going to list. Might not even get it in for the session, see? Just for the next five items and then out they go again, see.

But there is your address to the situation. Now, we move over to the body of the session. We're going to do, in Prepchecking, something in the body of the session that is going to materially change this person's attitude toward living and is going to improve his ability to confront life in this lifetime. That is the only thing we expect to have happen, but that is plenty, man. So therefore, we're going to do anything we can do, aside run a repetitive process in the middle of Prepchecking. We're going to do anything that we can do in order to straighten out some point of askew attitude in the pc's lifetime.

Now, let's go into a theoretical look here at what an overt is. I actually never have said much about this in lectures. There's just been a little bit about it in HCOBs and so forth, but I've never really given you this piece of business here. And this – it might help you a lot.

All things are an exteriorization from and an interiorization into or an interiorization into and an exteriorization from. There is no beingness in this whole universe that is bad. Also, there is no beingness in this whole universe that is absolutely good. But there is a badness about it and there is a goodness about it. And that is the individual's ability to interiorize into or be something or exteriorize out of and not to be something. And when an individual no longer has power of choice over that fact, the individual can be considered to be aberrated on that point. Where power of choice has vanished, in the subject of exteriorization and interiorization, he to that degree is aberrated.

Now, how much do you mean power of choice? I mean, power of choice – how absolute can this power of choice be? Well, there are many ways by which you enter certain beingnesses. Let's take the beingness of an army officer. An educated career officer is expected to have had certain physical attributes by the time he got up to time to go to military school. And he's expected to have gone through certain basic schools and passed examinations, go to military school, study to be an officer, keep his nose clean, do the things, the now-I'm-supposed-to's and come up at the other end of it and he's an army officer, don't you see? He nevertheless has gone through the steps of becoming an army officer. All right.

Now, he one day says he doesn't want to be an army officer or something of the sort, something else has presented itself. He can resign from being an army officer and hardly anybody will say anything about him. That is the usual course of human events. This is not quite so with the private, is it? One day he's sitting there minding his own business at the garage and somebody gives him a letter and it says, "Greetings." Some queen or the president or somebody has said, "Hey, boy you is it. And if you ain't it within twenty-four hours, we is going to send some people over with revolvers or automatics on them and they are going to take you and bring you to this depot and are going to convert you into a soldier. Thank you very much."

So they throw him in the ranks and so forth. In the middle of the battle he says, "It's too uncomfortable here, I think I'll leave." And you know, nobody agrees with him. See, he hasn't a prayer. Probably it's that point, rather than that people get hurt, that give war a bad name. Because I don't see that getting hurt gives some activities a bad name. Look at race driving. Hardly anybody ever says anything about race driving. Sometimes in steeplechasing they say something about the horses. I never hear anybody say anything in favor of the jockeys. On the highway out here, they kill more people every year, I think, than the US lost in World War I. Pretty good. So it isn't the blood or the pain or the suffering they're objecting to, it must be something else. Yes, it is the power of choice. That power of choice, when that is too badly thrown aside, people object to this thing.

That is why slavery has gotten a bad name as a practice. In actual fact you look at the economics of it and you find a lot of things about a slave society which are quite interesting. You find a society which is – has no objection to this sort of thing and which can free slaves rather easily and you find a lot of people walking up and saying, "I want to be a slave." But slavery itself is this thing of a beingness, an enforced beingness over which an individual has no power of choice and therefore it gets a bad name.

You can almost evaluate practices and beingnesses over the idea of people with regard to their power of choice of being them and not being them. Where an individual has a fair amount of freedom we find a fairly high scale activity. This fellow has an idea – as a hobby he wants to be a dancer. He's going to take up dancing for a hobby so he's going to be a dancer. One day he gets tired of it. There's nobody going to say to him, "Oh well, Joe, you have to be a dancer. I mean, if you don't go on dancing you will be talking to Commissar Zero." You don't hear that kind of thing, you see. It's a hobby, so everybody thinks dancing is fine, don't you see. Perfectly all right to dance, perfectly all right not to dance.

Power of choice with relationship to beingness is a very interesting study all in itself. And you will find in the general put-together of life, that that is simply a surface view of an under-the-level-of-consciousness activity which is going on all the time. Now, here is the cycle – this is the reactive cycle of beingness, not-beingness, beingness:

The individual has decided to *be* this thing. And then for some reason or other he has found out he couldn't easily un-be this thing, so he has a mechanism which he uses of committing overts against this thing in order to cease to be it.

Now, he commits these overts and withholds himself from being this beingness on a repetitive cycle of action. And his overts will get worse and worse and his effort not to be it will become more and more and more violent until he gets out to the final stretch. And then after that final midpoint – the midpoint, this is the final distance he's going to get from it – after that final distance is attained, he will still commit overts, he will still have withholds from this beingness, but every new overt and withhold brings him closer to becoming the thing again. This is absolutely one of the ghastliest facts you ever wanted to investigate.

I'll go over this thing again because it's a little bit grim. This individual cannot unbecome this thing. See, it's beingness A. Whatever it is. He can't unbecome this thing by choice. For some reason or other, no matter how slight the reason is – you know, his mother loves him so he can't drop the body, he's got so many friends in the army he doesn't want to leave – we don't care what it is, see. But he'll decide that he wants to un-be this thing but he can't un-be this thing. Now, we don't care which came first, the chicken or the egg. Well, one day he made this discovery that he was in a beingness he couldn't un-be rather easily. And for some reason or other he wanted to un-be it. He just tried to postulate himself out of it and he didn't – it didn't work, you see? So he's got another mechanism that goes ahead.

Now, that understanding of that little area there is a bit rough. But let's come on to the next point which is much clearer and these things are irrevocably factual.

He will then start committing overts against this beingness. And he'll commit more and more overts – not just the beingness that he is, but any other equivalent being that is like that beingness that he is, see. And he'll go on and commit more and more overts against that beingness, have more and more withholds from that beingness and he will try to move out of being it by the cycle of overts and withholds. And he'll get out here thinkwise – there is no real space involved in it, but he'll think he is actually getting up there. He is really winning, you see. And then after that midpoint is reached every additional overt and withhold he has brings him closer to being a totally enforced beingness of that thing. And he gets into a complete overwhelm when he goes through the whole cycle.

Now, it's a complete overwhelm. He just can't un-be it, man. God. It's horrible. Because at this point he doesn't even think he has ever tried to un-be it. See, the ghastly travesty of it is that all knowingness on the subject of un-being it, now vanishes as well. He enforcedly becomes it. You might say he becomes it on an inversion.

So halfway through the game, why, he may be winning. But after that, because of the overt-motivator sequence, he will simply wind up even more thoroughly being it than ever before. That's what's the matter with overts. That's all that's the matter with them. But that is the use a thetan makes of overts. That is what a thetan is trying to do with overts. He's trying

to *un-be*. So he goes through that cycle and he eventually winds up right in the middle of the thing he's trying to *un-be*. That is the unkind fact of it all, of it all, of it all.

Now, that cycle takes place on all dynamics. Every dynamic can run that cycle. Edgar the other day had a pc uptown here, was an ex-communist. And he had the – for some reason or other he used this question, I'm not sure why, but the fellow said that "Individual Scientologists were pretty bad, but collectively, Scientology as a group, they were very good," this fellow said. And they – he got a hell of a tick on this, about Scientology as a group, so Edgar followed this down on something like, "What is Scientology?" And you know, finally, as the overts came off – he just kept picking overts off, you see, against individual Scientologists and groups and things like that. He just kept picking overts off and more overts. And all of a sudden the guy began to realize that Scientology as a group was absolutely no good, but individual Scientologists were pretty good. [laughter] See, complete volte-vis. He turned right around the other way to. In other words, we'd reversed on two dynamics. And he went out and finished it up the rest of the way.

But what a – what's more important about this, is the fact that there's communism – there's communism. See, the guy is trying desperately, absolutely desperately, to be a – separate from a group. And they just go more and more separate from the group and they get more overts on the group to be more separate from the group and more overts on the group to be separate from the group and go out here and out here. And they get to be "only one's," you see, 100 percent – climate of Russia's liable to do to almost anybody, if you've ever been there. And then overts against the group and withholds from the group and overts against the group and withholds from the group and overts against the group and withholds – they're groups. "We are a group." "The individual is no good." Which is an interiorization into the third dynamic.

See, you've got a whole nation who has practiced this, which is quite marvelous. They by the way have self-criticisms and that sort of thing. And one of our end rudiments goes out in most of these self-criticism sessions. Each one tries to brag a little more than the next one about what he has done to the group. And of course this gives a perverted alter-is on their actual overts and here we go and they just plow in even harder. If that was used right and anybody ran the end rudiments on them they'd actually be able to run themselves out of the group.

But understand they actually collectively get together and try to practice a therapy which will separate them from the group. They're instinctively, reactively, trying to get off their withholds and overts against the group. They're going mad on the subject. Every time you get a bunch of communists together why, they're supposed to get together in some basement or something of this sort and they're all supposed to sit around and say what they've done to the party. See, they're to – it's just reactive. They try to get it off. They don't know how to get it off. And it doesn't do any good. They just keep plowing into the group.

Of course after they get their overts off, then they're – the punishment is ordered. Church – some churches do that too. They say, "Eighteen paternosters and three nose blows." [laughter] That's beside the point. There is exteriorization-interiorization.

All right, there's some bird way back down the track someplace, he's been a god. This has nothing to do with any case present although almost every case sooner or later runs into the eighth dynamic. And he's been that, so he tries to unbecome one, one fine day and he finds out that he just can't do without that beautiful roast chicken smell or whatever it is that's been sacrificed to him. Anyway, whatever it is, he stops – he stops comfortably being the thing, you see. And he decides not to be it. But then there's reasons why he can't be it. And then he gets overts, overts, overts, overts. He starts committing overts, you see? And he goes out and then he all of a sudden enforcedly becomes it. Then one day you find it as the terminal or something like that. You see how that – how that cycle goes?

It doesn't matter with him whether it's the eighth or the seventh. Now, there are a lot of people around – spiritualists. And they preach about being spirits and, "my thetan is over there," you know. It's the wildest thing you ever wanted to listen to. They've got overts against spirits, overts against spirits, overts against spirits. Well, how can you unbecome yourself? Well, believe me they've managed it. They actually have managed it. And they've got overts on spirits up to a point where they're obsessively being a spirit. But of course, is the spirit there being a spirit? No, it's being some other spirit than themselves. It's quite upsetting when you finally come back and find the spirit you are being is not yourself. [laughter]

And your sixth dynamic. Of course your scientist who is splitting the atom, splitting the atom, splitting the atom. "Ashes to ashes and dust to dust, thou art dust, to dust thou shalt return." They take off from some religious background of the seventh, slide into the sixth. And they give you a philosophy of "man is from mud." And they keep on going and then they start getting overts against MEST. See, they decide they are MEST and then they decide they don't want to be MEST and then they get overts on MEST and then they get more and more and more overts on MEST and then more and more overts on MEST and you finally get so they put their hands in water and the mud runs down the drain, you know? They just become total MEST. They become a total enmested being.

Take your fifth dynamic. I one time called up the – called the insect exterminator company and told them that there were termites in the building that we had there in Phoenix. And they sent a fellow down and brother, you never saw a man look more like a bug. [laughter] His head was sort of an ant's figure-eight sort of a head and he wore his hair as though they were sort of feelers. [laughter] Man, you never saw him. And he came over. And it was a very easy job, all he had to do was shoot some poison into a few holes. And he says, "Well," he says. He looked it over very carefully and he says, "Well, I'll keep my eye on them." [laughter] You could see, you see, that just one more overt on the subject of bugs and he'd shrink in size, man. He had the form now, now all he had to get to was the size. There he had gone through that complete cycle on the fifth dynamic.

And the fourth dynamic. You very often run around up here and you get into the House of Commons or the Senate or something like that. And you're always running into some bird who's a plunged-in fourth. Everybody he meets is no good and should be shot but he's for mankind. You hear him talking you know, it's a marvelous thing to hear. And they're being this thing, "mankind." But all groups are bad and all individuals are bad and everybody's wicked and everybody's against mankind and so on. You will generally see that their structure and that sort of thing is accordant in general.

And then of course, I've already given you an example for the third.

A lot of people get stuck in a second dynamic beingness of one character or another. And boy, have a hell of a time, you see, because there's terrific rewards of one kind or another for being this second dynamic beingness, you know. But you'll see them, they're trying to pull overts on the second dynamic, you see. And they'll pull overts on the second dynamic. They – you know, big reward. They can't get out of it. They got – you know, *whoo-bang*. And of course a person can go into his own valence. God knows what that is!

You run into all this phenomena more generally in a Routine 3 process, but it nevertheless is tremendously present in Prepchecking.

Now, in Prepchecking you actually are working with the mechanisms which bring about a Routine 3 bank. These things are hand in glove. They are not separate at all. So much so that you could probably find some items by Routine 3 and then prepcheck them and do some interesting exteriorizations from them and so forth. Actually, you don't have to go that far.

It's easier to solve on your Routine 3 level than it is on many other – on any other level. In other words, what we're doing now resolves what we're doing and these individualities resolve one way or the other and unstack. All very interesting.

But remember, that the individual, if he is any one of these items, was it. And then wanted not to be it and couldn't un-be it and started using the overt-motivator sequence in order to separate himself from it. And by the overt-motivator sequence brought himself straight back into obsessively being it. And then it flies off some fine day in processing. Remember that cycle takes place.

Now, because that cycle takes place in this one lifetime, let me point out to you that the pc has a certain beingness. He also has greater or lesser connections with all dynamics. In other words, you're looking at an eight dynamic package, but the item which you are handling or trying to handle, is Joe Doakes. That's his lifetime, this lifetime. That's his name this lifetime. And your Prepcheck is actually slanted immediately and directly at trying to straighten up his obsessive efforts to un-be Joe Doakes. You see, if he could be Joe Doakes he'd cease to have trouble with Joe Doakes. The pc's name is Joe Doakes. So, if he could only un-be or be Joe Doakes fairly well, why, he'd straighten out. And a lot of things would be much happier for him.

Frankly, although you can go whole track with Prepchecking and very often find yourself slithering on the whole track, funny part of it is that if you were to locate your pc in this lifetime and hold your pc quite arduously into this lifetime and not permit him to answer any whole track, you might very well occasionally recover material which would otherwise be completely lost out of this one identity. Because the only thing you're trying to do is straighten out one identity with Prepchecking if you're trying to do anything. And of course, the more backtrack you go, you're just going on free track of other identities which are more easily and better handled by a Routine 3 process.

It isn't that you should break your pc from going backtrack and all – bust him up in business and so forth. But if the pc was flying around too much backtrack and so forth, I'd

sort of get interested in roping him down into this lifetime a little bit. I'd – I'd start spotting the years in which we were looking for something. Because you'll find that most all of these chains on this identity can be dead-ended in the pc's own lifetime. Most of them. Some of them, no. But that's the this lifetime restimulation of another lifetime. And sometimes you get across that chain and you do go backtrack. You can't make a hard and fast rule about it because this lifetime is not a pure entity. It's not a pure beingness. It's a beingness which is already tremendously colored and – by countless other beingnesses which the person has been in the past.

But you'd be surprised how much forward progress you can make by getting off the actual overts on the various dynamics in this lifetime. You can accomplish quite a bit. It's well worth accomplishing if you want to accomplish it. But in order to accomplish this fact, you have to be pretty good. And you may not be superficial. You cannot be superficial about this lifetime. You are not going to do a single thing for a pc in a hundred hours of Prepchecking, if all he sits there and does is get off the criticisms he has made of others.

Well, I'll tell you why. Criticism is the last shadow that's a total defeat. He can no longer un-be this thing, he can only criticize. He's – all he's saying to you is, "I am unhappy being Mary Lou." He's criticizing Mary Lou, criticizing Mary Lou. Well, all he's saying is, "I'm unhappy being Mary Lou, I'm unhappy being Mary Lou, she's no good and so forth. And I'm very unhappy being her."

Well, if he's so unhappy being her what did he do to her to make her an unhappy thing to be? Now, that's the question you the auditor are trying to solve.

When you say, "We're trying to get the overts off," you are simply making a mechanical statement. You actually are not. You haven't got that as your end product. Your end product is trying to find out how he, Joe Doakes, made Mary Lou such a miserable person to be. Because obviously he was being Mary Lou in this lifetime, not because he hated women. Well, he's criticizing Mary Lou. Remember, a lifetime – you live eight dynamics in one lifetime. They're stacked right up alongside of you. Any being that ever walks up, he'll at least be an atheist or an agnostic. He'll discuss each one of these dynamics in turn. He will tell you how he's no longer interested in mankind. He will tell you how he doesn't get along with groups now. But he's still – he'll still discuss very interestedly with you every single one of the eight dynamics. He's been them all this lifetime. Slithery, slidey, slippery, but nevertheless he's had something to do with each one of them.

Supposing you unplowed the fellow from the one he was most obsessively trying not to be. Then he could be that thing with freedom and it would blow up in smoke. You've returned to the individual his power of choice of beingness. And if with Prepchecking you can return an individual any power of choice on a subject of beingness or not-beingness, you of course, will get tremendous resurgence on the case.

You could go at it this crudely. This is not an advised method, but this crudely you could go at it. You could say, "Well, who don't you like this – who have – who haven't you liked lately?"

"Oh, well so-and-so and so-and-so and so-and-so and so-and-so and so-and-so."

You're watching your meter as he names a few of them off and one goes, *clang*. This is not an advised way of doing it, this is just a demonstration. All right, *clang*. Mary Lou. A question you want solved is, "How did you, in your estimation..." You never ask the pc this, but this is what you're trying to solve. "How would you, in your est – how did you in your estimation, make Mary Lou a perfectly horrible thing to be? How did you do this?" Well, another way of asking this is, "What have you done to Mary Lou?" you see.

So we run this chain – necessarily must be a chain because you've got to get to the first part of the cycle of Mary Lou. Therefore it's got to be a chain. One lone incident wouldn't have done it. See, so he – you run this on this cycle, you run it in and out and all of a sudden he tells you Mary Lou isn't such a bad girl, wasn't such a bad girl. His opinion of Mary Lou changes. He has said, actually in essence, "Oh, I'm willing to be or not be Mary Lou." And at that moment there's a sector of existence from which he is not retreating. Therefore his reachingness into that sector of existence is improved, his doingness of that sector of existence can now occur, because his beingness of that sector of existence has been reoriented.

There's many a girl who can't cook because she hates her mother. Well, let's just take a mother who was a good cook. Let's just ask some girl, "Can you cook?" you know.

And she says, "Oh God, no."

You say, "Could your mother cook?"

"No."

"Well, could your grandmother cook?"

"Oh God, yes."

Overts against Grandma. They obviously are there. That girl *will not cook* until you have rehabilitated the beingness of Grandmother. And you get off her overts against Grandmother and all of a sudden this girl can cook. It's amazing when you come to think about it. This person will not do anything that a beingness can do that they cannot be. Now, you talk about disabilities, they're there by the ton.

This individual says, "I'd love to paint. But I can't paint."

"Did you ever know a painter in this lifetime?"

Well, you might not hit it on the button because "painter" may be all the way down the chain. But you'd be surprised at how you could take the worry away on the subject by hitting this lifetime on Prepchecking. And you say, "Did you know anybody who could paint?"

"No, never knew anybody who could paint."

"Ah, well, good enough. Who could paint? I get a knock here. Somebody can paint."

Most people are always trying to rehabilitate their artistic things, you see. Perfectly fine. Say, "Who could paint?"

"Oh, come to remember my grandmother. My grandmother took art when she was a young girl."

"Let's see, what else could your grandmother do?"

"Oh, she was a good cook. And she was very patient."

"All right. Can you cook?"

"Oh God, no."

"Are you patient?"

"Oh, no."

See, you've done – you saw your be-not-be proposition. You found it by "do," you see. That's diagnosis by "do." And you say, "All right, let's go to town here. What have you done to your grandmother?"

That's just a test question. That's not a standard What question.

And the fellow says, "Well, I threw her downstairs. *Ha-ha-ha-ha.*"

And you check it again. It might blow on one, you know. It might. Check it again, *ha-ha-ha*, still there, you know. Get a What question. "What about making your grandmother miserable," or whatever the thing came out to be. Get it down, run the chain, knock that stuff out and lo and behold, your pc will be able to paint and cook. Magic. Because it's a zone of beingness that the pc can be.

Now, it doesn't matter a damn whether the pc – this doesn't matter whether the pc still has that person in the land of living or not. The other person may be dead. See, but it's a this-lifetime situation. You're not going any further than that with this. Because pcs, 99 and 44/100's percent of the bank, are on the backtrack, you're going to miss occasionally. This is not a hundred percent proposition. But as you look this thing over you will find time and time again that you can knock it into shape. At least it will come into shape so the person isn't walking around all the time saying, "Gee, I wish I could paint, I can't paint. Gee, I wish I could paint, I can't paint. Gee, I wish I could paint, I can't paint." There are other things he can do, you see, than walk around doing that all the time.

I call something to your attention, that the person while he's doing this is not painting and is not not painting. This person is just not. You can invest the time in other ways.

So you clean up the beingnesses. You clean up a whole stack of this life beingnesses with Prepchecking and diagnose them with doingnesses. I don't really care how you diagnose it. I wouldn't care how you got into this at all. But if you were to say to a pc – a little limited goals activity – "What have you been trying to do in this lifetime?" You're not doing a Goals Assessment, you understand. "In this lifetime what have you been trying to do? What do you wish you could have done during this lifetime?"

And the fellow says, "Oh my. Huh. I certainly wish I could have been a streetcar conductor. I would have been much better off as a streetcar conductor. They can strike, you know and they get raised wages and all that sort of thing."

And you can say, "All right. All right. Very good. Do you know anybody who was a streetcar conductor?"

"*Mmmm.* Well, my uncle Bill. *Huh*, that's funny. My uncle Bill. *Hm!*"

"All right, that's fine. Now just – we're going to prepcheck on the subject of Uncle Bill. What did you do to Uncle Bill?"

And we're going to make that first one, see, a test question and it didn't blow. So now we're going to prepcheck it, full-dress parade. And I guarantee this person will come up the other end at least not worrying about being a streetcar conductor all the time. Do you see? That's the least gain you're going to get.

But you could attack Prepchecking head-on. That's all I'm trying to tell you here. You can actually attack it head-on. Stop fishing around in the dark. Life is real. On the whole track the items might be quite evanescent, effervescent, meaningless to the individual or very meaningful. He may be full of pains and agonies or without somatics at all. These are things that the individual has laid aside and is – they've long departed, even from the bottom of the hope chest. Of course, to do that and to straighten all that out requires that the individual be straightened out on the whole track from one end to the other. You're not trying to do this with Prepchecking. Life is real, beingnesses are actual, his dreams and skills have existed, he knows about them, he can know about them, these things can be straightened out right now.

Now, nobody asks you in Prepchecking to heal an individual's leg so that he can walk again. But let me tell you, an individual is much better off being able to hobble about without pain than to be in the pain and misery he is in and not be able to walk at all, do you see? In other words, think of – think of a limited objective. We're going to improve his condition. Just going to improve it, see. We'll make it a bit better. We're not going to shoot the moon and give ourselves a lot of loses and that sort of thing. Let's find out who couldn't walk, not – not on the whole track, no, no, no, this lifetime. "Who couldn't walk? Who couldn't walk? Can't find anything? Well who didn't go anyplace? Who went everywhere? Who was a terrific runner?" You know, let's walk all the way around the edges of this thing, you see. Anything to do with walking, running, using legs.

And all of a sudden, why, we find Aunt Chrysalis. And where the hell she's been – the pc would never help us out. Because she is buried between the ages of eight and eleven and was there for three years and then died a beautiful death. And was totally crippled. And all the pc ever wanted to do was beat her head in with a club. And remembers her as "Dear Aunt Chrysalis" but doesn't remember her at all. Ah, we've walked through the whole cycle and the pc is totally being Aunt Chrysalis. And the pc never remembers himself. He never remembers what he's being because he's right in the middle of it.

You know, if you were in the middle of a subterranean vault and you didn't know where you had been taken to or how you had gotten there or where you were, somebody would say, "Where are you?" And you would say, "I don't know. It's just all dark." Take you outside and let you get a look at it and you'd say, "Well, I was in a subterranean vault." He didn't know it at the time. And because the walkingness into the situation is – was so gradually done, so smoothly done, so easily done, with overts, on this system, the individual winds up being he knows not 'ho. You never have, at the beginning of Prepchecking, Doakes in the chair before you. Doakes is at least being some other dynamic in this lifetime if there's anything wrong with him. Just in this lifetime.

All right. You could restore then, a lot of things to Doakes, providing you have actual overts. Now, the think about it is on the basis of the wish. And that is certain – just a harmonic of the beingness. He is wishing – he thinks all the time about what he'd love to do to his father or what he should have done to his father or something. See, he thinks, thinks, thinks. So he gives you the answer, "I had an unkind thought about my father." Oh, fry it, man. What's he telling you in essence? He's simply telling you, "I have been wishing I weren't my father." That is all he is saying to you. And you're going to pull this and do anything with it? You couldn't. All you're trying to do is pull his wishes not to be his father. No, you'll have to get his actions and determinations not to be his father. How do you get those? You get the system he's been using to un-be Papa. Which is a system of overts and withholds. And they're real overts.

Here's where you err in Prepchecking – is misinterpreting the wish. Because you see it's perfectly true, you recognize yourselves, instinctively – of course this person doesn't want to be this other person. And you let him get away with it all the time. You let him sit there and say, "I wish I weren't a schoolmaster." You know and, "I wish I weren't Father," and "I wish I weren't Mother," and "I..." You know – natter, natter, natter. "I criticize Mother. I had an unkind thought about Father." You let him get away with this. All they're saying is, "I wish I weren't. I wish I weren't.... "

And how are you going to make this person well? All right, this would be the same process. "All right. Now, sit there and wish you weren't... thank you. Wish you weren't Father. Thank you. Wish you weren't Mother. Thank you. Wish you weren't your schoolmaster. Thank you. Wish..." You think he'd get anything there? No, he wouldn't get anyplace. Well, he won't get anyplace with Prepchecking either because the criticism, the unkind thought, is just the wish not to be. No, you've got to hit it more head-on than that. It's got to be do, do, do, do, *done something to*. It's got to be *done something to*. And it must be something that the person didn't want to be. That's why a lot of your Prepcheck questions are as cool as ice and they get nobody off anything and they never move anybody anyplace. There's no charge on it. If there's charge on it on the meter, there is a wish not to be. Because it's a *disagreement with*.

All a meter ever registers is disagreement. Now, if this person was perfectly willing to be Papa – you said "Papa" to him. You get no charge on the meter because there's no disagreement with Papa. That could be at both ends of the scale, he's obsessively totally being Papa. But that's beyond his reality and beyond the level and scope of Prepchecking. It will take a Routine 3 process to get that far. That's buried too deep on the whole track. But these half-beingnesses, these things he can actually un-be, these things he could become again, you know. He can halfway be them, halfway un-be them, these things he worries about all the time and so forth, you can take care of those things in Prepchecking. No matter how you sneak up on this, it will register on the meter if the person can't be it.

You could look over all the present time problems of the pc. There – it's a whole index of the things he can't be, the things he's trying not to be. And what he's trying not to be the hardest is the thing he has done the most to. You get an image of the pc with sledgehammers pounding upon the chest of the thing he is trying not to be. Well, please run "sledgehammers." You're never going to un-be him with just the hope that he won't be. All right, "Hope you're not Papa. Thank you. Hope you're not Papa. Thank you. Hope you're not Papa. Thank you."

Same thing. "I thought a bad thought about my father. I regretted having such a father," so forth. Think-think-think-think-think-think-th-. Well that's going to do nothing. He's done something, man. He's put glue in the old man's shoes, you know? He's put the – poured the molasses down the drainpipe and put vinegar in the syrup pitcher. He's done things. He's gone around privately and pulled three of the spark plugs off of the V-8 engine just before Papa had to go out to carry on his professional calls, you see. He's done things, you know? He's even let some of the air out of a tire hopefully.

One pc I know of, he'd become a doctor. And he'd become a doctor apparently for only one reason: to have better access to poison so he could poison his father. And he never did anything when he went home. He did – he never went home without having several varieties and brands of poison in an effort to slip them into Papa's coffee.

But let me call something to your attention. We knew about those and he still hated his father. We hadn't changed him a bit. No, no, no. He could tell you about those, because they were only hopes, weren't they? You know, he never did even almost put any poison in the old man's coffee. He never did. He used to talk about it, think about it, dream about it, brag about it. But he never did it. What *did* he do to his father? He must have done something. And that would be your job in Prepchecking to find out what it was. And don't be so detoured by the wishfulness of it all. See. Don't run, "Wish I weren't." Run, "What did you do?" Because it's only the mechanisms of kicking the old man in the belly at the wrong time that got him into the state where he could no longer be a father, be his father and so forth.

You'd be surprised the number of things you can trace down in Prepchecking if you go about it intelligently. Talk to the pc, know your pc, do a problems – do one of these surveys – Pc Assessment Form, on a pc. Look it over. Say, where's this boy been going, you know. You learn a lot of things this way. What, what's he trying to be in life? What would he like to do? You know, think it over a little bit and look it over and say, "Wow, you know, every time I look at this, every... *Heh-heh*. I wonder. I wonder. I wonder." "How about maiden aunts? How about aunts? How about unmarried women? Yeah, that's good. That's good. Which one of these women was unmarried?"

"Oh, well, that one."

"Aunt Gertrude. Aunt Gertrude, Aunt Gertrude." There we are. All right. And here we're off to the races. Give it the one-time check, but it's going to be a waste of time. "Have you ever done anything to Aunt Gertrude? Thank you. That sure knocks. All right. Good. That one. Oh, you pulled all her hair out. All right, thank you very much. Thank you very much. All right, now let's check that over. Have you ever done anything to Aunt Gertrude? That still knocks. All right. Good enough." *Whewwwww*, here we go.

You go on down the line and you pick up that chain called Aunt Gertrude and the first thing you know, why the pc can do some of the most remarkable things. Aunt Gertrude was a piano player amongst other things. And the pc all of a sudden has some interest in music. He doesn't go start screaming every time – every time music turns on, you know? His nervousnesses and his phobias and the things he's worried about in this lifetime that don't amount really to a hill of beans, but the things that make him unhappy with the business of living, can be picked up in Prepchecking and straightened out.

And if you're very clever and adroit at this sort of thing, if you understand what I've been try – how this cycle goes and why a person does overts and what happens to him when he does too many. And that the person can never do the things of the things he – that the beingnesses he can't be, can do. When you understand those various things you can take Prepc-checking and boy, you can play it up, down, middle. You'll never get anywhere with Prepc-checking asking for thinks, criticisms, buying this sort of thing.

Don't ever limit yourself on the amount of argument you're prepared to greet the pc with when he won't tell you a doingness. If you're getting a fall on the meter on something or somebody, pc's done something to that person and never shake it otherwise. Don't let the pc sit there and hope. The pc has done something. The pc carefully put the hot-water bottle in the bed, carefully unloosened the stopper on a cold winter's night, and Aunt Gertrude got pneumonia. [laughter] Something has been done that has been done with the paws. It has not been done with the think.

As soon as you know those things, can add it up, you could actually take a pc, size him up, saying, "Well, they're having this kind of a chronic present time problem. All right. Now let's see. Now, who had that wrong with them or who did the opposite?" See, present time problem – bad foot. Always has a bad foot. All right. Somebody had a bad foot, that'd be totally obsessive beingness of the person, don't you see, and he didn't want to be. Or somebody sure used their feet. It's going to be one or the other. The other's a half-beingness sort of a thing. They sure used their feet. You want to know who had a bad foot, you want to know who used their feet. You'll eventually spot this thing down. You'll get a person a pc has not even vaguely in view. You'll have to work like a beaver trying to get this person in view. When that person is in view and you get some overts off against that person, you're at least going to get a change for the better in that foot condition. See?

If you work it right, you can do wonderful things with it. If you just sit there and let the pc drive, of course what's the pc going to tell you? He's going to tell you all the things he doesn't want to be without increasing his ability to be them and without really decreasing his ability to be them. He's not going to change his case. Because look, he's been living all these years and hasn't changed his case yet. He's complained about these people all these years just like he's complaining to them – about you in the session. See, he's telling you in the session all about this, too. Don't think he hasn't told other people. Until you get the things he hasn't talked about and the things he has done, you're going to get no change on the part of the pc. Okay?

Well, that's "body of the session." That's what you're trying to prepccheck toward and that's why. And that's why the overt-motivator sequence, no matter how unpalatable it is to some people, works. But it only works if it's used as actually an overt-withhold system. It doesn't work if used, "I wish I could perform another overt against the old man, but the son of a blankety-blank is now dead" and is unable to do so. And he's actually – really, he's saying, "Criticize, criticize, criticize, I regret, I regret, I regret. If I could only exteriorize from the old man I'd be much happier." You know that? Only the funny part of it is it's not, "exteriorized from the old man." "If I only had the ability to be this without being misemotional about it, I would be much happier." That's the equation you go on, not the equation he's going on.

So the pc is trying to drive on one road and you've got to make him drive on another. He's got to cease to fight being it and get so he can comfortably become it, at which time he will cease to be it. And very few pcs appreciate this. You say to this pc, "Now look. If you just wouldn't hate your colonel so much you'd probably get out of the army." Oh, he knows that's wrong. He knows the best way to get out of the army and that is just do *more and more and more* things to the *colonel* and also the *major* and the *captain* and the *lieutenant* and preferably the *army*, but because you can't do anything, take it out on the army equipment and sooner or later you'll make it. And sooner or later he does. He drives a jeep over the cliff and goes out of his head and picks up another body. But we're not – we're not particularly advocating that system at this particular time.

See, your pc would not really believe. He'll believe it about other people's troubles and he'll believe it in zones where he's not aberrated. But on the exact zone and area where he is aberrated he won't believe it. And therefore you have to be quite a little salesman sometimes sitting down there, see.

"Do? Do? Oh, the hell with doing something about it. I tried and tried and tried!" The pc's liable to say. "I've just beaten my mother and I've beaten my mother. I've taken hot flat-irons and laid them on the platter and tried to burn the house down. I – I – I've killed all her puppies. I – I've done everything I could do. And you know I just can't get away from her!" He'll tell you this. If he was thinking the thought all the way through he would explain it all that way.

"And you know," he says, "I still can't cook." "I can't stand to wash clothes. I have a terrible allergy, every time I smell something burning I – you know – my skin all breaks out in a rash. And so on." He'll hardly ever believe that it was from that zone and area because he's worked on that one. He himself, in person, has worked on that one very hard without any success at all. And now you, you nut, are going to come along and try to work in that same area? He knows you can't win. Why, he's been throwing radishes and carrots and baseballs and everything else he could at this particular person and he hasn't ceased to become them. And now you're going to pick all these things up and erase all his good work?

The funny part of it is when you've got all the good work erased, why the overts he's even forgotten about and are buried and are down at the end of the chain, all of a sudden go *zip*. He can cook, he doesn't have any allergies and the barking of a puppy doesn't drive him insane. How marvelous. But don't feel strange if he attributes it to something else and another part of the session.

So that's the secret behind Prepchecking. And I do want you to do it. I do want you to, to actually get a good reality on the fact that you can drive that down the right road. You can ride that bicycle. There is no point in it. It isn't just going through the drill that rides the bicycle though, it's straightening out the beingness of the pc.

Thank you.

ADMINISTRATION OF COURSES

A lecture given on 22 May 1962

Thank you.

Well, I see you're late again! [laughter] The – this is what? The twenty what?

Audience: The 22nd.

Twenty-second of May AD 12, Saint Hill Special Briefing Course first lecture. This lecture concerns administration of Academy and Saint Hill courses, which has something to do with you. Not that you may be teaching them someday, which you will, but you need this data here and now because you're in the midst – you have been in the midst of a change and you are at the end of the change but you have not entered into the solid fact.

Now, first and foremost, we ought to take up the fact of whether or not I ought to keep on lecturing to you and whether or not we just shouldn't just drop my lectures.

Audience: No. No way!

All right, that settled that. [laughter]

Female voice: Anything but that.

All right.

The data which you should have about training is that this planet, this particular oblate spheroid (is that high-toned enough?) [laughter] – Earth, you know, is not a sphere. It's always been a little bit ashamed of this fact. [laughter] Somewhere or another it got in a spin, you know, and it got its North and South Poles kind of flat and it got kind of swollen out a little bit at the equator and nobody's ever audited it. Terrible, terrible. I get on that very easily because it has something to do with my goal. Anyhow – I mean the first one up.

But this planet has actually never developed a system of education. That's the first thing which you have to face when you suddenly find yourself in the midst of trying to educate. In the first place they don't even have a definition of "education." There is *no* definition of "education." As close as there is to a science of education is found in the Logics of Scientology. Those Logics, there are about fifteen, something like that, and if you look at those you will find out that they are an outline of the whole science of education.

But there is no definition for this thing called "education." There has not been.

I worked on this some little time ago and was going to write a textbook on education and I kind of didn't bother. That's about it, because with – the outline is right there in the Logics. If you want to know what education is all about why you can put a whole science of

education together right straight out of the Logics, there they sit. It's just waiting to fill up. With this – with this one single difference.

Now, let me give you, not something you're going to quote word for word, but let me give you an understanding of what education is. Education is basically the relay of an idea, concept, a datum of some kind or another, from one being to another being. You see that in its broadest sense it is a communication, no more than that. But at the other end in education there is an insistence on receipt. So if you just take the definition of communication and then put in "insistence on receipt," you'll get education as it is normally – short. It's – that's not far enough yet, see? But it stops at that point. See, Earth education.

Look at the universities and look at these schools and people go to these schools and they take examinations and they – they have shown they receive it. They've shown they've received it, see? That's as far as it goes. And then they give them a tie. I was going to wear an old plaid gambler's tie down here tonight to show you what an "old school tie" is like – the Seaforth Highlanders or something. But I haven't been a member of them for years, so it would be – not for lifetimes actually. But that's what you get.

Now, you come into training in Scientology and you run into all of your habit patterns and expectancies, don't you see, of basic education. And they caught you young, man! They caught you young. You were there at yo' mammy's knee saying, "A, B, C, D," lifetime after lifetime, you know. And you get pretty good at it after a while. I could read in this life when I was about three and a half years old. And then I went to school and they kept insisting that I learn how to read. And you know, I never learned how to read in school. I could read, only nobody ever heard that. So there's no – ever – any backflow ever accepted in one of these things. You see, you can read, so then if anybody tries to teach you how to read and you won't learn how to read and you can read, why nobody ever finds out about that. See? So you've had it.

So, let's say we were teaching a course on how to be a rocket jockey. How to fly a Mark 14 interplanetary scout ship. See, and we're running a course on this. And we've got somebody and they had Mark 18s in their system and he knows all about flying one of these things, you know. Well, that's fine you know. Here's this, here's that and the instructor keeps saying, "Now just a minute. Hold it down now. Now, that is your circumlocutor." And the fellow says, "Yes, I know. And you pull it like this and you go like this and so forth; and it's for vertical takeoff, see. Yeah, well now, what I do want to know is, you've got a couple of dials here that were taken off the later ... ?" And the instructor says, "Now just a minute, just a minute, that's the circumlocutor." See. That guy has a hell of a time, see.

Well, this is a rough deal because there's never any guarantee that there is a backflow. See? You can never convince the instructor that you can already circumlocute a Mark 18 and you want it a little bit modified. You want to know – the only thing you're trying to find out is – what is this dial? It wasn't on a Mark 18 and they got later models, they took them off, see. "And what's this damn dial here?" You see.

You don't get that till the third year. There you are, stuck for three years. You see? This happens to you a few times and you get allergic to education.

Well, now in Scientology this is carried – although this is understood to be the case in most Earth education, it's never stated, as a matter of fact, none of this is ever stated – it's always, education is the worser for the unknowable or something. You've got the communication formula, guarantee of receipt and now in Scientology, something no medical school ever teaches, no psychiatric school ever teaches, no nobody ever – no engineering school ever teaches and God help a nuclear physicist school if they taught it – guy's got to be able to do something with it. That's the missing step in Earth education, see?

They say "Now, *hmm, hmm*. Now you sit around the amphitheater, *hmm*, now we take the scalpel, you see, and we slit open the patient's stomach like this and we pull it back and we put the sutures in the forceps and – where's my chewing gum?" You see and so on. "And then we – we take the appendix and we go *glmmp flmmp*, you see like this, *hm-hmm*, there it is, *h-hm, h-hm*. Now, on your term paper give a description of an appendectomy." So they give them a description of an appendectomy and they make the guy a doctor. And then you come along [laughs, laughter] – that's the asininity of the whole thing, you know.

Oh, sometimes they let these guys intern, puddle around, you know. But that's supposed to have something to do with it. They make some vague effort.

But the first thing you would ask in this thing that we're stressing, is, was the information there being communicated? Yes. Was there a guarantee that the information was being received by the student? Yes. Could the student then perform effectively this taught skill? So the first thing we'd ask the psychiatrist, "Can you make people sane?" "Ho-ho," the fellow said, "Well, what do you mean? I have a certificate here from the *hmm-mm-mm-hm-m*, the Washington *hmm-mm-mm*, School of Freudian Appendectomies and so forth. What do you mean, can I make people sane?" He's liable to get real mad. Also, he's liable to not understand what the hell you're talking about. He actually has never moved his understanding that extra step. And not having moved his understanding that extra step, he doesn't realize that anything is ever expected of him with this information. And there's the trouble you have with the student in teaching Scientology skills.

The guy says, "Well, I guaranteed to you that I received it. I have proved it utterly, so you communicated it, I received it and I certify that I've received it and I can pass an examination on it, so therefore I have fulfilled all the requirements of Earth education. So therefore I ought to be graduated."

And I come along and say, "Yeah, but can you make somebody sane?" you know. Aw, the hell with that, you know. I mean, that's putting it too far.

But understand that on this particular oblate spheroid in this particular Sun 12 system, that question does really not form part of the professions. Oh, it may perform something on the order of artisan work. They very seldom let anybody get out of that because they've got the bricks right in front of them. And they say, "All right, build a pier. Build a lancet-type arch," you know. If a guy's been around he can do this, so he can do this.

But professional activities are not looked on in this light at all. And also artisan skills are not looked on as teachingnesses, you see? So they've just separated, they've just gone off in all directions.

Now, you've got to realize in Scientology education, not to drag on about this, that we are trying all three of those steps. See, we're trying to commute thought here, to understanding here, to performance there. See, there's the communication, the guarantee of receipt of the communication and the performance of the skill. Now, we are in an interesting position to be able to do that because we can do interesting things. Even though you at Saint Hill are – find yourself out here on the far horizon and frontier of research and you get messed up about it every once in a while, when I find out that you can't achieve certain results, why, I'm about the first one that finds it out.

And you therefore get it all backed up right for the first step again, you see. Well, this causes you – this causes you randomness – there's no doubt about that. But you're approaching a point here where the precision with which a session can be done is not to be trifled with, frankly. We're in a type of auditing today where you – now this is a – this is a joke – where you can't miss. See, that's a joke. You can't miss in this type of auditing. There is no number four ring in the target. There is only a bull's-eye. We're in a type of thing today where you must not miss.

Now, I'll give you some kind of an idea of that. You can – you could sit down, take almost any Class I, old-time process, not open the session at all and sort of hold the guy in your – in the chair, you see, with your hand and say to him the first command of a bracket of some kind or another, some generalized bracket, you see? And go over and over this bracket just repetitively taking the bracket all the way through and repeating and getting an answer to each one. And that's all you'd have to know how to do and, what do you know. I mean, you get a large number of the people you did this to would have a tremendous resurgence. See?

Now we move up into just a little more complicated activity. And the second we go much more complicated than that we get into rudiments. And the second we get into rudiments we're in a must-not-miss area. There is *no* almost-right action in Scientology auditing. That's worth knowing. There isn't an *almost-right action*. There's no number four ring to the bull's-eye, there's only number five, the bull. One bull's-eye. You've got to hit the bull's-eye every time.

Because if you hit a near miss you have accomplished a restimulation. You are – you are handling so close in to the heart of things that if you bypass it by just that much you have restimulated the pc where he lives, man. You're – you're auditing straight into the heart and core, you see, of aberration and you mustn't miss it. It's got to be dead on.

Now, that doesn't apply so much to a Prepcheck question, see, that can be looser. Ah, it doesn't apply so much to what Zero you're using, you see, that could be looser. But boy, how you pick up a missed withhold, how you get the rudiments in, see, how you list, how you handle a list, how you get the pc out of session again – those are bull's-eyes. Every one of them has to be a bull's-eye.

Now, I'll give you an idea. More than one of you got an overwhelming reality this afternoon. And more of you are going to get an over – screaming reality tomorrow, on the fact that you missed somehow or another, a rewording of the beginning rudiments question. See? You missed on that. I'll take that up later tonight, you see. But you were not asking – you were asking, "Since the last time I audited you or since the last session, have I missed a with-

hold on you?" Well, it's already been ... Yes, yes, a lot were doing it. And there's been a bulletin out for a long time – but not solely devoted to that, you see, it's down in the second page of the bulletin – where that was changed. There was a change in Model Session. A long time ago. And it was, "Since the last time I audited you, since the last auditing session I gave you..." or whatever it was, " ... have you *done* anything that you are *withholding* from me?" Oh man, you'd say, that's not very much of a difference, you know.

Well boy, it was enough of a difference that at least two auditors, this afternoon, had the most marvelous sessions, *ho-ho-ha!* Never had such a marvelous session, because they used that right rudiment. And they got off this *tremendous* quantity of material that had gone on between sessions and before they had never touched this! In other words, we buried a datum.

I buried a datum, inadvertently, on the second page low down on a bulletin – it didn't come out as, "Model Session (comma), Change In, Urgent, Vital, Important," exclamation point, see? And we left a point where you could almost hit, see. "Oh," you'd say, "that's so close, that's number four ring of the bull's-eye. You're in the target! What are you crabbing about here?" Nothing, except it wrecked every session where you didn't use it. That's all! Because it restimulates, see? Because the pc couldn't quite wrap his mind around exactly what the auditor was asking. "See, have I missed a withhold?" "No, he hasn't missed a withhold on me." See? So "No." And it didn't register on the meter.

And all – all he'd done – all he'd done between sessions was break course regulations one to twenty-five. Hardly anything, you know. And left the session halfway through with his pc in an ARC break, you see, he hadn't done anything you know! And kicked the cat as he went out, you know. Hadn't done anything.

And sure enough, "Since the last time I audited you have I missed a withhold on you?" "No." Wouldn't register, see? And here's this whole chain of overts and the session sitting straight on top of all this confusion. You can't have a near miss on these vital points such as rudiments, whether beginning, middle or end, no matter, on the exact way you get the invalidations and missed withholds off, you know, and suppressions off things. In those zones and areas you cannot miss, you must not miss. You just – if there's any white at all between the bull's-eye and where your bullet goes, you have had it, because you've actually picked into a restimulation. You've asked a restimulative question. You haven't got the answer to it. Pc's going to go out of session.

See, you're auditing too close to dead center. You see, if you weren't auditing close to dead center, if you were just auditing generally and so forth, why, you could sit there with your feet on the mantel on the back of your neck in the armchair, you know, and move the – move one foot down to shift the tone arm once in a while, you know, with your big toe. Pc could sit there smoking cigarettes, you know, and I mean actually he'd make some gains. Class-I-type auditing without any Model Session connected with it, no withholds, no overts, nothing like this going on and so forth, well you can be sloppy as hell.

Well, you move into this next grade of auditing, with a Model Session and so forth and boy you've had it. All you have to do is just put that – just that amount of white between the bull's-eye and your bullet. Ah, you have promptly got an enturbulation that makes the vol-

canic upheavals of Kilauea look like stirring cold coffee. *Scream!* Everything will go out. See?

Did you realize it was that critical? Well it is. The moment that you move up into this type of stuff which is going to give you fast case gains.

Now therefore, a partially trained auditor is about as safe to have around as one of these human bombs. A partially trained auditor. See, this guy at HPA, lowest grade level, you know. Ah, he got results and then he doesn't know what happened. He went into this other grade and he isn't quite sure what happened but somehow or another his pcs didn't get along well. You see what he did? He moved over toward the critical target.

Inherent in that critical target is ultimate gain. There is no ultimate gain inherent at all in this sloppy, floppy, generalized session. You see, that'll only go just a little distance and everybody's happy. But you start going for broke on this, you've got to come over to the main target. And swinging from the broad horizon over onto this main target is fraught with *many* difficulties.

Now, in the understanding of that, that there is a bridging area between coming off from the sloppy, wide type of auditing over onto the very precise type of auditing, an understanding that that doesn't actually take place in a gradient, it takes place 1) broad horizon, see? "Recall something that's really real to you. Thank you." See? Just repetitive old scale processes. Goes over 2) dead center in the bull's-eye. No transition. You transverse across no horizon. At one moment you can sit there with your feet on the mantel smoking the cigar and blowing it in your pc's face and getting away with it gorgeously and then you are tapped on the shoulder and you're supposed to sit up in that chair and you're supposed to do it this, this, this and this, dead-on, absolutely perfect.

And of course, the process of making this transition is enough to make you blow your brains out. It's ghastly. In the first place the technology involved demands of you absolute perfection achieved in zero time. See, otherwise you're going to be in trouble, trouble, trouble. The gradient scale, if there is any gradient scale, is the closer the auditor gets to being dead-on the target, see, the closer he gets to being dead-on, the more trouble he is in!

Now, therefore the educational processes have to allow for this understanding and we have just – I've just been cranking up the lineup and talking to the Instructors and finding out what trouble you've been having and so forth. And we've altered the educational pattern and that's – I'm giving you now the reason why we have the educational pattern and the next one is, that you must have at least three stages for any type of Scientology training that is earnest training.

And that is represented in the three sections. These three sections are the Theory Section, the Practical Section and the Auditing Section.

Now, three sections does not mean three grades. We are so used to going into the first grade and then the second grade and the third grade that if we have three sections, we're sort of used to going into the first section, the third section, you know, in gradients. You don't do that. You're in all these three sections, in Scientology training, at the same time with this ex-

ception – that the earliest section doesn't have any Auditing Section in it. The Auditing Section is deleted.

So in the earliest lowest grade you have a no-auditing. What you have is a Theory Section and a Practical Section. And you're in that simultaneously.

Now, your upper grade, of course, from that, the second he's got – the obvious reason for this is the guy can't be permitted to audit at all, you see, until he has a little bit of theory and a little bit of practical and then he can be permitted to audit.

So you might have an Auditing Section in that which is devoted to something highly elementary or terribly simple, that combines some of that skill and which cuts in late. So you see, it's not simultaneous. You see, after he gets this item, theory, and gets it practical, and this item, theory and practical and this item, theory and practical, *then* and only then does the Auditing Section cut in, don't you see? And that would be true of all grades.

Now, let me give you a much more general idea of this. You have a checksheet. Every student has a checksheet. He has a copy of – in his own possession, but nobody counts on the student not losing it or it going adrift. So the master checksheet, the one that you really pay attention to, is in the hands of the Examiner who is also the Course Administrator and he is in charge of the Theory Section; he's the examiner of the Theory Section.

And this checksheet he has – can – is for a grade, pardon me – a class, that is a class. It's a classification. Let us say that it is Class 2A. It has three columns. And these columns are from the left to the right, theory, practical and auditing.

So we have over on the extreme left side the item to be studied – if that is an HCOB or a drill or a something or other. Now you – you understand that nearly everything you've got has both a theoretical write-up and a practical write-up. There are gaps in this at the present moment. Those gaps will rapidly be filled. But you've got then, this – like HCOB of 1st June 1960, you see – whatever it is. Maybe some notation there of what it is and then there is a little dotted – or a little bar line for the Examiner to initial for theory. And then there's next to that, to the right of that, there's another bar line for the Practical Instructor to initial and then there's another bar line as to whether or not it's been audited under the Auditing Supervisor. Very simple, hm?

Now this new principle enters in which you have not seen before and you're going to find out that at first you will think this as working a hardship upon the pc because it's going to penalize the pc auditing time. And it's going to apparently get in your road. But it's this way – we've always considered the Auditing Section to be inexorable. The Auditing Section has always been considered to be inexorable. No matter what else was going on, there was an auditing session that day and the auditor was there and the pc was there, don't you see? And that is the arbitrary which has made training difficult. That's the hidden arbitrary.

We find that the auditor in – let's take up the auditing session now – section. And the Auditing Supervisor finds out this fellow's prepchecking and he's getting – he writes the What question out as Zero, see, Zero, and then he writes the What question you see. And then he lists the various overts after that as he goes down the list, you see. And then gets maximum – maximum needle reaction so he leaves it.

And the Auditing Supervisor at this point, having inspected the fellow's folder and probably having looked in at the session, decides that this person should not be prepchecking. So he posts it as a cancellation. It becomes a cancelled session. Actually in the exact administration, is the person who is doing the folders finds these GAEs – gross auditing errors – and writes up a cancellation list. They don't – they don't just write in it everything that is wrong with this. They write some comments on it of course but if they consider it a gross auditing error, then it is simply posted on the board and the auditor would come in, in the morning, he'd find his name posted there, that means he – his – the session he gives the pc is cancelled. There is no session. They report to nothing. And they've got some time to study then. But under that it says, the item or the item numbers which must be reviewed.

In other words, the Auditing Section has the right to require a second examination by Theory and by Practical on a point that has already been passed by Theory and Practical, you see? So he says this guy doesn't know from nowhere so therefore we're not going to go on letting him butcher up a pc. We just cancel the session. But this of course gives the auditor time to look into it. That is, it gives the auditor – the session – gives him time to get his theory and practical. What we've been doing before the session went on inevitably and the fellow was auditing all day long and he was auditing wrong and he never had time to find out if he was auditing right, don't you see, or how to audit. So that's a cancelled session list. And it doesn't mean anything more than that – the session is cancelled.

Something's going wrong here and usually what had to be done again would be written there and then the Theory Supervisor can tap the student or the student actually reading that you see, his session, you know, in which he is auditor, has been cancelled and for this bulletin and that.

His first action should be to use that auditing period, no matter how he's stacked up otherwise, to just study that bulletin like mad and go in and pass it, theoretical again. So he gets a theoretical pass on the material again, and then gets a practical pass. The Practical Section takes over from that. Now the full – the checksheets have to be available to the Instructors and Supervisors in the Theoretical and Practical, and when something has been checked out theoretically it goes to Practical, don't you see?

Exactly how that administration is made up between the Theory Section and the Practical Section is pretty well up to them. But it's also up to the student. Now if he knows that he has had to pass the Prepcheck bulletin or maybe a couple of Prepcheck tapes that take up certain sequences or something, if he had to get those again, and he does get those, well he knows doggone well that he had better report to the Practical in order to get his practical because he won't get back on auditing again, until he does.

Then he goes back on auditing as soon as he's passed these two things. I think you'll find the case gains are faster. Even though it's cost people some auditing time, you'll find the general case gain is faster. That's the economy. It's because of this – you must hit the bull's-eye, you can't go in the number four ring, you see.

Now, Auditing Sections, all auditing sessions are for gain not for practice, you see.

But I received this from the technical activity in London: "Do you want Op Pro by Dup in Grade 1A, do you want Op Pro by Dup and SCS flattened or just run enough to find

out if the student can run it in the Auditing Section?" *Yaaaa, see? Haaa, weeeooo!* Imagine every HPA being partially flat on Op Pro by Dup and SCS, see?

So we mustn't regard the Auditing Section as an interchangeable Practical Section. Yeah, in the *Practical Section* you get him to do it long enough to find out if he knows how to do it. But the Auditing Section must hold up before the student at all times, that this is for blood and nobody is going to hold his hand. And if there's too much arterial bleeding thereabouts, he is simply going to be amputated from the Auditing Section, you see, and put back through Theory and Practical until he gets there. Got the idea? This will cut down the amount of "bad auditing," and so on.

Now, this will work out this way, in framing up – in framing up sessions and in posting sessions, this will mark out this way. We'll find that the person who is not giving auditing will get balanced out by not receiving any. See, that'll be a point that the person who is arranging the Auditing Section – see, the Auditing Section does the posting of the auditors and pcs. So supposing we have gotten halfway through a week and cancelled an auditor. Well, this has penalized a pc, hasn't it? Well, the net result of that, if we just started in at the beginning of next week, you see, and we kept that same team going endlessly, why we would be penalizing the pc all during the next week, see.

So it means change of auditors, but auditors become more interchangeable, oddly enough, when you have a perfection of Model Session. That's more easily done. We're trying – we're trying to hit a happy medium between not too many auditors per pc and not everybody penalized. So if the fellow is actually giving auditing, why, we give him an opportunity to receive auditing by a juggled list on the next week's posting, don't you see? He's giving auditing, he receives auditing we try to keep that rule in. It won't balance out well. You can't do it very easily or evenly with total justice, but you can attempt justice in that direction. I mean attempt to make it as equitable as possible.

For instance, you don't want somebody who is – his auditor has been off the Auditing Section for three weeks, the pc of that Auditing Section has not been off Auditing Section and has been delivering auditing for three weeks. That's kind of a situation that would develop there. We don't want that type of situation to develop, if we possibly can.

This then brings out this interesting fact, if we try to keep an equity there, we try to keep it that people who are giving auditing also receive auditing, don't you see? It will obviously push your best students up closest to the top of the barrel; in other words, it works on a principle which Scientology itself has always worked on or tried to, which is to make the more able more able.

The tremendous gain gotten in the London County Council schools when we worked on the genius student was marvelous. You never saw the like of it. Some of the data on this is absolutely staggering, but the data was never really assembled and published for the excellent reason that Scientology was used for the backwards classes. Here's Scientology being used, and of course it wiped out their backwards classes where it was used. But they thought that was marvelous, you see; Scientology is marvelous because look, it's wiping out all the backwards classes. Well, this is a tendency of man, you see. Marvelous.

But they never looked at this other fact, that when it was applied to geniuses in the school, these guys all of a sudden *really* started to fly. The amount of tremendous surge up the line in IQ and everything else which these kids got – you see, the kid would start in with an IQ maybe of 118 you see, 120 something like this and he'd wind up with an IQ of 185 or something quite staggering you know. Kid be bright as a dollar and doing Earth arithmetic in his head and marvelous, could be a surgeon. Nobody has ever paid any attention to that.

But that is a factor which would become manifest if you started using this other principle. In other words, your better auditor would get more auditing. He – and the better auditor would be doing the auditing and getting the auditing.

So therefore you disconnect the whole time schedule on training, from the schedule. Time – time has nothing to do with it. See? Whereas how fast does somebody get through these grades? Well, he gets through the grades as fast as he gets through the grades. So this then doesn't give you the exact amount of time in school, student to student to student, which is unfair anyway. But is liable to put somebody in an HPA or Saint Hill class, put them in here at – three months and he's so Clear that when he's jostled in the hall he rings like a bell, you know. And he's got all of his checksheets and everything is gorgeous and he goes home, you know. 1890 [sic], something like that, why you keep bumping into this shadow. And then somebody says that isn't a shadow, that's a student from 1962. And he just never did get up – the longest he was ever kept on an Auditing Section list was one morning – was one morning in 1975, when they just had a new Auditing Supervisor and he put him on that morning and took him off that afternoon. But at the same time you wouldn't get a case being cut to ribbons, don't you see?

Now, you can actually get a case cut to ribbons with the stuff we're doing, see, so it requires to this – this much degree, particularly at Saint Hill. Not quite as important in Academy classes because after all they're doing these broad, generalized processes. They don't swing into Model Session until they've been there for quite a while. And you've got a different – a different view.

Now, the theory is that anything a person learns he can learn to do better. But of course there is a limit to this. There's a ceiling to where a person no longer is improving because he's not doing. There's nothing more ghastly – they found this during commando troops. The commandos were invented in World War II, early World War II, and in England, and they invented these fellows in order to make a strike-back and they did. They made a couple of minor strike-backs across the channel after Dunkirk. It was quite interesting. And not very effective but at least it was an aggressive action which the British believe in militarily.

All right, the army said – this was the army commando that they were developing, you see. And the army said, "What can these commandos do that any platoon in *my* regiment can't do, *ho! ho! ho! Hoo, hoo.*" And the commandos stayed home. They were restrained thoroughly from further action until almost two years had gone by. The minor actions which they undertook were greatly impeded in the War Office. The War Office was not about to use any commandos, see?

And those poor guys – those poor guys, there was only one worry about commandos after a while, is they were so overtrained with no doingness that they were just going raw rot-

ten, that was it. They were just going to pieces. They had been trained and they had been trained and they had been trained and they had been trained, and they never got a chance to perform any of their skills. And that was the basic trouble with commandos and the basic worry about commandos was the fact they never got any doingness. It was very interesting. You'd have thought the trouble with commandos is commando casualties in any landing were 50 percent. You'd have thought that was the main trouble with commandos. Who the hell would join them? No, that wasn't the case. It was just never letting them lose their 50 percent! Such is the idiocy of man.

But the point – the point here is that you can't have practice, practice, practice with no doingness. But in Scientology training you must not have doingness with inadequate practice. So there's a happy balance, educationally.

Now, of course there are many fields of endeavor here on Earth where you couldn't permit these three steps to take place. I don't mean the three sections, but the communication thoughtwise, the fact that the fellow had received it, in other words he gives you proof that he has received it and at the far end, can actually do it in a practical way, those three sections wouldn't work on every endeavor here on Earth because look at nuclear physicist. He's being trained to blow up the planet and there's just one planet, you see, and so on.

However, we're not in that state. I want to point out to you that there are two and a half billions, plus, of *Homo sapiens* and we're not going to run out of targets this particular way. Nor is it a wasteful activity as in psychiatry. They have one case and you give a psychiatrist one case, you then have one less case. You see, it goes the other way. It's a matter of a sort of an attrition. The way they – the way they handle insanity is some way that Hitler was trying to handle the Jewish problem. I don't think that – I think that these things are a direct analogy. I don't know quite how, but true, you see. See, they were getting rid of – not insanity – they were getting rid of the insane and they – one for one, you see. Well, their supply will run out if they keep that up, you see, so that's not a – I wouldn't say that was an endeavor.

Your supply will never run out because after everybody gets Clear, of course, they'll want to be aberrated again. And [laughs] – not particularly true. But somebody – we used to gag about that, that in a couple of hundred years our biggest study will – how to get people aberrated. You have cleared everybody.

Anyway, we demand then of somebody that he get an intellectual grasp of the situation, that he can demonstrate the second one – stage – is that the intellectual, the theoretical – he has understood it to a point where he can apply it practically. And then we let him *do it* and there are your three stages, and they follow out the definition of education, as we have it.

Now, the faults of this particular system, lie in these zones. The person who is having the most difficulty passing his examination is most in need of auditing. Now, that's a – that's a flaw in the system. And he's going to have the hardest time because, of course, he's going to get the least auditing.

Now, it's very interesting. You get to living with each other and rubbing elbows with each other and – and you get on up the line, and you get variously tolerant and intolerant of each other's aberrations, and that sort of thing. What's quite interesting though, the change is gradual if – and sometimes quite spectacular – but you become somewhat conditioned to see-

ing change and you don't pay much attention to it in a unit at this particular time, and you don't notice the effect auditing does have. (I'll give an aside here – even the stinking auditing that you've been doing lately. See?) That's – unparenthesis. Anyhow – we'll have to cut that out of the tape! [laughter]

But it's this – you want to take a look at the training records, the theoretical section, records. When we went on to CCHs, we'd do nothing but CCHs at that particular time, we weren't even involved in the thing – of course, this is one of these *broad* horizon processes. You can do CCHs, standing on your head – something's going to happen. Have somebody patting walls – something's going to happen. See? No Model Session about it. We weren't using anything hardly. And I think it was a couple of weeks before I even showed you how to do two-way comm, you know, and CCHs got better after that.

But the funny part of it is, did you know that the first week you were doing CCHs here, you know that your passes went up something like about *300 percent!* You don't notice some of these things about auditing, but that's quite interesting. *Fantastic!*

Well, of course, this argues against this and shows you that there is a flaw in doing things this way because naturally if the fellow's having an awful hard time passing his theory and his practical, obviously he needs some auditing. That's obvious, isn't it? That's obvious. And the whole system from time to time of training, systems we've had in the past, have fallen to pieces because people did realize the Marxist system of training was best. He getteth auditing according to his need and giveth auditing according to his ability, you know, it's the Marxist system of taxation.

"To everyone according to his need, from everyone according to his ability to pay." And if I can just get those nuts over in America and England to put this into effect in their taxation systems, we won't have to worry about them anymore! And they're getting closer and closer to not worrying about them anymore. That's directly out of *Das Kapital*, by the way and the system of taxation adapted in the last thirty or forty years, by Western nations. Well, look, it just doesn't work. He getteth auditing according to his need. He giveth auditing according to his ability to audit. So we take all the good auditors, you see, in a training unit and we work them to death, you see, auditing all the bad auditors. And the bad auditors don't do any auditing at all, you see. And the good auditors get no auditing at all, and then because the good auditors are auditing awful cases, you see, with limited skills – they're still in the training stage, you see – they compound the number of loses they get. So they get sort of *hopeless*, you know.

We say to this fellow, "All right, now, you've learned all about skiing. We've – you've read a book here, you've passed an examination on this book about skiing. That's good. Now we've passed this examination on skiing now, and you've gotten through your practical, you've shown that you can put both skis on without falling on your face. Very good. Now there's the top of Mont Blanc. Now ski up there and ski back." *Gyaaah!* Of course, the guy says, "You know, I feel like I've had a lose." He has, too, because if all of your best auditors are auditing all of your worst students, of course they never have a chance to get a little win. They're actually being asked – it's being asked of limited, and faint little skills that you get early on, you see, to climb the whole hill, on a student who is – who's particularly rough.

So that Marxist principle does not function or work or apply in Scientology training. It can't.

Now, if the auditor has been on the books too long – it isn't the D of P, the D of T's signature on the bottom that requires that he get auditing, it's whether or not he has been for a long time on his checksheet, without ever getting over into the Auditing Section. And if he's been an awful long time on his checksheet without getting into the Auditing Section, you solve it this way. You turn him over, in a Central Organization, to the HGC. That's the way you do it in an Academy. You say, "Well son, you better go over and get 25 hours from the D of P; they have a student rate over there and that's it. Because you've been this many years here, here it is, 1972 and you've. ..." That's the way you heal this, you don't heal it according to this other ...

And the second that you do use that Marxist principle of apportionment of auditing, *ha-ha-ha*, you've had it. Because your good auditors will just be audited into a hole and the bad ones are receiving all the training, and you're just doing the same as the London County Council did.

All right. So, what do you do on a course like this? How do you – how do you straighten this out on a course like this? Well, actually there's some little basic processes, some earlier Grade processes, and what you do after a person has been on is downgrade the person's class – they never seem to be able to get onto an Auditing Section. They've been going too long without auditing. You downgrade their auditing class for an Auditing Section. You let them do something like a straight Havingness Process without rudiments or something, after – after the Auditing Section Supervisor has found what the Havingness Process is or something, you know.

In other words, you throw a kindergarten unit in there so they don't go forever without auditing. HPA/HCA, some old D of T will look with *horror* at this – read over this, a new sheet out here, the May 21st. It isn't complete either because there may also be a Class 1C in the Academy containing the upper-grade repetitive processes, which have been halfway done here in – under 1B. That's weighting 1B too heavily, so there may be another – another grade, be put in there.

But, somebody here at Saint Hill, and he'd been going forever on his theory and he wasn't passing his practical and he isn't getting in the Auditing Section, you see, he isn't getting in there at all, and that's piling up. And you look at the date – comparable dates and so forth, you can drop him down to a lower grade of auditing and of course you always have four, five, six students of that character and you can make a small auditing group on some repetitive action which will pick them up a bit and they can go through. But it will have to be this one that can shoot the broad horizon. Don't let them – let me call to your attention, don't let them do it in Model Session. You can let them have a meter on their lap, so it can hold an ashtray or something. But don't let them – don't let them fool with meter reads or something like that. Do something minor like, "the tone arm keeps moving, you keep on saying this," you get the idea. That's about as close as you can get to it. I don't mean to make nothing out of that grade because remember, we went on for years with not even repetitive processes. And

we know a lot about it now; we know at least you stop auditing when the tone arm stops moving we didn't used to know that, you know. And we've gotten smart through the years.

Anyway, that gives you a rundown on training. I think it looks rather simple to you, doesn't it? The only change that it makes as far as you're concerned is you just get – you get the grade you're studying for, on one sheet. And you will get credited everything you have passed no matter what sheet it occurs on, so don't worry about that too much. But you can expect in the very, very near future – I don't know if we'll be able to get this rolling Monday, but we will try – you can expect to see, out here on the bulletin board, your cancelled session list and so look there before you go someplace else. Don't sit there for two hours waiting for the pc to show up. He saw the cancelled session list, you see? [laughs] No, you wouldn't do that.

Anyway, that's – now the springboard of all this is, is look, we've got – we've got terrifically precise actions. It'll do tremendous things, there is no doubt about it whatsoever, but for a new articulation of it, my study of it in recent weeks has demonstrated more and more clearly to me that we cannot miss, you know. I mean, that's a nice colloquialism. We say, "Well, we just can't miss with Scientology. That's so true you know. We can't miss with Scientology, we've got to put it right through the bull's-eye." And that the more auditing we permit, which is offbeat auditing, why the longer it takes to get the cases moving.

So the techniques which you are actually using do not consume large numbers of hours. They are fast. If you handle them expertly and well, you can get very rapid results with them.

So, it's sort of on the line – as long as we don't have a grind-out – well, when we turn this fellow loose at a certain level, well, let's make sure he knows how to do it. And then he will get the gain which is inherent in that level rather rapidly, and we won't get pc damage that is going forward.

Also it winds up that you will have less – less restricted auditing space and it gives you, probably, more attention in the Auditing Section because there'll possibly be fewer auditing.

But the thing to do is, if you see your – if you see your name posted as on the cancelled session list, it means you, as the auditor, are supposed to review whatever's listed after your name, and in Theory straight away and as soon as you've done that why, in Practical, and then you go back getting a session, being given a session again.

That way we're not letting the pcs absorb all of the shock involved, with somebody asking them – as we come down the line we get to the withhold question in the beginning ruds, and they say, "Well now, let's see. Have – uh – since – uh – since I last saw you – uh – since I last saw you, have you missed a withhold on me? No, no." And I think – when we see that I think it's time we send somebody back to Model Session, rather than let the pc absorb all the shock of it.

You see our Instructors are absolutely shockproof. They can receive an unlimited amount of shock. They can get up to the hundred-billion-megaton shock, you see. So if

they're – if they're there, you see, to take all the bang, and, of course, when they can't receive it they just fall back on me, and I can so that's dead easy. Because back of me there's nothing!

So you haven't – you haven't then had all the training taken out on you. Your Theory Section is the first part of it, the communication. Your Practical Section is the demonstration that you can put it into action. And then the third part of it, you can demonstrate your absolute and complete ability to get results with it. And that sums up the purpose of the training we're doing. And I think you'll find that is much more digestible, and if anything, I probably should apologize to you for taking this long to figure it all out. But then, of course, you see, I didn't have all the mistakes you're making in order to correct, so I didn't know the right answer until just now, so I thank you for your contribution! [laughter]

Take a break.

MISSED WITHHOLDS

A lecture given on 22 May 1962

Thank you.

Lecture two, Saint Hill Special Briefing Course. May the – what did you say it was?

Audience: Twenty-second.

Twenty-second. I get so mixed up on this planet's time. I don't know this planet's time at all. AD 12, English weather. [laughter]

This is a lecture on the subject of missed withholds.

Now, there's a long and involved bulletin on the subject which I haven't got in my hand, but some of you may have. And this has to do with several bulletins, amongst them HCO Bulletin of May the 24th, also HCO Bulletin of May the 21st, and HCO Bulletin of May the 22nd – last two are relatively unimportant.

Now, you are going round and round about this proposition of TRs and how you ask for this and that and exactly how you do this. And this bulletin of May the 24th talks about Q and A and there has been a great deal of misunderstanding about Q and A because there wasn't a real hot communication on what Q and A was. See, there has been a lot of talk about Q and A, but a real hot thing ...

Now it sounds like, when you read this bulletin, that I knew what Q and A was all the time. You see? And I'm talking to you as – it doesn't sound this way, but you could take it that – I was talking to you as, "You dullard, why didn't you know this?"

Well, the truth of the matter is, there is at least a third of this data – probably the most important third – was unknown. And I just recently discovered this thing. And the term Q and A fits in gorgeously if you interpret it as: questioning the pc's answer. So it really ought to be Q an A, no "d" on the "and." Question an answer.

Well, if you apply that principle "question an answer" throughout here, you get all three types. You get double questioning. Well, that's the pc says something and he gives you a reply to your question and then you question his answer. See? Well, of course, that is no acknowledgment and that is just a setup for an ARC break.

And Q and A also would be changing because the pc changes. In other words, you run a process on the pc and then the pc answers up this process – nicely and neatly – by changing, you see? And right in the middle of the change, because he's changed, you change.

In other words, you give the pc what he's giving you, you see? But you again are questioning the fact that he's changing. His response to the process is being questioned.

And then the next thing is, following the pc's instructions comes under this. Now, you've got a total reversal of the whole thing, and because the pc – obviously knows far more about his case than we do, or something of the sort, don't you see – why, therefore, it's always best, you see, to do what he says.

In other words, that Q and A hardly is the questioning of the pc. That is a Q and A of me. See? That's questioning my answers to his case. That's kind of stringing a longbow – an amusing way to put it. We've got the answers. If you know them and you can apply them, why, you'll get there. And if you keep finding holes in the line, why, we'll find some more that we didn't even know existed, but basically, an auditor must stay in control of the auditing session. There is *no* doubt about this.

Well, the way an auditor stays in control of the auditing session is to stay at cause over the session and put the pc at cause over his case. And if we don't stay at cause over the session, the pc cannot stay at cause over his case. He goes to effect. Because you see, we're raising the pc's causativeness by making the pc confront. And if we don't make the pc confront, the pc will just obey his bank and his bank says "don't confront."

Now, a full cycle of action must exist with an auditing command – a full cycle of action. And you can't have a muddy cycle of action.

Well, this puts a tremendous responsibility on the auditor to ask the right auditing question. You say, "What should I be running on you today?" You have asked a wrong question. You can't [can] ask wrong auditing questions. You can say, "Have you had a motivator lately?" [laughter] And that is a wrong auditing question.

So there are two conditions which can exist here: is a wrong auditing question and a failure to let a cycle complete itself. You can do these two things, both of them quite deadly.

Wrong auditing question: "Have I missed a withhold on you?" Now, we didn't know this was wrong a short time ago, but it is quite wrong because the pc can answer it with a motivator response. You've managed to dig that up for me. Pcs were never ambitious enough to do that for me. They just took the easy route and did what I want, but – most have found by experience that it was easier to do that.

But answering with a motivator has happened in many cases. So you mustn't ask a middle rudiments or a rudiment-type question which permits the pc to give a motivator response, because the pc is then throwing the end rudiments out.

Now, you mustn't throw your end rudiments out. This is the wrong auditing question. This is also part of the wrong auditing question. You mustn't permit the pc to throw his end rudiments out. You've got to keep his end rudiments in.

And if you look over the end rudiments, you will see there are several that can go out and if any of those end rudiments go out, the pc will go out of session. So if you ask an auditing question which permits the pc to let his end rudiments go out, you've cut your throat.

Now, let's get the middle rudiments in by throwing the end rudiments out, and then we've got a nice dog's breakfast.

Let's say, "In this session have I missed a withhold on you?"

"Yes. My pc – I've been sitting here thinking how mean my pc has been to me in the last few sessions."

Oh man, you've had it because, unless – you're in for a Q and A. Now if you keep the end rudiment from going out – this is the problem you've posed yourself – to keep the end rudiment from going out, you've got to Q-and-A. You can't permit the cycle to be finished. He just got through damaging his own pc.

Now these two things have to be held in balance, don't you see? This is a real crazy one. By asking a wrong auditing question you will inevitably throw yourself into a Q and A, because you've got to question the pc's answer.

You say, "Has anybody been mean to you lately?"

And the pc says, "Oh, yes. Yes, yes. Herbie's been mean to me and Reg has been mean to me. All my fellow students have been mean to me." I'm not talking about any particular student. [laughs]

All right. You've just thrown the end rudiments wildly out. Now, suppose you correct this. Supposing you ask some equivocal thing like, "Have I missed a withhold on you?"

"Yes. I was sitting here realizing that Mike has a deep, sadistic tendency."

Ooh, you've had it here. Now what have you done, you see? You asked a question which was equivocal. The pc gives you an answer which throws the end rudiments out. Now the only way you can correct this is with a Q and A. You can't buy this answer. This is the auditor's dilemma that I am giving you here. You can't buy this answer because you've thrown the end rudiment out.

You would question the answer in any event, even if you said promptly, "In this session have you damaged anyone?"

The pc would still realize that his answer had been questioned. That's – see, the auditor's dilemma. You ask a wrong question, you will Q-and-A every time.

So you've got to ask the type of question – I'm not giving you now words – I'll give you the principle back of such wording. You must ask a type of question which makes a Q and A very unlikely. I will not use the word "impossible." [laughter]

Now, you can judge whether or not the wording of a middle rudiment or a Prepcheck question or anything else – you could judge whether or not a question you're asking the pc is right just on that formula alone. Is it one which will lead to a possibility of having to question the pc's answer? And if it is, then it is to greater or lesser degree a wrong question, because he's going to give you a response which you then must question.

You're going to have to question his answer, and then he's going to feel like he's not acknowledged, and then he's going to feel like he can't talk to you, and then he's going to go out of session. And there goes all of your beginning ruds and all the end ruds.

Now, that's where you should direct your consideration of what you are doing with the pc. You must not Q-and-A. To prevent Q and A, you must ask the right auditing question. What is a right auditing question? One that will produce an answer you do not have to challenge.

That is the perfect auditing question: a question that will produce an answer from the pc that does not have to be challenged or qualified in any way by the auditor. You mustn't question an answer.

Now, here's a perfect Q and A – in case somebody came in late and doesn't have a copy of the bulletin – here's a perfect Q and A:

We run into Joe. We say to Joe, "How are you, Joe?"

And Joe says, "Awful."

And we say, "What's wrong?"

Well that's very socially acceptable. You'll hear it up and down the highroads and byways in every language, including the Chinese and Scandinavian. Everybody does it. It's social machinery. It would be unsympathetic of us not to do it.

We ask a question. We say, "Well, have you had a good day, Bill?"

We meet Bill, you know? And Bill says, "No." Inevitably, we have to amplify the thing, see? So we say, "Well, what happened?"

That's a Q and A: That questions the pc's answer.

Correct. This is correct:

"How are you?"

"Awful."

"Good." [laughter]

When you get an answer like that, it is much more polite to say, "Thank you."

Do you know, the funny part of it is even in social concourse, the fellow will feel better if you handled it that way. He told you how he felt, so give him the cheery ack, man – the cheery ack.

All right. Now let's take the auditing question. Now here's where auditors tie themselves, not just into knots, but double carrick bends, bowlines on a bight and other unlikely cask hitches, and so forth.

We're doing rudiments. We say, "Do you have a present time problem?"

"Yes."

"Well, what is it?"

Flunk, flunk, flunk, flunk! He answered our question. So therefore there's something a little bit phony with the question. See, that question is not the perfect auditing question. Because it isn't perfect, it leads us into a Q and A.

Now the best question, of course, would [be] one which would require him to tell us. So you would have to add to it, "and if so, tell me what it is." [laughter, laughs]

You don't always run into this problem, but the proper non Q-and-A response is "Do you have a present time problem?"

Pc says, "Yes."

You say, "Thank you. I will check it on the meter."

So, therefore, the slightly offbeat question leads us into an inevitability of a Q and A because we would be prompted to say, "Do you have a present time problem?"

"Yes."

And the auditor would be prompted to say, "Yeah, well, what is it?"

Hey! Wait a minute. The guy did answer your auditing question. Your answer – I mean, question – is "Do you have a present time problem?"

You cut his comm, it'll throw him out of session; you've thrown the remaining rudiments out, don't you see?

The trick of keeping rudiments in is not throwing the others out while you're getting one in. And in view of the fact that there are more you are not working than the one you are working, [laughter] the probability of your doing this is great if you don't know this rule about the perfect auditing question and what a Q and A is.

You can throw these things out wildly if you don't. Now, auditing is of course, is what you get away with and you don't run into this *in extremis*. Most times it goes off just fine.

You say, "Do you have a present time problem?"

And the fellow says, "Yes. I had a fight last night with my auditor."

Your proper response to that is, "Good," or "Thank you." The Q-and-A response would be "What about?"

And that just throws the comm straight out the window, you see, because it's an incomplete cycle; you have not bought the pc's communication; the pc will go out of session and rudiments start shedding out of the session like a white dog when you're wearing a blue suit.

There you are. You've had it, don't you see?

Now, auditors do these others such as changing because the pc changes. An auditor who does this constantly, after it's been called to his attention, just should be shot. I mean there is no other cure for it. I see them keep it up, you know? Actually, it tokens tremendous impatience. That is all.

This auditor is so anxious to do something for this pc that he's got to do it all in the next ten seconds. And therefore, he won't even run the full bracket. See, he'll do something like this. Actually, he's trying to help the pc like mad, usually. "Think of a problem you could confront. Think of a problem you could confront. Think – how are you getting along on that process? Think of a problem you could confront. Think of a prob--- how are you getting

along? Do you have problems now? You Clear yet?" [laughter] "Oh, well, we'll have to do something else. Let's see. Invent a problem. Invent a problem. That's best. How you doing? You Clear yet? Well, maybe we shouldn't be running Problems at all. Uh – let's – let's get down to something more fundamental. You used to talk about your mother an awful lot – uh – let's see. Now – uh, what has your mother done to you? Thank you. What has your mother done to you? Thank you. What has your mother done to you? Thank you. What has your mother done to you? Thank you. We don't seem to be getting anyplace here. What has your mother done to you? Ah, well, let's skip that."

Do you know auditors actually have done this? I'm not just joking on something that has never existed. You see it less commonly that way. More commonly, they will change from session to session. They won't flatten what they did in the last session because it's much better what they thought of today, you see?

So that type of thing – the auditor just simply needs training, but basically needs some confidence.

This auditor will also go off into extraordinary solutions very easily because he doesn't have any confidence in the ordinary doing anything because he's never done it.

And as far as following the pc's instructions again, you get a pc who is blasty, who is upset, who is misemotional, and so forth, and a lot of auditors just back out of it. And then they will do what the pc wants them to do. And it just about kills the pc. That's the usual source of that.

We're not worrying about that right now, however, we're worrying about this most basic and fundamental Q and A for which we do have an immediate and direct cure.

The first cure is always ask the right auditing question. The right auditing question is one which prohibits a Q and A.

There is no perfect right auditing question. You actually can get along with relatively sloppy ones like, "Do you have a present time problem?" Nobody has ever run into this so seriously on the present time problems.

"Yes," the pc says.

But it's a bad auditing question because it can be replied to so that you have to say, "Well, what is it? Heh-heh." Of course, that's a Q and A. The pc answered it, and now you pretend that the pc hasn't answered it. But the pc did answer it. Well, the pc gets the idea that he hasn't answered it, so there, if he hasn't answered it – you don't think he's answered it – then he knows what position he's in. He knows he's not in-session because the auditor didn't hear him. So therefore he must be withholding, so therefore he must be a missed withhold.

And if he's a missed withhold, then the thing for him to be is mad at the auditor. Very logical. But you'll find out that that is one hundred percent just like that. The exact mental response of one hundred percent of your pcs, no matter whether they look nice about it or look happy about it or anything else, that is the response of every pc who sits in front of you.

If you want to drive ... Take the mildest, best, goodest, most educated pc you ever had anything to do with; pc's never really been in-session; he just – sort of socially answers, re-

sponses, you see, and tries to be nice about the whole thing; and you never really get a bite on his case; and he's always sitting there in a very quiet, charming, nice – never makes any changes. You ever see this pc? Pc exists.

Take this perfect pc who never has any changes and just start this racket on this pc.

"Do you have a present time problem? Have you ever had a present time problem in your whole life? Yes, I know, but yes," you say, "Yes, I know, but have you ever had a problem in your whole life?"

The pc answers something. You say, "Well but – now look, look, look, look, listen now. In your whole life have you ever had a problem?" See?

And the pc says, "Well, yes, I – I – I had appendicitis and – and uh – and – so – so forth."

And you say, "Uh – now look, I'm talking to you. Do you have – you, see? Have – have *you*, you – right there, you know? Have you ever had a problem in your whole life? I – I want – I want you to tell me now."

And the pc, "If – I – yeah, my back's out and they gave me something."

"When are you going to tell me? Now just own up to it. A problem?" And listen, you keep up some kind of a racket like that – you could make it more flagrant than that – and do you know, you think a pc is peculiar who screams. You think this is a certain type of pc. Well, I assure you that that is not a type of pc – that's a type of auditor. Because you can drive that good pc, that perfectly educated pc, you can drive them absolutely into a screaming funk that you have just never heard the like of. You would just never dream that a human being can be that upset. And you can do it to every pc you audit.

And when this is done too much to a pc; when it's done at the wrong moments; when processes are also changed on the pc too often and when the pc is also giving auditing directions which have been accepted, and let's composite the whole thing, you see? We get somebody – all you have to do is look like you haven't received the question and thereafter the guy will start screaming – just look like you haven't heard him. You know? Be looking at the window when he speaks. You were going to come in right afterwards and say, "Yeah. All right. Thank you." you were going to do that, but you just paused for just a split second, and he saw that you were looking at the window and he'll start screaming.

"God damn you. You ought to go back to the Academy and, Jesus Christ, whoever the hell told you you were an auditor? For Christ's sake!" That's it.

In other words, you the auditor, can create that state of mind. You can create that situation much more easily than baking a birthday cake.

Now, I'm not talking now – because I myself a few times have been driven into "Christ almighty!" you know? I think poor Philip one day – I only did once – he missed fifteen or twenty. And the next thing you know, he – going like this because I had said a couple of very mean things – which of course I didn't mean – but the guy had just ... I'm not always a good pc or a bad pc, but just all of a sudden the no acknowledgment, the no acknowledgment, the no acceptance of the answer, something like that, and you sit there in amazement.

You sit back here – I've got a good reality on it and you say, "What the hell?" You know? You're saying, "For Christ's sakes, why don't you get your mind on it?" You know? And you sit back and look at yourself, "Did I say that? Huh? Was that me? Who was that? Did I hear some noise in here?" Because you're in the irresponsibility, of course, of being a pc, and you just react.

I did it to a pc, almost with malice, one time, but actually not on purpose. And that was when I learned exactly what the mechanism of it was. I had to look at exactly what had been going on. And I analyzed it and then I turned around and I did it again and brought the same response.

Now, I've taken other pcs and I can start up the same response. And then I analyze any situation where that is occurring and I find the same response. *That is it*, man.

Of course, the pc will go into apathy, go into a complete funk.

Now, there is an extreme action of questioning the pc's answer. That is the extreme response on the part of the pc to not receiving the pc's answer, because of course the pc thinks he's withholding.

And that's the whole mechanism – his replies have been missed. So therefore, he is a missed withhold. And he gets upset! Just as you'll find missed withholds works on everybody, so this mechanism will upset any pc.

But now look, look. Now listen to me very carefully. Do we have to produce the extreme state of screaming, of apathy, of making the pc ill, to have it in effect? I mean is there anything short of the extreme state? Oh, yes, yes. There is a twilight zone of in-session and out of session caused by the almost not-responded-to answer, the occasionally not-acknowledged reply by the pc. This sort of thing causes a borderline of not being out of session totally and not being in-session, but just being in a condition where all the rest of the rudiments keep going out all the time.

Everything is sort of flying out, and you're sort of keeping the pc in session, you know, just – just by gripping the table edge with your fingernails, you know? It's just barely keeping the pc in-session.

What's the answer to it? Don't Q-and-A. The pc says something – acknowledge it. Well, how can you keep from Q-and-Aing? Always ask the right auditing question. Of course, that is impossible to bat one thousand on the right auditing question, so therefore, make up your mind whether you're occasionally going to accept some nonsense from the pc, or drive the pc into an ARC break. And, actually, if you ask the wrong auditing question, you are honor bound to buy the nonsense.

But what if the nonsense throws out the end rudiments? Then you've worsened the case. Then you have to get the end rudiments in. Now, we've got some kind of a chain reaction going.

You ask the wrong auditing question; you cannot directly acknowledge the question because it isn't the kind of answer that you want or is a damaging answer to the pc, so this throws out the end rudiments. Therefore, you have to get the end rudiments in in order to get

this other rudiment in, and so forth. And then you ask this same question again, but of course, the pc gives you the wrong response which throws it – look at the chain reaction here. And that pc will not be in-session.

That is the only thing you can say about that – pc won't be in-session.

The pc will be half, three-quarters out of session all the time, all the time, all the time. Tone arm action is out and so forth. And then you have to become an absolute expert at putting middle rudiments in. Oh, you even develop systems sometimes to keep your middle rudiments in and you get very arduous. And it all stems back to the wrong auditing question in the first place, which forces you into a Q and A. You say, "Do you have a present time problem?" He says, "Yes."

You say, "Well, what about?"

What's this? You know? So you've already driven it a little bit up the wall, see? The exact right response is, "Do you have a present time problem?"

"Yes."

"Thank you. I will check it on the meter."

Now, for Christ's sakes, if you will pardon my French, don't ask him this again. See, if this is where we are going to get with this particular question, we had better ask a question which is far more intelligent, because there is an old, old datum that comes forward from 1950. And that is you can ask an auditing question once or twice without restimulating the pc.

You can always ask any process once or twice – even three times. But when you get up to three times, you're on the border of – now, you've got to flatten it from there on, see? Do you see what I mean?

So you can always ask a question, take the answer – it laid an egg. Well, let's sort out what would be the proper question here, now, and ask that question, get the answer to that and acknowledge it. But we'll do the pc far less damage if we do it that way. Far, far less damage if we do it that way than if we shift in midflight and Q-and-A.

"Do you have a present time problem?"

"Yes."

"Well, what is it about?" Oh, God, we've had it now. We've done a Q and A. Pc will go just that far out of session. Inevitably, although he looks – he still looks the same – you don't see it, it doesn't get written on his forehead in letters of fire – he has still done it. An invariable rule because it busts up the comm formula and does a lot of other things.

All right. So how do we approach this problem? We ask a question and if it obviously is the wrong question to ask and doesn't produce the answer, we back out of the same door we went in, gracefully, by completing the cycle of action always. You're always safer to complete the cycle of action.

Now, there's several other things you could do. You could do an interim: "I am not asking you questions. I am trying to find out what the responses are on this meter," like you have to do in Prepchecking You say, "All right now. You don't have to answer any of these,

but I'm going to ask you several little What questions about this thing and see what the best reaction we get now."

"Now, well, what about stealing vehicles? What about killing girlfriends? What about – whatever it is – yeah, well, what about stealing vehicles? Thank you. I got the What question now. All right. Now let's go back to this incident which you just had there. Good."

And we just prepcheck it. You see, there's a fumble period. I suppose you couldn't dignify it any more than call it a fumble period.

You ask a middle rudiment. Here's an example.

"In this session have I missed a withhold on you?" Cheerily, cheerily, cheerily. See, very happy – perfectly legitimate. You get away with it eighty-nine percent of the time. Oh, more than that – you'll probably get away with it ninety-five and a half percent of the time, you see? And it's those other few percent there and you run into that one head-on, see?

"Yes, I've been sitting here thinking what a rotten auditor you are. And how mean all the Instructors are to me."

And now, of course, you say, "Thank you. I will check that on the meter. In this session have I missed a withhold on you?" *Clank! Whew!* Now you see, right there you've had it, see? You know you're walking through the valley of death. You're walking down the street at sunset – let me put it that way – with Black Bart in town.

This is a deadly activity in which you are involved. So you say, "All right. Thank you very much. Now have I missed a withhold on you in this session?"

"Yes. I think you're giving me a bunch of no auditing. You know, I've had twenty auditors since I've been here, and you're the rottenest of the lot." [laughter]

Damage, half-truths, untruths. See, we're just compounding this felony, see, madly. So you say, "Good. Thank you. Have I missed a withhold – in this session have I missed a withhold on you?" How far can it go?

Well, you can not only take in all the end rudiments, you can also take in all the beginning rudiments. You can get them all out. See, that's the auditor's dilemma. Well, you're asking the wrong auditing question. So it is much safer to do it this way.

Oh, yeah, inevitably you will use something like: "In this session have I missed a withhold on you?" for the excellent reason it lets him tell you the "thinks" and the other things. And you don't want to prepcheck this guy and go back and find all the things he has *done* to you because he hasn't done anything really in the session.

He did something this morning that you missed in the beginning rudiments, and so forth and et cetera, *ad nauseam*. Yeah, all those things are true. But you'll ask something like this, you see? And most of the time you get away with it. So you say, "In this session have I missed a withhold on you?"

"No." *Clank!*

"Thank you. I will check that on the meter. In this session have I missed a withhold on you?" *Clank!* And what are we going to do? Well, you just enter a fishing or fumble period.

That is what you do. I've been trying to work out this data to a something-or-other and I have a package question which serves as a middle rudiments. "In this session..." I won't give you this package question. You'll start writing it down. But it'd be something like this: "In this session have you withheld, invalidated or suppressed any datum about listing, or anything about listing?" Do you understand?

I'm talking about just giving you an example of a package question. And you can name each one of these things as you go by, and you'll get the *fall*, you see? And you watch for the one that falls. That's very smooth. Otherwise, you're left in a fish and fumble period.

But, I don't care how perfect you make auditing, you'll still have fish and fumble periods. You say, "Well, just – just a minute. Let me check this over on the meter. Withhold, invalidation, suppression, untruth, half-truth, impression, impress, damage, command and a wrong command – haven't answered a command – meter. Meter. In this session, have I failed to find out something you were doing about a meter?" *Clang!*

And he says, "Eh – well, yes. Ha-ha – thanks. Ha-ha, ha-ha. Yeah, haha – I'm sitting here fiddling the cans so that you – so you'd get the goal 'to have more women' because I always get such a bang out of running heh-ha – that kind of a stuff, you know?" [laughter]

And you say, "Well, thank you. Thank you very much. I'll check that on the meter. Good. In this session have you tried to influence the meter?" whatever it is. "That's clean."

In other words, there's the fish and fumble period. You actually sort of run a little assessment so you could have a package question in the middle rudiments which would run a nice assessment for you. But if it were too long, you'd get lost.

Now if you're going to have such a package question, remember you're going to have to repeat it, so it had better be fairly standardized.

I'm telling you in this lecture how you figure these things out rather than giving you a bunch of pat data, you understand?

Now, there will always be a fish and fumble period in Prepchecking as far as I can figure it out. Otherwise, for the sake of smoothness and gallantry, you're throwing away efficiency. You're just discarding the possibility of getting the right What question.

You sit there and look at Mr. Meter and you say, "All right, let me test out a few questions here. Now what about throwing baseball bats at cops? What about throwing things at cops? What about doing things to cops? That's it. That's it. What about doing things to cops?"

"Now, you were just telling me about throwing a baseball bat at a cop. All right. When was that?" See, that's a fish and fumble period.

Well frankly, doing a list and nulling it is a fish and fumble period, isn't it? Well, there is always these areas in auditing when you're trying to find something out. And the mark of a good auditor is that he goes ahead and finds these things out without throwing the rudiments wildly out.

See, now you could go at this in such a way as to throw them wildly out. I'll give you an idea: "Well, this listing isn't going very well here, because I don't think you've given it very many right items for this particular list. They don't seem to really be the kind of item that

I would expect on this list. So this is sort of – of crude here, and although we've listed 1285 items on this particular list and we only have two items on these other three lists, I – I think – I think what I'd better do is figure out some better wording for the goal we found. And see whether or not we can't get this thing more adequately worded, because this thing doesn't show a sign of blowing and we have twelve hundred and fifty items, you see, all on this one list, you see, and it shows no signs of anything happening. So I think we ought to go about it that way. And if that's all right with you, why, we'll go back to the Goals Assessment. Now, What have I done to you in this session that you are upset about? Good. Good. What was that? Yeah. Oh, I didn't do that, you know, at the beginning of the session."

Well, I think by the time you had done all that, you would have the pc ready for his – to be measured for his straightjacket. Particularly, is that type of auditing would have gradually led up with 825 withholds to the cubic withhold. That'd be very corny, wouldn't it. But the funny part of it is you can do some mighty wild, offbeat things in an auditing session if you do them very smoothly, particularly if they are in the guise of letting you find out where you're going, without giving the pc a bunch of missed withholds or making the pc withhold madly.

And the only thing you've got to avoid is committing yourself to a cycle of action you can't complete. And if you commit yourself to a cycle of action you can't complete, of course, you've had it. I'll give you the crudest, oldest example: "What has your boss done to you? Thank you. What has your boss done to you? Thank you. What has your boss done to you? Thank you. What has your boss done to you? Thank you. What has your boss done to you? Thank you. What has your boss done to you? What's the matter with you?"

See, that has committed you to a cycle you dare not complete. I'll give you another old-time process: "Mock up some unconsciousness. Thank you. Mock up some unconsciousness. Thank you. We'll get you over being unconscious all the time. Mock up some unconsciousness. Thank you. Mock up some unconsciousness. Thank you. Mock up some unconsciousness. Thank you. What's the matter with you?"

In other words, that's committing yourself to a line of action you can't complete. Well, recognize that a question which lets the pc answer as a motivator in the middle rudiment is something you actually can't satisfactorily complete. It's all going to be astray. Something like this:

You're going to say, "In this session have I missed a withhold, on you?"

"Yes."

See, you sit there like an idiot, man.

Now, the wrong way to weight the thing is to throw it over onto a Q and A. That is always wrong, no matter what you do – it is always wrong. Let that be your guiding principle.

So you say, "Good. Thank you. I will check this on the meter. In this session have I missed a withhold on you? That's dirty as a dishrag. Thank you very much."

"Now, in this session have you been up to something I didn't latch onto?"

He says, "Yes." [laughter]

"All right. Good. Thank you. I will check the meter on that. In this session have you been up to something I didn't latch onto? That's dirty. Thank you." Let's see now.

All right. "Ah, what have you been up to that I didn't find out about?" [laughter] "Ooooooh! All right. Good. I will check that on the meter. What have you been up to that I didn't find out about? Thank you. That's clean."

See, the mistake you make is always beginning a cycle which you feel would be very unsatisfactory to complete. But the big mistake – the big mistake would be failing to complete a cycle you started.

Don't kid yourself. You're going to find yourself in an old bunch of Western tales by old Charlie Russell, the Western painter. He had an old plainsman named Bab, and Bab was talking about the time he was being chased by the Sioux Indians and he got into a canyon. And there was 10,000 Sioux came boiling in through the front of the canyon, you know filling it up to wall to wall. He kept backing up further and further into the canyon. He finally looks around over his shoulder and it's a box canyon; it's totally cleaned off. And old Bab sits back and relaxes and doesn't go on with the story until somebody prompts him and says, "Well, Bab, what the hell happened?"

"Oh," he said, "they killed me." That's where you're going to find yourself someday – back up that box canyon. There's no way out of it.

Well let me tell you. The way you never get out of it is with a Q and A. You just never get out of it with a Q and A. Ask the right auditing question, is the way to prevent Q and A.

And it's all right for you to sit there and tell me, "All right Ron, go on, invent the exact, perfect wording that always keeps us from never getting into a Q-and-A situation." I don't know. I don't speak Chinese. I couldn't invent it in Chinese, so why do you demand I invent it in English.

Now, the joke of the thing is that I can give you a good approximation; I can give you a good code situation; I can give you something that is probably completely embracive about the thing.

Well let me tell you. Someday or another, you're going to run into somebody who is doing something weird, because pcs can invent them faster than you can cure them up, man. And you had better know the principles back of the auditing command – "the perfect auditing command," (quote) (unquote) – as well as the command itself, because you'll find yourself in a situation where the perfect auditing command doesn't pull the withhold.

And you say, where am I at? Well, you're at a position where you have to develop an auditing command which does get the pc to give you whatever the pc is doing, and which gives you at once the only real mistake that you can make – which is to fail to complete the cycle of action and to do a Q and A. If you Q-and-A at that point, why, you've lost that much of the pc in the session.

Now, you don't always notice that a pc has gone out of session because they sometimes drift out of session little by little, tiny by tiny by tiny. And the total aggregate of it is, is

the guy is miles out of session, but he's gone on such a gradient scale, hardly anybody noticed.

It's like the prisoner that escaped from the jail. Just everyday they were supposed to be sitting on their bunks at the last inspection. And every night when the guard came by – this was an actual escape, by the way, from Alcatraz of all places – the prisoner was an inch closer to the door. And he gradually built it up so that the guard got so used to that, that he had a prisoner actually standing at the door at the time when the last inspection was made, do you see?

And finally, the prisoner was able to stand at the door and keep the automatic lock from going shut, opened the door and walked out and swam to San Francisco. I think they elected him mayor. Anyway ... [laughter]

A pc can drift out of session; you should know what he's drifting on. He's drifting on his feeling he cannot communicate to the auditor. That is what he's drifting out of session on. And the way to throw somebody wildly and almost permanently out of session is just lower the bars on him to prove to him conclusively and forever and aye, from there on out, that he will never be able to communicate to the auditor or he will never be able to tell any of his withholds.

You start punishing somebody for getting off their withholds and you produce this immediate and direct result. The fellow feels then he can never be audited. Why? That is – you see, you're dealing with the actual machinery of a mind. You're dealing with the actual responses of the mind. We're not playing with kid's stuff here, you see? We're not playing with psychology or psychiatry or other dirty words, you see? We're actually functioning right straight on the middle buttons of the mind. And that is communication, withholds, missing withholds, that sort of thing. And the person will stay in there and pitch, and do almost anything under the sun, moon and stars, for an auditor that he can communicate to. He'll almost take anything off of an auditor he can communicate to.

You see me run a session someday that looks awful rough to you and you wonder, "How in the name of God is that pc still in-session?" If you thought emotion, misemotion, argument, things of this character, if you thought these threw people out of session and if you thought that being kind and sweet and good as an auditor keeps somebody in-session, you should watch a good, knockdown-drag-out session, by somebody who knows better than to miss a withhold. And that is a pretty fantastic session.

I've done this, you see? I've asked an auditing question. The pc doesn't speak Chinese, the pc speaks English. I've asked an auditing question and I demand that that auditing question be answered – and go on and on demanding it be answered.

See, the pc's trying to answer some other question, and just never permit the cycle to shift in any other direction than to a perfect completion of the answer of that auditing question.

Cheer the pc up. Say, "Yes, yes, you can talk to me about any of those things. That's fine. I'm glad to hear about that. Fine." And so forth. "But I asked you if you'd ever seen a rat. And you keep talking to me about hats."

The pc will even come up scale on something like that. He'll say, "What the hell do you know? This guy listens to me. You know, he listens. That's true. I did talk to him about hats. He asked me if I'd ever seen a rat and I said – I said girls in their teens wear thick hats. I did – I said that, and he heard it. But I heard him and therefore I ought to tell him whether or not I've seen a rat. And I can tell him that because he'll listen. Proves it because he knows that I didn't answer the question."

"Yeah, I've seen a rat!"

There, that pc would be in-session, come out the other end smiling. My God, you would have thought for half an hour there was nothing but a confounded dogfight going on in the room. That was because the perfect communication cycle was always insisted upon, that the answer to the auditing question was given. But you have to be very, very smart, and hear your own questions because the pc very often answers your auditing question.

And when you don't hear that exact answer and don't realize it's an exact answer and you refute it, well, you've had it.

But by permitting him to answer something else beside the question asked, you also throw the rudiments out. And that's not a Q and A. "I'll repeat the auditing question. What have you done, done, done, done? Not what have you thought about doing. I asked you something you've done."

"Oh, oh, oh, oh yeah. You did, didn't you?" Guy listens. Good auditor.

Funny part of it is that the cycle, the completed cycle of action, must take place. The cycle of communication must occur. It must go all the way through, but only on the subject which the auditor has introduced, otherwise, it's a complete miscontrol and it isn't a response to what was asked.

So if you think you can sit there and be kind, and you say, "Well, have you ever seen any rats?"

And the pc says, "Yes, I've seen – a lot of girls wear thick hats." And you say, "Well, good." Because Ron always said that you mustn't Q-and-A and you have to accept the pc's response.

Don't be surprised if at the end of a half an hour of doing this kind of thing your pc is not in-session, because the withhold in this case you have created and the withhold is the right answer to your auditing question. Here is – this thing falls on both sides of the fence.

So therefore, there is a thing called control, there is a thing called the right answer, and so forth. So you must ask a question – this is the rest of it – you must ask a question that can be answered and then complete that cycle of action of getting that question that you asked answered. And don't buy any other answers.

And if you do that smoothly, man, pcs will just do almost anything for you, including go Clear. But you see where the tightrope walk is, is how do you keep the pc in-session while not permitting the pc to give you the wrong answer to the auditing question. Well, you have to be smart enough to know when he has given you the right answer; and when he has given you the right answer that you buy it and you don't challenge him.

And I'll say this at least once. You're going to find yourself sitting there gaping. The pc is absolutely right. He has answered the auditing question and you have developed the whole thing into a dogfight.

And you said, "Do you have a present time problem?"

And the pc said, "Yes."

You know, that kind of a situation, but it'll be in some other guise.

You'll be prepchecking somebody and you'll say, "Well, did you ever really know your mother?" Why you asked that, God knows, you see?

And the pc says, "Well, I – actually, actually, I don't know."

Well the question is, did the pc answer the cycle? Is it part of the cycle? Is that a right answer? And you go up in smoke and then you finally look back at your question and you realize that he's given you the only possible answer he could give you under the circumstances. And that is the answer to the auditing question and you're the one who has thrown him out of session.

There is two ways, now, he can go out of session: One, is you "complete the cycle of action," (quote) (unquote), or the cycle of communication on a wrong answer, because the right answer is now a missed withhold. Or you failed to complete the cycle of action on a right answer and, of course, now the right answer is a missed withhold. Now, that is the tight-rope walk which you walk, and you should know exactly what you're doing with an auditing question.

Now, when you see a session running off the rails, when you see a session doing peculiar and odd and strange things and the pc doesn't look right with your auditing, don't look at the pc as a peculiar ape. Don't develop that. And neither develop a good communistic self-criticism. Don't develop that either.

Just look at the questions which you're asking in a session and ask it to yourself if they are answerable by this pc and if you are accepting the right answers that the pc gives you here. Just look at the whole thing on a cycle of action on a communication line. See, a cycle of communication. Is it complete? Have you asked a question? Has the pc answered the question? Have you then responded in such a way as the pc knew you answered the question? And have you straightened out what you were trying to straighten out? Well, if you've done all those things and so forth right, and the pc is getting worse, then I'll let you in on something – something very, very tremendous. It must be his environment that is caving him in.

Now, the way – the way it goes – the way it goes... What you've got to reconcile yourself to is your pc drifts out of session, something is going wrong. Yes, you're doing something that is failing to complete that communication cycle. You're doing something that appears to – a Q and A – doing something like this.

Could be in your earliest sessions the pc – that you've inherited a pc, of course, that has been mucked up with this kind of thing. And you have to straighten out the pc's communication cycle and that sort of thing. But if you have to go on straightening out a pc's communication cycle, if you have to go on patching the pc up, if you have to go on crowding him in-

session, session after session, and if you have to go on sweating blood over this pc, look at your own wording and your auditing and this lecture and you will have the answer. You'll be able to analyze it.

It's a very ordinary thing to analyze. I mean it's a very easy thing to analyze. The funny part of it is, it'll be as crazy when you finally see what you are doing as this business of "Since the last time I audited you, have I missed a withhold on you?" And it isn't quite a question, don't you see?

So that has been followed by this, that and the other thing and lifted out, and then one day, all of a sudden, you get the right question. And the right question is "Since the last time I audited you, have you done anything that you are withholding?"

And the pc says, "*Brrrrrrrrrrrrrrzzzzzzzzzz*," and so on and so on.

And you say, "My God, my God, my God."

Well, remember something, there is every period between session has been missed. You've walked into a lousy auditing situation then, you see? My God. Ghastly things staring you in the face. It's always going to be coming back up and should be prepchecked. So you have to prepcheck some rudiments. You see that?

Mark my words, it'll be something like that. It'll be something the auditor is doing that the pc cannot respond on and the auditor isn't finishing the cycle with or can't finish the cycle with.

And if you get that down pat, you'll be able to analyze your own auditing, you'll be able to analyze auditing in general, you'll be able to tell why pcs are improving or not improving.

Only thing TRs do is get you to improve your skill in handling these things so you're not taken by sudden surprise and so forth. So that these responses are very usual and natural. But I always think it's best to know the principles underlying these natural responses, and there are some very solid ones.

Okay?

Audience: Yes.

Thank you. Thank you for staying over.

TV DEMO: CHECK ON "WHAT" QUESTIONS AND HAVINGNESS PROBE

An auditing demonstration given on 23 May 1962

We had an auditor given a list of five or six end rudiment-type Zero Questions to clean and every one of them was wildly alive at the end of the so-called session. Of course, the auditor is off auditing until he knows something about this.

We had this trouble last September very bad. And that trouble consisted of people not thinking it was important to clean an E-Meter or people skimping over it or people just not able to read an E-Meter. And we had all this trouble in September, and there are a whole bunch of lectures on that subject as of about that period – having to lay it in with branding irons.

Now, we're going to lay it in with branding irons this time. We're going to start the thing this way: We're going to get rudiments checked by the auditors who are auditing, at the end of pcs' sessions; and then I'm going to ask the Auditing Supervisor to get one or two of those preclears after that auditing period and check *their* rudiments; and if their rudiments are found out, we put that auditor off auditing. I think that's only fair. I don't think you have a sufficient – that is, some of you, certainly – don't have a sufficient respect for the fact that you have to be able to read an E-Meter, that the E-Meter reads the pc and that it has to be cleaned up on a question.

And frankly, I'm very happy to find out about this. I'm more than delighted, because I've been looking at some of the gray faces that are creeping up and down the hall and let me tell you, I knew there was something awry here. And I've been nattering about it and talking with Mary Sue about it, and your Instructors, for some weeks now. And, finally, we find out what it is: it's one more plague of not being able to read the E-Meter. Now, that's quite what it is. It's just a gross auditing error.

The grossest auditing error there is, is no auditing. And next to that in rank is the inability to read the E-Meter. There are auditors which actually will believe the preclear but not the meter; they think the meter is registering something else.

Now, we've got to reverse that thing. You never believe the pc; you only believe the meter. We've got to get these things clean, and we'll get some auditing results going.

Now, these results have been very poor in the last few weeks and I have been blowing my brains out trying to figure out why. And now I find out why: you're not reading E-Meters.

So there's a push on. And the demonstration tonight is – well, first and foremost – just so an Instructor in each room can call out the meter reads for you. And I want you to notice that there is some coordination between the question I ask and the pc and the meter. I know it's very hard to connect these, but there actually *is* a coordination. And you don't leave that pc, you understand, with that acting, and that's it. That's it. That is auditing. I mean, if I could lay it with a branding iron I would. But that is what you are doing. That is your gross auditing error. This is why, when you list, you are not blowing people to Clear. This is the whole story. The pcs are not in-session. The listing does no good because the rudiments are out. I mean, the whole chain of evil proceeds from that particular point.

Now, actually, the first thing I'm going to do here is simply check some old What questions. Now, the story of this particular pc is that some Prepchecking was set up and then I noticed the pc wasn't looking so good. So I had another auditor check all the What questions in order to make sure they were flat. Now, it was reported to me that all these What questions that the pc had been asked were flat. And now, I haven't gone over this, but in a nasty, evil, suspicious mood – you know, all Rons have two faces; one is good and the other is horrible; you realize that – in that nasty, suspicious mood, we are simply going to check this. This is not going to take very long.

And then, after that, I'm going to give you a demonstration of fish and fumble. That's not even a technical term, but I'm just going to show you how you fish and fumble around – what you actually can do with an E-Meter. I'm not even going to give you a very stylized demonstration of a session; it's just what you can do with an E-Meter.

E-Meters work! Every once in a while people don't think they work. And when that happens, pcs look grim and gray, and nobody goes Clear. It happened last September. It's happened again here now.

So, okay. Now, I'm in no militant mood, particularly, about this. I simply want to drive it home with cannonballs. Okay?

All right. Here we go. Have you got the right folder here?

PC: *It's me.*

LRH: Yes, yes, yes. This is the right folder. All right. All right. Sit down. Now, don't faint and don't drop through the floor, Smokey, because ... Push it forward.

PC: *How did you guess?*

LRH: Pick up the cans. Now don't worry about it, because there's nothing very bad going to happen, it's not going to

take very long, and I'm not going to reveal *everything*.

PC: [laughs] *Well, it'd be all right.*

LRH: Yes, it would be, wouldn't it?

PC: *Yeah. He said the combination of the stairs and uh ... Gosh! Are you sure you want me?*

LRH: Hm?

PC: *You know?*

LRH: You didn't believe it.

PC: *No!*

LRH: Oh, I see.

PC: *I thought you wanted Wing. You know, sometimes you get our names mixed up.*

LRH: Yeah, I know I do. That's because he's the fire-eater, you know? I mean, he's the guy that goes to fires.

PC: *Yeah. Eat 'em up.*

LRH: Anyhow, honey, I'm not going to do this in Model Session. All I'm going to do here is simply check these What questions. And they are not very revelatory, but I want to see a few things are ...

PC: *Well, they're funny. There's one on there that's really a ball.*

LRH: All right.

PC: *Wait till you see it.*

LRH: Now, your ... Well, I'll tell you the history of this.

PC: *Hm-hm.*

LRH: I looked at you many weeks ago and I said, "She isn't doing so good." you see?

PC: *Hm-hm.*

LRH: So I said, "Who's been prepchecking her?" and so forth. And then I had an auditor recheck all these What questions ...

PC: *Hm-hm.*

LRH: ... just to make sure they were flat, you see? And then I took a look at you after he'd done so, and he said they were all flat.

PC: *Hm.*

LRH: See, he said they were all flat. Yeah. I don't believe it.

PC: *Well, I didn't.*

LRH: See, I just think he wasn't reading the E-Meter.

PC: *Hm.*

LRH: Now, that's beside the point. But let's get back here. Here's your old CCH sessions – rattlety-bang of paper.

PC: *Yeah. They're fun.*

LRH: Yeah. You had a lot of CCHs. Now ...

PC: *Wonder if that reads a heartbeat.*

LRH: We're just – I'm just examining your folder here, honey.

PC: *Okay.*

LRH: There we are. And I think here is the... here is this horrible one that you probably ... so forth.

PC: *That one.*

LRH: Not very bad.

PC: *It's not so horrible. It's just funny.*

LRH: All right, honey.

PC: *Mm-hm.*

LRH: Now, all I'm going to do is just check these questions. Okay?

PC: *All right.*

LRH: All right.

PC: *You mean I'm on there?*

LRH: Huh?

PC: *I'm on there?*

LRH: You're on there?

PC: *Yeah, I am on the meter over there?*

LRH: Oh, yeah. Your meter is functioning fine. Perfect.

PC: *That's good.*

LRH: Yeah. Working fine.

PC: *Terrible? Does it show my heartbeat? It's beating fast.*

LRH: Well, I'm not even going to try to put you at ease particularly.

PC: *No. I'm fine.*

LRH: All right.

PC: *Doing all right by my window.*

LRH: The question is, "What about undressing every time you went to the bathroom?" All right. Let me check that. What about undressing every time you went to the bathroom? All right. What about catching catfish?

PC: *You're reading my mind.*

LRH: No, I'm just trying to see what the needle pattern is here. What about catching catfish? What about catching catfish? What about ... I'm banging on something here, honey; I won't be able to check these things out. Tell me what it is.

PC: *Well, I just told you. My heart was beating fast.*

LRH: All right.

PC: *Oh.*

LRH: I didn't get that, huh? Was that it?

PC: *Well, I thought you did.*

LRH: All right. Now, let me ask this test question again. What about catch-

ing catfish? You're getting a little bippity-bop here on the heart all right.

PC: *Mm-hm. Well, is it – is it my eyes, too?*

LRH: But it's also my voice. No, no, no, it's not your eyes. What about your eyes? Go ahead, swing your eyeballs from the left to the right. Swing ...

PC: *Really?*

LRH: ...your eyeballs from the left to the right. All right. Swing them from the left to the right. Getting no significant read here. But there is something reading on this meter.

PC: *Oh.*

LRH: There is something ...

PC: *It must be me.*

LRH: ... reading on here. There must be some kind of a – I don't think it's you. Let's ...

PC: *I think it was checked up all right.*

LRH: Let me check this.

PC: *Um, um-um.*

LRH: Squeeze your cans.

PC: *All right.*

LRH: Squeeze your cans. No, it's just your havingness is out the bottom.

PC: *Yeah, that's true. I know.*

LRH: All right. What's your Havingness Process?

PC: *Oh saints, I don't know. The last one that was used was "touching things."*

LRH: Huh? Touching things.

PC: *Touch ... Yeah. Hm-hm.*

LRH: Anybody ever run reach on you?

PC: *No.*

LRH: Hm? Well, let's see if it works. All right. Squeeze the cans. Thank you. All right. Look around here and find something you could reach.

PC: *Oh, I can reach that chair.*

LRH: Good. Look around here and find something you could reach.

PC: *Oh, I could reach that couch.*

LRH: Good. Look around here and find something you could reach.

PC: *I could reach that picture.*

LRH: Good. Look around here and find something you could reach.

PC: *The curtain.*

LRH: All right. Squeeze the cans. All right. That's doing exactly nothing

PC: *Uh-uh.*

LRH: All right. Okay?

PC: *Okay.*

LRH: Put your cans down.

PC: *All right.*

LRH: All right. Thank you. Touch the table. Good. Touch the chair. Good. Touch the table. Good. Touch the chair. Good. Touch the table. Good. Touch the chair. All right. Pick up the cans. All right. Squeeze the cans. All right. Just hold them loosely.

PC: *Okay.*

LRH: That's all right.

PC: *They do kind of ... Oh, I guess I'm big.*

LRH: All right.

PC: *There, now.*

LRH: Squeeze the cans. All right. Apparently – may be doing something.

PC: *Mm-hm.*

LRH: Put the cans down. All right. Touch the table. Good. Touch the chair. Good. Touch the table. Good. Touch the chair. Good. Touch the table. Good. Touch the chair. Good. All right. Pick up the cans. All right. Squeeze them. All right. Hold them down in your lap ...

PC: *Okay.*

LRH: ... just like you were before.

PC: *Hm-hm.*

LRH: All right. Now, squeeze the cans. Okay. That's not your Havingness Process either.

PC: *Well, really, one hasn't been found on me.*

LRH: You have never had a Havingness Process found?

PC: *No. Sometimes "Point out something" works fairly fine. Sometimes "Look around here and find something you could have."*

LRH: Well, what's the variation?

PC: *Sometimes they work and sometimes they don't.*

LRH: Have you ever invalidated a Havingness Process?

PC: *Uh-uh. Oh, I like them.*

LRH: Hm? All right.

PC: *Oh, there was one I didn't like.*

LRH: What one?

PC: *Uh – "Something you could confront."*

LRH: Hm?

PC: *"Something you would rather not confront. Something you could confront."*

LRH: All right. Good. Thank you.

PC: *I invalidated that one.*

LRH: All right. Thank you very much. Squeeze the cans. All right. Thank you. All right. Here's the first command. Look around here and find something you could confront.

PC: *That camera.*

LRH: Good. Look around here and find something you'd rather not confront.

PC: *That thing up there in the corner.*

LRH: Okay. Good. Look around here and find something you could confront.

PC: *The fireplace.*

LRH: Good. Look around here and find something you'd rather not confront.

PC: *Uh – the binoculars.*

LRH: Good. Look around here and find something you could confront.

PC: *That uh – sign on the door.*

LRH: Good. Look around here and find something you'd rather not confront.

PC: *Those rings.*

LRH: All right. Okay. Squeeze the cans. Okay. Now, you've got a trick squeeze here.

PC: *Mm.*

LRH: Now, you just put them down in your lap ...

PC: *Mm.*

LRH: ... the back of your hands in your lap.

PC: *Nm-hm.*

LRH: All right. Now squeeze them.

PC: *Okay?*

LRH: Okay. Yeah. But you know, all I want is an even pressure down and up.

PC: *Hm-hm.*

LRH: You know? Just let them go. Do it again. Mm-hm.

PC: *This okay? Hm?*

LRH: Now, just hold them naturally.

PC: *Hm-hm. My hands are kind of hot.*

LRH: That's all right. Doesn't matter.

PC: *Okay.*

LRH: Now, squeeze the cans. All right. Let them go. All right, that's fine. All right. What do you think about this process?

PC: *Well, it's all right.*

LRH: Well, are you just saying that? What do you think about this process?

PC: *Well, I really could confront any of them, you see, that I see.*

LRH: Oh, I see. The whole thing is a bad answer, is that right?

PC: *Yeah. It is.*

LRH: I get it. All right. In other words, you could confront any of it?

PC: *Yeah.*

LRH: All right. And yet you're having to answer, so there's some missed auditing commands in that Havingness Process. Is that correct?

PC: *It's possible, yeah.*

LRH: Huh?

PC: *Because, really ...*

LRH: Possible?

PC: *...I could. Yes!*

LRH: Well, is ...

PC: *All right, it is.*

LRH: ... is it?

PC: *Yes!*

LRH: All right. Go on.

PC: *Because I could confront the things that I say I'd rather not. It's ...*

LRH: So you just had to make up answers for the "rather not"?

PC: *Hm-hm. Hm-hm.*

LRH: Well, that's very interesting. Very interesting

PC: *Mm.*

LRH: When was that?

PC: *Wow, it must have been in January.*

LRH: Quite a while ago?

PC: *Yeah. Quite a while ago. When I first got here. About ...*

LRH: All right. Okay.

PC: *... the second or third week, I think.*

LRH: Good. All right.

PC: *Hm-hm.*

LRH: Now, let's proceed with just the one side of it.

PC: *All right.*

LRH: All right. Look around here and find something you could confront.

PC: *That wall.*

LRH: Good. Look around here and find something you could confront.

PC: *You.*

LRH: Good. Look around here and find something you could confront.

PC: *Mirror.*

LRH: Good. Look around here and find something you could confront.

PC: *That chair.*

LRH: Good. Look around here and find something you could confront.

PC: *That camera.*

LRH: Good. Look around here and find something you could confront.

PC: *Curtain.*

LRH: Good. Look around here and find something you could confront.

PC: *The ashtray.*

LRH: Good. Look around here and find something you could confront.

PC: *That thing.*

LRH: All right. Now, squeeze the cans. All right. Now, something very funny happens here ...

PC: *Mm-hm.*

LRH: ...is the needle only comes halfway back. So, do you continue to grip the cans afterwards?

PC: *Well, now this is ... My hands kind of stick, you know? They're long and uh – the hands are a little bit wet ...*

LRH: All right.

PC: *... and so they cling.*

LRH: All right.

PC: *See?*

LRH: I see.

PC: *And...*

LRH: I get it.

PC: *And they stay.*

LRH: Uh-huh.

PC: *You see, they don't uh – uh – be like they were before.*

LRH: Mm-hm.

PC: *They really don't.*

LRH: All right. Put them in your lap. Now, just lay them just lay them down in your lap.

PC: *Okay.*

LRH: All right. Good enough. Squeeze them. Thank you. All right. Look around here and find something you could confront.

PC: *Uh – that thing, whatever it is.*

LRH: Good. Look around here and find something you could confront.

PC: *Uh – the whole line of shelves there.*

LRH: Good. Look around here and find something you could confront.

PC: *Uh – the top of that uh – curtain.*

LRH: All right. Good enough. Squeeze the cans. All right. That is reducing the amount of squeeze.

PC: *Hm. Really?*

LRH: Okay?

PC: *I feel better.*

LRH: Yeah, I know you probably do.

PC: *Mm.*

LRH: But that's basically because you got an invalidation off, huh? Isn't it? Or is it?

PC: *Mm.*

LRH: What is it?

PC: *Probably.*

LRH: Yeah. Do you feel better about that?

PC: *Yeah. Because I hadn't said that to anyone.*

LRH: All right. Good. Now let's try this other one.

PC: *Mm-hm.*

LRH: The one I started with originally.

PC: *All right.*

LRH: All right. Look around here and find something you could reach.

PC: *The couch.*

LRH: Good. Look around here and find something you could reach.

PC: *That door.*

LRH: Good. Look around here and find something you could reach.

PC: *The venetian blinds.*

LRH: Good. Look around here and find something you could reach.

PC: *The telephone.*

LRH: Good. Look around here and find something you could reach.

PC: *Uh – folder.*

LRH: Okay. Squeeze the cans. All right. Now, have I missed a withhold on you?

PC: *No.*

LRH: Ah, what did you just think of though?

PC: *I Just thought, my God, could he have? [laughs]*

LRH: All right. Okay.

PC: *But I think I've poured out all my ...*

LRH: Think you got all that taped, huh?

PC: *Yeah.*

LRH: All right. All right. Now, this needle has become quite quiet compared to what it was. But it seems to me just a little sticky.

PC: *Oh. My goodness.*

LRH: But it's become quite quiet.

PC: *Mm-hm.*

LRH: Now, have you become upset about anything?

PC: *Well, I'm always upset.*

LRH: Well, have you become upset about anything in the last minute or two?

PC: *Oh, no. Don't think so.*

LRH: What do you mean, you're always upset? Go on, finish what you were telling me.

PC: *Well – well, you see, this is on TV. And I – I feel really upset about it. But I feel better about it now. But, wow!*

LRH: It upset you?

PC: *Yes!*

LRH: All right. All right. Has anything bitten yet? Anything bitten you?

PC: *You mean here?*

LRH: The TV camera suddenly blown a fuse?

PC: *Not a thing. That's – that's what's amazing.*

LRH: All right. Okay. Well, go on now. You want to say anything more about that? How about it?

PC: *No. It – uh – it just doesn't seem like it was.*

LRH: Doesn't seem so bad.

PC: *Uh – I seem – uh-uh.*

LRH: What did you think might happen?

PC: *Well, you know, it looks different from – when you're here than it does down there.*

LRH: Doesn't it!

PC: *Yes.*

LRH: Oh, I see. Maybe you're running out some of the stuff that was ...

PC: *Uh – it's possible.*

LRH: ... left.

PC: *Oh, like I would – oh, like I was afraid that you were going to have me up here last week.*

LRH: Oh, yeah.

PC: *I breathed a sigh of relief I didn't even think of it this week.*

LRH: All right. You had a surprise.

PC: *Mm-hm.*

LRH: All right. Put your cans there in your lap.

PC: *In...*

LRH: Yeah. Just – don't – just hold them with your ...

PC: *All right.*

LRH: ... backs of your hands down. All right. Now, squeeze the cans. All right. We apparently are ... Do it again. Squeeze the cans. There's something real fluky here – what's happening I don't quite know what's going on, because this is not a proper can squeeze.

PC: *Uh-uh.*

LRH: It doesn't release. It simply falls and that's it.

PC: *Well, my hands do stick to the cans.*

LRH: Well now, are you giving a can squeeze because more skin touches the can? Bring your hands up here on the table. Let's see ...

PC: *Yes, I guess.*

LRH: ... what this is all about. Now, is that can fitted snugly down there?

PC: *Yeah.*

LRH: Huh?

PC: *Mm-hm.*

LRH: Now, I don't want more palm against the can. I just want ...

PC: *Oh, it's nice and fitting.*

LRH: Why don't you just squeeze it between there and there. Now, we're going – I'm going to squeeze it for you.

PC: *Oh, there.*

LRH: Oh, there!

PC: *All right.*

LRH: Yes, there's something going on here. All right. There's no can squeeze there at all. You're just pushing more ... Yes. You were just pushing more – I suppose that was invisible on the meter, but ... Go on, squeeze it between there and there like I showed you. Well, how do you like ...

PC: *I didn't feel the can squeeze.*

LRH: Yeah, so that's it. But you're – what you were doing before was wrapping more hand around the can.

PC: *Hm. Could be.*

LRH: Yeah. Well, then, it wasn't releasing.

PC: *No. It just stayed.*

LRH: That's all right. But that's because the only fall we were getting on you was because more skin is touching the can. Not because of ...

PC: *I'm a terrible – uh – I'm a terrible havingness case.*

LRH: Hm? Yes. This havingness thing is fascinating here.

PC: *Mm! Fascinates me, too.*

LRH: Well, what goes on here?

PC: *Low havingness perhaps.*

LRH: Yes! This I will agree with.

PC: *Mm-mm.*

LRH: But what's that?

PC: *Well, now ...*

LRH: What's your idea of this? Go ahead and tell me. Go on.

PC: *Well, you know, I don't have any idea of it at all. I just know that I did have a – a – a havingness thing. You see?*

LRH: Mm-hm.

PC: *Mm-hm. And I still do.*

LRH: Hm! How do you account for this?

PC: *I haven't the faintest idea. You know, people are like that.*

LRH: You know that ... All right. All right, honey. Okay. Well, this is an activity I didn't expect to get into here. Squeeze the cans like that again.

PC: *That's what I was afraid of, too, you see?*

LRH: Yeah, but that's all right.

PC: *All right.*

LRH: Squeeze the cans again. No, I mean it's a darn good thing I started checking up on this.

PC: *Why?*

LRH: Because if you'd ever had an auditor, he would have straightened it up.

PC: *Well, I've had a lot of auditors.*

LRH: I don't think so.

PC: *I've had six.*

LRH: Nobody has straightened up your Havingness Process.

PC: *Well, maybe I don't look like a havingness case. I mean, you know, I might not.*

LRH: I'm not invalidating your auditor. I wouldn't do that in a normal session. But you're not in a Model Session.

PC: *No.*

LRH: I was just slapping some people's ears. Put your cans down.

PC: *All right.*

LRH: All right.

PC: *My ears just got red.*

LRH: Come on, I wasn't slapping your ears; I was slapping their ears. Now, look-a-here. Touch your ears.

PC: *Hm-hm.*

LRH: Thank you. Touch the top of your head.

PC: *Hm-hm.*

LRH: Thank you. Touch your chest.

PC: *Ha!*

LRH: Good. Touch your stomach.

PC: *Yep.*

LRH: All right. Touch your shoulders. Good. Touch your stomach. Good. Touch the top of your head.

PC: *Hm-hm.*

LRH: Thank you. Good. Touch the end of your nose.

PC: *Hm-hm.*

LRH: Good. Touch your stomach. Good. Touch your shoulders. All right. Thank you. Pick up the cans. All right. Squeeze them.

PC: *Better?*

LRH: Do it again. That's all right. All right. Mm-hm!

PC: *Maybe I'm not very strong.*

LRH: Oh, that's all right. I'm not going to worry about this.

PC: *Hm.*

LRH: All right. Once more we're going to try out this reach thing.

PC: *All right.*

LRH: But we're going to try it out in negative.

PC: *All right.*

LRH: All right. Look around here and find something you aren't reaching.

PC: *That door.*

LRH: All right. Good enough. Look around here and find something you aren't reaching.

PC: *I'm not reaching the window.*

LRH: Good. Look around here and find something you aren't reaching.

PC: *Uh – that light switch.*

LRH: Good. Look around here and find something you aren't reaching.

PC: *The ceiling.*

LRH: Good. Look around here and find something you aren't reaching.

PC: *Oh, that weigher.*

LRH: All right. Now, how do you feel on this – for a minute?

PC: *All right.*

LRH: Does that make you feel strange?

PC: *Uh – no. I just started feeling here and it's sort of echoish.*

LRH: Oh, all right. Good. Squeeze the cans. Oh, I think it's a tiny bit increased.

PC: *Oh.*

LRH: Has it annoyed you?

PC: *My space is kind of small.*

LRH: Huh?

PC: *My space is kind of small.*

LRH: All right. But has it annoyed you that these Havingness Processes were all grab-out-at-something, grab-out-at-something, or something like that?

PC: *Uh – possibly.*

LRH: Well, has it or hasn't it? Don't try to be obliging, just tell me.

PC: *Well, it was uh ... Well, sometimes things would be too far away, yes. Hm-hm.*

LRH: And you sort of felt like you couldn't reach it. Well, answer this question: Have you ever failed to answer a Havingness command?

PC: *I don't think so.*

LRH: All right. I will check that. Have you ever failed to answer a Havingness command? I'm not getting a direct response on that.

PC: *Oh, I don't think I have failed to. I might have had difficulty answering them.*

LRH: All right. Let me check that ...

PC: *The last uh – time I ran uh – Notice – Notice! That was a good one....*

LRH: Yeah.

PC: *Uh – the auditor had me notice things that were small and close, you see? And that helped, to me.*

LRH: I see. All right. All right. Well, we got this ...

PC: *He started on a gradient scale, you know?*

LRH: All right.

PC: *It worked.*

LRH: Now, just for fun ...

PC: *Mm.*

LRH: ... let's run a few more of these negative commands.

PC: *All right.*

LRH: Okay?

PC: *I like them.*

LRH: Squeeze the cans. All right. Thank you. Look around here and find something you aren't reaching.

PC: *That nail.*

LRH: Good. Look around here and find something you aren't reaching.

PC: *That rug.*

LRH: Good. Look around here and find something you aren't reaching.

PC: *That chair.*

LRH: Good. Look around here and find something you aren't reaching.

PC: *The top of that uh – shelf.*

LRH: Good. All right. Squeeze the cans. All right. That's reducing the can swing ...

PC: *Oh. Well ...*

LRH: ... as you could expect it to. What?

PC: *I uh – almost said I wasn't reaching you but I found out I was, so I didn't.*

LRH: All right. Okay. You suppressed ...

PC: *Mm.*

LRH: All right. Okay. Now, let's now check out this Notice, hm?

PC: *All right.*

LRH: All right. Notice that ash-tray.

PC: *Mm-hm.*

LRH: Okay. Notice that wood.

PC: *Mm-hm.*

LRH: Good. Notice that telephone.

PC: *Mm-hm.*

LRH: Good. Notice that ceiling.

PC: *Mm-hm.*

LRH: Good. Notice that flower.

PC: *Yes.*

LRH: Good. Notice that necklace.

PC: *Mm-hm.*

LRH: Good. Notice that E-Meter.

PC: *Mm-hm.*

LRH: Good. Notice that lamp.

PC: *Yes.*

LRH: Good. Notice that button.

PC: *Mm-hm.*

LRH: Good. Notice that pencil.

PC: *Yeah.*

LRH: Good. Notice that pencil.

PC: *Mm-hm.*

LRH: Good. Thank you. Squeeze the cans. Well, it's possibly coming up just a little bit more.

PC: *Mm.*

LRH: Squeeze them again. All right. All right. I don't like the reaction of that ...

PC: *I'm ruining it.*

LRH: ... process particularly. Hm?

PC: *I'm ruining the demonstration.*

LRH: Are you worried about that?
I'm not ...

PC: *A little bit, yeah.*

LRH: ... worried about that. What are you worried about it for? Well, come on, what are you worried about it for?

PC: *Well, I just – I did.*

LRH: All right. Don't worry about that. No, I'm quite interested here. I'm quite interested here. I'm looking for a bug on the subject of havingness.

PC: *Mm.*

LRH: I'm looking for a bug of some kind or another ...

PC: *Yeah.*

LRH: ... on the subject of havingness. Here's the way you check into one of those things, for your own information.

PC: *Mm-hm.*

LRH: Have you ever failed to answer a Havingness command? I got a reaction that time.

PC: *Did you?*

LRH: You ever fail to answer a Havingness command? I got a reaction that time.

PC: *Hm. Um – I did once, but I answered it later, because I told him.*

LRH: All right. Okay.

PC: *Yeah.*

LRH: Thank you. Let me check that on the meter.

PC: *Hm-hm.*

LRH: Have you ever failed to answer a Havingness command? All right. You got a rather heavily swinging needle here. I'll have to check it again. Okay?

PC: *All right.*

LRH: Have you ever failed to answer a Havingness command? All right. That's clean.

PC: *Yeah. I usually try. I – I – I like that, you see? I like the havingness Processes.*

LRH: An right.

PC: *And uh ... I don't think I've failed to answer.*

LRH: Okay. Now, have you ever failed to find a Havingness Process on a pc?

PC: *I don't think so.*

LRH: Ouhh, man, we've got a nice fall here.

PC: *It scares me though to think about it.*

LRH: Yes. We've got a nice fall here.

PC: *Hm-hm.*

LRH: I'll ask that again. Have you ever failed to find a Havingness Process on a pc? There's something here.

PC: *Hm.*

LRH: That was ...

PC: *Let's see now.*

LRH: Well, what was that?

PC: *Hm.*

LRH: What's that? What are you thinking about right there? What's that?

PC: *Oh – oh, by-y-y-y golly, I got sidetracked there.*

LRH: What were you thinking about? You say you got sidetracked, but what did you think about at that point?

PC: *Yeah.*

LRH: Come on. That's it.

PC: *I'm sure I must have.*

LRH: Must have what?

PC: *Failed ... Oh...*

LRH: Yeah, go on. Have you ...

PC: *And...*

LRH: ... ever failed to find a Havingness Process on a pc? There's something in this.

PC: *Hm-hm.*

LRH: All right. What is it?

PC: *Well, I'm sure I did. You found it.*

LRH: All right. Thank you. I will check it.

PC: *Yeah.*

LRH: Have you ever failed to find a Havingness Process on a pc?

PC: *Yeah, I must have.*

LRH: That's latent now.

PC: *Yeah. Well, I'm sure I did.*

LRH: You're sure you did.

PC: *Yeah.*

LRH: Thank you. All right. Let me ask this question: What Havingness Process did you fail to find on a pc?

PC: *Goodness' sakes. Oh, it was a "Point out."*

LRH: Hm?

PC: *It was "Point out something," I think . .*

LRH: Hm-hm. All right.

PC: *... on someone.*

LRH: Thank you. Let me check that.

PC: *All right.*

LRH: What Havingness Process did you fail to find on a pc? Well, I got ...

PC: *It must have been "Point out something."*

LRH: I get a wobbly needle on that. What Havingness Process did you fail to find on a pc? I've got a reaction on that still.

PC: *Yeah.*

LRH: All right. Let me ask you this question ...

PC: *I uh – it was the thirty-six ones, I think.*

LRH: Hm?

PC: *You know, the thirty-six Presessions.*

LRH: Oh, yeah.

PC: *Yeah. That was what it was. Hm?*

LRH: Hm-hm. All right. Let me check that again. What Havingness Process did you fail to find on a pc? That's still live.

PC: *Still.*

LRH: What are you thinking about when you hit that?

PC: *Well, it – it was one where you have a can between. "Point out something."*

LRH: Mm-hm.

PC: *That was the one.*

LRH: All right. Let me ask you this question.

PC: *Mm-hm.*

LRH: What pc did you fail to find a Havingness Process on?

PC: *I think it was my son. I don't know.*

LRH: All right.

PC: *Seems like it must have been.*

LRH: There's a steep fall here.

PC: *Well, it must have been him. You know, undoubtedly.*

LRH: Why? Why undoubtedly? You don't remember this ...

PC: *Because that's the one I was thinking of.*

LRH: Oh, all right. All right. I'll check that.

PC: *Mm.*

LRH: What pc did you fail to find a Havingness Process on? All right, that's still dirty.

PC: *Still dirty.*

LRH: Not dirty, by the way, just falling.

PC: *Oh.*

LRH: It still reacts, however.

PC: *Hm-hm.*

LRH: Let me ask you the question again. Now what pc did you fail to find a Havingness Process on?

PC: *I guess that was Carl. Probably.*

LRH: Who?

PC: *Carl.*

LRH: Carl.

PC: *Hm-hm.*

LRH: All right. Okay.

PC: *Hm-hm.*

LRH: All right. Thank you. Let me check that. What pc did you fail to find a Havingness Process on? All right. That's clean.

PC: *No kidding. It was Carl. Hm!*

LRH: All right. All right.

PC: *That's true, too.*

LRH: It's true?

PC: *Yeah. That's the one.*

LRH: Hm? All right. Very good. All right. Squeeze the cans. All right. Now, let me ask something here out of my – just out of curiosity here.

PC: *Hm-hm.*

LRH: You were sort of waiting for the meter to tell you whether that was right or wrong. What was this all about? Didn't you really remember that yourself?

PC: *Not until I told it to you.*

LRH: Oh, yeah.

PC: *Not Carl.*

LRH: All right.

PC: *I knew there was someone, and the thirty-six Presessions and then this thing between the cans.*

LRH: All right. You do remember – you do remember doing this?

PC: *Yes.*

LRH: Yeah. All right.

PC: *Definitely.*

LRH: Good. All right. Let me check this once more to make sure we get out from underneath the thing.

PC: *Mm-hm.*

LRH: All right. What pc did you fail to find a Havingness Process on? I get nothing on that now.

PC: *Mm, it was Carl.*

LRH: All right. Okay. Now let's see what luck we have here.

PC: *All right.*

LRH: All right. Squeeze the cans. All right. Thank you. Look around here and find something you could reach.

PC: *That hanger.*

LRH: Good. Look around here and find something you could reach.

PC: *Uh – the couch.*

LRH: Good. Look around here and find something you could reach.

PC: *Uh – that uh – connecting thing.*

LRH: Good. Look around here and find something you could reach.

PC: *I could reach that camera.*

LRH: Good. Look around here and find something you could reach.

PC: *The camera holder.*

LRH: All right. Thank you. Okay. Squeeze the cans.

PC: *Did I do it right?*

LRH: Put those backs of your hands on the table here.

PC: *Hm-hm.*

LRH: Now put the backs of your hands – now, put your hands up to where I can get them here because I don't want to cover up the dial.

PC: *All right. There's my fingers.*

LRH: All right. Now just hold them relaxedly.

PC: *Mm.*

LRH: Man, there's certainly very little drop here, let me tell you, man. All right. Now, I'll tell you something

PC: *Hm-hm.*

LRH: I'll tell you something. Is there something that you consistently want that you can't have?

PC: *Sure.*

LRH: Well, what is it?

PC: *Uh – a lot of motion.*

LRH: Hm? A lot of ...

PC: *Motion.*

LRH: A lot of motion.

PC: *Mm-hm.*

LRH: And you don't think you can have this?

PC: *Uh-uh.*

LRH: Well, all right. All right. Okay. I get a little reaction on this.

PC: *Yeah.*

LRH: All right. Is there anything else you consistently want that you can't have?

PC: *No, I don't think so.*

LRH: All right.

PC: *Well, I'd like to be a – a real excellent auditor.*

LRH: All right.

PC: *That I would like. But, you know, that – that I can come to in my own slow way.*

LRH: All right. Now, let me ask you this question again just to check it on the meter. Okay?

PC: *Hm-hm.*

LRH: Is there anything you consistently want that you can't have? No, that's quiet now.

PC: *Yeah.*

LRH: It's sensitivity.

PC: *Just those two things.*

LRH: All right. I'll check it again. Is there anything you consistently want that you can't have? No, that's clean.

PC: *Mm-hm.*

LRH: All right. Very good. Okay, honey. Now, we're not going to fool with this anymore ...

PC: *Mm.*

LRH: ... as a Havingness Process. But I'm going to recommend that we just do a standard job now of trying to find a Havingness Process on you. Okay?

PC: *All right.*

LRH: Because I've taken a little bit of charge off this thing. And I've now got – whether we've got havingness or not – I still got – I've got now a rather quiet needle.

PC: *Mm-hm.*

LRH: This thing was going slam-ity-slam before.

PC: *I'm not surprised.*

LRH: Okay?

PC: *Yes.*

LRH: All right. Let me check these What questions now.

PC: *All right.*

LRH: All right?

PC: *Hm-hm.*

LRH: All right. What about undressing every time you went to the bathroom? All right. We're just doing a check on this. It's just – this thing is – there's something about this. What about it?

PC: *Well, I just think it's silly.*

LRH: All right. Okay.

PC: *You know, what an effect!*

LRH: Thank you. Let me check that again.

PC: *Mm-hm.*

LRH: What about undressing every time you went to the bathroom? All right. Thank you. That's still a little bit warm.

PC: *Is it?*

LRH: Mm-hm. All right, honey.

PC: *For goodness' sakes.*

LRH: Now, here's the next one. What about you acting rowdy? All right. That's an active question. Do you care to say anything there particularly?

PC: *No.*

LRH: All right. Thank you, honey. Well, what about withdrawing from people? Let me check that again.

PC: *All right.*

LRH: What about withdrawing from people? All right. That's ...

PC: *That one's all right.*

LRH: Apparently nothing on it very much.

PC: *Yeah. I think I undid that one real good.*

LRH: By the way, what overt was found that caused that to be asked as a What question?

PC: *Santa Maria!*

LRH: What overt was found? This is the question: What about withdrawing from people? I want to know what overt was found that led to that question being asked.

PC: *I haven't the faintest idea at this point.*

LRH: What might it have – I get a reaction here.

PC: *Yeah, because I'm supposed to know. I mean, I ...*

LRH: Well, do you remember any overt?

PC: *No, I don't remember.*

LRH: Did you ever have an overt on this?

PC: *Oh, yeah, I must have.*

LRH: You *must* have, but did you?

PC: *Yeah.*

LRH: All right.

PC: *Sure.*

LRH: Did you ever have an overt on this?

PC: *Mm, yeah. But I can't remember it.*

LRH: All right. Thank you. Thank you. All right. All right. Nothing wrong with this.

PC: *Yeah, I – I had a lot of them, really.*

LRH: You went over a lot of them with the auditor?

PC: *Yeah.*

LRH: Mm. What was the type of overt?

PC: *God...*

LRH: Go on, what was the type of overt?

PC: *Oh, withdrawing my support and stuff like that.*

LRH: Hm?

PC: *Withdrawing my support and uh ... Gosh, really, I don't really remember.*

LRH: Well, is that so? All right.

PC: *Yes, sir.*

LRH: Thank you.

PC: *Yes, sir.*

LRH: Thank you.

PC: *You're welcome.*

LRH: All right.

PC: *But it seemed terrible at the time, I'm sure.*

LRH: Mm-hm. All right. Okay, honey. All right, we've got "What about picking up a body?"

PC: *That's what I said at the time.*

LRH: All right. Very good. I'll check that on the meter again. What about picking up a body? Okay.

PC: *I didn't like that one.*

LRH: What about putting a body in storage?

PC: *Pretty terrible, huh?*

LRH: Hm?

PC: *Pretty terrible, huh?*

LRH: Oh, pretty grim. Well, what about it?

PC: *Yeah! Just think it used to be a good way to put them in, you know?*

LRH: All right.

PC: *Save them.*

LRH: Thank you.

PC: *No problem with me right now.*

LRH: All right. All right, here's one I find. I'm not going to go over all these.

PC: *I think Mary Sue had a list of the whole bunch on the front of it.*

LRH: On the front of something here, huh?

PC: *On the very first page.*

LRH: Hm?

PC: *Right on the very first page there. Yes!*

LRH: All right. I'll check a couple of more of these. What about invalidating a teacher? Anything you'd care to say?

PC: *Mm. Well, I only did it a couple of times.*

LRH: All right. Good. Now I'll ask that again. What about invalidating a teacher?

I'm not going to check any more: They're all hot, every one of them.

PC: *Good heavens.*

LRH: All right, honey. We'll arrange to get something flattened on here. Okay?

PC: *Except me.*

LRH: What about except you?

PC: *We'll not flatten me.*
[laughs]

LRH: Horrible remark.

PC: *I know.*

LRH: All right, honey. You don't want to be flattened, huh?

PC: *Uh-uh.*

LRH: That's a bad one, huh?

PC: *Yeah.*

LRH: All right. All right. Now, the only thing I'm going to put down here is "1. Find this pc's Hav Process and use it." And "2. Flatten all What questions on list." And "3. Withdraw both former auditors from auditing." There we are.

PC: *But I had six of them.*

LRH: Hm?

PC: *I had six of them!*

LRH: Good. It's just the last two. Just the last two. Okay?

PC: *Mm-hm.*

LRH: Because when I tell somebody to get something done, then I expect it to get done.

PC: *Yes, sir.*

LRH: I found a gross auditing error here in auditing a pc without a Havingness Process. Now, I try not to invalidate your auditors: I'm not interested in invalidating them or not. All I'm interested in is, one day I walk out in the hall and I see a girl I like, called Smokey, and she is look-

ing like she has just been dragged in by the cat, Sambo.

PC: *Didn't, though?*

LRH: Yes. And so I says, "Well now, we'll check into this." So I said, "Well, the person has had a lot of What questions run, and we'll get these checked over." They were announced to me as being clear and clean and null: they're all hotter than a pistol.

PC: Mm.

LRH: Great? Furthermore, they're not very intelligent What questions. But that's all right; that's beside the point.

PC: *I had fun with some of them.*

LRH: Sure, I know you did. But those things can be cleaned.

PC: *Mm-hm.*

LRH: Okay?

PC: *All right.*

LRH: So I made up my mind that the cycle of action which I began ...

PC: *Mm-hm.*

LRH: ... on straightening you up would be finished. I found two gross auditing errors here: one of them is auditing a pc without a Hav Process, and the other one is not flattening the questions. That was all I was looking for.

PC: *All right.*

LRH: All right.

PC: *I think I just fool people, you know?*

LRH: Hm?

PC: *I think I do fool people. You know, I don't usually – you know, it takes a lot to run me down.*

LRH: All right, honey. As far as fooling people is concerned, you can't fool a meter.

PC: *Oh, I don't try to.*

LRH: I know you don't.

PC: *Hm.*

LRH: No, it's just technical.

PC: *Hm-hm.*

LRH: What are you trying to do, take responsibility for this? Perfectly all right with me if you do.

PC: *Oh, of course!*

LRH: All right. Go ahead and take responsibility for it.

PC: *All right.*

LRH: That's all right.

PC: *That's better.*

LRH: All right. Now, have I missed a withhold on you? Thank you. That's clear.

PC: *I know.*

LRH: What were you thinking about?

PC: *Naturally it's clear!*

LRH: Huh?

PC: *Naturally it's clear.*

LRH: All right. Now, is there anything you care to ask or say before I end this?

PC: *No.*

LRH: Hm?

PC: *Not a thing.*

LRH: Anything you care to ask or say before I end it?

PC: *Well, just say "thank you," of course.*

LRH: All right, honey. Now, I got a little dirty – instant dirty needle there.

PC: *Well – uh – well, that's my secret.*

LRH: What's your secret?

PC: *You see, I have hot flushes sometimes.*

LRH: All right. Okay.

PC: *Age, you know.*

LRH: Yeah. Yeah.

PC: *Mm.*

LRH: Yeah.

PC: *So it – it gets a little dirty needle at times ...*

LRH: All right, honey.

PC: *... on that one thing.*

LRH: Okay. Let me ask this again. Is there anything you care to ask or say before I end this checkover?

PC: *No. Don't think so.*

LRH: All right. Think of anything else? Little something there?

PC: *Uh – well, I appreciate your finding uh – that the havingness is out, because I do think I need it.*

LRH: Mm-hm.

PC: *Mm-hm.*

LRH: Hm, all right. All right. Good enough.

All right. I'm going to check this one question on the meter here.

PC: *Mm-hm.*

LRH: Is there anything you care to ask or say before I end this checkover? Thank you. That is clear.

PC: *Okay.*

LRH: All right, honey. Thank you very much.

PC: *All right. Thank you.*

LRH: Put down the cans. You can go to – back downstairs and give the Instructor this.

PC: *All right.*

LRH: Thank you.

PC: *Yes.*

LRH: Okay.

TV DEMO: FISH & FUMBLE CHECKING DIRTY NEEDLES

An auditing demonstration given on 23 May 1962

LRH: We are going to give you a proper session, and we're going to do some fish and fumble there.

PC: *Okay.*

LRH: I told you just a moment ago, we're going to look for this tick-tick, and we're going to see if we can find this tick-tick, and find out what it was, because that had me mighty curious when I had you on the line.

PC: *That was the one on – on that Prepcheck chain I went down.*

LRH: Yeah.

PC: *Hm.*

LRH: That's right. That was an interesting thing I actually did narrow it down to just that, and – since then.

PC: *Hm.*

LRH: So we'll see if it's still there.

PC: *Great.*

LRH: Okay. Is it all right with you if I begin this session now?

PC: *Yeah.*

LRH: Good. Start of session. Has the session started for you?

PC: *Yeah. Not really.*

LRH: All right. All right. Here it is.

PC: *Yeah.*

LRH: Start of session.

PC: *Okay.*

LRH: Okay. What goals would you like to set for this session?

PC: *To be able to get to sleep easier at night. I've been having trouble getting to sleep.*

LRH: All right.

PC: *The last few nights. And to*

...

LRH: Good.

PC: *... to stay in present time when I'm studying. When I sort of run out of – get out of present time, find myself reading over a paragraph of a bulletin or something like that without reading it.*

LRH: Okay. All right. Any other goals?

PC: *That ought to do it.*

LRH: All right. Got an ARC break there? All right, thank you. Any goals you'd like to set for life or livingness?

PC: *I'd like to – well, I have a goal: it's – it's – it's an imp – almost im-*

possible goal, but maybe it's possible, you know?

LRH: Yeah?

PC: *To get Class II by the end of the month, or by the end of this period. But, you know, it's getting pretty close there.*

LRH: All right. Anything else?

PC: *I'd like to be auditing next week. Start auditing.*

LRH: All right.

PC: *Champing at the bit. I want to – like those – a little like those commandos who want to, you know, get out.*

LRH: [laughs] All right. Okay, Fred. Now, look around here and tell me if it's all right to audit in this room. All right. Now, let's see. What process was working on you? It was Touch, wasn't it?

PC: *Yeah.*

LRH: All right. Squeeze the cans. Thank you. Put the cans down. All right. We're going to run a little bit of Touch here. All right. Touch that table. Thank you. Touch that wood. Thank you. Touch that ashtray. Thank you. Touch that chair. Thank you. Touch those cans. Good. Give them a squeeze. Squeeze 'em. All right. Squeeze 'em. Hey, that's a difference! All right, thank you. All right. That's it. Now – check this on the meter. Look around here and tell me if it's all right to audit in this room. Thank you. Relatively clean.

PC: *Hm-hm.*

LRH: Just a little slowdown; doesn't amount to a hill of beans. Feel better?

PC: *Yeah.*

LRH: Hey, what do you know? That was fast enough, wasn't it? All right. Are you willing to talk to me about your difficulties? Thank you. That's clean. Since the last time I audited you ...

PC: [laughs] *A lot of water's gone under the bridge.*

LRH: Since the last time I audited you, have you done anything that you are withholding? I have an action there.

PC: *Well, I – I – I – I got an overt against Robin, I guess.*

LRH: Okay.

PC: *I – I thought that was pretty clean. Anyway, when I – I left the – I left that post, I – I wrote a whole series of notes ...*

LRH: Yeah.

PC: *... explaining the job to ever – whoever. I – I addressed them to Franchise Secretary from Fred.*

LRH: Hm.

PC: *Whole series of notes explaining the job, explaining various aspects, vari – you know, the various things I was working on. And I – I wasn't exactly sure Robin was going to come on the post, but I was pretty sure. And – but I thought it would be kind of funny if I – you know, it would be interesting, if I ...*

LRH: All right.

PC: *... wrote these notes and told Robin how to do the job. But anyway, it was kind of an overt on Robin.*

LRH: Okay.

PC: *It was.*

LRH: All right. Let me check that on the meter.

PC: *Yeah.*

LRH: Since the last time I audited you, have you done anything you are withholding? Got a little tick there.

PC: *Well, it's uh – I uh ...*

LRH: That's it.

PC: *... this friend of mine – it's about this – this ... Remember about – suspicions about that key and about ...*

LRH: Yeah.

PC: *... this friend? This is about that key. I – I never got in touch with him. I wrote him a letter ...*

LRH: Hm-mm.

PC: *... saying, "Oh, you know, gee, I haven't seen you, and give me a call." I got the letter back – no – n-n-not at – not at that address.*

LRH: All right.

PC: *You know? And I was, you know, wondering what – what happened. Something's – something's wrong there, you see?*

LRH: Hm-mm.

PC: *I have to check in ...*

LRH: Hm.

PC: *... because, (a) he wouldn't move without letting me know his new address.*

LRH: Hm.

PC: *Um – (b) I might have wrote it to the wrong address ...*

LRH: Hm.

PC: *... but I – I – I don't think so.*

LRH: Mm-mm.

PC: *And something wrong there. I have to look into that.*

LRH: All right. Very good. All right. Let me check this on the meter.

PC: *Yeah.*

LRH: Since the last time I audited you, have you done anything that you are withholding? Little tick, much smaller.

PC: *Yeah.*

LRH: That's it.

PC: *I had a party at my place, and some girls over, and kind of a wild party.*

LRH: All right. Okay.

PC: *I told you about that, I think...*

LRH: Yeah.

PC: *... probably the group, you know ...*

LRH: Okay.

PC: *... but not about that party.*

LRH: All right. Let me check that on the meter. Since the last time I audited you, have you done anything that you are withholding? That's cleaner than a wolf's tooth. Very good?

PC: *Yep.*

LRH: All right. Do you have a present time problem? Thank you. That's clean. Okay. Now, I told you about fishing around here.

PC: *Yeah.*

LRH: And we're going to do some fish and fumble ...

PC: *Hm-hm.*

LRH: ... see where we wind up here. And mysteriously, I have no tick-tick.

PC: [laughs] *Well...*

LRH: Obviously, you're ... What were you going to say?

PC: *I don't know. It was on that chain, and it was on that past life, or connected up with it.*

LRH: Uh-huh.

PC: *Maybe if I found that again and I could – I don't know if it was that or something else, or what.*

LRH: Well, that, you know ...

PC: *It was something – it was something about messing with little girls ...*

LRH: Yeah?

PC: *... You know?*

LRH: Yeah.

PC: *Something – messing with little girls ...*

LRH: There it is. There it is. There it is.

PC: *Yeah.*

LRH: Ha-ha, ha-ha!

PC: *Uhh.*

LRH: All right. Well, we didn't have to fish very long there, did we?

PC: *No.*

LRH: Something about messing with little girls.

PC: *Yeah.*

LRH: And just like that, we get it back. All right, let me check it now.

PC: *Yeah.*

LRH: Okay? What about messing with little girls? Well, that isn't quite the tick-tick.

PC: *No.*

LRH: Now, let me see if we can get it just a little closer than that. There it is. What did you just think of?

PC: *Dang! I – I – I just look – kind of looked at a little something there, and kind of looked away. I can't – you know, sort of a hunk of something, you know?*

LRH: Yeah, yeah, yeah, yeah.

PC: *One of those gray hunks of something ...*

LRH: That's right.

PC: *... that don't have any definite ...*

LRH: There it is again.

PC: [laughs] *I – it looks like a – a rocket ship nose, or something, or – or a bomb nose, or something like this. I don't know.*

LRH: Yeah.

PC: *Is that it, or ...*

LRH: Yeah.

PC: *... or not? I ...*

LRH: Well, let me check this over again. What about messing with little girls? Ahh, there – there's a tiny little slowdown there.

PC: *I looked at that thing again, when you mentioned it.*

LRH: Something here about messing with little girls in the nose of a rocket ship?

PC: *I – that's what the – I looked at that, and there was something connected there or someplace; I don't know why.*

LRH: Yeah.

PC: *But, you see, it ...*

LRH: Yeah.

PC: *It's a – it's kind of a, you know, what's happening here? You know? How come – how come this connects up like this or something like that, you know?*

LRH: All right. Well, I'll find it.

PC: *Yeah.*

LRH: I'll find it. Now – there it is! Who are you looking at?

PC: *Well, it – that was th-th-those two little girls that we talked about in that Prepchecking session that I ...*

LRH: That's it.

PC: *... those two twins.*

LRH: Uh-huh.

PC: *They were either twins or – or sisters that I messed with ...*

LRH: Uh-uh.

PC: *... in – back in early – early days in my life.*

LRH: That's it.

PC: *I was ten years old, or so. And so ...*

LRH: And we were going down that chain.

PC: *Yeah. Yeah. We kind of went past them, and ...*

LRH: All right. Let me see if I can get a What question that's right into the middle there.

PC: *Hm.*

LRH: What about sexually interfering with little girls? That's it.

PC: *Is it?*

LRH: I get a tinier, smaller read.

PC: *Yeah.*

LRH: I might be able to vary that just a little bit. There it is. What's that?

PC: *That's a picture of sexually interfering with a little girl.*

LRH: Yeah.

PC: *I don't think it's this lifetime. I mean, I don't know ...*

LRH: Well, that doesn't matter.

PC: *Yeah. That's that sex pervert or ...*

LRH: Hm-hm.

PC: *... probably a sex-pervert thing. But that's tied up with that other – that – that ... Well, it – I – I think it's the same little girl as in that other picture I've had so many years, I looked at.*

LRH: What was that? The ...

PC: *The one of having a little girl with her panties down, and with a – switching her.*

LRH: Hm.

PC: *And seeing – this picture is seeing an – an older man do this. Watching it from the bushes, something like this ...*

LRH: Hm-hm.

PC: *... in – in the yard of this ...*

LRH: Right.

PC: *... place with ...*

LRH: Right.

PC: *... a stream going by or*

something like that.

LRH: Right.

PC: *I've had that picture so long, you know?*

LRH: Hm-hm.

PC: *And this – I'm not sure if it's the same girl or not.*

LRH: All right. Now, hold your cans still there and let me check it.

PC: *Yeah.*

LRH: Let me check another little What here.

PC: *Hm.*

LRH: What about punishing little girls? Clean.

PC: *Hm.*

LRH: What about sexually interfering with little girls? It's not giving me the same read as the double tick.

PC: *Yeah.*

LRH: There – what's that?

PC: *Switching little girls.*

LRH: What about switching little girls? That isn't it.

PC: *Eating little girls?*

LRH: Beating little girls?

PC: *Beating or eating?*

LRH: Eating?

PC: *Eating little girls.*

LRH: All right. What about eating little girls? Well, I get a something of a reaction there. What about eating little girls? It cleaned.

PC: *Hm.*

LRH: All right. Let me try another What question here. What about stealing little girls? I get an action here.

PC: *Hm-hm.*

LRH: You see, the reason I'm putting that together isn't a shot in the dark. You were talking about taking over a body before this lifetime.

PC: *Yeah.*

LRH: See, and I was ...

PC: *Yeah.*

LRH: ... getting a reaction on that. Now, what about taking over little girls? I don't get the same reaction.

PC: *Hm-hm.*

LRH: What about stealing little girls? I get an instant read on that. What about stealing little girls? It's not the same instant read I'm fishing for, however.

PC: *Hm-hm.*

LRH: There it is. There it is. It was just for a minute and we went by it.

PC: *Boy, that's awfully fast, you know? It's – it's ... Boy, it's something that's really occluded.*

LRH: Yeah, yeah, yeah.

PC: *Ha! No – all around it, but I can't ...*

LRH: All right.

PC: *... can't get to it.*

LRH: All right.

PC: *But I keep popping – keep thinking about – on the same line, I don't know if it's just jazz chat or what. But some incident I ran – some past life incident, way back.*

LRH: Hm-mm.

PC: *Spaceship – just wound up taking over the ... Supposed to burn off this planet and save one city and rape the city, or something like that.*

LRH: What's this now? Take a ...

PC: *I – I – I.*

LRH: ... a burner ...

PC: *Yeah, to burn off the whole planet.*

LRH: Oh, you burnt off a whole – I got it.

PC: *Yeah, I was supposed to blow – burn the whole thing off, but I saved one city, and I raped the city before I burned it off.*

LRH: Yeah.

PC: *And part of that was it – at least as I came up in – I don't know, it – hell, it picked them – I mean, it's just not ...*

LRH: Well, now there – there's the double tick.

PC: *Yeah? It's – I take – took all the – asked all the five-year-old girls in the – all the five-year-old blond little girls in the town into the palace, and raped them all.*

LRH: Hm-hm. We're getting the tick-tick.

PC: *Yeah. Huh!*

LRH: We did.

PC: *And then – did that and my – I ordered my men, or my men and I raped – raped all these little girls ...*

LRH: Mm-m. There's your tick-tick.

PC: *... five-year-old girls. And then afterward, we burned the city off.*

LRH: All right. Let's see if I can make up a What here.

PC: *Hm.*

LRH: What about raping a city? All right. What about raping little girls? What about raping little girls? No. What about that auditing session? What about that auditing session that you ran that in? That's it. There's a latent on that.

PC: *Hm-hm.*

LRH: All right. What auditor was that?

PC: *Think it was Stan.*

LRH: Who?

PC: *Stan Stromfeld.*

LRH: Yeah?

PC: *Think it was him. Must have been him.*

LRH: Was it? I don't get a reaction here.

PC: *No?*

LRH: Was it Stan Stromfeld that ran that? I don't get any reaction on that.

PC: *I'll be darned.*

LRH: Somebody earlier than that?

PC: *Janine? No. Unless it was New York. Oh, maybe it was Doris. Marge? Damn. I don't – I can't remember ...*

LRH: All right. Let's put it together here.

PC: *... who it was. Raping – past lives and ...*

LRH: There – you got the – there's the ghost of a tick.

PC: *Denise?*

LRH: Yeah. There it is. Microscopically smaller.

PC: *Yeah, I know it. You ... Something there.*

LRH: I just want to know what auditor it was.

PC: *...I'm not sure. You know? I mean, I – I – I don't really get anything.*

LRH: All right. Well, let me help you out, may I?

PC: *Yeah.*

LRH: All right. Was it a girl auditor? Was it a male auditor? Male auditor.

PC: *Hm-hm.*

LRH: Did it happen in the United States? Did it happen in Paris? All right, did it happen in Paris? Now I've got a double tick.

PC: *Hm.*

LRH: What are you thinking about? Happening in Paris?

PC: *Vincent? Mario? Maybe it was Jack Campbell.*

LRH: All right. Was it Jack Campbell?

PC: *Maybe it was.*

LRH: All right. Was that auditor Jack Campbell?

PC: *Yeah, I guess it was.*

LRH: There's something here about it now.

PC: *Yeah.*

LRH: I'm gettin ...

PC: *Yeah, I guess it was. 'Cause he – he – he – he ran me on RT-3, think it was – OT-3.*

LRH: Yeah.

PC: *And it kind of went way back ...*

LRH: Hm-hm.

PC: *... into a lot of stuff ...*

LRH: Now we're getting a double tick here.

PC: *... past life stuff. Yeah. There was that.*

LRH: All right. You remember this now?

PC: *Yeah, yeah.*

LRH: All right.

PC: *Yeah.*

LRH: Okay. And, now, did Jack Campbell miss a withhold on you?

PC: *Undoubtedly! [laughs] No doubt.*

LRH: All right.

PC: *Yeah, I think he did.*

LRH: All right. All right. Okay. Let me check that on the meter. Did Jack Campbell miss a withhold on you? I get a reaction.

PC: *Yeah. [laughs]*

LRH: All right. Now ...

PC: *It – it's like saying, did Jack Campbell ever audit you? You know, I mean, it's like the same question. In fact, it was – it was funny.*

LRH: Now, we're taking off from that as a Zero question.

PC: *All right. Ooh.*

LRH: All right.

PC: *There must be something there? Line charge? Or something. [chuckles]*

LRH: Okay. Now let me check out a possible One.

PC: *All right.*

LRH: Okay. What did you successfully hide from Jack Campbell? All right, let me check that. Now let me check another one. What have you done to Jack Campbell? Well, we're going to take that first.

PC: *Yeah, it would be a good idea, I think.*

LRH: Rightly or wrongly, we will take that first, because it'll flatten rather rapidly.

PC: *Yeah.*

LRH: All right. We will test that now. We know that you have withheld from him.

PC: *Hm-hm.*

LRH: All right. Would that be doing something to him?

PC: *The action of withholding from him?*

LRH: Yeah, we actually are wrong here in phrasing this What question ...

PC: *Yeah.*

LRH: ... but I'm just testing this thing. Is there a specific overt?

PC: *Uh...*

LRH: I get a tick.

PC: *Yeah. It – it's a kind of a – a specific overt, many times, in a sense, you know?*

LRH: Hm-hm.

PC: *Well, the first overt, really, is that I considered that kind of – something was not quite right, or I didn't quite ... Well, when I first took the Communication Course in Paris, this ...*

LRH: Hm-hm.

PC: *... You know, in Scientology – the Scientology Communication Course – you take the Communication Course.*

LRH: Hm-hm.

PC: *I – I didn't have the money for the course, and I told him that – oh, I was – I – I knew he liked me.*

LRH: Hm-hm.

PC: *All right, I knew he and Gernie liked me, I knew they were interested in me, they liked my work in the theater, blah-blah-blah.*

LRH: Hm.

PC: *And so I said, "Well, I – I – well, I – I'm – gee, I'd like to take this course, Jack, but I – you know, I can't pay for it. Don't have the money."*

LRH: Hm.

PC: *Like that. Now, I might have been able to scrape the money up if I had really – you know. You know, if he'd said, "Well, no, you go after the money and come and take the course."*

LRH: All right.

PC: *But he said – I don't have the money. I – I can't take this ..." and he said, "All right. It's all right," he said, "We – we want you to get the course. You can pay me later." I said, "Fine."*

LRH: Well, tell me this now. Good. Tell me this now: Was that – the question we're on is doing something to him. Now, what specifically did you do to

him there?

PC: *I kind of conned him into – I conned him into giving me the course for nothing. You know?*

LRH: All right. Good. You conned him into it.

PC: *Yeah. After – yeah ...*

LRH: All right.

PC: *... after a fashion.*

LRH: That's it. All right. Now, what about conning Jack Campbell?

PC: *Yeah, that's a good What question.*

LRH: All right.

PC: *Yeah. That's a good What question. Very good.*

LRH: Good. Well, that's the one we are going to work.

PC: *Yeah, it makes me sweat a little bit.*

LRH: All right. Very good. When was that?

PC: *Summer of 1958.*

LRH: Very good. Is that all there is to it?

PC: *Oh, I thought, well, if – you know, what do I have to lose here, you know? Nothing – nothing in this course, and, well, figured on paying him later on.*

LRH: All right. Good enough. All right. And what might have appeared there?

PC: *Well, I could have shake – shaken some money up from someplace, I think ...*

LRH: All right.

PC: *... to pay for it.*

LRH: Very good. And who didn't find out about that?

PC: *Well, Jack didn't. I – I – I – the fact I could have gotten the money someplace to pay for it, I think.*

LRH: All right.

PC: *You know.*

LRH: Very, very good. Okay. When was that? Very specifically.

PC: *July of – gee, the Moscow Art Theatre was in town.*

LRH: Hm-hm.

PC: *I think it was the end of June. I think it was the end of June. End of June in 1958.*

LRH: All right. Good. And what else is there about this?

PC: *Well, I – I – I – I went on and took the course, and conned him again into giving me the HPA Course without paying for it over there.*

LRH: All right. Okay. And what didn't appear there?

PC: *Fifty thousand francs for the HPA Course.*

LRH: Oh-ho-ho, I see.

PC: *Still hasn't appeared.*

LRH: All right. And who didn't find out about that?

PC: *Well, the – the people who I owed money to didn't find out that I was spending more money or, you know ...*

LRH: Hm-hm.

PC: *... putting myself into more debt ...*

LRH: I see.

PC: *... in a sense.*

LRH: All right.

PC: *Kind of a little bit of an overt against them. Very funny.*

LRH: What?

PC: *Just getting more debts without paying them off.*

LRH: I see.

PC: *You know, something like that.*

LRH: All right. Very good. Very good. All right. Now, let's test this What question.

PC: *Hm.*

LRH: What about conning Jack Campbell? Have to test it again: What about conning Jack Campbell? That seems to have a tiny little bit of reaction on it. Let me ask you this. Is there any earlier moment there? Is there anything earlier, before that Comm Course? What's that?

PC: *Yeah, had coffee or something with Jack and Gernie...*

LRH: Yeah?

PC: *... and – I – Jack paid for the coffee or the drink or something – earlier, when I first met him. And I kind of conned him there a little bit. You know, he paid for the drink.*

LRH: All right. Well, when was that?

PC: *Was after a – hm. It – it was – well, it must have been after a – it must have been that spring, along in March or something like that.*

LRH: Get a tick-tick.

PC: *Yeah. In March ...*

LRH: Yeah. All right. Good enough.

PC: *... that year. Yeah.*

LRH: All right. What else is there to that?

PC: *I just – that was the first time I saw him. That night.*

LRH: That's the first time you ever saw him?

PC: *Yeah.*

LRH: Yeah. Bang.

PC: *Yeah. Gernie invited me for a drink after an American Embassy Little Theatre group ...*

LRH: Hm-hm.

PC: *... production.*

LRH: All right.

PC: *I'm not sure if it was hers or somebody else's. And – with her and Jack, and I saw this character first appear.*

LRH: All right. Okay. And what might have appeared there?

PC: *Hm. Well, I don't know. A couple of hundred francs from my pocket, I guess, to pay for the drinks, could have appeared.*

LRH: All right. All right.

PC: *I think I was broke, or something, and I had to con him. You know, I couldn't pay the drink. I don't think I had any money on me, or something like this. It was funny.*

LRH: All right. Very good. who didn't find out about it?

PC: *Well Jack and – Jack and Gernie didn't.*

LRH: All right. Very good. Very good. All right. Let me test this What question again: What about conning Jack

Campbell? Still got an action. Did you meet him any earlier than that?

PC: *Not that I know of.*

LRH: Ah-ah-ah.

PC: *Yeah?*

LRH: You meet Jack Campbell earlier than that?

PC: *Man, I don't remember if I do.*

LRH: Come on, come on, come on. Did you meet him earlier than that? I got a reaction here.

PC: *No.*

LRH: Let me test this very carefully, before I send you off on a wild-goose chase.

PC: *Yeah.*

LRH: All right. Did you meet Jack Campbell earlier than that? You've got a reaction here, man.

PC: *I'll be darned. Jack Campbell earlier.*

LRH: Yes, Jack Campbell earlier.

PC: *I knew Gernie before I knew Jack.*

LRH: Uh-huh.

PC: *The first I remember Gernie is meeting her after one of my productions there.*

LRH: All right.

PC: *And, I heard about Jack. Damn! Or something, and I was kind of curious about him.*

LRH: Hm-hm.

PC: *And...*

LRH: What are you plowing around with there? You got a double tick.

PC: *Yeah. It was meeting Gernie*

...

LRH: Yeah.

PC: *... after that production ...*

LRH: Right.

PC: *... in – in – in the foyer of the ...*

LRH: All right.

PC: *... American Students and Artists Center ...*

LRH: Hm-hm.

PC: *... and – this – there's some unknown there. I can't remember about this – that ... Something ... I – I wondered where Jack was, or something like this. I'd never met him, you see?*

LRH: Hm-hm.

PC: *But I wondered where Jack was ...*

LRH: Hm-hm.

PC: *... or something. You know? I mean, there's – there's something like that.*

LRH: Hm-hm.

PC: *This – about all I got.*

LRH: All right. Just experimentally, was there a desire to withhold yourself from meeting Jack? No. All right. Let me check this What question again: What about conning Jack Campbell? Still reacts.

PC: *I intended on meeting Gernie ...*

LRH: Good.

PC: *... I intended to get – get her interested in my theater project.*

LRH: Ah!

PC: *And maybe that's conning Jack a little bit, by getting Gernie interested.*

LRH: All right.

PC: *Inadvertently conning Jack – conning Gernie into – into getting her to back my theater project.*

LRH: All right.

PC: *Because I heard she was important, you know ...*

LRH: All right.

PC: *... she had connections ...*

LRH: Now we got little tick-tick. Yeah.

PC: *... and money, and – yeah – money and connections, and ...*

LRH: All right.

PC: *... may – maybe it's kind of overt against Jack, and conning him, too, or something.*

LRH: Well, you don't have to add it up to him. Were you trying ...

PC: *Yeah.*

LRH: ... to con Gernie?

PC: *Yeah.*

LRH: Hm?

PC: *Yeah, yeah.*

LRH: Oh, yeah.

PC: *Yeah.*

LRH: All right. Now is there a missed withhold right there at that meeting?

PC: *First meeting with Jack? Yeah.*

LRH: No. With Gernie.

PC: *Gernie.*

LRH: There a missed withhold there with Gernie? What would it be? What didn't she find out about?

PC: *On me? Gee, I don't know. That – well, the first I – when I first met her, I – I didn't – here was this big, fat woman here, you know?*

LRH: Oh, I see.

PC: *Yeah. And – but – had a lot of – pretty alive, you know? Gernie is pretty alive.*

LRH: Hm-hm.

PC: *She – and she was interested in – in – in me because she had seen the production and liked it. And I didn't know who she was.*

LRH: Hm-hm.

PC: *She – very nice talking, and gets – I got some admiration there, and stuff like this ...*

LRH: Hm.

PC: *... You know, it was nice.*

LRH: Well, have you answered the auditing question there? Is there a missed withhold from Gernie? I haven't got a reaction on it.

PC: *No, I – I – I can't think of any.*

LRH: All right. Now, let me test this What question again, huh?

PC: *Hm.*

LRH: All right. What about conning Jack? Now, we've still got a little tick here.

PC: *Yeah.*

LRH: All right. Did you meet Jack Campbell – coming back to one we had before ...

PC: *Yeah.*

LRH: ... did you meet Jack Campbell earlier than this? All right. Let me ask you once more. Did you meet Jack Campbell earlier than this? I'm not getting a reaction on that.

PC: *Hm-hm.*

LRH: I'll – I'll say it once more, because you're getting dives here.

PC: *Hm.*

LRH: Did you meet Jack Campbell earlier than this? No, that's clean.

PC: *Yeah.*

LRH: All right. Now, is there a meeting between that first meeting with Gernie and what you were saying was the first meeting with Jack ...

PC: *Yeah.*

LRH: ... when he bought the drinks?

PC: *The meeting with Gernie? Between that time?*

LRH: Yeah, well, is that – is ... Yeah, yeah. Is there a second meeting with Gernie before you met Jack?

PC: *Gee, I sure got it occluded if there is. There must – I ...*

LRH: Uh-huh.

PC: *... yeah, there must have been. There must have been.*

LRH: Uh-huh. We got a ...

PC: *Must have been.*

LRH: The double action is on there.

PC: *Yeah. Funny, I've a little charge, too.*

LRH: What goes on here?

PC: *Gee. I'm just trying to think of what it was.*

LRH: All right. Good. Good.

PC: *Yeah. You know, it must have been, because by the time I met Jack, Gernie and I were already good friends, you know, there ...*

LRH: All right. All right.

PC: *Wonder what happened in there.*

LRH: Yeah. All right. When might that have been?

PC: *March? Well, yes. I first met her, right ... God, 58. What was that, Streetcar Named Desire?*

LRH: Hm?

PC: *Yeah. Streetcar Named Desire. I first met her then, when – when she was – it must have been after Street – no, it must have been sooner than Streetcar. Man, I've got so much confusion through this period, you know?*

LRH: Interesting.

PC: *It's interesting.*

LRH: All right.

PC: *Uh...*

LRH: Okay. Well, how can I help you out there?

PC: *Well, I – I – I – I'm not sure what you – what to look for now. I kind of got lost off of that ...*

LRH: All right. Now, I asked you if there was a meeting ...

PC: *Yeah.*

LRH: ... with Gernie, before you – from that – between that first meeting ...

PC: *Yeah.*

LRH: ... and when you met Jack. I was asking you ...

PC: *Yeah, there must have been several of them.*

LRH: ... when was that period?

PC: *Yeah. I can't remember when I first met Gernie.*

LRH: That's it.

PC: *Do you follow?*

LRH: That's it. We haven't got the first meeting spotted, have we?

PC: *Yeah.*

LRH: All right. Well, when might it have been?

PC: *I – it seems to me it was after Waiting for Godot. I – I – after I did that production. And that was in – sp – well, spring of 57. Yeah.*

LRH: We're getting a bit of reaction there.

PC: *Yeah.*

LRH: All right. Is that all there is to that meeting now?

PC: *Yeah. You mean that meeting with Gernie?*

LRH: Hm-hm.

PC: *Yeah. Far as – yeah.*

LRH: Hm-hm.

PC: *Far as I know.*

LRH: All right. What didn't appear there?

PC: *Well, Jack didn't.*

LRH: All right. Okay. Did you particularly want him to appear on that scene?

PC: *No, I didn't even know about him existing, you see, at that – at that point, really.*

LRH: Oh, you didn't know he existed at all?

PC: *No.*

LRH: All right. Very good. All right. And who didn't find out about that first meeting? I got a reaction.

PC: *Oh, the – yeah, the – the people that ran the American Students and Artists Center didn't find out about that.*

LRH: Oh, yeah. All right. Very good.

PC: *'Cause they were supporting me, they were behind me, and it was kind of – I don't know.*

LRH: Well?

PC: *I was – I was getting support from other people, too. Confused. I was, you know, very confused there.*

LRH: Well, all right. Now we're getting onto something interesting. While they were supporting you, were you looking for support from other people?

PC: *Yeah, for my – well, not really. But I felt kind of guilty about – people would off – or something. You know, I'd – I'd get admiration and stuff like this. I was becoming an independent figure, you see?*

LRH: I see.

PC: *Kind of like this.*

LRH: I see.

PC: *In a sense.*

LRH: All right. Good enough.

PC: *Yeah.*

LRH: Let me check this over now.
Another What question here incidental,
just to be checked.

PC: *Hm.*

LRH: What about these meetings
with Gernie? Now there's a double tick on
these meetings with Gernie.

PC: *They're certainly occluded,
in through here.*

LRH: There it is.

PC: *There's a year ...*

LRH: There it is.

PC: *See, there's a year going
through there ...*

LRH: All right.

PC: *... about that.*

LRH: Hm.

PC: *You know.*

LRH: I'm going to put that down
as a ...

PC: *Boy, I sure had trouble with
Gernie later on, so there must be – there
must be something in there.*

LRH: Yeah? You do something to
her?

PC: *Yeah.*

LRH: What?

PC: *Oh – I – later on there, I
fought with her, you know?*

LRH: All right.

PC: *Fought with her ...*

LRH: Did you do something to her
specifically? We got a tick.

PC: *Yeah. I – yeah, one time she
wanted to – she wanted to come and have
supper with me. I told her no, I was going
to go with some other people.*

LRH: Hm-km.

PC: *I – I – you know, kind of
pushed her away.*

LRH: You what?

PC: *I kind of repulsed her.*

LRH: All right.

PC: *Repulsed her and ...*

LRH: Well, let me ask this ques-
tion: What about refusing Gernie? No, that
isn't live. It isn't quite right. What would
you do to Gernie? You repulsed her, then.

PC: *That time. Yeah.*

LRH: Well, when was that?

PC: *Was quite a bit later. This –
I was back ...*

LRH: Well, when was it?

PC: *Nineteen – Jesus – Sixty.
Spring of 60.*

LRH: All right. Very good.

PC: *March of 60.*

LRH: Is that all there is to it?

PC: *Well, there's other stuff dur-
ing that incident. She was producing; I was
directing a production there.*

LRH: Ah. You were working with
her.

PC: *Yeah, working together.*

LRH: Oh, all right.

PC: *Long time.*

LRH: Good. All right. And what
didn't appear there?

PC: *In that particular instance there of repulsing her? Well, some friendliness on my part didn't appear.*

LRH: All right. Very good. And who didn't find out about it?

PC: *Well, Gernie didn't, really.*

LRH: Okay. Thank you.

PC: *Yeah.*

LRH: Let me ask you a couple of just leading questions here, could I?

PC: *Yeah.*

LRH: Is there any affair – is there any affair with Gernie? Is there any refusal to have an affair with Gernie?

PC: *Yeah. Not – do you mean love affair? Or ...*

LRH: Yeah, I don't care.

PC: *Yeah. It was never – it was – it was neither way, you know? It was – we got together one time and – on this American Theatre Association thing, and she said, "Fred," she said, "I'd help you, but I want something out of it."*

LRH: Hm.

PC: *And I – at that time I – I – I – I wondered – I had the consideration that, well, people should help me because they should help me, you know? Not because they want something out of me.*

LRH: Hm-hm.

PC: *You know? Very ...*

LRH: All right. We're on the double-tick line.

PC: *Yeah.*

LRH: Go on.

PC: *Yeah. And that – that I deserve to be helped. You know?*

LRH: Hm-hm.

PC: *I – I – and I don't – I don't need to give anything in return.*

LRH: Ah.

PC: *Except my – my "contribution of art to the world," you know?*

LRH: Hm-hm.

PC: *Or something like that – some jazz like that. I'm important enough, and I'm – you know, I should be helped and not be bothered about things like this, and what have you. I – I kind of left her with a maybe on that whole thing.*

LRH: What did she mean by, she expected something out of it? What do you think she meant?

PC: *Well, she – she expected to direct a play now and then, when she wanted to, you know ...*

LRH: Hm-hm.

PC: *... enter in artistically into the thing. And I wasn't interested in letting her do this. I didn't consider her capable at the time of ...*

LRH: Did she ever find out about this?

PC: *She never found out about that, no.*

LRH: Oh. Is there a consistent withhold here on the subject of her capability?

PC: *There certainly is, yeah. Certainly is. Certainly is. All through – all through our relationship. Kind of culminating up into producing this play ...*

LRH: Hm.

PC: *... together.*

LRH: Hm.

PC: *I found out, in working together, that she was very capable.*

LRH: Oh, I see.

PC: *Before that – you know.*

LRH: You had an opinion through that period?

PC: *Yeah. Yeah.*

LRH: All right. She didn't find out about this at any time?

PC: *No.*

LRH: Did Jack ever find out about this?

PC: *No.*

LRH: Might Jack have found out about this when he was auditing you?

PC: *Yeah, he might have, if he'd ...*

LRH: All right.

PC: *... asked me.*

LRH: Is there anything else about Gernie that Jack might have found out about? That's it.

PC: *I – I had a feeling she was interested in me as a man, you see, sexually.*

LRH: I see.

PC: *I couldn't – you know. I wouldn't want Jack to know that, that I kind of got the idea from her. Not through any really terribly overt – kind of covertly, I mean.*

LRH: I see.

PC: *And I wouldn't want Jack to know about that.*

LRH: All right. All right. Now let me disentangle ...

PC: *Yes.*

LRH: ... all of this a little bit here.

PC: *Right.*

LRH: And let me ask that question again, check it on the meter.

PC: *Hm-hm.*

LRH: Might Jack have found out something about you and Gernie when he was auditing you? Getting a little action on this.

PC: *Seems to be something else.*

LRH: It's what something else?

PC: *He might have found something else out – something else about me and Gernie, beside what I said.*

LRH: Something else ...

PC: *Yeah.*

LRH: ... than this capability thing.

PC: *Yeah.*

LRH: Was there anything else to find out? Got a reaction.

PC: *I didn't like her!*

LRH: All right. All right.

PC: *I didn't like her.*

LRH: Good. Well, might he have practically blown your head off if he'd found out about your opinions with Gernie? What do you think? Something going on here.

PC: *Yeah.*

LRH: I'm trying to get to the bottom of it.

PC: *Yeah. I – I – I don't know – I – my considerations at the time or my considerations now?*

LRH: Your considerations at the time.

PC: *At the time. Well, you know, I – he might have – he might not have liked me, or something like that. But that's the missed withhold.*

LRH: All right. Very good. All right. Let me check this lineup now.

PC: *Yeah.*

LRH: Okay? What about conning Jack Campbell? Got a reaction.

PC: *Hm.*

LRH: Instant reaction.

PC: *Hm.*

LRH: But it's not now the dirty needle reaction.

PC: *Yeah. I mean, there are some other times when I conned him, kind of.*

LRH: Oh, just give me a rapid rundown. What's the relationship here?

PC: *Well, I – I – I got some books from him and never paid him for the books.*

LRH: All right. Good. Thank you. Any other one?

PC: *Oh, I – I – I was going to trade twenty-five hours of auditing with him.*

LRH: Hm-m.

PC: *That's – that was a con, because he was a better auditor than I was.*

LRH: All right. Okay.

PC: *Actually I got twelve and a half.*

LRH: Good. Good.

PC: *Uh...*

LRH: Any others?

PC: *Can't think of any right now.*

LRH: All right. What?

PC: *No, it's a motivator.*

LRH: Well, that's all right. What's the motivator? Perfectly all right with me.

PC: *Yeah. Well, there's – there was – there was some confusion with him about when I was on the course – when he came on the ACC over here. That's ...*

LRH: Yeah.

PC: *... when he was a student on an ACC. He and Vincent came over here. And – well, no, there – th-th-th-th-there's an overt in there. Yeah.*

LRH: Yeah, that's what I was going to just ask for, but you saved me the trouble.

PC: *Yeah.*

LRH: All right. What's the overt?

PC: *There's an overt in there. He left Mario and myself to teach the course there. Mm?*

LRH: Hm-hm.

PC: *And we were supposed to work together in teaching the course.*

LRH: Hm-hm.

PC: *But Mario went on a concert tour, didn't come back.*

LRH: Hm-hm.

PC: *See? And he was supposed to come back in a week, didn't come back.*

LRH: Hm.

PC: *... at all, you know. But I went ahead and taught the course, myself.*

LRH: Hm-hm.

PC: *And spent the time blaming Jack, kind of, for not – you know, for Mario – to let Mario – Jack, everybody else, whereby ... The overt was – golly, it's kind of – there's something to do with holding down the whole thing by myself ...*

LRH: Hm.

PC: *... and proving to them that they were no good, or something like this. You know, I don't know.*

LRH: All right. All right.

PC: *Something like that.*

LRH: Good enough. Thank you. All right, let me check this question again. What about conning Jack Campbell? All right. I don't know if that was a reaction or not, I'll check it again.

PC: *Hm.*

LRH: What about conning Jack Campbell? I've still got some kind of a reaction. Let's get the 1B checked here.

PC: *All right.*

LRH: What about these meetings with Gernie? All right, let me check it again. What about these meetings with Gernie? That is clean.

PC: *Yeah.*

LRH: All right. Now let me check the first one again. What about conning Jack Campbell? Let me check it again. What about conning Jack Campbell? I've still got a reaction on that.

PC: *Yeah.*

LRH: It's much quieter.

PC: *Yeah.*

LRH: Everything is smoothing out. There is something else here. Is that

the first meeting you had with Jack Campbell?

PC: *Yeah!*

LRH: Was it?

PC: *Yeah!*

LRH: All right.

PC: *Far as I know.*

LRH: Now, did you and Gernie talk about Jack Campbell? All right. There's no reaction there.

PC: *Hm-m.*

LRH: Is there any other con there that you might have skipped? Did you ever borrow money from him, or ...

PC: *Yeah. Yeah.*

LRH: ... never paid it back? You so far have just mentioned course fees, and so forth. Did you ever borrow money and not pay it back?

PC: *I think I paid all the money back I borrowed from him.*

LRH: I get no reaction on it.

PC: *Yeah.*

LRH: All right. Did you ever take a girl away from him?

PC: *No.*

LRH: Did you ever steal anything off of him?

PC: *No.*

LRH: All right. Did you ever take a fee while you were teaching there and didn't pay it back, or something like that?

PC: *No. No.*

LRH: Huh?

PC: *No. Huh.*

LRH: What do you mean?

PC: *Oh, yeah!*

LRH: What?

PC: *Yeah, I just remembered an overt I got against him ...*

LRH: Yeah, all right.

PC: *... on that.*

LRH: What is it?

PC: *While I was there, teaching – you know, teaching the course, holding things down, his – I'd use his office, you know, I mean, his office there.*

LRH: Yeah, yeah.

PC: *And he said, well, I wasn't supposed to go in the bottom left-hand drawer of his desk.*

LRH: Right.

PC: *I'm not supposed to touch that bottom left-hand drawer.*

LRH: Okay.

PC: *And so I went in the bottom – so I did go in the bottom left-hand drawer ...*

LRH: All right.

PC: *... and rummaged around there a bit, and found some dirty pictures down there.*

LRH: Okay.

PC: *And never told him about that. Never told him about it.*

LRH: Okay. Did he audit you after that?

PC: *Yeah. Oh, yeah.*

LRH: All right. Thank you. Thank you.

PC: *Yeah.*

LRH: Good enough. Now let me check this question again. What about conning Jack Campbell? Well, this is getting to look much cleaner.

PC: *Yeah.*

LRH: All right. What about conning Jack Campbell? I am not now getting an instant read ...

PC: *Hm.*

LRH: ... but it's a little bit before, and it's a little bit after.

PC: *Yeah. Well, there's a lot of – must be a lot of – several other things I have done to him, you know?*

LRH: Well, think of any offhand?

PC: *Hm, hm, hm.*

LRH: What's that?

PC: *Oh, well, I – yeah. I conned him there.*

LRH: What?

PC: *I took the test, my final exam paper ...*

LRH: Yeah.

PC: *... from the HPA, home, and did it at home ...*

LRH: Oh, I see.

PC: *... in a sense. That's sort of a con. Well, yeah, because I – I – I went home and I – actually, when I took this paper home, I thought it was a joke about learning the Axioms. I – I – you know, learning, memorizing all those Axioms. That was silly.*

LRH: Hm-hm.

PC: *And when I – I came – I brought it back. I copied them out of the book, you know.*

LRH: Hm.

PC: *Brought them back, you know, I brought them back. And he looked at it, and he checked it over, with me there, and he saw that everything was perfect in it.*

LRH: Hm-m.

PC: *You know? And he looked at me kind of funny, like "Well, you got it right."*

LRH: Hm.

PC: *I conned him there, because I realized when he looked at me funny that I – it wasn't a joke. I should have memorized those Axioms.*

LRH: Oh, I get you.

PC: *And I – I hadn't.*

LRH: All right.

PC: *And – and at that moment I knew that – really that – that I hadn't. You know, I mean, I should have, or something, you know?*

LRH: Hm-hm, yeah.

PC: *And I conned him there.*

LRH: Okay.

PC: *Yeah.*

LRH: We got it taped now.

PC: *Hm.*

LRH: All right. Let me check this question again. What about conning Jack Campbell? This looks fairly clean.

PC: *Hm-hm.*

LRH: I'll check it just one more time. What about conning Jack Campbell? I haven't got anything on it.

PC: *Hm.*

LRH: That's clean.

PC: *That was a – that was a – actually, that was the big one there. I mean, that – that one there.*

LRH: Yeah. That cleaned it. All right.

PC: *Funny, because I told you about that once, but it wasn't – it wasn't as precise.*

LRH: It wasn't "who missed the withhold," was it?

PC: *Yeah. Yeah.*

LRH: Yeah. Now, all right. Anything you care to say before we leave this Prepchecking?

PC: *Nope.*

LRH: All right. Are you sure of that?

PC: *Hm-hm.*

LRH: Anything you care to say before we leave this Prepchecking?

PC: *Now about the double tick? Is that off?*

LRH: I knew there was – I can't find it.

PC: *Yeah.*

LRH: It started disappearing when we cleaned up Gernie.

PC: *Hm. Hm.*

LRH: And I haven't seen it.

PC: *Hm?*

LRH: But ... you ask about it there. There's ...

PC: *Hm.*

LRH: ... there's a wide motion, there's a wider motion.

PC: *Hm-hm.*

LRH: It's about so long, but it isn't the tick I had in the first place.

PC: *Hm.*

LRH: I've got a tick here of some kind or another.

PC: *Hm.*

LRH: It's not a tick. I've got a – a stop and a sweep.

PC: *Yeah.*

LRH: But I was looking for a dirty little tick-tick.

PC: *Yeah.*

LRH: And it seems to have dived for cover at the moment.

PC: *Hm.*

LRH: There – no, there it is again.

PC: *Yeah.*

LRH: Why? What are you thinking of, as you think of that?

PC: *I don't know. That's the funny thing, you see? I kind of look at something. I kind of look at an area of the bank.*

LRH: Hm-hm.

PC: *You know, or something, or a piece of a ridge there, or something like that.*

LRH: Well, that's all right.

PC: *You know ? And I get it there ...*

LRH: It's all right. It's all right. Okay.

PC: *I can bring it back by sweeping, you know? Scanning across.*

LRH: Well, try it – to bring it back.

PC: *To bring it back? It's – I don't know.*

LRH: Yeah. A little bit. Little bit.

PC: *Yeah, there's a little button there, it's – push – I don't know.*

LRH: All right. There it is.

PC: *Creeps up on me. I was just trying there ...*

LRH: All right. But do you think we've attained anything there, on that?

PC: *Yeah.*

LRH: All right.

PC: *Yeah, yeah.*

LRH: All right.

PC: *Okay.*

LRH: Okay. Now, let's see what we've got here. Okay?

PC: *Yeah.*

LRH: Have you told me any half-truth? What's the half-truth? That's it.

PC: *Oh, about writing those things for Robin, maybe. That's what I thought of ...*

LRH: All right. All right.

PC: *... right there.*

LRH: Thank you. I'll check it on the meter. Have you told me any half-truth? Got it. Check, bang. It reacts.

PC: *Hm-hm. Half-truths. Gee, I don't know.*

LRH: Hm?

PC: *I don't know what it was.*

LRH: Think of anything at all? What's that?

PC: *Oh, well, there must be some other things with Jack, I think.*

LRH: Oh, all right.

PC: *You know.*

LRH: All right.

PC: *I was ...*

LRH: You weren't satisfied that the What question was clean?

PC: *Yeah, I was satisfied.*

LRH: Yeah.

PC: *There was probably other things on the chain there along some – you know, little ones ...*

LRH: All right.

PC: *... like that, but not enough to ...*

LRH: Okay.

PC: *Hm.*

LRH: Thank you. I'll check the auditing question. Have you told me any half-truth? Clean. Untruth? What's the untruth?

PC: *Untruth.*

LRH: That's it. Untruth.

PC: *About Gernie? I don't know.*

LRH: Think of an untruth?

PC: *Well, she didn't actually – I don't think she really ever really insinuated that she was interested in me, sexually.*

LRH: Ah.

PC: *You know? I – it – I think it was mainly my own ideas or something. You know, I mean, I kind of switched things around or something.*

LRH: All right. Okay. Have you told me any untruth? Got a reaction.

PC: *Hm. Huh, I don't know what it is. Untruth.*

LRH: There's something.

PC: *I don't know what it is.*

LRH: Something there.

PC: *Yeah.*

LRH: All right. I'll ask the question again.

PC: *Yeah. Yeah.*

LRH: Your answer is you don't know what it is?

PC: *Yeah.*

LRH: All right. Thank you.

PC: *I- I got an idea.*

LRH: What is it?

PC: *Something about beginning rudiments.*

LRH: Did you think one of them was still hot?

PC: *Maybe I had kind of a suspicion or something. I wasn't sure.*

LRH: Oh, yeah?

PC: *Well, it could of – yeah, well, kind of a – of a missed withhold or something, you know?*

LRH: All right. All right.

PC: *I was – I was – when you said – when you asked about a present time problem, I had a tiny present time problem that I haven't been able to get to sleep too well ...*

LRH: Yeah.

PC: *... over the last week or so.*

LRH: Yeah.

PC: *And I thought that it might show up. And then it didn't show up. And I thought it might show up, and uh – but it didn't show up.*

LRH: Hm-hm.

PC: *And so I thought maybe that was something wrong there.*

LRH: All right. Is there an untruth? Was any of that an untruth?

PC: *No, no, there wasn't an untruth on that.*

LRH: Well, was it an untruth? Did you tell me that it ... ?

PC: *An untruth, huh?*

LRH: Thinking of something there.

PC: *Well, yeah. If I said I had a present time problem and it didn't react on the meter, then it would be an untruth.*

LRH: Is that right?

PC: *Yes.*

LRH: Is that what occurred?

PC: *Yeah.*

LRH: You're not sure?

PC: *Yeah.*

LRH: Is that your answer?

PC: *Yeah.*

LRH: All right. Very good. I will check that. All right. Have you told me an untruth? I get a reaction. Let me check it again ...

PC: *Hm.*

LRH: ... because you got a pretty dirty needle.

PC: *Yeah.*

LRH: Have you told me an untruth?

PC: *Gee, I don't know what it is.*

LRH: This is very equivocal.

PC: *Yeah?*

LRH: Do you have a guilty conscience about telling untruths or something of the sort here? This is not getting the same reaction ...

PC: *Yeah.*

LRH: ... constantly at all.

PC: *I – I – I have a guilty conscience. It's just, you know, a general one-has-a-guilty-conscience guilty conscience, you know?*

LRH: Well, does that upset you that I asked you if you've told an untruth?

PC: *Yeah.*

LRH: Is that what this is falling on?

PC: *Yeah, maybe.*

LRH: Well, is it or isn't it?

PC: *Yeah, I didn't expect it to fall.*

LRH: Oh, all right. Okay.

PC: *Yeah.*

LRH: All right. Let me check it again. Have you told me an untruth? Now, I still get a reaction on this. That's it.

PC: *Oh. About my friend with the letter?*

LRH: All right.

PC: *My friend?*

LRH: Well, what's the untruth there? That's it.

PC: *Well, I'm not – I'm not absolutely positive I wrote it to the right address. Huh? Have to go back, I have to check my – my address book ...*

LRH: Hm-hm.

PC: *... to make sure, because I just – I wrote the address out, you know ...*

LRH: Hm-hm.

PC: *... after having remembered it. And I'm not – I have to check my address book.*

LRH: All right. Thank you. Is there an untruth in that anyplace?

PC: *Well, I said that ...*

LRH: What was the untruth?

PC: *Hm.*

LRH: That's it.

PC: *Well, that he – that I'm sure – well, that I'm sure that he would have – would have told me if he had moved.*

LRH: Oh, I see.

PC: *You know.*

LRH: All right.

PC: *And maybe he wouldn't have. I'm not sure that he would have told me that he moved.*

LRH: All right. Very good.

PC: *Right.*

LRH: Very good. Have you told me an untruth? All right. That's clean. Or said something only to impress me? I'll check that again. Have you said something only to impress me? Have you said something only to impress me? I haven't got any reaction on that. Your needle is banging around here ...

PC: *Oh.*

LRH: ... so I have to check it a little bit. Would you care to answer it?

PC: *I was thinking maybe that this overt on Robin I said, but it wasn't only to impress you. No, it wasn't.*

LRH: All right. Good.

PC: *Yeah.*

LRH: Let me check it again.

PC: *Yeah.*

LRH: Have you said something only to impress me? Now I am getting a kick on this.

PC: *Oh, it wasn't only to impress you, but maybe I – it was a little bit to impress you. This overt on Robin, about writing him notes and stuff ...*

LRH: All right.

PC: *... like that.*

LRH: Okay. Thank you.

PC: *Yeah.*

LRH: Have you said something only to impress me? That's clean. Or tried to damage anyone in this session? Thank you. That's clean. Have you deliberately tried to influence the E-Meter? Now what's the ping on that?

PC: *I was looking for that – that double tick.*

LRH: Oh!

PC: *You know?*

LRH: All right. All right.

PC: *Looking for the double tick that I had.*

LRH: Very good. All right. I'll check that. Have you deliberately tried to influence the E-Meter? I get a little tick on it still.

PC: *Well, I implied that I could influence, I suppose, to a certain extent, if I could "push the button." I said I could "push the button" there and get a double tick.*

LRH: Oh, yeah.

PC: *You know, and that – if that was true, then I could push the button any time and get a double tick.*

LRH: Yeah.

PC: *Sort of push the button.*

LRH: All right.

PC: *That wasn't true, you know.*

LRH: Okay. All right. Have you deliberately tried to influence the E-Meter? Very improbable. I will check it one more time.

PC: *Oh, I don't want it to read when – when I can't find anything to – to – for it to read on.*

LRH: Oh, I see.

PC: *You see?*

LRH: All right. Have you deliberately tried to influence the E-Meter? I haven't got a reading here ...

PC: *Yeah.*

LRH: ... but subject seems to be kind of mucky.

PC: *Well, I've kind of held my breath at times, hoping that I wouldn't get any read, or something on that. Read a body read or – I mean, it was silly, you know? I was sort of holding my breath or holding my body still and holding my hands still to make sure that the E-Meter doesn't read.*

LRH: All right.

PC: *You know.*

LRH: Good. All right.

PC: *Hm.*

LRH: Okay. Have you deliberately tried to influence the E-Meter? Well, this is a *bzz-bzz* ...

PC: *Hm-hm.*

LRH: ... sort of question. It isn't reacting very hard, but there's something there. Feel you gave me a lose by making – I was trying to clean up this double tick, or ...

PC: *Something to do with that. No, not so much.*

LRH: ... or something like that? Any feeling like that at all?

PC: *Yeah. Well, yeah, maybe – maybe I thought it at the moment when I said "What happened to the double tick?"*

LRH: Hm-hm.

PC: *And I thought, well, the double tick should have gone by now, you see?*

LRH: Hm-hm.

PC: *It cleared up with Gernie, then that was the end of the double tick.*

LRH: Hm.

PC: *Then it came back.*

LRH: Hm.

PC: *And in a sense I felt I influenced the E-Meter, or something, to bring it back on, you know, like that.*

LRH: Hm. All right. Okay. Now let me check this question again.

PC: *Yeah.*

LRH: Have you deliberately tried to influence the E-Meter? That is clean. All right. Have you failed to answer any ques-

tion or command I have given you in this session? Thank you. That's clean. Have you withheld anything from me? It's a trifle latent ...

PC: *Yeah.*

LRH: ... but what is it?

PC: *I was thinking there was one, just – there was one question that I may have failed to answer ...*

LRH: What was that?

PC: *... much earlier, and I'm surprised it didn't react. I was thinking there was one, and it should have reacted.*

LRH: Oh, all right.

PC: *Or something like that.*

LRH: All right, what question was it?

PC: *The one about "What about those meetings in between?" I never did find a meeting in between ...*

LRH: Oh, all right.

PC: *...you see, those two.*

LRH: Thank you. I'm sorry I asked you a double question there.

PC: *Yeah.*

LRH: All right.

PC: *Yeah.*

LRH: Have you withheld anything from me? I got a reaction.

PC: *I don't understand what you meant by double question. Or ...*

LRH: I ask you a question, you answer it and I ask you another question. I was just apologizing

PC: *When was that? I...*

LRH: Just a moment ago.

PC: *Hm.*

LRH: All right. Let me check this

...

PC: *Yeah.*

LRH: ... again. Hm? Have you withheld anything from me? Well, this – this is greasy. This hasn't anything to do with it.

PC: *Yeah.*

LRH: Have you withheld anything from me? There is not an instant read on this.

PC: *Yeah.*

LRH: Withheld? Well, there's a bing on withheld.

PC: *Yeah.*

LRH: Withheld? Yes, there's a bing on withheld.

PC: *Lot of things I'd like to talk to you about. I – you know ...*

LRH: Well, all right. Now, get the question here, now.

PC: *Yeah.*

LRH: All right. Have you withheld anything from me? All right. It looks much cleaner.

PC: *Yeah. There's a lot of things I – I don't tell you or talk about, or something like that. You know, sometimes I ...*

LRH: All right.

PC: *...I've withheld – I've withheld communicating to you how pleased I am to be on the course, and how – how – how ...*

LRH: All right.

PC: ... and how many gains I have got and how tremendous I think it is. That's all.

LRH: All right.

PC: You know?

LRH: Very good.

PC: But it's not an overt act. I'm trying to give overt acts that I've done and I've withheld, you know, or something like that.

LRH: Oh, I see. All right. Have you withheld anything from me? There's a slight needle change ...

PC: Uh-huh.

LRH: ... right there on the end of that.

PC: Uh...

LRH: There it is. There it is.

PC: Yeah. All right. All right. This is very funny. I – I got myself in the front – right at the front of the class ...

LRH: Yeah.

PC: ... this week, under the assumption I was no longer an old – a new student – that I'm an old student. Last week Herbie caught me in the third row from the back, in the first lecture, and I – here you know I – I kind of snuck up to the third row that first day ...

LRH: Yeah.

PC: ...you know. He told me I could sit in back, you know ...

LRH: Yeah.

PC: ... new student, next time. Well, yesterday I got in the second row from the front ...

LRH: Uh-huh.

PC: ... and no one caught me at it. If – if now, as – a little games condition thing there, and I was just seeing if – if the second week, if you're still a new student, and – and if I wouldn't be (a) I wouldn't get caught at it or (b) I would – could argue my way out that I was a new student.

LRH: All right.

PC: And – or something like that. Anyway, it's silly.

LRH: All right. Thank you.

PC: Yeah.

LRH: All right. Have you withheld anything from me? A halt as it goes, as it comes back up.

PC: Hm.

LRH: There.

PC: Hm.

LRH: There. What are you thinking about?

PC: Well, I ...

LRH: There.

PC: I had an argument with – a little argument with Robin.

LRH: Hm-hm.

PC: ... about – after I took over the post.

LRH: Hm-hm.

PC: And I ... oh, I don't know, I didn't tell you about it.

LRH: All right. Very good.

PC: Yeah.

LRH: Okay?

PC: Yeah.

LRH: Is that it?

PC: Yeah.

LRH: All right. Let me check this question on the meter. Have you withheld anything from me? It's just a little roughness. Pretty clean. Just a little roughness.

PC: *Hm-hm.*

LRH: Hardly detectable. A slowed rise.

PC: *I'm trying to differentiate between motivators and, you know, overt acts, and what's really a withhold, and what isn't, and, you know, I'm still a little confused on that.*

LRH: All right.

PC: *And...*

LRH: Does that answer the question?

PC: *Yeah. And I'm not sure what – what a withhold is at this point, in a sense, you see?*

LRH: Oh.

PC: *And...*

LRH: I see.

PC: *Because it ...*

LRH: I get you.

PC: *Yeah.*

LRH: Well, go ahead, if you want.

PC: *Well, it's just a "damage somebody," you know? I mean, it's not – see, I'm confused.*

LRH: All right.

PC: *You know, it's – it's that – that's – it's – it's – it's not a withhold, really, because I wouldn't mind telling you*

LRH: All right.

PC: *You see?*

LRH: All right.

PC: *So I don't ...*

LRH: Very good.

PC: *... but if I did tell you, it would be kind of a "damage"; then it would be an overt act, then it – you know, it would – the rudiments would go out. And then, you know, I'm a little confused on what's a withhold. It's something I did.*

LRH: All right.

PC: *And I can't think of anything I did that I, you know, withheld from you.*

LRH: All right.

PC: *You know.*

LRH: Let me check the question again.

PC: *Hm.*

LRH: Have you withheld anything from me? Still get a reaction.

PC: *Still get a reaction.*

LRH: There it is.

PC: *Right there.*

LRH: There it is.

PC: *Well, I – I – I ...*

LRH: There it is.

PC: *Well, it's kind of an overt act now. I changed the franchise thing a – a little bit while I had the post.*

LRH: Hm.

PC: *And it didn't really become an overt act until Robin got excited about it when he took over.*

LRH: Hm.

PC: *And then – then I – something happened.*

LRH: Hm-m.

PC: *And I put in some – made franchises a little stiffer, you know, to get a franchise.*

LRH: Hm-m.

PC: *And made co-audit centers beef it up a little bit to – you know, to get more information to them for people who didn't, I felt, deserve franchises or, you know, because they weren't working at it, you know?*

LRH: Hm-m.

PC: *To kind of give them a gradient to get up to a franchise. Well, I withheld from you telling you that – that since Robin had taken over he's – he's switched it back and made franchise very easy to get, you know, and everything else. And I think that's wrong. And I withheld telling you that I think it's wrong.*

LRH: All right. Okay.

PC: *But it's none of my business anymore.*

LRH: All right.

PC: *Huh.*

LRH: Thank you.

PC: *Yeah.*

LRH: Okay. Let me check the question. Have you withheld anything from me? Well, it's clean.

PC: *Yeah. Oh, is it?*

LRH: All right. Okay. Look around here and tell me if you can have anything. Thank you. Squeeze them cans. All right. Squeeze the cans. All right. Put the cans up on the table.

PC: *Yeah.*

LRH: All right. Touch the table. Now, we were running Feel, weren't we?

PC: *Yeah, well, same thing.*

LRH: Does it mean anything?

PC: *Yeah, yeah.*

LRH: All right. Okay. Touch the table. Thank you. Touch your chair. Thank you. Touch that. Good. Thank you. Touch the table. Good. Good. Touch the top of your head. Good. Thank you. Touch the table. Good. Touch your chair. Good. All right. Pick up the cans. Okay. Squeeze the cans. That's much better. Squeeze them again. All right. We are going to let it go at that. Thank you. All right. Made any part of your goals for this session?

PC: *I think so.*

LRH: Okay. All right.

PC: *I think cleaning off this stuff on Jack will help me in Scientology – (a) in Scientology, help me in my – in studying.*

LRH: Stay in PT while studying? All right.

PC: *Yeah.*

LRH: Good.

PC: *And – what was my other goal?*

LRH: Sleep.

PC: *Sleep?*

LRH: Sleep at night?

PC: *Yeah. Yeah. Yeah, no trouble. No trouble. Won't have any trouble.*

LRH: You're postulating that, or do you – do you know?

PC: *No, I know. I just know.*

LRH: All right.

PC: *I'll just go to sleep easily.*

LRH: You're not trying to make me look good?

PC: *No, no.*

LRH: All right.

PC: *No. I – I just – I just feel better, and feel kind of tired, and feel like sleeping, instead of nervously tired. There's a difference.*

LRH: All right. Okay. Okay.

PC: *Yeah. I've been nervous. And I don't feel as nervous now.*

LRH: All right.

PC: *So...*

LRH: I see. All right. Well, have you made any other gains in this session you care to mention?

PC: *Cleaned up on Scientology.*

LRH: All right.

PC: *Remembered a few things, that...*

LRH: Okay.

PC: *... didn't remember otherwise.*

LRH: Anything else?

PC: *Hm ... I just feel more rested*

...

LRH: All right.

PC: *...you know. I don't feel as frantic as I used to feel.*

LRH: Good. All right. Thank you.

PC: *I got on television again.*
[laughs]

LRH: All right. Okay.

PC: *It's a game.*

LRH: All right. Okay. Is there anything you care to say or ask before I end this session?

PC: *No, but thank you.*

LRH: All right. You're sure?

PC: *Yeah.*

LRH: Let me check that. Anything you care to say or ask before I end this session? Thank you. All right. You're all right, then, huh?

PC: *Yeah.*

LRH: All right. Is it all right with you if I end this session now?

PC: *Yeah.*

LRH: All right, here it is. End of session. Has the session ended for you?

PC: *Yeah. Yeah, it has.*

LRH: Has it?

PC: *Yeah.*

LRH: All right.

PC: *Yeah.*

LRH: Very good. Tell me I'm no longer auditing you.

PC: *You're no longer auditing me.*

LRH: Thank you.

E-METER DATA: INSTANT READS, PART I

A lecture given on 24 May 1962

Thank you.

Well, I'm glad to be in your midst. Actually, I enjoy lecturing to you. I do.

And, last night enjoyed giving a session. I thought that was the most, you know? You saw me lay a couple of eggs with this pc here earlier, you know, and remember, the earlier sessions were not particularly productive of any vast gain; pc didn't go downhill or anything. And last night, why, you see, I just got the idea that I'd better show you how to do some fishing and fumbling, and you might not have noticed what it did. It might have been all something or other.

All I did was let the meter wave until it ticked, and I just steered the pc onto a double tick. I just set out to clean up a dirty needle and actually, in that hour, made a stage of cleaning it up, and we got some of the stuff cleaned off it. And what do you know, it was right on his goal line. (You don't mind my mentioning it.) It was right on his goal line and everything was fine. And you notice, I didn't go out of this lifetime. I didn't even go back into his childhood, nothing. I held him securely anchored in the last three years. Remember? See that? Well, that's steering the pc. That's just fish and fumble. You can clear up some of the most remarkable things, particularly if you're aided and assisted by the fact that the pc has a meter pattern to start with.

But there was something very tricky last night that you might have missed – and that was just this and nothing more: was the handling of the stuck picture. Pc has a stuck picture; pc complains about stuck picture. You find session in which picture was first found; get the missed withhold off of that session. See? Don't you go running that engram, because it's a stuck picture so obviously it won't run.

Well, enough of that. I'm going to talk about the meter.

Now, what's the date? Twenty-fifth?

Audience: Twenty-fourth.

Fourth?

Audience: Twenty-fourth.

Well, what are you doing in the 24th? I was in the 25th. Well, I'll come back to the 24th. All right. It's the first lecture, Saint Hill Special Briefing Course, 24th May 62.

We have a lecture about the E-Meter. Once there was a cat, and he went sniffing along corridors in the open cracks below auditing room doors. Heh, heh, heh. And after being baffled for a very long time, he became a very wise cat. And out of all this we have – we have a single plea: use the E-Meter. I know that seems like a lot to ask but if you use it, it'll treat you right; and if you misuse it, wrong.

Once again we have a complete breakdown in progress that occurred here in September of 1961 whereby everybody fashionably was reading the E-Meter cross-eyed with the rudiments wildly out and everybody was plowing into the ground. And we have come again into that particular period.

Now, recently I have talked to you scoldishly and I've said, "Why don't you make your pcs look good?" Remember? Well, I'll tell you, your pcs don't look good because you're not reading an E-Meter. That's all. It's a gross auditing error – simple, factual, 'orrible to contemplate, but true. It isn't the way you are holding your little finger in a session. It isn't the fact that your thumb is insufficiently calloused on the tone arm. It isn't any one of a thousand things. It isn't because you don't have a command of Model Session. It isn't because of something weird or wonderful in the pc. It's just that you're not reading an E-Meter. That's all.

Now, that sounds horrible, but I don't think this applies to all of you. It couldn't. But it must apply in some degree to all of you because I don't see anybody listening to this lecture three feet off his chair. Today all you have to do is just exactly what you have to do. You don't have to do anything fancy. And that is a very, very rough thing to get through to you. We actually are there, as far as technology is concerned – been there for some time, but been improving, improving, improving, little bits, little bits, little bits. But, do you know, I don't know a thing today that you could audit on somebody that wouldn't produce a remarkable gain. See? I don't know anything we're using that wouldn't produce a remarkable gain on the pc.

And I caught you out this way: I audit a pc with exactly what you're using, he shines. You audit a pc, and I get an Instructor to check it and your rudiments are all out. How could your rudiments be out? It isn't that you're not asking the exact, proper question. Oh, you're asking the right question. But the needle goes over, hits the pin, bends; blue smoke comes out of the meter connection, the sensitivity knob becomes incandescent, and you say, "That's clear," and go on to the next question. And that's all that's happening. Honest. Honest. I plead with you.

Now, I know you think you aren't doing it. But Fred was telling me in the break up there, he says, "You know," he said, "I had to practice quite a while in practical, and I've suddenly realized I was just *not seeing* instant reads. And all of a sudden I started to see them."

There is some kind of an oddball phenomenon that goes this way: Your eyesight shuts off. That's the only way I can explain it. Now, what shuts off your ruddy eyesight? What shuts it off? So I had to ask myself this embarrassing question: Did we know what made an auditor turn off when he turned the meter on? Do we *know* that? And up till last night, we didn't.

So I had to figure out what happened. Well, of course, I had the data, but I had to assemble it. And so I can give you this cheerful information. You can stop looking as though I have just beaten you, because I haven't just beaten you. You see, if I hadn't confidence in you,

why, I wouldn't even try. But a few weeks ago I took a look at you all, and I realized that the gray sunken cheek, the thick and muddy eye, the dragging of oneself up the stairs, was not being caused by your late hours or lack of food or anything else, but must somehow or another be caused by the auditing. And I started on a campaign at that time to locate what was wrong.

Now, actually I wasn't trying to look *for* anything I was just looking to see what was there. This is always a good idea. When you are looking for something, don't make up your mind, like the psychologist, that you know the something you are looking for before you look. It's very remarkable. You can look across a whole beach of white pebbles for a white pebble, don't you see, and never find one. If you've already specified that in order to find a white pebble, it has to be black, you see, or something odd like this. No, the thing to do is just to go down to the beach and look, and not even look for a white pebble. Just – just look and see what's there.

That's always very good in research. By the Ford Foundation – I think it's 100 million dollars a month. I think that's the value of the research as done by the Ford Foundation – about 100 million dollars. Oh well, that's an exaggeration; it's actually 100 million dollars worth a minute, because of course they get no place. If the Ford Foundation's research along these various lines was to be chalked up in value, why, it couldn't be, you see, because they haven't gotten anyplace.

Actually, the Ford Foundation was founded at exactly the same day – did you know this? – of the first Hubbard Dianetic Research Foundation for exactly the same purposes: to discover the basics of human life and the mind. It's fascinating. And there they are. And it's cost them, since that time, several billion dollars. And they recently, a few years ago, just after they investigated a HASI in Phoenix, Arizona – they sent a representative down, and he gave a report of some kind or another – they wrote a letter to an inquirer that they had ceased to investigate in that particular field. Now, out of that we didn't know quite what to imply, but we've whipped 'em.

But the idea is that fantastic sums can be spent in research by taking records and compiling records and comparing records to records, and the next thing, when you get through you've got some records. They make nice bonfires; you can toast weenies over them.

But to date, this type of research which does all the lookingness on a via through symbols ... You know? We're going to mathematically compute it all. See, we've got a white tree in front of us, so we're going to mathematically compute as to whether or not a white tree can exist. And then we figure out that it can't, and we walk away. See? And that's very commonly the fate of research.

Who was it? Hegel or Hume, or... Hegel, I think it was. It was some such bird. Somebody or other had up and looked through a telescope and had found the eighth or ninth planet or – eighth planet, that's it – and somebody like Hegel, I think it was, said, "Couldn't exist because the perfect number was seven!" And for several years nobody would admit that it existed. All they had to do was train a telescope on it, but it couldn't exist because the perfect number was seven. Therefore, there couldn't be more than seven planets in this system. That's what's known as looking at the figures, you see, not looking at anything else.

So all of this kind of thing, I start narrowing it down. Now, the first observation was you didn't glow, see? I'm always looking, and this one I found. See, you didn't glow. That was obviously a fact. There was nobody glowing. To prove it: you're in the basement, aren't you, here? We're still using coal. See? That's enough, see. Proves itself, doesn't it? So... He wants some mathematical computation to go along with it, I'll just throw that one in, you see?

So from that I made a couple of assignments. Not necessarily sneakily. I really did just make these assignments. You see? And the assignments I made was one, I gave an auditor a list of questions – Prepcheck questions to be cleaned on a pc – and I gave another auditor a list of questions that had already been asked, to check over whether or not they were live. The best way to repair a case, you see, on a Prepcheck is to pick up all the questions left alive and clean them. That's the best thing to do. Ho-ho-ho, ho-ho-ho.

I also got some rudiments checked by your auditing Supervisor, and I was coordinating tone arm against out-rudiments. And one of the earlier discoveries on this: When the rudiment is out, the tone arm, she don't move. Important fact. That's a new fact. If the rudiments are out, no tone arm action. That applies to anything.

All right. I went ahead, then, and you saw the results last night of one of these people I checked out. This is not necessarily derogatory to the auditors who did this. There's no point in you going out and blowing your brains out, because we'll just have to pick you up in the next life and clear you again, see? Nobody is being condemnatory on this particular line. But it is indicative of something, and the thing it's indicative of is somebody wasn't reading the meter, because I'm absolutely sure – absolutely sure – that the auditor checked those questions but they didn't read right – something. Something, see?

Now, a further discovery of this: I find out that the auditor believed the meter did not react, and that there was some belief present that TR 1 must be out – that the auditor isn't delivering the question hard enough, you see, to the pc, or hasn't enough control over the pc to make the meter register. See, that could enter in, you see? And a lot of other things. You can explain this a dozen ways.

I actually don't buy any of that. I think the meter reacted and it wasn't observed. That was just as simple as that. Let's take the gross auditing error just as a gross auditing error, not a lot of mathematical figure-figure over alongside of the thing. Let's not try to figure out why, particularly, on that basis. Let's not say the meter didn't operate and the pc didn't operate because look, this has been several widely scattered pcs, which picked up immediately afterwards – one of them by an Instructor he could cheerfully strangle (the pc could: that Instructor couldn't possibly have anything with that pc but an ARC break) – and every single one of them reacted.

But we can't attribute it to some other mechanism except just this: He was a-lookin' at the meter, and the meter wobbled – the needle went *bap!* – and the auditor didn't do a thing about it. The auditor didn't see it. That's the only available explanation. Because other people hostile to the pc, in the pc's estimation, found the meter operating for them.

Do you think it's easy to sit up in front of that TV camera? It isn't, man. Not for a pc. Not easy at all. Takes quite a bit as an auditor to hold him in. And you saw those questions falling off the pin; but those questions had just been checked over, and some statement was

made that they were mostly clear. Now, afterwards we found out, although they'd been stated mostly clear at first, the auditor said that not all of them were. However, there was one there that the auditor had said was clear that was *not* clear on my test, see? Well, that wipes it out. The things were reacting, in other words. In other words, something was happening with the meter and it was not observed. Well let's not try ...

And listen to me! You see me crossing this bridge right now. You're going to cross this bridge. See? There's hardly a one here that isn't going to cross this bridge sooner or later. You're going to stand there speechless, whether in the HGC or an Academy, or with somebody who's helping you out as an auditor or something of the sort. I don't care where it's going to be, you're going to cross this same barrier, and you're going to say, "Mrs. Glutz is not doing better. Did you notice the blood dripping out of both her eyes when she left the session today?"

And the auditor will say – whether student or staff auditor or whoever it'll be, see – will say, "Well yes, but she's just a very difficult pc. She's very difficult." And if you don't know what to do at that point, you yourself will go figure it all out mathematically.

The thing to do is to get ahold of the pc and take a look at the pc. That's your first thing And the pc isn't better. See? That's good enough with modern processes. The pc isn't better. The pc does not look better. Therefore, somebody isn't reading the meter. *Bing, bing* – something. You wait! You'll be on this hot seat. And you'll get Mrs. Glutz and you'll put her down in the chair and you will hand her the cans, and you will say, "Well, now, let's see, now. Now, let me see. You just had a session. Now, in that session did you tell any half-truth? Untruth?" Tone arm action. [laughter] "Did you try to impress the auditor?" "Did you try to damage anyone?" There's no sense in going on checking it because the needle – the tone arm is now at 7. [laughter, laughs] And you'll turn around to this auditor and you will say, "Hey, Mike. Hey, hey, hey, bud. What the hell? What goes on?"

Hell say, "Well, they were all in when she left the session."

And you, you idiot, may fall for it. And you're liable to say, "But then what might it have been? Might it be that his TR 1 is bad? Or actually that the pc is so ARC broke that doesn't read on the meter for that auditor? Or is it the fact that they were clear at that moment for him but not for me? Or do they have mutual withholds between themselves which are then coming out because I am checking...?" I mean, you know, you can just figure yourself crazy.

Now, this is the one you want to figure: The meter wobbled and the auditor was looking out the window. Don't figure it any other way, because if you do figure it any other way, you will miss its cure. Thing to cure is not necessarily the auditor's eyesight.

How can an auditor get in that condition? By invalidating the meter, of course. An auditor can go stone-blind on a meter.

Now, how does this come about? The auditor is audited by an auditor who is stone-blind. Just exactly how do we get this chain reaction, see? He's sitting there early in his career, minding his own business, and his auditor says to him, "Do you have a present time problem?"

And he thinks, "Oh, my God, if I don't pay the rent by two o'clock, I'm going be thrown out," you see? And he can just feel this thing seethe, you know? The auditor across from him says, "Thank you. That's clear."

And he says, "You know, that said that didn't register." You understand, he couldn't see the dial so he doesn't know whether it doesn't register or not. He makes the assumption that it didn't register. "Didn't register, see? Feels like a present time problem to me. I guess the meter is... Well, all right. And I'll just ..." He just kind of suppresses it and goes through the session gritting his teeth.

Next session: (During – the night before, see, he was on a drinking bout with this guy's girlfriend, see, or something like that – whatever it was, it doesn't matter.) "Since the last session, have you done anything" (or something like this), "that you're withholding?" See?

"Oh boy," he says. "Man, when he gets this... I don't know whether I can get this withhold off or not. *Ohooooo*. I can just imagine him going out and buying a sound truck and driving up and down the streets, you see, with this particular withhold; because that's what they always do with hot withholds, you see? Well therefore, at no time will I..." you know. "But if I sit here real quietly and don't breathe at this moment as he asks the question, be all right."

And the auditor looks at him and says, "That's clear."

And the guy says, "*Whooh!* boy. That was lucky." [laughter] "Man. *Whooh!* Got away with that."

And this happens often enough to a point where a guy gets the idea that meters don't read. See, all it requires is for one auditor, auditing another auditor, to make one error – be looking elsewhere when the meter bangs. Just requires one of these, and you start this chain going. You think the meter didn't read. And this is very invalidative to the meter. You think meters don't read. That's where that comes in.

Well, of course, that happens while you're in-session and you're kind of non compos mentis at the time or too interested in withholding what you're withholding or something like that, you see, to pay – to go into this thing deeply, and so you close that one out. That's a total suppression. You forget it – and it lays the most beautiful chain in you ever heard of.

You know it should have read and it didn't read. Therefore, the meter is no good. But your assumption is the incorrect assumption, so it lasts in space, which is "meter didn't read." That is a lie. The meter read. And as any lie, it'll hang up. And it builds a whole chain up with somebody who is audited this way – builds an enormous chain.

The way you clear that chain is you just prepcheck the question "Has any auditor ever failed to find a meter read on you that you thought should have reacted?" That gets the unknowns out of it because that's the most likely area of unknown, even though it's kind of motivatorish. It's actually neither an overt nor motivator; it's just hanging in space. But it's quite unknown because it happened in the middle of the session while the pc was very interested in other things, see? So it's a quick one.

One of the ways the ancient medicine man operated ... I actually, at one time or another, have studied in this particular field. I remember about 1630 I was very disgusted; I did some study in North America on the subject of becoming an Indian medicine man. One of the fine ways to go about it is to learn how to scream. And if you can let off a good scream, see, that's got saw-toothed edges, that is twice as loud as any psycho's scream, see? – just a good, total-volume scream. You can stand close to somebody, scream suddenly, utter a command phrase, and then continue your scream. And it'll go in as a total implant. That is a crude and savage way of implanting, but very effective. This is your old medicine man. Make a terrific amount of noise, no noise for a second and utter a command phrase like "You are a pig," see, and then interrupt the scream at that point and then start it again at exactly the same pitch that you stopped it, and go on and finish the scream.

The person who heard this scream is unaware of its ever having been interrupted, and after the session will look at you attentively and say, "Oink." [laughter] Really will. I mean, this is quite, quite effective – quite effective.

There would be many ways to go about it. You could take a pistol and put somebody in sudden terror and shoot past his face, and then stop shooting for a moment and say something to him, and then shoot the other three shots, you see? He'd never have any idea that you ever said anything. It goes into an unknownness and makes a compulsion.

This is probably how the ancient magician enchanted things. Possibly princes *have* turned into deer in the forest. If you took a period in the magic universe when thetans were still capable of mocking up their own bodies, and you pulled some shocking stunt on the person and sandwiched into that "You are now a deer," why, he'd cease to mock up the prince and start mocking up a deer, don't you see? And he would be an enchanted deer. That would be how enchantments were accomplished. I mean, the mechanism of enchantment is no cruder than that.

So when you lay something in like a hellish invalidation of the meter, the person is so involved in their own think-think and worried, you see, about something or other – they're already very submerged and very withholdy – they get a further withhold on top of the darn thing, just as though they were being screamed at. You see, they're with – "Meter doesn't work," and then – "Meter doesn't work." But they don't know that. Except they can't read meters. See how you could do it to somebody?

But actually it wouldn't be just that motivator that made this thing come true. I'm afraid, for any prince to get enchanted, I'm afraid in the former life when he was a magician, he ran into a prince and committed an overt which was actually a motivator. And I think that's how it all got mixed up. He did the enchantment and somebody in front of him turned into a deer to hang the guy with his own enchantment. And then, of course, walked around the other side of the tree and became a prince again. See, you'd have to have an incident of that particular kind – the guy commits an overt that he thinks is an overt that is actually a motivator, but he doesn't know it is – in order to get some such goofiness started.

In other words, a pc is to some degree at an auditor's mercy. And when an auditor does something weird, makes some evaluative remark, the pc might be fogged up at that kind of an instant; and if it's too bad – *poohie!* It isn't that your auditing on a long range is going to do

anything, providing you eventually get rid of the person's GPM; because all of this hangs up on the GPM. When you eventually blow the GPM, it'll blow all the rest of it, don't you see?

So therefore, you have to audit in such a way as to not impede the pc from getting Clear. See? It isn't that you can actually hurt a pc, you understand? But the stuff is laying in against the aberrations and the GPM, see? And you got to audit a pc so that the GPM is *not* thoroughly restimulated, and so at the other end he goes Clear and the GPM blows to pieces. Got it? And then all the auditing and everything else comes off.

But in the meantime, if you do a rough job of auditing because the pc is in a rough state, why, of course, you get these implantations inadvertently – quite inadvertent. You have to be careful what you say to a pc who is in session, as you know very well.

Psychiatry, by the way – we find psychiatry hard to understand because the psychiatrist is always doing something on a goal line that we don't understand. We say we have a goal line. I ask all of you about this: What's your private opinion of why you audit a pc is a concern. But it's uniformly: to do something for the pc, help him out, something like that, you see? You all had that idea. Actually, psychiatry doesn't have that idea in treating a patient. They are not trying to make the patient better or cure insanity or anything like that. They have entirely different goal lines. So you find them incomprehensible.

By the way, in doing a 3GA, all the people who are incomprehensible are the people who would not want your goal. Those are the true incomprehensibles of this universe. You just can't understand them. And of course, you stop and think of a president of the United States who wants to be a piccolo player or something like that; you'd have a hard time understanding his foreign policy. You'd think he was being inefficient in running the nation, whereas he knows he's being efficient in running the nation. He is handing out enormous sums of money to disabled piccolo players, you see, or something like this. So he knows how to run a nation. He is president so he can go to concerts, see, and that helps out – comprehensible.

This would be the way – this would be the way most nations are run. Supposing, by the way, you got all the heads of state there are in the world that cause all this upset and misery and got them down the line and actually did a Goals Assessment on each one of them. I imagine it would be terribly revelatory. It would be a kick, man. You wouldn't believe it. God! The reasons they want to be president or king or commissar, generalissimo ...

Well, this goal line that the individual has is quite important. He's trying to get Clear and things that cross against it are all those things which we classify as auditing errors. You see, he's apparently being batted aback on the subject of his goal. Well actually, smooth auditing is designed not to bat his goal back. See? And that's the definition of what's right and wrong in an auditing session. Now, that doesn't mean specifically we have to know what his goal is or anything else. We just don't impede him on going forward. See? So the things that impede him we delete from the session. And we get some incomprehensible, like "Do you have a present time problem?" Yes, the individual does have a present time problem. Oh, my God!, you know. He's got this present – it's an antisocial present time problem, or something of the sort, and he really doesn't want to fess up to it, and he's right in the line of having to

make a horrible omission – admission – of some kind or another, and the auditor says, "That's clear."

Well, of course, he wanted to get rid of his present time problem, was his basic goal, and he didn't get a chance to get rid of it. So you've gone across his goal line, and you've laid one in, and that one that comes in is "The meter doesn't work." And he inevitably will make that conclusion at that moment. It's actually very upsetting if you go back and analyze the thing and go over it. You sit there very upset. You're saying to yourself, "My God! It's a good thing I got away with that withhold. Thank God I didn't have to get off that withhold." It's what you're thinking, kind of analytically, you know? "Whoa, oh boy! Would that have been embarrassing. This girl auditor and ... oh, gee. I'm so happy I didn't get off – have to get off the withhold, you know. She said it was clear. I don't think it was clear."

Hour and a half later – he's getting audited all this time, you see – "What the hell was the matter with the E-Meter?" you know? Well, he has to come to the conclusion it didn't work. See, the conclusion is – automatically, the response is "The E-Meter doesn't work." That's what's laid in. He knows it should react; it didn't react. So therefore what should react doesn't react, so therefore it doesn't react. And there's quite an upset about that.

I've seen this myself. I've had an ARC break – something like this – and the auditor wouldn't register, but I would, on the meter. In other words, I could ask myself the question, "Do I have a present time problem?" – the meter would go *plang!* you see? And the auditor would ask me, "Do you have a present time problem?" – it would sit there absolutely motionless. It was quite interesting. I've actually seen a meter myself, see? Now, with the auditor I said, "Well now, come on now, let's look at this. Let's look at this damn thing, you see? Here's a weird phenomenon." The auditor asks me the question – no reaction. I asked the question – reaction. Yeah, I was holding the cans. Fantastic!

So the meter can be ARC broke out of existence. But even so, the shock in not seeing the meter operate was quite something – a considerable shock involved in that operation. You know? She asked me a question: "Do you have a present time problem?" – doesn't seem to operate. I ask the question, "Do I have a present time problem?" – it operates. What the hell is going on here, see? I just couldn't believe it. You know, just stony-eyed disbelief. *Dahhhh*. I already have a good subjective reality on it – quite a shock. Patched up the ARC break, of course the meter operated for the auditor. Wasn't anything more to it than that.

You remember the time and date of this, because I studied this a little bit further and then found out that a meter could be inoperative in the process of an ARC break. But you'd have to ARC break the living daylights out of a pc before you got to this phenomena, and I don't believe we really reached this phenomena. That meter, by the way, I don't think was tuned to sensitivity 16. I think it was at a low sensitivity. I think it still would have read, one way or the other. But it was quite a shock to me.

Meter gets invalidated. At the same time the pc is ARC broke. Now, the next time this person is auditing, it sweeps, it reacts – perhaps minorly because his rudiments are already kind of queasy and the pc is halfway ARC broke. He gets a reaction; he doesn't believe it when he sees it. You could stack these up to a point where an auditor would simply be stone-

blind on the meter. He'd just never see a reaction, that's all. Or he'd try to explain the reaction, which is the same thing, you see?

You got one going right now which is very laughable. You know all about this, and yet I've had a despatch about it, and somebody else has had a despatch about it today. And that is: Do you take the reading during the sentence? Ah, this is just silly! If you ask yourself, what the hell? What is a reading which you get during the sentence? It's reading on the various words in the sentence, not on the sense of the sentence, so of course you ignore it. There's a prior read; you ignore it. There's a latent read; you ignore it. The only read you read is the instant read. *Bang!* If you don't get an instant read and you want to be sure, try it again. You saw one last night when I was auditing. You saw a prior read. Now, you didn't see me buy it. I said, "Well, we'll check it," and there it went that time – it fired. But we were getting some kind of a random read. Random needles are apt to read almost anyplace, but they won't ordinarily read two times running, accidentally. Do you see?

Now, you only buy an instant read. Just lay that in with iron, man – instant read. Actually, there is actually *no* time period at *all* between the receipt of your question and the response from the reactive mind. If there's any time period, it is consumed electronically. Might be an electronic lag. I've said a half, and a fifth, and a tenth, and I'm just trying to give you an idea of a small amount of time.

I was studying it the other day and I found out it was zero time. It's actually zero time plus the electronic lag. That electronic lag is pretty darn – pretty darn instantaneous unless your meter is damped. And to your eye, you really can't detect any lag. That's the only thing you pay any attention to.

There's only one other time when you use any other kind of read. You never use a prior read. You never use a late read, except this one. There is one exception and that is when you're helping the pc by steering. You're steering the pc's thinkingness. You saw me do it last night on a very broad scale: fish and fumble – very, very broad. I was practically sitting there waiting for the needle to hit on something so I could ask the pc what he was thinking about, you see? And then you've asked a question, you've got an instant read. You've asked him what it is; a moment later you see that instant read repeated, but this time as a needle pattern. You see, you see the same read so you say, "What was that?" see "What's that?" and so on. That's steering. See?

So it doesn't matter whether you steer it in a fish and fumble – just sit there and wait for the guy to react on something and say, "What were you looking at, at that moment," you see? "That. That. That." That's just steering. It doesn't matter whether you do it after you've got the instant read or without any instant read. You could use a meter in that fashion. It doesn't tell you anything. You just want to steer the pc's attention to something. And he, "Oh, well, that. That... oh, well, I keep seeing this stuck picture. That's what that is." It wouldn't matter what the "that" was or what his withhold was. It's just steering. It's the only time you ever use anything but an instant read.

Your instant read is never prior. It never happens before the end of the sentence. These must be single-clause sentences. It never happens except at the end of the sentence – the end of the word. Now, you can say, "Have you ever damaged anyone?" and get a "you," "have."

The person is all ARC broke on havingness, see. Have – clink. "You" – you know, "you" nearly reacts on all pcs? – clink. "Damaged," – clank! See? "Someone" – tick.

Oh, you could say to yourself, "Where the hell am I?" Well, just ignore all that earlier stuff, see? Just ignore the lot, see? And if you're not sure, say, "I'll repeat that. Have you ever damaged someone?" And *clang*, you'll get your instant read right on the *e* of "someone." It's right exactly – it's just as the tail of the *e* comes up, you'll get the instant read. [laughter] Particularly on a second repeat, because you kind of have worn a groove, see? You want to take a question apart – you'll get "have." "What about 'have'?" You'd be a real idiot to do this, see, but "What about 'have'?"

"Oh, I don't know."

"Well, what was that?"

"Oh, well, that was the Havingness session I had today. The auditor said it was my process because it kept tightening the needle."

"All right. 'You.' All right. What's that? That. That. That. That."

"Well, I don't know. It must be listing. We keep putting 'you' down on the list." [laughter]

"All right. Fine. Fine. 'Damaged.' Yeah, what's that? That. That."

"Well, I don't know what that is."

"That. That."

"Well, what am I supposed to be answering?"

"Just that. Uh – that!"

"But what am I supposed to be answering?"

"Well, just that! That's all."

Idiocy reigns, don't you see? That is your prior read. Just ignore the basketful, see? To hell with them. Same as latent. You wouldn't do anything with a latent read; well, don't do anything with a prior read.

When does a read become prior? Well, I would say anything up to a non-instantaneousness before you ended the sentence. And when – when does – when does a – when does a read become latent? Any non-instantaneousness after you have ended the sentence. I mean it's just as idiotic as that. I mean, there's – we're actually defining a cheese knife, or something like that. Crazy. I mean, it's so easy to read that you could keep missing it, you see? You don't have to compartment the question anymore to amount to a hill of beans. Ask it two or three times if you're not sure what it is. It all of a sudden will straighten out and read.

You see, you're actually talking to a thought of the reactive bank. Most of you make this fantastic mistake: you think the pc analytically can influence the meter, and he *cannot!* Absolutely *impossible!* He can do it on a via by thinking of something that he knows auditors always call on him. See, he remembers a session in which he had a missed withhold, but nobody has ever pulled, see? So he could actually go about this kind of a weird one. Every time

they ask him about something, he could think of that session, you see, and he'd get a reaction. But there must have been an unknown in the session. See, he could not-know enough about it, you see, so that he'd get a reaction by thinking of something that he knew he didn't know anything about. He could get a reaction. That's as close as he can get to it. And do you know, it always has a lag. You know, it will always give you a latent read? Because the guy has to sit there and think about the session, and the time it takes him to think analytically about the session gives you a latent read.

Now, an instant read can't ever go through the analytical mind and doesn't. It goes straight to the reactive mind, straight as a bullet. See, the reactive mind by definition is something that has never been timed, something that is still happening, something that is always now. And its "always nowness" deletes all time, and that is why you get an instant read. There's no time in the reactive mind, which is what is wrong with it. So of course it reads reactively *now*. And you think the pc knows the answer to what just flicked the needle. Now look, he can't move the needle analytically, so how the hell could he know it? See, there must be an unknown on anything that goes flick. I don't care whether it's a dirty needle or anything else.

Of course, you ask him if he has a present time problem and he's – he knows he's got a present time problem; he got reminded of it, you see, just at that moment. Terrific unknowns in this present time problem. It's the unknowns that fire. See? If something is not unknown to the pc, it won't fire, which is the other denominator of the reactive mind. It is a cauldron of unknowns which exist in "now" always.

So, you ask the pc something – it's because you only get a reactive response – the needle will not react. You sit there prepchecking somebody. You could get very impatient about it. But it sure makes the pc think, if he sees his auditor getting a little bit – crowding him. And he kind of *thuhuuuu*, and he thinks and grinds, and he looks and that sort of thing. The auditor could steer him around and say, "What's that?" Why does the auditor have to steer him? It's because he doesn't *know* what it is.

You'd ask – try this on a pc someday if you don't like him, if you've just been given a bad session by him yourself, or something like that; try this on him: "Say, have I missed a withhold on you in this session?" And the pc suddenly feels funny because, you see, he feels the surge just as you get, electronically, the surge on the meter, you see? So he feels this surge and he kind of knows "yes," you know?

You say, "Well, what was it?" you know. "What was it?" Don't help him out. Just sit there.

And he finally says, "Well, I can't find – I don't know what it is. Uh ..." and so forth.

You say, "You know what it is. Tell me." Don't help him out. Don't steer him. You can go on like this for hours.

But the pc is kind of looking around, you know, and you see a flick, you say, "That." He's looking at a table. He's looking at a picture of a table. Where the hell did that come from, you know?

"Ha-ha-haai ..."

"That," the auditor says.

"It's a picture of a table." Well, of course, it develops a little bit. He sees a little bit more of it.

"Oh, oh, oh, the missed withhold. Oh, oh, oh, yes! I was – that..." He recognizes what the table is. It's the table on which the E-Meter sits. He was thinking that the thing was awfully creaky, and he didn't say anything about it to the auditor; and it springs to view and all of a sudden you haven't got a reaction anymore. Why haven't you got a reaction? Because it's known.

So the more unknown underpinnings you have on something, the less reaction – I mean, the more reaction you've got, you understand? And the less unknown there is there, the less reaction. So magnitude of action... Beg your pardon, consistency of action – not really magnitude, but consistency of action – is determined by consistency of unknown and its immediacy in present time. So of course you can get a goal, and the goal will go bang, bang, bang, bang.

Well, you don't know what the hell the goal is sitting in; that's how that goal fires. We don't know the mass that surrounds it. How's it stay in place? What is all of it? What life did we lead? How come we got into that? You know, all kinds of questions like this. And yet the thing will still fire on the E-Meter. You say the goal – *bing*. Say the goal - *bing, bing, bing*. Say it every time, *bing, bing, bing*. You say, "What is the goal?" to the pc, and the pc can't tell what the goal is. Of course, that ought to wash out, shouldn't it? Uh-uh – *bing, bing, bing-bing*. That's why you have to audit them. See, it's a firing proposition.

All right. Now, this unknownness can get buried in. You can bury unknownness in the middle of an auditing session. You can sandwich it in just like the screaming witch doctor. They got one down in South Africa, yeah – or mostly Central Africa. They walk around... Not having seen it in South Africa; they kind of chased it out underneath the brush, I guess. But get a horsetail fly – a horsetail switch for flies, fill it full of fleas, shake it all over somebody; and while he's trying to brush them all off, say something to him. That's a version of that. That's implantation magic.

The Russians, being rather Asiatic, do this consistently and continually. Guy is en route to a questioning chamber and a woman dentist with forceps and so forth, steps out of a hidden door in the hall and examines his teeth and disappears through the same door. Shatters him! "Where the hell was she from? You know? What is going on?" Typical modern Russian tactic. Boy, these Russians, they go around this way, you know? This was what Pavlov taught them. I don't think he had to teach them very hard, for some of them.

I notice they made a terrific bid for popularity tonight. Fifteen-year-old boy swam across the river to get into West Berlin tonight, so they put – from the commie side – seven bullets in him. Mobs of people watching this. And they took him to the hospital with a bullet in his lungs and in a critical condition. Their bids for popularity are really marvelous to behold. They probably think it's the thing to do, you know?

But they do these surprising things. See? They do a sudden surprise in the middle of an action that makes an implant. Don't give them credit for being smart on this. It's probably a dramatization, because they don't do anything with it. You see?

You, knowing that, figuring out "And let's see, how could we use this politically?" "Oh well, easy. Uh, we'll have this guy – we'll play some Beethoven. And we'll have some soft perfume in the room and – lying on a soft couch – and we'll play some Beethoven, see? And under the table, out of sight, why, we will have the Moscow air-raid-warning siren – the biggest one. And just as he's all relaxed and listening to this thing, you see, we will press this button; stop pressing the button and say, 'You are a communist,' and start pressing the button again." The guy would walk out; he'd tell everybody he was a communist. We'd have done the trick, since a communist is more or less a robot anyhow.

I mean, you could apply these things intelligently. The Russians don't. You know, it takes them seventy days to brainwash, and they only get 22 percent. Isn't that interesting? You know, they only get 22 percent? I think this is marvelous, you know? Why do they try? Why do they try?

But this all comes under the heading of that sort of thing. Something that is invalidated secretly or privately – bang, like that – in a guy's mind. What is it? It's sort of interesting. You go over this. It'll make more sense when you get these things checked off, because it wouldn't take very long to check these things off.

You can go on and check it over, of course, on more of an overt proposition – just talking about getting rid of this meter blindness.

"As an auditor, have you ever deliberately ignored a significant meter response?"

When I first looked at that question, I thought, "My God." I-just had E-Meters all over in front of my face. I wrote the question down. All of a sudden this morning, I was sitting there looking at E-Meters. And I was willing to swear that I must have done it just every session. For just a moment, just having thought the thought "I must have done this every session, you know? I just must have ignored significant meter responses." So I just sat there, forced myself to remember exactly when they were. They amounted to exactly three.

One of them on you. I said I would take up the rudiments question in the middle of the Prepcheck session. In other words, "Are you willing to talk to me about your difficulties?" So I said, "We won't bother with it now because we're gonna take it up ..."

Another guy – I checked out a criminal and I couldn't clear it and didn't believe the meter. And the guy ran away with the crown jewels afterwards – you know, some such comparable action. And an early one, why, I asked somebody a question, and I got a response – an immediate and direct response on the question – and couldn't and didn't follow it up, and never developed it. And boy, was that fraught with havoc.

And there are only three. Think of the thousands of hours I've audited – there were three. And they had stacked up enough to give me an automaticity of meters, meters, meters, meters, meters, meters, meters, meters, meters ... My God, I saw meters going this way and that way. [laughter] Get the idea? I mean, they had it stacked right in.

Of course, the obvious one: "Have you ever invalidated an E-Meter?" And then another obvious one: "As a preclear, have you ever successfully persuaded an auditor the meter was wrong?" That's more hazarding it, but I know there are a few who have. And then: "Have you ever attempted to invalidate a meter read in order to keep something secret?" And I know some pcs have done that. But you notice in each case it says, "or any version thereof, or any version thereof, or any version thereof," and so forth. So you'd have to fool around with it and get the thing clear.

Now, I think it could – I don't mean to invalidate or make you believe that you are going blind and can't see anymore, or something like that, but the alternative is, is you're just plain wicked. And you aren't that either. The mistakes which could be made – "Are you just not seeing the meter bang?" See? You think that it's swinging all the time anyway, and you don't quite see the change of pace. Your eye isn't educated to seeing the change of pace, that's all. That would be one.

Another thing: your pc – before you investigate this thing and before you investigate your pc, you've already got him so ARC broke that the meter won't read at all. See, your TR 1 just is not responding on the pc because of the ARC break.

And the other one would be some confusion about what is an instant read. What is one? Well, of course, you see one, you see one. Last night Suzie was calling off for you just any read that came along, naturally. She was giving you read practice, and some of you took it that she was calling them all reads and thought she should have only been calling the instant read. I'll stop that. Why, she can call just instant reads next time. You will see these things read. It's the educated eye.

This is the grossest auditing error there is. It is the hardest one to put across. Nobody is trying to make you guilty, particularly. Well, I have got some ways and means by which you can feel easier about it. And I don't say that all of you are doing it, and I don't say that all of you are doing it always. But there's enough of it being done so that those pcs which I have checked out, or had checked out, in the last few weeks have been found to not – they weren't clean on whatever was being asked. Not only weren't clean on the meter but weren't clean physiologically on the questions.

You see, there are other ways to watch – you ask a pc a question, and he goes *zuuhmm*, *nyah* and *stuh* and *huh-huh* and blushes and squirms and ... Honest, it's as good as an instant read. You get all those reactions of one kind or another. Of course you add it up.

Observation – observation. That's the whole thing – the ability to look. I have always been trying to teach you how to look. Here is a direction to look; here is an instrument with which to look. And if I ever will just teach you just to look and to see what you are looking at without any interference or interpretation or anything else, well, I probably would have made a greater philosophic splash than any philosopher we've had on this planet, don't you see?

So this is the toughest one to get anybody to do, is just to observe. That's the tough one, see? Don't feel too bad. Just work on it. Get practiced up. All of a sudden you'll be right in there pitching. Okay?

Remember, once upon a time somebody delivered me a thing, and they said it was an Electropsychometer. And I sat up most of the night trying to find out what it did. And it was actually a week or two before I found out that it read on the needle. So you're in good company.

Thank you.

E-METER DATA: INSTANT READS, PART II

A lecture given on 24 May 1962

Twenty-four May, Saint Hill Special Briefing Course, AD 12.

All right. Now you seem to be considerably interested in what meters do, and you seem to be having an awful lot of trouble, one way or the other. I was going to talk to you about Goals Assessments in this particular lecture, but I won't; I will talk to you definitely about meters.

You know, you can get into more holes full of complication than anybody could easily dig you out of in a long while. You get complicated. And if you just would stop figuring and start looking!

I remember – went out one time – got a motorcycle off the boat, and I was straightening the motorcycle up and was trying to get the thing to function out in Camden, New Jersey. I was trying to get this motorcycle going so – lights wouldn't light, you know; and so we kept throwing the switch, and so forth. And it was just at that time this first cliché – the first time I had put out this cliché and so on. It was "Look, don't think." See? It was very funny.

And this little Francis-Barnett British motorcycle had a very complicated Lucas light system – its headlamp and everything else. And it was very complicated, very hard to get apart. All kinds of wires and condensers, and all sorts of things.

So I started taking it apart, and took the bulb out and took the wires apart and unhooked everything. We had parts that were lying around a good square yard. And then I happened to look down at the battery and the terminals weren't connected. We had all the job of putting it all together again. It would have taken about one minute to have put the terminals on the battery.

That was a marvelous example of "Look, don't think," because I'd sure done a lot of figuring right there on that motorcycle, you see, and the net result was dismantling the works.

You get doing this, and you get to figuring out what this is and the significance of that, and the complications of something else and so on. And I know what you're up against because there's a textbook called *Dutton's* which teaches navigation. And it is the textbook used by the United States Naval Academy at Annapolis; it's their key book on the subject. And it's – no doubt about it, it's a marvelous textbook. There is no doubt whatsoever that *Dutton's* is just absolutely wonderful as a textbook. Not a single datum of any kind on the subject of navigation that is not to be found in *Dutton's*. They modernize it, also, every year – marvelous!

You open it up, and sentence by sentence they machine-gun you with exact pertinent data with no amplification or further definition of any kind whatsoever. They don't bother to tell you it's a textbook on navigation of ships from here to there. They simply start in telling you, "This is the Earth and the sun and the planets and the alidade-amplitude angle dihedral in betwixt."

"A barograph is an instrument used to measure barometric pressure. It is read at two o'clock, four o'clock and eight o'clock." I don't know; what do you read? You read its directions? What do you read? You read the label on the – the manufacturer's label on the bottom of it? What do you do? Well, *Dutton's* never bothers to inform you about that. They're above all that, you see?

Unfortunately I collided – on a restudy of Earth navigation – I collided with *Dutton's* back in the middle thirties, hard, you see? There was everything there but an understanding. See? There was no understanding of what this was all about whatsoever, but there sure were hot data. Man, every datum in it was hot.

But there was never any side amplification, such as: You must always precisely locate the exact position of a battleship. See? See, it never says also that it is sometimes disastrous not to locate the position of a battleship. Your imagination is never invited. It is a dry feast of bare bones. It drove me stark, staring mad. I never learned how to navigate from it.

Finally got a book that – I think *Mixer's Primer of Navigation*, or something like this – and read this book. And it didn't treat it very seriously, and it was very happy about the whole thing, and I dug up a few data from that.

Actually, though, I thought it would be easier to go back and evolve the whole thing, so I did. Sometime in 44 an admiral was walking around on the bridge, and I was calculating something or other. And he says, "Well, I see," he says, "that you – how is this?" He'd just flown in, you know, from stateside. He wouldn't be there long because it wasn't very safe where we were. And uh – and he said, "I see," he said, "What – but – but how is this? You're using Commander Weems' new textbook on aerial navigation." And it puzzled him because it was just now in print in the States, and we couldn't possibly have connected that fast. No, I had accidentally evolved it as a simple method of navigation, and somebody else had evolved it. That was all. But it didn't come from *Dutton's*, but I imagine it's now part of *Dutton's*. And I imagine *nobody* can savvy it now. I mean, I imagine that's totally – totally lost.

But this is a method of losing information: is you just give a bunch of machine-gun data and expect everybody to hew the mark on that exact data, and it's never amplified, you see? So we have lots of examples of that particular character.

It is the *importance* of a datum that must be weighted. Weighted – you weight the importance of a datum. And you are so accustomed on this planet – you are terribly accustomed – to studying unweighted data.

Somebody opens up Krishnamurti, and he shows you three places in this book of Krishnamurti's whereby it's exactly parallel to exactly what we say in Scientology; so therefore Krishnamurti is Scientology. And poor old Peggy Conway – I showed her one day that these were totally unweighted data. They had no importance assigned to them whatsoever, but

were there with equal importance with about three or four thousand other datum. These other data were all there of equal importance, and they were – some of them were really wild data. See? So they were all equally important. In other words, there was no selection of importances.

And people keep forgetting this. They think all data are equal. And it's as big a mistake as to consider that all people are equal or anything else is all equal, because it's pretty hard to get an equality. Mathematically it's impossible to get an equality. You take an apple out here off a tree: and if you had another apple which is exactly the same size, shape, age, skin thickness, pattern of the skin, everything else, you'd say, "Well, that apple is equal to that apple." No, they're not equal. They're not occupying the same space. How could they be equal? All the characteristics of one apple would have to be equal to all the characteristics of the other apple and they're all – they're both occupying different positions in space so they can't possibly be equal.

Now, in order to study – I've heard this phrase "Learn how to study." I've had it thrown at me in very fine universities, very fine schools, and so on. Learn how to study, they say, and then they sit back. We should remember this: that there are several ways of laying out data. one is to lay it all out with equal weight with no amplification, no other explanation, nothing to assist understanding; we just machine-gun out a whole bunch of data – *brrrrr*, see? That's supposed to be real good. Your technical-scientific writer of today is educated to do this, and sometimes criticizes the writings of Dianetics and Scientology because it doesn't do only this.

All right. Now, there's another way of handling this stuff, and that is to throw it all out with tremendous obfuscations. You sort of interlard it with "Of course, you boob, you couldn't understand this anyway because it's all so complicated." And they do that in various ways. With footnotes: "Refer to Jervis Crack, page 39," you see? Of course, that book hasn't been available for the last century, so you've had it, you see. Well, what they're doing is doing a priesthood type of action. And most of the professors writing in modern university and so on, are guilty of that. They're trying to create a priesthood.

Now, the reason navigation sprung to mind, and the reason I talk about navigation, is they're exclusively devoted – not this *Dutton*, it's of another kind – but the navigator himself is devoted to the development of a priesthood. It is not for nothing that the early navigators of the South Pacific *were* a priesthood. And they were the reigning priesthood of Polynesia. Well, those birds, with a hole in a coconut shell and that sort of thing, navigated themselves all over the place. Quite interesting how they did it, but it was a priesthood.

And they surround this with a bunch of magic, and they surround it with a bunch of nonsense of one kind or another. Well, a chemistry professor is just as guilty. He gives you a whole bunch of nonsense.

But the reason a navigator springs to mind: if you were to go on a bridge of a naval vessel that had a navigator and to ask him how he was finding his position, he won't have you shot because that's illegal. Instead of that, he will either ignore you with a contemptuous sniff or utterly overwhelm you with a bunch of irrelevant bunk. That man is totally dedicated to the

protection of the cult. Navigation is what makes him important, and if every fool knew how to navigate he wouldn't be important anymore. And that would be that.

The textbook *Bowditch*, on this subject – I'm choosing an esoteric field (navigation), not that you're interested at all in navigation, but just because it's a – it's a – far enough afield that it won't confuse the issue.

Bowditch was a fellow up in the New England states who decided that celestial navigation should be decelestialized. So he did a bunch of tables and things of this character, and he went out on a China trip; and out of his little manual, which was about quarter of an inch thick, he taught even the cook to navigate by star-sights. It was marvelous. He taught everybody on the ship. He was teaching everybody up and down the New England coast how to navigate out of this little tiny book.

You should see that book today! Ha-ha-ha! It's also published by the United States Navy; and it is that thick, it's that high and it's that broad. It's the most marvelous thing for keeping a passageway door open you ever saw. [laughter]

But it has everything in it that has nothing to do with navigation, and it has tables developed which nobody has used for ages. And his original tables, I don't think, are even in it anymore. And yet it's called *Bowditch*. See, the whole thing has been obfuscated. Whole thing has been masked.

That is the way somebody swells up his importance. He makes himself very important. He's one of the twelve men in the world that can understand Einstein. Oh, I don't know, if there was anything there to understand, I think that more than twelve men could have understood Einstein. I took one of the twelve men in the world who could understand Einstein, and I went around to him to have him explain it to me, as the associate editor of the college paper, in a short article. (I was making friends in those days.) I wanted him to give me a short article for this college paper so that I could explain Einstein to the student body. He was very insulted. He was very upset, but is – I wrote an article.

But years afterwards, I was talking to a friend, and he was a pretty good scientist. He was good enough to be kicked out of the government; he was one of the sixty-four that were released for doing their duty. And he said, "Theory of relativity? Well, let's see? Mass equals mc^2 . Well, let's see if we can't do – I wonder if it couldn't be explained rather simply?"

And so we boiled it down and told it to a kid and he understood it perfectly. There wasn't much to this, except what? The vast importance of the person. See? Somebody is using this as a cloak of rare bird feathers, you see, so he can stand before the idol and tell everybody how important he is.

Well, these methods of communication of thought, methods of communication of data – now, we're in an interestingly peculiar field, because the data that is being communicated is in actual fact totally new data that everybody already has. That makes it very peculiar data indeed. Now, there's no language that embraces this because language comes after the fact – before the fact, rather – of the data. And so you get a few terms mixed up in it. It's nothing compared to medical terms or other fields. Nevertheless, it has the frailty of having new

terms. But you have to have new terms, otherwise everything you describe would be a whole package.

I could probably dream up an example and say, "Well, the combined impulses derived from force and duress in the past which have become forgotten but which are capable of impinging themselves upon the individual." Wouldn't you like to say that every time you said "reactive mind"? That would be pretty grim, wouldn't it?

So naturally, you get conversant with this, you start developing a bit of a shorthand. But the shorthand mustn't itself be terribly obscure, and most of our stuff is not obscure. We don't invent words where we don't need them; but we do invent words where we shouldn't be confused.

Now, we lack a complete dictionary. That we should have – there's no doubt about that – so that you could look up any phrase and understand it better. We've been in the throes of making up a dictionary for years. I had the notes on my desk recently, just a few days ago, to start recompiling the thing.

Trouble is, it's costly. That's the only thing that's wrong with a dictionary. You'd have to put two or three people on it for several months to really knock a dictionary together, because you'd have to listen to every tape on which every word had ever been defined at any time; and put all the definitions down for a single word immediately following it, and then that would be a worthwhile dictionary. It would also be quite a worthwhile textbook.

But it happens to be a labor. It's mostly labor: listening to tapes, taking down every definition; looking up all the textbooks, taking down every definition, you know; writing each word on a piece of paper, and then writing each definition that has ever been defined for it – because they've been defined several times.

Well, we – that is a barrier. There is no doubt about that. But what I try to do, the way I try to teach you this, is teach you one very simply and try to give you the weight of the datum – you know, how heavily this is weighted in comparison to other data, see?

I tell you "This one is important," see? And then because there are quite a few important datum, I very often make the mistake of not saying to you that there's a lot of data along this line that's not important. See? They don't amount to anything; they're merely interesting. Well, I tell you that – even that, too, occasionally – that it's an awful lot of bric-a-brac and phenomena.

Well, what happens is that I give you a datum that's important, and you very often pick up a piece of bric-a-brac that's right next door to it that is interesting. See? And you get the two things confused. You know, this other one's fascinating. There's no doubt about it. You start fooling around with things in the mind and there are fascinating things. The floor of the 'ead is strewn with them, man. I don't know how you can live in there.

There are many fascinating data; they are terribly, terribly interesting. Why, if I sat down and wrote everything I knew about needle phenomena or phenomena which could be disclosed by a meter, my God, it'd be something on the order of four or five million words! I know tremendous lots of oddities, fantastic things that you can do, all of which amount to a hill of beans. They're just of no importance at all. Amongst all of that, there are only a few

important data and they are boiled down into that savagely condensed book *E-Meter Essentials*.

Now that is an example, by the way, of a terrific boil-down. The instant read, however, is not described in that book. It is now described in the second edition, but in the original edition it's not described.

Now obviously, it should also be part of my responsibility to tell you what's *not* important. But look! But look, that's four or five million words, see, compared to a few hundred. That would be a job, man.

And you want to know about teaching you some of this stuff, what is utterly, staggeringly fantastic, you see, is trying to guess what you're going to do wrong next. And I tell you, man, that would keep somebody awake all night if he really worried. You know? I worry about it enough. But trying to guess which way the mistake is going to go – because, you see, it can go into any of those unimportant channel. See? And they're just infinite in number.

Now, right now you're riding the hobbyhorse of the interim read, the prior and interim read. Because the word *latent read* is forbidden, you see – I mean, the subject of latent reads we're not interested in – I've omitted saying that there's such a thing as a *prior read*, see? Well, it is also forbidden, see?

A prior read is as bad as a latent read. You only want an instant read.

But what is an instant read? It is that read which takes place immediately after the expressed thought. Now, if you sum that up as a definition, you will see that it precludes – that it is *thoughts* that impinge – not words – on the reactive mind. It's thought, not words. You may express them in words, but they impinge in thought. The reactive mind doesn't actually react to words. The words translate through symbolism into thought, you see? You got the symbols of the words, and then that melts down into thought. The reactive mind responds to the thought impulse. So you can have a lot of thought impulses in one thought.

"Have you seen any gorgeous, good looking, luscious, marvelous, sensational women lately?" How many reads would you get? Man, that's up to you and the gods.

Now, because you are thinking the thought, and if you read this as a straight thought through, the reactive bank at first – only at first – will impinge on every thought contained in the major thought. So you get a whole bunch of prior reads. And then it finally grooves in that *this* is what you're talking about, see?

The major thought is "Have you seen any women lately?" See? "Have you seen any gorgeous, beautiful, luscious, you know, women lately?" That's the big thought. And it'll register as "Have you seen any beautiful women lately?" as well as "you," and "seen," and "gorgeous," and... Get the idea?

Well, the funny part of it is, is you can groove in the major thought or the minor thought. "Have – you – seen ." See? You're going to get reactions by this time. That's a sort of a punctuated reading of something. You're going to get action, action, action, action and then action on the thought.

Well, you saw an example in the demonstration I gave you last night of a prior read. And I threw it away and asked the pc again because I couldn't tell if it was a read or not a read. I just threw it away; I didn't pay any attention to it. It was the one time in the session when that occurred – that something fell on the middle of the last word. Obviously invalid, but it showed that it might have been instant; it all depended. So I just checked it again. But that only happened – in a whole hour of session – only happened once. See how rare that was?

Now, you got the packaged thought. Now, if you repeat that thought, through to the pc, you have restimulated the thought *majeure*, see – not the thought *mineure*, the thought *majeure*. We could have a lot of fun if we were really – really fish-end tails, white tie, you know, type of subject treatment, you know, on the subject of Dianetics and Scientology, you know? You would be learning about the thought *majeure*, you see, and the thought *mineure*. Oh yeah, we could be fancy. Don't let me kid you.

Actually the trick of communicating the whole subject of the human mind with as few words – new words – as we use is quite a trick. That is actually one of the big things that we got, you know. We don't have to go four years to study Latin so that we can abuse *it*.

No, the thought "You seen any beautiful women lately?" is inherent in your statement. And so most of the time you simply read it and "you" almost always will get a reaction, by the way, and so on – whatever it is.

All of your interim spots may get a reaction, but you're only interested in the reaction which occurs with the last word – the end of the last word. It's not after you stop speaking, it's when the whole thought is completed.

Therefore, you'd never use more than one clause, but you can even get away with using several clauses and still get a reaction – lot of phrases and clauses and so forth.

But it may take you two, three or four reads to ring it in. That is one of the reasons you read a goal three times – because it might fall interrimly, might fall randomly. But you want to get the thought expressed. The thought has got to be expressed through to the pc. So you could never read it really successfully less than three times aloud to get the whole thought, that's all. The whole thought delivers through.

Most of the time, oddly enough, the whole thought does deliver through and react. But just that once in the hour's session, you see – well, we got some other interim reads – but only one interim read came so close to the end that a fellow could have made a mistake – indistinguishably close, halfway through the last word.

Well now, the point is this, is the pc's thinkingness isn't turning on the read. It's the pc's reactingness which is reading. So there's no understandingness of any kind consulted on an E-Meter read. It is all stimulus-response. There is no understanding of any kind. It's as though the reactive bank can listen and react. Oddly enough, it can.

It is the auditor to the reactive bank, not the auditor to the analytical mind to the reactive bank. That always gives you a latent read. You got an instantaneous proposition here. Doesn't matter how mysterious it is or isn't. It's just you've just got an instantaneous proposition. It's you – you read the thought, and it reacts in the reactive mind. And honest, the pc can

be doped off, nine-tenths unconscious, goofed off, everything else, and it will still read. I've seen a pc sitting there practically snoring and everything reading. I made several tests on this. I was flabbergasted! You could have said to him, "Women, women, women." You got react, react, see, just this nice *pang! pang! pang!* – three instant reads, nice strong ones. And you could have said, "What did I say?" And he'd say, "What? What's that? What? I don't know. What did you say?" He didn't know, either. See how crazy that is?

Until you actually explore that, it still looks to you as though you say something, the pc analytically hears you and then reacts to what you said, and it is not that cycle at all! That is not the cycle which takes place. I don't care to elucidate even what cycle takes place rather than invent knowledge, but that cycle does *not* take place. See, I can tell you which one *doesn't* take place.

You say it, and he reacts. What reacts? Reactive mind. And that's got to contain timelessness and not-knowingness in order to get a reaction. If you don't have timelessness and not-knowingness, you don't get a reaction on the meter. It's as simple as that. If he thinks of something in order to get a reaction, you always get a latent read; you don't get an instant read.

Oh, you want black magic? There it is. The reactive mind of most people is black enough. Look at the GPM sometime.

But of course, you have all of your latent reactive thinkingnesses of former identities are stacked up there like Genghis Khan's pyramid of skulls. There's plenty of them. And all of that combined thinkingness and reactingness, and so forth, has amounted to a GPM. So it'd be wonderful and marvelous that it didn't respond. But remember *it – it* I said. *It*, not the pc.

Actually, this is technically incorrect: "How did the pc respond on the meter?" The pc never responded on the meter! *It* did. *It* did. And when *it* responded, it did it instantaneously, exactly, peculiarly, at the end of the thought *majeure*.

I'll hang you with one just so you can feel upstage. [laughter] So if you're at some party sometime where there's nothing but professors, you could say, "Well, we mostly deal in the thought *majeure*." [laughter]

But there is this – there is this weirdity. Now frankly, you think sound travels at eleven thousand – eleven hundred feet per second, and so forth, and such. And undoubtedly there are lags developed in here because of sound, and so forth; but remember I don't know that. See, this is to some degree an invented piece of knowledge.

And we could calculate it out and say that the auditor's length of time to pour out to the end, plus the length of time of his voice impulse to the pc's ears, plus the length of time to the reactive bank, plus the time consumed in restimulating the electrical responses of the reactive mind, plus the lag of the E-Meter would be how long it took for the read to read instantly.

Now, I don't know, maybe we could sit on one mountain top and have an E-Meter lead from Mont Blanc over to Mount Punk, or something of the sort. And we yodeldeehoo, you see, across and ask some restimulative question and see how long it takes, and measure the electrical current and measure the amount of time in the air; and maybe we could do a lot of things like this and maybe we could learn a great deal. And I'm sure if some professor liked to

mountain climb, he would spend the rest of his life establishing that fact. We're more interested in the subject *majeure* rather than the subject *mineure*. Anyway – . [laughs]

So the main thing we're interested in is the thing reacts instantly, and it reacts instantly at the end of the thought. And of course, it will react to interim thoughts.

You say, "Have you, you swine, damaged any pigs lately in this session?" See? Well, now you're throwing yourself a curve if you add "in this session" because it's a clause after the thought. The modifying clause coming after the thought "fubbles" the whole thing up. So you should say, "In this session," and then you should drop the interjection "you swine," [laughter] and you say, "In this session, have you damaged any pigs?"

Now, this is the liability of reading a meter. Supposing the pc has an item called pigs. Now, you'll get into one of the world's most marvelous tangles, because it's reacting on the word "pigs," and you don't know whether it's acting on the thought *majeure* or the thought *mineure*. You don't know which is which. And that's the only time you can really get tangled up.

Say the pc's goal: "To catch catfish." And you're trying to test out the way to list it. Now, "Want to catch catfish," you know, "Who or what would not want to catch catfish?" "Who or what would not oppose catching catfish?" "Who or what would oppose catching catfish?" will all react on an instant read just like the goal, won't they? Isn't that horrible? That's very confusing because then you can't tell which is the right phrasing to line up on, unless you read them two or three times to groove it home, at which time, oddly enough, the goal will no longer react as the goal but will only react as a thought *majeure*. And that's a little test that you ought to make just to convince yourself – show yourself, what it is.

Take some highly restimulative interimly worded sentence – I don't care what it is – that as a major thought adds up to a whole, that you know would be hot on the pc. He's got some old item that's still in, see? Some kind like this. Put that on the end. And then you will see after you have read it about three times that it only acts on the thought *majeure* and will not act on that item. But the item will act separately.

You can take the item out of the sentence. Even though it occurs to the end of the sentence, you can take it out – it's just marvelous, you know? And you can set it out there all by itself. And you say, "Pigs, pigs." First time it doesn't react; it's cautious, see? "Pigs." Now you say, "Pigs, pigs, pigs, pigs." After that, "Pigs, pigs, pigs, pigs, pigs."

You put it back in the thought *majeure*: "In this session, have you injured any pigs?" No read. This is mysterious, man. Of course it might read the first time as just an additional "pig," but then groove it in again – groove it in again. "In this session, have you injured any pigs?" No, it won't react. Mysterious!

Now, the mysteriousness of it is: is below the unknowingness there is a terrific power of retention in the reactive bank. It is another one of its characteristics. It has fantastic continuity, fantastic survival. Otherwise it wouldn't be here. And what is put into it then acquires this characteristic of fantastic survival. So you have time, not-knowingness and survival. So what you pour into it will continue to react.

The delicacy of its operation is another astounding thing. If the goal is "To injure pigs" – that's the actual goal – and the wording which you have on the list is "To injure a pig," at first, "To injure a pig," will react and will then cease to react, and will react and it'll splutter and monkey around, and you won't quite know what you're doing on the thing. And all of a sudden the pc – you can never change it for the pc – the pc is liable to say, "Oh, well, that's – tha-that's to injure pigs." *Pang!* It's a marvelous precision. This is an old study in Dianetics, is the fantastic precision with which this thing will do it. "To injure pigs," that's fine. It'll react from there on out. See? But "To injure a pig" – sporadic, not in.

Don't also think that total retention is total wisdom. It isn't. So you get this kind of a circumstance where if you're a tiny bit offbeat you won't get the reaction.

Now oddly enough, you can get a generalized thought which is close enough in to get the reaction, and that's where you get your What questions from. That's why you actually ought to fish for your What question. "What about wrecking cars? What about stealing and wrecking cars?" The pc unfortunately used the word "swiping cars," and you're trying to get on "stealing cars," and my God, you never get a What question.

Last night we had a word. If I'd used any other word than that exact What question, if I hadn't used the word *conned*, it wouldn't have reacted. The pc said it so that must be at the base of the chain of the overt. Your clue must be taken from the pc.

Now, you can play ducks and drakes with this thing You can throw it all over the place, and so forth, as long as a central pin stays there to hook in and identify. You got to have something that will identify. You got to have a thought that associates and so on.

Well, you're doing an interesting thing. You're taking the whole of an overt act, which was all in terms of action anyhow, and you're putting it in terms of English, which it might not even have occurred in, and that thought embraces the action which took place which was the overt. Oh, my God! Nobody would be able to build a machine that did it. That would be utterly incredible. And yet the reactive mind can do that much of a stretch.

But "What about stealing a lot of cars? What about stealing cars? What about stealing and wrecking cars?" *Bang!* On another instance the pc said, "Well, I swiped a scooter." And you say to him, "What about stealing children's toys?" You know? BBC, you know, type of response. Nothing happens. You have to sound out your What question.

Now, you can alter it this far: "What about swiping toys?" That will be dead on. That's okay.

But you altered the doingness, you see? And the thought of the doingness shifted. You have to keep that pretty well the same, don't you see? And you have to have some – at least some associated object to make this thing react, but it will react every time.

And the odd part of it is, why does it react after "toys?" Why does it go "toys," See? "Toys" – click. Why? It's the total thought. All I can tell you is it does. And if you have a question which reads "What (tick) about (dirty needle) stealing (tick) toys? (fall)," you ignore everything but the fall. You don't do another blessed thing with a prior read. You just skip the lot. If it doesn't fall at the instant you said "-s." See, "toys," "toys"-fall. If it falls at "t-" (fall), it's not an instant read.

Don't tell me why the reactive mind does this. I couldn't care less. Just take it from me that it does. Then it cleans up and everything squares up and the pc feels better and it falls apart. It's almost as if it's drawn itself a complete plan of "how you take me apart." Most fantastic thing. All you had to know about the whole thing from beginning to end was exactly . You had to be able to look and observe.

Interim reads are so common that if you tried to pay any attention to an interim read on "Have you tried to damage – In this session, have you tried to damage anyone?" Suppose you're asking such a question, and it fell on "damage," – you knucklehead! The worst you could do – you saw me do it one time on an earlier session. I wrote "damage" over in the margin. I knew it would be a hot Prepcheck question, but ignored it for that because it didn't fall on "anyon-e" – See? It's just a curve of the "e" and then the action. See? "In this session, have you tried to damage anyon-e?" – *ooo!* There it goes right on that "e," see? Not earlier, not later, but right on. Marvelous. Why it works this way, God knows.

You know, I think even people with the big-thetan theory would doubt it. It's too incredible. But that is the fact. And you'll find out this pans out every time. You find out if you clean off that instant read at the end of the thought major, you'll be all set. And if you start monkeying around with the interim reads of the thought minors, you are going to fall on your 'lead every time.

Now, you very often will get in severe trouble putting together goals. "To go out and pick potatoes and sometimes have a girl in the potato patch." Man! And it falls on "to go out," and it falls on "and pick potatoes" and "to have a girl," and it falls on "potato patch." And there's no instant read after "patch." After you've said it three times, there is no instant read after "patch." Well, I'd say it has something to do with the goal, probably, in some version or form or another, as will eventually arise. And I'd get all the invalidations and the missed withholds and suppressions off of listing.

That's another one I should take up with you. I'll take it up with you right now.

When I say "listing," I don't mean items. When I say "Take it off the subject of listing," I don't mean take it off the items of listing. When I say "listing," I just mean listing. You say, "Is there any missed withhold on listing" See? "Have you suppressed listing?" "Have you invalidated listing?" "Have you ever committed an overt with listing?" That's the way you phrase it, see? That's listing. Listing. It is a subject. You could even say "Goals listing."

And when we say – when I tell you "items" or "individual items," why, then, I mean a goal or an item or a straight line.

"Is there any item on this list which has been invalidated? Thank you. Is there any item on this list on which there is a missed withhold?" Too complicated a phraseology, you can't get across the thought *majeure* easily, so you say, "Is there any item on this list which has been invalidated?" Say it the second time. And you get your click. Marvelous to behold; you'll get your click, and you clean that click off.

But you – there is the subject of listing, and then there's the subject of goals, and there's the subject of items in general; all of these things are different things that you can do things with, you understand?

Now, in this rundown of the goal, if you don't get your instant read on the end of the goal by the third time you've read it, it ain't it. And you certainly better ignore it. But very possibly – not positively at all – but very possibly potatoes have something to do with this goal, or maybe it's girls have something to do with the goal. Of course, we can't guess.

Now, I've even gone so far, experimentally, as to try to pick out all of the various words that had reacted and put a goal together for the pc. Doesn't work. Evaluates for the pc and throws the whole thing into that. The pc will give it to you eventually. You get all the withholds off the subject of listing, all the withholds off the subject of auditing, all the withholds off the subject of items, goals, that sort of thing. Any overts that might have occurred in this direction – just explore around, get them all over. And all of a sudden you say, "Well, are there any more goals?"

"Oh, yap, yap, yap, yap, and yap, yap, yap and yap, yap, yap, yap, yap, yap, yap, yap, yap – 'To lay girls in the open.'"

All right. You're nulling on down. There was your potato patch. See? Only this one will go "open" (*bang*), "open" (*bang*), "open" (*bang*). You see your read? Instant read, instant read, instant read every time.

It does not matter how many reads you get that are prior to the instant read. You ignore them. Please believe me. You just ignore them. It does not matter how many reads you get *after* the instant read. Ignore them. But you must put across your thought *majeure* to the pc. And if you got the thing all participially occluded, why, prepare to stand there for several reads before it'll finally embrace.

But oddly enough, no matter how complicated it is – I don't know, I think you could probably get – you could probably get a fall on *Uncle Tom's Cabin* where it says "The End"; you get your instant read, you know? But you would have had to have read it to the reactive mind fifty or sixty times, and I don't think anybody could stand that. [laughter]

So that stable datum – get used to that stable datum. Live with it and you won't have any trouble on the thing. And God almighty never ignore one. *Teowwwwwww!* Never ignore one.

On the subject of rudiments, middle rudiments, something like that: "A little while ago when I was talking to you about that goal, did you get an ARC break?" And it goes *zumth-zwy* – ARC break, goal – *zzzm-zzzumph*, you know? "A little while ago when I was talking to you about that goal, did you get an ARC break?" Now, you'll notice there's less randomness in it. "A little while ago when I was talking to you about that goal, did you get an ARC break?" – *Clank!* You put the thought *majeure* across, and it now is impinged, and it will react. But why did it take so long? That's because it's so complicated.

You would have gotten your instant read like this: "In this session, have you had an ARC break?" – *Clank!* See? Simple: fast. Complicated: takes you a while. A complicated thought *majeure* takes a lot of pounding before it is finally embraced and will give you an instant read.

Now you say, "In this session, have you told a half-truth? Untruth?" See? That package question possibly leads you astray, because there you are using a packaged bunch of instant reads. Actually, you're shorthanding: "In this session have you told a half-truth? In this

session have you told an untruth? In this session have you tried to impress me? In this session have you tried to damage anyone?" See? Oddly enough, you could package the whole thing together and use the interim reads. Oddly enough, only that one will go down; particularly after the third or fourth or fifth session with the pc, because the reactive bank is now grooved into that thought *majeure*. They're very obliging. A pc who is under control really responds.

This is all rather incredible. Why does the reactive mind react? Why does the E-Meter work? Well, I won't be so stupid as to try to force on you the same orders that the six hundred had at Balaklava, (which is some sort of musical instrument they didn't play well). There's this type of think about this. Now, I could say to you, the Instructors could say, everybody could say to you: "Now, look! When it gets an instant read, read it! Now, you don't have to understand it. Just when it gets an instant read, read it that way. That's it!" See?

And you say, "Yeah, but why does it read that way?", see, and so forth. You've got a perfect right to ask that question, see? Got a perfect right. *Why* does it only give an instant read? And why can you groove in a thought *majeure*? And why does it sometimes read on the thought *mineure*? See? Why? Why? Why? Why? Why? Like little Arthur says, see? You've got a perfect right to say that.

And I got a perfect right to tell you, "I don't know!" [laughter] It just does! This is a whole set of fortuitous accidents based on direct lookingness and on no figureness. There's very little think involved with this thing, you see?

The E-Meter itself, I think, was a Decca voltmeter which a guy held both sides of and it reacted, in its most primitive state. I think it was Richard Saunders at Elizabeth, New Jersey was monkeying around with this. He wanted to show doctors that there was a response, and he knew they would look at meters. So he pinched the living daylights out of a pc, you know – made him black and blue, you know – while they were holding on to this thing, and then told him to recall it and got the same response on the meter.

Well, fortunately today we're not dealing with that level of insensitivity on the subject of meters, because think of how you'd look at the end of session. [laughter] But this was picked up one way or the other or independently gone at by Mathison. I gave a lecture, described what kind of an instrument we really had to have. Mathison went home and he bread-boarded one up. It functioned remarkably well for its original state. It was very limited. Pcs went off the top of it and went off the bottom of it with the greatest of ease. I think they possibly still do on Mathisons.

But anyway, time went on and around Washington, why, I eventually thought it would be a good thing to have this one, and Don Breeding, and the rest of the boys got scratching their head over this thing, and old Joe Wallace and so on. And they kept hanging things together.

And then they'd do a perfect one, you know, and then they'd scrap it because they could do one that, you know, behaved electronically better, you know? And I'd take a pistol out of my desk and hold it on them and make them build the first plan.

And then they'd put fifty on the line or twenty-five on the line, or something like that, and come back and tell me that if they just eliminated the ruddy rod and put a couple of con-

densers there that would work much better. And I'd say, "No, you don't. You build the original one." See?

And they built some of these other ones, and they responded perfectly electronically, but they did not respond mentally. This meter responds mentally. Anybody alters that meter, it's practically over our dead body, because it's just empirically worked out. It's marvelous that it works at all.

But, do you know, people give you explanations for the working and for the circuit and for this and that about this thing. They're talking in their hats. They're talking through their hats. They can give you all of the stuff, and so forth, but that stuff all got assembled in there on the basis of just breadboarding something.

Now we've developed theories as to how this thing works. Now we've developed all kinds of things. There's a magnetic thing in here that swings that. We're dependent on James Watt, Edison, all the modern electronics guys, transistors, everybody else, on all of their know-how; but this hung together makes an E-Meter. Why? I don't know.

We've got a doctor's meter. Costs several times what one of these things cost. Reg got me one.

We played around with that thing. It doesn't work. We don't know what it does, but it does something else. The needle goes by so fast, you can't even see it go. We've learned exactly nothing from it, which I think is marvelous, except this one fact – you all knew that – that's doctors are frauds. But we have an example of this. They've tried to copy our E-Meter and they just haven't gone anywhere with it. They couldn't tell anything with this thing. It's marvelous! And we got it, and I'm glad to have it! It's not a wasted instrument. There is the peak of medical electronics.

Now, why does it work? Why does the reactive mind do this?

What you figuring for? For God's sakes, the thing is laid out on a red carpet. This is how it works, this is how it reacts and this is how you use it. Oddly enough, it's invariable – utterly invariable.

Now, one of these days you're going to get Clear, you're going to get very bright, you're going to figure out *exactly* why an E-Meter responds this way, *exactly* what wavelengths the thetan operates on in order to put a reactivity together, *exactly* how many condensers fit together amongst the ruddy rods. You understand? And how you can all do it on thought transference and set up an E-Meter on a table and read President Coolidge's reasons why he wouldn't run, you see? – read through time.

Yes, by all means get in that shape! Yes, by all means get that design. When you do, write me a letter. I'll publish it.

There's more phenomena around this subject – not just this meter – than you could easily count up on an ICBM [IBM] Comptometer, and there's an awful lot of particles in one of those.

Now, where do we got the figure? Where's the think?

Reg is an engineer, who is a sharp apple. You see him around here once in a while. He has a hard time with this, man. It violates all of his principles of electricity and the body and everything else. This thing is a ghost instrument. He concluded the other day that, well, there's nothing else to register there but thinkingness, or what did it? or how did it? or something.

It wasn't that he was baffled that this reacted against the mind, because that's rather common.

He's baffled about other things. He always thought it worked on the amount of sweat, and then he suddenly realized that you can't sweat and unsweat that fast. So there must be something else involved here, and a lot of things. But you walk up to most guys and they'll tell you it's sweat – measures sweat. All right. Good. Measures sweat. I don't know what that's got to do with it either. It doesn't measure sweat. It measures think.

But there's a lot of boys can put these meters together that don't measure think. Oddly enough, you can put the commonest type of Wheatstone bridge together and give it no damping, and the thing oddly enough will register even think. So there's nothing very mysterious about it.

The mind is hung together electronically, it's hung together with electricity. There's standing waves, standing masses in it which are timeless. These things are drifting along in present time, and it obeys all of your electrical laws and impulses.

But remember something. The human being is the author of this universe and he's also the author of all the electronics in this universe. Actually, there are flows and currents in the human mind that have not yet been discovered in electronics. See? That a junior subject can now study a senior subject is, of course, a weird joke. But it can, which is quite peculiar.

Now, you're not interested in why an E-Meter reads really – unless you want to do some research in that particular line – beyond this one thing. A thetan is an electric eel and it measures electric currents. That's about as close as I care to come to it myself. I never speculate on this. But you talk about oddball, offbeat data on the subject of the E-Meter. Why does the meter go tickity-tick, back and forth, with an exact pattern every time when a person wants to leave or go away or blow out of his head, or so forth? – the theta bop.

The study of the theta bop could be very long and very involved. I can tell you numerous ways to produce a theta bop. Lots of ways. "Did you ever think of leaving anybody?" You get a theta bop, you see? "Did you ever think of dying?" You get a theta bop. "Try not to be three feet back of your head." You get a theta bop. "Shoot him with a .45." You get a theta bop. I mean, it's an interesting thing. Well, we get the coordinative action then. And one of the ways that you could deduce or surmise that people could exteriorize and what exteriorization was and how people leave their bodies at the time of death, and that sort of thing, can be traced with a theta bop.

What do you want to trace it for? Why don't you just learn how to get out of your head and see how it is and get back in again. See? You don't have to figure these things out because you're on the main road anyhow. You don't have to go at it with a bunch of logics and substitutes, because it's there to look at. So you can go around picking up pebbles all over the road.

You can get them in your shoes. You can fall in the ditch. You can run into milestones and culverts and bridge abutments and the neighbor's fence. You can do all of these things. But let me call to your attention that there is a main highway, and you can go down it at 110 miles an hour.

And it's the instant read – prior reads don't count; latent reads don't count – just instant reads, that's all. And the instant read will abide by the major thought that you're putting across to the pc and, oddly enough, will occur exactly as though somebody over there had been informed when you were going to stop talking. Probably the OGPU or the NKVD. I don't know, they have an intelligence service involved.

You can be very mysterious about the whole thing, but the funny part of it is, it becomes terribly simple. And when you look at it in that way, when you clean up everything in this way, E-Metering becomes very odd.

Now, if you're so involved in prior reads and so involved in latent reads and so involved in why it reads, and if you also have a number of invalidations of the meter and also suspect that it doesn't work because it hasn't worked on you – you see, one day it didn't read when you knew it should have read – why, naturally you're going to have a hell of a time with a meter.

So break it down to that simplicity. Look at the only important read that is on the machine and you've got it.

The only other thing I can tell you about a read is when it goes more than one simple read, it is a dirty needle and is measuring somewhere on the track a missed withhold.

All the goals and items that you want have a single tick. The only reaction you will get on a proven goal item – single tick.

Double tick? Then the whole goal or item is a missed withhold. Soon as you get the missed withhold off, it'll no longer read. Missed withholds are always more than one tick. You never have goals and items finally proven out with any other pattern.

I have seen some prove out with a rock slam. I've seen some prove out with a rock slam. But latterly, I have realized that there wasn't much of a list every time that occurred. If there'd been a little bit more of a list, they would have proved out with a tick. It's all right as a goal, but I see these things months and months afterwards when they've settled down, and they all prove out with a tick. You understand? That's all you're really interested in with a meter.

Now, you talk about speeded rises, speeded falls, slowed rises, slowed falls – yeah, but those are all instant reads. Now you're talking about out rudiments. Now you're talking about reading the significance of the thought *majeure* but it's still an instant read. It is merely a change of needle pattern. So there's significances about what this read is and what that read is, and I've just rattled them off to you.

There are no more than that, you see? The dirty needle is always a missed withhold. That's a double-tick arrangement. Any change of needle pattern at the *instant* you're finished

is an instant read. And, that goals and items when they check out, if they're valid, turn out to be single ticks.

Frankly, you could get along with just the data which I've given you in this lecture. If you applied that and didn't go scrambling around the road for a bunch of new data, why, man, you'd have all the rudiments in, you'd be sailing and everything would be fine. Okay?

Audience: Yes.

I don't say stop thinking. Think all you want to. But don't stop looking

Thank you.

Q AND A PERIOD: GOALS ASSESSMENT, HAVINGNESS

A lecture given on 29 May 1962

Thank you.

All right this is what?

Audience: 29 May.

Twenty-nine May 1962, Saint Hill Special Briefing Course Lecture 1. And this is a very good opportunity for you to ask some questions. And a very, very good opportunity for you to ask some questions.

Now every once in a while I give you an opportunity to wish you hadn't spoken. [laughter] Okay, what question do you have tonight?

Male voice: What are the stable datums for doing a Goals Assessment?

What's the stable datum for doing a Goals Assessment? Can you keep the rudiments in on the pc? You must be able to keep the rudiments in on the pc before you embark upon a Goals Assessment. In other words, don't start on a Goals Assessment and then find out that you should have been prepchecking. This is the mark of a knuckleheaded auditor. This is – this raises one to the "Royal Order of Coconut." [laughter]

There you are, "To catch catfish, to catch cat-" Dirty needle. Ha-ha. Well, "To catch catfish." Dirty, continuing and repetitive needle. "To shoot squirrels. To shoot sq- . Have I missed a withhold on you?"

"Oh, no. No. No, you haven't missed a withhold on me. I ... "

That is the wrong time, see. That's the wrong time and place.

Somebody wrote me the other day – somebody who got a course incomplete here, by the way – and halfway through it, a Goals Assessment, had been able to straighten out the pc by going into three or four hours of prepchecking. Ha-ha.

What was this auditor doing prepchecking when they were supposed to be doing a Goals Assessment, see? They should have prepchecked it, got it *all* straightened out, got everything *all* smooth so that the pc's rudiments would stay in beautifully and then *zoom-zoom-zoom-zoom-zoom-zoom*, you could do a fast Goals Assessment and so forth. Otherwise you spend three times the time it takes to do a Goals Assessment doing the prepchecking that you would have done in one *third* of the time if you'd only been prepchecking. Now do you get the idea?

So the whole criteria of when do you do a Goals Assessment or what kind of condition the pc's got to be in to do a Goals Assessment or any other such question, the whole criteria is

totally that one thing. Will the rudiments stay in? And if they stay in – *clank-thud-bang*, in concrete – by all means do a Goals Assessment. Answered?

Male voice: Right.

All right. Yes, John?

Male voice: My question, Ron, would you care to say something about the expectancies of Routine 3 GA?

Expectancy of...

Male voice: Routine 3 GA.

... Routine 3 GA. Now do you mean expectancy in what you ...

Male voice: In terms of Clearing.

... in terms of Clearing. How long it might take to Clear somebody with this?

Well you'd have to make an estimate of how long it would take to – how long – what's the expectancy of Routine 3 GA in terms of Clearing somebody and so forth. Well, if you add to it how long does it take to prepcheck somebody up to rudiments in, see – rudiments well in. That length of time, you see, that's kind of variable. I don't know what length of time that would be. It's anybody's guess. It depends on the auditor to a very marked degree.

Phil is in the next room so it's all right for me to tell you. But he suggested that I make you good and guilty tonight about this and so forth – because we did three and a half weeks of student-rate Prepchecking this afternoon. We were at it about an hour and a half, something – an hour and forty-five minutes. I won't – I won't shorten it anymore than it was. It was actually an hour and fifty-two minutes. And we cleaned up invalidations of goals, listing prior goals lists – any overts against, you know I mean, that kind of thing. Got it straightened up. And got it straightened up so the middle rudiments would stay in pretty good. And we did it all in about an hour and fifty-five minutes.

Now, this just depends – how long is it going to take you to do it? Well it'd vary a great deal. Depend on prior processing the individual had had.

Supposing – supposing you come into session every day and you say, "Do you have a present time problem?"

The pc says, "Well yes, I have a present time problem. My mother-in-law has left me and I'm – I'm being – being sued by my wife and by three children who are in college are all pregnant." Or something of the sort.

He's got present time problems galore and so forth. And so you spend three-quarters of the session trying to get rid of the present time problem. Well, you are in no condition to get rid of present time problems. This guy's got problems, problems, problems, problems, problems, problems, problems. How are you ever going to get anything done, see?

Well, how long does it take to clean that up? So that's an open question. You might elect to run Routine 1A or something like that. And run it flat. Right away. Well you've shot

about twenty-five hours maybe, bang. Get the idea? So it's that factor – that factor, very variable for the auditor, very variable for the pc.

But let's say we've got this fellow up to a point where it's an "Oh, my God" situation. This one that just came out into the – got his toes just on the edge of Clear at the moment the auditor went south in a hurry. Got there just, you know, just ready to walk in through the gate, you know and looked up and the auditor had blown the area. I don't know why it was, but... Now, that history in Prepchecking, CCHs, Routine 1A and so forth is a *long and bloody* history. [laughter] His auditor used to spend hour for hour, one hour in processing, one hour in her bedroom crying quietly to herself over the hopelessness of it all. Actually that wasn't the action of one auditor, but the action of about three auditors. So all of the tough points of the case had already been straightened out. Case would stay in-session beautifully.

How long did it take from there on? Well the first goal, I think, assessment – I have no real figures on this – but I know that it couldn't have taken longer than twelve and a half hours. I know it just couldn't have taken more than that. And the actual listing down to the first appearance of the free needle with the tone arm down on four lists on that particular goal couldn't have taken more than about twenty-five hours. So there you have what? There you have thirty-seven and a half hours to the first free needle.

But there's this horrible variable, you see, up to this point, see. The ground looked like Flanders in 1917, you see. Everything was all smoothed out. And then from then on, see, very rapid. Careful preparation up to that point and then, gruesome as it might have been, then easy going from there on.

Now, finding the next goal – this is an indeterminate thing – but actually shouldn't take any longer to find that goal than to find the first one. So let's say another twelve and a half hours. And it certainly wouldn't take any longer than twenty-five to list that one if it took that long to list the first one. So, a very safe margin – you've got about another thirty-seven and a half hours. And let's be dispassionate about it and say that it's probably seventy-five hours right about this point.

Then the next one, you couldn't possibly occupy this much time with it. I mean you couldn't occupy thirty-seven and a half hours on the third goal if you tried – if the auditor knew his business. And let's just throw the third and fourth goal and their listing into the next twenty-five hours – you'd have about a hundred. And I imagine that needle would be free, free, free, at just about that time. You'd have a hard time stirring the case up.

I'm just looking at one case, you know – just trying to give you some kind of a forecast on it – just a guesstimate. Ah, I'd say time to burn – time to burn madly on decent auditing at a hundred and twenty-five hours. Oh, I imagine that it would've just been time to burn.

So I'd say perhaps your expectancy on 3 GA should range – the length of time of Prepcheck and CCHs to make sure that the pc's rudiments would stay in – whatever else you had to do – take *that* length of time – which is very variable. And put on top of that maybe a hundred and twenty-five to a hundred and fifty hours or something like that and you've probably got some guesstimate of this situation. You understand this is a guesstimate, this is still an experimental procedure.

But at least this procedure does tend to lower the sensitivity knob, although I haven't had as many reports on that as I would like to. In other words loosen the needle – does tend to – and tends to bring the tone arm down to the Clear read of the pc and all tendencies are that this one is in there.

By the way, there's another process that is on the assembly line. There's another process that is waiting in case, see. It's 3 G4, as long as we're going into it. 3 GA doesn't plow things well case to case – case – you've still got this other one. This other one is all figured out, totally untested, just lying on the shelf, maybe never be used. A very simple process but you would find it harder to do than 3 GA and that's why it is lying on the shelf.

You find a goal and then you find a goal that would oppose it. And then you find – you do another assessment and you assess for goals that would oppose that goal and then you assess for goals that would not oppose that goal. And then – and then you assess for goals that would not want that goal. And now you've got four goals and they all tick alike. You've got to get four goals that all tick alike. There can't be a hair's breadth difference in their reaction and that'll be all the manifestations of the package. And then you list all those four goals and you theoretically would come out with your same package. At the other end you'd come out with your four items, which are actually two items. And that's just another approach to the situation and I've seen absolutely no reason whatsoever to cook that one up yet or do anything about it. I just worked out the possibilities of processes and that of course is sitting there.

But expectancy for that one – the only reason I'm bringing that up now, you see – it's taking people normally about three weeks, you see, to find a goal and now, you understand you haven't audited that goal. This case is in no better shape now, really. This case just feels a little brighter and with that case in that same condition, now, you are going to find an opposition goal. I don't know how long that's going to take. And then you're going to find a not-opposition goal and we don't know how long that is going to take. And we are going to find a goal of "something that wouldn't want to" and then we don't know how long it'd take to find that goal. But I imagine you are up there to about twelve twenty-five hour intensives and you haven't yet listed anything So I don't look very... I'm hoping you don't find any way to misrun 3 GA, you see. That's the main – that's the main thing That answer your question?

Male voice: Yes it does.

All right. Yes, Fred?

Male voice: Since we don't have a modifier now, how do you keep a Goals Problem Mass keyed in uh – if it – if it should uh – key out and you get a free needle?

Well, all right. That's a good question. Since we don't have a modifier how do you keep the GPM keyed in while you are listing and that sort of thing?

Actually the modifier is only the label of one of those items which you are listing on that listing.

Male voice: Uh-huh.

See at – you were – you were oh, you're still finding the same package. You see, if you found an opposition goal and an opposition terminal, your modifier and all the rest of these

things – they're – they're still just – they're – it's the same package as you were finding in 3D. And of course by listing each one of these lines, you of course keep as much of this thing pulled in as you are going to keep pulled in anyway, theoretically.

Now, the next thing that you might run into is the *second goal* – trying to keep things stirred up for the second goal. But the pc will be able to approach the GPM much more closely now because the first package has been whizzed up into space. And I don't think, I don't foresee any trouble with that at all, because you are listing a line which keeps it pulled in. Okay? Right. Okay.

Yes Jim.

Male voice: The stabilizing of the Clear resolution – apparently – was a notice on the board that this was happening I'm curious to know what the procedure is.

Oh, that would just be going on and that would be going on and that would be going on. That is just more goals and more four lists and more goals and more four lists, more goals and more four lists – until you can't get a meter to read if you hit the guy over the head with a club.

Stabilization is just more of it in 3 GA and just more of it and more of it and more of it because you're not likely to find this pc flying off into a key-out. See, because every time you find a goal, you are going to wrap your paws around every element that was part of the Goals Problem Mass. And you could probably look for longer listing, more goals to be found than in Routine 3, you see. Let's see, what was your question again now?

Male voice: The stabilizing of 3 GA Clear.

Yeah. Does that answer it?

Male voice: Definitely, but uh – another question.

Hm?

Male voice: There's another question.

What is it?

Male voice: That is not actually a stabilization that you've described. Rather it's a continuation of the 3 GA process from the new – the ...

Yeah.

Male voice: ... new preclear that you have now – you are simply running 3 GA again on him.

Well, stabilization would be – the error in the statement, you see – if there is one – comes from the fact that you said, "Clear – the stabilization of a Clear." All right, the stabilization of a Clear would be able to get rid of the masses that were liable to be keyed in or that are waiting. In other words, you would get out of the road those masses that could scoop up this Clear and get him all involved in the bank again.

Now, you see earlier Clears, we didn't have that much horizon cleared for the Clear. Get the idea? And he could pick these masses up. All right. He could get enturbulated, in

other words, again. The GPM could come in on him again. But by continuing 3 GA – doing 3 GA again and again and again, why you're just shooting holes into the GPM and you continue on out the other side of it and won't find any, theoretically, you won't find any GPM now to key in, see? Because the GPM only stays lined up on the most tenuous impossibility that anybody ever heard of. The only way that can be here and in present time is so – is so fantastically intricate that actually sometimes – sometimes you'll hit a couple of items on the way through on listing and see them go *pfffft* and wonder what was that? It's like releasing a – taking a string off of a balloon neck at a party, you know, there they went. Well, they can't any longer keep themselves pumped up. So as you carve into this mass more and more and more and get rid of more and more packages, you are actually stabilizing Clear. You're only getting out of the road things – to stabilize a Clear – you'd only get out of the road things that could cause the person to go unclear again. You follow that?

Male voice: I follow that.

Yeah, it's like how do you keep an automobile.... This is – this is this kind of an answer, see. How do you keep a racing car stably going around the track? Well you take all the boulders off the track. Now, you've left on automatic the fact that the racing car will keep running. In this case, the case of a racing car, it wouldn't be safe to rely on it. But in this particular case, it is safe to rely on it because you are not handling a machine. You are handling a livingness, a thetan, see.

But remember that as long as you're talking about the word Clear, just as it implies, you are talking about something which has had the debris pulled off of it, see? You are talking about something which has been unbarriered, see? And this makes an enormous difference to the individual. He gets very close in a native state and all that sort of thing. See what's wrong with the question is, is you are stabilizing a Clear. All right, that's fine. Yeah he's going to stay Clear if there is no bank to run into. But, you see there's something else can be done with this person. See, you can put another engine in the racing car or something like that, you see and you've done a different type of action.

In other words you could drill this individual now into the reacquisition of skills just by the familiarity of things. Now you are doing a different type of operation and that is not doing anything to a Clear, see? You are going on into OT.

See, OT is the recovery of skills. That's overtly the recovery of skills of the thetan. And Clearing is just taking what you find and getting the bricks off the track, see. You haven't asked him to recover any skills. He quite incidentally recovered quite a few skills, you see, by unburying the situation. He'll come back to battery to a marked extent.

But the state of OT is another – another action entirely. That is the overt recovery of skills. You've got this guy Clear, but he can't speak Arabic. Spaceman walks up to him and says "*snob-snos-kerpop*" or whatever – some space lingo of some sort or another that they used to speak. And he says, "Sounds familiar but what is it?" you know. And, all right, well how do you recover the fellow's languages for him and all that sort of thing. Those are the questions asked at the level of OT, see? Just as OT implies Operating Thetan, you recover his skills of operation.

Clear, you just fix him up so he doesn't fall off the cliff every time he turns around. Not to minimize either state, but they'd be accomplished by different actions.

You say, "All right, get in that rubber tire and go round and round and round and round and round. You getting dizzy?"

And he says, "Yeah I'm getting awful dizzy."

You say, "That's a hell of a note. Get in the tire again and go round and round and round. You getting dizzy?"

And he says, "No, I'm not so dizzy now."

And you say, "Well good, we'll practice a little more. Go on roll back and forth across the George Washington Bridge on every truck that comes by here this morning and get so that you can stand the atmosphere of the tires and run round and round and round like that."

And he finally makes that, see. And you say, "All right, now go out and get yourself run over." You get him run over with steam rollers and he finally finds out this is pretty good and it's okay. He can be more and more there while being run over by trucks. [laughter]

And then one day he's on the Pennsylvania Turnpike, you know and he's practicing being run over and a big truck – a big truck comes along and at that moment he was sort of bored lying there, you know. He saw something pretty over at the right side of the road. I think the only pretty things on the Pennsylvania Turnpike, an ESSO sign or something like that. He saw this ESSO sign and he thought he'd go over and investigate it and he stood up at the moment the truck ran over him. Wreck on the Pennsylvania Turnpike. You know, something wild.

This is a – this is a wide field. Actually we know an awful lot about this field because we used to do this before we found out that the individual could get keyed in.

See, it looks to the thetan that if he does these things he's going to get his head knocked off, see? Well actually what knocks off his head? His aberration, his inability to reach, sustainedly, is inherent in his own bank – not inherent in the physical universe. As long as he has a lot of aberration, he'll key himself in by indulging in such exercises. But if there's nothing to key in, he won't. He will just get more familiar with the exercises. Got it?

Male voice: Yes.

All right. Did that answer the question now?

Male voice: The question was wrong in the first place.

Oh, I'm not trying to make you guilty. [laughter]

Male voice: No I'm making you guilty. [laughter]

I didn't notice. [laughter, laughs] All right. Okay, any more questions? Yes?

Female voice: All things being equal, Ron uh – if an auditor really knows his job, you know he's really – he makes no mistakes, what would be the fastest skill: Problems Intensive or Prepchecking?

All right, all things being equal if an auditor really knows his job. What's the rest of it?

Female voice: What would be the fastest skill, Problems Intensive or Prepchecking?

I can't quite ...

Female voice: What would be ... ?

Second Female voice: Problems Intensive.

Female voice: What would be the fastest gain, Problems Intensive or Prepchecking?

Second Female voice: Fastest skill.

Oh, the fastest skill ...

Female voice: Yes.

You mean what – what would do it ...

Female voice: Procedure, yes.

What would prepare him the fastest?

Female voice: That's right.

Ah, what would prepare the pc the fastest? Undoubtedly Prepchecking, hands down. A Problems Intensive is a sort of a junior grade Prepcheck. If you want to get where the case lives in this lifetime and clean him up and that sort of thing and if the auditor you are asking to do this is not very skilled ...

Female voice: Yeah, I'm talking about skills here.

... I said if your auditor – this is where this belongs – and your auditor isn't very skilled and you don't want to mess up the pc too much, you hand him a Problems Intensive. Got it? All right. But a skilled auditor, hands down, Prepcheck-CCH route. I would know no better route. I know no better route – that's why you are doing it.

Actually, I'm going up against the fate of the gods. It's almost impossible to teach an auditor how to prepcheck intelligently. See it's rough. Well, what do you think I'm climbing that hill for? I'm not climbing it just to get you exercise and me headaches, see. I'm not climbing it because I'm mad at your Instructors. I'm climbing it because you are not going to get there any other way. And if I knew a faster route up Mont Blanc, man, you'd be on it! And unfortunately there isn't one.

I've been experimenting for many, many weeks, months now, with repetitive processes for just working around with Routine 1 sort of oddities and Class I And trying to get rudiments phrased up into various types of processes and so on, so as to give some lower scale benefit so that some auditor could simply run these things repetitively you see and come out at the other end. There's a lot of value to it, there is no doubt about that. You do a three-way bracket: "What didn't you know? What didn't another know? What didn't others know?" And you keep that up for a while on the pc. Or "What did – what have you suppressed? What has another suppressed? What have others suppressed?" – same phrasing "invalidate," same phrasing "failed to reveal," same phrasing "been careful of." You've got these various buttons and you could run them repetitively back and forth and undoubtedly get somewhere. There wouldn't be much doubt about that. And it's all very well and so forth. And I can take an E-

meter and after you've ground one of those out for thirty-seven and a half hours or something like that, why I could have gotten there the first hour on a Prepcheck.

You see, I mean there's – I have not totally concluded that the repetitive process at Class I should be skipped because it has some uses. But I have, to some degree, doing a comparison on the thing, not to some degree, but Prepchecking, infinitely faster providing you prepcheck. That answers your question?

Female voice: Not entirely. Doesn't uh – by virtue of assessment on – uh – you know, on uh – the changes – doesn't that sort of hit the beginning of the chain in this lifetime instead of having to go down the chain. That's really what I asked you.

Now let me – let me hear that question again. Now I answered the first question. Everybody will give me that.

Audience: Yes, you did.

All right. Now we've got another question.

Female voice: That's right.

All right.

Female voice: In virtue of assessment on the changes ... Can you hear me?

Almost.

Female voice: All right I'll try and speak up.

All right.

Female voice: In virtue of assessment on the changes, you know on the various self-determined changes.

You're still talking about a Problems Intensive?

Female voice: That's right. The reason why I am asking this is governed by virtue of assessment on the changes. Doesn't that sort of give the first, earliest incident and that's the bottom of the chain?

No. There's something wrong with this question because changes, the changes he's had in this lifetime, leave you still with the task of a full Prepcheck. But they will get the chronic PTP of the pc and this is very pleasing to the pc and this is a very good way of finding out what you ought to prepcheck. But of course there is no substitute for Prepchecking. See? You got your processes; they're not quite lined up.

A Problems Intensive with the change assessment list that goes with it, you inevitably would do a case assessment on the pc. This would tell you something about the pc somewhere early on, you see. Now, cutting loose into a Problems Intensive with the change list and finding out what was the biggest change – the biggest self-determined change of the person's lifetime – gives you a very good place from which to jump off to do something for the pc. This is an excellent way to do it, particularly if you are not very skilled at prepchecking. You see, because you are going to get this anyhow if you are a very skilled prepchecker. It's almost – I wouldn't say it's not worth doing but it actually is to some slight degree a waste of time.

You're going to try to prepcheck the rudiments in. You're going to try to prepcheck this pc so the rudiments will stay there and so everything is going to go along fine.

All right. If I'm prepchecking in the rudiments I don't try to get the pc, lifetime problems handled, because I know they're all going to shift anyhow the second I start running a Routine 3 process. So I don't pay any attention to the pc. I just satisfy myself I can keep the rudiments in and let it fly. You see the different philosophy here?

All right. Now, if you're going to – if you've got – if you've got Mrs. Gotlumbosis sitting in front of you and she is howling about lumbosis all the time on the subject and you wanted to find her lumbosis prematurely and that sort of thing – if you wanted to get this chronic present time problem out of the way and handle some little portion of it to make her happy – do a "changes of her life" and an assessment of those changes and get the prior area to that and prepcheck the living daylight out of that and find the fundamentals on the thing – you can burn yourself up, by the way, fifteen, twenty hours doing this – and you can drop a lot of worry off of this thing. In other words you've done something for this person's chronic somatic.

But don't make a mistake. You probably have done nothing for yourself or your rudiments, see. But this is a very good thing that an auditor can do. That – he doesn't handle his Prepchecking well. He sits there and he says, "Could you – willing to talk to me about your difficulties?" He gets a fall and he says, "What's that?"

And he says, "Well I – I don't know, I have an awful lot of difficulties trying to get enough paper clips, see. And I don't like to talk to people about that because I think unkind thoughts all the time about paper clips."

And if this is as deep as this auditor is capable of steering a pc, he'd better do a list of changes on the person's life and get the one that assesses the most and go at it that way. Got the idea? And well, now we're going to get someplace. See, we're going to get someplace with this pc because we couldn't enter in.

We might have to do it. I'm not trying to run it down, you see. I mean we just can't seem to get anyplace with this pc. Well the pc's interest – we know we can always get the pc's interest on one of these change assessments, you know. What is the biggest self-determined change in this pc's lifetime? Well, man, you'll find it *there*; it registers. You go in *just* before that and ask him all about the prior confusion. Get a list of the people. Assess that list. And you are going to find out where they hid the body, man. And that's going to be very interesting to the pc and that will be very interesting to the auditor and you've got blood. Give the pc a win, all that sort of thing.

But actually it's an excursion. Don't classify it as anything else but an excursion. It's something that you would do either to train somebody to handle things, or to handle the pc that just wouldn't confess to anything. It'd be sort of *in extremis* and isn't a substitute for Prepchecking because that itself is prepchecked. After you've found this change – I haven't given any talks about this and so forth, because we haven't been doing it much, but you see it now on your class line – well, that's to give you, in Routine 3, a crack at assessment.

What is assessment all about, see? Well let's give you something to assess, because people made more mistakes on those, assessing for the biggest self-determined change of a person's lifetime, than any series of mistakes I ever saw in my life. And if a fellow can be taught to assess that list they can be taught to assess anything, see. So you've got – you've got this long string of people and we want to know *everybody* they knew before that time, see. We'll make the auditor make the pc list. We want to know everybody they knew, see. We haven't laid the stress down on this yet. I should be getting out something on it. We want *everything*. We want the *milkman*. We want everybody. We want everybody they *knew* prior to this time. We want *the cousin of the school teacher who taught the schoolroom next door to the schoolroom that was taught by the teacher who was a sister...* You get the idea? We want to know if there are any more people in that area. And that will give the auditor more drill in milking down a list. See it's just a list milked down, that's all. You are going to bleed this meter for a list. Let's find out if there is any other human being anywhere in the world, you see, on that prior confusion.

Well, that's marvelous, see. First you've got a kind of a Goals Assessment in problems. See it's a kind of a mock-up Goals Assessment and if you get it wrong, so what – it isn't going to do the pc any harm. And then we've got this *long* list of people and we're going to get this list of people and we want a nice long list of people there. We want 75, 80, 100, 125 people that they knew just prior to January the 3rd, 1938. Man if you don't think that isn't going to make that pc dig, you see. And that'll teach the auditor how to get some more people, you know. "Any more items on this list, see, any more people than that? Did you know anybody else prior to that time on January the 3rd in that lifetime – in this lifetime did you know anybody else?" And by God you will finally dig up the girl who knew the girl next door. You get the idea?

Just teach them to bleed a meter out to nothing and get their middle rudiments in. And every time they get their middle rudiments in they get the suppressions and things off, why then they find out the person's memory opens up and we finally get the age before January of 1938 so exposed that the pc thinks he's living in it.

But you see that's a method of doing a parallel action to a Goals Assessment and a parallel actions to listing. We can find out at that stage. Because you see, we suddenly lost 3D Criss Cross to train auditors in. 3D Criss Cross occasionally somebody did lists, got all stuck up in the lists – too hard to straighten out, that sort of thing, so it had a liability so I fell back on a Problems Intensive. Problems Intensive has the same two steps. The problem sounds like a goals list and the assessments, so he's already done it and we can teach him to do these things without fooling around with the pc's goals – because that is tough.

In other words there is a process that we can teach him to do it before he does it. This is a marvelous thing because we can teach Johnny to swim before we let him go swimming. And that's actually all the Problems Intensive is there for. Don't get it as a Problem Intensive – as a comparable magnitude to Prepchecking, because actually Prepchecking is how you would *do* the present time problem when you finished up.

You get the earliest incident on the mostest person that was involved with the prior confusion. You'd find out that'd blow the whole thing. You understand? You'd assess these

people. You'd find the one that was left in – I don't care what nonsense you engage in here – and you find out that it was Aunt Gertrude.

All right, let's get all – "What about doing things to Aunt Gertrude?" and let's get this thing bled on down to the bottom of the barrel, you see. Let's get the earliest thing off of this thing. This thing will blow up along the line. You'll find out that problem will blow right at that point. But they are not comparable processes, okay?

I didn't mean to answer so long, but there's some data here which I hadn't handed out. I thought I might as well mention it. Okay? All right.

All right, after that exhausting thing, you understand I answered two questions there. [laughter] All right. Okay, any other questions? Yes?

Female voice: There's a rudiment question on end rudiments.

Yes.

Female voice: The last question on the end of the rudiments is asking about goals and gains.

Yeah.

Female voice: One of the last. Now, if the pc uh – gives you an untruth on that or an impress on it – it throws all the rest of the end rudiments out that you've already gone over.

Mm. That's right.

Female voice: What is the best way to handle that? Just repeat the – the package after the goals and gains?

Forget it.

Female voice: Forget it?

Forget it. Totally non-significant. First place it's not a meter question.

Female voice: Mm-mm.

Person isn't on the meter. I sometimes keep a pc on the meter. I did today when I was asking it. I put in first goals on a meter occasionally, particularly if I've got the pc holding the cans and he starts about goals. And I ask him, "Well are there any more goals you'd like to mention?" And I get a dirty needle. Let's not go into the thing with a missed withhold, if you please. So I get the – *the goal I don't know about* and get him to tell me that in the session. And the missed withhold reading disappears and the pc goes into session beautifully.

But at the end of the session *don't weight* those last two questions. Give them no weight at all. It's, "Well have you made any part of your goals, you know, for this session?"

And the pc says, "What are they?"

And you cheerily, cheerily – but my God he's off the meter now, I mean, you are not looking at the meter. You've almost, you've made the gesture to – sort of brushing the whole session off, see.

This is the point where you are slowing down. Nothing you are doing now is of any importance. That is the weight which you give it with your voice and that sort of thing. "Oh, well, all right. Now we're, you know, end of session," you know. I mean, that's the sort of an atmosphere we have. "Well we can stretch now," you know. "Thank God we're over the – over the Great Divide now. All right, okay, made any part of your goals in this session?"

Pc says, "What were they?"

And you tell him cheerily, "Well it's so-and-so," and "did you?"

"And, yes, yes, yes."

You don't correct him. Put no weight on it at all. And then you say, "Well any other gains you'd care to mention?" or whatever it is.

And pc says, "Yes" and so forth and so on. Of course if you are really smart as an auditor you know damn well when a pc is propitiating you.

And I handle that. I have a special rudiment that I put in at that point, is I tell the pc, "You don't have to tell me that," when I see the pc is propitiating. I wouldn't advise you to use it. It requires – it requires a great deal of sensitivity. You see the pc is looking at you and he sort of, the eyeball does a small corkscrew. [laughter] That's the way you can tell.

And he says, "Well, I – I actually feel tremendously better. I came into the session, you see, with a terrible stomachache, you know and I feel much better." I mean you get that kind of a response.

I say, "You don't have to tell me that. How did you really feel at the beginning of the session?"

"Well, I didn't feel too bad."

I say, "Fine" that's it and "anything you'd care to ask or say before I end this session," you know, that sort of thing. Then I give him "End of session" Tone 50.

Two little kids the other day, eight and nine auditing each other. One of them really got the CCHs in. She used Tone 50. She was nine or something. I put it in an Information. Wildest tale of a session you ever heard in your life.

No, honey, that's a matter of weight. Don't put any weight on that end of the line and you won't throw anything out. Your session actually ends, to all intents and purposes – as far as your determinism is concerned, you see – just before you introduce the idea of goals and gains, see? It's over, it's all over.

It's a wonderful time to slow it all down, put on the brakes, you know. Start picking up your jacket and looking for the pencil you dropped underneath the chair, you know.

There's a bit of skill in weighting. You don't want a session to end this way – you don't want a session to end this way. You don't want a session to end that way anyway. You want a session to end sort of this way. Only I end them this way. Give tremendous weight to that "End of session," see. Really make sure they got out of session. You'll have a drill on that pretty soon. But that's all under the heading of weighting.

Yes, it is perfectly true that the pc could give you a half-truth and an untruth, but if the answer isn't terribly important it won't make much difference to the pc either. That is a courtesy rudiment. It has no real value in the session beyond making the pc realize he got someplace and bring him to the end of the session.

That's sort of like fishing a cognition – the old TR. You make him realize that something happened in the last couple of hours. Only you don't work at it. And in view of the fact that your – it could be pushed to a point of evaluation, you put it that way, you see. So it's got to be very light. "Well, did you make any part of your goals in this session? If you didn't it's all right with me and if you did it's fine with me," and so forth. "I'm not particularly influenced one way or the other whether you made your goals or didn't make your goals. And you make any additional gains? All right with me if you made gains, if it isn't – if you didn't make gains, why..." That's the atmosphere you see. I'm adding the additional words just for the heck of it. "Well if you didn't make any more gains that's all right with me. The world isn't going to perish tomorrow, so what."

And then well, so we're all finished up around here and you've already more or less ended your auditor's report, sort of time we got out the cigars, you know, that kind of thing. Then all of a sudden why you bead the pc with a beady look right straight in the eye and you say, "Now" you know, "is there anything you'd care to ask or say before I end this session?" See, this is not important, see. It's not important that he say anything. You don't care what he says, but that's the warning light, see. That's five, four, three, two, you see. And he says, "Well, thank you," or something like this.

And you say, "All right, now." Really fix him, you know. Here it is, "*End of session*. Now, is the session ended for you? All right. Good. Good. Now tell me I'm no longer auditing you. Good, that's fine." We don't care what he said. One auditor upstairs by the way got in a hell of a fight with a pc because the pc wouldn't tell. This was months ago. The auditor isn't here anymore. But the pc wouldn't say, "Is it all right?" he wouldn't say, "You are not auditing me now," you know, but said, "Go to hell." [laughter] And it was – totally conversational thing and the auditor jumped right in there and tried to 8-C and Tone 40 this pc into saying it. But of course the session was over. The auditor has no control value over the pc once the session is over, you see. And the auditor was Q-and-Aing with the purpose of that last remark which destroyed the control value, you see. And the auditor went right there puppy to the root. I think she even hauled the pc downstairs and pushed him into the training office with all four feet, I think, something like that. Most horrible squabble, fantastic, never saw such a ruckus in your life. Pc wouldn't say, "You are no longer ..." Well, that's the wrong weight, see. [laughter]

Now, you see that – yes, very easy – very, very easy to miss this and I will give you a method of getting over it if you want to. Before you say, "Is there anything you'd care to ask or say," so on, you can ask again for, "In this session have you done anything I haven't found out about," or something. You can ask for a missed withhold, in other words, again, just before that. If you are queasy at anytime during rudiments why ask for that. And any time you've got a dirty needle showing up or something like that, you can work that one to death.

But, if you wanted to be very sure – to answer your question very precisely – after you'd asked for goals or gains and you'd figured out they told you an awful half-truth and an untruth and impressed you and were actually trying to damage themselves or something and you could ask at that time, "Well have I missed a withhold?" Well this would get you out of any liability for this. They won't be mad at you then after the session, see? At least get off the missed withhold. And that's right before you ended the session, why ask for a missed withhold.

But I must tell you that this would be unusual because there's no weight, see, to "Have you made any part of your goals and any gains," see? There's no weight to it at all. It's just a courtesy to a pc. This is part of our free service, you know. That's all. That answer your question?

Female voice: Yes it does except if the pc is asked by somebody who is checking his rudiments out ...

Oh, I knew there was probably an ARC break there. [laughter] Why doesn't somebody pick up her ARC breaks? Somebody has found your pc's rudiments out.

Female voice: No, to the contrary, but it could happen. If he's done – if he's ...

Then you're worried. Then your pc's rudiments should have been out and they didn't find what... [laughter] You're right, you're right. If I was having my pc's *rudiments* checked at the end of session they would never find them out, because I would *always*, just before I said, "End of session" or "Anything you'd care to ask or say," I would say the middle rudiment from one end to the other and I would knock it cleaner than a toaster. And I would say "That's it, man." Whizzer-whizzer and the pc would go out of there and so on. And if that didn't work – that didn't work I'd just simply ARC break the pc. [laughter, laughs]

Now, does that answer your question?

Female voice: Yes.

All right. [laughter, laughs] Okay. We have time for another question here. Yes.

Male voice: Ron, could you say a few things – words on the importance of havingness and the use of havingness in Routine 3.

Yeah, yeah. I could. It doesn't apply to Routine 3 anymore than it applies to anything else. It's just the importance of havingness. A pc is going to start to have odd reactions if the havingness goes down.

Let me just fill you in, just to this degree. The pc's havingness goes down and you start to get physiological reactions, eyeball swivel, they notice the carpet and they get a theta bop, you know? And if you notice this you should ask yourself this question – why does the auditor say, "Look around here and tell me if you can have anything," see? And watch the meter. See, why does he do that? And if the meter reacts, then run Havingness. If you don't know this point, you see, that would seem illogical to you.

You'd say it much better than that, "Have you had any trouble in this room? Are there any objects around here which restimulate you?" You do all kinds of other things, but not just run Havingness, see? "Look around here and tell me if you can have anything," and it goes

clank! And then, if you are very observant you turn this tone arm down here from a 16, where you had it maybe a minute ago – and you turn that down – and you turn it down to zero and you say, "Squeeze the cans," you see. All right, the pc squeezes the cans and he gets – he gets *zooo*. Inevitably if you say to the pc, "Look around here and tell me if you can have anything," and he looks around and it causes his eyeballs to move or his neck to go or something like that, so as to make that kind of an action – unless he's done something weird with his hands, which you should know better than to accept anyhow – let's just rule that out – the pc just looks around, you know and you get this thing going tick, particularly if you get a little sharp tick. Well, what do you need? Neon signs to give you the word? How come it gets a sharp tick?

Well it gets a sharp tick because Havingness is what draws the *noives* – that they are having in New York right this minute, *noives* – very, very taut. It takes the masses and brings them down physiologically against the body. It packs this pc up like something that is going to be sold at the Safeway, see.

Male voice: Hm.

And this pc then, physiologically, could actually go like this and you're going to get some kind of a meter reaction. This is why I laugh like mad when somebody comes around and tells me, "Look I can make the meter react by swiveling my ears." *Nobody argues* with him. What we're trying to tell him is, "*Yes, if your havingness is shot to hell you can always do this.*"

Now we could – we could run – we could pick any of you up and run you for a half an hour solid, "Look around here and find something you could go out of ARC with." And then ask you to "Look around here and tell me if you can have anything." And the motion of the eyeballs will cause the meter to go *clank-thud-dirty needle-boomp-theta bop-crash*. You get the idea?

So it doesn't – wouldn't matter what you did. Now, some people they just move their head like this, you see and you could get a meter reaction. But why do they get that kind of a meter reaction? Well it isn't – that is not how the meter is supposed to react. And the meter doesn't react that way on the bank – except when the person's masses are so borne down on the body – the GPM, man, is right there, see. Every PTP the person has ever had is sitting on his left eyeball before it'll do anything, you see. You've got these solid electronic masses which are invisible which are sitting right up against the body with no relief or relaxation of the things and this person is a bundle of piano wire, see. They – they've got him tuned out to high C, you know.

So, you of course tell him to look around here and find out if he can have anything is *pling-poooh-bing*, you know. Well, you are going to run into infinite numbers of troubles on getting meter reads and so on.

There's two ways you can do it. One, miss a withhold, but that's what? Miss a withhold, the withhold the guy's pulling back against himself, see. So you get a missed withhold. So it registers twice as much as anything else. It gives two ticks where it should give one, see. What's the second tick? You see that's just hard up against the body, that's all. see the person's got masses pulled down on him.

And the other one is when his havingness goes down. When his havingness goes down, the guy just sort of wiggles one ear, you know and you get a *thidth*, you know, on the meter. You get this thing going *tick-tick-tick-tick-flurb-surge-whoop-woop-burr-ba-ba-burr-burr-burr-ba-ba-ba*. [laughter] What the hell man? Why bother!

See, along about this time you say to him – you say to him, "What's your Havingness Process?", or something, you know. You say – by the way, you very seldom do this. You should coordinate this. When you get real clever at reading the meter you will see that something is going wrong here. There's one of two things go wrong The guy's got a missed withhold or he's got a very dirty needle and the last twenty-one auditors in the last forty-five intensives have done nothing but miss one withhold per minute, see. And he's got so that he's got nothing but a dirty, swinging needle all the time.

Well, of course, this runs his havingness down which is the same phenomenon compounded. Or the person's havingness is down – badly and you'll get these interjected, wandering needle actions and they wander and they tick and they do this and they do that. The person isn't even thinking of anything. The person closes one eye and you're going to get a needle reaction. See? It's not a needle reaction, it's just an action. Goes click-click-click-click, wiggles his big toe, going to get some disturbance in the needle. Well why? It's a very extreme condition of no havingness. It's a very extreme condition. It's nothing funny, man.

Well, if you want that kind of a circus going on while you are prepchecking or while you are looking for goals, why just skip Havingness, see.

But watch it in the beginning of Routine 3. Now, this is what you want to watch. I'll give you some very – I'll give you one out of the session today. I was checking a goal, actually prepchecking, but it was about goals and things. Now, in this session today, it became apparent that the pc's havingness ran out. Pc's havingness ran the TA down. This is not always true – this isn't a reducing TA reduces the havingness, see. But it became apparent to me that when the pc's havingness went down, the TA dropped down toward 2. So I became alert to this and after the session was all over, after we'd done goals and gains, why, we did Havingness and some missed withholds. Sounds funny doesn't it? But I had noticed that the TA, when the pc's havingness was going down, came down here to 2 and that the pc's Havingness Process pushed the TA right back up to 3, neat as you please. So I noticed that in getting goals and gains the pc lost his havingness – for some reason or other lost his havingness, because it – goals and gains brought the TA down here to 2.

It was very peculiar, so I simply told the pc to squeeze the cans again and we got a *good, broad* can squeeze, see – we got that *much*, you know, *huh-huh*. I wasn't going to let a pc leave the session in that condition. So I just uncorked the Havingness Process and ran the TA back up and all was happy and everything was fine. That's all, see.

So there was – there was, right in today's session, there was something happening after the end ruds, see. And as far as running a Routine 3 is concerned, you start watching the pc's behavior pattern and you will learn what the pc looks like when his havingness goes out. You'll learn how he looks. And the pc starts going this way or the pc dopes off, the pc that ... All right, it's a missed withhold or havingness, you see. They are both cousins, so if you are just doing a – if this pc's havingness – by your experience – you ran fifteen commands of

Havingness and it brought the pc up to a dial drop. And after you'd been auditing this pc for twenty minutes, it came down to that much drop. If that was your experience, testing around on the pc's reaction to Havingness, you'd do the middle rudiments and run some Havingness, see? Every time you did middle ruds, run some Havingness, see – *bang-bang*. Well, there you caught both ways from the middle, you are not going to get this eyeball click.

There is just no doubt about it whatsoever, you know, that a pc can move and influence the meter by wiggling their big toes, swivelling their eyeballs, clicking their teeth together or raising their ears higher. There is no doubt about this whatsoever, but *only* when their havingness is out the bottom. So if you want to avoid vagrant manifestations of the needle, why, keep the pc's havingness up.

By the way my record was sustained. There hasn't been anybody around here whose havingness has been found. Before he came to me his Havingness Process didn't work. This is getting to be an all time championship. I found another one today. Pc's Havingness Process didn't work. Everybody had apparently been running this Havingness Process, but it didn't work.

Do you realize that to run the Havingness Process effectively your first squeeze is tested with this sensitivity knob practically off. Bring it down here to nothing, see. Now, tell him to squeeze the cans. Now they quite ordinarily and routinely will get that much of a fall, see? If their havingness is off they are liable to get this much of a fall and it's liable to go up here and then fall back, but not all the way and other goofy things. You understand? But it's just a little bit – maybe it's going to be an inch, inch and a quarter, something like this at zero sensitivity. Let's say something like that.

All right, if that is the case this is the havingness drop you want. You want more than third of a dial. You want about a half-a-dial drop if you can possibly get that. If you've got the pc's right Havingness Process, you will get your half-a-dial drop. Your pc's havingness was there, let's say there, now, you ran the pc's havingness for a few commands and you got the pc's Havingness Process and it's a half-a-dial drop.

You watch that. You'll see then – you see apparently you aren't giving enough attention to how much *increase of fall* there should be for the pc's havingness to be up.

Now, don't think this will continue. This gain happens almost at once and then happens very gradual increase from that. So, just a few commands, see and bang. You've got the – well that's the last command, the hell with it, see and you are off your horse and far away, see.

But we've got to have a third to a half-a-dial drop with this sensitivity knob at zero before we can say the pc has any havingness at all. Otherwise you are going to get the eyeball click phenomenon. Besides the pc is going to feel bad. The pc will get withholds faster. He will suppress things bad. He'll do think, think, think, think, think much more quickly. Why? Because the ridges and things are down and the masses are talking.

And if you want to really get masses talking, run a pc's havingness down, you know. "Run around – look around here and find something you couldn't have. Thank you. Look around here and find something you couldn't have." And the next thing you know these inert

masses and spheres around him will even start talking. He'll all of a sudden hear circuits turn on, other goofball things start to occur, see, by running his havingness backwards.

So just – the answer to your question is when do you use the Havingness Process on Routine 3? Same as any other time when the pc's physiological condition is liable to influence the E-Meter by reason of dropped havingness. Okay?

Male voice: Yes. Thank you.

All right. Okay, that's it. Take a break.

Thank you. Thank you.

SECURITY CHECK PREPCHECK- ING

A lecture given on 29 May 1962

Thank you.

Well, we probably ought to have a lecture this time. You've had that, but I haven't got anything to talk about. I haven't. It's a fact. Wouldn't have me guilty of a missed withhold amongst so many people.

Second lecture, Saint Hill Special Briefing Course, 29 May 62.

And now, the use of the Sec Check with the Prepcheck. It's been the subject of a bulletin recently. If anybody's got that bulletin, you can hand it to me.

Female voice: May 10th.

May 10th? The – you got one up here? Thank you.

This is the material of – it is covered on HCOB May the 10th, 1962.

Now, the easiest way in the world to do a Prepcheck is to let a preconceived form guide you into the overts which you're trying to cover.

Now, that's a very easy way to do the thing. Now, such a preconceived form would be a rudiment question. Let's take a – let's take the – an early variety of this sort of thing. Just take any one of the beginning, middle or end rudiments questions. Take any one of these and use it as your Zero and then just put "Have you ever – " type of questioning on the front of it or "Are you willing – " or "Have you been unwilling to talk to an auditor about your difficulties?" You see how you'd have to convert the question? "Have you been unwilling to talk to an auditor about your difficulties?" – something like that.

It wouldn't much matter how you worded this thing, but try to word the rudiments so there's little more span to it, don't you see?

"Have you ever had a problem during a session that you didn't tell the auditor about?" I don't care how you add these things up. Do you see?

You take your rudiment question as your Zero, you reword as your Zero A. Let's be very precise. You're going to reword this thing so that you get a Prepcheck going on it. "Had any trouble with problems lately?" You see?

The Zero is "Do you have a present time problem?" Your Zero A is possibly arrived at after you've done a little talk to the pc or something like this, you know, just present time

problem, "Do you ever get messed up with present time problems in a session?" you know, that sort of thing

And he, "Oh, yeah. Oh, yeah. Oh, terrible. You're never going to get rid of them."

And you say, "That's – thank you very much now. All right. Now, did you ever have trouble with present time problems in a session?" That's your Zero A, see?

All right. And then you fish around. This question is hot. You see, that's the only reason you'd have a Zero A. If you've asked the Zero A, you know, you check the Zero A – the guy tells you something, then you check the Zero A – your drill applies, just let's – applies to a What. This thing is still hot. You know you've got a Zero A. Otherwise, you'll have to monkey around and find another Zero A, because that one cleaned up, don't you see?

So you've got to have a hot, persisting Zero A.

Now, you start fishing around trying to find out what goes with this and did he ever do anything with this, and what's this all about and keep his mind on the subject of problems, and you suddenly see a dirty needle tick or something like this, and you say, "All right. What was that you were thinking of?"

"Oh, well, that was that time. See, I had this auditor who was very unsympathetic and he just never – never would let me get rid of any present time problems and that sort of thing, and ..." You know, lovely motivator sort of a reaction. Well, you have to remember to convert this. You're searching for your What question now, you see? And you have to remember that the question will be something like this, "What about lousing an auditor up by having present time problems?" You know [laughs] – something like this, see?

You have to ask What questions until you get a reaction. Now, your What question is tracked right out of your Zero A, don't you see? And there is your What question.

"What about getting lots of problems before you came to an auditing session?" You know? "What about worrying about problems in an auditing session and not telling your auditor anything about it?" You know – that sort of thing.

I don't care what you finally cook up out of this Zero A. It's going to be something that is very applicable to the case. And you're going to test around on it until you've got – he's told you an overt; make sure that it is an overt, steer him down till it is an overt. First he says, "Well, auditors just keep giving me problems all the time. Auditing itself is a problem," and so on.

Fish up. What's he done with problems here, see? Get an overt action, get your What question formed, make sure that it reacts. Now you ask your What question; the pc gives you the answer. Well, the same formula holds, see? You got to ask this What question again and you're in the soup if it cleaned up.

You've got to go find another What question. Your whole job is you're trying to find a question that's going to hold. And everything you write down, the Zero.

First, of course, your Zero had to be persistent, see, before you would monkey with it; and then your Zero A dragged from it has to be persistent before you'd monkey with it; and then your What question has to be persistent before you would monkey with it. Do you see?

Each time – each time you follow this same drill. You ask the question which you have finally cooked up here, and the pc gives you the answer to this question directly – even though you've just discussed it and he's given you something like that. You ask that question you just cooked up very directly, and you say so-and-so and so-and-so and so-and-so, and it goes *plang* on the meter.

He says, "Well, I – something or other, something or other, something or other." That's an answer to the auditing question.

And then you say, "I'll check it on the meter." And you ask him this same question again. And if it's there, well, you go to your next step. And if it's not there you retreat a step. This formula is *always* the way you do it. See, you go back to your Zero.

All right. Supposing your Zero was impersistent. "You willing to talk to me about your difficulties?" You're going to write that as a Zero Question. You got it on there? "That's fine. That's what we're going to check on now. Are you willing to talk to me about your difficulties?" Well, of course, it's one of the rudiments questions, so therefore it gives you a pat question to proceed from.

All right. Dandy. *Voilà!* This is there. You say, "Are you willing to talk to me about your difficulties?"

Now mind you that you can rephrase that so that it gives a little more span – like, "Have you been willing to talk to me about your difficulties?" But, let's not go very far afield here. It's *best* if you just run it, "Are you willing to talk to me about your difficulties?" and you get a fall. Or you know you consistently have difficulty with this, see?

But that's got to be persistent.

Now supposing the guy says, "Yeah, I can – found out I can talk to you everything a – except Indian tomahawks, and I just – just can't bring myself – I haven't been able to in the past – bring myself to talk to you about Indian tomahawks."

And you say, "All right."

This is just your Zero. You see, "Are you willing to talk to me about your difficulties?" You've had it.

But because this has already been cleaned up in the rudiments, you'll find out you have best luck if you broaden it for the Zero. Otherwise, you already got by it once, so you're not going to expect it to hang up again, are you?

So something better: "Have you been willing" see, "to talk to me about your difficulties?" You know? Anything that you wish to put down. But it has to represent that rudiments problem and preferably has to give more track.

You check it now and you say, "All right. Have you been willing to talk to me about your difficulties?"

"Yes, everything except that." you got no reaction at all. You've had it. That rudiment can be expected to stay in because you broadened the rudiment, see? You broadened the rudiment one way or the other.

Now your Zero A. Now, let's say it stayed in. "Have you been willing to talk to me about your difficulties?"

The fellow says, "Indian tomahawks. Never have been able to discuss Indian tomahawks."

"Good. Have you been willing – have you been willing to talk to me about your difficulties?" *Clang!* And you say, "Oh, well, that's all right." Well, we're in there now. And now we're going to go to the Zero A.

And the person says, "Well, I don't know. It has to do something with uh – your – well, I don't know. It's just, I have never been able to – to really express myself, and so forth. I feel that you're down on me."

Anything that you care to wangle out of this situation; it all depends on what occurs. Now you still want a very broad field here.

And he says, "Well, it's when I start to tell you something – well, I just feel all suppressed."

Well, your Zero, "Have you ever felt suppressed when talking to me?" I don't care if it's a motivator, see, because we're going to turn that into an overt. We don't care what are – those Zeros are that we clean up because it's not very serious.

From there on, it's got to be overts for sure. By the way, it is not necessary to have a Zero A in all cases. You understand that?

All right. Now, the person says, "Well, I – I just – just felt unwilling," and so forth. And you say, "Well, have you got any particular instant when you felt unwilling to discuss sex with me?" whatever he says. (You know, he says, "just unwilling to discuss sex with you.")

"Unwilling to discuss sex? What about – what about not talking to me about sex? What about hiding sexual data? What about ..."

He says, "Well..."

You say, "You done anything specifically to me or have you done anything specifically to auditors on the subject of sex?"

You see, you're not going to buy anything or put down a What question that isn't an overt.

And the person looks at you and says, "Well, I – actually, I was being audited by somebody one time, and I – I made a play for them and they rejected me."

And you say, "All right. What about making a play for auditors?"

And it goes clang! Now this same rule applies.

And you say, "All right. Thank you very much."

You asked them once, didn't you, and they'd already given you this thing. So frankly, you have checked it twice. You get this – this is a little bit tricky. But if you want to be absolutely by the boards – very pattern about the whole thing – ask it again and let them tell you

something and then check it to see if it clears. And if it clears, all right – it clears, man. Don't argue with that. You've got to go back up to your Zero or your Zero A, and come on down – anything is still reacting. Don't you see?

Supposing the whole thing wipes out and nothing is reacting now. Fine! Well, you've skipped it. Go on to your next Zero, see? Got the idea?

Audience: Mm-hm.

All right. Supposing he says, "Well, making a sexual – I ..."

"What about making a sexual advances to auditors – making sexual play for ...?"

It's always best to use the pc's wording in the thing, you see? "What about making a sexual play for auditors?" *Clang!* You see?

And he – "Well, I did. I did. My – my first auditor. I – I actually thought he was awfully attractive. Ha-ha."

And you say, "Good. Thank you very much. I'll check that on the meter," if you want to be lugubrious and laborious. Because you've already done this twice, you understand?

So, "What about making a sexual play for auditor?" and so on.

"Well, yeah." It's clang! Well, you're in the Prepcheck business at that moment.

"When was that?" See, he gave you the specific incident. You didn't form the What till you had one. "When was that?" "Is that all of it?" "Is there anything more to it?" See? "What didn't appear?" or "What did appear?" or "Who should have found out about it?" "Who didn't find out about it?" You see?

Your wording is varied on these things, by the way. You start using the same wording every time and you're going to be in trouble, because you're actually not listening to the pc; because these questions have to be adjusted to what you want to drag out of it. It doesn't require too much skill, but adjust this thing.

The person is telling you, "Well, I was trying to hide this thing."

And well, you say, "Who might have appeared there?" or "What might have appeared there?" you see?

And the person says, "Well, I've just – nobody told me anything about it."

"Well, what didn't appear there?" That's a very natural question. And he'll tell you. And then – and "Who didn't find out about it?" "Who should have found out about it?" Any one of these formula, see? "Who didn't you reveal that to?"

Doesn't matter what wording you use; it has to be appropriate. It follows these four things and you're saying them in various ways.

All right. You go down that once and you want to beat the pc to death, go over that eight or nine times. If you really want to get nowhere with Prepchecking, run the When, All, Appear and Who about eight times on every overt you find. That would be very good. That would get nowhere at a high rate of speed.

It all depends on what your needle action is with all this. You can watch your needle. Now, you are not checking your When, your All, your Appear, or your Who against the needle. You're just talking, see? And he's just talking. But you've got an eye, and that eye can be on that needle. And if this thing looks quite active as we discuss it, we can be very sure that we are not on an incident that is going to clear.

And actually, it'd be all right if you passed over it twice and it was unchanging – oh, my God, you should have been off of it the first pass over, see, because you're wasting time.

Now, your magic question you use after that is "earlier." See? "Was there an earlier instant where you did that?" See?

"When's the first time you can recall that happened?"

And now you can fall into your own trap.

You've asked him, perhaps, for the first time that this occurred, and it was during auditing and he gave you something which had June 1950 on it.

Now, you know confoundedly well that there's nothing earlier than that. So you abandon "earlier." You give up the ship right at that point. Well, let me assure you if this thing is still banging after once over on the – that is so powerful as the When, All, Appear and Who – the thing is still banging once over, you haven't got the first overt.

See, "What about making a play for an auditor – a sexual play for an auditor?" See? And it's still banging. You've got June 1950. Well, God, you're getting awful far aft. I mean, they – hardly even known as auditors. Heh-heh.

And you say, "Well, you can't get any earlier than that," so you give it up. See? Now don't – don't logicize yourself out of business.

Actually, a little thinking goes a long way. It didn't clear up. Now, what anybody who's having trouble with Prepchecking hasn't gotten through their heads is the old, old, old Book One material about basic on the chain will clear the chain. And nothing works so gorgeously as this.

If you want to see some marvelous examples of this, they're to be found in Prepchecking. And if a *chain* isn't clearing, you are not getting the basic on the chain. Actually, a this lifetime basic is usually most – a great majority of the time perfectly adequate.

So he says, "Well, I made a play for an auditor in 1950 in May, and that was when it was," and so on. And you're looking at this thing and it's going *cling, clang*. Well, now don't figure yourself out of existence and say, "Well, it could have been a psychoanalyst – could have been trouble – they had trouble with their accounting department." Now, don't figure yourself around the bend. Just ask them, "Is there any earlier incident?" That is the magic cure for all of this. "Is there any *earlier* incident?" You can't get before then, can you?

Well, he drags up – he drags up May, or she does. You've got May of 1950. *Ooo-oh-ho-ho!* And when you've covered that, it still falls. Well, don't lose faith, don't lose confidence. You just haven't – this is the only reason you haven't got the thing clear. You haven't got the first incident. So you ask them if there's an *earlier* incident. See?

Yeah, there was a person audited him out of *Astounding Science Fiction*. They'd forgotten all about the session; session totally buried. They weren't called auditors then. They weren't called sessions then. This person did talk to them about it and try to get them to remember something because of it. Don't you see?

But I really wouldn't call it a session. "Well, would you call it a session?" and so forth. "Well, wouldn't, no." See? And all of a sudden they give you this, and that happened in – sometime in the end of April of 1950, see?

Ahhh! We go over this and we notice when we say, "when – " you know, why, we get action, but the action damps. And when we say, "Is that all of it?" "Is there anything more to it?" the action is much milder than it was. And we ask – we go around it again, see, and we say, "All right. When was that?" And do you know that there isn't anything happening on that needle?

So we say, "Well, all right. How about this incident there in April when you made a sexual pass at an auditor?" whatever it was – "play for an auditor," so on. Yeah, that's it. Everything is ...

You come straight back. Don't go through all those overts They're not there anymore. You're just going to waste time, man. You got the first one – it's scrubbed. He – you is going to come right back up the channel, and you're going to ask the What question again. That is your next immediate action. If you've got the chain, that is it. There won't be a breath in that – left in that What question.

What question is null; you mark it null. That's all the writing you've done so far. No matter how many incidents you got, you just wrote the What question.

It's all null all the way – What question is null. The Zero A. Ask the Zero A. The Zero A is still alive, which is improbable. You've got to have another What question, so you proceed from there.

In other words, you go as far north as it's gone null, see, and you go as far south as it's necessary to null things. You just play within those two limits. And the next thing you know, "Are you willing to talk to me about your difficulties?" and there's no response, there's no action, there's no nothing "Have you been willing to talk to me about your difficulties?" whatever it was that you were trying to clear.

That's all gone; everything's gone; everything's fine; needle looks better; pc looks better; everything's fine – well, get the hell out of there. What are you doing monkeying around with that rudiment?

It doesn't take a week to clear a rudiment. It doesn't take a session to clear a rudiment. It actually doesn't take fifteen minutes to clear a rudiment. If you're very slippery as a Prepcchecker, you're in there, down the chain and out again with stuff that the pc hasn't ever remembered and was totally occluded before he has time to marvel at it. It's cleaned up quicker than he has a chance to worry about it. There isn't any value in it, except that you get auditing done. And you'll find out that you could get these things in fairly rapidly.

But you understand that a person – now that's just checking the rudiments in. You take them one by one and check them in, in this particular fashion. No matter how many What questions you had, it would be as many What questions as you kept coming back up to the Zero A and found a Zero A still alive.

Well, yeah, that leads to another What question, see?

Now you clean up a big chain of that, and you come back up, and you'll find that Zero A is still alive. Well, you better get another What question and clean that thing up. This is getting unusual though, for that to happen, see?

All right. Now we start – start in on this thing. We are talking to the individual about *exactly* about those things which are absolutely pertinent to the subject of auditing when we are prepchecking rudiments. These we've got to have in.

Well, the funny part of it is if the pc is living a life of secrecy, if the pc walks out of the session door every day and looks up and down the street wondering if the police have arrived yet and that sort of thing, we're going to find that we put the rudiments in on a Prep-check broad basis and they go out; and we put them in, and they go out. Why?

Because there's something more fundamental about this particular activity than rudiments. Then we eventually find out that there is something wrong that would ordinarily be covered by some type of a form as – such as the Joburg. This is so wrong; never been discovered about the pc; we have a horrible time trying to lean into it – it's actually a hidden factor on the case.

You notice the pc that has this once in a while will get a dirty needle and then you can't find out what it is. And it's mysterious and it sort of – you get the case lined up and then the case isn't lined up.

And this case keeps falling on its face all the time. Well, that's because there's an unknownness about the case – of magnitude.

Now, cases that go mad have simply got a number of missed withholds – if you want to know the anatomy of madness. It's the missedness of it all.

Sunday afternoon, Thornville, Ohio, was mysteriously, uniquely and suddenly on the telephone. I happened to pick up the telephone. First told the person that I wasn't here because I just didn't feel like going into all that, and – and it was a collect phone call. So after I'd put the thing down, it got to be a right-in phone call and they would pay the charges. And I talked to somebody that said that they had done some Self Analysis a long time ago, but now these days they felt they were going out of their mind. This girl felt she was going out of her mind and going stark, staring mad and insane and couldn't go to the organization or anything of the sort, and expected me to be on a plane at once and go to Columbus, Ohio, to audit her.

Well, this is all symptomatic of this and that and the other thing. Although people do call me up rather constantly here and there and expect me to go to the North Pole to audit them, or something like that; I always say, "Well, if the guy is worth saving, he can at least come within range." I always offer some auditing if they'll come within range, sort of thing. But you find out when they're in that kind of a state of mind – this is what's very interesting –

their reach is very difficult, and their departure from an area is very difficult, and the number of crimes they have under their hats are absolutely uncountable.

And if you were to take such a person in that *extremis* and try to put their rudiments in – *pssssssss* – you'd find their rudiments would go out faster than you could get them in. Why?

Because there's tremendous weight of unknownness, of crimes, of other things on the case. They're not related to Scientology or are related to Scientology. Now, the more nearly these crimes are related to injuring Scientology, the less you will be able to keep the rudiments in. Quite interesting. That has a definite coordination. That isn't just me talking.

People kick the bucket on these things. I mean, there's nothing to fool with about them. We just had a doctor up in Scotland die just the other day, by the way. He had been calling me up rather persistently and constantly and telling me I had to go to Scotland and process him. I actually knew the man's background. Possibly, if it had been any of you, I would have said yes. Do you understand?

But this guy's background – he'd had an awful time. He'd been murdering people and doing other odds and ends and putting women into trances and using anesthetics on them and raping them and – pleasant, you know? His activities – now never kid yourself – the activities of people of that particular character are gross.

Now, I'm not maligning the dead, because he's probably already picked up a body in Scotland. But don't kid yourself. When they're – when they go spinny, you've got a wrestling match on your hands if you don't get your paws on what's making the case so woogy, see?

I know this boy's background pretty well – I knew his background. I knew something about it, but more than that, I knew my Scientology. And I knew well, if anybody in his family could boost him up and get him down here, why, I'd happily get somebody to pull a few of his overts and so forth.

The girl that called from Ohio, I simply told her over the telephone, told her sister-in-law, to write – sit down and write all the things nobody knew about her except herself and send them in a letter to me. See? So that when that gets here, I will simply say, "Well, this is all very, very interesting, and thank you for sending this, but you have omitted several," you see? [laughter]

And I'll just keep this thing going, and eventually this person will straighten out. See? But don't be so filled with sweetness and light about all this sort of thing. People who invalidate E-Meters and have a hell of a time with this and with that and the other thing are actually having a hell of a time with something they've done in life.

Don't be naive. This is not just talk – this is fact. This is fact. And just stop wasting auditing time. Just accept the fact this bird's – you can't keep his rudiments in – he's got overts. Just accept that fact. And don't keep knocking your own brains out, see?

Here's this *dear* sweet, old lady who belongs to the Cat Society and who is kind to Half Decayed Flowers clubs. See? And you say she's never done anything in her life. But you can't keep her rudiments in. That's the only test.

Their rudiments keep flying out in various directions – man, they've been busy! I don't care – and probably the apparency they're sitting there with – and that's not in some past life, that's this one. And the apparency they're sitting there with is a – is a camouflage. Anybody that would join the Society for Decayed Flowers and Protection of Cats – camouflage.

They sit there with one flower waving on their Victorian hat. Camouflage, man. And you're probably talking to Mata Hari of World War II. Who knows? See? Used to kill partisans for the fun of it.

Don't be so naive, in other words. It's just a direct coordination – absolutely direct: can't keep the rudiments in – they got a lot under the lid.

Easy way to get it out is to take some broad, pervasive thing like Form 3, the Joburg. Take that thing (and it's got every crime known to man and beast on the thing one way or the other) and you clip some corner of what they've been doing. See, you'll take some – you'll scrape at it at least, see?

You'll notice every time you mention the word "rape," or something like that, their hair stands on end or needle goes off the pin or something like this. There's something going on here, see?

And in that way, a packaged form is of enormous use. Now, who knows? You'll be able to take perhaps one pc and directly – directly put their rudiments in. Overtly. They stay in. You can do a Routine 3. Everything is going along swimmingly, you see?

Now, I'm not saying the pc, the worse – or pc should be taken up in some other way, particularly, but you're going to get the next pc to that and you prepcheck all the rudiments in and they don't stay in. And you prepcheck them in, and they don't stay in. And you prepcheck and – and it's all like living in a world of hot grease. It's slippery. What's going on?

Well, what's going on is they've been up to things which in this lifetime would be termed, to be very understative, antisocial. See, it's not they believe they has been doing something antisocial. They've been doing something antisocial, for which they would be damaged if discovered. Get that? I mean, they'd be damaged. So, of course, they can't get off the withhold easily.

They wouldn't dare say, "Well, I – ha-ha – actually accepted German marks all during the war to turn in the number of ships passing Point Conception." They don't know. They read in the paper every once in awhile, huh-huh, that they're still trying war criminals, you know. They're not sure. Their judgment is never good on these things, you know? It always looks to them like everything is still rigged and these have to be pretty juicy. They have to be pretty good crimes. They can't be mild.

You know, one person doesn't consider crimes wilder than another person. The crime is the crime. I mean, that's all there is to that.

One of the reasons you don't get anyplace – when you don't get anyplace with Prepchecking – is because you say, "Well, Joe," you see, "is much queasier than Bill. So then Bill would have to have much less crime on his background to be as nutty as Joe," see? See? "Because, you see, Joe here, he gets all upset." Let me put it another way: "He gets all upset here

at just the *thought* of doing something bad, you see? Whereas Bill, he's very extrovert, and he can do something bad and not be that upset. So therefore, Joe and Bill being entirely different people, you'll be able to get Bill's rudiments in even though he has done many criminal things. But Joe, you can't get his in because he is a – a delicate flower, you see? And he really hasn't done anything. You just, you know, it's just his – his – the feeling of guilt is stronger."

Man, you're just rationalizing yourself into a hole, that's all. I get any of these girls – there's a girl, lay up here in a hospital and died one time – I guess about a year ago or something like that. I asked a staff auditor here to go up and give her some auditing, and he did, and the hospital was so upset, crowded and appetite over tin cup, there wasn't any way you could even get to her bedside and she went ahead and kicked the bucket. It wasn't no Scientologist – just a local girl up in town. We heard about it and so forth – thought we'd do something. And didn't make the grade.

Well, this girl wasn't even injured very badly. This girl was lying in a funk and was saying nothing. Ah – fascinating. Now, you think this is because she picked some flowers in the town council's front yard? No, brother. There's something her family didn't know about her, and she went ahead and was leaving. And the extremity of leaving is kicking the bucket. See? And when they get too many overts and too many withholds, that are too antisocial – they're very damaging themselves – they want to get the hell out of there.

That's all they can think of and so they die very easily, given the least provocation. Now, in the process of doing one of these, if you simply went and monkeyed with this case – I'm talking about dying people here with malice aforethought actually – if you went and monkeyed with this case and thought it was because they picked some flowers out of the town council's garden, and you went in at that level of expectancy of what you were going to find in this case, this case would be a corpse before you got anywhere.

See, you've got to say, "What is this now?" See? A kind auditor could actually – in this type of case, lying in the hospital – a kind auditor would just pat them on the head and say, "God bless you, because that's all that's going to happen."

And of course, the guy gets out of his head and tries to find God, but that's another story.

What's going on here? Well, the auditor has kindified him to death, that's all. This girl, the only way you could possibly have rescued her or snapped her back – if the medicos had built enough beds up in the hospital, you know, and didn't leave so many patients dumped in the corridors – you actually couldn't even walk to the side of her bed if I remember rightly or some such exaggeration – the auditor going in there, he has somebody who has a very, very short attention span, see. They aren't long for this thing. Well, he can't monkey with it; he hasn't got any time to monkey with the thing, you see? So he's got to ask some pertinent question.

He'd have to find out something about the person, you know? Is the person married? Not married? Living with family? See? Who is it here? You see? Something of that sort. He actually couldn't even spend very much time on rudiments on such a case. Don't you see? Because the person's concentration is withholding on a specific thing. You'd have to parallel what the mind is doing.

You'd say, "Well, where don't you want to go back to?" You know, "Where don't you want to go back to, dear?"

"I don't want to go home. Oh, no, no. No, I don't want to go home."

"All right. Very good. What don't they know about you, dear? That's right. All right now."

"Ooo-oooh, ooo-oh."

"Yeah, well, what have you done that you're hiding from them? Come on. Tell me. You can tell me, you know."

And "Oh – wow!" and they tell you, and they're out of bed and dressed and gone home. [laughter]

Magical. Magical. And of course, if you're kind and you go in and you say, "Well, you can confide in me. Have you ever smiled at somebody?" You know, some big overt. They haven't got the span or anything else, because their mind is straight on to the withhold when they're trying to pass out.

So you can try your pc's attention and you can throw your pc wildly out of session by not taking it somewhere where the pc's mind is concentrated. Now, to that degree, a pat list has a certain liability. See? It bores your pc stiff before it ever gets to his crime. So therefore, you should learn to rapidly sift the coffee beans from the chaff, with rapidity.

Here's the way you run one of those lists. That's what we're talking about.

"Have you ever stolen anything?"

The guy says, "Yeah, I stole a penknife once."

You say, "Good. I'll check it on the meter. Have you ever stolen anything?"

That's your Zero A, don't you see? And you say, "Have you ever stolen anything?" You say, "That's null, thank you very much."

"Yeah, have you ever drowned a waterbuck?" *Clang!* "All right. What's that? It's reacting. For your answering, I'll repeat it there. Have you ever drowned a waterbuck?"

"Oh, yeah, I'd forgotten all about that. Yeah, I did. I was down on the south side of the Brisbane River. Yeah. Yeah, I did."

"All right. I'll check that on the E-Meter. Have you ever drowned a waterbuck? All right. That's clean. Thank you. All right. Have you ever raped anybody?" *Clang!* You say, "That's reacting. I'll repeat it for you on the meter. Have you ever raped anybody?"

"Uhm – I've been worried about being raped."

"I'll repeat that for your answer. Have you ever raped anybody?"

"No, no. No, I never have."

"All right. I'll check that on the meter. Have you ever raped anybody? I'm awful sorry, but that is very, very live."

All right. Now we're going to go into it, see. And you say, "Well, let's fish it up here. What have we got? See?"

Let's get a What question wrapped around this thing. Let's get an incident. Let's get him raping somebody. Let's talk it over. What is this all about? Let's get him discussing the subject. Get him immersed in it one way or the other. Get a What question out of some overt.

"Well, I actually – I actually touched a girl once in a subway." That's all you can make out of it, man. That's the first chain you're going to have to clear.

And you say, "Well, what about touching women?" or "What about touching girls?" Test it out – see. "What about touching people in public places?" Whatever it is, get something. This pc is queasy, see? It's actually doing something. It's touching something. All right. Get that. Clean that up.

"What's the first time you ever did this?" You know, I mean, you've got the incident all right. We're going to chew it up.

"When was that?" and so on and etc., and so on. Fine – that's good. *Boom!* You know. "When's the first time you ever did this? Come on. When was the first time? Let's get to the bottom of this chain. All right." We picked that up and so on.

"Well, it was actually in school. I used to get a kick out of pushing around my kindergarten teacher and that sort of thing. Used to hang on her skirt and used to get a tremendous bang out of it."

You – "Thank you very much. When was that?" "Is that all there is to it?" So then you notice this thing is deader than a mackerel.

You say, "Ah, ah, that's fine. Thank you very much. All right. Now let's check this question. What about touching people? That's null. Thank you very much. All right. Now – *ahem*. Now, heh! Have you ever raped anybody? That is the question." *Clang! Boom! Thud! Crash!* Pots and pans falling out of the E-Meter.

"Well, I thought about it once. I actually considered it once."

"All right. I'm glad. Glad you got that much now. All right. Now. Have you ever raped anybody? That's what I want an answer to."

"Ah-whooo! Well, you wouldn't really call it rape." [laughter]

"All right."

The doors are going to open on that one. Get the first one on the chain. Get back up there again, man. Clean up that "Have you ever raped anybody?" You really got the chain. You have got a thing knocked out, so you null it off and that's that Zero A gone. Shouldn't take you very long to do it.

Now, because this is going to strain the pc's attention when you're doing a pat list from one end to the other, you should do it rather – well. See, you should do it rather positively. You should do it well. You should steer his attention very much. You shouldn't be in any doubt about what you're doing, because otherwise you're just going to wander on and on and on.

Now, in view of the fact that you're already not well paralleling his central crime – you're going to find it someplace on the list, but you haven't got it yet – and his attention is going to require an awful lot of direction because it tends to disperse all the time. He's actually hiding something from you, knowingly or unknowingly. And if he's knowingly hiding it, then it's got an awful lot of unknownness connected with it that he doesn't know about either.

And it'll be a tremendous relief to this character when you finally get down to that. But where is it? Where's the key question? Is it on the beginning of the list? Is it in the middle of this long canned list? Or is it at the end of the list? Or – you know, where is it? See, you can't tell.

So therefore, because you're checking – Prepchecking, Sec Check Prepchecking – a lot of dunnage ... Although it'll be very important to him, it'll make him feel a lot better and everything'll be a lot better. Oh, yeah, yeah, yeah, yeah; but there – it isn't right exactly what his mind is doing, therefore we have to do it rather well. You have to do it slippily, you have to do it fast. You have to be able to carve right straight in there and get right what you're going – clean up the chain, come right back up to the top again.

I don't know how many chains of this particular character you could clean up, but I think I could handle any number of null questions. I mean – let's say fifteen or twenty questions that had only one question that released them, see, plus at least twelve questions you had to prepcheck the living daylight out of in one two-hour session. I mean, I'd consider I was doing about all right if I did that many – about twelve Prepcheck chains out. Clean – clean as a wolf's tooth, plus about maybe ten or twelve, twenty null questions – all clean. See? That's the expectancy of rapidity.

Now, if you were doing it that fast, you'd be getting enough gain on the pc, you see, so the pc would be interested and in-session even though you weren't in the center of the pin.

Wheeeee!! You know? Now, there's no monkeying with one of these things. You don't sit down for a Scientology career on one question, because it won't clear on one answer. You see? Don't take the next 25-hour intensive to clean up "Have you ever hit anybody with a pease porridge pudding" You know? It doesn't take that long to clean up man, I guarantee it. Not if you fish the What question into view, you see? Not if you get that What question hot. you get the actual overt; get a What question that matches that overt; get down that line like a rabbit going down his burrow, you know, and just pull that basic-basic right *psszzzzt*. The rest of it'll just go *rrrrrrrr*, just like a bunch of dominoes, you know? Knock them one *brrrrrrr* – *bang!* There it went out at the top end.

You say, "That's it."

You can do it; you can do it. Actually, the patter that you use with it is becoming narrowly quite precise. There's very few questions about how you vary from one to the other and so on. You just do it, you know?

You say, "Have you ever raped anybody?" and then you ask a What question, "Have you ever raped anybody?" and it gives you a tick-tock, splash, you see, on the meter. You know? And then you get a What question that goes tick. I don't think you're on the right chain, you know. I really don't. I think there's something wrong with that.

I think somehow – usually something wrong with your wording, and you sometimes wake up out of a dream and realize that you're on a motivator chain or something stupid of this particular character. See?

You're talking to this girl. You've asked the question "Have you ever raped anybody?" You'll find out – you got to be pretty well grooved in or you get tired or something. And you suddenly got this thing all wrong. She's a girl, so therefore, she's the logical person to rape, so she was raped. So she gives you this rape thing.

Obviously, he says, do you mind – missed withhold. See, it's a missed withhold. And she's never told anybody before, and therefore, it is perfectly legitimate and then you go on, and you go on, and you go on, and you pull incidents, and you pull incidents. You find out she was raped when she was one, when she was two, when she was three, when she was four; raped twice when she was five, six, seven; skipped the whole eighth year. She was unconscious the whole eighth year for having been raped in the seventh year. And you can – it's just going to get worse and worse and worse, because the pc is not being prepchecked on the auditing question.

The question is "Have you ever *raped* anybody?" She's a pretty girl. You know very well that pretty girls never rape anybody. Oh, yeah?

And you'll sometimes get tricked into one of these things and dead end. And then you'll come up at the other end, and you'll say, goodness gracious, you know. It sure takes an awful long time to prepcheck something like this. Golly, it takes a long time to get one of these Zero Questions, you know, and get the Zero A, you see – and then get a What and then just-just takes – what really takes time is trying to get all of the overts on that particular chain from one end to the other. And if you ever find yourself in that frame of mind, listen to what the pc is telling you sometime. Because the pc never is answering the auditing question if that's the way it is.

You've kind of heard it crosswise. You got caught napping.

You said to this pretty girl, "Have you ever raped anybody?"

She says, "Yes, I was raped."

You say, "Good. All right. When was that?"

"Well, I was raped at the college prom. College prom, my freshman year."

You say, "All right. Now let's get a What question for that. What about being raped at dances?" and so forth.

And you got – you got to figure it out, and you – a little bit hard to figure it out. [laughter] And you finally get something that reacts there very well. And you go on and you get the earlier rape. And next thing you know, you're throwing your end rudiments out like crazy, you see? You just – pc is at effect. Got the whole thing backwards, but – I'm giving you a very silly example, but these can be pretty interesting.

A pc can really throw a curve at you and you all of a sudden realize that you're sitting right there square on a motivator, and this thing is a motivator chain and you weren't listening. And that's about the only time Prepchecking gets rough.

Or you're on some kind of a think, or a figure-figure base that sounded all right when you went into it, but somehow or another didn't turn out to be all right.

The pc has ceased to answer the auditing question. Is audit – answering something else. That's what happens to Prepchecking: It's that the auditor buys the wrong answer to his auditing question, see. The auditor asks for an overt: he gets a motivator. He asks for an action, he gets a think, see? And the auditor, unwittingly, at that moment goes on into that channel. And you'll find out, if you're ever training auditors, this is what gives you gray hair. It's grim, you know?

You say, "How could he possibly ask this?" You say, "What about being beaten by your mother?"

You know, you'll see this as a What question. You say, "For God's sakes, man. How the hell did that ever get on there?"

And you'll find out, if you coordinate them, you'll find a question, "What about being beaten by your mother?" is then followed by the remainder of the session auditing time.

They found this – it – the session was between 2:00 and 4:00 and they found this at 15 minutes past 2:00. And then down here at the end of it, the thing is still in full bloom and isn't marked null yet and it's 3:55, end rudiments. And then you look at next day's reports, you see? And they start into this question. And you'll find out that when they give these motivator answers – these think, these figure-figure answers – or answers not to the auditing question.

Say, "We're clearing Zero A. Have you ever raped anybody?"

And we got some What there that has to do with kissing.

"What about not wanting to be kissed?"

Well, the auditor sitting there has got to be able to translate this right away into the proper action. Otherwise, he never gets a fast Sec Check Prepcheck.

Here's the way you go astray:

You say to somebody, "All right. Have you ever raped anybody?" *Clang!*

And the person says, "Well, yes, I – at the junior prom, I – I was raped at the junior prom."

You say, "All right. Good. I'll check that on the meter. Have you ever raped anybody? Uh-huh. This isn't clear, so I'll have to go into a Prepcheck now. Let's see now. You say the junior prom. All right. Let's see now. What about being raped at the junior prom? What about being raped at dances? What about being raped by young men at dances? That seems to register well."

And all of a sudden, you say – I *hope* you will say to yourself, if you get that far – "What the *hell* am I doing?"

"Say, what was the answer to that question? Oh, come off of it. Look, look, you didn't answer my auditing question in the first place. Look, have you ever raped anybody? That is

the answer I want. I want – and you gave me some other answer. I'm sorry, but we've got to go back and pick it up."

You know, you'd have to do it in order to get your end rudiment in.

"Now, look. Listen, listen carefully. Have you ever raped anybody?"

"No." No reaction.

You say, "Good. Thank you. I'll check that. Have you ever raped anybody?" No reaction.

All right. Well, on to the next question.

You see, it's corny mistakes, actually, that get you into these fixes, and then you think Prepchecking, Sec Checking, goes on forever but actually the mistakes are quite corny. And you go back and you laugh at yourself.

I know the early times when I was doing some Prepchecking, working out Prepchecking, I mean, I got some outrageously weird cross-steers some ...

In the first place, while you are still learning your tools, you feel like an Indian juggler on the stage, you see, whose nearest rival has covered the whole stage with little round sticks. And there you are, you see? And you're learning your procedure and that sort of thing and you just don't hear these things as they go by. And you form this opinion that Sec Check, Prepchecking kind of takes forever and takes a long time. And your training pattern then becomes that this is a very slow action.

So you say, "Well, have you ever stolen anything?"

And the fellow says, "Well, I stole a clock once. I stole a clock once from my brother."

And you say, "All right. Thank you very much. I'll check it on the meter. Have you ever stolen anything? That still reacts. Thank you very much. All right, you said you stole a clock once from your brother. When do you suppose that was?"

"Back in the fe-."

"Oh. All right. Now let's see, what could that be about? Let's see, 'What about stealing clocks?' 'What about stealing things from your brother?' 'What about stealing things from your brother?' That'll – pretty good – *heh-heh-haha* – pretty good, there's the original read. All right. Thank you very much. All right. Now, when was that? All right. Anything else you'd care to say about that? All right. What didn't appear there? Okay, thank you. All right, who didn't find out about it? Oh, all right. Thank you very much. Now, is there an earlier one on that chain? Earlier – earlier than that?"

"On what chain?"

"Stealing things from your brother. Is there any earlier time you've stolen anything from your brother?"

"Stolen anything from my brother? Stolen anything from my brother? Oh – oh yes! Yes, as a matter of fact. As a matter of fact, yes, we were – when we were thirty, I borrowed

his car one day and he said it was stealing, but it wasn't. I sold it I know, but actually he ..."
[laughter]

"All right. When was that? Is that all there is to it? All right. What didn't appear there?"

Well, cripe! Thirty – you know this thing is going back there, man.

All right. Work it over. Work it over. Buy it. Give it the dignity of it. "All right. Who didn't find out about that? All right. Thank you very much. Good enough. Were you and your brother together when you were kids?"

"Oh, yeah. I suppose so. Yeah. Oh, yeah, yeah. Big occlusions in the area, but we were together when we were kids."

"All right. What did you steal from your brother when you were kids?"

"Oh. He used to pick on me a lot!"

"Good. All right. That's fine. That's – that's good. But what did you – I'll repeat that. Now, what did you steal from your brother when you were kids?"

"Nothing actually. I didn't – I never developed the habit until he stole ..."

"Good. Thank you. What did you steal from your brother when you were kids?"

"*Whew!* I stole my mother's affection from him. That's what I did." "Good. All right. Thank you. All right. All right. That – that's okay. When was it? And so forth. When was it? All right. That's good. Good, that's now all right. Okay. Now is there anything earlier than that?"

"You can't get any earlier than that."

"Well, why can't you get any earlier ...?"

"Well, we were both eight."

"Oh, I think we can find something earlier than that." And all of a sudden, well, this comes up at five he used to... His brother was smaller than him – and you've all this time had the idea that the brother, you see, was years older. But actually the brother is years younger. See? Suddenly, he gets this straight. Cognition – you see? *Ha-ha*.

And you find out that he used to tell his little brother that ice cream was poison, [laughter] that meat was poison, that dessert was poison and where his mother came in, was telling him that his mother was always trying to poison him, and befriending him by eating the food for him. [laughter]

And he just never remembered this. And you can see that thing just fade out; the pc square around. You ask some question about it, you know? It's just deader than a mackerel. You come right back up there. "What about stealing things from your brother?" You know? Null. "Have you ever stolen anything?" Null.

Fine. *Clang!* You're out of there, man, and you're on to the races. But actually, it shouldn't take you any longer to get that out of the pc than it took me to tell you and that was three minutes. See?

You're driving a pc – if you're not sitting there just going along for the ride, if you got your hands somewhere near the wheel – I don't absolutely insist at first that the auditor run the session. We like to sneak up on it and get him up to a point, well, where the session actually gets some control.

But, if you're sitting there right, with your hands on the wheel, you have that guy back down the track and snap that thing out of there and get the pc back up the line again. And that question nulls so fast, he hardly knows what has happened, except he suddenly feels so much better.

"Any goals or gains?"

"Yes, for some reason or other, I've – you know, I've always had this feeling like I've been poisoned. That's very funny. I don't have that feeling now. Yeah, that's some gain. Must have been something in the session that had something to do with that." Sometimes when you're in private practice, they call you up at twelve o'clock at night saying, "I just remembered. It's because I was trying to tell my brother I was keeping him from being poisoned, that I felt being poisoned."

[in a tired voice] "Thank you. Thank you very much." [laughter]

Well, there's your Sec Check, Prepcheck rundown. I tried to give you some idea of – rather than an example of doing it and so forth – I'm trying to give you the feel of it – trying to show you where to push, the pressure to put on the thing, and so on. And canned lists of predetermined overts of one kind or another are of tremendous use. Don't minimize their use, because they scrape up areas that the pc is trying desperately to avoid. And because they are a generally formalized – formulized thing that contain all that particular type of thing that would be considered reprehensible in this lifetime, then they scare up an awful lot of material and lay it in your lap and generally will come into some collision course with what the pc is trying to suppress.

You get one of these things done, get this thing done very well; you go back; you put your rudiments in; all of a sudden – with a Prepcheck, see, you prepcheck your rudiments in now – you'll find out they go in quite easily. That pc is very happy about the whole thing and they will stay in. Now you can move over into a Routine 3-type process and you are all set.

But unless you get up some of that stuff, you'll find out the pc just kind of keeps spinning, and he gets up and he falls flat on his face, and he gets up and he falls flat on his face, and so on.

Now, if you've gone over a lot of these things, your case repair, your checkout and so forth is to go over the same list of What questions. I must tell you this.

When you check up to find out if some auditor knew his business on a canned Prepcheck, look over the What questions. Do not look over the Zero A's. That's quite important. The Instructor or you or something, when you're trying to check up to find out whether or not the auditor cleared this up, *don't* look over the Zero A's, look over *only* the Whats. Check up only the Whats in Prepchecking. Never check – when you – just like when you're checking somebody's rudiments – never check somebody's Zero A's. Why? Because the process of Prepchecking increases the person's responsibility.

So if you checked Form 3 again, the questions consisting of Form 3, of course, there are many of them going to be alive, because they came alive because of the improved responsibility of a pc.

Well, why were you prepchecking the pc, see? To improve his responsibility. But what won't come alive are the What questions you've nulled. So you always check the What questions.

And if you find one of those out, why, really start chewing on the auditor. If he's gone on and left the What question live, he has sinned, because the pc's returning responsibility does not come up and revivify that What question. Do you follow that? And that's what you check. That's the only way you check out an auditor's ability to Prepcheck – is check his What questions, never his Zero A's – and you'll find out this will work rather like a dream.

If you checked his Zero A's, the increased responsibility of the pc will show them to be alive, when actually at the time he went over them, they were quite flat. And that's how you keep from hanging somebody falsely.

Now you check somebody's rudiments, of course, after they have had a whale of a session and if the rudiments are checked for the session, they are just in – for that session they just now had – the scale of improvement and increased responsibility of the pc is more or less on a plane, and you'll find out those things will be in. They'll be in for that session if they're checked right after that session.

If you want to have some fun sometime, start – and get really mad at early auditors, check the (quote) rudiments (unquote) or absence of them of very early auditors. Because, of course, the gain of the pc in the interim knocks the action and attitude and responsibility of the earlier sessions out of gear. It won't happen for the session we've just had this last day or so.

But you ask him if he had a missed withhold. He's liable to make a total mistake. He's liable to tell you yes, he had a missed withhold from that auditor. Whereas at the actual fact, the actual time he was being audited, he didn't consider it a withhold and he didn't consider it an overt, but he does now. You see the trickiness involved in all this. Okay?

Audience: Yes.

But you can develop a lot of speed with this, and you can get a tremendous number of results with this. You can make people really shine. These results are just as you see that a What question remains null, these gains stay stable with the pc. It takes quite a bit to knock out a Prepcheck gain.

So anyway, there is how you Prepcheck and Sec Check, and I hope you'll be able to make use of it.

We're overtime again.

Thank you very much. Good night.

TV DEMO: GETTING RUDIMENTS IN, PART I

An auditing demonstration
given on 30 May 1962

This evening what I'm going to try to do is just get in some rudiments, show you it can be done, get in some beginning ruds, get the Havingness command, run that for a few commands and then run end ruds. And I'm just going to do this on the Instructors and give you an idea of this particular type of session. I want you to notice the instant read characteristic of the meter and where the meter reads. Those who maintain that they have gotten the ruds in on the pc and then have – somehow or another – mysteriously they have gone out since the end of the session, simply didn't have the ruds in. That is – it's as easy as that.

LRH: All right, let us take the first candidate we have on this. Okay. Little closer. Pick up the cans, would you?

PC: *Right.*

LRH: Okay. Now. We – what I'm going to do here, is I'm just going to rapidly go down the rudiments, get them in, try a little Havingness and get them in. You've had a lot to do with this setup, and so forth, and you've never been audited. [laughs]

PC: *Never been in this chair.*

LRH: That's right. All right, see where we sit here on the meter. All right, you're reading about 2.5 on the meter here which is fine. All right. Is it all right with you if I start this session now?

PC: *Sure.*

LRH: All right, here it is: Start of session. Has the session started for you?

PC: *Yeah.*

LRH: Sure?

PC: *Sure.*

LRH: All right. Very good. What goals would you like to set for this very short session?

PC: *Oh, I'd like to get the ruds in.*

LRH: All right. Any other goal?

PC: *No, I think that'll do, Ron.*

LRH: All right. Any goal you'd like to set for life or livingness?

PC: *Yes, to be more able as a result of this session.*

LRH: All right, to be more able... Good. Any other goal?

PC: *No, I think it'll do for this session.*

LRH: All right. Very good. Okay. Look around here and tell me if you can have anything.

PC: *Yep.*

LRH: There's a little kick on that. Now we're going to take up havingness in the body of this session, and we're not particularly keen on throwing this thing now. But, just look around here and tell me if there is anything out of order or you feel misplaced or something of that sort.

PC: *Yeah, there was a missed withhold there that I didn't tell you. You said look around here and see if you can have anything, and of course I observed it wasn't the usual rudiment that one expects.*

LRH: I see.

PC: *So I didn't communicate that I did notice that.*

LRH: Oh, all right. All right.

PC: *No, there's nothing seems out of place.*

LRH: Okay. Good enough. All right. Look around here and tell me if it's all right to audit in this room.

PC: *Yeah.*

LRH: That's null. Thank you very much. Good enough. Now, are you willing to talk to me about your difficulties?

PC: *Sure.*

LRH: Well, there's just a little tiny tick on that. Anything you'd like to say concerning that?

PC: *No, I just flashed talking about the difficulties of the – getting the television set up into the new building.*

LRH: All right.

PC: *I flashed on that when you asked me the question.*

LRH: All right. All right. Are you willing to talk to me about your difficulties?

PC: *Sure.*

LRH: All right, there's a little tick on that. So, who'd I have to be to audit you?

PC: *You!*

LRH: All right. Very good. Who would I have to be to audit you?

PC: *Just yourself.*

LRH: All right. Very good, who would I have to be to audit you?

PC: *Well, I can't think of anybody better than yourself there, now.*

LRH: All right, very good. Let me check this. All right. Are you willing to talk to me about your difficulties?

PC: *Yeah.*

LRH: That's null as can be. Thank you very much. That was the last command.

PC: *All right.*

LRH: All right. Now, I don't think I've audited you very dress parade and so forth, or maybe a little coffee shop.

PC: *Hm-hm.*

LRH: So I can't ask you "Since the last session." But, since your last session, when was that?

PC: *Oh, about three weeks ago.*

LRH: Three weeks ago. Since your last session have you done anything you are withholding. I got a tick. That's it.

PC: *Fused the lights. But I'm not withholding that.*

LRH: All right, all right. You satisfied you've answered the question?

PC: *No, not really, because I wasn't withholding that. I've already told you about that.*

LRH: All right. All right. Let me repeat the command. Since your last session have you done anything you are withholding? That's the tick.

PC: *Well, possibly something to do with a meter read, that I'm checking. Sometimes I'm not too sure of every meter read. I feel I set a high standard there.*

LRH: All right. Very good. Let me check that on the meter here. Since your last session have you done anything you are withholding? Now, that's clean. Thank you very much. Okay. Now, do you have a present time problem?

PC: *No.*

LRH: Well now, I got just a little tick there.

PC: *Well, a problem getting that – uh – it's right here – the TV set up on – over in the new building.*

LRH: All right. Very good. Let me check that on the meter. Do you have a present time problem? All right, that's – that is an equivocal read. Let me check it once more. Do you have a present time problem?

PC: *No.*

LRH: I have the tiniest, faintest suggestion of a reaction. It's hardly a reaction.

PC: *Well, what I think of now is I'm not very good at putting things on paper. And I did say I would draw a*

sketch of the room, and I've started to do that. And that does present a little problem to me.

LRH: All right, very good. Let me check it on the meter now. Do you have a present time problem? I get a latent read on that now, so it's all right. Okay?

PC: *Okay.*

LRH: Very good. All right. Now, I would like to run some Havingness on you. What would you say to that?

PC: *Very good.*

LRH: All right. Very good. What is your Havingness Process?

PC: *Look around here and find something you could have.*

LRH: All right. We'll at least check that out and see what we've got here. All right. The command I am going to give you is, "Look around here and find something you could have," okay? Now, is it "could have," or "can have"? Which – which has it been?

PC: *"Could have."*

LRH: "Could have." All right. Here it is: Look around here and find something you could have.

PC: *That settee.*

LRH: Very good. Look around here and find something you could have.

PC: *Your hair.*

LRH: Very good. Squeeze the cans. Thank you. Look around here and find something you could have.

PC: *That camera.*

LRH: Good. Look around here and find something you could have.

PC: *The curtains.*

LRH: Good. Look around here and find something you could have.

PC: *The paper clips.*

LRH: Very good. The paper clip?

PC: *The clips...*

LRH: Oh, my goodness I could – didn't even see them! All right. Look around here and find something you could have.

PC: *The carpet.*

LRH: Very good. Look around here and find something you could have.

PC: *The switch gear over there.*

LRH: Okay. Squeeze the cans. All right. Lay your hands up on top of the table. Just relax them, relax them now. Now close them. All right. Now just squeeze – just these fingers... Yes. All right. Look around here and find something you could have.

PC: *Those three marks – small cut marks on the wall.*

LRH: Good. Look around here and find something you could have.

PC: *The door.*

LRH: Good. Look around here and find something you could have.

PC: *The fireplace.*

LRH: Very good. Squeeze the cans. Oh, that seems to work. That Havingness Process seems to work. All right. But just on the offbeat chance that there's some suppressions on that...

PC: *Yes...*

LRH: On Havingness Processes – on Havingness Processes, have you suppressed? I smell a mouse here, on this Havingness Process, okay?

PC: *All right, yeah.*

LRH: All right. I'm not getting tone arm action on it.

PC: *Do you want my hands up here still ?*

LRH: You can drop them.

PC: *Thank you.*

LRH: I'm sorry. Now, on Havingness Processes, have you suppressed? Well, what have you suppressed on a Havingness Process? I got it there.

PC: *I've suppressed – suppressed a desire very often in being run – in being run on a process, to beat the auditor to the command. In other words, I know what's coming and I'm halfway there, and I've suppressed doing that.*

LRH: All right. Very good. All right. On a Havingness Process, have you suppressed? Yes, I've still got a reaction to it. Anything else you can think of? Should be "suppressed anything?"

PC: *Sometimes when people are running a Havingness Process and they speak of permeating things and so on, I'm not always with them, and so I have suppressed any idea of getting up or saying I – that – that doesn't seem real to me.*

LRH: All right, very good. All right. Let me try this again now. On Havingness Processes, have you sup-

pressed anything? That's null. At least for – can I check it again?

PC: *Yeah.*

LRH: On Havingness Processes – on Havingness Processes have you suppressed anything? Well now, that read – that is latent. That is latent. That's an equivocal read. I'd better search it a little bit more. Can you think of anything else on suppressing things on a Havingness Process? There it is.

PC: *Um...*

LRH: There it is.

PC: *... yes. I know I started to Q-and-A sometimes with myself on – or argue with myself, as to whether I was really doing the process.*

LRH: Hm-mm.

PC: *And so stopped any – any idea – suppressed any idea of doing that. In other words, just do what I feel like doing when you – they give the command.*

LRH: I see. And what have you suppressed there exactly? I didn't quite understand that.

PC: *Suppressed any idea that I wasn't doing the process correctly.*

LRH: I see, I see. All right, all right. I got it. All right. Let me check that now. On Havingness Processes, have you suppressed anything? I've still got a bit of a reaction there. There's a tick.

PC: *Well, I haven't got a specific incident. I've got a feeling that in running – in sometimes checking a Havingness Process, when I've been auditing, that I haven't always*

had a full dial – an increase in the squeeze...

LRH: Hm-mm.

PC: *... in the swing when I – I've got them to squeeze the cans.*

LRH: All right...

PC: *And sort of suppressed that. Well, I oughtn't to pass this, but I did, you know, suppress the fact that you hadn't really got the full swing on the needle that you should have.*

LRH: All right, I understand that. Okay. Let's try this again now. On Havingness Processes, have you suppressed anything? That is clean. Thank you very much. Okay. On Havingness Processes, have you invalidated anything? There is a latent read on that, and there's an immediate and a latent, both.

PC: *What I've got then was the first Havingness Processes that I had run on me...*

LRH: Oh yeah?

PC:... *by Pearson, which was mocking up gold balls and pulling them in to me. And they always seemed to work very effectively.*

LRH: All right.

PC: *But uh – so I suppose I have invalidated those processes by reason of the fact we're running more in present time processes on havingness, you see.*

LRH: All right. I get you. All right, let me check this now, on the meter. On Havingness Processes, have you invalidated anything? I still got a reaction.

PC: *Hm.*

LRH: That's it. That's it.

PC: *Yes. Now this is something along the lines of – um – a process may – another process might run down a person's havingness...*

LRH: Hm-mm.

PC: *... and I've always – it's all been guided by the fact that any process that turns on a condition will run it off...*

LRH: Right...

PC: *... and so – uh – I wouldn't interrupt it to run Havingness, despite the – being advised to the contrary.*

LRH: All right, all right. Very good. Very good. All right, let me ask that question again; check it here on the meter. On Havingness Processes, have you invalidated anything? Now, that is probably clean. But let me make doubly sure here. On Havingness Processes have you invalidated anything? I've got a little reaction on that. It's a little tick-tick. That's it. Right there. That's it.

PC: *Room upstairs, I'm getting.*

LRH: That's it. That's it.

PC: *Oh! This would be on you – you've published and said that it's when you've – can have the largest object in the room.*

LRH: Right.

PC: *Now, then there's a tendency sometimes you find yourself starting off a process – I've only just realized this – I started off with the settee tonight when I was running the Havingness Process, and so that hasn't – as far as my case – that*

particular point hasn't become real to me.

LRH: All right, very good. Very good. All right. Let me check that now on the meter. On Havingness Processes, have you invalidated anything? All right, there's an equivocal read because it read on "invalidated." Is there something here about the word "invalidated"? Yes. What is this on the word "invalidated"? I mean that – that's what we're tripping over here. I'm not even asking you to answer this very seriously, but have you got something on the subject of "invalidated"?

PC: *No, it's very real to me. Um...*

LRH: Yeah, there it is.

PC: *Well, what – the thought that comes to mind here is, I am – I always feel that I myself am easily invalidated.*

LRH: Yeah...

PC: *I mean, other people feel – they feel they invalidate me.*

LRH: Did you ever conclude somebody else was?

PC: *Pardon?*

LRH: You ever conclude somebody else was easily invalidated?

PC: *Um...*

LRH: There's the tick. There's the tick.

PC: *Well, some.*

LRH: All right. Okay. Okay. All right. There's a tick right there, there's a little double...

PC: *Well, what I was thinking of there – that's – uh – I was – had this feeling of being, you know, easily in-*

validated. Only I'm not putting it in those words, it was – I had the feeling it must be something earlier than that.

LRH: Well, all right. Well, now, we have no business tracking down this word "invalidated" anyhow, it – just – except it's getting in the road of my read.

PC: *Okay.*

LRH: All right. So, let me check it here on the meter again and see if we get the same phenomena, okay? On Havingness Processes, have you invalidated anything. Now, we've got a little double read. We've got a double – little double tick here, on "invalidated" and on "anything" so we – we've got – we've got the lot here. Shed any light on that? There's the tick. There it is.

PC: *Oh, yes! Well, this – of course! Going on quite – on remembering something you told us – I probably got this out of context, I'm not putting it forth as data – but you suggested that havingness was just something to keep the guy happy.*

LRH: Mm.

PC: *Do you see? And uh – that it doesn't make a lot of difference, really. This is the impression I've got myself. And so I'm – I'm not all that bothered, I'm not all that concerned about running a pc's Havingness as such, because I feel that the major processes do him good.*

LRH: Hm.

PC: *And although we do it, and so on, then I always feel that... Well, I don't think we should really... It is-*

n't necessary to do all this with a Havingness Process.

LRH: All right, very good. Very good. Let me check that on the meter now. All right. On Havingness Processes, have you invalidated anything? All right, the read has now altered, but I've still got a read. But you're – you're making progress now.

PC: *Yeah. This of course comes to the session in the Mayflower...*

LRH: Oh yeah.

PC: *... that I was running. And there was a tick on the radiator in the other room...*

LRH: Yes...

PC: *And I felt afterwards that that process had been probably spoiled for the reason that I let the pc take control to some extent at that stage.*

LRH: Hm-hm.

PC: *So I probably invalidated that session to some degree...*

LRH: All right.

PC: *... as a Havingness session.*

LRH: All right. Thank you. Now let's see what we've got here on the meter. All right. On Havingness Processes, have you invalidated anything. All right, we've still got a tickety-bang, here. Is there some early Havingness Process that you said didn't work or wouldn't work or anything like that? This – I'll tell you – let me – let me be frank here. There's a bit of a double-tick missed with-hold on this, see, so somebody must have missed one.

PC: *Well, this again – it's going to lead back to this Havingness Process that I used to – that Pearson used to run on me. And for the life of me I used to get most cross when he would do the process and I'd go – dope off and he'd say, "Okay, mock up eight gold balls and pull them into you," you see. And I used to do this and – uh – sure enough it used to... And I used to get very cross that this would work!*

LRH: Oh, yeah.

PC: *And, in the end, it got to such a state I'd be doping off and he'd just say mock up... And I'd say, "Okay, I'll wake up," you see, and I used to wake up and I just... I see there I've invalidated the process and decided to wake up myself or – or put this interpretation onto it, at that time. Did I explain that to you?*

LRH: All right. Okay, yes, I understand that. Very good. All right, let me check this now. On Havingness Processes, have you invalidated anything? All right, we've changed the read markedly now. And we've got a broader one. Did Pearson – missed a withhold on you?

PC: *Oh blimey, he must have missed a hell of a lot.*

LRH: No, I mean on that Havingness Process. Did he miss that withhold? This germane to that?

PC: *I didn't tell him that.*

LRH: You didn't tell him that?

PC: *I – I told him as far as that – I didn't tell – explain to him that I had invalidated a process in any way.*

LRH: Yeah, yeah...

PC: *But I said – I did make a remark to him, "All right, I'll wake up."*

LRH: All right.

PC: *Said he needn't run the process.*

LRH: All right, thank you. Let me check that on the meter again. On Havingness Processes, have you invalidated anything. Well, what do you know, our read is now latent.

PC: *Good.*

LRH: So, we're getting there. We're getting there. But I'll recheck this later. And right now, on Havingness Processes, have you failed to reveal anything? All right. I got no read on that. On Havingness Processes, have you been careful of anything? We've got a read now.

PC: *Well, that's always very – as I say, careful to – um – do the command when the auditor says.*

LRH: Hm-hm.

PC: *Careful to squeeze the cans right at the end so as to make sure we're getting a read. Um – careful, of course, to try and get the process out of the way so that we can get on with the main body of the session.*

LRH: Hm. Hm. All right, all right, very good. Let me check that now. On Havingness Processes, have you been careful of anything? All right, we've got a couple of reads here now on this, all of which amount to nothing. Well, I'd better check this and just make sure now. Listen very carefully to the auditing command now. On Havingness Processes, have you been careful of anything? Now, I've got a read. Right at the end. Got a read there.

Nice one. Shed a little more light on this.

PC: *Well, I– I'm careful to try, when I'm running a Havingness Process, to get the squeeze before I start to run and after a few commands. Sometimes I've slipped up, but it's something I sort of take pains to do, because sometimes I forget to do it. So therefore I'm careful when I do, to try and get this done.*

LRH: All right. Very good. Let me check that again. On Havingness Processes, have you been careful of anything? All right. I'm going to read that once more. On Havingness Processes, have you been careful of anything? Now, as far as we're concerned, we're dodging around on this. I'm going to test it one more time. On Havingness Processes, have you been careful of anything? I've got a read there. I've definitely still got a read. It's a different read than you had, so you're cleaning it up.

PC: *Hm-hm.*

LRH: Shed any lights on this? There it is... There it is. There it is.

PC: *... Careful to look behind me sometimes when I'm running a process and when I'm having a process run, so as I get uh – all the roo... all the room in... And one other thing comes to me: Careful, yes, to make sure that I include the auditor sometimes so that the guy won't feel insulted.*

LRH: All right. Very good. Very good. Thank you. All right, let me check that again. On Havingness Processes, have you been careful of

anything? And that is clean as a wolf's tooth. Thank you very much. I'm going to run all of the middle rudiments now.

PC: *Hm-hm.*

LRH: All right. On Havingness Processes, have you told anyone a half-truth? Now, let me check that again; it might have been a read. On Havingness Processes, have you told anyone a half-truth? No, that's clean.

On Havingness Processes, have you told anyone an untruth? Let me check that again. On Havingness Processes, have you told anyone an untruth? There is a tick.

PC: *Well sometimes, like this evening, sometimes I start the process off and you sort of say you can have something, and then you – you wonder whether you really are having it. And to that degree one is telling an untruth.*

LRH: All right. All right. Thank you. Let me check that now. On Havingness Processes, have you told anyone a hal... an untruth? Got a tick, maybe that was my reading of it. On Havingness Processes, have you told anyone an untruth? This is tagging around here. I don't – it doesn't quite settle down on this. I'll check it once more. On Havingness Processes, have you told anyone an untruth? Definitely a little reaction there. Shed any light on that? There it is.

PC: *Something I wasn't – um – this comes on TR 10. I've instructed people not to use that in a test for*

havingness and I'm not quite sure whether that's true or not.

LRH: All right. Very good.

PC: *Is wrong data going on – maybe...*

LRH: All right. Okay. Let me check it again. On Havingness Processes, have you told anyone an untruth? All right, I'll have to check it once more. On Havingness Processes, have you told anyone an untruth? That is clean. Okay. On Havingness Processes, have you said something only to impress someone? That's clean. On Havingness Processes, have you tried to damage someone? On Havingness Processes, have you tried to damage someone? I've got a reaction.

PC: *Well, what I thought of is not a doingness, but – um – somebody once told me that anybody – uh – uh – uh – expect that – anybody that's put in the family way, if you ran Havingness on them, it might help them get rid of the baby.*

LRH: Oh, I see.

PC: *And I always thought this was rather – I didn't like this idea, but I never done that, I swear!*

LRH: All right, all right. Okay. All right. On Havingness Processes, have you ever tried to damage someone? That is clean. I will check it once more. On Havingness Processes, have you ever tried to damage someone? I get no read on that. Okay. Now, on Havingness Processes, have you tried to influence the E-Meter? All right, I get this equivocal reaction. I will ask it again just to check it on the meter. On Havingness Processes, have you

tried to influence the E-Meter? I got a reaction.

PC: *Well, this is on the... Sometimes I feel you squeeze the cans a bit harder to – to get the – on a Havingness Process, squeeze the cans a bit harder to get a read so that we – we can get onto something else.*

LRH: All right. Very good. Very good. Thank you. Let me check it on the meter now. On Havingness Processes, have you tried to influence the E-Meter? Got a reaction. Instant, but I – right on the button.

PC: *Well th – this – what I think of there is – I mean, is a "tried to," that, well, it's a – you're finding a Havingness Process, you always try to move the needle over so that you've found it.*

LRH: All right. Very good. Very good. All right. Let me check this now. On Havingness Processes, have you tried to influence an E-Meter? All right, there's a reaction on that. Tiny bit tardy, but there might be something else there.

PC: *Well, here again it – it's a question of uh – like now, my hands are warm and moist and uh – I feel inclined that before you test for havingness that I – it would only be fair for me, if you allow me to dry my hands. Do you see?*

LRH: I see.

PC: *So to that degree there's an attempt to influence the E-Meter.*

LRH: All right, very good. Let me ask the question again. On Havingness Processes, have you tried to influence the E-Meter? Now we got a

dead one there that's clear as a mackerel. Okay? Very clear. All right.

PC: *Thank you.*

LRH: Now. On Havingness Processes, have you failed to answer a command? And we got a reaction.

PC: *Well – I just got a whole – must have been a number of commands I didn't answer on Havingness at times. You know, you... Especially if you've just come out of something and the auditor is struggling to get you around again and he bats on.*

LRH: All right.

PC: *I know I just get an occasional... In my last auditing here, where the auditor said um – did you answer commands, and I said 'no, I – there's some commands you missed.' So he said, well give me the answers now. So I gave him the three answers and that seemed to clear it up.*

LRH: All right. All right. All right. Let me check this now. On Havingness Processes, have you failed to answer an auditing command? That's clean. All right? Just because some student would think that wasn't clean, I'm going to ask again. On Havingness Processes, have you failed to answer an auditing command? All right, there is the tiniest suggestion of slowdown. Let's be pedantic about it. On that first session, you just gave me some a few minutes ago.

PC: *The first session with Pearson?*

LRH: Yeah.

PC: *Yes, I suppose I didn't answer that*

command when I said, "Okay, I'll – um – all right, I'll wake up." He possibly... Yes, yes that would be the – the time.

LRH: All right.

PC: *I just didn't do the command.*

LRH: All right. All right. Okay. Let me check that again. On Havingness Processes, have you failed to answer an auditing command? All right, we still got a reaction. There's something there. There's something there.

PC: *Well, this is running um – Op Pro by Dup. When Pearson was running it on me.*

LRH: Hm-hm.

PC: *That's the command, I mean, I may have got this twisted up with a Havingness command in those days, and it's a question then of his asking me the temperature of the book and how the hell could I tell the temperature of the book because I hadn't got a thermometer with me anyway. But it was something roundabout, and I gave him an answer. But I never felt that I really answered that question.*

LRH: All right, very good. Now, let me ask this in relationship to a Havingness command.

PC: *Yes.*

LRH: Now, on running a Havingness Process, have you failed to answer a command? Well that's – there. There's something there.

PC: *Well, I've got one on somebody else.*

LRH: Yeah, what's that?

PC: *When I uh – let uh – a pc get away with – uh – without answering a command, even though they queried it.*

LRH: All right, all right.

PC: *Got that time, they uh – I – they said did I answer those commands, and I said yes. And on the inspection I thought, no, they didn't. And so the poor guy's going around with an unanswered Havingness command.*

LRH: All right. Is there one on yourself? That probably freed it, but let's get a specific answer on that.

PC: *Well, there's one with my last auditing again, when I missed out on one. This would – this would be um – oh, the same session I was talking about, where the – I'd said at the end of the time I hadn't answered all the commands.*

LRH: All right, okay. Good enough. Now, let me check this. On a Havingness Process, have you failed to answer an auditing command? That's clean. As wandery as the needle looks, it actually is clean. Okay? Now, we are going to resume this havingness activity. And we will get back right into it now, if that's all right with you. And how about you squeezing the cans? All right. Thank you very much. Good enough. Put them back in your lap.

All right. Here's the next command. Look around here and find something you could have.

PC: *Those flowers.*

LRH: Very good. Look around here and find something you could have.

PC: *That arm of the settee.*

LRH: Good. Look around here and find something you could have.

PC: *Key to the lock.*

LRH: Good. Look around here and find something you could have.

PC: *Fire.*

LRH: Good. Look around here and find something you could have.

PC: *That ashtray.*

LRH: Good. Look around here and find something you could have.

PC: *Telephone.*

LRH: Good enough. Squeeze the cans. All right, that Havingness command is for the birds.

PC: *Okay.*

LRH: Okay? And not to go into one of endless this and that, we're going to start more or less at the bottom. And if it works – dandy.

PC: *Hm-hm.*

LRH: All right, put down the cans, would you? All right, we're going to run, "Feel that."

PC: *Good.*

LRH: All right. Feel that tablecloth.

PC: *Hm-hm.*

LRH: Thank you. Feel that board.

PC: *Hm.*

LRH: Okay, thank you. Feel that ashtray. Okay, thank you. Feel that curtain. Okay, thank you. Pick up the cans now, would you? All right. Squeeze them. Like a breeze. Okay, put them down. All right, feel that chair. Thank you. Feel that jacket.

Okay, thank you. Feel the top of your head. Okay, thank you. Feel your right ear. Okay, thank you. Feel your left ear. Okay, thank you. Feel your tie. Okay, thank you. Feel your chair. Okay, thank you. Feel the tablecloth. Okay, thank you. Pick up the cans. All right. Squeeze the cans. Dandy. All right. Now, I'm going to give you two more commands and then we'll end this process, if that's all right with you.

PC: *Yes.*

LRH: All right. Feel that can.

PC: *Hm-hm.*

LRH: Okay. Feel that can.

PC: *Right.*

LRH: All right. Thank you very much. That's the end of... Anything you care to say before I end it?

PC: *No, thank you.*

LRH: All right, end of process. Okay. Now we're going on into the end rudiments. All right? Here we go. In this session have you told me a half-truth? Untruth? In this session have you told me an untruth? I'd better check that again. In this session have you told me an untruth? I really don't have a read here. But I'm getting a little double tick. That's all right, we'll catch it. Let me check this once more. In this session have you told me a half-truth, untruth? Tried only to impress me? Did you just think of something there?

PC: *I just thought that I had been trying to be a good preclear. At times, yes, trying to impress you that way.*

LRH: Oh, all right. All right, thank you. You tried only to impress me? All right, have you tried to impress anybody else?

PC: *Well, there's quite a little crowd downstairs watching and I just thought of them, but that's all.*

LRH: All right. Have you tried to impress them?

PC: *Yes, I should think so.*

LRH: All right. Okay. Let me check this again. In this session have you tried to impress anyone? All right, there's a tick on that.

PC: *Yes, I think I tried to impress you on the subject of this early subjective Havingness Processes that I – I'm very fond of those and I feel I've tried to get that line over to you.*

LRH: Okay. All right. Let me check this again. In this session have you tried to impress anyone? Cleaner than a wolf's tooth. Okay? In this session, have you tried to damage anyone? Tick. That's it.

PC: *Tried not to damage anyone.*

LRH: All right. All right. Tried to damage anyone? Tried positively to damage anyone? Got a tick there. We're wandering around here with a tick.

PC: *Well there could be a tried to damage – there's a possibility of damage of Pearson.*

LRH: Oh really?

PC: *I was saying that he didn't – that he let me get away with that unanswered command.*

LRH: All right. Okay. All right. Let me check that now. In this session have you tried to damage anyone? All

right. Let me check this now, and listen – listen to this auditing command. In this session have you tried to damage anyone? Clean. Okay. Thank you. All right. In this session, have you deliberately tried to influence the E-Meter? Thank you very much, that's clean. In this session, have you failed to answer any question or command? I got a clank here. What's this? In this session have you failed to answer any question or command?

PC: *Well, I did. I altered a command, so, inasmuch as you said, "Look around here and find..." I first thought of that settee and then instead of giving you that answer – that was the answer I failed to give you – I gave you the arm of the settee instead.*

LRH: Oh, all right. All right. All right. Let me check that now. In this session have you failed to answer any question or command? This is practically clean, but there's a tiniest slowdown now. Can you think of another one or that one or any one of them?

PC: *That one, yes. And that was followed by the – the key, where I – no I'm sorry it was followed by the telephone when I was about to... Sort of made up my mind to have that and then so – when I'm – I was ahead of you and beating the gun, so I changed to the telephone for your answer, so you didn't get the co – uh – that command – that answered.*

LRH: All right, all right. Are you satisfied you just answered the auditing question?

PC: *Yes.*

LRH: All right, very good. In this session have you failed to answer any question or command? Now, this is – this is nervous. This is a nervous little tiny needle here. I'm sorry to be dragging you around the bend on this.

PC: *Well, what I'm getting on this is just when you asked me then, was um – this question of having, again, whether I had really had these – decide I could have them when I named them off to you.*

LRH: Oh, all right.

PC: *And sort of chanting names to you, rather than definitely saying – deciding I could have them.*

LRH: Well, all right. Excellent. All right, let me check this now. In this session have you failed to answer any question or command? Got a reaction here. All right, just let me steer this; just think over the session here for a moment, and let me see what I've got here. Questions or commands you've answered in this session. There it is. There it is. There it is again.

PC: *Something to do with these cans. You asked – you gave – you said you would give me two more commands of the process.*

LRH: Hm-hm.

PC: *And uh – you – and I went to put the cans down.*

LRH: Oh, I see.

PC: *So there was an unspoken command to keep them in my hand, which is the nearest I can get one –*

it sounds awfully get-out, but that's the nearest I can get to.

LRH: All right, did you feel those two there, when I asked you to?

PC: *I felt the two, but no – before there, you see, I thought you were going to say put them down on the table.*

LRH: Oh, I see.

PC: *I anticipated that command. So there was the unspoken command to keep them in my hands, but I went to put them down, do you see? So to that degree I didn't fully carry out the unspoken command of putting them down.*

LRH: All right, all right, all right. Let's – let's put it this way. Let's put it this way – there's a tick. All right. In this session, have you failed to answer any question or command? Now I've got a reaction on 'command'. There it is. There it is. There it is.

PC: *Hm. I'm just not getting anything.*

LRH: There it is. There it is.

PC: *Well, this is the uh – beginning of the session then...*

LRH: Hm-hm.

PC: *... when you said, "Has the session started for you?"*

LRH: Hm-hm.

PC: *And I said "Yes." And you said, "You sure of that?" I'm not sure that I answered that second command of "sure of this." That's the nearest I can get to anything there. In other words, you asked me a question, or – which is a command, because you asked me something and I can't recall definitely giving*

you an answer to the second question.

LRH: All right, very good. Very good. All right. Let me ask you this question again. In this session have you failed to answer any question or command? That is clean, thank you very much.

Now, in this session, have I missed a withhold on you? All right, let me ask it again. In this session, have I missed a withhold on you? I got a tick.

PC: *Well, the only thing was that I didn't tell you names of auditors – all the auditors and pcs that I was referring to.*

LRH: All right, very good. Let me ask that again. In this session, have I missed a withhold on you? Tick.

PC: *This has to do with Havingness Processes – um – running of them. Perhaps you didn't get the... I said – perhaps I said occasionally that I've done this, and you didn't get the time, place, form and event of times when I hadn't...*

LRH: All right, all right.

PC: *... done this Havingness Process right.*

LRH: Good enough. All right, let me check this again. In this session have I missed a withhold on you? Once more I'm going to check that very carefully now. In this session, have I missed a withhold on you? There is a hang-up, right on the end of that. Could you answer that? That's it. There it is.

PC: *Um – yes, this is um – was – it was again the full circumstances of getting – letting – letting a pc – letting*

a pc not answer a Havingness command.

LRH: All right. All right. All right. Now, let me understand this now. The full circumstances of not letting a pc answer. Did that happen in this session, that? Now, what did you refer to? I just didn't get all...

PC: *No, I – during this I – I had told you about when I was running a Havingness Process and so on, so that had you pressed me you could have had some more details about that, and I didn't tell you all about it.*

LRH: All right. Very good. Now, let me ask you again. In this session, have I missed a withhold on you? That's clean. Thank you. All right. Now. Are you willing to talk to me about your difficulties?

PC: *Yes.*

LRH: Well, I got a little tick on that. What do you suppose that's all about?

PC: *Well I thought, "For God's sake don't let this one be out, clot."*

LRH: Huh?

PC: *"For God's sake don't let this one be out, clot."*

LRH: All right. All right. Are you willing to talk to me about your difficulties? Seems to be clean now. All right, what were you doing – making sure that was really clean?

PC: *Yes!*

LRH: All right. Now, look around here and tell me if you could have anything.

PC: *Yes.*

LRH: All right. I got a slight tick on that so I'm going to run a few more commands of Havingness. Okay? Would you put down your cans? All right, feel that cloth. Okay. Feel that ashtray. Okay. Feel that board. Okay. Feel those paper clips. All right. Feel your right sleeve. Good. Feel your left sleeve. Good. All right, pick up the cans. Okay. All right. Look around here and tell me if you can have anything.

PC: *Yes.*

LRH: All right, good. You get a bang on that.

PC: *Hm?*

LRH: You get a slight bang on that, just – just even so. Look around here and tell me if you could have anything.

PC: *Yes.*

LRH: All right, now, I get a bang on that. I get a bang on that. Is there anything – any way you'd care to answer that?

PC: *Well, I can have the door and the settee and...*

LRH: All right. All right. Let me check that now on the meter. Look around here and tell me if you can have anything. All right, thank you very much. That's clean. All right. Now, have you made part of – any part of your goals for this session?

PC: *Well, we certainly got the ruds cleaned up.*

LRH: All right. Okay. And have you made any other gains in this session you would care to mention?

PC: *Yes, I feel a lot freer and brighter now. And this isn't propitiation,*

there's uh – I felt a bit heavy and nervous when I came into session, I mean you sprung a surprise on me, and I did. I feel very, very free, and um – well, I'm very happy to know that I can go through a session like this in front of the audience – now I've remembered them again.

LRH: All right.

PC: *On that I've had quite a gain.*

LRH: All right. Well thank you very much. Is there anything you'd care to ask or say before I end this session?

PC: *Yes, I'm interested to know what the tone arm action was on running these rudiments, and so on.*

LRH: Well, your tone arm action here – your tone arm action with sensitivity at two – uh, pardon me, at sixteen...

PC: *Hm.*

LRH: ...is sitting here on 2. You came into session, at about 2.5, and then you went down to about 1.75. So the total tone arm action has been .75, and oddly enough, the greatest action you have gotten has been on Havingness.

PC: *Hm-hm. Yes.*

LRH: And I think that that – that answers your question. I can add something else on the thing.

PC: *Please.*

LRH: I think your Havingness Process has not been functional. That – this is a clean sweep as everybody that I have checked Havingness Processes on, their Havingness Process doesn't work.

PC: *Hm, yeah.*

LRH: So that's from my viewpoint. But you got .75 action there and it's been very good.

PC: *Okay.*

LRH: Okay?

PC: *Thank you.*

LRH: All right. Is it all right with you if I end this session now?

PC: *Yes.*

LRH: All right. Here it is. End of session.

PC: *Thank you.*

LRH: All right. Session ended for you?

PC: *Yes.*

LRH: All right. Tell me I'm no longer auditing you.

PC: *You're no longer auditing me.*

LRH: Okay. Take a break.

TV DEMO: GETTING RUDIMENTS IN, PART II

An auditing demonstration given on 30 May 1962

LRH: Now, here we go. You don't mind my fixing up an auditor's report for you? We will dignify this with an auditor's report.

PC: *Very good.*

LRH: Okay. I don't think I've ever audited you, have I, Mike?

PC: *Think you did a Goals Assessment on me when I first came here.*

LRH: I remember. Yeah, that's true.

PC: *Well, that wasn't even really started in the session!*

LRH: Well, you're right. Okay. Is it all right with you if we begin the session now?

PC: *Yeah.*

LRH: All right, here it is. Start of session.

PC: *Okay.*

LRH: Okay, has the session started for you?

PC: *Yes.*

LRH: All right. Very good. What we're going to do in this session now is just check your ruds out, run some Havingness and run your end ruds. Okay?

PC: *Okay. Fine, yeah.*

LRH: All right. What goals would you like to set for this session?

PC: *Um, well I've got a bit of a present time problem with my girlfriend. I'd like to – uh – feel a little bit happier about that.*

LRH: All right. Okay. Any other goal you'd like to set for this session?

PC: *Um – yeah, to feel a lot brighter at the end of session than I do at the moment.*

LRH: Okay, will do. All right, any other goal?

PC: *No, that will do.*

LRH: All right. Are there any goals you'd like to set for life or livingness?

PC: *I'd like to get married.*

LRH: All right. Any other goal you'd like to set for life or livingness?

PC: *Well, I – I'd like to sort out my future prospects. I'm feeling in a bit of an undecided mood about what to do about the future at the moment.*

LRH: Okay. Very good. All right, how's that, okay?

PC: *Yeah, that's fine.*

LRH: All right. Let's see where you're sitting on this, here – 2.4.

PC: *That's quite usual.*

LRH: Is that quite ordinary?

PC: *That's quite ordinary, yeah. It seems to sit around about twoish.*

LRH: All right, look around here and tell me if it's all right to audit in this room.

PC: *Yeah.*

LRH: All right. Okay. Let me check that. Look around here and tell me if it's all right to audit in this room.

PC: *Yeah.*

LRH: Okay. Anything occurs to mind about your ...

PC: *Well, as I – as I was looking past I noticed that camera up there and that sort of reminded me I was on view.*

LRH: Right.

PC: *Other than that, the room as itself is all right.*

LRH: All right. Good. Let me check this again.

PC: *Mm-mm.*

LRH: Look around here and tell me if it's all right to audit in this room. I got a tick now.

PC: *Yeah, I thought – well, I was probably avoiding looking at the camera this time.*

LRH: All right, okay. Okay, we are going to run Havingness in this session.

PC: *Yeah.*

LRH: Look around here and tell me if it's all right to audit in this room. All right, that's clean. Thank you. All right. Are you willing to talk to me about your difficulties?

PC: *Yes.*

LRH: All right, there's some slight reaction on the end of that.

PC: *Mm-hm.*

LRH: Anything you care to think of?

PC: *Well, the only thing is, I felt I'm perfectly willing to talk to you about my difficulties; I'm not sure about the fifty people down there.*

LRH: All right. Okay. Let me check that on the meter.

PC: *Hm-hm.*

LRH: Are you willing to talk to me about your difficulties?

PC: *Yeah.*

LRH: All right. There is still a slight tick on the end of that.

PC: *Um – well, I was mainly thinking about – uh – sex problems with my girlfriend, which is – a lot of problems come up, recently.*

LRH: Uh-huh, hm.

PC: *And that's what came up at that point.*

LRH: All right. All right. Let me check this again on the meter. Are you willing to talk to me about your difficulties?? That's clean. Thank you. All right. Now, when was your last session?

PC: *Oh, it was, when I was on the course. Last week I was on the course.*

LRH: All right.

PC: *Be about three weeks ago now.*

LRH: All right. Since the last time you were audited have you done anything

you are withholding? I got an action.

PC: *Yeah, well I thought – well, I've been to bed with my girlfriend a couple of times, and been unsuccessful in trying to have sex with her. It's a sort of a bit of a loss.*

LRH: Okay. Very good. Let me check that again. Now, since the last time you were audited have you done anything you are withholding? The tiniest shadow of a slowdown.

PC: *Yeah, I thought, well, on a couple of occasions I've agreed with students here when they've been complaining about various aspects of the course. I sort of agreed about it and I felt a bit bad about this. I thought, well I should have just said, "Okay," and acknowledged it, or pulled some missed withholds or done something about it. But these were points I did think needed picking up. So that's how I went into agreement with them.*

LRH: All right. Very good. Now, let me check that on the meter now. Since the last time you were audited, have you done anything you are withholding. That's clean. Thank you.

PC: *Okay.*

LRH: All right. Do you have a present time problem? I got a lot of reaction.

PC: *Yeah, I mean I've got lots of them! Um – the present one at the moment is with my girlfriend. Uh – I want to sort some things out this weekend. Possibly another problem is that we finish this session, I got a chance to phone her tonight.*

LRH: Oh, yes?

PC: *Yeah, hm. I've got a deputy to do this in case I don't finish session in*

time, so I guess that isn't so much of a problem.

LRH: All right, very good. Let me check that again. Do you have a present time problem? All right. I got an equivocal reaction there. Let me ask it once more just to be sure. Do you have a present time problem? Now you listen very carefully, to me now. Do you have a present time problem? I got a reaction.

PC: *Well, what I thought of then was I have a little problem keeping these ca – I notice my hand was shaking a little bit.*

LRH: All right.

PC: *And, uh, that was beginning to be a little bit of a problem.*

LRH: It isn't reading on the meter.

PC: *Hm. Okay, fair enough.*

LRH: All right. Okay. Let me ask you one more time. Do you have a present time problem? All right. Now, there's – it's probably zero, but I'm going to check it one more time.

PC: *Yeah.*

LRH: Do you have a present time problem? I got a reaction on it.

PC: *Yeah, now I seem. The whole subject of sex seems to be a present time problem to me at the moment.*

LRH: All right. Okay. Okay. Your thinking about it ba – Is there a missed withhold on this?

PC: *Hm, well a lot of people have missed the fact that I – I've never had any success in having sex with – with a girl.*

LRH: All right.

PC: *And I feel bad about this.*

LRH: All right.

PC: *And uh – hmmm that's it – a lot of people missed this!*

LRH: Okay. All right. Let me ask you one more time here. Do you have a present time problem? All right, the read has now gone latent.

PC: *Hm, okay.*

LRH: So let's check it one more time, and before we leave it. Do you have a present time problem? There is a little ghost of a slowed rise.

PC: *Aaah, well, what I thought of there, was getting these checksheets out for the course ...*

LRH: Right.

PC: *... and uh – it's a bit of a problem to me when I can't give as many checkouts as I'd like to, to students.*

LRH: Hm.

PC: *And I don't feel like Qing and Aing with them all the time; they keep on saying to me, "We want tests; we want tests."*

LRH: Hm.

PC: *And I still feel a little bad if I can't give them all the tests that they need.*

LRH: All right, very good. Let me ask you again, now. Do you have a present time problem? Equivocal read. Do you have a present time problem? I'm not getting a reaction on this.

PC: *Well, the only thing I was thinking of there, was that it – it just got a little bit of a problem if this was going to clear or not. I was getting a little bit anxious about it.*

LRH: All right. All right. All right, don't – don't be anxious, because it's a – you're reading on present time problem, and then, click. And so forth.

PC: *Hm-hm.*

LRH: All right. Do you have a present time problem? I didn't get an immediate response there.

PC: *Okay.*

LRH: Uh – but I'm getting a little, two – two ping-ping dirty needle proposition here, that I have no business taking up in the rudiments.

PC: *Hm-hm.*

LRH: But I know better than to go by this.

PC: *Mm. All right.*

LRH: All right. So I'm going to repeat this rudiment. Okay?

PC: *Yeah.*

LRH: In this session ...

PC: *Yeah.*

LRH: ... in this session, have you failed to reveal something? I got a little reaction there.

PC: *Well, uh – let's see, it'd be on the subject of sex.*

LRH: Hm.

PC: *Uh - well I've told you I've not had success in having sex with a girl. I – I've had this trouble of – of feeling that there was some latent homosexuality on my case.*

LRH: Right.

PC: *And this has bothered me.*

LRH: Hm-hm. All right, you've got the ...

PC: *That might have been what I've been thinking of, yeah.*

LRH: All right, very good. Very good. In this session is there something you've failed to reveal? All right, I got a reaction on that. Anything else?

PC: *Just thought about masturbation.*

LRH: All right. Very good. Let me check it again. In this session, is there something you have failed to reveal? All right, there's a tickety-tock here.

PC: *Hm-mm.*

LRH: Now, you listen to my question.

PC: *Yeah. All right.*

LRH: Just listen to this. In this session ...

PC: *Mm-mm.*

LRH: ...is there something you have failed to reveal? All right, there's a – there's an action on it.

PC: *Well, I haven't had sex.*

LRH: All right.

PC: *I've told you this.*

LRH: That's right. There it is – right there. That's it – right there.

PC: *Ah yes. Well, some trouble with – uh – various people on this – living with homosexuals and things like that.*

LRH: All right.

PC: *It always seems to (quote) happen (unquote) and I've never been able to pin down the overt on this line.*

LRH: Hm.

PC: *When I was being audited on the course, we messed around for about*

four days trying to find some What question on this. And uh – I nev – .

LRH: Really?

PC: *Yeah. I never really felt satisfied we ever got an overt on that.*

LRH: Hm. All right.

PC: *The one I think which came out was something about, what about withholding affection from a man or something peculiar. I've forgotten exactly the thing. And this – this seemed to be an overt, and it ticked on the meter, but we never really seemed to get to the bottom of it.*

LRH: Who was auditing you?

PC: *Um – Kevin.*

LRH: All right. Thank you very much. All right, didn't mean to ask you a second question there.

PC: *All right.*

LRH: All right. In this sessions, is there something you have failed to reveal? I got a reaction again. Click. Click.

PC: *Yeah, well, I thought at the moment I'm living with one – with a homosexual.*

LRH: All right. Okay. All right. That must be it because it blew more.

PC: *Yeah. Hm.*

LRH: All right. Very good.

PC: *And – oh – this is something I'm not at all happy about.*

LRH: Hm. All right. Okay.

PC: *And I can't find the overt behind it.*

LRH: Okay. In this session, is there something you have failed to reveal? Well now, that is just sitting there on a

constant dirty needle. I don't know whether it's reacting to this or not. Uh ...

PC: *Yeah, I think I've got it.*

LRH: What is it?

PC: *I think I'm trying to protect the guy.*

LRH: Oh, really?

PC: *Yeah.*

LRH: Oh, all right.

PC: *Hm.*

LRH: Okay.

PC: *I tend to go about on some sort of a protect of homosexuals. On my goals list this was the last goal to null out before my goal, and what actually came out was to, I think, "Help a homosexual," something like that.*

LRH: Oh, all right. Okay. All right. Let me check this one more. I'm running a middle rudiment in the rudiments.

PC: *That's all right.*

LRH: All right. All right. In this session, is there something you have failed to reveal? That is clean. Thank you.

PC: *Okay.*

LRH: All right. Now I'd like to run some Havingness on you. What would you say to that?

PC: *Fine.*

LRH: All right. What was the last Havingness Process that ran on you?

PC: *I believe it was, "Point out something."*

LRH: Okay. We will see.

PC: *Okay. [giggles]*

LRH: Now, I'm not trying to invalidate your Havingness Process, but you would be the first one.

PC: *All right.*

LRH: Now put your hands up here with the backs of the hands on the table. Let's grip that can very nicely, there. All right. And make sure that that can is sitting down in the palm. Now relax. All right. Squeeze the cans. All right, thank you very much. All right. You can do what you please with the cans.

PC: *Okay.*

LRH: All right. Point out something

PC: *That nameplate.*

LRH: Thank you. Point out something.

PC: *That cigarette butt.*

LRH: Good. Point out something.

PC: *Uh – those scales.*

LRH: Good. Point out something.

PC: *That telephone.*

LRH: Good. Point out something.

PC: *That camera.*

LRH: Good. Point out something.

PC: *That lamp.*

LRH: Good. Point out something.

PC: *That curtain.*

LRH: All right, very good. Now, squeeze the cans. All right. Thank you very much. That is not your Havingness Process.

PC: *All right.*

LRH: Okay.

PC: *Hm-hm.*

LRH: Put down the cans. All right, we're going to run – just to be in the complete groove we'll start at the bottom of the pile.

PC: *All right.*

LRH: All right. I'm going to run, "Feel that object."

PC: *Okay.*

LRH: Okay. Now, you understand, when I say "Feel" I want you to get the feel of it, okay?

PC: *Yeah.*

LRH: All right. Feel that tablecloth.

PC: *Hm-hm.*

LRH: Thank you. Feel that board sign.

PC: *Yeah.*

LRH: Okay. Feel that ashtray.

PC: *Hm-hm.*

LRH: All right. Feel that paper clip on this side. That's it.

PC: *Yeah.*

LRH: All right. Feel that can.

PC: *Hm-hm.*

LRH: Okay. Feel your right sleeve. All right, thank you. Pick up the cans. Okay. Squeeze the cans. Yes, there's your Havingness Process.

PC: *All right!*

LRH: All right, put the cans down. All right. Feel that tablecloth. Okay. Feel the back of your jacket. Attaboy, all right. Feel the buttons on that cuff. Okay. Feel that curtain. Okay. Feel that lamp column. Okay. Feel that telephone. Okay. Feel your tie. All right. Thank you very much. All

right. Now what we're going to do here is in the middle of this – not because you're doing anything wrong ...

PC: *All right.*

LRH: ... but let's just check out the middle rudiment on a Havingness Process, okay? Pick up the cans. Now, here we go. I'm going to ask you, "On – on Havingness Processes, have you suppressed anything?" A tiny speed up of the fall. There's something. There's something right there. There it is.

PC: *Yes, I think I've suppressed some sort of disinterest in the Havingness Process. You know, Havingness Process being run for the purpose of sort of cheering me up before the end of session. And well, I think I sort of suppressed the disinterest that I felt. I didn't really feel much better or much worse, but I said, "Oh, yeah, I feel fine."*

LRH: All right. All right, thank you. Thank you very much. On Havingness Processes have you suppressed anything All right. There was a tiny reaction again on that. Anything else?

PC: *Oh yeah, I suppress doing that – sort of letting out breath and yawning and stretching.*

LRH: Oh, really?

PC: *On Havingness, yeah, I sort of felt, I should sit here and do nothing and just do the Havingness Process.*

LRH: All right. Very good. Okay. Let me check this on the meter now. On Havingness Processes, have you suppressed anything? All right, I have to check that again. On Havingness Processes, have you suppressed anything? I've got a reaction.

PC: *I think I suppressed telling the auditor I didn't think it worked on a couple of occasions.*

LRH: All right.

PC: *Hm-hm.*

LRH: Okay. All right. Let me check it again. On Havingness Processes, have you suppressed anything? The read is latent, but I'm going to clean it.

PC: *Yeah.*

LRH: Think of anything? Oh, I'll repeat the question.

PC: *Yeah, I wa – I was off thinking of something else at that time.*

LRH: Yeah. On Havingness Processes, have you suppressed anything? There's a reaction.

PC: *Hm. Um...*

LRH: There it is.

PC: *Well, this seems to boil down to this uh – bit on homosexuality again. Don't know where that comes in. I think I felt if an – if a – if an auditor who was a homosexual, who I know – knew was a homosexual – audited me, I felt I had to be a particularly good preclear in session.*

LRH: Hm.

PC: *I probably suppress some stuff on this in session, so I probably am suppressing the Havingness Processes if they're in it.*

LRH: All right. Okay. All right. Now let me check this on the meter.

PC: *Hm-hm.*

LRH: On Havingness Processes, have you suppressed anything? All right, that looks clean. I'm going to check it one more time before we leave it; it looks

clean. On Havingness Processes, have you suppressed anything? There is still a reaction on that thing.

PC: *Hm!*

LRH: There it is. There it is.

PC: *Yeah! I think, on previous Havingness Processes when I've had to touch things, I sort of suppress feeling it very long. I felt this was all wasting the time in the process. You know, wasting the auditor's time, feeling it. And you told me to feel it, and it felt a lot better.*

LRH: Oh, all right. All right. Okay. All right. Now, we're going to check this again. On Havingness Processes, have you suppressed anything? Well that is probably clean.

PC: *Great, yeah.*

LRH: That is probably clean. We're wandering around in the middle of a needle here that's going this way and that. But that's probably clean. Let me check it just this one time. On Havingness Processes, have you suppressed anything? Oh, I got a speeded rise.

PC: *Could have been in the same session. Um ...*

LRH: There it is. There it is. There it is.

PC: *Something to do with the Havingness Process, um ...*

LRH: There it is.

PC: *Something to do about a curtain somewhere.*

LRH: Hm?

PC: *Something to do about curtains.*

LRH: Yeah, yeah, yeah, that's reacting here.

PC: *I think the process was, "Look around here and find something you could have," or "Where is the..." or something like that. And I looked at the curtains – it was something to do with reaching curtains – the idea of reaching curtains and I think I never really felt I could – I could reach those curtains. I felt I just couldn't have them. And they're not anything substantial enough to have. Some peculiar idea like that.*

LRH: All right, very good. All right, let me check it now. On Havingness Processes, have you suppressed anything? There's a reaction there. Tick. Tick.

PC: *Um – well, I always felt it was a good point in the session, if I were being run on Havingness.*

LRH: Hm-hm.

PC: *And I sort of felt, well, I shouldn't feel this way because I'm probably trying to avoid something else in the session.*

LRH: Oh, all right.

PC: *You know, something like this. I'm – I mean, well, I actually enjoy this to some extent. It's one of the few processes actually that I enjoy and I shouldn't feel that way about a session.*

LRH: All right. Okay. Here we go. On Havingness Processes, have you suppressed anything? All right. I still get a speeded rise on this. Now look, just give me a little – I'll give you a little help here.

PC: *Yeah.*

LRH: Can you pick up the first time Havingness was ever run on you? Just to speed this up a little bit. There it is.

PC: *Well, I – I'm not absolutely sure, but I believe this is the first time Hav-*

ingness was run on me. Yeah, it was in St. John's Wood and Peter Cowell was running some – was trying to pull me out of the mess he'd got me into by out of session running some Confront Process. And he probably ran some Havingness at the end of that session.

LRH: Hm-hm.

PC: *I don't actually recall him doing so, but he probably did. It's the first real session I can recall having.*

LRH: Hm-hm. All right, was that suppressive?

PC: *What, the session?*

LRH: No, the Havingness.

PC: *The Havingness? I don't know.*

LRH: All right.

PC: *Possibly.*

LRH: All right. That was more than I really ought to be piloting you into, but I was trying to give you a little breadth of reason here.

PC: *Yeah.*

LRH: All right, let me check this thing again now. See where we're at. On Havingness Processes, have you ever suppressed anything? I got a reaction.

PC: *Goddamn. I've been thinking about lots of other things, but I can't think of anything on havingness.*

LRH: What are you doing

PC: *Well, I was still sort of back in that session, thinking about what happened during that session.*

LRH: Hm-hm.

PC: *You know, with Peter Cowell.*

LRH: Hm-hm. All right. Now, let me check this word: Suppressed. That word is hotter than a pistol.

PC: *Yeah.*

LRH: All right. Well, we're just checking Havingness Processes.

PC: *Okay, fair enough.*

LRH: Understand?

PC: *Yeah.*

LRH: All right. Now you listen very carefully to this question. On Havingness Processes, have you suppressed anything? That is clean. Thank you.

PC: *Okay. Very well.*

LRH: All right.

PC: *I guess that word would be hot.*

LRH: All right. Now, on Havingness Processes, have you invalidated anything? Got a reaction here.

PC: *Well, I think I invalidated this, "Point out something" before I came into session.*

LRH: Really?

PC: *Yeah. Well, I thought, well that didn't – probably because I didn't seem – feel to get very far on my auditing on the course. Well, not as far as I'd like to have gone.*

LRH: Hm-hm.

PC: *It never really made me feel terrifically bright and cheerful. So I probably invalidated that before I came into the session.*

LRH: All right. Very good. Let me check this now. On Havingness Processes, have you invalidated anything? Reaction.

PC: *Yeah, well, on this one, "Look around here and find something you could have," at one time this was what was considered – what probably still is considered – to be sort of the most high toned of Havingness Processes. And if anybody ever tried to run this thing on me or test it on me, I sort of used to invalidate the fact, well, I wasn't up to the point where I could run this process.*

LRH: Hm. All right, very good. I'll check this on the meter again now. On Havingness Processes, have you invalidated anything? All right, there's probably a reaction on the end of that.

PC: *Um.*

LRH: We're cooling this off markedly.

PC: *Hm.*

LRH: There's something right there.

PC: *Yeah, I've got something – invalidated this, "Feel that" you know, I felt this uh – sort of reactively felt, well, this is a CCH-style process and it's – I should be able to run some more thinkingness style thing, you know. Something – something crazy like that probably crossed my mind.*

LRH: Good enough. All right, let me check this question again.

PC: *Hm-hm.*

LRH: All right. On Havingness Processes, have you invalidated anything? All right, "invalidated" is falling, so let me give you this question very, very strongly here. Now, you listen to it. On Havingness Processes, have you invalidated anything? That's clean.

PC: *Okay!*

LRH: Okay. Let's try the next one now.

PC: *All right.*

LRH: On Havingness Processes, have you failed to reveal anything? That happens to be clean.

PC: *Really? I had an answer ready for you.*

LRH: Give me the answer, by all means.

PC: *Well, I think I fail to reveal to auditors – mind you I've told you this before – but I think I failed to reveal to auditors the fact that I didn't think this was working really well. And also the fact that a lot of them didn't seem to ever tell me whether the damn thing was loosening and they often looked a bit puzzled – left me in a bit of a not-know. And I didn't reveal the fact that I felt that way about it.*

LRH: All right, very good. Very good. All right, just to cheer you up, I'll check it again. All right?

PC: *Yeah.*

LRH: On Havingness Processes, have you failed to reveal anything? Now, the reaction on it is quite latent.

PC: *Yeah. Okay.*

LRH: I'm going to ask it again just because we're cleaning up Havingness Processes.

PC: *Hm.*

LRH: You give me an answer to it. On Havingness Processes, have you failed to reveal anything?

PC: *Yeah.*

LRH: All right, what?

PC: *Well, as an auditor, I failed to reveal sometimes to my preclear, at the time I should have done, the fact that the thing wasn't particularly loosening. There have even been a couple of occasions where I've more or less said, well, this thing seems to be a little better, when I couldn't really detect any difference. You know, it was a half-truth, or an untruth to the preclear.*

LRH: Very good. Very good. All right. We'll check this out again. On Havingness Processes, have you failed to reveal anything? All right, we got a reaction there. A nice dirty needle.

PC: *Yeah, well I think this is all in the same line, you know, of sort of pretending to preclears. Um – couldn't find a Havingness Process, couldn't get anything to work, so I sort of more or less said to the preclear, "Well, that seems to be doing something," and run it for a few more commands.*

LRH: All right. All right. Okay. All right. We're going to check this again now. On Havingness Processes, have you failed to reveal anything? Got a reaction now. The dirty needle's gone.

PC: *Hm-hm.*

LRH: You got a just a straight fall.

PC: *Um – think I've done this quite a few times. You know, up and down during auditing.*

LRH: Hm-hm.

PC: *Um – failed to reveal the fact that the Havingness Process didn't seem to be really doing much.*

LRH: Hm-hm. Hm-hm.

PC: *Is this clear? It's all on the same line.*

LRH: All right. All right. Very good. Check it again. On Havingness Processes, have you failed to reveal anything? All right, there's a reaction on the end of that line now, again. We're getting somewhere though. I tell you we've got the dirty needle off of it. We've – it's moving right along here. We've just got a little flick up.

PC: *Uh.*

LRH: There's something right there. That's it. That's it. That's it.

PC: *Yeah, I think on some Havingness Processes I failed to reveal that I haven't answered the command, you know, I haven't answered the command on a lot of the processes.*

LRH: All right.

PC: *Didn't tell the auditor that.*

LRH: Okay. All right. Let's check that out. On Havingness Processes, have you failed to reveal anything? Getting better. Your needle's loosening up on it.

PC: *All right.*

LRH: All right. Go ahead and answer it. I'll repeat it. On Havingness Processes, have you failed to reveal anything There it is. There it is.

PC: *Ah, ha-ha-ha-ha-ha-ha-ha-ha, yes. If – if uh – if being audited by a man, I always felt bad that anyth – in a CCH Havingness Process.*

LRH: Hm-hm.

PC: *And uh. ...*

LRH: Hm-hm.

PC: *... any touching of body parts, this sort of thing I think I failed to reveal this to the auditor.*

LRH: All right.

PC: *Yeah, that's it.*

LRH: All right.

PC: *Hadn't thought about that.*

LRH: Very good. Check this again. On Havingness Processes, did you fail to reveal anything? All right. This is getting quite clean now. There's a little more here. There it is.

PC: *Well, this is merely a thought, this isn't something that I've done. But you – you were talking about this – this uh – process of touch my knee or something like that, you see.*

LRH: Hm-hm.

PC: *And uh – I was sort of thinking, well uh – this wouldn't be a bad process to try out on my girlfriend .*

LRH: All right.

PC: *And I thought of that then. I never have tried it, but that was the thought that came up.*

LRH: All right, let's ...

PC: *I wonder if this is a – this is as dangerous and as effective as you say it is.*

LRH: Okay. Here's the question again. On Havingness Processes, have you failed to reveal anything? Got a reaction. There it is. There it is.

PC: *I don't get anything there.*

LRH: There it is.

PC: *I no – I did – I just noticed a little somatic in my elbow there, but don't get anything else. Um ...*

LRH: There it is. Tick.

PC: *Well this is rather taking in the scope of something more than a simple Havingness Process, but taking any CCH*

Process to be somewhat of a Havingness Process. I guess I fail to reveal things at various times to the auditor.

LRH: Hm. All right, let's see if this cleans up. All right. On Havingness Processes, have you failed to reveal anything? All right, apparently it's very clean.

PC: *Yeah.*

LRH: Apparently so.

PC: *Apparently so. All right.*

LRH: No, fail to reveal is – is still mucked up.

PC: *Yeah.*

LRH: A bit.

PC: *Hm-hm.*

LRH: But it's just a restimulative word, you see. But the question itself is clean. Okay?

PC: *Yeah.*

LRH: All right. And here's the last one of these middle ruds. On Havingness Processes, have you been careful of anything? I got a reaction.

PC: *Yes, I think I've been careful of – of not sort of reaching out. Um – you know, I always felt that if I got daring and actually dared to reach out towards a – a larger object in the room ...*

LRH: Hm.

PC: *... there'd be something wrong in this. I don't quite know why there should be anything wrong, but I sort of felt careful, "Well, I must do it on a gradient scale."*

LRH: All right. Very good. Now, let's check this one.

PC: *Hm-hm.*

LRH: On Havingness Processes have you been careful of anything? Latent ...

PC: *Hm-hm.*

LRH: ... but still, we must clean it.

PC: *Yeah.*

LRH: All right, on Havingness Processes, have you been careful of anything? There you've got it.

PC: *Yeah, well I been – I think I've sort of been careful of – of letting auditors know that I can run a Havingness Process well.*

LRH: All right.

PC: *For some reason or another that's what came up there.*

LRH: All right.

PC: *Don't seem to make much sense, but, uh.*

LRH: Good. Good. Yeah. Good.

PC: *Yeah, that's what I've been doing.*

LRH: It reacts as a missed withhold.

PC: *Yeah.*

LRH: All right. Here it is: on Havingness Processes, have you been careful of anything? Reaction. Right on the button. Right on the end of it.

PC: *Uh...*

LRH: There it is.

PC: *Yeah, when – um – when auditors have been checking out Havingness Processes, I sort of sat very careful and still ...*

LRH: Hm.

PC: ... not to let my breath, or any sort of extraneous thought get in the way of the can squeeze or anything else.

LRH: Hm-hm.

PC: Always sat there very carefully when squeezing cans, been very careful of the way I squeeze the cans.

LRH: Hm-hm. All right. Very good. Okay. Now let's see if this is clean. On Havingness Processes, have you been careful of anything? Cleaner than a wolf's tooth. Okay?

PC: Yeah, fine.

LRH: All right. Now, let's return to the Havingness Process. Okay?

PC: Okay, yeah.

LRH: Put down the cans there. All right. Feel that tablecloth.

PC: Hm-hm.

LRH: Okay. Feel that chair. Okay, very good. Feel that sleeve. Very good. Feel your tie. All right. Feel that can. Good-oh. Feel the back of this E-Meter. All right. Thank you. Feel that sign.

PC: Hm-hm.

LRH: All right. Feel that curtain. Okay. Thank you. Pick up the cans. All right. Squeeze the cans. Very good. Squeeze them again. All right. Put them down. Okay. Feel that tablecloth.

PC: Hm-hm.

LRH: Okay. A moment ago, did you miss a command on the chair?

PC: Did I miss a command?

LRH: Did you just do something – did you wonder what part of the chair you should feel, or something like that?

PC: No, I was – all I was noticing there was that I really felt – I was really feeling it.

LRH: All right.

PC: I thought I had a stray thought. Well, I wonder if I'm taking up too much time, you see, on the TV again. You know?

LRH: All right. You take all the time you please!

PC: All right.

LRH: All right. Feel that sign. Okay. Now feel the lettered side of it. All right. Now feel the unlettered side of it. All right. Very good. Feel that tablecloth.

PC: Hm-hm.

LRH: Okay. Pick up the cans. Okay. Squeeze the cans. That's my boy! All right, put down the cans. I'm going to give you two more commands and end this process, if that's all right with you.

PC: Fine, yeah.

LRH: Okay. Feel the tablecloth.

PC: My favorite tablecloth.

LRH: Very good. All right, feel your chair.

PC: Yeah.

LRH: Okay. Pick up the cans. All right. Is there anything you'd care to say before I end up?

PC: No, I feel a bit brighter after it.

LRH: All right. End of process.

PC: Okay.

LRH: Okay. Now let's go into end rudiments here, shall we?

PC: Yeah.

LRH: All right. In this session, have you told me any half-truth? Tiniest little flick.

PC: *Oh, I didn't mention the names of all these people I've been staying with – the homosexuals, people like that.*

LRH: All right. Very good.

PC: *Didn't mention all their names.*

LRH: Excellent. All right. In this session, have you told me any half-truths? Reaction.

PC: *Well, perhaps it's a half-truth that I haven't really sort of had sex. I suppose I've attempted it enough times. I've never really had it satisfactorily, you know, or really got anywhere with it.*

LRH: All right.

PC: *I've never had it, period.*

LRH: All right. Okay. Now let me – let me check this with malice aforethought now. All right. In this session have you told me a half-truth? It looks clean.

PC: *Hm-hm.*

LRH: All right. I'm going to ask it one more time just to make absolutely sure. In this session have you told me a half-truth. No, I got no reaction on that to amount to anything.

PC: *I sort of had a latent thought on you looking down there. All right.*

LRH: Yeah. Well, there's a question in my mind concerning it. Your needle is doing a bit of a – of a swing here, and of course I didn't have your sensitivity up to 16 for the first question.

PC: *Ah, I see. Oh.*

LRH: I swung it up late. That's what you've just missed and the reality of it.

PC: *Oh I see, all right. Yeah. Possibly I feel there is some sort of half-truth in that I haven't laid my complete case out at your feet in this session.*

LRH: All right.

PC: *I've sort of got a – a feeling that I ought to and yet I oughtn't to.*

LRH: All right.

PC: *Hm-hm.*

LRH: Okay.

PC: *Hm-hm.*

LRH: All right. In this session have you told me a half-truth. I got no reaction on that to amount to a hill of beans.

PC: *Okay.*

LRH: All right. In this session, have you told me an untruth? Let me check that again. In this session have you told me an untruth? Got a speed up.

PC: *Hm-hm. Well, perhaps it was an untruth of we – I didn't get anywhere in my auditing on course. I did get somewhere on it – not as far as I – as I would have liked to. Perhaps I misled you on that.*

LRH: All right. Very good. Let me check that again.

PC: *Hm-hm.*

LRH: In this session have you told me an untruth? Got a reaction.

PC: *Well also, that we didn't dig up any overts on th – I probably gave you the idea that we didn't dig up any overts on Prepchecking. We did dig up some things,*

and odds and ends that were overts. I don't really feel we got to the bottom of it.

LRH: All right. Very good. Okay. In this session have you told me an untruth? All right, that's clean. That's all right now.

PC: *Hm-hm.*

LRH: Now, in this session have you said something only to impress me? Reaction.

PC: *Well, I thought that – well, yeah, perhaps the bit on the checksheets. Um – sort of giving the idea I've been working terribly hard to get out these checksheets, and I'm so pressed that I couldn't get anything else done.*

LRH: All right.

PC: *I guess that was somewhat to impress you.*

LRH: Okay. Let me check that. In this session, have you said something only to impress me? Clean. Thank you.

All right. In this session have you tried to damage someone? Clean.

PC: *Hm-hm.*

LRH: All right. In this session, have you deliberately tried to influence the E-Meter? Got a reaction there.

PC: *Well, I did notice that on the Havingness my hands – when I put – when I – um – picked up the cans after we'd been running the Havingness Process, that my hands did seem a little bit looser. Probably, I was thinking, well, I'd like this to be looser this time.*

LRH: All right.

PC: *And I did notice my hands were looser, and didn't tell you about this.*

LRH: Okay.

PC: *They did – you know, they weren't gripping the cans quite so tightly.*

LRH: All right. In this session, have you deliberately tried to influence the E-Meter? Still got a tick.

PC: *Um – oh, the same thing. I wanted the havingness to be more.*

LRH: All right. All right.

PC: *That more or less seems to be it. I did pick them up and they were looser, and I didn't tell you about it.*

LRH: All right. Okay. Here it is again: In this session, did you deliberately try to influence the E-Meter? Still a reaction here.

PC: *Well, perhaps this is something on that I did – um, my hands were a little less sweaty when I put them back on the cans. Possibly I thought well, this will make them glue less to the cans and I might get a bit of a wider swing.*

LRH: All right. Now, let me ask – repeat this question very carefully. In this session, have you deliberately tried to influence the E-Meter?

PC: *Well, I wanted the can squeeze to be bigger. So to that extent, yes, I did, because I picked it up and it – my hands were looser.*

LRH: All right.

PC: *I did deliberately pick them up looser.*

LRH: All right. Very good. Very good. All right. Here we go. Here's the next – here's the check-off on that. In this session, have you deliberately tried to influence the E-Meter? All right. The needle turns around on the E-Meter there; it's changed its pattern.

PC: *Mm.*

LRH: Think of anything else?

PC: *Well, I can't think of any deliberate influence. There was a couple of times when my – my hands seemed to shake a little bit and I didn't mention this to you, but it didn't seem to bother you. But perhaps I felt I ought to have mentioned it.*

LRH: All right. Okay. Let me check this now. In this session, have you deliberately tried to influence the E-Meter? All right. That's clean.

PC: *Okay.*

LRH: All right. You got a little bit of something on E-Meters.

PC: *Yeah.*

LRH: All right, but we sorted it out. That's okay. All right. In this session, have you failed to answer any question or command? Reaction.

PC: *Well, on this last one perhaps I didn't answer you straight out to start off with. On this last rudiment we were cleaning.*

LRH: All right. Okay. Good enough. Let me repeat this – check it on the meter. All right. In this session, have you failed to answer any question or command? That's clean. That's all right. You got a little – little slowdown on the word "command."

PC: *Well, the – the only thing I was thinking about was that perhaps I've been a little bit slow in this session in bringing up all points, some known points. You know, and sort of been a bit slow in answering the commands.*

LRH: I understand.

PC: *Mm-mm.*

LRH: All right. In this session, have you failed to answer any question or command? A tiny slowdown on the uprise.

PC: *Well, on this bit on failing to reveal, whatever it was on the – Um – checking out on the havingness ...*

LRH: Mm.

PC: *... I sort of felt, well, there's probably a lot more on the whole subject of failed to reveal. To that extent, I didn't go into it.*

LRH: Hm-mm.

PC: *And well, to a slight extent it's an unanswered command.*

LRH: All right. Good enough. In this session have you failed to answer any question or command? Now we're getting an anxiety here.

PC: *To some extent, yeah.*

LRH: All right, now you listen to this very carefully.

PC: *Yeah.*

LRH: In this session have you failed to answer any question or command? Clean, thank you.

PC: *All right.*

LRH: All right. In this session, have you withheld anything from me? It's an equivocal read – a little bit latent.

PC: *I was a bit surprised at the question.*

LRH: Is that all that is?

PC: *Yeah. I think so. I just thought, well, I have withheld these people's names and odds and ends like that.*

LRH: Hm-hm. All right. Very good. In this session have you withheld

anything from me? All right, it's a – it's a slowed rise.

PC: *Hm-hm.* [clears his throat]

LRH: All right. Okay. Are you willing to talk to me about your difficulties? All right, that was a reaction – probably followed the cough.

PC: *Hm, I don't know.*

LRH: Well, I'd – I think it was. So I'll check it again. Are you willing to talk to me about your difficulties? The read is equivocal, a little bit late.

PC: *Well, I think this all comes under the question of goals. I got – on my goals I set to sort of get my future sorted out.*

LRH: Hm-hm.

PC: *I haven't discussed any of this with you.*

LRH: Hm. Bang-bang.

PC: *Possibly there's been a bit of reluctance on this.*

LRH: Bang-bang. Yeah. All right. Are you willing to talk to me about your difficulties? That's smoothing out now.

PC: *Hm. I think it's the same thing – em – on planning my future, knowing exactly how long I'm going to stay here and what my plans in the future will be.*

LRH: Hm.

PC: *This that and the other. And I sort of left you out of the picture.*

LRH: All right. Okay. Let me ask this one more time.

PC: *Hm-mm.*

LRH: Are you willing to talk to me about your difficulties?

PC: *Yeah.*

LRH: All right, that's clean.

Okay. Now look around here and tell me if you could have anything.

PC: *Hm-hm. That chair.*

LRH: All right. I'll check this for meter read just to ...

PC: *Yeah.*

LRH: Look around here and tell me if you can have anything.

PC: *Yeah, that curtain.*

LRH: Yeah, I'm getting a reaction on that, so put down the cans.

PC: *All right.*

LRH: All right. All right, touch the tablecloth. Thank you. Touch that ashtray – what were you going to say? You were going to say something?

PC: *No, I don't think I was going to say anything.*

LRH: All right. Okay. Touch that ashtray. Thank you. Touch that E-Meter can. Okay. Pick up the cans. All right. Squeeze the cans. Thank you. Thank you. That was the last command.

PC: *Okay.*

LRH: All right. Look around here and tell me if you can have anything. All right, thank you. Thank you very much.

Okay. Have you made any part of your goals for this session?

PC: *You better remind me of them. I've forgotten what they are.*

LRH: You said you had a PTP with a girl.

PC: *Yes, I feel a bit happier about that, yeah.*

LRH: All right, very good.

PC: *Less tense.*

LRH: And you want to feel a lot brighter.

PC: *I do. Much brighter.*

LRH: All right. Very good. Now, have you made any other gains in this session you'd care to mention?

PC: *I think I can confront the embarrassed students better.*

LRH: Oh, yeah?

PC: *Yeah.*

LRH: All right. Just how do you mean that now, just so I understand it.

PC: *Um – well, I feel that I've probably got off some withholds they don't know about, and got off some not-knows on the line. I guess there's more reality about the place.*

LRH: All right. Very good. Very good. Any other gains you'd care to mention?

PC: *No, that about covers it.*

LRH: Hm?

PC: *That covers it.*

LRH: That covers it.

PC: *Hm-hm.*

LRH: All right, very good. Now, is there anything you care to say or ask before I end this session?

PC: *Well, thank you very much.*

LRH: All right.

PC: *I didn't think I'd survive it this well.*

LRH: You didn't, huh?

PC: *No.*

LRH: All right. Here it is then.

PC: *Hm-hm.*

LRH: End of session.

PC: *Okay.*

LRH: Okay. Session ended for you?

PC: *Yes, it has.*

LRH: All right. Tell me I'm no longer auditing you.

PC: *You are no longer auditing me.*

LRH: Thank you.

PC: *Thank you. That was good.*

LRH: Good enough!

PC: *Whoow!*

VALUE OF RUDIMENTS

A lecture given on 31 May 1962

Thank you.

Now, you-uns saw a demonstration last night. I understand – I understand that a couple people here found out I could read an E-Meter. Actually were several comments on that. I mean, after the demonstration, "Why, Ron knows how to read an E-Meter, you know?" I thought it was marvelous.

Everybody has apparently been going on the thought impulse system – the thought impulse system. You see, life is a great pool, you see, and we are all unsegmented portions of the mush. [laughter] And you see, when the auditor starts to think the auditing question, and before he asks it, you see, that is when the meter reacts.

So an instant read is when this thought impulse, you see, is transmitted instantly. Then asking the question has nothing to do with the meter, of course. For the benefit of anybody listening to this tape, that's not the way you read a meter. [laughter]

Well, here we are at 31 May 1962, Saint Hill Special Briefing Course, lecture one.

I'm going to talk to you about *rudiments*.

This is a very interesting subject – fascinating subject. I have just done a tremendous amount of work on it. Not the rudiments which you already had got and developed and so forth, but tremendous amount of work. How vital, how valuable and how deep will a rudiments process go if run as a repetitive process? Interesting datum, isn't it, huh?

And we find out that if you took a small spoon and started to empty out the Atlantic Ocean, a rudiments process has that much effect on the reactive GPM.

You get that? I mean I've got the data now on it – working on it for a long time here. If I look haggard, that's why.

I've had some comparative runs made on this, I've done a lot of comparative work on it, I've tried to figure these things out. I find out that that which is kicked into view by Routine 3 is not kicked out of view by any repetitive process known to man. That's an interesting datum, isn't it?

But here is the anomaly [anomaly]. Here it is. Here's the oddity. Why is it that this tremendous bulldozer – Routine 3, listing processes, like 3GA and so forth – why is it that this tremendous bulldozer won't run forward at all in the absence of these gnats flying against the back of it. Yeah, just why is that?

Well, we have the answer to that, too. The rudiments apply to present time and this universe now. They are a nowness series of processes. They apply to now.

Now, you have a good reality on that in that if you got a rudiment in with a club on a pc – I mean, let's really get this rudiment in, I mean let's really work it over. Let's get down there: "Do you have a present time problem? *Hm-hm, hm-hm, hm*. How – how present time is that problem? *Hm*. Let's see now. And any other type of present time problem that you might have?" and so forth. And we work these all over, and we run responsibility on them.

I even got a brand-new responsibility process. I thought, "My goodness this ought to revolutionize something." Would have revolutionized everything under the sun, about 1955 or 56, but now it's just a silent drop into the ocean and nobody hears of it again, you know. Has that much importance. But anyway, you run this responsibility, "What part of that problem can you be responsible for?" and you run it with all the new wrinkles and everything else, and you just fix that all up just very beautifully, you see? And this present time problem has to do with not being able to eat soup, you see. And my God can this fellow – doesn't worry about eating soup – he eats – he maybe even can eat soup and so forth. He can't eat asparagus though.

Well, if you list the number of articles of food which are commonly considered comestibles, you're licked.

In other words, if you were to use these rudiments processes – this is new data; this is brand-new data, by the way – don't think this is anything that's been sitting around for a long time. You wouldn't have thought I'd been sweating over this with everything that's been coming your way – you know, all the data. But the fact is my mainline research is what I'm giving you right this minute, see.

These rudiments processes are incapable of even denting the Goals Problem Mass. They just won't do it. They will do a little bit of a tiny, oh, a just microscopic key-out. Let's say you've got the GPM keyed in on somebody with a crash. See, this is really keyed in on him. This person, by the way, the auditing or nothing else keyed it in on him, you know. I mean they got this in life, you know. They were a citizen of some country, you know, or something like that. They just went all out into the total degradation, you see, of nationalism or something. I'm sorry, I shouldn't bring that up, but I mean I – every – the more I see what these so-called leaders of man are doing these days, the more my goal gets invalidated. Anyway ... [laughs, laughter]

So the basic problem is how to defeat their own nation with a minimum of difficulty for themselves and a maximum of difficulty for their citizens.

Anyway, we got this situation here where this fellow has got this thing keyed-in, you know. He's just black mass from here to Halifax. So we sit down and we run any version, no matter how learned, of a repetitive rudiments process. And no matter how we run it we're going to wind up at the other end of the line with the same way that old Hendrick Van Loon described eternity. He said eternity was the Rock of Gibraltar, and once every thousand years a bird came and sharpened his beak on the rock. And when the rock was totally worn away an eternity would have elapsed.

Well, that's just about the way it would look. I mean it's that – it's that rough. It's that rough. Now, we don't really include Prepchecking in that. We're talking about rudiments processes, see?

Prepchecking can do a key-out. And rather interesting that you can key out any part of it with Prepchecking. You can move it around with the CCHs. And here are all these processes that have to do with havingness, have to do with willingness to talk to somebody about difficulties. They have to do with withholding things from people and they have to do with present time problems, telling half-truths, untruths, not answering auditing commands, have to do with influencing meters and more withholds and problems and difficulties or anything else you want to add up on top of it, plus your middle rudiments, suppressions, invalidations, missed withholds, failures to reveal and careful of. These are the middle rudiments. I want to take those up much more broadly in just a few minutes.

You take all these things, see, we put those into process combinations, repetitive process combinations and we audit them on the pc. Rock of Gibraltar, bird sharpens a beak, see?

I've been over the jumps on this, you know. As I talk to you, by the way, I have a headache from a test on it.

The difficulties of assaulting the GPM are absolutely heroic. They're tremendous in size. How in the name of common sense Freud ever expected, see ... "Well now, when you were a little girl, did any little boys look at you?"

And the patient says, "Oh, yes, yes."

"Good. You're no longer neurotic." Silly as that, you know. Look at these rudiments processes – they're marvelous. You run them – oddly enough running them you get a good subjective reality on exactly what they are and you think the bank is moving them, and you say, "Gee, we really get someplace."

I can give you some rudiments processes which are killers! These are just test processes. You might care to clean up some auditing on somebody someday. This won't do it very well, but it's the strongest process known. If you're running Routine 3 it won't do it. But that is a Routine 3 process, right? "What didn't you know? What didn't another know? What didn't others know?" Doesn't that sound like a lovely process? It is. It is very effective. It's very effective. It gives a person – it kind of shifts somatics and they kind of feel better and they're happier about the thing. Sometimes when you've had a horribly ARC breaky session or something like that, some form of that process will do things – will do things.

But that process run up against a locked-in GPM has no influence at all on the GPM. You'd swear that it does have until you look up afterwards and realize all the masses are in exactly the same place as they were before. Horrible to report, isn't it.

Now, that process itself is a killer. You run that on some pc sometime in some co-audit or in an Academy and the pc would be absolutely delighted with the whole thing, you know, he will, would feel kind of odd occasionally and so forth, but he'd be delighted. Cognitions, you know – marvelous. GPM – bang.

Now, Prepchecking and the CCHs are capable of keying something out, providing it isn't too thoroughly in. Doesn't do actually anything to the GPM. It just sort of can take the pc off of it a bit. And you get a key-out phenomenon.

Then when you start running a Routine 3 process you key it right straight back in again. So you know very well it was just a key-out.

No, the value of a rudiments process run in repetitive process form as a button, swamping up track left and right, you think, phrased up any way you want to phrase it up, the ability of it to affect the Goals Problem Mass is, by the way – well, call it the reactive mind except the GPM plus locks and free track would be the reactive mind. Free track is actually the only thing missing and the only additional thing to the GPM that is in the reactive mind.

There's a bunch of whole track engrams that sit independent of it, which can also be included in. Now there's the GPM and then there's the whole track engrams that are scattered around about the place and so forth, the pc knows nothing about. And the whole of that is the reactive mind.

You can do things with that if you're influencing anything with these repetitive rudiments processes, used on a whole track basis, you understand? That's the only thing I'm talking down on these things. These are used against the whole track. This is trying to audit the whole case of the pc, you see?

I'll give you another one. "What have you suppressed? What has another suppressed? What has another suppressed on you? What have you suppressed on another – or in another?" See?

"What have others suppressed in you? What have you suppressed in others? What has another suppressed in others," you know? A multiple bracket on Suppress.

Stands your hair on end when you first start to run it. You say, "Man, this is going to take up – this is going to clean up the whole track. Couldn't help it. Makes you feel so horrible."

Use Invalidate in the same way. Use – I've already given you the Fail to Reveal, the Missed Withhold, the Don't Know, all of which are the same thing. Careful of – oh, you'd get very interesting results, I'm sure, you'd think. Not worthwhile. None of them are worthwhile. These are all rudiments buttons. None of them are worthwhile.

One time a well-known auditor out on the West Coast sent me a cable to Australia saying – recommending that I test out at once something on the order of "What lies have you told?" or "What have you lied about?" Some such process as that, you see? Because obviously a lie is an alter-is and that actually would be what the reactive bank would consist of. A lie therefore would be very hot. And frankly it follows these other thought button symptoms, and the buttons are just – it's just – just goes so far and it looks terribly promising and then nothing happens.

But now this doesn't say those rudiments should not be handled, see, and this doesn't say you shouldn't use rudiments. I'm just talking about using rudiments to clean up the whole

case – using this button called a rudiment, let's apply it to the whole case. Nothing's going to happen. You're not going to clear anybody with it. I can tell you that.

Now, basically this is because these are all thought manifestations. These are all think-thinks, see? These buttons are all figure-figure buttons. And what's got your pc buried is the fact that his postulatingness is basically thinkingness on a lower scale, see?

Think-think or figure-figure, see, is below effort on the Know to Mystery Scale, see. It's actually not – it's actually not postulatingness, see? Oh, way up, way up here, way up at the top of the scale, see, postulating. And he's thinking. He's below effort. And none of those buttons, weirdly enough, will carry him up above or through effort. They just sort of keep swatting him on the nose and swatting him on the nose and nothing ever happens except he gets swatted on the nose, don't you see?

He doesn't go Clear or anything. That's because you're below effort. It needs something to carry the pc up through the effort band into the higher ranges of the Know to Mystery Scale in order to get the pc there and that's your Routine 3 processes. And these rudiments processes will not carry the pc up through that effort band. Very remarkable, but they won't.

But your pc, because he is below the band of effort with his figure-figure, he's doing figure-figuringness in the middle of these GPM masses. He's getting his dictations from the circuits. He's getting the word from circuit A to circuit B and he's getting the word of all kinds of conflicting and oppositional identities of one kind or another. And all these identities are in conflict with all these identities, so their ideas are in conflict with all these ideas. And as you audit him, you have to keep him from being obsessively alarmed about present time and defensive, otherwise he is not up to confronting the effort and the masses. See, he can't; he'll go *r-r-h-h*.

And yet all the time he's sitting there, he's got a bunch of automatic thinks going. And these automatic thinks are all characterized under the existing rudiments – beginning, middle and end rudiments. Those are the buttons which keep him so involved with think-think that he can't go up scale.

Now, to get him to go up scale requires something like a Routine 3 process. And the reason that works is because you are labeling masses. Labeling, identifying masses which brings about a differentiation amongst masses and gets the pc up to confronting masses.

Your effort however is not to get the pc to confront masses. Your effort is simply to get the conflict of those masses identified and resolved any way you wish to do so. It's rather easy to do once you know what you're doing. He's been a boy and the boy has conflicts with girls and the reason boy and girl are suspended right where he lives is because they are in conflict. All right, boy and girl are in conflict.

Now, he eventually – he's never really identified the fact that he has been a boy or a girl or that boy or girl are part of this great mass called a GPM, the gross mass. Boy and girl are little pieces of this mass, don't you see? But he's never identified these things as having anything to do with him. And one day he's labeling – you've got him listing and he's labeling – and he sees boy. He says, "What do you know, you know, boy, a boy. A boy." That gets kind of real to him, and girl – that gets real to him to. These things cease to oppose each other.

In other words, you've actually unhinged the tricky, almost-impossible-to-maintain balance of this glutinous bunch of electronic guck called a GPM, you see. And it can no longer hang up and recreate itself.

It's creating itself, you see. He's furnishing the energy while it creates itself. It's very interesting, you see. He's creating with his left hand, gazing at his right hand, you know. Very tricky.

But the identification of the mass, the labeling of the mass is the fringe line between the think-think and the mass. That will move him up into confrontation of the mass, he becomes aware of the mass, the mass blows. It actually is nothing – no trick at all for a thetan to confront the mass. That's not even difficult to do. It's what mass to confront; that is the main thing that worries him.

And the GPM – now that we have some of the anatomy of the GPM by the identification of the various chunks of it – of course, the thing disintegrates and it tends to come apart and various things occur because you're doing this. Now, you can get a pc into the GPM or find out what part of the GPM he's in with a Goals Assessment. That's easily the best way, as I've always said, because it identifies the think-think that is going in and the principal mass that he's got to get out of.

If you want to know what the – what the ambition of the mass is, that – you want to find out what goal the pc has that hangs up that he calls his goal. And of course, that is the first identification of the mass he's sitting in which by being opposed and counter-opposed and not opposed and all that sort of thing is suspended right where he is. Now, you start listening down on this thing, all the pressures and electronic mechanisms and masses that hold this in place are suddenly – start lifting and as these things lift, of course, it can't stay there anymore, and where did it go, you know? He isn't even aware of the fact that he is in it or being it and he is definitely not aware of the fact that it is of no value to him but quite on the contrary is a detriment.

He'd tell you at first, "Oh man, if I get rid of this ..." Is an easy and early phenomena of Routine 3. "God, it's a horrible feeling – wait a minute, if I get rid of this I won't want to do anything."

Well, that's because he's – there's some of the old lectures on games, and so forth. He's so fixated on this that he thinks there is only one game in the whole universe and that game is it. And if that's the only game there is, that's the only thing he can play. And for a little while, every time you start influencing this, he says, "Well there's no other game, you know, and if I get rid of this then I'll have no game at all." Where as a matter of fact if you look it over carefully, he's not playing that game, see?

And if he were playing it he hasn't had any fun doing it. See, this thing is all – he's in a heavy conflict about all this. As soon as he gets his attention unfixated off of this, he sees, well, there might be some other games around. And as soon as he sees there's some other games around, why, he can become more fluid and more action and he can start enjoying life. Actually he's in a no-games condition – no (hyphen) games condition. Not in a games condition. He thinks he's in a games condition but he's actually in a no-games condition, because he isn't playing the game he knows he has to play as that's the only game there is.

So anyway, you get the pc up through this band, and the boost is accomplished by permitting the pc to have his full attention there playing upon the objects you're trying to haul him out of. Now, if his attention is distracted by things in present time, he has just that much less attention with which to address this task of going up scale through the Know to Mystery Scale and he feels – he might have – but he feels like he hasn't got quite enough attention units to look at anything. He's distracted.

He's distracted by the think-think. He isn't actually throwing his own rudiments out; his own rudiments are going out because various masses which also have influential ideas are impinging ideas upon him, consistently, and by pulling these off, you get extraneous ideas off of him which are liable to yank him into PT. But your primary concern is that present time and the operation known as auditing will not drain away his attention.

You keep him up in a high-toned state, whereas he's not worried about the present, he's not worried about the auditor, he's not worried about the session – his attention isn't split in any way. Then theoretically he has enough attention to attack the GPM successfully. And if he is worried about any one of these things, he has just that much less attention to give the GPM.

Well, you're already telling this fellow, "Now, mount this little – mount this little tricycle, here – has one grasshopper-power tricycle, and there's Mount Blanc, now. All right, now just ride to the top of it. Thank you."

It's quite unreasonable, I mean, to ask a pc to go through the GPM at all because, man, it is tough. This is a rough, rough, rough proposition. I don't mean to aggrandize or say how fantastic a GPM is. Its strength becomes as nothing the second that you know about it and know how to get out of it.

But it isn't anything that surrenders to half-baked auditing. And it isn't anything that surrenders to a distracted pc. If the auditor hasn't got that pc's every attention on exactly what the pc is doing, then the pc won't be able to overcome the bumps. See, he won't ride any tricycle to the top of Mount Blanc, man.

Then you start – you see that he can't do it and you start getting impatient with the pc. You start buying him airplanes and that sort of thing to fly to the top of Mount Blanc and you eventually will find him at the top of Mount Blanc, but he hasn't accompanied himself.[laughs]

So, the relationship of rudiments, then, to a Routine 3 type of process is the same relationship as a hedge would have along the side of a road. It keeps the pc guided, pointed and traveling – the same function as small stones might have on an otherwise broad highway. You can't make any speed over this highway unless you get these stones off the road, see. It's a sort of herding, non-impeding action. But as far as a rudiment or rudiments processes or processes based on rudiments actually moving this pc along that road, they do not. They move the pc no place.

But they can retard the pc from going. And if really badly done – if you've gotten down over the weekend and thought it over real carefully as to how to get the rudiments well enough out, you could actually get the pc traveling in reverse. You could actually make him

travel in reverse. That is possible under today's auditing. The rudiments would have to be pretty wildly out. The meter would have to be very badly read, indeed.

But you've just got this situation that the make and break of whether the pc goes forward or not – if your rudiments are (quote) in (unquote) your pc will make forward progress because he has enough attention to blast himself through where he's going. And if the rudiments are out the pc does not have enough attention to blast himself through. In fact there is no blasting and the auditor winds up all sour and doing the blasting for the pc. And of course, this doesn't do any good at all. This gets him to the top of Mount Blanc without having accompanied himself and that is a very interesting state to be in.

They've done this for years in Tibet. They know how to exteriorize in Tibet – they go out the bottom. That isn't why dear old Tibet has busily succumbed now to the ultimate degradation of it all, of it all, of it all. It's got commies on – in it and amongst it.

I ran into somebody the other day who was worrying about whether or not the – any of the old teachings of Lamaism would survive the communist smash of that particular government and so forth. I don't think commie is that active, I don't think he'd get around those cliffs and so forth. No, I don't think so, man. It takes energy. I'm sure the old Lamas have got it pretty well buried amongst the hilltops and in the caves.

But anyway, the essence of what you're doing is to collect to the pc all of his potential power of confronting, his potential power of examination, his potential power of blowing things. Well, in order to collect this all together, you have to set him up so he is all fine with the auditing universe in which he is being audited, which is to say, his auditor, his E-Meter, his attitudes toward the session, his attitudes towards the environment, his worries about the extensional environment out at home and this sort of thing. These things have got to be taken care of and then he has enough horsepower to climb the hill. Otherwise he doesn't have.

Now, if you flagrantly throw these things out, you can get the reverse effect of dropping him further back down the slope. If you try to get a pc to concentrate his attention – you just keep inferring to this pc or telling him that he must concentrate his attention on something while you are making him concentrate his attention on something else, he gets to feeling worse than schizy. See? You keep saying, "Now concentrate on the GPM. All right, now go ahead and worry about your problem. Yes, worry about my E-Metering. Worry about the fact I keep kicking you in the shins," Do you see? "Worry about whether you left enough money with your wife. And now – now you've worried about all those things? Are you enough bothered? Are you sufficiently agitated and upset? Good. Now put your attention on the GPM." *Dz-z-z-z-z.*

When he does this, he gets a recoil phenomenon. A pc whose attention is put on the GPM and then suddenly jerked off of the GPM will get a mass straight in his teeth. Every now and then you've see – you've heard of this happening or seen it happening or made it happen to you: One fine day you were sitting in session minding your own business and all of a sudden the window weights broke or something like that – the window came down with a dreadful crash. It wasn't the noise that bothered you. It was the mystery of the mass that hit you in the schnozola. What was that? See?

And you say to the auditor, "What was that?" you see, and the auditor obliges and he said, "That was the window falling down." Well, that's a damn funny sensation, see, to result from a – simply a noise blast. Actually it wasn't a noise blast. The pc's attention was distracted over toward the window and his attention acted as a sort of a pressor beam and it had part of whatever his bank was in focus, and when his attention suddenly swept sideways, it was just as though you took the pole out of the hand of a pole vaulter when he was halfway up to the bar. [laughter] Uncomfortable.

So keeping the rudiments in includes not yanking the pc out of the session. See? That is an understood part of the rudiments. And something which probably is not sufficiently stressed or commented on because there is no remark made by the auditor that invites this situation.

In other words, you could get all of your beginning rudiments in and then drop the ashtray. All your labor would be in vain, because you see, you have gotten all of the rudiments in and then you have thrown them all out. Why? Because you've got the pc's attention braced into PT. Now you've got him pinned in PT. You've got his attention on something else rather than the whole track and getting him into session. So he can attack these masses and aberrations and straighten them out.

You've got his attention on something else. And if you've got his attention on something else, he can't do it, that's all. He's like the marksman who is firing for a record to get his medals and his corporalmanship and a pretty girl passes on the road down the side of the rifle range. You know. He didn't get his corporalmanship, even though he shot the corporal that was teaching him. [laughter, laughs] Pc can't hit anything.

It's very funny. If you jerk the pc's attention out of session suddenly and then ask the pc the next auditing command, you get gobbledygook. You may not have looked at it as that direct a phenomena. You may have had other explanations for it. But actually if he's in a dispersal – he's been hit back by something – and you ask a question into this dispersal and he can't concentrate his attention. His ability to differentiate at that moment is tremendously lessened. He confuses things with things. He doesn't know what's going on. He has no attention to concentrate for a moment. His anchor points are driven in.

It is a bad and a sad thing that the rudiments can be put in very laboriously for a half an hour and knocked out in a tenth of a second. See? How can they be knocked out in a tenth of a second? Well, I don't know – telephone rings, you answer it, you turn around to the pc without any further announcement – you know, he's not out of the session or anything, he's right in the middle of session, he's right in the middle of a GPM something or other, you doing something or other – hand him the phone and you say, "Well, it's your wife. She says the police are at the house." I don't think you'd have much luck auditing that case.

Well, the funny part of it is that you can do this as slightly – the person – the further the person's attention is dispersed, as you find him as a pc – the Tone Scale, tone of case, degree of dispersal, degree of nonconcentration – these are all of one breed of cat, you see. And this person who is not well concentrated on what he's doing, you give him a little noise like this – and if he's halfway round the bend in the first place or terribly concentrated on something, you'd be amazed. You can knock ten rudiments out just like that. All of a sudden you

examine your fingernail and you've had it, see? He'd have to be terribly dispersed in order for this to happen, but that would happen. See?

Some pc that you're busy auditing – you say, "Did you – did you mind that? I" – you know, you [flicks finger against something] – "Did you mind, did you mind that?"

"No, no, no. No, it's perfectly all right." He might also have added to it, "I always suppress those things." [laughs]

Doesn't matter what the pc said, the rudiments went out, that's it. It's a sort of a tight-rope walk at best. But when a pc has experience of an auditor – that is not of auditors but an auditor – has experience of an auditor, and this auditor has successfully put the pc's rudiments in several times, you will find the pc's anxiety expressed about rudiments, his anxiety about the rudiments being in or not, his anxiety about the present time universe, are of the same breed. They're parallels. They're the same thing. He says he's anxious about the rudiments or something like this. Well, he's anxious about present time, you see?

And after an auditor has successfully put them in several times, pc will sit there in session – my God, you could practically drop the E-Meter, you know, and nothing happens. They don't go out. This is a factor known as confidence. Expectancy. The pc begins to understand that his attention can be properly directed by this auditor. He begins to understand that this auditor is not going to get him into trouble but on the contrary is going to get him out of it. It's – an aura of confidence begins to surround the session and at that time, watch out, because you're going to get too cocky, man! Because the aura of confidence adequate to Prep-checking is probably short of the mark adequate to Routine 3.

In other words you need an even greater aura of confidence. Although the process seems simpler, the auditor has to be far less [more] clever. The stress is so great that the rudiments have to be in much better and they have to stay in very well – otherwise the pc never climbs that band through the effort scale. He never comes out of the mud.

Some auditor could audit Routine 3, I imagine, with the rudiments wildly out, year in and year out, and wonder why the pc was going no place. Well, the pc's going no place because the auditor doesn't have the pc's confidence. Why doesn't the auditor have the pc's confidence? Not because of his domestic or personal reputation, it's simply whether or not he can put the rudiments in. That's all. That's all there is to it.

Now the pc realizes that this auditor cannot put the rudiments in, that he has to lie and cheat and wiggle around. He goes on automatic. He goes on self-audit and he isn't going to blow much of a GPM. Believe me, he's not going to blow anything. He's going to stew and chew and stew and chew and it's going on and on and on. He isn't suddenly and miraculously going to mount up scale. He's sort of going to hang. And this is nothing to be worried about, this is just – only happens when the rudiments are out. It isn't the esoteric personality. It isn't the swamiesqueness of the auditor. It isn't any one of these other things it might be. It's just are the rudiments in or aren't they? And if the rudiments are in, the pc feels confident and if the rudiments are out the pc feels nervous.

Now, when a pc has been audited many times with the rudiments out, he becomes more and more and more nervous. It is terribly to your advantage that no matter how little you

expect of the session to do a good job of putting the rudiments in for that session. Because you've always made this little hidden gain alongside of all the obvious gains. And if you're good at putting rudiments in – that is to say, you can put them in – then the pc has learned one more time that you can put the rudiments in and the pc is that much more confident of being able to buck up things while he's in session.

You know the old expression of the pc is able to blow things. Well, in the absence of in-rudiments, the pc cannot blow things.

You get some pc and he's being audited by one auditor – Auditor A. And it's – he doesn't – hasn't had any difficulty. They start blowing engrams by inspection. They've gone into free whole track engrams, you see, and they inspect this thing. Well, he was a headsman in that life and that blew, you know, and he was – and there was this life, while he was – yeah – he made a specialty in that life out of slaughtering vestal virgins. He could probably even get up to blowing lives, you see? And you give him Auditor B – now you understand this is the same pc – you give him Auditor B and one fine day, why, you find the session has sort of deteriorated to Straightwire and the pc has remembered going to bed last night and he's got a stuck picture on it.

What's the difference between these two sessions given by Auditor A and Auditor B? Auditor A: Pc's confidence was very high, rudiments in. See? Only it's not just the rudiments for that session and this is a history of rudiments in. See? And Auditor B: It's just not the rudiments out for that session, it is a history of rudiments out. See, we've been auditing the last fifteen sessions and we have nine of the ten rudiments out, see. Wow, man, that is – and all of a sudden, why, he can't blow. He gets a stuck picture on going to bed last night.

Now you, trying to put – try – find this pc who has been audited by Auditor B, and you, Auditor C, move in and you're going to straighten out this pc, you are. And you start running rudiments and you've gotten nothing but a dirty, messy, twitching needle. No matter what happens, you know, you – it goes tick. There's five words in the sentence and although the sentence you ask him is actually live with an instant read at the end, as you approach it and draw in your breath to say something, you get an action on the meter, and you get two actions per word on down to the end. There are about twelve actions on the meter – this is a terrible exaggeration – and then it goes into stage four when you are finished, you see.

You're Auditor C. This is what you have inherited out of all this, see. "*H-oo-aa-h*, well this is an awful low-scale pc. How are we ever going to climb this cliff? How can we ever possibly do anything about this," you know?

Well, quite interesting, quite interesting, you wouldn't find any real difficulty in doing so, providing all you did was sit down and session after session put the rudiments *in*. And all of a sudden the pc's confidence comes up, his attention is collected and you're back to a point of where you're blowing lives at a crack. Because what are you doing in Routine 3? The pc has to blow a life at a crack, just by labeling.

I don't say this is hard for the pc to do. It isn't hard for the pc to do as long as his rudiments are in. And as Auditor C then, you have brought him back to the same state that Auditor A found him in.

It is the auditor, not the state of the case.

The first edge in may be difficult. We find this pc – twitch, clank, thud, stage four, rise, rise, rise, rise, rise, rise, rise – "Have you breathed lately?" *Reaction!* Tick, tick, stage four, dirty needle. "What was that? That? That? That?"

"Oh God, I wouldn't know. Oh, that's you sitting there." [laughter]

Well now, you'll see this work out as time marches on. You give him session one. Urrrh. You say, "My God, this pc is in terrible shape! Awful!" What do you mean by that? You mean he can't go anyplace and he can't blow anything. That's what you really mean when you say he's in terrible shape. Because you as a Scientologist are not necessarily impressed or unimpressed by his behavior out of session, except when he natters around and gives you a lot of trouble or something. Or horrifies you with something or other. You're not particularly critical of his behavior.

What do you mean by a bad pc and so forth? Well, it's a fellow who is just a hell of a mess in session. You can't get anything to read; you can't get anything to not read. The pc gets an ARC break; you can't do anything about the ARC break. The pc gets a present time problem and the present time problem is you sat down too suddenly in your chair after you sat him, and you work, work at this for three quarters of an hour trying to blow this thing and he just still got a stuck picture of a session beginning, you see?

You say that is a lousy pc. Yeah, true, absolutely true. You can take a pc that's in that kind of state and work him carefully with his rudiments – I don't care what you run in the body of the session. Of course, you get a long ways if you do something like a bit of a Prep-check, but it should be something fairly light in the body of the session while the rudiments are this crazy because he isn't going to be able to blow much. So, you just keep working away at it session by session, or short-session the pc if you're doing five and a half hours auditing. Do a session every hour or something. And just get the rudiments in, man. And again get the rudiments in and get the rudiments in, and the person says, "You know," he says, "I – I've got a present time problem. Yes, I have a present time problem." And he thinks to himself, "Why hell, present time problem – we'll just get rid of it. There's no use having one."

Even if he goes out the bottom on the subject of having present time problems. It doesn't care which direction he got, he isn't worried whether he has one or not. And do you know a pc who is really agitated up very often reacts on a present time problem just because they're afraid they'll have one, because they know that it can't be handled. Or if they do have one that it won't be handled. Or if they do have one, they will spend the next four sessions handling it. There are going to be penalties involved in this thing of having a present time problem. They're going to be punished somehow – not audited, punished. Well, that auditor must have the presence, you know, of a commissar.

Little by little, session by session, the phenomenon you will observe is that the pc's needle gets cleaner and cleaner. It's not particularly what you're running on him – it's the fact you're running him with the rudiments in and getting rudiments in. He's starting to get a reality on it. He feels better at the end of sessions. He stops being anxious about whether or not the rudiments are in or not in. He stops trying to run the session himself because it's so horrible being audited. See? All kinds of things occur. And you'll see – actually you should notice

it quite markedly at the end of a second session – that the pc's needle, if all goofed up when you took him over, is getting cleaner and smoother.

Now, if you go on several sessions, you actually – it actually isn't terribly significant what you cleaned up on the pc, don't you see? It's the fact that you did it neatly and the pc could handle all of the stuff you handed him to handle. You did it and he did it and, oh, this is a breeze, you see? And he'll be winning all the way along the line. You could interrupt this by giving him some hill to climb that was far too steep. You could say, "Well, there's the Empire State Building there and we're standing down here on the sidewalk. Now, I'm going to teach you to jump. I'm going to teach you to jump. All right. Now, squat down. Bend your knees, bend your knees. Good. Now, have you bent your knees real good? All right. Now, jump to the top of the Empire State Building. Oh, you couldn't do it, huh? Oh well, that's too bad. I guess we'll have to do something else," you know?

That kind of a reaction isn't going to do anything. You could put something in the body of the session, in other words, which was far, far too difficult for the pc, such as Routine 3 full-blown, "All right, we're going to run on down the line, getting goals." What do you suppose getting goals is but churning around these goals – middles of the Goals Problem Mass, man? Actually, when you're doing a goals list and assessment and nulling, if you did one badly with the pc all dispersed, he would feel like he was in the middle of a roomful of billiard balls or something of this sort. And they're all in motion and the room is in motion. He won't know what the hell's going on. Because goals are simply the expectancies or attempts of these various objects in the GPM, you see – of former lives, actually, is what they are collections of.

So you ask him to do something too steep, too fast, and the pc is overridden in his confidence. He feels like he's had a hell of a lose in the body of the session. So a good way to take hold of the pc is to run something real easy on the pc for the first few sessions. It doesn't mean you should prepcheck less arduously or CCH less arduously or anything like that. But Prepchecking and CCHs is actually just a little bit too high for somebody whose needle is going clickety-clack-clank, hit the pin, twitch, dirty needle. And you say – not because it's a rudiment – but you say, "Do you have an ARC break?" something like that you would say. Well, it turns out that he does have. And why does he have an ARC break? "Well, you breathed." It could get that sloppy, you see? It could get that grim.

You got a pc who is anywhere in that category, devote all of your time to the type of session which you saw me demonstrate last night. Notice each one of those sessions took about 50 minutes? There were two pcs. One of them, the first one, was in good shape to run a Routine 3 Process. First time I ever audited that pc. The rudiments went in very easily, didn't they? Second pc, they went in rough, rough, rough, rough, didn't they? The pc needs some Prepchecking and CCHs and actually needs more confidence on just rudiments alone. See? Somebody can get them in. Actually, he needs the exact session I gave him, see, but needs about three more of them. Pc will stop being anxious about rudiments, and so on.

But there is a pc that needs to be graduated up along the line a little bit and get a little more confidence in auditing. There was a pc who audited perfectly well. You could tell it just this way: The needle of the first pc was not doing anything unusual at all. It was ticking and

tocking here and there occasionally, but it was a pretty smooth needle. And the needle of the second pc was going *tickety-tock-pick-pong-thud-bang*. You ought to have seen it today, by the way, when they checked the pc's rudiments out. They checked the second pc's rudiments just to work out the same thing that I was going to talk to you about tonight.

The pc was sufficiently upset about rudiments in general that just checking the rudiments was upsetting to the pc. You couldn't get very much responding. He couldn't get very much differentiation on it. Why? Well, actually from an auditor's point of view that pc could be said to be in rough shape. That pc actually is not in rough shape except sessionwise. Now, with a few cool, pleasant sessions and so forth, you see that needle will – would just sit there and just ride around, and nothing very energetic about it. It would be smooth. And you get the rudiments in, why, they'd stay in. You wouldn't have to keep punching at them and picking at them and picking them up and putting them back and picking them up and putting them back – none of that, you see. All that would come out, providing you got the rudiments in every time.

Now, the first two times you get the rudiments in on a pc, the first two times you get the rudiments in on a pc, you should not expect the pc to respond well to a rudiments check. The pc won't respond well to a rudiments check. The pc doesn't know by that time whether his rudiments are in or out, don't you see? That's the first time – couple sessions with a new auditor. Rudiments check has relatively small validity.

The third time, this should be very manifest: If the auditor got the rudiments in for the length of time he got them in – if he got them in, in the first session thoroughly at the moment he was getting them in, and if he got them in thoroughly at the moment he got them in, in the second session, by the time the third session comes along, you are going to see that the needle has stopped acting up. It looks cleaner; it looks easier. And if that has not happened or if the pc's needle has roughened up by the time the third session's in, then the auditor did not get them in, in the first session, did not get them in, in the second session, did not get them in, in the third session.

You could check the third session quite validly for a check. You know, do a rudiments check the third time this auditor has audited this pc. That would be a very valid check. Check would be fine, providing it was a very precise check. But not as valid as the fourth and fifth check. Don't you see?

And the first two might have no validity at all. *Zzzzzz*. Now, that's a generality but intended to fit on numerous grades and types of pcs in numerous states of decomposition. See? So therefore it's a rough hat.

But the point I'm making here is simply that the pc feels the newness of the auditor, probably wouldn't have this auditor if he wasn't – if he had been going good with his last auditor. You see, a lot of things are monitored this way. A lot of factors add up to the fact that the first session – if he's having any trouble at all in auditing – it's going to be fully manifest. In the second session, why, it'll be less so, but it – possibly still be trouble there. Third session it's starting to look smooth and starting to look like something and then you could tell accurately then whether or not the auditor had been getting the rudiments in. After that, rudiments check – bang-bang-bang – hit them right on the nose every time, see. You got the idea?

But it'd actually be unfair to take a rudiments check on an auditor's first session on a – on a monkeyed-up pc, see. It'd be very unfair. For instance, you're going to get – you not only will get one rudiment out, on two or three consecutive checks, you'll get different rudiments out for the session past, you understand?

What's going on? Well, the only thing that's going on is the pc is very anxious about present time and actually can't differentiate between the present time he is being checked in and the session he just had, and you get all sorts of crossed-up relationships of one kind or another. But that will not exist after a few sessions, providing the rudiments had been gotten in session after session. You see how you check this out in full fairness to everybody.

Well, there's the value of rudiments. Rudiments are absolutely vital. You cannot do without them to get the pc up the hill. Absolutely vital. And they're not going to move the GPM a thousandth of an inch. You see how they fit?

But without them, the GPM is not going to be moved a thousandth of an inch. And there's the peculiarity of rudiments. And one of the reasons why I think you've maybe had a little bit of trouble understanding them or not understanding them – as the case may be – because they themselves do not have the power of resolving a whole case. But if they kept the pc in-session, then they should have the power of resolving the whole case. Problems like this have undoubtedly occurred to you.

So I rolled up my sleeve to settle it and I have actually been many weeks working on this, one way or the other.

And a rudiments process does not have the power of resolving a case, but in its absence a case won't resolve.

Thank you.

Audience: Thank you.

MIDDLE RUDIMENTS

A lecture given on 31 May 1962

Thank you.

And this is, second lecture, 31st of May, AD 12. Different time track than the first lecture. Same subject, only this one is middle rudiments. You will want to know about this one.

The middle rudiment consists of a package question, which handles suppressions, invalidations, missed withholds and careful of. That is your standard, basic middle rudiment. It is a package question, contains those four elements. And middle rudiments may also contain – this is less often – but may also contain the half-truth, untruth, impress and damage end rudiment, the question or command end rudiment and the influence of the E-Meter end rudiment.

Now let's expand the middle rudiment just a little bit further, you see, that would be this package suppression, invalidation, missed withhold, careful of, plus those first end rudiments. Now let's expand it a little further and you could run in "auditor," but less advisedly, and "room," providing there was a tremendous amount of disturbance in the auditing environment.

This would be the extent of any practical end rudiment – middle rudiments. Any practical middle rudiments would have that extent. Because before you got all the way up to all rudiments again, you had much better short-session it and just start – just end the session that you were doing with the end rudiments and start a new session with the beginning rudiments, which is much neater. See, so there is a point where middle rudiments become too numerous and too fancy and actually consist of restarting a session. There's a make-break point there. It is sometimes more economical to start a new session than to patch up the one that is running. And that would depend utterly on how many rudiments had gone out.

Now it's a matter of judgment. Now ordinarily, in Prepchecking and in Routine 3, only one package middle rudiment question would be considered mandatory. Middle rudiments have moved from the category of being a good idea over into the category of being mandatory. You always use a middle rudiment when doing Prepchecking or a Routine 3 process. You cannot get along now without middle rudiments. Because the middle rudiments have gotten sufficiently good that it just makes the case run so much faster that it would be senseless to omit them. And these are the middle rudiments that you would use ordinarily and when you would use them.

Middle rudiment would be, "Blank – " first phrase, but definitely a time span or a subject span, "(Blank), anything you have suppressed, invalidated, failed to reveal or been careful of?" Now that would be, "In this session, is there anything ... ?" "On goals listing, is there anything that you have suppressed, invalidated, failed to reveal or been careful of?" "On list-

ing ...," "On Havingness Processes ...," "In auditing ..." But when you get it outside, when you get it totally outside of the framework of one session, it becomes the equivalent of a Prepcheck and must be regarded as such. It's – it is very much better to take, "On the subject of goals is there anything you have suppressed?" as a single Zero Prepcheck question. Crash! "On the subject of goals, is there anything you have invalidated?" "On the subject of goals is there anything you have failed to reveal?" "On the subject of goals is there anything you have been careful of?"

Now, if you were to use these, as a session body, before beginning a Routine 3 process – now this is a Prepcheck session, which precedes a Routine 3 session – you would find that this case would really come up shining on this subject. But there you're going to beat him to death. You might be a couple, three sessions, on this, all told. But it isn't likely. I did a session identical to this in cleaning up somebody's goal that had been invalidated and it was one of the queasiest of goal mess-ups I have run into in some time and actually did it in, I think the length of the session was one hour and fifty minutes. And I prepchecked all of those questions, and got them clean, slick as a whistle. And got the goal checked out in addition to that. So you see this is nothing very arduous.

But nevertheless, that was a Prepcheck session which was a prelude to a Routine 3 session. Well, of course all Prepcheck sessions are a prelude to Routine 3 sessions, but this is instantly and immediately prior. So prior that it is a Routine 3 session. In other words, you're going to going to do goals on this person, you're going to do a goals list on this person, well, let's just get it all out of the road now.

We've already been working Prepchecking and we got all of our... we could – this pc could stay in session now, this pc is nicely grooved in. I mean we've got rudiments, pc knows you can get them in, you know you can get them in on the pc – all this has been going on for some time and you've got the pc feeling better about this lifetime and not so shy. He doesn't expect the police or his mother or somebody to rush in the door any minute and tap him on the shoulder, you know. He can be comfortable.

And now, before you did a Goals Assessment, you'd find it'd be fairly wise to clean up, slick up, polish up, put the fingernail polish on the middle rudiments. And you'd put them on in a Prepcheck fashion. You'd say, "Anything that you'd care to ask, on the subject of goals, on the subject of listing, in finding items, on Routine 3 processes." I don't care what beginning wording you use, it's got to be enough to embrace everything the pc has been up to, on the subject of doing goals or listing or 3D Criss Cross or anything else that has been a Routine 3 type process, don't you see? You get that and you use those as your Zero Questions.

And then of course there must always be four of them. If you said, "On the subject of flying airplanes – " to just get it out of the range of auditing, not that you would use these things, see, it wouldn't matter if it were on the subject of flying airplanes – you've got four Zeros. You've got four Zeros at once. You see? You've got suppression, invalidation, fail to reveal and been careful of, see. It wouldn't matter what you started, you're going to have to do all four of them. What you start is up to you, see. But you're going to have to do four of them and all those Zeros have got to be flatter than a flounder and of course they obey all the rules of Prepchecking.

You've got the overt, you get the action, whatever it was, realizing that things like this, the overts are very often against self. Suppression is against self or something like that. Prep-check it out, see. If it lasts for two questions, on the second question swing it in there, fish for your What, get that thing all straightened out, run it, run your chain down – I don't care if the chain only went back to last year, see. There's going to be action on it. Bring it back up, check the What, check the Zero. If the Zero wasn't flat, why, find another overt and run that on down the line.

You'll find out this works very rapidly. If you've done a lot of prepchecking, this will amaze you with the speed with which this will go and the immediate return that you will get in terms of auditing. Pc says, "Wow!" you know, "What happened?" you know, "Gee!" This is quite something. Because this is four very, very strong buttons. And they're good, strong, think buttons, man! And of course on the subject that you're addressing them to, why it's, "this lifetime" or, "since auditing occurred" – that's within the last dozen years, Routine 3 process last two or three years.

Whatever this thing is, you see, you've got a very finite piece of track and of course it cleans up at once. And don't let him go backtrack on the thing – he didn't audit anybody – he didn't audit anybody when he was two, you see. No, you got this little span. You find out it'll clean up fairly rapidly, but it all depends on how well you yourself can go over the hurdles, you see, with Prepchecking. How fast you can juggle these values and get it in there and get the pc to give you the overt and run the track back and clean it up, check the What and out of there, you see. It just depends on your basic handling of exact Prepcheck fundamentals. And if you are never guessing, if you know exactly what you're supposed to do and you get in there, *bang*, you'll find this thing will *roll*, man. And you'll find goals, you'll find wild things going on, you'll find all kinds of things, you know.

We already have a case, if I may mention it – I don't know who the pc is, but it was quite remarkable – the goals list was all complete, except those goals she had been so careful of she had never given any auditor. See, interesting manifestation. See, the "careful of." Yes, she'd been very careful of those goals and never given them to anybody. And I hope the pc will forgive me for mentioning that, I don't even know who it is.

But anyway, on another pc, who I hope will forgive me, pc on this little Prepcheck I just mentioned to you a moment ago, the hour and fifty minutes or something like that, pc actually sat down and didn't write his goals. See, he had a definite intention, you see, of writing something else. Got the idea? And we even found a goals list which way precedes Routine 3. Quite interesting, earlier goals lists. Pc was sitting there writing down things he wanted to be. See, sometime before. Fascinating base. I knew it must be there, however. See, when you get a good security on Prepchecking, you know it only stays in if the basic is still in. If you've still got the bottom of the chain in, it's going to stay in, man! And that thing is going to knock itself off the pin. So as unlikely as it is, you ask – . Actually the goals list, you couldn't get any earlier than this goals list, see. Obviously there was nothing earlier than Routine 3 had anything to do with a goals list. I still asked for one earlier. Why? Because I couldn't clean up the one I had. There must have been one earlier. And sure enough, there was an earlier one. And as soon as we found this earlier one – it didn't even belong in the body of Routine 3, don't you see?

I imagine you're liable to find somebody sometime that did one in college, "Things you want to be," you know, or something like that. Or did a – something wild like this. You'll find out your goals list isn't clearing up and the pc's having a hard time giving the goals, sitting on some piece of nonsense that occurred ages ago on some entirely different disrelated subject, but was a goals list. And you get the earliest one, each time, you see, on whatever you've got there, clean it up.

Well, that would be – that is a marvelous approach, this is not mandatory. I don't say you must always do this before you do a Routine 3. I don't have to because after you've used – after you've used the middle rudiments on a Routine 3 process a few times and you haven't done it, you'll wish you had! This is one of these obvious things. You don't have to even tell, "You always have to do this," because even if I omitted to tell you about it and just gave you the middle rudiment, you would find yourself trying to cheat on the auditing section by doing it over the weekend on the pc just so you could get the middle – [laughs] you'd be getting desperate! Because they wouldn't stay in, see, unless you did some fundamental action with it, see.

Now, there is one use of middle rudiments. That's its Prepcheck use. Prepcheck use for Routine 3. Now is there a use of middle rudiments for Prepchecking? Not just Prepchecking middle rudiments, but is there a use of them for Prepchecking? Yes. Yes. Be an awfully good thing – be an awfully good thing – to handle the pc, as I see it these days, and looking at the wins that you are getting and taking a chapter from your book and the wins you are getting right now and as cheerful and happy as you are about these wins.

Set the pc up in Model Session, do some Havingness in the body of the thing and just get the rudiments in. And get the rudiments in. And get the rudiments in. With some Havingness, you see. Now, I showed you middle rudiments last night in the demonstration. There was no reason under the sun, moon or stars to use them. I could have made the Havingness Processes work without them. But I just thought I would show you middle rudiments against a disrelated subject. I thought you might be interested in: what the devil is that? You probably recognized them for what they were. We're going to clean up the subject of havingness. Well, we didn't have to clean up the subject of havingness. We could have found a Havingness Process that worked. I just wanted to show you how they worked, using them as rudiments.

Now you see, you could use these four lines as Prepchecks, Zeros. When you use them as rudiments, you use them in an entirely different way. And don't ever confuse this. You use them with your good old drill, "Have you seen a cat?" Whatever the pc says, you say, "Fine, I'll check it on the meter" and you say, "Have you seen a cat?" You understand? You ask the middle rud, whatever the pc says you check the middle rud on the meter. You do not Q-and-A, you don't go afield, you don't try to dig chains, you don't do anything with it, but take what the pc says. Providing only that it is an answer to your question.

Now this will be a relief for some of – a dirty crack to make! This'll be a relief to some of you, you actually don't have to plow around and wonder about whether it's an overt or a motivator on running middle ruds. Because it's always a little bit of both. You see, they're just think-think, see. And the fact that the guy suppressed it is a sort of an overt. It doesn't matter whether he suppressed somebody else's item or goal or suppressed his own, it's an overt in

some way or another, he can't answer it without giving you that. Or how he said it was suppressed. We don't care how it was suppressed. It's just what the pc said, it's just answer the question, in other words. Of course, if we say, "In this session" – which would be your usual start to a middle rud – "In this session, is there anything you have suppressed?" And the pc says, "Uh – how soon are we going to finish the session?" Well, let me point out to you, that's not an answer to the auditing question, you're going to throw your end ruds out. So at that time, you have to insist that he answer the auditing question, simply by saying, "I'll repeat the auditing question."

Supposing he says, "*Bla-ll-zzzumm*," and you didn't understand what he said, you would say, "I didn't understand that," or "I didn't hear that," or "I didn't get that straight. What was it you said?" Now that doesn't challenge him with anything, that isn't invalidative, that's trying to get the pc's answer, not questioning the pc's answer, see. You want him to say the answer so you can understand it.

By the way the reason TR 4 doesn't work for an awful lot of auditors is they just complicate it up to the stars. All you got to do, you know, is just understand and acknowledge it and return the pc to session. Well, TR 4 often includes, "I didn't understand," when you didn't. See, the pc says, "*Bla-zzzmm*." And you're going to be a ruddy fake? And sit there and say you understood what the pc said? Heh! You better not! You better not Q-and-A and you better not not-understand it. See, you've got to understand it. So one of the steps you sometimes have to take to understand it is, "What did you say? I didn't get it." "I didn't get it." you see, the onus is on you. "I didn't get it," "I didn't understand it." "I didn't get that straight." Preface it in that way and there's never any ARC break. And you're asking the pc for Havingness answers, you know and the pc says, "Uh – and uh – the phonograph record." What are you going to do? Like a cheerful idiot sit there and buy a nonexistent phonograph record? Well, he didn't answer the auditing question, because something's wrong. Well, you'd better go to the mat right then or your TR 4 is out. You say, "I didn't get that straight. I didn't understand what you were talking about."

"Oh! Well it isn't a phonograph record, it's an ashtray. Ha-ha! Yeah, well, I'll take that."

He says, "Funny you noticed that."

You say, "I didn't notice it." I'd even go so far as to say, "I didn't notice it, I didn't understand what you're talking about."

"Oh well, fine. Swell, oh, okay. Swell, swell."

See. That's TR 4. TR 4 is understand and acknowledge. And you're looking for some fancy system by which to do this and there ain't none. The only – closest you can come to a system is, is you can't be a fake. See, don't be a fake – ever. Pc has a heavy Armenian accent, then by George, you have to ask him for a repeat about two or three times every time he says anything. Well, you want to know how to throw him out of session? Pretend you understand what it is. Boy, man! You turn false, he turns false, you've got missed withholds now from the pc, you get disinterested in the pc, your ARC drops with the pc, you start to goof. You leave the session being critical of the pc.

You show me an auditor being critical of his own pc and I'll show you an auditor who didn't understand what the pc said. TR 4 is out, see. Don't complicate it, simplify it. It says "understand." That's all you need. Well, make sure you understand it, see. I've had a pc even speak to me sharply on the sixth or eighth time. I just have to tell him, "Well, I just don't get it, I didn't get that, I don't – don't grab it." And the pc says, "*Sis-hallu-tha-lrrrum.*" "Well, what is it? I didn't get it straight." The pc sounds annoyed. It never registers as an ARC break. But this eventually will find you with an ARC breaky pc. "Okay." He says, "*Thall-uulm.*" And you say, "Okay, good." [laughter] Next thing you know the whole session – session doesn't exist, R-factor's gone, everything is out the window, see.

So this applies particularly to the use of these middle rudiments. It's your TR 4's got to be in. But it actually doesn't much matter what the pc said, as long as the pc answers your auditing question. Pc must have answered your auditing question. And that's the end of it. And then you just check it on the meter. Now that's the way you use a middle rudiment. You don't use it any other way, you don't try to run a chain, you don't do any – you just leave it. Don't Q-and-A and *hmmm!* You know? Just you – you ask him, he tells you. That's it, you see. You check it on the meter and that's that. Otherwise, man, you're going to go far afield, you're going to go adrift, you're going to go appetite over tin cup.

Now the other use is prepchecking *in* the Zero Question so that you can use middle rudiments. But the Zero Question, the Prepcheck Zero, "Have you ever suppressed an item?" or something, you see, that is actually not a middle rud. That's a Zero Question. And of course that's handled with the full panoply of Sec Check, Prepcheck, type action, see. You ask him, you don't get a read, of course you don't prepcheck it.

All right, now, and if you do get a read and he tells you and it doesn't clear, why, you're off to the races into prepchecking. See those are two different actions. Don't ever get these two actions confused in using a middle rudiment. Because you already have thrown a non sequitur into the session. Now it's all right to drop a few small stones on the road. They're not going to bother anybody. But now, don't start moving boulders onto the highway and stopping the whole session in order to go into whether or not his Aunt Tibia has possibly ever suppressed his libido. *Oooh!*

I got one from somebody, I will withhold this person's name and send them a bill. They aren't here, but they have been at Saint Hill. Had to stop a Routine 3 session in order to prepcheck out thoroughly some of the background of their difficulties. You do that to a pc, they think you drive wild. You start running... I'll give you a subjective reality on this, had a session one time where the auditor – I was worried about a government. We were in some kind of a mess and we ran a present time problem or something like that on governments, you know, just as a coffee-shop thing. And, all of a sudden the auditor missed an auditing command and I said, "Wow!" And so the auditor shifted over and ran "What have I done to you, What have you done to me?" As a repetitive process, see. That's dropping boulders on the track and we never did clean up the first one. See, you never come back on the road when you start that kind of thing.

So middle ruds are used with great discretion. With enormous thoroughness, but with great discretion. Minimum distraction. You're already throwing some pebbles on the highway.

But it's worth it. If you throw them on expertly you manage to get a few boulders off and the pebbles, too. See, if you do it expertly. But you don't use these things badly. You must use these things with a – a good rudiment approach. You must ask your question, get your answer, check it on the meter and if it's still alive, ask your question, get your answer, if it's still alive, ask your question, get your answer, check it on the meter each time, and now it's dead. It's not reacting now. Tell the pc so and get the hell out of there. That's all you do with it.

Now you use a middle rudiment after every What question has been nulled. Now I cannot give you the optimum time to use it in the midst of the Sec Check one – that is the list-type Prepcheck, you know where you do the Sec Check list, the Form 3 list, I can't give you the optimum time to get... Because I have a feeling like you could be too frequent. It's been suggested that it's every five or six, if they were flying along, see. If you were flying on down the road and you weren't actually getting much of a reaction on anything and so forth. But after a few of them you would use it. For sure, you would use it at that time, because the pc might have everything beautifully suppressed.

Now if I thought the pc was stringing me a long bend and had it just all suppressed and wasn't paying any attention to what was going on and that sort of thing, I would use it more frequently. But I would sure use it every five or six checklist type questions. And mandatory, that you clean the middle ruds whenever you have nulled a What question. That is absolutely mandatory. You mustn't go on to a new question, a new chain from your Zero, until you have knocked your middle ruds in.

You find out that they will be very, very productive. They will keep the pc flying. Now, the way you put those in, is to check the null of the What question. If you find it live, you of course look for the new chain. What did you miss? You must – couldn't possibly have found the basic. Something's wrong here. Well, you correct that. Now if you check the What question and find it null, you do the middle ruds and check the What question again. Don't do the middle ruds and move on to something else, because the middle ruds might have been out and that might have suppressed. You got the sequence? It's a relatively easy sequence.

It'd run something like this. You're doing a form type Sec Check, "Have you ever stolen everything? Have you ever raped a widow?" something like this. And, you've done six of these and you've gotten each one off with at least – with just one, see. Well, by that time you ought to put in your middle ruds.

All right. So you found one that repeated twice, then of course you've gone into a Prepcheck type activity. When you finish up your Prepcheck type activity just as the way you do, get back up there, that What's nice and null, put in your middle ruds and recheck your What. Of course if that What's still alive, why, there must be something more on the chain; you can fish that up and then of course, check your What question; if it's now null, once more do your middle ruds. Always the same action, do your middle ruds, check that What question, undoubtedly it'd be null by that time. And then you go on to your next form line.

In other words, you play that What question against the middle rud. That's what's important about Prepchecking, is make sure that you at least get your middle ruds in, after every What question has become null. And you'll find out this does not take long to do. Now, the middle rud standard response, or standard question for this is one of these package questions

and I – after the trouble we had getting people to read – getting – people were reading prior reads on the E-Meter and people doing that, I – these package questions make me a little bit nervous. Because they tend to give you the wrong impression. Because in a package question you're actually asking four rudiments in one breath. And it's just a very fast way of auditing. It's short-handing. And it possibly might not even be as accurate as asking each one all by itself and that sort of thing, but it does let you cover a lot of ground. And you do it in a package fashion and the package question of course is just, "In this session – " you see, that would – the way – that'd be – always the res – the beginning of it, "Is there anything you have suppressed, invalidated, failed to reveal or been careful of?" Watching each one.

Now, if one falls, like "invalidated" falls, you just stop right there. It makes a full sentence, even though your breath is left hanging in mid-breath. You have not dropped your proper tone at the end of the sentence, but just stop it. Now how do you proceed? Would, you just proceed by omitting the two that are now clean and then go on with, "In this session, have you failed to reveal – is there anything you have failed to reveal or been careful of?" You see how that would be?

In other words you don't repeat – keep repeating the things you have already cleaned up. Now if you just want to punish this thing to death, you can repeat the whole package after you've cleaned up all the parts of the package, just for the hell of it. But this looks to me like it's getting awfully – awfully picky. Almost to the point of annoyance to the pc.

You checked your middle ruds and you found "careful of" was out. Therefore the next question shortened down to, "In this session is there anything you have been careful of?" see. And whatever the pc had answered you, when you asked the question originally, you had cleaned it, so you say, "Well that's clean," and that's it. And you're out of there and the pc won't be getting all impatient to get going and getting onto something else. It's in the interest of rapid auditing.

Now, that is the auditing question you would use, that was what you would clean up, and how you clean it up I have already described to you, clean it up just as any other rudiment. And now, how do you use it in a Routine 3? In a Routine 3, we have much less definite answers. Much less definite answers. But this is mandatory, that between a shift, I mean after you've finished listing on a list and before shifting to another list, you do the middle rudiments just as a clean-up on a What question is done. Except you haven't got anything to check. You just take that opportunity to get the middle ruds in, that's all. You don't necessarily make him list longer or something like that.

This is not very definite beyond that one fact. When you shift from list A to list B, do some middle ruds between the – in the middle of the shift. And just finish listing one, put some middle ruds in and start listing the next one.

Now, this can be amplified enormously. This can be amplified *enormously*. And complicated *tremendously* when you start getting complicated steps into some Routine 3 process. Now I'm studying right now, listing against the needle. There seems to be some validity to this. It's an assessment of the four lines every time, instead of just going in rotation; you list to a condition of the needle, whatever that condition is, probably a still needle. I said "probably," you understand, this is all up in the air. List to a still needle on that list, then do an assessment

of all four lines. Find out which one is reacting the wildest and that's the next one you list. See, the complication is this: Where do you put any middle ruds in there? Well, I'd put the middle ruds in before I did the assessment. Complications can occur. The same general law, however, prevails.

Now there's another law in Routine 3 that you'll find out continues to be – in other words, when shifting processes or when shifting lists or when shifting some doingness, put a middle rud in between. That's Routine 3. You use it far more frequently in Routine 3 than you will in prepchecking, you'll find. You have to use it – and because it is capable of slowing up the session, you will have to be able to throw it in there with great glibness and speed and read it fast and get out of there. You see? Otherwise you'll be getting into the pc's hair most God-awfully. He'll think the session consisted of nothing but long, lugubrious middle ruds, you know? Well, learn how to do it fast and get out of there and he'll be very happy about your middle rudiments.

It's all with the speed and expertness with which you get them in. An auditor who gets rudiments in slowly, not carefully – pc likes to see you get in ruds carefully. But an auditor who gets in ruds so *carefully* and so *laboriously* actually gets the pc after a while so he's just practically spinning on the subject of rudiments, if at the same time the auditor despite all the care and labor doesn't get the rudiments in. And you can find out that this type of auditing exists: That the auditor is very *laborious* on the subject of getting the rudiments in, but never gets them in. And of course it'll blow the pc out of the water, every time.

But because middle ruds come into the body of the session where the pc's attention is terribly fixed on something else, you cannot afford a drag, a slowdown, a fumble, a dished-up stuff, you see. You check it as a package, you clean up the part of the package that was reacting, you get out of there, see. Don't go messing around, pushing the pc's attention around, "Now, well, did you do something?" and so forth and so on. Don't – don't bother with this.

Terribly important that the pc gives you overts and not motivators in the beginning and end ruds, but you don't be so critical in these middle ruds, see. Don't be so critical. Because actually when they throw one out they'll throw another out. You can generally get it on a repetition. Pc's driving too wild on this sort of thing, why, short-session the thing, just end the session and get your end rudiments and so forth. Start in, wind up on this thing, get it all straight again, because it's going to go up in a ball. Learn how to do middle rudiments easily and swiftly and with no great weight.

Remember you're doing in the body of the session what the pc's attention is absolutely *mandatory* on blowing. He's got to be able to blow masses and that sort of thing. You mustn't distract him too much. So get them in there, get them in, get out of there. You're actually throwing pebbles on the road when you're doing middle rudiments. That's why I didn't give you any middle rudiments until I was fairly sure that we had the perfect package on the thing. We haven't monkeyed with this very much, you've heard – you've heard about, "Get the withholds off and get the invalidations" and you've heard something about, "Get the suppressions," but you haven't been given any hard and fast packages or "got to's" on this thing and we haven't – I've been fooling with this for some days, starting a few days ago, talking to your Instructors about it and we've had it checked out and it works very nicely.

Now, where else would you use middle rudiments? Well, on listing of a goal, you will find you have a different proposition because you're not going to change lists, at least on Routine 3GA. You're not going to change lists but it's when your pc looks confounded and stops listing. Now of course you could be so quick that every time the pc took time to take a breath you threw the middle ruds at him. And this would very soon have the middle ruds just about as wildly out as you could imagine. No, I'm talking about the person says, "And catch, ah, catfish – yeah – I always wanted to catch catfish. And then ... Yeah, put that one down, catch catfish and then ... Ah, well ..."

Oh, man, his attention's gone out of session somehow or another, he's blown off something or other. Probably the next goal is "to go away," you know, and he's dramatizing it. A good way to get him right back in-session again and get him going with a minimum loss of time and so forth – you save a lot of time with minimum ruds if you use them right – is just feed him the middle ruds. Just feed him the middle rudiments at that point. "Oh, well, yes, I am in-session. What have I suppressed?" you know, so on, " – pressed, *bang-bang*. Yeah." He suppressed the next one. He thought it was discreditable. You'll always find there's some goofy answer about the thing or two back there was one he failed to reveal. Or, he's been very careful not to let his rudiments go out. You know? I mean there's something slowed him down. And you'll find every time that whatever his behavior was, the reason he slowed down or fouled up is contained in the middle rudiments. It's magical. The guy all of a sudden picks it up, he starts to run.

What kind of wording do you use? Well, let's say you've prepchecked this thing in and then your middle rudiments are sort of – you're having to put them in all the time – I think I'd take a short session and put in a Prepcheck set of middle rudiments again. I'd get – use the subject of listing. Now, you've done a lot of listing with the pc, you see. I'd get them in rapidly, but I'd make it an entirely separate session. Don't decide in the middle of a listing session or something like that, that you've got to get the middle ruds in with a Prepcheck. That's a gross auditing error, see? You're going to take the next session and do that.

You figure out, well, there's something gone wrong here and I don't know what it is and this pc is – just seems to be invalidating everything under the sun, moon and stars. What's going on here? There must have been some early invalidative action on listing. You'll find out that is the most prevalent thing to go out. There's something wrong with listing. Don't start throwing, "On listing – " and expect to pick up the whole subject of listing in one session or something like that. Now I'm talking – I'm being a purist, now, you understand? You understand that you could do this and get away with it, providing you did it in a rudiments fashion. You understand you could do this. But I would tend to handle it as itself. I would try to handle it that way.

Now this advice may not particularly hold good. It may be that you can get away with this, see? Maybe you can get away with it. Maybe you can say – pc's having an awful time listing see – maybe you can say, "On the subject of listing – " see. The whole subject of listing, you see, you're talking about various alterations, various changes, of wording and so forth, could take place or be in – and you could – might be able to get away with it. And I think you just did. You've been using it, found it very fruitful. Use something like, "On writing goals – " or something like this, " – is there anything you have been careful of?" was a

very hot rudiment. I don't know quite how you worded that or handled it. But he was handling more than one session on the thing and doing it quite successfully.

But before I did that, I would have middle rudiments pretty well in hand. You understand? I myself as an auditor would really have the grip on the subject of middle rudiments and their use before I start floundering around. Because you'll find out that they work in a finite state. They work within the one session you are doing. If I thought that this pc had a lot of suppressions on listing and was not eager to list and didn't want to tell me his goals, I certainly wouldn't think of trying to get it in with one slash of the middle rudiments. I would start a session, I would prepcheck a – Zero Questions, all about listing goals. "On listing goals, is there anything you have suppressed? On listing goals ..." one Zero, you see, "... is there anything you have invalidated? On listing goals is there anything you have failed to reveal? On listing goals is there anything you have been careful of?" And I would take those four and I'd prepcheck them. Really get to them. Really thrash this thing out. And after that my middle ruds would stay in. And I think you'd find it would probably save you time to do that.

However, I can't give you that as an absolute final statement, because there hasn't been – haven't been very many auditors using this and we haven't any broad auditor experience on it. We just merely know that the middle ruds themselves work like a hot bomb.

Now what corrections we have to make because of misuse and abuse of, that always follows later, doesn't it? Now, you'll find that you will be very happy with these things, normally used, because there are a lot of pcs around on this "careful of" button. Pc's almost sitting there self-auditing, you know. He's being so careful, he's being so careful not to withhold anything. And you have a pc popping up at odd intervals saying, "Uh – I – uh – I – I just thought, uh – I just thought the session was going pretty long. I didn't want to have a withhold. I didn't – didn't want to – " and they go on with this for a little while, you know and ... [laughter] "Who's running this session?" I very often will ask them that, you know. It's better to ask them the middle rudiment question. Not as a Q and A, because of their response, but just wait for the next favorable opportunity and ask them is there anything that they have "suppressed, invalidated, failed to reveal or *been careful of?*" [laughter, laughs]

"Uh – yes, I think I've been careful to keep you informed."

"All right, thank you very much. Thank you. Is there anything in the session you have been careful of? That reads."

"Well I've been careful not to have any withholds. Because I don't want you to get a dirty needle there and have trouble reading it."

"Thank you, thank you. All right. Is there anything in this session you have been careful of?"

All right, now, if it came to a case like that, I would slide the whole question in afterwards, if I was gunning for one thing and weighted it. Then I would say, "That's clean now," or whatever it was. "Now, let's check the whole question. Is there anything in this session – " you see, " – you have suppressed, invalidated, failed to reveal or been careful of? Yes, well, I have a read here on 'failed to reveal.'" Because it would almost inevitably follow. The pc who is being so revealing can be counted on to be not-revealing. These little laws you'll see work

out and you'll become accustomed to it and it's quite interesting the way you can juggle a middle rud against itself. Because actually it's asking the same question both ways. The "careful of" takes care of it, don't you see?

Now frankly, a suppression and a withhold are different. But they're quite similar. And they echo one against the other. And "been careful of" and a "suppression" are the same. "Been careful of" and "reveal" are quite often synonymous to the pc. In other words it plays a whole handful of cards at the same time. This shoots a lot of line.

You might be curious of where we got this "careful of," where that's been all this time. It might very well be "help," see, or something like that. But it isn't. "Careful of" is taken straight out of psychoanalysis. That's right. Because in my experience with psychoanalytic patients or inspecting and examining them, looking at records, doing that sort of thing, I have found out that there is one thing they all wind up being and that's careful. [laughter] That is the background music to that thing. And it's quite interesting. And we don't want that in Scientology, so let's take the opportunity of throwing it in with the middle rudiments. Not because of that but because it is quite embracive. Person starts tip-toeing around in sessions and tip-toeing around in life and "Let's see, I mustn't think of an item because I don't have a piece of paper to write it down and give it to the auditor." [laughter] That's all "careful of," don't you see. And it all gets a similar registry on that.

Some people are careful not to have withholds, see. Other people are careful not to commit overts so they won't have withholds, see. Other people are careful to find out – to make sure that other people don't find out they have not been careful. Any way you want to play the violin it'll make some interesting tunes. That is one of these embracive package words which doesn't really mean suppression. It means something else entirely different. Doesn't really mean help. I just hooked it out of thin air; I knew it was a common denominator to somebody having trouble.

The end product, the end product of all aberration is being very careful. And that goes hand in glove with some research I did the other day. I was reviewing the overt-motivator phenomena and I was getting it all kicked together and once more ran into the factor, this time with more weight than ever, that doingness is dangerous. And the people consider – the more people consider doingness dangerous, the less they do and that's a direct index to aberration. So of course "careful" fits right in there. Another method for asking for one of these near-center pins of aberration. Quite fascinating. You start using it into the middle ruds one way or the other, you'll find your pc will start coming up on this alone. You know?

Now, there's another question I must ask and answer and that is simply this: Do you ever use middle rudiments amongst the rudiments? I haven't answered the question yet. But supposing, supposing your rudiments were leading in a very deteriorated direction. That is to say you've got present time problem, a present time problem and you run, "What part of it could you be responsible for?" and "What part of it could you be responsible for?" and "What part – " and checked it and you still have present time problem, so on, I'd be awfully tempted, if I did that, to run middle ruds, end ruds and start the session. *Somewhere* in that body of thought-buttons, the like of which nobody's ever collected, we're going to have

the answer to this thing, you see. He's doing something in this session. He must be doing something in the session. He's probably lied to us about what the problem is or who the problem is with. He's probably told us an untruth concerning the problem. Or he is trying all the time he is sitting there to suppress the problem. He isn't running the command. He's trying to suppress the problem, so that he can get on being audited or something like that.

Or he's invalidated something about it or he's being *careful* to make sure that he doesn't get audited with a present time problem. You see, and you could run on down the middle ruds and straight on down to the end or may – usually present time problems have a "failed to reveal" connected with them. But you could run right on down from there and down into the end ruds and end your session.

And I'd say – I've not been hung up like this, as an auditor. And, well, I could imagine that somebody could get hung up like this as an auditor, get into some kind of a mucked up mess in the session, where what they were trying to clear wasn't clearing. They couldn't get it clear, see. Something was really goofed up. I'd take it at that point, run the middle ruds, run the end ruds and start a new session. That is the best way out of it, rather than beating your brains. Your brains don't have anything to do with your thinkingness anyway, what are you beating them for?

But, that is – now understand, I've not run into this problem, so therefore to that degree I'm giving you a synthetic solution. But I could see that the middle ruds might have some use. Might have some use. This pc's got a PTP and you can't clean this PTP, you've run something like twenty, thirty commands on this PTP. Looks the same as it did before. Not having any effect on it at all.

I would assume there's something wrong other than this PTP. And it would be contained in the middle ruds or the end ruds. And so I'd just go ahead and run it right straight on out; start the session all over again. I might even tell the pc we were going to do that. Let the pc run out the amount of groan that he groaned.

But it might be a very bad policy to give a hang-up PTP that much value. I myself have never had this problem, I don't know why I'm wishing the problem off on you, I myself never had it.

But I, once in awhile, hear you talking and say, "What do you do when the present time problem hangs up and you can't clear it?" I hear – occasionally hear this question asked. I should think it'd happen with every other rud out. I think that it must have something to do with that. It probably has very little to do with – something of the sort. If this present time problem's terribly severe, if this fellow's wife has just been taken to the hospital that morning, you're trying to audit him and he's waiting for the baby, why I don't know, you're pretty good, but you're not that good, man! To audit over a PTP of that magnitude. Where the phone's liable to ring at any moment and even bring the phone over alongside of the – of the chair so that he could answer it, you see, if the hospital called. Not when there's a big wait and expectancy and all this kind of thing on a – on a situation. You're trying to do auditing on something else, of course it violates the idea of the pc's concentration. He can't concentrate on anything else.

I'd be far more likely to run a session on him at that time that set him up where babies were concerned or something like that. His whole attention is on babies, whole attention is on his wife. Till it straightens up so he'll be nice to the baby when he comes and won't spit at him. See? I'd in other words, I'd recognize that existence was so grim or so interesting or so compelling that to yank the pc's attention directly and immediately off of it would be inviting catastrophe anyhow. Better solution of course is to make an appointment for next week. Sometimes you can't do that. Sometimes you're assigned to the session and that's it. You've had it. "Yours is not to question why" sort of a situation, you know.

Well, one of the best things to do is run an equivocal type session. You're running Routine 3, this happened, you're running the PTP, you see. You know you're going to run a PTP, it's going to go up the hill. It's going to go over the hills and far away. It is happening right now. You see, his brother's being executed, but may be given a stay at any moment. And remind him when he gets out of session to call the governor. See, we had one last night, didn't we? He had a present time problem, was still running at a high roar today. What could you do for it? You saw what I did for it. I just said, "Ah, women!" And we went into the body of the session, didn't we? Did you notice that? We dusted that one off lightly. In the first place the pc practically sent it on Morse, radio, telephone, every other means of communication plus neon lights, "This is what you're supposed to audit on me. Second dynamic. My problem. This is what you're supposed to audit on me."

If I'd audited that on him, man, that would have been a Q and A to end all Q and A's. He wouldn't have gotten anyplace in the session anyhow. Did you know it was a rule that what the pc gives you in the rudiments is seldom what should be run at a long – on a long-term Prepcheck basis on the pc? Did you know that? You can handle a chronic PTP, that's about as far as you can go. The pc says, "The trouble with my case is I hate cart horses. Always had trouble with cart horses. Cart horses are always stepping all over me. Me and cart horses do not agree. In fact just coming down here to the session today a cart horse ran away and dumped apples all over my Austin. And I have terrible problems with cart horses. You see, my mother looked like a cart horse ..." And all this has been explained to me. I'm afraid I would consider myself guilty of no session control of any kind whatsoever if I ever had anything more to do with cart horses. Not that the pc said it, pc's perfectly willing to say what he please and I'm perfectly at liberty to take it up. But if he knows that much about it, that isn't what's wrong with him.

And you know one of the – one of the ways your prepchecking goes astray, every now and then, is you take what the pc gives you in the rudiments and try to make that right on the pc. Well you can't make it right because it isn't wrong.

Somebody gives you a long involved PTP – now a PTP of chronic long duration. You saw me audit a pc one day and I said – one evening and I asked the pc, said well, "I understand you've got a PTP of long duration. What was it?" and so forth and we cleaned it up, because it'd been coming up session, session, session, session, session, see. It was getting a reaction. There was every reason to audit that. But you know – you know half the time they never get a reaction. It's marvelous. If you ever audit a PTP on somebody that doesn't have any reaction, you have just committed a blunder for which you will pay dearly. It isn't you should be shot. You'll just wish you had been before you get through. [laughter]

Didn't react as a PTP and then you're going to handle it? Oh, no, man. Yet the pcs will very often tell you they have a PTP when they don't have. The way to handle it is quite honestly. "Do you have a present time problem?" The pc, "Oh, yes, yes, my mother was a cart horse." [laughter] You say, "All right, I'll check that on the meter. Do you have a present time problem?" You say, "It doesn't react now, either." [laughter] "Didn't react the first time, doesn't react now." And don't ever take them up.

And when a pc rudiment after rudiment gives you the whole background history of his case and it's all on the third dynamic, they've been kicked out of the communists and they've been kicked out of this and they've been kicked of that and it's all third dynamic, third dynamic, third dynamic, third dynamic, third dynamic, aw for Chri – please, do a dynamic assessment. It's generally on the seventh or the first. It is never on the third. I just absolutely guarantee you it's never on the third. If they know that much about it, that isn't what's wrong with them.

A lot of times your prepchecking goes totally astray, because you're sold this bill of goods. You understand? Well, similarly, I suppose you could get a bill of goods sold to you by middle rudiments. Pc starts riding a hobby horse on the subject of middle rudiments, but never correct a middle rudiment unless it's out. And always tell the pc what you find out. And always tell the pc what is now in. Say, "That doesn't read." Or, in asking a package question, you say, "That Fail to Reveal reads. What is that? I'll ask the question again. Is there anything you failed to reveal in this session? Ah, that's fine. Good, good – check it on the meter." Keep him informed. And never put anything in that doesn't register that it's out. That is a hell of a thing to do to the pc. And if you can't get something *in* and it's still *reacting* and you're going to *leave it*, tell the pc you're going to leave it and it is still reacting. Be honest, see. And you know, there's very little consequence of doing that in most cases.

There's less consequence in doing that than spending the next five sessions trying to clean up something you haven't got a grip on anyhow. A middle rudiment – you must never make a profession out of one middle rudiment. Don't start a whole Prepcheck on Fail to Reveal in the middle of a Routine 3 or a Prepcheck, see. Don't keep asking it and asking it and asking it, you'll get tired of asking the thing. Pc hasn't leveled with you, it's still reacting. If you're going to leave it, tell him so. "This is still reacting, however at this time I'm going to leave that and see if it won't develop, and come clear later, thank you very much." See, be honest about it. You don't necessarily have to cancel every rudiment that comes up and hits you in the face. You better had, but if you leave them, tell the pc you have done so. And never correct one that is not out.

You check, "Do you have a present time problem?" That's clean. Now don't ask the pc, "Well, how's this problem about your mother seem to you now?" *Clang!* It's going to read again. So you say, "You see, he was being audited with a present time problem." No, "he wasn't. A rudiment's just something you dust off lightly and get on with the business. And that applies to middle ruds and it applies to every other kind of rudiments. You don't make – don't make a whole session out of a rudiment or you get the pc rudiment-broke. And he'll be very upset. Okay?"

All right, well that's middle rudiments. Use them all you want to, get familiar with them and I think you'll have good luck with them.

Thank you very much.

Good night.

HOW TO DO A GOALS ASSESS- MENT

A lecture given on 12 June 1962

What is the date?

Audience: Twelfth.

Twelve June, AD 12. Saint Hill Special Briefing Course, lecture 1.

All right. Yeah, you're very fortunate to hear this lecture tonight for several reasons. There's (1) I'm very busy writing the basic text on these things now and (2) is, why, I feel lazy. But you need the material, so nothing is too great a sacrifice. [laughter] I will go on and give it to you.

But it's very, very fortunate for you to hear this lecture because I am – got a plateau and every once in a while, why, some piece of Scientology can be wrapped up and you say that's that. You've seen several such pieces wrapped up. You have Havingness, Prepchecking – these things are all wrapped up. Model Session is in its final version. I'm writing it now. It mostly consists of corrections that have already been published, but the material is simply being released in one concise bulletin, and of course, "In this session" precedes everything, you see, rather than ends it.

I am satisfied now that Model Session used with middle rudiments, and so on, is a very close to perfect auditing form from the viewpoint of a pc. That is, nothing goes wrong that doesn't get handled, providing the auditor does it and can read a meter.

We've got the meter pretty well wrapped up. I knew there was a bug in the meter on account of people weren't being successful here and there, so there must have been a meter bug. And sure enough there was. They didn't know that an instant read came after the thing – after the line was uttered. The instant read never occurs before the last consonant – I like to get in plugs about instant reads because some people have to be told it a lot of times. It's after the last consonant in the sentence or, if a vowel comes last, after the last vowel. [laughter]

I just had a couple of old-time auditors make a mistake on this – I mean a couple of very expert auditors make a mistake on this. They were checking out a goal that didn't check out on me. I didn't think it – it didn't look right. It didn't sound right. Didn't have enough track with it. Didn't sound like my goal so I got a subjective reality on it. It was "To conquer Earth." No difficulty with conquering Earth. Had it conquered for thousands of years. But couldn't be a goal. They were reading it "To conquer." See? "To conquer," instant read. And you look that over, "To conquer Earth," see, and an auditor can say, "To conquer Earth," and watching his needle, the "Earth" and the needle can coincidentally act, you see? So because

you can say "Earth" so fast, of course, it must have been an instant read for "To conquer Earth," except the needle was moving while he was saying "Earth."

For an instant read to have occurred and for that to have been a valid read, the instant read would have had to have begun at "h" of "Earth," not at "E" of "Earth," see. And that is how cotton-picking precise you've got to be in reading an E-Meter, see. Now that was a wrong goal. Couldn't have been wronger. And the word "conquer" had a little charge on it. But apparently what made it hang as a goal was that it was the wrong goal. That's simple. You know, pc's disagreement and all of this sort of thing and the pc invalidating and everything and it messed up into a wrong read. But that's a fascinating one, isn't it, that the needle starts moving with the "E" of the last word and we get an entirely wrong goal.

Now, a right goal is terribly important. And if you can read a meter, it – reading a meter is a very precise action. It's not a sloppy action. And if you can read a meter and if you can prepcheck and keep rudiments in and if the pc has been properly prepchecked and brought up to a point where he can be audited, you can do a Goals Assessment, providing you do all these other things. But this is the touchiest action in Scientology, bar none.

And the name of this lecture tonight is "How to Do a Goals Assessment." I've talked about the final version of Model Session. Well, this is, as far as I'm concerned, a final version of how to do a Goals Assessment.

I'm studying this thing for quite a long time, trying to find out what people were doing wrong. After this, if you do something wrong with it, I'm not going to learn a thing from it, so you might as well do it right. It'd just be a wasted wrongness. I won't pay any attention to it at all. I'll just tell the Instructor, "Make them do it right." You know. *Baah*.

Now, the method of doing a Goals Assessment – quite precise. You probably could do something else than how I'm telling you this and possibly get the right goal. And on some pcs could do it easier than this. You understand? But at no time would I be comfortable that you had gotten the right goal.

And getting a wrong goal is so appalling, listing a wrong goal is such a wrongness, that you'll wish to God you'd never begun it by the time you wind up on it because you're going to throw the pc into fits.

Now, if a psychologist or psychiatrist, God forbid, ever started fooling around with Routine 3 in the University of Illinois where they copy Scientology and release it to United Press – alter-ised – Dr. Hungt there reads our books and releases them to United Press quite often. He's now decided – don't think he's very bright, man – he's now decided that children's intelligence could be raised. And all these years afterwards, he has now learned out of all the burden of Scientology he has read that intelligence can change. I think that's a masterpiece. What intellect! Makes him one of the brightest psychologists in the world. He was able to misduplicate and come out with some sort of a minor fact.

But if a psychologist or psychiatrist ever started fooling around with Routine 3 at the University of Chicago, pulled another gag of trying to take Book One and read it for ten minutes and then audit some people and then find out they didn't go Clear that afternoon, you know – that's the way they tested it – now don't, don't underestimate what I'm saying: they

could probably kill or make insane a patient. Let's not underestimate Routine 3. It'd take as much wrongness as those jerks would be capable of to do this. A mere Book Auditor couldn't do it, see. That's right. He couldn't make that many professional mistakes. You know, Evaluate, evaluate, evaluate, evaluate. "Oh, that isn't right. No, I don't think you could there. You sure your mother doesn't have a different goal than that? Are you sure that doesn't trace back to a childhood deformity?" You can hear them now, you know.

A fellow says, "Well, I wanted to play a harmonica."

"That's an oral action. Are you sure you don't have some homosexual goals?" Then they choose one of their own choosing, don't you see. And then they would list it wrong, and then they would ARC break the whole list, you see. And if you did that to that clownish degree that only such characters would be capable of – I'm not just being sarcastic. Only they are capable of it. Ordinary citizen wouldn't be able to figure out this many twists – they could either kill or drive insane a person. So you're not fooling with something with Routine 3 – any of the Routine 3 processes.

You list a wrong goal and you've had it. That is to say, the pc isn't going to die or go insane, but – on your hands – but he's liable to get awful sick. And he's liable to get dizzy. He's liable to feel quite spinny. Listing a wrong goal is not just agin the doctrine of Scientology, but it's agin the mechanics of the pc's bank.

I'm not going to attempt in this lecture to give you a full parade of why Routine 3GA works and why you have to have a goal, beyond saying that the goal is the prime postulate. It is the prime intention. It is a basic purpose for any cycle of lives the pc has lived, see. And reference is *History of Man*, cycles of lives.

Now, you get a cycle GPM and then a whole track GPM or a track GPM, you see. You could get a cycle GPM. Now, actually, the smallest cycle that you will see a goal and a prime postulate operating in, is you ask the pc, "What was the most severe operation you've had in your life?" and he says so-and-so. You just ask him for an engram, see. And you say, "All right. What goal did you have immediately before the engram?" And he will give you his goal just before the engram and then – if you did it very lightly – because otherwise it's liable to restimulate the bank because, of course, it's not a basic goal – you could actually disintegrate, probably, the engram itself just by getting the four-flows mechanics against that goal. See? That is your tiniest Routine 3, see?

A guy has an engram. He was in an automobile accident. "What was your – what was your postulate? What were your – what was your goal, idea..." and so forth. Immediately at the beginning of that accident, that will be the goal for that period of time. And any way the goal is not executed will be an alter-isness which creates a solidity, and that *is* the mechanics of an engram. That is how an engram suspends in space. It is the alter-ised prime postulate. And any alter-isness of that goal, you could call it, brings about a suspension of mass. The only way you get mass is by alter-isness.

Now, there it applies to an engram. I don't – I don't invite you to take engrams apart that way, because you're going to miss here and there. You'd have to do a little Goals Assessment at the beginning of the engram, don't you see, and work it out. Possibly you'd get away with it, but it might be so far – he might have been so far out of valence at the time the

thing occurred, and it might have been such an automaticity of circuitry, that you might have a goal which, if it were the wrong goal... See, you might not be able to reach his actual postulate, and if you listed for that little engram – the wrong goal – if you listed the wrong one, you would get a further solidification of the engram.

Now, you can do this with a life. All right. Just before you picked up that body, you had a goal. Just before, see? Bang. You had a goal. Now, that goal may have been carried out to some degree through the life or it may not have been. But to every single point that the goal was not executed, the person was doing something else during that lifetime. And in doing something else during that lifetime, mass was created in the mind, in the bank. So the lifetime finally winds up to be the accumulation of that mass which takes on a spherical shape with a hole in the middle of it, and that is your basic item on the track. That is a basic item on the track.

In other words, it begins with a goal for that lifetime. Now, I don't say that you again could do this for one lifetime – easily. You'd have to make a little goals list for the goals just before assumption in this lifetime. And you'd have to make a little list and do an assessment and that sort of thing. And you might come up with something. You might run out this lifetime; you might not. But this lifetime may be in opposition – the whole lifetime and that goal – might be in opposition to the basic cycle goal the fellow was running on, at which moment you would just get a beefing up, a growing of the mass. All auditing then adds to the mass of the bank. The net result of auditing is to make the bank beefier. Now, this is the basis of the Step 6 phenomena.

The Step 6 phenomena never occurred because of creativeness. It only apparently occurred because of creatingness. When what you are asking the pc to do was at great variance with the basic goal of the pc, you've got an increase of mass in the bank by reason of mocking things up. That's why it didn't happen with everybody.

Well, let's give you a gross and improbable example: Supposing the basic purpose of the individual was "not to be audited," and you were auditing the person, you would then get an increase of the bank. You get the idea? All of this is that – is that idiotically simple. The mass which is contained in the bank depends upon the amount of alter-iveness of the basic purpose of the person.

Now, there is a basic purpose, as I've shown you, for each engram. It's always before. Just like the instant read is always all the way afterwards, so the basic purpose is always all the way before – *all* the way before. It doesn't occur five minutes after the accident begins. It occurs before the accident occurs. It'll be there. The guy decides to have an accident or something like that. Usual. It's hard to find. So it occurs before the engram. It occurs before the lifetime. And it occurs – a basic purpose occurs before a *cycle* of lifetimes. A cycle is a similar or related series of doingnesses.

You know. It all happened in Arcturus. A guy is sixty thousand years in the vicinity of Arcturus, see. Well, that's a cycle. Then he decides to hell with Arcturus. Can't stand it anymore. He's got so many overts on it, he exteriorizes and lives for the next hundred thousand years in the area of Venus. Well, that's a new cycle, see.

So you get a cycle of lives. They don't necessarily depend on ... The definition of cycle is imprecise. It is simply similar areas and doingsnesses. Even though in Babylon he might have been a priest, he might have been a temple dancer, he may have been mayor of the town, he may have been captain of the guard, he may have been the sewer emptier, see? Because it's surrounded... And he might even have been out on the frontier or something in one lifetime, see. All kinds of different lifetimes, but somewhat united loosely by area or purpose. Loosely united. And you call that *loosely* a cycle.

But it is a sufficient change and departure from the last cycle to make its basic purpose stand independent. And this is very important to you in doing Routine 3. Because you want the basic purpose which stood before the earliest cycle you can get hold of that will register on the E-Meter. That is what you are looking for. Now, we call them goals, and they're much better expressed technically as a basic purpose.

We are looking, actually, for the beginning-of-cycle basic purposes. Now, we don't have to guide the pc in his understanding of this because you will get one basic purpose ticking – is all you're going to get anyway. Why only one? Because there is only one idea that is in disagreement with all other ideas in that mass. And that is the pc's basic purpose. And by definition it's in disagreement with all other activities, masses, items and ideas in that whole cycle GPM. It is the odd man out, man. And it can't help but register.

Now, if you audit it, it is responsible for all the subsequent alter-ness which caused all the other masses. And you're all right because every time you list another item, you have less mass in the bank. Not because the item does anything – but because by directing the pc's attention – and the basic purpose then falls out as the thrust behind the item. You're auditing the basic purpose out and the alter-nesses are what hold it in. You're not auditing out items.

Now, where does all this go in Routine 3? What happens to all these GPMs and counterbalances and items and masses and ridges and God-help-us's? What happens to them all?

If audited properly, they go *whooooo*, and they are no more, with Routine 3GA. They don't go back on the track. They don't go two miles out to the left – as they did with Routine 3. They go *whooooo* because there's nothing can support them. And you can take off maybe the last three cycle GPMs off the whole GPM, the track GPM, see. The track GPM is composed of all these cycle GPMs and sometimes they have stood separate for a very long time, and then the fellow led a very forceful cycle of lives and got them all condensed in on each other. Now, he's got *the* GPM, cycle after cycle after cycle after cycle. Oddly enough a basic purpose can stand independent at the beginning of a cycle sufficient to be listed because it disenturbulates all the things which came after. But it has to be the only one, the only idea. It has to be the right idea.

Now, supposing you list some other goal. Remember, every lifetime had a goal. I've just shown you every engram has a goal at the beginning of it. How many goals do you think this pc might possibly have in just one cycle GPM twenty thousand years long? Ghastly to think of. They aren't principal ones, but if you listed them all, they'd probably amount to thousands. Actually, he covers the bulk of them in under a thousand. You'll get – all you're trying to do is get your crack at the basic purpose just before the cycle – this whole cycle of lives.

Now, if we list one of these other goals that occurs, it is in opposition to the basic goal of that cycle. And every item we list will increase the mass of that GPM. You maybe can get away with it for a hundred items on each of the four lists. Your next hundred items, your pc will start going a little bit dizzy occasionally, and if you persisted in your error, the pc would all of a sudden be sick in his stomach and the dizziness would be very acute and the pc couldn't walk in a straight line and the pains in the pc's stomach would be agonizing

And if we went another hundred, persisting along this line, and so forth, why, the pc would probably be so wogged up, that it'd take him weeks to disenturbulate. You could certainly audit him into oddball psychosomatics he'd never heard of before. You see how it'd be done? You haven't got the thing that's being alter-ised. You've got something else that's increasing the alter-issness.

The basic purpose ... I'll give you an idea. The person had a goal to eat ice cream cones. Let's be ridiculous. Had a goal to eat ice cream cones and everybody came along and said you have to eat beef. And every time he said, "I want to eat an ice cream cone," somebody else said you had to eat beef – he'd develop a little more mass and ridges in his mind because he's doing something else. He can't as-is what's happening, you see, because he's supposed to be eating ice cream cones and he's now having to fight these people that want him to eat beef.

All right. So eventually he surrenders and becomes a beefeater. So he goes along eating beef and about this time he'll have trouble with his stomach. This we're for sure. So he decides at that time to be a doctor. Now, he finds out that he can't be a doctor because he has to have a license. See? As lifetimes roll along, there it goes. But his basic purpose was to eat ice cream cones. So now you've got the continuous alter-issness of eating ice cream cones by eating beef. And then you've got the continuous alter-issness of being a doctor which increases the mass. The more he's a doctor, the more he increases the mass of eating beef, the more he increases the mass generating around eating ice cream cones. You see? See how serious this gets.

All right, let's remove it a thousand activities up the track. At the thousandth activity, activity one thousand will, in devious zigzags, increase the mass of every other activity back down to the basic purpose or multiplies it by a thousand times. This becomes utterly intolerable, so one day he's flying a spaceship along, and he says, "There's a nice juicy sun." He gets up out of his – out of his pilot's chair and accidentally stumbles over the automatic control, jamming it irrevocably. Well, that's one way of getting rid of a GPM that is not very satisfactory. Now, but he thinks he's all over this now, and he's left it all back there on Sun 12 and so forth, and he's exteriorized and he's now being a nymph in the court at Venus. And that is entirely different. And his basic purpose is to raise hell with this place, and he can go off on another thousand lives before it catches up with him. You see that?

However, his cycles tend to get shorter, as you can see why. It gets too grim to live. The mass is too great to stand. Because it's painful. Living is painful. That's all there is to it. This is the source of pain. These accumulative masses. There are only these masses and free track in the reactive mind, that is all. And the free track, so called, is only in its mass state because it's impinged on the masses that are already there. So that is the composition of the

reactive mind. There isn't anything else in the reactive mind except an alter-isness of basic purpose.

But you understand that you've got a basic purpose at the beginning of each cycle. This is theory. The rest is absolute fact, but this is theory. At the beginning of each cycle there is a basic purpose and the fellow takes off along that line. And, that we look back, we get several cycles. Twenty, thirty different cycles, and if we could get the one right at the beginning, it would disenturbulate the whole track from there to there. Actually, you'd only have to ... If you could get the basic one and it would register on the meter, which is to say be entirely real in its location and area to the pc, you would have to list four items, and there'd be a bright flash where the pc was sitting and there wouldn't be anything left of him but a smile. [laughter]

Now, this is the touching faith of everybody in Scientology. They know there is a single button. Well, that's the single button. Difficulty with the single button is it isn't real to the pc. Won't even register. So what you're looking for is the first goal that you can reach which will stay active, that can be listed. And by listing it, you, of course, are going to run out the *subsequent* track to that goal. Subsequent track. You aren't going to get any track earlier than that. So when you got that goal flat, you're going to get the next goal that you can reach. And that will stay in. And then you can list that one and so forth. And eventually you'll get back to goal one that'll disenturbulate all the rest of it anyhow.

Well, the weird part of it is, is that one of those cycle goals, one that precedes the cycle, will list. That's what's peculiar. You're just lucky, but they will. Before I released 3GA with any velocity and so forth and wrote it up in proper bulletins and put it in the book and all this sort of thing, I wanted to be absolutely sure that I had my fingers exactly on it, and I didn't know why it worked. I didn't know exactly why it worked. So I went ahead and had to work out the rest of it. I had a lazy weekend. All I did was write a few bulletins and work that out.

Well, anyhow, the basis of a Goals Assessment then, is the discovery of – and you never mention to the pc that you want an earlier goal because these goals are all persistent and he takes them as this life or something like that – we never have to urge him, but we want the earliest goal that we can get that will register. It's got to be a prime postulate.

Now, oddly enough, the test for prime postulate is simply under the rules of assessment. You do proper assessment and a proper checkout, and if the goal stays in, then it's a prime postulate. It's the basic purpose at the beginning of some cycle. So it's safe to list. That is all you have to know. It'll drop with a single tick. If it drops with a double tick, it's just a missed withhold. It isn't a goal.

But if you follow the mechanics of assessment, you will wind up with this rather easily. Now, the mechanics of assessment follow. The Routine 3 auditor – not the Prepcheck auditor – the one who is going to do the goals listing and so on, no matter if the pc ... Pcs very often list goals on their own and bring them into session, so we're perfectly all right.

But the first time the auditor has his paws on this pc as a Routine 3 activity, whether the pc has already listed some goals or not, we care not, we want to make sure that that auditor does a Prepcheck based on the middle rudiments. That is the first action undertaken in a

Goals Assessment. And every fifth session thereafter, a Prepcheck of the middle rudiments will occur.

You understand, you use your middle rudiments continuously just as middle rudiments, but now we're talking about a *Prepcheck* of them. And that is just a highly stylized activity. You start your session in Model Session and you use as Zero Questions the following: "On goals have you ever suggested anything?"

Ditto, had anything suggested. Ditto, suppress. Ditto, had suppressed. Ditto, invalidated. Ditto, had anything invalidated. Ditto, failed to reveal anything. Ditto, been careful of anything Ditto, told any half-truth. Ditto, told any untruth. Ditto, influenced an E-Meter. Ditto, tried not to influence an E-Meter.

I don't know why you're writing them in your notebook. It's just the – with one single addition – it's the middle ruds and the beginning of the end ruds. And that single addition is suggested because we have had auditors around who suggested things to the pc. You can get a goal stuck in by suggesting the goal to the pc and it will then consistently register thereafter. Or the auditor has suggested the goal be worded a little differently and that will stick the goal, too. And you will get a read on it and it won't be the read of the goal. Do you understand that?

So you prepcheck those Zero Questions which are just your middle rudiments and the first two, three questions of the end rudiments, see? Use each one as a Zero and you just check them out and if the thing is getting a *bang-bang-bang* reaction, you just prepcheck it back. You form a What and get it back to the original and run it up, just like you do Prepchecking.

You must also prepcheck the same endings with, "On listing – ," and you must do the same Prepcheck with the listing "On items – ," ditto, see. It gives you quite a long list. You'd be amazed. And then on the word "goal." And you might as also take the word "listing," and you just prepcheck it as a single word. Your Zero in that case is "goal" or "goals" or "lists" or "listing." And if you get a knock on the E-Meter, you track it down. You want these words to be clean.

You see, that's very simple, and it's on goals, on listing, your middle ruds, beginning of your end ruds. Each one of these things makes a very embracive Zero Question. That's the formula of how you work that out. It took me fifty-one minutes. I checked this out to see how well and facilely it worked the other evening just before I released the information, and it took me fifty-one minutes to get rid of the lot – on the first time it was done on this pc. And it was clean as a wolf's tooth.

So it doesn't necessarily take a session. So you've got the other part of the session. Let's say you've done – this is your fifth session on goals on the pc, so therefore you're going to have to do a Prepcheck. Maybe the first hour would be occupied with the Prepcheck and then you'd close it out and start up your session again and your second hour would be occupied with a Goals Assessment. You understand?

It isn't necessarily true that you would have to occupy the whole of a two-hour session or a five-and-a-half-hour session or something like that. It's just in the fifth session, each fifth session you're going to do this Prepcheck. And that keeps you from working the middle rudi-

ments to death all the time. See, that lets you pick up chain reaction on these things, because your middle ruds are always being asked, "In this session – ," you see. And it can get a little bit frantic after a few hours, so it's a good thing to go back and do ... Well, let's pick up the whole chain and it probably goes back to childhood with some interference with lists, you know. I mean, that's right. That's right.

We found a teacher that was – knew how to teach. She told each one of her pupils to go over to the library and list all the trees there were, all the animals there were, all the birds there were. The little kids didn't have any time to play. They were just over there opening up books. They didn't know anything about the trees or the flowers, the plants or anything. They were just writing down arborvorous, arborvicons. You know, trying to spell it – hour after hour after hour.

This was listing, so of course this pc was having a little bit of trouble listing. And then I... You always find grocery lists and things like that all stacked up on the track, too. Or the people wouldn't give you a list. They sent you to the store, said get some strawberries, cheese, kerosene, half a dozen limes, six eggs and some ham. That is the missingness of a list. You go down the street saying, "Half a dozen kerosenes ..." [laughter]

That's the kind of thing you want off here. You want it – and you won't get them off, of course, just asking middle ruds, because your middle ruds have no track. They have just the session. They don't even have the track of the auditing sessions you've been running. They only have the track of this session. So that's your middle rud. Now, the reason you get that out is that you won't have any – anything much getting in your road and your needle going wild on that sort of thing.

Now, of course, in checking out one, you do this Prepcheck before you check out the goal. I don't care if you just did it last session. You found the goal now and you got it there. Well, let's do a Prepcheck and then let's check out the goal.

Now, one of the reasons you keep doing this and you keep prepchecking these middle rud Zeros is because the pc keeps changing under a Goals Assessment. Not as much as under listing, but they change. New incidents come up, new ideas, that sort of thing.

All right. Your first action then of a Goals Assessment is to prepcheck the middle ruds as Zeros. Your next action is to start listing, in Model Session, keeping your rudiments in with your sensitivity set for a one-dial drop, with some kind of an eye on the tone arm so that you can whiz along and you all of a sudden see that the needle's motionless, the tone arm's motionless, and there's nothing much happening, and well, your rudiments are out.

Now, I don't particularly tell you that you should read anything extraordinary, marvelous or wonderful from your meter while you are listing. Tone arm action is relatively unimportant and so forth. But you need that meter there tuned up and in function because you will get accustomed to taking some information from the meter even as you list.

Now, the second that you get the pc slowed down, doped off or a bit out of session, having a hard time listing goals, having a hard time thinking of more goals, you get in the middle rudiments. And of course your middle rudiments contain just suppressed, invalidated, failed to reveal and been careful of.

There is an additional middle rudiment that might apply to specialized pcs and you might like to use it. And the pc is actually suppressing suggestions and sometimes the pc doesn't rate it under the head of suppression. And it comes under "failed to suggest." "Did you fail to suggest something." The pc's sitting there madly out of session because they wanted to suggest that you do something, but they know that they're not supposed to and that you won't take it up anyhow, and all kinds of complications and so on. If you run into that kind of a situation, why, you can run "failed to suggest" into your middle rudiments. I'm not necessarily leaving it in there because I found out that it quite often comes up under the heading of suppressions. And you'll get a reaction on the thing if it's seriously out.

The middle ruds are never intended to be clean from a standpoint of the whole track. Rudiments are never intended to be clean from the standpoint of the whole track. Nothing is lasting about rudiments, you understand? Even when you prepcheck rudiments, don't expect it to be lasting. So just because you've gotten the rudiments in on listing five minutes before is no reason they're not now out.

Now, one of the things that you're sloppiest about is getting in – getting the rudiments in without knocking the pc out of session. You've got to get in, get your rudiments out – get in, get your rudiments in and then get back into session rapidly so that you don't make this thing a lifetime profession with tremendous weight on it so they're way out of session worrying about their rudiments. They're way, way out of session worrying about their rudiments when they should be thinking about their goals. You understand?

Giving middle rudiments the wrong weight, getting things very, very upset is one of the worst crimes that you can do under listing. Your rudiments can be used to throw the pc out of session as easily as to throw them in. But expert use of the rudiments and a refusal to Q-and-A with the pc, getting in, getting them in, getting them out again, leaving them clean every time, and so forth, is marvelous assistance on listing.

Now, your main idea in listing is to get something on the order of 850 goals listed before you do another thing. Eight hundred and fifty listed before you do another thing. Why? Very well the goal may be in the first 150 and most often is, but insufficient charge is off of the bank for you to isolate that goal easily. Insufficient charge.

The goals are so heavily charged up that you are not going to be able to separate one goal from another. You're going to come off with the goals remaining in very hard, going over it with many nullings, worrying, worrying, worrying, worrying, worrying, and it worries an auditor silly. You're not going to do 850 because the goal is not on the list until you've written the 850th goal, see. You're going to do it to discharge the goals list of charge, so that you can then find the goal.

You will very often find that it – the goal did appear in the first 150 goals listed. But don't worry the pc about this because the pc doesn't know it anyhow. The one thing the pc doesn't know is his own goal.

The pc who comes up and tells you that this is his goal and that is that and who tries to do a big sales talk even, you know, one pc out of five will monkey the meter. Did you know that? Oh, it's that prevalent. You know, shift the eyeball with the havingness down, you know. Start to sell the auditor the goal. Sometimes they sell it to the degree of lifting a little finger

off of the can. Fact. They want to have that goal. They know what goal they should have. They know better than the auditor or the E-Meter, and they get a wrong goal every time they do it.

Well, the goal is what the goal is. Not what the pc wants it to be and not what the auditor hopes it will be. The auditor can interject his hope on the thing to such a degree that he'll weight the session. And by suggestion, get the goal to continue to tick. And then if his middle ruds are badly cleaned up – see, the middle ruds'll get the tick off if it's ticking because of any other reason than it's the goal; don't worry about that. This goal can actually sit there and tick and respond every single time because the auditor suggested it to the pc.

So you come along and you find some pc who has – some auditor, and he had the goal "To shoot pigeons." And you'll find out that he tends to find on the pc the goal "To shoot woodcocks." That is very fascinating. How does he make it? He weights it. He actually can *suggest* to the pc one way or the other. It has to be quite overt. It's not esoteric at all. "Well, heh! Let's – let's – let's go in for this goal now. This – this – this one. Ha! This goal here. Ha! Ya! Ha! Yeah, we haven't been getting much excitement here. I'm glad we're to this goal now because I want to really check *this one out*: 'To – ' now, are you listening, huh?"

We've been running along at this rate, see, "To catch catfish, to run over poodles," so forth, you see. We get all of a sudden this burst of enthusiasm, you see. And then we get: "All right. *To shoot woodcocks.*" [laughter] For some reason or other the goal will continue to read. [laughter] Why? Well, it's just weighted to such a degree that it's gone over the border-line to a suggestion.

The auditor then, by being *sure* of what the pc's goal is, can actually weight the goal for the pc. And have done it. I've seen some of them checked out. Five goals found by one auditor. They were all alike on five different pcs. Quite similar. [laughter] It isn't anybody present.

I got a hurry-up despatch not so long ago that – auditor told me they finally found this pc's goal. They knew that everybody else had it wrong. Isn't it interesting there was only one word difference between the pc's goal and that auditor's goal. Well, I assure you of something – they're never that close together. Man in his infinite variety doesn't have standard goals because in the first place you're picking up beginning of cycle goals, and God knows what they'll be. What infinite variety occur in these things. And they're with their own wording and they're on their own subjects and so forth.

There is on the eighth dynamic a little more coincidence of goals than on any other dynamic. You'll find that God will come in more often. You know, if you've got – in any hundred cases you'll probably find all of them are different except maybe five, six, eight, something like this, will all have a goal that has something to do with gods or God, or something. It's the most incidence, and that's because there's the least subject matter in this civilization at this time on the subject of the eighth dynamic. We're still using Akhenaton's invisible big-thetan theory. And there's one God, don't you see? And you can't see him and it's only peculiar to this time and place, see. If you were doing this in pagan Rome, you wouldn't get that much coincidence. It's just for the lack of objects on the eighth dynamic. There is – some-

body's stuck on the eighth dynamic, you see, they tend to get the same object person after person.

All right. Your first action is the Prepcheck. Your next action is the listing. When the slowdown occurs on the listing, you get your middle rudiments in without making the case go z-z-z-z-z. You get them in smoothly, quickly and get out of there with no Q and A. No heavy weight. Get back on to your listing and go 850 before you null anything. I don't care if you go 1,000, but just don't stop south of 850. Much easier on the pc in the long run.

Now, it's true that very often you would be able to get away with it at 500. See? But you'd be getting away with something at 500 and you might wind up in a ball. The pc hasn't listed enough goals to get enough charge off the goals that you get easy nulling so you waste *all* of the time on nulling that you thought you saved on goals listing. And you even waste more time. In addition to that, if the goal isn't yet distinct, if charge enough isn't off of the case, then you're going to get this oddity. You're going to list the 500 and not have a goal for the pc. So you're going to list another hundred and not have a goal for the pc. And then you're going to list another hundred and not have a goal for the pc. Three loses in a row. Now, how do you think you're going to keep the middle rudiments in easily, huh? All right. Let's give him 4, 5, 6, you see, because now his rudiments are so far out that you can now start missing it. In other words, you're making it difficult. This is a difficult Goals Assessment to go by fits and starts. Some of you've got reality on that.

So just start right on out and list 850 and when you've got 850 or thereabouts, why, then bleed your meter down. "Are there any more goals?" "What about goals?" something like this. And "Are there any goals that should be on this list?" You get a reaction. Well, get some more.

Now, do a Prepcheck. Remember that you can get a reaction because the pc is ARC broke. You kept asking him for more goals and he didn't have more goals. And you didn't have your – you know and the pc couldn't tell you this. So the fact that there aren't no more come – becomes a missed withhold with the pc and you get fantastic needle reaction on goals, on asking for more goals, when in actual fact the pc is simply ARC broken. The thing you want to do is ask the pc if he has an ARC break and if you get a reaction, clean it up and then ask if he has any more goals, and you'll find out he doesn't have.

All that comes under the heading of simply keeping your rudiments in.

All right. In other words, you bleed down the situation. You bleed down the meter on the list. You try to get all the goals that the meter is calling for. Now, you start in at the top and you null and this is the way in which you null. You null, of course, with your rudiments in and you should be getting needle reaction on goals as you null. If you're getting no needle reaction of any kind, your pc is out of session. Your rudiments are out.

But if you're getting the occasional tick and tock as you go along, your rudiments aren't out. So it's at... If you suddenly notice that you're not getting any ticks or tocks or anything of the sort as you go along, well, your rudiments are out and you better get your rudiments in in a hurry. You see what makes it ... Actually you can tell if the rudiments are out by whether or not the goals you read one after the other are each one reading because they'll all

read to some degree. They got some action on the needle. You can tell a live needle and a dead one.

All right. Now, this is the way you call a goal out. You read the goal three times. You "okay" the pc after every time you read it. "To catch catfish. Thank you. To catch catfish. Thank you. To catch catfish. Thank you. That's out."

There is your most favorable patter. The pc hasn't said a word now, you know. The pc is just sitting there in a glorious state of irresponsibility about this.

Now, if the goal is null on the last two reads, you take it out. And if either one of the last two reads are live, you leave it in. The symbol to take it out is an X. The symbol to leave it in is a slant. You put an additional slant or an X every time you read a goal. In other words, it's cumulative. If you've read this goal five times, you will have five slants after it. If you read it five times, and then on the sixth read it went out, it'll be five slants and one X.

All right. Now, "To catch catfish. Thank you. To catch catfish. Thank you. To catch catfish. Thank you. That is out."

Now, that first nulling, the whole nulling of the whole list is done at a one-dial drop on the cans, please. One-dial drop.

When you put your rudiments in, you have to get over there and shift your sensitivity up to 16, of course. Rudiments are always put in at 16. And then they're cut back to the one-dial drop setting before you go on nulling. And don't make a mistake on that because you make a fool out of yourself. All of a sudden, everything is in. Everything is in, you see. And you don't want that.

All right. If the last two reads of that three, either one of the last two read, you leave it in. But if the last two are null, you take it out. That is at a one-dial drop. And that is how you call them in or out. Relatively simple.

All right. Now, you go over this list. If you've listed 850, by the way, you may only find one goal per column staying in. Very slight. But you'll be getting – that first one will tick. You'll see some reaction on the first one and then no action on the next two on almost every goal. There are very few of those goals will be completely flat on the first mention.

All right. Now, having read this list through to a point where you have 30 or 40 in, I don't know how many times you'll have to go over it to only have 30 or 40 in, maybe over the whole list twice, something like that. But you've got 30 or 40 left in. You reduce the list to that many left in.

Copy those goals onto a separate sheet of paper. Mark it a copied list. Be very careful that your middle rudiments are very beautifully in and crank your sensitivity up to 16 and don't leave one of those goals with any charge on it at all. There must be no charge on any part of that final list at sensitivity 16, when you finally announce "I have the goal."

In other words, the fifth one down from the top on that final list: that's got charge on it and the eighth one's got a little tick on it and the tenth one's got a tick on it and the twelfth one is reading like mad and you say, "All right. That twelfth one is it." No, that twelfth one isn't it

because you have not checked it out. You couldn't have checked it out because there are two or three other goals on that list that had ticks left in them.

So after you have gotten it all ground down to a fine powder and there's only one goal on that final list ticking, you say, "All right. This looks like it. We're going to check it out."

And now you do a nice, complete Prepcheck. Polish it all up beautifully, do a nice, complete Prepcheck. Get the pc's havingness in good shape. Shouldn't take you long to do either one of those things. Roll up your sleeves and read that goal against every other goal on the 30 to 40 list. Something like playing a game with a knife whereby you – you've always got to touch this X and touch a number of other X's at the same time and your knife touches the random mark and then it always touches the single X. Your goal is the single X, so you say – let's say the goal was: "To catch catfish." It's "To catch catfish. To shoot opera singers. To catch catfish. To drown pleasantly. To catch catfish. To join the navy. To catch catfish. To commit suicide," see?

And every one of those random ones must be flat and that last centerpin goal must be ticking every time for you to say, "I have a goal on the pc." Then you say, "I have a goal on the pc."

Now, cleaning up this goal with the middle ruds – it is understood that after you've prepchecked all the stuff in general, you're going to have middle ruds running. Well, your middle rudiments will run against this goal. I must mark this. Middle ruds could be run against lists, goals, a goal. "Has the goal 'to catch catfish' been invalidated?" See? Any one of your middle ruds. You ask them all. "Is there anything about the goal 'to catch catfish' that you have failed to reveal?" "What's that? That. That."

The very funny part of it is that your goal can stay in because the middle ruds are out and can be out because the middle ruds are out. You pays your money and you takes your chance. But if the middle ruds are completely flat on that goal and it reads, that is the goal.

Now, it should read every time tick, tick, tick, "To catch catfish. Tick. To catch catfish. Tick. To catch catfish. Tick. To catch cat-" See? But you may have a pc who breathes or something and you'll get a sudden upswing of the needle, which is too fast or too violent for the impulse to check. And your eye does not detect the infinitesimal slowdown of the upward throw. So as the needle is flying around, you say, "To catch catfish. To catch catfish." Those are in, see. "To catch catfish." And that one, there was a ... You said that on a violent upward swing of the needle. The pc would say *hrrrrrr* or something, you know. And a needle has weight and its inertial swing, as it's coming up with great rapidity or going down with great rapidity, can sometimes overcome the motion of a goal. So that would be the exception – the exception. Your needle would have to be moving quite speedily before you would get that exception, and actually if your eye was very sharp, you'd even tick – you'd even detect the tick in the middle of it even that time.

Now, that is a goal. That is a goal listed, found and checked out. There is actually no more to a Goals Assessment than that. And there isn't actually anything else to a Goals Assessment than that. Nothing mysterious about it, because that makes a very easy assessment.

That's carefully plotted to get you around an innumerable complexity of troubles that have existed in the past.

That it appears to be very simple is quite deceptive. Don't think of it as being terribly simple, so therefore it doesn't much matter what we do with it. We can make it a little more complicated, can't we?

For instance, let's ask for the goal in peculiar ways. How do you ask for a goal? Well, you just simply say, "Well, what goal have you had? Have you ever had a goal?" I don't care what. The only categories that you ask for particularly – you could ask for middle rud categories of goals. Goals that you have suppressed, invalidated, failed to reveal or been careful of. Now, there's – you could use your middle ruds to get you more goals. Under failed to reveal, of course, you could get such a subdivisional heading as secret goals, antisocial goals, goals you withheld from other people. So you could make various classifications, but don't go beyond that in terms of classifying goals.

You got your middle ruds and you could discuss those angles, but just ask for goals. Don't ask for a list of goals you shouldn't have had, see. Don't ask for a lot of offbeat type of things because you'll wind up with some other part of the track, see. You'll wind up with oppgoals. And God's sakes, don't get an oppgoal on the list.

Now, put anything on the list the pc wants on the list. Put it on the list as many times as the pc says it, in as many different ways as the pc says it. We don't care if he puts the goal down fifty times, "To catch catfish," and it turns out to be the wrong goal after all. We don't do any guidance on what he can have on the list or not on the list and we never advise him to reword something. We never try to build a goal out of the numerous parts of goals we have seen come in. Nothing tricky. We just write it down and that's the way it is from there on out.

Now, if the pc wants to add goals, we will add goals to the list at any time. We'll always add goals to the list. But if a pc wants to change the goal, we leave the goal in and we put the new wording down. We never eradicate a goal just because the pc wants to change his wording. We just put the new wording down. Get the idea?

When you get the second goal, you follow almost exactly the same procedure except the numerousness of the original list is not required. You don't have to list that many. You've already got 850 you're going to have to null all over again.

Okay. That is how you do a Goals Assessment. Fairly simple, huh? There will be bulletins and other materials out on it, but I have given you this lecture so that you would actually have it well in advance of its publication because you're using this material all the time and therefore need it. Okay?

Thank you.

MORE ON MIDDLE RUDIMENTS

A lecture given on 12 June 1962

All right, this is the second lecture, Saint Hill Special Briefing Course. June 12, AD 12. All right, this is going to concern nothing but middle rudiments which you haven't had very much information on. I'll give you how to do mid rudiments plus a few comments on fish and fumble. It's getting to be one of my favorite activities and you use them in conjunction with middle rudiments. You can.

Now first a remark on Q and A. When you ask a second question or double question the pc, you of course are omitting your TR 2 gorgeously. That's one of the weakest points in the broad body of auditors. TR 2, you wouldn't think so. Two Central Orgs have recently asked me for a new TR 4. It isn't TR 4 that is at fault. It is TR 2. An adequate acknowledgment is worth a very great deal in auditing. Now one of the ways of not acknowledging is to ask again. And that of course is the stinkiest TR 2 there is. "Do you have a present time problem?" "I had a fight with my wife last night." "What about?"

Now, if you get one of those things going you're going to spend the rest of the session, as an auditor did today, cleaning up the PTP. Now, I don't claim that auditor particularly didn't throw the TR 2 in. But certainly there must have been something going on there that didn't have too much to do with the price of oysters in Australia. Something. Otherwise this would have come off. Now frankly the auditor ran, "What part of that problem could you be responsible for," worded like that, not having isolated the problem the pc had. Which of course gave the rest of the session, as an auditing action.

Now, in trying to handle a Q and A, trying not to Q and A, you're liable to pull all sorts of oddball things, like not get the answer to the auditing question. You're liable to use the Q and A, you see. You mustn't Q and A so therefore you don't get the answer to the auditing question. "Do you have a present time problem?" "I feel all right."

Now of course it's not a double question, because the comm lag is the length of time between the auditor's asking of the question and the pc's reply to that exact question. There are fewer fundamentals missing today than you might think and that ...

"Do you have a present time problem?" "I feel fine" is just part of the comm lag. The pc has now begun a comm lag. That isn't an answer to the auditing question. So therefore you have to ask the question again. So you say, "Well, I'll repe-" You can say, "Uh-huh" or something and say, "I'll repeat the auditing question: Do you have a present time problem?" Well, that's not a Q-and-A. But it requires that the auditor hear what the pc said. So frankly TR 2 should include understand and acknowledge.

Now, more auditors go out of ARC with pcs by pretending to understand, I think, than any other single reason.

You say, "Do you have a present time problem?" and the pc says, "*Wah fi fooel.*" And you say, "Thank you." And at that moment a great black miasma settles down over all like Pittsburgh smoke. You know? There it is. You've now got a missed withhold. See? The auditor now has a withhold. He didn't understand what the pc said.

Now if you're so diffident about answering up and talking to your pc you of course can do this often. But if you have – didn't understand what the pc said, then for God's sakes say so. Not, "You mumbled" see, but "I didn't get it." you always put the onus on the auditor. You'll find the pc, after he's been questioned five or six times, answering perhaps with some asperity. But oddly enough he doesn't have an ARC break. He only gets the ARC break when the missed withhold accumulates in the auditor. "Do you have a present time problem?" "*Slaf wof whoove.*" "Oh, thank you!" For what, man? See, there's nothing there. You say, "I didn't get that."

A lot of you don't make old TR 10 function because you don't know what the pc is pointing at. "Point out something, thank you. Point out something, thank you." You know, the pc says, "*Wwhm, hmm.*" You don't know what he's pointing at. So of course you have to salt it down with two-way comm. If you're running such a general process that can't be usually understood, you have to say, "What'd you point at?" He says, "The wall." Well, just because he says it somewhat acidly is no reason he's got an ARC break. It's when he doesn't talk that he has ARC breaks. A pc who's screaming by the way is less ARC broken than a pc who won't talk.

Now, therefore all rudiments questions, not just the middle rud, have to obtain an answer, have to obtain an answer to the question asked. And if the question is answered, the auditor simply understands and acknowledges it. And that is all that happens. It is only when it becomes manifestly, gargantuanly impossible to clean it with single questions, repeated over and over, that you finally resort to a rudiments process.

Now, if a pc gets the auditor's question and answers the auditor's question and the meter is cleaned on that exact question, you'll find out, if your TRs are any good at all, that the number of rudiments processes you need are zero. The rudiments are now that good, if you're really putting it through and checking it on the meter and cleaning it up.

All right. Now, what happens in using a rudiment? You say – I'm using by the way an old rudiment so they won't get in your road here – "Do you have a present time problem?" See? And the pc said, "I have – yes, I have a headache" or something like that. You say, "Thank you. I will check that on the meter. Do you have a present time problem? That still reads. Do you have a present time problem?" The pc isn't talking.

"Oh, yes, I have another, I've got an appointment right after the – right after the session."

"Thank you. I will check that on the meter. Do you have a present time problem? That is clean. Thank you very much."

Now, doesn't matter how many times you go through that evolution, go through it forty times if you have to. It is more effective than a process.

What was peculiar about this auditing mistake today – just to not stress anything – was that frankly the one thing that will clean up on a repetitive request *is* a present time problem.

"Do you have a present time problem?"

"I have a headache."

"Thank you. I will check it on the meter. Still reads. Do you have a present time problem?"

"Uh – see. *Ooooh-oo ah umm*, got an appointment right after the session."

"Thank you. I will check that on the meter. Do you have a present time problem? It still reads."

"Well I – uh – I'm sunburned. Uh – it's a little uncomfortable sitting in the chair."

"All right. Thank you. Thank you. Thank you very much. I will check it on the meter." See. "Do you have a present time problem? That still reads."

"Aaaa-hm."

"Well, do you have a present time problem?"

"Well, yes, I do. Actually I don't feel good being audited – uh – uh – uh – uh, here – it's so nice outside. Now the present time problem is being – ins – yeah, it's being inside when I should be outside."

"All right. Thank you. Thank you very much. I will check that on the meter. Do you *have* a present time problem? Thank you. That is clean."

There is an old process: Tell me a problem you have had or tell me a problem you have. You know. Pc's always different, always different, always different. It's practically running the same process. See?

So, each one of these things actually converts into a direct process. It's just like you're running a direct process so the rudiment in that wise is used as *the* process. So why do you need a process? See, that's the question. Why do you need a process? You've got one.

"Since the last session have you done anything you are withholding?" Clank. "That reads. What was that? What was that you were thinking of? Yeah, that right there."

"Oh, well, I – I – I kissed one of the fellow students last night. I – hmmm."

"All right, thank you. Good. Thank you very much. Since the last session have you done anything that you are withholding?" See? It's an auditing question, isn't it? So you're just checking the answer every time to find out if you should go on running the process, that's all you're doing. And if you look at an anti-Q-and-A activity of getting a rudiment in in this fashion it all of a sudden will make marvelous sense to you. You will be able to make it work. You won't be sitting there in a tremendous impatience to have this run out. All you want to do is have the pc answer it and have the meter not read then. See? That's the only thing. And

every – actually every one of them is an auditing question. So you run the process till the meter doesn't read. On the needle of course. See there?

So there goes your – the – your session gets very smooth. You can understand that an old repetitive process would go something on the basis of, "Are you willing to talk to me about your difficulties? Thank you. Are you willing to talk to me about your difficulties? Thank you. Are you willing to talk to me about your difficulties? Thank you." See. Or whatever it is. And you know that sooner or later the guy is going to run out of steam. He's going to run out of answers. When he runs out of answers, you don't get no further reaction, that's the time you leave it.

So it's sort of auditing something against the needle, not against the tone arm. If you look at it in that wise, why you will become very, very clever at getting your rudiments in.

Now, don't go asking a rudiment *after* a rudiment is clean. "Do you have a present time problem?"

Pc says, "No." You say, "I'll check it on the meter, here." Now look, when you said do you have a present time problem, you got no read at all. What are you doing hanging around waiting for the pc to answer it? You answer for the pc. This doesn't leave an unanswered auditing question. I mean, that's another little trick you can do. You know you can sit back and repeat a phrase out of the pc's bank, you know. You can take a phrase and repeat it and repeat it and repeat it and repeat it and it will eventually go null in the pc's mind. Did you know that?

You know the auditor can do that on his own responsibility. He can also answer for the pc to this degree. He finally says, "Do you have a present time problem? Oh, that's null. Thank you. That's clean. Ha, ha, good. All right." Pc hasn't said a word.

And he says, "Well, I don't have to worry about that."

It's not a trick, it's just a fact. Why hang around waiting for the pc to dig one up? Let's take it while it's clean, man.

Now, this is – this is pure cruelty. "Do you have a present time problem?" No reaction at all on the meter, you see.

Pc says, "God, he's looking at me. It must be that I have a present time problem." So help me Pete he gets the problem of having to find a problem. Now, you ask it again and he's got a problem. So a double question goes about the meter as well as the pc. If you've asked the question and got it clear, get out of there, man. Don't ask it twice. The only time you ask it twice is when you get an equivocal read. Well, we don't have to use this high school word "equivocal" but I normally do. I couldn't tell. You know. Well, there's several ways that you can't tell, as a pc is coming on and being audited at sensitivity 16, you sometimes start your question with the needle on the dial and by the time you have gotten the question out of your mouth the needle is off the dial. And you sometimes have to run against the dodge of really throwing the needle with the tone arm down against the pin starting a long rudiments question and end it as the pc bounces back on the meter and shows that you have no read. Did you know you could do that? You have to be pretty sharp with a meter not to be wiggling it at the time the actual end of the question occurs. That requires very smart thumb action. But you

sometimes have to do it, you get your needle so floppy. That's all in the tools of the trade, however. And there's nothing unusual about that.

But your needle's null, it's null. Don't leave anybody in suspense about it. You've watched me audit there. You ever see any pcs I've been auditing in these demonstrations complain about any of this? No. You've seen me do this in demonstrations.

"Do you have a present time problem?" "That's null. Thank you." We're out of there and away and gone into the next one, see. Now if it's equivocal, "Do you have a present time problem?" And at that moment it's off the pin and you say, "I didn't get that read. I'm going to have to ask it again," see. Jack it around. "Do you have a present time problem? All right. That's null." Merely looks to the pc as though you were being careful, which you are. But don't leave him in suspense. Sometimes on a goal or something like this you can get an equivocal read. You don't know whether it read after the "h" at the end of the sentence, see, "... to conquer Earth." Or whether it read at the "E" or something. You just weren't sharp enough at that moment to tell exactly where that thing read. See, the pc's got some bugs. Pc's doing a think-think about something else and there's an occasional tick-tick here and there occurring on the meter. Well, the tick might have occurred at that point and if it's important at all, you say, "Well it's an equivocal read." You know. And ask it again. Because that's the onus on you. You couldn't read the meter. You didn't read the meter, that's why you're asking again. And that's the only time when you check a clean read.

Don't – it – say, "Do you have a present time problem? That's clean. All right. Now I'm going to make sure. Do you have a present time problem? That's clean." Hell, you've weighted the rudiments now to a point where the pc will stagger under their burden. And the pc's case will stagger. Also, it seems kind of stupid. Can you read a meter or can't you? Is the meter reading or isn't it? See? You're questioning the meter, now. And that's a double question. This is as destructive to the use of rudiments as anything else.

So a rudiment is basically a process. Being a process it of course is run until it doesn't react on the needle. In view of the fact that we're not trying to run it flat on the case, we can only run it flat on the needle. The second it is flat we don't give the pc any chance to cognite or stretch or tell you that it's flat, we tell him it's flat and we get out of there.

That is not evaluative because the pc knew before you did.

He gets a feeling that it's all right.

Now, if you go reverse end to and call one clean that isn't clean, through some misguided expediency on your part, of course you've set up the session for an ARC break from Hell to Halifax.

You always call a meter right. Don't ever call a meter with expediency. If you have a meter that you can't call and you don't know, say so. And if you're going to leave something live without cleaning it, say so. *Be informative*, auditor, be informative. Otherwise your R-factor flies out the window. You have to be informative consistently and continuously. You have to tell the pc this is what is going on. Let's not have the pc sit there in the dark worrying, worrying, worrying, worrying, see. You have to tell the pc what you're going to do and why you're doing it.

All right. The pc is going along the line and he's been – he says, "To catch catfish, to chase waterbucks, to kill tigers, uh – uh – to uh – to catch big catfish, *ummmm* – to catch big catfish – yah." What are you going to do? You going to sit there, wait for a holiday? This is something like painting a wall and leaving half of it unpainted, you know. It is the same thing. You're not going to sit there and let the pc go on and on and on, on auto in the first place. The way for calling for a goal or a list item is you call a stylized question. All right.

"What other goal have you had?" Something like that, see. "Tell me another goal you've had." And he gives you one and, "All right. You got another goal?" (it's rather informal type of question) and he says, "Yes!" He says, "To catch catfish, to drown waterbuck, to shoot tigers, uh – to paint battleships, to go down chutes, to murder little children, *ummm* – uh ..."

What are you going to do at that time? Are you going to sit there and wait? He's already given you about six answers beyond the answer you asked for – which is perfectly all right. Don't say to the pc, "No, now you've given me one. You've given me one. Now, just wait for a moment till I ask the auditing question again, you see." Hell, you'll throw him out, if his interest is put on the auditor and that sort of thing. So he gave you six. All right. And you have a hell of a time writing them down. Well, calmly catch up with writing them and the time you are halfway through the last one that you're writing, why give him the question again. See?

Now, he says, "*Hhh-hh.*"

You say, "Yes, yes. Any other goal you've had."

"Aaahh-hm."

You say, "All right. Now we're going to do a few middle rudiments if that's all right with you." He looks at you kind of dumbly and says, "Why?"

"Well we just don't seem to be listing as easily as we can, maybe something has gone out here." Tell him anything you want to, see? "And we're just going to do them just to be sure. Just to be sure." And you rattle off your middle rudiments question.

"In this session is there anything you have suppressed, invalidated, failed to reveal or been careful of" is the question, but of course it runs like this in actual use:

"In this session is there anything you have suppressed? Yes. What was that?"

"Oh ..."

"Yeah, suppressed. That. That there."

"Oh, well that. I've just been trying not to tell you that uh – I find it very, very, very hard to – to confide in you these – these – these various goals about murdering children. I – I – actually had – had – had a couple more of them and I didn't tell you."

You say, "Thank you. All right, I will check that. In this session is there anything you have suppressed? That's clean."

Now we go: "In this session is there anything you have invalidated? Failed to reveal? Yes. What's that? Failed to reveal. What is it?"

"Oh! It's just, these two goals about the – killing children. Ha-ha, yeah."

Say, "Good. Thank you very much. I'll check that. In this session is there anything that you have failed to reveal? That's clean. All right. In this session is there anything you have been careful of? Thank you. That is clean. All right. Tell me another goal you've had."

See? That's the way you handle them. You'll find out you'll win every time if you handle them that particular way. In other words you cut in at it as though you're going to take care of it in the shortest possible fashion. And if you've got one clean you sure don't repeat it. See? You leave that one alone.

Now you go on and list goals again and oddly enough you will find that your person is perfectly willing now to list goals. Perfectly willing to list goals. Every time the listing slows down, *bloombo!*

Well, about every fifth session they've gotten enough residual out-of-session nonsense kicked around that had been – invalidating enough and monkeying around enough that it's worth a Prepcheck. But supposing the pc came into session – we're going to do it every fifth session anyhow – and supposing the pc came into session and you got the beginning rudiments in all right and then you said, "All right, now on this goal list...."

"Well, I don't know that I want to list any more today. Can't we do something else because I just *assssar-bisar-hmm-berar-rrarrwow-rrorrowow.*"

Well, you got your beginning rudiments in so it can't be them. See? It must be the middle rudiments. So just go ahead and prepcheck your Zeros. Because now you're going to catch it. All the invalidations of listing as a subject, invalidation of goals as a subject, you see. That would call for a Prepcheck rather than do something else weird. You'll pick it up. They've been invalidating listing. That's the commonest source of stopping listing is they invalidate listing.

"I don't see how this is getting me any place." You know. Now the reasons they suppress and fail to reveal and all that sort of thing may be something odd but you will catch it in these four questions.

Now, you use this "suggest" and "failed to suggest" or anything of that character on a pc who is sort of on the verge of telling you what to do all the time. It's a critical pc that this is the most useful on because the pc is suppressing suggestions about your auditing continuously. So you can just run that into the lineup and certainly run it into the Prepcheck. I don't care whether you ask it as a middle rudiment or not. I wouldn't, but I would certainly fix it up as a Prepcheck. When Prepcheck time came around I would ask them if there was anything they had failed to suggest and we would get the *all* – all of the latent withholds on the subject of our auditing off and all kinds of things. You see. But the time to take that up is on a Prepcheck.

So in your middle ruds you're only interested in the immediate session. You're interested in the immediate session that you're running. That is because we're going to prepcheck them and that's going to take in all the – all the middle areas on the whole subject. The accumulations. And the reason you're going to run the middle ruds is to keep their needle relatively clean, so it is readable – that's your best reason – keep them in-session and part of keep-

ing the needle readable is of course making sure the needle is reading on the goal, not an invalidation of the goal or something of that sort.

So that's middle rudiments in their use on goals.

Now, they're used exactly the same way in – when you are listing a goal, the four lists of 3GA used in a goals list. Used exactly the same way except there's now a better pattern. Every time you stop listing on a line you get the middle rudiments in. And then go to your next line. So the middle rudiments all live between lines and they're just used as a bridge. You do line one, middle rudiments, line two, middle rudiments, line three, middle rudiments, line four, middle rudiments. See? Line one. Round and round and round but always the middle rudiments. Because he may have just run out of steam and that line might have been exhausted or he might have stopped listing on that thing because the middle rudiments were out.

So we don't question this or fool with it. It's too easy to get them back in again. So we just take it more or less that we better smooth it up and go on to the next line. And he'll accept this generally; after you've done it a few times he just accepts it as a matter of course and that's very easy and he never pays more – any more attention to it. It's not heavily weighted, in other words.

All right. Now in Prepchecking, in Prepchecking – now there's of course – prepchecking the middle rudiments is this – this thing I've been giving you here about goals and so on and mentioned in the first lecture this evening – but in Prepchecking you use middle rudiments. You use it after every What question is null. Whatever the What question is you use it after it is null. You've run the chain and come back and checked the What question and now you found it null. So, you do the middle ruds. "In this session have you ... ?" or "Is there anything you have ... ?" And get your middle rudiments in and then check the What question again. *Heh-heh-heh-heh-heh-heh-heh.*

Now, you'll notice that this is being put in as a broader look at failed – on a – on a missed withhold. You see, before you were supposed to ask consistently for missed withholds. Well, this is just a fancier, broader way of asking for a missed withhold. So you don't also ask for missed withholds. You just do your middle ruds. And then you go back and check the What question again. If your pc is sort of running down on havingness, is consistently down, there'd be two ways you could go about it. You could get your middle ruds in, check the What question again, find it null, then do some Havingness and go on to your next question, or if this needle was so agitated that you couldn't read well and were suspicious of your reads on the What question you would do your middle ruds and run the Havingness and then check that What question. See?

I don't care which way it is because Havingness can be put in any place. It's not necessarily a tailor-made adjunct to the middle ruds but it is something that can be run with the middle rudiments if a pc's havingness tends to go out easily.

So there is always a middle rud between What questions. Always. And then you're not going to miss any withholds on this pc and you're not going to miss straightening out chains and so forth.

Now, what if you did the middle ruds, found them wildly out, straightened that up and went back and checked the What question and found it now as live as a pistol? You'd go on prepchecking it. And when you've reached a new fundamental on it and checked the What question as null you would again do the middle ruds and go through the same action again. You'd always complete the cycle in that same way.

Now supposing you were running down a pat list, a Form Three, 1, 2, 3, 4 and you were asking, "Have you ever stolen anything? Have you ever raped anybody?" You're going on down the line, bark, bark, bark, bark, bark, bark, bark and you had about five or six of them and with one answer they have been cleaned up. I would also do the middle ruds. So that you would say any consecutive number of five or six What questions – I – five or six Zero Questions gone over and cleaned up with just one or less answers, do your middle ruds. Get them in. Because he may be suppressing something. And you, all of a sudden, find that the third one was *not* flat, it was simply gorgeously suppressed and you have to go back and clean that one up again and of course you'd follow through and ask the next one and do your middle ruds again. Same way.

If your middle ruds are found to be out you go back and do the thing you were doing except in listing of course and in that case you just go on to the next list. That's doing what you were doing anyhow.

All right. The use of middle rudiments can be extended. You can extend the use of middle rudiments to a specific subject, object or activity. This pc – we're checking out a goal, so we say, "Has the goal to catch catfish been suppressed? Invalidated? Is there anything about the goal to catch catfish that you have failed to reveal? Or been careful of? Thank you."

Now, there you can check – you can check, just bang, on the subject of a single goal, do you see and you can make sure that that's the goal that's reading, not an invalidation or something like that.

Now, there's another way to use a middle rudiment and that's just whatever you're doing. Put it in there at – as the headline of the middle rudiment. But if you get this thing too broad you're going to go into a prepcheck activity before you get out of it. So there is a limited area between how far you could extend the middle rudiment and before it has to be prepchecked and that's not very far. You can ask almost anything. "Auditor" is out. This would be a very unusual use of the middle rudiment. "Auditor" is out in some fashion, so we adapt the word "auditor" to the middle rudiments, see.

"In this session have I..." You see? "Is there – is there – in this session is there anything about me you have suppressed, invalidated, failed to reveal or been careful of?" See? That is an odd use.

Now I'm not telling you to do this. I'm not advising you and I don't expect you ever will, but I'm just showing you as how far this could actually go. You could probably put in every other rudiment with the middle ruds. I'm just trying to give you a flexibility of thinking about the thing. Person says he has a present time problem, you ask him the second time he has a present time problem, he tells you the same present time problem. It's still reacting, so you say, "Well, is there anything about this problem, *blah, blah, blah*" – you announce

the problem you see – "Is there anything about this problem *blah, blah, blah*, that you have suppressed?"

"Yes, what's that?" You know. And invalidated, failed to reveal or been careful of, you know. Get those things cleaned up, each one in its time. Come back and you could ask about the problem, you'd probably find it null. I do not advise that use of the middle rud. That would be very freaky and that'd be very tricky auditing. But, I'm just showing you that anything can be put in relating to this with the middle rud following it.

But sometimes your wording has to be shifted around, because of the peculiar phraseology of "failed to reveal" and "been careful of." You have to break it down into two questions because you can't have them both asked in the same line because you've put some odd-ball thing and you every once in a while will find yourself tripping into the fact – oh-oh. You can't ask "failed to reveal" now, so you're sort of in mid-flight with your voice at the proper intone in the sentence and ask it some other way so that you can get "failed to reveal" and "been careful of" on there, see, because your grammar would be all upset. You'll get used to doing that.

Now, this is a marvelous thing, the middle rudiments, because if you feel called upon to suggest a goal to the pc – God forbid – it'll be only because you're so anxious to have the pc find a goal. See? You're urging the pc, you see. You're trying to – you're pressing. You're pushing. That's because the pc isn't moving in some fashion, you see. You're anxious; you're impatient about the thing and so on. It'll only be because the pc doesn't appear to be getting anyplace. And he isn't getting anyplace because the middle rudiments are out. See? So if you've got this answer and you finally realize that the middle ruds will start the pc up again, you get very happy about middle ruds and you get very expert in their use because you say, "Looky-here, every time the pc slows down or stops, we get the middle ruds in and he'll start going again."

So ideas of evaluation, ideas of chopping up the pc, getting the pc – withholding from the pc that we'd like to knock his block off if he sits there just ten more minutes without saying anything, you see, well, that disappears, because you'll find out consistently that the reason he has stopped giving you answers lies in those four categories, not because there are no more answers.

You see that's the easiest one for you to say. There are no more answers. "Ho-ho, no more answers obviously. Obviously there are no more items on the list, he's already given me twelve hundred." Well, that he's given you twelve hundred does not mean there are no more answers. If he can't give you any more it's because his middle rudiments are out. And if you get a good reality on that you'll say, "Wow!" You talk about – you talk about the proper – the proper coin to drop into the electric piano, it's the middle rudiments. Slugs don't work. Middle rudiments: *Cling! Da-da da-di-da da-di-da* right away. It's marvelous.

I held off for a long time putting middle rudiments in because they were insufficiently formed. I wasn't sure that we had all these. But now I've been using these things, been working out fine. Now you wonder why we add on to the end of middle rudiments half-truths, untruths and meter and maybe command or question. Well actually, in middle rudiments you ordinarily wouldn't have to. You ordinarily wouldn't have to. And I would say offhand if your

pc has gone so far adrift that he's telling you half-truths and is hanging up the meter madly and has gone on in some different direction and offbeat and oddball, I'd say the pc was in the kind of condition where he should be short-sessioned anyhow, so go on and get your middle ruds in and then end your session with the end rudiments. Start your session, give the pc a break, you'll have already gotten this thing straightened out, get a new crack at the beginning rudiments and carry on. See?

That's smarter than to use these things. But of course you have to – you have to use some of those end rudiments – and you can use as many as you please when doing a Prep-check – you can... It all depends on your pc. You could weight this thing too heavily by asking everybody, "In listing have you damaged anyone?" – if you ask everybody, see, this. But you would know this pc – this is where you have to be a little clever, you know, you're in your Prepcheck, you know this pc and he's been saying, "Joe: *Groowrr*." You know? "Auditors: *Rowrrrrrr!* Instructors: *Hrroarrrrr*."

I think the next time you prepchecked him it might be a very good idea, if you didn't catch it on the end ruds, it might be a very good idea to ask him, "In listing have you tried to damage anyone?" you see and it falls off the pin. That's why he stopped listing. Listing was getting to be an overt act. See? He was considering listing critical or something.

But that would very definitely depend on your preclear and be a rather freak method of using it.

I don't want to introduce the idea now that there are a great many middle rudiments that you would or would not use or don't know anything about or something of this sort. I don't want to introduce that idea at all. Actually middle rudiments are simply, just and only, "suppressed, invalidate, failed to reveal and been careful of." That's middle rudiments. Now if you want to ask a pc something else, why, that's fine. And you'll find in the ordinary run-of-the-mill auditing the less something elses you ask the pc, the happier you're going to be. But I can't say that a pc – well, a pc had a – had a cough and didn't consider it suppression and the auditor had to include in the middle rudiments, "In this session, have you tried not to cough?" to get the meter reading again. See, I mean – so all right. So all right. You notice something like that's going on, if you think you need it go ahead and do it. But the less dress-parade patness you do, the better off you are in these middle ruds, because those four will take care of almost anything.

So he was trying to damage somebody in listing, the probability is that you're going to get it as you do the end rudiments, you see.

So there are a lot of – a lot of angles to this.

Those are your middle rudiments.

The – the best method of using them is simply a very straightforward method of using them and they make an excellent bridge from one type of activity to another similar activity or to a different activity. There are many ways to use them.

Now, a pc who has a rather dirty needle and who has to have medium – middle rudiments done three-minutes' worth for every minute of auditing.

There's something wrong with the middle ruds Prepcheck. See? Prepchecking the middle ruds is what's indicated there, you'll save time by doing so. And supposing prepchecking the middle ruds didn't do it, well then I'd say just general Prepcheck and the CCHs should have been done much more thoroughly. You understand you can often find a goal on a pc and so forth, in spite of the hedgehog character of the needle, but it's sometimes almost impossible and it can get so weird and so impossible and so forth that you have no other choice than do something else.

Actually getting a goal on a pc with a rather clean needle is a joy.

So, I have been specializing lately in fish and fumble. And I could be expected, if I was starting to have trouble that had developed since the beginning of the session – that is to say, you know – or was evident in the beginning of the session, with a dirtied-up needle and I didn't hit it on the beginning rudiments and the needle was still dirtied up, I would very – be very likely to start my session with a fish and fumble. No matter what else I was doing. Because I found out it only takes me from three to nine minutes to clean up a needle. I'm not saying I'm so good and you're so bad. You'll learn how. You should expect to clean up a dirty needle in three to nine minutes. Most of the time.

Now we're talking about the needle that goes *bzzzzt*, tick, tick, *bzzzzt*, tick. "Have you eaten any ..." *Bzzzt*. "... cucum ..." *Bzzzzt*, tick, tick, "... lately?" Clang. You're saying, "What am I going to do? Sit here the rest of this session, watch this thing go *bzzzzt*?" and so forth. Let's find out what the hell it is. So before I do anything else, why, I'd do a little fish and fumble and do it rather rapidly and get out of there. I'll put the beginning rudiments in and then say, "All right. Now I want you to carefully consider your auditing." Nothing happened, see. "And now carefully consider your life." *Heh-heh*. "What's that? Yeah, that." Needle's going *bzzzzt*, *bzzzt*, *bzzzt*, *bzzt*. You say, "What's that? What did you think of just then? What are you thinking of now?"

"Oh, well, I was thinking of that disk on the top of the E-Meter. It's red."*

"All right. Good enough. All right. What have you done to HCO?" [laughter]

Bzzzt, *bzzzt*, *chp-chp*, *dzzzt*.

What do you know! "All right. When's the first time you did that?" See? I got a What question: What have you done to HCO? I hit it lucky. Funny part of it is, I've been hitting these things 100 percent lucky. One pc said, "I can't stand the electricity in the cans." And I said, I said something about, "Have you ever shocked anybody?" As a Zero. Sounded more like that, you know. And *bzzzt!* *bzzzt!* *bzzzzt*. And it ran right back and we found a bunch of double entendres on the subject of shock. Shock means several things apparently. We got this all out and the needle suddenly went limp. I've been – I've been sorry ever since because the needle travels around so easily it's almost impossible to check anything at sensitivity 16. [laughter] I shouldn't have done that one.

* Editor's note: Refers to the old Mark IV meters that had (like the Mark Vs) on their lid, which in session faces toward the pc, a red, round plate with the HCO insignia on it. A picture can be found in "The book introducing the E-Meter".

But been having very good luck doing things like this. Do a little tiny fish and fumble. Not making any profession out of it. You just get the person to think or consider or look things over. Say, "Well, I'm going to sit here and watch – watch this needle and see what you are doing." That's good enough, you know. There's no stylized question, then *bz bzzzt!* Tick, tick, tick, tick, tick, tick. What the hell! You know. What's that? And by the way, if you're doing fish and fumble, just as a little side comment, trace only one pattern down at a time. Don't try to trace four. Trace the *bzzzt!* You know, and then it goes tick, tick, tick, tick. Don't pay any attention to those tick, tick, ticks. Then it goes *bzzzt!* "What did you think of just then?"

Then it's going clang, tick, clang, tick. Don't pay any attention to that. *Bzzzt!* "What did you just think of just then?"

"Oh! I've been thinking about my baby."

"Oh? Good. Done anything to your baby lately? Something happen to your baby lately? What about your baby?" *Bzzzt!* "All right. What are you thinking of?"

"I was thinking about she doesn't have any shoes."

"What about your baby's shoes?" *Bzzzt! bzzzt, bzzzt, bzzzt, bzzt, bzz-bzz.* Now fish and fumble takes a brighter auditor. I will tell you that. You have to say, "What have you denied your baby lately?" *Bzzzt! bzzzt, bzzzt, bzzzt, bzzzt.* Ah-ha. That's it, right there. "What have you denied your baby lately?" That's the test What question.

"Well, I did. I took her milk away from her last night."

"Good. Anything earlier than that?" *Heh-heh-heh-heh.*

"Took all her clothes out and burned them up because they smell bad."

You know, I mean horrible things been going on here. We get the chain pulled up. *Bzzzt.* All of a sudden you just got these ticks left. So you say, "All right, now. Just think things over now." Person's very relieved. They think life's wonderful. Tick, tick – those ticks. That one peculiar tick. You say, "What're you thinking over there? Then. Then. Then."

"Oh, I just think all the time – I just keep wondering why you're so inquisitive."

"Oh? There. Yeah, that. Is that what you keep thinking about?" So on.

"Well, is there some question I sh – I should have asked you? Something like that?"

"Well ..." Tick, tick, tick, tick, tick.

"What's that? What's that?"

"... well, have I been critical of you outside of session. *Heh-heh hehheh.*"

"Well, good. Good. All right. Well, (Let me see – see if this works here.) What have you said about me outside of session?" Tick, tick, tick, tick. "That's very good. That's fine. That's it. All right."

And you say, "Now what – what about criticizing an auditor? Have you done something like that, have you lied about me or done something I don't know about? What about criticizing me?" Tick, tick, tick, tick. "Oh, that's right." We'll just knock off the session here,

"What about criticizing me? Excellent." Tick, tick, tick, tick, tick. "Now can you think of an actual incident?" Because if you can't get an actual incident, you haven't got a What question, you've just got a test What, see.

"Oh, well, yes, I said something at dinner the other night, critical of you." "Yeah? All right. That's good." A specific incident. Let's work it. Let's get it back. Let's pull up the chain. Three, four minutes later this needle is clean as a whistle. It's just going....

You say – you say, "All right. We're going to do some listing now," whatever it is, "going to do some Prepchecking," I don't care what it is. But you can frankly clean up a needle just as it is. And you know it doesn't get dirty again easily. You really have to goof to get a needle dirty after you've cleaned it up like that. In fact I haven't seen these needles I've cleaned up go dirty again. I think there must have to be something going on with a bunch of missed withholds and all kinds of wild things being stirred up and so forth for the needle to be made dirty again. I don't quite understand how the needle is made dirty by poor auditing but it's basically on the mechanic that the auditor's TR 2 is so bad that when the pc says something it's automatically a missed withhold. Do you see how that could be? You don't see how that is?

Pc said, "I shot a dog" and the auditor said, "*Mowwwm.*" And you get to the end of the session, "In this session have I missed a withhold on you?" *Clank!* "What's that?" "Oh, about shooting dogs."

You're bewildered. You say, "But I acknowledged it, you know." you say. He didn't hear you. So it's a missed withhold. It's an inadvertent withhold. See? He said it but nobody heard it. And I think then double questioning and oh, running pcs on the wrong things. You'd have to be busy to dirty up a needle but I've been having very good luck cleaning them up and I should mention at this time that little technique of fish and fumble.

Now, one of the virtues of fish and fumble, it could be overused, of course, I suppose, but I haven't seen much reason to use it on a pc more than a couple of times, two or three times on the same pc and it hasn't taken very long on that pc either. It's just a fast method of cleaning up the needle. The needle must be banging against something and every different pattern that the needle is reacting with is a different subject so you only follow one pattern at a time. Don't get clumsy and follow a – a double tick and a single tick and a stick and make the mistake of, "What was that? What was that? What was that?" Calling off the double tick, the single tick and a stick. No, man, because he's thought of three different things in a row. No, you've got to just abandon all the ticks and sticks. Take the most vital of them first, which is the double tick. If you can get that you're best off because it's always the missed withhold. There's something wrong with it. The double tick you would choose up. You can actually clean that thing off the needle without too much worry or upset or take much time about it. That's why I'm quite surprised that a pc's needle stayed dirty during Prepchecking. It must be that they're going on a stylized basis of approach and it isn't the pc in front of them. See?

And you certainly are taking up the pc in front of you if you're picking up just that tick. The tick that goes, "*loollk, loollk.*" You say, "That's the one. That's the one. I'm going to find out what he thinks about." You'll find out it's something very innocent in present time

like this: "Well, the windows of this room are always big. You know, every time I think of the windows or look at the windows or something like that I get this."

Well, did it clean up? That's the test.

And it didn't clean up, all right, so you've got to do something more about the thing. And then you find out that it's a – he was a professional window breaker when he was a little boy, he used to haul off and break windows in all directions and you just pick this up and get the disentanglement off the thing and you won't get that tick any more.

Cleaning up a needle appears to me, at least in my recent activities in auditing, as a relatively easy action if approached with a fish and fumble, without any more intention than just to clean up the needle. And you will make one slick and floppy in practically no time. I'm beginning to believe that there's no excuse for a dirty needle now. It's getting that bad. Because they're very hard to read, dirty needles are. And you certainly can't do Goals Assessment with a needle that's dirty. Drive you mad. You don't know whether it's reading on the goal you are reading or what the pc is at that moment noticing *or – or –* if the rudiments have gone out *or – or – or ...* Well, you see it's a dead giveaway. You've missed this one. If you haven't cleaned up a needle and you're doing a Goals Assessment, why, you haven't any clue as to whether the middle ruds are out, because you only started going tick and flop and so forth and *bap-bap*, when the middle ruds are out.

So you know, you just stop right then, put them in. Well, if your needle was just sporadically *always* operating in this particular fashion, why, how would you know?

So I recommend fish and fumble to you. I recommend you setting up a little project for yourself just simply cleaning up somebody's needle. Not to do anything for the case but just to clean the needle and clean one pattern off at a time and see how good you are. It requires a faster auditor. He's got to be faster on his feet than routine Prepchecking because he has to do a lot of guessing. Because he's got to guess the overt ordinarily. It goes tick. And finally the pc says, "Well, I'm thinking of hollyhocks." Where does that leave you, man? It leaves you up the garden walk someplace.

You can always say, "Well, what about hollyhocks?" or something, you know. And he'll say, "Well, hollyhocks, they're beautiful." Man, you're still up the garden walk and it's still ticking. Hollyhocks are ... Actually it's foxglove that he's thinking of and it contains digitalis and he poisoned his grandmother but otherwise... You've got to short-circuit that line of thought. Well, the pc will help you out if you'll help him out. But it's something like, "Well, the current going through these cans worries me." See? "Did you ever shock anybody?"

Well, that's a one-two. Of course the pc must have an overt with electricity if the pc minds electricity now. That's the kind of think pattern that you have to develop. See? And you do that think pattern and you usually come out with, what the hell has he ever done with hollyhocks? You know? Must be an overt that connects with hollyhocks. It's either to or with. See?

Then you can stir it around a little bit and all of a sudden it will fall out.

But that's fish and fumble and it's a mile – it's a marvelous way of cleaning up needles and I don't know any faster way than to shape it all up, polish it all off, dust it all off beauti-

fully and carry on with what you're doing. I don't think you'd have to do it very often. And if you're doing Prepchecking on a pc you of course have the horizon wide open. This is the time to clean up the pc's needle.

But it's a rather easy thing to do and I should think you'd learn how to do it. And I don't know how well it will work in your hands or not work in your hands. It's not as well worked out of course as Prepchecking, to which it is a crude barbaric cousin. It is done exactly the same way as Prepchecking plus infinite intuition on the part of the auditor. You furnish the intuition. I've already furnished the stylized line of Prepchecking, it will do a lot of things all by itself. It takes – it's not that this supplants Prepchecking, this is to clean up a needle so you can Prepcheck.

See? It's pretty good. So try it. Try it. Next time you see this haunting tick that always goes off, get curious about it. What is that tick? It is something. It's related to present time. It will run back on a direct chain. It will clean up in from three to nine minutes if you're smart and fast on your feet. So I recommend it to your doing it.

All right. Well, that's middle ruds and the way they're used and that's actually how you can clean up a needle thrown into the bargain, so if you master that, why you're all set.

Thank you very much.

TV DEMO: CHECKING OUT A GOAL, PART I

An auditing demonstration given on 13 June 1962

[part missing]

LRH: You thought it would happen and then uh ...

PC: *I sort of thought, Oh, I hope it doesn't.*

LRH: All right. Hope it doesn't!

PC: *Yes.*

LRH: Oh, that's rough. We're not going to do anything very desperate here, honey. All we're going to do is check out your goal. But we're going to prepcheck. Now, I don't know whether you've been prepchecked on this or not.

PC: *No.*

LRH: And I thought it might be a good opportunity for you to get a little subjective reality on this.

PC: *Hm-hm.*

LRH: We've got plenty of people whose goals I could check out. But I sort of wanted when you came down calling me – I actually wanted to check out your goal. So, I'm going to shoot two factors with one session.

PC: *Thank you.*

LRH: All right. This sort of thing won't bother you anyway.

PC: *No.*

LRH: All right. Is it all right with you if I begin this session now?

PC: *Yes.*

LRH: All right. Here it is. Start of session.

PC: *Okay.*

LRH: Has the session started for you?

PC: *Yes, thank you.*

LRH: All right. Very good. What goals would you like to set for this session?

PC: *Well, to do whatever it is we are going to do, successfully.*

LRH: To do ...

PC: *...whatever we are going to do, successfully ...*

LRH: ...whatever we're going to do. And what's the last ...

PC: *successfully.*

LRH: ...successfully. Oh, well that is a goal. All right. Very good. Any other goal?

PC: *No. That will be fine.*

LRH: All right. Is there any goal you would like to set for life and livingness?

PC: *To use the knowledge and the gain that I get here, at London HASI.*

LRH: All right. Any other?

PC: *No. That will be fine.*

LRH: All right honey. You look a little bit nervous. Do you feel nervous?

PC: *No, not nervous, just – just cornered.*

LRH: Do you feel you've been betrayed?

PC: *Yes. I've been caught.*

LRH: Oh, too bad.

PC: *Yes.*

LRH: Too bad.

PC: *Doesn't – this system doesn't worry me. I was surprised. It's so separate here.*

LRH: Well, all right. All right. Now, uh – look around here and tell me if it's all right to audit in this room.

PC: *Yes, it's fine.*

LRH: All right. Look around again.

PC: *Hm-hm.*

LRH: All right. What's your Havingness Process lately?

PC: *Look around here and find something you can agree with.*

LRH: All right. Squeeze the cans. Thank you. My goodness! Out the bottom. All right. Here's the first command. Look around here and find something you can agree with.

PC: *That picture.*

LRH: Thank you. Look around here and find something you can agree with.

PC: *Curtain.*

LRH: Thank you. Look around here and find something you can agree with.

PC: *Couch.*

LRH: Thank you. Look around here and find something you can agree with.

PC: *Green vase.*

LRH: Good enough. Squeeze the cans. All right. Squeeze them again. All right. Has this Havingness Process been suppressed?

PC: *Sometimes it works and sometimes it doesn't. Sometimes "point out something" does and sometimes "tactile" does.*

LRH: All right. Has this Havingness Process been suppressed, invalidated? Is there something about this Havingness Process you failed to reveal? Yes, what have you failed to reveal about this Havingness Process?

PC: *Something I failed to reveal, but it wasn't the Havingness Process that I know of. It was the fact that I've seen that picture in several different people's houses and I thought of it before you started running it.*

LRH: All right. All right, thank you. Now, is there something about this Havingness Process you failed to reveal?

PC: *Not that I know of. Didn't get anything.*

LRH: Well, all right. I'll check it on the meter.

PC: *All right.*

LRH: All right. Is there anything about this Havingness Process you have

failed to reveal? All right. That's clean. Thank you. All right. Is there anything about this Havingness Process that you have been careful of?

PC: *Not that I know of.*

LRH: All right. We're going to run a different Havingness Process. Okay?

PC: *Hm-hm.*

LRH: All right. Squeeze the cans. Boy! You're just getting that much drop.

PC: *Hm-hm.*

LRH: All right. Put the cans down. All right. Here we go. Feel that table.

PC: *Hm-hm.*

LRH: Thank you. Feel that chair.

PC: *Hm-hm.*

LRH: Thank you. Feel that sign.

PC: *Yes.*

LRH: Thank you. Feel that ash-tray.

PC: *Hm-hm.*

LRH: Thank you. Feel that table.

PC: *Hm-hm.*

LRH: Thank you. Pick up the cans.

PC: *Okay.*

LRH: All right. Squeeze the cans. Squeeze them again. I think we've got a little broadening of it here.

PC: *Hm-hm.*

LRH: Put them down.

PC: *Hm-hm.*

LRH: All right. Just feel those cans without picking them up.

PC: *Hm-hm.*

LRH: Thank you. Feel that chair.

PC: *Hm-hm.*

LRH: Oh, all right. How does it feel?

PC: *Feels slightly sticky and leatherish.*

LRH: All right. Very good. Feel that cloth.

PC: *Hm-hm.*

LRH: All right. Thank you. Feel your skirt.

PC: *Hm-hm.*

LRH: All right. Thank you. Feel your shoulders.

PC: *Hm-hm.*

LRH: All right. How do they feel?

PC: *Solid.*

LRH: All right. Good enough. Feel that cloth.

PC: *This one?*

LRH: Yeah. All right. Pick up the cans. All right. Squeeze the cans. Ah – that's good. Try it again. Squeeze the cans. Yeah, that's your Havingness Process. Okay. Put them back down. We'll do it a few more. All right. Feel the can cord.

PC: *Hm-hm.*

LRH: Okay. Thank you. Feel the arm of your chair.

PC: *Hm-hm.*

LRH: Just that one.

PC: *Hm-hm.*

LRH: Just that one there.

PC: *Hm-hm.*

LRH: All right. How does that feel?

PC: *Smooth. Solid.*

LRH: All right. Very good. Feel the table under there.

PC: *Yeah.*

LRH: Okay. Feel this paper.

PC: *Yes.*

LRH: All right. Thank you. Feel the back of the E-Meter.

PC: *Hm-hm.*

LRH: All right. Thank you. Feel that ashtray.

PC: *Yes.*

LRH: Good. Good. Feel your skirt.

PC: *Hm-hm.*

LRH: Good. Feel both arms of your chair.

PC: *Hm-hm.*

LRH: All right. Feel the tablecloth in front of you.

PC: *Yes.*

LRH: All right. Now feel the table under the tablecloth.

PC: *Hm-hm.*

LRH: Thank you very much. Pick up the cans. Okay, squeeze the cans. That's good. Fine. Thank you. That was the last command.

PC: *Okay.*

LRH: All right. I'll check this on the meter. Look around here and tell me if it's all right to audit in this room.

PC: *Yes.*

LRH: All right. Anything particular you're running into as you do that?

PC: *Just at that moment, I noticed that camera over there.*

LRH: That was a big surprise?

PC: *No, it reminded me of a camera I once saw in my bedroom about three Christmases ago at the same time up in the corner of the room. It was a picture I saw and I got tummy upset for a whole day.*

LRH: So, all right. Good enough. Okay. Let me check this on the meter now. Look around here and tell me if it's all right to audit in this room.

PC: *Yes.*

LRH: All right. You still get a flick on something here.

PC: *Oh, I noticed the – a metallic object of some sort up there.*

LRH: All right. Thank you. Let me check it on the meter again. Look around here and tell me if it's all right to audit in this room.

That's clean. Thank you.

PC: *Hm-hm.*

LRH: All right. It was actually clean before, but I took a latent read. Okay?

PC: *Hm-hm.*

LRH: You feel all right about these cameras?

PC: *Yes.*

LRH: Really?

PC: *Hm-hm.*

LRH: Do you feel all right about these cameras?

PC: *The only thing I can think of is that just – I just remember being a student down there and how they – how we all used to laugh at different occasions and I – I keep expecting to hear people laugh when I say something and I don't.*

LRH: Oh, really. Oh, all right. All right. All right. We shoot them when they do that now.

PC: *Hm-hm.*

LRH: All right. We'll let it go at that. Okay?

PC: *Hm-hm.*

LRH: Do you feel – you feel – you sure you feel all right about ...?

PC: *Yes.*

LRH: All right. I get a very wide fall here when I say to you, "you sure you feel all right?" But it's not a – it's not an instant read.

PC: *It's not these cameras ...*

LRH: Yeah.

PC: *... I don't think.*

LRH: Well. Tell me what you think it might be.

PC: *I think it's being watched. But it isn't them down there watching.*

LRH: All right.

PC: *It's a sort of – there's a something watching. It's – it's this thing, I don't like being watched over my shoulder.*

LRH: Oh. Okay. You think there's something over your shoulder, turn around and look.

PC: *No, only me.*

LRH: All right. Okay. Now, you feel all right about this?

PC: *Yes.*

LRH: Yes, you do now. Thank you. All right. Now, are you willing to talk to me about your difficulties?

PC: *Yes.*

LRH: All right. Thank you. Let me check that. That was equivocal. Are you willing to talk to me about your difficulties?

PC: *Yes.*

LRH: All right. Thank you. It's got a latent read on it. But that's otherwise fine. All right. Since the last time ...

PC: *[laughs] Yes.*

LRH: ...you were audited at Saint Hill ...

PC: *Yes.*

LRH: ... have you done anything that you are withholding?

PC: *Heavens! Thousands of things.*

LRH: All right. Happens to be clean on the meter.

PC: *Okay.*

LRH: All right. Okay. We'll let it go at that. All right?

PC: *Yes.*

LRH: Okay. Do you have a present time problem?

PC: *No.*

LRH: I got a reaction on that.

PC: *Well, the only thing that occurred to me was that I really didn't want to get stuck with my early goal again. I'd much rather have the other one I've got.*

LRH: Oh. I see. All right. All right. All right. Very good. Let me check

this on the meter. Do you have a present time problem?

PC: *Nothing I can think of.*

LRH: That is clean. Thank you. Thank you. Very good. All right. Now, what we're going to do here now ... Your rudiments are in. That's fine. What we're going to do here now is we're going to do a very fast Prepcheck with the middle rudiments on the subject of goals and so forth.

All right, the first thing we're going to check – we're going to start in right now. You came down to 2.6...

PC: *Hm-hm.*

LRH: ...with all that, by the way. And the first thing here is your – just the subject – just the word – I'm going to just check the word. I'm going to see it – say it and see if we get a reaction. Goal. Thank you. Fine.

PC: *Hm-hm.*

LRH: Now, I'm going to check one other word.

PC: *Hm-hm.*

LRH: Listing. All right. That's clean. All right?

PC: *Hm-hm.*

LRH: Here we go. The first question here is: On goals have you ever suggested anything?

PC: *I think so, once.*

LRH: All right.

PC: *On a person at HASI, there was a prior read on a goal and I asked her, could her goal possibly be that?*

LRH: All right. Okay. I'll check that on the meter now. On goals have you

ever suggested anything All right. That's clean.

PC: *Hm-hm.*

LRH: Thank you. Now, on goals have you ever had anything suggested?

PC: *Hm-hm.*

LRH: All right. Doesn't read. What would you like?

PC: *I just – what I told you earlier today, the thing that I said.*

LRH: Go ahead and say it. It's all right.

PC: *Well, you suggested that my goal might be antisocial singer.*

LRH: All right. Very good. Okay. Okay. Now, on – on goals ...

PC: *Hm-hm.*

LRH: ... have you ever suppressed anything?

PC: *Anger sometimes, when I was being run on that one.*

LRH: All right. That's an equivocal read.

PC: *Hm-hm.*

LRH: But I'll check it now.

PC: *Hm-hm.*

LRH: On goals have you ever suppressed anything? I've got an action here that's just a little tiny bit late, but I'll have to take it into account.

PC: *Hm-hm.*

LRH: Can you think of anything else you suppressed on goals?

PC: *Well, I thought – I was wondering whether I had suppressed anything else. I suppressed speaking to you sooner about it.*

LRH: All right. All right. Thank you. I'll check that on the meter.

PC: *Hm-hm.*

LRH: On goals have you ever suppressed anything? Ah, that's clean.

PC: *Hm-hm.*

LRH: All right?

PC: *Hm-hm.*

LRH: You don't think it is? There's an upswing here. There was an upswing. I'll call it an equivocal read.

PC: *Well, the only feeling I get is that I always get suspicious if I sort of get a bit cagey about something, in myself*

LRH: Hm-hm.

PC: *And the thought of having to be run on that goal again, I sort of get a sort of "eek!" about it.*

LRH: All right. All right. Okay.

PC: *However, but if I'm being run on the other one, I'm sort of going smoothly. But that one I think "ooh, not into that mess again."*

LRH: All right. Okay. Here we go. I'll check that again, just to be absolutely sure. On goals have you ever suppressed anything? Ah, that's a sudden speeded rise.

PC: *Hm-hm.*

LRH: Can you think of anything else you've suppressed on goals?

PC: *Well, I suppose I just suppress that feeling I get, at the thought of that other goal.*

LRH: Hm-hm. All right. Good.

PC: *I got a lot of sort of pain with it when I was being run on it down here. Not physical pain, mental pain.*

LRH: All right. Very good. I'll check it on the meter again. On goals have you ever suppressed anything? That is clean.

PC: *Hm-hm.*

LRH: Thank you very much. All right, we've got this one, and we've got this one, and we've got this one. Now, let's take the next one. On goals is there anything you have suppressed?

PC: *I don't think so. I told you as far as I know.*

LRH: Yes. I got a reaction on it, too. Why does that give a reaction?

PC: *Well, I suppressed the pain, and I suppressed the uncomfortable, and I suppressed the anger. Oh, I know what I thought. I had it on the telex, have I ever suppressed anything and – and I think it's on my telex it says had – had anything been suppressed, and I was puzzled.*

LRH: Well, all right. Okay. I'll check that on the meter now. On goals is there anything you have suppressed? That is clean. Thank you. Thank you. There's a tiny latent. I'm not going to bother with it. All right. On goals is there anything you have invalidated?

PC: *Well, I invalidated you.*

LRH: All right. Okay. Very good.

PC: *At the time of that goal.*

LRH: All right. Excellent. I'll check that on the meter now. On goals is there anything you have invalidated? Equivocal read.

PC: *Hm-hm.*

LRH: On goals is there anything you have invalidated? That is clean. Thank you. All right. Now, on goals have you

ever invalidated anyone else's? That's clean.

PC: *Hm-hm.*

LRH: You thought of something latently.

PC: *I thought of something else.*

LRH: What did you think of?

PC: *Well, I thought of – um – I was given – I was told something about a person's goal that was found down here by one person and I invalidated that person's speed in doing it.*

LRH: The person's speed?

PC: *In doing it, because I said that I reckoned that we could do it faster.*

LRH: All right.

PC: *And then you told me more about it today. And I felt guilty about it.*

LRH: I'm not quite with you there.

PC: *Oh, well, it – it was um – the goal Mary Sue found – found recently.*

LRH: Oh, yeah?

PC: *Somebody – somebody told me how long it took her and I said, "Oh goodness, I'm sure we could – we could do it faster than that. "And then you told me certain other information about it today and I felt very guilty of having thought that and said it.*

LRH: Oh, I see. All right. Let me check that then. On goals is there anything you have invalidated? I got a slowdown. Think of something else?

PC: *Well, only – only that other – um – the one of – the goal I said to you that I suggested to that person when the – when the goal came up as the whole thing it was – it was, I think, "to seduce every*

man I want," from this particular person. I said, "Oh good heavens, it won't – it won't be that. I'm sure it will be something else." And when I checked it there was only a prior read when it came to the seduce part. And I actually invalidated it before it came up to me to check it.

LRH: Oh. All right. Very good. All right. Now, I'll check it on the meter now. All right. On goals is there anything you have invalidated? Equivocal read. I'll have to ask you again. On goals is there anything you have invalidated? That's clean as a wolf's tooth. Thank you very much. All right. On goals is there anything you have failed to reveal? It's clean. Thank you. On goals is there anything you have been careful of? A-ha! Now, what have you been careful of?

PC: *Been careful of?*

LRH: There it is.

PC: *Of that feeling that I get. That sort of "eek!" feeling at the thought of that antisocial thing, singer thing. "Oaaah!"*

LRH: Yeah! All right. All right.

PC: *I sort of have to catch myself on the big withdraw out.*

LRH: Okay. All right. On goals is there anything you have been careful of? All right. There's a latent you might want to tell me about.

PC: *I was thinking about that again actually. I know – I know what I thought. I thought, oh, this will save Jenny having to do this.*

LRH: Um?

PC: *I said this – doing this will save Jenny having to do it.*

LRH: Oh, she could do it easily. All right. Okay. I'll ask you again here. On goals is there anything you have been careful of? And that is clean. Thank you very much. All right. On goals have you told any half-truths? Thank you. That is clean. On goals have you told any untruths? Thank you. That is clean. On goals have you ever influenced an E-Meter?

PC: *Not consciously or deliberately that I know of.*

LRH: All right. We'll check that again. It was a little bit of a late read. Well, on goals have you ever influenced an E-Meter? No. Clean.

PC: *Hm-hm.*

LRH: On goals have you tried not to influence an E-Meter? Clean.

PC: *Hm-hm.*

LRH: All right. That appears to be okay.

PC: *Good.*

LRH: Now, we're going to take up the subject of listing. We've got that straight and we didn't run into any real trouble there. We're getting your tone arm down here, ma'am.

PC: *Good. I've been seven running that other goal.*

LRH: Yeah?

PC: *About six times a session.*

LRH: Yeah?

PC: *It's true. It's on the end rudiments. And he says it – during that session, and I go up to seven again.*

LRH: All right. Okay. Now, we're going to start in on listing. All right. On listing – on listing is there anything you have suggested?

PC: *I seem to remember in one session that I was giving Norman that he asked me a word and I told it to him. He asked me a word for something. I couldn't swear to it totally and wholly. But, I seem to think there's something like that there.*

LRH: All right. Very good. On goals is there anything you have suggested? That's clean. It wasn't really there in the first time, it was a latent.

PC: *Hm-hm.*

LRH: All right. You don't think I'm cleaning off latent reads. I'm calling it – if it falls after a quarter of a second. All right. On listing is there anything you have failed to suggest? That's clean. Thank you. On listing is there anything you have suppressed? Thank you. That is clean. On listing is there anything you have invalidated? Equivocal read. On listing is there anything you have invalidated?

PC: *I'm thinking of one session which one of the auditors was giving in London, that I was supervising in the staff training. And – um – an item was got and there was something wrong with it.*

LRH: Hm-hm.

PC: *And I said to the auditor, no, that won't be it. We'll have to go on for that. The – tha – that invalidated it at that stage.*

LRH: All right. I'm getting a fall on "on listing is there anything you have ..."

PC: *I beg your pardon.*

LRH: Yes. I don't know why.

PC: *Is there anything I'd what?*

LRH: I don't know. I – I'm not trying to foul you up or anything like that, but the read is equivocal because on listing is

there anything you have? You just thought of something, what's on ...

PC: *Well, this is the same thing. This is – this incident that this – this chappy came up with. But I don't quite know what you mean by an equivocal read.*

LRH: Neither do I.

PC: *... an equivocal read.*

LRH: Oh, it means that it's not on the button.

PC: *I see. Hm-hm.*

LRH: It means it's just – I couldn't tell if it is clean or not clean.

PC: *I see.*

LRH: See. There's a hunted read around it some place.

PC: *Oh. Well, I've been puzzled what this equivocal read has been.*

LRH: Oh, all right. Okay. Very good. All right. On listing is there anything you have invalidated? That's clean.

PC: *Hm-hm.*

LRH: All right. On listing is there anything you have failed to reveal? Yes. Yes.

PC: *Well, I get two things there. All the items on my list that I haven't sted – yet said.*

LRH: Yes.

PC: *And the fact that I – the way I was holding my cans pressing against my legs, I wondered if there was any reaction there. I've got those two things at the same time.*

LRH: All right. Now, did that answer the question?

PC: *Well, when you said was there – on listing was there anything I'd*

failed to reveal, I just thought of all the items that I yet hadn't revealed on lists.

LRH: Attaboy. All right. Thank you very much. All right. On listing – I'll check it here ...

PC: *Hm-hm.*

LRH: On listing is there anything you have failed to reveal? All right. Thank you. That's clean. All right. On listing is there anything you have been careful of? And that is clean. Thank you.

Now, on listing have you told any half-truths? And that is active.

PC: *Something sort of shot by.*

LRH: Hm-hm.

PC: *I haven't sort of got it.*

LRH: There it is.

PC: *It's a sort of something here.*

LRH: There it is.

PC: *I can't quite see what it is.*

LRH: There it is. There it is.

PC: *I can't think if I told any half-truths.*

LRH: There it is.

PC: *I don't get anything. I'm conscious of something around, but I can't see what it is.*

LRH: All right. I'll repeat the question.

PC: *Hm-hm.*

LRH: Maybe it will occur to you.

PC: *Hm-hm.*

LRH: On listing have you told any half-truths?

PC: *Well, the only thing I can think of that came to the surface then, was*

that um – on doing Routine 3D Criss Cross lists down here on my preclear um – on looking back now for what we know now, the lists weren't complete although at the time, of course, I said they were.

LRH: Hm-hm. All right.

PC: *So, it's a half-truth.*

LRH: Excellent. Okay. Let me check that on the meter now. On listing have you told any half-truths? And that is clean. All right. Here's the next one, on listing have you told any untruths? That is clean. Thank you.

On listing have you deliberately tried to influence an E-Meter? And I got a reaction.

PC: *Well, as an auditor I was hoping th – tha – that one item would be the one it was for the pc but it wasn't.*

LRH: All right.

PC: *That's about the nearest I can get to it.*

LRH: All right. Well, we'll see if that's it.

PC: *Mm.*

LRH: On listing have you ever deliberately tried to influence an E-Meter? And that is clean. Thank you. On listing have you ever tried not to influence an E-Meter?

PC: *No.*

LRH: Thank you. All right. Very good, madam. I am going to ask you one more ...

PC: *Hm-hm.*

LRH: ... on goals.

PC: *Hm-hm.*

LRH: On goals have you ever tried to damage anyone? Thank you. That's clean. On listing have you ever – on listing have you ever tried to damage someone? Thank you. That is clean. On goals have you ever failed to answer a question or command? Clang! Reaction. There it is. There it is.

PC: *Well, it seems to be something to do with one of the sessions that Maryann gave me. But I can't think of failing to answer a question or command there. She was running me on – when we were doing those sort of group mores ...*

LRH: Yeah.

PC: *... thing. But I don't remember failing to answer the question or command there. Unless I didn't run a – didn't answer a havingness command.*

LRH: There it is.

PC: *Oh! There was one day I think um – when there was some confusion as whether she'd given me a havingness command or not or whether I'd answered two of them or one of them or three instead of two or one instead of three or something like that.*

LRH: All right. Okay. Let me check it. On goals have you ever failed to answer a question or command? And that is clean. Thank you. Okay. On listing have you ever failed to answer a question or command? And that is clean. Thank you. All right. We are all set here. Now, I'm going to get my middle ruds in.

PC: *Hm-hm.*

LRH: All right. In this session have you suppressed, invalidated? And what have you invalidated in this session?

PC: *I invalidated you at the beginning.*

LRH: All right.

PC: *But I didn't intend to.*

LRH: All right.

PC: *I said I hoped this wouldn't happen and it was very rude of me.*

LRH: Okay. Thank you. All right. In this session have you invalidated anything? That's clean. Thank you. In this session is there anything you have failed to reveal? And that is clean. In this session is there anything you have been careful of? Thank you. And that is clean. All right. Very good. All right. Now, just for a moment here I am going to do a little operation known as Fish and Fumble. Okay? Because we've got an occasional tick wandering around here and I am just wondering what that is all about. And there it is right there. What were you thinking of? There it is.

PC: *I was thinking of the camera.*

LRH: All right. Thank you. Now think of the camera.

PC: *It's not that one.*

LRH: Which one?

PC: *It's this one I saw in the – as a picture in this bedroom in the Christmas of either 1959 or 1960.*

LRH: Oh, yeah?

PC: *It was just a picture up on the wall, not on the wall. It was a picture that I saw ...*

LRH: Uh-uh.

PC: *... You know, in my bank. It was pressed against the wall.*

LRH: All right. Good enough.

PC: *Hm-hm. And it reminded me of the thing on the Paramount thing – they twist the movie camera around and say the eyes and the ears of the world. But I often wondered whether it was a Fac One thing or something because I felt so sick for the rest of the day.*

LRH: All right. All right. Why don't we just fumble around with this for a minute here.

PC: *Hm-hm.*

LRH: Camera. Picture.

PC: *I don't like having my photograph taken.*

LRH: All right. Something there – you thinking of something right there? What's that?

PC: *Well, that's the feeling I get when somebody wants to take my photograph.*

LRH: Oh yeah, yeah.

PC: *Hm. I have the same feeling.*

LRH: All right. Well, you ever taken people's photographs?

PC: *Oh, a few times, not all that much.*

LRH: Yeah. That's deader than a mackerel.

PC: *Hm-hm.*

LRH: Have you ever hidden any photographs? Heh-heh-heh-heh, here we got it, here we got it. What about hiding photographs?

PC: *Well, I don't know. I remember having a f – a – a – a fascination when somebody told me that Eugene Goosens, a famous musician in Australia, brought pornographic literature in and he hid it, underneath his clothes and his bags*

and got thrown out of Australia for me – for it. And this sort of fascinated me.

LRH: Yes, yes, yes. We've got something here. Thank you. All right. Did you yourself ever hide any photographs? There it is.

PC: *I don't think I ever hid that one, that's a pict ...*

LRH: Pang! Pang!

PC: *... that's a picture of me when I was – that's a picture of me when I was about one.*

LRH: Good.

PC: *I don't think I ever hid it.*

LRH: All right. Well, did you ever hide any photographs?

PC: *I used to play with photographs. Mother used to have tins full of them. I used to play and look – look them over and put them in and out of photograph albums and I don't think I ever hid any. I remember doing this at a very early age.*

LRH: Hm-hm.

PC: *I don't recall hiding any of them. But I get an odd feeling in the diaphragm.*

LRH: All right, well ...

PC: *I think it's this life.*

LRH: All right. Well, let's fish around a little bit and see if you got anything earlier than that, about hiding photographs. That's it. We got our little ping-pang here just as nice as you ever saw.

PC: *Hiding photographs?*

LRH: Yes, hiding photographs.

PC: *I wanted to hide photographs.*

LRH: All right.

PC: *I couldn't stand them all over on the mantelpiece and I couldn't – I – I couldn't bear the family photographs on all the mantelpieces, and I would have liked to and I never did. Mother wouldn't put any of them away.*

LRH: All right. All right. Now have you ever hidden any? There it is.

PC: *I've hidden from having one taken.*

LRH: All right. All right. All right. But have you yourself, ever hidden any photographs? There it is.

PC: *I get a sort of odd concept of a – of some pictures in a pile ...*

LRH: Hm-hm.

PC: *...you know. But I don't - I don't know anything more about it than that. This is a bit of a mess in the picture of – of these in a pile there.*

LRH: What kind of pictures?

PC: *Well, black photographic plates.*

LRH: All right.

PC: *Oh! I have a feeling its me photographs, yes, in my bank.*

LRH: Umm?

PC: *In my bank. My bank has got all these photographs in – in long, long photographic plates.*

LRH: Yeah.

PC: *They're all compressed. They're hidden in the bank.*

LRH: Oh yeah?

PC: Yes.

LRH: All right.

PC: *I've hidden photographs, of that sort!*

LRH: All right. All right. Very good. Very good. When was that?

PC: [laughs] *Oh, what a question to ask. Millions of times.*

LRH: Hm. All right. Spot me just one.

PC: *Um?*

LRH: Just one. One time.

PC: *Well, I hid that picture of the camera I suppose, in that – in the bedroom in 1959. I've blotted it out again.*

LRH: All right. Thank you. Thank you. Is that all there was to it at that time? No?

PC: *No. Except feeling sick, that was all there was to it.*

LRH: Very good. And what might have appeared?

PC: *Oh, Fac One stuff.*

LRH: All right. Very good. And who didn't find out about it?

PC: *Well, there were about six people who did. Nobody else did. Nobody at all except those six people who were there on that Christmas day that I went to visit these people.*

LRH: All right. Well, who didn't find out about it?

PC: *Well, my mother didn't. You didn't. I never told an auditor before.*

LRH: All right.

PC: *I just thought.*

LRH: All right. Very good. Very good. Now, let me check this question. What about hiding photographs? All right. There is a speeded rise here on it now.

Now, is there any early period in your life when you tucked one out of sight? There's something.

PC: *I've trimmed one, chopped one.*

LRH: You did what?

PC: *Cut one you know, trimmed it. Oh, wait a minute! What a – what a nutty thing, of course! If you like to look at it that way, I had some picture frames at home in which sometimes I used to – it was – there would be one photograph and when I got sick of that, I'd put another one on top of it, so the one underneath got hidden.*

LRH: Oh, all right. All right. All right. When was that?

PC: *Ah, gosh. That must have been about 1938, or a little earlier.*

LRH: All right. Very good. And is there any more to that?

PC: *There was this particular photograph of myself that I didn't like.*

LRH: Hm-hm.

PC: *And I think that was one I hid.*

LRH: All right. Very good. And what might have appeared there?

PC: *Oh, people saying, "Oh dear, what a lovely photograph."*

LRH: All right. Very good. And who should have found out about it?

PC: *The person who gave me the photograph. I think it was my Aunt May.*

LRH: All right. Very good. Thank you. Let me check this question.

PC: *Hm-hm.*

LRH: What about hiding photographs? There's a tiny tick as we go by.

PC: *Hm-hm. Well, I could never make out why I had this absolute extraordinary puzzlement over this – this man who'd brought this pornographic literature into Australia. And I remember Father talking to me about pornographic literature, but I've never even seen any.*

LRH: All right.

PC: *And I could never make it out and this always puzzled me.*

LRH: Hm-hm.

PC: *That's – that's – that's what's came back to that time.*

LRH: All right. All right. Let me check this.

PC: *Hm-hm.*

LRH: What about hiding photographs? This is – this is looking cleanish.

PC: *Hm-hm.*

LRH: But, let me ask you now – there's a couple of times ... All right. What about hiding photographs? I get a slow-down.

PC: *Well, I've got the feeling that there must be still something there, because I'm quite puzzled on this and I feel that there is something around that's hidden, but I haven't a clue myself what it is.*

LRH: Well, is there any earlier incident? Is there any earlier incident on this? Did you hide some of those photographs that were in the trunk?

PC: *I took some of them. I didn't hide them. I told Mother I wanted some and some I didn't want and could I – I took them and put them in my own photograph album. Some of them are still there.*

LRH: All right. All right.

PC: *Don't think they are particularly hidden as such.*

LRH: Good. All right. Let me check this now. What about hiding photographs? Man, there it is, in full bloom. There it is. There it is.

PC: *Well, that's the picture of the um ...*

LRH: There it is.

PC: *That's the picture of the machine room – our printing office in Australia ...*

LRH: Hm-hm.

PC: *... where we do our printing. I didn't hide any photographs there that I know of.*

LRH: All right. All right. There's something ...

PC: *Funny feeling in my head.*

LRH: There's something right there. You just thought of something.

PC: *I got a picture of the machinery and this funny feeling in my head and I thought of machines.*

LRH: Did you do anything to that machine?

PC: *Well, there's lots of machines. There are probably about fifteen. I don't think I did anything to the machines.*

LRH: All right. Did you do anything to the photographs?

PC: *There were a whole lot of rather outdated posters on the wall that had photographs in it that I would liked to have pulled off. But, I just suddenly thought of some lithography – um – big lithography stones that we had, that had*

photographs on the inside. And I wasn't supposed to touch them and I turned them over and looked at them and I was told I mustn't – I must be very careful because they shouldn't be broken.

LRH: Hm-hm. All right.

PC: *And we used to do some color printing.*

LRH: All right. Did you ever hide any of those?

PC: *There's lots of things with – to do with blocks and things.*

LRH: All right. Did you ever hide any of those?

PC: *No. I played with them when I shouldn't.*

LRH: All right. *Pang! Pang!* What did you just think of? *Pang!*

PC: *I thought of a block, a printing block. You know, the um – um – the ones that you do with acid.*

LRH: Well, all right. Let's see if we can pick up something earlier than this. What about hiding photographs?

PC: *Well, the thing that came to mind very early when you were talking to me about this was – I was over in an auditing session in 1950 – 53, 54 and I ran into that thing with the photograph within the photograph within the photograph.*

LRH: Hm-hm.

PC: *And, I ran into that a bit and he asked – he talked about cameras ...*

LRH: Hm-hm.

PC: *... and um – and I thought of that when you – when you started – at the beginning of that – that passed through my mind. But there was nothing about stealing*

photographs there. There might have been doing things to people with photographs.

LRH: Hm-hm. All right.

PC: *I'm sorry, hiding photographs. Hm-hm. Hm-hm.*

LRH: Let me look this over. Let me look this over. Let's look over this exact question now.

PC: *Hm-hm.*

LRH: What about hiding photographs? All right. As far as I am concerned that's null.

PC: *Hm-hm.*

LRH: Now let's take up uh ... Think around about something or other.

PC: *I don't know. I thought the thing wasn't null.*

LRH: Uh?

PC: *I thought it hadn't been null actually. And I kept thinking about the photographs now, because I'm very intrigued to know what was making it react.*

LRH: All right. I get a stick now. Well, you've taken the double stick off of it. I don't know how, but we've taken it off. But it'll doing something else with photographs that we're interested in here, I think. Doing something else with photographs. Have you done something else with photographs? All right. Or have you done something else with pictures? Ah – pictures.

PC: *Well, I've blotted them out.*

LRH: Pictures. Mental image pictures.

PC: *Hm-hm.*

LRH: Clang!

PC: *Hm-hm.*

LRH: Clang! Mental image pictures.

PC: *Hm-hm.*

LRH: Yeah. We got a reaction here.

PC: *Hm-hm.*

LRH: We got another reaction here.

PC: *It's sort of like my mental image pictures are all – are like great big – in patches I get them in, like photographic plates ...*

LRH: Yeah, yeah.

PC: *... and they all get compressed up. And I see them occasionally like that. Sometimes they're little ones, but sometimes they're great long ones and I can see halls and halls and halls of them.*

LRH: All right. Well, let me fumble around here, for a minute here. What about mental image pictures? What about doing things to mental image pictures? There is our reaction. Can you answer that question? What about doing things to mental image pictures?

PC: *Oh! I can think of about three possibilities. Not-ising people's sort of mock-ups that they put up to – as ideas to – that they think are good and you sort of say uhh-huh. And um – sort of squeezing them up. And I also thought when I first came into Scientology that um – a mental image picture was quite different from what it turned out to be. I thought they had to be as solid as this room.*

LRH: Hm-hm.

PC: *And it took me about three years to discover, that at first of all they weren't.*

LRH: Oh, all right.

PC: *And um – I always wanted to paint. And then I suddenly had a – I thought at the time – that period – that until my mental image pictures got better...*

LRH: Hm-hm.

PC: *... I-I wouldn't be able to paint or draw.*

LRH: All right. Okay. Now, have you ever done anything to a mental image picture? Pang-pang. There we are. There it is. Bang-bang

PC: *Well, that's a mental image picture of mine, of a whole big filing cabinet of what I call one junky piece of my bank that had all cobwebs over it ...*

LRH: All right.

PC: *... and I cleaned it up.*

LRH: You cleaned this up?

PC: *Hm-hm.*

LRH: All right. When was that?

PC: *That would have been September of 1959.*

LRH: All right. Thank you. All right. Is that all there is to that?

PC: *I think I whitewashed it.*

LRH: All right.

PC: *It was my reactive bank filing cabinets and I didn't like it very much.*

LRH: All right. And who failed to find out about this?

PC: *Well, you did. Any other auditor except the auditor who audited me at the time.*

LRH: All right. Did that auditor find out about it?

PC: *Yes. As far as I know. I told her I whitewashed it. I sort of got the con-*

cept of painting the outside to make it look clean.

LRH: All right. Thank you. And uh ...

PC: *The inside wasn't clean though unfortunately ...*

LRH: Oh, all right. All right.

PC: *... that still contained the junk.*

LRH: All right. Now, let's take a – take a look at this now, this question here. What about doing things to mental image pictures? I got the double reaction here. Very nice. Can you think of an earlier instance where you've done something to a mental image picture? There, you're right on something there.

PC: *Well, that was an auditing session in 1953 when I had some mental image picture of a procession of monks going to throw bodies into a volcano and I never got it back again and I blotted it out I suppose. I've never seen it again.*

LRH: All right. All right. Thank you. Let me check this question now. What about doing things to mental image pictures? All right. I got a slightly speeded rise there. Can you think of another thing you have done to mental image pictures?

PC: *Well, sometimes I have seen pictures and I didn't really like them very much, so I sort of said "Oh, goodness," and put a screen up or put a bit of blackness up or something like that.*

LRH: All right. Okay. Now, let me check this question. What about doing things to mental image pictures? There's the double reaction. A tiny double reaction. There's two reactions here. One is a wide one and this is a tiny one. We're getting

them both on this subject. There it is right there.

PC: *I was thinking of mental images.*

LRH: It's what?

PC: *I was thinking of mental images and images.*

LRH: All right. Well, have you done something to them?

PC: *Images? Not ...*

LRH: Mental image pictures.

PC: *Well, the only other thing I can think of, other than the fact I was thinking about mental images or images, was that I've not-ised them.*

LRH: All right. Very good. When's the first time you recall doing this? There it is.

PC: *I think it's this 1953 thing.*

LRH: All right. Very good. And uh ...

PC: *I didn't know anything about it before that.*

LRH: Well, is that all there is to that?

PC: *As far as I know. We never got the incident moving or anything.*

LRH: All right. What is this? A failed incident?

PC: *There was a couple of failed ones with that auditor. Was the first auditor I ever had in 1953.*

LRH: All right. Very good. And what didn't appear there?

PC: *Whether I had poked somebody's eyes out or got my own poked out.*

LRH: All right. All right. And who didn't find out about this?

PC: *Me and the auditor.*

LRH: All right. Very good. Now this is just a little test question here. Was there a missed withhold in that session? I don't find so particularly.

PC: *Hm-hm.*

LRH: You do think of one?

PC: *No, I think there was a missed withhold with him in another question – in another session. But I think that was got to.*

LRH: Well, what was the missed withhold in the other session?

PC: *Well, he told me to go to the beginning of an incident. And – but that equated to me "cry". So, for years I thought that every auditor who wanted to audit me, was going to get me to cry. And until this was pulled off me, I always had that consideration.*

LRH: All right. Very good. Very good. All right. Now, let me check this question again. What about doing things to mental image pictures? It looks clean. All right. What do you think about all this now?

PC: *It seems so innocent.*

LRH: It does seem innocent doesn't it?

PC: *Hm-hm.*

LRH: Your tone arm is down here to 2.25. Needle's a little floppier.

PC: *Hm-hm.*

LRH: All right. We're gonna check out a goal. Okay?

PC: *Hm-hm.*

LRH: I just took a random read off here, that kept banging. You may have some more, but we're not terribly interested, I'm just trying to get – get the thing going. Now, this goal that you had ...

PC: *Hm-hm.*

LRH: ... was "to go to war."

PC: *Hm-hm.*

LRH: Correct?

PC: *Hm-hm.*

LRH: To go to war. All right. Now, very rapidly, we're going to get in middle ruds again. All right. In this session is there anything you have suppressed, invalidated? And what's that?

PC: *I didn't think of invalidated, I thought of suppressed. I sort of was comm lagging a little bit.*

LRH: You got an instant read on invalidated.

PC: *Um.*

LRH: What did you invalidate in this session? There it is.

PC: *Well, I thought then, I hope it checks out all right. I'd hate my auditor to be – to be invalidated.*

LRH: Oh, all right. Thank you very much. All right. All right. I'm going to check the whole middle rud. In this session is there anything you have suppressed, invalidated, failed to reveal or been careful of? Thank you very much. It's all clean. Now, on the goal "to go to war," has anything been suppressed? That's clean. On the goal "to go to war," has anything been invalidated? That is clean. On the goal "to go to war," is there anything you have failed to reveal? There's a tiny slowdown there. Almost imperceptible.

PC: *There's a withhold I've – have got from the auditor ...*

LRH: Yes, what is it?

PC: *... that she hasn't had a chance to get yet because I haven't had another session.*

LRH: All right.

PC: *But I wondered, whether she'd be able to get me through it.*

LRH: Very good. All right. Thank you. On the goal "to go to war," is there anything you have failed to reveal? All right. That's apparently okay. On the goal "to go to war," is there anything you have been careful of? All right. Got an odd reaction there. I couldn't tell whether that was a read or not a read. What's this that's just happened here?

PC: *I was wondering whether it was reacting and I thought of that goal you found on me and wondered why you weren't checking it, too.*

LRH: Oh, all right. All right. On the goal "to go to war," is there anything you have been careful of? All right. That is clean. All right.

Now, we're going to say the goal a few times. To go to war. Thank you. To go to war. It read the first time.

PC: *Mm-mm.*

LRH: To go to war. To go to war. To go to war. All right. How much listing has been done on this goal?

PC: *About five sessions.*

LRH: Five sessions worth of listing?

PC: *Hm-hm.*

LRH: All right. How do you feel after five sessions worth of listing?

PC: *Oh, tremendously much better.*

LRH: All right.

PC: *It's made an enormous difference.*

LRH: All right. Let me check it again.

PC: *Hm-hm.*

LRH: On the goal "to go to war," is there anything that has been suppressed? All right. On the goal "to go to war," is there anything that has been invalidated? All right. That's okay. On the goal "to go to war," is there anything you have been careful of? All right. You got reaction on that. Probably my question fault.

PC: *No, I thought of, that I ran into a picture last time that I couldn't break through a barrier. And I'm – I've as if I've failed to reveal what's behind that.*

LRH: All right.

PC: *Couldn't get cracking on it.*

LRH: Very good. On the goal "to go to war," is there anything you have failed to reveal? All right. I've still got a reaction here. Can you think of anything else you failed to reveal on this goal? There it is.

PC: *No, that was um – to do with what I said to you before. Um – when I had to check Jenny's goal ...*

LRH: Hm-hm.

PC: *...I had to pull some withholds off on her and she had some on me.*

LRH: Hm-hm.

PC: *One of them was jammed up on a withhold of the sort of stuff that I had to give her and I felt a slight sense of perhaps having to pull my punches with her,*

just in case I restimulated – restimulated her with that type of withhold.

LRH: All right. Okay.

PC: *Second dynamic sort of stuff.*

LRH: Okay. On the goal "to go to war," is there anything you have failed to reveal? There might have been a tiny slowdown there, I'll ask it again.

PC: *Hm-hm.*

LRH: On the goal "to go to war," is there anything you have failed ... on the goal "to go to war," is there anything you have failed to reveal? All right. That's clean. Okay.

PC: *Hm-hm.*

LRH: On the goal "to go to war," is there anything you have been careful of? All right. That's okay.

PC: *Hm-hm.*

LRH: All right. To go to war. To go to war. To go to war. To go to war. How much listing would you say five sessions had amounted to? How long are these sessions?

PC: *Um – about two – two to two and a half, except one at one and three quarters.*

LRH: Yeah, all right.

PC: *We have it – have it up at seven a lot of the time.*

LRH: All right. And how much listing do you think had taken place there?

PC: *I don't know how many items. I should say there's probably about – at a rough guess about four hundred on each.*

LRH: All right. Okay. Thank you.

PC: *Maybe more, maybe less. I don't know.*

LRH: All right. Very good.

PC: *Hm-hm.*

LRH: Now, on listing the goal "to go to war," has anything been invalidated? On listing the goal "to go to war," has anything been suppressed? Okay. You thought of something late. You care to say anything about it?

PC: *Well, there's one set of terminals that I get that I call my gracious lady. And they get joked about rather a bit. I suppose you could say they get invalidated, but it's out of session. Not in session.*

LRH: All right.

PC: *And I invalidate the nice side of this. There's an opposition side that I also feel really friendly and affable and I don't approve of myself being friendly and affable, see, so I invalidate that side of the listing.*

LRH: Okay. All right. On the goal "to go to war," is there anything you have suppressed? All right. That is clean. On the goal – on listing the goal "to go to war," is there anything you have suppressed? Halt. I'm sorry I gave that to you wrong the first time, but on listing it, there is something that has been suppressed. What is it?

PC: *Grief*

LRH: All right. All right. Okay. Good enough. I'll check it again.

PC: *Mm-mm.*

LRH: On listing the goal "to go to war," is there anything you have suppressed? Okay. That is clean. On the goal "to go to war," is there anything you have invalidated? All right. That is clean.

On listing the goal "to go to war," is there anything you have invalidated? I got a reaction here. A little bit latent, but I had better get it.

PC: *I was thinking about the grief again. I always suppress grief.*

LRH: All right. You invalidated the grief? Is that it?

PC: *Yes.*

LRH: ... what you're telling me?

PC: *I suppose so.*

LRH: All right. Let me check it again. On listing the goal "to go to war," is there anything you have invalidated? Yes ma'am.

PC: *I was thinking I always invalidate grief in myself. I don't approve of being grieved.*

LRH: All right. How about this listing?

PC: *Well, I got grieved one day doing listing and I invalidated it.*

LRH: All right. Very good. All right. We'll check it out. On listing the goal "to go to war," is there anything you have invalidated? All right. That's clean. Thank you. On listing the goal "to go to war," is there anything you have failed to reveal? All right.

On listing the goal "to go to war," is there anything you have been careful of? All right. That's clean.

PC: *Hm-hm.*

LRH: I'm going to repeat one of these middle ruds here. On listing the goal "to go to war" is there anything you have failed to reveal? That needle just tends to stagger just a little bit on that.

PC: *Well, I got a picture of this great – this meteorite-size piece of lump of mest that I saw the other night and I didn't find out the whole story about it.*

LRH: All right. All right. So, here we go. On listing the goal "to go to war," is there anything you have failed to reveal? All right. That's clean I think, I think.

PC: *Can't think of anything else I've failed to reveal, except I've failed to reveal the whole of my bank to myself yet.*

LRH: Oh, all right. I'm going to check this again. On listing the goal "to go to war" is there anything you have failed to reveal? That's clean. Thank you. Sorry to give you one as thin as that but uh ...

PC: *That's all right.*

LRH: All right. All right. Here we go. To go to war. To go to war. To go to war. To go to war. All right. To go to war. All right. That goal must be either just about listed out or something.

PC: *Hm-hm.*

LRH: Something. It isn't reading now.

PC: *Was it reading before?*

LRH: Well, it bangs once in a while when I use it in the middle of a context or something like that. But if it's been listed that far, why it wouldn't necessarily be alive.

PC: *Hm-hm.*

LRH: All right. Now, I'm going to check the other goal ...

PC: *Hm-hm.*

LRH: ... the old one.

PC: *Hm.*

LRH: All right. To be an antisocial singer. Okay. That read. To be an antisocial singer. That read.

PC: *It would.*

LRH: All right. To be an antisocial singer. That didn't read. To be an antisocial singer. Okay. To be an antisocial singer. All right. That is not getting a reaction now.

PC: *Hm-hm.*

LRH: All right. Is there anything about the goal "to be an antisocial singer" that you have suppressed? That's clean. Is there anything about the goal "to be an antisocial singer" that you have invalidated? That is clean. Is there anything about the goal "to be an antisocial sinner – singer" that you – I beg your pardon.

PC: *I'd be too pleased.*
