SHSBC TAPES 201-300

Black/White Version (suitable for print) (BW, Black/White)
Compiled 4. February 2015
a) Table of Contents, in Checksheet order:

1. 62-08-09 GOALS LISTING ................................................................. 1
2. 62-08-14 ROCK SLAMS AND .......................................................... 19
3. 62-08-14 WORLD CLEARING PROGRAM ...................................... 37
4. 62-08-15 TV DEMO: 3GA DYNAMIC ASSESSMENT ..................... 55
5. 62-08-16 3GA DYNAMIC ASSESSMENT ...................................... 87
6. 62-08-21 FINDING GOALS BY DYNAMIC ASSESSMENT .......... 101
7. 62-08-21 BASICS OF AUDITING .................................................. 119
8. 62-08-22 TV DEMO: DYNAMIC AND ITEM ASSESSMENT ........ 137
9. 62-09-18 DIRECTING PC'S ATTENTION ....................................... 165
10. 62-09-18 3GA DYNAMIC ASSESSMENT BY ROCK SLAM .......... 177
11. 62-09-19 TV DEMO: TIGER DRILL .............................................. 191
12. 62-09-20 LISTING LINES .............................................................. 219
13. 62-09-20 GERIATRICS ................................................................. 237
14. 62-09-25 CURRENT TRENDS ....................................................... 254
15. 62-09-25 3GA ASSESSMENT ........................................................ 270
16. 62-09-27 3GA LISTING, PART I .................................................. 286
17. 62-09-27 3GA LISTING, PART II .................................................. 299
18. 62-10-02 3GA LISTING BY TIGER BUTTONS ............................. 315
19. 62-10-02 3GA LISTING BY TIGER BUTTONS, PART II ............. 333
20. 62-10-04 MODERN SECURITY CHECKING .................................. 353
21. 62-10-04 MAKING A GOAL FIRE .............................................. 369
22. 62-10-09 FUTURE ORG TRENDS .............................................. 387
23. 62-10-09 INSTRUCTORS' BUGBEAR ......................................... 401
24. 62-10-11 3GA GOALS FINDING, PART I ................................. 419
25. 62-10-11 3GA GOALS FINDING, PART II .................................. 435
26. 62-10-23 3GA CRISS CROSS ...................................................... 451
27. 62-10-23 3GA CRISS CROSS: FOLLOWING THE ROCK SLAM ... 466
28. 62-10-25 3GA CRISS CROSS DATA ........................................... 482
29. 62-10-25 3GA CRISS CROSS SECONDARY PREHAV SCALE .... 498
30. 62-10-30 PREHAV SCALES AND LISTS ................................... 516
31. 62-10-30 LISTING GOALS .......................................................... 532
32. 62-11-01 THE MISSED MISSED WITHHOLD ............................ 550
33. 62-11-01 THE ROAD TO TRUTH .............................................. 564
34. 62-11-13 THE DIFFICULT CASE .............................................. 580
35. 62-11-13 ENTRANCE OF CASES ............................................. 596

GOALS LISTING

A lecture given on
9 August 1962

Thank you.
Well, this is lecture two, Saint Hill Special Briefing Course, 9 August.
What's the year?
*Audience: 1962. AD 12.*
AD 12. All right, thank you.
And what I'm going to talk to you about is just – technically just listing.
Listing: How to list.
In the beginning, there was the Model Session. [laughter]

Now, what do you do in listing that is different than any other auditing? Well, you prepcheck the object of and the lines of the auditing command – every session beginning with a fast check. Got it? And I think if you do that, your number of items that you need to list out a goal will materially diminish. I think you'll find it saves its time over and over and over and over.

So let's put in the rudiments – the beginning rudiments – *bangety-bangety-bang,* and say the pc's goal, and to-be-a-tiger it. In other words, get the middle ruds in on it, fast. Get it to firing if we can. Of course, we go just so far, this thing is going to start firing latent, and it's going to expire one way or the other. But after all, it is our target. And to run somebody endlessly with his goal suppressed and invalidated and all that sort of thing is liable to require a large number of additional items and all kinds of other things in the session, don't you see? Other things might go wrong. You might even waste a whole session and not even recognize that you have wasted one.

All right. Now, the auditing command, of course, is the Who-What lines, of which there are four.

Now, I'm not going to try to give you a wording of the Who-What lines and say that will forever and always be true.

First you have finding the goal, in 3GA, and proving it out, and then you get to listing. And in actual fact, the first step of listing is to find lines that fit the goal.

Now, you've got a picture that you must comply with. And the picture is an outflow arrow and an inflow arrow – arrows pointing at one another. Draw a circle for the pc and then
draw a line going out from him and then the arrow ends, and then draw another line extending
that one, but its arrow ends are in toward the first arrow.

And then you have the retarding arrow of the first line, and then you have the retarding
arrow of the second line, and they're just arrows alongside the other two arrows – going
the opposite direction. In other words, you got four arrows here: One is going out from the pc
and one is going in toward the pc. And then you've got the other pair of arrows further out;
the first one is in toward the pc and the other one is out away from the pc.

Now, the auditing command that you want simply matches up the four basic flows.
Now, you see, there could be 16 flows listed, there could be 32 flows listed, there could be
128 flows listed. Don't you see? You could list and list – oh, wow! But staying with four is
the most economical, as far as we know at this particular time. But those four must be mean-
ingful to the pc; they've got to make sense to the pc.

Now, we want to know – we want to know – the first line is, "Who or what would
have it?" "Want it," "Have it" – I don't care which one you use. That's as far as the goal is
concerned. Then "Who or what would oppose it?" See, that's your outer arrow pointing in
toward the first arrow. "Who or what would oppose it?"

Now we've got to have specifically, "Who or what would keep you from performing
it?" or "doing it?" You see? And then we've got to find out, "Who or what would oppose its
being opposed?"

Now, how you get these words to go together is remarkable, and so forth, but they
must fire.

Now, the goal has a rocket read, and then so must the lines. You've got to have a read
on those lines. And the read on these lines must exist not because you've made a mistake on
the line. You recognize that you could write the wrong line, and so forth.

Do you know to date we have had three people, one of whose clearing was held up,
and two, that was loused up, right here at Saint Hill, because nobody paid enough attention to
the wording and value of the wording of lines? So this is not a light subject. This is a very
important subject. And it is the auditor's responsibility, not the Training Director or somebody
else's responsibility. This is the auditor's responsibility. Those lines are there and they've got
to fire.

In other words, if you read this line, "Who or what would want to catch catfish?" that
thing has got to fire on that, not because the goal is on the end, but the line as a major thought
has got to fire. That's got to fire.

Now, remember that the whole rash of free needles that we got out earlier this summer
were all listed on this simplicity. (I'll show you how simple it can be.) Line one: "Who or
what would want to catch catfish?" (Let's say this is the goal.) Line two: "Who or what would
oppose catching catfish?" Line three: "Who or what would not oppose catching catfish?" Line
four: "Who or what would not want to catch catfish?"

Now, those are the exact lines – the verb form changing on two of the lines to an
"-ing." And look, even though they were reaching madly and having an awful time on line
four, and scrambling around on it most horribly, they still made it, see? Now, it was only when, on one, (and I'm not saying this just to be mean, although the person who thinks – who is going to hear it in a moment will swear that I said it just to be mean) – the introduction of "your" into the line (unreported by the auditor) – into one of the lines prevented that line from ever going to free needle. Till one day I caught the thing up and found out that this extra word existed in the line, knocked the extra word out, had it prepchecked a little bit, and wham, all four lines went to free needle.

See, there was one line in there – I've forgotten which line it was, but it was something on the order of "Who or what would oppose your catching catfish?" Not "Who or what would oppose catching catfish?" See? Just the introduction of that "your" on one of the four lines. See, it wasn't on the other three. And yet this was listed this way by three auditors, see? And the first auditor was completely exonerated on the matter because nobody had formulated the lines at that time to amount to anything and we were just at the beginning of this level, and this auditor put them together as kind of what the pc thought they might be, you see? And there was a "your" in it. And that prevented those things from going to free needle. So, in other words, the wording of the line can prevent or achieve a free needle for that line. It is the wording of the line.

Now, our modern – more modern version seems to hit people much closer. And we have had at least one goal not go Clear on the old four lines, but be much easier to run, and is running much more easily, and actually on the original four lines just went up to 5.0 as the TA, and stuck. Right goal, but it just went up and stuck because these lines were not adequate to describe the situation, you see, and started moving again the moment the wording was changed to these lines which we are now using.

Line one: "Who or what would want to catch catfish?" Line two: "Who or what would oppose catching catfish?" Line three: "Who or what would retard" (or "pull back") "opposition to catching catfish?" And line four: "Who or what would pull back" (what is it?) "…from catching catfish?"

Audience: "Someone or something."

Oh, "someone or something from catching catfish?" Now, "someone or something" could of course be on all four – on at least two of the lines, or on more of the lines, you understand. But there is the pattern which we are using now. It's "pull back" and "pull back," or "retard" and "pull back," on lines three and four.

But the point is, the line has got to fire. You read the goal, "To catch catfish," bang! "To catch catfish," bang! "To catch catfish," bang!

All right. That read transfers over on to all four lines. And it is not true that it transfers on to just three of the lines and the other one isn't hot just now. See, it's because that line that is not firing is not quite right. See? You should be able to put these four lines together and get them all to fire. You say, "To catch catfish," bang! "To catch catfish," bang! "To catch catfish," bang! "Who or what would want to catch catfish?" Bang! You see? They've all got to fire that way.
Now, there are various oddball wordings which haven't worked. We run into the problem of the negative goal. Let's take the goal "Not to talk." "Who or what would want not to talk?" That's perfectly fine, isn't it? "Who or what would oppose not to talk?" That's good, isn't it? That's fine. We're just going along fine there. Now let's get to line three on the old wording. "Who or what would not oppose not to talk?" Double negative. Enterprising auditor, shift the double negative, of course, change it around so you don't have a double negative, that'd make it "much better" – she never goes Clear. And line four, "Who or what would not want to talk?" Now that's really becoming garbage as far as the auditor can see. Pretty gruesome.

But what do you know! Interestingly enough, it's perfectly comprehensible to the pc. Double negative – so what? Doesn't mean anything to the pc. The line means something to the pc, but that it isn't grammatically something or other was not a thing. So that first wording was perfectly okay and was all right to remain just as it was if you had a negative goal.

But this wording didn't work, see – double negative, that's all right, doesn't matter. But this wording didn't work: "Who or what would want the goal 'not to talk'?" "Who or what would oppose the goal 'not to talk'?" "Who or what would not oppose the goal 'not to talk'?" For some cockeyed reason it ceases to make sense very soon, see? "The goal..." "the goal..." "the goal..." Makes it grammatical, but – apparently makes it unworkable.

Now we'll get another one: Let's take the "-i-n-g" out of it. "Who or what would oppose catching catfish?" See? "Who or what would oppose the goal 'to catch catfish'?" Now, this one is important for you to know about, because pcs will try to steer you into it. It hasn't the least bearing on the situation. It doesn't go clear. Apparently this one lays an egg. But a pc tells you "that's real hot." The pc will tell you, "That's real good." And apparently it is for the birds. See the difference? It's a different meaning. "Who or what would oppose the goal 'to catch catfish?'" of course is just dandy. That sounds good, doesn't it? Well, it isn't the same meaning that you want on your list line.

We don't care about opposing the goal. To hell with the goal – why keep it in that realm? We want to know who would oppose catching catfish, not oppose the goal "to catch catfish." It's "Who or what would oppose catching catfish?" that clears the pc. See, that's the opposition. It's the opposition to action. Because remember, these are flow lines. When everybody – anybody tries to steer you away from a wording which you think is proper and so forth, in arguing it out with a pc, or figuring it out yourself or something, just remember this: These are actions. These are actions.

Now, of course, we get "want the goal": that's a kind of an inflow, isn't it? And that has always kind of loused me up. I don't know quite why an inflow word like want works as an outflow action of the goal. But it apparently keeps the goal in the item's head that has got it. See? But have, as far as I know – although I don't have too much data on this – have apparently works equally well. Apparently.

But it's what fires that counts. But what fires has got to be actions of the goal. It's got to be action. Because you're listing flow lines.
So this would be dead wrong: "Who or what would oppose people who had the goal to catch catfish?" This is dead wrong. That's – you want to know who or what would oppose people. Well, that's not the goal.

All right. Let's go a little bit further afield here. It's after all "catfish," isn't it? All right, so "Who or what would oppose catfish?" You're practically listing two lines at once. That's what messes up there. Because anybody who's trying to catch catfish is opposing catfish, too. And anybody who's opposing catfish is also opposing catfish, and you've got no opposition anywhere. So you might as well just do the one line for the two, don't you see?

And there we come into the liability of listing lines. Now, believe me, this is quite a problem, because you're liable to make this horrible mistake, unless forewarned: The pc is given four commands but actually only lists three lines. Now, look at the mess this gets him into. He lists twice as many items on one line and he lists no items on another line, and an equal number on the remaining two lines.

In other words, he overlists one line and doesn't list another line at all. And the pc is going to go round the bend. See, he's really going to get cooked with this one. Next thing you know, your tone arm is stuck, and you'll be saying it's the wrong goal, and everything is all upset. Well, the pc, through his own interpretation, can do this just fine. So the best way to handle this is have pcs draw you pictures.

Now, you want to draw the pc a picture of the one I just gave you and present this as a problem to the pc of how you're going to word this thing. Of course, you're going to word this thing with correct wording. If absolutely impossible, you're going to change it. But you're going to try to word it with correct wording. But you want to show the pc this thing. And it's this arrow that comes in toward him, and this arrow that goes out that faces the other arrow, and then this arrow that pulls back and then this arrow that goes out parallel to the other one. You want to show him those four arrows, and you're going to say, "That's oppose. That's opposed to doing your goal, and this is doing your goal, see, and this is keeping you from doing your goal, don't you see, and that's retarding the other from being opposed. But at the same time, we don't want this fourth line here to be the second line up here. Do you see how that could be? See, who would oppose you doing your goal? Who would – and who would not want you to do your goal?" Ooooh, those things are getting awful ghostly close together, aren't they?

But you got to have wording here that means these four flows, with regard to the action of this goal.

Now, goals are action situations. Even "Being a hound dog," as a goal "To be a hound dog," see – requires an action. The action is at least "to be." That's not much action, but it's still enough action to be action and it causes a flow. You say, "Who would want to be a hound dog?" and of course now you've got it pretty well made. Of course, there's some action a little bit added in there. And "not want to be a hound dog," see? You could get these things, you see, but they're still actions. "Oppose being a hound dog," that's guaranteeing action, you see? And "retard opposition to being a hound dog."

And these are very hard for pcs to wrap their wits around very often. Particularly when they're lying at the bottom of the GPM. There they lie, nobody has disturbed them on this
subject for millennia, you see, or trillennia. Nobody's even breathed it at them or mentioned it to them, and you all of a sudden come along and propound the philosophic principle of whether or not they're going to oppose or not oppose being a hound dog, you know? They've just never considered it. They'll be in this kind of a state: They know that everybody opposes being a hound dog. And that is the "truth." That isn't a fact, you see; that's the "truth." The truth of life: Life opposes being a hound dog.

Now, you introduce a brand-new idea. You say, "Who would want to be a hound dog?"

"Want to be a hound dog?" Good heavens, nobody's thought of that, you see?

Well, that's factually – they haven't thought of it for ages. See? And these other actions, the other three actions – . So they very readily steer themselves over onto one groove, if they possibly can, it'll be the flow they happen to be stuck on at the moment you get them to figure it out.

So their advice is worse than useless. But you want to find out whether or not they can answer it. That's what you want to know. That's why you consult them. You don't take their wording, but you want to find out if they can answer it. And then you juggle the wording around or do anything you have to do to the wording so that you can clear, you know, invalidation, mistake, wrong word, anything like that you want to clear on this thing. And after this line is cleaned up with a fast check on the mid ruds, like to-be-a-tiger drill – after this line is cleaned up, brrrrp, see? That – you say that line and you get pow! You get a read, see? You say the line, you get a read. You say the line, you get a read. Dandy. Here we go. That's fine, see?

Now you want to get the next one, so that when you say that line you get a read. Say that line, get a read. Prepcheck it out. In other words, you midrud the thing. You see, you get those mid ruds in on the line, and then test it. You'd be surprised how busy they are sometimes in invalidating lines, and all that straighten out.

So frankly, I've opened up a subject to you, you possibly haven't looked at very intimately, and that is the wording of a line to be listed. But that, second to the goal, is the most important source from which all clearing flows – is that line. And now, keeping an even balance amongst those lines as they list.

All right. Now, so much for this – this wording of the line. Your next step is to make sure that as you list, you list in Model Session, your rudiments are in without antagonizing the pc unduly because; you see, you can put the rudiments in so often that it amounts to no auditing, and then the rudiments go out, see?

So your basic action is don't list too long on one line. How long is too long? It's the exact – I'll tell you exactly how long you should list a line, exactly how long: as long as the flow in that direction persists.

Yeah, how are you going to know that? Well, short of an oscilloscope, you're not. An oscilloscope will show you the flow line. So you just pays your money and you takes your chance.
But I'll give you an indicator. This would be slightly overlisting a line, but would be safe. This is slightly overlisting the line by an item or two, but it's very safe: As soon as the pc says, "Uh – and uhhhh – ," change your lines. Go to the next line. Why? You've hit the null point.

You see, don't be under the delusion that the pc is thinking up these items. Don't make that mistake. He thinks he's thinking; he thinks he's talking; he thinks it's all going off, but actually he's just a wound-up doll. See, he's just firing off – . He couldn't help it. He practically couldn't help but give you the items, because they're being dealt. See? Because they're in – they're stacked in the GPM in that way. He doesn't think of any of them.

Now, if a pc is groping for the right wording, you've overlisted. "I mean a-uh-I mean a-uh-uh-ummm-uh, no, that isn't the right word. Uhuh-a uh-a big-a big-uh-uh, no, a big, big – a huge – uh-uh – a gargantuan – uh-a tr-tr-uh, let's see, a tremendously – no, that isn't – uh, tremendously large – ." Oh, man, you overlisted a long way back. You should just quit, see?

Now, that item will spew onto the paper, bang! Just without any trouble from the pc. And long times in listing sessions without many items coming onto the page is all caused by the auditor not judging the flows right. Comm lag of the pc eats up session. And if you keep the pc out of that comm lag – you just list in rotation: one, two, three, four; one, two, three, four; one, two, three, four; and don't let the pc comm lag or shut off an automaticity.

Well, the funny part of it is, is you mustn't have shut him off at "water buffalo," because it'd suppress the next two items. He can't help but say them, don't you see? They're just being dealt off the top of the deck, one, two, three, four, see? They're just coming right on up, "one, two, three, four, five, six, seven, eight, nine, ten, eleven, tr-tra-le-nun-nun," and then "a-ah – ." Shift lines.

Now, I'll tell you when you've listed too long, slightly, but not to the other degree: "I can't get the right word for it. I don't know what – ." Oh, you're way overdue, man! You missed the 5:15, you missed the 6:20, see, you missed the midnight express. No, here's the one: The pc says, "No, that's not it." You've gone over. You've gone over, right now.

He's invalidating the item he is giving you. Why is he invalidating the item he has given you? Because the other flow line is now meeting the direction of his attention and is overwhelming his attention so that any item he thinks up is of course being overwhelmed by the other flow line coming to him. Just like that, heh! It's very neat.

And you just listen to him, as he goes along on listing, and he says, "A water buffalo, a tiger, a Mindoro native, a pygmy, a uh-uh-uh-uh-a p-python, a uh-um-uh-uh-a deer. No. No. No, that's not it. Um-a uh-buck. A buck-uh-uh-no, no, um-a buck, uh-no. No, not a-not-not-not a-not a buck deer. Uh-um – let's see, now. Um – . Well, I c-ca-can't can't really think of the name of the thing. Uh-uh – a big – uh-a buck, uh-uh-uh-a v-a very lar-uh-a uh – . It's a certain kind of a deer they have down in Mindoro, a uh-a dak, – or u-u-."
Oh man, you missed the 6:15, the 8:30, the 10:20 – they've all gone by. See? That's the whole gamut. You have run the lot now, see?

Your first indicator was "and a uh – ." Well, out of courtesy, you could let him give it to you. He'll say, "a uh-buck."

And you say, "All right. Thank you very much. Thank you so much. Now, all right, we're going to start on the next line. And here we go." We've shifted gears, and we're now listing on something else.

That's really the way to get away from the pin fast, and your pc doesn't get suppressions, and you don't have to put in the mid ruds all the time and all that sort of thing. Just catch it on that first "ahh – ." And it's just handed to you on a silver platter.

He tells you, "This line has run as far as it's going to go, and is now in an eddy area, and is about to turn around and go the opposite direction." That's what he tells you with that "ahh – ." With the invalidation, he tells you, "It has already turned around and is going in the opposite direction, and anything I think of is being overwhelmed and invalidated by the line which is now coming the other way." See? And when he can't think of it at all, he's just totally overwhumped. Now the line is really racing at him.

But similarly – let me make this point again – it is a high crime to shut off an automaticity because he won't be able to get it again. This thing is firing off and you put a suppression right on the middle of the thing. He's going to tell you all of a sudden thirty items – brrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrrr
Now, you're going to get in trouble sooner or later because your lines are going to get ragged if you list to the comm lag. And that's liable to upset you. So you take one of those times when he's feeling very, very easy, and catch up a few items. And it's a nice balance which you do. But if it's straining him to think of any more items just to make you catch up, you abandon catching up. You got it? Because it's not a quantitative process, after all. It's the amount of flow, see? It's the amount of flow that we're interested in, not the number of items. And number of items is merely an approximation of keeping them level. That is a sloppy index of how much flow has been gotten off any one of these lines.

As far as checking the mid ruds is concerned, every time you turn around, you won't have to do it if you list this way, which makes for very fast listing. But if you make yourself a bunch of mistakes – this is really when to use the mid ruds, a fast check of the mid ruds, not a repetitive check. If you make a big mistake, and this pc is going brrrrrrr, and you say, "Thank you. Thank you very much! Yeah, thank you! Yeah, well I got that! Now, are there any other item that – a person or being there that would want to catch catfish?" And the pc is sitting there looking blanched, you know? He's been struck dead. He's halfway through an automaticity, and he can't get it out.

Actually, recognize what's happened to him. You've suppressed thirty or forty items, just like that. Bang! You didn't quite see what you were doing, you know? You didn't realize he was running off an automaticity and it was just tearing right on down the line, and you all of a sudden gave him a nice Tone 40 acknowledgment, see? Brought him into present time, put him into the session, crash, you see, all that sort of thing, and you just smell the rubber burning.

You make a goof like that, don't let him yap or get upset about it, just get in your mid ruds. Suppress – man, that is really going to be hot. You made him suppress the lot. Get the idea?

Or, if you were kind of sleepy and it was a summer afternoon, and you suddenly wake up to realize that the pc for five minutes has been sitting there saying various things like this: "Is it a large – a – a large tiger, a-a-a very – no, no, a tiger, a stri – a striped – . I can't quite get the word for this. A tiger with horns. No, that would not be right," and so forth.

And you wake up suddenly, the pc's been going on like this for about five minutes – be an awfully good thing to get in the mid ruds. In other words, the mid ruds are something with which you pick up goofs. And if you're really a smooth auditor you don't goof.

Now, how many items does it take per line to list a goal out? How many items? What an interesting question. It's almost philosophic in its impulse. It has a lot to do with how smoothly it was done, oddly enough. And the less smoothness it was done, the less in-sessionalness it was done with, the more items you are going to have. So therefore you can't say how many items should appear on a list as just a fait accompli. How many items, bang! You see? You can't say that. But you sure can say that it isn't going to be ten or fifteen. Ten or fifteen hundred? Now we're getting more into the zone and order of magnitude.

But speaking, then, we're only speaking for the first goal. How many is it for a second goal? How many is it for a third goal? How many is it for a fourth goal? Well, these things become shorter and shorter – these lines do.
So, how many clears the goal? Well, as many as you write down well and expertly to a point where the needle goes free. That's how many it is. And it certainly is not going to be less than a thousand, I don't think. We've got the third goal, I think you're still within that order of magnitude. But I'm just guessing there.

The first goal, seven thousand items on each line – I wouldn't worry too much about it unless the TA has gone up and stuck and has been stuck for a long time, or something like this, you see? I wouldn't worry about the number of items. I'll tell you what to worry about in a minute. But the number of items isn't something to worry about, you understand? Too few – God help us. Ah, no.

Now, of course you don't ever null these items, and the pc is going to ask you, "Why are we writing them down?" It would be an interesting question: Why are we writing the items down?

Well, my answer to that is writing them down is a better acknowledgment and it's a much better way to keep tabs on your lists, and there's various reasons for writing them down. But amongst them isn't nulling. We don't ever do anything with these items. I don't know anything to do with them.

Your pc at first will be rather puzzled as to which one it is. Well, of course, that's the joke. It isn't a "which one?"

He's been going a long piece of track on that Goals Problem Mass, man. He's had an opportunity to collect an awful lot of identities. And the identities which he personally has picked up has had the opportunity to collect an awful lot of enemies. And he himself has collected an awful lot of things which oppose enemies. And he himself has had a very interesting taste for things which prevented him from doing his goal. He'll begin to wonder after a while what possessed him. And all of these things combined make quantity. And the quantity is large.

All right. Now, let's talk about how long a line is listed. It is listed exactly to free needle. It is not listed one item beyond free needle. Hear me now: not one item beyond the free needle. Needle was free. Now, the proper conduct of an auditor, when observing a free needle on a line, should be professional. He should not suddenly get hold of one of his favorite valences of a rodeo performer, start bucking about in the chair and trying to put a quirt to the E-Meter.

"A free needle! Ha-ha! Hey-hey! Ha-ha! Ha – that's enough, it's a free needle. Hey, do you want to come around and see this?" [laughter] That is not optimum auditor conduct. It's all right, because we can run the suppressions off. But you'll feel like that when you first see one.

You go to the next line and list it to free needle or, if it doesn't go to free needle, until the flow runs out as usual.

Sometimes one of them goes free, and three of them will stick for a while. Some of them – then you've got two free, and the other two are sticking. And then sometimes you've got three free, and one is all hung up. And then eventually it goes free.
Well, the way to do that is you keep going one, two, three, four, see? This thing is stuck. This line is sticky; it's not free. Come back here to your next line in sequence, see, and put one, two, three, free needle, see?

Now your needle is free when you go to your next line; your next line doesn't upset it at all. Now, I can't lay down a rule absolutely here, because it may not make the least bit of difference. But if it – you said the line to the pc and you get no needle reaction of any kind whatsoever and nothing happens to the needle, it might be very foolish to list it. So we go to the next line and we read the thing off and there's no needle reaction of any kind to it, you see, and the needle is still free. And we come to the line we had that was sticky in the first place and it's still sticky; now we list that thing on down until we get to a comm lag, and it's still stuck. Well now, which line do we come back to next? Because nothing is cooling this thing down. Well, you'd better check them, hadn't you?

Now, it won't upset anybody if you put one item on each one of these lines. Now, we're into a completely questionable area of what is the right thing to do? Experience will tell what is the right thing to do. I can't give you a packaged answer, but I can tell you this: is don't list beyond a free needle! Because it's quite upsetting. It's like asking for a rudiment answer when there isn't one, see?

And if I were to lay down an operating rule for myself on this, as something I would now be guided by, I would wade myself through this. I would read these other lines and see if I could get a stick, or a fall, see? Something. And I'd get an item. And then I'd walk back to the line that was stuck, and I would list it till I got a comm lag. You get the idea? And I'd walk myself through this. And if I had three lines, all of which were giving a free needle, I wouldn't test all three in rotation every time. I'd test one after the other. In other words, I'd take the sticky line, I'd list on it to a comm lag, and then I'd choose another one of these lines – not the one in rotation; I'd skip a rotation, see? And then I'd list some more sticky needle and then I'd choose the third one that was free and test it now. You know, I'd just walk my way through this, sort of like on eggs. You get the idea?

And I wouldn't list those lines. My instinct would be agin it. If I couldn't get a fall or a stick or any needle misbehavior on it, I don't think I would – I would touch them. I'd ask them the pc – I'd ask the pc if he had any items on these lines, but my auditing command would not be "Who – or – what – would – want – to – catch – catfish?" "Can you think of anything right now that – anything, anybody, want to catch catfish? No, you can't. All right. Thank you. Huh-huh, that is – that's fine. Thank you very much." Get off of there, see?

Pe said, "Yeah, I just thought – uh – game wardens catch catfish every now and then." And then you've set it down, see? All right. He just gave you that gratuitously; that's to keep from missing withholds.

You're at a touchy end of the case. And obviously to you it isn't a touchy end of the case at all, because the pc is now practically Clear and a Clear can stand anything. That might be your reason. If the needle is this free, why, doesn't matter how we treat the pc, is it?

Well, that's the wrong kind of thinking. Because right at that stage of the game it is rather edgy, because you could take one of these free needle lines and you could list it right
on into a hole. In other words, you could stick it all up again. It's already happened here. Don't think I'm just dealing on theory only. Overlisting has occurred.

All right. That's enough for that. You can certainly list through to free needle on four lines.

Now, if one line consistently and continually hangs up, and you can't make it go free, then you investigate the living daylights out of what is wrong with that particular line and see if you can find anything wrong with it at all. And see if you can get any variation of wording of that line to fire nicely and neatly, and continue listing on that new wording, and that line will go clean. Okay? That's in case of emergency. Because there might have been, throughout, something wrong with that one line. See, you might have missed it. Already been done here, so it can happen. Three lines went free, one didn't.

Well, when that happened before, "your" was in the fourth line. That "your" was enough to keep that line from going free. And an examination of it – only took a couple, three sessions of listing after that, and all four lines were free, just like that, see? So, suspect that if you get too much an inequality of this, and it's hanging on too long, don't let it go for months; look into it. Okay?

Audience: Mm-mm.

All right. Now, what are the dangers of listing? Number one, listing is auditing. It is auditing and must be treated as such. It is the only therapeutic action undertaken to free a goal – is merely listing. The pc does not give out these answers analytically, no matter how bright and alert the pc might act. They're all being dealt off the bottom of the deck, all out of the reactive mind, and you must not worry as to whether the pc is inventing answers or dreaming them up or thinking of them analytically or anything else. Just be calm about this. Look, there are enough things to worry about in auditing without inventing things.

No, just take what the pc gives you, man. Keep the session going and relax. See? All right.

Now, as you are starting in with the goal, you have a period of danger. And this period of danger begins at the moment of finding the goal and is over when you have proved beyond doubt that this goal, while being listed on all four lines, turns on pain on line one, sensation on line two, a little more sensation than pain on line three, and a little more pain than sensation on line four. And when you've proven that to your own complete satisfaction – .

Well, look, I – you're looking at me as though I should detail this more, but figure it out for yourself, man. Figure it out for yourself. Lines one and three belong to the pc. And lines two and four belong to the enemy. And the enemy is sensation and the pc is pain. That's easy. And unless you get that optimum condition of affairs, that goal is wrong. And you better get off of that, hotter than hot and faster than fast.

Line one – here's what makes a goal wrong: Line one turns on sensation. "Who or what would want to catch catfish?"

"Who or what would oppose catching catfish?"
"Ouch! Oh, what a terrible pain went through my head. Oh, what an awful pain in my back. Oh, dear, dear, dear. Ohrarr. Ohh, my – ouch!" See?

It's the wrong line! That should be turning on sensation; it's turning on pain.

And we get to line three, which is the pc's own line again, since it's an allied line, and the person says, "Nyoom! Oh dear, still very dizzy and so on, so on and so on and so on and so on. Very dizzy, and there's this little tiny pain in my ear, but that doesn't amount to much. Sure makes you dizzy, doesn't it?"

And he gets to line four, "Who or what would pull back your goal?" – you see, that's the enemy, man – and, "Ouch! Urp! Pain went through the back there. What was that?"

Now look, that condition as a purity seldom exists. It won't exist for very long. If you continue to list this it all becomes sen. Everything gets to be sen. But if you go too far on this, everything goes sen. The bank starts to become hard, beefy, lumpy. The person wakes up in the morning and the ridges he usually had are now really ridges. We're getting an exaggeration of the situation. That bank is becoming heavy. It's like running Creative Processing without having the goal "To create."

And the pc will wake up in the morning, actually, and he'll feel like there's a board going through his head, see? Something like this. And he's – . And it all turns into sensation. It's all dizzy, groggy, pressures, nausea, misemotion. Starts to feel like that after a while – he didn't do anything to high blood pressure, probably, but he starts to feel like high blood pressure would be much more comfortable. You see, all four lines go to sen. That's an interesting item, isn't it?

Now, if all four lines went to pn, I wouldn't worry. But if they all went to sen, to hell with it. Get out of there. You're wrong. I don't care what you think, you're wrong! You got it? I don't care what the pc says. That's the wrong goal! Yeah, it read! Yeah, it's fine. Yeah, it checked out. Yo. Yo, we had three Instructors and the governor of Australia check it out! [laughter] I don't care about all those arguments! The line is wrong! Because that is the final proof of a goal. You got it?

You haven't got a goal until you have listed it two or three hundred items on each line, as the auditor. And that will save your bacon. Of course, if it checks out beautifully, pc got pain on it, bang, and so forth, you're pretty sure, aren't you? But the final test of any pudding is the listing. You go two, three hundred items deep on this thing; if it's turning on pain in the right places and sen on the right places, and that sort of thing, oh boy, you're in. Go for broke.

Now, the only thing could happen wrong is you start listing with the rudiments out. Something crazy goes on in the pc's life, he's got PTPs like mad or rudiments are wildly out, or something of the sort, you see? And on a minor way – you see, checking the goal out every time is just a way of speeding this up. It won't prevent clearing, and checking the lines out won't prevent clearing by listing. They just slow it down.

But a wrong line will. A wrong line will prevent clearing. "Who or what would try awfully hard to oppose catching catfish?" And the next line to it is "Who or what would not want to catch catfish?" you see? And the next line down the line – all out of position, see, all misworded.
It would be too cruel an experiment – I have seen this in actual action – but you can take four lines, check them out, and then throw one. Now it will fire on a suggestion and an invalidation, see, and a mistake. You can get it to fire, of course, just like you can get a goal to fire. And now insist on listing that line. "Who or what would know he had to have to catch catfish?" And then put all the other ones down correctly.

The action of doing something like that is to bring the TA up to a stick. It's almost exactly 4.5 to 5.0. Almost always. I haven't ever seen a tone arm on a misworded line, or mis-listing, or ARC broke sessions, or over-listing in sessions – the errors you can make, in other words – that on goals listing didn't go up to 4.5 and 5.0. I'm quite prepared to see one go up to 6.0, or to 7.0, or 3.75. I'm quite prepared to, you understand. But it just happens that every one I've seen have gone from 4.5 to 5.0 and then stick. They'll stick at 4.5 or they'll stick at 5.0. And more have stuck at 5.0 than at 4.5.

So when your tone arm starts lingering around 5.0 for a session, and next session lingers around 5.0, don't be surprised if the third session your pc all of a sudden says, "Well, I was awfully dizzy. I was walking down the street, and I saw the buildings sort of reel." You're doing something weird. Something wild is going on here. Something's happened. You got to straighten it out.

Now, what straightens out? How do you straighten one of these things out? Well, you locate what's wrong. You better check out the goal and get it to fire again if you possibly can. Check out the lines, one after the other; see if there's any disagreement from the pc on these lines or these wordings. That's quite important. You're not going to change them around just because he disagrees with them, but you're going to sure make it answerable, if you can. Check out your sessioning in general (which isn't really enough to keep it all hung up) and just straighten this thing out and get it to rolling again. That's what you're going to do.

Now, look: If you can't straighten the goal out after you've listed a couple hundred, if it ceases to fire after two or three hundred items on each one of four lists, it's sort of "Which way did they go? What happened?" You got to get it back to firing again. Of course, if you can't get it back to firing again, it was probably the wrong goal in the first place.

The method we're using to find goals right now rather makes it very difficult to get a wrong goal. That makes it pretty difficult for you to get a wrong goal or run a wrong goal. That's the beauty of it, and why I love that method. Ease of auditing and positiveness of finding the goal were enough to have this. And that's not why I'm happy about it. It used to be that only an Instructor or somebody who was specially trained in that little tiny technique of checkout – we could absolutely rely on the fact that it was the right goal.

Now, any of you guys, if you're good enough to do nulling by mid ruds down to a point where you find a goal, you're so used to checking them out that checking out a goal doesn't faze you anymore. You'll be able to actually look at a goal and say, "Well, boom, let's check it out." Brrr, brrr. "To be a tiger" tzal-tup, bang, thud, bang. "Yup, it doesn't fire." See, that'd be all there was to it, you know? "Let's see, is there a suppression on there? That goal been suppressed? That isn't a goal." See? Positiveness enters into the picture. And that's going to save an awful lot of bacons.
So, preventing the wrong goal from being found has been quite a campaign I've had to engage on for here for quite a while, and actually it was – what was marvelous is that this new nulling by mid ruds, not just for its value for the auditor, but to prevent wrong goals from being found, is worth its weight in planets, man, and that's pretty heavy.

Now, this idea of finding a goal, finding it firing, and saying that is the person's goal or agreeing that it is the person's goal – that's perfectly all right, because it can be run out. It's an assertion, see? That's all right. But when the pc keeps saying, "No, it isn't my goal" and the auditor keeps saying, "Yes, it is your goal," a ridge is built up which is pretty hard to take apart. And it will keep a goal firing. So don't argue over somebody's goal or you'll make it fire and fire and fire, and it's not his goal. You get the suppressions, invalidations off it – he'll agree with it if it's his goal, and if it isn't his goal, he won't.

You could find an opposition goal. This is the other thing that could be wrong. You could find an opposition goal. Now, I don't know that by nulling by mid ruds you will find an opposition goal. I don't know too much about finding opposition goals, as distinct from finding goals. I can't give you much data on this, actually, because I've never seen an opposition goal that would fire after it has been prepchecked and nulled by mid ruds. You understand? So there's always the possibility that opposition goals actually only fired because they were invalidations of the goal or something. You get the idea? And they might not have had rocket reads on them at all, you see?

And somebody the other day came up with a reverse rocket read on a goal, and immediately proposed it was probably an opposition goal, which I thought was very interesting. So if you see that sort of thing, let me know. But I don't know that you can get a rocket read on an opposition goal. I don't know that it isn't just the invalidation of the goal that makes the opposition goal fire.

Well, there's – you're fairly secure if you have found the goal and checked it out. But don't be too cocky until you've got two hundred on a line. And if you found a goal and then turned it over to somebody to list, remember to reach out, by the time they got three hundred on each line or something like that, and say to the pc, "How are you doing? How do you feel? All right. When they ask you so-and-so and so-and-so, where does the somatic come?"

And the person says, "Well, it's so and so on."

"Now, what kind of a somatic is it? Is it a sensation, or is it painful or what is it? And what line is it on?" And check it all out yourself, you got the idea? You know, don't read the Auditor's Report. That's a good prevention.

Otherwise than that, you realize that somebody who is trained to HCA level could be quite competent in listing. And listing is the longest part of clearing. So if you had somebody helping you in auditing and you kept your eye on the situation, a person with less training than is necessary to find goals could list goals, and because he was doing this sort of thing and doing some Prepchecking and so forth as he went along, he would actually get up to a point where he could locate goals. So it's a good training school, listing is. See?

Now, that lengthens the number of people you could clear by three or four times. Savvy?
Now, you got to know all about listing and you should list somebody to Clear just to see how it looks and get the experience and that sort of thing, but I don't expect you to list every goal to Clear that you find. It'd be a much more economic situation for you to find the goal and then keep your eagle eye beagled on the somebody who is listing it out.

Now, how about auto-listing? Well, there is no telling. I won't say that auto-listing is impossible. I don't – I don't believe that it is possible or impossible, at this particular stage of the game.

I believe that it would be better than nothing. Let me put it that way.

But to tell somebody to go home and list on four lists and you will look into it in a couple of weeks, it seems to me like it's sort of taking his life in your hands! You know? I wouldn't be sure at this – about this at all. But I would say this – I would say this: that if you were on a desert island and you knew your goal, and you knew exactly what the goal is and it'd been expertly checked out – and there was absolutely no way under the sun for you to get Clear any other way, I would say that you should pick up a pencil and a piece of palm bark. But we would know more about that in due course.

Now, these are the various ramifications to listing. Clearing itself consists of the cycle of finding a goal and then listing it until you have a free needle on each of four lines, finding another goal and listing it on each of four lines, finding another goal and listing it on each of four lines. And the state of case is regulated by the number of goals the person has which have not been found and listed. Those are damping factors.

Now, here at Saint Hill it's fairly simple to make a first-goal Clear – not simple, but with heroic activities (let us put it that way), we can make a first-goal Clear.

Now, to find a second goal on a pc, and list that one out – this is getting much more difficult. We have just now found and checked out a second goal on Jean, and that was very, very good news that I was very happy about. And at least it was stated to me in so many words that it was checked out today. Was it?

Female voice: Hm-hm.

Yeah. All right, that's a second goal. Okay, now she's got a little time to list on this second goal. And I think they possibly even may list it out because the listing, very possibly, is much shorter than a first goal. But we know more about that in due course.

She's already starting to depart from the standard state of Clear, or such a person is already starting to depart from what we have considered Clear. They're starting to move up into Theta Clear or something like that, and it's an adventure from there on out, because these various states, now, of course are not regulated in any way by different processes to different conditions. It's a gradient scale of the same condition all the way, of course.

Now, I can't even tell you how many goals it is to OT. See? Or how long it'd take you to find and list each one of these goals. I was very happy to find today that the second goal would fire so nicely. Nice. I was told they had good rocket reads on the thing. See? I was very happy about that.
Somewhere up the line, why, the goals are not going to stay in. They're going to start blowing. But how far do you have to keep the goals not blowing to get OT? See? But that's – that is the road that we are on, basically. And it's a repetition of the same action.

The only improvement which I see in auditing which is coming immediately up, and so on, is a mechanical improvement. That is to say, a persistency of read – devices to make a read more persistent and therefore more observable by an auditor.

I don't see any changes to amount to anything on clearing as such. I do see some dodges one could do to probably shorten up finding a goal. And I see some frills one could add on to listing that would possibly shorten the thing up one way or the other. But I don't look for any fabulous advance from that line. I don't. Because there are certain limitations that you hit, and the limitations is that the person has got just that much case, and they have to sit there just that long, and they can talk just that fast. Get the idea?

All right. And maybe when we're all OT, why, maybe we'll look back over the whole thing again, and we'll say it would have been much easier had we done it this way. And I hope that we're in that condition and don't have to do it some other way.

Those are the improvements I look for in clearing. I really don't look for many other improvements. But I do look for improvements that will take little shortcuts – little faster, something that is more valuable to do this than to do that, you know, little things along the line.

And we may carve it down, we may carve it down considerably. We may use various systems of auditing. Just given you one tonight: You find the goal, let an HPA list it, see, under your eye. Therefore you've lost two hundred hours of auditing, just like that. Various other mechanisms of this character can be fine, and we can step it up into quantitative clearing. Our problem now is quantitative clearing.

My immediate problem is to get some of you to read an E-Meter better. Well, I'm solving that with drills and attention and various things, and I'm also double-solving it by making sure that a persistent-read E-Meter comes into existence in the very near future that can be hooked up to a Mark IV and red lights go on and pinball's dials go around when you hit a read, see, and it stays on until you do something about it or something like that. [laughter]

But I have actually no quarrel – no real quarrel with your drills, no real quarrel with your auditing presence, no real quarrel with these things. I see just this metering that's being a problem. And we'll get that licked.

I have a problem of how many – how many of you can I push on through to first-goal Clears in a space of time, when the fellow alongside of you can't read an E-Meter and neither can you. You know? Some of you are in that condition, and that's worrying me. I got these various problems, but I haven't got any technical problems now. I haven't got any. I'm not even worrying about what's in the guts of this meter. I just told them, well, what we need is an idiot meter. You have an on-and-off switch and a red light. When you say something to the pc the red light goes on. Or it doesn't go on. And if it goes on you clean it up, see, and if it doesn't go on, you don't clean it up. Idiot meter! These things we'll have. These things we'll have.
I can undoubtedly find where we can best expect the goal to appear on a list, and therefore cut down the number of goals we have to null in order to find the goal, you know? Do various other tricks of this character. But as far as technology is concerned, we got it made, and you're doing it. And the only thing some of you are doing wrong is you're missing a few reads, see? Well, that's all I got to cure, so that's easy. That's that.

Thank you very much.
Thank you.

Well, here we are, Saint Hill Special Briefing Course.

*Audience: Fourteen. Fourteenth.*

Fourteen? It isn't.

*Audience: Yes, it is.*

How did you get into the 14th when I'm in the 16th?

*Voice from audience: Bit of a comm lag.*

Fourteen August, AD 12. Lecture one.

This is on 3GA-goals: writing and finding goals.

First and foremost, there is the detailed theory which could go back of this. Once upon a time there was a thetan. And he couldn't go forward, and he couldn't go backwards, and he had to stay there and he mustn't stay there.

And at that point he got overwhelmed and received further orders to evacuate and then further orders to advance, and then orders to stay there.

And having done all this, he then caught the barrage. The barrage came in from in front, you see, and he was putting out a barrage himself in front and this would have been all right except his own artillery started to lay shells into his position at which moment he again decided he had better evacuate.

But he couldn't carry the orders out, and there he is to this day – rock slamming. [laughter] The mechanical importance of a rock slam is based something on that. It's a can't go, can't come, can't stay, can't be, mustn't be, you see. It's all that.

And, in short, is a highly charged agitation. Originally, on the 20th ACC, when I was doing assessment on people's goals, this manifestation during this assessment was so strong they called it the rock slam. And actually at that time you used to go down this chain to find the rock. That is how you get the word *rock slam.*
Now, in finding goals here during 61 and 62 so far, we have had a new manifestation that was not particularly known or understood, and that was a dirty needle. And a dirty needle is only a little, tiny, persistent rock slam. That is all a dirty needle is.

So I've been spending the last week or so on very hard study of rock slams – very, very hard study, and gratuitously there dropped into my lap a criminal of the first order with a record and so forth, who I knew – mind you, I integrated this data after the interrogation and – but I knew it within this span and area – that the fellow was guilty of a tremendous overt. He had been stealing everybody blind left and right, and the overts were particularly against me.

And I was able to see a rock slam turn on and off on this one fact and it was very interesting. And of course, he was trapped, too, and it was not a goals manifestation. It was simply this fellow was guilty of everything under the sun, and I had big rock slams and little rock slams and all kinds of rock slams – the dominant one about seven-eighths of a dial wide.

And I found out something very interesting about rock slams. That you can appear to clear a missed withhold off of somebody with a great big rock slam and have it dirty as can be. The needle just isn't registering right when you've got somebody with that large an overt.

You can miss withholds, you can do all sorts of things because the concentration is on the rock slam and the concentration is not on the auditor; and it takes superlative TR 1 to get by this and make a needle register at all.

You understand this rock slam has been rock slamming like mad and now it isn't rock slamming and you ask him if you missed a withhold, and you get a clean read. Have you missed a withhold, man! Oh-ho! You've just missed all the crimes in the book, see. "Have I missed a withhold?" and you get a perfectly clean read. That's quite interesting, isn't it?

Well, I was able through various fortuitous circumstances after this interrogation to actually run down the fact that this person was guilty without any slightest doubts. I found other corroborative evidence, you see.

And I began to understand this needle better. I began to understand this a lot better. As a matter of fact, I got all the dope necessary to prove it utterly and completely.

But as far as your interest is concerned, well, this opened up a new horizon because I didn't have just big rock slams, I had little rock slams. And I had dirty needles and I had all kinds of things here. It was a most fantastic pyrotechnic array of this and that you ever heard of.

Well, this was quite interesting. And it's terribly interesting to you. Because for the first time it dawned upon me that a rock slam is an overt. Therefore, a dirty needle is an overt.

Now, you chase these things around in Prepchecking, and you go round and round and round and round with these things. And you usually can find a series of overts that clear them off the needle. You can usually find this. The auditor or Scientology or something like this. You can fool around with it and actually get some current life overts that will clean the needle, and then you go back soaring on down the goals list, and the next thing you know, you flub; you make a little mistake.
You passed by a goal without cleaning all the somatic off of it which is a very hot goal. You do your Tiger Drill poorly, and you've got bzzz-bzzz-bzzz-bzzz. And you go down goal after goal, and this rock slam keeps turning on – well, you missed the one that turned it on, you see. You didn't catch that so you – the next goal to it starts persistently rock slamming, and – and you get down four or five goals for it, and the doggone thing sounds like a buzzer alarm system going off, see. It's really fanning the air. You've missed one.

Well, the point is this: That's a little rock slam, see. It's a missed withhold.

But the mechanics of a "Failed to reveal" are simply the still point which follows the Confusion. You've still got the stable datum and the Confusion. The Confusion comes first and it holds the stable datum in place.

You find somebody with a stuck picture, don't audit the stuck picture. Find the confusion that preceded the stuck picture, and the stuck picture will blow. It's quite interesting.

You got somebody there looking – this is actually old data I'm giving you. This is from back last – over a year ago on this course. It's been around for quite a while. But the stuck picture is there gorgeously and this fellow was looking at a telescope and it just continues to sit there. And you can hammer it and you can pound it and you can do this and that. It's quite wonderful that you can address it directly and ask him to take responsibility for that picture and something will probably happen with the picture. Now, that's quite remarkable.

But of course, what is an overt but an irresponsibility. An overt is an irresponsibility. Therefore, by taking some responsibility for the stuck picture, you can make this picture move. That's the only button that will make the picture move – one of these really stuck pictures, see. It's just, "What part of that picture could you be responsible for?"

All right. But if you really want to blow that thing off the track – by the way, don't monkey with these things. This is all experimental data I'm giving you. If you stop in an auditing session as some auditors were doing last year before we grabbed them by the nape of the neck and hauled them out of the auditing chair and squirted seltzer water through their ears a few times, they would just see a stuck picture, you know, and they'd stick in the session – just a total Q and A, see.

And they'd right away start handling this stuck picture, you know. Oh, this is marvelous. Session would go to pieces in a balloon. They – you know, they Q-and-A with a stuck picture, so they've stuck the session there.

Well, if you want to get rid of that thing – this is still just background music, you see, because you don't – it'll all come off in due course and you got no business monkeying with it.

But if you were to look just a bit earlier than that, maybe minutes earlier than the picture occurred – it's right close to it – it isn't 15 years before the picture; it's more like 15 minutes, you know when you get that sort of a thing.

And you'll find a confusion there, and then if you just picked the overts the guy committed out of the confusion, why, the stuck picture will go.

Sometimes it's enough just to locate the confusion, you see, and it goes.
In other words, a confusion is followed by a still. Stills do not exist without prior confusions except in the case of a goals postulate. There must have been a prior confusion for a still. Yet you wonder why cultures in various nations have settled down and are so fixed and so rigid. Well, it's very simple. Those cultures are that way because they have prior confusions and they're stuck.

Now, if you want to really lay in a culture, see, if you're up track someplace and you're giddy enough to create a new civilization someplace or another, and you want it to stick a la Roman, you know – the Romans really made their postulates stick, man – why, you just make the whole confounded, cotton-picking area so confoundedly confused that nobody can find which way is up. And then make the people commit an awful lot of overts and then suddenly settle in a still series of mores and customs. They'll stick. They'll stick.

That's how a legendary figure such as Quetzalcoatl can suddenly walk in on a barbaric and murderous scene and put out all of the rules of warfare, see, and rules of agriculture and so forth, and have those things go floating right on up the track – just totally stuck, see. Get the idea?

The situation must have been terribly confused with a lot of overts in it before you got this stuck situation. You can settle your mind to that. Now, that is one of these very large, very important Scientological truths. If you don't know that one in auditing sometime, you won't know what the dickens you're looking at. And it's a piece of understanding you should have.

Now, you know very well that this fellow committed a whole lot of overts of some kind or another and sooner or later he's going to hang up in a still. And well, he went around, and all he did was kick people. He used his left foot and he kicked people. And he kicked people and he kicked people and he kicked people, and he now has a paralyzed left foot. See?

Well, there was a lot of motion, see, and a lot of confusion and then it suddenly settled down and he decided he was guilty or something like that, and there it is. That's the chronic somatic you're trying to handle, see. This fellow walks in and says, "I understand you're a Scientologist, and like all other doctors, why, you're supposed to cure things."

And you say, "All right."

You're knuckleheaded that day. You got up on the wrong side of the bed and you're just plain stupid, you see? And in your effort to please, why you say, "All right. I'll fix up your lumbosis," you see. Well man, he's been stabbing people in the lumbosis for an awful long time. And it has happened often and frequently, and so forth. And you still could move around his lumbosis somewhat.

But if you tried to do this in the absence of pulling overts, you wouldn't get anywhere. You could cut it out, which is what the doctors do. It's still got the engram, but now it's in an alcohol jar.

And the guy now has somatics where it was. Marvelous. But this is back of all illness, all chronic states, these principles. They are what makes chronic states chronic. Now, an aber-
ration of a human being or a miller moth or a man from Mars or total foreign alien personality, such as governmental figures – these fellows have aberrations.

And prior to those aberrations, there were confusions and overt – and the business of settling the confusion with an overt, which is the modus operandi of our existing cultures here on Earth. You always settle the confusion with the overt, you know. Guy disturbs the peace; they throw him in jail.

Eventually the society will get more and more stuck in an aberration which they begin to mistake for culture. Oddly enough, culture – well, let's not say culture; let's say politics or a political form – is an aberration caused by the collective overt of the citizenry. And you actually could forecast very accurately the next political government or political form of any nation by an examination of the overt of the individual because the next government they elect, they will try to make those overt legal.

So you just figure out what the most common denominator of overt – interesting game. You could sit around and fool around with this and you come up with some of the darnedest answers – you just examine what is the most common overt and then realize that the eventual culture will be one based on the legalization of that overt.

For instance, they – they try to lessen the overt one way or the other by freezing something into line. They lessen an overt by freezing into place a motivator and there's all kinds of mechanisms involved in this, but the general law is: is you just figure out what the collective overt is and the next political form will be one which legalizes that overt.

I'll give you an example. A criminal has to come to the conclusion that property belongs to nobody. There is no such thing as private property. He's got to come to that conclusion, see. Otherwise, he would be guilty of so many overt, he couldn't live with himself. What was the crime rate of Russia before the 1917 Revolution? Yeah man, it was big. It was heavy. And the Russki legalized theft by saying there is no property. See?

See, that's the ideal criminal, political form. I'm not anticommunism as – if I was talking to a couple of communists now, I could fry their hair. I don't say I haven't in the past. I've converted communists to Royalists, and so forth, because in the form of politics, you see, it is only opinion and aberration. There is no wisdom.

If you could figure out that the overt in any state which has become a socialized state must have been weakness. It must be of an omitted participation – a weakness, see. Because now all of a sudden they've legalized weakness. They pay it. Weakness is now paid. Do you get the examples?

Audience: Mm-hm.

Well, this is aberration on the third dynamic. Well, this has an awful lot to do with clearing. Every once in a while, I'll run into a phenomenon and stumble over it and fall over it and bump my head over it and bung my toes up on it and ruin my shins on it, and try to get around it one way or the other, and so forth, and as time goes on – if I were brighter, you see, we'd be much further ahead – but it takes a certain amount, you see, of me falling on my face over this phenomenon to finally recognize that we don't have to avoid it – we can use it. That is usually what happens, you see. We can use that in our business. But you have to know quite
a bit about one of these things to be able to use one. And frankly, we really never used the rock slam to amount to anything except a little bit on the 20th. But then I couldn't give you a packaged word that described the rock slam, so therefore, it was to that degree useless.

Any auditor who's been auditing for a little while with modern technique knows when he's running middle rudiments now, you see that little needle *bzzz-bzzz-bzzz*, and you don't bother to say, "Have you invalidated it?" or anything. You do – you skip your Tiger Drill right straight to "Failed to reveal." You got a "Failed to reveal" sitting right in front of your face, so you skip your Tiger Drill to "Failed to reveal." And you pick it up – *pow-pow-pow-pow-pow*; and then that's clean, and then you go back to your Tiger Drill again, see.

And it's senseless trying to pick up an invalidation to read through a *bzzz-bzzz-bzzz* when this is obviously a "Failed to reveal," don't you see.

In other words, this little, tiny, dirty needle is a manifestation of "Failed to reveal." Now, a "Failed to reveal" must have been preceded by an overt, and I don't ask you to vary your Tiger Drill or your middle rudiments, and delete "Failed to reveal" and substitute "overt" in its place, because there's very little to gain. There is very little gain there.

You start picking up overt – pooy! You're using too strong a weapon, see. He only had to pick up the "Failed to reveal," you see, and you'll get the missed withhold phenomenon remedied, and other things will remedy, you see, at the same time. But you should realize that while you're picking up a "Failed to reveal," you're just skimming the top of the pot, see. If that thing is going to go *bzzz-bzzz-bzzz*, there's an overt under it.

And ordinarily, you don't pick up the overt. You don't bother with it. And your Tiger Drill is quite successful up to the moment you run into a chronic and continuous rock slam or dirty needle. And at that point, that gets very desperate, and O/W has been shoved into the lineup to remedy this.

And O/W will work as long as you get your question answered but will not work if you [don't] get your questions answered or if the pc is doing something else with the auditing question.

Don't Q-and-A with the pc and stick him up on the track by demanding that he answer the question more precisely, give him – you the answer you want – he's answering it technically right. No. Use clearing the auditing command, question after question after question, but keep giving him the question and getting the answers. Don't you see? Keep him in communication. Clear the auditing command every time. Inspect the meter. See if he did something else. You know – harass him, and he finally ... He – accept his answers; but harass him.

"Oh, well," you say, "have you done anything to your mother?"

And he said, "Well, I flew a-I-I-I flew a kite in World War II."

"Well," you say, "well, I don't see quite how that answers the auditing command."

"Well, it didn't. She asked me not to."

Isn't your face red? See?
So you can only do a certain amount of clearing up of the question. But now you're getting silly answers like this, why, on subsequent things you clear the auditing command better. That's how you handle that situation. Do you understand that?

His answer technically fulfills this, but it isn't what you want. And you'll find out if he's doing something else, keep clearing the auditing command with him – not while he is doing the command but after he has answered it, and you okayed it and everything.

Now, clear the auditing command with him again. Ask if he's doing anything else, if he did anything else besides just that or if he's trying to solve something with that answer. You know, get in there and pitch a little bit, and you all of a sudden find out that he's doing fantastic things with this auditing question. That's the reason O/W doesn't work for you when it doesn't work.

You either hang up and ARC break the pc to pieces by never accepting the first answer, see, or you collapse afterwards and just accept anything because you couldn't get it straight. Well, the happy medium between these two things, you see, is to run O/W and he's giving you technically acceptable answers. Well, keep clearing the auditing command. Use that as your routine between answers.

Keep clearing the auditing command; clearing the auditing command. I did it once for an hour one night and achieved some fantastic result. Pc says all of a sudden, "What?" They weren't answering the auditing command. They were trying to solve a problem with the auditing command and they were only giving answers that fitted into the problem, and then looked each time to see whether or not the problem had been solved, which it had not, of course – because the pc had never answered the auditing question.

Got the pc to answer the auditing question, and everything was fine. But the – you use clearing the auditing command between questions. You got that as a mechanism?

All right. That's why you have O/W and it isn't necessary to go into lots of overts and that sort of thing just when you're running "Failed to reveal," you know. That's perfectly valid, just fine because you're after all running with a whisk broom.

There's no reason to get a ten-ton bulldozer in there and start plowing up the whole ten-acre field, see. You will the moment you start for overts.

If mid-ruds consisted of. "Have you committed any overts?" ha-ha, "On this goal, have you committed any overts?" Where are we going to wind up?

Well, we're on that question now, two and a half hours and that isn't the purpose of the Tiger Drill. But asking if there's anything he failed to reveal, why, we'll get it reading. So it serves the purpose, don't you see.

But you shouldn't forget that underneath that buzzz-buzzz-buzzz, there is an overt.

All right. So, criminality has served us well and because there, it was quite obvious, that integrating this against all the other data I had that I was not looking at a rock slam on the goals chain. I was just looking at a God-awful overt which the individual was sitting across from me saying he had never committed! And the evidence existed not only had he commit-
ted it, but he had committed a dozen others like it, see. This bird had his heels planted in the middle of the road. And the harder he planted his heels, the harder that thing slammed.

So you should have seen me a couple of nights ago because, you see, this was a needle manifestation, not that – don't draw the inference that everybody who has rock slams is criminal. This was just this interesting phenomenon that here was the source of a rock slam and it was characterized by overt. And this suddenly fell into the line and said, "Isn't this nice and sweet, and I wonder whether or not I can turn one on at will."

And Sunday night in an auditing session I did the unforgivable. You know, the unforgivable. Your pc is listing away beautifully, and all of a sudden you see a free needle turn on, you know.

You say, "Hey, hey, hey! A free needle! I got it. Do you want to see it? Free needle! Ha-ha!" You know? Busts the whole session up, you know.

Well I did, Sunday night. This was too exciting – on a slam – because I found out I could turn on a slam at will on a goals chain. And right away, some iron doors opened.

Actually, it didn't disturb the pc at all. The pc was excited as I was because they knew they were going right for their goal.

And besides, the pc was in-session. You can do a lot of things if somebody's in-session, and you ought to try it some time. [laughs, laughter] Isn't that mean? Isn't that mean? Woke you up anyway.

Anyway, we've had 3GA, just as given last week – understand this now – is totally workable and will move right on out and do the job. You understand that? You list enough goals; you'll get the charge off and so forth. Now, our problem is just doing it faster and doing clearing faster. And this is not necessarily even an improvement on 3GA. This is just some way to find some goals.

Understand what I am telling you and this framework. This is just ways to find goals, see. I'd probably give you dozens and dozens of these in the next two or three, four or five years, you know.

You'll be sitting there and you've gotten it down to where finding a goal is a sure cure at eight hours, you see. Suddenly look at yourself, you'll be sitting there and you'll suddenly get a bulletin, you know, and it'll say – you put the E-Meter on the left side of you, you see, and – to the right side and you can cut it down to four hours, and you have to interrupt this lengthy goals-finding activity that you're engaged in, you see, to do it shorter. You can count on something like that happening. And this is one of those things.

Because the reason I tell you this is because we have already cleared a first goal Clear who had a wild rock slam. You follow me now? As listing was being completed, a wild rock slam was on the needle every now and then.

In other words, goals had been picked off the top of the GPM, and here we had a situation, you see, where somebody went Clear and free needle and so forth. On the second goal, we undoubtedly would have gotten a second goal and there possibly would have been some
rock slam residual there, you see, and we got a third goal, and we still had some rock slam, don't you see. And gradually it would have petered out and so forth.

Now, what I'm intrigued about is while all of you are sitting around smugly whose name didn't appear on the list there, while you're feeling comfortable about this, let me tell you this horrible fact: is you can turn it on on any pc knowing these details. [chuckles, laughter]

Because right up to this moment, you thought I was talking about a specialized case. I'm not talking about a specialized case – I'm talking about you; and me. Because we're monkeying around with this last night and we turned one on at will on me – bang! You know what it is, you can turn it on. Don't you see? It's an overt. It's an overt channel.

This guy has got himself caught in the front lines with a bunch of overts and he's sitting in a ridge which has got enough confusion and enough overt behind it that he couldn't move anywhere. So, there he is. See that? And wouldn't you like a goals process which might do as follows: which might omit the first two or three goals and leave you with only four or five, you see. Wouldn't that be interesting?

Male voice: Oh, yeah.

Just cut off the first three and make it much faster to find those first the – the first goal, and just bypass some big chunks of GPM which will just blow off. Wouldn't that be nice?

Well, that's the speedup which I have in mind here. I find this very fascinating. We've already run people, found perfectly valid goals and run people to free needle and found out they had a rock slamming needle underlying the free needle.

You overlist beyond this free needle a ways – fifteen, twenty minutes, something like that – and you had a firing rock slam turn on every now and then.

Well of course, this pc was going right on down the goals chain. Well, we already see that the track is laid out in cycles. A cycle is a series of lives or types of lives associated and allied, and with – highly variable in its time element. It could be a trillion years, it could be a billion years, it could be a hundred thousand, it could be sixty thousand.

It's just the fellow starts in on this brand-new endeavor to him and he goes on through to the end where it's so dead and so buried and so gone, that he won't admit to any part of it and he doesn't even stay in that corner of the universe, you understand. That's a cycle.

Well now, actually, what starts a cycle is a prime postulate that is not particularly influenced by any earlier experience or postulate. He starts himself out with a new goal which is not a solution to his problems, but a new game.

And then he'll swish up the track quite a ways going on this, and it'll finally – finally the steam will leak out of the boiler, and he eventually lays that aside and he finds himself taking no interest in life and doing nothing and getting no place, and in no trouble and he hasn't got any ability to get into trouble with, see. You know, it takes a certain amount of ability to get into trouble, see.

And he's finally gone down through the bottom and he's lying around now listening to Brahms, you see. [laughter, laughs] Life is hopeless, you know, and he's reading modern lit-
erature and he's pretty well washed out. Well actually, he goes on out through the bottom and while out through the bottom, why, he finds himself sitting out on cloud 9, realizes he's been there for quite a while, something like this.

And he didn't report back to the area for a new body or anything like that. He feels quite perked up, you know. He perks up – up to two or three grasshopper power. [laughter] And he says, "I-I think I'll get back in the game. Let's see now, what would be a good game? To never have anything anywhere! Yeah – not even me could figure my way out of that." [laughter]

And off he goes on a new cycle. You get the idea? Every other postulate he makes after that cycle is involved with this basic postulate. And he gets in – then they're really solutions to problems caused by the basic postulate.

So he goes tearing along for sixty thousand or another trillion or something like that. It all depends on how good it is. We someday will probably have a scale up on the wall. This postulate will carry you this many thousand years, you know. But anyhow that's – that's the way it goes. Well, now that's a cycle.

Well, now those are pieces of GPM. Actually, however, they have an interrelationship even though the thetan thinks they do not. It is of interest to clean up the earliest one you can get your paws on.

In other words, bypass some of them and you'll find out the later cycles then are very easy to knock off. Sometimes you might find they might even knock off just by inspection because he's less powerful in making his postulate each time, you see. That's a dwindling spiral type of action.

All right. Then theoretically is it – it is of interest to reach as far back on the track as you can for a goal that is still reconcilable with the pc's reality on it and his ability to run it. Those are the monitoring factors.

Now of course, you get that if a goal will fire – just take it this way: If you can get a goal to rocket read, you can list it. That is your guiding principle. You can get one to fire and fire and fire – all cleaned up, you see. It's all tigered to pieces. Everything is off of it and it's rocket reading every time you say it and everything is going along fine. Now, then that goal should – if it is kept clean during listing and is listed properly and if the lines are kept clean and are firing – that goal should list through to free needle, which means the vanishment of great chunks of GPM. Don't you see?

Then you have to go and find yourself a new goal. And if you've got – find one now that rocket reads after it's been all cleaned up, why, you can list that one out. Oh, this is sequence. You're actually reaching further and further and further back.

Now, if you were to come forward and find a later goal, that would be the easiest thing you ever did, see. It's easy – it'd be easy to isolate or locate these things. And it is of interest to find the earliest goal that you can lay your paws on that is real to the pc and if it's real to the pc, it fires just repeating what I just said.
Well, weirdly enough, a thetan never gets so messed up that he fails to leave out a flag. He gets buried in the cemetery but he usually has a tombstone.

You want to know, in early work this was particularly useful. The key engram of the person's current life still had a piece of picture. And the pc would go back and forth past this picture, and you ask him sometime – you ask him, "Have you got any very innocent pictures there?" "You got any pictures that don't mean anything very much?"

And, "Well, there's – yes, there's one here of my grandfather's rocking chair. Ha-ha. That's all. It's just an empty rocking chair. I see that quite often."

Sometimes grandfather has been in it, but the more he's gone across it, grandfather has been less in it – now isn't in it at all. It's just an empty chair. Well, you go and explore this. And you can actually take off and run it as an engram if you can get the fellow to face up to any part of it and the next thing you know, the darnedest Roman arena turns up around there, and it'll be a key engram on this lifetime.

In other words, he left a little flag flying out here of an empty rocking chair. And actually, there's an automobile accident and a couple of operations, and a funeral, and so forth, that he's forgotten all about. He doesn't know anything about these. These have just slipped his mind but he did leave a rocking chair sitting there.

I think it's quite remarkable. A thetan nearly always does this. He's always got a rocking chair or a little flag or ... Now and then he sees a small inscription on something that isn't there, see. It's just a little memory tab that sticks out of the reactive bank.

You'll find this thing in many of its manifestations. And the goal has a rock slam left on it. A key goal has a rock slam on it. Now, I don't say that you can't find a goal which is later on the track, closer to present time than that, and prove it out and clean it, don't you see, because we've done it. And then find an earlier goal and prove it out and list it to Clear, you see, and then so forth.

Nor do I say that you could do this on every person because we haven't done it on every person. There are a lot of people who haven't been cleared in this world. You might like to read the papers sometime if you need any proof of that.

And the generality here however, is that you're liable to run into somebody who's just got such a rock slamming needle or such a dirty, dirty needle all the time, all the time, all the time, that you can't prepcheck them, you know, you can't find any handle to prepcheck with, and you can't find any handle to assess with, and you couldn't do a Tiger Drill on them, and so forth.

Well, it'd be very doubtful if you would ever find a goal on that person. Very doubtful. It'd take a long time to sec check, prepcheck them out to a point where the needle is readable.

Funny part of it is the needle will probably at once collapse in – back into it the rock slam and the pattern the second you hit the goals list. Because we've never had any trouble with this, except when we were monkeying with goals. Isn't that interesting?

*Audience: Mmm. Yeah. Mm-hm.*
And every time you start monkeying with goals, you have dirty needles, persistent dirty needles, you have rock slams, you have this and that, and man. Yes, it's associated with goal phenomena.

And now, you recognize that that pattern is a "Failed to reveal." But how about the big pattern? He doesn't know what he's failing to reveal. You sometimes can pull a series of overts on the big pattern against a certain thing, like an auditor, and it'll turn off.

You can fool around with somebody's goals list and find every rock slamming item on the goals list, write those few down, pull a common denominator off, test it several different ways and then ask him if he has an overt against that lately. He gives it to you, and the rock slam turns off. You get that as a method of turning off a rock slam, but it's an overt on a certain target.

One of the most fruitful ways of finding what that target is, is to have nulled several hundred goals on the pc and found that some of them rock slammed. Take those goals, write them down on a little separate list – it isn't that they're in – and look at their subject matter, and then just sort out their subject matter until it makes sense. Test it a little bit. You know, overts on this. All of a sudden, you'll be able to turn on the rock slam at will.

But this oddity gets in your road: Subject one turned on a rock slam easily and well, but it wore out almost at once. Subject two that you selected turned on a rock slam and it wore out. You knew you had it, you see, and then it was gone. It didn't do it anymore. Subject three – and it turned on a rock slam and then it was gone, too. And then subject four, and subject four turns on a rock slam and it goes on. Every time you got a rock slam, you use subject four and it turns it off. Every time, you know, it works like a charm and this button isn't wearing out.

Why did others wear out? Because they were just locks on the main button, and a very little bit of auditing cleaned them off the chain.

You'll sometimes find somebody's goal was dial-wide rock slamming. And it turned out not to be his goal, and you found another goal, and it was dial-wide rock slamming, and that turned out to be not his goal, and then you got another goal, and it was dial-wide rock slamming. Where the hell? What's happening? See? Well, it's just that they weren't, but the charge is associated with them.

In other words, the charge can trickle up the line and attach itself to different things, which are allied in subject matter.

It's like a tree. At first any branch of the tree looks like the trunk, if you're examining it blindfolded. And you'll eventually find the trunk. Yeah, you take ahold of a limb of a tree ... And supposing you were examining merely the top of the tree, and the limbs of the tree and you had no sense of up or down and you wouldn't know where the top of this tree was. They'd all feel about the same, actually.

Well, the test would be, that when you finally got hold of the top of the tree, that button didn't wear out. Yeah, but you don't feel too cocky just because you get something to rock slam madly. Because just about the time you turn the meter around to show the pc or rush out of the auditing room without calling a break to find an Instructor to say, "Look, look, look!"
you know. You'll get back, the subject's probably worn out by that time. And then you have to
hunt around a little bit to find the allied subject that turns it on. I mean, this charge that is im-
parted to associated subjects – related subjects – is about the only thing that gets in your road
going back down this track because you're happily climbing down a branch of the tree, and
you say, "We sure are getting near the trunk," and then the branch peters out and never goes
near the trunk.

There's no rock slam, and there was no bridge, and nothing, no little man popped out
of the E-Meter and says, "Go to the left; this is a one-way street." You know? No directions
are given you.

But out of all this potpourri, if you followed it down by doing a goals list and finding
each type of goal that rock slammed, and then tested all of those out, you've got a system, but
it's a very laborious system, which would peter out all the time.

Now, Scientology has a number of basic truths in it. There are lots of fundamentals
around and instead of hunt and punch, you can always go find yourself a hat full of funda-
mentals and shove them into the works, you see, and everything goes off afterwards – and
you've got some fundamentals called the dynamics.

And the goals chain begins with an overt on dynamics. It doesn't happen to be an in-
tentional overt. It just happens that the goal happens to be, in the woof and warp of life, a
hellish overt against a part of one of the dynamics.

Now, you see, let's say there are eight dynamics, and each one has a hundred branches.
I know you – they have far fewer in their exact divisions, but you get a pc rattling off of how
many parts there are to a fifth dynamic, you ought to listen to him sometime, you see. Now,
he's really stuck on the fifth. My God – there's trees and there's grasses and there's shrubs and
there's flowers, and then you have to get a botany textbook, you see. And then that gives you
all the types of trees, all the types of shrubs, and all the types of flowers – the families there-
unto, the climatic differences thereof, see? And then there's mice. And psychology isn't totally
lost, you know. They're still authorities on mice.

And you say, "Well, to you, 'rodent,' you see." This would be one part of the fifth dy-
namic. Well, in actual fact, why you should just start reading the catalog of the number of
types of mice there are, you know, let alone rats. So it'd actually get pretty broad, don't you
see.

Well, you got all of these parts of life – all of its various ramifications and forms, all
branching out from your eight dynamics.

You see, you get an almost infinite variety of life out of these eight dynamics, but you
can go back to these eight dynamics. And anybody who has made a postulate may have been
in agreement with, totally associated with, everything fine with, seven of the dynamics and
799 parts of the remaining dynamic, but it's still going to be one hell of an overt against at
least one of the parts of one of the dynamics. You can count on that; it's going to be an overt.
Because life, you see, is built in many frames and varieties of postulates and you're going to
have some part of life that is going to be assaulted by any postulate a thetan makes.

We're going to say – well, I'm going to give you a crude example.
The fellow says, "To be a tragedian. That's what I'm going to be. I'm going to be a tragedian. That — that's going to be my next cycle." See?

That's fine. But some other knuckle-duster has said, "To make everybody happy." Those two goals are going to collide. See, somebody else making everybody's "got to be happy," you see, and this fellow's a tragedian, and this is a terrific collision, don't you see.

Well, actually, it's not postulate against postulate that you're particularly worried about. You're worried about postulates against parts of life.

And you've got yourself, and you've got the two divisions of the second dynamic, and you got groups, and you got species, and you've got the fifth dynamic, see, and the remaining species, and you got the sixth, which is the physical universe, including forms, and you've got the seventh which is spirits, and the eighth which is supreme beings, et al., etc. That's getting pretty wild here, don't you see.

And you say, "I'm going to help people," and this is an overt against a god which is designed only to help people. Don't you see.

You're going to help people. You're going to cut his throat, in other words.

See, there's all kinds of crossplays. There's no reason to go into it. You yourself have in your banks several hundred thousand excellent examples.

So you can use this rock slam to find the goals channel by doing the following: by taking the eight dynamics and — assessing them to find which one has a rock slam on it, a dirty needle. Which one gives up a dirty needle?

Now, if we can't get a dirty needle just by inspection, we can always cause one by asking him to think of overts against, and pick out the dirtiest, biggest needle we get.

You have to be clever to ask that question without missing withholds.

All right. Think of committing overts against yourself, and think of committing overts — sexual overts, or against sex — against sex is better — it's all against. You're going to get one of these things to rock slam. That's for sure. Either it was rock slamming just when you read over the list, and you just picked it up like that or you had to work on it a little bit harder and make something rock slam and pick that. See?

Well, if you've got that, you kind of want to prove it out. You kind of want about — to ask about it. Has he ever committed any overts? Get him to tell you a few, you know, and so on.

Now, what would represent that dynamic to the pc? This is a list that you get. Let's say you got third dynamic. Now, what would represent that dynamic to the pc? You understand what I'm giving you here is not a set pattern; this is merely an exploratory experimental process. But what would represent that third dynamic to him, you know.

And he gives you this, and he gives you that, and he gives you the other thing. Well he might get five – you might get fifty items. But you sit there and do yourself a little Assessment by Elimination is the way you do your Prehav Scale, see, but you're looking for the rock slam.
But you don't care if that list doesn't rock slam. You merely want to find the hottest point of that list. You understand? You just want the hot point of the list. If it doesn't rock slam, we won't worry about it at this particular time. We're just going to find something hot. And that list may stand out totally independent. And it may have, on the third dynamic, it might have something like governments, see. That's hot. Maybe it rock slams, maybe it doesn't rock slam. We couldn't care. It – but it certainly was the hottest button.

If it is the hottest button, then it's the only one on the list that – there's nothing else on the list that is rock slamming. You understand?

The way rock slam is used to – in that particular little dirty needle, bzzzt. It's the only one that will.

Now, we – it's very simple. We take our pen in hand. We spread out our legal length, 13 inch by 8 paper. We put down at the top of this, the date and the pc's name. And then we write this sentence: What goal might you have that would be an overt against a government? Question mark. Number 1. Use Arabic numerals.

And the proof of this pudding is whether or not that needle starts falling off the pin.

If that needle goes crash-crash after a little while, you want any – you write down any pain the pc has or any sen, and if that needle's going crash-crash-crash on this list, you just keep going as long as that needle's going crash-crash-crash. Got it?

But if that tone arm is moving, well, ha-ha-ha-ha, got good tone arm motion, and everything is going along here lovely and that rock slam is narrowing and finally gets down to a little dirty needle, and that finally disappears on your listing – when a tone arm needle, not so much the tone arm, but certainly the needle, is no longer caroming around just because you're listing goals and your needle's got nice and quiet, if you're lucky the pc's goal is on that list you wrote.

Ain't that interesting? It's like doing a crossword puzzle. That's interesting. Now, I said if you're lucky. I hope this doesn't happen to you: That you get the rock slam and get nothing but sen and a stuck needle. You got a rock slam, but you got sen and a stuck needle. You missed some place. Something is wrong here somewhere. Because the rock slam will very shortly disappear. And you will realize at this time that you've gone to the end of a branch, not to the end – top of the tree.

And you've gone down and it petered out, and that isn't so, and the best way to handle that – the best way to handle that is just do yourself a brand-new Dynamic Assessment, and do the whole process all over again.

Now, actually you're not looking at a lengthy process. This does not take long to do. If you think it takes a session to do a Dynamic Assessment, it doesn't.

It takes me ordinarily seven or eight minutes to do a complete Dynamic Assessment with the part. There's no trouble with this, see. It's not a hard job. It's a very simple action. Old Dynamic Assessment is done by change of characteristic.

Now, if you've been unfortunate and this rock slam just peters out, you want to know whether it's going or not, just make another test. Ask for overts against other dynamics, and if
you turn on a rock slam again, why, I don't know whether you ought to do the list where it ran out or do a new list on it.

But it's the length of time. You will, I think, learn the dwindling rock slam. You'll realize that you are taking the charge off by goals listing, whereas the rock slam just didn't—it was on and just disappeared, and you don't see it anymore, see.

Well, if you've got a list by dwindling rock slam, you of course are taking the charge off of that rock slam.

Now, you make the guy do 850 goals. You do anything else with a list that had—you have been told for 3GA. Your list is already this discharged when—by the time you do this thing. You don't spend any time much listing on him or straightening him out. You just look for the rock slam. You got the idea? That's the auditor action. You still want 850 goals from this pc. What do you do with the 850 goals? Well, you put them aside carefully and do nothing with them.

You want that little, short list that went down to the bottom of the rock slam. That's theoretically the way it would work. See. That leaves you with a handful of goals to null.

Now, if the fellow's goal isn't on that, you either have missed a meter read, which of course you will never do after you leave here. You may do it here, but you will never do it when you have left here.

You miss a meter read or that goal for some reason or other—well, you didn't have it straight or it was the wrong dynamic or the thing panned out—something went wrong on the thing. Still, just repeat the operation and get yourself another short list and see if the goal's on that. That is a fairly catch-as-catch-can economical way of doing it.

Oddly enough, you'll probably have the pc wheezing, sneezing, squeezing and saying, "God, gosh—what do you know," you know. "That's me." This kind of reaction taking place and he'll tell you exactly why this goal is the right goal and you get cognitional actions.

If you do it without—there's no cognition on any case, I would be suspicious of it. If the pc wasn't genning me in on why you had to have this type of goal, I would be suspicious of it. Pc's just writing them all down on a long grind, well, you probably are running down the branch of the tree.

Your rock slam isn't narrowing. It'll eventually just disappear and it'll leave you a list full of sen. That will be the way it is.

All right. Well, there's the experimental use of the rock slam in the discovery of a goal.

Now, perhaps on some pcs, you'd have to use this system absolutely. But on most pcs, the way this is predicted, it would bypass maybe the first two, three goals that you would have to find on the case and list.

So you see, this shortens up goals, it shortens up clearing if it works properly. As you do it and work with it and run into problems, I will undoubtedly have other things to refine concerning it but for the moment, that's the way it is.
Thank you very much.
Thank you. Lecture 2, Saint Hill Special Briefing Course, 14 August AD 12: World Clearing Program.

_Audience: Really? Mmm!_

This is the first lecture or announcement or bulletin or anything else on the forwarding of Scientology on a very worldwide clearing basis.

Now, the point involved here is that we have a world clearing activity sort of understood. See, it's sort of understood that we're going to clear a lot of people. See? But let me tell you that simply incorporating a Foundation and putting it into your own home with no administrative lines of any character is not the way to go about world clearing. The place begins to look like a bargain basement very rapidly.

Of course, these snide references are to 42 Aberdeen Road, Elizabeth, New Jersey. I don't hardly think even the foundations of the house were left when we finally…

But such things require a plan – an agreed upon and more importantly, highly workable plan that will deliver the goods.

Now, let me tell you about this plan in – not the plan itself – but let's tell you how a Central Organization could go about clearing. I'll show you then how the plan can develop out of these mechanisms.

We have HPA/HCA – some slight degree of neglected sphere now. Terribly necessary, but nevertheless a neglected sphere.

Prepchecking is not really an adequate skill to turn people totally loose with. There is another form of auditing which has just marched into view which has terrific therapeutic value. It's goals listing. Not finding goals, but goals listing. And whatever else happens with trick ways of finding goals and that sort of thing, you've still got goals listing. And the funny part of it is, is somebody is spinning in Keokuk and they write you a frantic letter saying what can they do. Well, it's dangerous to ask them for their withholds because they sure will neglect to put one or two on and just wind up madder than hell at you.

But you can ask them for their goals. You can tell them to write a goals list – state some astronomic figure and tell them to write you some goals, and send you the list and you can carefully preserve it or see that it gets turned over to an auditor or something of that sort.
For God's sakes, don't handle one of those lists badly.

All right. There – there is this action, and very shortly, clearing assistance will definitely be part of HCA/HPA training. Definitely.

How would he go about this? A trained HPA would know how to prepcheck, particularly if given a more reliable (if more expensive) meter with a red light or something like that – or a big oscilloscope or something of that sort.

You've got a Prepcheck action this person has to take. Now, that's very time devouring. Person isn't going to stay in-session at all with a flock of overts that are right here in PT or they won't talk to the auditor. You can't get them to ask [answer] questions. You'll never be able to get the rudiments in to find a goal. Don't you see? So that's a necessary action.

Your goals listing or any trick goals listing that you care to make sure is done could be taught at that level. See, we've taken an awful lot off of an auditor now. You just look at your checksheets. Your checksheets are thin compared to what they were.

And your next action would be listing a goal. See, we've just skipped finding a goal there. We just omitted that. So an HCA/HPA who could list goals, prepcheck somebody into position for a goal – smooth the case out, get the overts off, and that sort of thing – and then could list all the items for a goal would be a very valuable character to have around, wouldn't he?

And gradually, as he went along, for sure he'd learn how to find goals if he'd gone that far, see. See that? So if you included listing of goals and listing of items for goals, as part of HCA/HPA training, you've pushed clearing a long way ahead. Because why? Because a handful of Saint Hill grads in an organization could find all the goals necessary to be found in that organization. There's where the skill and accuracy must exist. See, you're very – you got a goal and you've got to really be sharp.

Now, that's very much to the point, because if you were to list the goals for the pc or drive the pc on into the listing of goals and sessions and – as a Saint Hill graduate – and prepcheck the pc and set the pc up in all directions to find a goal, and then go ahead and null by the mid ruds the list and find the goal; and then sit down and do all the listing necessary to clear that up, man, you're looking at hours!

Now, these hours are being pushed out into a rather fabulous thing. Yes, you're listing goals here after you found one.

But I call something to your attention: that once you get slippery on finding a goal and you get used to the Tiger Drills and that sort of thing, this is less time consuming, particularly as I'm cutting down and shortcutting how that operation is done, but notice that there are no shortcuts being done, aside from the tip that you'd better clean up the goal and lines at the beginning of every session, in listing a goal out.

And you realize that a goal listing action runs as many as 2500 items per list and there are four lists. That's 10,000 items. Man, that's a lot of hours of auditing.

So if we took a Saint Hill graduate and – and moved it down to the point where he did supervision on the goals list and supervision on the listing of items – made sure this was go-
ing along all right – he makes sure of this, by the way, that at item two or three hundred on each list, that the pain is in the right place and it's, you know, all firing off properly. And he gives the goal another Instructor's check and so forth, and makes sure it's firing.

As long as he was satisfied the case was set up to have his goal found, before he found the goal, and as long as he was satisfied that the listing would continue to free needle; if he had some people around who could list goals, do the prepchecking and do the actual listing of the goals, we've really smoothed this out, haven't we?

All right. So in a Central Organization, a policy letter has just gone out that forbids a Saint Hill graduate from doing anything in that Central Organization but find goals.

And staff training has all of a sudden been given the push on the tricks of – they've all got a lot of Prepchecking and so forth under their belts now. Now, just listing of goals and listing of items, don't you see? This is part of the training program.

So very soon somebody will be able to walk into a Central Organization and get prepared, get his Prepchecking, get the listing and so forth, and find himself a greater or lesser part of his ... You see, it isn't that the Saint Hill graduate would have him for one intensive or one and one-half and – or two intensives or something. It isn't divided up that way. You don't do that that way. He audits him as long as it is necessary to find the goal. You got the idea?

He picks him up at the moment he's ready to pick him up, as dependent on whether the pc is ready and has been carried on, and then carries him just as long as is necessary to actually find and – and prove out that goal and then drops him like a hot potato and picks up the next pc. You got the idea?

You see, he – he might be lucky enough to find the goal in four or five days or he might find the goal in one and one-half intensives or two and a half intensives or something like this, you see.

At that moment, why, you'd have to have a fluidity of schedule that the pc would be reverted to a staff auditor who is not a Saint Hill graduate. See? That way, you got Central Organizations doing clearing, as long as Saint Hill graduates aren't put around in Address Section or something, you see.

Now, that's a Central Organization program. It ain't Saint Hill graduates – there's – had enough metering and enough this and enough that and need pushing around and so forth – that's what they ought to be doing.

Oh yes, well, if you're rich, you can have a Saint Hill graduate as D of P and one as D of T, you see. That's getting wealthy. That's getting real wealthy. I will go into staff clearing in just a moment.

But let's take a look now at that as an activity. You see that that would be then a workable activity. And you'd start turning out Clears and you wouldn't be wasting your skill. This is a way to do this.

Now, you're going to see some section of this program as the wheels turn here. And although it is very hard on somebody in the middle of listing to suddenly lose his auditor and have another auditor shoved on, you're going to see that gradually taking place here. But the
advanced 3GA auditor is finding goals, and the new person just moved into 3GA is doing nothing but list. Got the idea?

*Audience: Mm-hm.*

Now, where you have a group which is a co-audit, you realize that if inexactively and if rather rough to supervise, still approximates the same type of activity – roughly.

And now let me say a word about staff clearing as a special activity. Your staff could co-audit on getting the goals listed and could co-audit on the listing of items and thus form an auditing activity with the Saint Hill Graduate Staff Staff Auditor (which is what they're called) picking them out just as fast as they were ready or as he had time, and whipping down the list and finding their goal and shoving them back into the group. You see? You'd still have clearing going forward on a staff training program. See how you could do that?

All right. Now, let's take another look over here at – we're not speaking of world clearing yet. We're speaking of Central Organizations. They will do an awful lot of it.

But let's look at a wider program here. Let's look at world clearing, exclamation point. We get fifty people and I don't care what financial arrangements are made with these fifty people. Central Organizations – they might do something like this at sometime or another in PE and so on, but possibly doubtful. If you got fifty people and perhaps those people are contributing so much per week as a group, as a co-audit – and you talk to these people, you talk to them straight from the shoulder, and you say, "Here's what we're going to do with you people. You all want to be Clear. Fine. That's all understood. There's no – going to be no arguments with that. All right. We've got that taped. You may not even know what it is, but you want to be it. That's fine. You're tired of being in the muck and going through the endless cycle of it all and going deeper. All right. We can lift you out of that. Fine. That's established and understood. But how are we going to accomplish this?

"Well, the way we're going to accomplish this is we're going to form a co-audit. And you're going to be in here three nights a week" – or whatever arrangements are made in time – "and you're going to have your pc, and you're going to be somebody's pc, and you're going to undertake the necessary actions to get goals listed, and then afterwards to get the items listed, and as soon as you're ready or if several are ready at one time, you are going to draw lots with short straws."

And the Saint Hill graduates running this particular unit, probably two of them, will get that person by the nape of the neck, when that person is ready, and just on a daytime auditing schedule, auditing certainly no more than five hours in the day, find that person's goal and shove them back into the co-audit. And pick up the next one and find that person's goal, and shove them back into the co-audit and pick up that next one, and find that person's goal, and shove them back into the co-audit. You see this?

*Audience member: Yeah, I do.*

And we say, "Well, that's what you folks is going to do, and that means that within the year you – all going to be Clear. Within the year."
"Now, as far as second goals are concerned, we'll go as far on that as we can after all the first goals are found. We will keep this cycle going.

"But your main action at first is to learn something about the tools of your trade and read a few of these bulletins and try to make sense out of them, and you're not expected to study the theory of what's going on and you're not expected to do this, but you're actually expected to sit there and look like an auditor," as people in co-audit very often do quite well.

And there's somebody supervising that co-audit and the co-audit is pretty muzzled, it usually runs off rather smoothly.

Well, the financing situation of this particular character, of course, is self-explanatory. I don't know whether you would charge them so much to find their goal or something of this sort or if they'll carry it all ahead just on their weekly contribution or what you would do about this, that's up to the persons running the co-audit. I myself would rather favor a fairly liberal weekly contribution – not a small one – and base it on the numbers I had that would make a perfectly adequate income running through the place. Even a princely income running through the place so nobody is having to dive sideways and audit some psycho from north Manitoba just because the center needs some money, you know. This is the wildest, most uneconomical thing to do and yet centers and field auditors are always doing this, you see.

They all of a sudden audit for free, audit for free, audit for nothing. The light bill keeps going up, you know, and the rent goes unpaid and then all of a sudden they have to go on some wild wingding of accepting pcs that they never would have dreamed of just because they were too bashful to ask for a certain constant contribution from people who are around that center. You got the idea?

All right. Now, we take this as an action. What damage would it do? Interesting question to ask since very naturally, you're going to have some interesting blowups in a co-audit. But if you have these people – if they've got any withholds or looking blowy or something like that – you, sir, make sure that they tell you about them whether they tell their auditor about them or not. You can probably keep this thing cooled off. Don't you see?

And you make some screaming set of penalties for anybody's pc blowing. Just don't let them have pcs that blow. In other words, make them take some responsibility for this fact, you know.

Take the other mechanisms which come into account or whatever other mechanisms are necessary to keep the group together and keep it going, you see.

Now, that group is going to be very hopeful. You're going to have to do a certain amount of training. If you don't do a certain amount of training, why of course, you'll find yourself around the bend with this activity.

Well, the thing to do is to do the training at first, but get some goals listed so your program isn't stopped waiting for goals lists or something and you take the person that is the best trained and looks the best or take – that – the few that are, you know, pretty good. You get the goals list in a hurry and get this program of finding the goal on your weekly auditing schedule, you see, just pocketa-pocketa-pocketa and then fit the rest of it in and put it together while you've got that part of it running.
And these guys are going to go frantic. The people who aren't up to it are going to go frantic. Because something is actually happening, and you haven't got to stand up in front of them all the time and fill them full of hope and courage and all that sort of thing because they see it happening in their midst.

"There's Joe. They found his goal last week, see. And he's going Clear. He's being listed right now by Betsy Ann. Ha-ha-ha-ha-ha-ha. Lucky stiff." See, something is happening. Well, you've got quite a boom to lower there if somebody starts slogging it and doing nothing and muck it up, see.

Now, you could even improve this just a little bit by making the person's auditing skill a certain number of points against their – getting their goal found. In other words, you balance this off. Not only is their needle straight and their list complete, but their auditing points must be adequate to that. Some type of police action so that they deliver a proper session or have a wish to, could count against their number on the list to have their goal found. Don't you see? When it comes to select the next – now, I wouldn't select them all at first. See, I'd grab them in handfuls of three, four, five at a time. I'd never get it plotted ahead more than about six weeks.

See, on the people who have not had their goals found, I would never get it plotted ahead more than a few weeks. You see why? There's this one bird says he's got to wait for eight months until his goal is found, do you see – just arbitrarily. Well, he's going to ride. He's not going to try to jockey himself up into a more favorable position by getting – making a better show out of it. You get the idea? Some type of mechanism of this character would be highly desirable.

Now, you might think that this would cut people off from going and getting trained. No, no – far from it. Far from it. There's somebody – he's looking pretty bad and – he's had his test – let us say he's had his taste of auditing. He's had this and he's had that. All of a sudden he'll propose to you the novel idea that he could be of more help to you if he went down to the Central Organization and took a course and came back because he isn't about to have his goal found in the next three months anyway, and why doesn't he go and take a course and come back in the meantime, and he'd be straightened out by that time and so forth. You'll find out this kind of randomness occurring, and far from discouraging it, you should encourage it. You wind up with more help. Don't you see?

All right. You continue on along this particular line and you will wind up at the end of a year – if two auditors had fifty people – you would wind up at the end of the year with a high probability of having gotten the lot.

You would have released into the community fifty first-goal Clears – thud. That would do things, man.

Now, you shouldn't multiply the number of franchise holders or co-audit-type groups doing this by the number of years and arrive with the figure of how many people will be cleared in ten years. This is not the way that would go at all. It would go by arithmetical progression. This stuff would start taking off on a high climb, you see. About the only thing that limits it is how many people could be put through Saint Hill. That's a limiting factor. And this
of course, is, you know, rough and at no time will I ever downgrade an auditor's skill just to let him go home because his wife is dead of starvation or something of the sort. These are minor affairs. Are you a good auditor? That's what counts, you see.

Because actually you lose the whole game, see. I let an auditor go out of here that can't audit, can't handle cases and that sort of thing, the whole game is lost. Any time he's been here is actually lost.

Now, that number actually could be stepped up without reducing quality too fantastic-ally by various refinements and so forth. But there are an awful lot of old-time Scientologists around. Lots of them around the world. You'd be amazed.

So I've instituted a new program of putting them in touch with franchise auditors. And I'm now in the process of getting all the names and addresses of everybody who ever thought he wanted to be trained and sending them to the nearest franchise holder, wherever they are in the world, see. So that in his own town, why, somebody may have quite a few HPAs, HCAs, that sort of thing that he hardly knows of or that have ... And then we – I'll write these people and tell them to contact this center, and the center can talk to that person and get that person in and cooperating in some way or another, you see. And well use our backlog. Well use our carefully built-up backlog.

And that backlog I, of course, have been carefully building up over a long period of time. And it's rather sizable. It'd surprise you.

Now, that gives you some semi-trained assistants right at the start from – for administrative action or it gives you people who would simply come into the group for this particular purpose or various other uses. Don't you see?

Well, this is – this is a jump-off. Now, that's not a very startling arrangement, is it? That doesn't stun you, but it's, it's a terribly simple arrangement. And if you think that in a single year, there's a possibility of releasing twenty-five Clears into this community and fifty into that one, and thirty-five into another city and this will start to look interesting. I think it'll look far more interesting than you realize at first glance. So this is a sort of a kickoff.

Well, now I've been waiting until we had a proven-up procedure. It was going along and it was doing all right. And of course I'm working on refining the speed with which goals can be found which is a single pin that would extend this program out too much. And we've got something in the run. And that is kind of the way I figured it out. I have talked to a couple of people who know on this and they seem to think this is a very feasible program. It's essentially very simple.

But don't get so crazy as to believe that you can audit twenty-five hours a day and carry forward the program. There must be a finite auditing period and I certainly would never audit more than about five hours in a day. I just wouldn't. Five, pardon, five – five and a half hours. That's about what a staff auditor does and if I, myself, were working in this center, I think I would probably work about, oh, I'd maybe do four or five hours of auditing a day, and I'd spend some time in the evening on training and making sure the co-audit was running all right.
And I'd have some Reception assistance – somebody to answer the phone and carry the money to the bank. It's nice to have such people around. I've always found them quite useful.

Now, as we expand this... That is a basic world clearing activity. Now, of course, the workhorse of Scientology is the Central Organization and always has been. It brings in new people quite consistently with it's PEs and it does various things.

Years ago, Central Organizations only existed as information centers and after that just as means of, well, training. They've always existed for training but as far as pcs are concerned, means of demonstrating results and keeping up the level of results and that sort of thing.

Now, we started out on a program which was not necessarily premature, but I just got the word around, that we had a certain number of people we're going to clear out in the field: former HGC pcs and that sort of thing. And a Central Organization ought to start getting those lined up, using this other program of clearing, see. It isn't a question of if they're going to come in. Because most of these pcs come into Central Organizations are rather scattered around. They're in the oddball places of the world, and so forth.

And they come in; we're going to run them through this same type of program I just described to you, see, that in Central Organizations they start getting these people lined up. Not a question of if they are going to come in; it's a question of they were on this list of people to be cleared. When are they coming in to get their preparatory actions?

And everything I've been doing is trying to improve quality of auditing up to a point where it could be tremendously trusted. Well, you're going to have trouble with that in any organization. You're going to have trouble with that on any co-audit – is to keep up the auditing quality and not let it be slipshod and not let it skid. That's always a fight. It's always a fight.

Because a bunch of green auditors can think up ... You think you can think up – God! Gave you a lecture an hour ago about Dynamic Assessment and there's going to be some of you asking the Instructors, "What do I do now? I have two dynamics rock slamming equally. Now, what do we do from that point?" You see?

Well, there's going to be a problem there. That's for sure. But you think you can think up problems. Well, most of your problems make sense. [laughter]

Man, you get a co-audit going – you get a co-audit going, the problems you get make no sense at all. You can't figure out how the devil this ever came about. It should happen to you, you know.

It's pretty weird. This guy's been mooning around and worrying and worrying and worrying, and you've never quite been able to figure out what he was worrying about and finally one day he levels with you and so forth. He can't figure out whether this is theosophy as it ought to be practiced.

And you say, "Huh?"
He's been there for six months, but he thought he was in a philosophy group of some kind. You'd be amazed at some of the wild things that happen. And, of course, you have less control over people and they get themselves fouled up. Well, you know, you can foul up pcs and students pretty badly on the second dynamic, other regulations when they're missing. Well, things can get awful kind of gruesome around in a unit, but how about one over which you have no control of any kind, you see, whereas the people are in their work-a-day life.

You also have the problem of they try to adjust it with you when they can get off, and so forth. And I just never would Q-and-A with that at all. I don't care when you can get off. I can only tell you what week you must take off because you've got to be here.

And the fellow says, "Yes, but if and if and if and so forth and I'd be sure and be fired if I took that particular week off."

"Well, get another job. Don't worry me with that part. You're supposed to be here." [laughs]

You can get that straightened out pretty well.

They have a tendency to muck up your time. You can watch a Central Organization. You know exactly what point the public is impinging against because it'll be that point that is the most scrambled and mucked up. It's the most off-line. And man, it's really off-line. It'll be – it'll be something in – wherever it directly contacts the public, that hat you've got to put back on about every three months, see, because it'll go sailing off, and Reception is now expected to empty the wastebaskets. Lord knows what's happening, but this has gone out, you see. Routing of bodies – body routing lines and that sort of thing.

Well, that can happen in a Central Organization. It sure can happen like mad on scheduling, and so forth, on co-audits. And your main danger there is not maintain – maybe it doesn't make any sense to you, but let me tell you very severely that the main danger is with your limited staff and the small number with which you are operating that the public shoves your time scheduling madly out and you just got to be meaner than a gut-shot bear.

They're going to tell you ... They're going to wander in there at eight o'clock when they should've been there at seven-thirty and that sort of thing. Well, you just got to learn to lower the boom. Because the point they'll most mess up is time.

Time is the single source of human aberration in actual fact. There'd be no aberration if it weren't for time. Old Dianetic Axiom.

And that is the point where the craziest ones will louse you up the most. So it's the craziest ones, of course, that you want to keep in line hardest. So if you want to keep the time line most severely walked, you will also be imposing a tremendous amount of good control on those that are the worst in the group and it's an excellent control factor.

So if you control time, if you control the group's time, you will find out there's less enturbulation and aberration visible in the group. And they will want you to audit them after the co-audit at night for two hours, you see, or in the afternoon from 1:37, you see, to 3:18, you see, because they have to pick their mother up at school, you know. [laughter]
And if you let them – if you let them move around your time factor, you've let them control you in their sessions. That's just something that you should use. Because the first thing they try to do, it'll be the hardest front for you to hold, but once you're holding that front, you'll find out that you will win in many other zones and areas that you never dreamed of winning in. Just hold that time.

Guy is there at 7:31, he is supposed to be there at 7:30, you've already started to tell them what they were going to do this evening and how they're pairing off. And you're reading their schedule at their roll call, and somebody walks in. For heaven's sakes, greet them effusively. Don't let them ever sneak in. Greet them effusively – just stop the whole operation. Be happy they glad – were glad to come tonight. And they'll be there at 7:30 after that.

And make sure they know that you think that scheduling is important. And as soon as they find out that you think scheduling of what you're doing with them is important, a lot of other marbles will start concatenating with other marbles, and the next thing you know they won't have lost their marbles so inaccessibly. They'll start to reassemble.

And they'll say, "Well, this outfit means business because everything fires off on time," see. It's a method of controlling people who are otherwise quite unruly.

Now, that's the – that's the basic action of control, but you've got to keep – you've got to keep a certain amount of administration running, and if you have just a couple of auditors and nobody doing any administration at all, you all of a sudden are going to waste an awful lot of auditing time. An awful lot of auditing time gets lost in answering the mail and filing the letters, you know, and answering the telephone and so forth, and answering foolish questions. And it's – you've got to save a certain amount of time in order to get broad clearing effective.

Now, I'm speaking about time merely because it's a primary control point because it's a primary aberration point.

These people, out of – given any fifty people – will rather string out to the degree of preparation if you have a single thing they have to pass. They will actually sort of sort themselves into the leading order of hens on the length of time they will pass this certain thing. It doesn't much matter what it is, see. Because of this: the longer they take to do anything, why, the more reactive bank is in their road. In other words, the more reactive bank is in their road, the less understanding per unit of time.

The reactive bank actually is composed of no time at all. And they get up into a total timelessness so they never have any time to do anything. So this has various ramifications, but it plots out just this way: Time is a single source of aberration and such a person requires or any – well, people have different periods of time to register the same recognition, see.

We hang a sign on the wall and it says boojum. And if you actually had a – reaction meters wired up to every person in the room that could plot it on a drum of some kind – it'd fire off – you would find out that everybody in the room would have taken a different period of time to have recognized what the word was and what was hanging on the wall. And it would get on down from anything from a hundredth of a second down to ten minutes.
And that is a direct index of how much bank is in the fellow's road on study. Do you understand? Some students require longer than others to absorb the same data. Now, if it were just a pan-determined factor, that is to say if it were just a factor which nothing – it existed the same on all subjects – this would be very easy to plot. We'd say this person is a ten-second character, see. In other words, it took this person ten seconds to really register and soak in any one item the person was looking at. Unfortunately, this isn't true.

Human beings vary from subject to subject, dynamic to dynamic because their goals are sorted on the different dynamics and they're stupider on one thing than they are on another. So it takes them longer to absorb one thing than it does another.

So you get a certain unevenness running through all this because of the variability and there actually isn't a real general constant. You take some – some girl and you show her – you show her a slide rule. And she looks at this thing, and she looks at it, and she looks at it, and she looks at it, and she looks at it, and all she's supposed to find on this thing is it's got numbers on it, see.

And she looks at it, and she looks at it, and she looks at it, and she turns it over, and she looks at it, and you're waiting for this girl to recognize that there are numbers on the slide rule. And she just looks at it and looks at it and looks at it. An hour later she's still looking at it. And there's only one thing you have asked her to recognize is that it has numbers on it. She just won't do it.

And you show her a cake recipe that's full of numbers. She goes bzzzt bang, practically knock out the cake together to throw it in the oven before you could spit. Get the idea?

It's just where her goal sits. See, here was numbers in one form and numbers in another form. And in one form she just knows she must not ever understand this. Well, of course, that's practically an infinite time non-understand, see. That gets in the road of your meter reading. A person's ability to read a meter is dependent upon the amount of aberration they have about meters.

In actual fact, in ten minutes, person B, who is very aberrated on the subject, has less time spent in recognition – you follow this? See, out of ten minutes there is less of that ten minutes used in actual recognition, than person A who is not quite so aberrated on that subject, who only observes it for a tenth of a second. There is more recognition for person A in a tenth of a second than there is for person B in ten minutes. Do you see?

That's why you hand the meter to one person and they have a hell of a time seeing the needle. They stare at it and stare at it and stare at it, you know. Well, hell, it read seconds ago, and they're still looking. And another person, the thing gives the barest tick, and the person is right there, Johnny-on-the-spot, see. He's recognized that, digested it and put it out. It's on the subject of a meter.

Conversely, we might take this same person, give them a very complicated bulletin – this isn't necessarily true. There is some coordination between these two points, but not necessarily – and we give them this bulletin and they fire off on the bulletin brrrrrrr, and they go in and they pass it, brrrrrrr. They understand all of it. Everything is all fine and so forth and they take the meter in the hand and ... "When did it read?"
Well, they'll stare at it as long as they haven't got time in which to recognize it. A very sane person has fantastic quantities of time. I almost made one – somebody faint one time by telling them the local program for this planet. That is, this quarter of the universe program for this planet. This person has – was just going ahhaaa. You could just see the exhaustion coming off of this person. Oh, my God!

That – just embracing a plan that had that much time mixed up in it, see. Real time mixed up in it. It just wore them out.

I was tossing off things – well in 5,000 years this is what's supposed to happen, you see, and then this is... Actually we're in a dead period right now which is absolutely true. There isn't anything much going to happen here for about 5,000 years, so there's a little time to stretch.

But after that, why, there's several programs firing off and so forth and the actual allowed time for this particular planet was 15,000 years, you see, and plot this, plot that, and so on. And that's a fairly rapid program. That's fairly rapid, you know, speedy program. That's a sort of a rush program.

This person was dying at the idea, you know, of planning something out for 5,000 years. Well, hell, I've seen a billion years planned out on the track, down to its smallest detail. It gets to be fantastic, you know. I mean how much – how much time is time. And it has a great deal to do with the amount of recognition a person can experience per unit of time.

So anyway, here is your source of aberration. Your basic source of aberration is time. If you didn't have any time, you wouldn't have any motion. Don't you see. You could have no havingness either. The unit velocity of vibration, so the possibility of having any matter would be quite slight.

All of these various other things all add up and the more bank a person's got, the less time he has during the longer period. Do you follow that?

A rock can sit there without any recognition at all for a few trillennia, you see. Speed of recognition depends on how much time a person can actually have.

Present time for some people is a thousandth of a second and for some people as much as a second or two. And you can expand that out to about ten minutes, and then it becomes frightening. If your present time was to be expanded in this split second here – I mean you just – I snap my fingers, your present time was expanded to ten minutes, so that you knew everything that was going to happen in ten minutes. Do you realize you would be able to see the consequences of everything that was going to happen and correct it before it occurred.

Audience: Mm-mm.

You certainly would make no mistakes, would you?

So the number of mistakes a person makes is actually proportional to the amount of present time they have. Present time is a band. Present time is not a – an instantaneous instant.

And the saner a person is and the better they are and the freer they are – let me put it that way; let's forget this saner – but the freer they are, the more present time they've got. It gets pretty wild sometimes.
Somebody with ten minutes of present time, you see, he can unturn all the corners he shouldn't have turned before he turns them. But this guy who has got a thousandth of a second as his present time never foresees the difficulty of doing anything. He never foresees it. He does the most impulsive and stupid things you ever heard of.

You'll find him always driving up the side roads and backing out of those to get back onto the main highway – driving – always! See, he's just in a total confusion all the time, all the time, all the time. He never can foresee anything. There isn't any time to foresee anything.

Foresight is not really brightness, but PT. There's nothing beats looking. You can be pretty smart and think your way out of things, but nothing beats looking your way out of things.

Of course, if you were able to foretell the future for a thousand years with complete accuracy, your first thought is that you would be bored stiff. Well, I don't know. How did you have to have excitement that way – whereby you have excitement only because you're stupid? That's quite interesting, isn't it?

Anyway, this basically gives you a very fast index on pcs. I didn't mean to talk about it so long. It gives you a very fast index on pcs, co-audit members, and so forth. It gives you very, very easily assembled groups and so forth.

Not necessarily dependent upon APAs and OCAs and that sort of thing, you see. Not necessarily dependent upon their intelligence and that sort of thing. But the amount of time it takes them to recognize something.

And you could almost break down your group in advance into when they would get their goal found. Do you see how you could do this? It's by measuring how much time is required to find out something is there. And this is useful in numerous ways. It's meter useful.

Put something in front of somebody and wait for a ping on the meter. Yeah, that's the most direct index I know of. You put a little red light or a statue of a snake or something like that on the desk in front of them – put it down with a thud and look at your meter. It'll finally register. But on some people, when you put it down, they register it instantly. You don't even have time to look back to your E-Meter. The thing has been recognized. You got the idea?

Well, the length of time it takes them to absorb auditing information would be the length of time it would take them to be reliable. There is some coordination between these two points. You shouldn't be too – don't yourself be stupid in classifying these people or in pairing them up. And you should pair up comparable recognition periods, if you want to call it that, rather than comparable social interests or comparable ages or something like that. It has nothing to do with it. It's comparable recognition period. And these two people in a co-audit will be fairly satisfied with each other.

It will seem reasonable to both of them, and if you've got somebody who's got a ten-minute recognition period or something like that, and you put them with somebody with a ten-minute recognition period, the other person will sit there quite happily. He knows how long it takes and understands.
But you mix up a tenth of a second recognition period with a ten-minute recognition period and they'll both drive each other batty.

Now methods, I haven't even explored, actually, many methods of determining, actually, what the recognition period is or anything like that, but such methods could easily be developed and easily be used for dividing up and separating and putting together co-audits that would be highly successful because your co-audit will break down on the basis that some member thinks the other members are stupid. And if you keep them segregated at comparable levels of recognition, they're not going to get this.

_Audience: Mmmm._

Now, all of that is in technical lines, but how much should you teach these people in a co-audit? Well, I'd just irrationally demand perfection out of them. I wouldn't cut back my sights. Never make a practice of tolerating bad auditing. I don't care who's doing it. And you demand this out of them, you'd be amazed how closely they will approach it.

Of course, it'll probably be utterly hopeless when you were ten feet away at first and then they'll let you be fifty feet away, see. They're okay as long as you're there. And then because you're running the group, they will be all right. I wouldn't count on them ever taking any vast responsibility for cases individually, don't you see, because they the ... But they work all right as long as somebody will take some of the responsibility for it. And you'll find out they work fine that way.

You'll find out in any co-audit the amount of gain in the co-audit is to some degree proportional to the amount of responsibility which the Instructor of that co-audit is taking for those people. And if he's taking very little responsibility, you'll have very little gain.

Regardless of what process they're running – people always come around asking me for a process. Well, there's thousands of processes. You, an old Scientologist, could sit there and dream up auditing processes day and night. They'd have – all have some workability. But you haven't got to waste any time on this co-audit by dreaming up processes of this and that. You have a present time problem process which is independent of O/W and responsibility.

You have "problem of comparable magnitude" going back even further so as you don't have to get too much into O/W in exchanging these terrible confidences that they don't want to. You can dodge these things to a very marked degree. You can set this thing up to run quite successfully. But your best bet is to just put them right on the project they're supposed to be on. They're there to list goals and list items.

Well, God help 'em, they'd better be studying or listing goals – doing something, or prepchecking goals lists or doing something analogous to a goals list right up to the time when they get their goal found, you see, till a person's goal is found.

In other words, put them on quite real actions. Start them out on a Prepcheck. You always got two or three in a group you've had something to do with. And you cleaned them up to a large extent yourself. Start in with them and get them with a goals list so their goals list is prepared. Start the others in with a Prepcheck type of action. That would be enough for staggering. Then really keep them – keep them quite germane to getting the – getting the goals list all straightened up and squared away, you know.
Spend lots of co-audit time on the actual fact. And don't try to dream up side panels just to keep them busy. Because if you've got to keep them busy, you can always give them something to study that would advance their skill.

And if you're up against keeping people busy, aside from swamping up their present time problem, and you – they've got everything else done and they're just on wait, make them study. You see? Make them study listing. They'd study that with considerable enthusiasm. You get what I mean? See, try not to occupy people's time because people have to be kept busy. But try to utilize the time available to you in that co-audit. Try to utilize that time in the most productive, possible way that's contributive to the situation.

Now, I don't know how many co-audit people could be handled by one auditor. I think one auditor handling it, it would get fairly lonesome. I'd hate to be in that position because I've been in it for years, see.

It's not a very tenable position. You got no datum of comparable magnitude. You're always on parade, you see. You never take your boots off in the barracks, you know. It's harder on you than you – than you would think. And many field auditors just practically go out through the bottom just because they're all by themselves. It's – they get lonesome. They got nobody to talk to about this. They're always explaining, always teaching, you know, and there's – there'll be something missing in their vicinity.

Now, as you see, a co-audit in a Central Organization could be organized also along these lines. There's no reason why a Central Organization shouldn't run such a group of its own in its immediate vicinity. But its group certainly would have nothing to do with whether or not such a co-audit group was running elsewhere.

Now, we speak of whether or not a group so running should be a franchise holder or a city office or something of this sort.

For a long time, I've been trying to decide this myself. In actual fact, we're moving up toward a better proposition as a city office. A franchise holder doesn't feel like he belongs as much as he should. There are many things that are a little bit haywire with this and actually, these characters are holding an outpost, don't you see, of some kind or another. They're holding an exact point of reference and if that point of reference isn't firmly on the map, they to that degree are being scanted.

Because they move around and fold up and pass on and that sort of thing, it has sometimes been difficult to maintain a center of control. I mean not control the point, but the point's control of the environment. The operation ebbs and flows to too great an extent. But I expect a greater stability will occur in the future and I expect to see franchises more or less turning into city offices. Had very little to do with income – it has a tremendous amount to do with the influence in the area and the erection and maintenance of a worldwide communication channel. You'll find out that your communication channel falls off to the degree that the person is outside the organization and comes up to the degree that the person feels he is inside the organization. You understand, that's just feels. See? It's quite amazing – quite amazing the difference this makes.
And what I'm looking forward to is that every such area and held down of course, is simply a city office. It's a perfectly official office.

People walk in there, if they don't and it's in communication with everything else and it gets itself in trouble, and it's got somebody to scream to and then the persons there don't feel that this is an outsider, you see. They feel well, that's one of the gang. We've got to pitch in and help, don't you see.

Any way we could promote this, I would be very happy to do so.

But we're advancing now toward a necessity to make everything neat – as neat as possible, because it's going to blow up anyway. I'm a great believer in blowing up neatly, you see.

For years now in Central Organization design and communication line design, I have tried to make those lines expandable, and yet I find out any time a Central Organization doubles its business, its lines blow up.

And what you really do is try to make the lines as expandable as you can and then be an expert in putting it back together again. Do you get that, see? And then you're smart. That's a very smart measure to take. Then you're not always dismayed because it somewhat fell apart.

For instance, I know that in every Central Organization the body line between the D of P and the Registrar must be put in every three months. See? I'm an expert now in patching that line up. I'm willing to be reasonable and talk to them about it and give them all kinds of unreasonable answers. You see, I work hard at this. All right. That line – because the public impinges against it totally – blows up every three months in every Central Organization in the world. All right. So it does.

Well, I used to knock my brains out and be very unhappy about it all the time because it fell apart. And now I've realized that it's perfectly all right for it to fall apart because I can always put it together again. Get the idea?

Well, any time increased traffic hits a network of communication lines, you can expect the seams to open and the water to pour in here and there – no matter how carefully you planned it. And if you're so sold on perfection that you go out and commit suicide because your plan wasn't perfect every time, so help me, you don't get much accomplished. You're just picking up new bodies all the time, you know.

But the point I'm trying to make is, is you start throwing sixty Clears, fifty Clears, thirty Clears into this community and that community inside of a year: well, we haven't got enough telexes, we haven't got enough personnel, we haven't enough administration, we haven't enough file cabinets, we haven't enough printed books. You understand?

Well, we're walking into this in that full realization. Just go ahead and realize it. And then realize that we can still put it back together again. You understand?

And it'll look a lot better to you. Because the second you start putting this much traffic and this much strain on your own communication lines, remember, you're putting an equal amount of strain, which actually is multiplied for various reasons on the public at large, and
they're not organized at all. They go into a total confusion, they hit your lines, they blow up, and any patch you've put on blows off at that moment, you see, and it's pretty bad.

You must be skilled in putting something together. Not skilled in holding the same old line together, see. You see your lines gone, well, don't waste your time and energy and sweat in screaming and saying how terrible this is. Just be an expert at putting the line there again.

You see it's gone: put it back. Don't scream at me and say "Do you realize that for four months there has been no HCO Secretary in Chicago." You know, like a what do you mean? Isn't – wha – what – what's the matter with you, see. I mean what are you doing that for?

Why don't you send me a cable and say, "I just found there's no HCO Secretary in Chicago and Janet Woods would be fine for the post. Is she appointed?" See? That's much more effective. Then all I have to do, I don't have to wade through the scream, you see. All I have to do is say okay. You see.

And all of a sudden you've got that area in order again or it's being put in order. Do you get how this is?

Well, you're not in a position of holding the world together. So you might as well get used to the idea of putting it together.

So any co-audit or Central Organization entering in on a clearing program should design it so that it'll operate perfectly – without a single hitch. Please do. And get the exact people on the post that should be on post. And get the exact files that should be there exactly filed and in place. Just plan it down to a – to a split hair and then put it all back together again the second it blows up. See?

Because you never do an expansion or a forward action of this character without coming apart at the seams. The public sees to that.

Now, you hold the fort with time, with good regulations, with discipline, by not compromising, by not throwing everything out of line, just because one person goes out of line. You hold it together and you realize that world clearing is on a basis of "you somehow make it." It isn't a planned juggernaut that rolls on smoothly down the highway. Look, there isn't even a road there. And until recently, hasn't even been a vehicle. So if you start bumping and so forth, look down and you'll find out you're going over tree trunks – don't scream, just make a better road. You got it?

No, it's something you do off the cuff. You follow policy as far as you can. You put it together the way it should be as best you can. And then you make it work. And as the thing goes all out of size and so forth, and you've got the city council also in the co-audit, suddenly, don't blink longer than is necessary to hand them the enrollment cards.

Go ahead and do whatever you can. But don't do this. Don't scant technology.

Don't fail to deliver the goods when you promise it. And don't fail to turn out Clears.

Those are the only mistakes you can't make. You can't make those mistakes.

See, you can make any God's quantity of mistakes and the world will forgive you. Okay?
Well, I didn't mean to preachify at the end, but this is the first word I've given you on world clearing, and it's quite important in actual fact and I think you, particularly, that are gathered here this evening, will find it quite exciting.

Thank you very much.
TV Demo:
3GA Dynamic Assessment
An auditing demonstration given on
15 August 1962

LRH: Okay. There you go. A little bit forward please. Thank you. Now, what's going to happen here is very elementary. I'm going to put in the beginning rudiments, if we can get them in. And going to do a Dynamic Assessment, and you should realize in doing this that there is no standard drill for Dynamic Assessment at this time. It'll probably get most awfully patterned later on, but now it isn't.

Pick up the cans, would you, so I can see what this is all about here. Okay. You're sitting on... Give them a squeeze. Thank you. All right. Thank you.

Now, all we're going to do is just put in the rudiments, take the body of the session, I'm going to do a Dynamic Assessment...

PC: Yeah.

LRH: ... and then I'm going to, if time permits, list...

PC: Yes.

LRH: ... the – a few goals. And then if time permits we will tiger drill the goals, okay?

PC: Yes, fine.

LRH: That's all if time permits.

PC: Yes.

LRH: Okay. All right. Is it all right with you if I begin this session now?

PC: Yes.

LRH: All right, here it is.

LRH: Start of session.

PC: Okay.

LRH: All right. Session started for you?

PC: Yes.

LRH: All right, very good. What goals would you like to set for this session?

PC: Well, to get the dynamic assessed.

LRH: Right. Another goal?

PC: And to list some goals.

LRH: All right.

PC: To not be shy in this matter.

LRH: Good. All right. Got it.

PC: And to help you all I can, help me.

LRH: All right. Very good. That do?

PC: That will do.

LRH: All right. Any goals you'd like to set for life or livingness?

PC: Yes, to, um – clarify uh – clarify my doingness in the future, for myself.

LRH: Right.

PC: That will do.
LRH: All right, very good. Are you – am I missing a withhold right there at that point?

PC: No, no, no, no.

LRH: All right, very good. You're not holding something back?

PC: No, no, I was just thinking that this is just one session, so that that would do for life or livingness.

LRH: Oh, all right. Thank you very much. Okay. Now, are you willing to talk to me about your difficulties?

PC: Yes.

LRH: All right. I'll check that on the meter. Are you willing to talk to me about your difficulties? Okay. A bit of a prior read, there. Have any thought on this?

PC: No. I just wondered how the needle would react to this question, just scanning over to see if there's any difficulties I wouldn't be prepared to talk to you here and now.

LRH: All right, very good. Let me check it again. Are you willing to talk to me about your difficulties? Okay, there's just the tiniest tick on that.

PC: Well I was hoping that the difficulties of – uh – marital difficulties and so on wouldn't necessarily have to come up and be flogged out here.

LRH: Oh, all right. Thank you. Very good. Well, what is the answer to that then?

PC: Well, that despite that, I am still willing to talk to you about my difficulties.

LRH: All right. Thank you. Okay. Are you willing to talk to me about your difficulties?

PC: Yes.

LRH: All right, unfortunately, it is still falling slightly. There it is.

PC: Well, that – oh that's a – um – a nervousness that – uh – sort of stage fright I...

LRH: Oh really.

PC: ...experience, but I'm having to talk to you about it, obviously, now.

LRH: All right. Okay. All right. Are you willing to talk to me about your difficulties?

PC: Yep.

LRH: Good enough. I'll check that on the meter. Are you willing to talk to me about your difficulties? All right. Well – mind if I check it again?

PC: No!

LRH: Are you willing to talk to me about your difficulties? Now, do you have an ARC break on this question? There is what it is.

PC: Well, what immediately comes to mind is there shouldn't be any doubt on the subject that I'm willing to talk to you about my difficulties.

LRH: Oh, all right. Very good. Very good. All right. Now let me check it. Are you willing to talk to me about your difficulties? All right, do you agree that's clean?

PC: Yes.

LRH: Very good. Thank you. All right. I audited you so long ago that I'm just going to skip that part of the question.

PC: Okay.

LRH: All right. And I'm going to ask you straightly, do you have a present time problem? And do you?
PC: No. Not as far as I know.

LRH: All right. Thank you. I'll check it on the meter. Do you have a present time problem? Thank you. Do you agree that's clean?

PC: Um-hm.

LRH: All right, very good. Well we got over that hump. Well, the reason I say we got over that hump is mostly because on a Dynamic Assessment of this particular character, person knows one's coming up, if he knows what it is, he's liable to start getting a dirty needle early.

PC: I see, yea.

LRH: Now, right now I'm not even vaguely upset if you have a dirty needle or if you had any kind of a needle, so don't worry about that for a second. If the needle doesn't go dirty, I'll start worrying!

PC: All right.

LRH: All right. Now, I'm going to take several dynamics here, and I'm just going to run them off in line. ...

If you'll excuse me here for rolling this down. I'm rolling it down for you, personal, in particular.

PC: Yep.

LRH: I'm making up a dynamic list. ...

All right, we got it here. That's fine. Now, I'm just going to take these dynamics, and I'm going down the line of these dynamics, and I'm going to turn me on a dirty needle if I can.

PC: All right.

LRH: And what I'm going to ask you to do, is just, when I ask you to consider something, why just consider it. In other words, I – I'm not asking you to do anything with it particularly, you – just consider it.

PC: Um-hm.

LRH: All right. And the first one, I'm going to ask you to consider yourself. All right, good enough. Thank you.

Now, consider sex. Okay. Consider sex. All right. Thank you. All right. That one's out.

All right, consider family. All right. Consider family. Okay. There. There. There is our first dirty needle. Thank you very much. So, that one's an R/S. Thank you.

All right, you feeling at ease?

PC: Yes, quite at ease. May I scratch my face?

LRH: You sure may.

PC: All right.

LRH: All right. Very good. All right. We got one to go on. See if we can get some more here.

All right. Consider groups. Consider groups. Doesn't – out. That's out.

All right. Consider people. All right. Consider mankind. Consider mankind. Mankind. Well, it's almost. Almost. I'm going to put it down as such, anyhow. It won't do us any harm. If it isn't it, it'll fall out. [-0° 10']

All right. Now consider living things. Living things. Yup. Thank you. All right, that's out.

Now, consider the physical universe. The physical universe. All right, thank – ah. What did you think of just then?

PC: Well, first of all I had a – sort of got the idea of the planet, and then I sud-
suddenly realized that the stars were also included, and I sort of flipped out to consider them as well.

**LRH:** Well, we're going to add that one in, since I got a momentary one.

**PC:** All right.

**LRH:** All right. And now, consider forms. Forms. Consider forms. Okay. Consider forms. Well, that's a little, tiny one and just to make sure, we'll put that one down, all right?

Now, consider spirits. That's my boy! How nice. Thank you. Nice rock slam on that. Okay?

**PC:** Yes.

**LRH:** All right. Thank you. Now, consider God. All right. Good. Consider God. Well, there - there's been enough here to warrant putting it down, but I'm not going to worry about it particularly, I'm going to put it down.

Now, consider religion. Religion. Now, that's all there is to that. That's out.

Okay. Now, let's go over these things again and see what we've got here. By the way, you're very easy to do a Dynamic Assessment on. It's a – it's quite interesting. Most of the time you get a little dirty needle and you have to make it bigger and smaller and…

**PC:** Um-hm.

**LRH:** ... and go over it and over it and over it, but yours is right on the button.

**PC:** Good.

**LRH:** All right. Now, this is almost textbook! All right. Now, we're going over this again. Okay?

Consider family. Consider family. Consider family. All right. Once more. Consider family. Man, that is… Well, there's just a hint of it left. So I'll say there's a tiny R/S there. Ah, it's just a hint, just a little bit dirty at the end. So we'll leave it in.

All right. Now, consider mankind. Consider mankind. That does a little dance. Tiny little bit, not hardly anything to bother with. A little bit better than family now, so we'll put down a tiny R/S.

And now, let's consider the physical universe. All right. Consider the physical universe. All right. Consider the physical universe. Man, that's the most microscopic…

**PC:** Yes.

**LRH:** … momentary one I ever saw. Probably anybody watching this thinks I'm looking for instant reads. I'm not looking for anything but whether or not we get anything, essentially. So you needn't worry about it here. That's why I ask you two or three times, just to see if I can keep it going, see? So we'll put down a tiny R/S there. I'm being much more particular. If you and me were just running an auditing session we would have had it by now. But we're going by the textbook. Okay?

**PC:** All right.

**LRH:** All right, forms. Consider forms. Consider forms. Man, that's clean as a whistle. All right.

Now, consider spirits. Okay. Consider spirits. All right. I want to put in some middle rudiments here.

**PC:** All right.
LRH: If it's all right with you, right at this point. All right. In this session, is there anything you have suppressed? I got a bang.

PC: That was when you said forms have gone out, I suppressed commenting, "Well that's one up on John," because he was running me something on form, when we were at HASI.

LRH: Oh, all right. Thank you. All right. In this session is there anything you have suppressed? Got another one?

PC: I suppressed commenting that – when you said you weren't going to do the withhold rudiment.

LRH: Oh, all right. Very, very good, thank you. All right. In this session is there anything you have suppressed? All right. Do you agree that's clean?

PC: Yes.

LRH: Very good. In this session, is there anything you have invalidated? All right. Do you agree that's clean?

PC: Yes.

LRH: Good. You got any afterthought, there?

PC: No.

LRH: All right, thank you. In this session is there anything you have failed to reveal? Got a little bing there. Is there something you failed to reveal?

PC: Well, I failed to reveal what I was going to reveal had you asked me the withhold question.

LRH: Oh, all right. Very, very good. Now, let's see what we've got here. In this session is there anything you have failed to reveal? Equivocal. In this session is there anything that you have failed to reveal? All right. Do you agree that's clean enough?

PC: Yes.

LRH: All right. In this session is there anything you have been careful of? I got a read.

PC: Well, I was careful to hold a cough when I wanted to.

LRH: All right, thank you. In this session is there anything you have been careful of? Got another read.

PC: I've been careful to listen to you, put my attention onto you.

LRH: Very good, thank you. In this session is there anything you have been careful of? Got another one.

PC: Well, careful to do the – to do the process – questions when you asked me. They seem too glib to me... I can't think of anything else.

LRH: All right, thank you very much. I'll check that here. In this session is there anything you have been careful of? All right. I've still got a bing here, of some kind or another. Well, it's still acting up.

PC: Um-hm.

LRH: It's probably different. It's undoubtedly different than what you have said, but – there it is, right there. What is that? Bing.

PC: Careful to sit still?

LRH: Well, all right. Okay. All right, in this session is there anything you have been careful of? All right, that's quite equivocal. In this session is there anything you have been careful of? You know, I'm – I'm getting something that looks like a read, here.
PC: All right. Um...

LRH: It's an anticipated read, but it's still a read.

PC: Well, I'm being very careful now to try and find out what it is I've been careful of it!

LRH: Well, all right. Thank you. Thank you. Thank you. In this session is there anything you have been careful of? And we get a read.

PC: Well, I was careful to ask you if I should scratch my face, before I did.

LRH: Hm-hm.

PC: I was overcareful, I think.

LRH: Thank you. All right. In this session is there anything you have been careful of? All right. Check that again. In this session is there anything you have been careful of? All right. Do you agree that's clean?

PC: Yes.

LRH: Thank you. All right. Now, in this session, have I missed a withhold on you? I got a little bing.

PC: Yes. You missed a withhold then, when you asked me had you missed one on goals.

LRH: Hm-hm. [~0° 20']

PC: Um – it was to do – it had something to do with the – the go... it didn't seem very real to me to ask for goals for life or livingness in this session, just for one session, do you see? I mean, if I was sitting down for an intensive, well that would be fine. But, if one wants to achieve something in life you would set it – I would set it down as a session goal. Do you see? And a protracted period, well, then you probably would set one for life or livingness. So I think the question was a bit unreal.

LRH: Oh, all right. Okay.

PC: All right?

LRH: Thank you. All right. In this session have I missed a withhold on you? I'll check it again. In this session have I missed a withhold on you? I've got a read. Something else now.

PC: Well, this has to do with the dirty needle. Um...

LRH: That was it.

PC: Well, it was to hope that I had a dirty needle. You wanted one, but – no – hope that I still had a dirty needle, in other words, for you.

LRH: All right.

PC: Now, I did withhold commenting when you said it was a nice – it was turning on nicely, that I was very – that was very – I was very pleased about that.

LRH: Oh, all right. Thank you. Very good. All right, let me check this on the meter now.

PC: All right.

LRH: Oh, all right.
LRH: In this session have I missed a withhold on you? You agree that's cleaner than a wolf's tooth?

PC: Good.

LRH: All right. Very good. Now, let's carry on here, shall we?

PC: Um-hm.

LRH: All right. Consider spirits. Good. Consider spirits. All right. Consider spirits. That's good enough. All right. I knew there was a rock slam there someplace and I certainly wasn't going to miss it. All right. It disappeared for a moment.

PC: Uh-huh.

LRH: It was big the first time I went across it on the first run and then it disappeared. So I decided I'd better get these middle rudiments in.

PC: Um-hm.

LRH: Okay? All right. I'm not instructing by putting in the R-factor, I'm just telling you.

PC: Yes.

LRH: Probably mystified why I would do that.

PC: No, I wasn't, I was – can I tell you what I thought?

LRH: What?

PC: I just thought it was very nice to be told what you were doing. It was...

LRH: Oh, yeah? All right.

PC: Yea.

LRH: Yeah. Well, we had a – we had a wide slam, you see. I actually thought because I suggested it was a wide slam to you, or something like that, why, I might have upset you.

PC: Um-hm.

LRH: All right. Consider God. All right. Consider God. Well, we'll call it a tiny R/S. See what we can develop out of this.

All right. We have five tiny rock slams, here, now. Microscopic. Now, let's go over and see if we can really turn these things on, huh?

PC: Yes.

LRH: All right. Consider family. Consider family. No, I can't call any part of that an R/S. So, she's out. Okay?

PC: Okay.

LRH: Now, consider mankind. Consider mankind. There we are. There's another R/S. Or are you – were you disturbed by anything, there?

PC: I was a bit.

LRH: What's that?

PC: I noticed you looked at the screen, outside, and um – over my – or looked at something over my shoulder, and I'd just noticed you'd done that. And I thought, "Oh, he's reading the meter," and then I found it difficult to get – to consider mankind.

LRH: Oh! All right. All right. I'm sorry.

PC: That's okay!

LRH: I was just wondering how well this camera was set up and I was trying to get the meter on the – on the dial.

PC: Um-hm.

LRH: Because I'm playing it way over here to the right.

PC: Um-hm.

LRH: I'm sorry.

PC: Okay!
**LRH:** All right, we'll ask that one again. Consider mankind. Okay. Consider mankind. That tendency toward R/S. We're going to leave it in there, okay?

**PC:** *All right.*

**LRH:** All right. Now, consider the physical universe. Consider the physical universe. Okay. Consider the physical universe. Trying to find an R/S here. Had one there for a moment, but it wasn't sure of it. Consider the physical universe. There. I'm going to leave that one in.

Okay. Now consider God. Yeah. That's good enough; we still got one. There we are. We still got one. Very tiny, but we still got one. Okay?

**PC:** *Um-hm.*

**LRH:** All right. Now we're sitting here, with one, two, three, four still in. Okay?

**PC:** *All right.*

**LRH:** All right. Here we go. All right, consider mankind. Consider mankind. Okay. Consider mankind. Yes, yes. Still with us.

All right. Now, consider the physical universe. Consider the physical universe. That did a little dance, eventually. What were you thinking of just then?

**PC:** *Stars, and so on, I was getting...*

**LRH:** All right.

**PC:** *... slight external view of the – of the planet – this planet, but ah...*

**LRH:** Oh, all right. Okay. Good enough. Consider the physical universe. Consider the physical universe. Consider the physical universe. There we are – onto something here.

**PC:** *Yea, I'll tell you something.*

**LRH:** What?

**PC:** *Well, I get the feeling, when you say consider the physical universe, I just all of a sudden I got the idea, well, Christ, yes, I'll consider the physical universe and – and it certainly wasn't from here!*

**LRH:** Oh, yea?

**PC:** *Uh – way – it seemed to be way back, and sort of, well, we'll consider this physical universe now!*

**LRH:** All right.

**PC:** *As near as I can put it.*

**LRH:** Okay. Good enough. All right. Consider the physical universe. Yes. We've still got an R/S. Thank you.

Consider God. Consider God. Consider God. Consider God. Well, there might be some tendency toward that, so we'll leave it in. Okay?

**PC:** *Yeah.*

**LRH:** All right. We got rid of one that time, we're left with three.

**PC:** *Can I wipe my nose?*

**LRH:** Hm? You betcha!
... Okay. All right. Consider mankind. Okay. Consider mankind. Definitely still a rock slam. Okay?

Consider the physical universe. Okay. Consider the physical universe. That pumped for a minute. Consider the physical universe. There it is. It does a little tendency toward a dance. Not a real good rock slam, but we're going to leave it there. Okay?

And – consider God. Consider God. Consider God. Well, we're going to have to leave that one in, too.

All right. Now let's see what we've got. We've still got three. But, a couple of them pretty faint.

PC: Um-hm.

LRH: All right. Consider mankind. Consider mankind. What you thinking of right then? Just considering mankind?

PC: Um-hm.

LRH: Thataboy! She's still with us. All right.

Consider the physical universe. Okay. Consider the physical universe. Oh, definitely. All right. She is still with us. Okay.

Now, consider God. Okay. Consider God. Very nice. Very nice. It's developing now. Easier to do this now, isn't it?

PC: Pardon?

LRH: Is it easier to consider these things, now?

PC: Yes, and I'm also sort of getting – find I'm getting selective on them. I – when I sat down here it didn't seem to matter, but now I sort of, uh – saying, well, I hope it's not that one – God, for example, now that we solved that one. That's the...

LRH: All right. Good enough.

PC: ... feeling there.

LRH: All right. Now, consider mankind. Consider mankind. I'm going to have to let that one go. Lost one!

Okay. Consider the physical universe. Okay. Consider the physical universe. Yes, this has got a tiny R/S tendency. There it is, yes. Yes, yes. There's something about it. Consider the physical universe. Yes, that one went right into a dance. What did you think of just then?

PC: Well, it just – it seems to me that you're presenting me with a choice, here, do you see. As if you're almost a salesman, do you see, black bag, and you sort of, "consider this universe, consider that universe, or consider this physical universe, what do you think of that?"

LRH: All right.

PC: A little tally!

LRH: All right. Okay. Good enough. All right. And consider God. Consider God. Well, that's out.

And that leaves us with the physical universe.

PC: Hm!

LRH: According to that.

PC: All right!

LRH: And now we're going to do – this isn't necessary. I'm just going to do a cross-check on this assessment now. Do you want to put your cans down for a moment and rest your hands?

PC: All right. Thank you.
LRH: ... All right. We will do a confirmatory run down this line, here, and see what we get now.

PC: All right.

LRH: All right. On the other one, as far as we're concerned here, we've got the physical universe.

PC: Um-hm.

LRH: As far as we're concerned. I won't monkey with that, any further. Not that there was anything wrong with it.

PC: No.

LRH: But, I just want to make awful sure.

PC: Good enough.

LRH: So we're going to do this one by overts.

PC: All right.

LRH: First thing we're going to do here is put in the session mid ruds.

PC: All right.

LRH: All right. In this session is there anything you have suppressed? Equivocal. In this session is there anything you have suppressed? Do you agree that's clean?

PC: Yes.

LRH: In this session is there anything you have invalidated? All right. Do you agree that's clean?

PC: Yes.

LRH: In this session is there anything you have failed to reveal? Equivocal. In this session is there anything you have failed to reveal? All right, you think of something there?

PC: I noticed you just stumbled over the word "failed."

LRH: All right, very good. In this session is there anything you have failed to reveal? All right. I can't make up my mind on that.

PC: Well, I failed to reveal at one time that my – I felt a bit cramped, here. My legs were cramped. But when you gave me the opportunity to put the cans down I put it right, but before then I sort of hadn't told you that.

LRH: All right, thank you. In this session is there anything you've failed to reveal? Okay, thank you. You haven't got any afterthought there, have you? That looked like a little bit of a slow.

PC: Oh, there's one or two comments I hadn't mentioned when you've been – you know, the things I've been doing when you've asked me to consider. I haven't – yes, I haven't revealed to you exactly the way I was considering these things.

LRH: All right, very good. Thank you. In this session is there anything you have failed to reveal? All right, do you agree that's clean?

PC: Uh-huh.

LRH: Thank you. That by the way, is – it's – it's all guesswork, more or less, when you – because your "failed to reveal" reads, of course, on the Dynamic Assessment.

PC: Yes, yes.

LRH: It's all muddied up – as far as that's concerned, particularly.

All right. In this session is there anything you have been careful of? All right, you agree that's clean?

PC: Yes.
LRH: All right. There was a latent read on that – do you have anything to say, as an afterthought?

PC: No, I didn't think there's anything I've been careful of, there.

LRH: All right, very good. Just thought maybe there was something you wanted to say.

PC: No.

LRH: All right, very good. Now we're all set. Now we're going to go through this one with another curve.

PC: All right.

LRH: And that is with "overt against." I'm going to get you to think of overts against.

PC: Mm-hm.

LRH: Now, I don't know whether it'd be "consider overts against," or "think of overts against," or "get the idea of overts against." Which one of those things seems right to you?

PC: Well, any of them I – I can do.

LRH: All right, then we'll use "consider."

PC: All right.

LRH: Okay. And here's the first one: Consider overts against self. Thank you, that is out. Okay.

Consider overts against sex. Okay, thank you. That is out.

All right. Consider overts against family. Okay. I'm going to mark it out. Okay.

Consider overts against groups. Well now, that's showing some tiny, little tendency, so we're going to leave that in just for fun. All right.

Now, consider overts against mankind. Yeah, that's got one of these. Thank you.

Consider overts against mankind. Yeah, that's got a tiny, little rising slam, I'm going to take it with us any-how. All right.

Consider overts against living things. All right. Consider overts against living things. It's enough little tick there to – I'll just make a note of it.

All right, now consider overts against the physical universe. All right. Consider overts against the physical universe. All right. Consider overts against the physical universe. Yeah. There's a – a little R/S turns on with that, very tiny. All right, and consider overts against forms. Okay. Consider overts against forms. Now, we're definitely going to leave that one in.

Now, consider overts against spirits. All right. Okay. Consider overts against spirits. Well, there's enough of an R/S factor here, a shake on that, to keep it in. With a question mark.

Now, consider overts against God. Okay. Consider overts against God. We got one R/S out of it. Yes, yes. That's tiny, but still there.

All right. Consider overts against religion. Consider overts against religion. There's something there.

PC: I have to tell you something.

LRH: Yes, what was it?

PC: Form and religion seem to be associated in my mind there.

LRH: Oh, I see.

PC: Two came up.

LRH: All right. Thank you. All right. Now, when you were considering overts, you were considering just the general idea of overts, weren't you?
PC: Well, I was considering – when you asked me, you see, I was considering what would be an overt against these things.

LRH: You're considering what would be?

PC: Yes. And to get the idea to consider ones, you see?

LRH: All right. Now listen, here's what I want you to do this time. And I'm going to change the question here slightly.

PC: Mm-hm.

LRH: I want you to consider you doing overts against...

PC: Um-hm. All right.

LRH: All right. Let's see what else we get here.

PC: Okay.

LRH: All right. I'll go down the list again. All right.

Consider you doing overts against self. Thank you, that's out.

Consider you doing overts against sex. Thank you, that's out.

Consider you doing overts against family. That's out. Okay.

Now, consider you doing overts against groups. Consider you doing overts against groups. There's an R/S. That's out. Okay. All right. That's enough to keep it in. And we got it already marked.

Now, consider you doing overts against mankind. That's out.

All right. Now, consider you doing overts against living things. Hm, tiny, little R/S, well leave it in there.

Consider you doing overts against the physical universe. Yes. Yeah, yeah – it's a little dance it does. Consider you doing overts against the physical universe. Yeah.

PC: Get a somatic under the heart on that one, too.

LRH: Oh, really? Pain?

PC: Mm-hmm.

LRH: Okay. Now, consider you doing overts against spirits. Consider you doing overts against spirits. All right, thank you. That is nicely out.

Now, consider you doing overts against God. You doing overts against God. Oh, there's just the faintest trace of something there. Consider you doing overts against God. I'm going to leave it in.

Consider you doing overts against religion. You doing overts against religion. Well, we'll leave it in.

All right. Consider – we'll go over them again here. We got quite a few in. Consider you doing overts against groups. Consider you doing overts against groups. Okay, that's out.

Consider you doing overts against living things. Well, there's enough to leave it in. Okay.

Now, consider you doing overts against the physical universe. Consider you doing overts against the physical universe. Yeah, there it is. Okay, consider you doing overts against the physical universe. Yeah – slightly dirty.

All right. Consider-consider you doing overts against forms. There it is, rock slam. All right.

Consider you doing overts against God. Yep, there it is.
All right. Consider you doing overts against religion. Naw. There's no rock slam anywhere along there, so that's out.

All right. We got living things, physical universe and forms and God. Now, let's see if we can sort this out a little bit further here. All right. Before we do this again, let's put in the middle rudiments, okay?

PC: Okay.

LRH: In this session is there anything you have suppressed? What was that?

PC: Suppressed? Um – a comment at one stage that uh – that – that's right, um – you were writing there, I looked there, and I was watching what you were doing, and you started giving me the next question, and I sort of looked up and caught you looking at me, and then I realized that I'd sort of come up there, and I thought, oh, you caught me then, or something. I suppressed pointing that out at the time.

LRH: All right. Thank you. In this session is there anything you have suppressed? Do you agree that's clean?

PC: Yes.

LRH: Very good. In this session is there anything you have invalidated? Do you agree that's clean? All right. In this session is there anything you have failed to reveal? Do you agree that's clean?

PC: Yes.

LRH: All right. Thank you. In this session is there anything you have suppressed? Do you agree that's clean?

PC: Yes.

LRH: Very good. In this session is there anything you have been careful of? Yes, what is it? There it is.

PC: Um, it's careful to – uh – when you get the idea – tell me to consider the – uh my doing an overt to these various dynamics, I-I'd been sort of mocking up something just to get – really get the idea. And then once, I sort of got the command and I didn't actually get anything – any ideas at all. And, yet it reacted, you see. And I didn't feel that I hadn't done the command, somehow, but yet I felt – of course I was overdoing it, so in other words, I was being overcareful, do you see, to do the command.

LRH: All right. Very good. Thank you. All right. Now you don't have to do anything.

PC: Okay!

LRH: But just consider it.

PC: Fair enough.

LRH: All right, very good. Okay. In this session, is there anything you have been careful of? Do you agree that's clean?

PC: Yes.

LRH: Very good. Here we go now. Here's our next one. Consider doing overts to living things. I couldn't call that a very healthy rock slam. That's out.

Okay. Consider doing overts to the physical universe. All right, let me check it again. Consider doing overts to the physical universe. All right. As far as I'm concerned that's now out.

Consider doing overts to forms. Okay. Consider doing overts to forms. All right, that's out.

Now, consider doing overts to God. Okay. Consider doing overts to God. All right. I'm going to revert to the last one, here.

Consider doing overts to forms. All right, very good.
Now, how are you considering doing overts to these things?

PC: Well, uh, I've now no set pattern. I'm just trying to get – get possibly how I'd feel if I was doing – doing overts, do you see? That I'm – do it, or sometimes I get a situation where I am doing – actually getting the feeling of doing something, like with the physical universe, bashing up planets, and so on.

LRH: Mm-hm.

PC: Or once or twice, one or two actual overts have sprung into view...

LRH: Mm-hm.

PC: ...but uh – and sometimes it just leaves me cold, as it were, you know, I'm finding difficulty to even get the idea or to get the feeling of it.

LRH: Hm. Hm. All right. Thank you. All right, in this session is there anything I have failed to find out? In this session is there anything I have failed to find out? I don't see anything hot. All right, in this session is there anything I have failed to find out? Okay. That looks clean. Now, what I'm going to ask you to do this time is not do anything.

PC: All right.

LRH: I don't want you to do anything.

PC: Okay.

LRH: You see, I want you to remain calm, cool and collected, and you let me do all the work.

PC: All right.

LRH: Now, just don't do anything at all, and I'll grab this off, here, as we go by. All right. All right. Consider committing overts against self. Thank you. Consider committing overts against sex. Thank you. Consider committing overts against family. All right, going to leave that in. Consider committing overts against groups. All right, we're going to take that out. Consider committing overts against mankind. Okay, I'm going to take that out. And consider committing overts against living things. Okay, going to take that out. Now, consider committing – now what are you doing? Nothing?

PC: Nothing.

LRH: All right. Thank you. That's all – that's all – that's all I want to know. All right.

Consider committing overts against the physical universe. Okay. Consider committing overts against the physical universe. Okay. Consider committing overts against the physical universe. Okay. That's uneven so we're going to leave it in. All right. Consider committing overts against forms. All right, we're going to leave that in. Consider committing overts against spirits. All right, we're going to leave that in. Consider committing overts against God. Ah! Now, what did you think of when we got down to that point? Did you think of anything?

PC: I noticed that on spirits – I don't know whether it was between spirits and God – I suddenly got this pain in my heart again.

LRH: It's moving around, isn't it?

PC: I hadn't noticed that. I just noticed that I've...

LRH: Just right there in the heart?

PC: Um-hm.

LRH: All right, thank you. Thank you very much. All right. Consider committing
overts against religion. All right, thank you.

Now, we're going over this lineup again. Consider committing overts against groups. Thank you. That is out. I beg your pardon. There, groups was out. Consider committing overts against family. All right, that's still in. Consider committing overts against the physical universe. Okay, we're taking that one out. Consider committing overts against forms. All right. Consider committing overts against forms. We're going to leave it in. This doesn't matter. And consider committing overts against spirits. Check that again. Consider committing overts against spirits. Consider committing overts against spirits. Yes, there's an R/S on there. Thank you. Now, consider committing overts against God. Consider committing overts against God. That's a rocky needle, if I ever saw one. Consider committing overts – it's not slamming, it's just uneven. Consider committing overts against God. Well, I can't find anything there to amount to anything. I'm going to take Him out.

Let's go back over this again, now. Consider committing overts against family. All right, we're now taking that out. Consider committing overts against forms. What were you thinking of, there, in the interim?

PC: Just aware of the somatics. I'm getting somatics now in the – in the – right across my shoulders, and the heart one is still there a bit.

LRH: Oh, all right. When did that turn on? After I said "family"?

PC: Family, the back somatic turned on.

LRH: And it's on, now?

PC: Still there a bit, yeah.

LRH: All right, thank you. Consider overts against family. All right. Thank you. Consider overts against forms. Consider overts against forms. All right. Consider overts against forms. Consider overts against forms. All right, thank you. I got nowhere here on that. All right. I'm going to take that one out. Now consider overts against spirits. Yes, there's our dirty needle. Consider overts against spirits. All right. Consider overts against spirits. Good. Consider you doing overts against spirits. Thank you.

Now, it might interest you, but I had this, with a large R/S on the first read.

PC: Mm-hmm.

LRH: Do you remember my telling you, well if you were – just you and I were doing this, we would knock off now?

PC: Yes.

LRH: Well, I went ahead, and once you've flubbed it then you have to go on and on and on, don't you see?

PC: Yes.

LRH: Now, I wasn't satisfied with just the element itself, that we finally got out on the physical universe. I went over the thing again, and again, and we finally flattened down, and we come down to where the only R/S left is on spirits. Everything else is that.

We will proceed to check this out.

PC: Right.

LRH: We'll see if we can't turn on a beauty.

PC: Right.
LRH: See, as far as I'm concerned, that was my first conclusion, and then I went ahead and I proved it and proved it, and I was getting different things.

PC: Um-hm.

LRH: Notice? Each time I had – you know, I got the physical universe, I got – came on down to God, here, one time, it came on down to this and came down to that, but it's come back to the one which the old man by experience knows was...

PC: Yes.

LRH: ...that. It was a honey. It was a blaaa. Well, we haven't seen it since, see?

PC: Hm.

LRH: I'm going to ask you this somewhat embarrassing question.

PC: Um-hm.

LRH: If I may.

PC: By all means.

LRH: I'm not going to necessarily ask you to reveal anything because of it.

PC: All right.

LRH: But, I am going to ask you: What have you done to spirits? Have you ever done anything to spirits?

PC: I – they're very unreal to me. I haven't much reality and I always am very skeptical of anybody talking about spiritual meetings and anything like that.

LRH: Mm-hm.

PC: When I was a boy, I attended a clairvoyant demonstration which didn't impress me at all.

LRH: Mm-hm.

PC: So, spirits seems to be stuck in my mind on that basis rather than the Scientology look at the word of "soul," and so on.

LRH: All right. Good. How about thetans? How about overts against thetans? Have you ever done anything to thetans?

PC: Well, I must have done a lot, but I can't think of any, particularly on that.

LRH: All right, good.

PC: Not – on – when you say thetans like that, I mean thetan – I'm trying to get the idea of thetans without bodies, do you see? Um...

LRH: Now, nobody asked you to do that.

PC: I know! Um, well I've certainly – yes, the best one I can get – I've certainly hurt lots of people's feelings...

LRH: All right.

PC: ... by um – well, many ways. But in this, um – thinking it over, this of course is one of the things I do try to avoid doing – hurting anybody's feelings. Um – at – um – it – it's a diff- it's my marital difficulty, what I come down to, is to – don't want to hurt their feelings, you see, I want to save their face, and so on. In that way it's the – it's a big overt with me.

LRH: Mm-hm. That's it. That's got a slam, here.

PC: Okay.

LRH: Think of hurting somebody's feelings. All right. That's too nebulous. Think of hurting my feelings.

PC: Yes.

LRH: Yeah. All right. All right. Think of hurting a girl's feelings. All right.
Now, let's see if we can't turn this up to a nice R/S, here. Hm?

PC:  *Mm-hm.*

LRH: Think of overts on spirits. Think of overts on spirits. Think of doing something to spirits. Think of doing something to spirits.

PC: *Bad auditing would be doing...*

LRH: All right.

PC:  *... an overt on...*

LRH: Good. All right. Think of doing something to spirits. There, you really did think of doing something to one, didn't you?

PC:  *Well, no, I missed it. There was something there about doing something. Then I sort of skated off there and was trying to get the idea of something but it's uh – it evaded me. I know there is something there, but I can't...*

LRH: It rock slammed, whatever it was.

PC:  *It seemed to be like gathering a lot of them together, or splitting them, like splitting the atom, or something.*

LRH: Mm-hm.

PC:  *Um.*

LRH: All right. What represents spirits to you?

PC:  *Uh – a symbol would be – would be steam.*

LRH: Steam?

PC:  *Steam, yeah.*

LRH: Good. Good, that's fine. All right, what else?

PC:  *A ghost.*

LRH: Thank you. Good. What else?

PC:  *A light.*

LRH: Good. What else would represent spirits?

PC:  *Um, a star.*

LRH: Thank you.

PC:  *And a sun.*

LRH: Good. What else would represent spirits?

PC:  *Um, Aladdin's lamp days – a bottle, with a-a bottle with the cork out.*

LRH: All right, thank you. Very good. Now, what else would represent spirits to you?

PC:  *Um – fairies.*

LRH: Okay. Good. What else would represent spirits to you?

PC:  *Young children.*

LRH: Okay. Good. What else would represent spirits to you?

LRH: Right. What else would represent spirits to you?

PC:  *A non-solid object, I want to say, is that I can't quite get... Um – a soul.*

LRH: All right, thank you. Good. What else would represent spirits to you?

PC:  *A white sheet.*

LRH: Okay. What else would represent spirits to you?

PC:  *I'm avoiding alcohol, though – keeps cropping up. That's uh...*

LRH: All right.

PC:  *A thought.*
LRH: Okay. All right. What else would represent spirits to you?

PC: A dream.

LRH: All right, thank you. All right, that's enough.

PC: All right.

LRH: Thank you... Thank you. All right. Let's see how we go here, all right? Okay.

Consider committing overts against steam.
All right, thank you. Consider committing overts against a ghost. Okay, thank you. Consider committing overts against light. Okay, thank you. Consider committing overts against a star. All right. Thank you. Consider committing overts against a sun. That's it, thank you. Consider committing overts against a bottle with the cork out. All right. Consider committing overts against a bottle with the cork out. All right, thank you. Consider committing overts against fairies. All right, thank you. Consider committing overts against young children. Thank you. Consider committing overts against haze. All right. Consider committing overts against haze. Consider committing overts against a soul. All right. Consider committing overts against a soul. Okay, thank you. Consider committing overts against a white sheet. Consider committing overts against a white sheet. Thank you. Consider committing overts against a thought. Good, thank you. Consider committing overts against a dream. Consider committing overts against a dream. All right, thank you. All right, we've got several of them still in here. Let's go over them again, all right? Feel all right?

PC: Yes.

LRH: Okay. Are you in disagreement with this dynamic that we have dredged up?

PC: No, no, no, no, no.

LRH: You're not, are you?

PC: No, no, no, no, no.

LRH: All right, that's fine.

PC: No opinion on it at all.

LRH: Huh?

PC: No opinion.

LRH: All right.

PC: I'm very good...

LRH: Very good.

PC: ... at this stage.

LRH: Okay. All right. Consider committing overts against a ghost. Consider committing overts against a ghost. All right, thank you, that's out. Consider committing overts against a star. All right. Consider committing overts against a star. Consider committing overts against a star. Okay, that's out. Now, consider committing overts against a sun. Consider committing overts against a sun. Okay, thank you. Consider committing overts against a sun. Okay, that's out. Now, consider committing overts against a bottle with the cork out. Okay, thank you. Consider committing overts against a bottle with the cork out. Thank you, that is out. All right. Consider committing overts, consider commiti-. What are you thinking of? All right.

Consider committing overts against fairies. All right, that's in. Consider committing overts against young children.
Okay. Consider committing overts against young children. Okay. Consider committing overts against a soul. Okay. That's out. Consider committing overts against a soul. Okay. Overts against a soul. Consider committing overts against a soul. Okay. Overt against a soul. I think I'll leave that in. And consider committing overts against a white sheet. Consider committing overts against a white sheet. Okay, we'll leave that in. All right. Consider committing overts against a soul. That's it, that's in. Consider committing overts against a thought. Consider committing overts against a dream. Consider committing overts against a dream. All right, that's in. Okay. 

Now, we just got a few in here, now. Not very many. All right. Consider committing overts against fairies. Consider committing overts against fairies. Consider committing overts against fairies. Okay, that's out. Now, consider committing overts against a soul. Okay. Consider committing overts — consider committing overts against a soul. Yes, that's in — with an R/S. All right. Consider committing overts against a white sheet. Okay. Consider committing overts against a white sheet. All right. Consider committing overts against a white sheet. Consider committing overts against a white sheet. I'm taking that out. All right. Consider committing overts against a thought. Okay. And that is in. And consider committing overts against a dream. Okay. Consider committing overts against a dream. Okay, consider committing overts against a dream. Thank you, I'm taking that out. All right. Now, how are you doing, now? Huh?

PC: Okay.

LRH: All right. Let's go at it again. There are very few left now. Let's see where we wound up. All right. Consider committing overts against a soul. Thank you. Consider committing overts against a soul. Okay. Cons-. 

PC: Excuse me. [coughs] Sorry.

LRH: Okay. Consider committing overts against a soul. Consider committing overts against a soul. Okay. Consider committing overts against a soul. You got to cough again? Don't you dare hold back those.

PC: All right.

LRH: All right. All right, that's out. That was just coughs. Okay, consider committing overt — an overt against thought. Consider committing overts against thought. Consider committing overts against thought. Consider committing overts against thought.

All right. In this session, is there anything you have suppressed?

PC: Cough.

LRH: Is there — you still got one?

PC: No.

LRH: All right. In this session is there anything you have suppressed? Okay, do you agree that's clean?

PC: Yes.

LRH: In this session is there anything you have invalidated? Okay, do you agree that's clean?

PC: Yes.
LRH: In this session, is there anything you have failed to reveal? Do you agree that's – what do you got? It isn't clean.

PC: No. Um – I – I failed to reveal to you that uh – the somatic had gone off or – had gone off I didn't notice when it went. And that uh – there was just a slight suggestion of it turning on again on one of these, I don't know which one it was.

LRH: Okay. All right. Thank you. In this session is there anything you failed to reveal? Yes, still got one.

PC: Yes, there's something there. Oh! I failed to reveal to you that for one flash, I – my attention went down. I wondered what they were thinking of this downstairs. But it's only once, I think, during this session, but I didn't reveal it to you when it happened.

LRH: Thank you. Good enough. In this session is there anything you've failed to reveal? Do you agree that's clean?

PC: Um-hm.

LRH: Thank you. In this session, is there anything you have been careful of? Do you agree that's clean?

PC: Um-hm.

LRH: Thank you. All right. I'm going to have to replay the last two or three of these.

PC: All right.

LRH: All right. Now, consider committing an overt against a soul. Thank you. Consider committing an overt against a – a white sheet. Okay. Good enough. Consider committing an overt against a thought. All right. Okay, what did you just have there?

PC: I just – that I saw you smile, so I guess I thought that it must have been reacting for you.

LRH: All right. Okay. Consider committing an overt against a thought. Consider committing an overt against a thought. All right. Consider committing an overt against a thought. Okay. There's still a tiny suspicion of an R/S on there. All right. Consider committing an overt against a dream. Well, all right, thank you. Consider committing an overt against a dream. All right. Consider committing an overt against a thought. Yes. Consider committing an overt against a thought. Well, we've still got a questionable rock slam here. I've come up with it twice now. It's a thought. The only thing we've got left here. Overts against thoughts. What could you do to a thought?

PC: Hm – Could twist it.

LRH: All right.

PC: You could misduplicate it, you could, um – not retransmit it.

LRH: Hm-hm.

PC: Make fun of it, you can ridicule it, you could uh...

LRH: Hm-hm.

PC: You could do lots of things to a thought!

LRH: Oh, you can, huh?

PC: Yes.

LRH: All right, good. Thank you. Well, think of committing overts against a thought. Think of committing overts against a thought. All right. Think of
committing overts against a thought.
Okay. As far as I'm concerned we've
missed the boat.

PC: *Mmm.*

LRH: We're not trying to look good, here.

PC: *Um-hm.*

LRH: You have had very few rock slams,
they have turned on, and then they
have gone off, and this probably is
pretty rough being audited under these
conditions. But, I wonder if anything's
missing out of this goals list. And let's
you and I go over this. Put your cans
down and stretch yourself there for a
moment. See if there's anything miss-
ing, on – I said goals list – is there
anything missing on this list of dynam-
ics? There's self, right?

PC: *Right.*

LRH: Name off the rest of them.

PC: *The dynamics?*

LRH: Any – not just the eight. Name off
what you think the dynamics are.

PC: *Yes. Okay. Well on self often get body.
Um – sex, family, children.*

LRH: All right.

PC: *Uh – groups – yes, it describes it very
well. You could put tribes, nations,
countries.*

LRH: All right.

PC: *And humans.*

LRH: Okay.

PC: *Uh – mankind.*

LRH: Okay.* Very good. Okay, anything
else?

* Editor's note: The tape changes side here. It is not
clear whether some part is missing or whether the pc

PC: *No.*

LRH: All right. Pick up the cans. We're go-
ing down this list again. All right.

All right. First we're going to put in our mid
ruds.

PC: *Mm-hm.*

LRH: All right. In this session is there any-
thing you have suppressed? Okay, do
you agree that's clean?

PC: *Yes.*

LRH: In this session is there anything you
have invalidated? What's that? There it
is.

PC: *Something to do with matter, energy,
space and time. I invalidated, then
when um – oh, I was assessed on dy-
namics once before and I seem to re-
member, he said, to the fifth and sixth
or something, I've got mixed up.*

LRH: Mm-hm.

PC: *And there was just a fleeting invalida-
tion then. What I've done, I've pulled
into this session the invalidation that I
don't think I believed him, do you see
that?*

LRH: Oh, all right. Thank you. All right. In
this session is there anything you have
invalidated? Got another one? There it
is. There it is.

PC: *Invalidated myself for not knowing the
uh – always read off the dynamics.*

LRH: All right. All right. In this session is
there anything you have invalidated?
Now that fell on something or other.
There it is.

---

just didn't want to add anything to the description of
the dynamics five to eight as used before in the ses-

---
PC: I invalidated a rudiment just then! Because you said is there anything I suppressed, and I had an answer. That I suppressed a curiosity as to the time.

LRH: Oh!

PC: Do you see? And you said it was clean, so I suppose I'd invalidated the rudiment.

LRH: Well, all right!

PC: In fact, this was a suppressed rudiment.

LRH: All right. Good. Thank you. In this session is there anything you have invalidated? There's still a little click on here. There is another click, I should say. There it is.

PC: Hm, yeah.

LRH: There it is. There it is. Fell. There.

PC: Thought?

LRH: There it is.

PC: Um – Heh! The uh – when you read out "fairies" I – I thought, well, I hope to God I don't get landed with having to do overts on fairies, or something!

LRH: All right. Okay. Thank you. In this session is there anything you have invalidated? All right. Do you agree that's clean?

PC: Mm-hm.

LRH: Thank you. In this session is there anything you have failed to reveal? All right, there's something there.

PC: I didn't reveal every time the somatic came on and off.

LRH: All right. Good.

PC: That's all it was.

LRH: Okay. All right. In this session is there anything you have failed to reveal? All right, do you agree that's clean?

PC: Um-hm.

LRH: All right, very good. In this session is there anything you have been careful of? Do you agree that's clean?

PC: Hm.

LRH: I better ask it again.

PC: All right.

LRH: In this session – in this session is there anything you have been careful of? Oh, that's clean. All right. You had a heartbeat, or – or a sneeze or something there.

PC: Um-hm.

LRH: ... and then we're going to do the other list...

PC: Um-hm.
LRH: … and see what we got here. Okay?

PC: *All right.*

LRH: All right. Think of doing bad things to yourself. All right, thank you. Think of doing bad things to sex. Thank you. Think of doing bad things to your family. All right. Think of doing bad things to your family. Yes, that is definitely a little, tiny halt there. All right. Think of doing bad things to groups. Okay. Think of doing bad things to groups. All right. We still got some reaction there. Now, think of doing bad things to people. Think of doing bad things to people. Okay, that's cool. All right. Think of doing bad things to mankind. All right, we're just going to forget that one at the moment. Now, think of doing bad things to living things. Okay, and that's in. And think of doing bad things to the physical universe. All right. Think of doing bad things to the physical universe. Now we have got an R/S – which agreed with our first assessment.

All right. Think of doing bad things to forms. All right, and that is in. And think of doing bad things to spirits. Okay, think of doing bad things to spirits. All right. Think of doing bad things to spirits. All right. Think of doing bad things to spirirts. Well. Think of doing bad things to spirits. All right. What did you just think of there?

PC: *Um – all I thought of, your – your attention was very much with me here, and that – I – for a minute I wondered how this was going on downstairs, again. And then I thought, well, then we're very much here, just you and I together.*

LRH: All right. All right. Thank you. Okay. Think of doing bad things to God. Okay. Think of doing bad things to God. Thank you. Okay, now we have a few little R/Ses and I'm going to do it on this same thing again – see if we come up with the same answer we got the first time.

All right. Think of doing bad things to family. All right, thank you. Think of doing bad things to family. Thank you, that is out. All right. Think of doing bad things to groups. Thank you, that is still with us. All right. Think of doing bad things to living things. Okay. Think of doing bad things to living things. Okay. Think of doing bad things to living things. All right, thank you. We're knocking that out. All right. Think of doing bad things to the physical universe. All right. Think of doing bad things to the physical universe. All right. Think of doing bad things to the physical universe. Okay. Think of doing bad things to the physical universe. Think of doing bad things to the physical universe. Yes, there's an R/S still there. Okay. Think of doing bad things to forms. Think of doing bad things to forms. Think of doing bad things to forms. All right. Think of doing bad things to forms. I can't make it do anything so we're going to take that out. And that leaves us with groups and the physical universe.

All right. Now, do you feel all right?

PC: *Yes.*

LRH: Good enough. Think of doing bad things to groups. Okay. Think of doing bad things to groups. All right. Think of doing bad things to groups. Okay. Think of doing bad things to groups. Definitely have an agitation on that, so
we'll leave it in, okay. All right. Think of doing bad things to the physical universe. Okay. Think of doing bad things to the physical universe. Think of doing bad things to the physical universe. Okay. Think of doing bad things to the physical universe. All right. For my money, that's just a part of this life.

Okay. Think of doing bad things to groups. All right. Think of doing bad things to groups. All right. Having a hard time turning a dirty needle on this. There's one. All right. Think of doing bad things to groups. All right. Think of doing bad things to groups. Think of doing bad things... to groups. All right. Think of doing bad things to groups. Okay. Think of doing bad things – think of doing bad things to groups. Think of doing bad things to groups. We got an R/S here, what is this?

PC: *Well, I've got a terrific somatic right around the – right around the chest, the front down here.*

LRH: The more we go into this.

PC: *The more – been just developing as you've been going on this one.*

LRH: All right, thank you. All right. What represents groups to you?

PC: *People.*

LRH: Good. What else?

PC: *Scouts.*

LRH: Hm?

PC: *Scouts.*

LRH: Good. What represents groups to you?

PC: *School.*

LRH: Good.

PC: *Business.*

LRH: Good.

PC: *Scientology.*

LRH: Good.

PC: *Uh...* 

LRH: Okay. What else? What represents...

PC: *Tribe.*

LRH: What?

PC: *A tribe. A nation.*

LRH: Mansion?

PC: *A nation.*

LRH: Nation.

PC: *Um-hm.*

LRH: Sorry. You can put the cans down if you want and stretch yourself.

LRH: What?

PC: *Armies.*

LRH: Right.

PC: *Navies.*

LRH: Good.

PC: *Bands. Bands of people, bands you know.*

LRH: Okay.

PC: *Gangs.*

LRH: All right. Okay, pick up the cans there. All right. What else represents groups?

PC: *Clusters.*

LRH: Hm?

PC: *Clusters.*

LRH: Okay. Thank you. What else represents groups?
PC:  Battle fleets.

LRH: What?

PC:  Battle fleets.

LRH: Okay.

PC:  Swarms.

LRH: Swarms. Okay. What else represents groups?

PC:  Crowds. Crowds of people.

LRH: Good.

PC:  Mobs.

LRH: Okay, good. Thank you.

PC:  Um – trades.

LRH: Trades?

PC:  Trades, yes.

LRH: Trades.

PC:  Um-hm.

LRH: Right. Okay. What else represents…

PC:  Professions.

LRH: Okay. What else represents groups?

PC:  Um – a badge.

LRH: Okay. What else represents groups?

PC:  A hammer.

LRH: Okay.

PC:  Oh, I got a withhold from you then, because I was going to say a hammer and sickle, I thought I'd better not! It's not the right place to say it.

LRH: All right.

PC:  Um.

LRH: Want to put it on the list?

PC:  It can go on the list

LRH: Hm?

PC:  It can go on the list.

LRH: All right.

PC:  If it's there, it's there. Um – uh – a flag, of course.

LRH: Okay.

PC:  And a banner.

LRH: Okay. All right. What else represents groups?

PC:  A leader.

LRH: Okay. What else represents groups?

PC:  Well, you've got a king.

LRH: Okay. What represents groups to you?

PC:  Well, a king represents a group to me.

LRH: All right.

PC:  Sorry!

LRH: No, I wasn't criticizing you!

PC:  No, no. Um...

LRH: What else represents groups?

PC:  Hm. A circle.

LRH: Okay. What else represents groups?

Thought of something there?

PC:  Well, I thought of a ring.

LRH: Hm?

PC:  A ring.

LRH: Do you want that in there?

PC:  Yes. A ring.

LRH: All right. What else represents groups? Something there.

PC:  A triangle.

LRH: Okay.

PC:  And, um – a set square, like – like a solid thing – I was looking at.
LRH: A set square?
PC: *Hmm. I think it's a set square. I don't know what it is they use, but something like that.*
LRH: All right. Thank you. What else represents groups to you?
PC: *A leather apron.*
LRH: Okay. Okay. What else represents groups to you? You had a thought there.
PC: *Language, I'd thought of just then, and a country.*
LRH: What, language is it?
PC: *Uh-huh.*
LRH: All right, what else represents groups? There.
PC: *Country.*
LRH: Okay. What else represents groups? There it is.
PC: *Prison.*
LRH: Prisons?
PC: *Um-hm.*
LRH: Okay. Thank you. What else represents groups?
PC: *A hospital.*
LRH: All right. Okay. What else represents groups? There's something. What is that?
PC: *A sword.*
LRH: Does that represent a group?
PC: *Don't know why, but uh – yes it does, it does, it represents a – uh ...*
LRH: Good.
PC: *...could do, I mean I thought of one that did represent a group.*
LRH: All right. What else represents a group?
PC: *A shield.*
LRH: Good. What else represents a group?
PC: *Um...*
LRH: There it is, what is it?
PC: *Um – signet ring.*
LRH: Okay. What else represents a group to you?
PC: *Um – a standard, if I had a – you know.*
LRH: A standard?
PC: *Yes, I mean a flag sta – type of standard, you see.*
LRH: All right. What else would?
PC: *A heraldic sign.*
LRH: All right.
PC: *No particular one.*
LRH: Good. What else represents a group? There's something.
PC: *I thought of a firework, then, but I – yes, a fi – ah, a rocket, it would be – a rocket.*
LRH: All right, very good. What else represents a group? Something there.
PC: *Hm, I just felt very sort of – I felt very hot but I don't – um, oh yes! Um – a fire!*
LRH: Okay. Okay. Now, what else represents a group?
PC: *A town.*
LRH: Okay. What else represents a group?
PC: *A city.*
LRH: All right. Now, how are you coming on this, now? It seem...

PC: All right.

LRH: …fairly complete as a list?

PC: I'm having to uh – struggle.

LRH: You see it fairly complete as a list.

PC: Um-hm.

LRH: Well, does it seem complete to you as a list? I'll ask you on the meter. Is this list complete? There's still something on it.

PC: A navy.

LRH: Okay, thank you.

PC: Had that once before.

LRH: Mm-hm.

PC: Um...

LRH: Something there.

PC: Well, the Marines, I'm thinking of.

LRH: Okay. Okay.

PC: A sphere.

PC: Well, a butcher.

LRH: A butcher.

PC: Hmm.

LRH: Okay, very good. All right, is this list complete? All right, let me ask that again.

PC: Hmm.

LRH: Is this list complete? There's still possibly a little bit more on it.

PC: Well, the various, um – trades, the masons, a mason, you see, would represent to me a group. An accountant, and um...

LRH: Can I put those down?

PC: Yes. Yes. And then...

LRH: All right. What else would represent a group to you? Something right there, what was that?

PC: A tanner.

LRH: Okay.

PC: Something...

LRH: Okay. Good-o.

PC: A soldier.

LRH: All right. Thank you. What else would represent a group to you? Got something on it. There we are. What did you just run into?

PC: Well, I've got this pain in my heart again.

LRH: Oh, really?

PC: And I seem to be – well, all right, this is what comes up, and I don't know why it does, an armada.

LRH: A what?

PC: An armada.

LRH: An armada. All right, thank you. What else would represent a group to you? There it is, what is that? There it is.

PC: Well, a knight, but that's not quite the – Christ! This – this is painful! Um – a barbarian.

LRH: Did you want a knight on there?

PC: A knight – and a barbarian is – seems to be more to the point.

LRH: All right. What else would represent a group?

PC: A black knight.
LRH: Okay. Okay. What else would represent a group to you?
PC: Um – a dagger.
LRH: Very good. Thank you. What else would represent a group to you?
PC: Can’t think of anything else.
LRH: You think that’s about it, huh?
PC: Yes.
LRH: What happened?
PC: I don't know, I suddenly came very clear, and the room is bright, and I just feel...
LRH: Your heart feel all right?
PC: That’s all right.
LRH: Well, all right. Okay. Here we go, now. Is this list complete? Looks so. Seem so to you?
PC: Yes.
LRH: All right. Very good. Now, that list is ready to be nulled.
PC: Mm-hm.
LRH: That list is ready to be nulled. And we haven't got time to do that.
PC: All right.
LRH: If it's all right with you – and so on. Well, how do you feel about group as a Dynamic Assessment?
PC: Well, that's okay, I think, and – and I've only just recalled this, that this is the – this was assessed out on me before when I wa – forget what they were doing with it then, but...
LRH: Oh, all right!
PC: I know I ran through a lot of the trades on that at the time, and it was on 3D Criss Cross, I suppose. Yes.
LRH: Oh, is that so?
PC: Mm-hm.
LRH: The Dynamic Assessment at 3D Criss Cross?
PC: Mmm.
LRH: Oh, and you've run...
PC: I've run terminals.
LRH: … items and terminals on it.
PC: That's right, yes.
LRH: Ah! Have you had trouble with the needle since?
PC: Well, it's the only time I've – I mean he was my last auditor – you're the only person who's audited me since then, so you tell me.
LRH: Oh, all right. Good enough. Good enough. Here we go. Here we go.
PC: No, it's been very interesting.
LRH: All right. End that much of that assessment? Untruth? Said something only to impress me? Or tried to damage anyone? All right, that’s…
Said something only to impress me? What was that? ... There.

PC: *Oh, that was asking if I could blow my nose, there, that was impressing you that I was a good preclear.*

LRH: Oh, all right. Thank you! All right.

PC: *I wanted to blow my nose, but I know the asking if I can put the cans down and doing it was being a good preclear, you see.*

LRH: Okay, Reg. All right. In this session have you done anything only to impress me? All right. In this session have you tried to damage anyone? All right, there was a little reaction on that.

PC: **Tried not to damage anyone.**

LRH: How's that?

PC: *Well, I tried not to damage Jenny.*

LRH: Yeah.

PC: *I tried to... Oh! No, I – that's right, it turned on to what might have been a damage because I was quite happy with the assessment that Dick had done, on, whatever had happened on that occasion, and you said, oh, since then have you dirty nee – had a dirty needle, do you see? And which uh – so what I'd said might have damaged his reputation by having left something wrong, you see.*

LRH: Oh, all right. All right. Thank you, I got it. In this session have you tried to damage anyone? All right. I'm going to have to read that more carefully – In this session have you tried to damage anyone? Okay. You have a half – fall on "damage" for some peculiar reason. Thank you very much. You agree that's clean?

PC: *Hm.*

LRH: Hm? That all right?

PC: *Yes.*

LRH: All right, very good. In this session have you deliberately tried to influence the E-Meter?

PC: [chuckles] What was that?

PC: *I'd – once during the – during the session, I was aware of moving my finger a bit, and I hoped that it hadn't influenced the meter, but you weren't doing anything on the meter at the time, so I thought, well that doesn't matter.*

LRH: All right, very good. In this session, have you deliberately tried to influence the E-Meter? Thank you. Do you agree that's clean?

PC: *Mm-hm.*

LRH: Very good. In this session have you failed to answer any question or command I have given you? All right, there's something on that.

PC: *Well, you've asked me lots of questions, and some of them I haven't answered you've been relying on the meter – that I personally haven't answered, I've assumed they'd been good on the meter, but apart from that the answer is, I haven't.*

LRH: Very good. All right. In this session have you failed to answer any question or command I have given you? All right, do you agree that's clean?

PC: *Mm-hm.*

LRH: Very good. In this session, have you decided anything? What was that? There. There. There.

PC: *Decided to cough? Once.*
LRH: There. What – what – decided to cough? All right, I'll check that. In this session, have you decided anything? Okay. Do you agree that's clean?

PC: *Mm-hm.

LRH: Thank you very much. In this session, have you thought, said or done anything I have failed to find out about? Do you agree that's clean?

PC: *Mm-hm.

LRH: All right. Did you expect the other rudiment there?

PC: *No, I wasn't expecting anything.

LRH: Thank you. In this session, is there anything that was misunderstood? In this session, is there anything that was misunderstood? Okay. Do you agree that's clean?

PC: *Mm-hm.

LRH: All right. Thank you very much. In this session, was the room all right? All right, do you agree that's clean?

PC: *Mm-hm.

LRH: Very good. All right. Squeeze the cans. All right, do that again, squeeze the cans. All right. What's your Hablingness command?

PC: *I think reach was the last you ran on me, reach or feel.

LRH: All right.

PC: *Uh – feel – uh – feel or touch, I mean.

LRH: Feel or touch?

PC: *Um-hm.

LRH: All right, put your cans down. All right. Touch the table. Thank you. Touch that sign. Thank you. Touch that ashtray. Thank you. Touch the can. Thank you. Touch the telephone. Thank you. Touch your jacket. Thank you. Touch the top of your head. Thank you. Touch the table. Thank you. Pick up the cans. All right. Squeeze the cans. Thank you. That's much better. That was the last command.

Okay, you can put those cans down now. All right, in this session, have you made any part of your goals?

PC: *Uh...

LRH: Did it get dynamic assessed?

PC: *Well, we've done that.

LRH: Yes. List some goals?

PC: *Well, we've partly done – we've got – made some progress on that, certainly.

LRH: All right. Not be shy?

PC: *I don't think I was very shy.

LRH: All right. And, help you help me?

PC: *Yes, well I've done my best, perhaps too much at times.

LRH: All right. Thank you very much. Now, any gains you'd care to mention?

PC: *Well, yes, I – the uh – I think I've blown one or two of these, um – somatics that I get occasionally on across the back.

LRH: Oh, really?

PC: *And so on, they seem to have gone.

LRH: All right.

PC: *And I certainly feel lots brighter than I did when I sat down to session.

LRH: Okay.

PC: *Plus there's always the gain of being audited by you.

LRH: Hm?
**PC:** There's always the gain of having a good session from you.

**LRH:** Oh, well, all right. Good thing I don't have to go back past the "impressed," but I'll accept that! All right, very good.

All right. Is there anything you'd care to ask or say before I end this session?

**PC:** Well, I want to say thank you very much for a very good session.

**LRH:** All right, well you are quite welcome.

**PC:** Okay.

**LRH:** Here it is: End of session. Has the session ended for you?

**PC:** Yes.

**LRH:** All right. Very good. Tell me I'm no longer auditing you.

**PC:** You're no longer auditing me.

**LRH:** All right.
Well, I had a previous lecture engagement. That's why I'm just a little bit late. I have to keep the children posted on the adventures of the famous Sussex witch, Ermaltrude Godhelpus. [laughter] And I've just been... So if I happen to throw some spells out to the left or the right while giving this lecture, why, you'll know why.

All right. This is lecture one, Saint Hill Special Briefing Course. And, what's the date?

_Audience:_ Sixteen August.

The subject of this lecture is Dynamic Assessments.

Now, we have made a slight improvement in processing lately. I hope you won't object too much to the change. [laughter] I hope so. Because I know that you don't like change ordinarily. I know this is a very bad thing, but I'm sorry that I had to introduce this change. It reduced finding a goal from two hundred hours to four hours or something like this. So that's the maximum on the minimum, see, the span and so on. So I hope you'll find it in your heart to tolerate the change. The motto of this is: If you can't beat it, join it, see? [laughter]

Ever since we've gotten into goals we have been assaulted by dirty needles, rock slams and other materials which have been very onerous and upsetting to the auditor. And finally, it occurred to me, belatedly, that this phenomenon might be utilizable. In another lecture I told you how it came about, but there's other mechanics connected with this and decided that we had better do Dynamic Assessments by Rock Slam.

By doing a Dynamic Assessment by Rock Slam, if done properly, you have a possibility of finding a goal in four hours. And, if you don't – why, you've still got a possibility of finding it in eight, ten, fifteen, you see? It's a little bit different, isn't it? Well, that was the one point of holdup that I could see along the line of very broad clearing. This all comes out of a specific program – if you have fifty people in a group and you've got two Saint Hill graduates running the group or there are four or five Saint Hill graduates in a Central Organization and they're supposed to find all the goals of the people there in the group or as they walk in the front door, you can readily see that arithmetically, you would have to practice mitosis more than auditing. And if a Saint Hill graduate is merely going to supervise clearing and supervise listing and not do the listing themselves – they therefore could cope with this activity – pro-
viding they could find a goal in a small enough period of time. So that has been the target of
this.

Now, the most difficult goals to find were those goals of people who constantly dirty
needled and rock slammed. And this becomes relatively easy now – that's one of the easier
ones to spot. So the hardest to find becomes more or less the easiest to find.

Because some of these cool, calm, collect characters – you're going to have an awful
time trying to turn on a rock slam. And with the fellow who's already got one, that's fairly
easy – you've just got to find where it's located.

That this sort of thing pays off as far as listing and 3GA is concerned. 3GA is getting
into the swing – and now that – particularly that you're getting your meter drills down and
that the meter drills are being run very correctly, you're making hay. In fact the hay is flying
off the fork in all directions and gathering in the stacks. It's quite a remarkable proposition.

Since Monday of this week, two pcs have been listed to free needles in this unit. We
produced a second-goal Clear. And we found three goals on pcs that we were about to give up
on. Pretty good, huh? You can delete that-we weren't about to give up. But it was about to
become much rougher. Now, three goals and a second-goal Clear and two free needles. That's
since Monday. You think we're moving?

Audience: Yes.

Now, let me point out something. This is Saint Hill. You've got all kinds of talent sit-
ting around here. All kinds of know-how sitting around here. And if it doesn't know, I'll jump
them, you know. And you've got all that sort of thing. Well, you got to be good enough to run
all this on your own. See?

Now, you go off someplace and do a Dynamic Assessment and get a goal in some
fashion that winds up with the wrong goal ... I was standing the meter manufacturer's hair on
end today with the horrors of finding a wrong goal. It's horrible. Don't ever kid yourself.
You're used to running somebody on the wrong process for a while and it was all right. Man,
you run somebody on the wrong goal – and, oh brother! You see, all gods have two faces –
for every positive there's a negative. And just as you can phenomenally, fantastically increase
somebody's IQ and ability, so you can pull the floor out from underneath him – not the rug,
the floor, see – in almost that exact ratio. It is reparable. Actually, it is a little harder to make
him worse than make him better. And you can repair it. But remember, that it is a very rough
proposition – very, very rough. You see less of it, but you see enough of it to stand your hair
on end if you're keeping your eye open.

Somebody all of a sudden – his ears are about three and a half inches further back than
they have been normally and he looks about 29 years older than he has for a long time and so
forth. Well, somebody's just found the wrong goal of it and messed it up in general. And
somebody's perseveringly listing him in the wrong direction and out the bottom, don't you
see. Or he had a right goal, they didn't check it out and now they're trying to do something
else, and they're no longer listing on the right goal, see? And these things are quite catastro-
phic.
Now, the auditor's skill is tremendously challenged right from the first fundamentals of auditing. Not from any new – brand-new skill that you'll learn at Saint Hill. But the fundamentals of auditing are what are challenged. Can you hold a pc in-session? Can you keep him interested in his own case and talking to the auditor? See? How is your TR 0, 1, 2, 3, 4? Well, it may have been good enough to security check somebody – but let me tell you that when the traffic starts to get some load, you know, and there's – the lines start loading up, those weak spots start blowing out. We almost released an auditor here. Well, I had quite – everything – was quite happy about this particular auditor, and all of a sudden this auditor ran into a rough spot. I mean, the pc just started blowing out at the edges – pc probably had the goal on the list and was very anxious and ARC breaky and so forth. And it just took that much more control – that much more good auditing. They had to look a lot more like an auditor and do a lot more like an auditor in that given situation, than they had ever dreamed that they would have to.

Well, all these things are consequent to having cracked the riddle. The riddle is the basic purpose of any given cycle. And the basic purpose of a man is the same, more or less, as the basic purpose of the universe. In other words, the universe has a basic purpose and so does a human being's reactive bank and difficulty have a purpose. It has a purpose – a basic purpose at the bottom of it which if dismayed causes all the rest of it to go to pieces.

All right, well, we have our hands on that. It's quite an important thing to have your hands on. Now, that it requires you to look more like an auditor and act more like an auditor and do more and better auditing, is almost incidental. We can measure up to that and we can do it if we recognize the necessity of it.

The pc's state of mind when he's coming up toward a goal – toward finding a goal, he wants his goal – is closer to the razor edge of ARC breaks than at any other time in his auditing career. When he was going nuts because his grandmother was about to divorce him or something, that had nothing to do with it. The nervous breakdown which he went through while working for the Lumbago Iron Works, that has nothing to do with it, you see. He really feels in a frantic state. He starts moving in on his goal and he gets close to it.

Well, I'll show you how far away from the goal the ARC break and upset commences. Actually when a student arrives here at Saint Hill, they start quivering in the direction toward their goal. [laughter] And actually, the longer they spend on rudiments and Havingness and Prepchecking and so forth, they "Ya – ya – ya – ya – ya! I got goals! See, I got goal." And they act more ARC breaky than a – than pcs would in an HGC any day of the week. You know? It's fantastic, the high mental tension. Well, that's just occasioned by this same thing. They're approaching – they know they're approaching solution, fait accompli, as far as their case is concerned and heh – heh – heh, it gives – it gives with nerves, it does.

All right. To accomplish this activity then, rapidly – to find the basic purpose rapidly – allowing a minimum of time in which the person – during auditing I'm speaking of, not during training – during auditing toward and directly toward his goal – the individual going in the direction of his goals should go there fairly rapidly. And this factor stood solidly in our road – is that the longer it took, the less likely it was. And, you can still write that down as a stable datum: The less time it takes to find the goal, the more certainly you will find it. Not the – not the reverse necessarily – if the goal is very easy to find, you'll find it quickly. If we put that
into a Russian translation machine, it would come out that way and that's the wrong way, you see. It's – the fact is, that the fact that it's found swiftly causes it to be found positively. The longer it takes to find a goal, the more difficult it is to locate.

So therefore, the demand was on a very sharp and certain process which would make it possible for the individual in the minimum length of time to find his goal. Now, this doesn't overthrow 3GA and, therefore, you haven't seen this under the heading of a new thing – like 3GDN or something like that, see? You haven't seen a new designation come out on this. And that's because, basically, you're doing all the steps of 3GA. And I want to hold that to your attention. It is much more difficult to find a goal on somebody who hasn't listed his goals. Because the whole bank will be charged up on the subject of goals, and you're not going to get more rock slam – you're just going to get more suppression.

So, for my money, it is highly desirable and I wouldn't want to tackle anybody who hadn't been prechecked so they could stay in-session – who hadn't listed 850 goals or so – I wouldn't want to tackle a Dynamic Assessment on that individual. Now, you could go to all sorts of shifts if you wanted to in the finding of somebody's goal, but those fundamentals still remain. We want a list. We want that – we want the bank discharged on the subject of his immediate goals. He's going to give you the solutions to all of his present time problems, don't you see – and you'll be falling all over these things, and so forth.

So let's just carry on as I've given you 3GA. And then let's turn around and not bother to null that 850 list. Let's cut right in through the dynamics and let's chase that rock slam right straight down and let's pick up the first available goal that we can get on the track. You'll find out that the goal will ordinarily be 1, 2 or 3 goals earlier and still be runnable – this is just a prediction – than if you had pulled it off the first list he gave you. In other words, we're undercutting a couple of GPMs. That's one of the tricks here that might go unnoticed. And yeah, you can find as many as two goals without turning off the rock slam and actually list them out and make the pc feel a bit better and everything is fine. A bit better – hell! Make him feel marvelous! And they still got the goal you would have found by Dynamic Assessment sitting there and it could have been available and grabbed by this system the first time you assessed them. That's worth observing.

Now, we'll know more about this in due course, with more data to hand.

But the method used then depends on having a pc who is sessionable, auditable, that is to say, and who's got a nice long goals list so that goals aren't too charged up. And then depends on the skill and meter reading of the auditor in doing Dynamic Assessments by Rock Slam.

Now, let me point out to you that we're doing ... This is right – all about Dynamic Assessments now – all right. Let me point out to you at first crack out of the box that this is not the same Dynamic Assessment that we have been doing – it is Dynamic Assessment by Rock Slam. Used to be change of characteristic. Well, that is good enough and ordinarily would lead you into a rock slam and undoubtedly would have value. And you'll find that many of your findings by rock slam concur with somebody else's findings by change of characteristic. As a matter of fact, you saw this happen in the demonstration last night in spite of the fact that it had been run. (Heaven help us!) Now that change of characteristic there was relatively val-
ueless because he wouldn't have found it again. So, frankly, by rock slam is a much more positive Dynamic Assessment.

Now, I maligned my poor pc last night when I said that – you notice I didn't use his list. Well, as a matter of fact, we probably will be using his list because I'm giving you a new expanded Dynamic Scale. And we'll take the dynamics and we'll expand it out, and it'll have maybe about twenty items on it. It'll have the main dynamic and some subdivisions.

Now, I learned this the hard way last night at about ten minutes of three. I don't have too much time to get my various research auditing in; and of course you're driving me very hard – you're walking all over my heels as a matter of fact. And, I – to be very factual and to be sure of my data – why, I've got to audit pretty fast and furious to get the thing squared away. And the session which I gave Reg last night, you heard me say it's not a textbook session, you know. You did hear that, didn't you?

Male voice: Uh – huh.

Well it's as much of a pilot session as anything else, you know. Of course I knew exactly, by theory, what I was looking for. But as far as what ramifications are introduced into doing this operation of dynamic, you know, and all written up in a nice schedule and beautifully packaged and all the warning signals all lying there – little flags pop up and hit you on the nose – these are not present in this activity. See, by theory it's dead easy, see. All you do is run down the rock slam and pull the goal that discharges the rock slam and you've got the guy's goal. See. That's all.

All right. But how do you do it? See, I've got you to worry about. See, I – it's not enough that I can sit down, you see, and audit, you see. I have to think about your auditing, too, you know. I'm going to get bowed down in an auditing chair – before I am – all these auditors on my back. Get downright round-shouldered. Because the truth of the matter is, is I don't have to – if you see, it would be relatively easy if all I had to do in auditing was just understand what I was doing and resolve the pc's case. See, this is dead simple, if you want to collide with it.

I've got to understand what I am doing in auditing – understand it much better, communicate it with a decent degree of clarity and then correct what everybody else didn't understand, see. This is an entirely added activity, so you don't wind up with a bunch of intuitives. And this is very hard on me, if you don't – if you don't mind my saying so. I'm not trying to act like the victim, but it cuts out my intuitive auditing. And, you know, I'm going to go all out of tune one of these days. You know?

I used to audit by intuition and what not on occasion, you know, and say, "Wow, what do you know, you know, I'll bet! Is it? Oh, it is! Oh, oh, well, ha – ha – haw." And there'd go the guy's case. You know? That kind of thing. But there wasn't any explaining it. See? All right. That is to say, intuition without language meant there must be a deficiency in my own understanding of it, if I couldn't communicate it. So everything I've been doing has to be analytically understood. It's all got to be up on the surface. It's all got to be communicable. None of these factors can exist in it; every one that does exist, why, other people get in trouble.
Long since I rather disabused myself of suddenly stepping up and saying, "Well, that's very easy – all I get it now, all you do is intuitivize and the pc gets well." And I've lost hope – people don't. Well, I don't know why this is. I haven't even bothered to explain it. But the other is successful. And so you take a successful route. And I will say this, because I have to articulate what I'm doing, I come to understand a lot more than I ever cared to find out about it. You get the idea? And I have to study it and understand it and make further advance on it than I'd originally thought I would. Do you get that bonus factor which keeps adding in all the time? Well, that of course catalyzes and drives forward the research. So far from being victimized by you, I'm of course considerably assisted by you. Because very often when you in the majority don't understand something well enough – well, I have to step back and say, "Hey, wait a minute, maybe it isn't understood," you know?

Somebody said the divine doubt was the beginning of all wisdom. It's very true. You know, Kipling – Kipling had that, "If" – When you can hold up your collar studs when all about you, you know, are losing theirs and blaming it on you.* Whatever that was. Anyway ...

Well, you know that there isn't anything to holding your nerve and course when everybody about you is doubting and blaming you – there isn't anything to this. There's a much more fantastic level of approach. If you can doubt yourself, too, while all about you are doubting you, and still carry through, why, you see – you'll be an auditor, my son. [laughter]

And I have to decide every once in a while that there's some part of this I don't know anything about. And whenever I decide that, why, you get a rather interesting advance into the situation because a new piece of understanding turns up, a new polka-dot piece of the puzzle suddenly shows up and so forth. I suddenly cease to think that you are all being very, very stupid, you see, and it suddenly dawns on me that I might be either uncommunicative or kind of dull myself. And at that moment, of course, I'll start looking hard.

When you've had as much trouble as you've had over the last year or so with dirty needles – we didn't follow through this particular course of action on Dynamic Assessments of me deciding that you were having an awful time and that I wasn't having this time and so forth. No, I decided I'd make it easier on all of us because I've run into dirty needles, too, see? I'm right in there with you. I've read them with a magnifying glass, and at great cost of eyesight and midnight oil. I have read dirty needles which finally turned out to be meter interference. [laughter]

And you needn't feel too bad about reading a meter because the manufacturer of the Mark IV, this afternoon, had to be furnished a magnifying glass and almost smash his nose on the front face of one of these things to realize that it had a considerable amount of noise in it. It was jittering like mad, a particular meter that I had up there. It was just whizzing at a great rate. And he thought it was dead still, even under a magnifying glass and everything – until I pointed it out to him and he finally said, "Well, yes, it is pumping, isn't it." But first he said, "Well, it's just smoothly rising." "No," I said, "that is jittering; there's noise on that." And I moved it over into the Set pattern over here and carefully moved it down so he could see exactly on both sides of the needle blade, gave him a big powerful magnifying glass and let him

---

* Editor's note: In this and the next paragraph LRH humorously alludes to Rudyard Kipling's poem "If".
look at it for a while. It took him the longest time to see that that needle was vibrating. It was very plain – you or I would have seen that it was vibrating by just glancing at the meter, see. Nothing wrong with his recognition; but it wasn't a trained recognition. He builds the things.

All right. Now, having this much trouble with a dirty needle brought about various other observations which brought about this fact – that we never really had much trouble with dirty needles till we had something to do with goals. Hmmm! Here's an interesting coordination. Never had any trouble with them, all of a sudden we start assessing for goals and we have trouble with them. Well, I decided we might as well look in this particular direction. I particularly learned what it was.

After all, a dirty needle is just a small rock slam and a small rock slam is what you get when you get a "Fail to reveal." And therefore, if a goal is a "Fail to reveal," why, it must underlie a big rock slam. And furthermore, if the goal is an overt against one or another dynamics, it of course, will react as a big overt, which is a rock slam. And all you have to do is find the dynamic it is an overt against – and then list the parts of the dynamic and find the rock slam on that and then list the goals and then find the goal that rock – that goes down the list and makes the rock slam cease and peter out. You just list goals until you got no rock slam or until the rock slam isn't riding there steadily. You can assess that goals list and having assessed it you will find the person's goal on it. Quite interesting, isn't it?

In other words, you're tracing a series of overts against a dynamic. And that's all you're tracing. And the person has those overts against that dynamic – not because he has overts against a dynamic – that isn't the genus of the goal. It's because accidentally what he postulated is particularly an overt against that dynamic. You must learn this very well. It is not an intentional fact that he's all messed up with that dynamic. Now, listen very carefully here. It's not an intentional fact.

Spiders, as far as he's concerned analytically, he can take them or leave them alone. He doesn't want to have anything to do with spiders and yet his goal, peculiarly, is aimed at the heart of all spiderdom. He does! He hates spiders and he – he mopes on the subject of spiders and he gets a big black eye and turns on a rash around his medulla oblongata every time he sees a spider, you know? And there's lots of physiological reaction to spiders and so forth. And this is very puzzling to him because in – when he first postulated this goal or basic purpose, he didn't have spiders particularly in mind. You see that?

But then by the structure of the dynamics, he actually can't postulate in this universe a goal or a basic purpose without trodding upon the toes of one or part of one dynamic. It is inevitable that if he acts in this universe he will act against something. No matter what else he benefits – no matter what else he intends – he's still going to act against something.

Now you can work this out. A fellow says, "I'm going to sit out here in the sun and enjoy myself." Now, let's take as innocuous a goal as that. This particular area that he sits down in happens to be a very attractive spot for bees to gather pollen. And after a few bees have crawled over him and stung him, he, of course, goes out and gets himself a can of "anti-insecti" and blows it about the place, in all innocence. Direct consequence of this goal, don't you see? Not necessarily an intended consequence, but a direct consequence of the goal, you see?
So he's going to lie in the sun and enjoy himself. Well, that's dandy. So he goes down to the beach – no bees down there – he goes down to the beach and the sand flies are all around the place. And they don't bother him so much – he hasn't got enough overts by this time really to be bothered – but they sure get over Junior. So he dusts Junior off with a good slug of DDT, don't you see? And every time he tries to lie in the sun and enjoy himself he gets all mucked up with insects.

He goes to a picnic. He lies down in the grass. The next thing you know his mouth gapes open and he's chewing on ants. [laughter] So he bites up a few ants and spits them out. You see?

And it just seems as he goes on down the track and the trillennia accumulate that he also seems to have been accumulating some native affinity based on the agreement of mutual hate with the insect kingdom. And he never intended to at all. He had no idea of any overt when he first formed up his basic postulate.

But that doesn't mean occasionally, late on the track particularly, when they formed up the overt they didn't have an overt in – I mean – when they formed up the basic postulate – that they didn't have an overt in mind. Sometimes, you see, no matter how innocent the goal is it will result in some overt – in a chain of overts. But the funny part of it also is, is many of the goals are just basic postulates which are overts per se – they just are overts, that's all.

"I am going – well, I can think of a good game to play! Ha-ha. Ah, I don't know, that was a good, good old planet, no – no worries about it anymore, they elected too many democratic presidents. Ah, billiard-balled – there it is. Oh, well, another – another cycle, another postulate. Well, let's see, what the devil should I do? I've been sitting here for a couple hundred years and it doesn't seem to me to be very productive. Game – I ought to be playing a game of some kind or another. What would be a good game? Well, somewhere in the universe there must be young girls. I'm sure. Well, let's play a game of messing up young girls. To mess up young girls – that ought to be pretty productive of a game."

The odd thing, the young girls have done nothing to him and he'd done nothing to young girls. He isn't solving any problem. There's no purpose or basic reason for it. It just seems to him that this would be a good game. And he's absolutely right. [laughter] So whether he intended an overt or didn't intend an overt or even if he particularly wished to avoid an overt – he's going to wind up with a chain of overts – inevitably. Particularly if he wished to avoid one.

I can see it now, you know. He's been hauled off looking at this smoking ruin that was the planet, you know. He's been sitting on this asteroid whizzing about this system and he, every once in a while, sees this smoking ruin down below there – debris is spread out, you know, and everything is sort of charred. And you go near it, you know, and you can still hear the radioactivity fry. In other words, somebody held an election one way or the other; and there's nothing doing back there. You know. There's just nothing. Nothing. That's it. And he goes whizzing around. And he said, "That was pretty grim, pretty grim, to be blown up by that." He's influenced to some slight degree this way although it isn't the immediate source of his postulate. He makes a brand-new postulate and he says, "Never to hurt anybody again!"
Oh brother! [laughter, laughs] Oh, brother! Man, has he had it! This is the sort of a life he leads. He doesn't want to hurt his wife so he doesn't tell her to use Listerine. So he divorces her. Inevitable cycle, you see. He doesn't want to hurt anybody's feelings. He doesn't want to hurt anybody or upset anybody anyway, at all. And he just seems to wind up clobbering them, you know. And he never quite understands how this is. He's the most puzzled man about the whole lot. Not-hurt he has mixed up with no-communicate, don't you see? And that's where he gets messed up.

Well, we're on particularly firm ground thus far. But it was quite a series of discoveries that led us into this very rapid Dynamic Assessment. Now, the Dynamic Assessment, of course, takes advantage of the fact that no matter what goal he dreamed up, it's going to have an overt on some channel. And that you can put down as a stable datum. Any goal will wind up eventually as an overt on some dynamic.

So, if this is the case it can be found if an E-Meter would register, directly, overts. And, yes, it does – an E-Meter can be made to register, directly, overts. And I found out what it was – it's the rock slam. The dirty needle, is the registry of an overt.

Now, let's take the stable datum and the confusion. The prior confusion must exist to hold a stable datum in place – not a stable datum, but to hold a fixed datum. To hold a problem in place you must have had a prior confusion, you know, this kind of thing. Similarly, you have to have a prior overt – it's the same mechanism, you understand. I say similarly – no, it's the same mechanism; I'm just stating it in different words. You got your confusion and then that's fired, followed by a fixed problem and decisions and so forth. But you've got this mechanism working here whereby your prior confusion – it'll be expressed as an overt or a series of overts followed by a withhold. And your overt is always prior to the withhold.

There isn't ever a withhold which will register on a meter that hasn't been preceded by an overt. Every withhold is preceded by an overt. This is just the geometry of the mind. This is as simple as the laws of gravity – you hold up a fork, you drop it, it falls to the ground. Every time there is a withhold earlier than the withhold there must have been an overt, otherwise the withhold won't be withheld. You get the idea? I mean, it's just the mechanics of this thing.

Now, any time you want to prove that a rock slam equals an overt, ask somebody for a withhold and watch the meter reaction. Watch very carefully. Take it – on a quite a few pcs if you're having trouble. And ask them for withholds. Withholds. Withholds. Something they failed to reveal. And if your metering is even vaguely anything – you know, you know which side of the E-Meter to look at – you'll see that little bzz-bzz-bzz needle back of those, person after person after person, see. So much so that when you're doing Tiger Drills, an experienced operator on the Tiger Drill sees the thing go dirty needle on him, you know, he sees it go bzz. It was – it was going "To be a tiger," bzz. "On this goal is there anything you failed to reveal?" See? Nothing else – why say anything else? You're not going to get anything else unless you get off the "Fail to reveal." Well, you could pull that. But every time you see this little tiny, tiny rock slam – it doesn't matter how big the rock slam is – you've got a "Fail to reveal" back of it. And the "Fail to reveal" – of course, withhold, in other terminology – must have been preceded by an overt.
Well, now, how is this character so hung up in a dynamic? Consider the dynamic he is hung up with as a withhold preceded by an overt, and you'll see exactly what that is, see? In other words, he's hung in something – it is actually quite heavy and massy what he gets hung in. But it's the same law is at – is at the bottom of this; that is, if the individual is hung in something it must have been preceded by an overt against that thing.

We see this entomologist come down and inspect the house for termites. And he has a flat head and he's got his hair combed in a certain way to look like antenna. Most marvelous thing, you know. He's got enough overts against termites that he's finally building his own body into a termite body, see. He's hung up in that valence. We call it a valence.

All right. Similarly, you go around to a lot of undertakers and, man, if they don't – if they don't resemble corpses! Ah, not bad looking corpses, you understand, they're all well preserved corpses. Very well preserved. And no matter what their basic goal was or what they would assess out on the dynamic – they'd probably assess out something else – you can see this mechanism in the current lifetime, you see? You see little shadows of this mechanism.

Now, it goes from just a slight think-think. We get the guy on the meter and we say to him, "Are you withholding anything?" And the needle goes bzz-bzz-bzz-bzz-bzz, a little tiny, tiny, tiny rock slam, dirty needle, rock slam, simultaneous meaning – similar meaning, same thing. So we get this little bzz-bzz-bzz-bzz-bzz. Now, we say, "Are you withholding anything? Are you not revealing something?" We don't care what it is, see.

And he eventually breaks down and he tells us, "Yes, I – I thought when you sat down in session that you were in need of a shave." And the thing clears up, boom.

We don't notice that he's given us two in one. See, he's given us the overt which clears the withhold. Get the idea? We can see that all the time. That's just on little thinks and that sort of thing, you know. He said, "I had an overt thought and that is what I am withholding." He'll give you this all in one scrambled package. You see? And we'll see that bzz-bzz-bzz disappear. There it is. Unless, of course, he's got some other bzz-bzz-bzz and he was withholding something else. But there that goes, don't you see – bow, gone. Isn't anything more to that.

All right. Now, how about the fellow that we say... This guy has really – has really been at it, you see. This guy has – every time we get a Coke, see, and we take a couple of swigs out of the Coke and set it down in order to make a phone call or something like that, it disappears, you know. We're just not ever able to finish a Coke. If we ever set a Coke down it vanishes. And this is a hanging mystery with us – is what happens to our Cokes. You see?

And we get this guy in session and we say to this fellow, "All right, is there anything you've failed to reveal?" And it goes bzz-bzz-bzz-bzz-bzz-bzz-bzz-bzz-bzz. And he says, "Well, I failed to reveal that you needed a shave. I thought that when I came into session."

And you say, "All right, thank you. Is there anything you've failed to reveal?" And it goes bzz-bzz-bzz-bzz-bzz-bzz-bzz-bzz-bzz. "Well, what was that?"

"Well, actually just before the session, why, I – I had a – well, I-I-I thought maybe – maybe your TR I wasn't so good."
And that disappears for a moment and we say, "Is there something you have failed to reveal?" And it says bzz-bzz-bzz-bzz-bzz-bzz. And we say, "All right, something else you've failed to reveal?"

And he says, "Well, yes – yes, there's something else I failed to reveal. I thought that you were a pretty poor auditor in the sessions you've been running lately. I've been looking at your pcs and they're all caving in – that's what I thought." And that clears up.

And we say, "Is there anything you've failed to reveal?" And it goes bzz-bzz-bzz-bzz-bzz.

What's happening here? What's going on?

This guy's got a God-awful overt, see. He's got repeated overts – actual overts, so, of course, the thing doesn't clean. And the little – little rock slam persists. And every time he even slightly withholds something or thinks something critical he keys in this big one. See? So it's all charged up from this.

We finally prepcheck day in and day out, week in and week out, sweating it over, wearing out the linoleum with CCHs, Prepchecking, sweating so; and finally one fine day we're particularly gifted and we happen to mention accidentally, "Have you ever stolen anything?" and the thing falls off the pin. Goes in to a big slam – acts up, slam disappears, the needle won't register on instant reads, nothing. This meter is sort of shorted. We test the leads. It still does it. "Ever stolen anything?" you know.

And all of a sudden he turns kind of a beet red and he says, "Oh-ho-ho, I did mean to tell you, the last month or so every time you, ho-ho-ho, had a Coca-Cola I hung around, ha-ha-ha – it was just a joke, you know, I mean – I picked it up before you could finish it."

And it cleans up and that is the end of it. And you have no more bzz-bzz-bzz, except when he has an immediate withhold. Then we get the bzz-bzz-bzz, and you say, "Is there something you failed to reveal?"

And he says, "Yes, I wanted to move my feet and I didn't."

And you say, "Thank you very much." And it's gone and it doesn't recur. You get that as an expanded mechanism here.

All right. Now, let's just expand it a little further, see. Every time we mentioned Papa he said, "Oh, my father actually did me in and my father has often done me in – as a matter of fact my father was a professional do-me-iner." [laughter] "He lived only for that purpose and he was very gifted."

And we find out he embezzled the old man's bank accounts and ripped the transmission out of the old man's car. And, we finally trace it back to using the old man's pipe habitually for making soap bubbles and then never telling him, always carefully wiping it off and putting it back on the rack, see. And we finally run this one out.

But all during that time we're getting a bzzzzz-bluow-blzzzz! All we do is mention his father, see. Bluzzzzzz-bzzz! We want to turn it on, all we'd have to say to him is one of two things. "Have you done anything to your father?" That would turn it on. Or just abandon doing anything to his father, say, "Get the idea of withholding something from your father."
See? Same mechanism is turned on by the two different sources. If he withholds he gets it. See? And if he thinks of overts against him, he'll get it. Either way. Either way you get the same rock slam!

Now, don't get the idea that the overt is a big one and the withhold is a little one or anything like that. They're just blood brothers. See, the same manifestation of different periods on the track. The overt is the commission and the withhold just parks it. That's all. And they register, then, as a dirty needle, a tiny rock slam, a big rock slam, a huge rock slam, a burned-out meter. The order of magnitude doesn't matter, you see. The mechanisms are all the same.

Now, there's another – now, let's look at that. There's another wider line, see. Let's not worry now about Father, let's worry about families. And what do you know, he hasn't – it isn't that he has made a habit every lifetime for several lifetimes of caving in the family. He – that isn't good enough, see. When we start bringing it over the level of families, we're bringing it across a cycle. In other words, it's fortunate for us that these withhold things run, the little light ones are a day or two or three. See? And then the next grade is almost an absolute, it's this lifetime. See? See? It's either a little period or a lifetime or a cycle. Get that? That's quite – quite interesting, you see. It's three grades. There aren't a whole bunch of intermediate grades and that you can be very thankful for. You'll occasionally see a trace of one and think you've got something, but don't worry about it because these three grades are dominant, as there's a rock slam for the cycle or several cycles, you see? It's a cycle magnitude, lifetime magnitude and very finite magnitude. It's days, you know – days, minutes, that sort of thing. After three or four days the guy – the thing the guy was withholding from you three or four days ago tends to key out. It isn't bothering him, see. And what the guy had withholds in, in a lifetime, key – tends to key out at death.

And then we've got the big great-grandpa of all. We've got those which occur as a result of having a basic purpose or basic postulate or goal which directly or inadvertently tremendously affects the family. Let's say the most natural thetan goal in the world – to be free. And then she marries this guy. And then a life goes on and she marries this guy. And, you know, and he marries her – and she, you know – the thetan as him, marries her and so on. And he always wants to be free, you see, and of course every time he frees himself, the family starves to death or something of the sort. And he comes back and they're all lying there – skeletons in the burned cabin. You know, this kind of thing. And this – this thing just is... See, basically, there doesn't seem to be any connection between these two things. But in all things, that one is the one key line. Fortunately it remains constant – it hasn't got lots of branches. Thank God a thetan is a specialist!

So, see – you see your various sizes of dynamics. Various sizes. You get this – main postulate will be about a dynamic or some major part of it, see? Your goal, see, is against a dynamic or some part of it. It just winds up that way. Or was directly that way. Or tried not to be that way. It'll always wind up this way. C'est la vie.

Now, the next – the next size is... You actually have postulates in ahead of these things, by the way, even on a lifetime basis, you see? Guy says, "In this lifetime I'm going to be good." Hasn't anything to do with his basic purpose, see. "I'm going to be good." His basic
purpose is to be free. But this lifetime he says, "I'm going to be good," see? Louses him up, you see, because it's not his basic purpose in life. But he tries to be good during all this lifetime. You can find this lifetime's leading goal – to be good. It won't do you a bit of good. If you ever try to run it, it will beef up the bank, bang!

Now, of these the only runnable things are the overts. The long-haul runnability is all overts. Overts are the main runnability. Withholds are simply the secondary manifestations of the overts. You can directly pull overts all away along the line and practically dispense with pulling withholds because, of course, as soon as they told you the overt it ceases to be a withhold.

Now, oddly enough, you can turn it around and for the purpose of rudiments you can just pull the withhold and it desensitizes the overt unless you've really put your foot in it. And most of the time you can get away with just asking for the withhold; you just ignore the overt. "Are you withholding something from me?" "Yes, I had a hostile thought." That might even be good enough to clean it. See? It might also leave you with a missed withhold occasionally. But you can pull it just on a withhold basis. You can ask for the withhold, you see, and ignore this overt until it gets too chronic – too messed up and then you're in a mess. Then you've got to ask for overts.

Hence, you have O/W which is a sneaky way of asking only for overts. And the only reason you ask for the W at all is to keep the flow balanced so the pc won't get caved in on nothing but outflow. Let him taste the inflow as well as the outflow and he can run it more easily and better and longer. That's really the reason why you have the W question in overt-withhold. See? That's "What have you withheld?" See?

Well, that's just to reverse the flow – not because you need to ask the question, see? In just the basic mechanics of the mind you don't have to ask the question at all. But for the basic mechanics of energy and stuck flows and the pc getting gummed up, you have to ask it, see? And the mechanics of auditing require that you ask it, but as far as aberratively – if you could just free all those without influencing flows in any way – of course you could just ask for overts. Don't you see?

So the mechanism, then, comes around to the fact that if you can pull the goal – the basic purpose of a human being – it pulls the whole overt line on his chronic targets. And thus wise go bzzzt and renders as nothing, all them overts. And the odd part of it is, you list it by items and he doesn't even count it off as overts in many cases. Smooth as that.

Now, also a person departing from his (quote) main goal line (unquote) is susceptible to alter-is, counter-postulate, resistance and all the kinds of other mechanics proceed from this particular action. And that he's unfaithful to himself when he disobeys that basic purpose is the main source of aberrative consequence.

But taking that – moving off into the mechanics of the thing, moving off into the energy phenomenon, mental energy phenomenon – all these various kinds of things. Why, the one thing that holds true through all these things is an overt chain. See, it was never intended to be an overt chain in most cases. But it became an overt chain and is therefore discoverable by the phenomena of rock slam. Now, you see this thing all knit together neatly now? You got it?
So all you have to do is find out which one rock slams the mostest and the most persistently to get the dynamic on which he has the most overts and trace that back. And it will wind you up with a very narrow perimeter – in which he can write down his basic postulates – a list of any one of which might be it. You assess out this hatful – very small number. You wind up with the guy's goal, merely because mechanically you have narrowed the field to such an extent.

Now, at the time you pick up this pc, he is wandering in a cloud. Pretty radioactive at that, see. He's in a cloud, he doesn't know whether he's coming or going. You ask him for his basic purpose and he says it's "to shell spikes, to build catfish, to remove universes from my path, to eat walnuts, to worship God, and to like myself." And in some cases, five thousand goals later, he will be going on with that type of list. In that it takes you one minute to null one goal you don't want them five thousand, nor even one thousand, long. It takes too many hours to null them.

So all this other work is very rapidly done and you come into the small perimeter where you maybe have a hundred or two goals, something on that order, at a guess, that you null by the Tiger Drill. The guy's goal falls out of the hat, the bank's all discharged, it lists like a breeze.

Now, the heavy work, the long work, becomes listing. And accurate listing and keeping the goal cleaned up and so forth. And you're sailing right straight toward Clear.

So with this mechanism and with having worked out this path – this tightrope walk – why, we've got a high road to Clear.

What we need is an auditor sufficiently skilled to do a Dynamic Assessment very exactly, very accurately – know a rock slam when he's looking at one.

But there's one thing that stays very greatly in our stead. You might not be able to read an instant read of one tick, but I defy you not to read a half-a-dial rock slam.

Thank you.
FINDING GOALS BY DYNAMIC ASSESSMENT

A lecture given on
21 August 1962

Audience: Hooray! Hooray! Hooray!
[Audience cheers enthusiastically.]
Thank you.

Ah, that's very good, that's very good. I thank you, my goal thanks you, my auditor thanks you.*

All right. Got some announcements here right off the bat; we're going to christen the new building as soon as I get back, but you are going to be using the chapel here in just a few days, as soon as they get a floor in it, why, you've got it. And we'll have a bit of a party when I come back and because we'll have some space we'll have some party there for that, now and then, on a weekend. And we've also got a canteen planned out there, small size and a few things to make life more livable for you. I am leaving Thursday on the Queen Elizabeth for America and I'll return here, be back here the seventeenth of September.

Now, I've given you an extra lecture so that your Thursday unit doesn't mess up. But actually you are only losing two weeks of lecture because one of them is blank anyway. Okay?

Audience: Yes.

Is it all right with thee to do this?

Audience: Yes.

All right, thank you.

I always ask the kids is it okay if I go, you know, and they always think it over very carefully and tell me yes. [laughs]

* Editor's note: Assuming from this remark and the unusual cheering at the beginning of the audio recording, LRH has probably just before announced that his goal was found in auditing. This is confirmed by what LRH says on page 10 of this transcript.
All right. And the Washington congress goes off on Labor Day and so forth and I'll be saying hello for you and so forth and I'll tell them how good you are so it's up to you not to make a liar out of me. Okay? [laughter, laughs] All right.

Okay. We have some new students amongst us. Probably some of the older students are already telling the new students about the – they should have been here in the old days when... [laughter] You know, you know. I'll bet – I'll bet this has already occurred, "You think it's tough now, well, you ought to have been here last June." [laughter] I suppose this is already happening.

All right, we've got two lectures tonight – both of them are quite fundamental. The first lecture is the "Dynamic Assessment," the other one is the "Basics of Auditing." The other one, depending on how embracive the material is and that sort of thing, will be a lecture which you better take to heart because you will be using this very lecture in training students.

But this particular lecture, this first lecture, lecture number one, Saint Hill Special Briefing Course – date?

Audience: 21st, 22nd.

Somebody says the 22nd, somebody says the 21st.

Audience: 21st.

Twenty-first, all right, thank you. Had me mixed up there for a minute. I was in two days. All right, the twenty-first September, October, December, what's the date?

Audience: August. 21st of August.

August, the 21st of August. All right, AD 12. Thank you very much.

The way I start my stories to the children, Saint Hill, England, planet Earth, solar system, this galaxy in this part of this universe, see. Once uponet a timet.

All right, Dynamic Assessment. Now, there has been a considerable advance made and I gave you the Tiger Drill. I told you at the time when I gave you the Tiger Drill that I really didn't much like releasing it. But you needed it, it's released. All right. Similarly, you've been walking on my heels with Dynamic Assessment. I've got the whole story here on Dynamic Assessment all the way down the line.

The first thing you should realize about this is that ordinary Routine 3GA, exactly as you have had it a week or so ago – a couple of weeks ago when I gave you the full rundown on the thing – that is totally valid, there is nothing wrong with it anywhere at all. The Tiger Drill can be a little bit improved by which you null the goals, but I'll give you that improvement in this lecture.

Now, but that's perfectly valid. You go out and you say to somebody, "Do 850 goals." You find the goals list is still charged. You ask him, "Who would oppose your goal?" you know, and get that four-way list and get, "What goal might you have?" as a separate list. And you just use all of these things and then you just start from goal one and you go on through and in a large majority of cases you'll find the pc's goal before you've hit the mark 500. Okay?
Providing you do a good job of nulling. You understand that's a perfectly valid procedure. That's in the can.

Now, another one is this: There is a fancy way of finding a goal and this fancy way is by Dynamic Assessment. And this will be done by a Class IV Auditor.

You could probably find a goal on anybody, even though he was riding 8,785 goal-type case, don't you see. I mean you could have him run goals and goals and goals and write goals and goals and the paper is accumulating. You use a small shopping cart, you know, coming back and forth from the auditing sessions in order to carry all the goals list, you know. Thing has to be put on IBM microfilm, you know, special projectors to read the stuff off; because otherwise, it would take up the space of the Library of Congress or something like that, you know.

Now, this character – the goal is almost impossible to find on him and that comprises a large percentage of the cases, about 25 percent. You are not going to find any goal on this character until you've gone out. So 3GA would find the goal on this pc. You understand that. But it is becoming uneconomical, see, in terms of time. And the difference between these two pcs is specifically and directly this: that the goal of the pc that is going to take you a long, long while, you see, in terms of hundreds of hours of auditing, to find on 25 percent of the cases is an overt – a direct overt-type goal. In other words it's an overt goal that is directly overt. You see.

And the other is an inadvertent overt goal. You get the idea? The inadvertent overt goal is very easy to find. But the one that is a direct overt goal is very difficult to find.

Now, you think that the wording of the goal is what makes the goal difficult to find. Let's take such a goal as "Not to be located," you see. And you offhand would say at once that this was the most difficult type of goal following Dianetic-phrase reasoning, you see, therefore the goal would duck, whereas as a matter of fact that does not hold true. Those goals very often turn up in the first hundred goals listed, by experience and are not the difficult goal to find.

The difficult goal to find is the direct overt goal, it's a direct overt goal. And the pc who has this can be told on the meter because in the process of auditing he commonly has a rock slam turn on which is wider than an inch or two. And that is that pc. That's 25 percent of the pcs and that pc has a direct overt goal – wide rock slam.

You run a little bit of O/W on this pc, you are prepchecking this pc, you get a wide rock slam. Well, actually, this wide rock slam is not because your ordinary pc has done something personally to you as an auditor. You could have this as a freak.

Let's say you are auditing your girlfriend or your boyfriend and you've got a dial-wide slam starts turning on and they don't have a directly overt-type goal at all. No, they've just been two-timing you, that's all. Now, you get that overt off against you, personally, the auditor. It's practically – it has to be against you the auditor to come into that classification. It must have been done to you personally, see, and you will get that dial-wide slam. But they've done something pretty wild and that they're not admitting. It's not something they are just trying to keep you from finding out, you know, nothing mild like this you know, but they were
the person who foreclosed your mortgage and threw you out on the street, see. You get the idea, they've been having illicit affairs. They have a prison record and don't want you to know it because if it came to be known of this it would do something to you, the auditor. You get the difference here.

Now, that's what this means. You just get that off. You keep testing for that as a direct overt and if a direct overt doesn't exist there, you see, or if the dial-wide slam turns on any other, this is a better test, on any other thing than you, commonly, why this is a direct overt-type goal.

The way to test this is the simplest thing in the world. You say, "What have you done to me? What overt have you committed against me?" And you fish around for a while along this type of line and you get a slam. Well, that's just the person has got a fantastic overt against you, personally. But this also can miss as a test, because you might be included in the goal. You got it?

Now, it is so infrequent that the overt is against you, personally, as the auditor, even though you are living with the person and everything else, it is so infrequent that this is the case that it can be neglected. Now, this is getting much simpler isn't it? It can actually be neglected in the main course of auditing, but only must be remembered on the off chance that it exists.

And the error that you could make is not very serious. It is not serious at all, you see, because you would simply take a course of action with this person and nothing would work out. You just couldn't get to first base with anything. Remember that there is another chance that the person has a fantastically direct overt against you, personally. Got it?

But oddly enough you could make up your mind to that far too easily, see. Because there is another factor saving it, you see, that it takes pretty heavy charge to get that much slam, you see, on a needle – takes pretty heavy charge. And even though the person had an overt against you directly you probably could find the goal anyhow. Do you see all the logic behind this? Now, it all sums down to this, that you could sort this out, which one it was; but having sorted it out, you would only know this: that you had to prepcheck the pc more carefully than otherwise.

And now wait a minute, the goal could also be found, the goal could also be found on the dial-wide slam proposition by a Dynamic Assessment even though the person had this much overt against you, providing you could read the person's meter. You understand, providing you could and of course you can't. You see, you can't read that person's meter. Person's meter is not responsive. Do you follow this? Do you follow this out?

Audience: Yes.

So although I'm giving you all this logic, it doesn't matter. I don't like to give you a statement which is a partial truth, see, so I'm giving you all the data back of this. You could just say for all working principles that any person who turns on at anytime during his processing, a quarter, half-a-dial slam – you do a Dynamic Assessment type goal and you are going to find the goal easily. Got that? If you are able to read the meter at all you can do a Dynamic Assessment, you understand?
If you can't read the meter at all and it never responds at the right points and so forth, you must also assume the person has overts on you.

But then, of course, what are you doing running a non-prepcheck pc on a goals run? You're following – you're following there? If you'd prepared the pc properly, you would have found this all out anyhow, see. You see how this is? So I just don't want to give you a half-truth.

But for working purposes you don't have to worry about it – you get any kind of slam, I don't care if it's only this wide or if it's this wide, see, I don't care if it's this wide or only this wide or if it's hitting both pins – you just take a look at that, that has occurred to the pc – just know then that your chances of finding the goal easily, by 3GA usual – I mean the commonest – not the commonest but the simplest method because you probably all will be using Dynamic Assessments on all pcs, see. I'm just telling you the limitation and you just can't – just know that you're in for a hell of a run, that's all.

But listen, on some of those cases ordinary Routine 3 old-time Goals Assessment found the proper goal – on some of them, very small percentage of them. So it probably scales it down to about 20 percent you would sweat for uahhhhh, see and then, oh my God, months later you'd come up with a goal. You get the idea? By ordinary Goals Assessment.

Now, this is the other side of the coin. All pcs can have their goals found by Dynamic Assessment, see. It is not limited to those pcs. I'm just telling you the pcs that the possibilities of locating the goal are very remote – except by Dynamic Assessment. But now on Dynamic Assessment this makes it even more easy. You are talking about a 100 percent of your pcs. You can use it on all of them if you can use it. If you can pull this card trick, why it is the fast road to finding goals. This is the high, fast, M1 superexpress, no crossroad highway to finding goals. See, this is fast.

It is fast, but it is also fatal if an auditor were to do this on a pc and bleed all the charge out and get all of the data and not turn it over to his next auditor and not sort of pin it on the pc's lapel, you've had it. Just that! You've just had it, that's all. You've got to meter this pc now and straighten this whole thing out by recalling the sessions the pc has had to get the data back.

Now I'll tell you one of the methods of getting the data back. We knew that a pc who just left here as a second-goal Clear – we knew a pc had run Clear on a goal and we didn't even have the goals list and we didn't remember what the goal is. So I told her auditor to do a list of goals on this pc in which this word occurred which we knew the pc had been run on. That was all the data we had, see. And we did a list of, I don't know how many goals were done. I said fifty. I don't know how many got done. And then they assessed this list and they found this goal back. Well, of course, it was the most obvious one. Well, we couldn't take a chance, don't you see? And we found that goal and then we went ahead and ran and listed that goal and the pc went Clear on it. Don't you see? The right goal had been found.

But remember this, you desensitize the case. You desensitize the case terribly by doing this Dynamic Assessment. Do you realize that by removing the charge on these lines, that is the only time you are ever going to get that data at the end line. You never are going to be able to do it again; it is a one shot. You understand, you are going to be able to do it once.
Now, the odd part of it is, is you can't do it once wrong. You can do it wrong a thousand times and the charge will still be on the bank. You see this now? You could do it wrong all you want to. You are not going to bleed any charge off the bank. Get the wrong dynamic and the wrong item and the wrong this, the case will just simply be a little more ARC breaky to audit, that's the final end result of that.

But do it right and then don't make the data known. Do it – do it right, find the dynamic, find the item we are looking for on this Dynamic Assessment, find all these steps and then get a goals list and don't find the goal. If we've gone this far, aghhh, this poor pc has had it. If we don't make this data known to organizations or auditors or central clearing point for such data, some pc is going to get hung, man, because there is just no recovering it, that's it. You follow me? You can't do this again.

It is something on the order of going up on a tower and pouring all the water out of the tower and there is no pump to ever get any water back up to it again except another 200 trillion years of living. Now, you go up and you empty all the water out of the tower and you are supposed to find the key at the bottom of the barrel. Next auditor comes along he can't even find the tower, much less the key, if he doesn't have the data that was found by this, see.

So your auditor's reports must note with great care – now let me impress this upon you – note with great care whether or not certain phenomena such as rock slam dwindling out was present. And you must know what a dwindling-out rock slam is, because you can do it wrong and have the rock slam occur on the first part of the list and then vanish because you are not on the list. Just like any wrong goal practically will list the first hundred items without killing the pc and even doing him a little bit of good. After that, the second hundred throws him sort of into a state of where he isn't quite sure whether he wants to go on living or not. The third hundred kills him and the fourth hundred, if you can get him to sit still to run them, of course, you bury him. That's just that, see.

It looks awful good there for a moment sometimes on the beginning of a Dynamic Assessment or list or something like that. We get a dizzzza and we say, "That's it," you know. And we go to the next step and nothing happens.

So you want to make all these things clear in your auditor's report that you did a Dynamic Assessment and you found a hell of a slam on the "physical universe" and you couldn't get anyplace else. See, make that very clear. Or, if you got someplace else, that as you were listing the items derived from "physical universe" that you got a dwindling slam or you got a slam which persisted very widely for the first ten items and then vanished and never went down to a dirty needle.

Never went down to a dirty needle, you know. Never got smaller and smaller and smaller and smaller and smaller and smaller and mash. You saw one of those on my television demonstration. You saw a type of list and it went bwow and then it didn't do a thing, see. That was one of those. See, wrong line, see. I went in the wrong corner of the slot. You were watching there actually research auditing sessions, not demonstrations, see. Trying to find out about this. Thought you could learn from it, too. Hoped it would come out all right.

Since that time I've really done some auditing, see. Man, the engrams have been flying, you know. I don't know how much auditing has happened since you last saw the last
demonstration last Friday, but it's, oh, I don't know, must be something on the order of about – what is it, about thirty-five hours, thirty hours, thirty-five hours? Almost as much auditing as there were days.

And getting this thing taped out. Getting this thing grooved because – it's always before I take trips – it was much more vital when I was still riding airplanes.

You know why I'm not riding airplanes? It's just too much responsibility. It's not whether you'd lose me, you see, but it's just my responsibility, see. My responsibility is just a little too heavy. And furthermore, I think that a thirty-six thousand-foot fall is very hard on Rolleiflex cameras. [laughter] Of course, they are shedding airplanes out of the sky these days something like raindrops in England. And – oh, you have to wear steel umbrellas lately where they are crashing airplanes, you know. But it is awfully hard on my cameras and I know you wouldn't want me to lose any more cameras. I have lost one camera for the sake of Dynamic Assessment. You actually lost two and we don't want to lose any more. We can afford so much for research, but beyond that... [laughter, laughs]

All right. Now, let me give you a packaged statement of the person you must run, in case somebody got lost here or he got confused on it, the person you must run a Dynamic Assessment on.

I'm going to hear some – hear some whistles here in a minute and "Oh, I see, oh yeah, what do you know, huh, yeah, that's so true," you know, that kind of a reaction it is. Just listen now.

The wide rock slamming needle turning on once in a while or now and then, what – but which has been known to turn on on this pc in auditing. Got it? Under all those classifications, see. It turns on and you've seen it. An auditor tells you it has turned on, don't you see. It's on a lot. It's on now and then. It's on rarely. You know, just however we've learned about this wide rock slam needle, you know, heavy, searching, hunting, banging, crashing needle, you know. Doesn't matter how we learned about it. You needn't try to find a goal on that pc by any other method than the Dynamic Assessment method because you are going to lay an egg. You are going to be up there about three thousand goals up the line and you are still sweating. Got it?

But remember, don't worry about it too much if you can only do old 3GA only, see, don't worry about it too much because a certain percentage of pcs, a very small percentage of those pcs, still have found their goals early on the list. You see that. So you are not taking your life in your hands.

Now, that's type 1, see, wide rock slamming needle, known, reported, we don't care how, wide rock slamming needle.

Number 2, a pc who is unresponsive to the auditor on the meter. You say, "Are you willing to talk to me about your difficulties?"

And the pc says, "Myah, I guess so, yeah I'll talk about my difficulties."

And you don't get any knock on the thing. And you get suspicious and you sort of put the meter aside for the moment.
And you say, "Well are there any difficulties that you aren't willing to talk to me about?" Just check them over carefully and you might...

"Oh well," and he gives you an automaticity. Naaahhh, you might say it's a pc in a chronic ARC break state, unresponsive on a meter. The pc is too remote. There is no impingement can be made on this pc.

Now, it doesn't matter how good you are, this is a rare piece; not – not too rare but this is a special class of pc. You can never get a rudiment in on him, anything. The clue and key to this pc is everything is suppressed. We'll go into that later. Pc's got everything suppressed and suppresses the auditor and suppresses this and suppresses that. The clue to this is you ask the pc – you can find out what this pc is doing and establish the suppressed pc rather easily – and you say, "When I say there, there, there to you, what do you do?" Because the pc is seldom answering you.

"Well, what do I do?" Pc doesn't react to steering, you see. You say, "What do I do?" Pc says, "What do I do? Well, well, I throw aside those that you are saying because they couldn't be it." And you know that's quite a few pcs. And the only thing you have to know about is the pc doesn't answer up to steering. That's all you have to know about it. That takes care of your whole Class II pc here of this type, see. That's the whole lot. They just don't answer up to steering.

You say, "Are you willing to talk to me about your difficulties?" and you get a tick, tiny tick. And you say, "Yes, there, there, what difficulty aren't you willing to be talking about?" you know. "There, there, there, there." Pc doesn't say anything. "There, there," pc doesn't say anything. You say, "There, there, there," you say, "What are you looking at?" The pc tells you something. Get the idea?

Now, the normal pc, when you say, "There, there." Pc, "Oh well, that, yeah, well, I don't know what that is, you know. I've got a picture of a bed, I don't know what that is. Oh, I know, I know, that was where I murdered the policeman. Yeah, I guess that's the sup..." That's that, see, they give it to you, see. Give it to you as a result of the steering.

This other type of pc never gives you anything as a result of steering. So watch the steering. Keep your weather eye open on this pc. Pc doesn't react to steering, the clue to the case is suppress and the only thing you've got to do with this case is run suppress till it runs out of the pc's ears and you can make the meter operate, goal or no goal. Got it?

All right. Now, your next class of pc is a pc who turns on a dirty needle, ever. I see you like that. Now, of course, you will get a slightly tick-tickey needle on a missed withhold, you will get on a Failed to reveal, on almost any pc you will get a tickety-tick once in a blue moon. But a pc who regularly gets a tickety-tick has not got his goal found. It's not been found, it isn't on the list, hasn't been elucidated and is nowhere to be located.

Well, that was a surprise. I told you you'd say ha-ha-ha, I didn't expect you to laugh. You probably don't believe me. Any pc around whose needle is going bzzt-bzzt, particularly on the other rudiments, now that's for sure – on the other rudiments, but any pc whose needle you have to work to clean up because it is a dirty needle, you have not got the pc's goal on the
list or the pc's goal is so buried and so suppressed and it's been found a long time ago or something, but the probability is it hasn't been found at all.

A good test, which you could never find out, by the way, the data is never available, is the pc who had had a goal found sometime previously; it read with an instant dirty needle. Any goal that reads with an instant dirty needle is not only not the goal, but it indicates that the goal has not been found. It doesn't exist on the list and has not been enunciated to the pc – by the pc to anybody, see?

Does this apply to your pc? Any pcs you are auditing at the present moment ever turn on a dirty needle? Well, that pc's goal is not on the list.

Life becomes fascinating doesn't it? What does it take to make a dirty needle turn on? Well, brother, it is something like the power or force of Krakatoa which, when it blew its head gave the world red sunsets from the Sunday-Monday line clear on around and back for three years, see. There's power, there's force underneath that, see. It is somewhat like trying to sit on a plain lid on a superheated boiler with the steam accumulating, see, and as that comes up and hits the underside of the thing you'll get this little phenomenon [imitating the sound of a boiling kettle which vibrates its lid] kno-kno-kno-known as a di-dirty needle, see. It's not that the pc is feeling upset or something like that, it is that the pc is definitely and desperately suppressed with magnitude and then they are holding charge on that that would blow a nova, see. That's charge.

Now, the more goofy the pc's needle is, now let's take an E-Meter Essentials, the more pattern a needle develops, the more charge is on the goals line. And a vaguely un... well, a pc whose goal is on the list or a pc whose goal is very accessible or a pc's goal is very easy to audit or something like this – never gets a tick or a tack. You'd have to put him into the most remarkable state, you'd have to run the most weirdly offbeat processes to finally turn on a bzzt, and then you'd only turn it on very briefly.

But this pc who gets a little missed withhold – they want to sneeze and they don't sneeze, you know. And the needle goes bzzt-bzzt-bzzt, a little tiny, dirty, rock slam, zzt-zzt-zzt-zzzzt-zzt-zzt. You say, "All right. What withhold have I missed on you?"

"Well I wanted to sneeze." And it disappears, see.

Why look, a sneeze doesn't turn on that much dirty needle oh-ho-ho-ho-ho-ho. Uh-uh, takes more than that, man. It takes something like enough force and power to blow the whole planet to pieces, see, sitting down underneath the bank for a person just to think that they don't want to sneeze and turn on a dirty needle because these are a series of reversing currents in the reactive bank. How jammed in does a fellow have to get?

Now, how about the fellow, now that boy – that boy, you could probably 3GA him, Routine and find his goal, see. You probably still could do that rather easily.

But how about this guy? You get a quarter-of-a-dial rock slam and you say, "What was that, what was that, what's that, what-what-what-what's happened?" You know, "What-what-what's the matter?" you know.
He says, "Well, I was – suppressing a sneeze." There is only one method of finding that character's goal, by Dynamic Assessment, unless somebody has a shot in the pants with luck, see.

Find my goal the other night, one of my – for that session one of the session goals was "to be lucky." And we were. First time I ever put it up as a session goal.

Now, look I'm probably wasting a lot of your time on going into the ramifications of this and that, but I'm just trying to tell you who this is – should be runnable on and who it's best on. But remember it can be run on anybody.

Now, exactly what do you do? Now, let's go into the one, two, three, four, bang, bang, bang, bang, bang, bang. Well, the first thing you do is you get the pc to write 850 goals and then you strip the list one way or the other. And then you save that carefully and you save any goals list the pc has. You got all that? He does that on his own, bang, that's just 3GA, see.

All right. Now, if you are a goals-finding auditor and you just get this pc – you get a pc by the scruff of the neck and you've got him – somebody else has prepared him, they've prepchecked him and everything like that. You set him down and you just go right in and you do this action, bang, bang, bang, see, you do this action. You make him build the wheel of life, see. Make him build the wheel of life. You give him a lot of samples. You give him a basic wheel that's got eight parts. That's just your eight dynamics, see. It's a lot of little pies can be put into this thing and the reason you use a wheel sort of a thing, not that it is easy to assess, as it is not, but it gives him the idea of entirety. It's good symbolism. And you give him some sample lists. You give him some samples, you know, like there's these, you know. There's sex divides into family, children, marriage, wives, so forth and other things you might think of, you see, other things you might think of, you see. And he can draw all these things out and he can find these things here. Get this?

Some old-time Scientologist, say, "Well, what are the dynamics according to you?" And he gives you thirty, bang, that's items on it. That's simple. The raw meat pc, mysticism rears its ugly head, see. The whole track opens and gapes, you see. You say, "Do an entirety of existence." He won't even be able to embrace an entirety of existence unless you give him some symbolism of some kind to help him. You say, "This is the whole of existence, this thing. And it's divided into eight segments here, as you can see and there is all this and that. Complete it and here's some samples on the back. We'll give you some of them," see. And you can draw one up. Give him a whole bunch of samples. You know, divide marriage up into homes and cooking and, you know, anything. And he just goes ahead and he fills this out. Well, I don't care whether he does that in session or not, see. It's a good thing when you first hear of him to go around and hand this to him with all of its directions on it. He's supposed to complete the wheel of life before he comes in and talks to you, see. You can sit there with your turban on, you see. [laughter, laughs] I don't care whether you call it this or not, I'm gagging to some degree, but it's just your old eight dynamics, see.

But there is – you want some additional segments. And it's a good thing to have a whole list of them of various, optional segments that might be part of it according to him, see. It's a good thing and – but coax him at the same time to believe that there might be a lot more missing. Sort of give him the idea that unless he solves this puzzle, all of his auditing may be
held up, which is absolutely true. You tell him to solve this puzzle and get all of it on there, see.

An old-time Scientologist has already solved the puzzle. He's thought over this and he's sat around and he's said, "Well, let's see, there was four in the first book and then there was four more and I think there are also this many and these really divide this way." And he's given you several subdivisions of the sub-divisions, see. And he's got his own ideas of what these things are and he's just laid his case in your lap. Savvy?

I made a mistake the other day. The reason you didn't see a good session is because I didn't take the pc's list. Don't often make an error. For Christ's sakes profit by it.

All right. Now, look-a-here. You got this thing now, see and you assess by rock slam and you just go around this thing calling everything off that is on it until you get a rock slam. And you go round and round and round on this thing, see. And it's just Assessment by Elimination, just that. The ones that are in, you go over them a second time, the same way you do a Prehav Scale and everything else.

But the auditing command for this assessment is entirely different than an old Dynamic Assessment. And it is not a common Dynamic Assessment. *It's overts against,* so you say, "Think of doing bad things to" or "Consider committing overts against (dynamic)," see. And you just keep that up, keep that up, keep that up, keep that up. You got it? And "Consider committing overts to sex. Consider committing overts to children. Consider committing overts to marriage. Consider committing overts to home and family," whatever he's put down there, you see, as these sub-divisions, you know. And you go round and round and round on this thing and you mark each one to its reaction – that reacts. But you are looking there, not for a necessarily instant reaction, but one in the vicinity of it.

And I'll tell you something. The more – if his item is on there, you'll get instant rock slams and if his item isn't, you won't. Got it? Isn't that a nice indicator? I do you a favor every once in a while, see. You are not going to get an instant rock slam if his item is off there. The read is late and scrubby and all this sort of thing. The item is off that list. So if you see that this isn't instant rock slam, don't break your heart. Go around on this thing and if the first couple of times around you haven't got something rock slamming; takes maybe about three times around to do the whole thing till you know for sure, my God is this thing "spirit," you know. You hit spirit, it's bzzzzt, boom, boom, knack, knack, boom, boom, spurp, spurp, spurp, blurp, you know. Like one of these electronic plays you hear, the ions going around inside the tube, you know. Crash-crash-crash-crash, it is unmistakable. It is something like the difference between driving on a rough country road and hitting a tree, you know. You can tell the difference.

If you don't get that kind of a reaction after about the third time around and haven't already made up your mind, you better get him to do the wheel of life again and just pat him on the back and say, "Well, son, you haven't solved this and I think you'd better just take this up and you'd better consider this more," and so forth. You can let him consider it in the session, but why waste your time. You could say, "Now, let's get down to business here. There are eight basic dynamics, you realize that, according to Hubbard there are eight basic dynamics. What you've got to do is correct him on this because there are obviously more. What are they?
Now, you've obviously left one out here." Give him another list of things to study like Webster's International Dictionary, anything you want to.

Now, there will probably be lots of tricks of the trade as to how to get this wheel of life out of the pc, but everything else depends on making sure that's complete. Okay? Everything depends, because what you are going to get if you follow through an incomplete list of the dynamics is they will all come down to little *dzzzs-dzzzs-dzzzs-dzzzs*, and then they all go out and then maybe a dirty needle stays on everything. And then you say, "Well, this dirty needle is more than the rest so we will list it." And the whole thing lists to a little dirty needle and you get down to the end, you've got a little dirty needle and there's a little dirty needle and he gets a rock slam, there's a little dirty needle and you ask him a question, he gets a little dirty needle and ... You know.

It's definitely laundry work to hand, see, and all of that is caused because the dynamic that you want is not on this wheel. That whole phenomena is caused by just that. There is a piece of life that he thinks is an integral section of life that he hasn't put down.

Now, the odd part of it is he may not think of it without some suggestions, so some lists will sometimes be necessary. Maybe if you could divide marriage up into thirty parts. "Which one of these are actually parts of marriage?" you see. You know, I mean, second dynamic into thirty parts, "Which one of these are actually parts of the second dynamic?" you know. Let him choose one or two, because he's going to be too random for us to make a patient basic list. He's going to be too random.

You'd be surprised but toothpicks will be a necessary dynamic on some pc. Toothpicks, that's the seventh dynamic, yes. Maybe so, but if it is, man, will that assess out. You get the rock slam on it. It's an integral part of life. Life consists of God and self and sex and he's not sure about mankind or species or living things of the physical universe or that sort of thing, but *toothpicks*, see, there – that's what life consists of. And he'll give you this item.

Now, what do you do with this item? Now, look, don't monkey with it if you haven't got that item. That item will sit there and rock slam. You are not going to wear the rock slam out of it as long as the pc stays in-session and he isn't all ARC breaky and so forth. He can even ARC break and you still get the rock slam. It's a nice, hefty rock slam. Everything else eventually disappears and the *whole* reaction goes into this thing. It's usually a couple of divisions, three divisions, somebody with a decent needle, you see. It's a nice, nice, heavy scratch-scratch-scratch-scratch-scratch-ach-ach-ach-ach. You read him the next one to it, nothing. It's also instant. Bang-bang-bang-bang-bang, bang-bang-bang-bang-bang, you see. "Physical universe." Bang-bang-bang-bang-bang. "Physical universe." Bang-bang-bang-bang-bang. "Spirits, God, self, sex," *bsst*. That's one time around, "Sex," *bsst*. And then, "Physical universe." Bang-bang-bang-bang-bang-bang-bang. You got the idea? Unmistakable. It's not one of these equivocal things. No matter how lousy the needle is, this will do.

Now, something else I should tell you is it doesn't matter how lousy the pc's needle is to do this. It just doesn't matter. You should get him into session somehow or another, but it really doesn't matter how lousy his needle is because you are going to address this subject, he's going to have a lousy needle. Doesn't matter how clean and whistle clean his needle was
before you brought up this nasty subject of the wheel of life, his needle is now going to be dirty and you start assessing it, it's going to be a mess. You got it?

All right. You take that one you found and this is what you do with it. You say, "What represents the dynamic you found (it's the one that rock slammed) to you?" And you just make a list of this and you go on down and you make a list of this and this is the way it ought to look. And if it doesn't look – it can look three ways. Everything is dirty needle. That's wrong. These items as you list them each one goes bzzt. He says these, you know, bzzt, bzzt, bzzt. It's undiminishing. It never diminishes, never gets smaller, never gets less. Little tiny dirty needle – well, you did a lousy Dynamic Assessment in the first place for that to have happened. The dynamic wasn't on the list. You went and guessed at it out of desperation or you did something corny, see. Something wrong was done at that point.

Now, the next action is, is it goes, (and this is also a wrong one) it goes crash, crash, crash, crash, for the first five items and then you don't have anything. Big rock slam for a few items and then you don't have anything. Well, that's also wrong, so you haul off of that one.

No, the exact proper phenomenon is big rock slam, slightly less, slightly less, slightly less, slightly less, slightly less, slightly less, diminishing each item he gives you. He may give you a couple of null items, but the next hot item that is on the list you've got bzzt, bang, brrr, bang, brrr, bang, brr, bang, br, bang, tick, tick, nothing. Got the idea? It's almost like going down a river which has got less and less water in it and you finally go aground when you are at the end. See the idea.

In other words, you steer into this thing called the wheel of life – the dynamics – you steer into this thing and you find a channel and you go down through this channel and it's wide, rock slam all the way down this channel, see. And you get to the end of that list of "What represents " and you shouldn't have anything left. There should be no reaction to the question "What represents (dynamic)?" There should be no reaction to (dynamic). There should be no reaction to anything, don't you see? You run that totally ... "Do you have any more items? Is the list complete?" All this kind of thing, you see. That's gone, that's dead now.

The list is relatively short. It certainly seldom will exceed, I think you'll find in actual practice, a couple of hundred items. That would be a rather hefty list, see.

All right and that's gone, but it sort of dwindled away, don't you see. It is sort of like going down a cone. It just dwindled away and got to be nothing, see, the charge was less and less. In other words the phenomenon of bleeding charge off of this thing is definitely present.

When you see this you'll say, "Well, how did Ron know that?" you know. Well, I'll ask the same question.

Anyhow, our next action now is a little unexpected. And this is all new stuff now. You take the item, you assess the thing by elimination and you'll get this nice, big, rock slam back, but it won't be quite so big. And one of them will rock slam. This is not any – you do it by elimination, you don't do it by Tiger Drill or anything like that. One of them rock slams and that thing is it. There shouldn't be any question in your coco but what that is it.
Meantime, you've found the dynamic. For God's sake write it on an auditor's report in capital letters so it can be seen, so it doesn't get lost anywhere, because no auditor coming in your wake is ever going to find it again because you found it by bleeding the charge and the charge is now gone. Okay?

Now, you do the next action, see. First the dynamic, then you've listed the dynamic. Then you assess by elimination on that list and you find this item which is now rock slamming and now you take that item and you say, "What represents that item to you?" And you do another list and that will do the same thing. That will come down and it will be rather slight. This list is much less, probably less lengthy, less charged and it should dwindle away, too and leave one item in it rock slamming. And maybe it's the same item you found, but maybe it's slightly different. In other words, you are asking him to rephrase this item and then you are finding the rephrasing by assessment. You got that? You got that?

Now, all you've got to do is take a Prehav assessment, the old Auxiliary Pre-have Scale, do it by elimination. But, by the way, all these assessments are, you know, "What represents this to you?" That's not dynamic against, don't you see. You follow this? It's not considered "Committing overts against these items," it's just "What represents to you," don't you see. It's as simple as that. You can assess that way.

But you can also assess by, "Consider overts against these things," and you could go down the line that same way, don't you see. This would again pep it up and that sort of thing, but in actual fact, the thing will just rock slam if you just assess it. You got that?

Of course you can, you know, "Think of committing bad things against these" – of this item list. You could do that, see and "What represents that?" In other words there's a couple of ways you could go about this thing, neither one of them wrong.

Now, you can take the old Prehav list and take your final item and that was catfish, see. "Ha-ha. It was fish, see. It was dynamic's fifth dynamic. What assessed out was fish on the first list and you've got fish again. All right. What represents fish to you?" And the fellow gives you this and that and the other thing and the other thing. And you find out it was catfish, ha-ha-ha-ha, wasn't fish, it was catfish, ha-ha-ha-ha. Now, you can actually do a Prehav assessment on the subject of catfish. "Should you (dynamic line) catfish? Should you withdraw from catfish? Should you leave catfish? What should you do to catfish?" You got this? And one of those is going to rock slam and you've got the guy's goal in a bucket.

There'll be a fee for all this heavy work. I mean I'm not going to work for nothing on this. That's a real fancy Dynamic Assessment. Actually you don't have to be quite that fancy to come up with the answer, but that's getting real fancy, see. You not only found the dynamic, but you found the item that represented the dynamic and then you found the item that represented the item that represented the dynamic. That brought you in awful close didn't it? You practically got the exact thing that the goal is worded with and then you did the Prehav assessment to find the verb. Ha-ha-ha, ho-ho-ho-ho-ho.

You may get such a thing as, "to withdraw from catfish," but you know damn well that it is not exactly this type of goal. See, it's not exactly "to withdraw from catfish." So now you've got to have a list of things, goals he might have that would express this action, "to withdraw from catfish."
Now, there's only one hole in this. If it's an inadvertent goal it may be entirely different. But an inadvertent list, remember, was a non-rock slamming, not upsetting... You do the same thing and you'll get the same phenomena and everything else will turn on. It will all go up according to Hoyle, but if it's a non-overt – no, I mean it's an inadvertent overt, see, not intentional. It's just the fact he wants to make steel and you know, he wants to make steel. That's the goal, you see. And oddly enough they make fish hooks out of steel and he's committing an overt continuously against catfish with fishhooks, see. He didn't have catfish – he didn't have catfish in mind. That's the inadvertent goal - the inadvertent overt goal. He didn't have catfish in mind, but it's collided with this thing just in the natural course of the events.

This other goal is to take catfish and do something very overt to them. See the overt – the direct overt goal will probably contain the word catfish and the inadvertent goal won't. So if the list wasn't much charged why it's probably inadvertent.

Now, here is the way you get around that. You give the pc – after you've done all this, and you also then do this list of goals and that runs charge out until there is no charge on it. But the fact there is no charge on it is no guarantee that the goal is on that list. That is not a guarantee. You got that?

It is no guarantee at all. You could actually ask him to do a couple of hundred more goals, just off the bat. He could go ahead and do that.

Here is why you wrote your 850 list. You say, "Now, go back to the beginning of your goals list," and give him a purple pencil with red polka dots, see. And you say, "You mark in every goal there that would be an overt – would express anything like withdrawing from catfish, see. You just mark any goal that would even vaguely mean this or any goal that would be an overt against catfish. Any goal – any goal, see, you just mark in anything." And he starts in at the beginning and he marks in every one of these goals which would be.

Now, when you take his goals list to assess it you take the 850 list, the items he's marked in and run it from the beginning, forward. See how you do that? He did the 850 list before you fooled around with the Dynamic Assessment. But now he knows where the goal is targeted. There is no slightest doubt in his mind about where the goal is targeted. And you know whether the goal is the right goal or not. Of course you know whether it is the right goal at that, but you can get a goal there that – you spend time on these goals now.

Now, the only other thing that can go wrong with this type of assessment is the fact that there is a hole in the original Tigers Drill that I released it to you. That is, that's – things can be suppressed below the level of meter read. You got that?

So you prepcheck Suppress. One of the best ways to handle this, the offhand pitch is you prepcheck Suppress with the meter laid aside, see, when I say Repetitive Prepcheck, see, with the meter laid aside. Don't look at the meter. Look at the goals list and say, "On the goal to catch catfish, has anything been suppressed?" And you are looking straight at the pc and he says, "Brrjrrnm." You say, "Well, answer it, has it or hasn't it been? Try to think, any suppression on this goal?"

And he says, "So-and-so and so-and-so."
Then ask him, "Do you have any additional answers?" "Well," he says, "so-and-so and so-and-so and so-and-so."

And you say, "All right, now. I'll check it on the meter. See. On the goal to catch catfish, has anything been suppressed?" And only then can you promote a tick.

A goal can be so suppressed that the Suppress won't read and if the Suppress won't read nothing else will read and you've got to promote the read. And when you are checking an old goal and trying to get it alive again, don't worry about the meter until you've got the pc flat on the Suppress on the subject of goals, on the subject of clearing, on the subject of – you know, your Prepcheck. But don't do these things down the line the way it is in the policy letter, see, and forget to ever go back and check any of these things. When you finish one of these sections on that Prepcheck, ha-ha-ha-ha-ha, you better check all of those over and see if there is anything else on.

In other words, you've got to clear each one of those sections, not just run over it differently, one item at a time. Let's find out if there is anything else on this thing. Do a fast check on them after that. You find out this thing has hotted up and the suppress may have hotted up on you again because suppress is the only tricky button.

Don't worry about the rest of them being tricky. You'll find the reads on those, but you won't find the read on Suppress. If you don't find the read on Suppress you can't get the read on the rest of them. You got that? And that's the only hole in goals finding and that's how your goals disappear and that's how goals can't be found and that sort of thing. You got it?

Now, on the beginning of any goals list by Dynamic Assessment and so forth, you make awfully sure that you have the pc's goals that have been found before. Put those to the beginning of the list. I don't care who prepchecked them. I don't care what he did with them. I don't care anything else.

My own goal was found last June and has sat suppressed ever since. And five wrong goals were found on top of it, one right after the other. And only by accident after Dynamic Assessment did that goal blow into view again and of course it was the perfect overt. It was an inadvertent overt. That was why it was lying there sleepily. You follow this?

Now, I don't care whether you do the Prehav assessment or not. I don't care whether you do that or not. It is just another string to your bow. Got it? Just another string to the bow. That will give you the item, the goal is an overt against. But an inadvertent overt goal won't have the item mentioned in it. And it might be far wide of the point, too wide for the pc to guess. So that is why you go back over the first 850 goals and have him mark in those that it would be an overt against whatever the final item was.

He may start marking in too many, but don't upset him too much about it. The probability is, is the goal is in the first few pages. Maybe he's only marked in twenty on the first – in the first 300 goals, you see. That's a lot different than doing 300 goals isn't it? See, you are saving time all the way and you know what the goal is – looks like. See, you know about what it is.

The pc may badger himself around all over the place trying to find out what this goal is, but you can locate the goal.
Now, there are probably other tricks by which you can define and make the goal de-
finite and so forth. Those tricks can be developed from time to time. Ideas can come up
about this. We know exactly what the anatomy and structure of goal charge is and exactly
what it leads down to. Now, you can probably do a tremendous number of things with that,
but that is Dynamic Assessment as it exists right now here on the 21st of August, AD 12.
Okay?

Thank you.
All right. This is lecture number two, 21 August AD 12, the Basics of Auditing. The Basics of Auditing.

Auditors keep asking me for rules, and they ask for more rules, and they ask for more rules, and they ask for more rules, and they ask for more rules. And then they goof in session, and they ask me for more rules. And then they goof in sessions and don't apply those rules and ask for more rules.

I think it's about time I gave you a lecture on the subject of the basics of auditing. This is very fundamental material I'm about to give you. It is probably more fundamental than HPA. But, it's a very strange thing that fundamentals usually come at high ranges of training. In other words, the fundamental auditing can be understood only after one has audited perhaps by rule for quite a while, and he runs into what the fundamentals are.

Now, that I'm giving you this lecture makes a fundamental change in training. Training from Class Y on up remains completely the same, you see, but training of the W and X units are shifted by this. That is your very low basic training, and HPA/HCA training is shifted by this.

Let me tell you what an auditor should be able to do and thereby you will understand it far, far, far, far, far better. An auditor should be able to get another being to be interested in his own case and to talk to him. That is the way that is. That's what he should be able to do.

Now rules and tricks and all kinds of things of that particular type – rudiments, auditing positions, various types of upset preventers – all of those things are contributive to getting this fact to occur. But remember they're only contributive to getting this fact to occur. Your E-Meter is only contributive so far as it applies to rudiments in body of session. Your E-Meter is only contributive to this fact as far as it applies to rudiments. Of course, the E-Meter has an entirely different function, which is assessment. But where you're using the E-Meter to get somebody into session and to audit him, you continuously go astray and become completely unstuck, because you try to do with the meter what you can't do naturally, if you ever have trouble with sessions. You're trying to make the rules and the meter do something that you can't do. Now there would be some reason why you couldn't do this.

That is to say you didn't want pcs to talk to you or you were trying to make them sane because they were so crazy, or someone's basic purposes get in his road on this. But some auditors, all they got to do is sit down in the auditing chair and the pc ARC breaks. Well, do
you realize that this is getting worse? It is more apparent in sessions these days than it ever
was before. It is more apparent.

Why? Why are ARC breaks very often these days so much more catastrophic and ex-
plosive than they were perhaps five or six years ago? It's only been in the last two or three
years that you could really make an explosive ARC break, and that's the period we've been
using meters.

Well, that's because the auditor can do this interesting fact: The difficulties that an
auditor encounters are his own difficulties. And the mechanics he is using force the pc into
session with an auditor who doesn't want the pc in-session or who doesn't understand the pc
should be in-session or why the pc should be in-session. You follow me? And these rules
have made auditing so powerful – the rudiments themselves have made auditing so power-
ful – that where the auditor is actually incapable of getting somebody interested in his own
case and to talk to him, and yet is using all these rules to put a person in a state of mind – see,
to be interested in his own case to talk to him – but the auditor doesn't want the pc to be inter-
ested in his own case and talk to him. He thinks auditing is for something else. See?

The rules drive the pc into session and the auditor drives him out, and it kind of drives
the pc around the bend. You see how this could work? Do you see how this could work?

This is very, very vital. This is very, very vital. How could this work?

You have the auditor sitting there looking like an auditor. The rules trick the pc into
being into session. The pc suddenly finds out he's made a mistake. The auditor does not want
to hear what the pc is saying. The auditor doesn't understand the basics of auditing. The audi-
tor's just auditing by some kind of a set of rules. In fact there is no auditor, but the technology
is sufficiently powerful to create a pc.

The technology with the auditor busy auditing – understand this – the auditor busy au-
diting, you see, with all these rules but not auditing then leaves a pc without an auditor. Do
you see how this is? And this can be the most maddening thing, and a pc really doesn't know
what's wrong. He's actually – a lot of tricks have been used on the pc to get him into session.
And now he's in-session and interested in talking to somebody about his own case, see, and
interested in general; and there's no auditor.

Now, look-a-here. We've been blaming meter reading, missing meter reads, cleaning
cleans and that sort of thing. This is just another technical rule. Now a man who is auditing or
a girl who is auditing by the basics of auditing – understood the basics of auditing and could
audit by them – could actually miss reads and clean cleans on rudiments and session material
and still have the pc perfectly happy and in-session.

_Audience: Yes, yes._

Do you see that? But, a person who is cleaning cleans and missing reads must also be
committing this other error of not auditing by basic auditing but auditing by rules which force
the pc into session. Now the pc is only facing rules and a meter. The rules may be right, but
the meter is wrong. There's nothing else holding the pc in session. And as a result, you get a very, very upset condition on the part of the pc.

Therefore, it's very necessary to know what basic auditing is. And I'm going to tell you the gruesome fate of the Ws and the Xs at the Saint Hill Course, including those who are present at this moment in those two courses.

The others who have graduated above those courses are fortunate unless they have been peculiarly unlucky — it's always "unlucky," see, it's never any reason for it — in not being able to handle pcs. And then they will be graded back into this W, X type training.

The first moment somebody appears here — we've got some more auditing space coming up shortly so we can do this — they're going to start auditing. See? If they appear here, they're going to start auditing. I'm going to take the meter away from them. They're not going to have any meter. And they're under orders to put all of their rudiments in and move on up the line — not with Havingness, see — move on up the line with some salient Prepcheck questions. And they can get out of that unit when they can have all of those rudiments in, checked by a meter, after the session.

We're going to make some auditors. We're going to make some auditors. It's a horrible thing to do to some people, perhaps. Think of it. You're sitting there and you got no meter, and you say, "Willing to talk to me about your difficulties?" And there's the pc, and the pc is in a particularly 1.1 frame of mind that day. [laughter]

Says, "Yes. Talk to you about anything," you know, the frank-eyed stare of the criminal just after they robbed the First National, you know? "No, I wasn't even there. Um — I wasn't even near the place." Greenbacks in their pockets, you know? And be able to go through all of those rudiments, do some Prepcheck questions, get those all clean, miss no withholds of any kind, catch all the missed withholds, bring them out the other end with the end rudiments and no missed withholds, and an Instructor can check that all on a meter and find every single one of them in. See?

Well, they can do this, because they're going to learn the basics of auditing beginning with this tape.

Basics of auditing in rapid fire are very easy to state — very, very easy to state. Why does auditing exist at all? In the last two issues of Certainty magazine, published in, I think, July and August in London, you find a critique of psychoanalysis. It's an "old" article — 1956 — but is possessed of several terrible and unavoidable truths of what psychoanalysis did wrong. It's pats on the back in there for old Papa Freud. I'm not kicking Freud's head in particularly. But we had to know what psychoanalysis was doing wrong. What did psychoanalysis do wrong?

Frankly, no auditing ever existed in psychoanalysis. Nobody in psychoanalysis was ever permitted to be in-session — never permitted to be — but went into session accidentally. And it's no accident... now this is a figure that you — it's something like "All jewelers — jewelers never go anywhere." You know, it's one of those horrible, broad generalities.

Thirty-three percent of people going to psychoanalysts, according to the records in the United States based on the 40s (and these records, you see, are not very public), in the first
three months (this sounds incredible) wind up in spinbins or commit suicide. That isn't given in that pair of articles. But that's the truth. But the data of why this is occurs in those articles, and any interested auditor's attention is directed to that, because it was a rather careful breakdown based on old technology as far as we're concerned – not particularly up-to-date in Scientology. But nevertheless, that told you why psychoanalysis didn't work: no, the guy could accidentally go into session and he never had an auditor. There he was down the track, and all of a sudden, "And my mother did this to me." Motivator, motivator, motivator, you know? "My mother did this to me and my mother did that to me and my mother did something else to me and awham-ijjuh-er-ooo-rowrr. And I-I was so abused when I was a little child, and oh, yes, everybody interfered with me sexually. Yes, everything was terrible," and so forth.

And he's way down the track someplace, and the analyst says, "Well, it's five o'clock now. That's the end of your period. Thank you very much. I hope you do well now, Mrs. Jones. And goodbye."

Just look at that, man. This could happen to a dog, you know? Nobody ever brought them up to present time and squared them around or anything like that. Hypnotists even have rules on the subject. For God's sakes, wake your patient up and slap him in the face and pour cold water on him. Don't let him walk out of the door and out onto a busy public street, because they very often do and get themselves killed or run over or injured, because they're still hypnotized when they leave the session, you see? Well, that's a hypnotist, see? Even a hypnotist knew. Psychoanalysts didn't know. I'm not jumping on Papa Freud. Papa Freud perhaps had all kinds of rules about auditing that we'll never hear of, see? Because he's not a well-recorded man, if you recognize that. He has fantastic numbers of interpreters. And he himself didn't write enough or put out enough dope, and he was not really scientifically oriented. He was more mystically oriented.

All right. Well, that just gives you an example. See, they made a lot of mistakes. Well now, do you realize that we could walk forward into a lot of mistakes unless we examine the basics of auditing. What, why is auditing – and these basics are very few. There's the mechanics of blowing something; why auditing works. Ask yourself that question, that burning question: Why does auditing work? See? There's such things as asking an auditing question, getting it answered. Now, there's just that fundamental, you see? There's make the pc feel better. An interesting thing that gets overlooked – just that. That's quite incidental to auditing, but is a – is an underlying factor in auditing. I won't say that I have never given a session that made anybody feel worse. But in recent years, I give somebody a session trying to get something done, see?

That's fine. I'm very happy that they feel better, but the point is that, God Almighty, they could fall through the bottom of the chair and break their arm, and it wouldn't stop me from getting done what I'm trying to do.

Let us say we're – let's say we're trying to check out some Prepcheck questions and make this per – self – that this person is going to stay in session, don't you see, while we do a Goals Assessment. See, that's what we're trying to do, see? Well, I just get in there and pitch and hammer and pound and do everything else, and they go to the end of the session and they feel better – wasn't even intentional. I don't care whether they felt better or not.
It isn't that I don't care whether people feel better or not. I do. But in that particular session, see, they could have – as far as I was concerned – could have wound up at the end of the session feeling like hell and they would have been better off, because we were now up along the line to do our next step and get closer to clearing this guy. You see, it's quite incidental. But nevertheless, the pc felt better.

You do a Security Check on a pc; the pc feels better at the end. See, this is an underlying thread. This is the golden thread that goes through all good auditing, is the pc always feels better. You've really missed the boat if the pc feels worse.

Let's say we're doing a Goals Assessment. It's one of those horrible sessions where we have not found the pc's goal and it lies somewhere behind us and we haven't found it out yet. And the pc is just blowing his stack and is upset, and we can expect everything going to hell in a balloon. A good auditor should be able to bring that session off with the pc feeling better at the end: goal missed, everything missed, everything gone to hell, you see, as far as the pc is concerned. The pc feels better at the end.

Now man, that's asking something, because the most fruitful source of a screaming ARC break is a missed goal. That's a missed withhold with magnitude! Do you realize that's why human beings are so inhuman to humans, just because every one of them has missed the basic purpose of every other one of them. This is what makes your Torquemadas.

Possibly the basic goal of Torquemada was to make people happy. But nobody ever found that out. So he knew how to make them happy. Most of them could be happy if you tortured a few. Ha-ha-ha! You see how wildly astray the man could have gone? Why? It's a missed withhold. Nobody believes this Torquemada. Nobody believes this fact. He actually hadn't hidden it – just nobody ever finds it out. He could even have told somebody someplace on the track that he was trying to make people happy. Nobody ever believed him. He never got off the withhold, in other words. And eventually it got to be more and more a withhold and more and more a withhold and more and more a withhold. And we find a book that dear old Torquemada bound with his own little paws, which is in the Carmel library, by the way, off at Pacific Groves, California. It's bound in human skin. This was the great boy who made Spain safe for Christianity or something. Actually, there is a copy of that book bound in human skin. Interesting. That was our boy, see? Maybe his basic goal was to make people happy, you see? And he turns into a complete beast because everybody has missed this withhold.

So, you say – originally, the pc is sitting across from you, you got a missed withhold on him to begin with. You haven't got his goal or any of his goals, plus you haven't got any of his overts, plus you haven't straightened out anything that people have missed on him in this lifetime. Hu-hu! What's that make? Ha-ha-ha-ha-ha-ha. It makes a cabinet minister or something, you know? This makes a boy. Ha-ha. There he sits. We all know how it feels to be like that, because before we got into Scientology we felt like that. We knew what life was all about. Rowrr.

Now, the earliest part of auditing is the roughest part of auditing, therefore. And an auditor who can handle new cases has to be far better than an auditor who is handling a case who has gone along the way for a while.
Now, this is fashionable in Scientology to believe that Scientologists are harder cases than raw meat. And that's only because you mainly get Scientologists to audit, see? You really don't collide with raw meat. Ha-a-a-a! Let's go out to one of the Johannesburg mines and just tap a black boy on the shoulder, just at random. Let's not get somebody who has reached for Scientology. He – that already tells him that he's accessible for auditing. He's reached!

All right, we just tap this boy on the shoulder and we sit him down. And we say, "We is gonna audit you. Ha-ha-ha-ha."

And he says, "Wus dat?"

Well, that would be an interesting test of an auditor, wouldn't it? Yet an auditor ought to be able to do that. I've put cops, newspaper reporters, all sorts of weird characters into session while being interviewed. And occasionally have them come around and ask for auditing – occasionally audit them; get their rudiments in. You know, that kind of thing. And let me tell you, when I haven't done it, I've usually been sorry.

But I very often think that the guy is too rough or something like that, or he's too this and that, you see? He's too far gone. He's unauditabl e, and it's very hard to get him into this type of session, and I let him go.

So you see that type of fellow who is dead set against it, and so forth, he could be very rough. He could be very rough to handle. But you would be surprised at who will go into session and who can be audited.

The Detroit police, one time, came down with a crash on a center in Detroit, and they did the incredible thing, which has never been repeated anyplace, of seizing a whole bunch of tapes. And they had fourteen cops, I think, listening to these tapes in relays down at the police station. And twelve of them resigned from the force. [laughter] That's a record, isn't it? That's truthful, it's factual; I've had the reports from it now. And that shows you that there are – people are auditable if you approach them right. [laughter]

An auditor has got to handle the pc's problems. An auditor should be able to get a clean needle so a pc can be assessed and made to feel better. I don't care how he does it. Whether he even does it by Dynamic Assessment, he should be able to do it, you see? An auditor should be able to get things done in an auditing session and not audit for the purpose of auditing.

Don't audit to audit. Get things done in an auditing session. That's an interesting fundamental that is, interestingly enough, missed. People all will sit down sometime, and they will audit. And they audit, and they audit, and they audit, and they audit, and they audit, and they audit, and they audit, and they audit, and they audit, and they audit, and they audit, and they never get anything done! Get the idea?

We had somebody – a team going here. I mean, won't mention any names. I had a team going here for a week. I was saying via the auditing section – I was saying get this one little thing done on this audit – on this pc, because this pc is having a rough time. This pc has continued to have a rough time, and a check back shows that in one whole week of three-hour sessions this auditor was unable to get done this one little thing. There wasn't anything else to do for the case. It's just clear up a couple of questions, see, something like that. Had to get it
done or the auditor couldn't have gone on, and yet for somehow or another went jockeying
back and forth and just auditing on and on and on and on and on and on. For God's sakes!
Fifteen hours! And never got this one little thing done. You see, so busy putting in rudiments
and making out the reports and handling the E-Meter and starting sessions and ending ses-
sions and giving breaks and doing this and doing that, doing this, doing that. [scrambling
around with the stuff on his desk, audience laughing] And they substitute looking like they're
doing something for getting something done, see? They look awful busy, but you check up at
the end of a period of time and you say, "Well, all right. That's fine, son, but what have you
got done?"

And the individual says, "Well, we – we've got the pc's goals list in his folder."

"Yeah. Well, did you do any part of that…"

"Well, we didn't do anything. That was – that was completed before we – we started in
there."

"Well, all right. Fine. Now have you – have you set the pc up? The pc got a clean nee-
dle here in order to be…"

"No. Well, the pc's needle is pretty dirty. We – we – it gets dirtier almost every day, I
think." [laughter]

And you say, "Well, have you prepchecked out the subject of clearing or you got
something accomplished that way…?"

"Well, no. We were going to start on that here next week."

And you look at this long span of auditing time and nothing happened in it, see? Noth-
ing got done. They did other things in order to get something done. You get the idea? Other
things. They did a lot of other things, but they never got anything done. Seems like whenever
they'd start to do anything, they would hit some sort of a via that led them into some other
type of action, which led them into some other type of action; but somehow or another they
never did get around in the session to asking the girl if she had a missed withhold on her hus-
band in order to cure up these PT problems which have been coming up for the last twenty
sessions. See? Never did get around to that, see?

Now, auditing actually consists of little accomplishments. It's a series of small accom-
plishments. It's getting something done. It is not going through motions.

Now, you should be able to get somebody into session without a meter or anything.
You should be able to get somebody into session. You don't need a bunch of – you don't even
need rules or anything. You get somebody in session. How do you do that? A lot of people
have this as a sort of a gift they call it. They make terrific auditors. They've already crossed
this little bridge, so they can get somebody interested in their own case and willing to talk to
them. That's all it takes, see? And that's without any artificial aids of any kind whatsoever.
And they can get somebody in session.

Now, an auditor should be able to allow a pc to blow something. That means an audi-
tor must permit the pc to talk to him. And you'd be surprised how rare this is. You would
really be surprised how rare this is: that the auditor will let the pc talk to him. A large trouble in auditing is differentiating between a Q and A and TR 4 – and this is another thing.

An auditor must be able to differentiate between Q and A and TR 4. And an auditor must be able to handle the session and do things the pc wants done without Qing and Aing. And auditors who have trouble with this are just having trouble. It's almost willful. I mean, you have to practically sit up all night to have trouble with this. You have to work at this trouble.

I'll tell you the basic differences between Q and A and doing something. Q and A is a very simple thing; it's just not accepting the pc's answer. That's all a Q and A is. You question the answer of the pc. I mean, how simple can it get? Isn't anything more simple than that. Don't question his answers. And everybody comes around and they want to know rules: how you're not supposed to question their answers. Oh, no! Please. I can't substitute for somebody's lack of understanding of anything. Oh, I can do a lot, man, but that's pretty – that's asking it, you know?

In other words, let the pc talk to you and you'll never have any difficulties with Q and A. See, people who Q-and-A do not want the pc to talk to them. That's all. So they use a Q and A to keep the pc from talking to them.

You can just see them sitting there with an oar in the auditing session, and they use a remark – an evaluation, you see, or a comment or a request for more information or – perfectly, occasionally to ask the pc for more informa... you don't think he answered the auditing question, you better ask him for more information. But usually this doesn't apply to this, see? Or, the pc is asked another question without any acknowledgment of what he just asked [answered], you see, or he's asked a question which is wildly off what the auditor was trying to do in the first place, you see? It's all a defensive mechanism. Or the auditor does something every time the pc says something. You know that will break down a pc quicker than anything else? TR 4 be damned!

Once in a while a pc gets so hot, so smoking, ruddy hot in the room, he can't stand it. He can't stay in session and he says to the auditor, he says, "Please open a window."

And the auditor says, "Well, I mustn't Q-and-A. Ho-ho-ho-ho-ha-ha-ha-ha-ha. Let him sit there and roast. Ho-ho." That makes Ron good and wrong, isn't it – doesn't it?

*Hell's bells! Go open the window! Say, "You feel better now?"

Pc said, "Yup," and you go on in session.

An auditor who never does anything that the pc wants him to do will drive a pc mad. I guarantee it, man. And a pc – an auditor who always does something when the pc says something will also drive a pc crazy.

Pc says, "Well, why were you going over that goal there? I had a little bit of withhold there. I mean, I th – I thought to mys – ha-ha-ha – thought to myself that's silly – ha-ha-ho-ho-tha's silly; that goal is silly. That's what I thought."

Well, there's a variety of courses open to the very bad auditor.
He can say, "How was the goal silly?" See? Completely psychotic comment, see? He can say to the pc, "All right. Uh, ah, thank you." (That's good TR 4, isn't it? Ha-ha. That got the TR 4 in there. I – you understood the pc thought the goal was silly.) And he says immediately, jumping out of the middle of his Tiger Drill, "Has that goal been invalidated? No – no there's no read on there. Hummm. Wonder why not?"

Well, why not? The pc got it off just now. See? This auditor is in a fog, man, if he does a thing like that.

The pc said, "Well, I-I think that last goal, ho-ho, the last goal up the line there – I thought the last goal up the line there, the one that you just went across, I-I-I actually thought that would stay in." You know, the pc has dared open his yap, see? He's dared be in-session.

And the auditor said, ("I'll fix this. Ha-ha-ha-ha-ha. I'll fix this. Ha-ha-ha.") "I'll check that for you again."

What's this? That's using session doingness to prevent communicatingness.

Now, there's two things that pcs do: They ask the auditor to do things which, if the auditor doesn't do them, the session is just going to go round the bend, let me tell you; and they originate. And auditors who are having hard times with pcs never differentiate between these two facts. They never find out when the pc wants them to do something or when the pc is originating. They can't tell from the tone of voice or something of the sort. You could do all sorts of weird things, like make bargains with the pc, and so forth. You don't need to do that.

The pc says, "Heh-heh-heh, he-heh. That-that-that-goal that-that…" He's pointing at you, your goals list upside down, you know, with his can sort of, you know, "Ya-ah-h-h-heh, to ca-catch catfish-to-to-catch catfish. I-I can't believe that that's out. How – how – how can it be out? I-I-I think you've missed a suppress or something!"

And the auditor says, knowing he mustn't Q-and-A, you know, audit by the rules, says, "All right. Thank you. To be a tiger. Has that goal been suppressed?"

He finds this pc hanging by a rope from his neck in the barn, don't you see? He can't keep the pc in-session; he keeps wondering why. He's auditing by all the rules, isn't he? Never Q-and-A, never do anything the pc says, never this, never that, see? Never, never, never, never, never. Well, actually, basically, he's not doing any basic auditing. So he just doesn't know his business. He doesn't know his basic auditing. He's auditing by some kind of a bunch of silly rules. Trying to make – you know, he's trying to make me wrong through having said a rule some time or other.

This is a rule that you can follow. Every time the pc says something – a Q and A is challenging, questioning the pc's answer. See? Also doing what the pc tells you to do is a Q and A. Well, that's for sure, but what's the order of magnitude here? There's a hell of a difference between running, "How many times have you gone unconscious?" as the process which the pc demands, and rechecking a goal the pc thought was in. There's a hell of a difference between these two things, you see? You sacrifice no session control of any kind whatsoever when just being a civil – a civil auditor and saying, well, cheerily, "Oh, right – let's see…" You're supposed to help the pc, man. Well, let me tell you. You don't help the pc ever by run-
ning his processes. You never help a pc by taking the process he knows should be run on him. Oh, never. Pc doesn't know.

The pc knows this is his goal, so the auditor says, "All right. He knows it's his goal, so therefore, we'll take it as his goal and we'll list it even though we can't quite check it out," see?

Well, there's a hell of a difference between that, you see, and just civilly – the pc says, "There's a racket out in the hall, I-I just can't stay in session. There's just this racket out in the hall," and so forth.

And the auditor civilly says, "Well, it will probably be over in a minute. Why don't you put down the cans. Why don't you put down the cans and have a smoke." And they do. And the racket subsists or the auditor goes out and say, "What the hell is going on out here?" See?

And somebody says, "Well, we're just changing the mop pails."

And the auditor says – shouldn't say to the person, "Well, you must never change mop pails while I'm auditing." For this is nuts, see? He should say, "When will you be finished?"

Well, the person says, "Well, couple o'hours."

Well, you better find something – do something yourself or find somebody in charge. Let's get this thing squared, you see? Let's not keep running into this. Let's not demand of the pc that he stay in session under such impossible circumstances, don't you see?

At the same time, it may be a situation where, well, it's raining on the tin roof and this gets on the pc's nerves. Now you say, "All right. Look. Ha-ha. I can't do a thing about it," you say to him. "I'd like to help you, but I can't do a thing about it. It's just a tin roof. And this is the only place we've got to audit, and there's the reality of the situation. It's going to audit on the tin roof." And then say, "Well, does it remind you of anything in particular?"

And sometimes the pc looks at this terribly reasonable attitude on the part of the auditor, he says, "Well, yeah. When I was a little kid, I used to have nightmares all the time. And you know, I used to have nightmares all the time and slept in a room that had a tin roof."

"Oh, yeah. What do you know? Oh-oh, okay. How do you feel about it now?"

"Well, I guess I can get along in a session," and he goes on in being audited. It's handling the pc.

Handling the pc isn't making him sit still and talk when he's supposed to and not talk when he's not supposed to you know? That isn't handling the pc. The pc, as far as the auditor is concerned, is a rampant reactive bank that is influencing an analytical viewpoint, and there's limits that you must not go beyond, of course, in helping out. And anything serious like, "Well, in this session today we're going to prepcheck."

And the pc says, "Oh, my God! I thought we were going to…" (This is the roughest part of auditing, is why I'm picking up goals, you see?) "Oh, my God! I thought we were going to – uh – gee. What the hell! God damn! I sat up all last night doing this list and now you're not even going to go into it!"
And the auditor says, "Well, I've got my orders here from Mary Sue to prepcheck you this session." [laughter] Gives him Mary Sue, you see, as an auditor. He just backs out of the session totally, you see?

No. An auditor on the ball handles that. And he said, "All right. I would be very happy to go into this. I'd be very happy to do this. However ... it ain't reading very well. And some time here in the very near future, we're going to find your goal and all will be straight, and I'm not going to desert you, and I'm going to raise hell if I get transferred off of you. I'm going to find your goal. Don't worry about it. From where I sit here, I think we ought to have a Prepcheck, and I think this Prepcheck will straighten out a lot of things and smooth the whole thing out and that's why I'm doing it. And if you can give me a hand here, why, we'll get through this thing, and of course the more you help me get through this thing, why, the faster we'll get through it. And we might even be able to get onto a few goals today. Ha-ha. How about that?"

Zip! Zip! Zip! Zip! See, you get a Prepcheck all down the line. In other words, you use the force of the protest to get your auditing done. A lot of tricks. You could probably learn it by the rules, but actually there's no substitute for an ability to understand and a feeling of humanness. See, there's no substitute for these things.

Now, why does auditing work? That is the burning question. Why does auditing work at all? Well, you could theorize on the subject of ventilation, and you could theorize on the subject of as-ising. But let's not theorize. Let's just take ourselves a look at the basic-basic basics of the basic-basic.

This guy has been going around haunted for a long time, feeling that the whole nation was after him, and then you find out he was Benedict Arnold, and this somehow or another blows some charge. This wouldn't be a normal action. You find a goal will blow charge. But actually just finding out the character was – you know, or something like that. This might do an interesting thing, you see, for the case.

Well, all right. You've gotten something done, and so forth. But how did this do anything for the case? It's because as long as only he had his attention on it, and as long as he had to keep anyone else from having an attention on it, it bothered him. And when he puts it out where somebody else can see it, too, and he can see it, too, he all of a sudden sees it, too. And we don't care what other mechanics occur, don't you see? You can find them all in the Axioms and that sort of thing.

But look at the condition of the guy who is withholding. He is not letting anybody else see it. All right. So he lets somebody else see it. And the other person says he sees it. Then he knows that it has been seen by somebody else and then he waits there for a moment for the roof to fall in, the clouds to collapse, Earth to open or the devil to appear complete with forked tail. What you're running into is the phenomenon of "no consequence." Axiom 10 hasn't fired. He hasn't produced the effect he thought he was going to produce. He was always absolutely sure if he ever told anybody about this, he'd, of course, be executed on the site. He can imagine hordes of people swinging in, climbing in through the windows to get at him.

I know what he feels like. I've only hit one of these on the track and it was very funny. It was one morning when Suzie was doing some coffeeshopping, and we were hitting back
along the track someplace and I was trying to pick up something of the sort. We'd had a session and I was trying to pick up something. Then all of a sudden I had the feeling like everybody was after me, see? Just for a moment. I spotted it suddenly where it was and where it was on the track and what I'd been doing at the particular point of it, and the feeling that they were still after me was almost overwhelming. It was right in present time, don't you see? I could practically feel the cops battering the door in there for about – oh, I don't know – it must have been over a second or so that the feeling lasted, see? I just knew that was what was going to happen. It puzzled me very much afterwards exactly why it happened for about three or four minutes, and then I added it up. It was a scarcity of dead families. Imagine that. Hadn't seen one for two or three billion years and all of a sudden saw one. Scared me half to death, see? I thought I'd done it! Yaw. Ooh. Horrible! And I didn't tell anybody I thought I must have done it. Somehow or another I must have produced this action, now withheld, and then I didn't look at it again. And it was just sensation of this and that. And just the process of ventilation of the thing, and nobody came in the doors, nobody came in the windows. The Galactic Empire didn't immediately send a despatch and a scout car to have me picked up for the execution, you see? Nothing happened. It's anticlimactic, whatever else it is.

Well, he hasn't made an effect with that one. So he drops it like a hot potato. And we don't care why auditing – we do care – but we don't have to go into why auditing works by what phenomena exist and as-ising and so forth. Let's not go into the actual complications of as-ising and all this sort of thing. Let's just look at this one interesting fact: that when the guy has presented something to his own view and the auditor's view and the roof hasn't fallen in as a result of it, or if the somatics turned on didn't actually kill him – and they never do, you know, unless you're listing the wrong goal – you get a sudden feeling of relief. You have ventilated something. They – various phrases have been applied to this basic phenomenon, you see? What you've done is, his attention doesn't have to be on it anymore because he doesn't have to hold it in. You've freed up his attention is what you've really done in the most common action. You presented something to view. The auditor hasn't knocked his head off.

Now supposing the auditor did this. The guy says – in this particular instance, the guy says, "I think I was, ohh, dead family lying there in a log cabin, and I think I killed them. Uop!"

And the auditor says, "...You what? You murdered a whole family? Mmmmmmmmm. Well, I don't know whether I care to audit you anymore." See, we let the bird create an effect with this thing, you see? We let him – we haven't ventilated it. He still has to hold onto it. It hasn't been presented to view. I mean, it doesn't fall with a thud. You get the idea? I mean, a lot of things here go on. And, man, that thing will persist like crazy. Let's just look at that as a fundamental that something happens. That is blowing something. You call it colloquially, "blowing something." The pc blew something. You do it all the time. You call it all the time. Well, that's what you're describing.

An auditor who will not let the pc answer an auditing question will not let the pc blow anything. And auditors have interesting mechanisms by which they forbid the answering of the auditing question. They use the meter. "Has anything been suppressed?"
And the pc says, "W – ." He's about to say, "Well, actually a – quite a few things. Yesterday, why, I was thinking about this and I suddenly said I'd better not think about it because I was supposed to study this bulletin, see? And so forth. And there was yesterday and a suppre – . I was about to say that." See, the pc is about to say that.

And you say, "Anything been suppressed in the area?"

And the pc is just saying, "W – ." He gets about that far.

And the auditor said, "Good. Well, that's good and clean. Thank you. All right. Has anything been invalidated? Good. That's good and clean."

The pc had about ready to say, "Well, yes. The suppression I just had was invalidated. I was just about to say that, see? But..."

"That's clean. That's good. Ha-ha-ha. Fine. All right. And all right. Is there anything on this you failed to reveal? That reads. That reads there. What was that? What was that?"

And the pc says, "Well, wasn't able to re – ." And he's about to say...

"Well, yes. Well, what was it?"

And the pc says, "Well, I-I was going to – going to – to tell you, there's a – there's a suppress – press – press read, and – uh-uh-uh-uh..."

"Well, what was it?"

And the pc says, "Well, I'm tr – trying to tell you. There's a – it's a-s-s-ppre-pre-a suppress read, and-an-an-an-and I was going to tell you about that, too."

"Well, what was it here, something you failed to reveal?" [laughter] "Right here. There. There. There. What's it? Where? What's it? What's it? Well, all right. I'll ask the question again now. Is there anything you failed to reveal? That's clean. I told you it was clean." [laughter]

Well, of course, no auditing occurs at all. You can actually tiger drill with complete impunity if your intention is well understood by the pc. You're just asking the meter and trying to check and that sort of thing. You're not interested in getting the thing answered. But there's even a way to do that, see?

You say, "All right. On the goal to catch catfish, has anything been suppressed?" And "To catch catfish."

"Ah, well, that's – uh..." And the pc is saying, "Uh – that's, uh – I-I-I had – had – had an answer, you know? I thought of something that's suppressed. And – and so forth. And, uh – I had an answer there. I felt kind of suppressed in the session, just early on in the session, you see?"

"Oh, you did, huh? All right. Well, I'll check that. On the goal to catch catfish, has anything been suppressed? Yeah, well, it's – it reads now. What was that?"

The pc says, "Well, I just told you. I mean, I um – umf – give me a session, I felt something, bzzzzz, that heh-heh."
"Oh, well, yeah. All right. That's fine. But there's a read here. And what's that? This is the one I want."

"Well, that's the one I'm trying to tell you."

"But well, this is right here." [raps on the e-meter] This read. This read. Suppressed. That's the one I want."

"This is what I'm trying to tell you."

"Oh, all right. Well, what was it? What was it? Go on. Well, say it anyhow, and then we'll clear this up. On the goal to catch catfish, anything being suppressed? That's it. That's the one. That's the one right there."

"Well," the fellow says, "pft-ft. I've told you."

"Well, it's reading on something here."

Pc said, "Well, it's probably an ARC break."

"Oh, well..." Auditor knows now he mustn't Q-and-A so he can't ask if there's an ARC break, see. [laughter] This whole thing would go completely around the bend, you see? It becomes a comedy of nonsense – just becomes asinine.

The way the mechanism works is every time the pc tells you something, you do something. You never Q-and-A. You could never be called guilty of Qing and Aing, you see? But still, it somehow works out that the pc says, "Well, at the beginning of the session, I was warm." And you go open the window. The pc doesn't quite know what to make out of this, see? He was trying to get off a withhold. You just asked him for a withhold, and he said, "Well, at the beginning of the session, I was sort of warm," and the auditor goes over and opens a window. Why, the pc realizes if he's going to get any auditing, he'd better not talk to this auditor. See that? The auditor never quite differentiates between these two things: of the pc asking him to do something and the pc getting off something. That's because the auditor doesn't understand what basic auditing is – the mechanism of blowing something. That's why auditing works. He never reads this difference in the pc.

The pc is saying, "Oh, my God! I just suddenly realized something. I have been withholding a Suppress here for the last four goals you were nulling."

Well, you got an interesting question there. That suppress is a pretty tricky button. This pc gets this off – he tells you. You say, "Well, all right. What is it?"

And he tells you what it is and so forth. "Well, I don't know." You got to put in an R-factor if you're going to do anything about it.

You say, "Do you think it affected those next goals?"

"Yes. Well, my mind wasn't on them at all."

"All right. Well, do you think it might be a good idea if we covered those again? What do you think of that?"

He says, "Well, yeah. Yeah, I better." Well, that's because he suddenly caught himself on a mistake. Don't you see? This is – you've got to have an ear for this sort of thing.
All right. Here's an entirely different situation. Pc said, "Well, I just suddenly realized that you asked me a Suppress question a minute ago and I've been sitting here with an answer to it. Well, I've been holding my breath every time you said anything because I was afraid my breathing was reacting on the meter."

And the auditor says, "All right. We'll check that Suppress question again."

Get the interesting dividing line, see? Well, the basics of auditing include the mechanism of blowing something. And if the auditor always does something or Qs-and-As and does – says something else and never buys anything from the pc, nothing is ever blown. And if the auditor never, even on a Tiger Drill, makes any allowances for the pc to say things to him and never sets it up in the session so the pc can talk to him, why, of course, the pc never blows anything. And after a while the missed withholds stack up, stack up, stack up, and it becomes painful because auditing works because the pc blows things. And the auditor is actually preventing auditing from working. Of course, the pc will stack up and almost blow his head off like he was an active volcano. It's just the force and power is built up on this thing. Oh, the pc must be permitted to blow things. It's as simple as that.

The answer to Q and A and TR 4 and all these other interestingly involved and technically difficult questions is whether or not the auditor is actually auditing the pc or going through a drill, see? That's the difference. And inevitably, if an auditor is having trouble differentiating this way and getting into ARC breaky sessions, they've got something that is – they've got a bug on preventing the pc from talking to them. Auditing can still happen under these circumstances, but it's rather rough; auditing can still be very successful under these circumstances, but it is tough auditing.

The more the pc is in-session, the more understanding and the less antagonism the auditor has for the pc, the more the pc can blow, the easier it is for the pc to go over the road he's going over, the more auditing occurs per unit of time. These are the basics of auditing.

And actually, an auditor ought to understand why auditing works; ought to be perfectly willing for the pc to talk to him and also realize that the pc's havingness will run down and right on out the bottom if the pc talks to the auditor too much. Because then the auditor isn't really being talked to. He's being talked at in some fashion.

You don't let a pc go on for three-quarters of an hour telling you about how his mother caved him in. You can't. You'll kill him.

You see these little dividing lines? An auditor has got to know these things. And an auditor has got to know that when he asks an auditing question, he's got to get an answer to that question, not some other question. And when that question is answered, by God, he's got to buy the answer to it. And if he finds himself in the embarrassing position of the question having been answered, but he didn't buy the answer but questioned it, of being graceful enough and willing to admit that he is wrong and apologize to the pc and say, "I'm very sorry. I didn't realize that that answered the auditing question." You know, bang, bang! Everything would go back into shape, and he keeps going.
If the auditor explains to the pc why he didn't think that was an answer to the auditing question and how he was really right in challenging the thing, of course, out goes the session because he hasn't let the pc blow anything.

And your pc feels better as he goes along. Now, auditing is validated for him. He becomes more willing to be audited, less defensive. If he feels worse all the time, he becomes harder to audit. And you try to get a pc with a lousy, dirty, scrubby needle that's going bzz, bzz, bzz, and you're trying to read through this thing and you're trying to do this. Now that you got a Dynamic Assessments, that cures it. You see? But oddly enough, if you're a good Prep-checker, you can also cure it. And oddly enough, you can actually assess on old 3GA on a dirty needle that you can clean. And you clean that dirty needle. And you should be able to do that. You should be able to clean up a pc's needle slick as a whistle. See? He's right in the middle of a rock slam. You should be good enough that you just clean up his needle, bang! You know? You ask him this, you ask him that, you ask him the other thing. Say, "What does that refer to?" Bzz. Bong! Bzzz. Bong! Got a perfectly even needle. You understand?

There's no excuse for trying to ask questions across a dirty needle. Of course, I will admit that I have spent as long as two hours, two hours and a half of a person's auditing time just shopping around for, "What the hell is this all about?" And then all of a sudden, why, strike the jackpot. Say, "Oh ho-ho, I get it. Yeah. I got it now." And ask the series of questions, straighten the thing out – pc assessable. Got the idea?

Pc would be prepcheckable on the thing. What turned it on? You must have turned it on somehow. It got turned on somewhere by something. An auditor ought to be able to clean up the pc's needle. Just similarly, an auditor without any meter at all should be able to sit there and just bleed every single one of these Precheck questions dry as a bone without another tick on them by just looking at the hunted look in the pc's eye, by looking at this, by looking at that; just watching that pc operate and keeping that pc talking to him until the pc looks nice and comfortable and relaxed and happy about that particular zone in question. You see? You ought to be able to do that.

You can't assess goals without a meter. At this stage of the game, you can't do it. Impossible! Period. Don't ever try it. You'll get into trouble, man. You'll have a pc so damned sick, he won't know whether he's coming or going. You're burying that boy, you understand? But you sure should be able to put a whole Model Session together without a meter within a mile of you – sensitivity to the pc. Don't get dependent on this meter to put a pc in-session. You should be able to – a good auditor should be able to put a pc in-session, put all of his rudiments in, make the pc happy as a bird, get a lot of things done and so forth. We did it for years with lots lousier technology than we got now. Ah, what's all this dependency on a meter? You put the mechanics in and take the human being out. And you should be able to get things done in an auditing session, not just audit for the purpose of auditing. And you ought to be able to allow the pc to get well, the pc to get up, the pc to have wins, the pc to do this.

If rules are so much in your road according to your understanding of the game, then you probably don't understand the rule. It isn't the rule is wrong. You just don't understand it. And it must then follow, immediately, that you're using the rule to audit the pc. And do you
know a rule will never acknowledge anything? You could set a rule down in front of the E-Meter, and it would never clean or clear anything.

Fundamental auditing, basic auditing simply consists of getting the pc in the session willing to talk to the auditor; and then, for God's sakes, let him talk to the auditor. And then be able to use the technology that you have in front of you to make himself feel better and put him in-session, square him up, bring him up smiling at the other end. You should be able to do that.

Actually, you should be able to audit a pc without a meter for an hour and bring him up at the other end – Model Session throughout – bring him up to the other end, have an Instructor check the thing and find – with a very sensitive meter – and find every rudiment in, neat as pie. You understand? If you could do that, you can audit.

And today I don't mind telling you the reason I'm giving you this particular basic data has really nothing to do with the fact that we are making bad auditors. We are not. It has to do with the fact that 3GA requires a superlatively good auditor. It's not going to get easier. I don't expect it to get easier; I expect it to get shorter. You understand? But the more you shorten it, the more tension you put on the pc. So the more you shorten it and the faster you do it, the better you've got to be as an auditor. So I have been studying basics. And that's what they amount to. And, actually, auditing consists of no more than I have told you in this lecture. Interesting, isn't it?

So wherever we see ARC breaks flying, we don't necessarily suppose we've got a bad auditor on our hands. But where it happens all the time, then somebody is auditing "by the rules" but not sitting in the auditing chair. Something or other – the rules are somehow being misused to keep the pc from talking to the auditor. We don't care about an ARC break, and a pc blowing his stack and going to hell in a balloon. His goal has been missed, and everything has gone to hell and so forth, but an auditor ought to be able to sweat it out one way or the other and get the job done. We don't care about that. We're talking about a persistent, continuous action of the pc always feels worse, the pc always feels more upset, we never get anything done in a session, the pc is always nattering, this, that and the other thing. You got that sort of thing. We're talking about that kind of thing. And that auditor must be auditing by the rules, man. He must be auditing "by the rules" on a sort of a white mutiny basis, you know? He should never Q-and-A. The pc says, "You know, there's a tack in this chair and it hurts, and that's what you're getting on the meter is this tack in this chair." [laughter]

And the auditor says, "I mustn't Q-and-A," and never removes the tack. Three sessions later – this has been going on for three sessions – why, he has a dirty needle and complains to the Instructor the fellow was unauditable. See? Well, I don't expect things like that to happen around here. Okay?

All right.

Thank you very much.
An auditing demonstration given on 22 August 1962

**LRH:** All right. With all the excitement of finding fire and everything else coming along on top of it ... Have a seat. Okay. You can pick up those cans. Now, to put in an R-factor here, we're going to give you a going-over here on your Dynamic Assessment, the like of which you've never heard of before.

**PC:** All right.

**LRH:** All right. Now, a couple of times we've been over this and we've laid an egg and you gave me a nice list here and I didn't use it and that was my error. Okay?

**PC:** All right.

**LRH:** And we're going to handle this now from that viewpoint. And all I'm going to do is put in the rudiments, give you a Dynamic Assessment, try and find an item or not find an item. All right? Is that all right with you?

**PC:** That's fine.

**LRH:** All right. Okay. Is it all right with you if I start this session now?

**PC:** Yep.

**LRH:** All right. Here it is: Start of session. All right. Has the session started for you?

**PC:** Yes.

**LRH:** Okay. Thank you. What goals would you like to set for this session?

**PC:** I want to work well in the session.

**LRH:** All right. Okay.

**PC:** Feel better at the end of it.

**LRH:** Okay.

**PC:** Find the dynamic and the item.

**LRH:** Find the dynamic and the item?

**PC:** The item. Yeah.

**LRH:** All right. Very good. Any other goals?

**PC:** No, they'll do.

**LRH:** All right. Are there any goals you'd like to set for life and livingness?

**PC:** Oh, to be more able.

**LRH:** All right. Anything else?

**PC:** Yes. To get through my sea – first big sea voyage without mishap.

**LRH:** Okay. Good enough. Is that it?

**PC:** That's it.
LRH: All right. Good enough.

Now, are you willing to talk to me about your difficulties?

PC: Sure.

LRH: All right. Thank you. I'll check that on the meter. Are you willing to talk to me about your difficulties? All right. Looks smoother than ice. Okay?

PC: Good.

LRH: All right. Very good. Now, when was the last time I audited you?

PC: Last Friday.

LRH: All right. Very good. Got that spotted?

PC: Yes.

LRH: All right. Since the last time I audited you have you done anything you are withholding?

PC: No, I don't think so.

LRH: All right. Thank you. Check it on the meter. Since the last time I audited you have you done anything you are withholding? All right. I'm not accustomed to this meter face, I'm going to have to check it again.

PC: Fair enough.

LRH: Since the last time I audited you have you done anything you are withholding? Looks clean.

PC: I'm sure it is.

LRH: All right. Sorry to doubt you there.

PC: That's all right.

LRH: I wasn't doubting you.

PC: No. No.

LRH: All right. Okay. Do you have a present time problem?

PC: No.

LRH: All right. Here we are. Let's check this on the meter. Do you have a present time problem? All right. There's possibly a tick on that of some kind or another. You got any thoughts concerning this?

PC: The only thing that comes to mind is I haven't done my packing yet and there's probably a little problem there.

LRH: All right.

PC: To fit it in.

LRH: Good enough. All right. Do you have a present time problem?

PC: No.

LRH: All right. Let me check that now. Do you have a present time problem? Okay. No afterthoughts on that? Very good.

Okay. We're going straight into this Dynamic Assessment here. And these were the items that you broke down for this assessment. Now, are there any others? There's self, body, sex, family, children, groups, tribes, nations, countries, humans, mankind, animals, vegetation, matter, energy, space and time, birds, thought, spirit, supreme being, nature, Mother Nature.

PC: Two occurred to me. One – one's plants.

LRH: Okay.

PC: And I think after the second time – dynamic I would put "wives."

LRH: All right. Thank you. All right. Any others occur to you?

PC: No.

LRH: Hm? All right. Okay. Well, let's hope this is complete. Okay?
PC:  Uh-huh.

LRH: All right. And I'm just going to go right straight through here. Now – I'm going to check this on the meter: Consider committing overts against. All right. And think of doing something bad to. All right. We're going to use, "Consider committing overts against." All right?

PC:  All right.

PC:  There's something I want to tell you.

LRH: What?

PC:  That's just that one or one or two ago I got this pain turned on again across my chest again.

LRH: When I did what?

PC:  On two items back. I can't tell you which one it was, but ...

LRH: It turned on, huh?

PC:  Yes.

PC: The somatic just went as you finished doing it.

LRH: Right.

PC: And the other thing is that I had a slight hang-up when you gave matter, energy, space and time as one. I'd gotten them in my mind as individual dynamics.

LRH: Is that so? Well, very good. I thank you very much. I'll just put those all down the line in that order. Okay?

PC: Yeah.

LRH: Good. And we'll catch them next time. All right?

PC: Fine.

LRH: Anything else you'd care to say?

PC: No.

LRH: All right. Very good. Here we go again.

PC: All right.

LRH: Consider committing overts against body. Consider committing overts against body. Okay. Consider committing overts against body. All right. That is in. Consider committing overts against sex. Consider committing overts against sex. Consider committing overts against sex. Consider committing overts against sex. All right. That is out. Consider committing overts against wives. Okay. That is in. Consider committing overts against groups. Consider committing overts against groups. Consider committing overts against groups. Okay. Consider committing overts against groups. Okay. I'm going to leave that in. All right. Consider committing overts against tribes. All right. Consider committing overts against tribes. Okay. That is in. Consider committing overts against nations. Consider committing overts against nations. Okay. I'm going to leave that...No, we're not. Consider committing overts against nations. Consider committing overts against nations. All right. Well, I'm going to leave it in just for fun. Consider committing overts against countries. All right. Consider committing overts against countries. All right. Consider committing overts against countries. All right. Consider committing overts against countries. All right. That is in. All right. Consider committing overts against matter. Okay. That is in. Consider committing overts against energy. All right. That is out. Consider committing overts against space. All right. That is in. Consider committing overts against time. Consider committing overts against time. All right. That is in. All right. Consider committing overts against nature. Okay. That is in. Consider committing overts against Mother Nature. Okay. All right. That is in. Okay, we've got a few less this time. Anything you care to say before I swing down here again?

PC: No, it's - it seems to me that it's on overts that I'm getting this pain. It's considering overts. Not that, now this pressure, seems it's like a crushing pressure I'm getting across the chest. And at one time it was even making me - well it seemed - somewhat difficult to breathe. And I sort of caught myself doing this.

LRH: Oh, it was firing - overts was firing a couple of times.

PC: Oh, I see. Yes.

LRH: And I'm sure that that's - is a source of it.

PC: Mm.

LRH: When did it turn on that time?
PC:  Almost at the beginning. We got through the first two and then I noticed it was turning on again as we got to the second dynamic, wives and so on, it got a bit worse.

LRH:  Well, all right. Very good. Okay. You're finding me not reading this very smoothly here to you. That's because I've got a very limbered-up meter here in front of me.

PC:  Uh-huh.

LRH:  It's probably running at about 64 times a Mark IV.

PC:  Mm-hm.

LRH:  And it's got a very fast dial swing. So forgive me if I seem to halt.

PC:  Surely.

LRH:  All right. Okay. Here we go again. Consider committing overts against body. Consider committing overts against body. All right. That is out. Consider committing overts against wives. Okay. That is in. Okay. Consider committing overts against groups. Okay. That is in. Consider committing overts against tribes. All right. That is in. Consider committing overts against nations. Consider committing overts against nations. Consider committing overts against nations. All right. That is in. Consider committing overts against countries. Consider committing overts against countries. All right. Consider committing overts against countries. Once more. Consider committing overts against countries. Consider committing overts against countries. Maybe it's firing; I'll leave it in anyhow. All right. Consider committing overts against matter. Consider committing overts against matter. Okay. That is in. Consider committing overts against space. Okay. That is in. Consider committing overts against time. Okay. Consider committing overts against time. All right. That is in. Consider committing overts against nature. Consider committing overts against Mother Nature. Okay. Those are out. And consider committing overts against forms. Consider committing overts against forms. Consider committing overts against forms. Consider committing overts against forms. All right. Here we go again. Getting less now... No, we're not going. Here's a ... Have you thought of any other dynamics or anything else that should be on this list?

PC:  I haven't thought of any, no.

LRH:  Haven't thought of any? The list isn't necessarily missing?

PC:  No.

LRH:  Have you thought of anything else that should be on this list?

PC:  The only thought on that line that has occurred to me is "bodies" instead of "body." Or as well as.

LRH:  All right.

PC:  That - that was the only one that seemed - suggested anything to me at all.

LRH:  All right. Anything else should be on the list? All right. Thank you. Well, here we go again. Okay?

PC:  Yes.

LRH:  All right. Consider committing overts against bodies. All right. Consider committing overts against bodies. Consider committing overts against bodies. Okay. Thank you. That is in. Consider committing overts against wives. Consider committing overts against wives. All right. That is out. Consider committing overts against groups. Okay. Consider commit-
ting overts against groups. All right. That is in. Consider committing overts against tribes. Consider committing overts against tribes. All right. That is in. Consider committing overts against nations. Okay. That is out. Consider committing overts against countries. Okay. I'm going to test both of those again just for sure. Consider committing overts against nations. Consider committing overts against nations. Oh, there's a little ping left on there. Consider committing overts against countries. All right. Thank you. That is in. Okay. Consider committing overts against matter. Consider committing overts against matter. All right. The world of machines form a dynamic?

PC: Machines. That would be the sixth. Machinery.

LRH: Machines form a dynamic?

PC: Machines ought... They could do. I'd be quite happy to have it on the list.

LRH: Well, is it or isn't it? How would you phrase that?

PC: Machinery. If anything.

LRH: Machinery.

PC: Machinery.

LRH: All right. Let's just put it on here for fun, shall we?

PC: Mm-hm.

LRH: I'm not missing one. We've got one.

PC: Mm-hm.

LRH: But we're just making absolutely sure here.

PC: Well, I just look around that for a minute, the... oh, power is the - would be the description for me of machinery and would be - would be a dynamic, you see, power.

LRH: All right. Power.

PC: Mm-hm.

LRH: Very good. Let's put power and machinery on the list, shall we?

PC: That's fine.

LRH: All right. Thank you. Okay. Consider committing overts against machinery. All right. Consider committing overts against machinery. All right. Thank you. Consider committing ... That's out.

PC: Mm-hm.

LRH: Consider committing overts against power. Consider committing overts against power. Consider committing overts against power. All right. Consider committing overts against power. Okay. Consider committing overts against power. All right. We'll leave that in. Consider committing overts against matter. Okay. That is out. Consider committing overts against space. Okay. That is in. Consider committing overts against time. All right. That is in. Consider committing overts against forms. Consider committing overts against forms. I'll take another look at that. Consider committing overts against forms. All right. That is out. All right. Anything else you'd care to say before we fire down this line, huh?

PC: No.

LRH: Okay. Here we go again. All right. Consider committing overts against bodies. Okay. That is out. Let me check it. Consider committing overts against bodies. Consider committing overts against bodies. All right. That's out. Consider committing overts against groups. Okay. That's in. Consider committing overts against tribes. Okay. Consider committing overts against
tribes. Consider committing overts against tribes. Okay. That is out. Consider committing overts against nations. Okay. Consider committing overts against nations. Consider committing overts against nations. All right. That is out. Consider committing overts against countries. Okay. Consider committing overts against countries. All right. What did you think of just then?

**PC:** Oh, just - just before you asked me. It was about um - you'd asked me about machinery and I was - you were coming up to this and I remembered it was out and I went out of session a bit. And um - wondered why you'd asked, you see, I thought, oh gosh, has he got a stage four needle or something turned on.

**LRH:** No.

**PC:** Well, that was the thought.

**LRH:** Nothing wrong with your needle. Thank you very much. All right, Thank you. All right. Here we go. Consider committing overts against power. Consider committing overts against power. All right. That's in. Consider committing overts against space. All right. Consider committing overts against space. Consider committing overts against space. Okay. Consider committing overts against space. Against space. Yeah, that's out. Consider committing overts against time. Consider committing overts against time. Consider committing overts against time. All right. That's in. All right. We have a very few left here. And it's going -all is proceeding very fine. I'm reading this meter at - at top revs.

**PC:** Yes.

**LRH:** And all is well. Okay. Consider committing overts against groups. Consider committing overts against groups. Consider committing overts against groups. Consider committing overts against groups. Ah, that's still got to be with us. All right. Consider committing overts against countries. All right. That's in. And consider committing overts against power. Okay. That's in. Consider committing overts against time. All right. That's in. There we are. Well, we're boiled down now to three. And here we go.

**PC:** I've a horrible feeling that I'm about to be found out, you know.

**LRH:** Oh, yeah.

**PC:** Back to the wall.

**LRH:** All right. All right. Okay. Anything you'd care to say before I sail into this next one?

**PC:** No, thank you.

**LRH:** All right, all right. Okay. Consider committing overts against groups. All right. Consider committing overts against groups. All right. That's in. Consider committing overts against countries. Okay. Consider committing overts against countries. All right. Consider committing overts against countries. All right. Consider committing overts against countries. All right. That is out. Consider committing overts against power. All right. That's in. Consider committing overts against time. Yes, that is in. Now, anything you care to say here?

**PC:** That's a painful operation, this.

**LRH:** Does it hurt?

**PC:** Yes.
LRH: What's hurting? Your back?

PC: Back and chest. I mean, sort of clamp. My back is pressed hard on the chair from the front, you see, and it's real intent on being crushed.

PC: That's all right.

LRH: Okay. All right. Here we go. Consider committing overts against groups. Consider committing overts against groups. Consider committing overts against groups. Consider committing overts against groups. Consider committing overts against groups. Consider committing overts against groups. What does it do when I say that on the somatic?

PC: Well, it - it's pressing this – pressure particularly and pain on the right –on the spine, in the back. And uh ...

LRH: Is it that one that gives you an odd feeling?

PC: Yes. And it's - as you were saying it then I felt that all the time. I'm sort of resisting this - something from on my back, you see. It's right on me shoul... lower part of me shoulders.

LRH: Mm-hm.

PC: That's all I can tell you, I'm afraid.

LRH: All right. Is that "groups" that turns that on? You note it more noticeably than the others?

PC: I can't honestly tell you which one it is. it's ...

LRH: All right.

PC: It turns on intermittently.

LRH: Very good. All right. We're going to check groups once more. Consider committing overts against groups. That's out. All right. Consider committing overts against power. Consider committing overts against power. All right. That's in. Consider committing overts against time. Okay. Consider committing overts against time. Okay. Consider committing overts against time. That is out. Leaving us with power. That's the dynamic. Now, how does your back feel?

PC: Well, it's easier. I'm still aware of the pressure.

LRH: It eased right up, did it?

PC: It eased right up, yes.

LRH: All right. Good. Did you notice it turning on with one dynamic more than another?

PC: Um, well after you left it this last time around and in between um - time and the one before it - I forgot what it was, power, come to think of it - it's uh - I had terrific breathing. You know, labored breathing, it was turning into; it was really quite a ...

LRH: You didn't like it.

PC: I didn't like it at all, right.

LRH: All right. Did you notice which one that turned on with?

PC: Well, I should say it would be on power. I - I'd completely forgot which one it was. It was the one before time, you see.

LRH: All right. Let's see what we've got here, all right? Okay. Consider committing overts against power. All right. We'll find out how right or wrong we were
here. Consider committing overts against power. Okay. Consider committing overts against power. There it is. Consider committing overts against power. How's your spine?

PC: It's painful.

LRH: You didn't like that?

PC: No.

LRH: All right.

PC: It's a crushing - painful. Christ, it's not a knife pain, it's a crushing pain.

LRH: All right. That turns on when I say that, huh?

PC: Yes.

PC: Well, it's - I'm getting the idea of being crushed, you see, from right across the chest. I haven't got a picture of this, but it's as if I've got something heavy on me chest pushing right down on my back, you see.

PC: Mm-hm.

LRH: All right. Now, has this item been suppressed? Yes. What's that?

PC: Uh, this is suppression of power, because - not quite in the sense of the word. I suppose it would boil down to the same thing, but in my business position, I mean, I suppressed the power. I mean, I wouldn't - hate to take advantage of it.

LRH: Oh, yeah.

PC: Suppress it to that degree.

LRH: All right. Thank you. Has this item been suppressed? Any more than that? Has this item been suppressed? All right. It seems clear at the moment. All right. Has this item been invalidated? Have a thought there?

PC: Well, it flashed on to Dick Halpern when he was auditing me on - uh - this ties up with authority. Sort of submitting to authority.

LRH: Oh, yeah.

PC: Uh, authority being a power, you see.

LRH: Mm.

PC: This would be the connection there.

LRH: Mm.

PC: That was the thought.

LRH: Mm-hm. All right. Has this item been invalidated? All right. There might be a little something there.

PC: Well yes, um - this is a bitter complaint of mine that if you're successful, people try to make nothing of you. And I've been successful in - in one field, anyway.

LRH: All right.

PC: And people do try and make nothing of it.

LRH: All right. Good enough. All right. Has this item been invalidated? Looks clean at the moment.

PC: Okay.

LRH: All right. On this item has anything been suggested? Got any answer there?

PC: Nothing comes to mind on suggest.
LRH: All right. Anything on this item you've failed to reveal? Yes. What's that?

PC: Yes. I would secretly - not so secretly either - but secretly use power very often myself.

LRH: Mm-hm.

PC: And an instant occurs to mind quite recently where I wanted my own way, so I just came in with the power to get my own way. And did.

LRH: All right. Okay. All right. On the item power, is there anything you have failed to reveal? All right. How does that seem now?

PC: It seems all right.

LRH: On the item power is there anything you've been careful of?

PC: Very careful how to use it. And to respect it.

LRH: Uh-huh. All right. Very good. On the item power is there anything you have been careful of? There is something.

PC: Electricity. Yes, I am careful with electricity. And I know that if I'm in doubt at all then I'm ultra careful. As long as I know it's all right. But I am careful with electrici - electrical power, in other words.

LRH: All right. Thank you. On the item power is there anything you have been careful of? All right. Does that seem neat to you?

PC: Yes.

LRH: All right. On the item power has anything been suppressed? What's that?

PC: Well, thought of a rhyme on it - compressed - for some reason or other. The chest has been compressed. But, well I go around suppressing it all the time. There was somebody on this course who had an item, something, "To be the hidden secret" or "hidden power," or something. Wasn't it? And this, I thought when I saw it, well that's something in my line because here I am a pretty wealthy man and I can walk into - around London and there are people probably not so well off who get a lot of notice taken of them and are particularly avoided. You see? Because, well, it's dangerous.

LRH: All right.

PC: So I suppressed power that I would have to that degree.

LRH: All right. Very good. All right. On the item power has anything been suppressed? Another one? Perhaps there's another one. I wouldn't swear to it.

PC: Well, I think I've got something there somewheres.

LRH: Yeah, there it is - ticking on something. There it is.

PC: Electricity. Yes, I am careful with electricity. And I know that if I'm in doubt at all then I'm ultra careful. As long as I know it's all right. But I am careful with electrici - electrical power, in other words.

LRH: All right. Thank you. On the item power is there anything you have been careful of? All right. Does that seem neat to you?

PC: Yes.

LRH: All right. On the item power has anything been suppressed? What's that?
suppressed? There's something right there. There it is. There it is.

PC: Well, yes. I don't seem to be making myself out a very good man... Why I suppress power is that um - I suppose what I'm fighting though is doing an overt. I'm avoiding overt here. But I suppress disposing ... I have the power to sell my business for quite a nice sum of money and I suppress the desire - suppress it. And the excuse I put up here is that I wouldn't like to use my power again the employees. You see, they might not have such a good deal with another employer. I'm not so sure that that is the truth of it, Ron, but that's how it looks to me. That's what I see.

LRH: All right. Very good.

PC: Probably worse than that.

LRH: Okay. All right. On the item power is there anything you have suppressed? It looks clean at the moment.

On the item power is there anything you have invalidated? Looks clean. Have a thought?

PC: No.

LRH: All right. On the item power is there anything you have suggested?

PC: I don't get anything.

LRH: All right. On the item power is there anything you have failed to reveal? All right, that's good.

On the item power is there anything you have been careful of? There is something.

PC: Careful. Oh, yes, this is, whenever I've been up against anybody who in my estimation is more powerful, then I have had to be very, very careful and adopt evading tactics or something like that.

LRH: All right. Very good. Thank you. All right. On the item power is there anything you have been careful of? All right. That looks clean.

PC: All right.

LRH: Okay. I'm just going to say this item a few times now. Power. Power. Power. All right. Now, let's use the question we were using.

Consider committing overt against power. Consider committing overt against power. Okay. Consider committing overt against power. Yes. It's firing.

PC: Okay.

LRH: It's firing. All right. Nothing else is on the list, but it is. Okay?

PC: Right.

LRH: All right. So let's try to list this thing out and see where we land. Okay?

PC: Yes.

LRH: Okay. Now, let's see what we can do with this. I don't guarantee to do anything with it, but we will try. Okay?

PC: Can I blow my nose for a minute?

LRH: You sure may. Put the cans down as far as that's concerned.

... All right. Okay. Let's just see what luck we have here. Okay?

PC: Mm-hm.

LRH: All right. The question is: What represents power to you?

PC: Got that.

LRH: All right. Very good. Here we go. What represents power to you?

PC: A dynamo. A dynamo.
LRH: Okay.
PC: A group of people. A group - a group of people, yes.
LRH: All right.
PC: A general.
LRH: A general?
PC: Yes.
LRH: Very good.
LRH: Right.
PC: A board of management.
LRH: Okay.
PC: Company directors. Rulers.
LRH: Okay.
PC: Kings.
LRH: Good.
PC: Women.
LRH: Hm?
PC: Women.
LRH: Okay. Very good.
PC: A lion.
LRH: A lion?
PC: A lion.
LRH: All right.
PC: I’m sorry about this one: a tiger.
LRH: Oh-ho-ho - Very good.
PC: Well now, a panther and a jaguar.
LRH: All right.
PC: Um ...

LRH: What represents power to you?
LRH: Okay. Okay. What represents power to you?
PC: A steam engine.
LRH: Okay.
PC: A steamroller.
LRH: Okay.
PC: Something that crushes.
LRH: Something that crushes.
PC: Yes. You can also describe that in another way as well, as a crusher.
LRH: All right.
PC: A fighter. Yes, a fighter.
LRH: All right.
PC: And... a heavyweight boxer.
LRH: Okay.
PC: And a wrestler.
LRH: Okay.
PC: A statue.
LRH: Okay.
PC: A statue of a - of a muscular man.
LRH: Is that a statue, then a statue of a muscular man?
PC: Yes.
LRH: Yes. All right. All right. What represents power to you?
PC: Dive bomber.
LRH: Okay.
PC: A battleship.
LRH: Okay.
PC: This is going from the sub-lime. A little seed. A little seed, yes.
LRH: Okay.
PC: Well, an atom.
LRH: Okay.
PC: A claw. C-I-a-w.
LRH: Right.
PC: A torture - a torture chamber.
LRH: Well, okay.
PC: Sun... Did you get that one?
LRH: Yeah, I got it. I'm sorry.
What represents power to you?
PC: Sun and a ...
LRH: I'm sorry I did get it. Okay.
PC: Got it?
LRH: Got it.
PC: Uh-huh... A windmill.
LRH: Okay.
PC: Wind.
LRH: The wind?
LRH: Okay.
PC: A gun.
LRH: Okay.
PC: And a cannon.
LRH: A cannon?
PC: A cannon, yes.
LRH: All right.
PC: A cannonball.
LRH: Okay.
PC: A mystic.
LRH: All right.
PC: A clever man.
LRH: Okay.
PC: An accomplished man.
LRH: All right. Okay.
PC: Could I have the question again please?
LRH: I'm sorry. What represents power to you?
PC: Thank you. The sea.
LRH: Okay.
PC: It's better described - uh - tell you - uh - is better described as "the relentless sea," for some reason or other. Volcano.
LRH: Okay.
PC: A kettle.
LRH: Mm-hm.
PC: A rocket.
LRH: Mm-hm. Okay.
PC: A flea.
LRH: Okay.
PC: Terrific power a flea has in comparison with its size.
LRH: All right.
PC: Armor.
LRH: Okay.
PC: A sledge hammer. A bludgeon.
LRH: Okay.
PC: And a morning star.
LRH: Okay. Excellent.
PC: A mace.
LRH: Okay.
PC: A crown.
LRH: All right.
PC: An orb. And a scepter.
LRH: That's an orb ...
PC: Uh-huh.
LRH: ... and a scepter.
PC: Yes.
LRH: All right.
PC: A throne.
LRH: Okay. What represents power to you?
PC: An electric battery.
LRH: A what?
PC: An electric battery.
LRH: An electric ...
PC: Battery.
LRH: ... battery. Okay. And what represents power to you?
PC: A sports car.
LRH: A what?
PC: A sports car.
LRH: Oh, yes. All right. Good.
PC: Um ...
LRH: A what?
PC: Knowledge.
LRH: Knowledge?
PC: Mm-hm.
LRH: All right. Good.
PC: Know-how.
LRH: Okay.
PC: Oh, authority. And a government.
LRH: Okay. All right.
PC: And a council.
LRH: All right.
PC: Supreme council. A commander.
LRH: Okay. All right.
PC: Torpedo.
LRH: Okay.
PC: Seem to have run out. Food.

Food.
LRH: Mm-hm. Good.
PC: Sugar.
LRH: Okay. There's something there.
PC: Light.
LRH: Hm?
PC: Light.
LRH: All right. Thank you. What represents power to you?
PC: Heat.
LRH: Okay.
LRH: Mm-hm. Very much so. Thank you.
PC: Clenched fist.
LRH: Okay.
PC: A big building.
LRH: Okay.
PC: A city.
LRH: All right.
PC: It's a - a city of stone.
LRH: Okay. Something there?
PC: Leader.
LRH: Okay. All right.
PC: A fire.
LRH: A fire?
PC: Mm-hm.
LRH: Good. What represents power to you?
PC: Steam.
LRH: Steam?
PC: Mm-hm.
LRH: Okay.
PC: Ability.
LRH: Okay.
PC: Laws.
LRH: Okay.
PC: Contracts. Agreements.
LRH: Okay.
PC: Certainty.
LRH: What?
PC: Certainty.
LRH: All right. Very good. All right. What represents power to you?
PC: Words.
LRH: Okay. What represents power to you?
PC: The oratory.
LRH: Okay. What represents power to you?
PC: A bus.
LRH: Bus?
PC: Mm-hm.
LRH: Okay. What represents power to you?
PC: Force.
LRH: What?
PC: Force.
LRH: Mm-hm. Okay.
PC: Um ...
LRH: Something there?
PC: Yes. There's something on the mystery line here. It's a ... I can't ...
LRH: There it is.
PC: Invisible.
LRH: Hm?
PC: Invisibleness. Invisibility.
LRH: Invisibility.
PC: Yes.
LRH: Very good.
PC: A crankshaft.
LRH: Okay.
PC: A propeller shaft.
LRH: All right.
PC: I suppose I ought to put down "money."
LRH: Oh, you put down "money"? All right. Very good.
PC: That's them all. I'm dry.
LRH: All right. You feel kind of run dry? Let me test this question here. All right. Is this list complete? All right. Let's see what's happened to the item. Power. Power. Power. Power. Consider committing overts against power. Consider committing overts against power. Consider committing overts against power. All right. Consider committing overts against power. Well, this list may or may not be complete here. How do you feel about it? Think there's something still on it?
PC: Well, I'd have to dig very hard, I mean I could probably come up with some more items...

LRH: Well, don't worry about that.

PC: ...but I think it's complete.

LRH: You think it is complete?

PC: Mm-hm.

LRH: Do you feel it is complete? Or don't you?

PC: Yes. I-I thought it was complete when I said to you that.

LRH: All right. Very good.

Now, what - what's happened to that somatic in your back?

PC: Well the somatic in the back's gone. The crush has gone.

LRH: Mm.

PC: Towards the end there I had this heart somatic turn on and that's gone. There's just a slight vestige of it there now, but I think if I were to stand up that would have gone.

LRH: Mm.

PC: Well, that's what's happened.

LRH: All right. And they're gone now?

PC: Yes.

LRH: Got any sensation of dizziness?

PC: Not dizziness. Muzziness, rather. You know?

LRH: You've got a feeling of muzziness?

PC: There's a difference to me. Dizziness you go round and round. Muzziness you just, yeaaah.

LRH: All right. And when did that turn on?

PC: Oh, whilst I was - I don't know - was about the middle of the list I should think, the muzziness turned on.

LRH: It did?

PC: Mm-hm.

LRH: All right. How are these somatics now?

PC: They're all right. I've got no somatics now.

LRH: Do they exist at all?

PC: No.

LRH: All right. Well, I'm going to see here ... Is this list complete? Consider committing overts against power. All right. Well, we'll see what we've got here. You apparently have listed out your favorite Dynamic Assessment's somatic. Is that right?

PC: Yes.

LRH: Huh?

PC: Overt somatic, I should think.

LRH: Oh, all right. I don't know whether we have time actually to null this list or not. But, if you will put up with the possibility that we will have to leave it and finish it at some other time ...

PC: Mm-hm.

LRH: I will be very happy to begin it here.

PC: That's fine with me.

LRH: All right. We'll see what we've got here. Okay?

PC: Mm-hm.

**PC:** Mm-hm.

**LRH:** A board of management. That's - yes, that's out.

**PC:** Rulers. You thinking about something?

**LRH:** He found it on you?

**PC:** He found it - he had it on his line I think, and then I think it came out when he was assessing me or something.

**LRH:** Oh, yes. All right. Rulers. Rulers. Rulers. Rulers. All right. I haven't got anything on it. It's out.

Kings. Okay. Kings. All right. That's in.

Women. Okay. That's out. What'd you just think of?

**PC:** I just thought Dick had ruler or something. He found that - that item on me.

**LRH:** He found it on you?

**PC:** He found it - he had it on his line I think, and then I think it came out when he was assessing me or something.

**LRH:** Oh, yes. All right. Rulers. Rulers. Rulers. Rulers. All right. I haven't got anything on it. It's out.

Kings. Okay. Kings. All right. That's in.

Women. Okay. That's out. What'd you just think of?

**PC:** I just thought that I'm feeling very nervous. Just noticed that I was nerv... feeling very nervous, for some reason or another.

**PC:** All right.

**LRH:** And we're going down the line on this on the subject of overts. Okay?

**PC:** All right.

**PC:** Good.

**LRH:** Any somatic turn on?

**PC:** There's a different one. It's something up in this shoulder now.

**LRH:** All right.

**PC:** Not worried.

**LRH:** All right. Consider committing overts against a crusher. Okay. That's out.

Something we forgot to put on the list. All right. Okay? You don't mind my putting that on your list?

**PC:** You're welcome.

PC: No. That's all right.

LRH: All right. What's the matter? Anything in particular?

PC: You just started to say consider - you started to say committing without saying consider first.

LRH: Oh.

PC: On that one. And then you asked me if something was the matter. And it went right away.

PC: Oh, no.

LRH: Got it? All right. Consider committing overts against a gun. Okay. That's out. Consider committing overts against a cannon. Yes. Consider committing overts against a cannon. Okay. That's out. We're going to make it very easily here. Anything you'd care to say?

PC: That's very good. Glad of that.

LRH: Hm?

PC: Glad of that.

**PC:** Unless it's just in the last four. That's up in this shoulder again. It's into the chin. Nothing very serious, but just noticed it's painful.

**LRH:** All right. Thank you. All right. Consider committing overts against authority. Thank you. I'll check that again. Consider committing overts against authority. All right. That's out. Consider committing overts against a government. Consider committing overts against a council. All right. What thought did you have? That's out.

**PC:** I thought you were going to check on "Consider having overts." You stopped when you said overts - presumably the needle went off or something.

**LRH:** When was that?

**PC:** Just then. And you said, "Consider having overts" and then you said again, "Consider having overts against a council." I thought you were checking on the word overt.

**PC:**  *All right.*

**LRH:** You're all right? Put your cans down for a minute. And you're actually surviving?

**PC:**  *Yes.*

**LRH:** All right. Very good. I thought you might like to rest your paws for a minute.

**PC:**  *Thank you.*

**LRH:** Going to tear down the line here, we should have this very shortly.

**PC:**  *Mm-hm.*

**PC:** No.

**LRH:** All right. Fine. Got a few left here and we'll be tearing down the line. Any somatic turn back on again?

**PC:** There's bit this way right across here, right in this area.

**LRH:** All right. All right.

**PC:** Comes and goes.

Well, the charge went someplace else. Let's see what we've got now. There's not very many here now, so let's see what we can do with these. Okay?

Consider committing overts against a group of people. Okay. That's out. Consider committing overts against kings. Thank you. That's out. Consider committing overts against a jaguar. All right.

**PC:** Fine.

**LRH:** All right. Good enough. Consider committing overts against a jaguar. All right. That's out. All right. Consider committing overts against a clever man. Against a clever man. Okay. That's out. Consider committing overts against a bludgeon. Consider committing overts against a bludgeon. Okay, that's out, and that's that. All right. Now on this list - on this list has anything been suppressed? Think of anything on it that's been suppressed? How is your somatic?

**PC:** Just had a - I suppressed telling you then that when you said a clever man, I did get a - quite a sharp somatic in the - I don't think it's in my heart there, but it's in the - in the chest there.

**LRH:** Is that so?

**PC:** And I was rather - I thought, well, you know, I was rather surprised it went out. But I suppressed telling you that.

**LRH:** All right. Thank you. All right, on this list is there anything you have suppressed? Something there?

**PC:** I only suppressed something I thought whilst you were running it, but it has nothing to do - Oh, no, I know what it is - I suppressed telling you at one stage that I had gone out of session, in my mind, Id missed quite a - two or three words that you read. I didn't - I didn't hear them.

**LRH:** All right. Good enough. Thank you. Thank you very much. All right on this list is there anything you have suppressed? Okay, thank you. All right. We will now check the last two items. Okay? Consider committing overts against a jaguar. Okay. That's still out. And consider committing overts against a clever man. Yes, there it is. Okay. Consider committing overts against a clever man. Okay. Now, on this item is there anything you have suppressed? Yes.

**PC:** Well, I suppressed telling you then this one: this is the only item on this list that I felt I could do anything with. Do you see?

**LRH:** Oh, yeah.

**PC:** And then I suppressed telling you that it was - then I suppressed telling you that. And there we are.

**LRH:** When did you do that?

**PC:** Just -just now when you ...

**LRH:** Oh all right. Very good.

**PC:** ... when you read it.

**LRH:** Thank you, I got it. All right, on this item is there anything you have suppressed? Okay, it looks clean. Okay, let's see what we got here now.
A clever man. Okay. A clever man. All right. On this item has anything been invalidated? Yes, what's that?

**PC:** Well I must - I think I've invalidated clever men.

**LRH:** All right. Very good.

**PC:** All my life.

**LRH:** All right, good enough. All right. On this item is there anything you have invalidated?

**PC:** Myself.

**LRH:** All right.

**PC:** Some- everybody - many people. I have been told many times that I've been clever, but I've never considered myself as being clever.

**LRH:** Oh, all right, thank you. All right, on this item is there anything you have invalidated? All right. That look clean to you, too?

**PC:** Yes.

**LRH:** All right. On this item has anything been... suppressed, next one.

**PC:** I've suppressed the name, the item now, clever man, clever man. I'd - I'd forgotten what the item was. I suppressed that.

**LRH:** All right, thank you. On this item has anything been suppressed? Anything been suppressed? Yes, something.

**PC:** I've suppressed the name, the item now, clever man, clever man. I'd - I'd forgotten what the item was. I suppressed that.

**LRH:** All right, thank you. On this item has anything been suppressed? Okay. You had an afterthought there. What was that?

**PC:** Well, that's that in the crazy, mixed-up way that we are, this could well turn out to be my item - to be an item anyway.

**LRH:** Yeah.

**PC:** Um.

**LRH:** Okay, very good. You got a somatic on it now?

**PC:** No.

**LRH:** Disappeared.

**PC:** Yes.

**LRH:** All right, very good. On this item has anything been suppressed? Okay. How's that now?

**PC:** That's all right. Only little thought I had there.

**LRH:** You had a little thought.

**PC:** Yes, the only little thought I had then was that... it's got something to do with clever men. That I'm suppressing it the whole time. I'm not - I don't consider I'm clever and never - dexterous would probably be the word - dexterous would be - that's right - when one is using one's hands and so on. I'm not.

**LRH:** Um.

**PC:** That's probably what cleverness means to me.

**LRH:** All right, very good. On this item - on this item has anything been suppressed? Okay, that could be cleaned up a bit more ...

**PC:** Um.

**LRH:** ... and we're going to leave it at that.

**PC:** All right.

**LRH:** Okay, here we go. Now, let us go into the end rudiments if that is all right with you.
PC: That's fine.

LRH: Okay? Now, is there anything you care to say before we do that?

PC: No.

LRH: You all right?

PC: I'm fine.

LRH: All right. Let me at least mark down the time. Okay, and here are your end rudiments. All right.

In this session have you told me any half-truth? Untruth? What was the untruth?

PC: The untruth was when you asked me a little while what you thought - what I thought of - you said you got a little – I said I had a little thought - you said, "You had a little thought?" And then when I came to it the thought wasn't there and I'd lost it; and I gave you an answer, but it wasn't really the answer, and that thought had just disappeared. That was the untruth.

LRH: All right, thank you very much. In this session have you told me any untruth? Untruth? What was the untruth?

PC: The afterthought was that when you asked me what I was thinking about – oh, about the meter, and you moved, that it - my pointing out rather emphatically that's what I thought about, might have damaged you in some way, you see. That is to say that you had handled a – Qed-and-Aed with me.

LRH: Oh, all right. Oh, all right, thank you. Thank you very much. Good. All right, do you agree that's clean?

PC: Um.

LRH: All of those? All right. In this session have you deliberately tried to influence the E-Meter? Equivocal. In this session have you deliberately tried to influence the E-Meter? All right. Any comment there?

PC: Once during the assessing my grip just tightened a little bit, and I just wondered whether it had influenced the meter or not.

LRH: All right, very good. All right, in this session have you done anything here to tame this thing down. In this session have you failed to answer any question or command I have given you? What's that? Something.

PC: Well, you told me to put the cans on the table when I blew my nose and then I picked them up without you telling me.

LRH: Oh, I see.

PC: So I'd done something wrong with the command.

LRH: Omission.

PC: Omission, yes.

LRH: All right. Thank you. In this session have you failed to answer any question or command I have given you? All right, do you agree that is clean?

PC: Um.

LRH: Very good. In this session have you decided anything? That's something.

PC: Hm!?
LRH: What have you decided? There it is.

PC: Oh! This was early on in the session after you had done the rudiments, and I think a bit before session, but it seemed to me that to really be in-session you would - right here and now in present time, and your attention wasn't on anything at all - and you could damn well tell if the rudiments were out or not because immediately it was presented to you it was there, and you can tell whether the rudiment is going to be clean or not.

LRH: Is this the auditor or the pc, what?

PC: The pc.

LRH: The pc. And what was it again now? Let me ...

PC: That - is to be right here in present time.

LRH: Yeah.

PC: And to, when the - when the rudiment is done, if there is anything on it at all and the meter is going to read it comes up.

LRH: I see.

PC: It's there. Otherwise your mind is just not - nothing comes there at all to pick up. And it's quite - it was my decision, I decided I knew this, you see? That is why I twisted it around to decision, but it's sort of a cognition in the session.

LRH: Well, I don't quite dig this. I'm not going to do this just to end this session rapidly, but right frankly I've not quite got this straight.

PC: Well you asked me ...

LRH: Either my attention is wandering, or I don't quite track this. What is it?

PC: Well, I decided that I knew what to be in-session was.

LRH: Oh, I see. All right, go on.

PC: And as I explained to you that to be in-session - when one is in-session - that you are right here and now, in present time ...

LRH: I get it.

PC: ... and your attention is not on anything else at all except the auditor.

LRH: I get it. All right.

PC: And it's quite something to realize, I think, because you can tell whether a rudiment is out, or - or what, and you are sort of just poised here waiting for the next auditor's command. It's quite something.

LRH: All right, very good. Now, I dig it now.

PC: Good.

LRH: All right. All right, let's see if this is clean now, check this on the meter. In this session have you decided anything? All right. In this session have you decided anything? Well, there's one more, one more, there's another one here. What is it? Another decision. There it is.

PC: Oh, oh, it's difficult to twist this around to decision, but it was to do with the sea and the - the item was the rate - no, was it the relentless sea, I think I put it down as ...

LRH: Yes, yes.

PC: ... and when this went out I decided that, well, that settles it, I'm going to have a good voyage.

LRH: Ah-ah, all right. Good enough, good enough. I shouldn't have pulled that one, should I?
PC: No!

LRH: Okay. Let me check that again. In this session have you decided anything? All right, there is still one on decided. That's decided anything. I don't quite know what to make out of this. Perhaps you can untangle this for me. There's something.

PC: I think I decided that I could, well - at some stage decided I could get my packing done quite easily in the morning. Oh, I think, I know what it was, I decided not to come into - I decided to do my packing before I came to Saint Hill in the morning.

LRH: Well, very good, very good, all right. Thank you. All right, let me check that on the meter now. In this session have you decided anything? All right, there is another decision here.

PC: Oh, really.

LRH: There it is. There it is.

PC: Well, I noticed your suit and the color of it, and I've got one that is light color, and then I decided that the odds against two people - two men - turning up with the same suit, pattern, were very remote.

LRH: Ha-ha, oh dear.

PC: And I just decided it - decided that the odds were rather great.

LRH: The what now?

PC: The odds against it were great, you see.

LRH: Oh, very good.

PC: I've been busy, haven't I?

LRH: All right. That's perfectly all right. All right. In this session have you decided anything? All right, equivocal. In this session have you decided anything? All right, do you agree that's clean?

PC: Yeah, that's clean now.

LRH: All right, very good. In this session have you thought, said or done anything I failed to find out about? Let me check it again. In this session have you thought, said or done anything I failed to find out about? All right, there's a tick here.

PC: Well, it was - well, what I think of at once, on "said", that I gave you an item, and I wasn't sure whether you'd got it or not.

LRH: That is correct.

PC: Um.

LRH: All right. That's perfectly all right. In this session have you thought, said or done anything I failed to find out about? In this session have you thought, said or done anything I have failed to find out about? All right. I get a bang-bang on a thought, and a said, thought, said or done. I get a thought, said and a done - the lot.

PC: Well, all right, well I moved - I moved forward in my chair once

LRH: Um-hm.

PC: ...whilst you were assessing, and I thought to mention it and then I thought I wouldn't, and I didn't.

LRH: All right.

PC: There's the whole lot for you, right?

LRH: All right, all right. Okay. In this session - in this session, have you thought, said or done anything I failed to find out about? In this session have you thought, said or done anything I have failed to find out about? There's a halt here. It's probably on my repeating it, but it hit the pin over here. What thought did you have while I was rolling that?
PC: Well, I thought it must be clean by now. It's - you've found out everything that's gone on in this session, I'm sure.

LRH: All right. In this session have you thought, said or done anything I have failed to find out about? Yeah, it's clean. All right, here we go, one more. In this session has anything been misunderstood? What's that?

PC: Oh, you misunderstood my cognition when I was trying to tell you. I had to tell you again.

LRH: All right, thank you, all right. In this session is there anything that was misunderstood? That's it, all right, good enough. In this session was the room all right? Now what was that on the room?

PC: A bit warm.

LRH: A bit warm, thank you. In this session was the room all right? Okay, once more, anything else on that?

PC: Well, I got it ready, and I - as I did it I thought well this isn't quite the job for the preclear. But it didn't matter, it was my job anyway.

LRH: Oh, I see, all right.

PC: I moved this chair, do you see, changed the chairs and wondered whether that was - that was the more comfortable chair, but I thought this was the right one.

LRH: Very good, all right. In this session was the room all right? Okay. Squeeze the cans. All right, put the cans down. Okay.

Feel the table. All right. Feel your jacket. Thank you. Feel the table. Thank you. Feel the telephone. Thank you. Feel that piece of wire. Thank you. Feel the back of the meter. Thank you. Feel both cans. Good. Pick them up.

All right, squeeze the cans. That's better. Do it again. All right, thank you very much. How's your havingness feel?

PC: It feels fine.

LRH: Feels fine? All right. Thank you very much. Now, did you make any part of your goals for this session? To work well in session?

PC: Yes.

LRH: Yes, all right. To feel better at end?

PC: Yeah, I feel very bright.

LRH: All right, good. To find the dynamic and the item?

PC: We found the dynamic but, ah - well, I think we found the item, anyway, you know yourself.

LRH: All right.

PC: Pc's never right, I know, but never mind.

LRH: Very good, all right. Okay, are there any other gains you'd care to mention?

PC: Well, I feel a lot brighter and - and that cognition about in-session was very, very good.

LRH: Okay.

PC: Got a terrific reality on that.

LRH: Good.

PC: And I think, I think I've shown myself somehow or another - we've had a look at something en route here on - about the sea voyage, you know.

LRH: Oh, all right, okay.
PC: I don't feel as nervous as I did in the middle of the session about things. I think I've gotten rid of a lot of fear, or something.

LRH: All right, very good.

PC: I might just say one other thing, that I did realize whilst I was going through, that a lot of the items I gave you were very overwhelming, and things I was scared of, and to some degree I must have done quite a bit of confronting there, and I'm sure that will have - you know, I shall notice this as an advance.

LRH: All right. Thank you. All right, anything else?

PC: No, that's fine.

LRH: Good enough. Now is there anything you would care to ask or say before I end this session?

PC: I just want to say thank you very much.

LRH: All right, you're welcome. All right, here it is. End of session.

PC: Thank you.

LRH: All right, very good.
DIRECTING PC'S ATTENTION

A lecture given on
18 September 1962

Well, that's very nice of you. Thank you very much.

Well, this is what?

Audience: 18 September AD 12.

Eighteen September…

Female voice: 12 AD

… AD 12.

You realize your chances of getting out of here Clear actually occur in the first six weeks of your presence here. Somebody sighs. Some old student sighed. It was too true, wasn't it? You don't think it was true. He – he came Clear and he hasn't been the same since.

[laughs]

Male voice: That's right.

Yeah well, I'm here now. I'll fix it. I'll fix it. I know what you got overts on. Har-har-har! You didn't take me seriously did you?

Male voice: Yeah.

You should have! [laughs, laughter]

Well now, on the boat – when I was down in the cabin working like mad, and other people I won't name were up swimming and dashing about the decks [laughter] and looking athletic and enthusiastic – a remark was made to me that on the first night back with all the data I had to give you, "Well, you'll probably be here till 12:30." I wish to disabuse you of this particular fact and say that why don't I just make this a ten, fifteen minute lecture and then we all go home. Wouldn't you rather do that?

Audience: No.

All right.

Well anyway I will give you some of the data, tonight. But it might take till 2:30. Anyhow, that's…
I probably should tell you something about what happened over in Washington but I
couldn't get it into a five or six hour lecture schedule. This was very adventurous. I left here
tired; I arrived in Washington tired; I finished the congress tired; I finished my stay in Wash-
ington tired – always looking forward to this next moment when I was going to get some rest,
you see? And then finally came back to Saint Hill, tired. [laughs] I have never done so much
auditing, looked over so many goals, done so many Dynamic Assessments, talked to so many
people. And few people who were at the congress, were aware of the fact that I spent most of
the congress off the stage auditing. I was making very sure we had a goal to announce by
congress end, you see?

And also we were straightening up some of the organizations in the States. The best
way to straighten things up is an E-Meter. And I'd like to give you a tip: Instead of reaching
for an argument, reach for an E-Meter. That's a nice tip. And if you followed that tip more
often, life would run like a summer dream. That is so overbearingly true.

For instance, amongst the adventures which assailed me on this rapid passage was a
fellow coming into my room in 1827, just as we had all the baggage stacked up in the hall,
and insulting me. He said the one unforgivable thi ng that mustn't be said to me, on the subject
of how I was responsible for everything, everyplace.

And I promptly barked, growled, headed him backwards over stacks of luggage – it
was very disgraceful, I mean, cameras and briefcases went in all directions – and he got out
the front door and I hooked him back in the front door on the realization that this was not a
way to resolve a case. And so I hooked a hand around his neck and threw him back into the
house, and hooked the hand around his neck the other way and threw him into my room, and
gave him a good shove in the chest, and he sat down.

I opened my E-Meter case – it was all packed; we were just about to leave for New
York. We were going to leave for New York at two o'clock and something came up. And then
we postponed it till three and something came up. And then we postponed it till four and
something came up. And I think this happened at five.

Anyway, I just sat there and pulled his missed withholds. Put the cans in his hands, put
on my auditor hat and, just as though nothing had been happening, just sat down and pulled
his missed withholds. Just like that. One right after the other. And cleaned three buttons in the
space – I don't remember what the auditing period was but it couldn't have been more than
about half an hour to thirty-five minutes.

And I cleaned three buttons. And I wish to recommend this to you as an auditing job.
Three buttons clean in about thirty or thirty-five minutes as follows: "What have we failed to
find out about you?" (meaning all Scientologists everyplace), "What have I failed to find out
about you?" and "In this session have I missed a withhold on you?" – all three clean, slick as a
whistle.

He was giving me nicer and nicer answers. The answers were sweeter and sweeter.
And he was more and more pleasant. And I think somebody out on the other coast had given
him a twenty-five-hour intensive to clean up these buttons, but hadn't ever scratched them.
That's interesting, isn't it? And at the end of that time ran a Security Check on him.
This is in the last five minutes. Told him that his goal was in opposition to Scientology after I had done so. This was a – this was – the last minute was a Dynamic Assessment. And told him his goals were in opposition – his goal was in opposition to Scientology, and that was why he'd been acting that way, because that's what the meter said.

And he said, "Well, what do we do about it?"

And I said, "Well," I said, "You go on and get yourself some auditing, and I'll see to it somebody finds your goal somewhere along the line."

And he got up and shook me by the hand and he said, "Thank you, very much." He said, "I'm going to make you a good auditor."

Now, the number of hours of administrative time that this person had already occupied on various lines in various places had amounted to a minimum of fifty or sixty. And if you don't like administration, use an E-Meter. Get the idea? And when you use an E-Meter, get something done.

Now, that may be a novel thought. That may be a novel thought. When you use an E-Meter, get something done. I see that lands more or less on deaf ears.

An E-Meter is not something that you should spend lots of time on; an E-Meter is something you should do something with. You can do a great deal with an E-Meter. Somebody's busy arguing with you left and right, somebody's busy knocking your head in, somebody's getting very uppity and monkeyed up; well, you're lucky if you can get to him with an E-Meter. You're very lucky. Because sometimes you can't. Such as the building you're sitting in is illegal, and Town and County Planning are corresponding. Now, I'm sure this will take a great many hours to settle. But if I could get these cotton-picking monkeys on the other end of an E-Meter, I'd pull the withhold fast. We might even arrange it. Oh! Well, that's another story.

Anyway, Scientology is to be used. It's for use. It is something you can use. And it isn't something that you pick up and use in an auditing session, necessarily, but it's something you can use all the time. But when you do decide to do something Scientology-wise, well be effective and do it. Yeah, that's all – just do it. And most of the rules which are laid down in auditing and in clearing are all devoted to keeping you from doing ineffective things. These rules are a path of effectiveness.

Now remember, men have been talking to men for a number of millennia, ever since they came out of the trees. And they've been talking. And they've been doing a lot of talking. Some of them are still in the trees. In fact, I saw a psychiatrist the other day wearing a swallow-tail coat. And, he had to. And, the general position of talking and discussing and so forth has been that it has been a waste of time.

Now, how is it in auditing that we can use talkingness and suddenly something happens, see? How come? How come this occurs?

And the rules by which you audit are the rules of an effective path to an accomplishment – of reaching someone, of bettering someone, of obtaining agreement and improving existence. But it's a highly circumscribed path.
Now, if you were to – if you were to look over a great many activities in the past which were supposed to cure people or supposed to make them sane or supposed to make them happy or something of the sort, you would be amazed at their numerosness. They're just almost without number. We know a few of them as the witch doctor, the *rrarh* psycho-analyst, the Aesculapian school of healing. These things – I could go on and on and on and name and name and name and name and name and name, and you'd all come down to something quite interesting, is that it had to do with talking to somebody about something or listening to somebody about something. That's been assisted from time to time with puffs of smoke and pinches of pepper as in the case of the witch doctor – juju horsetail flies with fleas in them. All of these things have a – have a talkingness, a reachingness, an effort to reach connected with them.

For instance, by the simple expedient of scattering fleas all over somebody with a horsetail fly, the juju doctor creates a confusion into which he can put his implant. You recognize that it's – fellow wouldn't pay much attention to what was coming in; it would just go in at that moment.

The – well, most old witch doctors had to learn how to scream, and you got an interrupted scream. They'd scream loud enough to kick your eardrums in and then say something and then continue the scream. And the patient thereafter didn't know they had stopped screaming, but of course had a sandwiched implant, with the statement in the middle of the scream, you see, being an implanted suggestion of some kind or another. Usually, in that stage of medicine, the suggestion was something on the order of, "You're going to die."

There's always been a talkingness and a reachingness. In other words, we found Axiom 10 operating throughout efforts to overwhelm, efforts to heal, efforts to control, efforts to make sane, efforts to better, efforts to become better. All of these various things have Axiom 10 running through their midst.

Now, how is it that we in Scientology can suddenly come along and, by certain applications of this same talk that has been going on since time immemorial without effectiveness – with this same talk, being effective? How do we do this? That's something to think about, isn't it?

Now, many a student misses this. They miss the fundamental of auditing – the most fundamental fundamental there is. Auditing has to do with a communication formula, and when a person says something and somebody acknowledges it (if the statement is truthful and the acknowledgment is received), can blow, erase, eradicate, deintensify mental charge. It's on that fact alone that auditing works. Auditing is *based* upon that fact. There is no other erudite fact on which it is based. It's Axiom 10!

Now, it actually isn't what's said by the person who is being treated. It actually isn't what's said by the person who is acknowledging. It, to a very marked degree, is what is said by the person doing the treating in the first place. This causes a momentary restimulation, and that restimulation is picked up by the pc, recognized, verbalized and blown by the moment when the acknowledgment is received. Somebody has heard him.

Now, that's your – that's the cycle of auditing. The question or the command directs the person's attention to a certain area of bank; and the person, perceiving that area of bank,
responds, and knows he has responded when he is acknowledged and receives that acknowledgment. And that is the cycle of an auditing command.

Now, it is to maintain a purity of cycle that you find most auditing rules growing up. These rules occur to maintain the auditing cycle. And techniques specify what is to be restimulated in what sequence. Now, if you've done that right and you know what button should be hit and what responses should be given, you only need add to it repetitive question and repetitive response, order of question – that is, the sequence of questions asked by the practitioner, each one followed by the same cycle as I have just named – to obtain a state of Release or Clear or Theta Clear or Operating Thetan.

In other words, it's that magical formula which leads all the way out, and don't you forget it. That is the only reason anybody goes out. It is not the charm of the practitioner, the nameplate on the E-Meter; it's not that the person believes or disbelieves Scientology – because let me point out, I think the fellow – you'd say a fellow who has been yanked around by me and javelined all over the front hall would not be in a very receptive state. In fact, he'd be in a very repressed state of some kind or another to audit. Yet, the exact button processed on the person relieved the state. In other words, the auditing was greater than the wooling.

Now, what – what might somebody come to believe? Well, if you want a list then just take all the asininarities that have been written in the books of philosophy on any planet in this universe – take the lot, make your list and you'll get how many departures there can be from the auditing cycle. And that's an awful lot. So there's really not much reason to go into it.

A salesman depends on some kind of a cycle in order to sell. He says to somebody, "Here is an automobile, buy it!"

And the person is supposed to say, "Okay. Here is my check."

And then the salesman is supposed to say, "Okay, take it away." And do you know, most cars are sold on that simple a formula. Guy's already seen the car, he wants a car, he walks in and he says, "Do you have cars for sale? Is that car – is that – that purple car in the window for sale?"

And, the fellow says, "Yes, yes, we just have one left."

And the fellow says, "All right. Oil it and grease it up. I'll drive it out the rear door."

Actually, that's what would more or less be called the majority of sales.

Now, a salesman believes, of course, he has to sell the car. And that is what cancels the majority of sales. Now, that even goes so far in some places which have done a cycle of action on the subject of business which is gone into a fine games condition, where the seller will not permit the buyer to have the product. Now that can be attained, too. I remember one time spending an hour and a half in my office, selling an Addressograph salesman on the idea of selling us a machine.

Well, that's because aberration is entered into it. But there are certain cycles of action that go along with selling. And there are certain cycles of action that go along with teaching, which are quite different than these auditing cycles of action. And then there are all these varied cycles of action that have turned up in philosophic tech since time immemorial. Zen Bud-
dhism – that gives you a stack of them that gets nobody no place. By the time it had gotten out to Japan, they didn't know much about Buddhism. I say that advisedly because I'm no authority on Zen Buddhism. I'm still sane.

Such practices try to handle some ramification of Axiom 10 – all of them. And they all go off in different directions.

Now, you get this fellow that's been a salesman for the last twenty-nine to the twenty-ninth power lives, and you make him an auditor. You try to make him an auditor, you see? So he sells the pc engrams, and the pc takes them away with him, too. He'll sell clearing, and the thetan's lucky to get away from there with any body left, because it goes from nowhere. In other words, he's trying to handle a cycle of communication which is pertinent to some other field. And he doesn't see that auditing is its own cycle of communication.

Had an example called to my attention the other day. Pc comes in and he says, "Well," he says, "I've been up all night, and uh – I been auditing myself, and uh – I kind of messed up and uh – so forth, and uh – tsk – well, that's it."

And the auditor flies into the D of P or the Auditing Supervisor – just breaks off the session right there at that point – and says, "Oh my God! I can't possibly audit this fellow because he – you know what he's just told me? He's told me that he's been auditing all night, and what can you do about that?"

Aaaaah. Ow! Do about that? Everything about that that can be done has already happened. The pc has told him. You get the idea? I mean, everything that you're going to do about it has already occurred.

Well, an auditor who will do that is on some other communication cycle. See? He's trying to sell planets or something – he's not auditing. I don't know what he – I don't know what he thinks auditing is if he does something like that, or what is supposed to happen in an auditing session.

I have run into students, sometime ago, who actually thought the E-Meter fell on the sound of their own voice. We've been curing this up. In other words, when the auditor spoke, the E-Meter reacted. I think that's marvelous, you know? Because it shows no comprehension of the auditing cycle. Because this immediately lends itself to some weird, old past track idea of some kind or another, whereby it is the practitioner who wears the case of the patient, and by speaking about it gets it to react on the meter, and now that the pc or the patient witnesses it, becomes well.

Now, I hate to burden your wits with that one, but I'm just showing you there's another cycle of action.

Now, you've seen characters laying on hands. Well, this is not a disgraceful activity. As a matter of fact a Touch Assist is always welcome. But how come this communication cycle of "We lay on the paw and draw the pain out of the wound, and experience the pain in the paw, and then shake it away like a dog coming out of the water." You've seen that, haven't you?

Well, it's an interesting cycle of action.
Now, we take somebody who of course is totally addicted to another cycle of action of some kind or another and never sees the auditing cycle of action, and what do we get out of this? After he reads the E-Meter, see – got the E-Meter there and he says "Have you sinned?" "Now he's better." Do you get that? It is totally – totally possible. This sounds utterly mad.

But I'm only calling this to your attention because the basic of auditing is an auditing cycle of command which operates as an attention director – call it a restimulator if you want, but it's an attention director – eliciting a response from the patient to as-is that area, and who knows he has done so when he receives from the practitioner an acknowledgment that it has occurred. Now, that is the auditing cycle and any departure from that auditing cycle will wind you up in the soup.

Now, that auditing cycle all by itself is sufficiently powerful to get gains no matter what button you direct. Let's be very, very, very puristic about this. Let's remove all significance from it as an action and see if anything happens to the pc! Let us tell him, from where he is to get the idea of looking at his left ear, and thank him, and get the idea of looking at his right ear, and thank him, and get the idea of looking at his left ear, and thank him, and get the idea of looking at his right ear, and thank him. Well, what happens is he's not going to wind up without ears. But the mere fact of directed attention and the acknowledgment that he has directed his attention – just that fact all by itself – operates as a therapeutic action. See, there's no significance in the command. It just says, "Inspect your right ear; inspect your left ear," see, and that just run bang, bang, bang, bang.

Now, just doing it once might not be observably therapeutic. Doing it twice, probably not. But here is a new thing that enters into it: repetitive. The repetitive action. Duplication is added to the communication formula, which contains duplication anyway. So of course, you've taken the appearance of duplication – pardon me, you've taken the appearance of communication and increased it enormously by the fact of duplication. This fellow really knows he's being communicated to now, and he can direct his attention better and better and better. And he knows something is happening because somebody has told him so every time the acknowledgment occurs.

Now, what occurs this way? The person will become aware of some other being in existence, will become aware of mass, will become aware of the fact his attention is easy to shift or hard to shift. Various things will occur. His awareness of these things will increase and his attention becomes free. It becomes freer and freer and freer. Now, the thing is limited because he wots not of what he's looking at. Nobody has asked him for any sense to it. It takes longer.

Now, in essence, those are your CCHs. It's the nonsignificance of directed attention, and those of you who are still trying to read all kinds of significance into the CCHs should just tear that little chapter out of the book and go over in the corner quietly and read it, because the CCHs present different ways of directing the pc's attention with minimal significance. And of course, your worse-off pc does very well on them, because he finds out that there is matter, energy, space, time, and somebody else alive in the world. It's probably one of the greatest cognitions that an individual can have, if he doesn't know it. It's almost with horror that he realizes it for the first time.
How do you suppose the great criminal manages to live with himself? How does he manage to live with himself? It's just that nobody else exists, so therefore it doesn't matter what he does. And there he goes.

How are you going to get this fellow out of it? Well, you can't tell him, "Think of the significance of this or that and the other thing" most of the time, because the significance would never arrive. He – this he could not duplicate. He cannot duplicate the significance of looking at it – the significance of looking at a significance. He can't do that. But he can duplicate the relatively nonsignificant action of simply directed attention.

If you want to make some pc feel like he's being hypnotized when he isn't, set up two bottles in front of him and tell him to look at the left one, and then tell him to look at the right one, and then tell him to look at the left one, and tell him to look at the right one, and tell him to look at the left one, and tell him to look at the right one, and all of the sudden he'll get some weird feeling of becoming hypnotized. Of course, he isn't becoming hypnotized; hypnotism is running off. And if you do it for a little while after he first begins to feel that he's being hypnotized, he'll realize actually what is happening. He's waking up. Sleeping Beauty.

Now, there you see a new idea in the communication cycle. It's a communication without significance, beyond the significance of what the attention is directed to.

Now, many an activity has directed attention, but not duplicatively. And that is one of the secrets of Scientology processing and why it works. Duplicative. One of the reasons this was never discovered was because most people can't take it. It's the practitioner who can't take it, not the patient. Therefore at HCA level we like to have a lot of Op Pro by Dup, and somebody comes through and says, "Well, should Op Pro by Dup be run just during the auditing periods for three days in order to get in – or four days in order to get in eight hours of it, or should it be run all at once, or should it be so, and should it be so on?" You see, they're so starved for significance they won't just do Op Pro by Dup. I don't care how it's run; run it! See?

But of course, every time the fellow says that he cannot walk over to the book one more time, at that moment you assist him thither. It must be run. And where everybody is busy worrying about how it's run, they very often neglect that it must be run. If you ever wanted to see a Scientologist natter, find one that early in his career was run on Op Pro by Dup by consent of the pc on this basis: The pc says he's getting tired so the auditor says, "All right, sit down and take a rest." The pc says he can't tell just now, so the auditor lets it skid. And boy, what's happened there? The cycle of action is entirely and completely mishmashed. You don't get the intention of the practitioner expressed in the direction of attention of the person it is being run on. And therefore, then, you don't get the acknowledgment – and it's very weird.

But there's a very basic action, and you could do this in a single-action basis. But it doesn't make space and it tends to make the guy feel kind of stacked up when you say, "You see that black spot? All right, look at that spot. Thank you. Look at that spot. Thank you. Look at that spot. Thank you. Look at that spot. Thank you. Look at that spot. Thank you. Look at that spot. Thank you. Look at that spot. Thank you. Look at that..." You haven't got two points, so of course you've no space. And the odd part of
it is this black spot will start to look closer and closer and closer and closer, and the guy will begin to believe he's kind of being pulled out of his head toward the black spot. Because he can't make space, so therefore he doesn't know where he is.

So two is always better. And then of course, two adds to the element of duplication. We got a two-pole universe and we've got duplication going and here we go. Op Pro by Dup becomes a killer.

But recognize that you could direct attention repetitively, in a duplicative fashion, on and on and on – in almost any fashion – and achieve a renewed awareness on the part of another being, for yourself and for the world around him. See? It isn't – any other significance in it than just that. There is no further significance in that action than that. There is actually no further result in that action than that either. Somatics will turn on and off and you'll think he's getting rid of lots of somatics, and you'll run to them – run into them later on, to the place where he is going to. And there they'll be waiting on the track again. But that's beside the point. The person has become aware. He's become more aware and to that degree he has enormously improved.

Now, this does very interesting things in terms of improvement. It improves IQ, it improves alertness, it improves sogginess of one kind or another in life. It'll do all kinds of things. You could write up a bill of – a bill of health on the thing and put it on a slab board outside, that a lot of customers would be very, very happy to come in and get that to happen to them. But it's an elementary purity. Op Pro by Dup.

Other activities, as I was just about to say, have done repetitive commands. Various activities have done this. There is a one-command process which is used over in the heights of the Himalayas which deletes these things, and that is "Regard your navel." The command is given once and twenty years later the fellow is still sitting there. It's not optimum auditing. It's called an auditor comm lag. But recognize that as a cycle of action of sorts. Recognize that.

Somebody writes down in a book "What you want to do is regard your navel." All right. So the fellow says, "Fine. I'll regard my navel." He's got one auditing command and one navel. And he gets stuck! Because the acknowledgment is missing even for that one command. The author of the text never comes out afterwards, through the pages of the book, and – sort of breaking the fellow's attention off as it's staring downward – and says, "Thank you very much."

You go around to somebody – if you want to produce a shock of magnitude on some monk of Tibet, why, learn this in Tibetan. It'd probably get you past many monastery doors. They'd be so flat on their backs after you said it that nobody would stop you. And that would be "Thank you very much for regarding your navel." Guy has been waiting for it, you know?

Now, if you – you see that then the – there are different cycles than the auditing cycle, and it is very easy to fall into these other cycles because men have been in them for a long time. There's lots of them on the track. There's an enormous variety of ways to handle communication. There's, for instance, a cycle – there's a cycle that might go something like this: "Hello, dear." Bang! You see? The acknowledgment comes with the greeting. Well, we see this in less domestic ways on such a thing, "Halt or I'll shoot!" Bang! You see?
It's like the captain walking past the guardhouse one day and new sentry said to him, "Halt or I'll shoot. Halt or I'll shoot. Halt or I'll shoot."

And fortunately before he got the last syllable completely out the captain reached over and shook him and said, "Hey, what's going on? What's the matter? What's the matter?"

"Well, sergeant said to say that three times and then shoot." Well, that's another cycle of action.

Now, wherever you've got a – a communication line set up, you have some kind of a response system on this line and it'll go through some kind of a cycle. There are some marvelous cycles. I wouldn't spend any time studying them particularly. But if you know there are different cycles of communication or action, then you'll see that it is a unique cycle. The auditing cycle of action is unique. And frankly you could sit down and study it for quite a while with a considerable amount of benefit. You could say, "What is this thing all about?" You utter a command or ask a question, and this directs the pc's attention; and then you'd realize that the question or command (also unseen) directs the attention of the pc by pulling the reactive bank up around the pc's ears, which is operating independent of the intention of the pc, and is more responsive to the practitioner than it is to the person.

I can always make people's somatic strips go tearing around. It's very fascinating. Any outsider has more control of a person's reactive bank than the person himself. Of course it's on that additional point that auditing is to some degree based. This fellow sits inside of his skull and he says, "I'll restimulate it and then I'll as-is it, and I'll restimulate it, and I'll as-is it, and I'll restimulate and I'll as-is it, and I'll restimulate and I'll as-is it, and I'll restimulate it and I'll as-is." Odd part of it is it has some workability, but he gets stacked up after a while, you see, because he actually isn't as-ising some of it and never notices when he goes off of it. He isn't a good director of his reactive bank, because the common denominator of the reactive bank is other-determinism.

So auditing basically requires a practitioner. That is because an other-determinism handles the other-determinism of the reactive bank much more easily than the individual himself. Did you ever think of that?

So when the auditor isn't following through the cycle of action of auditing – the cycle of an auditing command – then nobody else is going to adjust the bank for him. And an auditor who won't help him out by adjusting the bank for him, of course, is leaving him in the soup; and the pc feels like he's getting no auditing.

If you go ahead and study the cycle I've been talking to you about in this lecture, you will see most of the mistakes of auditing. You will see how these things grow and come about: first by a habit pattern from other eras and scenes and activities, and second by not recognizing that it is a set pattern that you're following. There is a set pattern. It is very set. Auditing has a very precise cycle. And if that cycle isn't followed, auditing doesn't occur.

The next thing that you should recognize about this is that a pc whose attention cannot be controlled cannot be directed into areas of significance which don't (reactively) want to have any attention directed into. Let us say this pc has a goal "never to look." And you're busy trying to find a goal "never to look," only you don't know what the goal is. Oh, coo! I invite
you to try to find this on a pc whose attention you, the auditor, does not – do not control. You see what would happen? The bank has more authority over the pc than the auditor.

Now, this pc's attention can be directed so – and the auditor is skilled at directing his attention, not diverting it by dropping E-Meters or comments on the weather – and there is a point in the session when this ridge, or whatever the buildup is which sort of surrounds this goal, first appears over the reactive horizon. And it says, "never to look." And of course, the auditor has more control of the pc's attention than the pc's own bank. So therefore, the pc looks straight at it and tells the auditor exactly what it is. And you write down the goal "never to look" on the pc's list, and when it's tiger drilled you find it.

Now, a pc who is gloriously "out of session," we call it – that is, a pc whose attention is not being directed by the auditor – he hits this one and he obeys the bank and he doesn't look over there. Bank says, "never to look." That's it. Pc doesn't look over there. Do you see how it is?

Now, all goals lists contain goals of this character. This is not peculiar to one pc. For one pc to have this as a goal would be an individualism of one kind. That's the pc's goal. But all goals lists contain goals of this character. And you can almost – this is just a hazarded guess here – look over the list of the pc whose goal is not being easily found and you will find on it a complete absence of goals which command the attention to go the other way. There'll never be anything on it like "never to look," "not to talk," "to be silent." These things will not appear on that pc's goals list. And the pc whose attention can be directed by the auditor will have a great many of these on the list. That's just an educated guesstimate, not based on very much observation. But I'm just giving you just a look at it.

So you wonder why pc A's goal cannot be found and pc B's goal can be found. It again comes down to the auditor and to nobody else. There are no good pcs or bad pcs. There are only pcs. There are good auditors and there are bad auditors. And good auditors use a communication cycle and get it executed. And bad auditors monkey along and never direct the pc's attention. Therefore you have fast goal finding and slow goal finding. You have fast auditing and slow auditing. You have all the varieties of auditing which are presented to your eye by any group of pcs passing through an HGC or a private auditor's hands. That's the way it is.

Now, we say, "Well, some pcs' attention is harder to direct than others." And I say it's still the auditor. It's sometimes an auditor has to work harder than others. And that's about all that you can say about it. If you look over your own auditing on the basis of the cycle of auditing, and if you look over any pc that you are auditing on the basis of "Is his attention being directed by me and can I count upon the fact that it is?" you will learn a great deal about what is going on, both with your auditing and with that pc and the relationships in between. Okay?

Thank you.
Okay, second lecture, 18 September, AD 12. 3GA Dynamic Assessment.

Once upon a time there was a thetan.

Nobody happens to have that "Rule of Thumb"; do they? No, that's all right. Remember most of them.

3GA. The thing you should know about 3GA Dynamic Assessment by Rock Slam is that when it does not work, you haven't done it! There's several tips one could give on this, this is not particularly an expansive lecture that gives you all of the odd bits and all that sort of thing, but it's definitely of great interest to you that this has been working. And it has been working very well. It requires further working on, and I am working on it further.

But there are many things you can do with this Dynamic Assessment by Rock Slam. The idea is simply this: The rock slam is called a rock slam because it is a needle manifestation which is achieved when the auditor is approaching what we once called "the Rock." Now, there's something earlier than the Rock and it's called a goal. And if it were called a "Goal Slam," you would have it. Because it is the goal that is slamming. It's producing a great deal of random needle motion. And this random needle motion is occurring solely, entirely and completely because of the currents being set up amongst the items and identities the person has assumed or fought in the progress of executing his or her goal.

And it goes this way and it goes that way, and it goes someplace else, and the individual has no place to go, no place to go to, no place to retire from. In other words, he cannot get away from it, he cannot approach it, nothing else is happening, he is in a state of agitation. Now, this rock slam, or goal slam, which we will not call it, we will maintain the word rock slam, is a thetan convulsion. And in the absence of a slamming needle, you will very often find a convulsing body. The body will convulse, before the rock slam will turn on.

People who have convulsing bodies may sometimes not develop rock slams, and people who have rock slams may suddenly develop convulsing bodies. Was talking to somebody over in Washington on an innocent subject, and he looked like he was going to go into a convulsion. He's very, very afraid of going into a convulsion, this idea upset him very much. And that I was merely approaching the subject which he thought would send him into a convulsion, if I'd had him on the meter at that moment I would have found a slamming needle.

---

1 Editor's note: HCOB 19 Sep. 1962, "3GA, Tips on Dynamic Assessment, Rules of Thumb"
Do you see that? So, it – there it is in the bank, the reactive bank, and it's the crisscross of currents that are battering a thetan around. And, when this gets into a solidity, why, it of course has the power of throwing the body around.

Now, the degree that it can throw the body around probably approaches poltergeist. The thetan produces a rock slam on the needle. Well this – he's just feeling kind of ththththh! He's being – you know, his currents are going left, right and center, and so forth, and they're going through him and by him and up and down and side rrrrrllmm!

All right. The next thing that would happen is this submerged – this is all surmised, by the way, but it has some factual evidence behind it. I'm just trying to give you this illustratively. You might have somebody who was convulsing physically. You know, the head starts going like this, uhh-uhh-vuhhvuhh-rvuh-vuhh-vuhh-rvuhh, see? Like a slamming needle. But then you also might have somebody whose whole body started to go that way, and that is called an epileptic fit. It's also called other names. That type of convulsion is the type I'm speaking of.

Now, supposing it advanced further than the body, and – this is surmised, you see – advanced further than the body and entered the physical universe around the person. And you would get the physical universe at first responding sort of enturbulatedly. You get a psycho, walks up the front steps of an HGC, the Shipping Clerk starts cutting his fingers with the shears, you know? That's a fact! You want to produce turbulence, or something, why, just take some psycho and put him into the auditing lineup and you've got it. You yourself will catch yourself dropping commands, and so forth.

I had a session like this in Washington. I was quite amazed. I was handing out the wrong commands a time or two and so forth, ugh! It was a sort of a – of a theta poltergeist, you know, in the immediate atmosphere around me! Dzzzz-zzzz, you know, you could sort of feel it.

All right, now, if that went a little bit further, you would get real poltergeist, perhaps. You know, the rugs being thrown around, and so forth. But certainly you get enmest. Whatever else you get, you get enmest. You look at that person's possessions and they're starting to get chewed up, you know? You give this girl a brand-new handbag. And in the process of her grasping the handle it ages! [laughter] You get the idea?

Anyway, what it is, is obsessive and random motion. Or a postulate which is in a state of producing obsessive and random intentions and impulses when restimulated. Let's say this fellow has a goal "to swim the English Channel." And we know this but he doesn't. You see you never really get that as a pure test. We take him out to the cliff, over at Dover, and we say to him, we say, "Swim the English Channel!" see? And my God, he wouldn't know whether to jump off the cliff, or run to London, or hide under a clam shell, and he'd probably go into some kind of a convulsion.

He's being required to do something, the requirement is illogical, unreasonable, unexpected, you get all these conditions attached to it – would probably produce you some very interesting behavior. And yet very often a person's goal is said to them! Sometimes in a level of command. And a person starts going hzzz-hzzt-bzzz-bzzt-blzz-wzzzl-zzmm! You walk up to somebody who has a goal, "to eat cats." And you say to him, "I'm afraid you'll eat the cat!"
He'll totally occlude the statement, he'll go straight into the bank, and you'll get a rock-slammy mental condition.

And he's liable to remember this on the backtrack as a convulsion of some sort. He's been backed into his item, or he's – or he's been backed into his goal in some fashion, and he can't quite tell what it is. But he sure feels random about it.

I see somebody has had this experience with an item. Or, even a goal. And you remember times when this one suddenly was presented to you. A fellow has a – has a goal "to jump off high places" see. Such a goal, anybody had. Has a goal "to jump off high places." It is the goal, you understand. I'm not talking about a random, casual little subsidiary goal, you know. Finds himself on a high place. Man, that is enough! He doesn't jump off high places. But actually he doesn't not jump off high places. You get the idea? He goes around seeking high places to jump off of, and then never climbing up them.

Now, you should understand a rock slam for what it is, then. It is the goal track. There's many things you can say about it. The pc's interest, by the way, follows the track of the goal. And therefore follows the slam. Pc's interest follows the slam. Pc's getting interested, the needle's slamming, pc's interested, needle's slamming, pcs interested, needle's slamming, pc's not interested, needle's not slamming. In other words, the pc's interest follows the slam. Pc's cognitions follow the slam.

All of a sudden, the pc's been sitting there, as dead as some of this South African wood that won't even float in water. See, there he is. Total session response: "Uh-huh, hm-hmm." Been like this for hundreds of hours of auditing. "Hm-hmm." All of a sudden this pc says to you, "I'll bet all roof rafters are not really straight. You know, there is something about that. They're not really straight. Yes, yes, that item you just called out there, that's very interesting. Not-straight roof rafters. And – and – yes, and it goes down on the other side, too, and very often they're long. Yes, I've had this experience and so forth. So – funny thing, I've just realized that most roof rafters, they pretend they are straight!" See? Well, if you weren't watching your needle at the time, you'll find that it was – you look down on it, you'd find it was slaming.

You're looking for the cogniting pc. Pcs, any pc cognites, when the slam is being followed. You're going down the slam track. And the pc will cognite. If you just get on the edge of the slam someplace, the pc is liable to cognite. But a pc's cognitions actually go down the track of the rock slam.

That is very interesting, not that a pc is suddenly, inexplicably in-session, never having been before, but the pc in actual fact is being reached as a case. Well, this is all grist to the auditor's mill. It isn't the pc is not in-session when he is not rock slamming, but if you want to see an exaggeration of in-sessionness it is during one of these periods.

Now, it's as much as your life is worth to ARC break a pc who is in the middle of a rock slam. You won't be able to get away with the things you got away with when he wasn't rock slamming. In other words, it takes pretty careful auditing. Somebody the other day was busy teaching all the HCAs in the Central Organization to do Dynamic Assessments. And some of them were even up to running ARC Straightwire! What he didn't realize – well, we won't go into that. And it's all right, everything is all straightened out now, except they're
probably all mad at me, and realizing that I am preventing them from going Clear. I'm sure they realize this.

You really got to sit in there and audit. That auditing better be pretty smooth. If a flub on your part coincides with a cognition on the pc's part, well, I don't know, blow up the room with an atomic bomb, it'd be much calmer. Something's going to go wrong. And furthermore the case is going to hang, very badly at that point, and will have to be straightened out.

You can get into more trouble – anything you ever heard of, by putting the pc on the, on the track of a slam, and then all of a sudden making a horrible goof, bust, dropping the ball, laying an egg, in an auditing session. It just isn't done. Therefore, you should be a pretty good auditor before you start monkeying around with rock slams.

Now, the pc's interest is high, remember the old tone drop. Remember the curve, the down curve, remember? You've got the guy going from Tone 30, straight down to minus 8, with no gradient. Now, you're going to erase this. Well, you spend the next few sessions patching it up, see? But this can't patch up, because of course, your patching it up means no auditing, and he already is cogniting, but he's already cogniting on it, but you've got to get rid of the auditing that messed it up, so that in getting rid of the auditing that messed it up you're not then furthering his auditing or cognitions or case, but you can't further his auditing or cognitions or case until you have cleaned it up. This is a time an auditor wishes he just had never picked up that E-Meter on that pc. It was the wrong time of day, it must have had something to do with the stars in their conjunctions, if not their prepositions.

This is very intense. The whole subject of Dynamic Assessment is very intense. And it should not be regarded casually by an auditor, it is a very intense activity. All goals finding is an intense activity. The main intent and intenseness is on the part of the pc. His interest is so piqued, that he thinks things get in his road which don't. Because all the time he's going down that track he, of course, is running into the items which you eventually will list out, after you've found his goal. And they're all telling him he can't have it; that they oppose it; that he isn't. You see? And he knows not what of any of this.

So the first benefit of a Dynamic Assessment is that it takes off the lot of the edginess from a case, and gives the reward of some very large finds to the pc. You find his detested person. He's very happy. Oooh! Yes! That's why he's always hated Josibelle, see. Ho-ho! That's the person he hates the most in the whole universe! That means something to the pc.

Now, we move it on down, we find a dynamic. And we get this dynamic found. If it is the dynamic, and it is found, and it slammed, ah, my! He's really got his fingers on something that means a great deal to him. Now, we go ahead and find the item. And here is something which is enormously significant to him. He can explain things all over the place that have been happening to him for ages. Some people, if they never got any further than finding the item they'd be perfectly happy. The auditing had repaid them thousandfold over anything they'd expected it to be repaid, see.

And then, when you find their goal, why, all else pales. But, this is a gradient. The fellow isn't put on an enormously long wait before anything happens, so that you get a nervous charge building up over that tremendous long period of time of search. That is one of the
things wrong with 3GA done on its routine ordinary style of write out eight hundred and fifty goals and tiger drill them.

But you understand, that when we were eliminating goals by Assessment by Elimination, this tension was sufficiently great in building up in the pc over a period of time, to practically break the pc's heart, and the auditor's heart, too. That was tough. But the reason it was tough is not that it was tough to do. Not that it was impossible to find goals by Assessment by Elimination. Because God help us we're now running into more goals, now, after Dynamic Assessment, that were found in the old days, so we can audit them out the rest of the way.

Good heavens! It heads right back to the original goal. But the pc's original goal was so burdened by all of these other things, and rock slams, and so on, that the pc never really did get a full digest of the goal. No full reality on it.

An Assessment by Elimination brought about a nervous condition on the part of the pc, where he is so nervy and so ARC breaky, he was almost impossible to audit. Now that's – that should give you an idea or two of why we're – why we're very happy to have such things as Tiger Drills and so forth.

Now, if you tiger drill a list, the goal is never behind you – unless you're a complete knucklehead. And the pc is making gains most of the time. And by erasing goals by Tiger Drill, you are actually getting a very, very thorough, therapeutic result for the pc. And the pc is feeling better and better and better and better. There's something to occupy the pc's time. So an eight hundred and fifty goals list tiger drilled, properly of course, is highly therapeutic, and this is fine. And this is easier to do, but it's still not easy enough.

You need shorter jumps. Now, I've seen a Tiger Drill list go null on a pc, with more consequent splatter than anything I care to put a pc over. And many auditors doing old 3GA, even with a Tiger Drill, just say, well, I just never want to put a pc through that again.

And it's not that it hurts, it's not that it's arduous. But the fellow's right on a terrific attention line. And any little wiggle in the session, or any breath of wind in life, is magnified a thousandfold to the pc.

Well, now, on Dynamic Assessment you throw away most of these liabilities because you're going right in after it. The pc's attention isn't directly on the goal, it's on the goal line. In other words, you're following in to the goal line by interest. See, you got a gradient of interest. And the pc's interested all the way. He isn't sitting there like a dummy, the way he was in Assessment by Elimination. You're actually tearing on down the line and the pc is an active participant in this, because you're getting a result every few hours. Now, that's an advantage that shouldn't be discounted. You're following the interest line by following the rock slam. And the pc is turning up and handing you up data all the time. Very valuable to a pc just to list. List the rock slam out.

Now, aside from this, a Dynamic Assessment by Rock Slam being successfully done makes the pc feel absolutely marvelous. Just puts him on the top of the world. It's just great auditing. Don't kid yourself, it's great auditing.

The funny part of it is, the auditor doesn't give a damn. Those gains are just chaff in the wind. They are nothing. Three cheers, so the pc feels better. Good. We don't give a damn.
if he feels better. What we want is his goal! You understand? It's worth doing, just to make
the pc feel better. But this is not the end product of it.

Doing this over in Washington just in the last three weeks here, astounded by the fact
that the pcs began to apologize to me because I'd made this remark to them two or three times.
They come out, "Oh! I just feel glorious! Just top of the world! I never felt better! If I never
got any more out of this than audit... If I never got audited any more than this, everything
would seem wonderful to me! Wonderful!"

And I'd say, "Will you please shut up and sit down and pick up the cans! I'm trying to
find your goal!" And it finally got through their skulls that I didn't give a damn whether they
felt wonderful or not, I was after their goal. And they'd cooperate like crazy.

But they'd say, "I'm sorry, Ron. I'm sorry to have to tell you, but you know I feel
great!" You know? [laughs, laughter]

Well, one doesn't necessarily try to promote that apology in a pc. But don't lose sight
of it. Because actually in doing a Dynamic Assessment by Rock Slam, properly and correctly,
with all coal on the fire, and with that old needle wagging on dwindling slams as you list, and
that sort of thing, you're liable to be totally misdirected on the subject of what you're after.

You know, a pc feels so good, and everything, and you pat yourself on the back, and
you say, "Well, I got the pc's item! Made him feel wonderful!" Don't you ever tell me that!
Don't you ever tell me how wonderful the pc felt after a Dynamic Rock Slam Assessment.
Because I'll ask you right away, "Did you find his goal? You got the pc's goal?"

"Oh, well, no. As a matter of fact we sort of knocked off on that. He's sort of feeling
pretty good these days and we've really entered into a Prepcheck area, and you know, kind of
capitalize the gains," something like that. Has nothing to do with it. Did you find the pc's
goal?

Now, a Dynamic Assessment by Rock Slam is sufficiently spectacular to distract the
auditor from the basic reason he is auditing the pc, believe it or not. He's supposed to find the
goal. And therefore, if you do excursions or diversions or something, in some direction, that
do not enhance finding the pc's goal, you are wasting time. And enough time can be burned in
a Dynamic Assessment by Rock Slam as it is. You can burn lots of time up on one.

Now any of you that are ever going to make a Class IV Auditor, let me tell you this.
You've got to be able to do it fast. Do it fast. You understand, I think you're pretty wonderful,
right here, I think you're pretty wonderful, to have picked it up, in the short period of time,
and have produced as many dynamics, and as many items, and as many goals as you have in
this very short period of time. To learn it and to do that is a great tribute to you. And I don't
want you to sit back on your laurels and expect you to think that is how long it should take
you. Because let me tell you something, you should be able to find, by the reason of schedul-
ing, by reason of finance, by reason of routing of pcs, by reason of running groups, by reason
of program Clear Earth, you've got to be able to find the pc's goal in a week. And that in-
cludes a complete assessment with the goal in your paw. You've got to be able to do it in a
week.
Otherwise, nothing is going to tally. Now, I'm demanding something of you, which I can do. And which you can do. But you set yourself a nice zenith. Be effective! When you find that meter in your paws, you audit! You understand me? We don't care how good the pc feels or how bad the pc feels. We're not interested in the least, so long as it doesn't get in the road of our auditing. "You feel as good as you want to, just let me go ahead and get this list!" See, it's that frame of mind.

Now, why am I talking to you like this all of a sudden? Well, that's because I'm talking to you on the basis of an upgrade. Talking to you on the basis of an upgrade. I expect you to get out of here a Class III. Definitely expect you to get out of here a Class III. And if you really want to be up on top, a Class IV. Now I'm not kidding about Class IV. Because it'd take a Class IV to handle a group. You understand why? Let's say – let's say you've got fifty people in a group. And they're going to co-audit, and they're going to do this and they're going to do that, and every week you're going to reach into that bunch of people and you're going to pick up one human being, and you're going to completely alter, change their lives, and send them on the road. Put them back in the group again, to get the thing listed out.

All right, that's your program for world clearing. You'll find that that program is working right now – is being started on the Washington staff course. That program will be started here and there and the other place, and you're going to be very familiar with that program. Because there isn't any other way you can do it. You can't afford the time to do it any other way. Therefore it's up to me to make a Dynamic Assessment by Rock Slam or some other method of finding a pc's goals as rapid and effective and positive as possible! And therefore it's up to you, a Saint Hill graduate, to be able to do this.

The end of one year, you would have produced fifty Clears. Not to be sneezed at. All right. Now, that's pretty terrific. It's in your hands to do this. I'm not talking to you about pie in the sky and wouldn't it nice – be nice to be Clear. And all this sort of thing. I'm not talking to anything – about anything that is even vaguely out of your reach. This is right in your reach, right now.

Therefore, I want you to be a Class IV Auditor. And be able to find a goal in a week. And as soon as I am able to trim the edges around the technology a little bit more, to find a goal in twelve and a half hours. But let me tell you, the hotter it gets, the hotter you've got to be as an auditor. The faster you find a goal, the cleverer, quicker and more responsive you've got to be as an auditor, and there's some point where you reach diminishing returns. You find the goal so fast the pc doesn't find out about it! [laughter]

This idea of setting him up in a ray machine, you know, with one thing going in one side of his head and the impression on a screen on the other side of him, and we analyze the wave and say, "Your goal is to catch catfish! Ah-ha-ha!" No, I'm afraid that point is without the pc's interest or attention. He'd say, "It is?"

Now, the funny part of it is that a goal listed, I have found out now, without the goal being tiger drilled at the beginning of every session into a decent read, will not make Clears on all cases. And some cases will bog. So therefore you've got to be able to have a goal there that the pc's got some reality on, will follow down you've got to keep it cleaned up, and you...
will see a pc's interest in his goal, his reality on his goal, ebb and fade, as his listing continues. It is always brought back simply by tiger drilling the goal into the clear again.

But that has nothing to do with finding the goal. Finding the goal is a precision activity which is based first and foremost on terrifically positive, good, smooth auditing. This auditing can have nothing to do with the fact that "I don't understand TR 4." This auditing can have nothing to do with the fact "I'm having trouble reading a meter." This auditing has nothing to do with the fact that "I don't like to audit some pcs." You understand?

In your hands, at this time, exists technology which has not before existed. It is positive, it is definite, it has a definite end product. The same technology undoubtedly repeats over and over. The second goal found on the first second-goal-Clear made here, was found by the original method, but with Tiger Drilling. And it was number 400 and something on the second 850 list. That's interesting, isn't it? The second goal was found on that list, and it was that deep onto the list. Takes a long time. It takes one minute to clean up a goal, on an average, on Tiger Drilling. And you should be able to hit a goal a minute. That is the average for the long ones and the short ones, and the middle ones, and those that the pc wishes to God he'd never put on the list, you know. "To tie a knot around my Aunt Marandy's left ear." And the pc is saying all the time, "That isn't my goal," and the auditor's having to clean it up. So, there it goes, there it goes, there it goes.

That includes that one, but it's a goal a minute, that's about – that is the speed of Tiger Drilling. Now, at 460, you add 460 minutes plus your rudiments, over that period of time. Now, that's very fast goal finding, if you take a look at it. But with most pcs you will not find it is quite this fast or quite this easy. That's not slow goal finding. You divide 6 into 460, and you're going to get something that doesn't look like too much auditing. Because in the first place, you didn't sit there and list the pc's goals. The pc just wrote those goals out of session or elsewhere or somebody else listed them. Well, you see, that one, by indications, comes well within an ability to find a second goal, in a very short intensive, just by routine and ordinary methods.

But a great many pcs will never have their goal found in the absence of a Dynamic Assessment by Rock Slam, and the first intensive, that is, the first time that you try to find a pc's goal, ah-ha, that's a rocky road, man. Most pcs, that's a rocky road. It is amazing that as many early goals as we found are in. That's amazing to me! Goal after goal, person after person that we found them on originally. But isn't it interesting that they faded away? Wouldn't show up or anything until we'd done a Dynamic Assessment by Rock Slam on them. And headed it right into inevitably just that goal. That was the only goal it could be! I'll tell you some funny stories about that – right now I won't, but it's very amusing.

Now what are we heading for? We're heading for an efficient positive method of finding goals. We're not heading for a method in which it takes us 3 hours on Josibelle and 196 hours on Pete. This method we want nothing to do with. Nothing to do with. Because it lends an uncertainty onto the line which drives an auditor halfway around the bend and sends the pc through the top of his skull-uncleared! Just try it sometime. Say, "Well, list 850 goals, and we'll tiger drill them down the line and find your goal. 850." They're all dead behind you and there are no goals in front of you. So you say to the pc, "Well, your goal wasn't on that list.
How about, well, how about writing me another couple of hundred goals tonight, and so forth." And you do the couple of hundred, and you say, "Heh-heh-heh, awfully sorry, but you – seems like we've erased the last goal here. How about writing me 5 or 600 goals tonight?"

On some cases this could go to 5 or 6,000 goals. That's 5 or 6,000 minutes man! 5 or 6,000 minutes of auditing, and that's an awful lot of auditing! See what that adds to?

Now, we found some goals on ACCs earlier, and some ACCs ran all 6 weeks without finding anybody's goal. Auditing and auditing and auditing and auditing; what a terrible lose! Very upsetting. No, we want a stabilized action.

Now, right now, Dynamic Assessment by Rock Slam is unstable to this element of luck. Just like you have luck as to whether or not the goal was early on the list, so you have luck as to whether or not the list you're assessing is complete. First thing you must recognize. A cardinal rule of thumb about a list is if no item assesses out unmistakably, unmistakably, no item assesses out, the list was incomplete. There is no other reason. I have added these all up, and subtracted them, and multiplied them, and subdivided them and turned them over to the rabbits and birds. There is no other reason. If you didn't find the item on that list, the item was not on that list, and that is the open and shut of it. Very simple.

Now, you'd be amazed how often you have luck, just by writing down the 8 dynamics, calling them off to the pc, and say, "Consider overts against…" and so forth. You'd be surprised how often this is lucky. You'll be surprised how often you have 250 (quote) "dynamics" (unquote) listed by the pc, and have no item on them. Do you see that? Some certainty needs to be attached to that, and the certainty that attaches to it is the rock slam during listing.

Now, new capers can be expected along this line. This is not a sterile line. This is under very hot development. But use what you've got. What I would use right now is exactly what you've got. What we know this. We know this. That if we can get a dynamic a pc has rock-slamming overts on, we can then list what represents that dynamic to the pc, on a dwindling rock slam. The rock slam dwindles, item by item, gets smaller and smaller and smaller, and we then have a list that we can assess, and we will find an item. And that the goal will be an overt against that item in one shaded meaning or another, as given on the list.

Now, those are your certainties. Now, the entrance point is the tough point. Trying to find the first slam. Now, we developed a new caper. I dreamed one up in Washington on this basis: The most detested person. "What opinionated person have you most detested?" was the original question. Well, it's not a bad question! But what if the fellow couldn't ever see any people at all? Or people were nowhere near anything he found to be wrong. Now, you're going to lay an egg. You're going to have to say, "Who or what have you detested?" And you're liable to wind yourself up with something that looks like an item.

Now, we're into the experimental field of Dynamic Assessment by Rock Slam. Do you see why? "Who or what have you detested?" This isn't too good. It isn't perfect. But it's better than nothing. How many ways can you enter this thing? Well, let me tell you a shortcut. A very short, shortcut. You say to the pc, "What do you wish was not part of existence?" And you take a list which you scrap. You don't pay much attention to that list. And then after you've done that list, which kind of oils him up and grooves him in, you say, "What isn't part
of existence?" And you've got the, "What isn't part of existence" list. This will serve you as an item, if it will develop a rock slam.

You assess it by, "Consider overts against..." You will find out the common denominator of all dynamics and items is that the person will not admit they are part of existence. It's a test. When the person first thought it over, he said, well, that wasn't real, wasn't part of existence, didn't belong on the dynamic scale, see. It's a – it's a thing from which they have individuated. It's a thing that they're against. It's a thing they don't want anything more to do with. And there'd probably be several ways you could groove somebody in.

But do you wind up with an item? You've actually really wound up with a person or a thing, which is the most detested person or thing, haven't you? Now, you could regard it as an item, and you could get someplace. But experimental action right at the present moment would be to use this question – highly experimental – you get this thing, "What isn't part of existence" list. Get that nice and long. Assess it by "Consider overts against..." You'll find one finally has a heavy slam on it. "Consider overts against..."

This last slamming item can be built, perhaps, back to a dynamic this way. You understand, this is a, "When-all-else-fails." You realize I'm giving you the, "When-all-else-fails." I probably haven't made it too clear. Your – you've tried to get a dynamic list and you failed. You tried to get a detested person from that and get a dynamic list that was meaningful. And it just didn't go anywhere. You got the idea? We couldn't get dwindling slams, we just couldn't get anything on. You've always got this one, "What do you wish wasn't part of existence?" Throw that list away and list, "What isn't part of existence?", assess that list and you've got an entrance point. Or, you've got an item!

Well, it's interesting, I'm not sure how you decide. And therefore I'm about to make the following test to see whether or not this works. We take an item so found, and we say, "What part of existence does (item found on 'What isn't part of existence?' list) belong to?" See? "What part of existence does ____ belong to?" And we're going to get a larger thing, which perhaps then... Well, we get a list, we assess that, "Consider overts against..." We pick out the rock slamming item out of that, and then we list this, "What part of existence does a (blank) represent?" See, represent again. See if we get our dwindling slam. You understand this excursion?

What I'm pointing out to you merely by giving you this experimental method is not whether or not this works, or doesn't work. But that this has several entrance points. And if I found as many entrance points as this, you can expect more. You can expect them to be very thorough entrance points.

Right now, you're in a somewhat hit-or-miss state. It's kind of by luck that it's on the first list. Detested person is a very, very fine way of finding it. You use the "detested" person this way: You say, "What opinionated person have you detested?" or something like that. Assess it by rock slam. You could say, "What part of existence does blank (the assessed person) represent to you?" Not, "What is (blank's)... ?" By the way this is a serious error to say, "What is (blank's) idea of the dynamics?" That doesn't work.

But we get "Joe," see. And we say, "All right. What part of existence does Joe represent to you?" see. And the person will give you a dynamic list. Sometimes it lists down at
once to an item and sometimes you've already found the item on the list. You get the liability here?

Well, your exact procedure – the way I would go about a Dynamic Assessment on raw meat – would be just this way. I'd say, "What part – what opinionated person have you detested?" They give me one person. Then they give me two, three, four, five, six, seven, eight, nine, ten, eleven, twelve, thirteen, fourteen, fifteen, twenty, twenty-two, twenty-three people and I'm not even bleeding the meter, don't you see? I say, "Are there any more?", and they add a couple as an afterthought, and then I'll assess that list by, "Think of doing bad things to… " Each person in turn, and assess it rock slam by elimination with that question, wind up with one of these people. You'd be surprised how often it's the first person they said. It's amazing how often it is just the first person. It's not good enough, however, to just take the first person.

All right, we take this person, we say, "What part of existence does (blank) represent?" As soon as we've got (blank) busily listed, we've got a dynamic list, and we will find that rock slams are appearing now. That list doesn't get listed however on a dwindling slam. We shouldn't expect such riches at this time, and we assess that new list by saying, "Think of doing bad things to… " the items on this list, and we will come out with an unmistakable rock slam, if we are lucky. If we've had a rock slam, why, before, on the person, and we've had a – some rock slams on the listing of the dynamics, and if we've had an unmistakable rock slam, and hammer and pound away on the dynamic we finally eliminated down to, let me tell you, that the list, then, of the item will be a dwindling slam. It'll start wide and item by item it'll get narrower and narrower, finally go down to a dirty needle and had to be bled off.

Then we assess that list, which is the item list, once more, "Consider committing overts against..." or "Think of doing bad things to..." Either command will serve, and bang, one of those things will fire. We finally get that firing very, very well, and we have the pc's goals line. And then we say, "What goal might you have that would be an overt against (the item found)." And that should be a dwindling slam and go right on down and finally disappear into a dirty needle and pass away.

And then you should list List Six\(^2\) right away. And then you should list some of the other lists, but List Six is a must, because in a high percentage of the cases, the goal will be number one, two, three, or four listed on List Six. So much so, of course, that you quite often ignore List One. And other lists. Hit that List Six.

Also do not, do not tiger drill selected goals by the auditor. Do not do that, just start at the top of List Six, and start going. Yeah, why think about it, see? Why even add that element of evaluation? These lists are rather brief, don't you see? It doesn't take you long to do these things anyhow. And who knows, the pc's goal might be, "to kiss a mermaid who hasn't eaten garlic." We're not sure what his goal will end up, see. But, in any event, the goal is the goal, and it will be the goal, and if it's there, it fires.

---

\(^2\) Editor's note: "What goal might you have that would be impossible to realise [or: to achieve] if you were (item or part of item)?" – see HCOB 22 Aug. 1962 and HCOB 1 Sep. 1962
Now, an action which must go before, must precede any Dynamic Assessment by Rock Slam is as follows: The pc lists 850 goals on his own, or he's listed it for them by another auditor in a co-audit and, don't forget this one before you do the Dynamic Assessment and go to all that trouble, you sit down and you take every goal ever found on the pc, and you make a list of those goals. I don't care whether they were good, bad, indifferent. He says they've been erased, we don't care. We write down that list of goals. And we tiger drill that list. It seldom goes more than 6 or 7.

And we tiger drill them with these magic words. The first Tiger Drill is done as follows – tiger drilling words, this is a brand-new idea to you. "On the word 'suppressed' has anything been suppressed?" Got that? You tiger drill the buttons. It's amazing what you can do. Somebody's sure they've had pain-drug-hypnosis, been proved to them, in upper Sullivan Island, and you can tiger drill pain, you can tiger drill drugs, you can tiger drill hypnotism. Tiger drill words. Quite amazing what it does.

If you think somebody's dramatizing her name because she's crying all the time and her name is Teary, you want to know? We used to do other things with this. Well, the answer to it is Tiger Drill. Just tiger drill the word Teary. And you can tiger drill to flatness or cognition.

Now, that is a must for somebody who has been audited a bit – for a lot or prep-checked and so forth. Let's clean up these words. We have had an experience, a horrifying experience, of a pc selected to have his goal found at the congress slamming with gorgeousity! Kicking the pin. You could see the needle bend, I'm sure. And the second the pc thus tested reported for session, was found to have no rock slam at all. And the rock slam just was off, and that was it. Pretty grim, huh? Well the suppression there was terrific. Because the consequences of all our clearing him were succinctly stated by that pc in letters of fire with exclamation points. He'd have to practically do everything include committing suicide, I think. It was pretty drastic what he'd have to do if we cleared him. Of course the overt word was Scientology. And that saved our bacons nicely.

But as soon as we got onto the line, the rock slam turned back on again. How could this have been turned on earlier? By tiger drilling words. Also, it could have been handled by tiger drilling a period of time. You've not heard of that one before, you heard of prepchecking a period of time, but Tiger Drilling it is just sitting right there on the meter and bingety-banging it.

That, however, was not too good on this case. What was happening on this case was the consequences of becoming Clear. Something that has to be gone into with every pc that you are working. You have to go into the consequences of being Clear. If I cleared you, what would be the consequences? You'll find out sometimes it's so catastrophic the pc never will give you his goal. He knows what clearing is. He's done it lots of times himself. You put the person in front of the Fac One machine and you start turning the handles. And he knows why you shouldn't clear people, because he gets a hole in his chest! You know, the old machine that had the – had the big blast that went out the front, and the little peekhole in the back that it came back and hit the operator. Somebody was telling me the other day they're going to make these for the US Army, and I – why, I didn't – I didn't think they ought to do it. They
could only be operated by Clears, and Clears wouldn't operate them. Interesting. So, why build the machine?

Anyway, here was a case of a sudden vanishment of a rock slam. Now, you're going to confront that many a time. And maybe there are many better solutions to it. But right now, you will find that tiger drilling words will serve an enormous number of purposes. That's one for you to put down. Because I think that will be with us for a long time.

The other thing is work the Suppress button hard, and the other thing is to work the Careful button. Careful is actually more likely to turn on a rock slam than Suppress. And the probability is that our pc's rock slam at the congress would have turned on if the Careful button had been well enough operated, or heavy enough operated. But I don't think it was used. Because it was put in a little bit later. I'm not sure about that but I think that's the case.

All right. Now, I've seen a lot of rock slams occurring underneath that Careful button. Rock slams which were off. So, now I told you that there were two things that you should do before you start in on a Dynamic Assessment on a pc. There were two things you should do. And one of them is to tiger drill the buttons into some kind of shape, and the other one is to take those early goals.

Any goal found on them to date, and tiger drill those goals with this command: "In auditing, on the goal to catch catfish, has anything been suppressed?" etc. Do you get it? "In auditing on the goal so-and-so..." And you tiger drill with no other phraseology than that. You just tiger drill that one. And you will find out that a goal that has been buried and cannot be made to read again, can be made to read by prechecking the buttons. And then prechecking with this formula: "In auditing, on the goal," whatever it was, "has anything been..." the buttons. Got it?

Now, that has a varied – a varied form. Where it didn't succeed, you can go into "Since..." whatever date the goal was found, "... on the goal..." whatever the goal is, "... has anything been..." and tiger drill it in that fashion. Okay? So you've got an alternate method. You've got the period method, and you've got, "In auditing."

I've seen a goal tiger drilled, a goal already found and abused, I've seen a goal tiger drilled, with plain Tiger Drilling, ordinary Tiger Drilling, out of existence. It didn't read, it didn't fire, it didn't cough, it didn't sneeze, there was nothing. There was not a yeep left on it! Pcs satisfied with it, too. No somatics left on it. Everybody happy. The pc happy, and the auditor happy, and everybody cheerful that his goal being gone. Then opened up on again with tiger drilling the buttons of the Tiger Drill, and then swinging in on the goal and making it read.

And I have seen this happen: Taking an old goal, seeing it totally flattened with – utterly and completely erased as far as anybody could tell, not a quiver on a Mark V E-Meter. And here it goes, gone! Not a, not a mention. Couldn't get Suppress to read. Couldn't get anything to read. Couldn't get any part of anything to read. Gone! And then suddenly run, "In auditing, on the goal to catch catfish, has anything been suppressed?" and all of a sudden seeing the goal come back to life with a crash. Okay? Seen them both.
So don't ever discard old goals as beneath your contempt. An early goal is found on this case. This goal is for the birds. Nobody could possibly make anything out of this goal, and it was run on the pc for some days with no success. And you say, "Well, I guess we can neglect that." Yes, you can neglect it, why not neglect the whole case? In fact, why audit the case at all? Because from that moment onward, that case makes no further forward progress. That's horrifying, you know? That says why we stopped them from letting HCAs find all the goals! Dzzzz! Must have been rough! See that? So your pc has had this ridiculous goal found, "to tie bowlines on a bight on the backs of catfish and ride with a pipe in my teeth across the seas of Arizona." And the auditor says, "This couldn't possibly be a goal, therefore I'll neglect this thing." And the case is parked from there on. Case is parked.

You got to handle that goal like I just told you. I may even think of better ways of handling it. But that's good enough for a few – three weeks of development. You'll get that goal firing and knock out any residual fire in it. And get it out and get it gone, get the protests off of it, and get that thing went. And now all of a sudden the pc a – runs like a baby carriage. Savvy? Get rid of them old goals before you wind up on a Dynamic Assessment and you will be a happy character. Because the pc has already experienced an improvement under your auditing and therefore has confidence in you as an auditor. And you can use every bit of that confidence while doing a Dynamic Assessment.

Course, if you insist on doing it and it's – already they've been thoroughly cleaned up, and you can't get a spark out of any of them, and the pc keeps telling you, "But they've been cleaned up!"

And you keep saying, "Well I know, but I've got to make sure, according to Ron's lecture of September 18, AD 12, I have to go over these things with a fine…"

"I know! But the auditor did last week!"

You'll eventually get the goals reading again. Of course all they'll respond to is the word "protest." They'll all be reading! That's outside the auditing formula. But there, in final analysis, is where we have arrived at with 3G Dynamic Assessment by Rock Slam.

Good hunting!

Thank you!
TV DEMO: TIGER DRILL

An auditing demonstration given on 19 September 1962

LRH: Okay. Is it all right with you if we start this thing in motion?
PC: All right.
LRH: All right? You comfortable?
PC: Yes. Thank you.
LRH: Not too close?
PC: 'Tis a bit, yes.
LRH: All right. Pull you back.
PC: Thank you.
LRH: All right. Pick up the cans. Okay. Squeeze the cans. All right. That's fine. Okay. Give them another squeeze. Thank you. That's fine. All right. Now, I'll tell you what we're going to do here, is I've got a few goals to tiger drill, and that's all I'm going to do.
PC: Right.
LRH: And I'm just going to go on down the list of existing goals with some that you have added on here, and do all this in Model Session. Okay?
PC: That's fine.
LRH: Very good. I hope you won't mind that the room is still. [PC laughs] All right. Is it all right with you if I start this session now?
PC: Yes.
LRH: All right. Here it is. Start of session. All right. Has the session started for you?
PC: Yes.
LRH: Very good. What goals would you like to set for this session?
PC: Well, to find the goal.
LRH: Good.
PC: To work well. To work well.
LRH: Good, got it. Good.
PC: And to feel even better at the end of it.
LRH: All right.
PC: That's the lot.
LRH: Okay. Are there any goals you'd like to set for life or livingness?
PC: Oh, to be Clear.
LRH: Good.
PC: And um – goal for life or livingness – and as part – I'd like to get part in this session, that is to get my eyesight back as it used to be.
LRH: Eyesight better than it used to be?
PC: I'm sorry. As – as better – as it used to be in other words. To get – get my eyesight better, as it – as it used to be.
LRH: I got it. As it used to be.
PC: Yes.
LRH: All right. Very good. You'd like to also set that as a session goal?

PC: Well, part of it, you see. I don't uh ...

LRH: All right. Very good. Any other goal you'd like set for life and livingness?

PC: No. That'll do.

LRH: That'll do.

PC: Well, there's the rest I've always given still stand.

LRH: The usual.

PC: Yes.

LRH: All right. Well, your tone arm is sitting here at, oh, about 2.9, something like that.

PC: Uh-huh.

LRH: Very nearly 3.

PC: Your work wasn't in vain on board.

LRH: Hmm?

PC: Your work wasn't in vain on board.

LRH: All right. Okay. Good enough. Now, are you willing to talk to me about your difficulties?

PC: Yes.

LRH: Very good. I'll check that on the meter. Are you willing to talk to me about your difficulties?

PC: Yes.

LRH: All right. You might have something more to say about that. What was that right there?

PC: Well, that was that I'm quite willing to talk to you about my difficulties, and just after the — after the previous thing and even despite the fact that we're on TV.

LRH: All right. Very good. Are you willing to talk to me about your difficulties?

PC: Surely.

LRH: Very good. Check that on the meter. Are you willing to talk to me about your difficulties?

PC: Yes.

LRH: I've got a fall here I'll have to clear up.

PC: Um – well, this is um – nervous feeling I've got is in the stomach, and it's obviously something to do with the fact that uh – that we're in this room now. I shouldn't be nervous. I don't know why, but that's the difficulty I have right now, but I'm quite willing to talk to you about it.

LRH: All right. Very good. Are you willing to talk to me about your difficulties?

PC: Yes.

LRH: All right. I'll check that on the meter. Are you willing to talk to me about your difficulties?
PC: Yes.

LRH: All right. Now, what difficulty aren't you willing to talk to me about? There it is.

PC: Oh, well, that's the – yes. That's the difficulty of um – of – I did mention it to you briefly before we started the session, of getting the TV sets into the um – chapel because um – now that they're auditing there all day, it's rather difficult for – or almost impossible to get them in, do you see?

LRH: Mm.

PC: So I'm quite willing to talk to you about it but there ha- has been a reluctance really to worry you with it ...

LRH: All right.

PC: ... and to get it down somehow or other. And so there we are.

LRH: Okay. Very good. Are you willing to talk to me about your difficulties?

PC: Well, on the same thing, now, the other difficulty in the same connection is getting the sound so that it suits you, which means that we got – we really need you down there to – whilst we're testing it to check it, but I'm willing to talk to you about that.

LRH: Very good.

PC: That's the only other thing I can think of.

LRH: All right. Very good. I'll check that out on the meter. Are you willing to talk to me about your difficulties? There's no reaction there.

PC: Thank you.

LRH: Thank you very much. Okay. Now you can sigh with relief. All right. When was the last time I audited you?

PC: On Monday night.

LRH: Very good. Now since the last time I audited you, have you done anything you are withholding?

PC: Well, I'd been away for a long while. I hadn't seen Jenny for a long while, so the inevitable happened last night.

LRH: Very good.

PC: As this always comes up in talking to you – it always seems to happen just before a session for some reason, even though I don't know it, that when I go to the toilet, I have a mishap somehow, do you see. And this happened again last night. Now that's something I was withholding from you and the public.

LRH: All right. Okay.

PC: And I think that's the lot.

LRH: All right. Very good. I'll check that on the meter. All right. Since the last time I audited you, have you done anything you are withholding? All right. I have a reaction here. What have you done? There.

PC: Well, um...

LRH: That's it.

PC: I made a phone call tonight – um – that I think you know about now anyway, but I went to some trouble and a lot of dashing around in the general office.
to find the right telephone number. I – see, to get onto this – this telephone number, I had to go ring up somebody to find somebody else's number who knew this number, but I never call him there. That's the only thing I thought of then.

**LRH:** All right. Thank you. Since the last time I audited you have you done anything you are withholding?

**PC:** No.

**LRH:** All right. I'll check that on the meter. Since the last time I audited you, have you done anything you are withholding? All right. I have a reaction here. What have you done? There it is.

**PC:** Well, I've got the area. Well, I suppose I am withholding it. I spoke to a student today about the – his future, and then I said, "Well, I'll pass this on to Ron, but you can write direct if you like," and he chose that way, so therefore I've withheld the information – not this big, I mean nothing serious in this – withheld it because he's going to do it direct.

**LRH:** Hmm. All right. Thank you. Okay. Since the last time I audited you, have you done anything you are withholding?

**PC:** Well, I can't think of anything else.

**LRH:** Very good. I'll check that on the meter. Since the last time I audited you, have you done anything you are withholding? I have a reaction here. What have you done? There is.

**PC:** Well, this is at...

**LRH:** There it is.

**PC:** ... this is on the quay side on Tuesday.

**LRH:** There it is. There. There.

**PC:** Loading up – loading up the car...

**LRH:** There.

**PC:** I just remember we were getting your car out. Um...

**LRH:** What was that? There it is. There.

**PC:** Loaded the car up.

**LRH:** There. There. There.

**PC:** Oh, I lent somebody some money.

**LRH:** Oh, I see. All right. Very good. Thank you. Since the last time I audited you, have you done anything you are withholding?

**PC:** No.

**LRH:** Very good. I'll check that on the meter. Since the last time I audited you, have you done anything you are withholding? All right. I have a reaction here. What have you done? It's another one. There.

**PC:** Well, that is – well, this is only a thought, but um – the ... We came out of the hotel in – when we – where we stayed for lunch on Tuesday, and I took rather a dim view of the way you came out of there, because there was another car coming up, we came out rather... There was a lorry parked on the right which might have distracted your attention. This car came up from the other side. I think it was a – or a bit earlier. Anyway. And I thought well, you hadn't looked, and it was rather a disparaging – disparaging thought. That's all.

**LRH:** All right. Very good. All right. Since the last time I audited you, have you done anything you are withholding?

**PC:** Interesting – but I can't –
really can't think — scanning over anything else.

**LRH:** Very good. I'll check that on the meter. Since the last time I audited you, have you done anything you are withholding? I have a – another reaction here. What have you done?

**PC:** This is an omission. I noticed somebody was wearing a brooch and I didn't remark on it. I noticed – there's the done, but I didn't remark on it.

**LRH:** Very good.

**PC:** That was — that was — now there's the withhold. Yes. That I had noticed that they had — wearing a brooch.

**LRH:** Very good. All right. Since the last time I audited you, have you done anything you are withholding?

**PC:** Well, yes. I wonder if this is what's holding it up. I have taken over the cottage which I'm withholding from a lot of people, not from you, but from a lot of people.

**LRH:** Hmm.

**PC:** There's one thing there, yes.

**LRH:** All right. Very good. How you doing now?

**PC:** I'm doing all right.

**LRH:** Oh, all right.

**PC:** Rather a little um – surprised at all these petty little things that're sort of kicking on the meter. That's all.

**LRH:** All right. All right. Okay. Since the last time I audited you have you done anything you are withholding?

**PC:** Well, I think I withheld from you that I didn't sleep very well on Monday night. In fact, I lay awake quite a long while and so on, and I was – attention was taken sometimes by the tugs coming along-
thing else. I must be the world's silliest withholder. Well, I – I spoke disparagingly of somebody because they borrowed my car and they didn't fill it up with petrol.

LRH: Oh, all right. Very good. Okay. Since the last time I audited you, have you done anything you are withholding?

PC: Well, I found the missing photographs – the pictures – last night that I was supposed to take to America.

LRH: Oh, I see.

PC: And I withheld that up to now. I mean – they would have been ... Anyway I had withheld it up till now. Nothing else found there. No.

LRH: No? All right. Very good. All right. I'll check that on the meter now. Since the last time I audited you, have you done anything you are withholding? All right. I have a reaction here. What have you done?

PC: Well, uh ...

LRH: There it is.

PC: Well, I – there's two things there. One is that I received today the parcel of – of parcel containing the equipment so that we can synchronize a tape with a film – with a slide show. Um, the other thing is I'm withholding, I think, getting very impatient because this rudiment doesn't clean up.

LRH: All right. Very good. All right. Is that it?

PC: Uh-huh.

LRH: All right. I'll check that on the meter. Since the last time I audited you, have you done anything you are withholding? All right. There is a reaction here.

PC: Uh-huh.

LRH: Now let me see if I can't help you out here a little bit, hm?

PC: Uh-huh.

LRH: All right. Let's just follow this reaction. There. What's that? Right there. There it is. It's been the same reaction straight through. What is it?

PC: Well, there's nothing I'm consciously avoiding.

LRH: There it is right there. There it is. There it is.

PC: Well, I announced to Jenny on the – over dinner tonight that I was going to be audited and um – told her what I'd have to admit, but uh – that's that.

LRH: Now, what's that? What's that one right there?

PC: Well, it's to do with the TV.

LRH: All right. What's that right there? What do you do when I give you a that?

PC: Well, I-I just see what I'm looking at, or what I – whereabouts I – when you give me – when I start to look, I just try to scan over the period to find something I had done. When you say that, I stop where I am and look around that area to see whether there is – what is there that I'm withholding.

LRH: All right. Very good. Perfectly proper.

PC: Um-hmm.

LRH: All right.

PC: Um.

LRH: There. What's that? What's that right there?

PC: Well, that's ...

LRH: Right there. There. There.
PC: Well, this is the training office. Um ...

LRH: That's it. That's it. That's it.

PC: Oh, this was sending you a note about some of the students who have left and so on. I can't see any withhold there.

LRH: Well, there's a tick-tick here.

PC: Is it pills? I-I-I took those pills up today. Um – withheld that from you, that I didn't think you wanted to be bothered with those things, you know. Those pills you received on board, I took them up to Peter so he could handle that. Um ...

LRH: ...There ... There ... There.

PC: I've moved around to ...

LRH: Hmm?

PC: Going to bed last night, but I've told you ...

LRH: Mm-mmm.

PC: Not withholding anything about that.

LRH: All right.

PC: I feel there's something wrong here because I-I'm sure there's nothing I've done that I'm withholding, and um ...

LRH: What are you looking at right there?

PC: Looking at the cottage.

LRH: Mm-mmm.

PC: Um ...

LRH: There. There.

PC: My coat hanging on the tier, lighter not working. Comb my hair and thought of you telling me it was all stuck up the other day. Um ...

LRH: What are you sitting on right there?

PC: Wish I knew.

LRH: Right there. There.

PC: Car.

LRH: ... There ... There. You're sitting right on it. It keeps going click-click, click-click, click-click. There it is. There it is.

PC: Well, I'm looking to see whether I've said something out of place about you, but I can't – I don't think I have anyway. Um – talking

LRH: What's that? What's that?

PC: I'm an absolute blank.

LRH: There.

PC: I was conscious of a ...

LRH: There.

PC: ... nervous tension in my stomach, but ...

LRH: There.

PC: Well, what I keep thinking of is when you said to me tonight – you said, you know, "Do you want a session?" I said, "Yes, that's fine," and then after that I just thought, what have I done since because I'm going through this. And the only things that came to mind are what I've already told you.

LRH: Well, was this a self-audit sort of thing?

PC: Possibly, yes. Well just – I just scanned over when um ...

LRH: Was there any effort here not – to have these things out of the road so they wouldn't register?

PC: Well, no, not to have them out of the road. Oh, there was some play at
this over dinner time, but uh...

**LRH:** Ah – what was that?

**PC:** Oh, well I said to Jenny – oh, I've told you this anyway – I said to Jenny going on TV tonight. So she – she said something about oh, um – well, if you'd known you were going on – if you'd known you were going on TV, you wouldn't, you see. So I – then Philip said, oh, you – he needs a good acknowledgment. So this is sort of the joking was to as-is it all, you see. So I said that won't do it. And so I just resigned myself it would have to come out. That was all.

**LRH:** Oh, I see.

**PC:** That's all I've done. I mean...

**LRH:** There's a decision there.

**PC:** A decision? Yes.

**LRH:** You made a decision. Now what was it?

**PC:** That I'd have to come out with this withhold, give all my sex life away and so on.

**LRH:** All right. All right. Now, is that something you've done?

**PC:** Yes. And withheld it up to now. Yes.

**LRH:** Is that right?

**PC:** That's right, yes.

**LRH:** All right. Okay. Now, can I check this out on the meter?

**PC:** Yes, please.

**LRH:** All right. Since the last time I audited you, have you done anything you are withholding? And that is as smooth as glass.

**PC:** Jesus.

**LRH:** Apparently we've been working away from this one point.

**PC:** Mmm. Mmm.

**LRH:** Ok?

**PC:** Yes.

**LRH:** All right.

**PC:** Fascinating.

**LRH:** You feel all right about this?

**PC:** Oh, I feel quite all right about it.

**LRH:** All right. Any ARC break connected with this?

**PC:** No.

**LRH:** All right. Thank you, there is none.

All right. Is it all right if we go on now?

**PC:** Yes.

**LRH:** You feel all right about it?

**PC:** I feel quite happy about it. Cocky, as a matter of fact.

**LRH:** Okay. Now, do you have a present time problem?

**PC:** No. Not after that.

**LRH:** All right. I'll check this on the meter. Do you have a present time problem? I've got a reaction here. What problem do you have? There it is.

**PC:** Oh, that, yeah. Well, that's the problem on getting this – the problem that I was on the phone about before, which I feel is my problem as well. There's that. There's the problem of getting the TV in over the road and the sound working.

**LRH:** Mm-hmm.

**PC:** And problem of getting the, not a lot, but my in-basket cleared up since
I've been away. There's not much there. I don't think there are any other problems.

LRH: Very good. All right. Do you have a present time problem?

PC: No.

LRH: Very good. I'll check that on the meter. Do you have a present time problem? All right. I have a reaction here. What is your problem?

PC: To get off this rut and to get on with our goals.

LRH: Very good. All right. I'll check that on the meter. Do you have a present time problem? All right. Do you agree that that is clean?

PC: Yes.

LRH: Very good. Thank you. All right. Now, we've ... There's a blowdown here, came down to about 2.25, under all this hammering. All right. Now, we've been boxing around here with a goal line, haven't we?

PC: Yes.

LRH: Hm?

PC: Yes.

LRH: When I asked you to write a certain number of goals and I actually got a certain number of goals to do, and I haven't had the chance to tiger drill many of these goals, so why don't I just start in here some place or another ...

PC: Mm-mmh.

LRH: ... and we just see what we can locate here. Okay?

PC: That's fine.

LRH: You just now gave me a new list ...

PC: It's on those short, small pieces of paper.

LRH: Yes. It's charted all by itself. It's here in these worksheets. I will find it in here. Many of these goals might be perfectly valid. Hidden under that sheet. All right. Why don't we just dispose of these?

PC: All right.

LRH: Hmm? I asked you to do some goals on "a murderer." Now, we're going to get "a murderer" to fire. Okay?

PC: Right.

LRH: All right. Here we go. Consider committing overt against a murderer. All right, there's a small stop on that and I'm going to settle for that small stop. Okay?

PC: Right.

LRH: And here's our first goal. And what were these? These were goals that uh ...

PC: Condemn. Goals that would really condemn a murderer, I think.

LRH: Really condemn a murderer since it was condemn that we were – hey! that's still reacting. It was "to condemn" that we started out from on this. So here's the first one. Okay? All right with you if I go on with this now?

PC: It's fine, yes, yes.

LRH: Anything you care to say before I do?

PC: No, no.

LRH: Anything you have to say, why, just open up and tell me. Okay?

PC: Mm-mmh.

LRH: All right. Here's the first goal: "to know." On this goal, has anything been invalidated? All right. What is that? What's been invalidated?

PC: Well, I've invalidated "to
know" a bit because it comes below not-know on the Tone Scale, and so "to know" – it would be a higher goal than that, you see, to not-know.

**LRH:** Very good. On the goal to know, has anything been invalidated? All right. There's another one, what's that?

**PC:** Well, I've often been accused of being a know-all, which is "to know," so then – so to that extent it's been invalidated.

**LRH:** Very good. On the goal to know, has anything been invalidated? All right. There's another one. There it is. There.

**PC:** Well, it's invalidated as though you must know. I didn't know what it was, do you see, so I was invalidated on the goal to know.

**LRH:** All right. On the goal to know, has anything been invalidated? Okay. To know. To know. On the goal to know, has anything been suggested? All right. On the goal to know, is there anything you failed to reveal? There it is. What is that?

**PC:** Well, I've often – I've played this game quite a bit of being um – uh – ignorant. I've found this has often paid in business. You find out a lot that way, so sometimes when I've known quite a bit, I've pretended I didn't in order to draw the other chap out. So I invalidated the goal "to know" to that extent.

**LRH:** Mm. Very good.

**PC:** I'm sorry, failed to reveal that.

**LRH:** Very good. All right. On the goal to know, is there anything that you failed to reveal? All right. Probably okay. To know. On the goal to know, has a mistake been made? All right. What's the mistake? There it is. There.

**PC:** Um.

**LRH:** There.

**PC:** Something on the lines of – it's a mistake to know as I was telling you just now. Well, yes. When I wrote it out, I thought it was probably wrong. It's probably "to know something" and "to know" on its own wasn't quite right. Hence, the other goals that follow on that have got "to know," but there's another bit more added onto the goal. So that could've been a mistake.

**LRH:** Very good. On the goal to know, has a mistake been made? Okay. There's another one. What is that? There. There.

**PC:** It – it's a mistake to know – um – I have a somatic under my – in my neck.

Well, I just – well, going on getting when I wrote them out, I hadn't my glasses on first of all, and I was wondering whether I had written it – couldn't quite see what I'd written afterwards. I wasn't sure whether it was right or not. I wondered whether there was a mistake. But there wasn't.

**LRH:** Mm-mmm. All right. That answer the question?

**PC:** I think so.

**LRH:** You satisfied?

**PC:** Mm-mmm.

**LRH:** You don't look so.

**PC:** Yes, I'm satisfied.

**LRH:** Really?

**PC:** I was wondering whether you would be satisfied.

**LRH:** Oh, all right. All right. Good
enough. On the goal to know, has a mistake been made? All right. That looks clean for the moment. To know. To know. On the goal to know, has anything been invalidated? Yes. What's that?

PC:  Well, I'm invalidating it because I think somebody else has got this goal on the course, and I'm wondering whether I've just put it on because I've heard it from them.

LRH: Very good. On the goal to know, has anything been invalidated? All right. That looks clean. All right. To know. On the goal to know, has anything been suppressed? There it is. What's that? What's the suppression?

PC:  Well, I actually, I thought of this goal on Monday night in bed and I suppose suppressed – I suppressed an urge to get up and write it down.

LRH: Oh, all right. Okay?

PC:  Yes.

LRH: Anything else?

PC:  No. Getting quite some somatics on this one, on the chest.

LRH: What?

PC:  Some somatics. Pain across the chest and the neck.

LRH: Well, good.

PC:  Just developed. Thank you.

LRH: All right. Thank you. All right. On the goal to know, has anything been suggested? On the goal to know, has anything been suggested? On the goal to know, has there been anything you've been careful of? All right. On the goal to know, has anything been invalidated? All right. Just another invalidation. What's that? There it is.

PC:  Well, I'm invalidating it. I just can't ... Seemed quite real when I wrote it down. It doesn't seem so real now. Doesn't seem as if it was my goal. And yet – so I'm invalidating it to that extent.

LRH: All right. On the goal to know, has anything been invalidated? Yes, what's that? There it is.

PC:  Well, I've invalidated the goal a lot because I won't know detail. I invalidate the necessity to know detail. That's the answer.

LRH: All right. Thank you. On the goal to know, has anything been invalidated? Okay. On the goal to know, has anything been suggested? All right. Did you think of a suggest?

PC:  Well, the only fear – the only suggest could have been somebody else having it on course.

LRH: All right. Thank you. On the goal to know, has anything been suggested? There is another one. What's that?

PC:  It's been suggested that these go – this goal is probably too – one, you know, that is getting a bit too basic for – too basic, almost fundamentals of – fundamentals of Scientology and so on that probably – it's been suggested that, and therefore suggested it wouldn't be my goal.

LRH: Very good. On the goal to know, has anything been suggested? Yes, there's another one. What is it? There.

PC:  Well, I'm getting quite a lot of discomfort and – and pain as you're doing this one. And I'm trying to ... There's a peculiar thing going on here because I'm suggesting it's nothing to do with it and it's accidental – the somatics that turned on with this.

LRH: All right. Okay. On the goal to know, has anything been suggested? All right. On the goal to know, has a mistake
been made? There's a mistake. What is it?

PC: Well, when I first thought of this goal, I was really – really hit me, you know. I thought oh, this is it. This is it. This is what we've been looking for. This adds everything up. But now I feel there's a mistake been made that it wasn't so – you know, it wasn't so much my – I'm sorry uh...

LRH: What's the matter?

PC: Oh, I lost myself. I don't know what I was saying even.

LRH: All right. Mistake. Has a mistake been made?

PC: When I first thought of this girl – goal, girl! I was really sure it was mine.

LRH: Uh-huh.

PC: And then I – I don't know. I feel so uncomfortable right now. Me arms are tightening – tightening into the side and I feel I'm try – I feel almost that I'm trying to sell it to you and it shouldn't be, and if it does check out, it will be a mistake. So that's a mistake ...

LRH: All right.

PC: ... this attitude.

LRH: All right. On the goal to know, has a mistake been made? Equivocal. On the goal to know, has a mistake been made? All right. To know. All right. To know. All right. On the goal to know, has anything been suppressed? On the goal to know, is there anything you've been careful of? On the goal to know, has anything been invalidated? Has anything been suggested? What's the suggestion?

PC: Your sitting – your pausing on the read of this and the method of Tiger Drill suggests whether it's in or not.

LRH: All right. Very good. It's still clicking.

PC: Mm-mmh.

LRH: I'm just trying to get it to click more. Hence even when it clicks, I sometimes use a Suppress button.

PC: Um-hmm.

LRH: Okay?

PC: Yes. Thank you.

LRH: All right. On the goal – on the goal to know, has anything been invalidated? Has anything been suggested? Is there anything you failed to reveal? Equivocal. On the goal to know, is there anything you failed to reveal? Yes. What's that? Failed to reveal. There it is.

PC: Well, this – this is not something I just thought of. I'm afraid I've – this sort of kicking a bit and so on. And I – then I sat here and I thought, "Oh, it'd be terrific if this checks out," and then I thought, "and the blighters down there think we found this goal first and you're going through the motions."

LRH: Uh-huh. Oh, all right.

PC: And well, there's a "failed to reveal."

LRH: All right. Very good. On the goal to know, is there anything you failed to reveal? All right. To know. To know. To know. I got three agitations – two ticks and a long drop. Okay?

PC: Um-hmm, um-hmm.

LRH: All right. On the goal to know, has anything been invalidated? Equivocal. On the goal to know, has anything been invalidated? All right. Has anything been suggested? Okay. Any suggestion there?

PC: Yes. When I was looking this
over the other night when it was so real to me, I was looking over and thinking how often I say "I don't know."

LRH: Mmmm.

PC: And it – it's a pet phrase of mine. I don't know. I don't know. And this seems to me to tie up possibly to somebody who had the goal to know – he obviously wouldn't know. And, this has once or twice has been pointed out to me that I go around saying, "Well, I don't know," and so on. So there we are.

LRH: All right. Very good. On the goal to know, has anything been suggested? There's another one. What is that?

PC: Oh, now I'm going right back to when I was having the assembly and there was little Bert there and somehow or other then I came out with this phrase "I don't know," and he suggested that that was quite – "I don't know" was quite a wise thing to do, you know.

LRH: Um-humm.

PC: That's it.

LRH: All right. On the goal to know, has anything been suggested? Okay. There's another one. What is that?

PC: Well, that's again – you suggested it might be the goal by telling me the reads.

LRH: Okay. Very good. On the goal to know, has anything been suggested? Another one. What's that?

PC: Well, I've suggested it's too highfalutin a goal to have.

LRH: All right. On the goal to know, has anything been suggested? All right. Probably there's another one there. Just a guess that there may be one. If you don't think of one, that's all right.

PC: I haven't got one readily available ...
things — I often suppress them. God, yes, so as not to hurt somebody else. This has been very good, but uh ... This reflects on me so that I won't be thought bad of, but sometimes I know something and I will let people talk and go on and pretend I don't know.

**LRH:** All right.

**PC:** Suppress it then.

**LRH:** All right. On the goal to know, has anything been suppressed? There's another one. What's that?

**PC:** My life's been suppressed from many quarters from knowing. Um ...

**LRH:** Your life?

**PC:** Mmm.

**LRH:** All right.

**PC:** In uh – Christ, this pain is something terrible – It's an exaggeration, really...

**LRH:** All right.

**PC:** Don't know why I said that, but it's not — it's not pleasant.

**LRH:** Okay.

**PC:** But in my life I've — I've wanted to go out and know things or find out things and people have been too flip-pant about things, you see, so to that degree they've suppressed what I'm doing.

**LRH:** Mm-mmh.

**PC:** That's all I see on this.

**LRH:** All right. Very good. On the goal to know, has anything been suppressed? Okay. There's another one. What's that?

**PC:** Now I'm getting sen because of — my hands feel like a — ooh, this is so heavy that they're really pressing — they seem to be pressing right through my thighs where the are on my ... Seems solid down there.

**LRH:** Mm-hmm. All right.

**PC:** Um.

**LRH:** What's been suppressed?

**PC:** Um...

**LRH:** There it is. There. There.

**PC:** Well, sex has been suppressed. This may amuse — amaze — not so — but — in that connection I got — suddenly got the Biblical phrase "She knew him," which I believe means she had sex with him or something.

**LRH:** Oh, yes. All right.

**PC:** Sorry for that, I don't know where that came from, but ...

**LRH:** Okay. On the goal to know, has anything been suppressed? Yes. What's that? That's it.

**PC:** Efforts to know ...

**LRH:** All right.

**PC:** ... have been suppressed.

**LRH:** On the goal to know, has anything been suppressed? Equivocal. On the goal to know, has anything been suppressed? There is another one. What's that? There it is. Yep. Walking into a slam here. What's that suppression?

**PC:** Well, I've suppressed people knowing about me. I've kept my life very often very much to myself so I've suppressed their knowing what I'm doing.

**LRH:** All right. On the goal to know, has anything been suppressed? All right. Do you have another answer there?

**PC:** No.

**LRH:** All right. There probably is one. See if you can look around and find it.
There it is.

PC: *I'm suppressing at this moment any attempt to do anything until you direct me.*

LRH: All right. Very good. On the goal to know, has anything been sup– has anything been suppressed? There's another one. What's that?

PC: *I suppressed your hesitation.*

LRH: Very good. On the goal to know, has anything been suppressed? All right. Equivocal. On the goal to know, has anything been suppressed? All right. It's clean for the moment. On the goal to know, is there anything you've been careful of? Can you think of an answer there? There. There.

PC: *I'm careful to find out things and to know.*

LRH: Mm-mmm.

PC: *Oh ...*

LRH: All right. On the goal to know, is there anything you've been careful of? Think of another answer?

PC: *Careful to just sit here.*

LRH: Okay. On the goal to know, is there anything you've been careful of? There's another one, probably.

PC: *Well, that's a maybe, is the best I can do for you. It's maybe I've been careful of knowing ...*

LRH: Mm-mmm.

PC: ...on the goal to know, because it's sometimes dangerous to know. Yes, that's better. It's um – you don't want bad news so you don't know. You don't go make any effort to know, so you're careful not to find out and know.

LRH: All right. On the goal to know, is there anything you've been careful of? All right. Maybe another one. There, what's that?

PC: *So is it careful?*

LRH: Yes.

PC: *Um...*

LRH: What have you been careful of? There. What's that?

PC: *Well, I'm sorry. Just – I was aware of your pencil that you dropped just now ...*

LRH: Right.

PC: *... because I got aware of it.*

LRH: Okay.

PC: *Careful not to try – careful not to take any notice of what you – that you had dropped.*

LRH: All right. Good enough. On the goal to know, is there anything you've been careful of? All right. There's one. What's that?

PC: *I've been careful to listen to all your lectures. Gone to great care to do that, which is on the way to knowing.*

LRH: Very good. All right. On the goal to know, is there anything you've been careful of? All right. Looks clean for the moment.

On the goal to know, has anything been suppressed? All right. Don't find much on that. Have you got any answer? All right. To know. To know. To know. Firing a bit latent, but that's all right. Differently. On the goal to know, has anything been invalidated? Yes? What's that?

PC: *Well, I was invalidating your read then because I noticed that I was*

---

3 Change from Tape 14A to 14B
breathing, and not deliberately, but seemed to come – my breath seemed to come as you said. I think I'd invalidate almost anything with that.

LRH: All right. Very good. On the goal to know, has anything been invalidated? Yes. What's that?

PC: Oh, that was – I suppose I did a bit of invalidation as well, but I had a letter from some strange guy today who – oh, I don't know what he was, but he'd written about my book and I think he finished up by being a bit sarcastic and saying he admired my courage. He was trying to prove some point about energy and mass. He was saying there was no – to take – not mass, solids – to take a solid thing as a stable datum was wrong or something, so there was his invalidation of my knowledge, my "to know," my method of knowing. So I promptly slapped him one back and suggested to him that he hadn't understood my book right and perhaps he'd better read it again.

LRH: All right. Okay.

PC: There's a postscript to that and I must tell you this, otherwise it'll be a withhold. Um – to better still, that you read the works of L. Ron Hubbard.

LRH: Okay. On the goal to know, has anything been invalidated? All right. There's probably one. Find that there?

PC: Mmh.

LRH: What's that?

PC: Mmh.

LRH: I'll repeat the question. On the goal to know, has anything been invalidated? Yes. There is one there.

PC: Yeah. Well, I suppose I've invalidated some of the students sometimes when I've flunked them or told them they weren't right and so on.

LRH: Okay. On the goal to know, has anything been invalidated? All right. Has anything been suggested? All right. On the goal to know, is there anything you failed to reveal? All right. On the goal to know, has a mistake been made? All right. There may be a revealed here. On the goal to know, is there anything you failed to reveal? Yes, definitely. What's the failed to reveal?

PC: Well, I fail to reveal very often that I haven't understood things. In other words, known what was going on, and um – there's a sort of a – uh, yes, a pretended knowingness sometimes.

LRH: Um-hmm.

PC: But what is perhaps worse here is that I'll get a – you – you will say something either in a lecture or to me or to a group, that is – I can wholeheartedly understand and agree with, and then it goes, afterwards, you know. I – seems almost as if I just duplicate the data so completely that it's no longer with me.

LRH: Umm.

PC: Um – so there's a failed to reveal, do you see? There's some – there's something I failed to reveal on a – on a goal "to know" that this happens to me. It – it's not quite true because then I find that – provided I'm not asked what did you say on such and such a date, if somebody will come up and ask – ask me a question on that, I can very often just come out with the answer. I know I did it today to somebody, came to ask me a question. I didn't have to think at all. I just gave him the answer.

LRH: All right. Thank you. How are these somatics?

PC: Well, they're easing off a bit, but I've still got this one right across
the chest, and I've gone a bit throaty, and the heavy – my hands still feel heavy, but that terrific pressure that was nearly breaking my - was sort of pressing down my arms - that's gone.

**LRH:** All right.

**PC:** I still seem to be gripping hold of these cans fairly tightly.

**LRH:** All right. Very good. On the goal to know, has anything been suppressed? All right. On the goal to know, is there anything you failed to reveal? All right. On the goal to know, is there anything you've been careful of? All right. On the goal to know, has anything been suggested? All right. What was that?

**PC:** Well, I just suggested that - how this tied up with the other goals you been checking out. And there was this one about truth – not being truthful or honest and so on, do you see?

**LRH:** Mmh.

**PC:** They all – they all tie up somehow or other.

**LRH:** Hmm.

**PC:** And I was also suggesting to meself that this one's dying hard.

**LRH:** All right. On the goal to know, has anything been suggested? All right. There's probably another one here. Suggest. Suggest.

**PC:** Well, I'm sorry, but I just suggested to meself it's rather a surprising goal for me to have or something or – it's a goal you might be proud of.

**LRH:** All right. Oh, I see. I see. Okay. On the goal – on the goal to know, has anything been suggested? All right. On the goal to know, has anything been suppressed? Yeah, there's probably suppression there.

**PC:** Well, that's – was a – a desire just to wipe my nose. It's not necessary, but just a sort of desire then.

**LRH:** Very good. On the goal to know, has anything been suppressed? All right. This seems clean. To know. To know. To know. All right. How is this – how is this somatic and so forth?

**PC:** Well, it's still across the chest. It's easing off a bit, and I've still got it across the chest.

**LRH:** Now, do you mind if we leave that goal partially checked out and check the next goal?

**PC:** Mm-hmm.

**LRH:** All right. Just – just for fun.

**PC:** That's all right. Enjoy yourself.

**LRH:** It's almost the same goal and I'm trying to explain the latent read here.

**PC:** All right.

**LRH:** All right. Because the goal is still hidden.

**PC:** Okay.

**LRH:** To know all. To know all. Okay. To know all. On that goal has anything been suppressed? Yes. What's that?

**PC:** Well, that it – I've just suppressed it because it sounded to me like an impossible goal.

**LRH:** All right. On that goal has anything been suppressed? All right. Another one. What's that?

**PC:** I'm – uh – I like the other goal best, and I'm trying to suppress this one.

**LRH:** All right. Very good. On the goal to know all, has anything been sup-
pressed? Okay. To know all. Very good. That is no longer amongst us. I'm going to get the next two in a hurry here ...

PC:  All right.

LRH:  ... because they're both the same type of goal.

PC:  Mmh.

LRH:  All right. To know about people. On this goal, has anything been suppressed? All right. That's probably out. All right. To know all about people. All right. On that goal, has anything been invalidated? All right. Has anything been suppressed? All right. We're not going to pay any more attention to that. Now let's go back and look at this goal some more, huh?

PC:  Mmh-hmm.

LRH:  Good. Sometimes you can loosen them up by knocking the others like them.

PC:  Can I just wipe my nose? It's just taking my attention a bit.

LRH:  You surely wipe your nose. Go ahead and wipe your nose.

PC:  Thank you.

LRH:  All right. Now, we're going to get in the middle rudiments here for the session, very rapidly by fast check. Okay?

PC:  Okay.

LRH:  All right. In this session, is there anything you have suppressed? Invalidated? What's that? In this session what have you invalidated? That.

PC:  Well, I invalidated some of those goals just then.

LRH:  Yeah. All right. Okay. In this session, is there anything you have invalidated? There's another one. What's that?

PC:  Mm.

LRH:  There. What's that?

PC:  You um – somehow. Oh, I think I was — uh — what was I doing? I was invalidating you a bit in the rudiments by thinking you were cleaning cleans.

LRH:  Oh, all right. Thank you. In this session, is there anything you have invalidated? Equivocal. In this session, is there anything you have invalidated? All right. In this session, is there anything you failed to reveal? All right. In this session, has anything been suggested? Yes. What? What's been suggested?

PC:  Well, I just suggested — and was horrified afterward when I heard what I'd said — that you were cleaning cleans and I thought well, that leaves that one down.

LRH:  All right. Very good. Very good.

PC:  Oh, there is an addition to that because then there was a silence after it and I thought you were suggesting by your silence I was in for a dig.

LRH:  No, I think I was trying to keep from laughing. I wouldn't have a withhold from you. Needle falling off the pin the whole way. And I said to myself, "Well, I've got witnesses." [PC and LRH laugh]

PC:  Okay.

LRH:  All right. In this session, is there anything you have suggested? All right. That appears okay. In this session, is there anything you failed to reveal? All right. You think of anything? There? What's that?

PC:  Well, I failed to reveal — but I did.

LRH:  Hm? You failed what?
PC: I failed to reveal the withhold for a long while in the rudiments.

LRH: Hmm.

PC: I did eventually. But there was a fail for a while there.

LRH: All right. Very good. In this session, is there anything you failed to reveal? Equivocal. In this session, is there anything you failed to reveal? I don't find a failed to reveal, but the word "session" is banging here. I won't bother to investigate it. But in this session, is there anything you failed to reveal? Well, there possibly would be another one if you could dream one up. If you can't, it's all right with me.

PC: Oh ...

LRH: What's that? What's that?

PC: I ... it – it was a failed to reveal and another failed to reveal that I had a little while ago. I gave you one, and I thought there's another one, and then – then you had an equivocal read, and I was going to mention it then ...

LRH: Mm-mmm.

PC: ... and then when you gave it to me, I was going – I'd forgotten it and it's gone now, I'm afraid, but anyway I failed to reveal that.

LRH: All right. Very good. Excellent. All right. In this session, is there anything you failed to reveal? All right. There is one. You could accuse me almost of cleaning cleans here.

PC: [laughs] Mm... Mm.

LRH: There, what's that?

PC: Mmm.

LRH: What's that? What's that?

PC: That's the beginning of the session, just before the session started. Ah! I failed to reveal to you the exact trouble they were having with the TV set downstairs. I know you looked a bit mystified and I was and – I was chasing around a bit getting all this. I was late back from dinner, do you see, and they kept ringing up saying this wasn't right. Well, there's nothing I could do from it up here. They'd just have to put it right downstairs. But I failed to reveal this to you. I left you in a bit of a mystery.

LRH: All right. Very good. In this session, is there anything you failed to reveal? All right. We're going to call that clean. In this session, is there anything you've been careful of? All right. I don't get anything on that unless you want to give me an answer.

PC: No.

LRH: All right. In this session, has anything been suppressed? There's what – there's one. What's that?

PC: Well, it was details of what happened last night. The details.

LRH: Very good. All right. Very good. In this session – in this session, has anything been suppressed? All right. There's another one.

PC: Well, that was the comment – last night's your own these days, is it?

LRH: All right. In this session, is there anything you have suppressed? All right. There's another one. Thought of something there?

PC: I-I've suppressed too much hope that this goal will check out.

LRH: Very good. In this session, is there anything you have suppressed? All right. Another one. What's that?

PC: That's the thought that this is the sort of goal where you could get your teeth around.
LRH: I beg your pardon?

PC: *It's the sort of goal you get your teeth around when you come to list it.*

LRH: All right. Very good. In this session, is there anything you have suppressed? All right. Looks clean to me. Got any more answers on it?

PC: No.

LRH: Very good. All right. Seem to you middle rudiments are in?

PC: Yes.

LRH: All right. Now, let's go back to this goal to know. Okay?

PC: Yes.

LRH: All right. Sorry to distract you from that. Did that bother you any?

PC: No.

LRH: All right. To know. Slowed. To know. No reaction. To know. A sort of a trip. To know. A stop. All right. On this goal, has anything been suggested? Yes. What's that?

PC: *Well, I just suggested it would be a nice goal to list.*

LRH: Very good. On this goal, has anything been suggested? All right. Probably some more.

PC: *Well, this – this – this pain across my chest suggests it might be bloody near it if it isn't it.*

LRH: All right. Very good. On the goal to know, has anything been suggested? All right. Seems clean at the moment. On the goal to know, is there anything you failed to reveal? All right. What might that be? There. There.

PC: When I was looking this over I um – had a cognition about it. Because when I first thought that this would fit into on this particular question, and this was on Monday night on the ship in brin – in bed.

LRH: Um-hmm.

PC: That's – you could – basic – uh – wearing your hat – somebody saying that this goal was pretty high on the Know to Mystery Scale, and I've lost the full cognition now, but it was something on those lines that it was – you could probably – that's right – you could probably get the classification of where a guy's goal came by this scale, you see...

LRH: Mm-hmm.

PC: ... and classify goals in that, yes.

LRH: Mm.

PC: That's it.

LRH: Mm.

PC: That's it.

LRH: All right. Thank you. All right. Let's see what this goal does now. To know. Reacted. To know. No reaction. To know. No reaction.

PC: Yes. I-I'm sorry.

LRH: Go ahead. What were you going to say?

PC: I seem to – it reacts – you tell me it reacts, and then I think, oh, no, it won't. I'll do this right immediately after you say it.

LRH: Mm-hmm.

PC: This is – this is a too good to be true thing I've got.

LRH: Mm-hmm.

PC: Thought I'd better tell you that.

LRH: All right. Very good. On the goal to know, has anything been – has anything been suppressed? All right. On the goal to know, has there been anything
you've been careful of? All right. Got an answer there?

PC: Careful to tell you that thought just then.

LRH: Very good. On the goal to know, has there been anything you've been careful of? Yes. What's that?

PC: I've been careful to know what is necessary and to know ... Oh, yes! Christ! I've never passed an examination or any ... I have no academic qualifications, yet I am fairly successful in my line of business, modestly. Very successful. And it's — but I've always said I know where I can find out rather than have to know the data, do you see, and this has been something I've relied on.

LRH: All right. Okay. On the goal to know, is there anything you've been careful of? All right. There's another one there.

PC: Careful to be modest about knowing, as is just evident.

LRH: All right. On the goal to know, is there anything you've been careful of? All right. There's another one.

PC: Careful not to give the impression that I know more than I do.

LRH: All right. On the goal to know, is there anything you've been careful of? All right. To know. On this goal, has anything been invalidated? Yes. What's that?

PC: I've invalidated myself by suggesting that I know less than I do.

LRH: Very good. On the goal to know, has anything been invalidated? All right. On the goal to know, has anything been suggested? All right. There's a suggestion. What's that?

PC: Well, I failed to reveal knowledge on many occasion. I mean it's an advantage in many spheres to — not to play all your cards and to keep knowledge one has to oneself.

LRH: All right. Very good. On the goal to know, is there anything you failed to reveal? Yes. Another one. There.

PC: I failed to reveal my whereabouts to my — my mother as a child. Now, um — she would want to know where I was and I would keep it quiet.

LRH: All right. On the goal to know, is there anything you failed to reveal? All right. Seems clean. To know. To know. On the goal to know, has anything been invalidated? Yes. Got the invalidation. There it is.

PC: This is people — I seem to get invalidated myself. I very often know the right way to do something and then people will ... No, that's not right. I know how to find something out; how to know, in other words, do you see, and people will follow another — another course. I — this
comes up – this is why the teaching goal stayed in for so long, or whatever it was, instructing.

LRH: Oh, yeah.

PC: That was on the list. That I know how to let people know, but then they won't – they won't follow that, so they invalidate it.

LRH: All right. Very good. On the goal to know, has anything been invalidated? Okay. On the goal to know, has anything been suppressed? All right. What's the suppression?

PC: Well just then. Oh, how did it go?...

LRH: There it is. There it is. There. There. There.

PC: Suppressed the suppression even. Sorry, I'm absolutely – gone blank on everything.

LRH: All right. We're looking for a suppressed on the goal to know. There it is.

PC: Umm.

LRH: There.

PC: Yes, it's to do with what I was ... Well, it's almost the same answer as I gave before, that it's the suppression of my – a suppression of my – of auditing somehow, not by me. Well, people have suggested and so ... Oh, I suppressed auditing somehow. It made nothing of auditing to me, saying it's not worthwhile, so their goal to know is being suppressed as a result.

LRH: I see, all right. On the goal to know, has anything been suppressed? All right. To know. Slow. To know. Ah – reaction. To know. No reaction – a latent reaction. All right. How's these somatics?

PC: Well, they're easier. I've still got it across my chest slightly there. Otherwise they've eased off. Um – slight bit of a headache or a pain behind the eyes. Nothing serious.

LRH: Mmm. All right. You're doing all right in general?

PC: Mm, yes, yes.

LRH: All right. Well, let's bang away at this thing a bit more and see what we can get out of it here.

PC: Mm. That's fine.

LRH: All right. On the goal to know, is there anything you've been careful of? On the goal to know, has anything been suppressed? Yes. What's the suppression?

PC: Well, I was tending to suppress the somatics then, you know, to say, "Oh, they've – they've gone," and so on, and that's to do with the goal. After all, they've come in on this one.

LRH: Mm-mmh.

PC: Mm-mmh.

LRH: All right. On the goal to know, has anything been suppressed? Okay. To know. To know. To know. To know. To know. All right. This thing has got less than an agitation now. On the goal to know, has anything been invalidated? All right, no reaction. On the goal to know, has anything been suggested? Okay. And on the goal to know, is there anything you failed to reveal? All right. On the goal to know, has a mistake been made? All right. On the goal to know, has anything been suppressed? Has anything been suppressed? Yes. What's the suppression?

PC: Well, I didn't hear a lot of those rudiment questions then. Um – and, um – oh, God. Well, I suppressed hearing
the questions.

LRH: Hmm?

PC: I suppressed hearing the questions just then.

LRH: All right. On the goal to know, has anything been suppressed? On the goal to know, is there anything you've been careful of? All right. Do you think of an answer to that? Okay. On the goal to know, has anything been invalidated? All right. What's the invalidation?

PC: Well, you just saying it is just ticking and it led me to suggest that it was going out.

LRH: Very good. On the goal to know, has anything been invalidated? Another one.

PC: Oh, more or less confirmed on myself then that I suppose it is out, you know.

LRH: Oh, all right. On the goal to know, has anything been invalidated? All right. On the goal to know, has anything been suggested? All right. Maybe there's a suggestion.

PC: Well, there was a slight suggestion to you that it was going out or that I had got from you that it is going out.

LRH: Very good. You might be interested in the last couple of times I used it in a sentence, it's fired both times.

PC: Mm-hmm.

LRH: All right. On – on the goal to know, has anything been suggested? Any answer to that?

PC: Well, I could give you an answer that, by telling me it's firing, then you were suggesting something or other – I wasn't particularly interested what – I just thought I could dig up a suggestion there.

LRH: All right. On the goal to know, is there anything you failed to reveal? Is there anything you failed to reveal? Yes. What's the failure to reveal?

PC: Well, I failed to reveal that I've now got different somatics down the – down the – my arms.

LRH: Hmm. All right. On the goal to know, is there anything you failed to reveal? Yes, what's that?

PC: Well, I failed to reveal I've also got the somatic across my chest.

LRH: All right. On the goal to know, is there anything you failed to reveal? Yes. Another one... There. There. There.

PC: Oh, I failed to re– failed to reveal just then that I heard the lift move or a sound like the lift moving.

LRH: The what?

PC: The lift moved.

LRH: Oh, really?

PC: And I failed to reveal that.

LRH: All right. On the goal to know, is there anything you failed to reveal? All right. It seems clean. On the goal to know, has a mistake been made? Yes. What's the mistake?

PC: Well, I think you made a mistake there. I'm sorry about – to suggest this, but it – you didn't – perhaps didn't quite see how the last answer tied in. It was that I knew the lift had moved and therefore I hadn't revealed it and it was to do with the goal "to know," do you see?

LRH: All right. Very good. Thank you. On the goal to know, has a mistake been made? All right. Any more answers there? The needle's flying very fast. It might be, it might not be. Okay?
PC: *Mmh.*

LRH: All right. To know. To know. To know. This roughs the needle up, is what you could say about that if you're wondering whether it's in or not. All right. To know. To know. That gives you several fast rises, speeded rises.

PC: *Mmh.*

LRH: To know. To know. To know. This thing is not reacting very satisfactorily.

PC: *Mmh.*

LRH: You see, it went the reverse way. I thought, well, all right, if it's out I'll clean it up.

PC: *Mm.*

LRH: If it's in – it went the reverse way.

PC: *Mm.*

LRH: See, it got worse. You got a new set of somatics turned on.

PC: *Mm. Yes.*

LRH: Huh? You see the position?

PC: *Hm. Oh, don't worry. I'm all right.*

LRH: Are you all right?

PC: *Yes. Yes.*

LRH: Will you forgive me if I leave you with those somatics?

PC: *Uh-huh.*

LRH: Not necessarily suggesting they won't go off at once.

PC: *I don't mind. They'll be going off.*

LRH: All right. Very good. Is it all right with you? Say so if it isn't.

PC: *No. I'd say – no, it's quite all right with me.*

LRH: Hm?

PC: *Quite all right with me. I'm quite happy.*

LRH: All right. Then is it all right with you if we conclude the body of session?

PC: *Yes.*

LRH: A little disagreement here. What might it be?

PC: *Um, I wasn't quite sure of the time. That was the only thing.*

LRH: Oh, it's twenty minutes of ten.

PC: *Okay. That's all I wanted to say – wasn't anything I was careful of.*

LRH: All right. Okay. Is it all right with you, then, if I end the body of session?

PC: *Yes.*

PC: *Uh-huh.*

LRH: Noting that pc's left with somatics on this goal. All right?

PC: *Uh-huh.*

LRH: Okay. 2.5, your TA. So here we go with the end rudiments.

PC: *All right.*

LRH: Here we are. In this session, have you told me any half-truth, untruth, done something only to impress me? And what have you done only to impress me?

PC: *Opened me eyes sometimes.*

LRH: Hm?

PC: *I've opened my eyes sometimes.*
LRH: Okay. Very good. In this session, have you done something only to impress me? All right. There's another reaction.

PC: I was leaning forward on the table...

LRH: Uh-huh.

PC: ...at one stage and then I sat back to impress you that I was all right.

LRH: Oh, all right. Very good. In this session, have you done something only to impress me? All right. I have another reaction here, what is that? There it is. Okay, what's that? What's that?

PC: Umm.

LRH: There it is.

PC: Well, I think I’ve kept my eye – my hand in my lap once when I had an itch on my forehead. And I thought it'd look bad if I'd put it up and scratched it, you see.

LRH: All right. Very good. In this session, have you done something only to impress me? All right. Do you agree that's clean?

PC: Uh-huh.

LRH: Very good. In this session, have you tried to damage anyone? All right. I have a reaction here. What is that? There it is.

PC: Um, I thought I might be damaging Jenny at one time.

LRH: All right. In this session, have you tried to damage anyone? All right. Do you agree that's clean?

PC: Uh-huh.

LRH: Very good. In this session, have you deliberately tried to influence the E-Meter? All right. Do you agree that's clean?

PC: Yes.

LRH: All right. In this session, have you failed to answer any question or command I have given you? All right, do you agree that's clean?

PC: Uh-huh.

LRH: Okay. In this session, have you decided anything? All right. Do you agree that's clean?

PC: Uh-huh.

LRH: All right. In this session, have I failed to find out anything you have thought, said or done? All right. There is a thought there.

PC: Oh I thought that you'd probably find out that I'd noticed you'd altered the rudiment around.

LRH: Very good.

PC: That's funny, I pointed it out once. Yes.

LRH: All right. Very good. In this session, have I failed to find out anything you have thought? Very good. Do you agree that's clean?

PC: Uh-huh.

LRH: In this session, has anything been misunderstood? And what is that?

PC: Well, you misunderstood me when I said it was all right. It was all right and you asked me – kept asking me, as much as to say you didn't understand that it was all right.

LRH: All right. Very good. In this session, was anything misunderstood? All right. I have another reaction there.

PC: It was the thing with the lift. I think you misunderstood at first.

LRH: All right. Very good. In this session, was anything misunderstood? All
right. Do you agree that's clean?

**PC:** Uh-huh.

**LRH:** Very good. In this session, was the room all right?

**PC:** Uh-huh.

**LRH:** All right. Do you agree that that's clean?

**PC:** Yep.

**LRH:** All right. Any comments to make on the room?

**PC:** No.

**LRH:** Very good. All right. Squeeze the cans. All right. Put the cans down. Okay. We're going to run just a few commands of Havingness.

**PC:** Uh-huh.

**LRH:** Okay. Feel that cloth. Thank you. Feel the back of your left hand. Thank you. Feel the back of your right hand. Thank you. Feel your wristwatch. Thank you. Feel the top of that telephone. Thank you. Feel the dial. Thank you. Feel the top of that telephone. Thank you. Feel the clock. Thank you. Feel that lapel of your jacket. Thank you. Feel the inside of that can. Thank you. Feel the outside of that can. Thank you. Pick up the cans. Okay. Oh, that's much better. Squeeze the cans. Fine. Fine. Fine. That's good. All right. It came right back up toward 3.0.

**PC:** Good.

**LRH:** Okay. Now, have you made any part of your goals for this session?

**PC:** Well, I think we've done very well.

**LRH:** To find the goal is the first one.

**PC:** Well, we're on it or something. I don't know but we've certainly done a lot of work on something there.

**LRH:** All right. To work well.

**PC:** Well, I think I worked very well.

**LRH:** Uh-huh. All right. To feel even better at the end of it.

**PC:** [laughs] Well, I do really. I'm not - the pain's gone in my chest. Hasn't gone completely but it's eased off quite a bit. Me arms are quite okay now since we did the rudiments.

**LRH:** All right. Very good. What will we say about that, to feel even better?

**PC:** Well, yes. We're feeling

**LRH:** All right. Very good. And this was part of it: to get my eyes a bit better.

**PC:** Well, I can't tell you about those at the moment. They're a bit moist. Uh, yes, I can read that a bit better than I could. Yes, I think there's an improvement there. Because me eyes have been - very conscious of me eyes sometimes in session.

**LRH:** All right. Very good. Now, are there any other gains you'd care to mention?

**PC:** Um, yes. I- uh - despite the slow haul getting away in the beginning rudiments - uh - it really got me into session because - uh - it's only about once or twice did I really think of the people downstairs. And I think that's - really getting in-session is quite a gain.

**LRH:** Mm.

**PC:** And I had a number of cognitions throughout.

**LRH:** Okay.

**PC:** I think that's the lot.

**LRH:** All right. Very good. Now,
is there anything you'd care to ask or say before I end this session?

PC:   Well, I want to thank you very much for the session. And, it's a pity we didn't make it on that one. It would have been quite a...

LRH:  All right.

PC:   ...quite something. But there we are.

LRH:  Okay. All right. Is it all right with you if I end this session?

PC:   Yes.

LRH:  All right. Here it is: End of session.

PC:   Thank you.

LRH:  All right. Tell me I'm no longer auditing you.

PC:   You're no longer auditing me.

LRH:  All right.

PC:   Thank you.
LISTING LINES

A lecture given on 20 September 1962

Thank you.

Well, here we are on the what?

Audience: Twentieth.

Where did the 19th go? Oh, I was auditing that night. That's right. So this is the 20th of September, AD 12.

I'm going to talk to you right now about lines and listing.

It's only four days deep into this week and six goals have been found. We're running at a rate of one and a half goals per day. Those of you who have had the half-goal found… [laughter, laughs] Six goals – just like that. They're rolling off now at a highly rapid rate.

All you've got to do is learn how to do it so that it happens with everybody you address in under twenty-five hours. That's what I want to have you do. And that way you can run a co-audit and that way you can do a terrific amount of this and that. Okay?

Audience: Mm-hm.

All right. Now, I want to talk to you about goals and listing. Listing is a problem you have not yet wrapped your wits about. None of you were listing on the right lines. I doubt there's anybody listing on the right lines. Your lines are probably wrong. I have tried to develop a formula for lines without much success, which could be rattled off boppity-boppity-bop.

The formula is probably: create, curious, desire, enforce, inhibit, you know? The CDEI Scale with a create on top of it. That's probably the formula. And that goes positive and negative and oppose and not-oppose. And then it goes cause and effect on the goal line. Well that, if added up, give you forty lines. Look it over; that's a forty line listing rig.

Now, I haven't listed one out totally on those lines because I've just – you're as usual, trodding upon my heels very tightly. And I have to fix – I have to get the backs of my shoes fixed more often than any other person, anyplace.

But the essence of this is that if you had: one, create, do you see, causative, then of course, there is a create effect. You'll understand more about that in a minute, see. So that's a group of four. Create causative immediately becomes a group of four. I'll give you an idea:

"Who or what would make catfish?" See? Now, that's fine. Who or what would make catfish? All right. Now, that, of course, goes into "not make catfish," "would oppose making
catfish" and "not oppose making catfish." Instantly and immediately we have a group of four. It's always on a group of four.

You always have the plus and the minus and the plus-oppose and the minus-oppose – always. There will be some version of that and it must be in a multiple of four.

Now, if you have a causative end of the line – you know, "Who or what would make catfish," then you've got… This is a very crude example and I should tell you right here that the problem is not as critical as you're making it out. With four lines it was terribly critical. You had to get these things to fire; you had to get everything all set and whooo!, it was really sharp and so forth. Well, we're handling it quantitatively now. Who cares? See? You don't have to get these lines – you don't have to prepcheck these lines, you don't have to get these lines to fire, you don't have to do anything. You just take the goal, put it to it and list and the weird part of it is you're operating on a plus margin. You're way over what it takes to make him Clear. You understand? And I'll go into that more.

But let's take a look at this now. You've got the effect end, which gives you another four. Now, if you've got a cause four, you must have an effect four. You got the idea?

"Who or what would make catfish?" See? You've got to have "What would catfish make?" Do you see that? And "What would catfish not make?" and "What would catfish oppose making?" and "What would they not oppose making?" You understand that?

Just because you've got an object in the goal is no reason that the effect end is settled. You got the idea?

We had somebody once who had a goal that had the word "empire" in it. Well, this saddled everybody. An empire was an empire and that was all there was to it. You know, the object end of the goal; the effect end of the goal is all taken care of in the goal. That's obvious, isn't it? It's got an empire on the end of the goal, so therefore, "Who'd want to run an empire?" You see? Ah! We'll have to get over to the other side of this thing, "What empire would want to be run?" Don't you see that?

Don't take it for granted that because the goal has an object in the sentence that that is a fait accompli and that is never alterable or anything or you'll leave your pc there with stacks of extra answers.

Now, how did all this come about?

It came about this way: PCs listing on four lines were having to alter-is the command to squeeze the answers in sideways. You got it?

Audience: Mm-hm.

And they were always left with extra items and these sometimes would pile up to a point where the tone arm would start rising and would go up and stick. And those were just piled-up suppressed items that there was no line for them to go on, alterations of line, alterations of the auditing command. You see these were all disobediences of the basics of auditing: must be a clear auditing question and it must be a clean auditing answer to that question. Don't you see?
All right. Now, the answer to that is, of course, give them more lines than they ever heard of. They always got someplace to put the extra item.

Now, furthermore, even though you have somebody's goals already all fixed up, see, and it's already grooved in and you've got this all taped and everything, and he all of a sudden comes up with a rabbit. And he tells you after you've gone through sixteen consecutive lines of listing – which is all you had for his goal – that he's still got a rabbit. Well, you don't throw this rabbit away. But let me tell you, the rabbit – the rabbit is what he would make. Do you see? And there just is no place to put this rabbit. And here's this poor old bunny sitting out there on the side and it drives your pc halfway around the bend.

Well, you can't put in an extra line which accommodates the rabbit. If you put in an extra line to accommodate the rabbit you of course have to put in eight lines. So, actually, the minimal number of lines that you can add to anybody's list is eight. Not four, but eight. It must be subject and it must be object. You see? The cause and the effect. You see that?

So anyway, if your pc can't accommodate a rabbit then you'd better give this thing a good study. Not evaluate for him and tell him where it belongs but tell him what he thinks this rabbit would have to do with what he is doing.

And he says, "Well," he says, "the rabbit of course – the rabbit would – would – the rabbit – I guess the rabbit would – well, he'd be impossible to make."

And maybe the goal was "to make things." A rabbit would just be impossible to make. Well, you're off to the races. Just put the word "impossible" into eight lines. You see how you'd do that? And you'll accommodate the rabbit and you'll find out there's a whole bunch more that will come in on top of it and I don't care how many sets of lines you use.

But if you do that, don't try to catch the lines up to the other lines, just add them in the normal course of events. You understand? You'll always find extra items.

Now, there's an oddity here as any pc that has been run on it and is jostling around can tell you. "Who or what would want the goal to catch catfish? Who or what would not want the goal to catch catfish? Who or what would oppose the goal to catch catfish? And who or what would not oppose the goal to catch catfish?" All of those get different answers than anything else. "Who or what would catch catfish?" and all of that bracket, actually you get different answers when you say "the goal". That's an interesting ramification, see. If you say, "Who or what would want the goal to catch catfish?" Don't you see? Well, that gives you four lines that sort of stand out.

Now, what would be the object of this? Is what catfish? You got the idea? You'd have to add the other four in some haphazard fashion to make it a balanced eight. Do you understand? But it'd all be the goal – the goal, the goal, the goal. That would be eight lines all devoted to the goal. You understand? If you were going to run it that way.

Actually, you're now riding in clover. You're way out on the wide-open sands and you've got such abundance of places to put things that you're riding on a quantitative cushion, you might say. The pc can put anything – anything he's got anyplace without that one, the goal. But I'm just giving you an idea, see?
This, by the way, I've seen boggle a pc. I'm not advocating that you use this one. See? The pc would be saying, "Who wants this goal?" and, "Who wants this goal?" and so forth. Well, just gratuitously add eight more lines. Got the idea? Each one with the goal in front of the thing. And you'll get a whole bunch more answers. You understand? You're always at liberty to do this.

Now, I don't care how many lines you list. You can list 128 lines if you want to. But they're all listed in the same way; they must be answerable and each line is put down at the top of a sheet of paper and you add 4 items to that list and put a check mark and go to the next page. Not five, not three: four. That is what you want, just exactly four.

And what if he gets an extra item?

He says, "But-but-but-but I've got this item here. I got this rabbit. I-Here's this rabbit. I-I-I got this rabbit. I got this rabbit."

You say, "Good. I'll write the rabbit down in the margin. You can have him the next time around." Got the idea?

And this disciplines and puts the pc at cause over these wild automaticities that you so far have been accommodating – too accommodating about. Got the idea? Four. Not three, not five: four. And that leaves the auditor at cause over the session. See? Because listing sessions tend to become too uncaused. They go wild. The guy writes three sessions on, "Who or what would not want to have made catfish?" See? And it goes on and on and on and on and on. Actually jams himself up by doing this, too.

Now, why do I say "four"?

Well, four appears to be a fairly optimum number. But I would not be surprised to have you come down sometime or another with a real jammed-up case to one.

Now, why would you drop?

You wouldn't drop on the case after you'd started. If you started with four, you'd continue with four. If you started with one, you'd continue with one. But one, that isn't very quantitative. But you might get it so jammed up that the guy can't do anything about it.

Now, what happens exactly if you overlist?

First you get a comm lag. And then you get a "fishing for the right item." These occupy a lot of session time of which – there's no value in occupying that session time, see? Has no value at all. And then the next phenomenon is, "Oh, that isn't it!" You got it?

All right. It's first comm lags. "There's – there's a waterbuck and a tiger and a ahh-ahhm-ahh-ahh-aahh-ahhm-ahh-ahh-ahh..." At twenty-five dollars an hour. That's crazy. You don't want that. You get the idea? See, he's listed sixteen items and then he goes on to ahh-ahh-ahh, and the next thing you give him, you say, "All right, give me another one on that line." If you did that – you ought to make this as an experiment some day just to see how it works because it always works out this way.

He'll say, "Well, it's a big – no a small, a large – an enormous, a huge – uh-uh-a big – m m-mm – it's a certain type of waterbuck. It's a large – who, a who – big, small, no, no – it
isn't big, small – no, no – couldn't be – so on and so on, so on. Oh, I finally got it! The item is a certain type of waterbuck. Yeah, that's great."

Now, if you said, "Give me some more items," he would be saying, "A waterbuck – no that isn't it. A tiger – no that isn't it. A giraffe – no that isn't it. No, don't put that down. Uh, that wouldn't be it. A tiger. No, that isn't it," and so on.

You've got to run them all out in invalidations on a Prepcheck. To hell with that racket. See, that's no good.

What's happening? What's happening?

On the ahh-ahh-ahh-ahh-ahh, what you've got is the line has flowed in one direction. You see, these flows – you're listing flows – and you've run one of these flows to a point where it's idling at the end, you see. It's idling and it isn't reaching anything and it's kind of trying to come back. So he's kind of saying, "Uhh-uhh-uhh." It can't strike anything because he can't reach in that direction anymore. The flow is now stuck.

And the next phenomenon is: he does manage to reach something but he knows kind of that it's undescribable. You're asking him to reach too far, don't you see? And it's too far in that direction. It's undescribable and therefore the right thing and all of that and so forth. Now, if you – if he goes past that and manages to describe it, he's already overreached himself considerably.

The next phenomenon is that the backflow on that same line starts to hit. And so he no more than announces something than he is invalidated. You see? The backflow has started. You're trying to reach out and it's trying to come in. Or you're trying to reach in and he's trying to flow out. You get the idea? It's self-invalidative. And if you run a line too long in one direction, you will get this, "Isn't it, isn't it, isn't it. Catfish, isn't it. Waterbuck, isn't it. Tiger, isn't it." You get the idea? And all you're running into there is bank phenomena.

The comm lag, the indescribable, the invalidated; and that is the cycle that those listings go.

So, you want to stop short of that and keep the pc fluid. Now, the way you can keep him running properly in these lines is to get a large number of lines and let him put a definite number on each line. The – a good average number is four. But if you start in with four then he damn well give you four. And that's all there is to it. And you'll find very shortly he gets totally educated on the thing. He'll give you four – one, two, three, four. Next line, one, two, three, four. Next line, one, two, three, four. Next line, one, two, three, four. Next line, one, two, three, four. And then he'll say, "Ahh-ahh-ahh," on the next line. And then, one, two, three, four. And one, two, three, four. And one, two, three, four. And one, two, three, four. And, man, you're getting items, man. And that guy's going Clear in a hurry. Savvy?

None of this ahh-ahh-ahh-ahh-ahh, you know? Auditing is not an exercise in gargling. [laughter]

Now, that's how to get fast listing done.

Now, the funny part of it is, the more lines you've got the shorter your listing will be. The more lines you list, the less listing you're going to do. Let me give you an idea. This is –
this is suppositional. That on four lines you would have had to have listed twenty thousand items to free needle. So we list eight items and you would only have to list on all – that is, this is a total number of items – maybe eighteen thousand. See? We list sixteen lines and we only list twelve thousand items. You get the idea? You see, it isn't per line. That's just the gross number.

Now, perhaps you could go too far out on this. And the only way you could go too far out on this is by failing to sandwich the causative and the effective properly. Now, you can have eight causative and eight effective without getting into trouble. But if you start up from that number you had better have four causative, four effect. You understand? Four cause, four effect.

Now, you understand what I mean by cause and effect. "Who would want to be a goddess?" and "Who the hell would want a goddess?" You get the idea? See? Get that as cause and effect, see? Who'd want to be one? Who'd want to have one? That's your four lines in sequence, one to the next. You savvy?

Now, oddly enough, you can do this rather badly and still win. Lucky – lucky that it's that way. On the four lines you had to be very precise, you had to keep your mid rudiments in, you had to do this, you had to do that, you had to check – precheck everything, you had to precheck it every time you turned around, you had to do this.

Why?

Well, in looking into this to find out why, I found out that the items were being stacked up in alter-is. So if the items are being stacked in alter-is, why then of course, you had to precheck often.

Now, why did the items [lines] themselves have to fire?

Well, they had to fire because you did – you didn't have any abundance of lines: you were running on an economy of lines, which gave you, of course you had to get those lines which fired most and then you had a chance. But by listing a large number of lines, why, you're all set.

Now, I don't know what the proper number of lines is. I know very easily that sixteen you could undoubtedly get by with. You could get by with sixteen lines. Twenty-four lines – that's your next number up. That's dandy; they're fine; that's fine. Thirty-two – okay; okay. Forty – fine. See, it's almost a matter of, who cares?

But you get those together and you determine the number of lines you're going to have unless the pc had – starts having leftover rabbits, a case of leftover rabbits, why you wouldn't have to form up any more lines.

But now here's the precise way in which you list one of these things. I'm going to go worse, then I'm going to go over this again with you – formation of lines – because this is a headache. But let me tell you – let me get it in so I won't forget it. Here is an exact, proper listing session. I want to tell you what an exact listing session is. Exactly what it is.

You sit yourself down. You sits the pc down. You adjust his chair and you get the can squeeze and you put him into Model Session. You got that now? All right.
And then the firsttest thing you do is you super-tiger drill the goal till it reads. See? You get that goal reading.

Now, the magic phrase, "In auditing on the goal," or "Since (blank)" (whenever the goal was found or since the last time he was prepchecked up to) are also usable in that Tiger Drill. "In auditing on the goal to catch catfish has anything been suppressed? In auditing on the goal to catch catfish is there anything you've been careful of?" You understand? And you drill that thing back into a read before you start a thing in that session. And after that you don't do a darn thing with it. You don't do anything with lines. You don't do anything with anything. You just list. You got it to read, that's it.

Now, of course, if your session goes to hell you get your mid rudiments in. But you don't do anything else with the goal. If your session goes to pieces, why, you get your middle rudiments in. That's when you use middle rudiments.

Now, middle rudiments are best put in with this line, not "In this session" but "Since the last time I audited you." Got that? They're always put in best that way. "Since the last time I audited you." I know it's right in the middle of the session and the guy's all out of session and everything else and so forth, well you figure this must have gone wrong between sessions.

Why? Why is this?

Well, I discovered a new phenomenon. There's a new phenomenon. You miss a withhold on the pc in a session, it'll key in a withhold that happened before the session. Now, that's a hell of a thing. This had to happen to us, see. I'll give you an idea. You say – the pc says to you, one of his items is a buttercake, see, and he says to you, "Buttercake."

And you say, "A blossom." You're muttering to yourself.
And he says, "No, no, no. No, no. A – a buttercake."
And you say, "A splutterbath."
And, he says, "No, no, no, no, a buttercake. A buttercake. A buttercake. That – that's what I want on there, a buttercake."
And you say, "All right. Waterbuck."
Now, then you finally wake up, see – this was a warm day – and you say, "Oh, a buttercake." And you put down a buttercake.

And you say everything is all right but now the middle rudiments are a little bit out. So you say, "In this session yip-yap, yup-yup, whoop-whop..." And you straighten it all out and the pc is still out of session.

Well, what's taken place here?

Something very interesting has taken place. Because you missed, see, that's a withhold – you made him have a withhold called a buttercake – you will key in a missed withhold that wasn't registering in the beginning rudiments. Heehhh! This would happen to us! Now, the liability of it – you must understand this – because the liability of it is this: that it didn't happen between sessions but is a missed withhold from eighteen years ago. Ooooh!
Well, if you just know that one can happen, you can also get it from eighteen years ago. But that's why a pc appears to stay ARC broke, even though you get in the middle ruds. You got it?

In other words, when you missed a withhold in the session it keyed in a missed withhold. Weird business, you see. You hadn't missed it up to then; you had missed no part of it because it had never come up. Well, because you missed one in the session you key in one and miss it. You got that?

_Audience: Mm-hm. Yes._

So a good prevention of this – but not the perfect prevention of this – is of course, "Since the last time I audited you." Now, that will catch most of them. But sometimes you just got up and drunk the wrong brand of coffee; it must be, because it's just unlucky. You keyed in one when he was five years old and it doesn't even get included into the Problems Intensive run on him, you know? And there's a missed withhold sitting there staring everybody in the face and the pc's all ARC broke and nobody can make anything out of it.

Now also, you could have gone past something or other about his goal or missed an item or he's suppressed one. And that will operate as a missed withhold and key in an earlier missed withhold. You get the idea? In other words, he gets in a snarl, but it's still under the heading of missed withholds.

The only thing you've got to solve when a pc continues to be ARC breaky is the whenness of the missed withhold. See? It's the whenness of the missed withhold that will louse you up in a listing session or a goals finding session.

You missed something so you keyed in an earlier one that you hadn't missed. You know? He stole a piece of cake off of you two months ago and it's never come up. You've been auditing right across this thing; you've been just doing fine in the session and everything's been going along dandy and session after session, never come up, never disturbed him, he's in good ARC with you, never been critical. And then one fine day he says, "Buttercup."

And you say, "All right. Waterbuck."

And here we go. You've missed a withhold in session, he keys it in – all of a sudden the pc's all chopped up, very ARC breaky and you finally get very, very clever and finally find the stolen cake two months ago.

And you say, "How in the name of common sense could I have been auditing this character for two months?" Well, it wasn't keyed in. It just stayed there. You know? There it was.

You know an engram never becomes anything unless it's keyed in. Well, that's the same thing with a missed withhold. See? A withhold – a potential withhold does not do anything to anybody until he withholds it and you or somebody else misses it. You got the idea? It takes the action, then the pc's withholderness and then somebody missing the withhold for this thing to really go up in a cloud of blue smoke. You see that?

It's sort of the way you fire a depth charge: you can put a 16-inch shell through a depth charge without exploding the thing. But a tack hammer hammered against one end of it, ignit-
ing a primer, igniting ground-up TNT then ignites solid TNT and you get an explosion. And you'd never get an explosion unless it went exactly on that route. And that's the way a missed withhold goes together. It's been sitting there ready to be withheld and ready to be missed. See?

So getting in your middle rudiments on a pc in a listing session, particularly, or a goals finding session, it's very important that when you've had an ARC break or it's a big chop-up or you don't understand what's going on with the pc and he's still ARC broke, that you get your middle rudiments in in such a fashion as to get any withhold which might have been keyed in outside the area of the session. See? Because the boob probably keyed in something earlier. Got that? That's quite important.

So all right. You just go right on to the end of the session. You list, list, list, list, list – just carrying on with what I was telling you how to run a listing session. You go right on to the end of the session right up to the – to the clock and give him the business with the end rudiments and bring him right on out of session. In other words, you check nothing else, you prepcheck nothing else, you do nothing, nothing, nothing, except list. Got it?

All right. Now, that's all listing sessions consist of.

Now, what happens if you go to free needle on a line? You go to free needle on a line? Well, you ask him the question and it doesn't disturb it. Well, now this is why four: four are never going to jam nothing. See, just four items. It isn't going to jam anything. But you might be careful toward the end of the thing and only get one item if you were starting to run into lots of free needles. Got the idea? You could do your four straight on through without ruining the pc.

See, you would just go – the way – a listing session has very little to do with the meter. See, you can watch your meter and watch your TA action. Make sure your TA action is continuing because your TA action isn't continuing, your pc's out of session. Middle rudiments are out, see. And – or you didn't tiger drill the goal to read, see. It's mostly tiger drilling the goal to read – that's the important thing in beginning the session. You get TA action if you get to keep that goal tiger drilled.

All right. Now, it has got that – you've got the goal to read and then you list it. And you've got written across the top of the sheet of paper (you can usually double column these), you write the title of the line, you see – the whole line wording across the top of the sheet – and then you come down here over on the left and you write four items and then you put a tick and that tick goes just below and to the left of the fourth word. It's just a little strike of the pencil. Why?. That's because you then never have to add up the lines to find out if you've got four or not, see? It's always apparent that the unit is four. And that's counting the next four because you can very easily see if you have four without doing any numbering.

And then you write those four and then you flip the sheet, see, to the next page and you write the four and you flip the sheet to the next page and you write the four and so forth. And you can have a whole mass of things and you can put – if you can make it – two columns to the sheet. And then, of course, each sheet has a back with two columns on it. And you have
as many sheets as you have lines. And this makes very neat listing and the pc gets monotonously used to having a piece of paper flipped over in front of his face. You got it?

All right. Now, it becomes embarrassing when you start running out of captioned things in the middle. And nobody's had a solution to this yet. I've – we might have a mirror clip or something that reads the line on the back of the sheet while you're writing on the front of it or something. You get what I mean? I mean, you haven't got any lines prepared and you've got no sheets prepared, and where are we going now? You see. Well, you solve that the best you can. Right now the technology concerned with that is summataable in a four letter word: cope.

Now, you'll find out that one listing session isn't going to knock the goal badly out of read, and in fact will improve its read. And ordinarily, unless you've run a very lousy session, indeed, why – you know, run it with the rudiments all out and you never got them in in the first place and you missed all the reads and all this sort of thing – you'll find out ordinarily that if you read your goal at the end (and you ought to do this a time or two just to see the facts of the case) "To catch catfish," pow! "To catch catfish," pow! you know? I mean that thing is really reading then. And you'll find out at the beginning of the next session it isn't reading at all.

Well, what happened?

Well, pcs think. It's unfortunate, but they do. Some pcs are awful busy. I almost say this to pcs sometimes and I think I've been known to, is: "My God, you've been busy," you know? "What a busy, busy pc."

You know: "Think, think, think, think, figure, figure, figure, figure – invalidate, invalidate – suggest, suggest, suggest, suggest – fail to reveal, fail to reveal, fail to reveal, fail to reveal – mistake, mistake. Could it be a mistake?" [laughter] "Mistake, mistake, mistake-mistake, mistake. Well, I'd better suppress the whole thing!" [laughter] "Now, if I'm very careful until the next session, nothing will happen to the goal." You see? Pretty wild. Busy.

Anyhow, it's very strange what listing a goal will do for a goal. But, remember this about goals; remember this about goals: that listing – this is by actual test – listing will not polish up a goal all by itself.

In other words, you can't take a goal which is totally out of read and then list on it for a while and make it read. Now, I've already seen that tested and I have finally come to that conclusion. That conclusion might be based on firmer evidence, I might have examined it longer but I've just examined three pcs whose goal had been found a long time ago, who'd had the goal listed but nobody had ever polished up the goal for a period of months and months – in one case, a whole year – nobody had ever polished up that goal, it had only been listed, it was totally submerged, the pc's tone arm was way up and stuck, the pc looked like hell and nobody could make the goal read. You understand?

So that was good enough evidence for me. Because when I went in and rolled up my sleeves and tiger drilled the thing I got it to a total flat. Then I did a Dynamic Assessment and came right back to the same goal and got it firing like crazy. But it took that much to get that goal firing again, see? It took that much. And it also took a whole lot of, "In auditing, on the
goal blankety-blank, has anything been suppressed?" You know, a whole lot of that type of Tiger Drill and I finally got that goal firing again. But remember that goal had been listed in the interim. That's interesting, isn't it?

So listing in absence of Tiger Drilling at the beginning of every session is liable to find your pc getting lumpy. In other words, they're liable not to go Clear unless you do this. That's the secret back of it: you've got to keep the goal firing and keep the listing constant and regular and routine.

Now, let's get into self-auditing on listing. Can it be done? Yes, if somebody's around to tiger drill the goal. And if somebody holds the club over the pc and says, "You list these lines and that is it. You don't list any other lines but these."

You could do this. This is not necessarily optimum. It's probably a long way from optimum, but I can tell you already it can be done.

Now, how far this can be done is determinable by somebody sitting down and tiger drilling the goal into action at routine and regular intervals, see? But that's sort of on the emergency basis. You understand? That's getting out there to an emergency. It can be done. It isn't done well. And one of the reasons it isn't done well — one of the reasons it isn't done well is because the pain and sen will appear on the wrong lines. You got that?

Sounds funny, but the guy auditing himself is going into different valences and there's no auditor to give him the commands so he skips over into other valences to give himself the command and he gives the command to another valence. You got the idea? And therefore you louse up where the pain and sen belong. You got that figured out? You know, he goes into the oppose line to list the want. You understand? He goes into the want line to list the oppose. So he gets the sen and the pain in the wrong places. And this gets him awfully confused. You see, there's a liability to that. So self-auditing is different than being listed on it. But there's a possibility of doing so. Okay? Emergency situation.

All right. Now, there's a great deal to know about goals and goals listing and so forth. And I'd better give you what I can think of right here in an awful hurry because it isn't down anyplace else.

Now, when you are proving out a goal, you will find that sen occurs, sensation, by which we mean motion, sensations of pressure and misemotion and by the way, sexual sensation, all of those things occur on the Suppress, Careful of and Fail to reveal buttons. And on Invalidate, Suggest and Mistake you get pain.

Now, you're somewhere close to the guy's right goal or somewhere close to his goals channel when it behaves that way. But on a checkout of an actual goal you get pain. The only place you'll get sen is when you're hitting Suppress, Careful of and Fail to reveal. You're liable to get some sen when you're running those, but otherwise you're going to get pain, and pain is dominant in a checkout. If you're checking out the right goal, the pc's got pain; that's dominant. There's more pain there than there is sen and when you finally got it all the way checked out there is no sen — no sen at all and only pain. Got that? Because just to some degree you haven't tiger drilled it enough if he's still got sen. You got — you see how this is?
Now, don't worry about this too much if your imperfections of auditing and pc's out-of-sessionness and another thing leaves some sen on his right ear while his throat is being cut with a very sharp knife repeatedly. See? Don't worry about this. Just make sure, for the rule of thumb, that it's lots of pn, see? He's got to have pn. The pc who has no pain while the goal is being checked out is not being checked out on his goal. That's one very fast way of knowing about it. But that, by the way, isn't enough to stop checking out a goal. You are honor-bound to check a goal until it neither has pain nor sen. And that will keep you from erring anyway.

As long as he's got pain or sensation that began at the time you started checking the goal – that began during the course of your checking – you've got to continue until there ain't none. In other words, that doesn't mean you've got to continue the session till there isn't any, but you've got to keep on that course of events, session after session, until there isn't any. You understand? Because some goals might possibly go as long as six and a half hours to a fade. That's horrible, isn't it?

I did a goal in Washington – was marvelous, made a horrible liar out of me. I checked it for about an hour. It wasn't firing beautifully, but it sure looked like a goal. Man, it sure looked like a goal. It was "to be totally aware." Man, did that look like a goal! Well, I said, "That's good enough for me! Ha! Nothing to it." Turns out that it was the principal ending on the pc's old goal. It was a modifier. The pc's old goal went just before it. It sounded just like a goal, you understand. So, of course, it checked out hard. And it moved back into the pc's old goal and of course, it dropped out and the old goal stayed in. But that was only because it was a consecutive goal. You got the idea? It followed all the rules – my God, it had rocket reads and everything else.

That – don't make that shiver you to death on this because it only took another – about another half an hour or so. Took about an hour and a half of fooling before that thing did a fade. And then this was all being done in the face of a found goal. See? This wasn't very – would never be true of new goals. This is patching it up. You're running across all sorts of oddities in patching things up.

But you could hammer and pound away at a goal and pound away and hammer at a goal and have the thing fade; have it go. Oh dear, and you're about ready to pass in the checks and hand in your thetan and so forth, when you all of a sudden remember I told you in a lecture, "In auditing on the goal 'to catch catfish'..." And you brighten up and start tiger drilling it on that and it comes back and reads again and it is the goal after all. And goals are heart-breakers to this degree: they go in and they go out.

Now. Pain – this is the absolute rule, if we can get as close to an absolute, but it is an absolute to that degree just within this framework – must be present. Pain must be present during a checkout. Whatever else is happening, some pain's got to be there.

And in listing, pain must be present. When the goal has not been adequately tiger drilled, listing occurs without pain even on the right goal and isn't running out anything. You understand that? You just set off and you don't tiger drill this goal and you just go on and list – mm-mm. Pc gets sen, sen, sen, sen, sen, sen, sen. There's no pain anyplace.

Now, that's also true of a wrong goal, don't you see? A right goal, with the goal made to read at the beginning of the session on listing will give the pc pain. There will be some pain
and there will be some sensation. But it must have pain. Whatever else happens, there must be pain during the listing. You understand? You got to be alert to this. So that's something else you have to look for while you're listing. Is the pc occasionally letting out feeble little yips? If he isn't, he's not all right, oddly enough. Sounds -- sounds funny, you know. But it's true.

You say, "Always before in this universe we have carefully avoided pain. Now, we carefully avoid those things which don't give people pain." Probably you'll have a hard time raveling... I think it's about time, though, for the whole flow to reverse, so you'll probably do this very comfortably.

Now, there's -- there are some musts. There are some musts. You start worrying during a listing session when the pc is getting no pain. Now, understand we don't care what line the pain occurs on. You understand? Just wipe out the old rule that it's got to occur on one and three. We don't care what line it occurs on as long as it occurs. Pain can occur on one and three. Pain can clear -- can occur on two and four of any series.

Why? Because pcs get in wrong valences. They can be totally switched around on this and have pain gorgeously occurring on two and four and sensation roaring on one and three. That is not meaningful; it's just the pc is stuck in another part of the bank at the moment and probably feeding the auditing command through to an old friendly valence that he had, you know, some old witch. There's some circuitry going on; some other things are occurring.

But these are the things to know about listing. Tiger drill it in. Run a good, smooth session. Rat-a-tat-tat, pocketa-pocketa-pocketa-pocketa-pocketa. And you'll find out it's very easy to do.

But the four per line -- four items per line -- and sixteen or more lines solve any problem you're having with listing. It just goes off dead easy. There's no fumble; there's no sitting there waiting for the pc to think of another answer and ARC breaking him because he went to sleep and you woke him up -- there isn't any of this nonsense occurs in the session. And of going on and on and on and running out of paper on one line and then having to go back and find some paper on another line and how many did you list where and -- pooey. See? This is all for the birds. You'll find listing is as easy as you keep it pocketa-pocketa-pocketa at an even groove, see.

You say, "Who or what...?" And he gives you one and he doesn't seem to be in the mood to give you anymore. You want to watch a pc. Don't give him the command as he's saying one or you'll get him all suppressed. See? And, he gives you one and you give him the command and he gives you one, you give him the command and he gives you one, you give him the command and you give him one -- that's all. And of course, you acknowledge him each time he occurred.

And you'll find the pc very rapidly gets up into this frame of mind: you give him the command once, he gives you four answers and you acknowledge. See?

Remember the answer doesn't -- the question never asks him for one, see? So it's not a disobedience of the auditing. It doesn't ask him for one. It says "who or what" and both of those are plural.
So normally he gets into a groove like this: You say, "Who or what would want to catch catfish?" He gives you four. "Who or what would not want to catch catfish?" He gives you four. "Who or what would oppose catching catfish?" He gives you four. "Who or what would not oppose catching catfish?" He gives you four. You got it?

And you just acknowledge and write them down, your pencil flying, "Cheerio, cheerio, cheerio, cheerio."

Now, some auditors won't like this. They haven't any -- any boil-off periods in which to catch up their notes.

But you can really keep it flying. And that's very fast clearing.

Now, what happens toward the end of this listing -- whole series of sessions? What happens? What happens on the meter?

Well, it starts to go free.

What is a free needle? You'll know it when you see it.

Is a free needle a quarter of an inch wide? No.

Is a free needle a half an inch wide? No.

Is a free needle a dial wide? No.

Does a free needle have a pattern to the left and right? No.

Does a free needle have a pattern to the right and left? No.

Well, then, what is a free needle?

Well, a free needle is a free needle. You've never seen anything like it till you've seen a free needle. There's no describing it. It looks like it's floating on air or something. It's disconnected.

The auditor's -- one of the auditor's first responses when he first sees a free needle is to get a hold of the cable, see, and check the cable and plug it in and out.

And then his worst mistake is to say, "Hey, hey, hey look, I got a free needle on you!" When he turns it back again, it isn't free. It just floats, that's all. It doesn't float in any pattern. That is what is peculiar about it, see, it doesn't have any pattern.

Once in a blue moon a free needle appears to hit heart beats or it appears to hit breathing or it appears to hit something else. But a tight needle can also hit these things. We don't care what it hits; it's free.

You -- this would not happen, but you could say the pc has just murdered his grandmother. You ask him the question, "have you murdered your grandmother?" And the needle won't register, see. It's a non-registering needle. That's all it is and it floats.

Now, should the pc always be at his Clear read as you come toward the end of listing sessions?

Nope. The thing will fly around as much as one and a half divisions on the tone arm dial just before he goes Clear totally.
The last two days – now, let's take up the grimness of listing sessions – the last two days or three days of listing sessions are the worst. The pc gets better and better and better and then stays along and is doing all right and is doing all right and is doing all right and then gets better and better and then is doing all right and is doing all right and then gets a bit worse and then gets a little more worse and then is doing better and he's doing fine and he's getting along all right and he's doing better and he's doing better and then he gets a little bit worse and then he gets a little bit worse and then he gets a little bit worse and then he gets a little bit worse – and then he gets very worried and he gets very invalidated and he's not sure that you're the right auditor or those are the right lines or this is the right universe.

You've brought him down to a point of stand and deliver. You're within just probably dozens of items of the goal springing. And he's thinking of this goal as really something. This goal is real valuable. All kinds of wild ideas are going through his head. Why did he ever start this clearing in the first place? Because, look, he obviously will never be able to catch catfish again if he gives this thing up. And it's a terrible situation that he's run into. And, furthermore, he won't have any game. That's what's worrying him. If he gives this goal up now then he won't have any game anymore. And there's no game to play except catching catfish and if he gives up the goal – this is his logic, if you want to call it such, idiot's logic, see – if you stopped cat – if you gave up the goal "to catch catfish" then you would stop catching catfish, then you'd no longer be interested in catching catfish so, therefore, there's only one game in the world which is catching catfish. So this means therefore, that you would only have one game and that would be gone, which would leave you as gameless. And this is not tolerable and this is something that's too horrible to contemplate. And the pc giving up just the last, last struggling line – a few lines, see, a few items, so forth, get – really gets in a terrible state. And you really have to persuade him through this. Then all of a sudden, why, he says, "Oh, well, there it goes. There's – there's-za-za-za-za – there's nothing there."

I guess he expected to meet somebody, George Washington. [laughter] Because it's just nothing and it just all went pfff, see, there's nothing left. And he says, "Well, gee-whiz, you know, I feel good, I feel wonderful; this is terrific."

If you'd ask him at that time, "Would you like to go out and catch some catfish?" he'd say, "Sure, I'll go out and catch catfish; it's as good as doing anything else. However, I want to try whistling at blondes." Because he's already thinking about putting in the next postulate. [laughter, laughs]

But there – it'd take him a long time to get it stacked up like that again. And he's really not in good enough shape to put it in the way he did the first time.

Anyway – fortunately – the situation is – this, I want to impress this on you – is the listing out of a goal is not a smooth snore. It has its rough spots. The pc will start to get somatics – sharp, impersistent, that feel exactly like the original accident. You know, being stabbed in the back with a knife feels like being stabbed in the back with a knife. And they get flinchy sometimes on somatics. And then this passes away and then they don't care about it. And they have to run out. But they get flinch – they get so they flinch on these things and so forth. And they do various things.
Now, the course of action of a somatic is, early on, they tend to be rather dull and persistent; dull and persistent. Fellow's got a head somatic and he'll tell you day after day after day after day after day after week after week after week after week about – this all depends on how long he's being audited or whether he is being audited at the time – about how this pain in his head or this pain in his foot or this pain in his stomach is pretty bad. You know, it's persistent.

And then you get to about the middle part of listing and they come on and they go off. You know, it's they come on like turning up a light by rheostat, you know? And they go off by shutting it down by rheostat. You know, it just gets dimmer and dimmer and there it goes. All right.

Now, you get down to the end of the thing and, man, they're on and they're off with a click of the switch. See? Bang! You know? It's gone; it was here and it left. That is a symptom of winding up. You're getting on down toward the end of listing when this is occurring. And they're getting sharper and they're getting swifter. And the pc's actually much more able to brace up to them and, you know, he doesn't care a bit about them as much in spite of the fact it hurts like hell. They occasionally will say, "Yipe!" You know? And this, of course, is why they resist getting Clear: it's those last residual somatics.

Now they actually are not resisting going Clear at all. They just don't quite like to face up to that. That's why it's a good idea to have an auditor on listing. Somebody's going to list by himself off in northern Saskatchewan or someplace, and all that's very fine. But he'll hit one of these bogs or he'll hit a wonderful spot, you know, "I feel wonderful." There's no – the guy isn't Clear yet but he feels wonderful. Be suspicious, because it's probably like inhaling the air and throwing out the arms on the upper edge of the Grand Canyon without watching where you're going. That expansive outfling of the arms and that gorgeous inhalation of the ozone is very often accompanied by a pale scream as he goes southward. [laughter] He hits the manic and he hits the depressive. Don't you see? And he'll be up feeling good again.

But halfway through with the lines not even vaguely listed out, a pc who begins to feel wonderful, he just feels wonderful, watch it, man. He's going to drag himself into session in the next day or so saying, "I feel terrible!"

He's gone over these manic ridges and that sort of thing. But he goes all the way through those things.

Now, of course, when it's all-out clear you know when it's clear because it's blown.

He'll tell you it's blown many times, too. I-I forgot to tell you that one. "It's blown! Yeah." Comes in in the morning, "Well, we needn't list on that anymore; I haven't any more items for these lines because it's blown." You know?

You put him on the needle, you know and there he is with a good old stuck, sticky needle, you know. You say, "Well, good; just list enough to get – let me check this out." You see?

And about the first two items he'll give you, it'll be, "Yipe, ouch, yrrrp!" and he won't mention anymore its having blown. Yeah.
Anyway, anyway, the beauty of it is, it all comes to pass. And when he – when he's through that – when he's through that series of jumps, he's through it.

When the goal is actually clear the needle will stay free and continue to be free if you've listed all the lines all the way out, it will continue to be free up till the time you find the next goal.

Now, in view of the fact that he knows you're going to find the next goal, don't be too upset if he starts to look for it before you start to look for it and find the needle all going gummy. It's not going gummy on what you did; it's going gummy on what you're going to do. And that's – that's the way that goes.

How many goals it takes to go to OT, I don't know – can't tell you at this time but it's probably some finite number.

Anyway, there is the whole course of listing. There's items. There's the lot. And that's a listing session. And that's how you do it.

Listing can be done by HCAs. Listing is not necessarily a Class IV Auditor activity. But it takes smooth auditing. It takes very nice auditing. It takes very good TR 2 to carry it through. And, of course, the guy has to be kind of a sharpie to keep the thing tiger drilled.

Now, if listing is being done on an HCA level, why, there must be somewhere around a supervising auditor that can occasionally take a look at it because, God knows, what stream they will go aground on or how – what shape those lines will get into. And with bursts of enthusiasm they've all of a sudden added two extra lines onto the end of it.

And the goal "to catch catfish" – the pc also had an idea that he might have a goal, "to be soulful," see? And, they've got Dover sole and other things written down on this other line. They're liable to go astray. You understand? So you have to keep your eye on it and just keep them on the groove I gave you and the fellow will go Clear.

And of course, you know that free needles to date have been going Clear on the four lines. And just give you one idea of this they also have stacked up a bit. Those people who have been four-line listed to free needle be – on being given an indifferently patched up sixteen-line list, whistled a sigh of relief and were very happy because parked someplace over on the northeast sector of the bank, they had all these rabbits they hadn't been able to dispose of. And they were very, very happy to write those rabbits down on the list. So that tells you that we were right in going in this particular way.

Okay?

Thank you.
GERIATRICS

A lecture given on 20 September 1962

Audience: Yeah. Got it.

It's a trick way of saying gerontology. But actually, gerontology never solved geriatrics. But we have.

Geriatrics is of some interest to you and has been floating around you all the time, and you yourself have noticed it, and you've kept your eye peeled on it, and you've been curious about it, and you've actually used it as a method of measuring whether a case was progressing or not, but never really given it any further significance. Well, it does have further significance.

You should understand that one of the longest searches man has ever indulged in has been that of longevity itself. And the study of living longer is geriatrics. I, by the way, was one time a leading light in the American Society of Gerontology. What do you feed men to make them live longer? Well, there are many such preparations. Women: there's equinprimine, stilbestrol – the female hormones. Somebody gets beyond forty or something like that, why, they ought to start shooting them with a bit of equinprimine, something like that, that makes them look younger and feel friskier and make passes at the iceman.

Anyway, I had a very astonishing experience one time. I saw a lady and… This was right after the war. I had just studied quite a bit of endocrinology and found it a very fascinating study, but I was only studying it for one particular peculiar reason. I wanted to find out if the mind monitored the body or the body monitored the mind. And obviously the switchboard system between the body and the mind is the endocrine system or the glands. All right. Could you feed somebody these marvelous preparations which had been biochemically developed and effect a better frame of mind? And I found out that you could do so, occasionally, on lots of people. That's not good enough, is it? What was introducing the variable?

Traumatic second dynamic occlusions and one thing or another prevented the hormones and other shots from operating. I did this work at Oak Knoll Naval Hospital in Oakland, California. All right. A line officer wears his badges of rank on both collars and a staff officer wears them only on one collar, see. So I first got into their medical library simply by taking off one of my rank badges off one collar and hired a Marine to come by and say, "Good afternoon, Doctor." And that was very simple.

So anyway, we entered the field of endocrinology for only that reason and I ruined a great many cases. I ruined them abundantly. I – there was a doctor there by the name of –
think his name – one of the doctors on the thing was named Yankewitz, improbably. And this
guy was keeping records on this sort of thing. And they – the government at vast expense was
importing carload lots of pills and shots and monkey glands, and they had the problem of all
the fellows who had been incarcerated in the Japanese prison camps. And these fellows were
in a very bad state. They were too fat, and they were too thin, and they were too this, and they
were too that, and they were trying to put them back to rights with hormones.

And this is a very valid proposition. You can do far more for somebody's ulcers by
giving him shots of testosterone than any other known method. The doctors, of course, are
unable to operate, so they don't favor it. It's out of favor entirely.

Anyway, they were bringing these pills in and capsules in carload lots and they were
administering them to people. And having a bit of access to their records, I knew what cases
were being successfully affected and which weren't. And so I have done a little bit of work in
trying to ascertain whether or not the people who were being successfully affected were or
were not aberrated. And decided they were not very badly aberrated. And the people on
whom they were not being effective, I found to have psychic traumas by the bucketload; and à
la Freud, with a few frills from Ron, flipped a few psychic traumas out of the road and made
these endocrines operate on them very successfully, and came to the conclusion that an endo-
ctrine… The United States Navy should be given a rising vote of thanks for this, because I'm
sure the program cost them millions and millions and millions of dollars. And they derived
absolutely no benefit from it of any kind whatsoever. But we did. I didn't ruin their whole
program, but I sure sent their figures a little bit awry occasionally, you see. It's how many –
what the dosage should be. And on a case or two it became "none."

Now, this simply monitored this – this was not very conclusive, it was not very defi-
nite, and I could have done far more along this line of course, but I was only trying to estab-
ish one thing: By using physical substances, could you change a person's mind? You under-
stand? Or, by changing a person's mind, could you change the character of physical sub-
stances? I found the latter to be the case and thereafter have spent no time monkeying with
physical substances. Do you follow this line of reasoning?

In other words, the mind can change the body, but the body only slightly alters the
mind. In other words, function monitors structure, structure does not monitor function, see.
Now, of course, structure can monitor function sufficiently and observably enough that some-
body's liable to take this as a keynote. The obvious broad fact that you cut off somebody's
legs – he can't walk. Now, structure certainly monitored function. And a medico, being
somewhat of this crude reasoning level of course, takes that as the fait accompli and says,
"That's it. That's it. Therefore – therefore, no function monitors structure." I don't know how
he ever got there, you know? It's something like departing for the moon and finding yourself
on Wrigley Field and saying, "Well, that proves it. But we're not quite sure what," you know?

Now, here's – here's the point. They are wrong. They are wrong. Because if – the uni-
formity is that you can always get function or thought to monitor structure. You can get
thought to monitor structure, but you can't always get structure to monitor thought.

And that's how I came to that basic conclusion. Why you never find me paying any
real attention to structure. Because if you don't flip out the psychic traumas, you're not going
to monitor anybody's thinking. And if you do flip out the psychic traumas, why, you're going
to monitor structure. You follow that? See?

This guy can't perform in some direction. Well, you could feed him all the hormones
and give him all the Turkish baths and all the exercise, and all the dumbbells in the world and
he still wouldn't be able to do this, don't you see? But you change the psychic condition and
he'll make some progress in that direction.

Now, his structure might be inadequate to performing what he wants to perform, but
that again, by extrapolation, is an error in not enough thought, do you see – on it.

Now, these conclusions – these conclusions are very valid in the field of geriatrics.
Some girl, when she gets to be forty or so, and so forth, would do very well – I say so, would
do very well, since I've seen a lot of evidence in this line – to go down and get herself a fist
full of stilbestrol or equinprivine, or something... You don't get a fistful of equinprivine; you
get the gluteus maximus full of it. That – it's a shot. Anyway – anyway, a man hitting around
that age – that'd be a very good thing for him to do, get ahold of some methyltestosterone and
throw it down his gullet.

Frankly though, if either one has any slightest second dynamic aberration, it'll do a
minimal amount of good. And if their second dynamic aberration is terrific, it won't do any
good whatsoever. You might as well pour it down the drain. Do you see that? All right. This
has a lot to do with geriatrics. Not the second dynamic.

Metchnikoff, I think his name was – I've forgotten my books on this to a large degree,
and didn't bother to look them up because it wouldn't do you any good. Once – I just remem-
bered this as an anecdote. He said sour milk would make somebody have a greater longevity.
Make them live forever and that was fine. And he, by the way, was quite a boy. He added
quite some number of medical substances to man's category – amongst them compound calo-
mel in the prevention of syphilis and other things of this character. This guy was quite a
sharpie. And he was getting on in years, so he studied geriatrics. They all come to studying
geriatrics sooner or later. And they feel those years creeping up on them, you know, and they
start cracking the textbook on gerontology.

So, he collected sour cream and more sour cream and sour milk and sour skimmed
milk and sour watered milk, and – I almost said sour British milk – and he collected all varie-
ties. All varieties. And he had his basement full of them, and his neighbors' basement's full of
them, you know, and so forth. And he'd led his experiments and he had it made. He just had it
made. He and his partner both had it made, as a matter of fact. And they could extend life
with these magic compounds based on sour milk indefinitely. And they both died on the
sunny side of seventy. Just like any other man.

Usually, this is the fate of gerontological hopes. In the Middle Ages, why, people were
always slipping a bag of gold across to the aged witch to receive in return the amulet which
would cause them to live forever, don't you see? And those fellows, they'd still die in bed at
the age of seventy. And the soldiers were always getting amulets for not being shot in battle,
you know, and that sort of thing. And occasionally these things worked. The bullet hits them
and can't penetrate, you know, something like that. There's all kinds of amulets and potions to
save life, continue life, to make life longer and that sort of thing. All of which is very odd
because you can't kill a thetan. That's very peculiar when you come down to think about it, that there'd be all this tremendous interest in geriatrics.

What they're interested in, actually, is the preservation of a body. And they are not interested actually in the prolongation of individual life, because that does not need prolonging. It may need better remembering, but it prolongs itself. You don't drop out of the race. But the point is, here, that a body, being a possession, starts aging and caving in, and limiting a thetan's activities and he or she gets upset about this. And they want to look younger, and they want to feel younger, they want to act younger. And so they would rather go in the direction of gerontology. And almost anybody who comes along with a magic amulet or a potion or a shot of pills of some kind or another, is going to get a considerable amount of interest on this exact line.

Now you, as an auditor, have very often seen a pc doing well and looking younger, and doing badly and looking older. Have you ever noticed this? Do you have a good reality on this? Have you ever seen people look younger and look older through processing? Have you ever seen this? Now, some people look very much older and some people look very much younger. And it's quite mad how this thing will go.

Now, in the process of finding a goal in a Dynamic Assessment, you see this roller-coaster rather rapidly. This person is all exhausted over lots of goals they've been over, and lots of this and that, and they feel bad about it, and they've had a bad goal found or something, and you give them a Dynamic — they look terrible, you know, they look like they're about 180, and they're just all caved in. And then you do a Dynamic Assessment on them, and you get the dynamic. And right away, they look a bit younger, you know. They look nice and younger. And then you find an item, you know, and they look lots younger, and you find a goal, and boy do they look young and spry! Everything is getting along fine. They haven't hit any ultimate yet, but that's dandy. And then the auditor ARC breaks them, and they look much older. And then they will look younger, and they'll look older. And as the lines are listed out you can normally tell if the pc is having good progress by just this one point alone. Do they look younger?

For instance, I'm looking at somebody that last June had a line listed off to Clear, and I came in and thought we had a new teenage student. And a couple of weeks later, the goal had flubbed, there weren't enough lines, nothing had been tiger drilled on the thing and so forth and she looked about ninety-five. You get — this is this wild. But you've seen this. You've seen this with your own eyesight. So I'm not telling you anything you haven't observed. You've seen this.

This is definitely allied to the science of aging. You say, "Well, Ron, why are you mentioning this? We've all seen this. We know this." Well, one thing is we don't know all there is to know about this, see. We don't know how long a body will live in a five-goal Clear. You know, a five-goal Clear, how long can that person make the body live? We don't know.

We haven't any data on what the longevity could be stacked up to, but we can hazard a few good, solid guesses. That — let's say, somebody who was about thirty-five, or something like this, as raw meat, would look what would be average thirty-five, and if cleared would undoubtedly drop a few years in appearance. This we've got some reality on. Somebody who
was about forty-five or fifty, something like this – well, you'd probably get a much steeper drop. Don't you see, they'd probably drop back to a much younger appearance proportionately.

Somebody who's around seventy, of course, is kicking the point of no return or has already passed it, but you'd still expect them to look younger. Now, also, how much longer would you expect this person to live? Well, that's almost in the lap of the gods, you know. But you could make some ragged guess at this thing that maybe you'd put five, ten, fifteen, twenty years onto their life.

Now naturally, if you clear somebody at the age of thirty, you're probably going to stack thirty or forty years onto the end of their line, you see, at least. And if you clear somebody at seventy-five, why, maybe you'd stack another five or six, don't you see? So the older they are, probably the less years you stack on, or there's some rule of that character might apply.

Now, studying geriatrics, you're in a very, very interesting field. You're in a field of no data because none can happen for the next seventy years, you see. So, never do you get geriatrics being studied in any one lifetime. And nobody, of course, is ever able to keep any records on this, because they get bored. And there's no series, you see. The guy who was interested in keeping records has kicked the bucket and nobody else has picked it up and so on. So you're always challenged along this line in the field of gerontology on just this one fact: "Well, nobody has lived long enough to prove it."

Well, that is your usual blunt argument that is offered. But that is not what you're trying to prove. You're not trying to prove by the actual livingness. But age is normally determinable – relative physiological age is determinable – by the condition and character of certain parts of the body, certain functions of the body, and cellular structures.

You see, we are the first that could do this, see. There's been nobody else before us that could do anything about this, you see. But you would take and make a physiological examination of the person, their cellular structure, you see, and this and that and the other thing about them – the springiness of their joints or something – and you'd take this person and then clear this person, and then get an independent examination of the springiness of the joints and the cellular structure and that sort of thing. All of these various things.

Now, that's going at it rather painfully. But you would determine, then, that the person was physiologically younger, which of course predetermines the fact that they will live longer. You see how that works out? In other words, this is susceptible to proof now, in Scientology, in a period of less than six months, whether you have added to longevity or not, don't you see.

Now, that's the first time anybody's ever been able to do any conclusions on the subject of geriatrics, and we probably should go ahead and do something with this. Because this is – this is something that people are interested in. People are interested in care of the body, care of the body, preservation of the body, all that sort of thing, and they would find that this is very, very much to the good. Before a person can carry out any of his personal ambitions, he should have enough physical energy, and enough resilience of body to be able to accomplish this. And therefore, it is important to people.
Now, you try to tell people about the mind, the mind, the mind, the mind, the mind, and they very often don't know what you're talking about. Or they think you're apologizing or something, and they say, "Well, I had a brother once who was crazy," you see. I mean, this sort of thing – this sort of thing is completely beyond them. But you start talking to them about geriatrics and longevity and this fellow says, "What is this thing, Scientology?"

"Well," you'd say – you'd say, "Well, what do you suppose your life expectancy is?" This puts it where he lives, see. He might even collect some of these insurance tables. They're the lyingest things you ever had anything to do with. But insurance men believe in them implicitly, and people who do actuarial work – that's the phony mathematics that determine how much you pay for your policy – this kind of stuff gives you all kinds of tables.

And there's one over in Rockefeller Center that's the most alarming thing I ever had anything to do with. And you go up to it and you set on a dial – and – how old you are. And then you go around the corner and look at this other thing, and that tells you when you're going to die. Sort of blunt. And not at all accurate.

But they figure it out this way: A baby who lives to the age of six months has got a chance of living to one year. Because most babies who are going to kick the bucket, of course, do so within the first six months, don't you see? But the baby who lives to the age of one year has a life expectancy, you see, of maybe two-and-a-half years or something like that. But if somebody has lived to the good old age of fifteen, then he's got a good chance of living, according to the averages, to the age of thirty-eight. And somebody who has lived to the age of thirty-eight has a good chance of living until he's eighty-nine or something, you know. This is a totally mad series of scales, but everybody believes in them. It's sort of "the magic charm." "What's your life expectancy?" It's quite a game.

And one time I went up there – many years ago – Rockefeller Center. It was before the war. It didn't say any war was coming up on the thing, so it was not a very good swami, it didn't predict that. And I remember, I think I was something like twenty-seven or I was twenty-six. And I turned up twenty-six on the dial, you see. Went around the corner and took a look. And my God, you know, I'd been dead for years, according to what it said. [laughs]

So anyway, regardless of what these expectancies are, the insurance policy situation is very easily overridden by changing somebody's life expectancy. Now, you'd think insurance companies were interested in this, but actually they're not. You can't sell these things to an insurance company for the good reason that they don't deal in anything but figures. And their figures are based upon expectancies of claim payments. And it's all mathematics.

Actually, an automobile insurance company doesn't care how many wrecks you have – doesn't care for a minute how many wrecks you have, because it's all going to be figured out actuarially and averaged, don't you see. It's – some of the fellows up at Lloyd's worry because one or two of the syndicates may have the Queen Elizabeth or something, you see, under total insurance. Huh-huh! You know, and that's just one ship, you know. And it's worth skillions. And if it ever went thud, why, that would be the end of that syndicate. Don't you see, all their – all their eggs are in one funnel, you know?

And anyway, where we have a spread out risk, though, like in life insurance, and that sort of thing, or automobile accidents or something, it's just a matter of "who cares?" They
just charge as much for the policy as they're going to pay out in claims. I mean, that's the blunt thing. They're not in the business of making people live longer. As a matter of fact, most insurance companies would scream with terror if you proposed to them that you could make every one of their retirement policy holders live an additional hundred years.

Also, a socialist state is liable to get rather queasy on this subject. You finally break it down to the fact that there's one three-months old baby left in the entire place who is able to work and isn't on a pension, don't you see? It's just too ghastly to contemplate.

So you get a reverse philosophy going, that you will occasionally run into in geriatrics, which goes as follows: "If people weren't kicking the bucket all the time, we would be in a terrible state. And it's a very good thing everybody is dying off the way they are," see.

And you get all kinds of reasons why death is a marvelous thing and so forth. And they're actually thinking about their Aunt Tilda, who, if she lived forever, would never let them come into their inheritance or something of the sort. But now with inheritance tax they don't even think that anymore.

The upshot of this condition in geriatrics is you've got people who want people to live longer, and you've got people who hope to hell they don't, see, and would do anything they could to shorten it down just a little bit. But insurance companies have an open mind, and others don't care. I'm just telling you this so that you won't bother to approach these people with this subject. And – but I'm also telling you what arguments you will get into in this, and they're quite funny.

But when you say to somebody that you could increase his longevity, he's liable to be much more interested than if you said you could make him healthy. He – well, I'm only talking about a small section of people – would be far more interested... Guy's gimping along on crutches, you know, and he's all caved in, both ears are bent, and he says – you say, "Well, I could make you healthy. I could cure you." Well, he's not sure. He's not sure about that. He's got his service facsimile right there in his pocket and he knows its various uses. And if you cured him up he wouldn't get his pension anymore from the railroad. And you've threatened his survival.

But if you told him you could make him live longer – Oh, now we have another entrance point on the same Joe, see. Ho-ho. You're not only taking his pension – not taking his pension away from him, see, you are actually... [laughter]

So therefore, in actual fact, a Scientologist needs this other string to his bow, in the case of an argument along these lines. And you see somebody gimping on crutches, you say, "I could take you off the crutches," and you've made an enemy. And you say, "I could make you live longer," and you've made a friend.

People, of course, really don't believe that they can live longer, they just wish they could. And you have Greek plays, for instance, which convince you utterly of the folly of immortality. There's one of them there who at the end of a thousand years of age, why, he's just begging the gods to kill him off, because he's lost all his friends and everything else like that. I think he was a dope. But anyhow, that's beside the point. If he had that much influence
with the gods in the first place, why didn't he get his friends living longer, too? The guy was merely selfish.

So the point here is that you have a reverse argument, and there is use for this argument and this action. Now, how much longer you can make the person live, by the process of just doing a Problems Intensive, I don't know, but it must be considerable. You can make a haphazard guess at it, and your guess would be as good as anybody else's.

This person is, let us say, thirty-five years old, and they feel like they're going to die any minute, and you give them a Problems Intensive; well, you've increased their life expectancy – that is, how long they expect to live – regardless of how long you have increased their actual livingness. Do you see? And most people are fighting living any longer.

Now, let's go into this a little more searchingly. What exactly leads one off into any conclusions on this subject, at all, that have any validity?

Well, right there in that pavilion you're using these days, I conducted a bunch of plant experiments. Just vegetable matter, true, but it had something binging in it, and theta-bopping. And I conducted a series of experiments. And in the far end of that, that's furthest from the chapel here, there were a bunch of tomato plants which were championship tomato plants. Nobody has ever heard their like. I've got photographs of them and records of them to this day. But they were growing as far – as many as forty-seven tomatoes to the truss. This is unheard of, it's absolutely impossible, see. And they were growing up in height, higher than sixteen feet. And nothing was killing them off. They hadn't heard of seasons. Their temperature was being held constant, their moisture was being held constant, and I developed quite a little bit of stuff in order to get something to do this. Everybody thought I was interested in horticulture. I really wasn't. I was interested in several other things – namely disease and things of that character. But very carefully, none of these tomato plants were given any injuries.

Now, the normal way of raising tomatoes is you punish them until they yield tomatoes. You snip them. Every time they try to put out a new little branch or something like that, that you don't want, you snip them. And you top them and you do this to them and you do that to them. You do other things to them. And you're always at them, you know. Always at them, at them, at them, at them, at them, you know. And they finally will grow a lot of tomatoes for you. Yeah, they'll grow some big tomatoes and so forth. But oddly enough they are very fragile.

And hothouse tomatoes, growing, is an adventurous activity. You have the banker on one hand and on the other side, why, you have every disease known to tomatoes – all manner of blights and fungus and this and that and the other thing. You never saw anything as sick as a tomato plant when it's been got at, at, at, at, more, snip, snip, snip, snip. See, it all comes under the heading of, "Care for it, care for it, you know. Look after your tomatoes, care for it. Torture them. And when you finally get this going real good, why, they'll bear you a few tomatoes," but it actually establishes a short cycle of life.

In other words, the life term of a tomato and the amount of punishment that a tomato plant is given have something in common. That's something to remember there. They're both the same – a similar curve.
Now, a tomato plant which is abused will become ill. A tomato plant standing right next to it, wide open for infection, that hasn't become abused – hasn't been abused, doesn't become ill readily. Or if it does, it can be cured. In other words, abuse has something to do with incidence of illness and has a great deal to do with longevity. How long's this plant going to live?

So I raised half of that pavilion over there full of tomato plants that you had – we finally had to shoot them down, that's all – I don’t know where they would have gone. But they were filling up the whole house, and they were the most cheerful tomatoes that anybody ever had anything to do with. And they were just getting bigger and producing more tomatoes. And they'd already gone through two seasons. And they were preparing happily to go into a third season. I said, "The devil with it. We have concluded all I want to conclude. Cut them down." And we did. And that's the only reason that house isn't well, that's the only reason the whole pleasure garden out there isn't full of tomatoes to this day.

Now, stationed around these tomatoes, and amongst this, under exactly the same climatic conditions, were tomatoes which were abused, and which did not follow this curve of action. They were the same tomatoes, under the same environmental action, and they became (quote) "sick" (unquote), and their longevity was very short. Now, they were not badly abused, they were simply brushed against rather regularly, and they were snipped the way tomatoes are supposed to be snipped, you know, and so forth. But they never even managed to pass their diseases over onto these other tomatoes.

Now, I'm telling you as much as one could observe within the crude limits of experimentation which can be accomplished on this planet in any case. These were as well done as you can do such experiments. But no experiment is perfectly done, ever. The fellow who perfectly does an experiment – he hasn't been found yet.

So, within those limits, these facts are very factual. But certainly, I can show you the photographs of these tomatoes, and my God, you never saw tomatoes grow and grow and grow. And trusses would come out, and tomatoes would grow on the trusses, and so on. I think the record one for England is something rather low like thirty-four tomatoes to the truss, something like that. And these were going – we didn't even bother to count all of them, because you couldn't reach them all, you know. But many of these were forty-seven tomatoes to the truss, see.

Here you had longevity; you also had reproductiveness and creativity. You had these various things. So some of the fondest theories were upset in handling those tomatoes. All of which has to do – had a lot to do with the human being, if you consider a human being mainly body. Because a body follows apparently these same physiological lines. And I've seen nothing to disprove this fact: that a body and plant life and so forth, these things are all cousins. What laws apply to one tend to apply to another.

And I learned enough out of this to learn that abuse determines longevity. And that was the datum that came out of that. And once I had stared this in the face, I looked around in amongst human beings to see if this continued, and to a marked degree it did. And all of our experience in Dianetics and so forth, tended to conclude that anyway, even long before these experiments.
Now, the other thing was that abuse determined incidence of illness. A thing was as sick as it was abused and its life was as short as it was abused. See, these two things emerged as parallel conclusions as a result of these plant experiments. Now, that means that there are two levels or two lines of approach here, as far as dissemination of Scientology is concerned. You can talk about incidence of illness, or illness, or you can talk about longevity.

Now, these of course are quite inferior to talking about a thetan and clearing and beingness of a person, his individuality and that sort of thing. But remember, when you're talking about individuality or an individual or an individual being, you're not talking about a body. See? And so therefore, these things are true when you mean a body.

And on a planet which is terribly fixated on bodies and so forth, these two things are very strong and powerful dissemination media. If everybody's interested in the body and their minds are all busy being interested in the body, you can give them a couple of data about the body which is quite interesting. And one of those is the longevity of a body can be increased or decreased in livingness, and the other, that incidence to illness and being well can also be monitored, you see. These two things can occur. A person can be made "weller," or a person can be made sicker, or a person can be made to live longer, or look less old, or can be made to live less long and look older, you see. These things can all be concluded from these things. And they are not such foreign statements that people – people can misunderstand them. And they're all quite factual and so forth.

Now, the abuse of the tomato plant, and the deletion of abuse from the life of a human being have a parallel. In other words, if you delete the abuse, you have done something like not abuse. And that was how I cross-translated the experiment, rightly or wrongly. In other words, if you could pick up the abuses out of a person's lifetime or pick up those factors which made the person believe he was abused, you then picked up, of course, the characteristics of not having been abused. Do you follow that? And sure enough, that's how longevity follows.

So these tomato experiments were important to that degree, but you couldn't very easily process a tomato, at least I haven't been able to yet. Turn on theta bops on them, and rock slams and things like that, but I never got into good communication with them. I'm sure they were ready to go into session, but I didn't know the language.

Anyway, the point I'm talking about here is, when you're talking to a world that is terribly fixated on bodies, that world will listen on the subject of bodies.

And there are two things which utterly bypass the laws against healing and the laws against helping people, and so forth. And those things are longevity – geriatrics. I mean, that's wide open, man. Make them live longer. It's wide open. It has no medical connotations connected with it whatsoever. You're not giving them drugs to live longer. And the other one, on the other side of the fence, of course, is, "Maybe you're not sick, maybe you're just suppressed," see.

Now, let's look at this other one for a moment, which is aside from geriatrics. This dissemination mechanism is of great interest to us. Because you can say this – particularly in England you can say this, "If you've been depressed..." We use that word instead of suppressed, and it's not too good to continue to use this button "suppress," because you have to
tiger drill it hard because people have kidded about it, you know, and done other things with it. But "If you've been depressed, you can develop symptoms which look exactly like illness."

Then you go up to somebody and you say to them like this, you say, "Hello Joe. Joe, have you ever – you ever been sick?"

And he says, "You kidding?"

And you say, "Well, you ever go to the doctor?"

And he says, "Sure."

"Oh, did he cure you?"

And he says, "No, of course not."

Well, you follow your line in, "Well, maybe you weren't sick. Maybe you're just depressed."

And he says, "Huh?" His interest will be caught at that point.

"Maybe you weren't sick, maybe you're just depressed."

"What do you mean?"

"Well, a lot of people – you know, they feel depressed and they are depressed for a long time and life depresses them. You know, it, pushes in on them, depresses them one way or the other. And they will eventually develop a feeling or a belief that they are sick. And they'll actually develop symptoms of sickness when they're not sick."

And this guy'll say, "Maybe I'm not sick! Hm! Hm! What are you talking about? Yeah, maybe I'm not sick. All right, what do I do about it?"

Well, you say, "Get processed."

And that's all, see. You give that person a Problems Intensive. And let me guarantee, the data which has come rolling in on me here in the last, I don't know how many – well, I guess the last two or three months – have been demonstrating some of the wildest recoveries you ever wanted to hear. Perfectly illegal diseases, they must not be treated. I think there are twenty-five diseases that you better not have in California, because it's illegal to treat them. By law, it's illegal to treat them. Cancer, arthritis – there's a whole bunch of them. You mustn't treat them; you can go to jail for it. I think that even applies to medical doctors. But of course it safely applies to them.

Anyhow – oh, and you talk about – you talk about fancy treatments – I don't know how much a treatment for arthritis costs, on gold shots. They're called gold shots with reason. Man, you'd have to be one of the biggest directors in the Bank of England able to sign those five pound notes in your own fair hand in order to get enough gold shots to make you well. And furthermore, cortisone and other such things are only relief as long as they're administered. They cure nothing, they just relieve. So you've got tremendous numbers of relieving medicines for this vast number of diseases.

Now, if you came up and said – correctly, it so happens – "Well, I don't care whether the fellow has cancer or arthritis or hangnails! Nothing to do with me. He's depressed. He's
not sick. I'm not practicing medicine. Sure I've cured him – of being depressed! And very often when people are depressed they exhibit symptoms of illness. All right, he's well. So he recovered from his hangnails. Who cares? I haven't told him I'd…" And you must do this, you, "I've never treated him for hangnails. I never had anything to do with hangnails. I never recommended it. Never even diagnosed he had them. He said he had them, but that's nothing to do with me! All I did was treat his depressed or suppressed condition," whichever word you want to use. "I treated his suppression. Life had suppressed him very badly, and he'd answered by telling people he was sick."

"Oh, you're treating hypochondria."

"No, no, no, no. He didn't even believe he was sick. He just felt sick."

This is the peculiarity that you can drive home. You could get into one of the most circuitous – and people could run it out on you in sessions on the half-truth rudiment – get into one of the most circuitous arguments you ever wanted to get into in your life. Either one of these – geriatrics or "not sick, suppressed," see. Either one of those things gives you an absolute wealth of material that you can embroider back and forth, and work one way or the other and talk about. You can generate tons of ideas. It just starts an automaticity of generating ideas.

You're talking to some bird and he says, "Well, I don't know. I'll never be the same again. I know that. Ever since my first marriage, I've been pretty well caved in, and I'll never be the same again. I know I'll just go on being ill like this," and so forth. And you say – well, you know you're on the wrong button. You see, that's the wrong button to play on that case. So you just go into geriatrics, see. And you say, "Well, actually – actually I realize that some people are practically incurable. I realize that. There are some things that are practically incurable." And somebody can run it out of you in a session, you see. Because what you mean of course is his fixed idea on the subject of he has to be sick. He thinks it's a sickness you're talking about and you just simply tell him, "Well, there's another thing Scientology can make you do, and that's live longer. That has an apparency. There are some indications that processing makes one live longer." Well, you're not being dishonest there! You're not being dishonest there at all.

You can certainly tell him, "It makes you look younger." You can tell him that with some truth. They'll go consulting the mirror every time they turn around to see if they live younger. This is in a world, of course, which is totally fixated on a body and you're trying to disseminate to people who haven't heard of anything, who don't know anything about clearing, don't know anything about releasing, don't know anything about anything. And there you go. It opens up a door.

You can certainly tell him, "It makes you look younger." You can tell him that with some truth. They'll go consulting the mirror every time they turn around to see if they live younger. This is in a world, of course, which is totally fixated on a body and you're trying to disseminate to people who haven't heard of anything, who don't know anything about clearing, don't know anything about releasing, don't know anything about anything. And there you go. It opens up a door.

Now, the reason why I'm addressing this has nothing to do with whether or not I want to sell people an idea. We've got to have a bridge. We've got to have a bridge from raw meat to clearing. Well, that bridge has got to contain reality for the person it's happening to. And unless we have a bridge, we'll simply clear up all those people who are already interested in Scientology and that'll be the end of the line. There's got to be some bridge that brings the person into contact with a reality on the mind and life. I know nothing better than a Problems Intensive or a series of Problems Intensives.
Now, let us suppose you are running a clinic. It was – you were talking about making people live longer or you were talking about making people feel better. We don't care what you're doing, as long as it's either one of another or these particular activities. You have a – well, let's say it's a clinical type co-audit. You're using interns or anything you can lay your hands on, you know, and you're giving people Problems Intensives. And they're walking in and the Problems Intensives are given at two hours a week or nine hours a week or thirty-eight hours a week. We don't care how these things are given. And they're getting processed and they're walking in and all you're doing is running just a straight Problems Intensive, that's all. And you're just getting the buttons repetitively, and it's all right, because you're running a Prepcheck repetitive style. Doesn't matter whether the button is clean or not. If the fellow can't think of any more answers, why, you just say, "Well, all right," and shift to another button.

All of this is perfectly fine. And that fellow's going to come out the other end, if any kind of a job of auditing was done at all, looking and feeling younger – geriatrics – and well of something he has been sick of. Both are going to happen to him, if anything was run at all. I'm getting some amazing reports on what a Problems Intensive is doing.

You know, it's sort of like you climb this arduous mountain to find a nugget, you see, and you get up to the top of this mountain and somebody down in the valley, down below – there you are mopping the sweat off your brow, and he says, "Hey!" he says, "There's one here that's two feet in diameter." He says, "Would that do?" Well, we just bypassed it because the whole top of the mountain is gold, don't you see?

There still is that nugget in the valley. We've evidently bypassed the Problems Intensive. We've bypassed the potentialities of "suppressed, not sick," see. We've bypassed geriatrics completely. Haven't paid any attention to it until tonight; you probably haven't even heard the name. All of these things, you see, we've just thrown them away. We aren't paying any attention to them at all.

Now, I dare say we have people right here – their hidden standard is whether they look younger. You know, they go to the mirror every morning, and see if they look – and some of them, who want to look older. You see, it's – they're using age, or appearance of age, as a hidden standard to find out how they're doing. Are they looking younger? Are they looking older? You know? Well, this is a very, very standard hidden standard. This runs all through the human race. And if it's that general, well, you'd certainly better have a use for the generality of the button. And the generality of the button is this.

I'm not trying to teach you how to be con men or something like that. I'm just trying to teach you how to talk to people within their sphere of interest. Now, in Book Three of Book One – that is the third book of that first volume, Book One, Dianetics: The Modern Science of Mental Health – it says that if you can parallel – that's right at the beginning of it, if you can parallel what the mind is doing, you see, you can reach it and do something for it. Well, I'm trying to teach you a trick here to take raw meat and get their – to parallel, and for you to be able to parallel what their mind is doing. You see? That starts a session before the session happens. And I've all been – always been looking for these little buttons one way or the other and have accumulated a lot of information about it – information which I'm sure you can use.
So, you've got these two buttons, and with a superfixation on the body, the fellow is thinking, "How well am I?" and "How young or old am I?" See? "How well or sick am I?" "How young or old am I?" He's asking these questions all the time.

And on a superfixation on the body you can always get him into a communication on this subject, because his attention is fixed on it. How do people greet each other on this planet? They say, "How are you?" meaning "How sick are you today?" [laughter] And the other fellow brags up and says, "Well, I've had a cold lately, but uh..." so forth. Just read a letter that emanates from one farm district to another farm district, just catch the mail on censorship, and it all has to do with health and Aunt Lizzie's kidney stones, you know. These are the milestones of time, you see, and this sort of thing. Well, those minds are definitely stuck on state of the body. And of course, state of the body is young or old, sick or well.

Now, the reason I've called this lecture "Geriatrics" is because it's a brand-new—brand-new sphere. It's a brand-new look. It's a brand-new communication line, and it's a very old hidden standard. I imagine, trillions of years ago, when you wanted to know if you were getting along all right, you stuck your doll body up in front of a mirror to see how its dents were, you know? And you'd say, "Well, I'm getting on now, I'm getting pretty dented." You know, "Paint's getting kind of worn off. Face is no longer shiny."

Now, you've come on down the track trillennia, you have a meat body, and you go up to the mirror and you say, "Well, I'm doing very badly because my nose is shiny," you know. There's all kinds of changed considerations on this thing. But thetans have always been going on these two views. "How young or old do I look? How sick or well am I?"

Therefore, these are very, very good dissemination media. They're a good media for conversation. And I give them to you simply because you have a pat solution in the Problems Intensive.

Now, what clearing does for this is fantastic. We haven't even talked about what clearing would do for this, to any degree at all. I haven't a clue, because it is just too much. It's beyond a ready embrace of the mind. Age is hooked on to the body, normally, by the thetan himself as self-expression. And it is held in place in terms of engrams and secondaries. It's held right there, man. Anything that is wrong with a body is held into it and on it by the thetan who has that body. That's it. As long as he believes he can't grow a new leg, he won't have one, either. And this is very observably the place. There is frankly no limitation on what thought can do to structure. There is no limitation on that. There is a fantastic short look on what structure can do for function or thought.

But nevertheless, this is a ready tool. This is something that you need. You're sitting there, somebody says to you, "What is Scientology?" You look them over. You can tell them it's something that makes you well, or something that makes you younger. You can tell them, not in a dictionary definition of this or that which they won't understand anyhow because they won't have any comparable datum. The reason you have trouble defining Scientology to people is because there is no datum of comparable magnitude in this universe.

So they always put up a datum of comparable magnitude and hang you right away into a suppression and disagreement. So you have a hard time. Because they say, "Oh, it's like Christian Science."
"No," you say. You're hung right away with a suppression. You say, "No, it is not like Christian Science." And that puts you into a disagreement, and you haven't got the thing in session, don't you see. There it – it isn't flying now.

But they say, "Well, what is Scientology?"

And you say, "Well, Scientology is a study of livingness. A study of livingness. Now, do you often wish you were younger?"

The fellow says, "Oh, yeah, yeah, I do that."

And you say, "Well, good. Scientology processing and so forth would possibly permit you to achieve that desire."

Now, they've got a datum of comparable magnitude – themselves. So never let them find a datum of comparable magnitude; you give them one. Now, your datum of comparable magnitude may be, to a baseball manager, his baseball team. You see, but always give them the datum of comparable magnitude. It's themselves or it's what they own or it's their family or it's their aging or sick mother or their ailing wife. It is something like that, don't you see? It's a datum of comparable magnitude. And you can say – it's almost a short circuit on the thing. They say, "What is Scientology?"

Take a look at them: "Do you feel – do you often wish you were younger? Have you been sick lately?"

The fellow says, "Well no, I've never been sick a day in my life."

"Well, do you wish you felt younger?"

"Uh – No, I – I never did. I – I don't – don't ever wish I felt any younger."

"Do you have any ailing members of your family?"

"Oh, yes, there's my dear old mother."

"Well good. Scientology would be something that would make her well."

"Oh, uh – it's medicine?"

"No. No," it's – you're off on the wrong line, so you'd better amplify completely your statement. You'd say, "Well, Scientology is a system of processing which does certain things for the individual and straightens them out. And some people are not sick; they're just suppressed," and so forth, now.

And he says, "Your mother – uh – my mother," he says, "My mother, she always was kind of suppressed by my father. Oh God, I hated him! You know, he was no good at all!"

And you say, "Well, there you are. She's pretty suppressed, huh? Well, you could take something like Scientology to pick up that suppression and straighten her out."

And he says, "Well, now, that's a good thing."

See, that's his immediate conclusion. See how you'd do it?

But he's going to reach for a datum of comparable magnitude. You're not going to be able to stop him from doing that. Because understanding comes by comparison, don't you
see? And he's going to reach for a datum of comparable magnitude, so you better reach for him first.

Now, naturally, we take this society lady, and she has powder on her face a quarter of an inch thick. We're left in no illusions about it, but we also have to be very tactful. We're going to use geriatrics on this case, but we have to be very tactful about it. Like, "Some people, even when they look young, can be made to look even younger." [laughter]

You'll find many people cannot confront illness, have nothing to do with illness and illness is a very forbidden field to them, illness is a zone and area for specialists, illness is a place where you must not tread. This prejudice and superstition is fantastic, and yet to get an entrance in the case you've got to talk about something about the body. Because they'll never envision the mind.

All right, then you have geriatrics. You can get into the most endless discussions on people about whether people are older or younger, or as old as they feel or younger than they feel. And what if you just kept processing somebody and processing them, and they went down and became a baby and… ? You know? And could you process a person the wrong way and make them look older and older? And all kinds of things like this, but you'd find interest would quicken. You see?

Well, you've got, "Maybe you're not sick, maybe you're just suppressed," as a dissemination medium. I thought I'd better tell you about geriatrics, because there's a large section of the society that can't confront illness and won't even talk about it. Now, you've got geriatrics. An interesting, very interesting field. And one which we have incidentally wrapped up en passant and haven't even noticed. So I thought I'd better call it to our attention before we passed by it utterly. But you would be amazed how many billions of dollars are spent every year trying to discover the route to eternal youth. We are the only ones who have that map at the present time and naturally we've got maps to so many more worthwhile goals and actions that we've paid no attention to it at all.

So I thought I'd better call it to your attention.

Thank you very much.

Female voice: Thank you.
Thank you.

Well, this is the what?

Audience: 25th of September.

This is the 25th of September. Oh, you're a day behind me. All right, you can listen across that time gap. AD 12, Saint Hill Special Briefing Course, lecture number one. All right.

We haven't got very much to tell you. You know it all now. You know everything there is to know. But your basic Dynamic Assessment, or looking for a goal, has many things on which it depends, and first and foremost amongst these is the auditor knowing how to audit.

Somebody can look over the directions for a Dynamic Assessment and think he can do it because it's very easy, and all you do is fall on your head, and – and it's very simple. You just ask for a list, and that's all there is to that. Remember that lying underneath all this is the ability to audit.

I hope it doesn't happen to you, but all you've got to have is one wrong goal listed on you – one wrong, wrong goal listed on you – see somebody stumbling around that's had a wrong goal listed on him or her, and you'll never do it again. Let me tell you, you'll never do it again, man.

And you let a bunch of HPAs start finding goals, you'll get wrong goals found. Right now the main difficulty is not clearing people; we can do that. That's a fait accompli. Well-trained auditor, doing his stuff well, and so forth, and you can get somebody Clear. We have the technology with which to do this fact.

Twenty-five hundred years after the facts of somebody dreaming it could happen on this planet, ten thousand years after somebody hinted it might occur, why, we can do it. Not because they regard their navel meditatively or think right thoughts or realize that it's all thought after all, and not think bad thoughts about things and think right thoughts about things and read the book, held in a proper position on the knee and tie the cat properly to the bedpost, without all that line of – why, we can clear people. And that is a triumph of great magnitude.

Because it takes it out of the sphere, out of the sphere of "a gift because you are so holy"; something you deserve because you have believed right. And of course, that is the most
fantastic trap of all. Your freedom depends upon your absolute slavery. "Big Brother is watching you." 1984, here we come, see? Inquisitions – all these various mechanisms.

And the only inclination we have in the direction of discipline in this particular lineup is getting it done. That's the interest. Just let's get it done, and that's all. Let's just get it done.

Now, the odd part of it is, is there are certain things which occur, which prevent it from getting done. And amongst those things is not doing it. Saying you are, but not doing it.

Now, we can see a medico – he's hard up, cobwebs growing across his door, poor fellow. Bill collectors coming around. "Internal Ravening" screaming over the Telephone for his income for the year 1915. And he finally has an enormous cognition – almost blows his head apart. "It's those cotton-pickin' Scientologists that have done this to me! I am no longer permitted by the public – because they don't want me anymore to rip open people's bellies and take out odd organs on the belief that there's a possibility that if I take out enough odd organs something odd will occur." [laughter]

And "Well, I-I-I-I can clear people, too! Ho-ho-ho-ho-ho! I can clear people, ha-ha! What you do? You get an E-Meter. What's an E-Meter? Well, we had one; it's a um-hm-hm it's a galvanometer, it developed the skin pore count, I think. We'll put him on that. Yeah, that's good. Now we'll say their basic purpose – all men are evil – so the basic purpose of any of these people, it'd be to kill everybody or something like that. And I'll tell them that's the goal, and of course, do like the Scientologists do, ha-ha, and there it be, you know."

All of a sudden everybody around the place says, "Well, he's doing Scientology, and he's killing people." You see the danger?

So actually, a certain amount of safeguard must exist in the vicinity of any such technology. Now, the – not the most optimum way to do it, or the most practical way to do it, but sometimes the most desirable way to do it is just shoot people dead who don't do it right, see? Not optimum, or practical, but it's so satisfactory! [laughs]

Now, all of a sudden the other day in – oh, where else could it be – Los Angeles. All of a sudden, why, all HPA students and all HCAs in class and everybody else, all of a sudden started finding goals on everybody, and ran out all the dynamic rock slams and now the Saint Hill auditors around there can't find any rock slams or find any items. Nobody bothered to mention it or anything. Now, I think it'll take them a while to pull that one apart. An air letter is just now aflight. I think it has just now passed, Des Moines, Iowa; it is en route. And it is saying it takes two Saint Hill graduates to check out any goal found in the state of California and a cable to me before it can be listed.

Now, you say that's ridiculous. I mean, my God! Two Saint Hill graduates, and so forth. Well, I don't know why not, see? As far as cables, they're expensive. Human beings come cheap, but cables, they cost money. Now, you'll see somebody skirting around the edges of that one. And they all of a sudden will be stacking it up.

We have a responsibility. One is to make it very, very clear to people that clearing is a subject of very expert auditing, and is not a casual piece of nonsense that simply can occur anywhere on any crossroads. And go to some lengths to make sure that people who have the
pensant for trying to, get trained before they do. Now, that's our biggest danger right now. That's our biggest danger.

Now, one of the ways you can always tell when we're successful is the number of protests that come and the amount of attacks that develop. You can always tell when we're very successful. I have various uses for hostile thought and activity. I use this. I use it very, very good. If I engage on a certain plan and announce it in advance and there are a great many protests against the plan, I look up the people who are protesting against this plan, and if they belong to the "Rock Slammer's Club"... You know, they're old, well-known squirrels, we haven't heard from them for years, but all of a sudden this plan is announced and they've written in to condemn it utterly, I know, man, we're on the right road and put it into effect at once. It's a sure test. It's a sure test.

Now, the other use, the other use you put this to is I know we're successful if we're being counterfeited. And these sad efforts to duplicate and that sort of thing – very pale they are – start springing up around and about a certain something, why, I know we're being very successful.

Did you know that the one of these copycat outfits, by the way, is still in existence down in "Taxas?" Taxas – that's a part of the United States. It's Concept Therapy. It's run by a bunch of chiropractors down around – I don't know, oh, some bayou. And – that's Mud Flats. It's run by them. And they're still "conceiving." They're still going on. They picked up old Concept Therapy from 19... I think it was 1953 or 52 or 54. I don't know, way back, anyhow! Whenever it was – 52, if I remember rightly. Summer, isn't it – 52. Concept Therapy. They're still doing it. Well, that's fine! That's fine! Please let them keep on doing Concept Therapy. Don't let them get suddenly ambitious. But unfortunately they're liable to get ambitious, because who appeared at the last Washington congress but the chief movers in that movement. They were all there, and they heard all about clearing, and are going to go home, and they're going to spin some people in.

We ought to make it a law that they test it out on each other before they do this.

Now, the ethics of the situation, then, simply involve the effectiveness. The ethics of clearing are the effectiveness of clearing. In other words, he who can clear can clear. And he who hath not been trained into clearing had better keep his paws off. And that's ethics. Now, in any – when – any time you get ethics matched up totally with effectiveness, and so forth, well, you've got a win on your hands, because it's not superstition, because it'll actually defend itself. If we let it be known very broadly that this is what we stand for, is effective clearing, we don't care if somebody had a fluke. You know, one fluke can kill somebody, you know? It's horrible. For instance, even you, even you can make a fluke. It'll ruin you for a while. Do you realize that? You know, you have a lucky break. No, I'm talking about a bad one; I'm talking about a good one, see?

And you're sitting there, minding your own business, and you accidentally ask the pc if he has any string in his pocket. This is just sort of out of the clear, you see? And the pc says to you, "My God, I know what my goal is – my goal is to string people along!" and so forth. And there you are. You've had it. You've had it.
You haven't got a technology which expands beyond one pc. Now, the fight has been
to get a technology which covered everybody. And the assessments which you're doing now,
the Dynamic Assessments, are very embracive. You don't have exceptions to these things,
you see. But you can derail yourselves on them by having a lucky break. I don't know, there
are a couple of auditors around that have had lucky breaks and have been regretting them ever
since because – why? Because they keep waiting for it to happen again, and of course it doesn't
happen again. The pc does not have any string in his pocket, you know? Pc after pc is
stringless.

Well, now, a broad general technology, then, is a desirable thing. But it can get hacked
up to where it particularly fits just a few, or fits a very few cases, or something of that sort.
Therefore, broken down, then, in its broad general application, it ceases to be effective. So
you might say it becomes unethical to clear somebody "unstandardly." You g – you get the
idea, see? This now can get up toward an idiocy. A Simple Simonness about the whole thing,
you see. You have to clear somebody according to the rules. You can't clear them any other
way. Well, of course that too outlaws the occasional lucky break. So that'd be bad, too,
wouldn't it?

Here's the way you do it: You clear somebody according to the rules and take advan-
tage of every lucky break you get. And then realize that the break will probably never again
occur, of that particular type. You understand? If you can realize that, you're protected then,
very largely, from stumbling around and making a bunch of fruitless this and that about it.

So broad clearing technology of necessity must be preserved as it is. And released, and
to a marked degree safeguarded. There is some responsibility for the know-how. See. Well,
because there's a responsibility for the know-how, you do get some responsibility, then, for
the communication lines of the know-how. And the communication lines of Scientology are
simply just that. They're the communication lines of the know-how.

In that wise, you keep a broad breakdown, you keep broad technology going, and a
breakdown of broad technology from taking place. Now, how are we able to suddenly inter-
rupt all this in Los Angeles at such a – such a rate of speed? Well, it's just excellent commu-
nication lines, good positioning, communication centers operating, people alert and so forth,
and it can all be put back together again, zing, zing, zing! you see? In absence of these com-
munication lines, well, you just either have to let it go, just let it happen and go to pieces, or
wait until some far distant date when you can finally put it back together again, you hope, see.

Well, actually the way we're operating right now is something goes wrong – it's pretty
much – it's pretty much this way: Something goes wrong anyplace in the world, on the subject
of clearing technology, something like that, and so forth, why, it's just a matter of zing, zing,
zing! We hear about it; we do something about it. Bang, bang! You see? And it's within a
forty-eight-hour, sixty-hour proposition quite normally. Well, that's how we can operate right
now. And we can put things back to rights before they can fall apart. Now, it's very important.

Now, it's very important, these data to you, for this reason, is you're going out and
you're going to get stuck in some corner of a Central Organization or into a clearing co-audit,
or something of the sort. And you're going to have everything up against your chest, and your
world is going to be the immediate zone of influence, and you're going to have some tendency
to say, "That is happening in the next block and is none of my business." And that I don't approve of.

Nobody on this planet could hold my post at this present time. That I know would be completely impossible, because I can't hold it. It's backing me up, man. I've held on to it for years and kept it wheeling for years, and so forth, against all manner of this and that, and it's just getting too rough right now to – to cope with. Frankly, it is. Somehow or another it'll get coped with.

But let me point out something to you. Those things which I am handling at the present moment, which are giving me trouble, are out of routine. They're off-line. You understand? They're difficulties which have not been predicted and cared for long since, they're offbeat things that are occurring here. And that's what's giving me trouble. I can keep up with routine actions, with the administration lines, with all of these things, I can keep up with these things. But you start giving me a fistful of oddities – one corner and the other way, and it's this and it's that, and it's the other thing, and my God, I feel like a boxer backed up in the corner of the ring, you know, being hit by about four fighters. I start getting punch-drunk.

Now, if I'm going to handle everything that goes wrong in Port Darwin, everything that goes wrong in Mexico City, everything that goes wrong in Tierra del Fuego and Paris and Rome and a few other points, all on nonroutine basis, let me tell you, I can't do it. It's just not possible. And who's going to do these? And what goes wrong anyhow? Well, I'll give you a little rundown on what goes wrong and maybe you can understand why I'm talking to you about this.

"Somebody doesn't act," is the inscription on the tombstone of more graves than you can count. Somebody didn't act, that's all. Something didn't happen, you understand? And it drops a ball. A big one or a little one, ball gets dropped. And an area of confusion occurs. Now, prediction of what is going to happen is normally the common method of taking care of these emergencies. And a communication system or an administrative system is simply something which is already planned to handle traffic so that nothing becomes an emergency, you see. But if somebody doesn't act along those lines, or if somebody doesn't use his noggin along these lines somewhere, then the next thing you know, why, zip-zap-boom! And you've got confusion going at a mad rate all over the place. Confusion is occurring madly.

Now, who is this somebody who should have acted in the first place? Well, today, I got the most confoundingly confusing despatch you ever heard of. An HCO – I hate to use the name in this derogatory regard, but it's only a temporary secretary on post there – actually wrote and said, "Because the HCO was not collecting any of the monies which were due and owing to it, that it was out of funds, and therefore couldn't continue very long that way." What an incredible statement! But the person actually wrote this statement and sent it through the lines, and is feeling quite upset at this very minute, and is quite resigned and feeling apathetic about it, you know.

All this person has to do, you see, is just collect the monies owing to it. They are not unreasonable pieces of money from unreasonable quarters, don't you see? This perfectly ordinary action has to be taken, but is asking for an extraordinary solution, because the ordinary solution has never been taken. See, all the sources of income are right there, they're perfectly
able and competent to pay this HCO its money, but the HCO can't ask for that money, and somehow or another now an extraordinary solution has got to be dreamed up for this particular area, and so on. Do you see the setup?

So actually what the despatch was doing was demanding that I take some extraordinary step with regard to this area. It already isn't doing its job, it already has dropped the ball. Now, of course, an unusual solution must be entered into the situation.

Now, let's see how fundamental this combination of events can become. Whenever you have an extraordinary solution demanded of you – in supervising auditing or pcs or something – whenever you have an extraordinary solution demanded of you, it will only be because the ordinary solution was never in action in the first place. You have the unusual demanded of you because the usual has not been followed.

You've got a pc suddenly appearing on your doorstep, 3:00 A.M., they're shaking, they're sweating. Oh! They're just about ready to blow out their brains. Where did this pc come from? How come? What's the enturbation in this immediate person's area? Well – now, look at this. You're there. There's the pc. Well, it's up to you to do something about it, that's for sure. You've got to do something about it, you can't just recriminate and make everybody guilty for not having taken the usual steps. But let me call to your attention that you actually have two actions you are being asked for. Let me please teach you this one thing. There's the pc on your doorstep at 3:00 A.M., shaking, you know, loaded revolver in hand, "I've just come by to say goodbye," you know. Now, you naturally would take a hold of the pc or put him on the meter, talk to him, or give him some Phenobarbital, or anything you could think of I don't care what solution you use, see.

You get this pc calmed down, and you'll get the pc picked up in auditing or straightened out one way or the other. I know you'll handle that much of it. You always have. So you'll handle that much of it. Well, please, can I point out to you, there's another step you must always take. Is find out who dropped the ball that brought that pc into that condition! And straighten that area out! Got it? Always take that second action. Please, I'd be less than doing my job if I – if I didn't tell you about this, you see.

Always take the second action. I know it takes a few minutes longer; I know you feel hard-driven; I know that there's two pcs upstairs and one in the basement that are waiting for your time; I know there's three telephone calls in the – coming through the switchboard for you personally and nobody else can handle it, you see? I know all this.

Just as I say that I remember a telephone message I didn't deliver this evening, see? But the point is simply this: You've got to find time between those two pcs. You see, you've already found out that this person who appeared on your doorstep was audited and a goal was found last month by George Snikwick. And between the phone calls and so forth, ask, telephone, do something. "Who is George Snikwick?"

"Why, that's easy. He's the person who took the PE Course. And I think he went halfway through HCA Course, but dropped out – dropped out in the middle of the second week, because he knew more than the Instructors."
Well, your indicated action, see, is to do this second thing. Let's straighten out that zone. Otherwise, that zone is going to multiply more pcs on the doorstep and you're not going to be able to breathe, ever. This way I'm giving it to you, someday you can look forward to being able to breathe, see. Now, there's two or three things which are indicated there. What Instructor let him out of what class? What D of T didn't take this person in and put him on the meter and pull his missed withholds and send him back to class? Who didn't do this? Who doesn't know the May 3rd, 1962 bulletin? You understand?

What HCO Area Sec has not bent his ears over the top of his skull and tied a knot in them? You understand? And just take enough time to call up and say at least, "What the hell are you going to do about George Snikwick? Right now? Not next week, but right now!" See? That's actually about all you have to do, because it belongs to somebody else, you see?

And then that second step is not complete unless you've done the following: "What have you done about George Snikwick?" Understand? And that way perhaps we can keep calm reigning someplace or another. Now of course, there's things going to occur that the devil himself couldn't do anything about. But then the devil isn't OT. He got withholds, so he couldn't be. [laughter]

You got a problem here of keeping the plate level on the table and keeping the soup in the plate, not all over the room. And if you always take this second step, we can manage it. And if you don't always take the second step, why, zzz! You'll have areas sometimes – you say, "Oh, my God, nothing can be done about it!" True.

The United States Air Force Signal Corps, or something, has just decided to clear all of its pilots with auditors certified by the American Medical Association. *Ha-ha-ha-ha-ha*. What can you do about something like that? Well, I don't know. It must have gotten pretty bad, there must have been a lot of balls dropped up to a time when something like this could occur, you know.

You say, "What can I do about something like that?" Well, you can scream. You can always scream. And because you can always scream, scream! You understand?

And remember that there's this interesting mechanism which exists in this particular universe. You can always make a force turn around and serve you. I've taught a few people this; it can come absolutely deadly afterwards. No matter what force comes their way, they use it. It's a trick that is taught championship tennis players.

The force of the ball hitting the racket is employed to drive the ball back. Now, there's a little trick of rolling a racket. You know, the ball hits the racket just a little bit off slant and the racket is rolled, and actually will go straight back to where it came from, or it can be positioned almost anyplace. Did you ever hear of this tennis trick? It's a terrific trick. Try it sometime. Try it with a tennis racket. You'll find out that it isn't enough just to stand there and resist the impact of the ball. You can actually, by hitting the ball just right, roll your racket just right and it'll turn, and a lot of the force of incoming rolls outgoing. Do you get this trick?

It's something like dropping something into a cup. Instead of hitting the bottom of the cup it comes up the other side. This is merely illustrative, not a lesson in tennis.
All right. Use the force to serve you, and you often can. And it's a trick that's peculiarly adapted to this universe.

Now, you know that if auditors certified by the American Medical Association are going to clean up and clear the US Army Signal Force Air Corps, man, that's going to be disaster. That's going to be terrible. That's going to be pretty grim. So, unable to prevent the emergency, take advantage of it. You know very well what's going to occur. So you just publicize the fact and get everything all ready to take care of the catastrophe. Set yourself up as a small civil defense unit.

All right, we're talking to somebody who went halfway through an HCA class and he's read all the bulletins, and he knows how to clear somebody and he's going to clear them. That's fine. He's got an E-Meter that was manufactured for the American Medical Association, something like that. And he's going to clear this person, and he's going to work on his wife, and you're talking to this fellow.

Oh, he's going to do it, and you say, "But look, you haven't any right to do this, see. In the first place, you haven't been properly trained, it's a very touchy operation," and so forth. "And you haven't any right to do it, and you're actually putting your pc in considerable danger. Why don't you run a nice Problems Intensive? You can undoubtedly get away with that. You can make your pc feel better. Why try to kill your pc off?" you know. You – all these arguments now, they're good arguments and most of the time they'd serve you, but this time they fail.

Well, don't go off and hide your head. Do the secondary operation to that, which is he finally says, "Well, I'm going to do it, I don't care what you say!"

This is the time to say, "Well, now, here's my telephone number. Have you got it there? You got a pencil there? Here's your telephone. Now, I'm going to put it right here, under 'emergency' and 'ambulance.' Now, here's my telephone number and here's the time I can usually be reached," and so forth. "And – now, I'll tell you something, that sometimes if the person gets shaky, or something like that, if you cover them up and keep them warm. And you got any B1? Got any B1, anything like that; give them some B1, and cover them up and keep them warm and call this number." In other words, set it up to take care of the emergency. Cut the other trick.

The fact that you have set it up to take care of the emergency may very well give somebody enough pause that you get your own way in the first place. Guy says, "Uh, well, I don't know, you c–." Rolling up his sleeves; he's going to go on into session with his scalpel, you know, and do a goal-ectomy. [laughter] And he passes by the telephone, and sneers at it, you know. Collects an overt on the way by it. And goes in and starts, "What is the detested person?" He's read that in a bulletin someplace that you ask this and you don't much bother to put the data down, but you must have the pc answering this question, is: "What is the detested person?" Wrong question, but he knows you're supposed to do something like that. And of course, his wife says, "Well, let's see, you, and then there's you and, uh – you. You. You, yes. That's – that's you."

And he says, "Well, it couldn't be me because I have always been nice to you! And you'll have to give me somebody else."
Well, you can imagine where, with that small takeoff, this activity is going to go, and so forth. And there's somebody pale and shuddering, and he has finally found her goal, which is, "to love my husband." [laughter, laughs] He lists her on this, and they—it's all gone very ruggedly. In passing by the phone one day—she's upstairs sick—and he says, "Well, I-I-I won't say anything. I maybe just better call up and tell him how things are going." And so he does and you've taken care of the emergency. And you check out the goal and you find out that wasn't the goal, and he by this time is thuuu, and so forth. And he finds somebody to find the right goal, or he'll go get trained to find goals, or he'll do something effective. Do you understand?

After, of course, the US Army Air Force Signal Corps has plowed in 50 percent of its aircraft, why, they would begin to become aware that there was something more to this. But they would think there was nothing to it at all if somebody had not set up the emergency ward for it, you see. So, you do them up a paper, something like that. You say, "Well, I can get in contact with about twenty-five auditors on emergency and we can set up an emergency unit, you know. And we can take care of the various suicidal and depressive effects which you're going to bring about, and so forth. And we want the name of every person you employ on this auditing project, because we will hold them as untrainable thereafter and as not suitable for training in Scientology. And we'll do this and we will do that." And you do it all up, you know, make sure the commanding general hears all about it, and so forth.

Just like this other guy, he's going to laugh hollowly at first, you see? But finally, why, he's going to get those first bad reports. And he's going to say, "Uh-uh, uh-uh, uh." He's going to get some more bad reports and very few good reports. Doesn't look good to him. He probably won't go that far. He'll probably be on to you, and he'll say, "Wait, you're—you're a member of the original group on this sort of thing, and you're supposed to know your business on this sort of thing. How about straightening this up?" And of course, at that time, you straighten it all up for him under the same conditions they imposed during World War II: unconditional surrender. You just impose all of your conditions, with no monkey business about it.

Now, you see how to take care of this situation? We're walking into an emergency situation. Our second-goal Clear got out of here—you probably don't know this story yet, and you probably haven't had it on the grapevine. My lines are faster than grapevine. My communication lines are the only lines in the world that are faster than grapevine. [laughter, laughs] She got down there, and she announced a clearing co-audit, and to quote her, she practically got her clothes torn off of her. She just got ripped to pieces in the rush.

A clearing co-audit announced in Bulawayo, the place where they all got killed, caused a stampede of magnitude. And she was absolutely knocked appetite over tin cup in the rush. And the reason why she signaled for John to come down there is she was actually going down for the third time, and she had to have somebody on deck, now. She was trying to audit ten hours a day, and run a co-audit, and straighten everything out, and handle everything, and she couldn't make any part of it, see.

Well, can happen, you know. It can also happen like this: You go back into an area, and everything is nice and sleepy, and there's nothing wrong, and everything is going along.
quietly, and you clear somebody up, and you're going to do all of your own listing, and all of your own goals listing, and you're going to do all of your items listing, and you're not going to have to groove it in anyway, because there isn't anything much to do about it, and you – you – so you clear up this person, and then you do something with that person, and then the next thing you know, it – you're opening the door in mornings, it just seems a little more crowded out there.

And one morning you open the door and the whole house gets swept away. It doesn't matter how quietly it starts or how long it takes to happen, it's going to turn into an enormously confused area in your immediate vicinity, no matter what you do about it.

Give you some kind of an idea: I was living a sleepy life, quiet, everything was going along, rather interestingly. Peter had very little to do, sorted papers, and he took most of the important despatches off the line and handled them and I didn't have anything to do. I'd just sit at my desk and breeze along. And practically no emergencies anywhere. This was 1960.

Well, in the last month, the last thirty days, let's not look at seven thousand some odd miles of boat travel, and seven hundred miles of car travel, or congress, or any one of these things. Just omit those, because frankly I had no time for them. So they just have to be deleted off the time track.

You add the amount of auditing I have done in the last thirty days; the number of cases that I have directly consulted about; the number of cases I've straightened out; the number of plans and solutions which I've had to put forward because the area was screaming for it; the number of new transcription and communication activities which I've had to try to set up to cope with this sort of thing; and you would realize what I was talking about.

On top of all this, of course, there are several emergencies around that have nothing to do with any of these lines, don't you see? But I actually could not at this present moment and have not been able to handle in the last thirty days, just my auditing supervision, see. I haven't been able to handle that much of my job thoroughly.

Now, when you add to my job all the things that are added to my job, you get sort of a feeling like things are going rather rapidly. You also get the feeling like things are kind of out of control. You get to wondering where it's going to land. I know this. I know this before. I've had it in 1950. And you're facing another 1950. But this one will come out straight and right, providing we all keep our heads screwed on, and keep the show on the road, and don't monkey around with a bunch of squirrel nonsense and don't tolerate a bunch of bad clearing. And if we can do these things, why, it'll all come out all right in the end. We'll get through this all right. And if we don't take care of these things, however, if we just say, "Well, my job is an auditor and there isn't anything else to do on this particular line," let me tell you, we won't get through it. I mean, it's that rough. We'll practically be wiped out in the rush.

Because the number of times I have raised my voice in the last few days, in exasperation and in total dismay, well, it must be six or eight times. And it's enough so the kids are now getting used to it and smile and pat me on the back. At the same time, I've been able to kind of get things grooved in a little bit. So, that just before the lecture tonight I was able to show them a movie on Tarzan of the Apes, and that sort of thing. I hadn't put my tie on yet,
but I showed them a movie. You can also do living at the same time you're doing this, you know, if you kind of fit it in edgewise.

But I see all the symptoms here. Now, what's even more interesting to you, perhaps, is a whole new country just blossomed open, suddenly. Crash! Japan. And the biggest evening paper in Japan has just run column stories on Scientology and has tied up their switchboards totally. John Ockard, from University L.A., Department of Mathematics, was over in Japan and he gave a public lecture – talked about clearing and that sort of thing. Now, a little bit of pioneer work had been done there, a few contacts had been made; he evidently went along these lines, and I don't think the Gentleman who is sitting right there realized that this wire was that live. He thought maybe it had a hundred and ten volts in it, but it's got a couple of hundred million volts in it. The Japanese public, four hundred – four and a half million readers of that one single paper almost knocked the building down.

Now, this leaves me – of course, I know we don't have time to do this, but I have to do this – leaves me with the job of writing special articles for Japanese papers. Of tailoring up and editing Scientology textbooks to be translated into Japan, without time to train an auditor as a translator. Grim.

I can't read Japanese characters. I can read a little bit of roman, which is their romanized letters. My Japanese is far too rusty. I spoke it a bit once, but not anything in gear, see. There's just nothing in gear here at all. Now, there's a country, a large population. Vital, a very vital, a very forceful people.

George Jellinek going over some surveying with me this evening. You say, "Where did that hat come from?" Well, it just happens to be another hat. We were standing out here, talking about surveying, and surveying things up, and we were talking about various types and classes of architecture, so as to plan up what's to be done with that courtyard over there. And he was talking about how vital Japanese architecture was, and how powerful, how forceful and how brutal their architecture was. He didn't think he could cope up to it. Well, I doubted the last fact, of course.

But here's a very vital people. Poised on the threshold of Asia – the newest awakened nation in the world – these people, with a handful of battleships and so forth, almost made it, just a few years ago, man. I know, I was on the receiving end of some of that. They darn near made it. Now, a nation which is whipped in war inevitably goes into thought. They'll move up from force to thought. But remember, a thetan never gives up. They had conquest in mind, and conquest they will attain, only it'll be a conquest of thought.

There is an arrow poised at the heart of communism, poised at the heart of all these enslaved states. There is a very interesting situation. Now, sooner or later the Japanese are going to break out, they've already broken most of their treaties with the US. The US can't keep them in line now. Student riots, and that sort of thing, prevented Eisenhower from going in there.

There's an interesting people. There is no philosophy tailor-made of a political nature which would handle that situation. And all of a sudden this wide people, already they are – their communistic aspects is they believe that the individual should have a greater chance and
the state should have this and that, but the individualism of the individual should be terribly maintained. In other words, this is very confusing.

Karl Marx is dead right, except where he was confused with Nietzsche, see. And this is pretty it's pretty pretty confused. That nation isn't half whipped. All right. If one can guide ist it, by the way, owes its primary upsurge of civilization to an incursion of Buddhism. Many centuries ago Buddhism was the first civilizing agent in there, and they taught writing, and they taught the various arts. Japanese had no writing up to the time the first Buddhist monks arrived from Tibet.

It's very interesting that into Japan swept Buddhism, centuries ago, and brought about a literate civilization, which eventually was opened up. And suddenly, with enormous enthusiasm, we get the wide arm embrace for Scientology coming in from the West, which of course is a whole wisdom all in itself a moment when it is delivering the goods. In other words, you can take off all the slack of the years of hoping, and waiting on Ron, and hoping it worked, and the forward surge, and so forth. No, it'll just come as the total impact. From first book to last book all in one package, bang! Pretty startling.

Well, what's this going to do? I don't know. I haven't any particular plans of conquest in Asia. But it looks like I don't have to have any, it's... [laughter] There goes China, man. There goes China.

Well, which of you, which of you right this minute could go to Japan and train some auditors, and do some "clear up" of the situation, get a sort of an organization together which can serve as a library, and can control the activity in the vicinity so it doesn't go all to pieces, and so forth? Well, which of you are going, you know? It's that sort of a question.

Because of course, you can't go, because the place where you're already going to probably already expects you, and so forth; but there are many places in the world that need you equally as much. You understand? Any Saint Hill graduate that doesn't know where to go, for Christ's sakes, get in touch with me, man. [laughter] Despatches in my mail just this evening were demanding two Saint Hill graduates before yesterday morning. The situation is totally out of control, see.

Now, it's also interesting that the FCDC income has doubled since the congress and is remaining at a doubled state. This has never happened before. Usually, it'll last for a week or so, as an upsurge income, and then drops off quite markedly. Well, it is doubled, and is slightly increasing. Their units are kicking now around seventy cents, with every sign of rising income.

They've just moved into another building, and so forth, and an additional building just for the HGC alone, and all kinds of things like this. And they're on my back on the subject of more Saint Hill graduates.

There's a new plan of clearing, and all clearing plans are the same plan now. Only we call them "Staff Clearing Project"; we call it the "Public Clearing Project"; we call it a "Staff Co-audit Clearing Project." I don't care what you call it, it's all the same plan; is you get an untrained or a well-trained untrained is PE level or well-trained HPA-level auditor who does the Prepchecking.
The first PE level, of course, does it under heavy supervision and the HCA would do it under less heavy supervision. He does all the basic auditing. In other words, he gives whoever comes in a Problems Intensive, and he lists all the goals, and he gets them all padded into shape and their needler's fine, and he gets their withholds off. He gets them straightened up, in other words, so that they can fly.

Then he turns them over to a Saint Hill graduate who audits them just long enough to find their goal, and as soon as that person's goal is found and proven out, that person is put back into the pack again to get the goal tiger drilled at the beginning of every session and listed. So, your auditor who's doing this has to know how to tiger drill at one goal alive and list out a goal.

All right, now, that is the clearing plan. That is the way it is working out. You don't let a Saint Hill graduate do Prepchecking, you don't let him list the original goals, and you don't let him list the items. You're doing it here so you'll know how. But here's ordinarily how it goes.

This is your – your HCA-level activity or very heavily HCA-supervised public activity, and it runs along on this track and then it does – just – this person is ready to have his goal found. Or there is auditing time to have this person's goal found and it suddenly goes tick, tick, boom, bang! And he's back on the track. You understand? He comes right along this line here, and so forth, and then he's totally derailed off it into the hands of a Saint Hill graduate. Person's goal is found and instantly he is put back immediately on this other line. Anybody who isn't doing that, any Saint Hill graduate who isn't operating that way these days is operating at a hell of a waste. Not just for himself, but waste of treasure and waste of human time. See, because that's the way it ought to run.

Now, what do you have? You have Staff Staff Auditor number one is a Saint Hill graduate goals finder. You call him the Staff Goals Finder. And staff co-audits on their own time. See, they co-audit each other and then soon as one is ready to have his goal found, why, he's passed over to this Staff Staff Auditor number one, and for that period of time he is in that auditor's auditing room getting his goal found. And as soon as the goal is found and checked out, why, he is put right back into his co-audit thing.

But you have two things running on staff. One is a co-audit; that is, the untrained staff people are done in co-audit that meets Monday, Wednesday, Friday sort of thing. And then you have the trained staff member who is permitted to co-audit on his own time and doesn't attend this co-auditing – these co-auditing sessions which are supervised. You see how that's done?

And the Staff Staff Auditor number one has an HCA assigned to him who operates – could be as a part-time, or even two part-time HCAs or HPAs. And these people review the folders and make sure that the staff members that are doing the co-audit hand in their auditor's reports, and keep the thing scheduled and that sort of thing and handle the administration for them. Or you can have a full-time administration person who also does the supervision, so on.

Doesn't much matter exactly how this is worked out, the basic plan is that there's a Saint Hill graduate there finding goals, and people are being all handled and squared up – he's not having to do any of this handling – squared up and then they hand him a person, and he
finds the goal, and feeds the person back into the other lineup. You see that? All right, you do that with the public.

For instance, we have a new release form, the darnedest release form that anybody ever heard of. You know our old release form? It says, "Nobody – we're not responsible for anything that happens in the HGC." You ever read one of those release forms? "If you fall down or break your neck, or anybody audits you badly, why, you daren't sue L. Ron Hubbard or the organization or the Assoc Sec or anybody, and it's nobody's fault but yours," and that's what the old one reads.

The new one reads just this and no more: It says, "The organization takes full responsibility for clearing you. And you on your part pledge to make yourself available for processing and pay for the auditing until this is done." Signed by the person, signed by an officer of the organization. You look it over from a legal standpoint, it's very amusing that it's a more legal contract than the other. I can just see some old judge trying to settle this thing as a release form, see?

"Well, they took full responsibility for you, what did you do? You're suing them. What did you do? What did you do? I mean, did you make yourself available, as it says here, for what... [laughter] Well, you didn't. I thought not. Thirty days or... Oh no, it's a civil suit." [laughs]

You see, a different spirit pervades the land. So what happens? What happens? This guy receives this contract someplace out in the field, and he signs the contract and sends it back in. What does he get for signing the contract? A promise that we will not raise our rates to him for a year. That's the only reward he gets for it, because believe me, cost of processing is going up everyplace. We promise not to raise our rates to him if he signs a contract. And this is the person we promise to clear.

Central Organizations some time ago sent out letters to everybody saying we were – had them on our clearing list. Well, this is their first issue on that subject afterwards, is this release form. And it says, sign it. And tremendous numbers of them will be signed and sent back in.

But that – same thing – all of a sudden, you've got two, three, four Saint Hill graduates on the staff and you got a lot of staff auditors. And all these Saint Hill graduates are doing their – but not being permitted to be Ds of T or anything else. They can only be Technical Directors by my special permission. And Assoc Secs. Yes, they can be an Assoc Sec, providing they're not needed someplace else. You get the idea? I mean this is a different look.

So you got two, three, four of these people and they're on staff, and just as fast – you bring these people in from the field, fix them up, get them all ready, and so forth. And when you've got a Saint Hill graduate, call him in again. And find their goal and feed them back to listing and zip them out of there.

In other words, this is assembly-line clearing. And this is World Clearing Program. Of course, your co-audit is you get sixty people together, and there's a lot of tricks that you can use on that. I'll talk to you a lot about that later on.
And I figured out a new angle on how you charge for this, if you're going to do one of those so that it makes the people who join the co-audit very anxious to bring in new people because it costs them less. See, the basic cost of the co-audit is five hundred dollars, or a thousand dollars a week, and of course, if they only had one person it'd cost him a thousand dollars a week. He's very anxious it'll have a hundred people. And in any event, you get – you get twenty-five dollars more per week, or something like that, for every person there. I can just see some guy trying to leave that co-audit, you know! [laughter]

But anyway, these are the problems. This is the atmosphere of the – the world is living in right now, Central Orgwise. And Central Organizations are short of Saint Hill graduates. They're trying to start this and trying to do that, and not enough time and not enough people and not enough technology, and already using the bulletin that's going to be received tomorrow, you know. And this is the operating climate that we're moving up into. And that operating climate, of course, will smooth out some years from now, perhaps. If you live long enough, maybe even in your lifetime.

But this is what you're walking forward toward, and this is what it looks like. And I just wanted to talk to you about these various things, and talk to you about the ethics of the situation. To talk to you about – you got to keep clearing good and you got to keep it getting done. That's the only thing that's really effective. And take the steps necessary to make clearing effective and keep it from being messed up. And we've got our job done.

We got the technology, we're on the way, and so forth. And even you will be Clear very shortly.

Thank you very much.
Okay. Lecture two, 25 Sept., AD 12, Saint Hill Special Briefing Course and we'll talk to you about 3GA.

Well, you know all about it, of course. There's nothing much to learn about it. The first thing you should know about auditing is auditing is what you get away with. That's it. And that sometimes is disastrous. Because you get away with something and then you never get away with it again.

Now, the best auditing, I think you'll agree, is very standard auditing. There's somebody here right now that was screaming about the wound-up doll character of a Saint Hill graduate, got twenty-five hours from one and thought, "Man, Saint Hill auditing is the most." When you're on the receiving end of good, stable, standard, high-skilled auditing, it makes all that difference. It is recognizable miles away.

Now, the difficulties of goal finding are generally put there by the auditor. The pc is perfectly willing to be audited, but the pc has a bank that is very often unwilling to be audited and the first step of any auditing activity is to make the pc auditable. Now, that's quite interesting – he makes the pc auditable.

Now, that's quite important, because the pc has got to be in a very auditable condition before you can do very much with finding goals. And if you ever want to have a hard time, take some pc who isn't very auditable, who has an anti-Scientology goal, don't improve the pc's auditing quality in any way and try to find the goal. Now, you just – I don't know. I don't know how the devil you could do it. It'd just be too wild for words.

Now, you take somebody who is quite auditable, but has a goal that he conceives to be an overt against Scientology or the auditor or something of this sort, you'll find that's tough enough, without adding the fact that the pc has no familiarity with auditing and isn't grooved in in any way. That's really asking for trouble.

Now, the best way to make a pc very auditable is to give the pc very accurate sessioning.

I can't emphasize this too much. If the pc feels all self-auditish and all run around and messed up and that sort of thing after some auditing, the reason for that lies with the auditor. There aren't ARC breaky pcs. You must remember this. There aren't difficult pcs. You must remember this.

There are auditors who can't handle pcs. And this will come home to you with a crash. You should have seen poor Wing Angel after he got out of here.
By the way, Wing's goal was completely listed out and he was checked Clear a couple of days ago and it's time that he was, because he's handling the Academy in Washington for a few weeks. And I went in and I saw the (quote) "auditors" walking around, you see, very stiff, "With your right hand, touch that wall. Thank you." Ruf! ruf! ruf! ruf! ruf! And I said, "My God, Wing!" And he says, "Listen boss..." He's always calls me "Boss." Gag! He says, "You should've seen them yesterday!" [laughter]

Well, someday you'll be handling some situation like that and it'll just about – you'll always have somebody coming up to you saying, "This is a very difficult and a very bad pc that I am auditing. This pc is very ARC breaky, this pc will not stay in-session, this pc this, and this pc that," and blame the pc, blame the pc. Whenever you see that kind of a situation you just know that lousy auditing is going on and you concentrate on training the auditor up better.

That's the answer to it. Because if you've been at this long enough, you find out that there aren't bad pcs or good pcs – there are pcs that are more auditable than others. This is for sure, but the auditor's job, of course, is to make the pc auditable, not blame the pc.

Now, it's a very funny thing. You take some pc that's been been very roughly audited – audited with the rudiments out, auditor has been cleaning cleans madly, you know, and missing the reactions, and the very things that you're struggling with. And this has been going on for several sessions. And, man, this auditor is just getting the pc so the pc is kind of coming up the leads, you know, of the E-Meter. You know, the pc's crowding into the session and the pc's falling back out of the session again and the pc's trying to keep his own rudiments in and all these various things which you occasionally see when you're moving in on this.

Now, this pc is weird. This pc is ARC breaky and had lots of problems and appears to be leading a very messy life and ifs all very upsetting. All right.

You take that pc, just as an experiment, and you just give him three sessions, each one about thirty to forty minutes long. That's within the hour limit of the session. Just give him three letter-perfect sessions. Don't do a thing for the pc. You understand? Don't try to do anything for this – don't try to handle the pc's problems or anything of this sort. See, nothing extraordinary. Just give this pc about three sessions, see, on Monday, Tuesday, Wednesday. Or week one, week two, week three, you see? I mean, just three sessions. And watch the difference in that pc. Because good, positive auditing is pure magic.

This pc all of a sudden will stop trying to keep his rudiments in, this pc will relax, this pc will say, "This is a good auditor," this pc'll say this and that. He'll give you praise you probably don't deserve. See, you could even miss a rudiment or two and still get a pc into marvelous condition

But you haven't run anything on the pc. This is what I'm trying to make a point of. You've not run anything on the pc. You've not taken up this pc's constant and continual worry about his lumbosis. See, you've not done anything for this pc. You could even go so far as to just, well, prepcheck the buttons, Careful and Agreed Upon. Not even Suppress, you see? Since – well, I don't know, pick some random date – since last Tuesday – just any old "Last Tuesday," you know? And that's all you ran in the body of the session. See, you maybe just
cleaned one of them, you know, see? Or since Saturday, or since this morning. We don't care what you did. See, you weren't really doing anything.

Now, all you did was get in those three rudiments up front and clean up this one button for some short period of time and then get your end rudiments in and end the session. Just do this for three consecutive sessions. And you'll find yourself looking at a different pc.

You should get a good reality on that, because it'll keep you from keeping auditors in the lineup untrained. If you recognize that this is true, then you won't put up with some auditor monkeying up a pc, you see? You won't say, "Oh well, I don't know. It's just poor old – poor old Billikins there – poor old Billikins just has a terrible time get – he's unlucky. He always gets bad pcs. Now, somehow or another Billikins always gets bad pcs," and so forth. That's not true, you see?

You see, if you don't know for sure what I've just told you, then you will keep Billikins in there and not do anything about Billikins. See? He just isn't auditing pcs. That's the only adjudication you can make out of it. I've had the experience a few times... Oh, well, right here, in your TV demonstrations, I've had a pc tell me afterwards – pc hadn't had any cleans cleaned on him, hadn't had any reactions called when there were none, you know. I mean, the pc was just given a fairly straightforward session – tell me afterwards, "Yeah, well, that was a marvelous session!" you know, "Never had such auditing!" I didn't do anything for the pc. See? Except just give a straightforward Scientology session, that's all, without any monkey business.

Now, the worse off an auditor is, the more he figures. Now, that's a stable datum that you can put down. The worse off an auditor is, the more he figures.

And the conclusions he draws will hold at dismay the origins and answers of the pc. The pc is always talking up against a foregone conclusion. See, the auditor has got it all figured out, every time. The auditor never sits there as just a – you know, he receives the origin, acknowledges, and so on. He's wearing himself out, man! He's just working! You talk about work! You never saw so much work as this! Oh, God! The foot-pounds of energy being put in by this auditor there if added to a steam engine would drive a locomotive the length of the – Great Britain or drive the Queen Mary halfway across the Atlantic. That's steam, you know! Figure, figure, figure, figure, figure, figure, figure, now let's see, figure, figure, figure, figure, figure, figure, figure, figure, and then some more figure, figure, and figure, figure, figure, figure... The auditor says, "Do birds fly?" You see? And as soon – just before the auditor did that, he said, "Well, I know what this pc will answer. The pc is going to answer the fact that birds don't fly because actually he's got – he's sort of flighty, you see, and he's going to have – he's going to have all this, and so forth. And therefore that's – that's the cause of his long-long nose and so forth. And when he – when he answers up, it doesn't matter what's running, I-I-I-I know what the answer is." Got it all figured out in advance.

So he says, "All right. Do birds fly?"

And the pc says, "I don't know. I guess so. Haven't given any thought to it at all."
And the auditor says, "See? I told you." Confirms it and so forth. Well, actually this auditor hasn't received any communication from the pc. He's received a proof of his own conclusions. And of course, he's never in communication with this pc.

And after an auditor has been at it for a while and he's done an awful lot of auditing, he's getting pretty smoothed out about the thing, well, he says, "Do birds fly?" and it's all right with him if he gets a positive answer, and it's all right if he gets a negative answer, and it's all right if he gets a screwy answer. It's also all right if the pc doesn't answer the auditing question; the auditor just tells him to answer it. And it's a very relaxed emanation coming out of this session – if you want to specialize in emanations. It's very relaxed, see? The theta waves are very smooth in that vicinity. [laughter]

And the pc knows. He knows he's talking to somebody. He knows somebody is talking to him and that there's not a lot of crisscross going on. See? There are not a lot of crosscurrents going on.

Now, this doesn't say that an auditor never has to figure out a pc's case, because he does. But the thing to figure out and figure on are the important things, not the unimportant things. "Now, let me see. This is the fifth consecutive list of detested people and things that we have drawn up without a single one of them slamming. Now, what the hell is wrong here? What's going on?" See? And he has to come up with the right answer. He has to do something that is effective about this.

So, it's only when an auditor is being ineffective that he starts working it all out. He – otherwise, he could just sail through like a breeze. He knows his stuff, he knows what's happening, and so forth. The pcs he audits; the person sits down there – well, it's just the fact that the session is a very smooth, routine session and it all comes off all right, and the pc winds up at the other end, and the auditor's heard what he said, and the pc has answered what was given him and the rudiments are all straight, and nothing's gone out of line, and there it is and the pc starts building up a big lot of confidence. And he doesn't put all these think-think figure units, you know, to work, and get all stuck in the session and get to fighting and batting around, and so forth. The pc just cheerfully goes on and becomes a pc.

That's very important, because in that state, he'll give you the right answers and he'll be able to look into his own items and units and 'ead and he'll give you goals and withholds and… In other words, auditing really gets done if the person's being audited. You understand what I'm talking about?

Now, if that kind of an auditing session cannot exist, you haven't got a dog's chance of finding somebody's detested person, dynamic, goal, item – anything. And these things are just not findable! Because the pc is just, you know, all nerved-up and knocked around. "God! He – I won't talk to – about this because – yes, I will talk about – I can't find any other difficulties I'm not willing to talk to him about. Difficulties? Difficulties? What are difficulties that I wo-da-da-da. I – but I've told you all the answers. Well, you say it still reads on the meter, but I – let's see! Difficulties? I can't think of any other difficulties that I'm unwilling to talk to you about." [pants exaggeratedly]

Have you seen something like that? Heavy! Pc will go around the bend! Now, that's no frame of mind to be looking for a dynamic and an item and a goal, man.
So the first requisite of 3GA is that the *auditor* can carry on a smooth routine, unworried, unharassed auditing session. That's the first requisite. And it takes a lot of training to get an auditor into that and it takes a lot of self-discipline, and that sort of thing, to get up to that point. Some auditors just seem to be naturals. They seem to be naturals. And other auditors seem to be – have a hell of a time to achieve it. But they can all achieve it.

As far as discipline is concerned, you'd be amazed that every now and then I have to take myself by the scrap of my neck and audit exactly by current procedure. And I do! I work it around and audit by current procedure – exactly current procedure, you see?

Sometimes I audit just a little ahead of current procedure. For instance, I'm asking two questions now, you heard in the demonstration last Wednesday, probably baffled several of you. There is "done" in the first end rudiment. Did you hear it as it went by?

*Audience: Yes. Mm-hm.*

Now, it was more important to ask that one than it is to ask the old one, see? Put "done" in that first rudiment. "To impress me," "Is there anything you've done to impress me?" You know? "Have you done anything to impress me?" That's the idea. "Done anything." It's not "said anything to impress me," but "done anything to impress me." You'll find out it's much more effective. And also critical – well, if there's anything misunderstood in the session, the pc's going to be critical; so it's much more beneficial to ask them, "In this session was there anything that was misunderstood?" And you'll find out this will work out much better as the session goes.

Well, those are little changes, and so forth, and I just get so flat out I don't have the time to issue them to you, and it's not terrible important, and I know I'll get around to it sooner or later, and you'll catch up with them. But of course you do this to yourselves. It's all your fault, you know, because you scream like mad every time I change a comma on you. But otherwise I audit with a very standard approach. I can give a very, very standard – very, very standard session. Extremely so. And groove it in, clean no cleans, miss no read – just give one of these sessions. Quite interesting what happens in it.

When I think of the times in the past twelve years when – or longer than that for me – that I have sat down and utterly sweated blood over a pc trying to figure it all out and not being aware of what conclusion was going to be reached by the end of session and all of this sort of thing. Well golly, I would have given a lot over these years to have been able to audit this very smooth, quiet approach that we audit with today. And man, if you do it right, it holds a pc in-session as though you had him tied down and threatened with wild bulls! They don't move. You really get them into session these days.

Well, it's that attitude of auditing: the calm, effective, certain, hopeful approach. You know what you can do. Sometimes you do it sooner and sometimes you do it later, but you know you can do it. That approach is fundamental for 3GA.

If you're still in a frame of mind where you sit down and audit a pc and "Uhhhh! I don't know how this is going to come out," and so on, and "I know what this pc's going to say, I know what his goal really is. His goal is to – his goal is 'to catch black catfish.' I know what his goal is because he says he's colorblind, and then obviously, I mean, and so on," and et
cetera, et cetera, et cetera, figure-figure-during the session, see? You're under big strain all during the session. "How is this going to come out?"

Well, just to that degree, this strain is communicated to the pc and the pc is incapable of producing the things which you want. You understand that?

Now, that's something to cultivate in 3GA, if you haven't already got it down. You got to be a relaxed, hopeful, positive, effective auditor. You've got to know your business in order to emanate the fact that you know your business, in order to get the pc to do exactly what you want him to do. And that is how to get a pc to get – to do what you want him to do – not hit him with your fist, but hit him with total competence. And you'd be surprised how far you'd get in that frame of mind.

But for the nerved-up, uncertain, questioning, technique all slipping out of his fingers, you know, like greased pencils. Uhhh! It doesn't go across. It's auditing attitude. It's auditing accomplishment. It's auditing effectiveness.

You actually should be up to a position where you can sit there and hand out a rudiments-havingness session. And just know that by the time you've given your pc two or three or four such sessions, he's just going to be calm as a millpond. You just get up to a point where you know that and you're ready to hand out 3GA.

That auditing attitude is important. All right. It's something that can't be neglected. And that's the basic reason why you're not going to get good, accurate goals finding, and so forth, amongst half-trained, poorly trained, uncertified auditors and that sort of thing. The discipline is just not adequate to it.

Well now, what I'm pointing out to you is, there is an actual auditing result as a result of calm, competent, effective auditing. Now, that's what I'm pointing out to you. See, it's on that fundamental that 3GA is built. And lacking that fundamental, you're not going to get another thing done. You could have the data memorized by the mile, be able to spit it out by the geyserful and you would not find any goals or make any Clears. Do you understand that?

Audience: Mm-hm. Yes.

So there is something on which clearing is built: It's competent, calm, effective auditing. And that's your first requisite. And no trick will get you over that zone. So everything I tell you about 3GA is based – understood upon that fundamental.

Now, the next thing that you need in 3GA is luck! See, you want luck. Well, you don't have to have luck to succeed, but it makes it so nice! It's so nice.

Now, look: Total competence will breed luck. But it takes some luck just on its own hook, too.

Every now and then... Let's say you're running a clearing co-audit and you're lucky on fifteen pcs out of fifty. You're just lucky, you know? The person just laid the goal in your lap, you know – bang! But there it is and it rocket read, and everything was fine. You – the pc – just before you started listing dynamics on the pc, the pc was waiting for you and he's sitting there reading a magazine – this is what I mean by luck – reading a magazine. It was *Time Magazine*, which is a companion piece to *Dog's Life*. [laughter] And they just happened to be
reading this magazine and they opened it up and they were reading the obituaries (which I think is their most common commodity that they peddle in that magazine). Obituaries, see, obituaries. See, he was reading that and he comes in and offhandedly – giving the dynamics. And he says, "Well, there's God, and there's obituaries and there's so on and so on," and you assess it all out – bang, bang – and my God, it's "obituaries," and it just falls off the pin. You see? Crash! Crash! Crash! Terrific rock slam – so on.

And you start checking around hurriedly and he hadn't given you the dynamic, he'd given you an item and you're already there. And all you have to do is list a few goals against the obituaries and it's there. See? That's what I mean by luck, you know? It always takes just a little bit of that luck, you see. It didn't – and that – all luck does for you is just shorten it a little bit. That's all it's going to do. It's not going to make it. You don't have to have luck to find the goal, but it shortens it. It makes it more rapid.

And you sit down in a session and your pc has done an old goals list. And he's found this old goals list and he drags it into the session and he gives it to you. And he says, "Look," he says, "there's three goals on there, I just happened to see..." Before you go into the arduous listing of about a hundred goals the pc has, "There's these three goals, and I wrote this about a year and a half ago. And I just happened to find it there and I thought – and it's a very funny thing, but the first three goals on that are all overts against that dynamic, ha-ha!" And you look at it and it's the first one on that list. It rocket reads three times, you clean it up, you have it checked out and that was the pc's goal. You get what I mean?

It's all in the direction of time shortening now. It's not in the direction of total consequence, because you're going to find the pc's goal. Don't worry about that. That's why I'd like to see you find several goals on pcs, because you suddenly start getting insufferably cocky about the whole thing. And listen, you can be as insufferably cocky as you please. I'm not going to put any bulletin out about being insufferably cocky. [laughs]

So you see what I mean by the element of luck. It's there. It's there. You find the goal at the beginning of the list instead of at the end. You see? The pc opens his mouth and you say, "What is the – what person or thing have you detested in this lifetime?" something like that.

The pc says, "Uncle Joe."

And you say, "Yeah, all right, give me another one."

"No! Ha! Don't have to give you another one. Uncle Joe! That's the one!"

You're looking at the meter. Man, that's the one! It's slamming itself off its pins! You say, "Uncle Joe," and it renews its activity. You don't get any list – you never get a chance to. You got your detested person.

And you say, "Well, who or what did Uncle Joe represent to you?" see, which is a proper question there.

And the pc says, "Spirits – always talking about spirits." And you're looking at the meter and it's rock slamming. At this moment we're twelve minutes deep into the body of session. [laugher]
And you say, "Spirits, huh? Well, what else did he represent?" and so forth.

"Well, mostly spirits!" Bang, there it is, you see?

You say, "Well, that's good. That's good. Now, what do spirits represent to you?"

And the pc says, "Undertakers! An undertaker. Undertaker. Yeah, it's an undertaker. Yeah, it represents an undertaker. That's a spirit to me."

Ha-ha! There it is! [laughter] Fifteen minutes deep into the body of the session you got the item. You see?

And you say to him carefully, "Well, what goal" – you don't want to stretch your luck at this point. [laughter] You say, "What goal would it be impossible to achieve if you were an undertaker?"

And the pc thinks for a minute and he thinks for a minute, and you see a couple of small rocket reads, you see? Pc is thinking hard about it and thinking hard about it and finally says, "To live. Yeah." Rocket reads! Crash! Crash! Check it out, that's the goal! Twenty-two and a half minutes deep… [laughter]

All right. Well, you could be dodging around, you see, against fifty hours, for the – exactly the same result. See? Now, the element of luck has a shortening time value.

Now, the next pc after this pc, you're going to do slower than you would have done if you hadn't had all of this luck, because you say to the pc – this next pc – you say, "Who or what have you detested?" And the pc gives you a 425-name list and the item of detestation isn't on it. The list is not complete. There's not a single slam on it anyplace.

Well, the thing to do in the face of this much luck brings us to our next step, which is certainty. Now, we're not dealing in a "You might find the goal and you might not find the goal," see? That is not what you're dealing with at this time. You're dealing with "How easy is it going to be, how hard is it going to be, to find this pc's goal?" That's the quotient you're stacked up against. It isn't "Am I going to find it or am I not going to find it?" No, you're going to find it. And you go by the rules of the game that we've got right this minute, and you'll find that goal. It's a question of how long it's going to take.

Now, the length of time it takes is to some degree influenced by your certainty that the goal will eventually be found. You follow this?

Audience: Mm-hm. Yes.

Because when you become uncertain, you will start doing things that are unusual and extraordinary and which may very well lead you into some backwash that is going to take you hours and hours to get out of.

You say, "Well, I don't know if I'm doing the procedure that will find the goal or not." If that thought is occurring to you – "I don't know if I'm going to find this pc's goal or not" – if you're in that frame of mind, you're going to make mistakes. So it's up to you and you will perhaps acquire this somewhere up the line – particularly if I mention it to you – you'll get to a point, after you've done a few successful assessments, you'll realize it isn't whether or not
you're going to find the goal, it's a question of how hard it is going to be to find the goal. That is the measure or the yardstick by which you measure pcs.

When you achieve that, you will be in a very good situation as an auditor, because it will reinforce the first requisites – the calm, competent aspect of the auditor. And it will also tend to breed luck.

It's as a highwayman looks very, very dangerous to the degree that he has a tremendous reputation. I imagine some poor little old highwayman has gotten out on the – alongside the track and the mail coach has come along, and this highwayman has stepped out into the road and tried to flag the coach down and said something or other: "I'm Timmy Simpson! Stand and deliver!" You know? And the coach goes by and not only does it go by, but it throws mud all over him. It's a disheartening sort of thing. That's the difference between Dick Turpin. He's sitting there on a big, black horse and he hasn't even got a pistol in his hand and the coach comes up the slope to the top of the grade and sees him sitting there and the coach stops, and they stand and deliver. They even volunteer to carry it a distance for him this time. That's sort of the difference of reputation, competence – that sort of thing. That's the difference it makes. It's a big difference.

Now I'm not trying to give you an aspect of Fagin teaching his boys, but the aspect of "Well, it's just inevitable. You – there you're going to give me the dope and you're going to give me the withhold and you're going to give me this, and there it all is and that's it. Bing! Dm-dm! Inevitable, you're going to do this." And that certainty, actually, can take a pc and the pc's… That doesn't ever enter his head that he's going to withhold anything from you and a tremendous amount of the battle is won, see?

Now that's different. You box around with this pc, and you say, "What is this fall? Yes, well. Since the last time I audited you, have you done anything you are withholding?"

"Yeah, well, I ate breakfast." And you say, "Thank you. Since the last time I audited you, have you done anything you are withholding.?" (I've been hearing this lately said different ways. I'm just throwing that in gratuitously.)

And the meter goes clank, and he says, "Well, I… tsk! tsk! Nothing!"

"Very well. I'll check that on the meter. Since the last time I audited you, you done anything you are withholding? It still reacts."

"Well, I don't know what it could be."

See, this is not a climate of auditing in which you're liable to get too much done. You see? As your competence goes up, your luck increases. See? And as your luck increases, why, the whole thing adds up to greater certainty. You finally get insufferable! And that's just fine, fine.

I've heard a person or two say, recently, "Well, whatever else I can do, I can audit. By God, I can audit." You know? They know that. I heard myself saying it one day. Yep. And they can, too.
Now, there is a stage, of course, before they've been trained when they believed that, too! [laughs] There's a small valley about the depth of the Grand Canyon between that state and the next state of competence.

Now, certainty. You're going to find the pc's goal. That's going to be done because that'll keep you at it until you do it. That's what's important. It'll keep you at it. And if you haven't got any real belief that you're going to find the goal, you're liable to be kind of weak and staggerish about it.

Now, I'll admit that at the end of about thirty or forty hours of slog on some pc who gets alternate dirty needles, and that sort of thing, and that is kind of hard to read and is stacking up lots of withholds and it slams on you like mad, you start getting a little laggardly about these things, you know, and you don't really pitch it in too hard. You have a tendency to slow down a little bit. And the more you slow down, why, the less certainty is entered into the session, the less certainty you've got and the less likely you are to finish your job off. You must always finish the job off. You owe it to your own morale to finish the job off. That is the whole thing.

So it took seventy-five hours to find Aunt Mabel's goal. Kick her in the head afterwards if you must, but spend the seventy-five hours. You got the idea? Don't go stacking up a bunch of people whose goal you didn't find, you understand? That's almost fatal along the line.

Now, let's get into the technology itself.

This is fairly well settled now. I'll just go over this very rapidly. On a Dynamic Assessment you ought to have your 850 goals audited on the pc just to have a good backlog supply of goals. It should be. You can violate that. Your pc should be prepchecked and be very auditable. Sometimes you will violate that.

But for sure, you enter into your next steps, they go something on this order. And this is current and this routine is susceptible to being changed. And if I find any shorter shortcuts, you're sure going to get them. But it runs something like this:

It's "Who or what have you detested?" Now, it's usually not necessary to add "in this lifetime," but you can if you wish. And you finally get yourself a list and if you've got a very, very close eye to the meter, you'll see that some of them slammed. You'll see that some of these names slammed. Sometimes it comes the first one on the list. After you've been totally spoiled and realized that every time you ask this -- any person who he detests, that you get the item the first time -- because it's in the majority of the cases you do -- you then run into the pc that the item is 436 down the list. That makes a citizen out of you again and there you are.

But you get this detested person and this slams. And you take this slamming detested person and you find "What part of existence" -- this is paraphrasing; it's almost any phrasing of this -- "does that person represent to you?" You don't say, "What is -- what part of existence does this person consider the dynamics to be?" or "What dynamics does this person consider to be?" I've made that error two or three times and it never works. It's always, "What part of existence."
So you say, "What part of existence does this person represent to you?" and the person will give you, usually, a dynamic list. And this list is going to have some slams on it probably, of one kind or another. And you're going to get a long list there. And you may not get a slam that you run out on that particular one, you see – that's possibly not slamming.

Your first list of detested people only had a few slams on it. You had no dwindling slam or anything like that. It just slammed once in a while, you know. And you got this list of dynamics. And it just slammed once in a while. And it isn't necessary that you have any dwindling slam yet because you haven't entered that zone or area.

Now, you assess that on "cons..." – and all of these assessments are carried on with "Consider committing overts against" or some such phrase. "Think of doing bad things to." There's a lot of these things. Those are not optimum. Someday we'll get a better phrasing for that, because the pc thinks you're telling him to do something and he always tries to do it and sometimes gets all gummed up on it. We don't know a better one though than – at this particular time, than "Consider committing overts against." That is the assessment question.

So we find this thing. And then, having found this slamming item on this list, we then know we have or think we have, the dynamic. And now having the pc's dynamic, we want "Who or what would this represent to you?" See, this dynamic, see? Well, let's say the dynamic was families. See? Well, "What do families represent to you?" See, now you're going to get yourself a slamming. Now is the first for sure dwindling slam you're going to get. If you're right, you're going to get a dwindling slam.

Now, what do we mean by a dwindling slam? You take the item, the dynamic in this case. You take the dynamic, you get it so it reads. Now the rule is, if you're going to list anything, you get it to read first. If you're going to list from anything, you get it to read first. I can tell you a lot about how to get things to read. But you get this thing reading. And most – a lot of your lack of success is, is you have this thing so suppressed or so unsuppressed or something that it won't read. And you don't – you find the item on Tuesday – I mean, the dynamic on Tuesday and it's families and it slams like crazy. And you pick it up on Wednesday to continue your session and it doesn't even tick. So you tiger drill it a couple of minutes to see if it – and you finally get it so it gets a little tiny dirty needle. And now you go ahead and you list from this thing. You're going to lay an egg, man!

You want a slam in that thing. You want that item slamming, just as before, before you go on listing from it. You understand me?

Now, when you list that item down on, "What does that item represent to you?" the pc – you're going to get a dwindling slam. And that's going to start wide and item by item it is going to diminish.

Now, a sporadic slam is different than a dwindling slam. These things are enormously different. A dwindling slam diminishes item by item. Written thing by written thing, you get a dwindling slam. It's less and less and less and less and finally a dirty needle, and it isn't even a dirty needle and gone.

Now, when we say dwindling, it may start two inches wide and then it'll be an inch-and-three-quarters wide and then a few items later you're watching this thing and it will be an
inch-and-a-half wide and then it'll be an inch wide, and then it'll be a half-an-inch wide and then it'll be a quarter-of-an-inch wide, and it's just a little dirty needle, and then it's disappearing and then you complete the list. You bleed the meter. You ask the pc, "Are there any more?" and if you see a reaction here you write it down, you see. And you got that thing complete.

Now, that is a dwindling slam. That is different than a sporadic slam. A sporadic slam is you write down, you know, "What does families represent to you?" See? And Oooooo! It goes bang, bang, bang, bang! And you write the next item down and there's no reaction. You write the next item down, there's no reaction. You write the next item down, there's no reaction. And then you write down an item and you get a big bang, bang! big slam so forth. And then you write down another item and there's no reaction. And bang, bang, bang! Another slam, you see? And when you finally finish the thing up it – you aren't getting any slams anymore. But if you cleaned up the original thing from which it proceeded, you would get the slam back again. You understand?

In other words, this slam has not been listed out. This slam is occasionally turned on. And there's where an auditor is fooled more than anything else. And it's most heartbreaking to sit there and watch something that you're absolutely sure would list. And the darn thing... There's a slam about every third or fourth item and then you list eight items in a row. They all slam – same width, not diminishing. And then you list seven more after that and there's no slam on those. And then you list an item and it slams, you see? Nah, that's not a dwindling slam. You understand?

But this nice interesting phenomena – the dwindling slam – will occur.

Now, when you finally got the item, what do you do with the item? You want to know, "What goal might you have that'd be an overt against" – and let's say it's diapers. That's a good one for families, and so on. So it's diapers. And what would be an overt against diapers and, man, there's your dwindling slam again. If you're right, and that is the right item, it'll be your dwindling slam.

Of course you've assessed this item list, of course, with: "Consider committing overts against..." Just like you did any – the dynamic list, just like you did the person list, you see? Everything that is an – looks like a dynamic or an item or detested person or a thing, you see, that is always assessed with "Consider committing overts against..." You're assessing with slam for slam. Therefore it's Dynamic Assessment by Rock Slam and you turn this thing on that way.

Now, when you list those goals out, you list a dwindling slam. And it'll dwindle down, just as I've described to you, to a dirty needle and drift out.

That doesn't mean the goal is on that list. That's just proved the fact that it's the item. And that dwindling slam is the proof of the pudding. The main thing that you're going to do wrong is you're going to ride this horse to death. See? You're going to get this long list and you're going to assess this thing and it's – there's nothing slamming anywhere on the list, you know? It's "Consider committing overts against..." and you got your rudiments in and there's nothing slamming and it's all dirty needle – everything's got a little dirty needle, little instant
dirty needle – and you finally pick out this little instant dirty needle thing and now that – yet you say that must be the item, and…

See, you've read all the way through this 329 list and you assessed it all and, oh man, you've worked like mad. Now, the horse drops dead, see? About the time you've been through it once and nothing has slammed on the whole list, that horse is dead, man! And yet you'll continue to ride the horse. You'll go over it again. You saw me do it about two or three times on TV on the research sessions, remember? Those were just research sessions, see – no reason why you should do it.

All right. Now, what's going to happen here? This horse falls dead and then you get off and you take your canteen, and you fill up a sponge and you wash out the horse's mouth, and you groom him, and so forth, and you polish all of his harness, you know? And you sleek him up, you comb his mane, you know?

What are you doing? You had no business around there. Get yourself another horse. Grooming dead horses: You're going to often find yourself doing that. Because you're so hopeful. You say, "Well, at any minute now a slam's going to turn on, see, and we're going to go through this 389 list, and it's only taken us five sessions to do it," because it takes so long to get the rudiments in and all you get out of it is dirty needles and all that sort of thing, and you're just nowhere, see?

Well, I'll tell you. Although I may do this myself once in a while – I tell you, I know when to get off that horse now. I unload before the horse drops dead. I know he isn't going any further and I drop into the sand and go find my – start whistling for another horse because I know he isn't going anywhere. He's got "Kansas City" or "Wichita" on his nose.

Now, you've got a tremendous list but this is why dynamic slams are – why you have trouble with them: they haven't got the item on them. Your rudiments could be desperately out in the session – which isn't very probable, not at the auditing skill level you're in – or the item isn't on the list. So actually the answer is, the item wasn't on the list. That's it. The item isn't on the list! If you can just get that through your 'ead! Of course, you – probably everyone of you have to learn as hard as I did. I've just done assessment after assessment after assessment after assessment on and on and so forth. And carry each one through to its final, total completion of finding out not one stayed in. There I am, sitting there. Or one is giving a little tiny slam of some kind, but won't list. See? The item wasn't on the list, that's all. And I found that to be true every time.

Now, I'll tell you how I do it these days. I go over the list once and if I get a slam, I stop right there and we go on about our business.

I advise you to go over the list twice because sometimes if a pc is somewhat out of session, the item will skip around. One will slam and another one will slam then it'll settle down on something.

I was reviewing a pc, a few – couple, three weeks ago, that'd already been done and had gotten the wrong item on the pc. Wrong item. But there was one item on the list that was slamming. So I just read down the list, came to the slamming item – I would like to tell you that I finished up the list, but in actual fact I didn't. This item was slamming, man! Boom,
bow! See? Like dropping a hot shell into a powder magazine, you know? Boow! See? All the rest of it dead calm, you know? And here's this one. Bow! And I just stopped right there. I said, "Well, that's that."

The reason I stopped there is because the pc cognited two-and-three-quarters yards worth. You'll learn that the pc's interest follows the slam and the pc's cognitions follow the right items. Pc's sitting there, you know, holding the cans, you know – sitting there doing nothing, sitting there. Pc is sitting there and you saying, "Hogwash and dillywumps and buffaloes," and whatever the item. And the pc sits there, you know – hogwash and so forth. And all of a sudden you hit "crackerjack," see? And you say, "Crackerjack."

And the pc – "You know I had an uncle once who was in the Cracker Jack business. Manufactured Cracker Jack. I used to eat so much of those, used to always make me very sick. Cracker Jack always used to always make me very sick, and it's a very interesting thing that that ties in with the Supreme Being very well. Now, I have – have two or two or three instances here where the Supreme Being is tied in with Cracker Jack. There are several instances on record where Cracker Jack has been very, very interesting. That reminds me of a goal I had once, too." [laughter]

You read down the list, you see, and there's the pc, you know. All of a sudden, you know? What the hell? What are you going on any further for? The meter slams, the pc slams, everything slams! See, the pc's interest suddenly – bzzzzzzz!

Ah, go down to the bottom of the list and go down again. And you'll find your – you'll eventually find out that you're right. And you'll get very great confidence. You'll find that item slams every time you go by it.

You should know the item far earlier than the pc ever dreams of it. You should know that the item is on the list first pass through. And if you're insufferably cocky, you'll just pick it off the first pass through.

You'll be going on down the line and read on down to the end but you already know it's "Cracker Jack," and you just lay the whole thing aside, and say, "All right. Well now, Cracker Jack. That slams very nicely. All right. Now we're going to take this now. Thanks."

And pc is saying, "And my Uncle Joe once had a Cracker Jack factory and so forth."

And you say, "All right, thank you very much. Now we're going to take this piece of paper here and we're going to write on down the line here. Now, who or what represents Cracker Jack to you?" you know? We don't care what exact question we ask him, as long as we get "represents" in it "to you," and we get it stretched out there and we've got our next list. Or we've got our goals list.

Now, that's the way it's done.

The goal is ordinarily – occurs on List 6. And it occurs one, two, three or four on List 6, which I think is fabulous. "If you were a Cracker Jack, what goal of yours would be impossible to achieve?" If you're lucky, it'll be in the first three or four of List 6. If it isn't, your luck was out that day and you better follow the next plan of action, which is to tiger drill the posi-
tive-negative buttons versus Cracker Jack. "Your goal – would your goal suppress Cracker Jack?" "Would your goal invalidate Cracker Jack?" You just take the thirteen buttons. "Would your goal be careful of Cracker Jack?" Also you add a few buttons of your own selection. You say, "Cracker Jack, that's very interesting. All right, we'll put in 'devour' on our button list, and 'spit out' and 'buy,' and we'll put 'give away,' and then of course we'll have 'ignore,' " You get the idea? Just add them to your buttons list. You make up your own. That's what I've been doing lately, is making up my own Prehav assessment for the thing.

And it's quite interesting. So you say – you take the item – this item's well proved – and you say, "Would your goal," positive-negative, see, "Would your goal suppress Cracker Jack? Would your goal not suppress Cracker Jack? Would your goal invalidate Cracker Jack? Would your goal not invalidate Cracker Jack?" And all of a sudden you're going to be looking at a great big rock slam. You've got it. There it is.

Now, you have the pc list goals which would not invalidate Cracker Jack. And he'll give you four or five, and if your luck is in, it's on that list, maybe the first one or two. Got it?

Seems to do something to his mind. Got that as a method of finding goals? I've talked to you a long time about this, using the Prehav Scale to find goals. Well, I've been doing it lately, and it's been very successful. Looks good. Looks good.

Now, there's another shortcut. You can't find yourself the dynamic. All you can find is something that goes flitter, and thub, and dirty needle and disappears. And you can't find anything. You can do this horrible shortcut but I don't advise it or advertise it. But this horrible shortcut is just skip the detested person, skip the dynamic, skip the item and you just list straight out, flat out – you say, "What do you wish wasn't part of existence?" You make a great, big, long list. Get the pc well grooved in.

Make thirty or forty, fifty items on this list, and then throw it away. That gets him well grooved in, and you ask him, right sequitur to that, "What isn't part of existence?" and you go on down the line and his item will be on it, because the characteristic of all of these items is that they aren't part of existence. The pc has too many overts on them, so naturally, they're totally unreal, so therefore they aren't part of existence. You got the idea?

Now, you take that, and you do the same button trick on it, and so forth. Let's say and then you'll find out – this is how you got Cracker Jack. It wasn't part of existence and there it is slamming. All you do is consider overts against that "What is not part of existence?" list. Do you understand?

Supposing you wind up with a dynamic and you can't find the item? Well, the dynamic was probably the item. So you – after you can't prove it out, you abandon the whole thing and list goals against the dynamic. You got the idea? What – you list goals against what you've got. You didn't get a dwindling slam of goals, nothing. But you notice finally – here's the last desperate trick. This is the end trick and the most desperate and the last appeal (and if you got this far, I'd be ashamed of you), but you just find something that the pc slams against. You happen to notice in prowling around that the pc, every time you say "cheesecake" slams like mad. Every goal that has "cheesecake" in it slams like mad. Everything that has "cheesecake" in it slams like mad. So you just take "cheesecake" and list goals against it.
That's desperation with a capital D. Semidesperation is "What isn't part of existence?" You see that?

All right, that's your existing technology today; that's about the way it goes. If you're a very clever auditor, if you're very well trained, if you're lucky, if you audit with certainty and you follow the standards of the procedure I've just given you, you wind up with the pc's goal every time. And you can't avoid it. You understand?

Therefore, goals finding is actually pretty easy today. But I will say, after doing a lot of it myself, that it requires these elements. There's got to be some luck connected with it; you got to be able to think on your feet and keep your eyes open. There's no substitute for it. Think on your feet and keep your eyes open. You suddenly realize that this pc is not completing any lists. You never get any item on any list that you can have anything to do with, but you do have an item – you got to know when to throw in the sponge and do a semifinal action. Don't you see? You got to know when to quit on these things. You got to know when to take advantage of these things. In other words, you got to do some inspection and thinking for yourself within the broad framework of exactly how it's done. There then is no substitute on top of it – and I'll give you the last qualification, which is a clever auditor. And then you just find goals by the bucketloads. Okay?

_Male voice:_ Yes.

It's tremendously therapeutic to find a detested person on a pc. It's therapeutic to find a dynamic on a pc. Therapeutic to find the item on the pc. Therapeutic to find the goal on the pc. And the last comment I will make is the pc will throw you for a loss every time by telling you how good he feels and how wonderful he feels or how bad he feels, how much he hurts.

I've been telling pcs lately, "Thank you very much, I'm very glad of that. Now, that's very nice. I'm very happy. To hell with it. Now, let's get on with the session." I don't care how they feel. We're not doing these things to make the pc feel good, because we have this enormous gain coming straight up that's greater than anything any man on Earth has ever experienced, before us.

So the pc doesn't have headaches anymore. Well, that's dandy. Is he flying yet? No. Well, let's get on with the assessment.

Okay? All right.

Thank you very much. Good night.
Thank you.

This is what?

*Audience: 27th of September AD 12.*

[huge part missing]

Now, the subject of tonight's lecture has to do with something you haven't been paying very much attention to and on which there's very little technology and which I've even got notes for; it's the first time I think in history. I sometimes come in with notes but I seldom use them. In this particular case I asked Suzie to give me some data from an earlier lecture so that we could compound these lectures and put them all together. And this lecture is all about listing. And you never heard about listing before, obviously.

You've heard about listing for 3D Criss Cross and the list must be complete. And you've heard about listing this and listing that. Well, just so nobody misses it, see, when a goal is found, see, when a goal is found you then have a number of lines, called "lines." And item by item, you ask the question of these lines, you see. You ask the question of the lines of the pc and he gives you the answer and that is written down. And that is called line listing. And when you have finished all the lines completely, there is a free needle on all of the lines and you have a Clear. Unless you list the goal, you don't have one.

Now, I just wanted to put this in as data in case anybody had missed it. Listing is not Prepchecking. It's different. Listing is done in Model Session. Listing is done with very good auditing. And anybody who believes that it could be done with slap-happy, Q-and-A auditing sort of thing has got another think coming. And it is a very smooth operation.

Now, in view of the fact that it is not studded with stellar actions and... such as, "Well, I found the dynamic, I found the goal, I found the item!" Some people don't think it is important. But it is listing that makes the Clear.

Now, the things that are listed are items. And today we are listing forty lines. Forty lines – forty. You have sometimes seen marquees on carnivals and so forth: Forty girls – forty. But these are forty lines – forty. And these are all listed. And these lines each contain items which are terminals.

Now, lists are not done by significances. This is an important point because somebody, sooner or later, is going to mess up a line and fix it up so that it can only be answered
with a significance. I'll give you an example. Here's a goal: you say, "To be good enough," as the goal, and then say, "For what?" See? That gives you a significance. Well, the line must always be answered – or written in such a way that it can be answered with an item.

Now, there are several reasons for this. You want to know why people can't go Clear just by finding goals. Well, that's because you can reach infinite distances in the world of thought and therefore reach amongst all of these massy, massive, electronic, supercharged masses called items, which exist in spaces, and which are all jammed up on the time track to time zero, called the GPM. And the GPM is only slightly composed of thought. The GPM is composed of masses. And the masses make up the difficulties that the pc is having. Now, please remember that. Please, please remember it.

It is so easy to face thought, that in all fields of philosophy they thought that thought was enough. And it aren't, you know. Read the philosophers if you want to know how far they thought thought could think.

No, the GPM is made up of masses. And it is masses that keep the pc from going Clear. Not thoughts. In other words, you could audit forever – forever, spelled: **f-o-r-e-v-e-r** (underscored with an exclamation point afterwards) – in the field of thought without producing a Clear.

And the reason we've made it and others haven't is based on this one point – this one point: that we have discovered that the bank and the reactive mind contains masses. Whether those are expressed as pictures, as in engrams, as circuits, as machines or anything else, they are masses and they exist in space. And the confrontation of those masses is what makes deaberration. And you could thought and think and thunk and figure and figure and think and thunk and thought for generations, for eons, and for the next two hundred trillion years without making a Clear. Now, do I make myself very positive on this?

**Audience:** Yes.

Because you're liable to slip on this, you see? The reason this is liable to slip is thought is so easy for a thetan to confront. He's nothing, thoughts are nothing – duplicate perfect. See that? Perfect duplication. See? So he most easily goes to think and he avoids the masses. And you're going to hear, as the years roll on, people leaping up here and leaping up there and expostulating the fact that somebody could go Clear with "thinks" – because it's so painful going Clear on masses. They're so hard to confront, so people are going to take the easy road out and try to go by thinks. You understand?

So we have to make that clear on listing – that listing consists of getting items, getting the pc to confront items and name them. Now, that is what listing consists of. And you don't, as an auditor in listing, don't have to stress this point. All of the mechanical data is already there. You just go through the action of listing and all the rest of this takes place. But that pc is confronting masses! It's terribly important. See?

Now, the mind, according to every philosopher on the track from here back to none, is composed of thought. See? They all believed it was composed of thought. It was full of think. And nobody ever asked, "What the hell is all this think stuck in? How come he can't un-think?"
And you know, I pondered this one question for years and years and years and years and years before I finally came down to the answer of it. You address masses. And you will never think a person through to anyplace. Interesting, isn't it? You confront him through.

Now, all of the material that underlies clearing, it's tremendously extensive. There have been tremendous quantities of it deleted as unnecessary and it comes down to this simple operation known as listing. And the operation looks so simple that it can slip. It is near perfect now; it is very near this. And it contains a complexity of combinations which are staggering once you begin to look them over.

The GPM is composed of masses. And these masses are composited identities. It's actually masses of identities.

I'll show you what happens. The thetan sails through life, he's wearing a body the whole way, he's being hit by trucks and hitting trucks and beating his wife and being spat in the face of, you know? She's been hanging new dresses on herself and corseting herself so that you can put a circle of your fingers around her waist. There's all kinds of impacts, compression, suppression, so forth. And all the time, this thetan is emanating energy and absorbing energy and emanating and absorbing, and energy is being emanated at him or her and things are absorbing his or her energy and here they are, you see? And when they finally take the body and put it in the six-foot box, or in the tree or in the sand dune or other customs, or send it back to be melted down for the new doll-body factory; when they finally finish up with this, they don't bury with it the masses. That's very interesting. But those masses are not buried. The thetan tucks the old tin cans sadly under his arm and goes clanking away, dragging every chain of that lifetime.

And not having any way to get rid of them and not knowing what to do with them and being low on havingness anyhow, he sort of tucks them all together and wads them up, you know? He takes a whole lifetime and makes it look like a Kleenex and stuffs it someplace because it may someday be of use. And also because he's never known what the devil to do with it. He tries to shove it into bodies and it doesn't stick. He says it belongs to bodies and wears it on himself. This thing is pretty fabulous when you come to think about it. What the devil is he going to do with his accumulated bric-a-brac? A lifetime looks like a picnic-ground Monday. With no place to put any of the debris. So he's sort of liable to pack it over into the corner and wad it down. When you finally get all through he's got a GPM that's a honey. Because he's done this hundreds of lives, thousands of lives, millions of lives, and every one of them had its residue.

Well, there it is. There's the stuff. There's the junk. Not only that, but this material has the oddity of appearing in his vicinity as a whole beingness, as a machine, as a circuit, as a thinkingness. All kinds of weird things occurs. He sees himself yesterday and he says, "Ooooh! There's somebody." Yes, there was somebody. And this is very, very often compounded. But sometimes he does see somebody, don't you see? He sees you or he sees somebody, or he sees another thetan and he wonders whether or not it isn't a valence or an item, or whether you aren't part of his bank. And you know there are people walking around right now that think everything else and everybody else they see is just part of their own reactivity.
In the story "Fear" (not calling off any of my own bibliography), the stunt of walking
down the street and being absolutely sure that the whole street is knocked down and di-
smantled as soon as one is out of sight of it, you see, and making sure that the people who are talk-
ing together don't just stand there like dummies after one has gone by and never move there-
after, you see – this feeling that the whole world is an emanation of self could be a result of
one of these packed-up banks. He can't any longer tell the difference between an identity in
the bank or an actual being or anything like this. It gets to be pretty mixed up. He finally gets
so he doesn't know them and he doesn't know himself and he doesn't want to know. He doesn't
know how it got that way and he doesn't know what to do with it.

So he invents psychology, which proves to people that you've got to be crazy to be
clever. "Be Glad You're Neurotic" – have you ever read that great textbook? Well, that actu-
ally is the type of textbook that a thetan writes when he's just given up, man. He says, "There
must be some use for it." He's been saying that for trillennia, you see? So finally he knows the
use for it; you write a book about it and say, "Be glad you're neurotic." It's a valuable posses-
sion.

Well, you'd think processing some pcs that you were trying to take away their head
when you take away an item sometime. They'd be very sad about it and they'd be very upset
and they'd be very this and very that. The item you're trying to get is a crazy man that has
made this person unsuccessful his whole lifetime, hasn't even been a game, he didn't even
know he had it. See? This thing is pretty wild.

Now, it's listing that gets rid of all these items and that accumulation. The fantastic
thing has occurred of finding out how it is that the masses came into being in the first place.
And that's really pretty fantastic to plumb that particular secret. But that is the secret of any
being. That is his secret. How did the masses materialize in the first place?

They materialized through an alter-isness of his basic purpose. And if he never altered
his basic purpose and never lost and never had any conflict with life because of his basic pur-
pose and was always able to carry it out, theoretically he would have gathered no mass. Theo-
retically. It was never opposed, he never opposed anything with it, don't you see? Theoreti-
cally it'd never happen. So it's an alter-is of this one idée fixe, the basic purpose of the being.

Now, he just – one day he was floating out amongst the clouds and he was awful
bored and he didn't have anything to do, and by God, he thought something up.

He says, "Well..."

See, he doesn't care – he's gone beyond caring now, see?

And he says, "Well – no games. I think I had better have a basic purpose. I really
should have a purpose in life. What would be a good purpose in life?"

There's no reason for him to have it at all, you see?

He says, "To catch catfish. That will be it. That's a good, laudable purpose. Catfish are
evil beings and I'm going to catch catfish. And that's going to be my purpose in life."

So he gets a job as a street sweeper, walking around with a dustbin, spearing paper.
There aren't any catfish. Well, he's in trouble now, you see? He's got to go through all the mo-
tions of materializing catfish so he can catch catfish. And then he's got to have some opposition to him doing this. And then he's got to have this and he's got to have that. And the laws of games set in at once. And he starts individuating out of existence, having made this basic purpose.

Now, he little envisioned any vast consequences of this, or that he would forget his basic purpose, or it'd be so lost as to be unexecutable. Or to face the fact that the one thing he did with strain was his basic purpose. He could do anything else well. But this one was tough to do. He had to do it and it was very hard to do. It practically wore him out, but he never much paid any attention to that. But the reason he was accumulating everything and had unsuccessful lives and didn't have a game was the reason why – the only thing is he is specialized in his game, you see? The game must only be to catch catfish. He may play no other game.

So there is his idée fixe, his total limitation of ability. And as he goes along the trillennia, this thing snowballs in terms of mass. He accumulates beingnesses. He opposes beingnesses. He gets mental image pictures of these things. He tries to oppose his own goal. He does everything you can think of. And eventually he's walking around and he doesn't know whether he's afoot or horseback, much less able to or not able to catch catfish. Finally he has – thinks he has thousands of purposes and he can't execute any of them and he is a confused boy.

Now, there is a school of thought, an interesting school of thought, that tells you that livingness is necessary. You very often hear an auditor say this. I've never come down under it or made many comments about it. But here's the truth of this school of thought of "livingness is necessary": Familiarization with something raises ability. You go out and pat an automobile for a while and you'll improve your ability to drive.

Now, that is true. Because it's an analytical, causative motion whereby the individual is actually touching and withdrawing from an automobile. And familiarization will result so long as the person is at cause. Now, that's as far as that livingness thing goes. But because it exists to that degree it has been stretched to an enormous extent. And what does it look like now? Well, if you have enough automobile wrecks you won't mind them. And you know that isn't true? It just isn't true.

Now, if you have a goal to wreck cars, you won't have much trouble in automobile wrecks, because that's your basic purpose, after all. You'll be able to wreck cars with enormous impunity. You'll be amazing. You'll be somebody like Lucky Teeter. You can go out on a fairgrounds and run cars over jumps and smash them into walls and lock them up in barns and set it on fire, and do all kinds of mad things on the subject of wrecking cars, and it looks like familiarization. But every once in a while this fellow, Lucky Teeter, will pick up some young fellow that he's going to train – and here's something very peculiar – he never seems to be able to train these young fellows. They wreck cars all right. And wherever Lucky Teeter has gone, you come in the town a short time afterwards, you will find that there's one or two young fellows in the hospital there recovering from burns, breaks and contusions.

Now, you know by experience that if you break your leg once it'll heal up pretty well. And if you break it twice you have a little harder time at it. And if you break it three times it
starts to get pretty difficult. And you break it four times you don't even bother to heal it up. In other words, you don't get used to it.

And the basic lie on the track is that you can get used to this universe. See? That is a wild game that passed off in some direction or another and it's never materialized. So a thetan keeps on going up the time track expecting at any time to get used to the universe. And he's getting less and less and less and less effective, picking up more and more psychosomatics, picking up more and more difficulties, having more and more GPM, always hoping he's going to get used to this livingness. That's one of the biggest operations that was ever pulled off on life. And it's one of the primary operations of this universe. That you can just get used to it – you're all set – if you can get used to it. If you just fall down enough wells, you'll eventually get an expert well-faller-downer.

Familiarization, oddly enough, requires an entirely different action. The pc must be at cause. And the pc must do the reaching and withdrawing. And life, if you will notice, does most of the reaching. And the person is carefully educated in this universe that he cannot have caused it. Having built it, he's now told somebody else did. Uniform lie.

You get the compositings of these lies and you get the fact that there was no possibility of a person living his way out of it. This is one of the earliest philosophies that you run into when you start to do listing. I'm not berating this universe. One isn't berating it just to say what it's about.

The individual, then, as far as the GPM – take any cycle of the GPM; operates as the whole GPM – the individual, then, is a universe. He is building up as a universe; he is collecting the mass of a universe, so on. Because he apparently follows identically the pattern of this universe. The physical universe is a ba – is basically built on a postulate which was alter-ised. That's apparently the mechanism of the sixth dynamic. That's apparently how it was built. Now, a thetan does this same thing and he builds up on this basic purpose.

Now, here's what's wonderful about this. There is only one basic purpose at a time. This is quite fabulous. There's just one at a time. Now, why that is, I don't know, see? You can find an earlier basic purpose in the individual – it governed an earlier cycle. But you won't find that earlier cycle. I've thought for a while you could reach deeper in the bank and you could do some things like that – no, you can't. You find the goal you find and you will only find one. That's qu- that's nuts, you see? You're only going to find one goal in this individual – until it is gone – and then you can find an earlier goal. Then list it out. And then you can find an earlier goal. But at no time do you find two goals! This maybe comes as a surprise to some of you, because I've never said it that emphatically. There isn't any such thing as two goals.

As you sit there as an auditor finding goals, you've paid your money and you takes your chance. There it is, man. There's only one. I don't care how long the list is, there's only one goal on it. You can console yourself with this interesting fact: that it does exist. Or the person wouldn't be here. It is here, in other words, and there's only one.

Now, that one has accumulated unto itself, by collisions with other identities and activities, many more purposes. What is the purpose of a catfish? Well, this is one of the ways – you get it by oppgoals – one of the purposes of a catfish could be "not to get caught." And an
individual who is catching catfish will eventually pick up the goal "not to be caught." And it's all tangled up in the GPM and he very often doesn't know whether it's his or somebody else's or anything else.

Other way: He goes up the track – the silly goof – and he's been catching catfish and catching catfish, but for some reason or other, Town and County Planning has eradicated all catfish, you see? They've gotten rid of them all and they passed an ordinance, you see, against them and said that this is it, see? And this is unreasonable because it isn't even in their department, you see?

But the individual is kind of wiped out about the whole thing so he gets the goal "to eradicate all governments." He decides that because, you see, he has to eradicate all governments in order to catch catfish, see. You get how this works, see. Now, in the process of eradicating all governments he finds out that he can't rouse up people to doing anything about it. He goes around and they're all reasonable, you know? They say, "Well, Town and County Planning men mean well, and they aren't all idiots the way you say, and they're perfectly reasonable, and you have to have planning."

Here's all sorts of weird and odd things, you see. So eventually he decides to hell with this, I'd better dream myself up another idea here. And he does. And he decides to increase his ability to convince people. Here's another goal: "to convince people." Now he finds out that the people are just in total overwhelm with regard to the government, and even though he convinces them, nothing happens. They just go on paying their income taxes and tearing down their homes and so forth.

And so he finally says, "To squeal with this." He says, "I'm just going to be above it all."

Now, you try to get him on an E-Meter and, of course, he yo-yos all the time. It's all right, I washed that one out last night so I can use it.

Now, you think your old goals will never be used again. You'd be surprised. They live on and on.

You see how it goes?

Now, he could have thousands of these things. He's got the oppgoals, and he's got the goals he had to have because of the goals, and then he finally finds out that catfish are sympathetic and come around and nibble at him when he's in despair, so he has a goal to be in despair. See? And it's all around. And then he doesn't know what he's trying to do after a while. Is he trying to be above it all? Or to eradicate governments? Or convince people? Or what? And somehow or other he overlooks the basic goal. He never seems to be able to get near it. It's so charged up by this time that he can't approach it. He doesn't recognize it. He doesn't know what he's trying to do.

And here is a being who is totally built, you might say, as far as the mass he's collected, on a purpose, being purposeless. And the result of his purpose is eventual purposelessness. And the reason he's purposeless and can't seem to get anything done is because he has a tremendous purpose that he doesn't know anything about, and to break your heart, didn't need in the first place.
Now, finding the goal is difficult. Sometimes it just drops in your lap. Finding the goal is difficult. And therefore, listing it by comparison appears to be less vital and so you're likely to neglect it. But this is true: Bad listing, or bad auditing during listing, can wipe out and cancel any benefit of the goal and make the pc worse! Just remember that when you're teaching HPAs and other people to list, see? Just remember that. Bad listing can wipe out all the hard work that the goal finder has done. A goal can become utterly and completely submerged and unrecognizable, completely challenged, mishmashed and the pc turned into a bundle of sensation and dizziness and no pain, and everything pushed out of line and messed up with bad listing.

How can you do this?

All right. Let me show you the basic mechanism. When you're checking out this goal, it isn't a goal unless it has pain on it. You all know that. All right. Their sen comes and goes. Sen is not opposition. I will tell you what sen is: Sen is the product of the three buttons: Suppress, Careful of and Failed to reveal. Now, I'll tell you some other time about Big Tiger, but you can just rack it up for now that you've got, in an ordinary Tiger Drill, you've got – this is an ordinary Tiger Drill – you've got over on the left side – if you can envision it here.

You've got three buttons here; you've got Suppress, you've got Careful of and you've got Failed to reveal. They're the guard of the left. And here we have: Invalidate, Suggest and Mistake. And they're the guard of the right. Got these three now? Group your Tiger Drill this way.

These buttons, Suppress, Careful of and Fail to review [reveal] produce sen, and these buttons produce pain. That ought to make Tiger Drilling awful easy for you. Not Big Tiger, but ordinary Tiger. See? Awful easy. There they are.

It doesn't much matter the order in which these buttons are hit in this particular drilling. But remember this: The goal fires falsely on the buttons on the right, Invalidation, Suggest and Mistake. They make the goal fire falsely. See? This goal I just gave you, "to be above all," it fires falsely if there's any fire in it at all, you see? You know, ticks and things – not rocket reads – but ticks and so on. It makes it look like it's the goal, you see? Because of these three buttons: Invalidate, Suggest, Mistake.

All right. Sen – sensation, motion, misemotion, so forth – these things are caused by Suppress, Careful of and Fail to reveal.

And when the goal doesn't fire it's in the left-hand column: Suppress, Careful of and Fail to reveal.

And when the goal falsely fires it's over here in the right-hand column: Invalidate, Suggest and Mistake. You got that? That's very neat, isn't it? All right. Well, call that just ordinary Tiger Drill. You see the goal fires, pick a right-hand button; goal doesn't fire, pick a left-hand button. Got it?

Sensation is totally not the product of opposition, although opposition will also give you sensation. You should ask yourself, "Why does opposition give you sensation?" It's because you're suppressing it and it's suppressing you. Actually, suppression gives you sensa-
tion. Being careful of gives sensation. Fail to reveal gives a sensation. See, it's a pull-in. Got it?

Now, these buttons can get tangled up with the right-hand buttons so that sometimes you get the goal firing and you find out it was a Suppress that was firing. But boy, that's all tangled up. And if you analyzed it very carefully you'd find out it was an invalidation which had been suppressed, you see? It's intertwined, it's a mess in other words. And you get it straightened out, but this is your order of action.

Now, you got this guy, he's got his goal – there's got to be pain, see, while you're listing that goal. There must be pain. There's also going to be some sensation and so forth. But while you're listing that goal, if you got the pc to suppressing you, the auditor, or if you the auditor got to suppressing the pc, his right goal will turn into a total sen. It is his goal and he'll get nothing but sensation on all lines. In other words, he's suppressing the auditing; he's being careful of the auditing; he's failing to reveal things. Don't you see? And the net result of that is it'll look just like a wrong goal.

And one of the primary tests of whether or not it's the right goal is whether on listing it produces pain. And if a goal only produces sensation, on listing, your first conclusion perhaps would be to call it a wrong goal. Ah, but supposing you have Joe Jinx who almost got through the Comm Course. He failed; he couldn't remember where the door was. And you got this fellow listing and you hear his auditor's report, see? You get his auditor's report.

And he says, "Well, I don't know, the pc, every time I ask these questions, 'Who or what would want to catch catfish?' and so forth, the pc just goes dizzy, or cries."

You finally say, "You knucklehead, what the hell's happened around here?"

Maybe you were the goal finder, see? "Did I miss? Could it be? Know that thing rocket read. Tiger drilled for hours and prepchecked and so on. It read and produced pain at that time."

Right then you'd start to think, "Well, look-a-here, I – this guy's doing something wrong!" And you'd find out, yeah, he's doing something wrong.

This is the way he was auditing the goal: "Now, who or what would-uh – would-uh-uh-uh-who or what would want to try cat – uh-no, that's wrong. Uh-who-uh-huh-uh ... What cat-. No, that's the wrong line. Who or what would try to catch catfish? Yes. What's the answer?" [laughter] Or he reads the auditing question, "Who or what would want to catch catfish?"

And the pc says, "A fisherman."

And the auditor says, "No, you had that, you had that a couple of lists back. You had that a couple of lists back. Can't have that one, you have to think of another one. You have to think of another one. That's no good."

Or supposing it went like this: The pc says, "Well, a fisherman."

"Well, why would a fisherman want to catch catfish? You sure that's the right answer? Now, what's the date of that?"
"The date of what?"

"Well, the date of that."

Or the pc says, "I'm sorry, I've lost the auditing question."

"Well, you must have a missed withhold then." And the first thing you know it's all over on the left-hand column. You got it?

Now, if you weren't the goal finder and you weren't sure it was the right goal to begin with, ah-ha! You're going to invalidate your fellow auditor and you're going to say somebody found a lousy goal. And you could just beat your brains out now because you try to do a Dynamic Assessment when it's already been done. And you can't find any dynamic and you can't find any item and you can't find nothing. You make yourself a lot of work and then you decide to prepcheck the goal. And accidentally the auditing gets prepchecked and all of a sudden the goal has pain on it again. Do you see that?

It isn't opposition that makes the sensation then. It's the suppression of the opposition and the suppressiveness of the opposition that causes the Sensation. See? Therefore, listing becomes very important.

Now, there are various tests for whether a goal is the right goal or the wrong goal. And with Tiger Drill these days and expert auditing and getting the goal to fire at the beginning of every session you're not going to get this type of submergence. That was another step taken. There's very little chance of a wrong goal being run. Very little chance of it. Because in the first place a goal when found ought to be checked by another auditor. I don't care who found it, including me; it ought to always be checked.

You always look it over, because in the first place, it might be one of these in-and-out affairs. You may not be aware of the fact that some goals have been tiger drilled, Big Tiger, for twelve hours and then faded. But they weren't rocket reading and they didn't look like a goal. They were very out most of the time, but they still produce sensation, they still produce pain on the pc for that period of time.

Some mornings you get up and you just should have stayed in bed, you see? You chose that goal to go into. The pc feels wonderful. So what! You didn't find the goal, you see? That's how long they'll hang on sometimes. But remember, those goals aren't rocket reading worth a nickel.

A real goal goes in and out and it rocket reads and doesn't read and it ticks and it ticks sporadically, and then it won't read at all, and then it gives you three beautiful rocket reads, and then the pc says, "Well, I'm in, that's it!" And having asserted this, of course, you get three ticks.

Or he says, "I-I just ... Well, I-I guess I'd better not have to put my attention on this anymore. They've just found it and if I just kind of withdraw over here and not pay any attention to the auditor, it'll stay in." Pcs do the darnedest things. And then you get – after these three nice, beautiful rocket reads – you get three complete no-read-at-all. All kinds of wild things occur on goals, but that is not necessarily the subject of this.
Let's say the goal has been tested, the goal has been checked out and there you have the goal. Now you've turned it over to somebody who lists or you're listing it yourself. Now, at the beginning of every session, which is done in Model Session, you want that goal tiger drilled until it fires.

Now, how fire is a fire?

Well, you'll find a goal which has been listed halfway out has about a half a rocket read left on it. And then they start going sporadic on their reads. They start going prior and latent and they start doing other queer things. They do all kinds of oddball things.

These, by the way, can usually be straightened out. You can usually resurrect a goal no matter how long it is – if you want to spend that much time on it – to make it absolutely read, a perfect instant read, every time. Now, how long it'll stay that way – the pc coughs and it doesn't read like that now, do you see? So you want that thing to fire every time.

Now, you see, that's a good provision. Because if it's the wrong goal and is made to fire every time, and if you prohibit listing unless the goal fires – you got that rule, see? Goal no fire; no list. See? Why, the worst that's going to happen to a pc is he's going to get three or four or five listing sessions and there'll be no goal. And nobody can make it read and nobody can do anything to it and nobody can resurrect it and – Big Tiger and everything else – nothing can pull it back to life again. There's no pain on it. There's no sensation on it. There's just nothing. It's gone. You see what would happen even if you had a wrong goal? See, that's a wonderful safety factor there, no matter how good you are as an auditor or how good the fellow who's doing the listing or the goals finding and so forth, you can always miss, see? So that's a good safeguard to have in there.

Completely aside from this, listing is not effective unless the goal is firing. You won't get listing done unless you get the goal firing. That's why old listing took so long. Did you know it took upwards to two hundred hours? Did you know it took that long? And that was done without getting the goal to fire. It was done on too few lines. And it was done this way and it was done that way. It still produced some Clears.

These characters are always very, very happy now to get sixteen or twenty-four lines at least. They say, "Well, that's funny, I mean, you know I kept rolly-coastering. I'd get up in the morning, I'd put myself on an E-Meter and I'd read 2.75; then after I'd had a cup of coffee I'd read 3.1; then by noon it would be settled down with a total free needle; by five o'clock in the afternoon it'd be reading 2.5." It worries them.

Well, why are they worried? Why do they put themselves on E-Meters and do other odd things like this?

They got pieces of GPM still kicking them, see? Their needle was free in the session, then a couple of days later a piece of the GPM from the same channel keyed in on them. Do you get what happened to them?

When that's all listed clear on enough lines, that doesn't happen. You see, you got a high degree of stability. And if the goal is made to fire at the beginning of every session – just at the beginning, right after the beginning rudiments – that goal was made to fire, and made to
fire so that you say, "To catch catfish – pang! – To catch catfish – pang! – To catch catfish-pang! That's fine. Let's get on."

     How much of a rocket read must that have?

     Boy, I pity you, I pity you – the questions that are going to be asked you and you and you by people doing listing on the subject of how fire is a fire? Because as the goal begins to pass away and the force and power of it deteriorates, you're going to get decided differences in what a fire looks like and what is a fire. Eventually the goal is going "Tsk, tsk, tsk." And eventually the goal is going "Tsk..." [laughter] You're going to have more people coming to you saying, "Gaaaaaaaaa!"

     Of course you look for the other signs: Pc still getting pain on listing, lines are going fine, pc's looking good, everything's going along like a hot shell. And there we are. Say, "Go on, go on, list, list, list."

     "Yeah, I know, but I can't get it to fire."

     "Well, get the pc to fire instead. Go on, get a listing."

     This is what – this is what you face. This is my subtle revenge on this matter for all of the questions you've asked me. [laughs]

     All right. Now, if a listing session is a wrong session, you're going to get certain manifestations occurring in that session which are very easily distinguishable, and so forth. But the subject of what I'm telling you right now is, is smooth auditing. (Take that up in the second lecture, see, the exact lineups.) But the trouble that you're going to have, is – been because of the various preventions. Really not with wrong goals. The trouble you're going to have is with lousy listing, see. Because that's unspectacular.

     Listing is quite exciting. You find lots of items. And all of a sudden you find an item and, "Oh, woof, what's that? Wow, whoa. Wow!" the pc says.

     You say, "What's – what happened?"

     In other words, there's a lot of excitement to be had in listing. And there's the other thing that you want to train people to do about listing: Is the randomity produced by the pc is usual, ordinary, standard; the convulsions, the foam at the mouth, these things are not anything to worry the seasoned auditor. What he is supposed to do is ask the next listing line. That is what he is supposed to do. And when people come running to you and their face looks so white that a paper company would pay a fortune – they'd – that is – they, he says, "Huh-heh-huh-a-heh..." Pc ...

     You go back and you find out what's happened. Nothing. The pc just got off items one and two. They were counter-opposed, they both stuck together, and all of a sudden the whole back of his head blew off and his body coordination went kind of baaaah for a minute, and he's sitting in the chair going like this, getting over the shock. Now without an auditor. [laughter] What you're supposed to do is ask him the next auditing command.
And if you can train a listing auditor to be able to confront pcs and ask for the next auditing command, and write it down and not fumble paper and drop the sheets all over the floor, and a few things like that, your listing sessions will go off like a bomb, the goal stays in, the pain all stays on, you don't – you need a minimum number of Prepchecks and the guy goes Clear – swish. That's very much to everyone's interests. It's a minimal number of auditing hours.

Now, the worse a listing sessions are, the longer it takes to list a goal to free needle. And the monitoring thing is not the state of the pc's bank but the smoothness of the auditing of the listing auditor. That is almost the total determination factor on how long it takes a pc to go Clear after the goal is found. One pc doesn't have more items than another pc. That is almost neglectable. You don't have to do anything about that. They all come out about even.

But one pc's list will get longer and longer and longer and longer and lo– what's he doing? Well, he's actually not blowing anything, so he keeps putting the same items back on the list, hoping they will blow, you see. He isn't in-session. The rudiments are out. Other things are wrong. So therefore, it appears that he has a much longer list.

The length of time it takes to go Clear is determined by the skill, quietness and ability of the auditor doing the listing.

And by and large, so far I've found that the goals found at Saint Hill, that those goals which were found to have been – gone out, apparently, or weren't the goal – that was of last year, you see – goals were found and run on other Routine 3s. They were the goal, but they'd just been very badly listed. And the pc was total sen and hadn't gotten any better and everything ...

A person takes his life in his hands leaving here without his goal listed, let me tell you that. I'll just put that across the pan. You think you save time by going home. Ha-ha-ha-ha-ha-ha-ha-ha-ha. Not so.

So anyway – just holding that horrible thought up to you – it's the quality of the listing auditor. So my point of this lecture is simply this: is listing may not be spectacular. You might say anybody can do listing. But just remember this: Anybody who can do listing must also be a very excellent auditor. He's got to be smooth. He doesn't have to be clever, he doesn't have to be spectacular, but he's got to be smooth, he's got to be able to keep the pc in-session and he's got to be able to do his job without chopping the pc up. In other words, he's got to be pretty good.

What you try to keep from happening in a listing session is randomness, questioning, Q and A, auditor taking up items, all of this nonsense. The best listing session is an almost totally muzzled session. No comments, no two-way comm, nothing. That's the best listing session. It's just a bare-bones session.

Okay?

Thank you.
A lecture given on 27 September 1962

All right. This is lecture two, September what? Twenty-six?

_Audience:_ 27.

Twenty-seventh. You got a day ahead of me. Holy Cats! Here I've been in Wednesday all the time, and you're in Thursday. September, 27, AD 12. And this is lecture number two, and it continues on the subject of listing.

The rules of listing. The rules of listing consist of good Model Session, simple auditing, minimum two-way comm, rapid writing, rapid writing, minimal paper-shuffling, get the goal to fire before you list. Goal no fire: no list. And in addition to all that, be alert for free needles on lines, and when some line has gone free needle, you drop the number of items to be listed on it.

You still include it in the lineup, to make sure that it doesn't, till you're absolutely convinced that it's going to stay that way, and then you can drop it out. But that's adventurous. You just minimize the number of items. You are listing right now – probably this number will change, this number I'm about to give you will alter – forty lines is the current number of lines being listed on a goal, and those are all listed to free needle. And the number of items you write on a line is four, and you include it in the auditing command.

You say, "Give me four items for the line, 'Who or what would want to catch catfish?'" And you take your four items. And if the pc forgets the auditing command, you can repeat it for him. But you omit the "give me four items." You can say, "The line was... 'Who or what would want to catch catfish?'" is the way you repeat it, okay?

Now, that's total standardization. You don't want five, you don't want three. Now, after a line has gone free – and this is subject to amendment on experience – after a line has gone free, you want just _one_. If it's sitting there with a free needle, it's been sitting there with a free needle, you can cut down the number of items listed. And you say, "Give me _an_ item!"

And you get one item for it. That at least keeps the balance. Otherwise that thing is liable to jam out, don't you see? "Who or what would want to catch catfish?"

Now, this permits you to catch up old lines, because some lines have been listed a lot longer than others. Don't you see? Because somebody has been listed on four lines or sixteen lines, and therefore, those lines would wind up as being overlisted. They're liable to go Clear, or free needle, before the other lines. There's a possibility of this happening. So this four and one proposition permits those things to catch up.

Now, however many lines are listed is not very important, and exactly how you handle items after a needle has gone free does not invalidate the data I'm giving you. That's susceptible to amendment. But the facts are these. That you don't want to overlist a free needle. That
is one of the rules. Don't overlist a free needle. This person is very, very free, and you overlist it, and you're going to run into the possibility of jamming it all up again. Because the pc is having to create answers, and you have entered in on an area called Creative Processing. And it's not permitted these days.

You see how that would happen? All right. Now, a pc looks like he's dreaming up the lines, and thinking them up, and creating them – actually not. They're dealt to him like a stack of cards. He's just dealing out the GPM. He's not inventing anything until he gets to a free needle. And then to have an item he'll have to dream up an item, unless he repeats an item. So you mustn't overlist free needle lines.

Now, the next thing is, is what is a free needle? Well, a free needle is best described as a free needle. Somebody – this is also – you're going to have a happy time with this; more power to you. I can see you now, standing there, somewhat overwrought, having to answer off the bat three people in a co-audit, all of whom are asking you, "But what is a free needle look like?" And they show you proudly a stage four needle, you see.

They say – the other one-another one is saying, "Is a free needle a quarter of an inch wide, or a half an inch wide?", see. "Is it a free needle at sensitivity 16 or sensitivity l?" "Is it a..."

And the answer to that is the same answer I'm going to give you. When you see one, you will know one. I've never had anybody fail to look at a free needle that didn't recognize it as a free needle. It suddenly has become unattached to anything. The needle apparently is not connected to the meter or the pc or anything. It's just sitting there floating. And it has an odd, floating characteristic, that has nothing to do with falling or rising. It floats up the dial and it floats down the dial. The pc will be somewhere in the vicinity of Clear read, depending on the accuracy of your meter.

Do you know that after you've carefully set up a meter, during the process of a session, the discharge of batteries, the warmth of it, the heating of the cans, a number of other things, can change the position of the Clear read? Did you know that? So the way you handle a test, for whether somebody is sitting at Clear, is not to take the meter which you tuned up this morning, and test the pc with it this afternoon. You got that? You have to set it up instantly before the test, and the meter has to be warm. Okay?

If there's any doubt about it at all, have an electrician get you five thousand ohms, and twelve thousand five hundred ohms, and put them on a couple of clips. They're resistors. And get a pair of resistors. You hook those between the cans, and it's very simple. You get two resistors and just – they've got little clips on the end of them, you just hook one end to one can and one end to the other can, keep the cans apart, and your meter should come exactly to the Clear read female and the Clear read male. Okay? Should come right on. In other words, you could know your meter sat someplace else. Don't you see?

But actually, the resistors can be changed inside this by the trim knob. That's why the Mark IV and later designs will be found to be built with a variable resistance inside the meter. Meters can be changed, meters can be dropped. You can suddenly start using a new type of
battery or something of the sort in a meter, and have some other situation set in, don't you see? Something can happen to your meter so that it is no longer accurate.

But as far as exactly reading on the Clear read, you should know that five thousand ohms and twelve thousand five hundred ohms is standardized only on fifteen people. That's the original standardization. And that wasn't a very good standardization, don't you see? It was accurate, it was accurate, and it has held amazingly accurate. But what is amazing about it, is that it has held accurate. Do you see that? What's amazing about it, is that they do go to five thousand ohms for a female and twelve thousand five hundred ohms for a male. I mean, that's rather fantastic when you come to think about it.

How come? You'd think all thetans were built on the same battery circuits, you know. Actually, it's just the residual resistance of the body itself, and it's not so amazing, because a body is built against certain potentials and actions-electrical potentials. And a body does not depend for its electrical potentials upon the mass of the body.

You're going to get this little four-foot-eight little girl midget, see. Here's this four-foot-eight little girl, she's a very petite package. And here's this girl who has been one of the chorus, she's six-foot-four, see. And the little four-foot-eight girl, why, she weighs upwards to seventy-nine pounds wringing wet, you see. And here is this beautiful chorus-line girl, and she's six-foot-four, you see, and built like an Amazon, see. And she weighs something on the order of two hundred and ten pounds, you see. But because these are girls, they're both five thousand ohms. Gets me, you know. In other words, this is inserted amongst the same set of anchor points, you might say. It's this – this – anchor points are the similarity, not the mass of the body. All right. That's beside the point.

How accurate this is, to some slight degree, remains to be seen, see. How dead-on this is remains to be seen. I have to give you that word of warning because I tell you what the calibration was based on, see. Based on only fifteen people. All right. And on an American 1957 meter. Something to know, isn't it?

And I tuned up its resistances afterwards, and I said that's what they are. And the electronics boy, Scientologist, there working in the organization went down immediately and... You know, it some – it's something like carrying the measurement on a piece of string. You've done it yourself. You've taken a piece of string at one end of the garden, you know, and carried it over to the other end of the garden to find out if you could get the chair through the gate, or something, you know. You've done things like this. Well, that's – that's about the accuracy of it, see. He took the piece of string, you know, down to the electronics workbench and measured it. Actually carried the meter down, and measured its ohmage.

Now, that was the score on these things. Now, the basic datum on which this is taken is interesting. It's the United States Army meter resistance, or electrical resistance of a dead body. And they claim it is ten thousand ohms approximately, with great differences. They never noticed, see. They averaged this amongst men and women corpses. Get the idea? That's the only other known datum on this.

Now, if you want to go down to a mortuary sometime with a volt meter, why, more power to you. And if you do, for heaven's sakes send me the data. They got some stiffs down here and so forth. There are three white men, a Mexican, a Negro and a Chinese, you know?
And their ohmage is so-and-so and so-and-so and so-and-so. Good. I'd be very happy to have the data. You see, the data's quite scarce. Very scarce.

Now, just with that word of warning, put your reliance on the free needle.

Now, you're going to get somewhere near, on your meter, the "M" for males, and the "F" for females. But as long as it's in that range, don't quibble about it too much. But let me tell you, that if men are reading at 2.0 with a free needle, and women are reading at 3.0 with a free needle, I don't know what's reading with the free needle, but it's not the pc. See, if it's within a tenth, within a quarter, something like that, of male or female read, fine, see. That's fine. Don't argue with that too much, see. But a whole division, or a swap-around that way, no, I – that's too far out.

Now, as far as somebody reading with a free needle at 5 – nup, nup, nup. Ain't never happened, ain't never gonna happen. When they get up to 5, man, there is something wrong! When somebody's reading at 4.5 and 5 constantly, and never comes down from 4.5 and 5, all tone arm motion is somewhere in the vicinity of 5, like 4.75 to 5.25, see – you've got something wrong. That we have learned. That is just experiential, that is absolutely, completely, empirical data. Just by observation.

Somebody's listing, and they never move off 5, and one session they're at 5.25, and the next session they're at 4.75, and next session they're at 5, and they just – 5 and 4.5 and 5.5 and 5, and ... Well, you better look into that, man, because that's one of the warning signs. That's one of the warning signs. That's wrong goal, wrong auditor, you know.

Now, these things are important to you, because they are the criteria by which you're making a Clear. It isn't whether or not the pc can spring over the back fence with one leap, see. Or whether he can now do a hundred and seventy-five handstands, whereby yesterday he could only do one, and collapse, you see. That has nothing to do with it. That is spectacular, but it's not data. Clear is registered on a meter. Not on a pc. Because, boy, can you be fooled.

Somebody can go into some tearing manic, you know. Man! They've never been able to lift pianos before, and they got one in each hand, you know? [laughter] There they are! And you say, "Well! Fine! He's Clear!" Yeah, he's Clear, till that valence called Hercules suddenly slips into another part of the bank, you see. That was always the trouble with it, anyhow. It was never there when it was needed, long enough.

No, it's not the conduct of the pc that makes a Clear, see, never. Now, the only use – the only thing you use the pc for is to find out if the pc is looking worse. Now, how much worse is worse? Well, I could again see you standing in that lecture room with eighteen students standing around you, saying, "Well, the pc looks worse." And they all think, how much worse is worse, see. "How much worse is worse? Is worse worse than worse, or is worse worse than worse?" Well, worse is how the pc looks when they're being audited on wrong goals or by the wrong auditor. That's – that's what worse is. That's how the pc looks.

Frankly, it is basically a question of how old they look. There's another factor which is interesting. It's a glowingness of the skin. When a person is going wrong way to in goals finding or Prepchecking, and it's all getting very weird and rough and mean, or they're being audited on a wrong goal, their skin goes dull, very dull, extremely dull. So much so, that I can
usually tell at a glance just about where somebody is in processing and how well the processing is going.

Because it's the youthness of the skin. And after they've been audited properly, you'll find that they glow. The skin has a glow to it. Has nothing – anything to do with color, it's just that the skin glows. And the skin doesn't glow, they are not making good progress. Skin does glow, why, they're making good progress. Skin was glowing yesterday, isn't glowing today, well, they're having a bad day.

Skin was glowing on Monday, but on Tuesday, Wednesday, Thursday, Friday, Monday, Tuesday, Wednesday, Thursday, Friday, you in observing them, decide that they're looking older, and look less glowy, and less glowy, there is something wrong. You understand? They'll get less glowy for a period, like a day, or two sessions, or something like that, and more glowy. But consistent unglowiness, we don't tolerate. Got it? It's – you might call it the firefly effect.

But you'd be amazed. Now, the funny part of it is, is their physiological structure changes in clearing, and they look older, and they look worse, and they – their bones go worse. Body mass and – can be measured on scales. But these other things aren't as measurable as that. Their body mass will ordinarily lessen on proper auditing on the right goal. It'll streamline down. And it will increase, definitely, on the wrong goal. And will not decrease on bad auditing. Not decrease on bad auditing.

Won't necessarily increase on bad auditing, but it could. But not necessarily. On a wrong goal, it increases fantastically! Zoom! You're liable to have him put on two, three stone-twenty-eight, forty-two pounds, to Americans. I didn't get this "stone" stuff myself until a short time ago. They didn't have any weights over here, they had to use stones. That's ... [laughs]

Anyway, weight goes up on wrong goal and doesn't decrease on wrong auditing. That's just a casual mark, not of any vast importance. Might be of some interest to you. This glow principle is very important. People run on wrong goals unglow fast. The tides of night sweep across the psyche.

Now, physiological facial structure can alter, too. I've seen jaws, jawbones decrease in size, increase in size, faces fill out, so on. Quite a common thing is for the face to start sinking under the wrong goal or bad auditing. The face gets sinking – it starts sinking in. Gets flatter. And starts to fill out on good auditing and the right goal. The shape comes forward.

All of these are various manifestations. And you'll get a little experienced on this, keeping your weather eye peeled. And one fine day, why, you get to the point where you can just – actually just look at a case and know whether it's running right or not, you know. Bang! Just like that.

You say, "Well, that isn't so good."

You would ask the auditor, "Which lines is the pc ARC broke on?"

And the auditor would say, "How did you know?" you know.

You'd say to the pc, "Well, are you very dizzy today?"
"Oh, how did you know?"

The room is going round and round and round, you see. Wrong, suppressive auditing. Other things, see?

Now, if the goal is found but the pc is running wrong in listing, you have these items that could be in error. It could be one of these: One, the goal could be wrong. You never really trust a goal till it's been listed a bit. Yeah, all the other signs are fine, and the wrong goal won't keep on firing, and a lot of other things, but just for your own peace of mind, why, the goal is found and proven when it's been checked out by a – found by the – an auditor, checked out by another auditor, and listed a bit. How much is a bit? I can see you now, in the lecture room... [laughter] Why should I dream up figures for these things, you see. They depend basically on observation and judgment. Trying to communicate them to you with a bunch of invented facts would, I'm afraid, serve no purpose at all.

Now, these are quite correct, these, these six things. Goal could be wrong; (2) lines could be wrong; (3) auditor has not cleared goal by "in auditing, on the goal..." Tiger Drill and gotten goal reading, see. Didn't get the goal firing – number three; (4) rudiments are out. I think you possibly have heard of rudiments being out in sessions. That includes, of course, missed withholds. Bulletin May the 3rd, 1962; (5) pc protesting about listing a line or listing lines – listing and lines. Pc's saying, "Whra-whra-whra-ne-wra-I don't need these lists-ah-tha-wrah-tha-nah." Something wrong; and (6) the consequences of being cleared. And that you haven't paid enough attention to.

That's a very, very interesting one, however. Pcs have been known not to put their goals on a list, because they were so frightened of becoming cleared. What happens to you when you become cleared? Oooh, you turn into solid glass, of course, and then put on display in the Metropolitan Museum. They know what happens to you if you get Clear. They – of all of the aberrated balderdash and nonsense you ever want to listen to.

Well, get somebody who has been – who has got "Nothing" confused with having been imprisoned. You know, they got a complete identification. Remember people get identifications. You've heard of A=A=A=A. Well, it's never more present than in the vicinity of the goal – never more present.

And they get some wild identification of some kind or another and they want to be cleared, but when you come right down to asking them for their goal, you'll have a person here or there who will suddenly – you can hear the squeal of the brakes, you know? You can see the furrows in the roadway as the heels dig in. And they'll have various interesting things go wrong. Odd part of it is, this is not the thetan operating, see. They got a valence, and it's having a ball! And of course the keynote of any valence is survival. That is the common denominator of valences. And things that valences do to perpetuate themselves is fantastic! And one of the things that they do, is resist clearing.

You see all the time the pc was living that life he was trying to live, wasn't he? He was trying to survive. Well, this valence is just the leftover shell of that life, which go on – goes on operating in the bank like a thinking being. Well, there it is, and its basic motivation is to survive. And all of a sudden the person gets the idea that something's going to happen to va-
lences. You know? But as a valence, gets the idea that something is going to happen to valences, you got that?

This is very funny. As a thetan, the person is all the time cooperating with you to get Clear, see. But every once in a while in an auditing session, or something like that, particularly somebody who has a goal that is in the direction of good auditing, or something like that – a person with a goal, "to be a good auditor" – you know, let's say that was the basic purpose of the person, which it wouldn't be, you see – we get a "to be a good auditor" and then you get him shifted, and they're in a valence of a pc. And they aren't themselves as a pc, ever, you get the idea? Something weird like this going on. And they set up the awfulest commotion about sometimes about going Clear. And they stand back, and look at themselves and "Look at this silly mess I'm making. Now, what it is?"

You know, if you ever believe it, you almost crack the person up as a thetan. If you really pay any real attention to this. You know, besides clearing it up. If you should say, "Well, he doesn't want to get Clear," and so on, man! You'll see this as we go along the track here on Earth, you'll see this.

There's somebody bra – he's throwing brickbrats – bats, you know, and he's drawing cartoons of us, and he's raising hell with us, and so forth, and he's screaming in an awful fit. And if you really want to break his heart just tell him, "Well, we're not going to clear you." Maybe the very subject of the cartoons is "Getting Clear – that's terrible! They're making supermen! They're doing Germans' stuff! And we're going to be invaded again, by men from Mars!" and any kind of idiocy, see.

And you just say to the fellow, "Well, we're not going to clear you." He'll really go to pieces. This is the most fantastic thing you ever wanted to see. And if you Q-and-A with this, and if you get a pc actually in there saying, "Oh, no, no, no! I-no, no-tha-da-listing lines is terrible!" and so on. Just finding trouble, see. The auditor's wrong and the lines are wrong and the goal is wrong and everything is wrong and you're wrong and the room is wrong and everything is wrong and you can't audit and so forth, and what did they teach you at Saint Hill anyhow, you know. On and on and on and on and on and on and on and so forth. This could be one of the things.

Well, you don't condemn the person, you simply audit it. Because if at any moment during all those protests, you were to say, "Well, all right, then I won't," you should see their face sag. And a person will come right out of a session doing that who hasn't found his goal yet, or something, and write down lists for you and give them to you and force them off on you and everything else, you know. This is the most fantastic phenomena that you ever wanted to witness, when you really see this in high bloom. And you never suspect it because the person is quite often quite cooperative while they've got their heels set. Covert. Only their cooperation will be quite real. But they've still got their heels set.

There's various ways of doing this. The simplest one of course is "What would be the consequences of my clearing you?" Remember it must be "... my clearing you" or "... our clearing you." It is never "What's the consequences of going Clear?" That is a wrong auditing command. It's generally tied up with the person's valence, which is opposed to some valence that you are. Let's say you're a male auditor and it's a female pc and she hates men. And the
consequences are not that of going Clear, but of being cleared by a man. She knows what that means. And this is basically what is at the bottom of it, see.

Going Clear gets associated in people's minds with being killed and exteriorizing from a dead body, which of course it isn't. See, being Cl– going Clear gets reactively associated with the idea of ceasing to exist. They very often will give you some of the silliest answers. Some of the answers you hear coming off of this, the person listening to them himself or herself doesn't believe them either. They just sound utterly balderdash. And it's a valence proposition is what you're looking at.

Well, if the pc is stuck that thoroughly in that valence, that valence is oddly enough not going to list out. It'll be the valence the pc doesn't see or the valence the pc sees last is the valence the pc is in most. Now, I call to your attention the old Reality Scale, and some of all of that data. See, it's the last one they see, is the one they're in the most, see.

My God, it'll kick up an awful fuss. And you're having trouble, trouble, trouble. Well, there's various reasons pcs can get ARC breaks in goals finding. We're not touching on those now. Although this consequences of being cleared does enter into goals finding. But it certainly enters into listing. And it enters into listing more than it does goals finding. Person might have sat there like a little wooden soldier and let you find their goal. And you start listing it, and this is another story. Because you're asking for valences, and the valences restimulate, and all of a sudden everything is blowing up and going to blooey, see. Yow!

"Oh, you mean to say, me as a soldier is going to get killed. Me as a mother is going to get killed. Me as a ..." see, "... is going to get killed. I am being wiped out. I am being slaughtered," so forth.

Well, I don't know. It's exteriorizing them from a valence. They also restimulate, of course, death. And getting rid of a valence may restimulate the idea of exteriorization from a body. You see these various things, how they cross up. But they're just reactive and they have no basis in fact and they're nothing to slow you down. And if you don't clean it up, you of course have got somebody who is ashamed of being so ARC breaky. And you just hung the person with shame-shame, so therefore they suppress this, and the next moment you've got sen, sen, sen, in all directions if you let them stack it up, stack it up, stack it up. Okay?

Now, the – as I say the auditing command "What is – what would be the consequences of my clearing you?" "What would be the consequences of our clearing you?" whichever seems to fit the bill. And you run that. And how flat do you run it? Well, I can see you now, standing in that lecture hall ... Anyhow, let's go on.

Actually you never do patch - I'll give you a rule for that. You never do patch-up jobs longer than is necessary to get done what you were trying to do in the first place. Now, if you'd just had that when you were coming up the track – I hate to be critical – but if you'd just thrown that second goal away, you see, at the time that it ceased to be of any use to you. You'd – that is to say, in effecting the first goal – see, you're trying to effect the first goal so you get a second goal. And if you use this second goal longer than is necessary to get the first goal effected, why, then you've got your start of the bank. And auditing can actually approximate that little goofball situation there.
So, don't ever do anything longer than is necessary to get done what you are trying to do. You'll save more auditing time that way. That's a nice, crude rule of thumb, but it's awfully good. You're running O/W, and you're still getting needle ticks and actions when on the question, but the person's needle is now smooth. And you keep on running O/W. Well, you're being a knucklehead, of course.

Similarly, any such thing as, "What would be the consequences of getting Clear?" you'd run that long enough to get items on the list smoothly and without trouble. Because of course it's just coming from a valence anyhow. And this process is not going to get rid of any valences. Trying to change the mind of a machine, a valence or a circuit is – underscore this – impossible. You cannot change the mind of a valence or a machine or a circuit. It's not possible.

You can submerge it, you can suppress it, you can wreck it, by making it inactive. You know, hit it – you can hit the steam engine hard enough on the valves and controls, and so forth, so it apparently won't run, but you can't change it into a petrol engine. You know, say, "Run like a petrol engine," and keep stoking up the boiler. Won't work. You can't change the mind of a valence.

That by the way goes back to the first lecture I was telling you, why thought, see. Well actually, the thought is encased in mass. And you can pull some of it out, and you can alter it in the mass, but in aggregate, the mass exists on and on and on and will continue to encase thought. You can't take the thought out of the mass, but you can take the mass off the thought at which moment the thought evaporates. I've lectured on that before. Quite interesting phenomena.

Yet you can list these consequences of being cleared out, providing the consequences of being cleared aren't causing suppression in the session. So you see you can deintensify a mind, but you cannot change a mind. So all you're doing with this is deintensifying the objections. Got that? When I'm saying "a mind" you realize I refer to the mind of a valence or the mind of a circuit. These are little minds that guys have stuck around their own mind, the mind majeur, and I was referring to the mind mineur.

All right. Somebody sooner or later though, is going to take that out of context and say, "Well, Ron says you can't change anybody's mind."

Now, that's an easy one, and you wouldn't have any real trouble with getting this. Providing you do it. The reason I'm giving you so much talk on this, is it keeps getting lost.

Because the truth is that the pc actually wants to be Clear, would do anything to get Clear. That these objections are so much of a lie and are so aberrated and the pc knows they are aberrated that you very often ignore them. By tacit and common consent. So this is one of the things you must do in listing. Let's find out – if we're having a hard time finding a goal and certainly if we're having a hard time listing – find out what are the consequences of "our clearing you" or "my clearing you." What are the consequences of it?

See, the goal-finding auditor actually was just finding something. But the listing auditor is clearing somebody. See, he couldn't do it if he didn't find the goal, and the goal is the
important part of it. But the clearing will not take place unless the listing is done, don't you see?

So the consequences of being Clear are very, very important to the listing auditor. You'll see that a tremendous number of cases go right down sometimes to the last two days before all lines go free. And they just go to pieces, man! Oh! They're up all night, and they come in, there's circles under their eyes, that go clear down to their chin.

"What's the matter?"

"Oh, well, heh-heh. Heh-heh, heh-heh-heh-heh. Why don't we just knock all this off now?"

And if you've run very bad sessions you don't have the pc at all, you have a telegram from Edinburgh – they're still heading north.

It'll just be some valence that's very, very reactive and the pc just going through a total dramatization on this silly valence. And it'll deintensify, and the pc will come back rather shamefacedly of themselves, and you start to list them again, the valence goes into full cry, and they try to dive out the window, see. This is the wildest thing you ever heard of.

It is the entity fighting for survival, is what this is. And why does it fight for survival? Because it wants anything? No, it's not even sentient. It is a reflective area which mirrors a lifetime in which the pc fought for survival as that thing. So therefore, a restimulation of it restimulates a fight for survival. That's the wildest thing you ever had anything to do with, is battling around with some stupid entity this way.

The pc: just as mild as milk and everything is fine on Monday. And on Tuesday: "Ny-ah-lyah-yah-wrah-rah-rah-rah ... !"

You say, "What's gone wrong?" Well, you can take the explosion out of it by pulling the missed withholds and getting the pc in-session, and that sort of thing. And you can also realize that once you've cleared the consequences of clearing, sometime down along the line of listing you may have to clear it again. Got that?

It isn't an action which you only undertake once. You may have to undertake it two, three times. Remember, as you list this person you're shifting this person into different parts of the bank. And you finally get this person into the part of the bank named "Space Opera, doll-body bin number 8647."

Now, at that particular section of the bank, life was tough. Life was hard. One was either the galactic police or one was this pirate commander or one was the rebel or one was the tough spaceman's crew or one was ... And everybody was practically unkillable, except that the weapons were very painful, and life is hard.

And you – this pc's been going along just fine. And you run into this where survival is spelled with a capital "S," you see, and all of a sudden the pc's: "No! No! They don't know! They don't know about being Clear!"

They made a mistake. They think they better go back to Australia or something. Anyway. And there it is! You're confronted suddenly with this, and you don't usually go back and try to reason it out or say why. You'd think maybe you'd go back and – but you might out of
curiosity and interest look at the last items the pc listed. Here's another little rule in listing or in finding goals, or in listing goals: The pc tends to dramatize the last goal or item put down.

Pc comes in in the morning and says, "Oh, my God. I just all night long lay there smelling fish." Look on their list. The last item they wrote in the session the day before was "fishmonger." "A disgusted fishmonger" is what they put, see. All night long, fish! That's odd, but the last item – it isn't the next item up that they haven't told you yet, it's the last item down. They'll tend to dramatize the last goal.

I'll tell – give you an instance of that. I told Reg this one time. And he – somebody who had just been put to listing goals as a therapeutic measure which of course is quite therapeutic – this person, in listing goals, had been listing them away, and all of a sudden "Yow-yow-yow-yow-yow-yow!" and was on the phone and was terrified and everything else, and Reg remembered this little rule.

So, he made her write a few more goals. Got the last goal – sure enough, she was dramatizing the last goal she had written down, see. She hadn't actually stopped writing goals, because it was that goal, it just was the last goal on the list. So then she started dramatizing that goal. I don't know what the goal was, maybe it was "to be terrified." But you can count on that.

And it's very funny. You'll go along on a day's auditing, you take a break – take a break sometime – and the person has written down "a sad Chinaman." And during the break, you look at the pc – [laughter] it's quite wonderful.

You – the mechanisms of the mind are gorgeous indeed. You say, "Well, all right. The fellow regurgitated it. He's already got rid of it. That is the reason why, it is now out there," so on. Well, that must not be the case. In other words, he doesn't get rid of it all the way. Apparently items nudge, and goals nudge, the last one out, see.

You get some weird theories on this. It doesn't matter whether you have a theory on it or not. The fact is, you got to get items listed. And when they're listed down, why, they're down. And very ordinarily the ones higher on the scale are out. But the one you just put down isn't. And sometimes in a listing session, your pc will be looking at you suddenly, beadily, meanly. You say must have a missed withhold, and so forth. Don't be a knucklehead and bust up the whole session.

Actually, the less you do in a listing session, except list, why, the better off you are. Because that's auditing. So the less you do, why, the better off you're going to be. And the less trouble you're going to get into. And the reason the pc was sitting there, looking – well, why don't you look at the list which was right in front of you? You just got through looking down and you've written down "an angry mind reader." And there he is, the angry mind reader, see. Quite amazing.

Pcs apparently – not always, but sometimes – peel these things off by putting them on their own body first. I don't know, it's like you deal cards backwards, you know. Instead of – you know, you pull them on to the deck, see, not throw them off of the deck before you throw them out, see. It's like taking dealt cards that are scattered all over the place in the pc's bank,
and then they put it on themselves, and then they throw the valence over their shoulder or something.

Well, in actual fact, they don't do anything with the valence. The valence is evaporating because the alter-ising thing is the basic purpose. See, valences and units and items don't go anywhere. They vanish. They don't go back on the track, or out into space, or clutter up anything. They just vanish, because they are built of alter-is of the pc's basic purpose. You understand? You don't have to worry about them.

Now, the signs of a wrong goal or bad listing is (1) the TA is mostly at 4.5 or 5 – it never comes down; (2) pc is ARC breaky; (3) pc is looking bad – there's your "firefly factor"; (4) no pain. Doesn't matter how much sen is present, as long as there's also pain, you understand, but no pain – man, there's something wrong, see; (5) all sen – which of course contains no pain but all sen, nothing but sen, nothing but sensation. The pc has been weeping for the last four sessions. Now that's sensation, man.

I had a pc tell me just a moment ago that no sensation was coming off, and I know the pc was crying in session today. See, pcs are not reliable judges of this. The auditors have to ask. You understand? You have to ask. You have to check up on this. Don't just sit there forever. Just ask once in a while if the pc's got any pain or if the pc is dizzy or if the pc feels any emotion. Think of that once in a while when you're listing. But of course, keep it to a minimum, don't chatter on it, because it's just for your data.

"Is everything going all right?"
Pc hurts. "Fine."
"That's dandy."

Now, if it's all sen, this is really going wrong. Now, this is something that you should start worrying about. All sen – now this is wrong. There's something real wrong here. Now, you're getting suppressions and you're getting all kinds of things, and it might even go back to a wrong goal, you see. But suppress, protest, the pcs auditing under protest, pc is ARC broke, pc is suppressing the lines, pc – usually, the commonest cause of a pc going all sensation is not wrong goal. The commonest cause of it is the pc doesn't understand the listing lines. Pc no dig.

You say, "Who or what would want to catch catfish?" and the pc doesn't understand it. You see, because you the auditor understand the line is no test at all of whether the pc understands the line.

Now, number (6) is bank beefing up. Now, that's a colloquialism. But I don't know anything to express it better. If you said, "The bank is becoming more solid and is pressurizing the pc, and this or that and the other thing; and sensation is tremendously and oppressively present, and there appears to be more bank in the morning than there was in the afternoon previous; and there's more and more bank, and there are ridges of the bank are getting rather solid," and so forth – this is what comes under the heading of "bank beefing up." See, in other words, it's just there's something being fed to this bank. It's getting solider. And it can become as solid as a board. And if you let a pc go that far, you'll half-kill him, see. It can really be gruesome.
Now, (7) what you can expect after that, is the pc is sick and nauseated.

Bank will beef up – that's not too bad – bank beefs up some more. It's getting kind of solid. It's got solid fringes on it. The pc feels like he's in some kind of an invisible iron suit or something weird is occurring here. In other words, the engrams and things are getting heavier and more solid. And he can't see them, he can feel them worse, and that sort of thing. This kind of thing happening is the result of wrong goal or bad listing. That's mostly seen when you're listing a wrong goal. It can become awful gruesome on a wrong goal. But it can also proceed from bad listing.

Pc's becoming sick and nauseated, that's pretty much wrong goal. It's seldom that listing drives them that far. But a wrong goal can drive them that far. They can start losing their cookies, man. Their weight going up, pc nauseated and dizzy and room going around and mest going out of plumb. You know, a room has eight points at the baseboard and ceiling, you see, and those will sometimes go completely askew. You know, eight points no longer make a box. They make a twisted space. The room looks like that to them. You get the idea? Well, motion goes haywire on these people. Bzzzzzz! Bum show. Rough, rough on them.

That's a wrong goal overlisted. And you should've been able to detect it before it got to there.

Now, how do you patch up a case that's gone wrong? How do you patch them up? Well, you check over and get rid of all earlier found goals than the goal the pc is listing, or all other goals than the pc was listing that were found at any time and were said to be the pc's goal. You understand? We'll take all excess goals whether they were before the goal or after the goal that is being listed. See, all excess goals on the pc.

Sometimes, several goals have been found on a pc, and then they find one of the earlier goals is it, and then everybody neglects to do anything about the last three goals found that were listed maybe. Well, clean them up. Clean up those goals. Pc says they've been cleaned up already or it appears in an auditing report, check them for a cleanup. Just a rapid Tiger Drill on them. After all, it's only four or five goals, see. There's three minutes worth of work, see. But check it up. These goals charged up in some way or another. Something going on here.

All right. Get rid of them, in other words, and you'll find out sometimes that they have oppressed the right goal. So that as the items were listed, or something, the session's becoming restimulative, ARC breaks and that sort of thing have tended to throw one of these other goals into action. And it's oppressing the right goal. And the pc is beginning to wonder if the other one wasn't his goal. You got the idea? So you get all kinds of oddball things going on. So just make sure that goals the pc has supposed – been led to suppose in processing were his goal, that those goals are out and flat.

It isn't that they'll charge up again and come back in, but just make sure that it is done. Of course, if they aren't, what you do is give them a Big Tiger Drill and get rid of them. You see, a Big Tiger Drill that you were watching last night on TV demonstration is not Prepchecking. It just adds more buttons and plus-and-minus buttons, and plays it out to get off the maximal amount of sensation and somatic in the minimal amount of time.
Then you prepcheck the goal. And the way to prepcheck a goal – this might be news to you – is give it a time duration and name the goal.

Now, "On auditing" – or "in auditing, on the goal to catch catfish ... " See. Ah well, this is all right. "In auditing, on the goal to catch catfish ... " that's pretty good for patch-up. That's good! You can get old goals firing, you can do all kinds of things with it.

But if you're going to prepcheck, and you're going to sit back there with a repetitive question and do a full-blown Prepcheck on this goal, then you'd better use time duration. Remember in your releases on Prepchecking the importance of time span. Don't worry about listing, don't worry about this, don't worry about that. Let's use a time span.

So you get an auditing command something like, "On the goal 'to catch catfish'" – and this is one month before the goal was found, as far as you can figure it was "... since January 1961 has anything been suppressed?" "On the goal 'to catch catfish' since January 1961, has anything not been suppressed?" Alternate question, back and forth, and you will work your- self out quite a deal.

Now, that seems to be a rather large mouthful. But you would be surprised how many self-audits you catch. The interest of a goal is such that it leads people to self-audit far beyond any processing ever did. They speculate, they do it, they figure, they think. After all, you're monkeying with their basic purpose, so of course it goes into a high degree of restim. And they wonder about it and they occlude it and they try to prepcheck themselves, all kinds of weird things. "I wonder if I've suppressed my goal?" Well, why don't they ask themselves the auditing question and they're off to the races.

Now, it happens to be impossible – impossible, I repeat – it happens to be impossible to self-audit a goal. Now, you can list the lines on a goal, if somebody makes them up for you and says he'll beat your head in if you don't write the answers down. As long as the thing is tiger drilled in, the person's still got an auditor, don't you see? It's an extended session. But – now watch this – you've got the opposition terminals, which are mostly sen, and you've got the terminals of the goal. And those sit in the bank, to a large degree, opposite each other. Got this? See, they're opposite each other.

We'll say, blob one faces blob two. Well, blob one is some kind of a mishmash of own terminals that also had the goal. And blob two are opposition terminals that never had the goal but always opposed it. You got that? All right. The fellow's going to prepcheck his own goal. Ha-ha! Now, he's sitting there in blob one, see, very happily.

So he says, "I think I'll prepcheck this goal. See, On the goal, to catch catfish, let's see, has anything been suppressed?" And he of course is instantly into blob two, facing blob one. And blob two has sensation on it. And it's a mess of sensation. And he can't feel any pain. And one of the first things that alarms him is the fact that he's dizzy and doesn't hurt. So he says, "It can't be my goal. It can't be my goal, because there's no pain on it. There's only sen- sensation. And I remember Ron saying this."

Well, he goes down the street a few minutes afterwards, and he slips accidentally into blob one, see, that has the goal "to track" and the pain on it. And he says, "Ouch!" And tends to avoid, now, blob one. He says, "Well, that doesn't feel too comfortable," and he kind of
tends to back out of blob one, and there's no place to go but blob two. So he backs into blob two, and he's had it.

Do you see, that self-auditing on the goal leads to these very interesting things. Now, self-listing: it'd be very unlikely that if somebody found your goal and didn't make up your lines, and didn't do this for you and didn't do that for you, and didn't tiger drill the goal, every time, that you would ever be able to list it by yourself. But given those requirements, you probably, possibly, could sit down and list the goal at somebody else's behest – see, with the auditing commands at the top of the sheets in somebody else's handwriting. You see that? Possibility of doing that.

As a matter of fact, if you were very powerful and pervasive as far as somebody else was concerned, you could actually tell them to go ahead and list the goal by themselves after you'd prepared all the sheets. And then you tiger drilled them regularly to throw them back into the right valences and lines. But even that throws them into the wrong lines, see, for the wrong questions, unless that's been very thoroughly impressed on them.

But you see there is some possibility of self-listing. But there's no possibility of self-tiger drilling, or self-prepchecking. Won't work. I make my point? You go flippity-flop.

I'm sure in this room there's hardly a person who hasn't, to some slight degree, wondered if his goal has been suppressed, and thought it over, just suppressively: "I wonder if he's invalidated something today?" I don't know if you've all been alarmed at this. But every once in a while you wonder if anything has been invalidated today, and you get sensation, you see. If you're very educated as an auditor, and if you didn't know these other points I'm giving you right now, you could become quite worried.

Of course you say, "Has anything been invalidated, on the goal to catch catfish?" and instantly the goal items which you're in are over there, and you're in the items with sen. In other words, you get the pain and sen on wrong lines, and everything goes to hell in a balloon, see, when you start doing this. You follow this activity?

Now, when you tiger drill the goal every session, that's an insurance against the – a wrong goal. See, that's good insurance. So it actually leaves as the main problem, bad listing.

You have to watch and be very alert, on listing sessions. And the things you're alert for are: high TA, 4.5, 5; pc ARC breaky; pc looking bad; no pain, all sen; bank beefing up; pc sick and nauseated. These are all bum things. And when you see those things, you start worrying.

And the answers to them is check over those earlier found goals, let's find out if anything happened there. Let's prepcheck the goal with the date line. Let's tiger drill the goal into good firing condition, and so forth. If we can't get it that way, then just prepcheck harder, and you'll either get the goal back or it was the wrong goal.

There's not any trick to listing. You don't have to be terribly clever. You don't have to be clever at all to list. You've got to be very workmanlike, very thorough and very competent. This is what it takes to run a good listing session. There's no clearing without listing. So don't relegate it as an unimportant activity and just toss it off and say that is that. Listing is good, and it's as brief as the auditor is good.
Now, I haven't talked to you anything about listing lines or what happens on lines, how you put lines together, because let me assure you, that is another story. But the actual conduct of a listing session should be very steady, very press-on, lot of confidence on the part of the pc in his auditor, no slips, no goofs. Regular, nice, smooth, keep the pc in-session, get the middle rudiments in only when the pc looks like they're completely gone on something. And just carry on and do a good, sound, competent session. And he'll go Clear as fast as he has confidence in you as a listing auditor.

And it's very tough on a pc to change auditors in the middle of listing.

Can be done, but only if the second auditor is as good as the first one was. A good listing auditor is a good thing. He – they're not always to be found. Because auditors will obsessively get in there, talk too much, try to do too much, alter-is too much, interrupt the pc, try to stop the pc from talking, Q-and-A on the things, question the items, write too slowly, improperly pronounce and call the auditing commands – all of these things lead to bad listing. So that what you want is smooth, steady, straightforward, predictable competence. You got that, man, your pc will go Clear and you'll see free needle on all those lines.

In absence of that you'll have a pc that'll look like he has a wrong goal.

It'll just be all sen, all ARC break, all upset, and *blah!* You don't want that, you want Clears. So listing to that degree is extremely important.

Thank you very much.
Thank you.

You'll have to pardon me for being late. It was really quite an emergency.

You see, there was Gary Cooper and he was all by himself, you know, and he was fighting off these Indians. [laughter] Gary, you know, he actually was raised next door to me in Helena, Montana. It was very, very funny to see him done up like Rudolph Valentino in the old 8-millimeter movies, you know, from way back. I run one off for the kids every night. And even they're starting to laugh. [laughter]

Well, the subject of our lecture this evening ... This is the 2nd of October, I think. I hope you're in the same day as I'm in. If you've been listed on these lines today, no telling what day you're in! This is the 2nd of October, AD 12. Saint Hill Special Briefing Course, lecture number one. And the subject of this lecture is "Listing by Tiger Buttons-3GA." This replaces, and you can to all intents and purposes destroy your notes of lecture number two, 28 September, AD 12. Because since that time you have had a complete revisal.

*Male voice: 27th.*

Twenty-seventh? Your notes of the 27th of September, second lecture.

First lecture stands. I made them that way – figured there'd be something that you'd get into, and you did. Because after that lecture you asked enough foolish questions and pronounced enough imponderables that it was very obvious that the work which I had been doing slowly and casually on listing had to be done in a hurry. So you cost me my weekend. And there will be a fee.

At something on the order of 4:30 A.M., Monday, I was just finishing this work up. This was quite a sprint.

There were many things wrong with listing. There are many things right with listing. And we must remember, first and foremost, that the old type of listing we were doing – writing down the buttons – answers, pardon me, writing down the answers to lines; on four lines – "Who or what would want goal?" "Who or what would not want goal?" "Who or what would oppose goal?" "Who or what would not oppose goal?" – brought a lot of people to free needles on these lines and made first-goal Clears. It had to be in the presence of very smooth auditing. It had to be in the presence of good auditing.

And wherever any rough auditing occurred – now, I'll tell you what happened to these four lines – where any rough auditing occurred of any kind whatsoever, you got a jam-up and
the tone arm started up toward 4.5 or 5.0, which is standard position for a tough stick. That's standard position: if you've got somebody's tone arm riding 4.5 or 5.0 during a listing session and it just goes on riding there and on and on and on riding there, man, that is wrong. Something is very wrong, as I will go into in this lecture.

But in the presence of rough auditing, a pc suppresses. And in that suppression is able to produce sen and no longer gets pain even when he's listing on the right goal.

That's quite important, because a right goal can be listed so roughly, with the presence of sufficient rough auditing, that it'll look like a wrong goal. And, of course, in the presence of the smoothest auditing in the world, the same phenomenon takes place when you're trying to list a wrong goal.

But, in other words, rough auditing during a listing session can make a goal look wrong, fire wrong, act wrong and otherwise raise the devil with the case and everything connected with it.

Anyway, there is no substitute for good auditing. See? There's no substitute for good auditing and a good auditor.

Now, what's odd is that there are lots of people in Scientology whose goals are not answered up to or compared to or measure up to or declare that they should be active in Scientology, who are in Scientology and who are doing very good auditing. It's not true that everybody in Scientology is dictated to be there because of their goal one way or the other. That's a lot of – lot of nonsense.

But it also is true that goals very often assist people to be a good auditor. Let's say – let's have somebody with a goal "to listen to people's troubles" or something like that. He won't be as smooth an auditor as somebody who has a goal "to build mountains" or something, but he will still have some little special skills of one kind or another that pcs will find quite, quite attractive. You understand?

And then there is the broad majority of goals of people in Scientology which are just neutral. I mean they don't necessarily make them better auditors and they don't necessarily make them worse auditors. And that is the majority.

And then there is a small group, a minority, whose goals are in opposition to Scientology, who feel desperately that if their goals were ever to be achieved it would be over the dead body of Scientology. In other words, as long as Scientology exists, why, they'll never make it, you see? In other words their oppterm is Scientology. And those people make very rough auditors. They're practically unteachable. It's terrible. And they also stop auditing and they'll do that sort of thing.

You determine what people these are just with your rock slam test – you know, your HCOB that gives you the new Security Check – which would just rock slam. You know? "Consider committing overts against ..." and then you say, "Well, Scientology, the organization, your auditor, Ron." You get rock slam on one or more of those things, you got somebody who'd be awfully hard to train and who will make a very lousy auditor until you've got that goal. You just take it from me, I've watched them now. I've watched a lot of them. I've won-
dered why is it that some of these people can audit and why is it that some of these people can't audit and why is it that the vast majority of people in Scientology can audit?

Well, the goal sometimes assists, sometimes retards, and the vast majority has no influence. Now, the rock slam test takes care of the only part of it we have great interest in, which is the people who can't audit. The reason they can't audit is just that they can never get grooved in on the subject of auditing; they're always doing something weird in auditing. The pc says something and they jump down their throats. One way or the other they louse up what the PC does or says, you understand? And what they do is either add or omit and they never just audit. They add or omit.

Give you an idea. PC gives him an item: "a centipede." All right, the auditor who has an oppgoal to Scientology says, "a chrysanthemum."

And the PC says, "No, a centipede."

And the auditor says, "Well, how does a pc – how does 'a centipede' answer the question: 'Who or what would have many feet?' Well, I've got it now: a naturopath."

And the pc says, "No! A centipede! A centipede. A centipede. A centipede. A centipede!"

See, you've got a missed withhold going here, see? And the auditor says, "Have I missed a withhold on you in this session?"

"Well, you haven't taken this item!"

"No, that couldn't be it. The missed withhold must be earlier."

Well, things like this happen in auditing.

Well, you start mucking that into a listing session or never acknowledging anything the PC says. He does 465 items, see, 465 items and finally he gets an acknowledgment, which is "Mm-hm." See? Now, that's an omission. But you can use an acknowledgment the same way to just louse it up like crazy.

All of a sudden the PC gets a horrible gleam in his eye, "Who or what would have many feet?" you know? And, my God, he thinks of armies and centipedes, and so forth, and this avalanche is just about ready to roar, you know? Just about ready to roar, and he says, "A centipede."

And the auditor says, "Thank you!"

The PC says, [in a feeble tone of voice:] "Uh-eh-yeah, all right-uh-an arm..."

"Thank you!"

And the PC says, "What was I talking about? Where did they go? What part of the roof didn't fall in?" Get the idea?

Well, therefore, in view of the fact that errors of one kind or another can interrupt a listing session; and in view of the fact that PC protest, ARC breaks and rough auditing can make a goal simply – well, it can be found again – but it makes the goal turn on sen, look like a wrong goal, make the PC upset, not go Clear (that's the main thing that's wrong). He can list
for months and months and months and months and months and he wouldn't go Clear under this type of auditing. In view of that fact, we required a type of listing which permitted a minimal chance of error on the part of the auditor. See, so an auditor's – an auditor would get minimally in the pc's road. And we have it in 114 line listing. Listing by Tiger Buttons we will call it.

And we have that for this reason: The auditor doesn't comm lag by writing the item down, he simply makes a little strike on a card. He can't forget the auditing command because it's right on the card in front of him. And all he's trying to do is get all the items he can on the card – now, this is important to you because it isn't in the bulletin – he's trying to get all the items he can on the card without dragging the PC into an overlist. He doesn't want this PC to go into a long comm lag or feel badgered so items become missed withholds.

The only judgment the auditor has to make is: Is he demanding more items than the PC has or is he cutting the PC off before the pc has given him all he has? And that is the only point of judgment in this listing.

That is the single, most important point of judgment. Does he shut the pc off before the pc has given all items pc easily has? Or does he badger the pc into giving more items than the pc has on that line? Because he'll drag the pc, on the second case of demanding more items than the pc has available, into a condition of invalidate. Items, when they're overlisted, feel invalidated; so, the pc becomes very doubtful and everything becomes unreal.

And, in the earlier case, the first case of cutting the pc off before the pc can give all of his items, the auditor introduces sen. So, you see, demanding more items than the pc has, produces invalidation, unreality on the part of the pc. You understand then? And keeping the pc from giving you all the items the pc has, produces sen.

So, if the condition of the pc degenerates on Listing by Tiger Buttons into total sensation and no pain, you know that the auditor is demanding more items from the pc than the pc has. You understand? If he's got an unreality growing up, you know that the pc is being made to overlist. Let me put it that way very straightly. Don't want to mix you up on it. I, myself, haven't got it out here in front of me. You understand?

For instance, pc will list on a flow and he'll list as long as the flow is flowing. But when the flow stops flowing he is then listing against a backflow which brings about a sensation of invalidation. Because the items which are backflowing against the items which he is trying to give, see, causes an unreality to take place. He doesn't think any item he's giving you is the right item for that line. Do you see that?

Audience: Yeah.

So if you run this flow too long in any one direction by demanding more items than the pc has, the pc will begin to think that the items he's giving you are unreal. Because the sensation of invalidation occurs when a line has been made to flow too long in one direction.

Now, on the other side of the picture – on the other side of this is, you keep the pc from giving you the items he has, then you put him on a whole string of missed withholds. He protests the session and turns on sensation.
So the two things you can expect, principally and primarily from rough or bad auditing on a pc where the auditor is getting in the pc's road most God awfully—it has to be pretty extreme. Most of you are sitting there thinking, well, you drop your pencil once in a while and this upsets the whole session... No, no, it—you have to stand back of a session that is really being run by somebody—just whisper "Scientology" at him and the... Well, you know, it isn't the needle that rock slams, you see; the needle doesn't rock slam. What happens is both ears rock slam and both eyeballs rock slam, see? Ah, you watch him trying to give a session; he'll pull one or the other of these things. And it has to be awfully extreme before it starts really showing up. It's colossal. The little blunders that you make from time to time, and so forth, that isn't going to upset anybody. You pick them up in the end ruds, and so on.

But you start this kind of thing, see, this big avalanche, and the pc's got centipedes, armies, so forth. And these things are just sort of stacked up in the slot and they're all ready to go down the chute, see. He just wants to hand them out to you, brrrrrrrrr. See, like that. And you say to the pc—not you, but this auditor says to the pc...

THE PC SAYS, "CENTI-"
"Thank you!"

And the pc says, "A-a-ar-armies, ar-armies, ar-armies, I think, ar-armies."
"Thank you very much! Now, you don't have any more items, do you for this line? We're getting awfully long on this particular list anyway." [scrambles with papers]"Let's see, how many do we have here? Let's see. Awful lot!"

It's pretty bad. You'll see it. You'll start a co-audit someday and you'll see it. You'll actually see it with your naked, bare eyes; and you'll be ashamed. Be fantastic. We stand back of some co-audit, untrained auditor and he'll be trying to do this listing on somebody and, honest, they practically do everything but pull the wall off the wall and shove it in the pcs teeth.

Now, what happens to the pc? The pc suppresses. He's being made to suppress. He suppresses the auditor, he suppresses the list, he suppresses everything, and so on, stacks himself up on a bunch of missed withholds, with all the consequences of the missed withholds, because each item, then, that he didn't give you becomes a missed withhold. And the next thing you know, this goal that has been turning on sen once in a blue moon and pain all the time, now turns on sen all the time and pain never. And he's just going wog, wog, wog. And you can take a real goal and monkey it up this way, and you can actually have the pc getting the walls out of plumb.

I was fooling around with some research one day—during a demonstration session (withhold from you)—and I had been doing some research lines and I'd been trying to put some lines together and was doing some research—actually, analogous to this bulletin. But this was many weeks ago, before I went to America.

I was sitting there and I had been, of course, fooling around with a bogus goal. You know, and trying to list this bogus goal. And it was actually the way I was working it out, you know—I got to a point trying to work out lines where I turned on motion. And you don't just turn on motion so that you sort of feel like things are moving and they're not or you get dizzy or something like that. Man, you can turn on motion which is really interesting. And while I
was giving that session (it was to Reg there) why – I didn't miss any meter reads as you noticed but – well, I never have – but that – the meter was moving away from me like this suddenly. It was a little bit hard to find out where to look for the needle. And the table – the table was going swoop. And every once in a while the floor would go the opposite direction, swoop. I knew what it was so it wasn't disturbing me any; it was just where was I supposed to put my eyes.

But pcs don't have that much equilibrium and they often get very worried when they walk down the street and have the sidewalk in the middle of the road and then back where they aren't. You got the idea?

They also will become sick and nauseated if they're really roused up.

And if this is done on a wrong goal, you'll just put the pc in the hospital. Supposing you had a wrong goal and then you wrong listed it: pc – hospital. I mean, that's about all there is to that.

Psychiatric special. If this stuff ever got into the hands of psychiatrists, why, they'd have full institutions, brother. They'd make up their mind what goal it was.

So I myself through listing wrong goals and through fooling with goals in research have a very good subjective reality on what can happen to somebody like this. It's very rough.

Now, the other one is not quite what you would be very familiar with.

It's sort of a hidden manifestation. But have you ever seen one of these characters walking around who is totally doubtful all the time? You've tried to sell them Scientology, I know that, from time to time. One of the ways to get to them when they do this to you; you say, "Well, now, well, you help people, see. That's what we do in Scientology; you help people. You know, you do things for them, you help people."

And they say, "Well, how do you know you really help them?" You know? And, "Studies of the mind are no good, really, because, I know, because I had a brother once and it was all pretty bad, and so forth. And what do the medical doctors think of this?" You know, all this kind of stuff that goes on and on and on.

It's very interesting. You've only got to ask them on any analogous subject, such as medicine, you say, "Well, what do you think of medical doctors?"

"Well, I don't know. Well, how does anybody know?" What's amusing is, is this person is so disoriented in general, is they will do the same thing with all subject. And you think they're talking about Scientology. No, they're just talking and this is the way they talk, see? And because you're interested and sincere in what you're talking about, you never – you miss the boat. All you've got to do is take your index finger and just shift the conversation about a degree and get them to talking about psychiatry. You get agreement, see, because the psychiatrists are no good either, see? See, and you get – they're just like the wind in the willows. You know? Any breath of air will blow that unreality around. And it's all unreal; the sensation is it's unreal. Those walls aren't real. They know that people have been kidding them. Other people pretend things are real but this only convinces them that everybody pretends. You see?
They know that there are no well people. See? They know everything is bad. But, basically, it isn't real. Nothing is real.

Now, although this is a phenomenon which can be produced by lessening the overt, which is how it's normally produced – things aren't real to somebody who has many overts against those things. See, the person – well, fellow's been burning houses and he's been spending lifetimes burning houses, and he's – just does nothing but burn houses. You watch him go up to the front door of a house someday and he can't even find the doorknob, you know. He tries to walk through walls – houses don't exist. There aren't any different kinds of houses. It's the most remarkable thing, you see? Tremendous numbers of overts against some object or item or type of person brings about an unreality on the overter's part for that thing, see, and it becomes totally unreal.

For instance, I have this to some degree on religion myself. And it traces immediately back to burning whirling dervishes. I just got into a bad habit, you know? Whirling dervishes show up, why, you execute them, you know. That kind of thing. I mean, that's the wrong thing to do, let me tell you. It produces an unreality on the subject of whirling dervishes. See, you go around whirling dervishes and they just are a blur – when they're whirling and when they're not whirling. They're thin. You can see straight through them almost. See, that's under the phenomenon of they become unreal because one has overts against them. That's the rationale back of this.

But the same exact phenomenon can be produced by causing a person to outflow too long in one direction on a goal line. See? So that he gets a backflow inevitable. You understand? You see this dramatization in life as somebody does bad things in the community until people have to do bad things to him.

Well some dog – he goes around biting people or something like this for a long time, and eventually they'll do something to the dog.

You see this in real life that an individual committing overts has things committed on him, see. You see this in life. People enforce this one.

But I'm not talking about that. I'm talking about the simple thing of the fellow who throws a bowling ball out in front of him long enough will mentally restimulate a backflow against bowling balls. And the way to make bowling balls unreal is just to keep throwing them away from you and never recovering them. And they will eventually get totally unreal. You see why? You see that?

So when you make a pc overlist, what he's done is go out the flow line. Remember this is a very aberrated zone of action in the pc's mind. He's pretty spiny on these subjects. He's very identified and overflown and he jammed up. Well, if his goal was to be a pinball machine, he'd have a marvelous mess on the subject of everything was a pinball machines and the basic purpose of everybody in existence was to do things to or with pinball machines, don't you see? And everything is identified with everything; all purposes are identified with his purpose, you see?

And you're going down this channel ... You are operating now in Book One's A=A=A. You see, you're operating right where it lives. And don't be surprised sometime if the pc has
some weird identification and you just can't make any sense out of it at all. Yet the pc says it's an identification. He looks at you quite blandly and says, "Well, all ashtrays are just exactly like roofs. You know that. All ashtrays are roofs," you know? Or "All women are mothers." He believes this, you see.

But you could understand that – how he could get into that. But now, how all ashtrays are roofs! You say, "This guy is unhinged someplace." Well, of course, you're operating in the zone and area of unhinged hinges. They're by the gross lot on the goals channel because he's got everything identified with everything, and so on, because his flow lines have been all overflown and backflown. You see?

He's got a whole lot of specialized flow lines – all of them overreached, all of them backflown on, and so forth. And when you're taking those things apart you must take them apart as to what's there. You can only take apart what's there. Do you understand? And although it looks to you, the auditor, as you sit there listing on a pc, that he's dreaming up these items and handing them to you. No, he's looking right straight down one groove, and it'll be just one single bunches of file cards in the file machine, you see. There it is it's just that many items. And it goes right on down to that many items. And one more item will regenerate a backflow so that the last item he gives you he will now be doubtful about.

Now, he can put it down as – with perfect certainty, "a centipede." And then you cause him to list ten, fifteen more items in that direction. He hasn't got them, man! He's got to go in past the opposite flow, which is now generated and flowing, and reach around. It's like going upstream against a roaring river, don't you see? And, after a while, he kind of says to himself, "It isn't worth it. There's nothing there." You know? The spray in his eyes and everything. So, you ask him for all these additional items and he hasn't got them: "Centipede" that he put down as totally real now seems not to belong on the list. See, he put it down as totally real and if you gave him the item back, he'd tell you, "I really don't think that that would want to walk. No, I don't think so."

Similarly the next ten, fifteen items, they just go. I mean, they're so unreal they'll just start disappearing. He won't even be able to tell you what item he has just said or anything like this when you overflow this.

But the basic thing I'm trying to get to is you can produce a total unreality on the part of the pc. You can make him feel just like he is in a world which doesn't exist. Now, there are characters around whose world doesn't exist and who don't exist in any world of anything to them. You run into brick walls but this pc never does, see. Never seems to be able to run into a brick wall. Of course he's always coming in scratched and contused, but he cant tell you how. See, brick walls are unreal. That's his difficulty. And, of course, he always runs into them – they don't exist.

But his reaction toward life is uncertainty and insecurity. So, making a pc list too many items brings about a mental framework of insecurity, unreality, doubtfulness. And, of course, that extends over to the auditor, it extends over to auditing, it extends over to everything.
So, you could get a guy's goal and then list him wrong and have him believing at the other end of the line that Scientology was totally unreal, that it'd never done anything for him. I mean, you could list him into a hole to that degree.

Now, the weight factor of overweightness, and so forth, also belongs on the other side of this. That's not letting somebody give you the items. You can actually put pounds on somebody by continuing to miss the withholds. Isn't that interesting? Increase somebody's weight with this kind of auditing. Now, smooth auditing would decrease somebody's weight. Definitely.

Now, do you see then, these are just – these are the two major factors. There are probably other things you can do. You could confuse a pc. You can get him wog-wog, so, you start in on the line "Who or what would want to catch catfish?" The pc answers "Who or what would want to catch catfish?" and you say, "No, you're answering 'not want' to catch catfish." You ask him "Who or what would want to catch catfish?" And then all of a sudden you make a mistake and the pc – he doesn't know, see. So he's sort of on a not-know. See, you can produce confusion; you can produce various things. But they're not as serious as these other two phenomena.

Now, therefore, this type of listing is designed to minimize the amount of time necessary to record the fact that the pc is giving you items. And that is its first advance.

A lot of you have asked me, from time to time, why we wrote them down at all. Well, we had to record them in some fashion. And I wasn't yet sure that we wouldn't have to do something about them. And I've become sure we don't have to do anything with these items. So, therefore, all you want is a tally system. You do have to have some check on parity to find lines are overlisted or underlisted. You do have to have this. So all you need there is a tally system. And I've introduced the crudest tally system there can be, which is four slants and a bar. And if you will look down at your right hand you'll find you have five fingers and man counts ably. It's instinctive. You go slant, slant, slant, slant, crossbar.

You know that man's method of counting is based on five, not ten, see. You know that you can conceive five objects just like that. Science was, by the way, trying to prove fifteen or twenty years ago that a man could not conceive more than four. And I didn't go into the root of this thing, but I think it was being put out by some sociological, electronics computer man who had no thumb. Because the one thing you can count with a glance – you can count five.

As a matter of fact there are four hinges on these doors and one lock, if you consider the lock a huge lock. You can certainly grasp that number at a glance.

So five is the easiest recording number. It's instinctive. Now, that's chosen not because auditors are stupid but because auditors becoming involved with a pc, and so forth, haven't got all their attention on numbers. So I've taken the most basic unit or cluster figure which is five, so an auditor won't be thrown by it.

He's trying to handle a pc who's having a hell of a time. PC's squirming all over the floor and falling out of the chair and ARC breaking and writhing and all that sort of thing. Well, he's liable to get completely blooey on the subject of tallying. But if you give him an
instinctive tally figure that is an idiot's figure, you know, just – he can keep on doing that without any attention. You got the idea? That's why that's chosen.

Now, that introduces no slowdown. That introduces no slowdown, and it gives the auditor time to watch his meter and its behavior and also keep up his auditor's report and give the pc attention.

Now, most listing sessions, the auditor has become so engrossed in writing things down, that he has not been able to give enough attention to the session itself and so has lost control of his pc. But if you're good at this, you can take – and you can look straight at the pc who is giving you five items, let's say, and you can go one, two, three, four, five, strike. You see, you don't need to look at what you're doing to record it. See? That, in other words, has been reduced to an idiot simplicity.

You know, it's very interesting the research I've done on this. It was up as high as 182 lines over the weekend. And I had one system – you can probably all think up better systems maybe, one way or the other, but I don't think you can think up simpler ones than this. That's the one that takes genius. Anyway ...

I thought of getting a tabulator, but – every time the pc said something, you stepped with your thumb on something, you see. So, all you had to do was shift your thumb every time the pc said an item, and then before you turned the card over you simply wrote the figure that was on the tabulator on your card and turned it over. See, that's very nice. There's only one thing wrong with it: it clicks. They will inevitably click. So the most silent means – and furthermore, it's a mechanical; you have to have something. Furthermore, mechanical things often break. And this requires a minimum: it requires a pencil and some cards.

Now, one of the big things I had trouble getting over, and it isn't totally solved: how to make a maximum number of items on one card without having to rewrite the card. See? Well, frankly, this is not totally covered in the bulletin, but you don't have to rewrite the whole card list; you can get by overstrikes with three colors of pencil, use. Because you can always see a group. You probably couldn't see the little individual slant lines if you had a black one and a red one and a green one, don't you see, on top of each other. But you can see there's a black, red, green, you see, and the card is totally filled with black, red, green. You've still got an approximation even though it was very badly done. You get the idea? I mean ... Now, the way to do that isn't in this bulletin.

That card which totally fills up: You take a stapler and you staple to it another card and rewrite that one line on the face of your fresh card so they turn over two at a crack. You understand? And that doesn't let it all get separated out from underneath you. Now, that will, oddly enough, leave you rewriting only some cards. In other words, you don't have to rewrite the whole list all the way down. That's one of the easy ways to get on it.

Now, the odd part – here's another one: If you don't even want to rewrite the line, you can take a card that is less wide which still exposes the line and staple that onto the front of your filled-up card. You understand? I don't care what you do with this, but you can do this job with a stapler. Now, I wouldn't worry much about the backs of cards. If you turn the card over – if you turn the card over, you have lost sight of its overlistedness. You can make a little
mistake there, don't you see? Because this card turned over looks just like any card face up until you turn it over. You follow me?

Audience: Uh-huh.

Because – and it looks like it's a single card. Whereas if you've got a double width card comes up with this thing, it's immediately called to your attention that this line is awfully long. Do you see how that would be? This line is pretty doggone long if you've got a double card in your hand; whereas, this would not be observable to you if you had only one card turned over with the line written on the reverse side of it again.

Well, now these things – we probably will do things to them; you'll probably find things change. But I've gone over this pretty thoroughly and tried to reduce it down through its cycle. All things go from a complex – from a somewhat complex to a more complex to a simple basis.

You've seen this time and time again in Scientology. We'll run this cycle:

I'll bring out something that's very simple, some auditor will be complete idiot with it, I'll find out it's not totally workable, some goofball things will occur, some pcs will have some hard luck with it, and so I'll make it more complicated, see, and then add the things that you mustn't do to it, and then push it on forward into more complicated, and all of a sudden the whole thing falls downstairs to becoming simpler than it was in the first place.

Well, I've tried to make this listing run that cycle over the last weekend.

And I did it. One time I had it up to 182 lines. In other words, I was cutting it – it went way up; the complexities were terrific – and then cut it back to a simplicity.

Now, as you sit there listing, several questions will occur to you: How often should you use this question that is on the card to the pc? How often should you use this?

Well, you use it as often as the pc isn't answering it easily.

In other words, your pc says, "A centipede, an army and a black cat."

And you say, "That's fine. Thank you."

And you didn't get any comm lag there, did you? No comm lag. But he stopped. He isn't still thinking, particularly, he's looking at you now; he thinks he's done his duty, don't you see? So you ask him the question again and he says, "There aren't any more."

Now, you think, well, that's going to leave an unanswered auditing question, and sure enough it could, but he won't tell you there aren't any more until you really start straining him.

Now, the question you're trying to answer is how often should you ask the auditing command, don't you see? How often should you ask this thing? How often should you repeat it? And how hard should you pound on the pc's head in order to get answers?

Well, in actual fact, you only want answers until he comm lags hard over them. The comm lag is going to be followed by an invalidate. His comm lag will end up with "trying to find the right one." And "trying to find the right one" will move over into an invalidation of anything. Do you see? So your symptom of the pc having been driven too far – already driven
too far – is he can't get the right word. He's trying to think of the right word. Now, that isn't a phenomenon of the mind; that is an overrun of a flow. And you've already ridden him too far on that flow. You've goofed. That is classifiable as a goof, don't you see? So, where you want to stop is the comm lag which precedes that phenomenon. The pc is saying, "A centipede and-ah-ah-hmm-ah... A-ahhmm - ah ... " And if you just let him go on with that, why, he'll say, "Well, I'm trying to think of the right word for it," is his next stage, see? And if you let that go through and he thought of the right word for it, then the item he gives you after that is not the right item at all. See, first it's the wrong word, then it's wrong item. Comm lag, wrong word, then wrong item, see. That's the way he's going to answer you up on these things. So you got to catch him at that moment when he is just about to comm lag and hasn't done so very critically. Do you understand? That actually then requires some sensitivity on the part of the auditor.

That's why I've unburdened the necessity of the auditor in HCOB October 1st – unburdened the auditor's attention on the writing down lists and that sort of thing. Because that's the critical point.

Now, if the pc says there aren't any more items on that line, this is not a balk. Do you understand something about listing. Pcs never balk. Do you understand that? Pcs never balk! They can be overdriven or distracted to the point where they're not in-session. But if they're even vaguely in-session they just never balk. They're not balking at listing. Do you understand? A pc will not balk at listing. He will always give you an item or another item or three items or four items, but he can be prevented from listing, see? The balk isn't there but the prevention is there. And if you look at it in this framework, both doing auditing and supervising auditing, you'll see where the goofs occur. Do you follow that?

You see a pc balking – apparently, see – just recognize pcs don't balk. Pcs have to be prevented from listing. See, the balk is just an apparency. And there's something there that's preventing the pc from listing and it isn't in the pc's head. It's either the lines are wrong – somebody's written up his lines, like "Who and – who or what would want to help not suppress because he didn't catch catfish?" and the poor pc is saying ... The line was never cleared with him in the first place, you see? Nobody came along and said to him, "Well, can you answer this line?" as the first time the line comes up on the pile, you see. "All right, here it is: Who or what would want to run away when centipedes aren't catching Suppress-Help?"

He says, "Huh?"

The lines are wrong or the auditor is actively preventing him from being in-session. Session started out like this: He got into the body of the session, the needle was free, everything was clean, got the goal firing – the goal fired beautifully, and so forth. And the pc is all sitting there and he's getting steamed up. He knows just where he is: They're going to start on the Create. See, he already knew this because he knew the bulletin or something. And he's going to start on the Create, and he's already got the first item there, see, a "candy machine," see. And he's actually been thinking of this as the next item. He's about to say ... You know, he's just waiting. All you have to do, you know – all you have to do is just open that stack of cards at the right place and you're going to get a "candy machine," see, bang!
And the auditor says, "Well, now, all right, now, let's get in the middle rudiments for this session." You know that confounded candy machine will go through the rest of the session. It'll go clear around till they get around to it again. And it'll come up some day or another on a Suppress. He's prevented from listing.

So pcs – just as a rule of thumb on the thing – from your standpoint as a Supervisor, an auditor's Instructor, and in auditing, and so forth – they just never balk, they're prevented. And you look, not for something that's wrong with the pc, you look for something that's wrong with that listing session or what's going on in it.

Because, listen, you list lines on a pc, it's something like putting a button in a candy machine, see. Penny goes down the slot, hits the button in the machine, something in there whirs and some candy comes out the bottom of the machine. Only this machine never breaks. You can't ask him for anything on his goal line without him giving it to you. You just can't do it! You see, it's very nearly impossible. Unless when you ask him, you won't let him give it to you. You have to get in there with a little sledgehammer and monkey up the chute, you know. You have to feed it an Irish penny or something. There ought to be curve on this. He has to be prevented because, frankly, he just will deal these things out like a professional gambler dealing cards. He just can't help himself; he'll just deal, deal, deal, deal, deal, deal, deal, deal, deal, deal, deal, deal, deal, deal, deal, deal. You just turn up the stack there and you read the auditing command and you're going to get answers if you're anything on the beam at all.

Once in a while you'll get into trouble because he's got two buttons of the Tiger Drill crossed. That is to say, you should be running Suppress at this stage of the game and you aren't; and you figure it would be a Q and A to go back to the Suppress section and do anything about it, and so on. But you've already done something wrong if you get to that state. You've already done something wrong if you've got two buttons mixed up or something. See, something's already gone haywire with the auditing.

Well, the thing to do is just sit there and list. Get your rudiments in, get the goal to fire, make the pc happy and cheerful. And sit there with your pencil alert and your stack just right and don't drop them on the floor. Just sit there and deal them off and ask the question. And the pc says, "An army, a centipede, a bulldozer, a-uh-uhm ... That's about all I can think of."

And you say, "Thank you very much." And you turn the card and you ask the next question. See, just as neat as that.

And then you say, "Now, who or what would oppose catching catfish?"

And he says, "Oppose catching catfish."

And you say, "Yes, that's right." Don't make him give himself the auditing command. Don't you see? The rules of auditing all apply in listing.

And you say, "All right, yes, that's right. Who or what would oppose" – say it softly so as not to blow him out of the water, but give him the command. He obviously hadn't got it, he's muttering it, see? And you say, "Who or what would oppose catching catfish?"

And he says, "A-ah-hm-hm-hm-hm ... Who or what would oppose catfish?"
"Yeah, that's right. Who or what would oppose catching catfish?"

And you say (tick), "Thank you very much." And get the hell off of it, man. You got an answer to your auditing command, see, and you were lucky. Because that line was hanging fire right on the comm lag, and you opened it up on the comm lag. You understand? Get one item.

I sometimes ease the crush on a pc by saying, "Well, just give me one so the auditing question will be answered."

"Oh," he says very happily, "game warden." Gives you some old item. "Game warden!" You say, "All right. Well, that's fine. Thank you." Get how the thing goes?

But the whole attitude of the session must be one which permits the pc to list items. And if you want to know how to list, then delete all out of it that prevents the pc from listing. And you'll find out this is what has happened here on this Listing by Tiger Buttons. There's practically everything out of it that prevents listing, still leaving those things in it which make people Clear.

Now, the whole – whole aspect, then, of a listing auditor is somebody who is in benign control. Benign control.

Now, get this as a definite difference to Sec Checking. You say, "Now, have you ever robbed a bank?"

And the pc goes clang! on the E-Meter.

And you say to the pc, "Come on, come on. Have you ever robbed a bank? I got a read here. What – ever robbed a bank?"

And he says, "Ho-ho-ho-ho-ha-ha, no, not me." Clang! "No, I ... As a matter of fact, I was the victim of a bank robber one time. Uh-uh-I was actually in a company that had a bank that was robbed and they really did me in."

And of course, the Sec Check Auditor is not worth his salt who wouldn't have said at that time, "Done, man, done. You know, done. Have you – now listen carefully – you, have you, you, you, you, the one sitting right in the chair, you, now, you. Got that now? Now, listen carefully: robbed – robbed a bank? Now, that's the question now. Now, I'm going to ask it on the meter. Have you robbed a bank? All right, that's null. Thank you very much."

Or clang! "All right, what is it, man? What is it now? What bank? What bank? Come on give here, man, give, give, give." You know? You know?

You don't do that with listing. [laughter]

There are different types of auditing, appropriate to all occasions.

Benign control: you're running an airy session where we're all pals together. And sometimes the items are funny, too. And sometimes they're very sad. Nobody is asking you, the auditor, to shed crocodile tears in sympathy with the pc, but don't go laughing like a bunch of
goons when he's saying, "A dying mother, a perishing infant, a starving puppy." Don't sit there going to pieces, you see?

Sometimes I know it exerts your control because you know what he'll be doing a few minutes later: He'll say, "A starving mother!" You know? "Ha-ha!"

Another list this will come up: "Who or what is no damn good?" you see. That'll come up on that list. Different frame of mind.

All right. So – but the listing auditor is in benign control. Now, actually, benign control is far harder to exercise than very harsh "cop" 8-C. Guy is in-session and doesn't even know it, doesn't even think of being out of session, auditor isn't in his way. It's a little velvet little finger that nudges him back into session when he starts steering out.

Well, we – if the pc is saying, "Oh, God, I don't know, I mean, these pains through my stomach. They're just terrible. I mean, the pain ... Have we got to list any more today? Just one or two more items you know, and I thought a moment ago my heart was going to stop or my umbilical cord was going to go to pieces. Man!"

And you say, "All right, all right, all right. Now, look, we've just got a few more here, so forth. Just got a few more here. Let's finish those up. After all we've got a few minutes left in the session, you know." [laughter] That's the way you handle people under listing, see. Persuasion, it's coaxing, it's the old smoothie.

And the way not to handle them is just to sit back ... [pounds the table] "Who or what would want to catch catfish?" And yet you could very easily get into an overwhelm frame of mind. The boisterousness, the behavior of the pc is very often quite overwhelming. The pc all of a sudden goes into conniption fIts of one kind or another. The pc's interest is sometimes as burning as a blowtorch, you know? Like somebody said one time, about somebody listing here early on the course. And, "And the pc told me all about – all about spaceships and exactly how they worked, and so forth." This was a girl that was auditing him that had a well-known antipathy to mechanicisms. "And the pc told me all about spaceships and how they went and how they were built and everything else; and you know, if I'd had the money right there in-session I would have bought one, you know?" They get interested, man!

Now, the only thing that can make a pc disinterested in auditing off these lines is the auditor. The auditors enter something in there.

Now, this is a skill. This is a type of auditing. It has to be pretty well done. It has to be pretty well controlled. The more you interject into an auditing session, the sorrier you're going to be. And you just sit there and get them off and keep the pc at it and doing it and you're interested and everything is fine, the atmosphere is fine and the pc is in-session, so forth; man, he'll just go ripping through at a high rate of speed.

And if you sit there stopping him from listing, paying attention to a bunch of Simple Simonisms: he hasn't answered the auditing command, see? He went, "Er-ah-er-game, a game, no, not a game-uh-uh-uh-no, that wouldn't be the item anyhow; a-uh-uh-uh-uh-a person who supervises fish. Uh-uh-uh-no. No, that wouldn't be the item. A person whouh-uh-a person who-uh-uh-uh-would fish. Uh-no, no, that wouldn't be it. Uh-let's see-uh-uh..."
"Well, give me the item. Come on, come on, give me the item. I want the item, see. I want the item."

"Well, a person who changed... No, that couldn't be it. Uh-uh-who has no fi- hmmm, hmmm..." and so on.

And the auditor who just sits there and says, "I must have the auditing question answered," see. "Give me the item. I've got to get it answered. It says right in the book the question has been asked and it must be answered, and so forth and so forth." He's just making a mess out of the thing, man. He's got the guy to a point where the guy is invalidate, invalidate, invalidate, and the devil himself couldn't precheck the pc back out of it again.

No, the auditor's got to be slippy, got to be clever. He unfortunately due to his own stupidity, has asked one more time, "Who or what would oppose catching catfish?" He was sleepy or something, you see?

And the pc has already been searching for the word, "A game-uh-uh-that wouldn't be the right word. A-uh-a park off-. Uh-no-uh-uhuh-uh-mmm-umm-umm-a-a-a game warden."

And the auditor has stupidly said, "All right. Thank you very much. Who or what would oppose catching catfish?" See? And then saying, "I've got to get ... " having made the mistake, have to compound the felony of making the pc answer the mistake, see. Idiocy.

No, the thing to do is to come off of it and say, "Look, we got lots of items here, I mean, on the line and so on. Just scrub that one. Let's get onto the next one. You know?"

The pc says, "Oh, oh, oh, huh, what's the next one? Who or what would not want to ... oh! Who or what would not oppose catching ... oh, that's all right. Oh! Fishmongers. Fishwives. Safra-su-saf-ru..." You get the different aspects? So, you have to tune in. You have to know about this flow thing. And I spent a whole hour talking to you about this flow thing because it's the most important thing in listing. You miss that, you've missed everything. So it is very far from unimportant.

It's the aspect of the pc which determines what you do in listing. Whether you ask for more or ask for less, forgive the auditing command, that sort of thing, smooth him out and so on.

You want the pc listing easily all the time. And a perfect listing session is the pc is just sitting there, pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa. That's all. Next card: Pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa. Thank you. That's all. Next card: Pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa. Next card. See? That's a perfect listing thing. Practically no comm lags, pc knows when the line is finished, pc in good communication with the auditor.

And on a very good session that was run today, twelve hundred items were listed in a single session. Interesting, huh? Well, that's fast clearing.

So you've said goodbye, I hope, to two hundred hours of listing to get a goal to clear.

But remember, the one thing that can mess up listing is an auditor who doesn't understand it - an auditor who doesn't understand what he's doing.
He's trying to keep that happy balance. He's trying to prevent the pc from overlisting – he is actually trying to keep the pc from overlisting because pcs sometimes will, see? Or – and he's trying to prevent the pc from withholding items, inadvertently. He's trying to keep out of the road everything in the session. The pc, for instance, all gone wog-wog; auditor doesn't get the rudiments in for his session; the pc then can't stay in-session long enough to remember what items he's supposed to tell you, or he's being distracted by the fact his wife is going to phone him at three o'clock and say whether or not he's been divorced, see? Auditor didn't clean it up, you know. Bad auditing has happened.

And in good auditing you make fast Clears. And the cleverness of auditing takes place in goals finding.

The smooth hammer and insistence and 8-C of auditing takes place back there in Prep-checking, and so forth, see.

And then the clever, reassuring auditor – that's what it takes there in goals finding. When it gets over into listing, that takes benign control. Pc doesn't even know he's sitting on control and he just sits there and spits out items of express train, jet speed. They're all down on the list. Finished. Clear. Free needle on everything. That's all there is to it. It looks very easy.

If anybody is dead against anybody being Clear, though, he won't do it. Don't you see? Okay. Thank you.
3GA LISTING BY TIGER BUTTONS, PART II

A lecture given on 2 October 1962

Thank you.

All right. The wishing well is outside for your convenience. A crown, why, that's a wish for a good auditor, you see? And a half crown, that's to – hoping your goal will fire quickly, you see. There's a nice scale of rates here of one kind or another. And a florin, well, that's hoping somebody won't start screaming in the rest of the room, you see. There's rates of pay on this. It's very interest... You'll find it's very workable.

Anyhow, this is lecture two, Saint Hill Special Briefing Course, 2 Oct. AD 12, October. And we're continuing lectures here on listing 3GA – Listing by Tiger Buttons.

Now, your activity – now, hear me carefully – your activity as an auditor on a listing session has these responsibilities in an ordinary way: That you get the goal to fire and that the pc is not prevented from listing and you get the most items down that you can – it's quantitative. That you don't get him to overlist and you don't make him underlist.

Now, there's various ways that you could effect these various things and the first and foremost is you could get – be auditing with your rudiments out.

Now, let's be smart about pcs. We already know in Dynamic Assessment, if you're running any goal that has been gotten by Dynamic Assessment, you're fortunate because you have data on the pc. And I learned this myself just in the last twenty-four hours. I finally had to make up my mind about this, because, man, supposing you have a pc whose item is "floors." Now, look at this, man. The item is "floors." Now, this pc is going to run into a lot of floors. Right?

Now, take somebody whose item is "people." Or somebody, you know, or somebody whose item is "rain," and it's been raining for the last twenty-four hours, and so forth. Well, now, let's be smart about it, let's get intelligent about this. It isn't – you're not an adding machine after all, as an auditor or something like that. Let's take a look at this pc – this pc look all right?

Now, when I say that, I mean you take a look at the pc before the session begins. Go ahead and take a look at the pc. And the pc's sitting down and you're adjusting the chair and getting the can squeeze and all this sort of thing. Let's add something in there: Look at the pc!

Now, that might be new and novel, but you'll find out it'll pay very heavy dividends. You'll find out it'll pay very, very good dividends indeed. Your pc doesn't look as good today as pc looked yesterday at session end.
Now look, you don't have to have the pc on the meter and be studying the needle and studying the tone arm and all that. You don't have to hook him up to a battery of instruments to tell you that he looks sort of shopworn today, compared to how he looked yesterday. I mean, you already are a battery of instruments that can detect this kind of thing, don't you see? In other words, look at your pc. 

All right. The pc looked raggle-tagged and wogged up one way or the other. Well, what are you trying to do getting in your beginning rudiments without running O/W? Why don't you just start the session, run O/W, a few commands and so forth, and get – let the pc spit it out. You know, just general O/W and get the rudiments in before you put the rudiments in. Is there anything wrong with that?

And if this pc is normally quite withhold and has a hard time regurgitating items and so-so, well, run O/W, put in the random rudiment and then put in rudiment one. In other words, ask the pc if you missed any withholds while running O/W, see. You get the idea?

All right. Let's not just sit there and run some kind of a rote. Let's put the pc in a state to be audited, see. Straightaway – bang! "Is it all right with you if we begin this session now? All right. Here it is: Start of session." See? "All right, what we're going to do here now is going run a little O/W on you, just a few commands." Hope factor, see; you've already told the pc, "Just a few commands, see how it goes, so we won't have to waste a lot of time on rudiments," you know – anything you want to say. "All right. What have you done? What have you withheld? What have you done? What have you withheld? What have you done? What have you withheld?"

"Ah-oo-wa-woo-oo."

All right. Now you've gotten down – the pc is in pretty good shape. All right. And you say, "Since the last time I audited you, have I missed a withhold on you? That's clean. All right."

"Are you willing to talk to me about your difficulties? Clean." See? Clean as a wolf's tooth.

"Since the last time I audited, you done anything you are withholding." You already got it. Clean. See?

"Do you have a present time problem?" Well, he did have. Clean.

All right. Roll up the sleeves and into a Tiger Drill. Get that goal firing.

Now, I've been taking sometimes as much as thirty-five minutes to get in beginning rudiments on a pc and I finally realized that I was wasting time, because ten minutes' worth of O/W in every case had finally had to be run after the agony. And actually tremendous quantities of time were wasted in the session trying to keep the pc in-session when I should have run O/W in the first place. You understand?

So your whole interest in a listing session is get the pc in some kind of shape so the pc can be in-session. 

Somebody here suggested the other day that "under the control of an auditor" should be added to the definition of "in-sessioness," and I think this is a very wise idea. Willing to talk to the auditor, interested in own case and under the control of the auditor.
Now, there's nothing better in running up havingness and that sort of thing than a good, flashing dash of O/W.

Now, how much do you challenge those answers? How much do you challenge these O/W answers?

You don't, man, because you're using O/W to promote the thing. So the pc gives you six motivators and a victim. Fine!! All right! Pc figures it's something they've done. That's all right. Because you're using O/W to get the pc to talk to the auditor about his difficulties. We don't care what the pc says just as long as the pc says something.

"What have you done?"
"I've breathed." Very sarcastic, see. "I've breathed."
"What have you withheld?"
"Everything."
"What have you done?"
"Sat here and let myself be butchered up day after day by you!" [laughter]
"What have you withheld?"
"My better self." [laughter]

Get smart. Get smart. The pc is talking to you. Don't interrupt it for worlds for the pc will slide right on into session as nice as a fish going down a chute.

This one I gave this fellow I was telling you about, in Washington, when I suddenly said, "Well, to hell with this. There's no reason of knocking him appetite over tin cup." Made him sit down in the chair and take up the cans and you know the first quest... answers I got to my questions, "What have we failed to find out about you?", man, they didn't even vaguely resemble answers. But he was talking. He was talking. And remember, your in-sessionness; this contains that as a primary action: pc is talking to the auditor. Well, it doesn't even matter if he's bawling the auditor out, he's talking to the auditor.

You don't recognize that the only serious condition of a pc is when they sit there too apathetic to say anything to the auditor. If you've driven a pc down to that point, you ought to be spanked. You must have done it, because at some time the pc was talking to you and then stopped.

Well, what did you do to stop the pc talking to you? That's what you would have to patch up. Matter of fact, you could take somebody that had finally run down and won't say another word to you and won't utter anything to you and won't say anything else to you and is never going to talk to you again and is just sitting there bthaaah. They're not mad, they're just sitting there bthaaah. They're too weak; they just feel absolutely clammy on the subject of talking. They can't, and so forth. If you were to say something like this you'd be surprised; you'd surprise yourself. You'd say, "How did I stop you from talking to me?" See?

And the pc says, "Oh, well, you just wouldn't accept anything I said."

"All right. Good. How else did I stop you from talking?"
"Oh, you were sitting there, demanding I tell you things. I told you everything I got. There's nothing else. And ..."

Look, get off of the significance, scenic railway, huh? It's beautiful – those rails going around the peaks and beautiful snow-capped vistas and forests and streams and waterfalls, and so forth. The significance railway, I mean, you know? To hell with what scenery, let's have some scenery. We don't care if this railway is going to start running through garbage dumps, see? We're not going to insist on the beautiful vista. Let's at least get the railway running, you see? Let's get those cars moving. We don't care what the cars are going to go through or how much they clank.

Some auditors are perfectionists. And they hear a screak in the wheels, you know, as the car starts up and they stop the car to oil it. And they've stopped the car, man, and that's everything there is to it. They won't get that train going again easily. See?

So the whole thing about a session is the pc's willingness to talk to the auditor. So in a listing session, this is terribly important. Because all doubt about willingness to talk to the auditor must be washed out before you start listing. That's real important. That pc shouldn't have any qualms about talking to you – no qualms at all, man, no qualms at all. Pc just talks to you.

You can always bring a pc out of missed withholds if the pc will give you any missed withhold or any withhold or any comment about missed withholds. If the pc will just talk, you can do something about it. It's when the pc will no longer talk that you're in trouble. So you really have to have those rudiments in for a listing session. The best way to get them in: get the pc talking to you. And you'll probably find necessary far more often to run rudiment O/W in listing sessions than any other type of session. And it's so easy that you can overlook these things about listing sessions, see. That pc has got to be willing to sing.

Now, anything the auditor does that is offbeat, off-line or anything like that is going to prevent the pc from talking.

Now, in-sessionness, then, doesn't have the importance of getting the meter to read. It's getting the pc so the pc will be terribly interested in his own items and will be able to as-is them and get rid of them, bing. And, you don't overacknowledge; you don't underacknowl-

What is acknowledgment? Well, it's to let the pc know you got it. And if you were actually to sit there and say, "Got it, got that one. All right, got it. Got it, got it, got it, got it, got it," it would be very effective. Of course, you don't. You say, "Good," and "Thank you," and so forth. But you've got to give the pc the idea that you're getting these.

Now, if you put your flat of your hand against the pc's nose and stop the pc while you very carefully, look carefully at the pc like you're going to hypnotize him, see, and you say, "All right; all right now." Pc keeps giving you items, you see? "All right, now look at me. Now, all right. All right. Good!" I don't think you'll find that's necessary. You see, I'm being kind of hard on you, but I mean – these mistakes will be made.

Now, you want the amount – the amount of acknowledgment so the pc knows you got it. And that's how much acknowledgment you want. Well, that's how many you acknowledge.
He gives you thirteen so fast you can't go back – you already checked them off here – but you should – you don't have to go back and count the number since your last acknowledgment and say, "Well, now wait a minute, now I'm going to give you a 'good' for each one of these." See? Those are all unusual actions. Pc has to be acknowledged.

Well, what is this? Well, it's what the pc considers being acknowledged is. Well, what is that? Well, it's being acknowledged. This is a human value. It's not a mathematical value; it's a human value. Acknowledgments aren't one-for-one or one-for-ten or ten-for-one. Some poor pcs get ten acknowledgments for every one item, you know? You wind up as-ising the pc, not the bank.

So keeping the pc talking to you is a question there of how skilled the auditor is in not getting in the pc's road and letting the pc know that the auditor has heard it. And that's the type of auditing you're looking at in listing sessions.

All right. Now, this getting the goal to fire – now, let me give that a little more stress: getting that goal to fire. Now, did you ever hear a pistol "tick"? Well, when you heard it tick, it didn't fire, did it? That right? Well, that's what I mean by getting a goal to fire. It's not carelessly used. See? We want rocket reads on this goal, man. Now, of course, there's this dividing line: You can put the pc into a terrific anxiety if you can't get his goal to fire. I can show you how not to do it. Sit back ... "Well, I don't know if it's your goal or not. I'm just taking you over from another auditor. I've never even seen the goal fire. Don't know whether it'd fire or not. Let's see, all right: to catch catfish. Well, it didn't fire that time. Heh-heh. Well, that didn't fire, so on. Who said this was your goal?" You see? And, "Somebody say this was your goal? Have you had any sensation on it at all during your listing with your past auditor?" Oh, well, that is just plain – plain awful.

You can slaughter a goal with the wrong Tiger Drill. Now, what you want to do with a Tiger Drill: just walk in on the goal and clean it up. See? Actually, as long as you're taking Tiger Drill buttons – it's Big Tiger that you use, by the way, at the beginning of session, not Small Tiger. On the sen side of the picture on this, why, you have three minimum and on the pain side of it you have three minimum. (I'll go into that in a minute.) But you want Big Tiger – you want Big Tiger. And you want that – you want that goal firing. And just remember this: that pistols that tick haven't gone off – they're not loaded. You want it firing. Now do you understand?

Now, how much is a fire? How much is a fire? How frequent must the goal fire in the three reads?

Well, let me tell you one of the things: You can work a pc up into an anxiety so you can get a rocket read, a half rocket read and a no read. You say, "To catch catfish." Rocket read. "To catch catfish." Half a one. "To catch catfish." No read.

Well, what's happened?

Pc is sitting there saying, "Did it fire?" You know? "Heh? Well, did it?"

You know, you say, "To catch catfish. The goal fired."

And the pc says to himself, "Did it fire?" You know?
Then you say, "To catch catfish," next time and he half hears you.

And he's got the goal somewhat suppressed. And then says, "Well, God almighty! It isn't firing!"

And by the time you've read it the third time, of course, it's totally suppressed. That's the end of that.

Then you start in again and this makes the pc very anxious.

Mostly what you do wrong – and this is pretty uniform – is you don't keep a pc genned in. You run a secret on the pc. You run a withhold on the pc about what's happening. You can tell him with perfect honesty as long as you put in enough hope factor. That hope factor is quite important. You say, "Well, we'll get this thing to firing. Oh well, we'll get it to firing. Well, let's brush this one up and get it to firing so we can get going here," see.

Now, take any of those frames of mind and oppose it to this one: "Well, I'll see if I can get it to fire. Well, I'll try. You know, oh - 'to catch catf-.' Doesn't look that good to me." [sighs deeply] "All right." That's a no-hope factor-a no-hope factor.

No, you keep it riding – even if it doesn't fire. Why, you know this is the pc's goal. The pc has been getting pain on it and that sort of thing and it didn't fire. So you say, "Ah, well, all right, let's get this stuff off of it so it'll fire." Pc sparks right up and gets the stuff off it and it fires again.

"Well, I don't know whether I can get this thing to fire or not. I had an awful time with it yesterday. And I don't seem to be doing very good with it." That goal won't fire. In other words, you can predetermine whether or not the goal is going to fire by your attitude of getting the goal to fire. Got that? You predetermine whether or not the thing is going to fire by your attitude toward the job of getting it to fire.

This isn't necessarily true totally, but it also applies in finding goals. You get too desperate about finding a PC's goal and the pc will suppress all his goals. So you want to go into it sprightly. You want to go into it rapidly, brightly.

And you just, "All right, let's get the suppressions and stuff off this and get this thing firing. Or maybe it is firing today. Well, let's hope; maybe it is – maybe it's firing already. All right, all right. Let's see now: To catch catfish."

"Mm-mm," see?

"To catch catfish."

"Mm-mm."

"To catch catfish."

"Mm-mm."

"What are you doing?"

"Oh," pc says, "I just had such an awful time yesterday getting the thing to fire, you know. I'm just holding my breath. You see, if I hold my breath just right, like that, the goal will fire." See? "If I don't hold my breath, the goal won't fire."
Sometimes you can say, "All right, now the way to make a goal really fire is you hold that cigarette lighter in your hand there back of the can. And that's a good luck charm and that'll make the goal fire." And sometimes it will. [laughter]

You follow your natural bent of, "What the hell are you holding your breath for?" Or even if you say it, it's better than nothing. But don't say to the pc rather patiently like they're a small child, "Well, you don't have to hold your breath to make the goal fire or not make the goal fire. Now I'll take care of that." And so forth. That's reassuring, maybe, but it's on the wrong side of the ledger. No, give them something that they will consider ridiculous or take seriously. We don't care which way it is, now. Do something effective, in other words. You influence the firing of the goal. You know that you can make one fire through all of its suppressions and everything else? It'll just fire – naked, all by its lonesome, right out into the blue.

You say, "Well, all right, now, I'm going to read the goal so it will fire. 'To catch catfish.' That's firing real well. Thank you very much. Now we'll get on with the listing." That would be pretty short, wouldn't it? Well, you actually, the auditor, determine how short that will be by your attitude, your strain, your worry, and your lack of assurance, and so forth – and your lack of hope.

You want that goal to fire. All right. Then have it your intention to fire the goal. That isn't because you make the goal fire; that's because you intend to take responsibility for its firing. As long as the pc takes responsibility for the goal's firing, it won't fire because the pc is sitting there in a total, "I've got to do something. I've got to do something. I don't know what I'm supposed to do." You hear every pc say this: "I don't know what I'm supposed to do in order to make the goal to fire. When you say this I don't know whether I'm supposed to sit here and not hold the cans, to hold the cans relaxedly, hold the cans carefully or if I'm supposed to sit up straight or so on and so on; if I'm supposed to think something, if I suppress something I'll suppress it, if I don't think something I won't suppress it." You know the pc's frame of mind is pretty ghastly right at that point, see?

But why? Its only ghastly because you're making the pc take responsibility for it.

"Now I'm take full responsibility for the goal firing. You just sit there and relax. 'To catch catfish.' That fired beautifully. All right, we'll go on into the listing session now." That would be the shortest one on record, wouldn't it?

Nevertheless, when I say fire, I mean fire. Any goal will rocket read. Now, you can't expect a goal to rocket read three times in a row if the pc suppresses the second one and cancels the third one. See? That's too much to hope for.

So therefore and thereby, your action in getting a goal to read is in the direction of effectiveness. Don't harass the pc, don't worry the pc about it, but get that goal to fire.

Now the pc says, "Well, I have a whole bunch of items and let's not fool with the goal today."

You say, "Well, all right, let's not fool with the goal today. Good. Then I'll just read it once and you just sit there. PR get it to fire. 'To catch catfish.' That fired. Fine. Give me the items." See?
See, you did what you were supposed to do. You would be surprised, if you will take responsibility for the goal firing, how often it will fire. And if you take no responsibility for it and harass the pc for it, how often it won't fire. You get this?

I'm just telling you some of the little tricks of the trade. This is completely aside from Big Tiger, which we will have other talks about and lectures on.

But, I've got to tell you that sen – sensation – this is the result of the pc being slowed down and not being permitted to list. And you can list a goal straight forward into total sensation. Now, I've already told you that. It gets to an all-sen proposition. Now, all sensation and the bank beefing up and the pc sick and nauseated are signs of a wrong goal when they're all present. But you can actually list a goal into all sensation without the bank beefing up and without the pc sick and nauseated. And when that condition takes place that is just knuckle-headed auditing. That is all. That's just preventing the pc from giving you items or being in-session. It's very easy and you can look for it.

Now, pain will turn off on a goal. Now, the way if – you tell if it's a right goal is the TA is moving and it comes down and the pc is cheerful and easily put into session, the pc looks good, looks young, there's pain on it, also some sensation, and the pc's bank is getting less and the pc isn't sick or nauseated and feels pretty good. Now, that'd be the signs of listing a right goal.

Signs of listing a wrong goal, of course, is the TA stuck up there at 4.5 or 5.0 and really stuck; pc ARC breaky, chop-chop, messed up; pc looks bad, looks old; there's no pain on it at all – it's all sensation; the bank is getting more solid and ridges are getting more solid and – outside and inside the body; pc is starting to get sick, nauseated; motion sets in – it's mainly motion – the whole physical universe starts going out of plumb and so on.

You want to know how it sounds? Just take some goal that isn't yours and invalidate hell out of it. Think of somebody else's goal and then go off into a corner and make a bunch of invalidative, critical, snappy, snarlish remarks about somebody else's goal privately to yourself. You can actually start throwing the corners of the room out of plumb. See, it's not your goal and you're gotten – getting overts on it and you can turn on sen yourself. I don't advise it, but that's – would be one way to find out how it feels.

Now, it's the responsibility of a listing auditor that he doesn't list a wrong goal. See, that's the responsibility of the listing auditor. You must not list a wrong goal! You must not do it!

So you get – this 114-line setup is very carefully squared away on this basis: because it's Tiger Drill buttons, you're getting a sort of a running Prepcheck anyway which makes the goal ease up.

Now, that's fine. And if you get the goal firing at the beginning of every session and at the end of every session, the possibilities of your auditing a wrong goal drop to nothing. See, just by the fact of following these rules: get it firing at the beginning of every session; get it firing at the end of every session – of course, it's just going to tiger drill out of existence.

Now, a goal that disappears without producing a free needle on the meter was the wrong goal.
A goal that only rock slams and you can't turn on any rocket reads of any kind is probably a wrong goal.

A goal that ticks only when it's protested – these kind of things – when you only get the Tiger Drill buttons are out, does the goal read. These are the symptoms of a wrong goal.

And you mustn't list a wrong goal. So therefore you must get a goal firing before you list. You get this? See, when we mean fire, we mean rocket reads. Now, those rocket reads will reduce in size as a goal is listed, quite rapidly. They'll come down to about half the size. A good rocket read is about an inch – three-quarters of an inch, let's say, that's a nice rocket read. Three-quarters of an inch. All right.

Your rocket read on that goal will reduce quite rapidly by reason of being discharged to about a quarter of an inch. You – but you still got a quarter-of-an-inch rocket read. It's not quite complete but it's a rocket read. It starts out very fast and decays very rapidly – the motion of the thing. And it strikes to the right on the fall side of the E-Meter. Rocket reads always strike to the right.

Those that strike to the left are just the reverse side of a rock slam. And you push them just – they're wrong goals always – you push them just a little bit further, they go into a rock slam. You push them just a little bit further and the rock slam drops out; they tick, you clean up the buttons and they're gone. That's the usual course of a goal which at first reading strikes to the auditor's left as he faces the meter.

But you actually cannot forecast whether it's the right goal or the wrong goal until it has been made to fire properly.

Now, if you demand that a goal fires three times in a row, exactly right, with the pc sitting there without much faith in you, holding his breath like mad, worried stiff about the fact that you may take his goal away from him, you're nuts. You're just expecting the impossible. Don't you see?

But one way to do it is to put the goal in a sentence: "On the goal to catch catfish, has anything been suppressed?" Well, it read didn't it? But just because it only ticks in that sentence is not meaningful either, because you haven't got enough intention behind saying the goal. You understand that? That's no sure cure, but you notice the goal is reading within those sentences – feel fairly safe as you're tiger drilling.

You'll see a lot of peculiarities about goals. But don't expect that a real goal comes up, reads three-quarters of an inch, right on through to the day that it goes free needle, all of a sudden vanishes then and free needle ensues, because they don't. The course of a goal is more or less this way: a course of a goal is not down to tick. The course of a goal is full rocket read and often, as the pc isn't suppressing or being careful or something else, you can tell it's a goal because it's got a nice full rocket read. You list a few sessions or a couple of sessions, and so on, you've got maybe a quarter – half a rocket read, something like that.

And then the rocket read starts to fall uninstant. It's kind of a slow rocket read but it's a rocket read and then it fires late or it fires early. It isn't firing instant anymore, you see? It isn't totally connected up with this goal. You see how that is? And then it starts degenerating and subsequent sessions – to a flick and a tick and a sudden rocket read that is maybe an eighth of
an inch long. See, it's almost undetectably a rocket read, don't you see? Just tick. And you run
an Instructor's check is the only way to tell it at this time. You got to make sure, by that time,
that it hasn't got any of these active buttons.

The active buttons that produce a read that looks like the goal read are the buttons of
the right. And the buttons of the right are: Invalidate, Suggest and Mistake. And also, of
course, with Suggest comes other things such as Assert and with Mistake, comes in Big Tiger,
becomes Protest and so forth. But you've got the three buttons to the right.

All right, they will produce a read and they can make any goal read. You say to some-
body, "I heard the other day that you had a goal to be an Odd Fellow and you know I think
that's the worst goal I ever heard in my life. A fellow who has that must be crazy!" You put
him on the meter and say, "To be an Odd Fellow," and you're going to get a tick.

Then you say, "Has this goal been invalidated?" Invalidate will tick. You pull the in-
validate off, read the goal again, "to be an Odd Fellow" and it won't tick. Were you aware of
the fact that you could do these things with a goal?

Voice: Mm-hm.

See?

Well, all right. So you have to be very careful, if you can no longer get rocket reads on
a goal – that is say it's listed too long – to do an Instructor's check. And you have to learn to
be glib. You say, "On this goal has anything been Suppressed, Invalidated, Suggested, With-
held, or Mistaken?" Get no reads on any of them, say the goal, "to catch catfish," at once – get
a read on it, see. You have to read it burrrrrrrrr – pow! Put the goal right on the end there and
get the goal – pow! Aahha-heh! You read it all during one line and the pc didn't have a
chance to do anything, and you read it fast enough and he didn't have a chance to get in there
and louse it up. You read it one minute afterwards and it isn't firing, you see? He's suppressed
it.

The buttons to the left are Suppress, Careful of and Fail to reveal. And the characteris-
tics there, most associated with these things is: Suppress is no read; Careful of is no read or a
rock slam – also Invalidate will produce a rock slam – but Careful of very often goes into a
rock slam and Fail to reveal, which has a small dirty needle connected with it – it's an instant
dirty needle, an instant tiny rock slam.

Now those are the buttons of the left, but they take a goal out of read totally.

And the buttons of the right put a false read on the goal when there is none or steal the
read of the goal. Got that?

The read actually disappears over here on the buttons of the left and a read can be
made to appear with the buttons of the right.

The buttons of the left are Suppress, Careful of, and Fail to reveal. And the buttons of
the right are Invalidate, Suggest, and Mistake. See?

Well, you wack-wack those things back and forth against each other and so forth, and
you'll do fine. Now early on, then, it's easy to get a goal to read and as the goal is listed, it
disappears down the line and you've got to be very careful to give it an Instructor's check. Got
to be able – you got to learn how to say, "On the goal to catch catfish, has anything been suppressed, invalidated?" You see, right straight on down across those buttons *brrrrrrr*. "To catch catfish," See. You got to learn to say that. Suppressed, Invalidated, Suggested, Missed – Withheld – because I've given it to you, see – and Mistaken. You got to be able to say those with no read on any one of them. See, there's no read appears on any one of them and a read does appear on the goal. And that's the – called the Instructor's check. You can always tell if it's a right goal. You get no read on any of those and a read on the goal. And that's actually, later on, the only way you can tell a goal. You've got to make sure there's no read on any of those, see. You can even be fooled by that occasionally. He invalidates it before you get to Mistaken.

But if you're going to give that check, remember to get Withheld, not Failed to reveal, and Mistaken or you can't say it in sensible English. You have to clean on your Tiger Drill, Withheld; and you have to clean on your Tiger Drill, Mistaken. Those are the versions that you can get all into one sentence that will make sense.

If you get no read on those and you get a read on a goal, that's the goal, man. You're all set. If you get reads on those and reads on the goal, of course, the read on the goal is the read you got on those and – on one or another of them. Or the absence of read on the goal is because Suppress is hot. You see to how this little cat's cradle works out very neatly?

The only way you can tell a goal that's gone along the line for a long time is with an Instructor's check. That's the point I'm trying to put over to you. There's a HCO Policy Letter form on it – possibly could be modernized a little bit.

All right. Now, the reading of the goal must occur before listing. And this will prevent you ever listing wrong goals.

Well, so you listed it wrong. You listed a wrong goal three days running. Well, that meant you tiger drilled it six times. You got it to read at the beginning of session, you got it to read at end of the session. By getting it to read at the end of the session, of course, you wipe out all the nonsense that might have occurred during the session on mistakes and all of that sort of thing and suppression on items. By doing that you obviate further Prepchecking on this unless the pc is really in trouble.

Now, a goal that ticks with a high tone arm – stuck. The goal ticks and the tone arm is stuck high. Well, you better explore this goal. You better look at this goal over pretty darn good. And you better find out what were the conditions of its finding. That's the first thing you want to look for on some spook line like this. What were the conditions of its finding? Did the auditor say, "That's your goal!" and the pc say, "No that isn't my goal."

Or just before the auditor read it off the list, the pc saw it upside down on the list and says, "You know, that's too – that's too much recent times. That's – that's – that's much too recent a time track area to be a goal."

And the auditor gets to it and reads it, doesn't pick that up and said, "Well, that's your goal."

And the pc says, "No, that's not my goal."
And the auditor says, "Yes, that is your goal."

And the pc says, "Huh-uh, that's not my goal." And, boy, you know that goal will read for months and years.

You got to go back and get that. See, you've got to get that Assert versus the Protest. You got to get the Suggest and the Protest off of that thing. That's a mistake, man, so that has to be big tigered out. You have to take it out with Assert and Protest. Now, it could be in reverse. The auditor says, "Well it can't be your goal because you're a woman and it says that the goal is 'to be a man,' and you're a woman and it can't be your goal. See?"

Some auditor, way back, and he did this assessment in upper Kokono County or something and it was done by an ex-PE member, you know. Now, this thing is really goofy.

And by God, you run across it in a session and then this is never uncovered and nobody does anything with it – you know that goal will read. The only thing weird-looking about the goal is it never rocket reads and it always ticks with the same tick. Or it always goes squiggle – with a little dirty needle. Squiggle. Bzzzzzt, bzzzzzt, bzzzzzt. And it never does anything else.

Now, a goal which is in solely by virtue of ARC break has a constant read. Real goals have a variable read. Got that?

So you see a goal that always ticks, no matter what you do – you read it to the pc with the pc asleep and on the cans and it still ticks. No matter what you do or how you read it, you always more or less get about the same read. Boy, you'd better be awful suspicious because that is not the way a goal acts.

A goal goes in and a goal goes out, and a goal rocket reads, and a goal ticks and doesn't read. And it does this, it does that. And the pc gets very nervous. And then you read it and it doesn't read. And then you read it and it reads. And then you clean it up and it goes: tick, splash, dirty needle. "Huuuh!" you say, "That's good. That's a real goal." You got the idea?

But the one that goes – always goes a thirty-second of an inch tick and a thirty-second of an inch tick and you say, "Oh, hell, this isn't your goal," and read it again and it goes with a thirty-second of an inch tick. And you clean that up – what you just said – and it reads with a thirty-second of an inch tick. You get the idea?

Goals aren't built that way. So the charge of "too constant" can be levelled at a wrong goal. And you get down to figure this thing out. Wen, this pc has listed it, suppressed items, done everything of this sort, has gone around trying to tell people that the goal must – this is actually a case – the goal must not be listed with "your" in the line. Actually the line would never clear; the line was protested. Every time the auditor read it, the pc protested the line. That line would never go clear until the protests were taken off of it. You understand? There was a "your" in it that shouldn't have been in it. There it was.

All right. An auditor says, "Well, I can't get this to go out. I guess that's your goal."

And the pc says, "What – I never even put it on the list. I've never heard of it before."
And then, of course, every time somebody tries to list this thing the pc said – tries to tell the auditor, "Look, this isn't my goal, I've never had this as a goal. It just came in this way, and I've just never had it."

And the auditor says, "Trying to chicken out." And consists [insists] on listing it, see. Hey, you know that confounded thing will tick and it'll tick and it'll tick and it'll tick but it always ticks the same tick. See how that constancy gets built into the goal?

Now, you – it doesn't take any vast Prepcheck to strip this out of the goal. Let's just get slippery, let's be good auditors. What do you got? You got a chain? You got a basic on the chain. What's the basic on the chain? First time the goal ever appeared to the pc's attention. When was it? What happened? Bzzztt-bzzztt. All right. The whole thing will rip up and it will no longer read. That goal is out. See? Nobody expects you to sit there by the hour to find out if it's a wrong goal. Let's get smart in our old age, huh? In other words, it doesn't take forever to tiger drill a goal, is what I'm trying to put across to you.

Did you ever hear of directing the pc's attention?

"What happened when this goal was originally found?"

"Oh, well, a lot of auditors have gone into that. And I always tell them all the same thing: It's not my goal."

And you say, "Thank you. Thank you. Now, what happened when this goal was found?"

"Well, I always tell auditors it's not my goal. 'Tisn't, and so forth."

"Yeah, thank you. Thank you very much. Thanks a lot, I got that now. Now, what happened when the goal was found? When was it found? When?"

"When? Oh, it was found last summer."

"All right. Good. Thank you." Got him talking. Ha-ha-ha-ha-ha. Got him to answer. We'll take him right down to the ARC break that makes that thing read. Ha-ha-ha. They go bzzzzt – no goal. See?

Or if it is the pc's goal, even though the pc said it wasn't his goal, and so forth, it'll start rocket reading when you get the basic disagreement off of it. In other words, a goal can read by basic disagreement as well as by rocket read, but a real goal reads occasionally by a rocket read. Once in a while it reads by a rocket read – once in a while.

So you'd better see a rocket read before you start to list. Got that?

Now, as you sail down the line, one card at a time – you've got the cards all stacked up in front of you and your derringer laid along – oh, no, that's another game. You got the cards all stacked up in front of you and you got your pencil ready and you're reading off the line – now, the first time you go through these things take them up with the pc and... Doggone you, don't get in any arguments with the pc over these lines, because it'll act just like I've been telling you about the goal. I've been putting on the coal about how invalidation or protest or something can make a goal read forever. Well, it'll do the same thing with the line. And that line will never go free. And one day you'll get back there and by golly, you've got 113 lines
free, but every time you say, "Who or what would not help suppress a catfish?" the meter reads.

You'll have to prepcheck that line. You'll have to big tiger the line. Now, the best thing to do is to follow it down to the first time that line ever appears and you'll find every time, exclusively, that that line was the subject of a roaring argument that wasn't pulled in the session.

So if you get into an argument about a goal, let's get the argument off the goal. And if you get into an argument about a line, let's get the argument off of that line – both the right wording and the wrong wording.

Well, we had a pc around here for a while that went out and told everybody his goal was plural. And his goal was actually on the list as singular. And nobody prepchecked or nobody tiger drilled both the plural and singular goals because the singular goal may have been the right one, but that being the right one was the only one that was prepchecked or tiger drilled. Do you see that as an error? You've got to take both of them. See, you've got to take the wrong line and the right line. You've also got to take the wrong ...

Supposing the pc had a misapprehension. He thought his goal was "to secure elephants." He went around telling everybody his goal was "to secure elephants," when as a matter of fact the goal was "to keep elephants." Hey, this puts a bad mistake on it. He finally finds out his goal is "to keep elephants." Well, if you let "secure elephants" ride, you're going to have the goal line messed up one way or the other, because he isn't sure now. You've got to tiger drill this goal to "secure elephants" and it'll go out just in that much Tiger Drill. See? It's just out right now practically if you pay attention to this fact.

So you get into an argument when you're writing up lines on a pc and giving him lines and constructing lines and boy, you've had it. By the time you've added five or six versions of this line and tried to shove each one of them down the pcs throat and the pc has protested each version of this line, you have now six versions that will have to be tiger drilled in order to make the line go free at the end of processing. You got it?

So, don't be a knucklehead, man. You can dig your own grave. So just don't get in arguments about lines.

How do you keep out of arguments about lines? Well, you're supposed to sit down and compose the pc's lines, originally, in the first place, so they'd make sense.

All right. Look them over. These lines – the old lines, the create lines, the fifty lines, and so forth – were too hard for auditors to do. This has got enough lines so that a few inevitable errors that will steal into somebody's line is not going to louse up clearing.

When I say that, you're going to run lines five to eight on the – on the effect wording of the goal. See? All of you have been doing this. You've been listing those things as cause, see. You've been specialized in the cause side of the goal and never list the effect side of the goal. See? "Who or what would want to find? Who or what would want to be found?" And you'll neglect the "Who or what would want to be found?" And you say, "Who or what would really want to find?" and think you've got the effect in, see. It's not, see.
Well, you could make that mistake and it's still an answerable line and the line could still go awry and you'd still produce a Clear, see?

So I've built in a bunch of possible errors. But this one can't be built into anything. Get in an argument with the pc about the lines. Oh, no! See? You come to this thing and it's – you come to this thing and it's: "Who or what would goaling (blank)?" and you're running Suppress. See? And the goal is "to be" and you say, "Who or what would 'to be' (blank)? Who or what would 'to be' suppress? To be suppress. Well, all right. Yeah, we'll leave that in. Yeah, that looks all right." You've got to clear these things the first time you take them up with the pc.

Don't – you list a line – the first time you're going through these lines you take it up with the pc, then you turn it over and you take up the next line with the pc. In other words, you've got to clear those commands. You just ask him, "Is this line answerable?" And if it's not answerable don't get into a dog's breakfast on the thing. Make the changes he says unless it knocks the whole thing into a cocked hat and then delicately point this out. But, man that's delicate. And if you invalidate, run it off right there: "On this line has anything been invalidated?" You got it? Don't leave it sitting around because the line won't go clear.

Get in – if you do get in an argument about a line, tiger drill the argument, tiger drill the line – right now. Don't let it pile up because it won't ever list.

You say, "Who or what would 'to be suppress'? Doesn't – isn't grammatical: 'to be suppress,' so we'll put it down: 'Who or what to be suppressed?' No, that isn't right. Well, I'll take it up with the pc because I don't understand it and maybe the pc will."

Well, that's wrong thinking – you'd better take a look at that thing.

Many of you've turned sen on organizing some other – some pcs lines? You do to some slight degree, you know. It's all right – runs out.

But you can do anything you want to with a wrong goal except list it – on yourself, you know, I mean. You say, "Who or what would beingness suppress? Who or what would beingness suppress? Who or what would being suppress? Who or what would being suppress? And then we've got another line here: Who or what would suppress being. Oh, well. Who or what would be suppressed by being?" And then, "Who or what would be suppressed by being – no, that's the same line. Who or what would get suppressed if you were? No, that isn't right. Who or what would be suppressed? Who or what would get suppressed if you be?"

And you finally make up your mind to what it is. See? You come along and the pc takes a look at this – he's already wogged; don't give him too much of a one to run into. And he: "Who or what would get suppressed by be?"

"By being," he'd say, "being is right."

"Who or what would get suppressed by being?" All right. All right. We'll answer it that way.

The funny part of it is, you're not going to go too far wrong. You're going to go much further wrong if you involve it in an argument. Got the idea? Make it so that you yourself can
think of an answer to it without self-auditing on the thing. And then if the pc says he can't answer it, then doctor it up so he can, but avoid arguments on the thing because this thing is listing in wealth of lines. You've got enough lines here so that you've got a wealth of lines. You've got lots of them. Unless, of course, you muck them all up with an argument and if you do that, then he'll never go Clear.

Now, if you want to know why some line isn't going clear – 113 lines are going clear but, "Who or what would worrying – who or what would worrying be?" – that line, he's always had trouble listing it. "Who or what would worrying be?" He always seems to have trouble listing it. The line isn't going clear; the line is stuck.

You'll finally find out that you don't have to clear that line. What you have to do is tiger drill it: "Who or what would worrying be? On this line has anything been suppressed?" See? Tiger drill it. All of a sudden the Tiger Drill comes out and the only thing that was holding the whole line in was not the items left on it because they evaporated out from under it on other fronts. Yeah, the only thing you had left on it was a stuck line.

Now, at the end of listing, what happens? It's just lines, one after the other, go free.

What do you do with a free line? Well, for the sake of formality, you can ask them to give you a single item as you go by them or you can say, "Well I'm just testing this – see if it's free and if I get a reaction here you can give me an item. Is that all right?" And you read the line, but you don't press this on past a free needle.

And when they're all nice and free, when all the lines are free on the thing, another phenomenon should take – took place and that is, the goal should kind of go "pop." Pc will have some cognitions concerning the goal. If these cognitions concerning the goal never occur, the goal is still in.

"I thought it blew today." You will get so tired of hearing this from pcs, you could spit. They come into session every morning and say, "I thought of a couple of items last night myself. I put them down here on a piece of paper and I know it blew the goal. I felt it go."

You put him on the meter. The tone arm is at 7, you see. [laughter] They're always feeling it blow. Well, when it really does go, then they don't feel that it went – they don't. They'll say, "Well, when I was there – oh, I won't give you the cognition. Heh-heh-heh-heh-heh. I won't give you the cognition. You'll have to find that out for yourself."

Now anyway, there's the extent – the extent of listing and I've tried to give you the conditions under which listing should be done; what you're supposed to do and the purposes of it.

If you find out that trying to get the goal to fire at end of the session is too confoundedly difficult and that sort of thing, well for heaven's sakes, the next time you tiger drill it, take it before the date of the session. See? Take it since Wednesday if your session that you couldn't – didn't have time to finish really getting it to fire at the end of session – that was on Thursday. Well, the next time you tiger drill it on Friday, take it from Wednesday. See? "Since last Wednesday, on the goal 'to catch catfish,' has anything been suppressed?" In other
words, clue the other session in that you didn't get it to firing and you'll have very little trouble if you keep this going.

Now, all the preventions I can think of are in this, all of the actions. The goal itself is very meaningful to the pc, very precious to the pc. The pc figures the wording of it and so forth has got to be very exact. But in the truth of the matter you can almost have 20 percent of these lines written wrong as long as they make some kind of sense and could get some kind of an answer and the pc will still go Clear.

Now, there's the Tiger Drill and tigers must be fed, so we have the rabbit effect. And the rabbit effect is, of course – the girls probably won't understand this too well, but the boys do – I mean, the rabbit effect, of course is – it's very suggestive because it breeds lines. See, that's why it's a rabbit effect. You got a rabbit. The pc is – he's had this minuteman – minuteman. You know? And does a minuteman fit here? No, it doesn't fit there. Now, a minuteman, a minuteman – he's always had this minuteman. He finally tells you that minutemen subvert. Oh well, give him a break, put subvert on the list. That's how you handle a rabbit effect.

Well, what would be the relationship of a minuteman to the goal so that you can't get it on the list?

Well, he'd subvert things. Wouldn't do anything else. He wouldn't damage and he wouldn't agree with and he wouldn't destroy and he wouldn't create and he wouldn't withdraw and he'd subvert.

Well, that's only when you get a spare item. Don't get inventive unless the pc gets in trouble. The rabbit effect will then take place and breed you out of existence, because it immediately and instantly gives you six more lines. One rabbit gives you six more lines.

You say, "Well, what does a minuteman do to beingness?"

"Well, he subverts beingness. That's the only thing there can be."

Now, I wish to call to your attention that a lot of old ghosts have arisen and that Routine 3 really is Routine 3. And this is all very amusing, but you're looking now at the reentrance of the Prehav Seale back into Routine 3. This is a bobtail version of the Prehav Scale and I studied the Prehav Scale for a long time to find out what buttons on it were important in goals. These buttons certainly are.

The most important buttons are, of course – are ordinary Tiger Drill button. But these buttons would be very important to run.

Now, you can change the sense of this by changing – by – well, take Agree with – Agree with: "Who or what would a rabbit agree with?" "To be a rabbit" is the goal. "Who or what would a rabbit agree with?"

And pc: "Got to get it off – got to get that – in other words, it's to – to – yeah, I can answer that. Who or what would a rabbit agree to?"

And you say, "All right. Well, give me a sample."

"Well, he'd agree to a rabbit feeder and he'd agree to this – he'd agree to various types of forms. To agree with – he wouldn't agree with anything at all. He'd only agree to."

SHSBC TAPES 201-300 349 04.02.15
All right, use "agree to." See? Don't get involved in an argument on the thing – pc won't lead you too far astray.

Now, that's about the – that's actually – with the data that is in this bulletin, which hasn't been fully covered and the actual lines themselves, the actual buttons themselves, and a few other things such as your Model Session – just about wraps up how you do a listing session.

I have tried to give you the one thing the bulletin doesn't give you – that is, how you ask for them and what you do and how the Tiger Drill works and what – what you handle and then what's important about a listing session and so on.

There's only one thing I haven't said. I haven't said whether you bring the list into parity finally or not and somebody's going to be worrying about that. Well, if the pc goes free needle on all lists without you bringing them into parity, I am very happy. But your ticks will show you that a pc, if he's jamming, is probably jamming on these items that don't have any ticks on them at all. And the main ones that you've got to keep parity for are the first twelve. They've got to be in fair parity. They've got to be of somewhat equal length.

But you'll find out that he inevitably scouts "oppose" all the way through. And that line on final test on 114 lines for free needle, sticks. You can go through those cards and find out, well, of course it sticks. He never listed anything on it, so there's something wrong with it or he never gave you any items for it.

So you straighten out the line. "Is this line answerable?" you say to him.

Well, give him a clue. You know? You say, "Well, all right. I'll take that as an answer – nothing."

"Oh," he says, "that is an answer, isn't it?"

"All right. Let's give me some more," See? And coax him out and bzzzt and bow and bang and bang and bang and bang, and zooooom! And all of a sudden this hold-out line will go free – merely because you can see very clearly its wording and the fact that it wasn't listed very much, so there must have been something happen to it.

And at the end of clearing, which is the end that you'll be worried about, you'll find out those lines won't go free that haven't got anything on the cards. And there's something wrong with their wording, so a good auditor can take those cards and he can straighten those cards out and he can straighten those lines out and he can find anything and he can get the few items left on them. And he can actually take everything else out of the deck, except those few lines that didn't have very much on them; bring those things up to date and they'll go free needle, too. Savvy?

So you need that for your tally work. So that's the way that thing is put together. It's more complicated, perhaps, than you might have wished.
There have been people that since 1950 have been dreaming that they won't have to take any responsibility or have any auditing or get off any – I think it's to get off any with-holds – in order to get a Clear.

And somebody would walk in with a horse syringe and thrust it into the gluteus maximus, press the plunger authoritatively, and they would go "Whee!" and they would be Clear.

Well, I can call your attention to the fact that man has been trying to clear man in this way and with other things for a very long time and it has yet to be effective.

Now, even though this is a little more complicated than you would ordinarily look for, compared to a horse syringe and so forth, why, you aren't spared any of the difficulties that you would be spared with a horse syringe because the pc will scream on these lines, too.

Every once in a while the pc will let out a piercing little "Yeeeeeep" you know. And sometimes the pc falls out of the chair and writhes on the ground.

So what? You'll find out the pc will go Clear if listing sessions are done somewhat as I've told you tonight.

Thank you very much.
Well, this is the what?

_Audience_: _The 4th. October 4th._

Four Oct.?

_Audience_: Yes.

You fall into my bad habits. Four Oct. AD 12, Saint Hill Special Briefing Course, lecture number one.

A footnote. No, I'll talk to you about it more than a footnote.

For a long, long time we've had dissensions and upsets and casualties and so forth over the past twelve years.

Dianetics and Scientology looked like a battlefield, you know. It's coming out of it. Things are much more even. Things are much more easily handled. Things are smoother, but we still have occasional upsets here and there.

I gave you an HCO Bulletin the other day that had to do with new Security Checks. I'd better talk to you about the use of that bulletin.

The bulletin, of course, is valuable in two directions. One, it points the way to a resolved case and that's the most valuable. And on the other fork of the road, points the way to peace and quiet while we get the cases cleared. And these two directions are highly desirable, but one complements the other.

Now, for a very long time we have tried to find out, very often in vain, what obsessed or ailed somebody or something – what was making them nervous and why they'd suddenly revolt and do things and cut their own throats and that sort of thing. And there are quite a few dead men on the backtrack, quite a few dead men on the backtrack – there really are.

And how'd they get that way? What had happened? Was there any international group that was closely and devotedly opposed to the advance of Dianetics or Scientology? And the answer is no. There are a few psychotic activities around on the planet that would be as antipathetic to the grocer's goodwill as to ours. There would be as many people affected adversely across the planet as ourselves if some of these happy philosophies were put into terrific use; political philosophies.

There's another one which says anything you have should be – if you are working hard – anything you have should be shared with somebody who won't help you. That's socialism.
That's a nutty philosophy. If you work real hard, then somebody else won't have to work. And of course, this is represented as "everybody will have leisure." Except those, of course, who are keeping the society going and keeping the leisure possible.

Well, this of course is dead in the teeth of even Pavlov. It's the non-reward philosophy, you see. If you work, you are fined and if you loaf, you are rewarded. Well, what will that turn mankind into but a bunch of loafers? You see? I mean if you – if you know Pavlov's philosophy of the reward theories and so forth – how to make the dog slaver at the right times – if man is an animal and if that works, why, this would be death in the teeth of it.

There are political philosophies about, of course, which are the extreme of this. And that is to say that one man should own everything and everybody else should be in total poverty. Now, that philosophy is highly antipathetic to the greater good of the people, too.

A capitalistic system where you have a group of fifteen or twenty people in a country… Well, Mexico: They're very rich in Mexico; they're extremely rich. But South American countries just love this philosophy – there's the ricos and the pobres – and boy, the ricos are really rico, and the pobres are mmmm – really pobre. And the gap is so tremendous. There's no middle class; there's no anything. And you're either a slave or a king with no gradient scale between them and of course that's a highly false philosophy, too.

And there are others. There's a philosophy of democracy, so that the mean opinion is valid. Oh, I don't know, you take a whole bunch of uninformed people and take the mean of their opinion and then say that that mean is valid and therefore disregard it and then do things and tell them it's their fault. That's democracy in actual practice, see.

It's the perfect mechanism to prevent revolt. No better one has ever been invented. It's a self-perpetuating machine that is pure idiocy – an American president – they put up two goons which you wouldn't let clean out your chicken coop – and you're told you're free because you can vote for one or the other of them. [laughter] And then if everything goes wrong it's your fault. See? It's a great philosophy.

Well frankly, all government, of course, is merely a substitute for the disability of a people. Government is a substitute for the disability of the individuals in the population.

In the absence of an understanding of the human mind, government becomes inevitable. If you don't understand what makes man tick, you inevitably have government. And you have as much government as there is crime, till the whole government is crime.

You see the logical arguments? They say, "Well, well, you need a government. Should have a police force. Should have this, should have that, should have the other things."

"What are you going to need a police force for?"

"Well, you need a police force because you got crooks."

"What you got crooks for?"

It's inevitable that if you have a police force you'll have crooks. That's been proved out time and time again.
A little town down in Texas proved this not too long ago. They had a jail and they had a deputy sheriff or two and they had crime. A little two-bit town – spit across the city limits from one to the other. By George, economics got so bad in that community or politics got so rampant or the town was so small, it was so unimportant, that they removed the police force. Well, they removed it on a gradient scale. I think they took off one cop and left one and they had half as much crime. Then they removed the other cop and they had no crime. There hasn't been any crime down there since.

This is an interesting look – because the game of cops and robbers…

Well, look what they do. They arrest a fellow, put him in with – association with a bunch of criminals that really teach him how in prison, and then after a few years release him, and on to the public again, you see. Now he's educated. See? Now he's got a motivator. Now he's really a good criminal. This is the way it goes.

And this is a – I'm not just being bitter about it – it's true. Police forces have nothing in common with public safety. Now, if you're going to have crime, you will eventually get some people together and they will say, "We will hire somebody to protect us against this crime."

And then you say, "Well, there's some enemies on the border." So a bunch of people will get together and say, "Well, let's have an army." Now they've got a police force; now they've got an army.

And somebody's house burns down and they say, "Well, let's have a fire department." And they go on like this very interestingly.

Funny part of it is, that police forces, armies, fire departments and so forth have, all of them at one time or another run on a completely private basis. There's nothing the government does that has not been done privately at one time or another.

Well of course, the more government you get, the less liberty you're going to have, inevitably, because it – they're not producing. The government is a non-producer and you get more and more government, you're going to get less and less liberty, because the laws they pass against crime apply to you, who in theory – honest – hired them, you see. The next thing you know, you haven't even got yourself anymore and you've gone the whole cycle of idiocy.

But there is no international group that faces Dianetics or Scientology except to the degree that aberration faces sanity. And you get an auditor in there and he's doing a mediumly good job of auditing. He'll still have a bit of trouble with a psycho; he'll still get clawed up. Now, he will eventually, also, come out on top even if he's just mediumly good. An excellent auditor of course never does get clawed up. And of course, as a group we are moving forward now toward a higher and higher level of excellence in technical application. We know more and more about it; we know more and more about the application of these things. You would be amazed how the principles of auditing work when used in life and so forth – if you yourself haven't had a recognition of that already.

Well, what's all this leading to? No, the only enemy of man is the aberration of man. There's no international group which faces Dianetics and Scientology and means to plow us under any more than any other international group would tend to rave at the auditor. It's like a
psycho pc. Probably one of their biggest objections is the fact that we aren't auditing them, something like that. Normally, by the way, you figure that with a pc and it'll be right.

Some fellow at a dinner party and he's clawing you up because you're one of them Scientologists and he had a psychiatrist once who he dearly loved or something. And therefore, you're a dog and so forth. Oh, the only thing this person is asking for is auditing. I always assume – well, he wants to be audited, you know. Chews me up one way or the other – well, he wants auditing. All right, wants auditing. Voilà. I'll give him auditing. And they always quiet right down, too.

The only thing they want is relief from their own misery and agony. Now, once you've embarked upon a course of doingness sort of thing, you're for it unless you do it. And in times past when we have not executed our commitments, we have been in trouble.

Now, there's somebody right in this room right now that was awful mad at us a very short time ago before some auditing was given. But the reason of the anger is the auditing wasn't given, although this was never stated by the person.

You see that? I mean, the person was upset really – they had a whole lot of representations – but was upset really because you didn't understand the person and weren't auditing the person; weren't relieving them from this misery and agony. Because they're miserable! There is no getting around that. They're in misery, man!

Oh, you've been there, sometime in the middle of a session you felt like you were stark staring mad. How would you like to feel like that all of the time – twenty-four hours a day? And not be able to sleep much on top of it? Well, anybody that could take you out of that, you would have kissed on both cheeks. But you would have shot, maimed and stamped on somebody who could have, but didn't. See, that is the thing that is never forgiven.

So once you're committed along the line of a service, you must execute it. It doesn't do any good to tell some pc who is clamoring around, trying to get some auditing that you haven't got time, that you don't want to. It doesn't do any good at all. You'll have to go ahead and make some kind of an arrangement whereby it gets done, not necessarily that you do it. See, you have to make some kind of a solution where auditing can occur.

And in handling any of these situations and any condition which I speak of tonight in this lecture are governed by that principle. If you do that – if you do that, you'll come out all right. You've got to make some kind of arrangements whereby auditing can occur.

It's very funny, but you would be amazed what a pc… Well, let's take it right close to home; very, very close to home – right in where you're operating right now.

You're aware of the fact that the pc is screaming. Oh my God, you're the worst person that ever lived. And you're the auditor, you see, and this pc is just screaming, throwing down the cans and now that's it – they're finished. You know?

Now, your automatic technical response is you got to pick up their missed withholds and that is very, very true! Don't think I'm saying it's not true. Yes, you got to pick up their missed withholds.
But, here is something that you may not have noticed: that if you just start auditing them well, the ARC break evaporates. Now, have you noticed that?

What they're protesting against is no auditing. Now, if you sit there playing it safe as an auditor and decide that you're going to prepcheck – even a case as advanced and as rather stable as having found his goal – if you sit there as an auditor and go into some long, involved Prepcheck that does no listing and you insist on this sort of thing and the goal is ticking – pc feels all right; everything's fine – but you insist on going through this long Prepcheck, which is going to take the next twenty-five hours... Oh man, I don't know how you're going to keep that pc in the chair. I don't know how you would do it, man. I don't know!

You might get away from it – away with it for two hours, you might get away with it for three, might get away with it for a session and a half. Then the pc's going to start nattering. Then the pc's going to start to get restive. And the needle is going to start to act up even though the pc is keeping himself well in trim, things are starting to go wrong. Along about the third session, ARC breaks are awfully easy to come by – very, very easy to come by. All you have to do is put your pencil down gently on the pad, you see, and the pc will scream like mad because you have slammed your pencil down on the bare table, see. This pcs going to make an ARC break or die trying. The next thing you know, you got the thrown-down cans, the rage, the yap and so forth and if still nothing happens, you are going to get just a silent pc.

But you don't recognize that at any time all you had to do was start auditing the pc because, of course, you were doing no auditing. You were doing an unnecessary, unneeded action. See, it's a no-auditing situation. If you want to know what makes ARC breaks, it's no auditing. It isn't bad auditing. It's no auditing. You see, auditing can be conducted in such a way as to be no auditing – as to amount to no auditing of any kind.

I'll give you an idea. The pc's got his item. See, you can do this in a Dynamic Assess... but I don't advise you to do this – but I can show you how to get into trouble, fast. Pc got his item, knows that you're going to go ahead and get his goal, tells you inadvertently that he has a pain in his hip. And you start running, "From where could you communicate to a hip?" See what I'm talking about? Pc would get pretty upset.

Now, look. Supposing you did that for three sessions? Oh, man, there'd just be no living with this pc. Don't you see?

And that will happen inevitably. You must recognize, whatever other factors seem to present themselves, whatever happens to be present, that there is something even more powerful than the missed withhold. See, you can put a pc back into session with the missed withhold. You can pull the missed withholds and it's a necessary action, and so forth, but there's something more powerful than that. And that is making auditing occur or making auditing possible. See, that is more powerful. That is a stronger action than pulling missed withholds. I'm not downgrading pulling missed withholds; I'm trying to show you how powerful this action is.

Oh, I've had a pc just say, "Awrr, awrr, awrr, rum, ruaung, rarwr, uruawr, and that goes down and it's just terrible and so on ouwr-ouwr-ouwr and you pompous ass. What the hell are you doing sitting there?" and so forth.
And just say to the pc, "All right, now, if you calm down now, we're going to go ahead now and we're going to run this process here and let's get the direction of your goal."

Not another word out of the pc and nothing showing on the meter.

I just want to show you you have in your hands pure magic. Audit. See, it is pure magic.

You also have something in your hands which is pure poison, which is a pretense of auditing, without auditing. Its actually quite dangerous to be almost an auditor. It would be better to be out there sweeping the streets any day. You'd live a much happier life.

The person who is almost an auditor, but who isn't and really doesn't audit, goes through the motions of auditing, see. Asks questions that sound like auditing, see. Get a meter in front of them and do things with it just as though they're auditing. Now, if – the pc will just go mad. Remember this.

Funny part of it is, the pc will put up with a relatively poor auditor who is auditing, but won't put up with an auditor who is going through the motions of auditing without auditing. So anything I'm saying is real auditing a person – real auditing. You would be amazed what a pc will sit through. I've skipped all rudiments on a pc that obviously had to have them run and gone straight into a Dynamic Assessment quite recently. Just – zip, bap, zoom. Smooth needle, pc answering up, everything fine – boom. You see. Auditing probably across the top of missed withholds, present time problems – see, everything.

The liability was, if I weren't me, see, if my auditing in that particular case hadn't been right straight down the groove and hadn't been completely effective, I would have come a cropper. See, the absence of the rudiments would have tripped me up. If I for a moment had looked like I wasn't auditing, these things would have all flown back in my face, see. Funny part of it is, is as long as an auditor is trying, a pc will put up with it – just trying.

But supposing you did something like this: you made a pretense of trying.

And the pc has gone wog, wog, row, row, row, and there's been a bad ARC break, the pc's havingness is way down, pc feels completely in apathy and this "pretended auditor" (the auditor who's pretending to audit but not auditing) says to the pc, "Ah, look around here and find something you can have." And the pc does. And, "Look around here and find something you can have." And the pc does. You notice the pc's doing the command. And then, "Look around here and find something you can have," and then walk out of the room.

My God, you see, it's like taking a man in the middle of the desert, you see – waterless wastes in all directions – and offer him a sip of water and he takes a sip of water and then you just pour the rest of it out on the sand. See?

Hell hath no fury like a pc not audited. You practically could dish a human being that way. See, if you're going to audit, you audit.

Now, all of these things, then, that I'm talking about and frankly all of the things you think you're having trouble with, are all resolvable by the delivery of auditing. Whether these things are political, no matter what dynamic they're on – doesn't matter – they're resolvable by auditing.
If there is a great Supreme Being sitting someplace, I imagine he'd be awful happy if you came up some day and put the cans in his hands. [laughter] Just think of what he's been going along with.

Now, therefore you mustn't fall short of being an auditor. Of course, the more technically perfect you are, the less mistakes you make, why, the better off you are.

You saw a pc last night – really got thrown a curve. I was really thrown a curve. I stepped on the edge of the E-Meter and the E-Meter was springing like it was about to leap off the stand and it was shaking on the screen. Did you see the E-Meter shake at the early part? It wasn't secured. It was secured so as to be sprung, you see. Well, now maybe you weren't aware of it, but it was the pc who made it that way. He'd set up an auditing room that couldn't be audited in. Don't you see?

Now stop and think about that for a minute. Think of what this was.

Here was the pc who had done it, had fuss ed up the auditor till the auditor gummed up the front of the session, see and starts asking for goals before he starts the session because this was quite surprising to have an E-Meter suddenly start jumping at you, see.

But look, the pc had an overt. Now, there was the liability in the session, not what happened to me, you see. See, the liability was the pc was starting the session with an overt. Well, did you see me clean that up straightaway before we did anything else? And it cleaned up, didn't it?

Well, what's the difference there? The difference is simply this: that pc has confidence in the auditor and also the auditor straightened it up. Don't you see? So there is actually no great liability to a technical flub if the fundamental underlying all of this is correct, which is: The auditor means to audit and is auditing. Do you see this?

I don't know. I think there are two or three here that if they'd been caught in that exact position with a bouncing E-Meter – the pc had placed it there; the pc now had an overt on the session – I think they would have wound up at the end of session with that needle still rough, rock slamming – everything gone to hell, unable to get in any of the end rudiments or anything else. Don't you see how that was, see?

But no, auditing demanded that it be straightened up before we did anything else, and of course, that was what occurred. I was rather, by the way, afterwards, glad it happened. You'll do the same thing some day. Just remember, though, don't… So you got flustered, so things went to hell, so you no more than sat down in the auditing room and the plate glass window of the room shattered itself in the windstorm and seven flying pieces hit the pc, you see. This isn't a good enough reason to have a bum auditing session, see.

The auditing comes above all that and beyond all that and no matter what happens you straighten it out and continue. And it all comes out all right, so long as you're auditing – so long as you really mean to audit.

That intention, by the way, is something that apparently can't be counterfeited. A pc can read it wrong sometimes. You'll sometimes see in some institution or another, some poor
devil cowering back against the edge of the padded cell screaming, screaming, you know, saying, "Don't come near me! Don't touch me. You're a leper!" And that sort of thing.

And you say, "Good God, what do I do now?" Well, maybe, perhaps these words will come back to you: You audit. That's all that's wrong with him.

You don't say, "No, I am not a leper."

Hell, the fellow's got some reality, even if it's a corny one. Don't Q-and-A with the no-auditing situation he's setting up. Put in your R-factor and your H-factor. Put them in. You know?

"I'm here to try to get you out of this and I think I can do so if you give me a little hand here and help me out. Now, touch the wall." He's already touching the wall. "Thank you. Touch the floor." He's already touching the floor. "Thank you. Touch the wall. Thank you. Touch the floor. Thank you. Touch the wall."

All of a sudden he says, "What the hell, I'm touching the wall. Hey, I'm touching the floor! Where am I?" He'll come out of it a little bit and look at you and say, "Who are you?"

You just tell him you're his auditor. Simple. Don't go into any vast explanation about it.

If you don't ever intend to see him again, don't tell him so. But if you intend to see him again, why say, "I'll be around sometime tomorrow. We'll do the same thing. We'll get you out of this if we can."

And the attendants of the place would be treated to some fantastic scene, such as: Nobody's ever been able to come near this person or talk to this person or do anything with this person – nobody ever has. Picks up the stool and tries to brain him. And next time you go, why, you're liable to see something like he opens the door a little bit wider and dusts the stool off for you. Never offers you the tiniest bit of violence. That's as long as auditing occurs. See, that's the magic. That's the magic that underlies all other magic.

Now, what interrupts this magic? And what basically causes the apparent revolt against Dianetics, Scientology, auditing and auditors? What does it? What mechanism of the mind is it? Is it missed withholds? Yes, but it's the biggest missed withhold of all. And it has to be a very special kind of missed withhold called a dynamic or an item or a goal. That's the missed withhold.

Now, the funny part of it is, that it doesn't matter what the person's goal is or his item or his dynamic. It doesn't matter what it is – remember that person is a thetan. And down underneath all of this, never lose sight of the fact. You can say that, well, "Ron's wrong. People are not basically good. Because look at that guy, see. Just look at him, see."

No, remember that word "basically" and an appeal to that person, directly, past all this wreckage that he's got strewn about, reaches and gets that thetan's cooperation. And when you can get that thetan's cooperation to his own salvation, you're in. But you can only get it so long as you sincerely are going to proceed along and actually audit that person. That's a necessary part of it.
Therefore, it really doesn't matter what a person's goal is or the person's item or the person's dynamic. You have there an individual. And the heartbreaking thing about all the crime, wars and upsets of the world is that they were not caused by that individual. They were caused by the misapprehensions of that individual.

And the most misapprehension of all misapprehensions is his considerations of the dynamic and item as a result of his carelessly postulated goal and that is the most there is.

Now, were dealing here with human behavior. I could lecture to you for weeks and actually say it no better than: "If an individual exists and can be reached, then anything he is doing wrong or does wrong thereafter is the result of his not being reached." And not being audited, in other words.

It doesn't matter what his goal is. It doesn't matter what his item is. It doesn't matter what his dynamic is and so forth. This person will cooperate. This person will cooperate. But the thing which makes it tough to reach him is, of course, his goal and the item which has grown up as his pet antipathy and then the dynamic in which he's included all the badness of existence. He's fighting against shadows. But these shadows are quite real to him.

So you're going to get into trouble, occasionally, with somebody, basically through a no-auditing situation, because of his goal. He has a goal which is antipathetic to Dianetics and Scientology, in his opinion. And the great oddity is, is you might sit around for some time and look at this goal that he considered – that committed us to being opptems and try to figure out how in the name of common sense it could include us.

You could see at once how Scientology would not make it impossible for him to attain this goal. You can see this at once. But he has never been able to. Through the various aberrations and difficulties and situations he has been in, in existence, it is borne home to him that you match up to his opptem.

His goal is maybe to audit people. So you're standing in his road. See?

Now, some other fellow has a goal to damn all practitioners and he doesn't consider us opptems. So it's actually on the pc's interpretation and his experience on the track which has determined the opptem more even than the goal. So you cannot predict, from having found the goal, whether or not you are an opptem or not. See, that's not predictable, given a known goal.

All right, let's take this goal: "To be happy."

This person can't be audited. Apparently you practically have to sit on their chest and feed the cans into their hands and tape them down because they're just all ARC breaky and nattery and the meter doesn't operate well and that sort of thing, any time auditing falls short of very effective auditing.

One day you come into session and you're a little bit tired and you're a little bit cranky yourself. You've been sent a lot of telexes or cables from a lot of madmen. Why, you flub, you know. You don't feel like going in today and doing too much along this line. You just don't feel like it, so you say, "Well, we'll take it easy today. And I think that – Ah, I think
we'd better run a little Prepcheck on the goal, make sure that it's right, and so on." You feel this would be pretty easy to do.

My God, you got this pc at your throat! See, it's just that much of a letdown of no auditing and the pc's at your throat, see.

You may even have done something that you couldn't even interpret as an action, but it was – if you'll go back and look at it, it was something that didn't add up to auditing – not in the pc's estimation; in your estimation, too. Now, you did something that wasn't auditing or that wasn't effective auditing. You did something wrong. You weren't – it wasn't that you made a technical flub, it's that you weren't trying in some direction or another.

You want to see a pc really get upset with you, get halfway through to finding their goal, consider it's too hard and sort of knock it off. Sort of try to patch the pc up so you can turn him loose.

Oh my God, don't let that ever happen to you! You'd be surprised. There was somebody here on staff finding some of the staff's goals. He actually made some progress. He was doing all right. What he did wrong was take on too many pcs. He should have taken one and carried through. Don't you see? And he dropped people with only a dynamic found or a de-tested person found or something like that and he ended off their auditing. And they all got mad at him. He actually wasn't very smart doing this, but there's what happened, see, and they were all kind of cross with this fellow.

No, a rock slamming case is one who would get a rock slam – this is a piece of slanguage that we have been using lately: rock slammers. What's a rock slammer? Well, a rock slammer isn't somebody you can get a rock slam on. It would be wrong if you assumed that. This piece of slanguage means that somebody who gets a rock slam when you ask them, "Consider overts against Scientology." And that broadens out, of course, against Ron, against the organization or against an auditor. And you ask those four things: Ron, Scientology organization, Scientology, an auditor and you get a rock slam.

Doesn't mean the person's unauditable. You'd be amazed. And yet they – such a person would consider you part of their most mortal enemies. You are an enemy. And their meter behaves weirdly when you try to audit them; you get a suppressed meter; you get a slamming meter. You'll probably misinterpret this, because you think that because you can turn slams on to everybody this makes every case one of these cases. It does not. This case would actually directly have to rock slam when you ask them one of those four items.

You just pick them up – I'll show you how you do it – you just pick them up, put them on the meter, turn your meter up and you don't open session or anything. You just say, "Consider committing overts against Scientology. Consider committing overts against Ron. Consider committing overts against the HASI. Consider committing overts against an auditor." Then on any one of those four, if this pc develops and picks up a rock slam, you got a security risk. It is that phenomenon which has made things unpeaceful for the last twelve years.

It was not any vast international organization. It wasn't even the poor old suck-chiatrist or the psycho-anal-ist or the psychologists. Wasn't any one of these boys – none of these boys – wasn't any government. Nobody was after you. It's just this phenomenon
amongst our midst that has given us a bad time, because this other phenomenon matches up with it. This – these people, by the way – I don't know, I can't give you a percentage figure, but certainly is never any more than 20 – usually in an organization would be around 10 or around 5 percent. It's some tiny figure. It's a very small figure.

And you'll be running a group someday; you'll want a "clearing co-audit." All right, let me show you how this works out. Clearing co-audit. You get everybody; everybody goes out and they find you people to be part of your clearing co-audit and you're enrolling people. You're going to teach them to co-audit and you're going to find all their goals and terminals. Everything's fine, you know, you're auditing and everything's going along dandy, but in a clearing co-audit there's ample opportunity for no-auditing to occur. Ample. Because you yourself are not auditing the cases all the time. So therefore, it sets up a little bit of nerviness on the part of the members of that co-audit. You're not doing 100 percent auditing on them personally.

We've just had a Central Organization go this way. I wondered what the trouble was in that area. All auditing was being reserved for a few members on staff and wasn't being given to the public.

Well, the place was caving in, man. The second I tried to salvage it, in the last twenty-four hours, to keep it from going bankrupt – and I do mean to keep it from going bankrupt – the most piercing screams you ever wanted to listen to and the darnedest lot of lies and balderdash you ever heard of blew off.

And do you know all it breaks down to? You're stopping our auditing schedule! Got that? That's all. They had it all stacked up.

You see, you get people figuring it out this way. They can figure it out so logically. They could say, "Let's see, there's only a couple of people here who can find goals, so therefore, the smart thing to do is to have a totally cleared Central Organization and then we can be an example to the whole public."

And the poor, lesser staff member, he isn't getting any of this. The doors are closed, see, on any of it coming into the HGC, see. Technology is going to pieces left and right.

I'm afraid society has to survive. I've had people in the past put up to me this: "Well, why don't you, Ron, take one person and clear that person and teach him how to do so. And then have that person clear another person and teach him how to do so," and so forth. Inevitably that person has been a rock slammer. That surprised you, didn't it?

I've unwittingly used this principle many times in the past – unwittingly.

I would occasionally put out a projected action and if certain people that I knew to be hostile to us immediately embraced the idea, I didn't do it. But if they fought the idea, I put it into effect at once.

It was a beautiful method of screening promotional and release ideas.

There were about a dozen of them in England and there are about a dozen of them in the US. And if you heard from those people that your action was bad, then you heard from all twelve. See? Then you knew you'd done right. I didn't know why this was.
Well, now get a little further on this. The American Psychological Association is only furious with us for one reason. I found this out. I found it out from a government-employed psychologist in Washington, DC, two or three or four years ago.

You realize we won't release our materials? Do you realize that they would hold on to them, too, if they had all our answers? That's the kind of remarks that were being made to me. Auditing would have solved the situation.

Now, we have several staunch enemies. By the way, what is auditing? Well, in this case it was just some information. All the information was available, but they evidently couldn't pick up pieces of paper; they were too heavy or something.

All they wanted me to do, actually, was publish some of our case histories in their national magazine in America. That's all we really had to do. I didn't care to make peace.

So in actual fact, it was I who kept the game going just by being so disgusted with them in the past. They would have taken these things. Maybe they would have written snapping, snapping comments about them. Who cares?

But they would have taken them and published them with the full graphs and everything else in their periodicals. They just looked idiotic to me and I was busy. But that was auditing.

Now, those people would undoubtedly rock slam on you or us, because those people are violently antipathetic to the principles in Scientology. Do you know what's basically wrong with them? Well, you get somebody out here trying to pass a bulletin and you've got them on the meter – you've been doing that – a lot of that lately. If you cared to follow back what their basic disagreement on this line of approach was, you would discover it was something terribly fundamental.

And you very often do this. And they pull up something fundamental – some basic disagreement they have with this line of reasoning – and the moment that that is pulled up, why, zzzip! And all of a sudden they can learn the bulletin and it's all all right. Have you seen this? All right.

Now, let's take this on a broader level. The psychologist has agreed 100 percent that man is an animal. That's inherent in the practice of psychology. That's Professor Wundt, 1879, Leipzig, Germany. It's not one of my gags.

Man is an animal. There is nothing – there's not even a nothing-nothing in his head, see. He's a collection of gray matter. And the gray matter squiggles this way and it makes him see and it squiggles that way and he hears, see. He's a meat-robot and there's nothing else present.

This is very interesting because there's an earlier fundamental, earlier than this, which makes a liar out of them. It's psyche-ology: study of the human psyche. And all of their textbooks start out by having to tell you they don't know anything about this and don't have anything to do with their definition of their own word.
You read their textbooks? "We have nothing to do with the psyche. And nobody
knows anything about it anyhow and so we take off – man is an animal!" – quick – like, you
know? And get in there.

You got an earlier agreement that makes Scientology acceptable to them. Argue with
them about the derivation of the word "psychology." Don't ever argue with them about
whether or not man is an animal.

You'll blow off their disagreement with us. They'll say, "Man is an animal. He is not a
spirit." When they say man is an animal, they mean a man has no spirit, so they have an awful
time trying to study what we're doing.

But that would be acceptable to them because it would be auditing. It would be clear-
ing up something which was definitely antipathetic and antisurvival to themselves.

The individual existed before the goal; just as the word "psychology" existed before
"man is an animal." See, the goal is later than the individual. The goal is less fundamental
than the individual.

Now, it is only the antipathetic goal and maybe you won't be able to see why, but the
person will have interpreted it this way, which gives you trouble in – organizationally and in
groups.

As I started to tell you a moment ago, there you'll be in this co-audit. Everything's go-
ing along fine. Everything is very smooth. You've got everybody auditing and all of a sudden
there's a complete mutiny. Everything goes bzzt-aauugh. And people are going to quit and
they're chopping each other up over in the corner and you can't… Where the hell did this
come from?

And you say, "Well, it's that Grace and Agnes over there. They're having a… And
Mabel, Becky and so forth. I'll just have to get ahold of them and pull their missed with-
holds."

Well, look, you can pull their missed withholds until you're black in the face, because
the biggest missed withhold is the goal. And one of the mad things you do is pull that person's
goal first, because that rewards the rebel. And you mustn't reward the rebel.

The thing you do is put them on a meter. And when you start enrolling a co-audit, you
put those people on the meter. And you ask those magic four questions.

And if you get somebody who slams on any one of those four questions, don't enroll
them in the co-audit. I don't care how scarce you are in numbers. Don't enroll them and also
don't throw them away. Now, you could convene a sub-co-audit if you wanted to. Supposing
you collected four such people out of a unit of fifty. Well, you've got a sub-co-audit. In other
words, hang the rock slam around their necks and they're not going to cause any trouble be-
cause you've as-ised it.

It isn't even that they won't stay with you. As a matter of fact they're much more likely
to stay with you than some people that don't rock slam against you. Of course, all the time
they're with you, they're trying to slit the tendon in the back of your ankle and so forth and
slip the ground glass into the cornflakes. They – somehow or other they'll get this emergency
call on the telephone – they happen to be the only one present – telephone rings, they get the emergency call. And it's a call that you'd better come down to the hospital at once because of… And then somehow or another – they're intentions always seem to be so good! See, they actually can't be detected, because a thetan is a clever beast. And they'll write you a note and they'll put it on the edge of the table closest to the sideboard. And then, as they walk out and put on their coat, it will brush off and fall down. And then they can show you that they did write you a note, but that it fell off.

You never can quite spot it. You're left with this odd feeling of "it isn't quite all right." And honest to Pete, you can go around getting ready to blow your brains out. As a matter of fact, you'll start shooting down good people after a while if this keeps on and that's just what they want. Now they've accomplished it – they've started dissent.

The rock slam. The rock slam will be dramatized by this person. If you slip up and aren't auditing this person very directly, then that rock slam is going to catch up with some part of your activity. You'll find out that all of the silly things you say you're going to do, they will agree with and make sure you do. And all of the smart things you were going to do that really should have been done, they'll somehow or another dissuade you from doing them. But you'll never quite be able to trace exactly how you were dissuaded or influenced. You'll probably think it's your own idea. These people are pretty weird.

Let's take a husband and a wife. The wife has always been good. She has always been perfectly good and she has gone along, she has done her job, she has done this and done that, and on the surface of the thing appears to be a little hero. And the husband, he's gotten so he drinks quite a bit and he stays out late at night and he isn't working. You get the two of them on an E-Meter and you say to the wife, "Consider committing your – overts against a husband," or John or Bill or whatever his name is, see, and see if she rock slams. And get a hold of the husband and put the husband on an E-Meter and say: "Consider committing overts against a wife," Mabel – whatever her name is.

I don't think anybody was ever as unlucky as to rock slam against his wife while his wife was also rock slamming against him. [laughter] That would be catastrophe, man. The marriage isn't likely to break up; they're stuck – but it would be pretty grim.

No, but one of those will rock slam against the other and the one who is rock slamming is the one who is doing the other one in. No matter how innocent it all looks, no matter how many motivators this person seems to have, that is the person. There's no question about it. That is the person.

You watch that. You'll be able – when you're called on for marriage consultation, things like that – you'll be able to use the principle there to great advantage. So she's insisting that he get audited. She probably rock slams against Scientology, too, see. That'll mess you both up.

Now, you can stay out of an awful lot of trouble if you know these principles. You can handle a tremendous number of situations having to do with groups if you know these principles. And you can understand human behavior, knowing these principles, better than you ever have before. If you haven't got your hands on the person's dynamic, item and goal, see – if
you haven't got your hands on it – you can at least say, "Okay, that person has got a goal which is antipathetic to this other activity."

Well, it doesn't mean that all activities are good and it doesn't mean that all the goals are bad, because goals are assistive in life as well as detrimental. They've given one an experiential track. They've done all kinds of wild things. Maybe a person can't operate very well these days in the sphere of his goal. Maybe he has an awful lot of hard luck, but delete that goal and you've given him back all the effectiveness in that zone. You've given him back his whole experiential track and that's not nothing. You've given him now the ability to carry it out.

Therefore, in an organization; in a clearing co-audit; in a marital situation or in any other group, you have a sure-fire way of testing the person who has to be straightened out or the person who is messing it up. It's the person who rock slams when that group is mentioned. That's the rock slammer. "Consider committing overts against." The magic words. You never saw this before, because we didn't have the magic words, "Consider committing overts against." We just said, "the group," you see; we just said, "the dynamic," we just said, "the item." We never saw the rock slam and didn't realize that the rock slam was a concatenation of accumulated overts.

Now, it isn't just one bad act that makes a rock slammer. It's trillions of years of bad acts that make a rock slam. So don't treat a rock slam as something that is light. A rock slam is very meaningful. It takes a long time to make rock slams so the person has had a long time to do suppressions. So somehow, sometimes, you have to tiger drill the thing that you were testing before it'll test. Yeah, you just give it an ordinary Tiger Drill, polish the thing up and say, "Consider committing overts against it," see.

Let's say we're trying to test for an aircraft company so we say, "aircraft company," you know. Then tiger drill aircraft company: "On this company, has there been – has anything been suppressed?" you see, just tiger drill. Clean it up and see if the person rock slams. But the action I'm trying to bring to your attention is, is we are without enemies – we are without enemies, basically. If we lose, everybody loses. And if we win, everybody wins. We're in that weird situation. A situation that nobody has ever been in before. Therefore it's a little bit hard to understand this situation. If someone were to cave us in and knock us out, they would lose. Well, isn't that weird? If someone is actually able to paralyze you as an auditor, then the person would lose. So let me give you the last one-two of the Security Check.

It's an overt act of an auditor not to pick up and pay attention to the rock slammer. Because he's letting the person lose and making it possible then for everybody to lose, don't you see? I'm not trying to hang you with an overt in that direction. But look at it that way rather than "This poor fellow is being victimized by us because he rock slams." No sir, he'll only win if you do something about it. He'll never win otherwise. Because he's rock slamming, as far as were concerned, in the wrong direction.

And that's what we have been facing and that's what we've been fighting for the last twelve years. The few isolated rock slammers that misguidedly wish to knock us off because they confuse us with their items, dynamics and so forth. And don't think that any amount of argument will make them go straight, nothing will make them go straight but finding the goal.
Wherever you see trouble in Scientology, you are looking at the action of a rock slammer. Wherever you see an organization creaking, wherever you see pcs being dispersed or co-audit being knocked to pieces – somewhere, mixed up in that, there was a rock slammer.

The way to straighten it up is to isolate the rock slammers. Don't refuse them auditing. Put them over in a little group, over to the side. Say, "Now, we're going to take care of you, going to fix you up." Give them some hope, because they're alive, too, but don't let them mess up the rest of it because then they never will get Clear.

Now, there's a sensible program for handling it. A sensible pattern as I think you will agree. That's what's been giving us our trouble. That's the only thing that's going to give you trouble. There you are. Of course, the greatest enemy of man is not man. The greatest enemy of man, of course, are goals which tend to condemn man and everybody – when straightened out – won't.

That's a very interesting view and vista, isn't it? So no matter how troublesome a situation looks, you look into it, you'll find the rock slammer. You solve the situation by removing them, talk to the rest of it, bring in peace to the area. That is the formula and there's something more powerful than any aberration and that's auditing. And you've always got that as a weapon.

Thank you.
Okay. This is – what's the date? The 4th of October, AD 12, Saint Hill Special Briefing Course, lecture number two.

Okay. Pursuant to what I was just telling you a few minutes ago, we had a little bit of trouble recently in California. Poor Chuck was feeling rather sad, so we chased him into the HCO for a check and sure enough... [laughter] – we slam.

Yeap. He slams on me and the oppterm is someone who won't duplicate me. And Ava slams on "Scientology" and "Ron." The dynamic is "people with a cause," and the item is "someone willing to wipe out victims." Now you see?

Audience: Oooh. Yes.

All right. Well, that's nothing particularly discreditable; it's all within the realm of salvage. You see, it must be well within the realm of salvage with Julia sitting on top of it. Because they already – they already got the dynamics and items. They're just within a few inches of goal. See, that's easy to do.

And down in Johannesburg, we'll have that situation well under control. But undoubtedly there was somebody rock slamming down there madly, and they let the organization go down and down and down and down. And all of a sudden I found out quite by accident that they were facing almost immediate wipeout financially, because the Saint Hillers that were there – there were only two – were doing all outside private pcs for themselves and were doing none for the HGC, so no clearing was taking place. And there was just a little bit of staff clearing going on and clearing was being relegated for the chosen few. So we're having to remedy this situation.

Right now there are heads flying. And it was very upsetting; it made me late for supper and I couldn't give the children their movie. But I'm afraid that's all the damage it will do. When you're sitting with a fistful of answers you don't worry much because you can straighten things out. But it looked grim there for a little while, man; it looked grim.

Boy, I walked in there this afternoon and you should have seen my desk – it was stacked high. Somebody has been very busy sending telegrams to practically everybody in the world to send telegrams to me, see, protesting any action I was taking to set the organization back together again. And my action was simply to put the Saint Hill graduates in the HGC and start clearing people for the organization, not privately, just to salvage the organization. And this is the action being protested. There it is. Not a very survival activity, huh? We fix. We fix. We fix.
But life can get trying. And the breakdown at that particular point was no auditor in the vicinity was alert to this Sec Check bulletin. And nobody had suddenly walked in and started putting people on the meter and say, "All right. Consider committing overts against HASI Joburg." You know? And they would have picked up two or three slammers in key positions and that would have been that.

Auditors don't realize that they live by the meter and that their problems are solved by the meter and their problems aren't solved any other way. There was a member on our staff in there, this afternoon, was telling me about solving problems but said he'd left his meter home! Well now, how could he leave his meter home? That seems adventurous, because he has callers all the time and some of those callers are all ARC broke. The proper action is not to sit there and smooth something out. But this staff member is learning and advancing and I'm very proud of him, because he did some auditing on the person, not argue with him. But he should have had a meter because I know there was another withhold. See?

You have every right to put people on a meter. Don't get driven off of a meter. And as far as arguments are concerned, there's no sense in having arguments. I told you that adventure I had in Washington. Well, they all work out like that. Well, what's the idea of talking to somebody for five hours trying to argue into them. Because look, I can tell you by experience you'll never argue them into anything. You cannot argue them into anything, except auditing. They'll accept that, bang!

You ever try to educate a pc over the top of his aberrations? Well, why argue with a pc? Now, I don't mean to give anybody any black eyes, because all we're trying to do is keep the show on the road and keep things together and keep things rolling and we will, because mostly right is on our side. We're not trying anything horrible to anybody.

You only start breaking down when right is no longer on your side; when you are no longer a companion of truth. And that is when your light starts to dim. And alter-is sets in and there goes the GPM, and it gets bigger and it gets bigger and it gets bigger, and there you are. And it's not always true on all planets that I come along at the opportune moment, [laughs] so I'll give you a little piece of advice for the future: Live with truth and thy light will always shine bright.

Now, the subject I should be talking to you about is listing and goals finding and all that sort of thing. But the thing I'm going to talk to you about right now is how to make a goal fire. And that is the subject of this lecture, whatever preamble it had: How to make a goal fire; how to find the goal that's the goal; when is a goal is a goal is a goal? Subject of this lecture.

A goal is a goal when it fires. Well, how do you get a goal to fire?

By finding it. And by grooming it up, and with good auditing. There is nothing as sacred to a pc as the arrow lodged in his heart. That is a jewel beyond price. It must be handled with a maximum of sacreodity. You just make a comment on some pc's goal sometime and it'll take the auditor half an hour to clean it off. It's peculiarly vulnerable to invalidation, suppression and other buttons.
Now, I had a big problem up to the demonstration you saw last night and that was that some pcs are more suppressive than others. And there are some people whose goals are very, very hard to fire and I thought it was a special button and it's not; it's a special action. We got the buttons. What we need is a special action. And what you saw last night on the TV demonstration of October the 3rd was a routine Goals Prepcheck on an item and on a goal. That was routine.

And I went off the TV demonstration, turned around to another pc, audited the other pc about an hour and a half, an hour and thirty-five minutes and made a goal fire with the same action as I had used on TV. So that's that, because both these pcs have been worrying me about not being able to make the goal fire. It's obvious it was a goal, but I couldn't make it fire. I was looking for special buttons. It wasn't a case of special buttons, it was a case of special action. And that special action is this Goals Prepcheck. And I wish to recommend to you highly this Goals Prepcheck.

Now, I will tell you how you do a Goals Prepcheck. You find out when the goal you are prepchecking was found and you go a month earlier. Let us say it was found on the 2nd of September, 1961. Obviously, it only needs August in the auditing command. So you don't quibble about dates; it's the month before it was found. Even if it was the 1st of September, you use August. You understand? There's not any point in putting it earlier. You just want to get before it with the month. Because somebody might have been fooling around with it for several days, you see, before it was actually found or it might have been ticked. It might have been written down on a list. It might have been this, it might have been that. See? So you just try to scoop it in.

Then your actual action that you use on something like this is to put the date of the month before it was found in as a whole date. It's just the month, you see. And you say: Since (that month), on the goal, (whatever the goal is), has anything been (the seventeen, now eighteen, Prepcheck buttons of October 1st, AD 12, 3GA Listing by Tiger Buttons, 114 New Lines for Listing and it's the one on the bottom of the page of that bulletin).

These buttons are as follows: Suppress, Invalidate, Be careful of, Suggest things to, Withhold from, Protest about, Hide from, Reveal things to, Make a mistake about, Assert things to, Change (or alter), Damage, Withdraw from, Create, Destroy, Agree with, Ignore, and counter-button. That last one made you look up. Counter-button – what's the counter-button? It's the button you put on the counter, of course.

All right. Now, to this you could very easily add Decided. And you would have a – you would have a very complete area for Prepchecking. If you were to add that as a line button it'd have to be – "would decide" or something like that would have to be in there, see? Be "Decide." "Who or what would decide," you know, "to be something or other" – whatever the goal is. "Who or what would decide to catch catfish?" See?

The counter-button is the opposite button to the goal and you get this from the pc. The pc's goal is "to sniff," and you've got to get the counter-button. What's the counter-button? Well, you're not going to get it anyplace but off the pc. So you ask the pc what would be the opposite to his goal and he says, "'Not breathe,' of course." Well, you never would have
dreamed up that it was "not breathe." But, of course, it is. So your counter-button is "not breathe." It's just – be that silly, don't you see. You run it.

You say, "Since August, on the goal to know, has anything not been breathed?" Makes sense to him. Get the idea?

Supposing his goal was "to fly." You say, "All right, what's opposite 'to fly'? You know, what's the other side of 'to fly'?"

And he says, "to flop."

So your counter-button on this Prepcheck begins then, it starts in – just goes on down the line – and finally gets to the last one as the counter-button: "Since August, on the goal to know, has anything flopped?" It'll make beaucoup sense. That'll be very sensible to him. See? Got the idea? That's the counter-button. Because for sure that would be the greatest suppression on his goal.

Now, supposing his goal, or supposing her goal or something like that was "to be a lawyer." What's the counter-button to "be a lawyer"? Well, the pc could tell you. The counter-button is "to be illegal." Maybe this is what the pc says, see? So your counter-button would read, in the Prepcheck question, "Since August, on the goal to be a lawyer, has anything been illegal?"

And they will tell you, "Well yes, there were illegalities on the contracture of the goals on session number so-and-so that I had with my auditor. And actually he failed to live up to the contract, because at end of session, why, goal so-and-so had not been attained and therefore that was an illegal session." [laughter]

And you'd be surprised. This'll make big sense – makes big sense to the pc. See? Everyone who has a goal has a counter-goal of some kind or another. But you just don't – you don't try to assess this thing; you just ask them what it is and you've got the counter-button. Supposing the goal was "to be sane." What's the counter-button? Well, of course, it's "to be insane," the pc says or "to be crazy." "Since August, on the goal to be sane, has anything been crazy?" You see? Got the idea?

And they tell you, "Oh, yes! As a matter of fact the most psychotic actions ever heard of took place on the part – the night of so-and-so and so-and-so when I tried to tell my friend over the telephone that…" And my God, you never got this off as a Suppress, you never got it off as an Invalidate, you didn't get it off anywhere, you never heard of this phone call before; and there it is staring you in the face.

Now, the way you run this Prepcheck is elementary, my dear Watson. You saw me run two last night, one on an item, one on a goal. I think you thought that was pretty easy auditing. Didn't you think that was pretty easy to do? Well, actually it was. It was very easy on the auditor. You just cleaned it as though each question was a rudiment. Fast check – just a fast check rudiment.

You watch this thing and you say, "Since August, on the goal to catch catfish, has anything been suppressed?" And you say, "That didn't read. Thank you very much." And you go
to the next one, "Since August, on the goal to catch catfish, has anything been invalidated?"
And you get a read and you say, "All right. That read. What was that?"

Pc says, "Oh, that was so-and-so."

And you say, "All right." And you're watching the meter, see, always on the meter. Not your Prepcheck style of looking at the pc, asking it and then re-asking it on the meter. Nothing involved; it's just a fast check, see? And you say, "Since August, on the goal to catch catfish, has anything been invalidated?" And you clean that.

And you go to the next one and you go to the next one, just in this sequence here. (You can add Decide if you want.) And you go right on through down the line, include the counter-button toward the end and read the goal. See, this is not Tiger Drilling. Tiger Drilling is a working back and forth. This is more of a Prepcheck or a fast check action. See? Probably technically it should be called a "fast check." It's a goals fast check, but it would be too misleading if you called it that. Now, we'll call it a Prepcheck.

So, you come on down to the end and you say the goal, "to catch catfish, to catch catfish, to catch catfish." Now, actually, all the time without nerving up the pc, you have been watching the behavior of that goal because every time you said it, you could see it. You see? And you will see as you run one of these things – if you don't clean cleans and miss reads; everything applies to this that applies to rudiments – you get right on down to the end of this thing and you will notice that its read is improving, if it's the right goal. And you start right in at the beginning and you run Suppress again and you run Invalidate and you run the whole sequence all the way over again and you test the goal. And then you go back to the beginning and you clean them all the way over again. If that goal isn't firing by that time – phooey.

Now, that is an action which can be undertaken at the beginning of a listing session if a goal is not firing well. You understand that? Yet action will make it fire because if you try to tiger drill it on the pc, forever and hard, the pc gets nervy because you haven't any finite end. The pc sits in for the long haul. The pc's perfectly willing to do this with this goal because it's sort of a long haul. He's going over these things. And you tell the pc why you're doing it. And he knows it isn't going to be tested until you get clear down to the end, so he's not nervy about it. That's too far away to make him nervous. He goes on down to it and by the time he gets down to the end, he's forgotten why you were doing it. And he'll come back to the beginning of this thing and so forth.

Now, I'll give you the next little know-how on this. I'm going to tell you some more about goals here in a minute – how to find goals and what they are all about. But I wanted to tell you this "polishing goals," because it's quite an important piece of know-how.

This doesn't sound like much of a discovery because it sounds like much of what you've been doing. But I want to point out to you it isn't quite what you've been doing.

All right. Now, here's the next little piece of know-how: You get down to the end of the thing and you run the counter-button, and you come back to the beginning and you say, "On the – since August, on the goal 'to catch catfish,' has anything been suppressed?"

And the pc says, "Oh my God, why are you going into that? You went through it once!"
Well now, look, look. The reason the pc sort of blows up at that point is because they consider the answers on Suppress they now have to have been missed withholds throughout the Prepcheck, even though they didn't know about them. And so you don't put in your random rudiment, you tiger drill the button the pc objects to. And anytime the pc objects to your going over a button, you tiger drill that button. You got it?

**Audience:** Yes. Mm-hm.

So they answered Suppress like a lamb on the second run through. They answer Invalidate like a lamb on the second run through. They answer Be careful of, and Suggest — "Oh, why are you going into this!" *Heh-heh-heh-heh-heh.*

So you say, "On Suggest, has anything been suppressed? On Suggest, has anything been invalidated?" You treat it just like a goal. You could actually ordinary tiger drill it. You could say, "Suggest" — it'll fire. Therefore, it fired, so you go over into the right-hand buttons: "On Suggest, has anything been invalidated? On Suggest, has anything been suggested?" See? Wrack it back and forth, left- and right-hand button. Pow-pow-pow-pow-pow-pow. It's a fast drill, see. Just ordinary Tiger Drill. Pow-pow-pow-pow-pow-pow.

It's clean now. You test it again. You say, "Suggest" — doesn't fire; it doesn't read. You say, "Fine. Thank you very much."

Don't go into a lot of preparation. Don't get a French cooks approach to auditing. They have to have out the pastry, and they have to have the rabbit, and they have to have this, and they have to have a watercress, and they have to have the knives stacked up in exactly diminishing order on the board, you see, before they do anything, you know, and this drives the pc nuts. You know what I'm saying. You know, you don't go through a lot of ramifications about this thing. It's just you — so the pc says — you say, "All right, since Aug... (he's been going along like a lamb) — you say, "Since August, on the goal, to catch catfish, has anything been suggested?"

"Yeow, yeow, yeow, yeow, yeow, yeow, yeow, yeow, yeow, yeow, yeow, yeow, yeow, yeow, yeow, yeow:"

You say, "Thank you, thank you very much. Now, on Suggest, has anything been suggested?" — or suppressed or whatever it is. The thing's going to fire, don't you see? Get what I'm talking about?

**Audience:** Mm-hm.

Do you know how bad this button Invalidation and Suppression and so forth can get?

A pc, today in HASI London — and some of you are going to laugh (those that have been listed on lines) — refused to run the 114 new lines for listing beyond line twelve. Said it was impossible, you couldn't do it and it was no good and you couldn't do anything about it and the auditor went — almost went up in smoke. Why? That pc must have every Tiger Drill button all smoked up.

So you do the same action with this, see. If they get — their Tiger Drill buttons are all haywire, you're not going to be able to do a thing. The only reason they object to Tiger Drill buttons is when the button itself has got missed withholds on it. So you just straighten up the button. Don't pull missed withholds. You pull the missed withhold, but you pull them with the
Tiger Drill. See? See how you do that? So that ought to keep you out of more trouble than anything you ever heard of.

So you start down the line, so forth, the pc says, "Oh, I can't answer this line! I mean, this line is absolutely impossible! 'Who or what would catch catfish?' I can answer things like that – but 'Who or what would catching catfish suppose?' No! You can't do anything like that! You can't suppress fish. It's already under 'suppression.'"

Your answer to that is simply a smile and a pat on the back and you say, "On Suppress, has anything been suppressed?" Get the idea? You can just ordinary tiger drill it. You can even go in as elementally as saying – "Suppress" fired. "On Suppress, has anything been invalidated?" See? Bang, bang. Bang, bang, bang, bang. You get the answers that have been missed and away it goes. You got the idea?

See, you could do it on lines. You could do it on the Prepcheck or anything else. And you'll find, as time goes on, the Tiger Drill buttons will become mushy and invalidated and upset around. People use them kidding around and that sort of thing. You'll find out one of them will go out this way, you see? You have to know how to put them back together again. Well, you can put them back together again in a minute because you can put them back together with the rest of them.

Now, some pc says, "I can't stand Tiger Drilling because it wipes out all my goals."

"Tiger Drilling? It fired. Has anything been invalidated?" [laughter] And it isn't an invalidative action to do that, because you'll always find one sitting there.

Now, they can act, of course, ARC broken if they have missed withholds in the session. So you always want to put in your random rudiment now and then when you do this sort of thing. Got it?

There's the crux of this situation. You can thank your stars that just before the congress party in Washington, DC, I came out of my room at 1827, 19th Street, Northwest, Washington 9, DC and saw somebody crying in the hall. And they were very upset. And I was on my way to the party and should have been getting dressed. And Reg, of course, he was already dressed, and he was waiting there impatiently. (But I knew my responsibilities, you see. [laughs]) And I dragged this person into my room. And I think I did have a pair of pants on, but I was no more formally dressed than that. And I sat this character down and this character had been telling everybody everywhere that she had been PDHed.

So with a blinding flash of inspiration, I took the words pain and the word drug and the word hypnotism and I just tiger drilled them. And this poor character, after I got all the charge off of those she still said, "But if I admit that I haven't been PDHed, then everything I've done to people, thinking I had been PDHed, would be an overt."

So, I said, "If you have been PDHed, have you committed any overts? If you haven't been PDHed, have you committed any overts? If you have been PDHed, have you committed any overts?" and forced her to the final conclusion, which sort of – it wasn't evaluative, it was processing – but she finally – she finally had to conclude that if she was or was not PDHed she had committed overts [laughter] and she felt much better after that.
All right. But that was a – that was a lucky break. Because I was suddenly faced with having to do something rapidly in minimal time and still get to the party and so forth. And so I spent, I don't know – what? How much was it? Thirty-five, forty-five minutes, something like that. And had all of those – all of those buttons, all of those words tiger drilled. See? And I suddenly sat back afterwards, halfway to the party – Reg had been waiting rather impatiently for some time – I suddenly cognited when I was about halfway to the party: Hey, you can tiger drill any word, you can tiger drill Tiger Drill, you can tiger drill any button; in fact, you can tiger drill almost anything! And it's darn fast auditing and almost any level of ease can do it provided the words mean something.

And Virginia told me that she'd been auditing somebody and she'd been tiger drilling this girl. But the girl was about – oh, I don't know – must have been twelve or thirteen or fourteen or seventeen or nineteen, but didn't have too much education and didn't know what suppress meant and didn't know what invalidate meant. So Virginia would make her go to the dictionary and look it up, and then ran it and was getting – was being successful. If you can imagine such a thing. Well, the situation here, is that Tiger Drilling is very useful and you should know how to do it.

Now, there are two types of Tiger Drilling. There's Tiger Drilling to cancel out a goals list until you get to the goal, and that's just ordinary Tiger Drilling and you wind up those. You say, "To catch catfish." It fired – ticked a little bit – so you say, "On this goal, has anything been invalidated?" And that didn't read. So you say, "On this goal, has anything been suggested?" And that didn't read. And you say, "On this goal, has a mistake been made?" And that's – that read, so you clean that off and so forth and you say the goal again and it fires again one way or the other.

And you have to conclude then that one of the buttons you just went over has now just been invalidated or something of the sort. So you take a pass over them and then you take off your Suppress button – you can't find any action on that and it isn't firing – you can't find any action on the Suppress button so that's it. That's it – that isn't the goal, see?

All goals have a certain amount of charge in them. And the thing has to be charged up somewhat to have an invalidation register. It isn't the pc who is – you see, who is making all that read. See? It's the charge on the goal that makes Invalidate and so forth read.

Now, I give you this as a little test. Take a phony goal, like "to sing songs." See? It isn't the pc's goal and there's no charge on it. You say, "To sing songs." All right, we're going to – we're going to take this goal 'to sing songs.' You read, "To sing songs," and you get no reaction. You read, "To sing songs, has anything been suppressed?" You get no action. You say, "To sing songs, has anything on this goal been protested?", see?

What happened? Well, for the goal to read you had to have a charge. The subject has to be charged in order to read. You should learn that about an E-Meter. Pcs don't just make everything read. You got that? The read comes from the bank. You'll appreciate that more when you see a free needle and the pc is cussing and swearing like mad and the needle just
goes on floating. All right. So naturally you strike a goal and you give it an ordinary Tiger Drill, just coming down the list. And this goal is "to mend pants." "To mend pants" – it's got a tick on it. You say, "On this goal, has anything been invalidated?"

The pc, "Yeah, I saw it on the list before you came to it. Read it upside down. And I saw it on the list and I thought, gee, that couldn't be my goal. Because it sort of amused me, you know. 'To mend pants' – that's to use artificial respiration I thought." [laughter]

And you get that off. Of course, it had a little, tiny bit of charge in it.

See? So you say – to even fire that way it had a little bit of charge in it. So you say then, "All right, to mend pants," or you can say almost either "to mend pants," or "Has anything been invalidated?" Don't you see? Because if it's still got an invalidation on it then "to mend pants" is going to read again. Don't you see? You understand that?

So it's almost up to the auditor whether he double-cleans everything he gets or reads the goal again. He saves a little time sometimes when he just reads the goal again. You understand that about Tiger Drilling?

Well anyhow, so he reads "to mend pants," and it doesn't read. And "On the goal, to mend pants, has anything been suppressed?" And no, not pants – haven't been suppressed, so that's the end of that, see? Nothing reads. It's gone. Well, there's no sense in doing anything more than an ordinary Tiger Drill with this thing.

All right. Now, let's get to a different situation entirely. We say, "To catch catfish," and it goes tick – same tick as you saw before. "On this goal, has anything been invalidated?" – tick. You clean it. "On this goal, has anything been invalidated?" – no tick. You say, "To catch catfish" – tick. "On this goal, has anything been suggested?" You clean that. "To catch catfish" – tick. "On this goal, has anything been suggested?" That's clean. "On this goal, has a mistake been made?" – tick. You clean that. All right. "To catch catfish" – tick. "On this goal, has anything been invalidated?"

Now, you'll run into this sometimes when the goal is charged and the pc knows it isn't his goal and wishes to God he never put it on the list. You some... sometimes it takes you twelve, fifteen commands to clean one of those confounded things up. He unfortunately puts on the list: "to never have anything more to do with Tweetie Candies." He's thinking all this time, "My God, this can't be my goal." See? And you have to keep cleaning that off as invalidation. And you do – you better clean it off, man. You clean it up; maybe you're twelve or fifteen commands deep. You see? Well, that's still by ordinary Tiger Drill because it's obviously what the source of it is.

Well, let's say at the end of about twelve commands you're still doing this kind of thing: "To catch catfish." "On this goal, has anything been suppressed?" – tick. "What was the suppression?"

"So-and-so and so-and-so."

"All right. Good. To catch catfish," – no read. You say, "Aaah!" "On this goal, has anything been suppressed?" – tick. [laughter]
Well, look, you're now in for the only zone where you use Big Tiger. You shift your gears at this point because ordinary Tiger is going to take you a long time. So you just shift into Big Tiger on this thing. Anything that you consider Big Tiger is at the moment it is. But it's at least three buttons on the left and three buttons on the right and any other button that seems to apply. Don't you see? You say, "Now..." You're not going to leave this thing until Careful of is clean. See? Big Tiger could be distinguished as multiple buttons. And you're not going to leave the goal until both Suppress and Careful of are clean. You're going to make sure Careful of is clean before you leave the goal; Suppress is clean before you leave the goal.

In other words, this thing is firing hard enough to warrant some attention, so you just shift into this a little bit upper gear. You make sure now, that you get this thing tiger drilled well. It fires and it doesn't fire, and it doesn't do this and it doesn't do that. And maybe you're going to go about a half an hour or so on this confounded goal to get the thing cleaned up and get out of there. Well, you'll get there much faster if you're doing a Big Tiger rather than ordinary Tiger; that's leaving too many things by the boards. You understand?

You could almost – you've almost got all the buttons. There's probably more buttons here than should be in Big Tiger, don't you see. But you could use just those buttons at the bottom of the October 1st bulletin and you wouldn't go astray.

You can clean this thing and you'll get charge of it off and you'll wipe it up and it'll come back in and you'll get it out and it'll come back in. Well, you'd better use quite a few buttons to clean it up. But they're all played back and forth.

You're going to leave this thing – was, "To catch catfish" – didn't read. "On this goal, has anything been suppressed?" – didn't read. "On this goal, is there anything you've been careful off" – didn't read. You say, "Well, all right. We'll leave it." Get the idea? Now, it's perfectly safe. If you wonder, why, read the goal again – it'll probably be all right. You understand the use of this?

So you shift from an ordinary Tiger Drill to a more potent drill and it'll speed up the length of time it takes to clean up some of these rough, tough goals that go above a few commands. You see? Just shift your gears because there's more of a chance that is the goal and therefore you want to give it the treatment; you want to give it special treatment. Otherwise you can sweep these goals off at one every ten seconds. You know? They're going off of that list at a mad rate.

You say, "To mend pants" – no read. "On this goal, has anything been suppressed?" You see? "To be a cowboy.' On this goal, has anything been suppressed?" See? Nothing, nothing, nothing, nothing, nothing. Tick. "On this goal, has anything been invalidated?" – tells you, you know, "to be a cowgirl" – no read. "On this goal, has anything been suppressed?" Out of it.

You can get rid of a lot of goals. And then all of a sudden you hit "to catch catfish." You know? And it goes... See, they look so innocent at first and you tie into them and they go like mad. Well, you just shift into Big Tiger. Thing looks like it's full of beans and so forth, give it the business.
Otherwise you're liable to clean it up carelessly and leave the pc's goal behind you. So that's a prevention from leaving the pc's goal behind you.

Now I will tell you a few minor things – a little heart to heart talk.

By the way, the treatment of an old goal, or the Prepcheck of a goal ensues after you have found the goal by Big Tiger. See? You know, this goal was staying in so you shifted into Big Tiger and you drilled it and it fires and it doesn't fire and so forth.

Your next logical action for that goal is the Prepcheck which I described at the beginning of the lecture, not endless Big Tiger. You understand?

You finally got this goal so you can say, "To catch catfish" – fire. "To catch catfish" – tick. "To catch catfish" – no tick. "To catch catfish" – tick. See? You finally got it so it's saying that. "On this goal, has anything been invalidated?" No. "On this goal, has anything been suggested?" No. "On this goal, is there anything – any mistake been made?" No, nothing, nothing, no firing pin is firing. "To catch catfish" – tick. Oh, man – must be! You see, you've drilled it for a half an hour or so.

But it drives the pc out through the roof to have endless Tiger Drilling. Pcs don't like endless Tiger Drilling. Best thing to do is to shift, then, over to a Prepcheck. But that's when you've decided that it's pretty probable that that's the goal. It's pretty probable that that thing's the goal. It sure stayed with the pc. The pc sure is interested in it. Gave the pc some somatics and so forth. Ah, well, this looks interesting. Now, let's go over into the Prepcheck.

So there are three degrees of treatment of the goal: ordinary Tiger Drill, Big Tiger, and a Goals Prepcheck such as I just described to you. See? Those are the ordinary – that's routine on a goal.

Now, I'll let you in on some of the facts of life. These facts of life have been troubling you. Pc has goal found in upper south Amboy. Auditor somehow or another can't be identified. Nothing can be identified. But the pc can be identified. The pc floats into your vicinity and this goal has been found on the pc. You've already been auditing the pc four days before this fact was suddenly revealed: they had a Goals Assessment in upper south Amboy and the goal found was "to wrap around the flagpole and spit." [laughter] Now, you think that is a very silly goal, and so forth.

Well, it doesn't matter what you think of the goal. This is one of the goals found on the pc. This is something found on the pc. It doesn't matter what it is, how silly you think it is or how unlikely or how likely or anything else. The likeliness of the goal has very little to do with it, with this simple proviso: that on some of these goals, such as second dynamic goals which have been misassessed, you have to work harder than you ordinarily would otherwise. You just know, that if a second dynamic goal has been found on this pc of which they would normally be ashamed, that the thing is probably just reading on a "Failed to reveal." And my experience with those, see – "to go to bed with eight girls at once," or something, you know – my experience with these things is there's simply a "Failed to reveal" is the only thing that's making them read. Even those fall under this same heading.

Your first action with this pc – now, we're talking about finding or proving out old goals or finding new goals or what do you do at the end of a Dynamic Assessment? See? This
is actually all mentioned in the bulletin of October 1st – what I'm talking to you about here, right now.

Your first action on this is to corral (1) every goal found on the pc, and (2) every goal that went out hard.

You make a list of those goals in chronological order, against the time found, not the goal's occurrence on the track. That you couldn't find. You make your "goals found" in the order of their finding or their order of their giving the pc trouble. Pc suddenly remembers that they tiger drilled on a goal for nine and a half hours, called "to prove things." Nine and a half hours and it finally went out, see? All right. It was never announced as the pc's goal, see? Nothing like that. You put it down at the chronological order of its having been found.

Now, you just take those goals right from the beginning scratch and you don't tiger drill them – you just prepcheck every one of them, just like I've given you in the beginning of this lecture.

And if one is still firing when you've run through the first Prepcheck list, you go through it a second time.

And if it's still firing the second time, you better find out somebody goofed. Somebody's bypassed the goal. Because the probability is that in cases that have been assessed, that is what happens.

The test is this: If every now and then a goal goes out hard on a pc, the probability is the pc's goal has been found and abandoned. You get that little rule?

We have this pc – and we've got one right here. Every third goal found on this pc goes out – you practically have to shoot her down with a cannon barrage. It's "to mend pants." They go down the list, they get four goals below the last one that was tough and now they start tiger drilling "to mend pants." And it goes on, and it goes on, and it goes on, and it goes on. And finally the auditor just gets all worn out because it's taking – it takes two sessions to get rid of every fifth goal on this pc. Now, that is a sign that the pc's goal – I've learned this, just for you – that the pc's goal has been found and discarded. That is a sign of that.

Another sign of it is the pc was very ARC breaky while finding chronologically listed goals three, four, five, six, seven and eight. They haven't had smooth sessions. The very probable thing is that it was goal one or goal two. You got that?

But very often they smooth out and are perfectly happy, and they tell you they will surrender the goal and you've made them cheerful about it all – very often that's their mood. But every fifth or sixth goal, they stop you by requiring the next three or four hours of auditing to drill this goal out – the next goal. You get down the line; it's "to keep store." Here we go, see, at the end of an hour we will be prepchecking. And then for the next three hours we will be trying to do something with this goal "to keep store." And it finally disappears.

And we go down the list four more goals and we have another goal which is "to take a trip to the moon." And that takes three and a half hours to grind out. Got the idea?
No, that's a symptom of the goal is already behind you. The goal has been found; the goal is behind you. Get that? Just take that as an indicator. It's not necessarily always true, I don't think, because I haven't seen it on too many cases. But every case I have seen that on or have heard of that on, the goal has already been behind. They've already gone by the goal.

Now, you take this chronological list. What do you do with this chronological list? What do you do with it? That's interesting, because it has to have a Prepcheck. Each one of them have to have a Prepcheck. You'll find out a normal Prepcheck on these things will take you from one to two hours, and you're better off doing a Prepcheck than you are doing a Tiger Drill because it'll take you less time to do a Prepcheck than it will to do a Tiger Drill, and it's more likely that the goal will finish up firing having done this Goals Prepcheck, see? And you go over those things very carefully; you go over them very carefully.

Now, we're talking about somebody, of course, that you've found sitting on the front doorstep and they've turned up and so forth.

Now, you could go over these goals, each one of them, with a Prepcheck and find the right goal. You could do this. But do you know it might be more economical in terms of auditing to do a Dynamic Assessment on this pc. Do you see that?

Because if you didn't find the goal, there it is. And the goal has been unburdened and so it's more likely to fire. You see? And if you're good at doing Dynamic Assessments at all, it might be more economical to do a Dynamic Assessment on the pc and carry the pc through to the bitter end, because you'll probably have to do one anyhow because they best understand their goals when a Dynamic Assessment has been done. But I'm not making this mandatory, don't you see, because that would be silly.

Here's the way you test – and this is just a test – here's the way you test an old goal:

The pc says, "Well, there was a goal found on me in upper south Amboy at one time by somebody there and so forth, and the goal was 'to catch catfish.'"

And so you say, "Well, all right." And they want you to take a look at it. Well, of course you'd be wasting a lot of your time and their time and everybody else's time if you didn't take just a cursory look at the thing – just give it an Instructor's check. See?

But that it didn't fire means nothing! Got it? Even though somebody has checked this thing out with an Instructor's check – you know, just done that Instructor's check and gotten all the buttons rattled off and called the goals three times... You'd be surprised how often that will discover that the old goal was the right goal, see. Well, go ahead and list it – you know, checked out.

But if it didn't fire that doesn't mean anything. You don't discard that old goal just because it didn't fire.

Now, you're going to audit this pc for blood, see? You're going to get right in there and pitch. You're this pc's auditor. You had better collect all of these goals that went out hard and goals that have been found on the pc and you better make a chronological list of these things, see? And if this pc has had quite a bit of auditing on the subject of, and going up the track a ways, you're going to find a lot of pcs like this. Maybe this pc's even had a Dynamic
Assessment, something like that, see? You had better go over this list and prepcheck each one of those goals in rotation and see if you can't get one to show.

Now, what if some other auditor has already prepchecked them all? Well, your action is to prepcheck them all.

Now, it isn't because the other auditor was no good but because these things dive out and recharge and do various things. It isn't that goals can change or anything of that sort. It's just that this is an interesting fact about it is, I have seen goals missed and then somebody -- and last night was straightening out four or five cases that have been in the soup around here for some time. And I went down and the answers were there plain to see. They were contained in it. But in actual fact, one of these cases had several earlier-found goals.

Now, let me tell you something a pc will do. We can't get the old goal to fire. We're not going to waste a lot of time trying to get the old goal to fire; let's go ahead and do a Dynamic Assessment on the pc. You're not going to spend fifteen hours trying to get an old goal to fire, you understand? Let's do some auditing. This comes under the rule of giving the pc auditing, see? Let's say you checked it out; it didn't seem to check out. Instructor's type check, see -- it didn't seem to check out. Don't spend too much time on it because you may be grooming up this dead horse and polishing his shad -- his saddle, you know, and wiping out his mouth and combing his mane and so forth. But he's still dead, man. No matter what you do to him, he's still dead.

No, your proper action in this particular thing is you check out the goal the pc had, you check out -- or goals; maybe there's one or two -- and you don't get anything out of them: Let's do a Dynamic Assessment.

Now, that's going to make this pc shine. Because by doing a Dynamic Assessment, you tend to pull them out of the horrors and ARC breaks of having had their goal knocked in the head. You give them new hope. That old goal will now fire better because they can understand it -- they never did before -- it didn't have any item to fire against. Don't you see?

But you watch for this -- watch your pc like a hawk: When pc do List 1, when pc do List 6 or List 5 or any other list after a Dynamic Assessment and if pc slide old goal into list anywhere, you take old goal and you prepcheck and you find that pc's goal.

Got into an ARC break with a pc the other day. The pc -- oh, this was quite -- quite rowr-rowr, see. I did an assessment as to which list. I do things like this once in a while -- read off all the goal list lines and see which one assesses and do that one first. You know? That's only if List 6 didn't have the goal on it. List 6 didn't contain the goal so, I assessed -- found out it was List 2. Naah! Pc -- pc say List 5. Didn't say List 5 on that little assessment. Of course, that isn't a very valid assessment. Pc didn't say List 5. I get assessment for List 2. I try do List 2. Pc ARC break; Pc very upset. You think this is something intuitive, something deeply buried, something that was hidden from even the pc. Like hell it was!

Then it materializes that pc has slipped -- old goal has been passed over onto List 5. That's why pc want List 5 done. You get that? A thetan may look agreeable, but they never quit! [laughter]
So, I just took the old goal and tried to make it live again and it did and that was that. All right. So that should be very fascinating to you, that there are symptoms and signs here. Pc keeps trying to shove this goal at you; you may think, "Well, this person's just trying to sell this goal." That's right! [laughter]

But now, I tell you what makes some goals stay out. And this you must remember because there's a double Prepcheck on all likely goals.

There is another Prepcheck on likely goals, that is: "In self-auditing on the goal, to catch catfish, has anything been (listing buttons)?" That's the Prepcheck that has to precede your date Prepcheck, because any goal that's been around, for let us say, six months, five months, two months, something like that, and the pc has known that goal – they self-audit it. Now, they may not just sit down and try to run all the buttons on it and run a full Prepcheck, but they do that, too.

But they might self-audit it this way (and this is self-auditing although they don't recognize it as such): They're sitting out at a car stop. They're looking at all the people go by, you see. And the goal is "to catch catfish." And they say, "No wonder I'm always so bored sitting at a car stop, because naturally there are no catfish around here; there are just people. Oh, that explains, then..." (This is busy, busy, busy, you know?) "... that explains, then, why I've always been bored at sitting around car stops and why I've always thought there should be ponds on all properties." (Busy, busy, busy, busy, busy, busy, busy, busy.) "Well then, I mustn't think about that anymore because I'm liable to suppress it – Now, I'd better not suppress the goal. Now, there you are. Well, there I've probably suppressed it. I wonder what the suppression was." [laughter] (Busy, busy, busy, busy, busy.)

And sometimes they just simply knuckleheadedly sit down and try to prepcheck their own goal. And you can't ever tell it is, because the pc has tremendous interest on this channel – in fact, on no other channel. And they can't keep their attention off of it. And so you get this: "In self-auditing..."

Now, if you want to keep polishing goals up you can add other things. "In listing, on the goal to catch catfish," is another heading.

In other words, you've got several headings and approaches.

But the two that are absolutely vital to trim up an old goal and get the thing going well is "In self-auditing, on the goal ________" and the other is "Since_______ (month before goal was found), has anything – on the goal (so-and-so), has anything been suppressed?" You have to run those two Prepchecks. You got it?

Now, there's the essence of old goal finding. And you may beat your brains out – you may spend six, eight, ten hours trying to get some old goal to read, before you turn around and start doing a Dynamic Assessment. And then you do the Dynamic Assessment and then the old goal comes back in and reads. And you say, "Well, all I did was waste eight to ten hours of auditing."

And I have now got through doing this now, often enough, that I don't think it pays. I look back on the backtrack now and it's getting kind of strewn with dead horses. I've had to learn what are the effective actions with regard to a goal. See?
The actualities of existence with regard to goals is the goals are tricky, Dynamic Assessments are tricky, the auditor first and foremost has to be a good auditor, he has to be lucky and he has to be clever. But we've got ways and means of making goals read that we never had before. There's no excuse if you're listing a goal right at the beginning of a listing session that is going one tick out of six calls – there's no sense in that; you should know enough about auditing.

And just to do a formal check is sometimes not enough; you have to steer the pc's attention, which after all is the action of an auditor.

You say, "When was this goal found?" This is before you get it prepchecked, and so forth. "When was this goal found?"

"Oh, this goal was found in July – July of 1961."

"All right. All right, that goal was found then. Now, what session was it found in?"

"Gee, you know, I can't recall."

Oh-oh-oh-oh-oh-oh-oh! Right there, right there – there's a clue. That's why this goal doesn't – the principal reason why this goal doesn't read. There's something wrong with that session.

Let's go back and find that session. Well, how do we find that session? We can steer the pc's attention to it overtly and say, "In that session that found the goal, was anything suppressed?" See? And tiger drill it with that wording. Got it?

In other words, you can do almost anything with a Tiger Drill. You're only culpable and you're only in the soup if the goal isn't reading. And you're only ruining a pc if you utterly bury and lose his goal so it can never be found. So anything that recovers the goal is quite legal. Do you recognize that?

But I've been working for quite a while here, working on these drills. And I've given you the result of that work in tonight's lecture and it should give you a very good show.

One of the things I must tell you is, you must never, never, never leave a goal lying around, that has been found or the pc thought was their goal, on and on and on through auditing. Because it's like dragging buckets behind you when you're trying to go to sea.

Supposing, now, you had – the pc had six goals that were found on him or stayed in hard, see. And you found out it was goal number two that was the goal and you got it firing beautifully. Even though it's a little bit distractive to the pc – you've explained to the pc why you're doing this – you should also give a fast knockout to goal three, goal four, goal five and goal six. You understand? You should at least check those things out and get the principal dash and smash off of them. Because they're going to hold you up. The pc's going to be unable to do them well. Quite interesting.

A goal half-found and butchered up which isn't the pc's goal, stops the pc from having that ability. It slows him down.

Supposing the pc didn't have the goal "to take the air," and yet it appeared on his list, see - it was on his list and somebody – it had stayed in hard and somebody tiger drilled it half
out and then finally found out that it was "to be an aviator" that was his goal. And we just utterly neglected this goal "to take the air." Well, for quite a while the pc will not be – enjoy going for walks.

You'll have to get along and you'll have to give it a couple of cuffs and smashes and because it isn't his goal – and he knows it isn't his goal because he's got his goal – it goes out fairly rapidly, but it should elicit some of your attention. See? You'd say, "Well, let's get rid of these other goals so they don't hang up and hang us up." See? Just give them a box and – with Tiger Drill and they seem to be quite flat and everything's fine, just leave them. Got it?

All right. You're not going to have any trouble getting goals to fire providing you're willing to take the time to do so. But a one-minute cleanup to make the goal tick once out of five reads – that isn't good enough. And if you can't tiger drill this thing (in an ordinary Tiger Drill at the beginning of session) into reading, you can always prepcheck it into reading. And if you can't prepcheck it well into reading, then by George, you'd better change the wording of your Prepcheck to "In self-auditing on the goal," and so forth. And if that goal is reading a bit better then, then let's move it up into the next category and say, "In listing on the goal ___ (so-and-so)."

And you've got many ways that you can handle this particular type of action, depending to a large extent on how the pc has handled the goal and how long the goal's been found, and so forth.

But getting a goal to read – getting a goal to read – after the goal has been found or getting an old goal to read adequately requires very slippy auditing. In fact, probably requires better auditing than finding a goal in some cases. The refinding of a goal is sometimes much more rugged than just finding one fresh because now you have all the hurdles.

I find out almost uniformly that pcs know what their goal was and knew at some time in the past what their goal was and were very ARC broke when they lost that goal. And if you know how to put that goal back together again – of course with the Prepchecks and the stuff I've been giving you in this lecture – you'll find out your pc is very happy about the thing, and the goal will fire. People do know their own goals. I would never give a pc a goal who didn't cognite on the fact that it was his goal. A lot of symptoms go along with this. Don't you see?

I've revived now, a lot of old goals. I'm getting to be a specialist in it. I'm getting to be more of a specialist in the revivification of old goals than in the finding of new ones. Because people who come around to me – I busily work my brain to the bone, you see, finding the new goal, see. And I've just got my fingers on this new goal and we've just started to tiger drill it and boy, is it going out hard, when I look down the list four below it and I see the pc's old goal has been slipped back onto the list! So I tiger drill out the goal that I'm working on and then I start working on the old goal and now that the Dynamic Assessment has been done, it now fires like crazy.

This seems, in the last month, to have been my lot. Pc after pc: Do a masterly job, absolutely clever, lucky, everything – just beautiful, you know. All set up for a brand-new goal. Obviously goal number one on the list. Perfect! It fits the pc utterly and then the pc says to you, "Do you know that that first goal is the exact ending of my old goal?" [laughter] Well, that's fortune.
Well, there it is. There's a lot to know, about goals and their behavior. This is actually the first time I've talked to you about it. I'll be talking to you more about it but in actual fact I have given you in this lecture the bulk, if not all, the things known about it – this subject.

Thank you very much.
FUTURE ORG TRENDS

A lecture given on 9 October 1962

Well, what are we here? We've arrived at the what of what?

*Audience: October 9.*

Nine October AD 12. What planet is this?

*Audience: Earth.*

Oh, ho, Earth.

Anyway, the general situation is that I was going to give you an extra week of lecture here, and then skip two, and then give you an extra week on the other side of it so you don't lose out. And take Mary Sue down and show her the Mediterranean for a few days. She needs it. Me, I've been riding around, doing nothing, you know, and so on, but she's entitled to it.

I want to talk to you tonight about a very strange subject – a very, very strange subject: Scientology, its organizations. Now, this is a strange subject – Scientology organizations.

There comes a time in any activity when you have to look forward to the shape of things to come and what they will be. Now, let us envision this as an activity. We do nothing cohesive, everybody just goes his own way, we have no central control of any kind, and people just wander out and process people and so forth; and all of this has into its teeth the combined efforts of people with supervested interests in making slaves. And that supercombined vested interest then pick us up, one by one, and throw us on the nearest dung heap, and we thereafter find Scientology being practiced with electric shock by the governments.

Now, just look at that, not as necessarily an extreme picture, but one which very well might happen. Now, let's look at the other side of this picture. The other side of the picture consisting of a well-unified, a united Scientology with sufficient international esteem, force and wherewithal, that somebody suddenly decides to use Scientology exclusively to electric shock the Chinese to make them work on the farm and collectivize it all, and we sneeze and they fold up.

Now, Scientology would go the way of many other good things unless some thought is put upon its future. Buddhism went its way, collectively, and actually wound up enslaving people. Bum show. The East, the paralysis of the East, the fatalism of the East, and so forth, are as attributable to Buddhism as to any other single item. I don't know what Gautama Siddhartha said, but I sure know that people have been saying since, "If you just sat and regarded your navel for enough years and did nothing, you would become part of nirvana." And nirvana, as far as I can figure out, is the GPM. Well, just see a picture of it. It looks like a human
being surrounded with a lot of little valences. Nirvana. Look at pic – look at a Buddhist picture of nirvana sometime, and you got the GPM – bang.

So, they eventually found out how to put people into the GPM. And all kinds of squirrel, offbeat offshoots like Zen Buddhism – "If you know the answer, I hit you; if you don't know the answer, I hit you; because force is knowingness and never the twain shall be separated." Well, isn't that the way it must be? I don't know if you're acquainted with Zen Buddhism, but after you've done a tremendous amount of study on the subject, you finally can make up your mind that if you're hit, you know. That's the end product.

Now, Lamaism, with ghosts and devils and more GPMs, splintered off from Buddhism, everybody went into apathy, and there it went. Of course, they didn't have the technology. I just say that very advisably. The East has never known how to do it. That I can tell you out of the depths of my own experience.

I can show you an Indian rope trick, the small boy going up the pole. I can do it. Hypnotize the lot of you; you'd see most anything. Never did anybody any good. Anybody wants to dramatize Axiom 10, by all means dramatize Axiom 10. But there's a point where even that catches up with them. Indian rope trick is mass hypnotism.

The last fun I ever got out of mass hypnotism was hypnotizing the staff of Saint Elizabeth's Hospital in Washington. I don't know if I ever told you that story. I needn't bother to now. But this, this is all nonsense. They didn't have the technology in the East, they have never had the technology. They knew a few answers. And they all wound up in the soup.

So this is the first time on this planet, certainly – and I think the first time in this universe – when there's ever been a kickback against the ignorance, when man's – or sentient beings were capable of bettering themselves without worsening somebody else. Scientology is peculiar and unique. It is the game in which everybody wins. That's very peculiar. That's very unique. If somebody were to fight Scientology, and win over Scientology, then everybody would lose, including that person.

Now, any time you ascend above the level of games condition and get out of that mire, this other thing takes place. And that's what we're looking at. We're looking at a tremendous amount of force, which is not the kind of force that you put behind bullets and in ballistics. It is the force of reason. It is the force of knowingness. You might say – to use a Scientology phrase – it's theta.

And you're used to seeing a man who was being good all of his life get sat on, hard, and squashed. You're used to seeing this example in this universe. This fellow was good, and he got clobbered. And this grasshopper was being a good grasshopper and somebody squashed him. And this bird was being a good bird, and somebody throttled him. And it begins to look after a while that goodness is not a force. It begins to look after a while that goodness is weak, and that evil is strong. And of course, that's the lesson which this universe would love to impart.

It doesn't happen to be a true lesson. Evil is not strong, it is weak.

Let me give you an example: Once upon a time there was a Central Organization. I saw that it was failing, financially, and realized suddenly that it was not giving service to the
public – not giving service to the public. It was using the technology of Scientology internally on a favored few. And not giving service to the public, of course, it was failing in all directions, because the one thing you daren't do is not audit. It must audit. This organization, if it's there, it must give service. It's its only reason for being. Everybody was about to get very mad at this organization if it had gone very much further. It would have probably gone bankrupt.

So I was apprised of this very suddenly and also apprised of the fact that this organization had failed to file certain papers with the government; there were a great many administrative omissions. And so I sent them a cable. And I put the Association Secretary of that organization into the HGC to find goals on HGC pcs because the HGC was all stacked up with people for their goals to be found, you see. Had long lists of people, but of course they couldn't do anything about it because there was nobody there to find goals. Took the staff clearing auditor, put that person into the HGC to find goals. (They were both Saint Hill graduates; that was all there was there.) Told them to start finding people's goals and turn in the proper reports into the government.

This happens to be the entire length and extent of the perception and the directions given to counteract it. Are those unwise orders? I don't think you would think so. Perfectly reasonable orders. "Just get busy and give some service, and you'll be solvent, and everything will be fine." See? But no, no. No, no. Evil must triumph.

Somebody there sent out a whole string of telegrams to everybody they could lay their hands on to cable me as to how these orders and directions were all bad and couldn't be obeyed, and that they were about to follow anything I told them to do, except what I directed them to do. Something like that. They're perfectly faithful to me and were perfectly willing to follow my orders, while not having followed any of my orders for some time.

Well, I know what I'm doing. That was a perfectly valid direction with a perfectly valid goal in the end in view. And exactly what happened? I'm not setting this up as anything in the way of anything that I personally can do it. Get off that line. I mean, I'm just talking about a theta communication, you see. They're told to start clearing the public – which is a very theta action, I think you would agree – and to straighten it out and turn in the accounts and things like that they were supposed to turn in. That's all they were told to do, you see?

And then somebody sends out telegrams in all directions, tries to get everybody excited as to how this is the most terrible and awful thing that could possibly happen to them, and drags somebody else into it – who wasn't even part of this picture, by the way, and who was going to stay down clear at the other end of the continent, just because you had to have somebody to wear that hat while this organization straightened itself out.

And honest to Pete, the explosion is something to behold! I every now and then... I got ahold of this in 1950. There was somebody cutting a line in the New Jersey organization. Somebody cutting a line. You can always derive power by taking a theta line and tapping it and holding it up, don't you see. There's always a certain amount of power residual in the line and can be transferred to the person, you see, by tapping this line and blocking it. But at that time, knowing pretty well the mechanics of this situation, I made a remark to some of the auditors around that, by golly, that was just about the most adventurous thing for anybody to do.
I had ever heard of. And I said the end product would be that the guy will explode and spatter all over the landscape.

I actually didn't take any action. Believe me, I took no action of any kind whatsoever. And a few weeks later this guy spattered all over the landscape. It was just a pale pink mist. Nobody did anything to him, you understand.

What I'm talking about is the mechanics of the situation. These have intrigued me for more than a dozen years. Somebody tries to stop a theta line, or buck a theta line, and the resultant explosion is something fantastic. Now, so far as anybody knows at this exact moment of reporting, all is in order down there, all these orders are being carried out – the exact orders which I gave you – everything is smoothing out like mad. But the jolt is what I'm talking about. Because of the slowness of surface and air mail, letters concerning this explosion are beginning to land in other places, and some people are quite sh... were quite shaken up getting reports of what happened, you see. But in actual fact, the explosion occurred. It wasn't that I said this line. You get the idea? I'm not telling you that. But those were just very valid actions. See, they're very valid actions: Clear the public, and file your account statements, see. Very valid orders.

And somebody tried to horse them up and throw red herrings around, and mess it up, and tried to stop those orders from occurring and, honest to Pete, the explosion was fantastic. Wasn't even an experiment on my part; it's something I count on. And it occurs. That if something like that, something very sensible, that somebody is asked to do – if they don't do it, something happens, something weird happens. There's a funny magic concerning this sort of thing.

Now, how would an organization get in that shape in the first place? By individuation. An organization pulls off a few overts, pulls off a few more overts – I don't mean pulls them off, I mean it commits them – commits a few more overts, and gets into a bit of a games condition with other organizations around, and the next thing you know, starts considering itself something strange and different. And it can't talk well anymore, and it can't communicate well anymore, and it can't function or perform anymore.

Now, this cycle of individuation by overt is a very interesting phenomenon. It is amongst you. You see this, you see this every day. On a casual walk through a town, you will see examples of individuation by overts. Overts, of course, are normally followed by withholds. That is the still after the confusion. All a withhold is, is the still after the confusion. There is the confusion, which is followed by the still. So you've got the stable datum is – very likely to be, much of the time, whatever somebody happened to think after the fighting was over, see. Not necessarily the thing that held it all straight at all. But it is – you get an apperancy that it is a stable datum.

Well, let's take this battle has been going on, and all of a sudden, accidentally, why, a cavalry horse rides across the scene and trips over into a machine gun nest and wipes it out. And the other side says, "You know," he says to the fellows around him – all the shooting's over, you see; it's awful qui – awful quiet all of a sudden, and he says, "By golly, you know, that must have been by divine intervention. Some hidden hand must have directed that cavalry
horse across the battlefield and dumped him into that machine gun nest, you see, to obliterate it all."

Now, if you look on this, it's a hell of an overt against the cavalry horse to go dropping him in on top of machine gun nests, and all sorts of things. How about the cavalry horse's rider? He must have gotten shot and messed up some place or other. We look around here, we find really nothing but overts, and we don't find any divine intervention involved with it. I don't think God would muddy his hands up with that kind of thing, see, if you subscribe to the Big Thetan theory.

But here's this point. The other fellows around this soldier, as the years go on, they look back at that battle and they're all at this still stuck point: See, "We won the battle by divine intervention." They can invent all kinds of fancy stories as to how divine intervention divined at that particular moment, you know. It materialized in the sky, forty feet tall, you see, and all kinds of odd things occurred right at that exact moment. And all these things happened. And we get stories coming out of wars, time after time after time, which are the most miraculous things you ever listened to.

Well, there's one fellow said that religion had saved him, and he had been saved utterly in the war, and he carried around with him a little YMCA Bible. And a slug had gone into it and torn halfway through it and had stopped just before it entered — or exited from the Bible, you see, and shot him in the heart. And obviously his life had been saved by the Bible, don't you see? You can see it now: This guy — big state of shock, he's in a state of withhold, he's in a state of "what happened?" And he reaches, you know, to feel the blood, and he pulls out the Bible, and he looks at it, and it — you know, there it is. This is the quiet moment. Well, that one will tend to stick, don't you see? That sticks the incident, right there nicely. Tsk!

Well, the story is perfectly all right except I knew a sailor one time who collected pornographic pictures, and he had a… [laughter] So you see his still after that! [laughter]

Ah, well, anyway. That's rather risque and bawdy and blasphemous and that sort of thing. Anyway, the only point I'm trying to bring in here is you get the overt followed by the withhold. And the withhold becomes an action. That is, it becomes dramatized. It becomes a source of action. That sounds very funny. But it's the withhold that becomes the source of action, not the overt. Very peculiar anatomy.

I'll show you how that happens: Bill shoots Joe, and then doesn't tell the police. Now, the way that happened was, is he fired the shot, Bill fell dead, and he thought immediately afterwards (his rage now evaporating, you see), he said, "My God, what have I done? I mustn't tell the police." So this becomes a monitoring datum. See, shooting Bill doesn't really become the monitoring datum, but not telling the police does. He doesn't necessarily dramatize, you see, the killing. What he does dramatize is not telling the police.

So now he's not sure what he mustn't tell the police as time goes on, and he begins to imagine that he's guilty of many things. And in order to get rid of the source of pronouncement of his guilt, he will then commit many more overts. And each time he commits one of these overts — do you see the substance of "I mustn't tell the police" — he might as well have said, "I am different than and distinct from the police." See, he's made a declaration of individuation.
Now, in actual fact, in the field of action, he mustn't be Bill. Bill is full of holes, bleeding and dead, and he is not a thing to be. So we get our individuation there in the field of action. Joe shoots Bill, and then has to realize also that he's different than Bill. So right on the same action we get a differentiation, an individuation of self from the shot person and an individuation of self from the society, all in one fell swoop. So actually here's two withholds, and one of those withholds is a sneaky one.

Now, he can possibly remember and give you the withhold "I mustn't tell the police." But this other is an action, unarticulated, low-level, low-consciousness sort of a withhold. And that is that he mustn't be Bill. See, that's by example he mustn't be Bill. Yet there's a sort of a low-order decision in that, too. So, here you get individuation. Do you see that?

By the commission of an overt, we get an individuation. That's the only point I'm trying to make. And the more different and the more separate we are, of course, the less we can communicate, and certainly the less we can understand.

If you want to see somebody really muy estupido, completely incapable of "what's the score?", find something, find anything, on which this person has a bunch of overts. And ask him to explain it to you. And that is just about the most hilarious activity you ever wanted to engage in.

And some mathematician with a very fancy eye for equations perhaps someday would like to do this. Well, I did it once. I never bothered to keep the notes. But I derived all mathematics from affinity, reality and communication. All mathematics can be derived, of whatever kind, from those three factors. It's really fantastic. Affinity, reality and communication. This – you're working in the field of symbolic logic, you see. You're using – instead of numbers, you're using meanings. You work these things out. But you can derive all mathematics from ARC. You can derive all parts of life from ARC, and therefore you can derive all understanding from ARC, and the complete complement of an understanding is ARC.

In the absence of ARC, there is no understanding. Of course, if you have – the reductio ad absurdum – no knowledge whatsoever of affinity, reality or communication; if there's no affinity, no reality, and no communication, there can be no knowledge. Do you see that? You get no knowledge as the end result of this. The fellow has never felt anything for it, he has never seen it, and he's never heard about it, that's sure he doesn't know a thing about it. Do you see that as a fact?

There's an iron bolt, let us say, buried twenty-five feet deep out in the field in front of the manor house, and for the last three hundred years nobody's felt anything about it, nobody's felt it, and nobody's seen it, and there isn't even a via on which these is done, such as disguised in old records or something like that – there's no bolt as far as you're concerned. You see?

So you have to have A, R and C to know anything.

Now, the lower one's A or the lower one's R, the lower one's C, the less one knows about anything. It's very, very remarkable.

People consider those things dangerous which they're afraid to communicate with. Well, what's their definition of dangerousness? Afraid to communicate with.
Now, you can make people... You can always reverse these decisions. This might be interesting to you. You can always make a person feel he has done something if he has a withhold about it. That's an interesting mechanic of the mind.

Now, let's say we tell this person we're going to burn him (which I think is the highest level of ARC achieved by governments), we're going to burn him in the electric chair, see, or something like that, and do you know this fellow will turn around and dream up who he's murdered? I tell you this is a fact. He'll come around on the other side of the thing and he'll dream up a crime to fit the punishment. He'll get delusions about it.

He'll keep protesting his innocence, but he'll go and sit down in quiet and wonder just who he did kill, see. This is quite remarkable. In other words, if the punishment exists, therefore the crime must have existed. You see that? We can work almost anything backwards this way, and a human being will begin to believe the other thing.

Let me give you an example: I tell all of you carefully, when you come up to the desk or come by the desk or during the daytime when you're in this room, to be very, very, very, very careful not to touch this black wire. Don't touch that black wire. I tell you this every lecture. Even though you knew it was a joke, do you know that sooner or later you'd begin to believe that wire was dangerous? You get th – this is the reverse action, don't you see? People's definition of dangerousness is something you don't want to communicate with very much, see. So you just turn it around and you say to them, "Don't communicate with this very much," and they'll believe it's dangerous. You see how you can reverse ends?

The mind is very funny. It normally operates on two-pole conclusions. In other words, there's – one conclusion's dependent on another conclusion. You see the crudest example of this: Somebody walks up to you and says – they say, "You're a Scientologist. What is that? Is it like... ?"

Well, of course, you're stuck at this point, to describe Scientology, because of course it isn't "like" anything. There's never before been Scientology. So therefore, there isn't another Scientology extant in the society to compare Scientology to, and therefore the logical pattern and the communication pattern breaks down at that point and leaves you stammering.

You say, "Well, no, it's not like Christian Science, and it's not like religion, it's really not like Buddhism, it's not like..." See, you can define it by negatives. And then they will begin to believe it isn't. And your combat – if you look back on some of the things you've done in the past – of assertions of this character is just to deny the similarity. You find yourself in a big argument of denying the similarity. Of course, all the time you were talking you were actually saying, "Scientology isn't" to the other person. That's the way the other person understood it.

You see, if there's – or they say, "Oh, it's like Christian Science."

And you say, "No, no, no, no, no, it's not like Christian Science. Christian Science believes that..." and we go on and on, and potter around about it and so forth. We all the time are saying that Scientology doesn't exist because it's not like anything. Then we wonder, mysteriously, why the other person isn't interested in what we've been talking about.
You must always dream up something Scientology is just like. You want to talk to people about Scientology, realize that logic is two-pole; there are two sides to an equation; there must be comparison; there's data of comparable magnitude to enter an understanding – all of these, oh, a whole stream of these things I could go into. There must be comparable data. They understand something about something and therefore Scientology must be compared to the something something. And then they understand Scientology because it's compared to, you see?

Well, this is quite an interesting, quite an interesting complication. Because you could get over it every time if you realized that you had to compare Scientology to something. The only thing you have to do is make up your mind of what you're going to compare Scientology to so the other person will understand it.

Well, the more agreement or the more familiarity or the more ARC which he has with the thing you're going to compare Scientology to, the better he is going to understand Scientology. So you always compare Scientology to himself.

This sounds idiotic, but let us say, "Oh," he says, "Scientology. What is that like? What – what is that like?" Well, he really means "What is that like?" He wants a datum of comparable magnitude.

And you would be amazed how often you would get away with this crude – unthinkably crude – rendition of this: "Well, it's like you." You'd just be amazed how often this would intrigue the person. It's almost an idiot's argument from that point thereon. You say, "Well, it's like you."

And he'd say, "Well, how is it like me?"

"Well, you want things better, don't you? Everybody does. I don't care what they're doing in life, man's basically good. And underneath all of this 'got to gyp 'em all' or something of this sort, why, you're going to find some impulse that..." so on.

The fellow says, "Oh, yes, I'm trying to make things better."

"All right, Scientology's trying to make things better."

You get that? You say, "All right, now, you probably have a lot of basic wisdom about life. Maybe a lot of it is out of sight; maybe it's buried and so forth. But nevertheless you have a lot of wisdom about life. You've been around. You've observed things. You – you know certain things."

Guy says, "That's right."

You say, "Well, Scientology's just like you in that respect. You'd like to be free. You'd like to be out of whatever mess you're in. Well, Scientology wants that." You get this? This sounds like a weird argument, but you would be surprised how much appeal even the argument rendered that blatantly and that nuttily – that crudely! – would appeal to the bank manager or the janitor.

Here – just – guy would say, "Yeah, that's right, I'm trying to make things better; Scientology's trying to make things better."
I had an uncle who was a thirty-third degree Mason and Scottish rite, and other odd things, and Dianetics and Scientology were never quite right with him, but he finally figured out that we were trying to do exactly what they were trying to do in the Scottish rite, and after that he's figured out it's all right. You couldn't now disabuse him of the fact that we'd do everything that is done in the Scottish rite. We don't. But that is his channel of understanding. And he'd have to be processed before he'd change his mind.

Now, I don't even think he knows what he means by this, but he's satisfied with it. Because he has a familiarity with A, therefore something is shown to him to be like A, then he understands this something that was like A. Except he didn't really understand it. But he has a tendency to understand it. In other words, ARC then monitors understanding to this degree.

Now, in the absence of any ARC you have no observation or no knowledge of. That's the unobtainable absolute, of course. But this is – the something exists but you have no affinity for it and no reality about it, and you've never communicated on the subject, so you don't know that it exists.

All right, let's take the next level of that. Something that you feel something about, and you have a tiny reality on (you have an idea it exists) and you've communicated to its vicinity, slightly – see, you won't have very much understanding of that thing. Understanding of it will be poor but you'll know it exists.

Oh, I'll give you an idea. I'm sure that you realize there is a British constitution, and probably a constitutional society of some kind or another. If there's a constitution, there's usually a constitutional society of some kind or another. That's a supposed existence. You could understand that. You got an idea that you might be capable of understanding that, but you don't know what you should understand about it. See, you don't really know it exists, but you think it probably exists, and therefore if it did exist, you could understand about it. Do you get how this works out?

Well, that's a very thin fringe into the range of understanding. Now, you go up through all of the – all of the misemotional buttons on the subject of understanding, and you get various understandings. There's an understanding goes along with each one of these things. Even if one only understands that it is bad, one understands something about it. And this moves up into a total understanding.

Now, if you have total ARC, you would have total understanding. And if you want to know the road to wisdom – the road to wisdom, of course, presupposes a situation which the Buddhist would interpret as a nirvana. That is part of everything. To understand everything you'd have to be part of everything. It's a marvelous booby trap, man, because that's the reverse of individuation: enforced association. So, just as an individual can back away and become individuated from something, he can also enforcedly move on into it and obsessively become it. So there's two sides to this pattern.

Now, oddly enough this follows a cycle. With an overt, with the first overt, usually quite unintentional, you begin the cycle of individuation from something, and then that individuation cycle winds up with a reverse. And a person obsessively becomes what he is fighting.
How many of you in auditing your pcs have run into your pc's oppterm?

Well, the PC associates himself with his own oppterm. And you'll find this in varying, degrees. Sometimes the pc believes absolutely he's his own oppterm. Sometimes the PC merely hates his own oppterm, see. There's varying attitudes. From PC to pc you do a Dynamic Assessment and you'll get a different degree of obsessed association or obsessed beingness of the oppterm, and individuation from the oppterm. You get this in varying degrees. It varies from PC to PC.

One PC is more his oppterm than another, and another pc is more individuated from his oppterm than others. Do you see? You'll see this phenomenon throughout existence.

Now, this fellow has been committing overts – you know, that one – the old one about "tend to become what you resist." Well, let's clarify that and put it with more truth. One certainly will become that eventually which he has overts on, if he obsessively continues overts against a certain target and goes the whole gamut. He's been shooting penguins. That's the only thing he really does well. He shoots penguins, he shoots penguins, and he shoots penguins. And one day you pick him up, and he says, "I'm a penguin."

Now, he actually hasn't just directly interiorized into the penguin by the overt. Actually he has, through overts, has individuated from (because of the withholds he has from them and so forth) he's individuated from the penguins and become more and more individual. He is himself and penguins are penguins, you see. And more and more, more and more individuated, and then his wheels start to skid. See, he's got this rubber band now stretched as far away from penguins as he can get it stretched, and his efforts now to stretch it actually contract it. And every time he tries harder not to be a penguin, he skids a little bit forward to become slightly more a penguin. You see that whole cycle? That's a very interesting cycle.

That's a cycle of beingness and overts: the relationship to the individual's beingness an overt act has. Yeah, you go out here and you shoot a sparrow; you don't become a sparrow. But let's say you just had a ball, and you got up to a point where you just had to. And all of this logic is backing it up, how you have to shoot sparrows. And you do shoot sparrows, and you go on shooting sparrows.

I almost died one time. I – you can't laugh in people's faces, directly. The most comical incident I think that's happened to me in many months – the most comical thing I have seen – many – long time ago I was up at Lowestoft (a little town up on the North Sea), and a couple of herring merchants were getting rid of some of their ships. So I wanted to buy one of these ships, you know. Their names didn't sound like herring.

But I met these fellows, the pair of them, and of course they have run since time immemorial a fleet of herring boats. And, man, this pair had everything but gills! [laughter] They – if herring ever talked, they would talk just like that, you know? Their whole facial structure was that of a herring! Who was it that illustrated Dickens, you know? That boy couldn't have done a better job of portraying a herring. It was interesting that their method of handling things were sort of herring methods. They were sort of resistive to being slaughtered but it was inevitable. I offered a small sum of money for the boat and sailed it away, and they knew they had to sell it. That was enough of a lose so they knew they had to sell it.
This is the result of something like that, you see. I don't know what they'll pick up in their next life, but sooner or later…

Anyway, to make a long story short, this is the cycle of individuation and obsessed beingness. And that cycle is very interesting to you, because you start picking up sight of it with the dynamic and you get a very clear view of it straight in the teeth when you get the item. And that is exactly how the person got there, and is exactly how the meter rock slams.

Now, let's go back and talk about organizations for a moment. Somewhere along the line there was an inadvertent overt by this organization. And that built up, and then they became more and more different, and they became more and more different, and they became more and more different. And if they'd been permitted to go on this, they would have become a sort of a lower-level – which I think they actually had become – a sort of a lower-level beingness. You see, they could go through a whole cycle and come back to becoming an appearance.

Do you know that a thetan will actually run a whole cycle on Clear this way? And you pick him up on the meter, he's sitting exactly at 2, dead thetan? Well, that's how he got there. He's run the whole cycle. Now, he's obsessively being what he started out to be. See, he's obsessively being what he once was part of. He's relatively unprocessable. You'll have more trouble with that character than with any other. I am intrigued by this, you see. He's now a fake thetan!

And so that organization would have become a fake organization. Fantastic. You come to think about it, would have been a lower-level Clear – mockery.

Now, I've looked over very carefully, this, and the organization plan that says that this Scientologist is a field auditor and that Scientologist is a staff member, and therefore of different breeds and areas, and that this Central Organization is Johannesburg's or Melbourne's or something; and I've picked up a very fruitful source of inadvertent withholds. If we're planning anything broad in the way of organizations, the first thing we have to take out of is the incipient individuation. Otherwise we're going to wind up with a fake Scientology which will enslave the multitudes.

The HCO 10 percent is, for instance, a bid for individuation. See, it says, "Well, 90 percent of this is ours and 10 percent of this is yours, so therefore you must be different than me." Doesn't that sort of get understood at this line?

I'm not at this moment wiping out that, and so forth, because we're dealing with the - we're dealing with 1970. What's it going to look like in 1970? Well, the first rule that one must apply to it is that all the way around this planet it's got to be just one organization and that is Scientology.

And you look at this, you find that every organization breaks down into individuations and messes up, and so forth; they have no strength, and they don't stand, but when they finally do stand, why, they're sort of a false mockery of what they started out to be. They say that an organization's ethic is never stronger than it is at its inception. That is a comment that is made very sadly by people – philosophers along this line. There's no reason why its ethic shouldn't be much higher than at its inception.
Therefore, I don't see that it's possible, looking out across the years, for organizations to be different than other organizations in Scientology, to be different than the Central Organization, to be different than the International Organization – to be different than other organizations in Scientology, to be different than the Central Organization, to be different than the International Organization – to be different *than*, don't you see. Because you've set up the incipiency of the inadvertent withhold, the inadvertent overt may follow, and then you get a cycle there which will follow on through and everybody will wind up under the sword, "Being the Scientology organization or get your head cut off" Inevitably that would occur. But nobody would be free, and you really wouldn't have Scientology.

And the way to set it up is set it up as close to the fact as that not happening, and then keep it picked up along the line. And you get an organization that looks something like this. Would you like to take a look at the future on that?

About 1970 – might look very much like this: The basic building block would be the district office. I don't care what that district office is called. Whether or not it's the "Suburban Center" or the this or the that – but the district office. And it covers only a few square miles of houses, if that. It is tiny. Its influence is in terms of, oh, ten thousand people – no greater than that. But that is your basic building block.

And it has a building which is provided for it, which has an assembly hall, and it has some offices, and it has a couple of individual processing rooms, and it has a reception area, and you know. It's a little hall, actually, with some offices attached to it. And that is a district organization.

In charge of it is an administrator, who is an administrative person, and who, although he may be a trained auditor, is – still belongs to the administrative side of the picture. So you have the administrative side of the picture and the technical side of the picture running throughout this. You get occasional swaps across from one to the other. But nevertheless, they are distinct branches of action. There's two distinct actions.

The administrator is to keep things there and keep it paid and keep the place clean, keep the people walking in and out, and handle the money and the mest, and that sort of thing. And the technical side of it is to keep them processed and keep them happy, and so forth. That's all the technology of Scientology.

So this little center is actually in the charge of an administrator, and he has a couple of receptionists. They relieve each other. And they sort of act as the mail clerk and the switchboard operator and his private secretary, and anything else you can think of. You see, this is all in vignette.

And alongside of this administrator, there's a secretary there and you call her the HCO Secretary. Actually, she's the librarian, and the – she handles all the book stocks, and she issues the publications, and she does checkouts and examinations. She's a very busy person. She wears all factors of an HCO, actually, all in her own vest pocket, you see. And she's there actually to make sure that the material is available and stays straight, and so forth. She's not even there to see that any money is collected or anything like that. She's just there to see that the material's right, and that the material has library materials, and, you know, that's it – you know, that you have adequate supplies of these things, and to be able to get on the telex and communicate with other organizational centers, and that sort of thing. Because these things
are all hooked up, one to the other, communicationwise. Well, of course, there's also a janitor and there's a maid.

And there's two technical crews. And these two crews consist of two HCAs or HPAs (depending on where you are), and a Saint Hill graduate. And one of these crews is senior to the other crew, depending on length of time that they've been auditing, and so forth. So, actually have two crews and it – each one is composed of one Saint Hill graduate and two HPA/HCA level people. And the senior technical member is the senior Saint Hill graduate. That is the senior technical member in this particular unit.

And what do they all do for a living? That's very simple. They engage in mass clearing. This is easy. This is the easiest one to do, so that's what they do. And they've got this little specially built building that's exactly tailormade to their exact requirements to handle this sort of thing.

And what odds and ends of things do they handle? Well, they don't handle many odds and ends of things, because that's all handled for them in the city office which is mainly an administrative center. Doesn't do anything else. It's got a big account system, and it pays all their bills and pays their salary and banks their money, and does everything for them.

You wonder how a little district office like that's going to make any money or get forward or handle anything. Well, there are several ways that this takes place and several ways they go about this. The main way they go about this is they have an afternoon co-audit and an evening co-audit, six nights a week. And one afternoon co-audit goes, of course, Monday-Wednesday-Friday; the other afternoon co-audit goes Tuesday-Thursday-Saturday. One evening co-audit goes on Monday-Wednesday-Friday, and the other evening co-audit goes Tuesday-Thursday-Saturday. And you have the Monday-Wednesday-Friday crew under one Saint Hill graduate and two HPAs and a receptionist, and you have the other Tuesday-Thursday-Saturday people under the other technical crew. In other words, stagger their week days.

Now, what happens? Well, if you look over the economics of this situation, it becomes rather interesting. Because at fifty people in each one of these co-audits, you have two hundred people in that center a week. This is not going to be very difficult to manage. There are various ways of recruitment. There are various other ways of going about this. But the truth of the matter is that at ten dollars a week this gets to be a rather staggering piece of income. That's a lot of money. Ten dollars per person per week. That's all you're charging them to go Clear. Well, of course, you'd never charge them ten dollars per person per week, the cost would undoubtedly be much higher than that.

But they enroll in the co-audit and they're fed on through. Doesn't cost them anything extra to have their goal found, and so forth. You just have this co-audit and you kick them out the other end Clear. It's just assembly line clearing. They do co-auditing in the meantime, and so forth. Technology's going to get even faster. You'll find goals faster. They found out eight goals, I think, in one week, down in Bulawayo – a couple of Saint Hill graduates working down there right now.

So, anyhow, you see how fast that assembly line could work? But the funny part of it is, it's a staggering amount of income. It makes a Saint Hill graduate capable, in a center, of earning 250 dollars a week, or maybe 100 quid a week. That would be looked on as rather
ordinary income. It means this is your Woolworth aspect. This clears everybody. And the funny part of it is the Woolworth aspect is where it makes the money, not taking a lot of money from one or two people.

And as far as I can see, that's the basic building block, and it goes into an administrative center in the middle of that city. And you've got an HCA or HPA Academy set up with the Central Organization. And you've got some hospitals around which give clinical processing. And your big Central Organizations or your Continental Organizations are mainly administrative aside from running this little Academy – this Academy that takes care of that continent. And then you have your International Organization. It runs a university and doesn't do any processing. And it all just feeds through. There aren't 10 percents and exchanges and what's mine and what's yours, and so forth. And somebody…

The biggest crime that has been – ever been pulled off, is an auditor gets an area all stirred up and interested and then he departs.

Well, so somebody in Scientology gets tired of being in lower South Amboy, well, they can always be transferred to Chicago. Oh, say, a guy says, "I'm awful tired of being here, I want to go to Chicago." And you say, "Well, all right, why don't you write Chicago?" And they write Chicago, and Chicago would say, "Yeah, we'd be happy to have you." And you go to Chicago.

Now, there'd be money all over the place, as far as I can see. And in the Central Organization – just looking a little bit further ahead than that – there'll be a political officer. You want to know what happens when you clear everybody in that neighborhood, the only thing that center can become used for is a political center. Because by the time you've done all this, you are the government and you'll never be able to refuse it.

Therefore, these things should be provided for, and this thing should be looked over. And everybody in Scientology should be cared for. And the idea of asking for somebody to go out and sweat it through and stumble and fall on his head and collect his funds and that sort of thing – that day should very soon come to an end. It hasn't come to an end yet.

I'm just giving you a little glimpse of 1970. And it looks to me like a world that someone could walk down the street in. The situation between us now and that then is far closer together than you might think at this present moment. It's just within an ace of coming true. Any comments you have upon what I've said, I would certainly like to hear, because this is your world, too.

Thank you.
INSTRUCTORS' BUGBEAR

A lecture given on 9 October 1962

Thank you.

This is 9 Oct. 62, lecture number two. I better talk to you about something that you're more interested in. [laughs]

Just a final comment on that: I haven't given you all the information I have on that, but the final question I was asked here was about the technical, "hope it'd be more simple." Yeah, your technical will be more simple, but remember there's two HPAs on the floor in any one of these co-audits. Listing will probably be meterless – most of their auditing will be meterless. And it'll be worked down to a point where if a guy can get into trouble with this – with experts watching the thing – why, he'd really be quite a guy.

There are several technical little bugs that have been worked out already.

You give a See Check as the person comes in and you have a dunce unit-the rock slammers. And because you'll have all kinds of people, why, you'd just better take the rock slammers and you'd better relegate them to a certain category and certain handling, you see. That immediately takes the sour apples out of your co-audit and they'd run fairly smoothly.

Now the technical aspects of this are either whipped or whippable. And they give me no qualms at all. If that's all I had to worry about, it'd be a long snore.

The various aspects of clearing ... This is about clearing. This is just a lecture on clearing. I'm very interested in this. I'd be very happy to go on talking about it the rest of the evening, don't you see? But I want to talk to you about some of the aspects of clearing as they are influenced by auditing quality: clearing and auditing quality. And these two things are extremely closely associated when done by the expert.

He clears as fast, in actuality, as he is bright and delivers good quality auditing. Now, that's as fast as he clears. He clears then as slowly as he flubs.

Well, you want to find out why somebody isn't getting Clear fast... You know, your – it's a hell of a criticism of the auditor when that tone arm goes up to 5 and sticks. It's already proven that it's the right goal and yet there's that tone arm up there at 5 and it's not now moving and it's not coming down and that is the right goal, and you're listing on 114 lines. And as far as you can tell it's all going off like hot butter and yet there is that tone arm at 5. Now, that is not criticizing the pc. Learn right here at the incept that it is a criticism which is leveled straight at the bosom of the auditor doing the auditing. Learn that and you will have learned a great deal.
When I say learn that and you will have learned a great deal, I know what I'm talking about, because there are some people who won't learn that. They will resist learning that for a while. You see, they'll keep looking for what is wrong with the pc. There's nothing wrong with pcs. There's a lot wrong with auditors.

Now, some pcs require more cleverness on the part of the auditor than others. Because they – apparently the individuality of life was all attained by goals. Now, that doesn't mean that people are individuals because of goals. It means that they are odd individuals because of goals. They were all different people, don't you see, and then they postulated themselves a great cracking, big goal and here we went.

Well, a goal is a symptom of individuation. And from that point on, this guy is going to act differently with a different set of overts. And therefore, each person acts slightly differently in processing.

But when you realize that you can pick up such a goal as "never to be detected" – well now, that's quite interesting. What does that speak of the technology? Well, this thing says it must never be detected and yet we detected it. That's quite interesting, isn't it? That speaks very well for the technology.

So, I can tell you right at the incept that there is no goal that is too difficult to be found and therefore no individuation that is too difficult for you to crack. You've got to do it by the book and you've got to be clever. And you've got to be able to audit smoothly – auditing quality.

Many a fellow has the idea, many a girl has the idea that auditing quality is associated with sternness or is associated with immovability or is associated with being able to repeat the auditing command or is associated with "the auditor must always be right," or some other quality that has nothing whatsoever to do, in actual fact, with auditing.

Some new individuation has moved into the sphere of auditing and whenever this new individuation is moved into the sphere of auditing, you get some new difficulties.

So to an Instructor watching a half a dozen auditors audit, he may think that he needs a half a dozen different sets of rules to overcome the peculiar difficulties which these students are experiencing and that is not true.

What he needs, as an Instructor, is a tremendous ability to detect variation from the standard rule. And man, this variation is sometimes so clever and is sometimes so adroit and is sometimes so well hidden, that one never does connect with it apparently.

I'll give you an example: This person is apparently unwilling to have the pc talk. Apparently this person has to stop the pc from talking if the pc talks. The pc must be stopped. You'd swear their goal was "nobody must talk." Pc says, "I have a pain in the head," and the auditor almost holds up stop lights and stop signs, and hands out speed tickets and breaks out a dog muzzle and so forth, you see, because the pc has said something, the auditor's upset.

So we work on it on a straight basis of communication and we tell this auditor that the auditor must let the pc talk. And by golly, we don't solve it. We just don't solve it.
These sessions this auditor is running continue to produce fantastic ARC breaks. And yet now the auditor is apparently letting the pc talk, to all intents and purposes. Then we come in one day and we find out the pc has been talking for an hour and a half in answer to one auditing command and is getting very ARC broke in the process. So we didn't spot that one. That was wrong. This auditor was not trying to stop the pc from talking.

The ARC breaks this auditor got stemmed from the unwillingness of the auditor to face any confusion of any kind in the session and went on giving the auditing command even faster the moment it appeared there was going to be a confusion in the session.

Now, that's an interesting point, isn't it? Some confusion arose. Did the auditor acknowledge it or did the pc answer it? And this auditor's answer is to get away from the confusion and so gives the auditing command five more times, even more rapidly, to get five commands away from that confusion. But, of course, they can never get away from the confusion.

Now, the pc is only interested in doing one thing: stopping the auditor to get back to the confusion to unravel it. Did he answer the question or didn't he? So they have the auditor trying to get on with the session and the pc trying to stop the session and then you'd think off-hand, well, there's something wrong with the pc. No there isn't. There must be something wrong with the auditor, if the auditor didn't take up something in the session that makes it necessary for the pc to stop the session to get it taken up. You see this?

Audience: Mm-hm.

It looks like the auditor's trying to keep the pc from talking. See, but that really wasn't what was happening at all. The auditor wants the pc to talk, but on some other subject, if you please, than a confusion.

One method an auditor uses to take off, then, is discoverable only in this zone: that an auditor can leave the session on the forward track, as well as walk out of the room. You follow that?

Audience: Mm-hm.

The pc can be left at time-point A in the session, while the auditor is taking off and trying to get to time-point G, without ever paying any further attention to time-point A. The auditor is ignoring time-point A and is trying to leave the session by progressing forward to point G as rapidly as possible.

You'll find somebody is having difficulty reading his meter during the rudiments only because rudiments are something this auditor has had enough bad luck with that the auditor wants to get over them fast. And the auditor gets over these rudiments fast, while the pc gets stuck in rudiment one. And the auditor is clear up there to the body of the session, but the pc is left in rudiment one.

Now, in an effort to avoid giving a session, you see, in an effort to avoid facing the confusion in the session – let me put it that way – the auditor actually refuses to set up a session, unwittingly refuses to set up a session. Do you see how this could be?
The auditor knows he can't get in rudiment one – always had trouble getting it in – so he doesn't get it in. Gets a conviction that it can't be put in, don't you see, and therefore rapidly moves to two before one is in. Now, of course, two won't go in, because one is out. And then moves to three before the pc can stop him to get two in. And then goes into the body of the session with the pc madly out of session.

Now the pc, somewhere in his skull, unwittingly is trying to work out the session and get in-session while the auditor is running the session.

And most of the pcs that give you the most trouble are the pcs who do the least. They never explode in your face, they never walk out of session, they're not dramatic – they just aren't in-session. Auditing isn't biting. Auditing isn't biting at all, because they're not in-session. And they apparently are very easy to audit, except they never make any forward progress.

And the – it doesn't much matter what the auditor does. The auditor can go over and try to get all the rudiments in, and so forth, and they all kind of go in. "Meter isn't working," don't you see? They kind of get all the rudiments in and he gets into the body of the session, then he starts this and that, and doing this and that, and asking him some questions, and ...

The wonder of it is that anything happens at all. But you get about a quarter of an inch of gain out of that session – very undemonstrative session. It's just sort of sitting there, sawing wood, doing nothing, you know. Only get a quarter of an inch of gain out of that session and should have had five miles.

Your "good" pc is produced by an auditor who never gets the pc in-session in the first place. This pc isn't sufficiently in-session to ARC break. Pc is ARC broke.

Oh, it's a very funny thing. You could start sawing into a session of this particular character – somebody's running the session in this way – and you know, sort of getting it all in with a lick and a promise and it's sort of a tacit consent that very little auditing will occur and so forth.

You want long listing, you see, this is the way to get it. Everything is sort of shallow, nothing is very deep, nobody really inquires into anything very hard and we'll sort of sit here and get it all dusted off one way or the other, and when we finally wind up, why, we will not have had an ARC break, which is apparently the primary objective of the session. Well, of course, they didn't have an ARC break by having one the session's entire length. In other words, no communication, no understanding.

See, everything is just kind of out on the fringe and nothing is ever really introduced in. Don't you see this?

Audience: Mm-hm. Yes.

You've stood alongside and watched a session run, I'm sure, whereby the pc is just "Yeah, birds swim? Yes. Yes, birds swim. Oh, yes, birds swim. Yes... yes, birds swim, yes. Yes, birds swim and so forth."

And the auditor is saying, "Do birds swim?"

"Yes."
"Do birds swim?"
"Yes."
"Do birds swim?"
"Yes."

And everything's going on, and they move through to the – they use up every bit of the auditing time. That's the one thing that you can say about that session, is it used up the entirety of the auditing period.

All right. You get somebody in there who isn't avoiding ARC breaks, who isn't avoiding upsets, who is trying to look good as an auditor, who's doing all kinds of additives. His slew of additives have been added to what he's supposed to be doing, you see.

You get somebody in on the same pc and the guy says, "All right, now." He says, "Now, are you willing to talk to me about your difficulties?"

The pc says, "No. No, no, not me! No. No, no. No, uh-uh."

"All right. All right. What difficulty aren't you willing to talk to me about?"

Pc says, "Ooh, gee, I guess just about everything that's wrong. I mean ... " And all of a sudden starts opening up as a pc and suddenly you'll find that old tone arm just coming on down, just as nice as you please. What? With standard auditing.

But what is standard auditing? What is the standard from which we are departing? Well, it's this cycle: It's asking the auditing question of the pc who is sitting in that chair – see, not some synthetic pc – but of that pc that is sitting in that chair, getting a response or an answer from that pc, which is then understood by the auditor and is acknowledged by the auditor in such a way that the pc knows he said it. This pc knows he said the answer and did properly answer it. Now, that is the auditing cycle.

Now, when anything interferes with that auditing cycle or additives go in, you get one of these corny, weird, offbeat, god-'elp-us sessions. Do you see what runs it adrift?

Now, it's – this auditing cycle is a terribly simple cycle. And terribly simple people such as myself don't seem to have too much trouble with it. But more brilliant people figure their way through this thing and arrive at some kind of a mutated answer to it that produces a no-auditing situation. And how they've managed to do this is the subject of his Instructor's nightmares. That's what the Instructor is there for.

He's trying to find what else they are doing and point it out to them in such a way that they realize they are not doing what they should be doing. It is a terribly, idiotically simple thing. And of course, some very bright person could very easily miss it.

You would be amazed if you engaged in a catechism – Catholic church hasn't got any monopoly on the English language, we might as well take part of it – if you engaged in a catechism of an auditor who consistently was getting the TA swinging up high on the pc and asked that auditor searching, seeking questions regarding what was supposed to happen at these various parts of the auditing cycle – what a pc was supposed to think and what a pc was
supposed to do at various parts of it, and you will find something that is completely astray. Inevitably, you're going to find something that is really goofy.

I'll give you one, an actual one: "Well, so long as the pc refuses to make up his mind to be audited, there's nothing you can do about it." How do you like that one? In other words, all auditing is on automatic. It depends on the happy accident of a pc deciding to be in-session. And the auditor has nothing to do with getting the pc in-session. You understand that?

Now, why do these things exist? I'm not just being hard on people who have that sort of theory. I'm trying to make it easy for them to audit. Where do these things come from? They're all a bunch of oddball considerations that exceed this terrible simple simplicity. And when I say they're oddball, I mean!

But where do they come from? Now, it's all right for you to say, "Well, it stems from their goals." We know that and nobody need emphasize that piece of technology. Somebody who has the seventh dynamic, "thetans," as an oppterm or "an introverted person" as an opp-term or has "people interested in themselves" as an oppterm or "people who talk" as an opp-term are going to have a hard time with auditing.

Well, you can see that and I can see that and oddly enough we can surmount it fairly easily. Oddly enough, we do. It makes a tremendous change in one of these people when you get that item, and it adds up to something that interferes with auditing – makes a big change to them. Big change. There's hardly any substitute for it. When you find their goal, it makes a big change. When you get the goal listed out, that's a terrific change. See, so there are big changes along this line.

But if I were to tell you that because a person had an oppterm of such-and-such a characteristic, he then could not audit, we have entered upon a very dangerous piece of ground. We have said that no man can rise superior to his aberrations and that is not true.

A man can rise superior to his aberrations – as even some character who has some horrible oppterm that he just discovered has realized that somehow or another he was getting by and he was trying. And his oppterm and his goal are right in the teeth of his ever getting anything done about it, don't you see? And you is yet getting somewhere.

No, a man does not have to act his aberrations out to the full, that's for sure. Man can rise above them. He may not be able to stay above them, but a couple of hours of session, yeah, he can rise.

Now, when we get down to cases on the subject of auditing, then, it is not good enough to say that his item and his goal oppose his being a good auditor and therefore he can't do it. That is not good enough.

We know that his auditing will enormously improve. We know he'll probably never become a top-notch auditor until we've got these things wrapped up and he's Clear, but nevertheless he can audit.

So there is another channel which might – because this other one is so heroic – it rises up there like the Colossus of Rhodes, you know. It's completely visible, you know. It's his
item, it's his goal and so forth. And it's so visible you might never see this other one. You say, "Well, get him cleared and he'll be able to audit." Ha! Fine.

There's another one, even when you get him cleared, he might run into and that's the one the Instructor works with. That's the one you'll be working with when you're trying to make a co-audit function, when you're trying to make some HPA student toe the mark.

This one: He's got a hangover from some group or some philosophy or some activity – not necessarily associated with his goal line – as to what is supposed to happen, what he's supposed to do to make something happen and what's supposed to happen when he, the auditor, does it. And you will get things out of the pc – you'll get things out of the pc and then you do something with them and what does this indicate with the pc. You know? I mean, you ask him questions of this sort. "Now, you've asked the pc something, and he's responded such-and-such a way. Now, what does that mean?" See, this is a searching type of question, see. You actually can get – likely as not, get the auditor actually laughing at himself over some of the things he expects.

Let's say he was part of a society that preached only one philosophy – only one philosophy: that there was no reason why you couldn't decide to be anything you wanted to be and immediately become it. And all men were weak and evil and guilty and stupid simply because they couldn't do this. That, by the way, is a rather familiar one on the track.

"Well, why don't you decide to be Clear?" You know? "Go ahead. Go ahead, decide to be Clear. All right. Can't do it, huh? Hah! Shows what you're made of!" See, it's a sort of a weird way of making nothing out of thetans and so on.

Well, this person actually is operating in an auditing session on the basis "Well, if this person just made up their mind to be Clear, I wouldn't have to go to all this work." See, they think the other person is terribly weak because the other person just can't suddenly make up their mind to be Clear and they're having to audit the other person, don't you see, and they're auditing past this limitation.

They don't recognize they themselves are doing it. But an Instructor talking this little point over with them might discover a great deal concerning this, you see.

And they say, "Ah, well, if he'd just make up his mind to be Clear, I mean, there – I mean, I have to go through all these motions, you know, and ask him these questions and so forth. And actually there's no particular reason why I should, because all he's got to do is make up his mind – what am I saying? All he's got to do is – all he's got to is make up his – well, no, I couldn't do that."

See, he's got a terrifically fixed idea of what's supposed to happen, so therefore everything he is doing is being done in the realization – according to him, you see – is being done in the realization that it doesn't have to be done anyhow, so it doesn't matter what he does because the other person should simply be able to make up his mind to be Clear and then be Clear. So therefore, the other person is guilty of having a session. You see?

All right. That would be only one of thousands. See, only be one of thousands. "Why should you ask anybody a question?" Give you another one: "Why should you ask anybody a question?"
"Because, you see, they know the answer to everything and they know what you know, because they – what am I saying?" See, it comes to a dead end here. The guy all of a sudden realizes he's talking pure, unadulterated idiocy.

You know that people go around aware of the fact that everybody can read their minds? And so therefore there's no sense in anybody asking them questions, because everybody should know everything about them anyhow and every question is a complete insult.

Do you know that there are people around that every moment of the day is a missed withhold on the part of everybody? Do you know that people are a missed withhold? You know how you become a missed withhold to such a person? Do you know how you manage to become a missed withhold to them? You said, "How are you?" And you should have known! You should have known! You get the idea?

And because you didn't know how they are and therefore asked them a question how they are, why, this immediately indicates that they are a missed withhold. And they go around all ARC broke and upset twenty-four hours a day. You see? Because they're a missed withhold to everybody. Because people keep asking how are they: "Have you just been to class? What mark did you make?" Doesn't matter what question is asked them, they are sort of going on the basis of all the time everybody should know what they're thinking. Some kind of an obsessive idea. And they never inspect these things. So therefore the pc should know what they're thinking.

Do you see, that's very far-fetched and far afield. I'm – all I'm saying here – I'm not trying to give you a multiplicity of examples – it's just "What is this person doing when he is sitting there running this cycle of auditing?"

"Who makes the E-Meter read?" This is the type of question you would ask an auditor, see.

"Who makes the E-Meter read?"
"Well, the auditor does."
"All right. How does the auditor make it read?"
"By asking a question."
"All right." Now, the Instructor has to be a little slippier. "All right. If the auditor makes it read by asking a question, what does the needle fall on?"

The auditor says, "The question."

And the Instructor says, "That's right," and goes happily upon his way. And he missed the freight train, don't you see. It's way over there and over the horizon by this time. See, he's missed it.

Actually, this person is actually there and thinks that when he says, "Do fish swim?" that this action of his voice here makes the needle respond over there, although, he can observe that the pc has hold of the cans, that he himself doesn't have hold of the cans, and that there is no voice impact in this meter, he actually has always gone around believing... And the Instructor who didn't ask carefully, you see, would get an apparency of answer that sounded
very logical. It sounded quite correct. "Yes, the thing reacts to the question. Yeah, the needle reacts to the auditor's question."

Completely overlooks the fact the auditor in all sessions – and the auditor has overlooked it too – is actually sitting there in front of his meter and he asks the question which makes the meter read, and all the time sort of thinks it's silly that he's clearing these things, because he knows the answers to them. So therefore says, "Well, what's the use of a meter?" And he's never answered this question satisfactorily to himself.

In other words, these are things that the person has never revealed to himself. These are things that a little searching and look-over of just the auditing cycle, with or without a meter, would suddenly disclose to the auditor's own view because they look silly, even to him, you see. They look silly to the auditor.

This auditor all of a sudden says, "You know, I realize that there is no point in ever clearing up an ARC break, because the pc – reactivity is hate and the pc hates everybody, and you've got to as-is all this hate. And if you don't as-is all this hate, then the pc isn't going to get any better. So the best way to do is to get the pc into a level of hate and get the pc to hate you and then he'll be in ARC. So therefore, you should always ask your auditing command in such a way as to stir up the latent hate of the pc."

You start examining these – the rationale behind this and examine some of the other things that go into just this cycle, and repeated cycle of auditing and you're going to get astonished.

It's the auditor who makes the tone arm go up and hang at 5. Auditors should be in command of session. This is stable datum to this auditor. He hasn't got any other stable datum to go along with it, see. Auditor should be in command of this session. Auditor is in command of session. Therefore when pc suggest anything or pc say anything, then this means auditor no longer in command of session, so therefore pc must be suppressed. You get this?

_Audience: Mm-hm._

Now, people who that – who don't even have command or control in their goal, see. I mean, there's some side play or another. Do you get this?

You say, "Do fish swim?"

And the pc says, "You know, I've just had – well, I've had a whole avalanche of answers to that question 'Do fish swim?' and the answers could be yeah, no, and..."

"Ah! Now, now, now, that's enough. That's enough. Now, there's just one, just one, just one – just one answer. Now, that'll be quite plenty."

"Yeah, I know, but I have a little avalanche here."

"No, don't give me any more, now. That's it. That's it." "I guess I stayed in command of that session! See, I..." He's sitting there watching, you see, and he says, "I guess I stayed in command of that session!" You see?

"All right. Do fish swim now? Do fish swim?" Two hours later, "Do fish swim?" He's added the bank mass by suppress, see?
Now, his cycle of action, you see, is being just alter-ised to that degree. There's something awry in the cycle of – the auditing cycle of action. There's something missing here or there's too firm an adherence of some kind or another. There's too this or it's too that. There's something wrong with it.

And basically, you'll find that there is some misconception on the part of everybody who's having any trouble auditing. There's some misconception there someplace of what they're doing.

Now, you say to them, "All right, what happens if the pc makes a suggestion to you about the session that you examine the rudiment question again? Would you do it or not?"

Some fellow will say, "Absolutely not! Absolutely not. Not under any circumstances."

And we wonder why this is and then we discover something like whenever there's a confusion in the session, the auditor doesn't want to confront the confusion, and so the best way to get away from the confusion is to put time track between self and the moment of confusion, so therefore give eight or nine more auditing commands very rapidly, please. And that puts time track in between them and the confusion. And of course, the pc at that particular time can't leave that confused area, don't you see. Pc can't leave it because there's a confusion in it, and pc doesn't understand it. And then we come back and get the brass ring as the merry-go-round goes around and we find out that the auditor does not understand the pc a lot of the time and fakes understanding of pc. Does not know whether auditor understood or not. See?

And, we find out that the auditor has interpreted that he would look bad if he did not pretend to understand – when auditor does not understand. So there's the source of your confusion and it's right part of that auditing cycle.

Auditor asks the question of the pc and the pc hears this question, and the pc thinks of the answer to this question, and he says it to the auditor, and the auditor understands that answer, and acknowledges it, and the pc now knows that he has answered the auditing command. And all is as-ised and we go on along the track, see.

And this auditor is running his sessions this way: Ask the question of the pc, pc answers, auditor understands half of the answer, doesn't quite get the other half of the answer, decides that he'd better pretend that he understood it, acknowledges the pc's answer – which says that it's understood, don't you see – and the pc at this time gets a funny feeling about it – and all of a sudden there's a little confused area in the session and the auditor asks the auditing question again.

And the pc says, "I'm confused about the last answer."

And the auditor says, "Well, answer this question."

And the pc says, "I'm confused about the last question."

The auditor says, "Answer this question."

The pc says, "I'm confused about the last question."

"Answer this question."
"I'm confused about the last question."

"All right. Well, listen here, now, have I missed a withhold on you in this session?" That's another process, see. "All right. Let's have – have I missed a withhold on you? Missed a withhold?"

Pc says, "Well, I'm just confused. I – I don't know quite whether..."

"Missed a withhold? Missed a withhold? I know there's a withhold here, missed someplace. Yes, yes, that's right, that's right. All right, well, we can't get the withhold so let's run some O/W, O/W, O/W. Yeah. What have you done? What have you withheld? What have you done? What have you withheld? What have you done? What have you withheld? What have you done? What have you withheld? What... Pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa. See if we can get down the track, here, a distance from this." Because the auditor has committed a crime. He's lied to the pc. He has said, "Thank you." And that was a lie.

The auditing question was "Do fish swim?" and the pc said, "Well, often time, but not in hot bean soup."

And the auditor heard – the pc had said, "No." That's all the auditor got out of it, see, "No."

And the auditor says, "All right. Thank you."

Well, the pc knows very well that he didn't really put across this statement which was "Well, fish don't swim very well in hot bean soup." And the pc somehow or another knows the auditor never got that. And the pc doesn't know if he answered the question or not and it hangs right there. To some tiny little degree, the auditing cycle hung up right there.

And then the auditor, not wanting to take up the auditing cycle, can fly off down the track and do something else, but not take up what was really wrong. You see that?

So a simple study of the auditing cycle – or what is understood by the auditing cycle, or what the auditor is trying to accomplish in a session, or what the auditor thinks he should do in a session – just a simple take-up of this sort of thing produces sometimes the most revelatory results.

You say, "Well now, how does a pc..." You know, the Instructor has to be clever on these things. "How does a pc get over an ARC break? Hey, come on – how does a pc get over an ARC break?"

Auditor says, "Well, he uh – had a missed withhold, and so forth, and uh – you pick up the missed uh – withhold, and uh – well, I don't know how a pc gets over an ARC break."

And you say, "Well, why don't you figure out how a pc could get over an ARC break? What's an ARC break? How does a pc get over it?"

This auditor might have been telling you, "Pcs can never get over ARC breaks." But the pc [auditor] had not defined either the AR – what is an ARC break, or how you got a pc over an ARC break. And on the examination of this situation, was actually condemning the pc on the point of ARC breaks because "nice people never get angry." See, nice people never get
angry. So if nice people never get angry, of course, this is the answer. This is the idiot's answer, see.

Therefore, if the pc doesn't get over an ARC break, then the pc is not a nice person. Now, where the hell does that wind up a session? May I ask you that? Where's the session supposed to wind up?

Well, of course that doesn't solve it at all. But the person, in articulating this, has always thought that was a sort of a solution to the session, see. That sort of solved the whole thing.

No, it absolved them. And they mistook the absolution for the solution. They made themselves not guilty of putting the pc into an ARC break by adjudicating that the pc who had an ARC break was not a nice person.

I know, it sounds completely idiotic, but this has been sitting there as a substitute for not getting pcs out of ARC breaks. So therefore, they have never studied the thing any further. No further study has ever been given by this auditor on that subject. There wasn't another moment's study ever given to it. Why? Because he had a solution.

All right. Now let's get back to the Achilles heel of all training.

Psychiatrist has eighteen thousand electric shocks behind him, and you're going to teach him Scientology. You think he'll make it? The man's been in a university or a spinbin or something for twelve years.

You know, it's a good thing we don't recruit from people with the standard requirement that they be in a crazy-house for a half a dozen years, you know, like the psychiatrists do. I just thought of that one. I think that's delicious. [laughter]

Now he's been trained for a dozen years and he's all diplomaed up. And the state supports him, and the hospital supports him, and everything supports him but results – he hasn't time for those. And now you come along and you're going to try to teach him to be a Scientologist. Well, that's very interesting, because the one thing that stands in your road – there's one thing he doesn't know: he doesn't know that he doesn't know. See, that's the one thing he doesn't know.

Now, what makes it so apparent that he knows? Impacts of overts. I refer you to what I was saying about Zen Buddhism. You know, some people run a car into a brick wall sometime and come up with the idea that they know something.

You know, an impact is always substituted for a knowingness. They know.

Well, when you've committed a tremendous, fantastic number of overts against anything, you conceive that you know something about it. But it's an inverted knowingness. You see, it's the total cycle of individuation.

Individuated out, individuated out, out, out, out; knew absolutely nothing and then came back on the reverse curve and came back into the center of impact; so now one knows one knows.
Only, of course, you ask this psychiatrist what does he know – well, actually he can't tell you anything that he knows.

If you were to sit there and harp at him as to what he knew – I don't know, I think it might be an interesting thing for a Scientologist to do someday: go call on a psychiatrist and ask him what he knew. You're going to get some of the most brain-cracking responses, because you're going to de-individuate him out of an obsessed interiorization into whatever he's doing. Insanity. He'd be liable to start gibbering, you know that? He's liable to go mad! You know, maybe I've found a button here on how to drive a psychiatrist nuts. "What do you know?"

Now, you'd follow this cycle, you see: You'd try to teach him something to know. But, of course, that room has already been rented. It has occupants. So you can't, because he already knows. So, of course, there's no way to teach him anything that you know.

But at what level does he actually know? He knows at the level of impact. That is, he knows at the level of obsessive interiorization. This is how he (quote) knows (unquote). You got to reverse that cycle. See, the one thing he doesn't know is that he doesn't know. And you're – sometimes can be completely fooled, just flabbergasted in instruction in trying to teach somebody something. You can absolutely be flabbergasted. Stonied, I think is the better word.

You say to somebody, "All right. Now, this building is fifty-five feet long, fifty-seven feet long."

And they say, "All right. Good. I know."

"And it's twenty-two-and-a-half feet wide."

"Yes, I know."

You know, you'd fly in their face and say, "Well, how do you know? You never measured it."

The fellow will never tell you it's on the basis of "Well, I just looked and I'm good at estimating distances." You won't get that type of response out of that type of person, see. He will just say, "Yes, I know."

Well, if you're getting that type of response out of somebody, become a little bit puckish and a little bit adventurous about the thing and start skirting out, just a little bit further, to things that are more and more impossible that he knows. They're liable to do some of the weirdest reactions this way.

"Well, you know everybody in this block hates you, you know?"

"Yes, I know. Because – no! Wait a minute, wait a minute, what are you talking about?"

You say, "Well, I knew if I knocked long enough on that door, somebody would open it. Hello!" You get the unorthodox method of approach here.
You'd be fascinated about this cycle of the individuation, and the person tries harder and harder not to be part of it and finally becomes what he's trying not to be, all because of the overt and the withhold, and how that compares to knowingness.

And you've got this individual, then, that you're trying to teach something to and he already knows and doesn't know that he doesn't know.

Now, you try to attack this in many ways. You say, "Well, there's a great need for knowledge of the mind in your profession."

You know, a psychiatrist is liable to say, "Why?"

You're going to get the most – the most weird, erratic responses along this particular line. I'm just trying to give you a notion about it. And if you can keep up asking questions – this is a sort of coffee-shopping, on an unorthodox nonrepetitive command basis, you see – you keep asking questions, punching around one way or the other – all of a sudden the guy will realize that he's looking at complete idiocy. And you can spring him out of something like that.

We're not now talking about bad auditors or Scientologists or something like that, I'm talking about this on a much wider front: somebody who is absolutely fixated on the idea that he knows, but boy, he sure doesn't know what he knows.

You come along to somebody who is running an auditing session and you say to him, "Well, why are you asking the questions of the pc?" Well, you're going to get randomness. The answer is going to be this and the answer is going to be that. The answer may be sensible and the answer may not be sensible. But the end product of all this will be that the person either now knows he doesn't know or knows that he knows. And a new piece of certainty is added to his auditing.

As long as you leave all of these things uninspected by the auditor, as long as he thinks why he is doing it is something or other – it isn't a matter of criticizing him or showing he is wrong. Now, don't get the idea that that is what one is advocating. You're not really trying to disprove what he is saying, call him a liar or something like that. You're merely trying to get him to inspect something and what you do to furnish the inspection is the simplest possible cycle – the auditing cycle in the simplest form. Just ask him to inspect this.

"All right. Now, why do you ask the questions? Good. Good. Now, why do you think the pc answers in the first place? All right. Why does the pc keep on answering?" These, of course, are imponderables, man. These are braincrackers. These actually are considerable questions, you know.

All right. Why – but you're asking "Why do you think?" See. And "All right. Now, why do you think the pc requires an acknowledgment from you and feels lost if he doesn't get it?" And make him go over this cycle and ask it two or three times. He'll jog out all of his memorized reasons and he all of a sudden will take a look at "Well, why the hell? Why does he ask an auditing question? And why does it make any sense anyway to the pc?"

And you may do this to the auditor: you may cause him to – like the centipede, you know. You ask a centipede how he walks, you know. It's a fatal action, you know. Maybe this
auditor can't audit for a day or two but the truth of the matter is you've made him inspect the action. You've made him inspect the action. And in inspecting – well, he's asking a question: "Now, what does the pc do in an ARC break? What actually happens?"

Now, don't call him out, just accept whatever he says, don't you see. "Well, exactly why does a pc..." Now get very searching, you see. "Why does a pc recover from an ARC break?" Oh, buy any stock answer you've got, see, but come back and ask him again, maybe.

The guy finally says, "Why does he recover from an ARC break? Because he doesn't want to be mad at me anymore." And he sort of looks up and he says, "What do you mean, he doesn't want to be mad at ... What did I say?" you know. "He doesn't want to be mad at me anymore? Well, he didn't want to be mad at me in – well, yes he did. By George, you know, I think all pcs are just sitting there waiting for a chance to be mad at me." The guy's auditing will improve.

I'm giving you an idea about the – the fellow is inspecting what he is doing. This is a very crude rendition I'm giving you. But a fellow – get the fellow to inspect what he's doing and try to find out where those deviations are coming in from the ordinary auditing cycle. Because when he's got some cockeyed reason for it, there's going to be some cockeyed action following it.

It's the reason why he will never let the pc give the extra end items toward the end of session. Toward the end of session the pc is never permitted to give the additional items. Well, why? You could stand there and pound your brains out and guess and guess and guess. The thing to do is to ask – thing to do is to ask. Ask the fellow why he does that.

Only you don't even know what he's doing wrong if you just ask him to inspect the cycle of action. Ask him what he's puzzled about in auditing. "What puzzles you in an actual session?"

"Ohhwee!" And right away he's halfway to answering the question. He starts telling you what puzzles him in session; well, it's what he's having trouble with in session. And it usually isn't anything that he's being taught. It's something that he has added into the situation which doesn't exist there in the first place.

This is all off the cuff, but it comes on the basis of: All additives occur in the presence of misunderstanding – or in the absence of understanding, to state it the other way.

When you get an additive, you didn't have understanding – until you've got all additives and no understanding.

You want to see somebody doing something idiotic that he thinks is the exact, right way to go about it? Then obviously there was no understanding of how to do it in the first place. Don't you see?

But you don't look at it perhaps on this other very, very narrow view – very tiny view. You say the understanding is the reason for no additives and the misunderstanding is the reason for the additives, because it may look to you that the person understands what he's doing and yet you have these odd additives.
Well, when you see an additive you're looking at a misunderstanding. And this is picked up on meters as "disagreements with." Well, a disagreement simply registers as a no-comprehension-of.

And educating by disagreement is a fascinating activity. You simply get the fellow to pass over the thing while he's holding a meter – a pair of electrodes and every time it ticks you ask him what have you disagreed with. You wouldn't ask him, by the way, "What didn't you understand?" Now, I'm showing you there's a synonymous action here, see. You wouldn't ask him this, "What did you misunderstand there?" or "What didn't you understand?" This wouldn't bring anything out. You ask them for the symptom of the misunderstanding. It's the disagreement. They'll wrap with a disagreement.

Well, underlying that disagreement there's a misunderstanding.

Oh, I am sure some fellow has felt awfully silly. He has gone out and he has jousted windmills and he's torn things down, and he's busted up the millstones and he's just fixing the thing, you know, just fantastic, you know. And then he finds the fellow standing there was not a ghost but a miller. See, his whole destruction was based upon his misunderstanding of who was standing outside the mill.

That is the subject of comedy. That is also the abundant subject of tragedy in life. But in knowledge itself, which is the woof and warp that you deal of – with, and so forth, disagreement occurs after the misunderstanding.

And the way to set some auditor back to battery, of course, is get him to inspect the cycle of auditing and find out what's doing. But a much surer method you are using in your classes all the time right now: And that is simply that you are consistently – you're putting people on the meter; you ask him to read a bulletin while on the meter, you clarify the thing. Or ask them, "What – give me twelve things out of that bulletin that you can agree with." And you, of course, will inevitably have drop into the hamper the twelve things in the bulletin they disagree with, you see. Those can be clarified. You can trace it back to them.

Because a person cannot do what he does not understand.

He can give certain limitations to his understanding and do some small sphere of it. Like a girl running a computer does not have to build a computer, but let me point out to you that she is not building computers. She is running computers. Therefore, she understands the running of the computer and therefore she can understand the computer. If somebody were to ever come along and tell her why she was running the computer and enlarge her understanding of it, she would be a good – better computer operator, any day of the week.

You can always increase work output, you can always increase comfort and you can always make people more relaxed by letting them find out what they're doing and why they're doing it. This is inevitable, because you've increased the understanding. But people cannot do what they do not understand.

Those are two facts that I don't think any philosopher has ever joined up before. They are facts that stand very squarely in the road of good auditing. Listing will go badly, sessions go badly, Model Session falls apart and so forth.
There is some misunderstanding on the function of the auditor or the cycle of auditing action. It does not depend on the person being evil and therefore he's a bad auditor because he's basically an evil person, see. That is not the explanation. There is a misunderstanding of what he is doing or trying to do.

And sometimes as in your part on the subject of psychiatry – I no longer make this mistake – you can't dig psychiatry or understand psychiatry. That's truth. That's truth, you can't understand them. The reason you can't understand them is you really don't realize that they haven't any goals or aren't doing anything that you would think they should be doing. So therefore they're incomprehensible to you. They're perfectly comprehensible to themselves – perfectly comprehensible. They are not trying to cure anybody. They are not trying to make anybody well. They are not trying to make anybody sane. They don't have anything in common with any of those things. They no longer care for them or understand them or want to have anything to do with them.

You're trying to understand them on your own framework. You see, you'd like to make people well and you'd like to make them feel better and that sort of thing. And, of course, psychiatry is not understandable upon these basics. It's just not an understandable subject, then, because the basics by which it's being understood are incomprehensible.

Now, on a fantastically minor scale, some auditor isn't doing a good job because he just totally misunderstands what he should be doing as the auditor. Well, he doesn't have to have a very esoteric understanding of it. He doesn't have to be very informed as to what he is doing, but his misunderstanding will be so wild as to sometimes just make you feel like you've been snatched baldheaded. You'll say, "What? Not really!" See?

"I'm trying to straighten out this person's mind. I'm trying to straighten out this person's thinkingness. And therefore, the things they think, I've got to correct. Now, the only way you can straighten anything out is to correct it, isn't it? And the only way to correct anything is to change it, isn't it? So therefore, in order to change the pc you've got to correct the pc. So therefore, you have to tell the pc something different every time the pc says something." Of course, you're going to find far more idiotic responses to this in some kind of a co-audit than you'll ever find in any group of studying auditors. And there, it will become so ridiculous as to be fantastic.

But you can bet your bottom dollar that if you do not understand what is going on in a session that you won't be able to handle that session and at the bottom of all error is misunderstanding. That's not said on a think basis.

Some fellow's car, you know – this is an old problem of ours, is why does somebody's car go enmest? Why does this guy's car fall apart, and why does that bird's car stay together? See, what are these vast differences?

Well on the subject addressed, the person doing it has adequate understanding to the task.

See? This fellow's car that isn't going enmest, the best way of expressing it or a good translatable way of expressing it, is just to say, "Well, he understands cars." See?
This fellow who makes the good pie, well, he just understands pie, that's all. You'd find out that would follow through and be true. Now, this fellow who makes bad pie, you ask him about pie. And by golly, you're going to find out he doesn't understand pie.

You put him on a meter and ask him – now, this is the meter question that compares with this – you put him on the meter and you ask him what he disagrees with about pie. And you can run it down, pull it as a Prepcheck chain and after that you've severed his individuation channel, see. I mean, he's ceased to be – go this cycle of individuation on the subject of pie. All of a sudden he can understand pie and he can make one.

There is the whole subject of recovered abilities. There's how you recover any ability which you once had. You just restore your understanding of it. How do you restore your understanding of it? Well, it's unfortunately a very negative thing. You delete your disagreements with it. And if you can take your disagreements out with it, your understanding of it will restore. Then you can study it. You can look it over and familiarize yourself with it. And you can do it.

Well, in this lecture I've taken up some of the bugbears of an Instructor.

There are many ways you could go about the subject of instruction. But I think if you go too long and try to instruct too long without taking to heart the principles which I've just given you, I think you will come a cropper in a large percentage of cases. And they're the ones that'll break your heart.

A person can't audit – they don't understand what they're supposed to be doing. Why don't they understand what they're supposed to be doing. Because they disagree with certain things that they are doing.

If you wanted to follow it back down on an instruction-auditing back-check basis, pick up the disagreements. They could then familiarize themselves with what they are doing and then they could audit. Doesn't matter what their goal is – you'd still get by it.

Okay? All right.

Thank you and good night.
Good enough. What is this? This is the 11th Oct. AD 12, huh?

*Audience: Yes!*

The month of the octopus. And Ronnie needed eight hands to do everything he has to do.

We have some good news – some good news. And everybody around Sydney can be very happy with this. Of course, we're always very happy with this. Bill's just found Ian's goal.

*Audience: Great! [applause]*

There are probably some more, but due to the general breakdown in the auditing department, I haven't been informed.

We've stopped – we probably have found many dynamics and items and all that sort of thing, but we've gotten so we don't even announce those.

We have an interesting datum on this: It isn't necessarily true, according to the Auditing Section, and what has been coming through the Auditing Section, that the length of time taken to find the goal indicates the goodness or badness of the auditor. That is not what indicates the goodness or badness of the auditor. It is the fact that the auditor cannot find the detested person, dynamic or item.

Well, according to the statistics, if an auditor can't find somebody's detested person, dynamic and item in a fair hurry, there is something wrong with his auditing. See, if he then doesn't find the goal in a hurry, this doesn't indicate much. See, if it takes a long time to find the goal after you've got the item or something like that, we have no indication of this at all. But the speed of finding the detested person, the dynamic and the item is directly related to the smoothness of the auditor. Now, that's one to put in your kit as an indication of what's going on.

If the auditor can't find the detested person, the dynamic and the item in a fair hurry on the pc, then there's something fundamentally wrong with the auditing sessions. Wherever auditors have been changed on pcs here, why, we've gotten these first three things in a rush. Whereas before, we haven't gotten them in a rush. In other words, it wasn't the pc. Got that? It's the auditor. And this has just been sorted out by Mary Sue, and I think you might find it a useful datum.

Now, to give you some idea, Julia out there in California, is having a ball these days. This is getting ridiculous, you know? I – it is! It's ...
I told her that – to send me a cable – because they were – had a lot of offbeat goals being found out there and so forth, I told her to send me a cable on each one found. Julia's doing all the auditing and I'm getting a cable or two every day. And operating with terrific Saint Hill altitude, don't you see, and operating with the altitude of a good auditor anyhow, she's supposed to be running the show out there, but she's actually the California Goal Finder right now. And she's supposed to be checking out goals.

Something is going here whereby somebody sits down for a rock slam test, and they wind up with their detested person, their dynamic and their item, and then – and the length of time is spent checking out the goal. So they'll spend two hours finding the goal and two hours checking it out.

You're operating here, of course, without this tremendous altitude. You're just a student. [laughter] And you'll just be surprised how people stand and deliver on goals from the standpoint of altitude. You'll also be surprised occasionally as you're auditing along, how people can stand still and not deliver occasionally. But the general situation is that goals are tremendously variable in length of time to find, even in the hands of a good auditor.

Now, finding goals – this is a lecture on goals – finding goals is a science. It is not an art. It is a science. All of a sudden it's a science. But, like all sciences, it has a bit of luck connected with it.

I'll give you an idea. The pc puts his goal on the end of a two hundred goals list, and there are twelve goals on that list because it's going straight down the line of the proper lineup. Going straight down the line. These goals go out hard. You know, a bit hard. Just a bit hard to get rid of those two hundred goals, you see. And you're just taking them by routine, and the goal is a little bit offbeat from what both you and the pc thought it would be, you know?

And the item is "a target," to give you an idea – so, of course, "to be a projectile," you'd say, "Boy that must be the goal, you know?" And you and the pc are both convinced it's "to be a projectile," you know. And you get down to the two hundredth goal and it's "to be a little flower." See, you know – a curve in it.

Well, that's why the speed in – with which you find the goal is not necessarily an indicator. But getting up to the goals-finding step, getting the detested person, the dynamic and the item, apparently contains less luck and more meter reading and attention and smooth auditing. These are the factors there. You get over into the goal, and there you are.

Now, sometimes you get unlucky with your detested person. Somebody gives you a list of 420 detested people. Oooh! That's an awful lot, you know, to say, "Consider committing overts against_____. Consider committing overts against_____. Consider committing overts against_____. Consider committing overts against_____. Four hundred and some odd times, see.

Well, that's merely time-consuming because there was a lot on the list. And then this person's apparently a well of dynamics. And we get the detested person, we find out what this represents to the pc, and it represents 610 dynamics. And that's, "Consider committing overts
against_____." And, "Consider committing overts against_____." you see. It's just – it's just hard slug, and so on.

And then we find the dynamic, and we get one thousand items listed from the dynamic, and that's, "Consider committing overts against_____. "Consider committing overts against_____."

And the phrase is worn out by this time, so you say, "Well, think of committing trouble to_____." or something. You see, you – you've actually used repeater technique, and you've just actually worn out the whole English language on the subject of those words. They don't mean anything anymore. Anyway, you see that that is mainly a slugfest and requires good meter attention and requires alertness.

Now, the system is fairly infallible. In your hands I'm particularly proud of this system. It almost works better for you than it works for me. And that's really marvelous. Because on a couple of pcs I've had to take some wide tours. But I recall that this was before the system was perfected.

And then I have had bad luck recently with this system. I've been trying to find goals with it, and here's what keeps happening to me: After I get the detested person and the dynamic and the item, and get the goals listed very nicely – all of which proceeded with great speed – it turns up that the pc had an old goal and it is now alive.

You know, it's just been happening and happening, you know. Of course they got their goal, and that's fine, and it can read now and it never did before and all that sort of thing, but I haven't found a new goal with it, which I consider quite remarkable. Anyway – and then there are some other dodges I've been working on and so forth to speed up goals finding. I've been more interested in the research line than otherwise.

But you know, it's a sort of a disappointing thing, you know, you swear and spit after the session, you know. After you spent – you spent seven hours, you see. And you've just been working like mad, you know, and you've got it all up and it proves up beautifully, and then the pc says to you, "Well, I know you'll practically kill me for this but I think my original goal 'to catch catfish' should go on the front of List Six." Of course, you put it there, and that's it. You didn't find the goal with the system, you found the old goal.

You say, "Aw, nuts!"

But of course, the pcs got his goal, and it's all fine, and it's unburdened, and it's all to the good, and it's just your own professional feeling of pride that is hurt. You feel knuckle-headed, you know, because it was sitting there in the first place. You already knew about this goal, you know. You worked seven hours on a Dynamic Assessment, and of course the Dynamic Assessment is necessary to make the old goal read. See, it wouldn't have read without it. But anyhow, it feels sort of weird. I think I've done this too often now. And I want to see a brand-new, bright, shiny goal sitting there.

But my research auditing ... You saw a piece of research auditing last night. You didn't see a standard session. You saw a meterless Prepcheck to match up the goal, "to know." And the reason that was meterless is because actually using the meter on the pc to test out the goal,
I thought possibly was an invalidation of the goal, so the pc might prepcheck much more smoothly, you see, without the meter.

And I think you will notice that in each case the Suppress fell half a dial, when the pc said there was none. Did you notice that? I was quite interested in that and I thought you would be, too. And the pc is learning it for the first time.

Actually then, the meter knows more about suppress than the pc quite ordinarily. And the pc knows more about the other buttons probably. I'm sorry to have to reveal that. But did you notice that? Did you actually remark that fact? So, of course, there was a meterless check, and you had the pattern of the auditing and it all would have been the same, except I just wasn't using a meter. And we did get someplace with that. And the pc felt wonderful about it.

Ordinarily in another auditing session, not a TV demonstration session, I would have gone through that again. And at that time the pc probably would have fallen into some of these suppresses, see. And possibly would have cleaned it up. But that would have had to have been completed to make a positive statement concerning the fact. The pc thought the Suppress button was cool, and actually it was still hot.

Only for that reason would I be willing then to go on with doing anything with that goal, see. Suppress button's that hot; well, all right. Did you see it though? I mean, did you really see that? It was about a third-of-a-dial drop when he said, "Well, that's clear, and there's not any more answers there," and so on. Now I'll have to run it out of the pc!

But I thought that was interesting. The pc then does not necessarily have any alertness to the hotness of a Suppress button. You notice that none of the other buttons that I noticed, although it was pretty hard to keep the pc on the meter, did you notice that terrific amount of tone arm action? I was always going off the pin, of course, because I didn't want to keep watching the meter because that invalidated the pc. I wasn't able to put that needle back in the center of the dial as often as I wanted to. Did you notice that?

So therefore, you had a hard time following a meter on that at all. And I was trying to get it up to the middle as I said the goal, so that you could see whether or not the goal was firing or not firing. It was pretty hard to do, particularly on the askewness of that demonstration meter.

In view of the fact that in my own auditing these days, I'm beginning to audit only with the meter over on the left side of me, with a magnifying glass and straight on – auditing with a meter over here, askew with the other hand – getting so I'm ambidextrous. And the Mark V particularly – which I dropped and bunged up a bit last night, by the way – later on. It's all right. It still operates; it's a good test. These meters – the new meter is quite indestructible. There'll be Mark Vs available to you in about three to four weeks.

Audience: Good.

Anyway, let's hope they haven't altered the basic structure from the one you've been watching. It's almost identical face. Face is the same almost. The only thing we did was put "rise" in with the dashes.
Anyway, auditing with the thing over here on this side, and trying to follow that con-
founded thing through gives you less of a throw. Some of you, by the way, were being –
wondering about picking up latent reads – why I was picking up latent reads on this meter. 
The Mark V is slightly latent. I haven't bothered to inquire why, but the Mark V is slightly 
latent.

As you think you see an instant read on a Mark IV, on a Mark V you will begin to rea-
alyze that it is falling at some split second after what you thought it was falling on, on the Mark 
IV. And that is an instant read on a Mark V. That gives you one answer to it. And the other is, 
of course, that is what is known as a suppressed meter. And you will often have to do with 
suppressed meters.

Pc has very heavy suppression. Well, that's proven by the fact that when I asked him 
Suppress, you'd see your button go and so forth. But that is a suppressed meter. In other 
words, that meter isn't reading dead-on. A pc with terrifically heavy suppression on the goals 
line and so forth reads a little early, a little late and so on. This you will get used to. You have 
to know this.

And it breaks down the rule of the exact instant read. Whenever you have a pc who is 
under heavy suppression – this'd be a pc who rock slammed like mad, by the way, at half a 
chance – you'll notice that there's some – often something a little peculiar.

Now, at the time last week that you saw this meter, you mainly noticed the latent reads 
were being taken on the first rudiment. Did you no tice that? That's probably what first attrac-
ted your attention. And then it wasn't so latent on the other things.

Well, last night I straightened out the s uppressions on the first rudiment. In other 
words, this pc had several sessions jammed together on the first one, and we pulled those 
apart.

Now, you might have thought that was rather unusual to do, but remember it's the au-
ditor's job to get the rudiment in, not to sit there like a silly idiot and Simple-Simon the pc 
into the ground. You understand? So I was interested in getting the rudiment in, which I then 
proceeded to do. And traced the rudiment back to the first time he had trouble with it.

Well now, it was that rudiment – just to make  my point here – you saw last night that 
that rudiment was terrifically suppressed, and a week before, saw that it was reading latent 
and prior and every other confounded way except dead-on. You see that?

All right. Then last night, I cleaned it up. And I don't think you saw too much else, 
although there wasn't too much else in the session, because I was running a meterless test. I 
think you saw far less latent read, although occasionally you did possibly notice that 
hair-latency, but that hair-latency is the Mark V. And man, you'll have to get used to calling a 
real latent read, and what is an instant read, on a Mark V. And they're slightly different. It's 
different than a Mark IV.

There's just a little bit of white space, you might say, in – just a tiny bit of white space 
in to the end of your statement and the beginning of the read. I don't know why that is, I ha-
ven't bothered to inquire, but I have noticed it consistently and continuously. I'm the only one 
who has been operating with a Mark V. And when you start operating with a Mark V, you'll
first start noticing that it gives you a lot of trouble. That's your – be the first thing you'll notice, that this is a lot of trouble, man.

It's like you were running fan-job aircraft, you know, and they're with a fan, and they went like mad, 197 miles an hour, and they struggle into the air, and they fly through the air. And when you first got into one, having graduated from a Tiger Moth, you see, this thing really looked like it was going, you know. Tiger Moth going 60 miles an hour and this thing is going 197 miles an hour.

Well, you graduated from some old type of meter to the Mark IV, and you really thought you were flying, you know, this was really flying. (Probably at the moment perfectly happy with a Mark IV.) And then you start running a Mark V. Well, that's just graduating into jets. You just suddenly and inexplicably will find yourself in the world of jets.

As Mary Sue said the other day, she can't call them. Because it's gone, it's read, before she notices it. You know? The jet plane has gone by overhead and she wakes up to the fact that it has read, you see?

Now, the read is very positive. Its quite a persistent read and is actually much easier to sort out than that Mark IV, but you won't think so at first. I imagine you'll go on stumbling and blundering around for a week or so – I did – and educating your thumb all over again.

You just throw that tone arm up with your thumb a thousandth of an inch further than you intended to, and the Mark Vs needle goes over and hits the pin and lies there. Haah! And you've already started your sentence or something like this, you know, so therefore you have to stop your sentence and put the pc on wait, and adjust the thing, and you eventually will get your thumb educated to where you throw this thing, and it goes over and does a wobble. And you have to get so you can time the wobble.

There's no shunt. That's one of the reasons the Mark V is so terrific. On the actual meter in the Mark V there's no shunt. There is a small one in a Mark IV. And so there's nothing steadying the Mark V at all. And it goes over here and it wobbles. And then settles down and gives you the read.

Well, that is the education of your thumb is what that depends on.

Anyhow, that's beside the point, more or less. It has another characteristic: is that when you have a clean needle on it, it flows. That is the most flowing, smooth needle you ever wanted to see.

And let's say you had a flowing, smooth needle – this is another reason for the latency. You had a flowing smooth needle. "Are you willing to talk to me about your difficulties?" See, it's flowing, it's smooth, it's nice. It just looks like honey. It's perfect, you know. I mean, it's – everything is just "Oh, my, that's very nice." And that's on its highest sensitivity or its lowest sensitivity.

You normally run this on its second sensitivity – a Mark V. You run a Mark V with the additional sensitivity knob straight up, which I think is sensitivity 64. And you're running right now at sensitivity 16. There actually is that difference of multiple in the sensitivities.
So anyhow, it runs best with that sensitivity knob straight up, and you get your best reads out of it. And only when you're trying to pick the pc to pieces do you shove it over to a 128, see. And there it is, flowing smooth, and you say, "Now, when was the last time I audited you? When was that session? How? Yes. Well, fine now. Thank you. And since the last...

and this needle goes krup-krup, tuk-tuk, prr-brr-brr-brr-brr-gone.

Now, it actually kind of doesn't matter if it reads or not. This is a bad thing to tell you. You know there's something on the question. In other words, you can use this flow factor on a Mark V. You no longer have a flowing needle. There is something wrong with the question you are asking. And when you clean it all up you'll have this beautiful flowing needle back. And it's very easy to get it back.

But you can almost tell what question is hot by the fact that the needle is doing something, or that you have missed something in the session. Something is missed in the session. You can tell it from the unflowingness of the needle. It's going up in jerks. It's going up, bup-tek, krrp-bump, dit-du-bop, zzt-zzt, trip, thud. You know? It actually is very commotional. In other words, the Mark V to some tiny degree registers the state of mind of the pc by its character of rise. See?

Now, the Mark V also picks off all analytical thoughts. There isn't anything left in the pc's skull when the Mark V is clean. See, we were with the Mark IV picking off reactive thoughts only, and the pc could think an analytical thought and you wouldn't see it on the meter. With a Mark V you see every analytical thought.

Pc says, "Well, I hope that doesn't read." The Mark V will go click! So therefore, you heard me asking, and have heard me asking while you've been watching me do this, if the pc thought of anything, if there are any afterthoughts in that particular case. And it wouldn't matter if the thing were very latent, I would still ask the pc what he thought of.

Why? Because I don't want my needle brr, brr, tick, tick, brr, thup, bup.

Now, actually every analytical thought is to some degree a missed withhold, if it is not uttered to the auditor. So if you want the pc – without pestering him to death – if you want the pc really sitting in-session gorgeously, so forth, why, you've just got to keep a clean flowing needle. So this gives you something new that a meter can do. Right?

Now, this is very pertinent to goals finding. Because you're not about to find any goals on any pc whose rudiments are out. You're just not about to find any goal on a pc with the out-rudiments; that's all, man. And the Mark V puts rudiments in the like of which you never heard of before. You really get them in. You get them in including the analytical thoughts.

In other words, you get it in reactively and analytically and physically and every other way. You've got these rudiments in. Of course, you won't get them in as well if you are suspicious of your meter. And if your meter is not quite registering everything that it might be registering, therefore you'll very often badger your pc and start cleaning cleans. And that throws the rudiments out.

I know I had a bad time in the session last night. I got into the rudiments, the pc was out of session, I couldn't get the rudiments in, and we had quite a ruckus. Quite a mess. Auditing table upset and everything. This was remarkable.
Now, when this type of thing occurs it is – something else has happened.

And obviously I just got through missing the pc's goal. I think that was what this was all about. I couldn't really trace it to anything else. I must have gone right over the top of the pc's goal. Needle was rough and registering on "halffluth." But I think it would have registered on "Have you eaten any apple pie?" There was a lot of figure-figure going on. There was a lot of this and that going on.

So the meter is actually more sensitive than – for everybody's good, occasionally. You see, it's – you could get along with less. Do you understand? But yet you actually can't get along with less.

So this meter delivers back to the auditor a tremendous amount of skill in the order of auditing. It delivers back to him a lot of judgment about the thing. Is this pc doing all right, and is this pc really in-session? Well, you've got a free-flowing needle.

Now, the only thing wrong with that is you also get a free-flowing needle on a totally ARC broke pc, whether you're using a Mark V or a Mark IV or any other thing. I saw that last night, too.

See now, what's the point here? Well, no meter is ever going to be made, ever, which lays aside the ability of the auditor to perceive the pc. The auditor must be able to see the pc. The auditor must be able to apprehend what the pc is doing. Because he could then have a free-flowing needle on a totally ARC break pc with nothing registering anywhere.

Now, that factor will always take place because it's a characteristic of a living being; it is not a characteristic of a meter. And there's no beating that factor. I assure you of this; there's no beating that factor.

So you always have two inspection systems at work. You have the auditor, and you have the meter. And if you delete either one totally, auditing doesn't become more difficult, it becomes impossible! That's with an exclamation and an underscore. You delete either one of these systems, and auditing becomes impossible.

Now, when I say "When you delete the meter," you of course couldn't find the pc's goal. I worked and worked to find a system which would meterlessly find the pc's goal, and I have never succeeded in doing that. I don't even have a clue as to how to go about it, because everything – and I mean that everything I have put together that pointed in that direction has flopped. In other words, there has not been one hopeful sign.

Now, how do you like that? Now, you know you get on some goals channel with the pc, and if you're on the goals channel, it – occasionally a goal will go $zzpp$! and occasionally it'll rock slam, and occasionally will go tap, tap and a rocket read, see, as you go over one goal or another. You know that's a hopeful channel. All right.

Now, how do you like that? Now, you know you get on some goals channel with the pc, and if you're on the goals channel, it – occasionally a goal will go $zzpp$! and occasionally it'll rock slam, and occasionally will go tap, tap and a rocket read, see, as you go over one goal or another. You know that's a hopeful channel. All right.

There's been no hopeful channels of any kind in the direction of... Well, for instance, writing up a list so that the pc would eventually write only his goal. You get the type of thing here? Writing up combinations of lists which would eventually get the pc to write his goal. Doing this or that, asking questions of, and so forth. And this has just uniformly laid an egg.
I don't say that it's an impossible trail, but I do say that in quite some period of time now, two years, I have occasionally moved into that field and worked in it. And every time I've come out with a total skunk, pockets empty and all shells intact – skunked.

I've thought of how about having a pc just write goals until the only goal he can think of is that. That doesn't work either. Pcs can evidently write eight million nine hundred and ninety-nine billion goals without ever only writing their own goal, you see. Well, a lot of – lot of things go into this.

So, goals finding begins with auditing. And it requires an auditor capable of inspecting the pc who is being audited – the auditor inspecting the pc and an instrument inspecting the pc. It takes both.

Now, sometimes you can lay the instrument aside but that's only when you're proving something up. You'll eventually have to bring that instrument back into your lap and say, "Does that goal read?" Do you see? You eventually have to resort to the meter, no matter how many other approaches you make visually with your naked eye.

Now, your meter is not going to detect the ARC break of the pc if it happens fast. That's interesting, isn't it? Only the auditor's going to detect that.

And after that, the meter says, "It's all clean, it's all clean, it's all clean." The pc is lying on the floor, writhing quietly, see. The meter says, "He's well." The meter says, "He's well and happy and in-session." You see, "Have I missed a withhold on you? Huh-huh, clean. Willing to talk to me about your difficulties? Clean. Do you have a present time problem? Clean." See? "You told me a half-truth? Clean." Everything clean, everything clean, everything clean. Pc's lying on the floor in total agony and total despair.

So therefore, not this instrument, but any mechanical observer I think that anybody ever cooks up will have some ceiling of limitation on its power of observation. There'll be some limitation upon its ability to observe, which a thetan can always better. Because remember, a thetan can look, but a machine can't look unless a thetan is looking at the machine to read the answer off of the machine. This is something that the scientist uniformly overlooks.

The psychologist's dissertation on how the eye works is one of the damnedest pieces of buffoonery which has ever been perpetrated as a hoax – I mean, as a fact. It is! It's a piece of buffoonery. According to this, the eye looks out here, it points in that direction, and by some focal system of images – which of course he gets out of the science of optics – there is some kind of a screen back here which registers the image. And then... we don't say any more about it.

But carrying through this, reductio ad absurdum, we get a screen looking at a screen and then we would get another screen looking at a screen.

And then we'd get another screen looking at that screen, and another screen looking at that screen. And at no time anywhere do we have an observer. In this whole system there is no observer. I think the reason for this is the psychologist has never been able to observe. So he just discounts this very necessary thing, an observer.
You know, I did this one time with a UNIVAC, ENIAC smick-smack thingamabob whatnot that was going round and round and its wheels were churning, and its valves were popping, and I think it had cooling systems and so forth to cool off its fevered brow. And it had all kinds of instrumentations which crossed instrumentations.

I busted the machine by the way. I did. I fed it "two times two equals..." and it was unable to solve this problem. That was the end of it. The things went round, and they went round, and there was no "4" to fall out, see?

It was set up to have a more complex equation. And that was too fundamental an equation. Now, it could have said, "Two times two equals four," if you had first said, "The derivative integral of Y in its ratio to X is the distance between G and its square root of Q. And if this were true, then two plus two or two times two equals what number?" See, the machine is set up to take that many.

This just left all the blank files over here, see. And the machine looked in vain, it couldn't find anything there, so it looked again. And couldn't find anything there. And it looked again, you see, and it never would pick up the "Two times two." The cams were going mad inside the thing. They had to shut the thing off.

Spoke to me rather crossly. And they said, "This machine was not designed to solve things of that character." It was an astronomical computational machine. It had the distances to the moon, and the lunar positions thereof, as expostulated from the eclipse of something or other, you know, and this was all fed in. And of course the cams couldn't "Two times two equals four."

"Well, let me point out something," I said. "Let me point out something here. The machine never has seen an answer."

"Ho-ho-ho-ho, nah-ha-ha-ha, nah-ha-ha-ha, nah-ha ... !"
I said, "Wait a minute now. That machine has never seen an answer."

"Well," they said, "seeing you're just using some offhanded trickery or ... It's your writing background showing up, you know, just using semantic trickery, or ..."

"No, no. It never has. Who reads the answer when given up by the machine?"

"Well," they said, "the operator."
I said, "Then the operator is part of the machine."

"No! No, no. No! No, no."

"All right, then if the operator isn't part of the machine, then the machine has never inspected the answer."

"No, that – couldn't be true."

You see, that just led up the garden path on this. You had – you put an observer into any of these systems and they go to pieces. You've got to have an observer. I mean, you take the observer out, you say to – here's this system. And it says, "Well this machine observes itself and therefore integrates what it does." Well, you can set up a machine as a servomecha-
nism which will find out that it's nine o'clock and shut the radio off or turn the percolator on or do all kinds of things like this. But its inspection is just that. And actually it rarely inspects that it's done it.

Now, some machines, much more complicated, will inspect to find out whether or not it has done this. And if it hasn't done this it will shut itself off. An automatic phonograph will do that. It'll inspect itself to find out whether or not it's playing a record and therefore... But its inspection is limited to that one sphere, see. It can observe no further than that.

Now, you can't expect a meter to observe a pc. It will not. An auditor has to be there to observe the meter. And I'm stressing this point not because it's just a piece of ridiculousness, but you're going to find people around who think that the machine observes the pc and if they simply sit there and let this machine operate, they're going to be all set. And furthermore, that a machine can be developed which will observe the pc 100 percent and do everything there that is present in an auditing session. So their total action will be to develop better and better and better meters. The auditor is totally unimportant. See, the auditor will have nothing to do with it at all. It's just whether or not you have a better machine.

No, sir! Although it's very laudable to develop better and better and better meters, don't develop in them the direction that they will eventually wind up with no auditor. Because that's the trouble with any auditing session that goes wrong: is no auditor. At some point in the auditing cycle there's no auditor.

You can actually have the commands come out of a tape recorder. See you could actually fill up a whole record – a whole tape full of "Do fish swim?" And then put it on with a foot pedal, and sit there and the tape will play and ask you the question, "Do fish swim?" and so forth, and then you get into an ARC break.

Well, maybe then you could have another tape recorder and if you had an ARC break you could take your other foot and push down on it and it would say, "Do you have an ARC break?" See? And maybe if that registered "yes," you could even link that in to another machine which now said, "All right, recall an ARC break" or something, you see, and it would go on and on and on in this particular fashion.

In other words, you could get a system of complexity operated out like this. But look, no matter how many systems you have, the only observer present is the pc. So you still have an auditor present. It's the pc auditing himself. Now the question is what is he auditing? And if your observer is the pc, then what's the pc auditing? Well, he must be auditing some valence. Well, we're not trying to clear valences. We're trying to clear pcs.

All right. Now, let's study this a little bit further in goals. It becomes much more pertinent to this than it appears at first glance. The pc must have another beingness. This is peculiar to goals. You realize you can sit there and chant to yourself, "Think of a problem of comparable magnitude," and think of the problem of comparable magnitude to something or other, and solve something. You could even audit yourself through an engram. You can do all kinds of interesting things with self-auditing. Most of them wind you up in the soup, but the point I'm making out here is things can happen because of self-auditing, see? You can.
You're having an awful lot of trouble with some other human being; you can sit there and say, "Well, think of a problem of comparable magnitude to Bill." See, "Think of a problem of comparable magnitude to Joe. Think of a problem of comparable magnitude to..." and get your answer each time, and first thing you know you feel better about it. See, that's possible. Of course, you'll probably have a headache and so forth. But it doesn't matter.

Now, it's possible. Now, because that's possible – because that is possible then you could extrapolate and move forward to believe that goals finding and auditing was possible. You see?

In research and so forth I've had to, and have inadvertently or on purpose, run dozens of processes on myself. It's inevitable. You say, "I wonder what would be the effect of..." See, that's all you have to say. You answer the question. It's obviously a self-audit, see?

You say, well, would these people get better if you did so-and-so? Supposing you asked them, "Think of a problem of comparable magnitude. Well, think of a problem of comparable magnitude to this building." "Yeah, there's an answer. That's answerable."

Now, in actual fact, you, in dreaming up a PCs lines do a little bit of self-auditing. You say, "Well, let's see, is that answerable, or isn't that? Yes, you could say that'd be a clear sphere, or something like that. Yeah, there's an answer to that." You know? So, you get this kind of thing.

In other words it starts to be borne in upon you that auditing on self is possible. Well, it's possible to say, run a Touch Assist on your own leg. Yeah, you could probably cure up a scar.

Girl's got a scar or something like that, that she doesn't like, on her knee or something like that, why, she could probably do a Touch Assist on it ten minutes a day and at the end of a couple of months or something like that have no more scar. It's quite remarkable what can be done with a Touch Assist, see. And because that is successful, say, well, you could probably find and run a goal on yourself, see. Therefore goals running is possible.

Now, I collided with – on this on the Queen Elizabeth. And I've had a quite a go-around on this particular subject, and actually have let some people list their own goals. And this is what now materializes: Let me show you here: here's a person, see, and here's a valence. This flashlight, see. Now, here's the valence here. Now, this is the valence with the goal in it. Now, to find his own goal – see, you'd think it'd be like this, see – he said, "Let's see, 'to catch catfish.' I wonder if that is my goal. Let's see. Is that my goal? 'to catch catfish?'"

"Now," he says, "I don't know, that sort of made me feel dizzy. Let's see, 'to catch catfish'... How about, 'to be a game warden?'... Yeah, there's pain on that. That must be right." That's the oppgoal. See? That's the oppgoal. An individual has to be over here to look at the valence in which his goal exists. I'm making this point with you. And every time the individual thinks of inspecting his goal he exteriorizes from his valence into an opposition terminal. And an effort to run one's own goal or list one's own goal always finds one in the opposite lines.
Now, when one is listing opposition terminals, one of course is in one's own goal terminal. Here's the opposition terminal, see, and the thetan would come around here. Let's say these are terminals now. We'll take the terminal situation, see. And here's the thetan, see. Now, this one contains the opposition goal – the flashlight. And this little microphone here contains the person's own goal, see.

Now, person says, "To catch catfish. Who or what would want to catch catfish?" and inspects – goes over here to the opposition terminal, to inspect the terminal which contains the goal "to catch catfish." Savvy?

Now, to inspect the opposition, "Who or what would oppose catching catfish," the person goes into the terminal in which the goal exists to look at the opposition. Do you understand?

In other words, no matter what he looks at, he is always in the other side. Every time he looks at the goal or the Opposition to the goal – there's looking at the opposition – he's in the terminal with the goal. You got that? And while looking at the goal he goes into the terminal which is in Opposition to the goal. You see this?

So there he is, always on the wrong side of the fence, because – here's the trick: you can't as-is. You're always being the thing – you're always being the thing which doesn't have in it what you're trying to as-is. It's all exterior inspection, then. Everything is inspected exteriorly in the mind. A little bit hard to put this across.

But the point I'm trying to make simply is that the individual, the person, the thetan, in the bank stack-up, can never be in what he's trying to audit. And therefore never turns the sens or the pain on in the right places. It's always in the wrong place.

If it's lines two and four that are supposed to contain sensation, and lines one and three supposed to contain pain, why, in a self-audit, why, lines one and three will contain sensation and lines two and four will contain pain. This is real backwards, isn't it? And he can get so loused up, because he never is in what he is trying to as-is.

He star... he's going to check out his own goal. Let's say the goal is in this microphone, that's one valence, he's going to check out this goal. So he comes over here into the opposition to check out the goal. Now, he's being the opposition while he's checking out the goal, but this thing isn't here... He's not in it to find out how it thinks, so he only thinks over here in the opposition, you see what this... You get the idea?

Now, he's going to check out for the opposition goal; of course, he's in his own terminal and, you know, the one that does have the goal. No, it takes an auditor.

All right. Here's let us say is the auditor. And here are two terminals. Here's the auditor, and the auditor says, "to catch catfish," and the pc goes into the terminal of "catch catfish." And the auditor says, "Who or what would oppose catching catfish," and the pc goes into the terminal in opposition to catching catfish, see? In other words, he's in the right terminals for them to as-is. And so you get as-isingness. Then you get something as-ised and the bank starts caving in and he's always in the right viewpoint. But self-auditing he's always in the wrong viewpoint.
Because of this mechanic alone self-clearing becomes impossible. Also, after a great deal of testing and so forth, although a person could get away with it if his auditor was sufficiently powerful and stood over his head enough and had written the lines up and so forth, for a little while the person could self-list. But he's actually not self-listing; he's listing on a – he's just writing things on a list that was given to him by another person, don't you see? And even that one, as in the main, failed – self-listing.

I've just received a plea from Wing Angel who took somebody with self-listing, and he says, "Please, please, please, no more self-listing, please!" He had to mop up the pc, you see? The pc was going into the wrong terminals. And after a while the pc gets so confused they don't know whether they're coming or going. See what happens?

It's just the fact that a guy on a self-audit appears in the wrong places to self-audit on goals. I hope you understand that.

Audience: Yes.

You got to have an auditor out here. And the auditor asks the questions; the pc goes into the proper places to get the as-isness of the situation. Therefore, your auditing occurs. And he gets the pain in the right places and the sensations in the right places and his viewpoints in the correct spots, and it all starts going, and that's it.

Well now, he starts looking for the goal "to catch catfish," he at once will exteriorize from the terminal in which the goal "to catch catfish" is residual. And then thinking quietly to himself will realize that his goal is "to be a game warden." He'll pick for himself inevitably while he is looking for his goal, only opposition goals. This gets pretty fantastic.

If you inspect most terminals lists after you've... Let's say the first 850 goals list – which is still done, by the way – that list is quite remarkable for having on it so many opposition goals. It's got lots of them. Well, that's something that the pc listed himself.

Now, something that is listed on the pc by an auditor is less likely to have opposition terminals on it and contains a greater preponderance of his own terminals, see? This doesn't necessarily hold true because sometimes a pc is so spattered into his item that he can't tell the difference between the item's goal and his own goal. See, they're smashed so close together, you know?

Had an example of that the other day, you know. It's quite remarkable. The lack of criteria the pc had between his own goal and the goal that would belong to the item. You've noticed that in doing your lists sometimes, you know.

Let's say the goal was "to catch catfish," you know. "To catch catfish," "to bite hooks... to jump out of the water," see, "to eat well," "to never be scaly again." You know? You watch these lists and you will see that the pc is actually putting down opposition goals. But that's on the item. And of course, when you haven't got any item in sight the pc rackets around inside of his bank, and so on. He will put a large number of opposition goals.

That's perfectly all right, because they won't rocket read and everything is fine. You never find an opposition goal with rocket reads. Don't worry about that. Some of you've got it
tucked away in your head that some goal is firing, and it's the opposition goal, and you're now very worried.

Aw, stop worrying about it. Some goals will continue to fire for quite a while and then fold up, which aren't the pc's goal. You should be aware of that mechanism, but it isn't that they are opposition goals. And opposition goals won't keep on firing forever, see. That's very nice. You're saved by the bell. In the normal checkout period an opposition goal folds up, and it doesn't rocket read.

But sometimes you'll get other goals rocket reading when they're quite close to the real thing. And then it fades and the rocket reads fade. And apparently a rocket read can – the reason – any goal but the goal rocket reads is because the read can possibly – and this is just suppositional – transfer to another goal. And it'll stay transferred to the other goal for a short time.

That's a supposition drawn from the fact that the rocket read will transfer from the goal to the line. Just as you can get a line rocket reading, so you might be able to get a very closely associated goal rocket reading for a very short period of time. And that accounts for your occasional rocket reads.

You're going down the list, and you get this one, you saw one on TV one night. And it was something, I think, "to be dashing." And man, that thing really rocket read. You remember that? It's a long time ago. And it really rocket read. It rocket read, it rocket read, it didn't rocket read, and it didn't rocket read, and it didn't read at all, then that was it.

Now, where'd it get that rocket read? Actually it was a transfer to the goal momentarily, and the goal itself was in there someplace, see, and it was firing, and then this thing blew off the top of it and it wasn't the goal and so you no longer had a rocket read.

So, because your opposition is so close to the goal, occasionally opposition goals will rocket read momentarily. But not for hours, you know. And they don't check out. And they don't live up to anything. So you don't worry about opposition goals. It's not an obstacle.

The only thing I'm trying to tell you here is self-audit is impossible on goals. That's just it. I just have to come to that conclusion. There is no system by which you can self-audit into your goal.

Of course, you wake up some morning – you can wake up one morning and you can say, "My goal is ...!" Well, fine. Fine. My God, for all means, put it down on something even if the inside of a matchbox, and give it to your auditor. If you notice, as you tried to tiger drill it on the way to school or something – if you notice – it got only sen. And it got kind of unreal. And it got kind of fogged up, and so forth.

That's because, of course, you had to become the game warden, or you had to become something else, or you had to become the catfish, see, and then you're on the wrong side of it, and it's a valence problem, see? And you slide into the wrong valence and after that it doesn't work. And that's goals.

So it takes another observer. The machine cannot observe. It takes another observer in the session. And somebody who can sit there and issue the actual commands to a degree that a
person does not self-audit to find goals. Therefore, it takes very smooth, fine auditing to find goals. Your auditor has to have presence. The pc has to know there's an auditor there. Otherwise the pc is just mucking around from – in the wrong valences, and self-auditing into this and into that, as he would do on a machine.

So it takes a machine to do detection. The human being doesn't go that far. The thetan doesn't go that far on observation. But the machine will never be an observer. And as the machine cannot be observer, then a human being would never be in the right valence to find the goal. So that's why you have to have a fine auditor to find goals. And the more presence, and the more altitude, and the more certainty the pc has on the subject of that auditor, then the easier it is to find the goal. You follow that?

So the better the auditor, the easier it is to find the goal. And the weaker the auditor, the harder it is to find the goal. But the goal – the length of time of finding the goal, as I said, depends to a large degree on luck. But finding the item, finding the detested person, you know, finding the dynamic, finding that trio – of course, if the auditor has good presence, good skill, the pc's aware of him, they go into it, clank! and go outside of it, and say, "That is detested," go into the next item, bang! They say that is detested, go outside of it, go into the item, bang! That is detested, there it is, bong! And you've got it. You understand?

In other words, the auditor's presence is sufficient and adequate to putting the pc into the valence necessary to face the valence which is the opposition. See? So it takes an auditor. The auditor is necessary. The machine is necessary. We can make better auditors. We can make machines. But we can't, I don't think, make an auditor that will totally replace the machine. And I know that we can't make a machine that will ever replace the auditor. Do I make my point?

Audience: Yes.

Thank you.
This is lecture two, Saint Hill Special Briefing Course, 11 Oct. Continuing on the subject of goals finding.

If you've got down the fundamental that it takes an auditor and it takes a meter, then you see on goals finding there's no substitute for being there as the auditor and being accurate on the meter. Therefore, goals finding will never become the subject of sloppy auditing or sloppy metering.

Now listing requires more auditor presence than – that is, the listing sessions – than Prepchecking. An auditor will be able to get things done in a Prepcheck session – "Since October, 1913, has anything been suppressed?" You see, an auditor can sit there and bat this stuff off, and get a result on his pc which will be a very interesting result.

He's sitting there practically without a meter. He simply stops asking the question, you see, when the pc doesn't want to give him any more answers, and so forth. Because he isn't being pressed, why, the pc has a tendency to be rather accommodating. And it all goes off rather smoothly, without too many ARC breaks.

But the moment that you start listing... You see we'll just skip goals finding; it's absolutely impossible to find a goal without a decent auditor and decent presence and good metering. I mean, that's a foregone conclusion.

It mainly requires auditor presence and auditor permissiveness. Now, the rule is a very simple one for you to lay down on anybody. Somehow or another, he has to continue his presence while never asking for more items than the pc has and never preventing the pc from giving him items.

Now, that's the happy balance which this listing auditor maintains. Now, if you also have a circumstance whereby the listing auditor is asking a question and not getting an answer, you'll get a jam-up on the lines.

So this is interesting, isn't it. There's a nice little compromise involved there. The person doesn't have any items for the line and the auditor has asked the auditing question and therefore must get an answer to it.

Well, now, this is – gets interesting, because you'll find out that this little factor all by itself will stack up a case – unanswered auditing questions.
So you've got an auditor who has to be smooth enough to say, "Well, just give me an old one offhand. Well, just give me any one so the question will be answered." Pc will deal him the same item that he's dealt before or something like that and you've got the auditing question answered.

But that must be done sufficiently smoothly so the pc is not ARC broke or being dragged at, don't you see. Then you've answered the auditing question and you've got the item, and that's all very slippery.

Now what, in essence here, is the thing that would happen? What is the thing that would go wrong in a listing session – is that the pc gets into a suppress or a protest, either one of which turns on sen. In other words, you ask the pc for more items than the pc has. You see, it's the pc has, you know. Auditors don't sometimes get that point, that the pc has them or he hasn't got them, see.

The weird part of it is, see, the pc isn't dreaming these things up. Now, this offhanded, "Well, give me one more, you know, an old one, or something, to keep the record straight," is asking the pc simply to give you one already dealt, which the pc can always do. But the pc's got them there, and if you realize that the GPM is stacked up like poker chips, you know, he's either got that many or he hasn't.

See, he isn't inventing them, thinking them up, creating them, or something like that. That is just the items he's got. See, that's the – that is pretty hard to realize.

The other auditing point that auditors – poor auditors even have a bunch of trouble with, and any auditor will have trouble with some time or another, quite frequently, is the pc has said something was wrong and it sounds horrible to the auditor and the auditor believes it is now wrong.

Well, no, the pc has said it and it's been acknowledged, so it's actually no longer wrong. But the auditor feels very downcast because the pc has said this was the condition, and then the auditor adjudicates that the pc couldn't possibly get well, because the condition, you see, was so bad. You got that?

The pc said, "Well, I thought, 'What a monster you are!'"

Well, the auditor says, "My God, I can't audit this pc because the pc thinks I'm a monster."

No, if the pc had thought that the auditor was a monster and hadn't told the auditor, yeah, auditing pretty impossible. But the fact that the statement has been made is the alleviation of the condition.

Now, when a pc – when a pc is – that's the – I just added that in as the other point they have trouble with. And once in a while you yourself will say, "Ohhh God!" you know, "Look at what I've been looking at here!" But you're looking at past history. If the pc has said it and it's been acknowledged, it's always past history.

Now, that's with these items. When the pc says them, they're past history, see. And they deal off, just bang, bang, one right after the other. Bang, bang, bang, bang, bang. And they deal off, bang, bang, bang, bang, bang.
Now, if you demand that the pc give you more items than he has got, then the pc will have to protest what you are saying. He'll have to protest the demand, don't you see. So that's a protest which adds sen. Sensation is added then – dizziness, misemotion, so forth. And if the pc is prevented from giving items he has – it's the way this finally works out – then the pc will have to suppress those additional items, which gives you sensation.

Now, the symptom of a wrong goal is it starts out with pain and winds up with sen. Sometimes it just starts out with sen and winds up with sen. But sometimes early on in the run, you'll have pain on a wrong goal, which then develops into sen, regardless of how smooth the auditing is or anything else. That's a symptom of a wrong goal.

Now, you can make a right goal, of course, sound like a wrong goal, in a listing session – look like a wrong goal, you see – by making the pc suppress and protest. Pc says, "Well, I just haven't got any more items that – you know, that make a mistake, you know, make a mistake being a catfish. I just haven't got any more, you know?"

You say, "Well, come on, now, come on, now. This line is way behind. We only have a few strikes on this line. I'm sure you can think up some!"

Indeed he could! But we're dealing with just so many chips in the bank, you see. We're dealing with just so many things. These are quantitative items. See, he has so many thousand of this and so many hundred of that and so many dozen of something else.

Well, sometimes the stacks are wrong, don't you see, and you come around and ask for something he made a mistake about, and he hasn't got any mistake items right at that moment at all! He isn't even in that side of the deck! Hu-huh! He can't do a thing about it. He says, "Well, I just don't – I just don't have any."

You say, "Oh, come on now, come on now!"

Pc says, "But I don't have any more."

"Oh, come on, I'm sure you can give me a couple of more. I'm sure you can give me another ten or twelve. This line's way behind."

"But I haven't got them! But I haven't got them! But I haven't got them!"

You see – because that protest, protest, protest, sen, sen, sen, sen, sen, see.

All right. Now, let's take the reverse side of it. You say to the pc, "Well, this line is already overlisted. We've got too many on this line."

And the pc says, "And there's a – a game warden and catfish and there's fish hooks and there's – there's – streams and ponds and there's... "

And you say, "Well, there's too many on this, you know. I mean, you know, there's already – got a full card here, it's already full, you know. And uh – can't we get off onto some other side of this?"

And the pc has to go mvvrt – sen!

Well, now, with sen goes a climbing tone arm. Tone arm is a direct indicator of sensation. It's mass, but then of course sensation is symptomatic of built-up mass. The more he
chokes down and the more he protests, the more mass is going to get stacked up. So, of course, you've got the symptom of the climbing tone arm. Pc tone arm at 5; pc lots of sen – you can say this sort of thing has happened: that the auditor has demanded more items than the pc has, and the auditor has prevented the pc from giving items that pc has. That's your first adjudication.

So, to that degree, you're going to have trouble with listing sessions. But in view of the fact that it does not greatly depend upon metering – in other words accuracy of metering is of no account at all in the actual listing, except to watch the tone arm.

The only thing the meter is used for is to tiger drill in, but again, if he isn't tiger drilling – if he can't tiger drill, you can always have him give a rapid Prepcheck, and as you saw last night that can be done with no casualty at all – maybe not perfectly – can be done with no casualty at all, just on a straight Prepcheck.

So, your listing auditor doesn't even know how to tiger drill – doesn't even have to know how to tiger drill, do you see that? He could just give a Prepcheck round and do it once per session, see? Be interesting. You see what I'm driving at here?

So that's the main trouble there. Your main trouble is the lack of auditor presence – the auditor's getting in the road of the session. See, it's just the auditor won't permissively sit there and be an auditor. The auditor must be getting in the road of the session. The only thing you've got to do to remedy that is get the auditor out of the road of the session, either by making the auditor inspect the cycle of auditing or something like this, don't you see?

That's easy to remedy! You can handle that. And now, the goals finding – the goals finding here – that's something else. That's the combination of the observer and the meter. And the goals finder has got to be hotter than hot on a meter, and got to be accurate and not blurred up, and his auditing has got to be very smooth. Otherwise he'll cause sufficient suppresses to cause the items or dynamics or persons he's trying to find – he'll cause those things just to vanish. They just go!

They show up on the list, but there's so much suppress on the session, you can't get anything to fire. You see this? So if his auditing is rough, he's not going to get any of these things. In other words, they're suppressed before they occur.

Sometimes meters just stop slamming. And you work and you sweat and you slave and you eventually get the meter slamming again, you see, and it's always on the fact that it's a Suppress, Protest, Careful of, all these confounded things.

"Careful of," by the way, peculiarly enough, seems to be the brute that turns off slams. That seems to be far more pertinent on slam turnoff than any other button. Of course, the others turn off slams, too, but that one's peculiarly odd. Have you noticed that while running "Careful of," you'll very often get slams that you didn't suspect were there?

So therefore, the pc is too careful – he will turn off his slam. Now, the best way to get slams back on is with a goals Prepcheck using the eighteen buttons which of course includes the counter-button.
Now – you just take the item and you just, you know, give it a goals Prepcheck, you know. The item is "a candy bar," you know. And so you just say, "On the item 'candy bar,'" you see, "has anything been suppressed?" or, any way you want to run it, but you just run it that way, and you go on down through the end. You normally will get the slam back on without any extraordinary action – particularly if you're running it against the meter quite properly.

The best way I know to turn on goals and for you to turn on goals or items or dynamics that have turned off is just that round and round and round Prepcheck.

Actually, running it on the meter on the average pc shouldn't take more than an hour to go all the way through. But you get something that's really stacked up, you get one button per session, you know. I mean, vuuuh! It could be, almost, variable in time, but in ordinary course of auditing and so on, it's about an hour, hour and ten minutes, hour and fifteen minutes, to go all the way through that.

Now, the auditor – the auditor has got to be sharp. He's got to be – I gave you the characteristics most desirable in auditing, in another lecture – but that auditor has got to be a sharp auditor. That auditor has got to be a good observer, he's got to be a good meter operator and he's got to have good auditing presence. And his auditing's got to be very smooth. Given those things, why, man can he find goals! Take those things away and the goals just won't occur at all.

Now, oddly enough, the thing that's going to cause you the most trouble in any area you're operating in will be the lucky fluke – of course, causes you trouble occasionally. You do something that's a little bit off-line; you're being very clever, and you get a goal or you get an item, or you... Oh, you've had it! You know? It won't happen again in another thousand years. But you keep on trying it you know, and it's just a fluke.

Similarly, somebody is going to sit down in an auditing chair someday, as – he's just doing a Prepcheck, see, something like that – and all of a sudden the pc lays his goal on the line, you know, and says, "That's my goal." Or he's going over – he's listing the goals list and he's watching the meter, and all of a sudden one of those goals goes clank! brrrr! see, and he says it again and he says it again and he says it again and it checks right out, right away, see.

Ruins him! The rest of his natural career, he'll be sitting there, listing the first 850 goals, watching for that thing to go brrrr! See?

I think there's only one goal here for a long while that the first time it was read it rocket read three times in a row, there was no suppress on it, there was nothing on it, it was just clean as a wolf's tooth, and there it was sitting right out in the open. Trouble is I don't think it'd ever been on the pc's list before. See, the second they put it on the list it read perfectly. Of course, it checked out beautifully and that was it; and there wasn't any trouble with it, and so on.

The auditor that found it has been ruined, slightly. I mean, that auditor is liable to be – he'll just think back to that. Think back to the good old days, when he found that goal, you know. Next goal he finds, you know, he'll be sweating, sweat running down, and making his –
dropping onto the dial of the E-Meter, you know, and pencil's wearing out and pc's wearing out and everything, and...

Actually the reason he's having such a hard time is, of course, that he thinks a goal should do that. And of course, he's passed over the pc's goal and the pc's – this pc had a quarter of a rocket read and three suppresses. That was the extent this goal showed up, see. No somatics went with it to indicate it, either, you know. This should happen to him. You get how this is, see.

But he just doesn't think you should have to work that hard for a goal.

Well, an auditor has got to be variable and he realizes that his luck is variable, pc to pc. And sometimes he gets up on the right side of the bed, and he reaches over, and by golly, his shoes are right there, you know, and the laces are untied and he slides into them and there's nothing in them! [laughter] That's the day, see, that's the day!

Next morning he gets up, reaches to the same location – no shoes. Reaches under the bed – no shoes. Looks all over the house – no shoes. Sees his dog worrying something in the back yard! Well, that's the way it goes!

There's terrific variability in this situation. Therefore, pc to pc, an auditor has to learn to be variable in his attention to the situation. Just because he found the goal on the pc in this peculiar way and this peculiar fashion, is no reason he's going to find the goal on the next pc in exactly that way and that fashion. In other words, he's got to be variable.

Oddly enough, the variability of it is best covered by a very close adherence to the textbook solution. For the first time in the history of any race on any planet, our textbook solution is the best one. That's the first time this has ever happened.

Textbook solution. They had a song in the Marine Corps, about McBill McGin who died with a grin, because he had used the textbook solution, you know. They're usually quite fatal, in more subjects than one. I imagine in a physics or chemistry laboratory, or in the universities and so forth, the textbook solutions – I don't think you'd ever graduate if you used the textbook solution on the experiments. You just never would, that's all.

I used to look around me occasionally in a physics laboratory or measuring laboratory, and I'd find these students passing, you know, and everything panning out exactly, you know, and in the chemistry lab the precipitate always turned out to be pure potassium skoobfa, you know. I didn't realize they'd just gone over to the supply cabinet and got some potassium skoobfa, you know. [laughter] It's marvelous, marvelous! And the acceleration tests all work out on the physics bench, providing you put the answer down first and then work back to your experimental data.

No, the textbook solution is never very fortunate, which is liable to give many an auditor an idea that he ought to put a big curve into finding goals, see.

Well, now you take Model Session. Frankly, the more you vary Model Session the more trouble you're going to get into, because the first thing you do is throw out the predictability factor.
See, the pc considers you unpredictable, and the more unpredictable unpredicted things you do, why, the less predictable the pc thinks you are, so therefore becomes less and less certain of you as an auditor. And therefore you as the auditor deteriorate as the pc's observer. You see, by being unpredictable you destroy the reality of the auditor as an observer. You see that?

It might be very clever and it might be very necessary but remember that reality as the observer, from the viewpoint of the pc, is very often more valuable to maintain than to solve that particular little problem with that particular little piece of wit. See what I mean?

You say, "Well obviously, I ought to throw the random rudiment in on this pc after every other rudiment. See, I do a rudiment, then I'll throw in the random rudiment." And it might be very necessary, and it might be all right, eventually, with the pc if you did it every time.

But sooner or later you're going to conceive that it isn't necessary every rudiment to also throw in the random rudiment – you're going to leave it out here and there – then the pc doesn't know what's coming up next, and therefore doesn't consider that you are predictable, so therefore he's not so certain that he is being observed. Now, the more you use a standard Model Session, and use it every time, why, there you are.

Now, last night, you saw me throw an unpredictability. Well, this is only justified by the degree that the pc has had a wrestling match with this particular one, and it's a source of innumerable ARC breaks on the part of the pc. See?

All right, so we will take this rudiment up. Nevertheless it destroyed to some slight degree the predictability of the auditor – the pc's prediction of the auditor, see. You understand? I could get away with it that once, see, and that was fine. But let's say next time I take up the present time problem rudiment, and straighten it out the same way. And then I run perfect Model Session for the next two sessions and then suddenly take up the "Since the last time I audited you" rudiment and not clean this up but extend it into a full mid ruds. We would start getting an unreality on the part of the pc, on the auditor, don't you see? Well, to that degree you can get away with variability and variation.

Now, in view of the fact that you aren't going to always find detested persons and dynamics and items on this pc, this does not become a part of the picture of predictability. So you could do this different ways. As long as it was in Model Session, the pc would be perfectly happy about it.

You're only going to find the detested person once, you understand, and after that you're not going to find the detested person. But if you find this detested person and then you find the dynamic and then you find the item, all more or less in the same way, you'll find out the item becomes much more easy to find because, you see, the pc's now got a predictable pattern, see. He's more certain of what you're doing, so therefore he's quieted down. You understand that?

Now, he'll become – he'll think his certainty has been thrown out if you don't find the goal the same way. You understand that? Maybe you could swing in on the same system, "What goal does this represent to you?" and you might find more certainty in getting it. If you
could figure out how to get the goal with the same system by which you got the item, by the
same system by which you got the dynamic, by the same system in which you got the detested
person, see. You've set up a pattern of response here.

Well, the only virtue of the pattern of response – well, it has two virtues: (1) It's easier
to teach because it's a pattern, but that is not its main virtue. It is actually – makes the pc more
certain that he has an observer. The observer always does the same thing, so therefore there's
more of an observer there. See, the pc's certainty that somebody is there is compounded by
the fact that he can predict the actions of this person.

Now, I'll tell you how to make yourself very unpopular with a pc. Every time you
check the pc's goal, do it differently, and do it in such a way that the pc cannot predict what
you're going to do. Make it so that the pc can't predict when you are going to say the goal, if
you are going to say the goal, and then do it a different number of times, and all of a sudden
the goal won't read for you.

This is not a test which I advise you to make on somebody's goal. But you perhaps
have reality on it right this minute, which is why I'm saying it. If you said, "Now I am going
to test the goal 'to catch catfish' – to catch catfish, to catch catfish, to catch catfish," and you
always tested it that way, it'd probably be all right – probably be all right.

But it's corny, already. Because you've said the goal before you've said the goal, and
therefore the pc suppresses the first saying of the goal, which registers then on the second
saying of the goal, which is really the first saying of the goal, you understand? You get the
unpredictability of this action?

So it's much better to say, "Now I'm going to say this goal." Oh, a pc knows what goal
you're talking about, and if you don't think the pc will know what goal you're talking about,
you just say, "Well, what's your thoughts on this goal 'to catch catfish'?" See?

The pc says, "So-and-so and so-and-so and so-and-so, so-and-so and so-and-so."

And you say, "All right. Now I'm going to test this goal – to catch catfish, to catch cat-
fish, to catch catfish. Thank you very much."

However, if you did that too unpredictably, it'd startle the pc enough, so that by the
time you've said the second one, he'd squashed it.

Now, have you – I see that you have had a little experience in this! Supposing you had
always said it this way: "Now I'm going to test this goal. To catch catfish. To catch catfish. To
catch catfish," and that's the way you've been saying the goal to the pc. You've said the goal
to the pc this way three, four times, at different times. And now, if you do this one: "Now, I'm
going to say this goal, 'to catch catfish' – to catch catfish! To catch catfish. To catch catfish."
You know, you're not going to get any reads. It's just splattered all over the landscape, see.

So you see that, if unpredictability can smash a goal out of read (although that's a
fairly delicate thing), you see that unpredictability can smash a session out of read, just draw-
ing a wider bow, and of course, a listing session can be "scrushed" out of existence the same
way. Do you see that? It's the predictability, predictability factor. Sometimes your cleverness
defeats itself, because you become unpredictable.
What are you going to do? Let's say, one day you get in the random rudiments right in the middle of trying to clean up, "In this session have you told me any half-truth, untruth, done something only to impr ... Well, I think I'll get in the middle rudiments." He – oh, you'd possibly get away with it. Probably nothing much happen to you if you did it.

How many sessions do you think you have to audit that rudiment perfectly, before the pc stops being the gopher effect, you know, sitting up on top of his hole, you know, looking around, looking around. You're coming to the first rud. "What's he going to do? What's he going to do? What's he going to do? What's he going to do? What's he going to do? Oh! He's going to read it straight!" See, some part of his mind is doing this, see. You're unpredictable to that degree.

Well, goals – goals finding can get very, very complicated. You could be so complicated and so nagging and so upsetting and so suppressive, and get a – such a protesty pc in goals finding that eventually you just never would find anything at all, just never find a thing.

If something is wrong with the cycle of an auditing question, yeah, something will happen to finding detested persons and dynamics – things will happen to these things. That's why one looks with horror on the untrained auditor or the lower-level trained auditor, finding goals. Because you know that his technology is just not up to it.

He's liable to find all kinds of wrong things. In the first place, he doesn't know what a goal read looks like. In the second place, he's insufficiently smooth to even read one off. He can take any goal under the sun, moon or stars, make a mistake on it and make it read.

He can take a goal that's very unpopular with the pc. Let's say he's one of these auditors – a sort of an amateur, book-type auditor – who is over on the overwhelm side of the picture, see. He's got a basic philosophy that it must be true if the pc doesn't like it. That's his basic test. See, if the pc protests, that's it.

And then let's say he gets on some kind of a – of a sexual goal of some kind or another that in this society somebody'd be very ashamed of, don't you see, and then reads this with a gleam in his eye. He makes a suggest on it, then tiger drills it wrongly, gets the pc to protest it, asserts then that it is the pc's goal, as the pc is saying that it is not, builds up a nice ridge, and you know that goal will read for years. Of course, it'll only read with a tick, but it'll read until somebody pulls both sides of that thing off and pulls it apart.

Well, that frightens you, when you come down to look at it. So, we're not really, though, talking about that crudity of operation. We're talking about just the smoothness of finding a goal.

So, there's no substitute for good auditing and finding a goal. There's just no substitute for it. Luck we can't count on – about the only thing that would cause a person who couldn't audit well to once in a blue moon find a right goal. It'd be his undoing, too!

The steps by which a goal is found today are very elementary, they're very simple and they all follow the same pattern. We just ask the person who or what has the pc detested. Make it who or what, because the pc is on a – is on a "things" type dynamic, here. A detested person, though we still call it, will sometimes go by the boards, don't you see? They might not
have any people they detest; they only detest things, you see, and on that pc you're liable to miss most gorgeously if you say, "What person have you detested?" You understand that?

On a large percentage of cases you're just going to get away with "Who have you detested," see. But there's that other case that comes along and you get a thing.

Now, you could make the mistake of thinking this was so marvelous – having gotten this item – that you'll list goals against it or something like that. Well, that hasn't proven out as a good action or a productive action over a period of time. Even though it gives you something that looks like an item if you get a thing. You know, "a burned-out radiator." You say, "Boy, that sure looks like an item," you know? Naw, it's not an item.

Now, your next action is always represent. Now, your action, then, is – starts out with "Who or what have you detested," you see; get your list; "Consider committing overts against _______ (items on the list)." And when you get that item, it's always followed with represent.

Don't try to use other things. I've gotten an awful lot of data on this. And I've come a cropper every time I've tried to use some other form of action.

The pc's substitutes is what we want, and we say, "What does a burned-out radiator represent to you?" So that's always your next action to get the next list. See? And now we've got our next list, and we consider committing overts against it, and we get that one off that list, and it's – a next step is always "represents." Don't you see? And we can actually go along this line until we run out of dwindling rock slams. We could actually continue this until we run out of dwindling rock slams, which is quite interesting.

Why it works, that we only get a couple of dwindling rock slams out of this, I'm not quite sure. There are probably more dwindling rock slams available in some cases. But this works out just fine the way it is laid out now.

Your dwindling – first dwindling slam is, by the way, not on the detested person point – person or item. See, that doesn't – when you list those, you get no dwindling slam, you understand. There's no dwindling slam there at all. And there may not be a dwindling slam from that ite... that detested person or item when found. That might not be a dwindling slam.

In fact it'd kind of surprise me at times if you did get a dwindling slam. Because, may – man, that one's far out. See, that's the far out bet.

But if you got a dwindling slam, nobody's going to argue with it. But if you didn't get a dwindling slam, nobody's going to argue with it. You see what stage of this operation I'm talking about?

You say, "Who or what have you detested?"

And they say, "Sam Jones! Yes sir! And you, and..."

You say, "You? How you want that written down?"

"Well, you! You, you know. Bill Smith! You!"

Well, you write it down as Bill Smith, not "you." And he gets down to the end of the list, and says, "myself." Well, you take these pronouns and you want to know how the pc wants them written down. You don't challenge them
"Oh," he says, "Myself! George Smith!"

You write down "George Smith," and also write down "myself," because by the time you're sorting this thing out you're going to get in trouble with pronouns. Cons... get the – get the auditor sitting there, see. The auditor says, "Consider committing overts against you." So this gives you the "myself." Do you get the tangle that comes out of this thing? "Consider committing overts against you." And you just never come off of it.

So you "Consider committing overts against _____. Consider committing overts against _____. Consider committing overts against _____." You go on down the list and by the process of elimination, wind up with something that slams.

Now, how big does a rock slam have to be? I'm going to – I'm going to – I'm going to put this in immortal fire, engraved and blazing upon the mountainside for the centuries and millennia to come, because I'm tired of answering the question! It gets asked to me almost on an average of twice a week – three times a week; this same question. How big is a rock slam? It's the same thing as: "How long is a piece of string?" How big is a rock slam? How high is the tide? You know? Popular song!

Now, I can tell you that a little dirty needle on the detested person, in spite of anything you have been told by anybody else is not enough to indicate the right one. And if you have bought the little dirty needle, you're probably in trouble.

Now, the possibility is that you can get the thing down to a little dirty needle, and by doing a rapid Tiger Drill on the item, see whether or not the dirty needle expands to a slam.

But nobody has done this and that is not what is indicated and it's a waste of time as far as I'm concerned. Do I make my point? We don't want a little dirty needle. We don't want a little dirty needle. You understand. We don't want one! It means an incomplete list! You hear me? It's an incomplete list!

And if nothing is left at the end of the trail, it's an incomplete list. And if nothing slammed nicely as you went by, it was an incomplete list. And if you didn't get anything, it's an incomplete list. And if your assessment didn't wind up with a proper dynamic or item, it was an incomplete list. Do you – do I make this point? See?

And if the pc is ARC broke or calm, or something, it's an incomplete list. And the pc didn't cognite and say, "Ha, ha, ha! Ha, ha, ha! I knew it'd be a burned-out radiator! Ha, ha, ha! Yeah, burned-out radiators. Yeah, I never thought of that before. It's a very interesting thing. I had a burned-out radiator on a Ford one time. Aw, burned-out radiators. Pretty horrible!" Even if this pc is the Sphinx type – never says anything, never cognites – when you get that item, when you get that dynamic, when you get that detested person, dat pc gonna cognite. You hear me? Dat pc gonna cognite. He's gonna cognite with cogs flying!

You come on down the line and you say, "Consider committing overts against a game warden. Consider committing overts against cats. Consider committing overts... Consider committing overts against...". Consider committing overts against...". The pc sits there. And you finally say, "Game wardens." Pc says – you say, "The item – the detested person I got here was 'game wardens.'"
Just make up your mind it doesn't have anything to do with the pc, man. You got that? I mean, that's the simplest test I know of the rightness of all of this. If the pc is interested in it, it'll rock slam. If the pc isn't interested in it, it won't rock slam. If it doesn't rock slam, it isn't it.

Now, how wide is a rock slam and how high is the sky? Well, a rock slam isn't a dirty needle. It isn't a little bzzt, bzzt, bzzt. That's never enough.

When you go down that list the first time, you'll see about three items on it go blam! blam! blam! And you say, "Hey! What do you know! Ho-ho!" And when the second time you go down you will see those rock slams centralize on – onto only one item. They're differentiated now and you've got it on one item. And you go by that thing and it goes blam! And you say, "Ha, ha, ha, ha, ha, ha!" See.

And you go on down to the end of the list. You go over the list again; it goes blam! You go over the list again, and it goes blam! Same item. Go over the list again; it goes blam! In the event you ARC break the pc and upset it, why, of course it won't go blam anymore.

Well, I catch these things very easily as a bra... with the brass-ring tactic. If I go over it enough to have only one item going blam with a rock slam, and dat's da brass ring. And I put it right in the pc's nose right there. And I say, "That's it, son," and lead him right on down the track. You got it? And you do it by elimination.

By the time you go over that list the second time you ought to have that thing, man. You ought to have a rope dropped right around its neck. And if you haven't got it, you haven't got it! And you can unsaddle the horse, you can polish up the harness, you can fix up the brightwork, the brass, you can groom his coat, you can wash out of his mouth, you can brush his teeth and it still won't be the item. You understand?

And right away, as you go down the line, you'd ... I'd go down the thing the second time, I find there's only one thing slamming on the thing, I'd grab it right there. And I say, "This burned-out radiator, now, that seems to be it."

And the pc says, "Ha-ha! I knew that was it! Ha-ha-ha! Burned-out radiators. Yeah, God, I hate them, that's all. Been the cause of an awful lot of difficulty with me, never really looked at it before, but burned-out radiators ... Oh, heh-heh, I'm not at all surprised, you know. Ha-ha-ha! I'm not at all surprised. Burned-out radiators! Ha-ha-ha-ha! I wonder why that's why I'm always having trouble drinking rusty water." [laughter]

Pc's interest follows the rock slam, see. So it's inevitable that you – you're going to get – you get both. You got the item. But this pc that just wooden Indians on you to the bitter end, you got nothing. You can go on and on and on and on and on.

Now, how many lists of detested persons and things can you do before you finally get the item? You do the exact number necessary to find the detested person or thing. You got that? That's how many lists you do. That's a very simple answer to a very burning question. You do it till you get it.

Now, do you put on it the second time you do it, the things which it already ain't? No, you leave those off. You drop them in the spittoon or the cuspidor and let them splash gloom-
ily. Because if they weren't on it the first time – if they weren't it the first time, they're not going to be it the second time.

Of course, there's also no substitute for having the pc in session or for auditing or for watching the meter. There's no substitute for those things.

But the odd part of it is, the pc can be halfway ARC broke and you can still get this thing. It's almost impossible to keep him from being interested in it. It's almost impossible to keep him from slamming on it.

Later on, when you've bled everything down and so forth, you come back to this burned-out radiator – it may not slam. You may have to prepcheck the thing like mad and even then it doesn't slam; it just dirty needles. It's now past history, do you understand. It's past history. Who cares? Who's interested in it? There's no slam on it. Pc no longer interested in it. Pc no longer interested in it. Don't slam. Got that?

Now, we go through the same old routine from there on. Only we want to know what represents a burned-out radiator to the pc, or what a burned-out radiator represents – I just don't seem to care which – and we're going to get a list of that and we're going to get lists of that and we're going to list that. And that should or should not produce a dwindling slam. We don't much care whether it does or not. If it does, why you're in.

Something weird might have occurred. You might have hit the dynamic; you might have hit something or other, but such luck won't happen to you. You're going to find the dynamic now.

Now, "What part of existence does a burned-out radiator represent?" is the best one to find a dynamic with. That's a good one to find a dynamic with. "What part of existence – what larger part of existence does a burned-out radiator represent?" Well, "big burned-out radia-

tors" is liable to get a ...

Now, I give you a rule: Don't put "a burned-out radiator" on a list from which "a burned-out radiator" – don't – if you're making a list from burned-out radiators, don't put "a burned-out radiator" on that list, you hear me now. Don't put it on that list! I don't care if the pc gives it to you, thank him effusively and just leave it off the list! Because it's going to slam again and that's going to give you no item!

Knuckleheads. Several of you have done this, you know! And you wind up with the first dynamic as the detested person and the first dynamic as the dynamic and the first dy-
namic, you see, as the item, and you... Where have you progressed to? You have progressed to the detested person or thing. Now you list goals against it, you haven't got the dynamic, you haven't got the item, so of course you're never going to get the goal. You got it?

So, that's a rule, see. Never put what you're deriving from on the list you are deriving from it. See, if it's – "a burned-out radiator" is the detested thing, well then, don't put "a burned-out radiator" down as what "a burned-out radiator" represents, you hear. Don't do it. Just omit it.

Now, your dynamic list is assessed out, with "Consider committing overts against... Consider ..." The same rules apply. Go down – the second time you go down through the
thing, the thing ought to be slamming. If it isn't slamming, junk the whole thing, throw it away, get the pc in-session, do something, but get the item on the list. You see, it's again the incomplete list, is your main difficulty.

All right, and when you finally got that one sorted out, why the same rule of cognition applies. Only much more so now. The pc says, "Ho-ho-ho! Ho-ho-ho! Yo, yo! Sepulchers! Ho-ho-ho. Ho! Damp sepulchers, you know! I was always frightened of them when I was – children. Ho-ho! Yeah, yo, yo, yo, yo. With black interiors, yes, I was always frightened of them. You don't suppose that has something to do with the fact that I don't like to look in my hat?"

See, thing's slamming, pc's interest there, everything is fine. Pat him on the back and hurry on, man!

Now, you're going to list that thing. Now, by this time you ought to be producing dwindling slams, see. From the dynamic to the item, for sure, should produce a dwindling slam. I'm sure of my ground there. I know darn well that one will if it's the right dynamic, when you proceed from it to the item, it'll produce a dwindling slam.

And a dwindling slam starts wide and winds up and gets narrower and narrower. And every time they put one on the list, you have a narrower slam. And a lot of people think if it turns on on the fourth one and the eighth one and the twelfth one, and it's still slamming when they wound up, that's a dwindling slam. No, that's a wrong item – wrong; everything is wrong.

See, a dwindling slam starts wide and goes narrower for each item. And you say the next item and you got a narrower slam. You say the next item – if the pc gives you the next item – it's when the pc says it, by the way. And the next item and it's narrower. And the next item, it's narrower. And finally it's a little dirty needle, and finally you bleed it down and that's it, and that's all, that's a complete list, and by God, your item is always on that list – always. Now, it's "Consider committing overts," and that's done by "What represents_____," you know? "What does a black sepulcher represent to you?" see? And here we go, and it's done down to whatever the item is.

"Consider committing overts against_____ ." This next list that you derived from that – bang! One of them's live. The second time through, the rock slam has settled down. There it is, bang. And there you've the thing and you've got "a coffin nail." And you say, "There we go, man! We got 'a coffin nail' and that's it, and it slammed. And it's the only thing on the list that slammed." Well, it doesn't matter if that slam is an inch wide – quite ordinarily is only an inch wide – inch and a quarter wide, inch and a half wide, two inches wide, three inches wide, four inches wide, or a dial wide, or a quarter of a dial wide; but it's a slam. Doesn't matter how big it is.

And now, you take that thing, and that is the item. And the pc says, "Oh my God, coffin nails! You know. I've always associated it with cigarettes. And, by the way, all I remember is in 45 when I first heard them called that, is all of a sudden they give me a terrible cough. Cough! As a matter of fact, and so forth. Cough and – and cough-cough and – and so forth. And the coffin nails, cigarettes, and so on and uh – so on. I've thought about these coffins in China that they were taking tops off the coffins and so forth, and I thought that's a
pretty good idea, and so forth. They ought to leave the nails out because what if you got buried in this thing, and you couldn't get out of this thing, and so forth. And do you know that that very closely associates to the whole subject of necromancy? Do you know that necromancy's a very, very interesting subject. Have you ever been interested in necromancy? I myself have been very interested in necromancy from time to time. As a matter of fact my father one time or another... The last time I was audited at the HASI, I had an awful lot of things that had to do with necromancy. I remember now, and they now all fade together, and so forth, and that's just fine..."

You get the idea? See, the closer you get into that item, the more the pc is interested, man.

And he – then he says, "Well, us coffin nails are very often..." so forth.

He'll start to get oppterm trouble, you know. He's against coffin nails, he is coffin nails. Some of them are coffin nails, that's all – slam like mad against coffin nails, but they think of themselves as coffin nails, don't you see? And some of them: "Those damn coffin nails over there," and they never even come close to those coffin nails, you get the idea. Sometimes they're never close with the item.

All right. That's it. Now you list goal one – "What goal would be an overt against____.," and that's a dwindling slam, all the way down to dirty needle and so forth, and there it is. And very often you're lucky and the goal is on it. But the actual fact is the goal is most likely to be in the first few goals on list six. So, you do list one; you do list six. Fix up list six; you haven't got the goal. Dandy. Let's then write up list two, list three, list four, list five. Let's get some more goals written on these other lists, and then let's cross-index it, and so forth. And the pc very often, if you're lucky, will start putting his goal down on every one of those lists, that's it.

He says, "Well, I hate to, but you know I'm really – act like I'm trying to sell you this goal, but in the actual fact it does belong on that list, you know," and so on. And he puts it on down and you check it out and that's it.

Now, that's if you're lucky; if you're lucky, if you have altitude, if you are considered by the pc to be a good observer, if you have altitude with the pc, if you are the auditor, if you are in control of the session, if you can run a meter, if you are running very smooth Model Session, if you do this thing very flawlessly – if, if, if, if, if, if – and if that morning you got up and found your shoes in the exact right place and the laces were untied, and so forth, why, and there was nothing in them – you got the pc's goal. Got that? That's how you do it. That's a Dynamic Assessment.

Now, undoubtedly this can be groomed up. Undoubtedly there are various things we will learn. Undoubtedly this pattern can be expected at one time or another to change. But there are substitute patterns by which to do this already in existence which are not as good as the original pattern.

Now, if I can't find any of these items, why, I would write up a list, "What do you wish wasn't part of existence?" And then getting the pc oiled up, ask him, "What isn't part of existence?" Go on down the line, and treat that as an item.
Well, you should test out such a thing and try to list what represents what you found as "What wasn't part of existence?" Try to treat it as something else. If you get a dwindling slam as you list "What represents it?" why, dandy. Marvelous. You're going to wind up with a more pertinent item, don't you see.

Now, there's even another dodge which I have worked on recently, which is quite interesting, and is apparently quite good. It's not the one I've been telling you about, about the Tiger Drill button, "Would your goal...," something or other. It's possibly not as fruitful as the other one – although that has found goals. See, "Would your goal frarumph (item)?" See? "Would your goal suppress (item)? Would your goal not suppress (item)? Would your goal..." and a couple that you've thrown in, see. Whatever those buttons are, "the item," see.

Now that'd give us a list of goals that would do that, see. It'll rock slam, by the way, when you find it – give us a list of goals that will do that – and you're liable to find the pc's goal.

The more a pc rock slams, the harder and more frequent the rock slams, the harder the rock slam is to turn off, the harder it is going to be to find the goal. That has been turning out to be true. If the pc is a rock slammer from away back, that darn goal has got to be exactly on the button; it's being avoided by the pc and it's rather rough to get there.

So anyhow, as far as rock slams go, there is the – there's the criteria. It doesn't necessarily hold true that you won't be lucky and the pc won't be lucky and won't get it on the list earlier, because you very often may. But nevertheless that sort of holds true.

Now, the other thing is – the one I've been working on is – "Who or what would oppose (item)?" Just do a list of who or what would oppose item.

Go over the list, you're is going to get one that slams, and that is the opposition terminal to the item, and ask the pc what goals that opposition terminal has, because that opposition terminal is the pc's terminal.

Sneaky, and it apparently, at first glance, has as much validity as the item. Interesting, huh? It's "Who or what would oppose (item)?" That's how you list it and then you assess it by "Would (it) commit overts against_________(item)?" And it's going to slam – one of them is going to slam; follows the same rule – and you wind up with an additional item, and you can ask "Who or what – what would be its goals?" or "What goal?" and then also "What goal would make it become what it is?"

In other words, there's a new way of stripping goals out. I'm still working on that end of the line. That's the latest work I've done on it and it seems to be very, very productive. Okay?

It doesn't change anything else you're doing. It's just an additional step that if you're having a rough time, why, try that one and that's marvelous. Okay?

All right, I brought you up to date on this subject. And there's no substitute for two things – no substitute for two things: There's no substitute for finding goals and there's no substitute for your being a good auditor.

Thank you very much.
3GA CRISSE CROSS

A lecture given on 23 October 1962

Well, here we are at what day?

Audience: Twenty-third.

Twenty-third of October...

Audience: AD 12.

... AD 12. Hoped I hadn't lost a year here since the last time I lectured to you.

Well, if you're afraid of getting restimulated, you can leave now. [laughter] Now, I'm going to talk about the 3GA Criss Cross.

Now, I want you to carefully notice I haven't any notes and this is not a – this is just off the cuff, because in the past many, many weeks I've been auditing like mad myself on research auditing trying to pick up all of the data necessary to make it easy for you to crack cases.

You should realize, at first glance and at – immediately, that 3GA in its original form will find goals and has made first-goal Clears. You should recognize that, that we are going beyond a point of success.

The problem which reaches us, however, is that some cases do not respond easily to the original 3GA. It goes up into the thousands of goals on these cases. And if you had unlimited time, you could probably, undoubtedly, using no more than these techniques contained in the original 3GA – find the pc's goal.

But in view of the fact that we are few and the preclears are many and because of the peculiar position of the Saint Hill graduate today – in that he is looked upon to find a great many goals and do a great deal for a great many people in the field of Clearing – an endless procedure is therefore inadequate to our needs. Hence you get 3GA Dynamic Assessment by Rock Slam. That was the first upgrade and improvement of this.

Now, this saved time and this swept in the bulk of those cases that were very difficult. That is, it swept in the bulk of them. We were marching up now, higher in our percentage that could be done rapidly. And the technique, 3GA, with the Goals Assessment done by Dynamic Assessment by Rock Slam (that particular technology and those bulletins) is still valid and is still workable and there's a lot of people sitting right in front of me whose goals were found with that particular technology.

But this again failed, on some cases, to attain the goal rapidly. Once more, a slowdown came about on some cases.
Having established all of this, we found then that the goals on some cases went out hard. It was all right; we could find the goal and all of that sort of thing, but goals went out hard. Now, what do I mean by "went out hard"? I mean, as long as nine hours to tiger drill out one goal which wasn't it. You see, goals were going out hard.

Now, you understand as you upgrade procedure, that you also sweep in the easy case and make it easier to do the easy case. You understand that? That is not an incidental benefit, but was not the primary target in the research which I've been engaged upon. Don't you see? So the easy case always benefits from a resolution of the more difficult case. You'll find this is very consistent in Scientology, that once you are able to do a very, very difficult case, then you can do more easily an easy case.

So, once more, we are not confronted with "You do 3GA ordinary – the old 3GA – on some cases and 3GA Dynamic Assessment by Rock Slam on some other cases and then 3GA Criss Cross on just a few difficult cases."

No, you would find your goal by the highest, most sweeping procedure, which at this stage of development is 3GA Criss Cross. And you would find your easy case more rapidly with 3GA Criss Cross than you would be: "List me 850 goals and I'll tiger drill them." Don't you see?

But this requires facility and understanding on the part of the auditor.

And as we march forward into these more difficult cases, I have to tell you that I myself at the moment am slightly appalled by the fact that the technology is quite complex at this particular moment. And I – it was more complex Friday last than it was Monday. It was more complex the Wednesday before that Friday, don't you see, and so on. But it has now gotten to a point where I can give you answers which again speed up the time involved in finding somebody's goal.

Now, this is all in the direction of speedup. So when you go in the direction of speedup, you demand more accurate auditing that contains the element of luck less. That's swift auditing.

Now, as you understand by its title, 3GA Criss Cross is a direct grandchild of 3D Criss Cross. Old 3D Criss Cross was itself and had it been done by rock slam, well, people probably would have gone on running out items happily and gone to Clear on it. The only ingredient that old 3D Criss Cross needed was just those three words, "by rock slam," to make it a totally successful procedure.

Now, this doesn't mean that all of the rules of 3D Criss Cross apply to 3GA Criss Cross. So we might as well just start out with a brand-new set of rules and scrub those and I'll show you the old ones and I'll just show you, and you can recognize where these things fit in. Those of you who have been trained in 3D Criss Cross, you'll find this very much to your benefit.

Now when we were doing 3D Criss Cross, I was giving you a constant – the students who were here at that time – incidentally, there are – there are three students here right this minute, who have been beaten over the head on this and it must sound like old times. They've
just rejoined the class on a retread basis and it just must sound like just old times to them, you know, like the wheels haven't turned at all since they've been away.

But if they remember, the stress was on speed – speed. There are two things, speed and accuracy, which is involved here. And some auditor who takes one week of sessions, three hours each, to find an item on his pc isn't batting in any league that will give him any success with 3GA Criss Cross. In the first place, the pc's attention wears out by that time.

This is a rapid activity. If I find the item and it's totally successful, it's taking me one hour and ten minutes to adjudicate what is to be listed, list it and null it to a successful reliable item – one hour and ten minutes.

When I goof – and it's very possible for an auditor to goof on this; you take the wrong side of something or something goes wrong one way or the other – when I goof it's about two hours and a half. It takes longer to goof than to find a right one; takes longer to lay an egg than it does to come up with a reliable item. But two hours and a half, we are still talking in the framework of a three-hour session.

Now, I'm not holding one hour and ten minutes up to you as how good I am and how terrible you are. It's very far from this case. Because let me assure you that my research auditing during the past three or four – or worse than that – during the past two months have made a citizen out of me with exclamation points. You know? I'm batting right there in your league. I found out I can make mistakes, man. And it has been very annoying to me to discover that, for once in my life, I'm grappling with something where judgment is not infallible.

I look at this case and I say, "Well, that's what's to do," and I go ahead and do it and I'm finding that 50 percent of the time I am wrong. All right, if that's the way it's going with me, well, stop beating your brains out trying to be 100 percent right.

Now, those of you who have a goal "to be 100 percent right" [laughter] – this is no – this is no way to achieve that goal because a lot of the time you're going to be wrong. Now, even following all the rules, you're going to be wrong every now and then – even following all the rules. Because the nature of the beast that you're auditing contains several little excursions this way and that. And when you're following the rock slam, you have to follow the rock slam. And if the rule gets in the road of your following the rock slam, why then you follow the rock slam. You understand? The road is the road of the rock slam, not the road of the rule.

I can tell you how to find rock slams, how to trace them down and how to preserve them carefully, how to nurture them and derive items from them, left and right. But I am very sure at this stage of the game that I cannot tell you how to do it 100 percent of the time, always.

Now on any given pc, yes, you can find a rock slam, you can find the items. That's a forsworn, foregone conclusion. That part of it's licked. Yes, you can find a rock slam on a pc.

There are several ways of doing it. If you don't do it one way you can do it another way. What I'm talking about is on this one pc that you are auditing, if you expect to find an item every hour and ten minutes of auditing, you're going to be very badly disappointed, because you very often have a nerved-up pc and when you've missed the item you of course, then, have a missed withhold, don't you? So then you have to steady down the pc and you
have to do a lot of other things which are all very interesting and all very complicated and they all consume auditing time.

And then, after you've done it by the best traditions of auditing, after you have done it perfectly, you find yourself, all too often – but not more than 50 percent of the time, unless your luck is always bad – sitting there looking at a complete skunk – no item. Everything goes out. See, you do it all perfectly and then everything goes out.

Now I have been auditing very hard and very thoroughly, trying to whip the laws which underlie this and the laws which underlie it are quite interesting, extremely intelligible and very easily followed. And they will reduce, I am sure, the number of wrong turns that you make in following the rock slam – these various laws. But I know very well that they will not obviate them completely, because there are too many little lucky breaks and so forth, still contained in Dynamic Assessment by Rock Slam as it is done with 3GA Criss Cross.

Now, with that preamble and prelude to the situation, you should understand this as a procedure which, guided by good textbook auditing – actually the kind which the better auditors here are doing at this moment – done with that type of auditing and not with something that the fellow read three books and then he read half of a bulletin and then he took his E-Meter in hand and he turned it on by twisting the needle and... He's not going to make it, see. He's not going to make it.

This is definitely an expert's activity, but that is not all bad. That is very far from all bad. Goals finding and goals running is so fraught with disaster for a pc that it shouldn't be done by anybody but an expert. And if that expert's expertness becomes as fantastically evident as it does in 3GA Criss Cross, well, that just builds up your altitude. I mean, let's be crude about the thing: It puts it out of reach.

This fellow's going to do this 3GA Criss Cross and he's read a book and he went halfway through the Academy before he blew. And now he's going to find a goal on somebody with 3GA Criss Cross and he sits there and he looks at the meter and for a fifteenth of a second he sees a rock slam and then he doesn't see any more rock slams and he can't find any more rock slams. And no matter what he does he can't find any more rock slams and the road is blocked. Because only good auditing presence will keep a rock slam on.

So actually, the road is booby-trapped by bad auditing presence.

Now, if you'll notice lately I've put several booby traps into clearing. I fixed it up so that it's very unlikely that a wrong goal would get listed. Why? Well, before, with all too much glee, people could list a wrong goal and practically spin somebody in. Well, how did we do this? Well, we say you tiger drill it the beginning of every session. Of course, that is necessary to get the items to blow but at the same time, recognize that as a prevention against auditing a wrong goal. After you've done just so many sessions on the thing, why, the goal's going to blow up. And then you're going to have to do something to remedy the goal.

Now, even when a pc's goal has been found, in many cases – this is uses of this procedure – even when a pc's goal has been found by some other method of assessment, it is all too likely – you know, no items have been found on this pc – that his bank will be too heavily charged to list easily.
So, with 3GA Criss Cross you don't have just a goal-finding procedure. You have a procedure which finds a goal, but also which unburdens the bank so a goal can be run. Also you have a procedure which, when the pc suddenly sticks on "cops..." You know, he said "cops," and that was the last you ever heard him say. Tone arm went up and he ducked and he babbled something or other, and so on. Well, you continue his item assessment and you will get him back in the running again.

You – all sorts of uses, don't you see, these variant uses. You heard him say "cops," and "cops" is something – or you see him sitting there – it just happened today – is somebody sitting there with a horrible ARC break and the auditor finally argues him out of an item and then the item is seen to rock slam, so the auditor, I think, opposed and represented it – did both to the thing, and it unburdened, the case started cogniting, and the fellow started running again. You see? There was an item which he hadn't even presented, but the auditor found it and did something with it, see. That was during listing.

So when do we use this procedure? Well, we use this procedure when clearing gets tough and when Prepchecking won't remedy it.

And when do we use Prepchecking. When tiger drilling won't do anything for us. See, that's when you use the procedure.

So you can use the procedure to find the goal, you can use the procedure to prove a goal that has been found, you can use the procedure to unburden the bank so as to make it easy to run the goal and you can use this procedure, in addition to that, to get the pc unstuck from some item he's collided with in listing which he can't or won't confront. So you see, it has many uses – becomes a skilled activity.

Now, completely aside from its uses in clearing, this quite incidentally adds up to the fastest gain process that we have ever developed. Now, that one sort of is likely to get overlooked. You find a couple of items on somebody – you find one item on somebody that is a real, honest-to-goodness rock slamming item and you've changed that case – and you've changed it observably. Now, nobody has been finding items against OCAs and IQ tests and that sort of thing, but I'm sure that you would see some rather startling changes occur in IQ and profile as a result of finding an item.

Now, look at what this puts in your hands. Supposing in a Problems Intensive, you could get twenty points of gain on an OCA or an APA. And that took twenty-five hours. Recognize that the same gain is probably obtainable – or a greater gain obtainable – in the finding of one item in a space of less than three hours, if you're lucky. Now, look at your case resurgence. Look at that in time.

Now, in view of the fact that we're using this to find goals and actually clear people, that little point is liable to be overlooked, because we're not using it to make a pc feel good. And yet they do; they do.

Now, let's tackle this thing from the beginning. I've given you its various uses and applications. Let's tackle it from the beginning on the subject of nomenclature. We're going to get our nomenclature all mixed up.
Well, why do we say Criss Cross? And that's just because you go from one channel to the other channel and then you go back to the other channel.

What do we mean by channels? Well, we mean what the pc's been and what the pc has opposed. By saying Criss Cross, well, we get the idea of a channel from A over to B and from B back over to A; and we're going back and forth between the pc (what he has been) and the pc's enemies (what they have been).

So we've got a game going here of the enemy and the pc.

Now, I refer you to the lectures on the GPM. It is vital to understand the composition of the GPM as contained in those lectures. I am not going to repeat them at this particular time. The composition of the GPM, then, has much greater scope and complexity than what I'm giving you right now. But essentially it's composed of them and us. That doesn't matter on what dynamics these occur; it's a game of them and us.

Now, our nomenclature gives us the them as "opposition to the terminal," actually not "opposition terminals." Let me show you the packaging of this word. It was originally "opposition to the pc's terminal," and then became "opposition terminal" (just because people got tired of saying the other words) and then became "opterm." And that's the word which you should know it by. That's them-an opterm.

That is what the pc is agin. It's seldom either grammatical or delicate enough to be "against." He's agin it – brutally, violently and directly. It ain't him. That he knows. He may not know much, but he knows he ain't it – that's down deep and reactively.

But analytically, because he's supposed to be a reasonable being in a reasonable world, he very often collides with it and finds himself playing footsies with being it. And this is a sickening experience to him the whole way.

Now, in view of the fact that he begins by – when you – when in life, after occlusions of the GPM have set in and he can't remember who he was and he thinks he's only lived one life and he thinks he's a – oh, I don't know – he thinks he's a Baptist, and a – he thinks he's a this and a that and he's some nationalist. He thinks he's essentially an Earthman. Oh, wow, you know. This guy's occluded.

Anyhow, there he is and he walks around in life and he gets this feeling, you know – he's got enemies. You know? He knows this. And he has various ways of handling this. One is to be them, another way is to be interesting to them, another way is to make everything peaceful so they won't jump him. And the reason he has to have all of these rationales, of which they are just infinite numbers, is because he can't identify what the enemy is. He merely knows that something in the environment is hostile. He can't say what it is. Well, I'll give you an example. The fellow thinks that all publishers are against him – all publishers. That means newspaper publishers, book publishers – everything and you know, they're all against him and that's for sure. And he's got an uneasy feeling, so he goes through life solving problems as to how to get along with publishing companies, publishers, you see. He tries to be a writer; he does this, he does that and he – this – he worries about it all the time and one day you give him 3GA Criss Cross and the item turns up, "school copybook." That's all he's against: school copybooks, see. They're a deadly enemy. And immediately the identification between school
copybooks and all books and all publications and all publishers ceases to exist. So he knows now, when you've found this item, that he's against school copybooks. That's what he's agin. He feels much more comfortable even though they still knock his head off. You understand?

He no longer identifies in this particular subject. So the world looks like a friendlier place to him. Well, so you get $A = A = A$; you get a whole unknown existence, eight dynamics' worth, piled on this one thetan's head, until you start separating it out. Because at the same time he didn't know what he was being that had to oppose or was threatened by school copybooks. And then he finally finds out what he is being. He's being a student. See, it's not his military career that is giving him pains and aches, you see; it's not his life as a writer that is giving him pains and aches, you see; it's not his life as this and lead as that and the sphere of influence here and there and all that sort of thing. No, it's just the fact that, as a student, he is agin copybooks.

Now 3GA Criss Cross would make it possible to sort out the oppterm: copybook and the terminal: student. So you've got these two things. These are terms. Terminal: that means the pc's experiential track, what he has been, his beingnesses. And the oppterm: what his beingnesses have opposed or the oppositions that have made him assume his beingnesses.

So we've got these two things. We've got the "them" and "us" reduced to "oppterm" and "terminal."

Now, these are distinctly different things and life is made – is usually very simple on this. The auditor sails along and everything is fine and so forth, and he's been finding terminals and he's been finding oppterms and everything is going according to Hoyle. And he knows which they are, even when the pc is confused about it, because the terminal invariably turns on pain and the oppterm invariably turns on sensation.

Sensation being motion, pressure, misemotion; and pain simply being the sharp impulse or dull impulse of heat, cold and electrical. Heat is pn, cold is pn and bzzzt is pn. That's all pain.

But the pc is getting dizzy and he's getting sensations, and he is crying and feels griefy about it all and anything on the emotional scale. Or there's effort, pushing his chest in and he's got pressure against his eyeballs, and so forth – that's all sensation – commonly called sen: s-e-n.

All right. Those are very easily identifiable. Oppterm equals sen; term equals pn. And that's all there is to it. There are just those two things and that's the way they are and you got it all sorted out, you got it all straight, and the last three pcs you audited, you didn't have any trouble with. And when you get to the fourth pc: while he has sen, he talks about "us," and while he has pn he talks about "them." And he doesn't know which is him and which is them and everything you find has some pn and some sen on it. This should happen to you, see, as the auditor.

You'll find his rock slam on "consider committing overts against copybooks." Slaaaaam! you know. "Ouch!" he says. Everything is fine. He's had pain, himself, while facing the copybook. But then, of course because you're dealing only with the copybook, you turn on sen. So you say, "Copybook, copybook, copybook," to him and he goes zzzzzz – he
gets dizzy and so forth, you see. You say to him, "What would commit overts on a copybook?" and he gets "Ouch!" See? You're all sorted out, you're all straight as the auditor, you know which side it is. And oddly enough you will never really make a mistake on it because you can sooner or later sort it out as to which it is.

But your fourth – every fourth pc or something like that is not going to be able to get this through his own thick skull – which is him and which is them. See, doubt remains in his mind. Because there's pain and there's sensation on a copybook, and there's pain and there's sensation on a student. And one day he starts talking about "us copybooks," and "those dirty students marking me all up."

Now, if you've got the nomenclature and the rules straight, why, you're all set, because you yourself won't get mixed up on it. The auditor is actually never mixed up on it because he can make some simple tests. The pc is busy talking about "us copybooks" and all you have to do is say to him, "Well, what would commit overts on a copybook?"

And he says, "Ouch!"

Well, you know "copybook" – you know at once that "copybook" is an oppterm, because committing overts against it can give him an ouch if he lists it. See? So the lists of things committing overts against copybooks – gives him pain. But listing copybooks and what they represent gives him sen and he goes buzzz, buzzz. Sensation. Get the idea?

And you say to him, forcefully, "Copybooks, copybooks, copybooks."

And he says, "Stop that, you're making me dizzy."

You see how this is sorted out? You say to him, "Student, student, student."

And he says, "Ouch! Stop that. You're giving me an awful pain in my head." See?

At once, you're advised. Well, don't blame him if out of his confusion in the GPM and so forth, he can't make it out. He doesn't know whether he's a copybook or a student and he gets all mixed up about it.

Why does he get so mixed up? Because when he says "copybook," he's liable to get pain. I remember that lecture I was telling you about it – he's in the wrong-terminal situation. And when he says "student," and so forth, he's liable to get sensation. Why? Because he has to be outside of the beingness of student to gaze at a student in his bank which of course puts him into the copybook. You understand?

So the pc trying to sort this out for himself gets all mixed up, because sometimes he doesn't exteriorize from student while saying "student" and gets pain and sometimes he exteriorizes from student, you see, when he's saying "student," and gets sen; and sometimes when he is saying "student," he backs into "copybook," don't you see; and then when he says "copybook," he backs into "student" and gets pain. You see? And he just gets terribly confused about all of this.

So realize that the pc can get confused about what all these things are, quite often. He's usually straight about it, but don't expect him to be very reliable as to which is which. You're the person who knows, as the auditor. The auditor knows.
The auditor can make a simple test. He can – he's got two or three items there and he wants to know which side these items are on – he just says them to the pc, and one will produce pain and one will produce sen. And then he knows which side of the fence he's on, because, of course, he's an exterior source of command, so he tends to push the student [pc] back into the valence that he is calling. So the student [pc] experiences that valence.

Well, this is not something that has to be overstressed too hard, but becomes very important to the auditor when he starts to list goals – this becomes extremely important to the auditor. Because if you're trying to list goals against an oppterm, you use the lists 1 to 10 that were contained in the original Dynamic Assessment by Rock Slam bulletins. See? "If you were an (oppterm), what goal would be impossible to achieve?" You know, that kind of a thing. That's listing goals against an oppterm.

Listing goals against a terminal is quite different. The basic rule there is this: "What would be the goals of a student?" You see, terminal – student. You say, "What would be the goals of a student? Give me twenty, thirty, forty, fifty goals of a student." Pc's goal is likely to be in that list if you carried this far enough.

So you see, you ask different ways to get a goal, but you could use either a terminal or an oppterm to get a goals list from. You see that? So you have to know which it is. And you don't take the pc's say-so, because he's liable to say, "us copybooks." You follow that?

You've got to make a test. Well, the test is the pain or sensation. You say what it is or you write a list representing it; and the pc gets pain, you know you're handling a terminal; and you write what it is, and write a list concep... breaking it down, representing it; and the pc gets sen, you know you've got a list of oppterms and that that item, being part of that list, of course, is an oppterm. You understand that?

Pcs will throw you a curve every once in a while by turning on fifty-fifty of each on everything. That's the original mixed-up kid from Suppressville. See?

So there's your – those are the trials of an auditor.

You say "copybook," and the left side of his body gets under tremendous pressure while the right-hand side gets burning hot. And you say, "student," and they reverse. Which side of it is him?

Well, oddly enough, you could say, "Well, you find more items, it will eventually work itself out." Well, that proved here not to be the case about two or three days ago – proved not to be the case at all. We had terminal rocket reading, and pc didn't know whether it was pain or sensation. He had both. We had something rocket reading. Some item was rocket reading and so we had to list goals. So we just did both. We treated it as a terminal and we treated it as an oppterm and went over the whole thing and of course, it worked out in the final analysis, because only the goal stayed in. Got the idea?

In other words, we treated it as both. What goals would it have? We used it in a list of twenty goals all by itself – as the word – and then we did a list 1 I think, and a list 6. I don't even know if they got that far, but we were prepared to do it both as an oppterm and a terminal and sort the goals out of the total list remaining. Because, of course, you're only dealing with – well, you're dealing with less than a hundred goals. You see that?
In other words, you've got – even if you became totally unstuck and didn't know whether it was a terminal or an oppterm, you still have a remedy, which is just treat it as one and then treat it as the other. You're not dealing with vast quantities of material.

Now, more terminology:

A rocket read: A rocket read doesn't have any definite size because of course, were dealing right now with two different Marks of E-Meters: the Mark IV and the Mark V. And you haven't seen a Mark V yet, but I think they'll be here in a couple of days. You've seen them on your TV demonstrations, so forth. And of course, it gives a liver, longer read. It gives the same kind of a read as the Mark IV, but it is a livelier, longer-looking read. But it looks otherwise exactly the same. You could say this: it's longer on a Mark V than on a Mark IV.

To tell you how long a rocket read is would be adventurous, because rocket reads have been half a dial. And I've never seen a rocket read that was valid, an eighth of an inch. You see some goal will dwindle down to about an eighth of an inch and it will kind of look it, but you can't tell if it's a rocket read or not. So I'll give you the two limits: The biggest one I've ever seen was half a dial and the smallest I have ever seen was greater than an eighth of an inch.

Now, what's a rocket read? If you take three coins – a big coin and two small coins – and put them on a roughed-up surface, in a row (small coin: 1, big coin: 2, small coin: 3) – all in a row – their rims are all touching, and you take small coin 1 and rap big coin 2 a sharp rap, you will see coin 3 do a rocket read.

In musical note, it would be a fast decay. Called a rocket read because it takes off like a rocket and slows down. It goes off the pad with a burst. Probably more like a catapult. It goes pssswww! And no other read looks like it. There isn't any other read like a rocket read.

I predicted that this thing would exist. We were fooling around with oscilloscopes. It was quite remarkable, because Tiger Drilling had not then been released. And we had only seen goals up to that time, tick and fall, you see. But when any goal was tiger drilled out, why, sure enough this predict... I said a goal, being the basis of a bank, would probably read differently, electronically, than any other read. I couldn't see how it could do otherwise. And we dreamed this up and saw it on an oscilloscope, and it looks very funny on an oscilloscope. It apparently goes way up and way up above the center line and then way down above the center line and then back to the center line again. It makes a very peculiar pattern: sort of a shortlegged Z stood on end. And this very peculiar thing was seen first on an oscilloscope.

Now, on a meter – it turned up on a meter and as soon as any goal was well-drilled, well tiger drilled and very smooth, and so forth, it would consistently and continuously rocket read. You'd say it and it'd give an instant rocket read. It looks quite different. It's an amazing phenomenon that it would read that way.

Now, it isn't a fall and the only time you can make a mistake with it is on the first leg of a rock slam. Now, once in a blue moon an unfinished rock slam will be at just at that triggered position, that when you say something, the first part of the rock slam will fire. Now that really isn't a rocket read because it doesn't go off with a spurt and do a fast decay, but it does
such an energetic flash that you can be taken by surprise by the thing. That's the first leg of a rock slam. The next time you say it, it probably does it in reverse.

Now, a rock slam very often looks like a reverse rocket read when it first starts out. But once more, that isn't really a rocket read because it doesn't give you the very rapid beginning and the very slow end. I know I every once in a while have been startled — or was before I got used to it — was startled occasionally; I'd see a rock slam start and think I was looking at a rocket read, you see? And then say the item again and then see the rock slam finish itself and say, "Ah, b... E-Meter."

Now, rocket read: You think, well, that's just — just some more slanguage to learn and so forth. Well, it isn't covered in E-Meter Essentials, because it was discovered after E-Meter Essentials was written and it's — it is itself. It is itself, definitely.

Now, rock slam: That's very interesting because the word dirty needle, here, gives you a curve. We have unfortunately developed, in our midst, a homonymic word. (Love that, don't you? Homonymic.) One explanatory double-word phrase that means two things and that's why you may have trouble with this thing called a dirty needle.

You'll find auditors trying to get over the heading of this saying, "Well, it was an instant dirty needle." Well, in actual fact, this is what a dirty needle really is, although I don't expect to stamp out its use with just a few words here because I've already defined it and had everybody fall from grace and I hear them using it and using it and I'm afraid it's gone too deep into the language now.

The original dirty needle was a bzzz, bzzz, bzz, bzz, bzzz, bzzz, that was happening with the needle sufficiently consistently that you couldn't pick a read out of the middle of this guys needle. In other words, it was a bad, small, sudden, continuous needle pattern that made it impossible to read the meter. And that was dirty needle. If I remember rightly, it had another name at that time, but I've forgotten what it was. It perished; nobody used it very much.

_Audience member: Scratchy needle._

Hmm?

_Audience member: Scratchy needle._

Oh, yeah, "scratchy needle" was being used at that time. Well, for some reason or other — for some reason or other, scratchy needle didn't survive, but dirty needle did.

And that really means a consistent pattern of little tiny bzzz and bzzzz and bzzz and bzzz — and up and down, up and down the needle face, you know, up and down the face of the dial. And just about the time your — you — well, it's laid off for a minute, you see. It's not doing that now, and you're going to say "to catch ca-" bzz, bzzz, bzzzz, bzz. You say, "All right, now, have I missed a with-" (Watch it carefully, watch it carefully. "Yeah, well, I see what its pattern is and now if I say anything that is meaningful, you say to yourself, it'll disturb the pattern I see in front of me.") "All right, Have I missed a with-" ("Oh well, that's doing something else now.") "Have I missed a withhold on you?" ("Oh, I'd say it read. I don't know.")

Well, that is the bane of 3GA, all through the line, has been the dirty needle. Because the confounded thing gives us everything but a read.
Now, it is actually a tiny rock slam and it is caused by – just as a rock slam is – by O/W. Only we call it "invalidate – failed to reveal." You see these little bzzzs and bzzs and bzzzzs and bzzzzs on the fellow's meter, he's invalidated something or he has failed to reveal something – one or the other. But the odd part of it is, he very often has invalidated something, he has failed to reveal it and he's now protesting your asking him about it. So very often Protest is the better entering button than either Fail to reveal or Invalidate, even though it is.

Now an auditor with lots of experience can take a look at this thing, knowing the pcs operating on it, of course and he can say, "Oh, this guy has just picked up a missed withhold." See, "I've just missed a withhold on this pc, because now here goes a – this needle was clean and everything was fine and now it's a dirty needle." Well, that's its usual use.

Now, he can say, "Well, have I missed a withhold on you?" or something like that and the pc gives it to him after some argument and after that, the needle's clean. Or it's an accumulation of these things, but you'll find out it's more often – when you can't clean it up at once – it's more often just protest, just common old garden-variety protest.

It also, by the way – if you missed and failed to complete a list and you've left a list all unfinished and you went on and you missed the item, and so forth; after that you get bzzz, bzz, bzzz, bzzz. Also wonderfully enough, you can sweat your head off trying to turn off one of these things on a pc. All during a Prepcheck it was always like this; you could never get the rudiments straight on this pc; it's always like this and, you know, it's sort of like, out in – out amongst Homo sapiens it's halitosis that loses you friends, see, and in Scientology it's having a dirty needle. You know, after a while nobody will audit you, you know? "He's got a dirty needle. To hell with him."

And oddly enough, on two occasions on chronically dirty needles, I have seen them turn off with the first item found by Dynamic Assessment by Rock Slam and they just vanished and I see them only now when the pc really does have a withhold of magnitude or something like that. That's interesting, isn't it?

In other words, 3GA Criss Cross will blow up this dirty needle phenomena and you can expect the pc who has a dirty needle and is giving you a hard time, to keep on having it until you find the first reliable item.

All right, let's continue here with this rock slam.

Now, when you get an instant dirty needle – that means your instant read is bzzt! See, it's a bzzzz. Now, how big is that bzzz? And people are always coming up to me and expecting me to translate thought into mensuration, English type. And I will confess to you that every once in a while I get tired of being badgered and I will toss something off like "a half an inch" or "quarter of an inch," you know. But the truth of the matter is, it varies by the meter and it varies by the meter setting.

Now, a Mark V meter at 128 sensitivity – a dirty needle looks like the first cousin to a real rock slam, because it's pretty broad. And now you take it down to sensitivity 16 and it's this little eighth-of-an-inch bzzz, see, that you're used to on a Mark IV. But it's a tiny needle disturbance of great rapidity. Actually what it is, is a small rock slam.
Auditors are always saying to me, hopefully, "Well, I found a lot of little dirty needles on the list and can't I take those? Aren't they really a rock slam?" you know, "Please Ron? Please Ron? Say I've found an item." Well, I can't tell you you've found an item if you haven't. The answer is no! You see?

Well, how big is the smallest dirty needle? Well, how long is a short piece of string? This is one of those things. This is something that comes by experience and frankly, I have never taken a ruler and sat there over an E-Meter trying to measure the width of one. But I will tell you this: I have never seen one narrower than about an inch or an inch and a quarter, by my guess—see, I've never seen one smaller than that— that meant anything to a pc. Pc didn't cognite if your rock slams were smaller than that and did cognite if they were bigger than that. So— but what meter is this? Oh, I don't know, pick a meter!

Actually, it's not reducible to that degree. Don't you see? A rock slam then becomes a dirty needle when it ceases to carry with it a cognition on a found item. But it is a matter of size.

I'd say, if I finally assessed everything out to an eighth-of-an-inch rock slam, I think I would just tear the list—I would—even after I tiger drilled it and did everything I could do with it, and I'd polished it all up and I worked like mad; and working my brain to the bone trying to make this thing rock slam and it wouldn't do any more than an eighth-of-an-inch—I think I wouldn't have spent that much time on it. I think I would take the list and you—what you do is take the list and you fold it over once, you see and you tear it across the middle and then you put the two pieces together again and you tear them again.

Leave it in the guy's record to show that it didn't go anyplace is the proper professional thing to do, but my impulses are more savage than this sometimes. I seldom throw them in the pc's face now. [laughter, laughs] I mean, I've gotten myself under good control that way. Dump E-Meter tables on the pc sometimes but not often.

But it's got to be accompanied by the cognition, see? But a rock slam is a rock slam and I would say that the graduating point on a Mark IV is probably sensitivity 16, maybe plus or minus half an inch or something like that, as the smallest possible rock slam. But I've never seen one that small that meant anything. It's always been up there around an inch and a quarter.

Now, a rock slam is a nervous, agitated, flinging-to-and-fro of the needle and now I have been compounded with the felony of a slow rock slam. Well you could say a stage four needle is a very slow rock slam.

But, a slow rock slam—well, there are rock slams inside of rock slams That I've seen. I've seen a needle slamming while it was slamming. That's very interesting, because as it sweeps up the dial, it does three or four buzz slams of incredible speed and frequency as it's traveling an inch and a half very rapidly. That thing really looks savage. It looks like a thetan on an electric chair that he doesn't know whether to lean back or sit down. You can just see this guy bouncing out of his head and all over the universe.
This thing is a very frantic action. To say that some rock slams are slower than others is true, but that brings us up "how slow is a slow rock slam?" I don't know. That's something you'll have to answer by experience.

But a rock slam of the speed of a grandfather clock ticking from left to right would, in my opinion, be suspect. That's a too slow. There can't be such a thing as a too fast rock slam, however, because it just simply develops rock slams inside of rock slams. And it looks more and more frantic. But it is a frantic needle and sometimes thetans are more slowly frantic than other times. And once more the index is: Is it accompanied by cognition?

Now, those basically are your fundamental terms that you're using and doing business with 3GA Criss Cross. There really are no fancier terms of one kind or another than those things. Because all other terms are very, very explanatory; such as, "oppose" is simply you oppose it and "represent" is you simply represent it and so forth. And to go into that and call that a lot of terminology is practically a waste of time.

So, as all intents and purposes, I've given you the lexicon of 3GA Criss Cross and its various terms except one: item. Now, you've got "detested person" in 3GA – by Dynamic Assessment by Rock Slam. You have "detested person," you have "dynamic," and you have "item." And that's fine. And that belonged to that procedure. And I'm very happy to have it belong to that procedure, because in 3GA Criss Cross, they're all items.

If you wrote it on the list, it was an item. And if you found it, it was an item. It's still an item. And when it's obviously a provable item capable of delivering up further items, you call it a reliable item. See, you don't have to worry about detested persons and dynamics and items and all that sort of thing. You just call them items; just call anything an item.

Also in listing goals out, the pc is giving you items, don't you see? So it's just all items.

What do we mean by an item? We mean it's a terminal, whether a species or ally of oppterms or a species or ally of terminals. See, they're all items. And we needn't – we've got to have a word that embraces both. So a reliable item, then, is an item which the pc got after the list was nulled and that's – it's reliable and can be used to obtain further items. Well, that is a reliable item. It's also called – and you will call it, I am sure – the pc's item, even when it is an opterm. Go ahead and call it what you please but just recognize that there is a sloppy use of this word item and there's no reason for too many terms on top of item. You've passed into 3GA Criss Cross, call them all items. People know what you're talking about. You say, I found an item." Obviously, you have proven an item out on a pc, you see? You'd also say, "I wrote four hundred items on one list." See? It sort of differentiates itself.

There is no other terms to be defined in this except auditor.

And an auditor in 3GA Criss Cross is somebody who can find reliable items on the pc. Of course, that's a joke, but I make my point. It really takes an auditor to run this one.

Well, I will cover in the next lecture, now, the more amusing vagaries and departures from grace that we can have as we follow the rock slam.

Thank you.
3GA CRISS CROSS: FOLLOWING THE ROCK SLAM

A lecture given on 23 October 1962

Okay. Here we are. This is the second lecture, Saint Hill Special Briefing Course, 23 October AD 12.

And continuing 3GA Criss Cross, as she is cooked, and the recipe, and the subtitle of this lecture is: "Following the Rock Slam."

The tips which were put out on rock slams earlier apply in 3GA Criss Cross and you will find that the preclear interest follows the rock slam. If you can keep the rock slam you can keep the pc's interest. When you lose the rock slam you've lost the pc's interest.

Now, the cognitions follow the rock slam. We've often wondered, back through the antediluvian periods of Dianetics and Scientology, how come Mr. A cognited and Mr. B didn't cognite? And how come Mr. B sat there through 275 hours of auditing without a single cognition? Well, that's because you never came near any rock slams on him.

We used to try to get rid of rock slams, now we try to preserve them. In photography, if you will look at the modern manuals of photography put out as the great pictures of the year, you know, like the German annuals, and all that sort of thing, you will see in it that all of the bad features of the photography of ten years ago and the things that were condemned in the best photographic salons have now become – become the artistic thing to do today. In other words, they used to think grain was terrible and now grain is wonderful. And they used to think that out-of-focusness was awful and now they think it is just the cake.

Now, that is a process of being overwhelmed by that which you can't whip. [laughter] Now, you might say it's almost the same thing today with rock slams. Just a year ago, occasionally you would hear a half-angry, authoritative auditing voice in a session saying, "Floor! Floor! Floor! Floor!" trying to turn off the condemned rock slam so he could get on with the game, you see? Not any more. If I hear anybody using "floor, floor, floor" to turn off a dirty needle or a rock slam during an assessment and so forth, why, I will conclude that he doesn't know how to get in mid ruds and is trying to get the pc a loss. Because that's all that's going to happen.

Now, a rock slam, when it turns on suddenly and inexplicably in the middle of doing something else, is still a great embarrassment. But you had better find out what turned it on and why.

A pc on the rock slam channel, while he's following the rock slam very nicely and you're doing everything to get him to follow the rock slam, has a tiny withhold. The tiny
withhold, if it's in the direction of the rock slam object, of course is just the rock slam reacti-
vated by the withhold. And this makes life more complicated because it gives us this interesting
fact, that while you're doing a list and finding the last items on the list, the pc can have a
withhold on a certain item which will make it look like it is in when it is not. The rock slam is
occurring on the pc's withhold or invalidation or protest, and not on the item. Oh, isn't that grim!

Well, that's just – makes life more interesting, doesn't it? That's a hurdle.

This can actually occur, particularly on a pc who incipiently slams on auditors. He just
has this one little slight withhold: you're going down this list, everything is fine, and maybe
the list is a total blank. Maybe there's nothing on this list. Nothing. Nothing to be found any-
where. It's not going anyplace.

And you get down to the last three items and one of them is "a cadaver." And while
you read "cadaver" the last time through, the pc invalidated your auditing. Now, you read
"cadaver" again and it rock slams beautifully. Makes life more interesting, doesn't it?

Well, it merely gives us some of the reasons why you do what you do.

And the answer to that, of course, is you get a list down to the last three or four items
and then you take the remaining items out, not by elimination, but by Tiger Drill. You got
that? You don't eliminate the last three simply by calling them off with "commit overts" and
that sort of thing. You take the last three and you tiger drill them. And then you test them with
"would it commit overts against _____," or some such thing. And then you will see whether
or not it is actually rock slamming, not because the pc has a withhold on that item. Do you
understand that?

Now, because there are so many liabilities in this business, there are certain textbook
formulas. Now, these textbook formulas will prevent you from making 98 percent of your
mistakes. That's not choosing whether you oppterm or represent, they won't totally eliminate
that, but they'll eliminate 98 percent of your mistakes. Now, I said 98 percent. If you followed
them perfectly, they would eliminate 98 percent, and then the other 2 percent will just come
swinging in from Mars on an unpredicted wavelength. So you've still got to audit alertly.

In doing 3GA Criss Cross then, the byword and password is "be alert and be lucky." You're going to see some odd things happen to a pc and if you don't catch the brass ring when
you see them and do something about it you're going to be out of luck. So it's a very nervy
experience. And there's no substitute for experience. It's nerve-racking.

Therefore, there are certain textbook activities go on in this particular procedure, such
as – I got caught with this one the other night and ceased to be cocky about it 100 percent.
Took all the wind out of my sails. After all I've argued with people about not completing 3D
Criss Cross lists, after all of the enamel chipping and jaw chomping that I have done on the
subject, so help me, I didn't get a list complete. Isn't that – oowww. That should happen. And
I didn't get a list complete. And at the end of the session picked up the fact as a missed with-
hold. And having worked all that session to undo all of the mess which was constantly occur-
rning, see – dirty needle and everything else occurring on this thing – I finally find out where it
comes from: list wasn't complete.
Well, I hadn't even really been careful to complete that list. So I actually earned exactly what I got. It looked complete, it was apparently complete by test, but I didn't test it very hard. So I sighed and I said, "The next time I do this I will be guided by 3D Criss Cross rules of complete list."

Now, we can actually increase and improve those rules today. So the rules of listing actually go as follows: You list everything the pc can give you easily and when he tells you that's it on a list, you don't keep chanting the auditing command at him because some pcs will go on an automatic, you know, of answering the auditing command every time it's asked. Did you realize that? You see, you're not doing Prepchecking.

Now, that's the first habit you've got to get out of in listing. You're not prepchecking. You're not sitting there waiting for the pc to say, "No, that's the last one." You understand? And if you ask the question every time, every time, every time, some pcs just go on an automaticity of answering the question. They haven't got any more items, but they just keep answering it because it's being asked. Do you see that?

So you will find yourself occasionally shutting the pc off, just letting him run down rather than get some overbearingly long and meaningless list. Some pcs want the list 495 items every time you ask them one question. Well, that is unbearably embarrassing. I consider a complete list in this business of somewhere around eighty, ninety items. But that – that won't hold good for all pcs. But I can tell when a pc is endlessly and arduously listing, and they're going to list it all and so forth. Well, in such a pc I would tend to repeat the command less often. I'd sort of start omitting the command. And the pc would eventually say, "What was the command?"

And I would say, "Well, all right. Good. Good. That's fine, that's fine. Now, let's make a test out of this." Just ignore the whole invitation to go on with this automaticity, don't you see?

But you've got to have a complete list. So there is a rule that you can underscore: You've got to complete the list. But that doesn't mean an endless list done by the pc, it simply means a list that has discharged the charge.

There's a phenomenon occurring here, that if you list anything, the pc will have less charge on it. Now, there is also a danger here: you cannot go ahead and just list at random. You can list on the rock slam or near the rock slam with complete impunity, because you're listing on the goals channel. You understand that? But just taking off from nowhere, or from an arbitrary point that has nothing to do with anything, and permitting the pc to list a long time on it, is exactly the same as wrong goal. And every phenomenon that occurs in listing a wrong goal is liable to occur in listing four or five hundred items with no rock slam from a no rock slam item, and then four or five hundred items from another rock slam item, you know, no – no rock slam, this – no rock slam item has occurred, you know? And the next thing you know, your pc star... going to start going sen and wog and that sort of thing.

So you have to keep some control of this listing. The whole operation consists of taking something on which the pc is likely to have overts against and making a list of it. And out of this developing a rock slam. And then taking that list by assessment and finding the one item on it which really contained the rock slam.
Now, the oddities are that you can make a list of things the pc is likely to have overts against. You can null that list and pick out the item and will find that the rock slam has settled on one thing, if it's complete. But if it's incomplete, of course the thing that's least likely to be on an incomplete list is the item. You understand? Because a list completes rapidly after the item is put on it. So an incomplete list is less likely to have the item. You understand that – why?

Now, finding this item we have something against which the pc has overts. Similarly, we could have something which was a terminal with which the pc has committed overts. Now, why overts? Well, the whole phenomena of rock slam and meter behavior is based on the overt-withhold sequence. And a rock slam is the result of – as a meter representation – is the result of innumerable committed overts in a certain direction. And when you've got that certain direction isolated, that is to say, the items against which the overts are committed isolated, you then have, of course, a rock slam. And there'll be one thing that he has more overts on than others.

Now, if he gave you a list of eighty, which is pretty close to right, if he gave you a list of eighty, he will actually have committed overts on all eighty. But the reason he's committed overts on all eighty is A=A=A. He's identified them with one thing that he really commits overts on. And these are all of its cousins and sisters and brothers and aunts, you see? The odd part of it is, is getting a list of that character at all. But he of course isn't inventing these things, he's just dealing them off the bank.

Now, this whole thing is an interesting activity of doing clearing – you should look at it as to what it is – it is clearing without having found the goal. Now, it'll take you an awful long time to do it, and it is not – it is not well located or well centered or anything else. But in theory you could go on finding these and finding these and finding these and finding these, and at the end of a few hundred hours you would have found all of them and your pc would have been sitting there Clear. And then he tells you what his goal is. You see?

So what you're doing is kind of a swindle here, you see. You're actually finding the items before you find the goal. See, now, in Routine 3, you're supposed to find the goal and then find the items. Well, why does this make such a difference to the pc? Actually, why doesn't he find his goal in the first place? That's because he's got so many overts and so many withholds that he himself doesn't know what it is, doesn't dare confront what it is, has lessened the overt so thoroughly, and has then withheld it even from himself to such an extent that he can't even tell you what his goal is.

So this is the basic mechanism of how the pc's goal gets obscured in the first place. It gets overlaid with heavily charged items that the pc has used to commit overts with and things on which the pc has committed overts. The symbol of the rock slam is overt.

Now of course, as every overt or confusion is followed by stills, so the overt is followed by the withhold. So you could actually do this by withholds. You could do a Dynamic Assessment by withholds. You understand? But stills don't run well out of the bank. This would be much less reliable. But it still furnishes you a test. After you've found the overt you can ask the pc what he wouldn't give it and you'll get the slam back. See, because the slam
was held in place by the overt. See, the slam is still residual as the withhold even though you've gotten rid of the overt. Don't you see?

So you can still pull this trick as a test trick, you understand? Let's say we've run all the slam off the bank against waterbucks, with overt, you know. "Consider committing overts against a waterbuck." Slam-slam-slam-slam-slam-slam – proven, good reliable item. It all goes up in smoke, we don't know anything more about it, it's disappeared and that's that. We could still get it to slam again by saying, "What wouldn't you give a waterbuck?" And of course that's "what would you withhold from a waterbuck," you see. And it'll go slam-slam-slam-slam-slam. But if you ask it very much, of course, it all blows up in smoke because there's no powder under it now. See, that one will wear right out. But you can at least see that it did slam at some time or another on overts.

This will be useful to you some time when trying to recover from some HPA's attempt to do 3GA Criss Cross who has run off the slam. It gives you nightmares sometimes. It's very hard to recover the entrances to slams when they are discharged. All right – means someday we'll have a central division – a central division of some kind or another of "what was my item?" you know, and all goals and items and everything else when found are registered there at the central division, don't you see? And in extremis, why, you can always cable it and get the pc's reliable items. Anyway, such doesn't exist now, so you're left on your own.

Now, the mechanism here then, is the pc has lived, and being terminal A, has committed overts against oppterm B. The effort then merely consists of locating the cousins, sisters and aunts or character of oppterm B, then listing this thing down in order to recover a slam. Because of course, while being A, and committing overts on B, he will produce on the meter the rock slam. And oddly enough you can find A by just asking – that is, the terminal – by just asking if it would commit overts. And it will slam. You don't even really have to have "against" anything. See?

Now, "Would you commit overts ... " – let's say the terminal is waterbuck and the oppterm tiger – "Would you commit overts against a tiger?" Slam-slam-slam-slam-slam if the tiger's a reliable item, you see? "All right, that's fine, thank you. Now, would a waterbuck commit overts?" Slam-slam-slam-slam-slam. You see? So therefore a terminal will slam, as well as an oppterm. It's just how you word it. You must realize that the terminal commits the overt and the oppterm receives them. Therefore, that will always give you the proper direction for your wording.

Now, this is an interesting action then. Because it goes down through some part of the GPM, actually, if carried on, to hundreds and hundreds of items. You recognize that, just speaking loosely, as far as items are concerned, that pcs list ten, fifteen thousand items to go Clear. You realize that. So supposing that every 100 of those 15,000 items contained a key item that was really built in, terminal or oppterm. See, that's 15,000 – that gives you 150 items to find on the pc to make him go Clear.

And in view of the fact that you're going to be wrong at least 25 percent of the time no matter how lucky you are, that means you will actually be running up the bank at something on the order of about 200 items, a lot of them meaningless, you see, and let's suppose you're an old slowpoke, and it takes you two hours. Why, your whole clearing activity then boils
down to something on the order of 400 hours. See, that's far too much. And it's only theoretical that you could go the whole way. You understand that? Because after the slam is gone you might not find yourself going anywhere at all. And then you'd have to shift gears and go by cognition and you'd have to go by needle manifestations and little tiny slams and you'd work your way through this thing most arduously.

So therefore you make far more mistakes in the last half of the clearing than in the first half, so I'd say maybe you got about five hundred, six hundred hours to Clear, going at it in this way. But recognize it as a clearing procedure.

Now, a guy got all messed up because he had a goal. See, he wanted to do something. Somebody has already written in and said to me, "Well now look, if the pc's goal is this important, shouldn't you look just a little bit earlier, Ron, and find the assertion? Now, I'll give you an idea of what I mean. 'To catch catfish.' Now, a little bit earlier he must have had to assume that there were catfish to be caught. And therefore you find the assertion that there are catfish, and therefore it would clear the pc much faster."

Well, that's perfectly valid thinking – as long as you just think about it. That's perfectly valid and I'm very glad that somebody was thinking about it at all. But of course that's the second goal he's talking about.

So he's asking me, "Why don't you find the second goal before you find the first goal?" Well, if he knew how much sweat it was on most pcs just to find the first goal, he wouldn't be worried about finding the second goal before you found the first one because that's impossible. The second goal is totally detached from the third goal, and the third goal totally detached from the fourth goal. But the truth of the matter is, they tend to be solutions, one to a next. It's quite interesting.

Second goal set up problems which the first goal – you know, I mean, we're speaking now of the first goal we find – is a solution to. "To catch catfish," well, it's some kind of a solution. A second goal is, "to make too much of everything." See, and it happens that its terminal, its chief terminal, is a catfish. So he gets down the track a while and he all of a sudden has this brilliant inspiration: The way to remedy it all is to catch catfish. Heh-heh! That will solve the problem set up, you see, on his earlier goal.

They aren't actually connected and they will blow separately, which is the most marvelous thing about clearing that I know of. They will take separate stance and they do blow separately and so forth. But nevertheless I have noticed that the second goal is solved by the first goal you'll find. And so on.

Now, this piece of bank started up by "to catch catfish," resulted in the fellow being something that would catch catfish, and having assumed that identity went about his business happily catching catfish until he ran into an oppterm which said, "Thou must not catch catfish." Of course you say, well, catfish is enough of an oppterm. No, that sort of generally runs through the whole thing. And catfish aren't going to be solved totally by that goal. But he gets to a game warden and the game warden says you mustn't catch catfish. See? So we've got pc – fisherman; game warden, see, is the oppterm. All right. Now, that's all dandy, but he goes into some kind of a – an avoidance there of game warden, so county commissioner appoints a game warden, don't you see, so he gets the idea that he had better be a politician, see, and that
sort of gets him around this oppterm. And you'll get by these devious things and so forth, and then he finds out that economics inhibit the catching of catfish because the tackle is very expensive. You know, I mean, all kinds of wild things happen.

So he picks up additional opptersms and additional terminals, and he's still going on this goals line, but he's becoming different things, opposing different things, and different things are opposing him, see? And so you get this horrible muddle of little black balls which you call the GPM.

All right. Now, as this dance continues, you recognize that it's full of overts. He's getting motivators like crazy as a terminal, you see, and he's passing out overts like mad while being this terminal, against other specialized and selected terminals. And the meter manifestation of all this activity is a rock slam. So all you've got to do is follow the rock slam, and you wind up with the later day things that – you know, you won't wind up with the fundamentals, you'll wind up with the later day things, you know, like "world conqueror," you see, that was the ultimate of politician. You know? And "nut house" is the oppterm, because every time he says he wants to conquer the world they tell him they're going to put him in the nut house, don't you see?

And it's very funny, you look back on the item track of the pc – after you have cleared him – and it all makes sense. Everything makes sense. It looks completely idiotic though, to you, perhaps, while you are finding items. But they all make sense and they are opptersms and they are terminals. Of course, the time we're doing this on most pcs we don't know what the pcs goal is. But these things are so stacked on it that we can't find the pc's goal easily.

The saving of time amounts to this: The pc's goal, we find it. Well, somebody sits down and he says, "What's your goal?" And he writes down five goals and one of them rocket reads and it goes bang, and he's got the pc's goal and it's all set, and so he gets a Prehav level and he's going to list the whole thing, and he gets down there and he says, "Now, who or what would want to catch catfish?"

And the pc says, "hrmmm" and it rock slams, "hrmmm" and so on, "I get a –so on," he says, "so-and-so and so-and-so and so-and-so," and rock slams pretty bad, tone arm starts up, and gets up, and gets up, and there it is – 5. It's just sitting at 5. You found his goal, but the tone arm is now sitting at 5.

What do you do about this? Just 3GA Criss Cross. You don't even have to find out, you see, what he's stuck on that made him go up to 5.0. You've just got to find an item that rock slams, don't you see? And then you will take the weight off the bank and then, because the weight is so great, his overts are so great in that direction, he dare not confront in that direction anymore. So he runs into this section of the bank and he says, "Oh, there's nothing there. Ha-ha-ha." Lessens the overt, see? "Aha, no game wardens. Ha-ha-ha-ha, oh, yeah. Game warden, well, they're pretty unreal to me. Actually game wardens really aren't part of existence and I prefer not to associate with a game warden anyway. And there's no sense in putting that down on the list."

So he starts dealing off old items. You know, it's a treadmill. He never deals you this item. And his tone arm responses go up to 4.5, 5, stick, everything looked very mucky and muddy. Well, he couldn't confront it.
See, you found his goal. But you've got a – such a thoroughly burdened bank that the pc can't run it. And you'll find that more than often is the case. So the safe way to do it is not to spend endless hours prepchecking goals, but find an item or two or three and then check the goal again. Find the goal any way you want to. Do you see how that would be? You can take enough weight off of this rock slam, you can take enough charge off of his overts so that he can confront what he has overts on, and then find out what he is while he's confronting overts against and therefore he can list. You see the track he's trying to list through, you see the game he's trying to list through? The complexities of it all?

All right. Now, as we enter the case, on some cases we'll find the goal more easily than we will find the item. When the goal isn't real, then neither are items. But that's beside the point. We arrive at the toughest end of 3GA Criss Cross, which is its beginning. Now, oddly enough the toughest end of every case is its beginning. And the toughest end of any procedure is its beginning. And this is very sad. Because at that end of the game we, of course, know the least about the pc. The toughest part of auditing should be down toward the end of the intensive, wouldn't you agree? It never is. It's right there in the first session. See, the pc has to be in the best possible condition to handle this, but we find him at this stage of the beginning, you see, in the worst possible condition, casewise, to handle it. And all this is very unfair because it makes the auditor's job much tougher. A case, of course, should always be Clear before you start auditing him.

Well, turning on the rock slam is the first difficulty that you will run into in 3GA Criss Cross.

Now, in some cases this is dead easy. You give them a Sec Check, a rock slamming Sec Check, and they just drop it in your laps. The thing is slamming like mad and one of the things you used on the Sec Check was it. Well, you've got your first item. And you just do what you do with it and carry on and there you are. That's easy. Some other case, you sit there and you try this and you try that and you try something else and there's no rock slams.

Now, there is a method which will undoubtedly be espoused by the American Psychiatric Association – if after it goes nuts and is dealing in one of its spinbins and trying to clear itself – will of course for the auditor to beat the pc often enough and long enough for the pc to develop a rock slam on the auditor. But this is not advised. Because all it's going to do is wind up as its basic-basic with the first session. And you were there anyway. So you might as well not take that excursion at all.

The thing to do is to get the pc in-session. That is your first action. Because if this pc is suppressing like mad and throwing his rudiments out like mad, you're never going to see a rock slam. It's going to start to turn on, it's going to turn off. The pc is going to suppress before anything occurs, because a rock slam can suppress out of existence, Careful of can turn off a rock slam, and particularly Protest. Protest, I have found, is a very hot button on rock slams. You get off the Protest and then you get off the Careful of and then you get off the Suppress and you usually have your rock slam back. But Protest is very vital in turning off rock slams.

Now, how do you turn it all on? Well, the first thing, get the pc in-session. The next thing, there could be many steps and there are several different methods. The easiest pc would
be one that you simply say, "List the dynamics or parts of existence," he does, you assess it and you've got your first rock slam.

Next type of pc, next grade up, "Who or what have you detested?" They give you a list, it rock slams, you've got one of the persons there, and you've simply got your first item and you go on and use it.

Another pc, not quite as easy as this, is – you sneak up on him by – get "What – what do you wish hadn't been part of existence?" or some such phrase and then get what isn't part of existence. And he gives you a long dissertation on what isn't part of existence, you get a long list, one of those items rock slams like crazy, you're in and you've got your first item.

Now, let's take a slightly upgraded pc from this and let's get "What would you prefer not to associate with?" or "What wouldn't you want to associate with?" That is another entrance point. And you make a list of these things the pc wouldn't care to associate with and you will find there your rock slam at the final end of this.

Now, there are undoubtedly other approaches to this. We do not know them at this particular time. There are undoubtedly gradients that carry us in further on this particular road. But those are the various approaches that you can use to turn on a rock slam on a pc straight from scratch.

Now, how do we write this list? That might take up a little bit of interest here. We sit down, we put the pc in-session, we've got the pc well in-session, well under the auditor's control. We take a piece of legal length paper – that's 13 inch by 8, or something like this, 13-inch-long paper, and we write the list in a single column, is usually best. Gives you lots of latitude. Some people who write very small can get two columns on the page with the greatest of ease. But if it gets too scrimpy and too small, why, the auditor starts having trouble and the next auditor that picks it up could shoot the last auditor that did it if he's having to renull something. So actually leave some space for things to happen.

All right, so you write it like this: You write the pc's name, you write the date and you write the question that you're asking the pc to get this list. Now, that is vital, because if anybody, including you, is ever going to make sense out of what's been going on with this pc, you're going to need those data. You're going to need the date, the pc's name. We don't care who the auditor is, we can't read it and we still know who you are. I mean, we're getting to be terrific deciphering calligraphers or something like that in Scientology. Man, you talk about cryptography! We'll be getting orders in here any minute from the Royal Navy to decipher the Japanese codes. We're getting good, you know, I mean, good. You'd think so if you could look at some of these lists. It's all written in Arabic.

Anyway, you write those data. Now, when you turn the page over, of course, to write on the back side of it – and it's perfectly good and you should use the back side of that page, it's of course pure idiocy to repeat the question and the pc's name and the date. But how about Page 3? So you don't write anything on the back of Page 1, but you do write the figure "3" and the question. That gives you a consecutive series for page 3, don't you see? And you – somebody can see that "3" and they know there's a missing first page. Then they can find all the brutal data from the first page, don't you see? Because in the speed of writing up things,
you don't want to delay too much, but it's very easy to write "3" and the question, isn't it? Then you can add it up, because you know there's a page there.

Well, supposing it goes over to another list, of course you go on the back of this list. You don't write anything on the back of this list. Now, you go to 5, don't you? And on 5 you'd better write the question again. That makes all these lists join up beautifully. You don't number 2, you don't number 4, don't you see; you don't date those things and so on, because that just holds up the pc. You get how that system works? I think you'll find that's very serviceable.

Your lists actually seldom go beyond page 5 if you're doing any kind of a job of watching what the score is at all, and you keep repeating the question to some pcs and the pcs will keep on giving it to you. And then on some pcs you will get a two or three hundred list to make it a complete list and all that sort of thing. All that's allowed for.

Now, when you null this list, your administration should actually, to keep you from making mistakes as you're flying along the line, your administration should be multiple color. And the best way to handle this is, the first time you go down the column, just to use the pen that you wrote the thing with. I've been using various versions of this and how easy it is or is not to spot. And this is the one I have been using lately and find it's working very well. I also have to work out administration while I'm doing these various things. Because you see, other people read these lists besides you. And if we don't standardize, then the next auditor can't make head nor tails out of what went on.

All right, now, you see, it's important that there be next auditors, particularly if you're finding goals and somebody else is listing the goal. This character will want to know what cooked here, because he may have to take off in the middle of something and do something about it, don't you see? Or some other goals finder may have to pick this thing up and he'll want to know what went on, see? And you may have left it at a dead end or something and then listed the goals against your last reliable item, but that wasn't good enough to carry the listing through. They want to find some more items. They've got the guys goal, but they've got to find some more items. Well, they'd certainly better know where it all ought to stop, don't you see?

Well you put slant marks, just the plain slant mark for everything that is in, in the color pencil that you wrote the list with, and then everything that is out you put an X. Your next time through, grab a red ballpoint. You actually could carry it on through with a red ballpoint. The second time through, if it's out, you put a full X. That leaves you there with things that are still in, glaringly apparent, don't you see? And it also, by the time you've got two or three slants or a cross, you've had some cases bog down in the past with 3D Criss Cross just because the auditor didn't follow this very stupid point.

They – there – there's two items in on this sheet! That are still in! And the auditor never nulled them and the whole thing went blooey and he couldn't find the goal and it all went up in smoke and then Mary Sue'd go over the thing again and there's two in. It was one of those. See, he just missed it, completely. It was sitting in the middle of the page. So this
color code system's pretty good. I haven't ever bothered to carry it on into a green flash system after it, but you could.

Now, how do you call a list? That's your most interesting thing. I've given you the headings of these lists – "Prefer not to associate with," all those these other headings of one kind or another. You ask the pc to list these things. Well you actually just ask the question and he gives you a flock of answers and you ask the question again. Or he wants you to ask the question again and you do, and he gives you some more answers, and then the needle – you're watching it all the time.

Now, the best way to handle this on a meter is to pull your sensitivity down. Pull your sensitivity down so that you don't have to be adjusting this tone arm all the time, you got the idea? You don't pull it down to one or anything crazy like that, but you just – you just bring it down. That'd be very important to you when you get to a Mark V. It just flies around so dog-gone much that you have to put it on a lower sensitivity than you would use to null, don't you see? And remember then your rock slam won't be so big. So you sit there with one thumb on the thing and your other hand wrapped around the pencil writing this list, keeping that thing in center, and watching the moment before the pc says it. Watching the meter the moment before the pc says it. See if there was a slam. You understand?

And every time you write down an item, you put after it, if it slammed, "R/S." And if it's just a little dirty needle turned on with it – just went bzz-bzz – you write "dn." And if the pc volunteers that he had some pain on it – you're not terribly interested in this, but if the pc volunteers he had some pain on an item or sensation on an item, why – you don't pester the pc for that data while he's listing, by the way. I see some of you have been. Just write it "pn" and "sen."

You're much more interested in the aggregate pain and sen of the whole list, or a sudden pain or sensation that turned on.

The pc all of a sudden is going "Whhhh!" and you say, "What's the matter?"

"Well, my legs, just from the waist down are – just went hot as fire."

You say, "Well, when did they go hot as fire?" and try to trace it back up the list to what item turned it on and then mark it over here as a very likely item because the somatic is one of your indicators. Got it?

Pc tells you they're – they're – they're uncomfortable – you ask the pc and they say they are... trace it back to where it turned on. That's good procedure.

You don't go nulling back there, you just say, all right, when, and the pc will eventually tell you. And remember, the pc nearly always tells you one or two late.

See, it's on – it's on item – it's on item 83 on your list – you don't number these items, by the way – and actually the pc says it turned on on item 83, that was when he noticed it. It might also have been 82 or 80, don't you see?

So you kind of watch that closely. He gives you an indicator.

Sometimes on a Dynamic Assessment, a somatic will turn on – or a sensation, more likely a sensation – will turn on so shatteringly when you hit the dynamic, that there isn't any
thought of going on with the session. The pc is practically booted out of his chair, don't you see? And you'd just better take care of that right now. You'd better listen to the pc about it and you'd better hear about this and you'd better hear how it turned on and you'd better mark it down very adequately on your report and you persuade the pc: "Now, without invalidating this item or abandoning it or anything like that, of course – have to null the rest of the list – is that all right with you?" and you go on and null the rest of the list and then cope with it afterwards, do you understand? But every once in a while, when you've got an item, bang, you – he thinks the roof fell in. And that's a terrific indicator, it almost always is the item.

All right. Now, just your administration of this should be fairly neat. And somebody should be able to read these lists. But how do you call this list off? All right, if it is an oppterm list, it's "Consider committing overts against_____." Or to shorten it up, "...overts on." Uh, "Consider committing overts on_____." Now, that's a mouthful, but you're not going to be able to get away with it. I made several tests of just calling it off all by itself and I found out that I missed the boat when I did that, on oppters, so oppters are always called with "Consider committing overts against_____." or "Think of doing bad things to_____." You could also say, "Would you do bad things to?" or "Would you commit overts on_____.?" or "Would you commit overts against_____?" It's what registers with this pc, what makes sense. So there's variations of this. But they all carry the connotation of "Consider committing overts against_____." Because it's the overts against that are going to turn on the slams.

Now, you've got a checkpoint, "Consider withholding things from_____.", and you're going to get the same responses on your assessment, but it's not going to discharge it as well. You understand? Once "Consider committing overts against_____" is all worn out on this item, you can always say, "Think of withholding things from_____.," and you'll get the slam back. See, they're both sides of the same coin. You see that?

All right. So an oppterm list is always called in this particular way. Now, a terminals list – a terminals list, can be called directly or very involvedly. It can simply – you just call it. You know, "Waterbuck, tiger, cat, dog, fire warden," see. And register the instant reads. That's a terminals list. You just go bark, bark, bark, bark, bark down the line. Because it gets very involved to say, "Would a (whatever your item is on the list) commit overts against a tiger?", because nearly every one of them turn on a slam. How do you pick a slam out of all those slams? Because one of the characteristics of slams is they are persistent. You understand?

Now, one of the best ways to sort this thing out so it doesn't slam, is to put the terminal it's against, if you're repeating that terminal every time, before the sentence. "On tigers, would waterbucks commit overts? On tigers, would fire wardens commit overts?" See? That's if you're calling the whole sentence. You'll find that's one of the most desirable phrasings. Because you get rid of the tiger's rock slam, and then you just pick up general rock slam that turns on either with the item itself or overts against. But overts itself occasionally slams, so picking your way through it is quite interesting.

But fortunately, with your meter turned up to a very high sensitivity you can read them once and take any instant read on a terminal. You cannot do this for an oppterm. A terminal's list can just be bark, bark, bark, bark, bark – once each. You understand?
Now, "Consider committing overts against," you see, any such phrasing as this can also be read just once if you're an old sharpie on the meter. Now, if you're not sure, for God's sakes, don't fake it, just read it again.

Now, do you tell the pc if it's in or out? No, you don't. The more words you can get the hell out of auditing, kick them out! Now, "Would a waterbuck commit overts against a tiger? Thank you. Would a waterbuck commit overts against a tiger? Thank you. Would a waterbuck commit overts against a tiger? Thank you. That is out." How long did it take me to say that? A shocking length of time. Multiply it by 80 and you'll see why it takes you a week and a half to find an item, see?

All right, we've got an oppterm list. See? Its got "tiger" on it. And right after "tiger," why, it's got "carnivore." We say "Consider committing overts against a tiger. Consider committing overts against a carnivore." Where's the "that's in"? Where's the "thank you"? Well, the hell with it. Pc's got all the thank-yous he needs. How does he know if it's in or out? Won't that develop you a dirty needle? Well, after a while he'll get bright enough to find out that your pencil goes flick-flick, when it's out, and flick when it's in. [laughter] They smarten up quick.

In other words you can read them once. There's no "thank you." There's no "that's in, that's out." We're talking about this peculiar type of nulling. This doesn't alter nulling and doing other things in other departments of the game, see. This is talking about 3GA Criss Cross. The auditor says bark, bark, bark, bark, new one every time, you know? Then all of a sudden, why, "Consider committing overts against a fire warden." Didn't miss that, you know? You don't say, well, "I'm awfully sorry, pc, I – hey – I – I'm awfully sorry – come out of your boil-off – I'm awfully sorry that I missed that. I – I – I think I should have – have – have watched the meter more closely. And if it's all right with you... I'd better run some Havingness first, all right, I'll run some Havingness on him." See, that's not the way you do it at all, see.

You say, "Consider committing overts against a fire warden." Didn't read it, see, you didn't read it, but you don't say anything at all, you just say, "Consider committing overts against a fire warden." That's all. You didn't get it the first time so you read it twice. Pc knows you're reading it twice and going to read it again, because he – his mind very rapidly gets educated to the fact that you don't go slant-slant, see. He hears your ballpoint go scrape-scrape. Slash. You got the idea?

Well that's how you pick it up to an hour and ten minutes to list and find the item, see? Now, that requires very, very reliable meter reading, because you miss the key one and you've had it. You shouldn't have gotten out of bed that all – at all that morning, because the pc now has a missed withhold and the pc has this and the pc has that, and everything has gone to hell in a balloon. Now, the upshot of all this auditing culminates in a reliable item. A reliable item. That can be an oppterm or a terminal. And that meant one that slams when you found it. It slams in the same session that you found it. It doesn't have to slam the next day. It reliably slams and that means found. You completed the whole nulling and that one slams. You completed the whole nulling and that one now slams and that is the proven item, that is your last reliable item. Next day doesn't have to slam, never has to slam again to the end of time. Be-
cause of course you discharge the slam off and it'll be rapidly transferred onto something else just the moment you start listing.

You've got to – it's got to find it that day, though. See, and it had to slam very nicely and then you mark it down there on the report in letters of fire that that item slammed, and how wide it slammed, and how long it slammed. Now, one that slams just twice is something that the pc – and then passed out, you can't tiger drill it back on again, that's not good enough, in the session, see. Because you should be able to get that slam on and off. You should be able to regulate that slam with a Tiger Drill, you understand? You understand that?

It's not enough to have it go slam-slam while you're listing, and then never slammed again and didn't slam at the end and you call that an item. You'll be up in soup. All the way down the list you've got an item slamming, slamming, clear to the end, you've got items slamming. You go over it again, you don't have a slam in the whole lot. And it's - h_u_u_h_h_h_h! You say, "What happened?" Nothing happened except the pc's rudiments may be out, but the fact of the game is because the pc was saying them while you were listing them put the pc on the other side of the fence, and now when you're nulling them you don't get slams back on. So don't let it worry you when something doesn't slam again while you're listing; only start worrying if it doesn't slam at the end of the activity. Then you should start worrying. No slam on the list. You understand that?

You don't have to get slams back. What do you expect this list to do? Just stay preserved in wax till the end of time? What do you think was happening while you were listing? You were listing a slam off. It very often puzzles you because you go by a rock slam. You know, it listed it and you marked it "R/S" and you go by nulling it and it doesn't R/S. There's many an auditor here then spends the next half an hour fooling around trying to get that to R/S. Ah, to hell with it. Don't bother with it. So it didn't R/S, so what? Make fairly sure your middle rudiments are in and carry on. That doesn't mean you get your middle rudiments in just because it didn't R/S, either. You just go sailing down the list.

waterbuck commit overts against a tiger?" Slam-slam-slam-slam-slam-slam-slam-slam-slam-slam-slam-slam-slam-slam-slam-slam-slam, that's fine. Slams went off, and came on, and go out, and you mark it down in your auditor's report, and you say, "reliable item." In your red pencil in the middle of your blue report, you say, "reliable item, tiger." There it is. Underscored. Never has to slam again to the end of your days or anybody else's and probably won't. You understand? But you've got the last reliable item.

Now, why do you want the last reliable item? Very simple. There's the law of the last reliable item. What do you do when you've followed the rock slam to a dirty needle and went off the deep end of the cliff and you are now nowhere and the pc is ARC broken and disinterested and all life has turned green and gorgeously bilious? What do you do? You return to the last reliable item and do something else with it.

Second rule is: there are two things you can do with an item – you can oppose one or represent one. If you have opposed one the other thing you can do is to represent. If you oppose one and don't get a slam, then you can represent and down to a slam. In other words, if you've done one, you now do the other. If you've done one with no result you now do the other. And you'll probably get your result.

Now, items that are listed on oppose are always reversed. You say, "Would a waterbuck..." you know, "Who or what would oppose a tiger?" you know and "Who or what would a tiger oppose?" You always call them both ways. You make two lists, treat it as one list when you null it, but reverse your "Consider committing overts" command, if you're doing it that way or if it is a terminals list, just call it one-shot, you know, one item at a time on the way down, mark any instant read as in. In other words you get two lists out of an oppose. "Would a waterbuck op-" in other words, "Would – Who or what would oppose a tiger?" and "Who or what would a tiger oppose?" And you'll always catch the brass ring in that particular fashion.

Now, inert – this is the law on this: Inert items are represented most of the time, and active emanating items are opposed. And you won't go very far wrong by doing that. If you ask the pc is it – pc sometimes doesn't know. Well, do one or the other and you'll only be 50 percent of the time wrong. You see how this is?

In other words, you represent an inert item, something that is not active. "Dumb bunny." There is a good inert item. So you represent "dumb bunny," Supposing you come to the end "an ox head." All right, now, you represent "an ox head," don't you see, because it's still inert, and all of a sudden you'll find yourself sitting there with an active item. So you oppose it. Got the idea? "A spitting cat," oppose. Get the idea? "Shotgun," oppose. See? And you most of the time you'll be right. And part of the time you'll be wrong.

What do you do when you go off the deep edge? You use the rule of the last reliable item. That's a very reliable rule. The last one that you could really count on, you represented and it wound you up nowhere, ha-ha! Go back and oppose it. Supposing you neither get a represent nor oppose off of it and it all goes to hell? Then you go back to the last reliable item before that. Got it?

An item may rock slam and not be accompanied by cognition. Very doubtful, very doubtful. You'll get sensation on oppterms, pain on terms. You will get a rock slam and a cognition. In other words the pain or sensation, depending on whether it's a terminal or
oppterminal, and in addition to that, the rock slam, and in addition to that, pc's interest and cognitions, and that's what it takes to make an item. If you follow that on down and you either oppose or represent against the rule of whether it's inert or emanating, you'll find yourself following the rock slam. And you will do a very lot for the pc, and eventually, you will find that an item you get to, rocket reads, unless the pc has something against going Clear. But I will take that up in another lecture.

Thank you very much.

Good night.
Thank you. It has become damp. The English weather has turned into unusual California weather. Used to have a secretary while I was working down in Hollywood for films. Studio would send her over every morning. Route me out. She'd come in. She'd open up the blinds. She'd look outside. She'd say, "My! What unusual weather!" see. This kept up for about two months. [laughter] So, one day she came in and she opened up the blinds, and she looked out – and before she could speak, I said, "My! What unusual weather!" She applied for a transfer to some other writer. [laughter, laughs] I can tell you that as a story, Suzie isn't here yet. [laughs]

Anyway, this is the what of what?

Audience: 25 October.

Twenty-five – 25 Oct. AD 12. This is the month, with the thermonuclear in it.

Well, this first lecture here is an experimental approach to 3GA Criss Cross, and accumulated data on 3GA Criss Cross, and I have awfully, awfully, awfully good news for you. I have made a breakthrough, I think, which you will find very, very interesting. And if this works out uniformly – which I have no reason to believe that it will not – it will be a simple method of an assessment on a couple of lists, and you'll have your first item with a crash on the pc. That's interesting, isn't it?

Audience: Yeah.

I don't know why you should be so lucky as to have me around, but there it is. [laughter, laughs]

Now, the rock slam was called a rock slam because it was obvious that the first item on the pc's track was an item with which the pc had a very large confusion. It was the first thing that he used to help with or to get help with or something of this sort. And it was called the Rock. And it's actually original definition, I believe, was that it was the first mass that he attributed large significances to.

Now, we were clearing people by merely clearing out of the road the Rock. Now, that was done exclusively with Help Processes on about a 5-way bracket. And we did make some Clears – people that went free needle and proper point on the tone arm, and felt wonderful, and so forth. Just by this process of assessment for the Rock.

Now, I noticed in doing the research work on this, that the road to the Rock was accompanied with a very peculiar agitation of the needle. And no other word or name had been given this agitation of the needle – which went left and right and back and forth and so forth –
and I gave it the term "rock slam," because it's certainly a slamming needle. Its going to the left and to the right, and back and forth in a high degree of agitation.

Now, that phenomenon is an extremely basic phenomenon in clearing. And as you can realize the number of stable Clears that were made in earlier years must therefore be very close to zero. We've made temporary Clears lots of times. We've – people have hung on quite a while, and all that sort of thing. But stable Clears, no. You see. And that is our target. Somebody who will simply get that way – and stay that way along the line.

Well now, obviously a person who was a Rock Clear – that is you could get down to their Rock, and blow their Rock – still wouldn't have knocked off all of the GPM. Because underlying that Rock was a goal. And between that first – that ACC in which that was taught – was that the twentieth?

*Male voice: Yeah.*

The 20th ACC, and sometime, just before I – it was about the time of the South African Congress, I integrated "goal" as the underlying thing, below the Rock. Now, this broadened out clearing considerably. You see. Now you have a whole channel of pertinent terminals, of various kinds – things that the pc has been – and then this goes down to the earliest been-ness – which is the Rock, see. But underlying the Rock we find the goal. You get what the anatomy is. You can draw yourself a little channel here very, very easily, and you would see exactly what we are looking at here.

And these data are very hard to come by, by the way. Here is your – here is the way it might be said to be. There's the Rock at the bottom, here. And then, here's the goal. Now, you see that? See, there's some sort of a channel of livingness which comes down this long line and gets to the Rock and there's the goal. All right.

Now, the goal then lies earlier than the Rock. But the Rock is the first big mass that occurs after this fact. And of course, up this channel of livingness we have all sorts of small valences, you see, or repeating valences. And what I didn't know at that time, and which I found out about the middle of last year, is you actually have two valences like this – one whose force is that direction, and one whose force is against it in that direction. Looks like a dumbbell.

Every once in a while pcs run into these things and they say, "Ron, how did you know?" Well, I looked. And anyway, the – this thing is the basic unit anatomy of the GPM. You have mass A versus mass B. And they are impinged on each other and one is a terminal and one is an oppterm. Referring you to last Tuesday night's lectures.

Therefore, the Rock must have another Rock. Get the idea? The Rock's got another Rock. Now, you have to ask this question about the GPM, see. "How come it stays in place?" "How come it stays in place?" "How come it stays suspended in space?" "In time?" "How come it stays with you?" Well, it must be very carefully balanced against an opposing force. And hence we get this word, "Goals Problem Mass" heard relatively a few months ago. Last autumn, I think.

Why Goals Problem Mass? Well, it is that mass which results in the problem of the terminal versus the oppterm – as a result of the pc having postulated a goal. Now, this inter-
esting proposition could be offered, and we could say that that's how it hangs up so delicately in space. I worked this out synthetically, you know, just on asking this one question of how the devil does it stay there, you know? And it has to be opposing forces, which are in balance with it for the thing to stay in place. So we have these two dumbbells, one against the other – repeated many times in the bank – but each one of them held in very, very critical balance.

The one thing that is missing in Newton's laws in the field of physics that no physics professor – and I think there must be hundreds of thousands of them lecturing on physics throughout the world – has ever seemed to have noticed. There's the law of comparable magnitude. And they violate this. They know them – the data is incomparable all the time, and they give you such an idiocy that when you stamp on the Earth, the Earth moves back to the degree that you move down, you know, relative mass, yes. Well, you know I've gotten out there and taken a look, you know, and it doesn't!

Now, we have the comparable magnitude of the overt. You consider it no overt to swat a fly. Yet flies swat you through disease and other vias, once in a blue moon – but you don't consider that a return of the overt. I don't think that's much of a terminal-opportunity situation, you swatting a fly. You see, the law of comparable magnitudes is violated.

Now, Newton's three laws are only valid in the zone of comparable magnitude. For every action there is an equal and contrary reaction. Well, that isn't necessarily violated, because it does say "equal." But that in itself is the assumption of an absolute which makes the law, heh-heh – a little bit questionable. But, there's the law of acceleration, there's the law of inertia – the tendency of a body to remain at a state of rest or remain in a state of motion, don't you see. All these things are true unless you get forces which are too different – too far apart. You get the idea.

Inertia: The tendency of a body to remain in the state of rest. Well, I think, actually, when a cannonball hits a palm tree splinter, I don't think the palm tree splinter has any law of inertia. Get the idea? I mean, it has no tendency at all to remain at a state of rest. See, it'd be utterly unmeasurable. And it becomes idiotic, see. Drop the Empire State Building on a fly. You see, and then say the fly had a tendency to remain in a state of rest. These things become ridiculous, don't you see?

Now, the size of the basic Rock-opprock is pretty darn big! And these things versus one another contain rather interestingly strong forces. Very strong forces. And they're studied, and pushed in against, and everything is smashed up together, of smaller pairs of these dumbbells. And there's smaller pairs of dumbbells and smaller pairs of dumbbells, and the further the thetan progresses in time from the moment of the assumption of the Rock, then the less force or mass he has to have to consider it force or mass. His consideration of what is force and what is mass, deteriorates. So you get smaller and smaller and smaller and smaller dumbbells. See?

They go from – well, you've seen somebody around, and you've swatted him on the back, you know, in a friendly gesture – you've patted him on the back, you know – just about hardly any – hardly even that, you know, and he says, "Oooww! God! I've broken my ribs!" You know. Well, a slice of carrot, versus a slice of cabbage would appear to him to be insurmountably great and powerful. You get the idea of the size of the dumbbell. It's declined. His
conception of his own force, his ability to handle force, and so forth, and mass, has deterio-
rated. And it's deteriorated down to a point where the dumbbell at the top of this – if we con-
sider that now – is almost microscopically small, one versus the other. And then as we pro-
gress down from the top toward this Rock, we get bigger and bigger dumbbells. A versus Bs, you see. Till we get down to the Rock versus the opprock and we've got it, see, and that's big.

Now, that tells you at once why, when you say to somebody, "All right, that's your
goal – well, why don't you just change your mi-
nd?" See, that's approaching clearing on a
no-gradient. And he can't do it. Why can't he do it? Because his concept of force in the vicin-
ity of the time he postulated this goal, envisioned something being pretty forceful before he
would call it force. And now, he lets out a gentle sigh and thinks he is blowing a furnace
blast, you see. So he can't face that much force. See, he can't face this much force at once as is
contained in the Rock-opprock area which is much earlier in time. Do you follow that?

So, you say to him, "All right. Blow the GPM. Thank you. Well, I guess you failed,
huh? Heh-heh-heh!" Why can't he blow the GPM just like that? Well, it's a decline of force is
the story as the eons have marched on – his concept of what is force has degenerated. In other
words, he doesn't consider that that forceful. He doesn't consider... Once upon a time he con-
sidered motion with an exclamation point, you see. Well, that'd be something on the order of a
meteorite hitting a spaceship. He'd say, "Hey, pretty good! You know? Ha!" And now he
dents the left fender of his car slightly, you see, and "Oh, my God!" you know. That's too
much force, you see?

So the reason he doesn't blow his goal instantly and at once is a very simple reason.
The goal lies before and earlier than a higher idea of force. And he gets into that zone, and he
can't tolerate that much force in that much area, so he cannot confront it. He just can't con-
front that much force. "It's too much for me!" he says.

Now, you might be able to get the forces of this lifetime and audit them very easily.
But as soon as you start chipping back about five or six lifetimes you start running into this
phenomena. You know? I remember my idea of a good way to warm up was to take a horse
like a Percheron, you know, and take ninety-eight or a hundred and ten pounds' worth of ar-
mor and take about a fifteen foot long ash spear and go out in the lists someplace, you know.
And get this horse up to about thirty miles an hour, you know, and let him run head-on into
another guy coming down the course in the other direction at thirty miles an hour. You know?
That was a nice, quiet way to warm up!

Now, the reason why it was spectacular is the people in the grandstand considered that
too much force for them. And the reason one was successful at it, is it did not exceed his idea
of what was forceful. Because that didn't look like all that much impact to him. Why do you
stop such a thing?

Well, after a few centuries of monkeying around this way, you pick yourself up off the
ground and pick the hardware off of yourself, you see, and your head is ringing! You know,
and you say, "You know, I'm just not the man I was once. I think I'll take up judging these
things," you see? [laughs] See, you said, "That's too much force for me," you see?

Once upon a time, this was almost a gag. See, that much foot-pounds of impact – well,
that was just a good way to warm up – you know? Yeah, make you feel kind of alive. And
you deteriorate in your concept of that same thing of, "Good God! How can they stand up to it?"

Similarly racing. On this – at this time on this planet you have many of these ideas, in restimulation, and so forth. You've got racing. It's always coming as a surprise to somebody that he can't stand up to as much force as he thought he could. A car hits a brick wall, or something like this, and he gets his wind knocked out. And the fenders get dented and so forth. He hasn't conceived there was that much force. Well, how does his idea that that isn't very fatal permit him to go into a race where that could be very fatal? Well, it's his misconceptions of the thing. He's measuring track by an earlier-track idea. Follow this?

Now, in the Marcab Confederacy a racing car was a turbine-driven job and they went on for thousands of years. I think there was ten or twelve thousand years. They always had the same race cars, same races, everything. They didn't believe in progress. And they went about two hundred and seventy-five miles an hour according to our present standards. They went at a high whine. And they used to have casualties. Those things would go into a brick wall or one of the concrete ramparts or something like that, and they'd have a casualty. They'd have to take the pilot out and take him to the hospital tent. See, take the driver out of that and take him to the hospital tent to patch him up.

Now, that is within the last forty thousand years. You get how rapidly one's concept of mass can deteriorate. Because – I mention that because some of you have got Marcab on your tracks. A lot of you people run into bits and pieces of the racetracks of Marcab. Well, take a look at it – at how much force, you see? Two hundred and seventy-five miles an hour in a turbine-driven car hitting a concrete wall and having to go to the hospital tent. Hundred and ten miles an hour – caroming off of a brick wall or a fence and getting buried. That's different ideas. See, it's a deterioration of the idea of force.

Now, that doesn't say that the thetan sometimes miraculously suddenly can't regain his older ideas of how much force he can tolerate. But, it does say that on the average there's a general deterioration. So when you ask a thetan to go on the earliest track, find his goal, be right there at the point of his goal. "All right, now you see that, now just change your mind. Thank you," and it blows the whole bank – you see now why that doesn't work? See, you've asked him to go and climb in to a five hundred mile an hour racing car, hit a concrete wall and live. That's the way it looks to him. He says, "What! Ha-ha! Ho-ho! You silly? You must think I'm stupid!"

Well, at the time he made up this thing it'd been something on the order of if he went at the speed of a meteor and you hit an asteroid – well, that was a good way to acquire mass! See? About the time he was making this goal up that was his idea of mass, you see. Impact, force – way up there!

Well, you want to know what you're up against in clearing somebody. You're up against a concept of mass and force relative to their experiences and bad experiences. And there isn't even any name for this. We have randomness, its plus or minus motion, can be tolerated by the individual. And it comes under the heading of randomness. But it would also be an extension of this thing called randomness. It'd be plus or minus force the individual could tolerate, and plus or minus mass.
How much mass is mass? And early on the track he said, "Oh, well, that's a pretty good-sized mass there," and he points to a big planet. "Yeah, that's a nice piece of mest. You know? That's nice. Just about my size!" And we find this same thetan late on the track, and she can handle a bonbon very well. Say, "What's – what's – what's your idea of mass?" and person says, "Ah, that – that bonbon, that's very nice, very nice piece of mass, there." Or a diamond ring – very nice mass.

Now, if you don't think people's ideas of mass deteriorate rather rapidly, you should look at the disappearance of solid coinery in the bigger denominations – gold pieces, that sort of thing. That isn't all, it isn't just the scarcity of gold – somebody could have dreamed up something to solve this, I'm sure. But, it's another thing. It's another thing. Do you know that they used to make silver pieces in very outrageously large sizes. I saw one time, I stepped off the plane, to get a breather, I think, in Salisbury. And somebody at the lunch counter was fooling around, I think, with a five-shilling coin. It was an interesting looking coin! It was a monstrous coin. It was very thick, and it was very soft, and it was solid silver, and it was way back from the old days when they used to dig it out of a vein down there, and throw it in the mold, and hope it was legal tender, you know?

But that was at one time a nice – well it was money! It was valuable, it could buy something. Well obviously it's too much mass, now. That's obviously too much coin. Because that coin – although five shillings doesn't buy now anything it would have bought then – why the people take two much smaller coins to make up that five shilling, by preference. Don't you see?

You get the deterioration of the monetary idea. Well, you can see this almost anyplace around. There's some signs of this thing.

Now, what's this add up to? It adds up to why you can't immediately, rapidly and right now clear somebody. And why some cases clear easily, and some cases clear hard. And this is the answer to that. I can guarantee this to you, now – that is the answer. It isn't anything else.

This case has a very – still got a very massy idea of mass, you know? You know, he says, "Well, yeah, a nice piece of mass, you know, a mountain." Well he clears pretty easily, see? But this next case says, "Well, a nice piece of mass – take that dirty coin out of here!" He's inverted on the idea of mass. Can't look at it. Doesn't want to have anything to do with it.

Also, it might surprise you, if you haven't thought of it – that the idea of pain as an undesirable commodity – pain as an undesirable commodity is a late idea! Pain is not uniformly an undesirable commodity on the whole track. It is simply another sensation!

Now, pain tends to increase as an unwanted, feared and undesirable thing as one's concept of mass and force deteriorates. There's a direct relationship between these two things. Well, let me – let me state this properly, mathematically. It's an inverse relation. So the more a person fears pain and shudders away from pain, why, the less mass and force he can tolerate. In other words, this idea of pain.

Pain is basically a sensation of impact. That's basically what it is. You seldom have pain without having some separation of impact, or collision of impact, or something like that.
Pain is most normally in this line. Although pain is a heat-cold-electrical sensation. It is that with which force begins to be greeted as the individual's idea of force deteriorates.

Well, let's take in one lifetime. At the age of sixteen, fast enough is ninety miles an hour. He considers that's pretty good. Ninety miles an hour – that's fine with him. At the age of twenty-five – fifty-five, sixty, that is fast enough – and that's fine with him. Thirty-five on – forty. That's pretty fast – that's fast enough. And about the age of seventy – you get the character who causes all the accidents by going down the middle of the road at fifteen!

Now, people may think they want bigger mass, but they tend to compensate for it with slower speed. So there is also a speed-mass ratio of tolerance. You can have a big mass if it goes awful slow. Therefore, you see the fellow in his Cadillac going twenty miles an hour on the turnpike, you know. You see this quite a bit, you know. Massive car – very tiny speeds, so on. The car would be totally undesirable to him, you see, the speed-mass ratio would be too – have too high a figure if he drove that ear at a proper speed. Thirty-five, forty, fifty – something like this. Ha-ha! That's too much for him, man!

Also, you get the popularity of small cars and the popularity of scooters, motorbikes – but not motorbikes that go fast, but scooters that go slow. And you find those things are getting – they have a popularity. Well, they may or may not have a practicality – they do furnish transportation at very, very low petrol and gas cost.

But remember something. You're actually increasing the liability of an impact, see? There's something going astray here, because the percentage of accidents that occur on scooters – I'm not condemning anybody's scooter, I'd just as soon ride scooters. I'd preferably prefer TT Model 650s however – but the deterioration of his idea of what mass is good mass actually puts him in danger, see? So it isn't reasonable. Sense and logic have nothing to do with this. It is simply the concept of how much mass is mass, and how much, and so on – and they will do stupid things!

And you want to know how stupid they can get? About 400 A.D., the Roman legions – because the armor was too heavy – had ceased to practice with practice armor, which was always heavier. And they have ceased to use practice armor of any kind. It was always heavier than battle armor, don't you see? Nobody could get them to practice with it anymore. And fifty, seventy-five years later – we find these same legions going into battle having thrown away their armor! They're nuts! See. They no longer can strike an accurate blow, and here they don't even defend themselves, don't you see?

So, frankly what happens is – their concept of the stronger higher forces diminishes and disappears. See, it fades out. They no longer have any concept of these forces. These forces are beyond their concept. Well, similarly with pain, an individual readily forgets how much pain, pain can hurt. You know, how much pain can pain be?

You find accident victims very often are surprised as hell at how hard it hurts! See? Well, similarly, they're just surprised as the devil when that much mass occurs. That's too much mass, see. They get the idea. In other words, not only does the ability to experience it deteriorate – but the ability to conceive it deteriorates. So eventually they start doing stupid things.
See, they're trying to avoid pain, so they get hurt all the time. That's your accident-prone. They're no longer able to conceive the mass, they're no longer able to conceive the force, and they're always being surprised at the pain. And it doesn't last in their minds any time duration at all, so they get hurt again – and they get... And that – sometimes these people will explain to you the chain of circumstances by which they were hurt. And man, it hasn't anything to do with what happened. You stand there with your jaw dropped.

You've already made a leg up on this before you came to Saint Hill, actually. Because all the time you've been in processing, your tolerance of mass and force has been increasing. And because you can wipe out pain in yourself with an assist, and you've had experiences of this particular kind – your respect for it, and your awe of it is diminishing. Well, you're just climbing back up the scale. So I'm actually talking about something – a route you have been on for some time.

Now, it'd be just a little bit difficult for you to immediately and directly then, catch up with what the (quote) man in the street, (unquote) has as a concept of pain, force and mass. See? What does he think these things are? What is he willing to handle? What does he conceive of as actual force?

Actual mass? See? And so you see him going on doing silly, stupid things. And one of your biggest protests against the world around you is people are doing such stupid, silly things! They're doing very silly things – they do very silly things with force – they do very silly things with mass.

You've got an instance right this moment, (although I told Ron I wasn't going to say anything about the world situation), you've got this very moment * – and have had for a dozen years or more – oh, more than that, twenty years, force which is totally beyond the concept [with a trembling voice:] of the world's greatest leaders. You have to say that reverently. [laughter] But they don't know what they've got their paws on! See?

This you read with amazement how they compare nuclear fission to a hundred-thousand-ton bomb of TNT or something – or sixty-two TNT bombs, or groping around, you see, within something that they can call a textbook, you see, response of World War II. Well, that hasn't anything to do with it! Because that force and mass is delivered in a split second. And because it is delivered in such a small moment of time – it has enormous impact value which is upwards through millions of times the impact value of TNT. But, you know, not even in their textbooks have I seen them sort that fact out. They don't adequately sort it out.

You see, actually the force increases as the time decreases. Because force is always measured in units of time. So if you have milliseconds of time in which a force is delivered, you see – you can't use force without a reference to time – just that – by definition that's what force is. So, the shorter the time period of the force delivery, why the greater the impact. You see the greater the actual force. I'm using very clumsy words, because force does contain time, don't you see?

* Editor's note: This refers to the Cuba Crisis which reached its climax in the late October of 1962
See, you can't say that the smaller amount of time in which that force is delivered, you'd have to say the foot-pounds are delivered, see. You deliver a thousand foot-pounds, you deliver a thousand foot-pounds in an hour, and all you are doing is driving uptown in your car. See? Something like that. And you deliver it in five minutes, and you're probably pushing over a brick wall or something. And you deliver it something on the order of a half a second – you're getting up around naval gunfire. See that's – well that's a thousand foot-pounds, don't you see? So this distributed out over a period of time becomes confrontable. But as it is reduced in its period of time, becomes un-confrontable.

And nuclear fission has done just that. There is no such thing as comparing it to a thousand TNT bombs. Exploded at what frequency? How often? In what mass? Because they don't even go off as fast as nuclear fission. This is very interesting, because they've just totally avoided this whole idea. So they don't know what to do with this. They haven't any idea of what to do with all this force.

Here's a head of state, and he has these tremendous forces, and these tremendous striking powers, and all that sort of thing – and he says, "Well, go shoot me some gnats." See, do something like that with it. He doesn't know. He's groping. Don't you see?

The distribution of this force – what would happen to it? You'd find all sorts of arguments. They take great – great pat on the back. They pat themselves on the back as realists. They say, "Well, it wouldn't crack earth's crust. If we exploded a thousand of these things over Russia – it wouldn't do anything much. We hope. We guess." Well, I frankly believe that any time they start using this stuff at any great range, or action, and so forth – I firmly believe that it'd be just exactly like firing a shotgun with the breech half-closed. The guy firing it is going to get just about as much as anything being shot at. You know, they're up there to a force that they can't live with having released.

So that's why you have these brothers around conference tables discussing and arguing. And they're trying to play chess with this stuff, you know? You watch this, you know. Well it isn't that these are great men that know what they're doing – and guiding destinies all properly – it's just that they don't know what game they're in, see? This is going to surprise them! They're going to get a very great surprise! War usually surprises such people.

You're wondering whether I think there will be a nuclear war in the next five minutes. Well, I'm not going on a vacation on the second of November. I just looked at the old crystal ball, and it looks sort of explosive up there around the twelfth or thirteenth, so I thought, well, I'll go later. Oh, I don't think they'll do anything very desperate. I'm just giving you an idea. These birds – the forces involved are actually sufficient and adequate – if they had any concept of what they're doing – to bring them at once to a conference table, to arrange to disband the lot! You get the idea?

Let's take it all down, let's put it in a hole someplace – and make fuel out of it or something – and they'd just be pals, you see, about this whole thing, you know. And, no no, they're playing games with it, you know. "I'll shoot you if you shoot me," you know. God! That's crazy, you know? Because leader A fires at leader B, the same shot is going to take leader A's head off.
Yeah, I often wonder if they don't think of themselves as the whole world in flames, and the government building untouched. This is marvelous to behold, don't you see? But they're just dealing with greater force than they have any concept of. See, and they're actually – still want to play politics. Well only mad men would do something like that.

I had a good title a few years ago; I was going to write a book: The Madmen in Charge. Never got around to it. But, still may do it. Sounds like it might be an interesting book.

Washington, by the way, its evacuation plans change every month or so. But, apparently everybody in the Navy Department is supposed to go get their car in the parking lot and then drive past the entrance to the Navy Department. And then the people in the entrance to the Navy Department are supposed to come out of the entrance and they're supposed to get in these cars, and then they're supposed to go to an area nearby. And then they're supposed to set up something there. I'm not quite sure – I think the plan fades out before they get to this new area. We're going to have a queue of two thousand cars, or five thousand cars, or fifteen thousand cars – strung out in front of a single entrance. Aw, they'd just never make it, that's all.

This deteriorated, these civil defense plans deteriorated to something very amusing. I think not too long ago, somebody from civil defense headquarters in Washington, from writing books, as to what we were supposed to do – I saw their last set of plans. This is very interesting. They move things from one section of town to another section of town, compared to which section of town was damaged by the bombs. Yeah! And their – the hospital, where they're going to bring all the casualties to is in the middle of town! [laughter]

This is just insane raving, don't you see? I was very much amused at all this, but the denouement of this – having been issued many copies of this from time to time and changing plans, and so forth – why, the last one I heard from FCDC is the civil defense officials had come around and called – I think it was on the Org Sec – and had asked him if we had any civil defense plans! Did we have any plans? He didn't want them for the town – apparently the policy now is for every organization to have its own plans for civil defense. You get the deterioration into the total individuation of it all, see. Now everybody's supposed to have a separate set of plans. And man, that'll really look good!

You get around Washington, you know, some of the kids around Washington, they really laugh about this, because they go out along the highway – I think they've taken most of these signs down. I didn't see them when I was over there last month. I didn't see a one! But I wasn't looking very hard, either. But they used to have signs, and you drive outside the District of Columbia in any direction and it said "In time of national emergency," (or something like this) "this highway will be closed to civilian traffic." Only it was on all highways, and on all roads – on all sides of the district. Marvelous! In other words, they cannot plan in the face of that much force, do you see? They become totally illogical in the face of that much force. There is no planning involved beyond their concept or ability.

Telephone call this afternoon from the States, somebody remarked that people are tearing around madly in all directions buying supplies of food and digging holes in the ground and they're having a ball! They're having a ball. Think probably the safest place in the world is probably Washington DC. Probably very safe – because, you see, if their level of confront
is that poor – it's very doubtful if anybody will confront Washington or Moscow. Because
these'd be the two places you would have to confront to solve the situation. But I don't think
the war will ever come up to confronting either place! I think we're in more danger. I think
they will probably find out that it was England and South Africa that started the whole Cuban
invasion. [laughter] They'll get something figured out!

Therefore, you are baffled very often at somebody's approach to his (quote) "Prob-
lems" in life. What he will do as a solution to his Problems, and how this sounds logical to
this person, you don't dig, see. You listen to him, you hear words – but it doesn't make any
sense! Now, let's see, if he just sends his wife, who's forty, to the university and if he himself
will take up skin diving, why, somehow his overdraft at the bank will all work out. And man,
you'll hear some wild ones! Now, what's the matter with this guy? Well, his problems contain
force. And he cannot confront either using or receiving that much force, so he simply neglects
it.

Now it's this factor alone, on which the governments of the world are constructed to-
day – that people cannot conceive force. You realize, if you break the law flagrantly in any
large country – you realize that the entirety of the army, the navy, the air force, and the whole
police, the entire judiciary, and through newspapers and so forth, public opinion, meaning the
rest of the population – can be totally turned against a single individual. You realize it's
rigged that way? Well how could it possibly get rigged that way? It's because nobody con-
ceives that it's rigged that way. They say, "Well, I have the power of vote, and I am a free
citizen," and you go on hearing these yap, yap, yaps, see. And then all of a sudden this indi-
vidual says, "No! I won't pay any taxes." Well man, they make short work out of that!

Well, what if this individual got themselves a machine gun emplacement and sat down
and spoke back in kind? What do you think would happen? And then supposing he got two or
three other means of defense and got a defense in depth, and so forth? How much troops do
you think would eventually be piled up against this individual before he finally surrendered?
It would be the whole force of the country, wouldn't it? Well, every citizen in a country is
versus the force of that country. This is not democracy – this is just blindness. Who ever got
around to figuring out a form of government like that? It has no freedom involved, it's just an
overwhelm – a total overwhelm.

Ireland didn't quite buy this. Ireland had an interesting thing and – in its government.
You can sue personally any individual in the government who does anything you don't like.
Now, of course, that rather returns it to a democratic process. Cop gives you a parking ticket,
honest! He's just in trouble if he doesn't have witnesses. Because he can't enforce the collec-
tion or the fining of that ticket if you contest it. Because you could sue him for the full value
of the fine if you won your case. You don't get a very militant police force this way. They're
more angry than otherwise. But all right.

In Washington, this might theoretically apply, but in Washington you should realize
that about seventy-five warrants a week are requested of the federal district courts against
government officials for non-constitutional and illegal acts in the performance of their duty.
Just about seventy-five a week are requested by the public in that one area of Washington.
And to date, the district court has never issued one. They simply refuse to issue. It just stops right there. They just blanketly refuse to issue those warrants.

That means if a government official came in, pulled out a gun, killed everybody dead in the house – this is the *ne plus ultra* on the thing – and some relative wanted him indicted for murder, it wouldn't happen. That is the government of Russia today. So you see how governments deteriorate? That's not the government of the US or England today – but it's the government of another country today. They do walk in and kill everybody in the house every now and then, and drag somebody off to prison. Nobody ever hears of them again. And there's no recourse. Nobody can say a word. You have to – in England and the United States, we generally keep a propaganda fan going of some kind or another. It's just propaganda. It's just talk – against the official. We back him down. We back him down. We always got to keep him more or less convinced that he hasn't got any rights. See? You've got to keep snarling. You got to make him trouble. See, you've got to do this, you got to do that. The English have got this down to a fine art!

That's how you keep a government from finally caving in and falling all over you, you see, and dragging you off in the middle of the night, see. But the truth of the matter is there's absolutely nothing that restrains them from doing it, except tradition. Rather thin stuff, tradition, isn't it? Yes, when I'm faced with machine guns and cannon and troops with fixed bayonets – there's nothing like having only tradition to hold my position, I always say. It's so thick – so protective.

Every once in a while, though, you hear of somebody getting very satisfactory – a very satisfactory bang out of dying like a hero for his country on the gallows, or for the people, or something like that. Well, I want to point something out to you – he died on the gallows. Cost him a body to make that remark. And at one body per remark, it gets expensive! [laughter, laughs]

Well, there I've pointed out to you on upper dynamics the decline of force till force becomes invisible to the person. He doesn't recognize that the force is there. Well, as an individual goes on from the time of the goal through the Rock area and the opposing masses, and he's terminals, and he's faced with oppters – and all this gets crushed in and the counter-forces and that sort of thing – the whole thing eventually vanishes. He can't see any part of it anymore. He doesn't even know it's there. See? It doesn't exist! And you tell him to try to confront it and he flinches. Well, it's interesting that he flinches from nothing.

The modern psychologist can give you a very good example of this. He says there's no such thing as a mental image picture. Occasionally you'll run across in his text some mention of it. I ran across a mention of it one time, and he said children and morons sometimes have them. Yeah, that's fascinating! The man is below observing them. He's never observed them professionally until it's walked into his science, see, as a fact, that they don't exist.

I preserved carefully the last copy off the publishing company's line – it was the textbook on psychology for the University of Chicago, I think. And it moved off of the assembly bookbinding line – as the first copy of *Dianetics: The Modern Science of Mental Health* moved off that line. See? The last copy of that run was followed by the first copy of *Dianetics: Modern Science of Mental Health*. I picked the book off and said to the publisher – (the
binding was not well pressed or anything), and I picked this psychology textbook off, (actually it was, right on the assembly lines, on the belt, you know) – and I picked it off and I said to the publisher, "Look, let me have this, will you?" I said, "Because after this they're going to be writing this book into their newer texts, and I want to know what exactly psychology was." And he said, "Oh, yeah! Well, you can have a copy of it, Ron." So I kept it. And I've still got it.

It's rather fascinating. Because in the last twelve years they have taken different looks at things – and they have discovered all sorts of things, prenatal influences and that sort of thing, and they will discover more and more as time goes on. But what does it depend on, that series of discoveries? An improvement of their own ability to look. So you get them to confront a little bit more and a little bit more – and they can't confront what you can confront – but they can confront a little bit more, don't you see?

Well, their gradient scale of confront is what you are up against, in handling any pc toward clearing. And isn't enough to just tell him, confront it and confront it and confront it and confront it and confront it – because every now and then you tell him to confront it and something knocks his silly head off – and he knows better next time. Because you've pushed him into an area of too much force. Too much mass, too much force, it's getting too real to him. And he backs out.

So the study of clearing – now that one knows the mechanics of clearing, and what the bank apparently contains and looks like – brings us to the realization – not to the startling new data, but it brings us to the realization that a gradient scale of confronting is the only way we ever clear anybody. The improvement, of the ability of the pc to confront then becomes a very pertinent point in clearing. And that too cannot be done directly, because you have to find out what he can confront.

And fortunately if you – if you just asked him to confront, and confront something more, and confront something more, why he, theoretically, you see, would come up with his goal in the end, and he would be Clear, and so forth. But let me point out to you, this has never happened, and it's never likely to happen because there's already too much there for him to confront. See, he's already above the confront level.

So this meter or any variety of meter gives you – this is what this meter does, oddly enough, that does – it's unsuspected by you unless at least you take a look at it – it gives you the highest, toughest confront that the pc is capable of at that given moment. And it's a measurement of confronting.

So if it took you ten thousand hours on gradient scale of confronting to clear somebody – you wouldn't but, let's say that you did – just ran some confront process for ten thousand hours, maybe you'd get a Clear. Who knows?

This, to make clearing factual and fast within reason – so that you get it done now and then and once in a while – you've got to be able to pick up the highest level of confront that the individual is capable of, repetitively. In other words, you've got to give him everything he can confront right now. And then everything he can confront right now. And then everything he can now confront right now. Got the idea? And his confronting has got to be beefed up and
improved to that degree. And a meter selects out for you, the auditor, to find something the pc can confront.

And oddly enough – this is just luck on our part – we have an instrument which leads us straight down this channel without any divergences, by giving us the mostest he can confront now. Now the most he can confront now, see? And by these great big bites of increased confront, he gets over the idea that he can't confront. He actually would confront no more than you can find reading on the meter – he'll confront no more than you can find on a meter.

If you can't find it on the meter, there are only two reasons why you can't find it on the meter. And the first reason is, he can't confront it, and the second reason, could be, that you just haven't found it. In other words you didn't get anything on the meter, so of course he can't confront anything on the meter.

Every once in a while you'll be busily clearing somebody, and, suddenly you'll see that thing go slam, slam, slam, slam, slam! You're running lines, see? And you'll see it go slam, slam, slam, slam! And you sit there and utter the command, one of two things happen – either the slam dwindles, or it vanishes. Now, if it dwindles, all right. If it just vanishes, you ask the pc, "What'd you do?" He says, "Well, heh, hah-heh-heh-hah was a little bit too hot for me, ha! Oh, I'm sorry, I backed out of that!" See, they didn't know what they were getting into, and it made them nervy, and they backed out.

Now, that doesn't mean that they won't go back there, or won't mean that your commands and so forth, just ordinary process of doing lines, won't bring them back into the channel again. But what is this slam, slam, slam, slam you see on the meter? Actually, it is force hitting motionlessness. There's a motionlessness in the bank that is being impinged upon by forces. And the direction of flow, back and forth, and motion of particles in the vicinity of that motionlessness apparently is what gives you the phenomenon of a rock slam. In other words it's something that's changing polarities at such great speed – from plus to minus, and back and forth, and so forth – that it causes direction of potential changes, and so forth. So the meter doesn't know what it's measuring and it's measuring high-low-medium-high-low-medium-high-low-medium, see? And it'll go badada-badada-dadada-dadada-dadada-dadada, see?

You could say that you're coming down the exact meeting points of the terminal and oppterm. You're measuring their exact collision points. So that's where you'd have maximal force with minimal motion of the obstacles. So these things start flying apart when you start disturbing this balance of potential between the two of them. And you eventually get down, blow the Rock, and – you hear the Rock go kind of... It'll go – I don't mean that, actually. The pc says, "Something went!" you know.

Once in a while, a couple of pieces of something goes, and you get fooled. One dumbbell goes, well, that wasn't the Rock, see. There'll be another one blow and there'll be these other things happen. But he gets on down below, and he finally hits his goal, and bang, it goes clear, and it goes kind of pop and there it was and that was why I made up my mind, and gee-whiz. Give him a bit of a Prepcheck, get rid of the fragments, and that's that, he's Clear. You never do it without following them down the line on a meter, and you'd never do it with-
out the maximal speed of improving his ability to confront. That has to be steep. As I say, if you just took it, at a slow poke, you might be ten thousand hours in the process before you made it. But you hit it on the high line, you come right straight down the rock slam channel, it goes right on down to the Rock, the Rock and opprock, and you've all of a sudden have got it the whole way, you're down to basic, that blows, the rest of it tends to fly apart and that is that.

You understand now, why this is important? And what you're doing actually in clearing, of course this is – I give you this mainly as a – allegory, and so forth. But actually, that's a pretty accurate graphing of the way it is. Under that will lie another package and another GPM.

Somebody said to me, "Why don't you run the assertion that goes just before the goal?" He didn't realize he was saying, "Why don't you run the second goal you're going to find on the pc before you run the first goal you find on the pc?" Why doesn't the second goal register? Ha-ha! It can't! How can it? The guy's confront isn't up to seeing the first goal. Well, the second goal is just that much stronger and that much bigger. So you have to run the goals off by a gradient of confront – and you run down to these rocks by a gradient of confront. You understand then?

So you got a whole series of these things, one after the other, of these whole maps of a GPM, see. And eventually, when you get to that, you'll just raise the level of confront all out of proportion. That's why your pc gets to feeling better, why your pc looks better, so forth. The pc is much more capable of confronting force, much more capable of withstanding pain, and much more capable of observing and conceiving mass. Okay?

*Audience: Mm-hm.*

Thank you!
3GA Criss Cross
Secondary Prehav Scale

A lecture given on 25 October 1962

All right. This is lecture two, Saint Hill Special Briefing Course, October 25, AD 12.

Now, the experimental material – I've given you very factual material so far in this lecture series tonight. The experimental material consists of, how do we find an entrance to this channel that leads to the Rock and the goal?

Now, we should recognize that the pc will very often conceive he has seen and blown the Rock because he has seen a couple of dumbbell – you know, these two spheres fly off. Very often these spheres fly off and he doesn't even observe them because he's inside the mass and there's an impenetrable barrier between himself and the outside of the mass. These things very often fly off the outside of the mass and he doesn't see them, but he happens to be located in a fortuitous position and he sees a pair of them blow off. Well, he's already progressing very well down the channel if he sees this phenomenon. And they – nobody has reported to me watching the Rock go, which I consider is very interesting that no report has existed on it and that is why you'll find me continuously working with lines and telling you that you have to finish off clearing. You see? Because there's more there to blow.

Now, you should recognize this channel on your meter, looks like a whole series of rock slams of high agitation, but in actual fact is not a series of rock slams. That's just your meter manifestation, don't you see?

It's a whole series of these dumbbells, you see, with their opposing forces.

It's a whole series of these things, don't you see? And looking at them in proportion as you would go down, they are not inverted and getting smaller; they are in actual fact getting bigger. See, they're not growing as you process the person, they simply – the earlier it is on the track, the bigger they are. You see? So you enter it, blowing small pairs, and wind up blowing big ones. See?

Now, it requires – it requires a pretty good faith in the auditor on the part of the pc in order to list.

Why? Well, actually, the pc's ability to confront is: pc plus auditor versus the bank. I give you The Original Thesis. And when you've got the auditor plus the bank versus the pc, he's got too much to confront in present time and he doesn't do any confronting.

The length of time in listing is directly – inversely proportional to skill of auditing. In other words the greater and smoother the auditing skill, why, the less time, theoretically, it
would take in listing, because the pc's ability to confront is rising because he feels safe and able and so forth, under the guidance of this auditor. Therefore, you never jump a pc; you handle the pc very smoothly and very permissively in listing, particularly.

Too overwhelming an auditor activity while trying to find items at the beginning of a case, of course, will seal off finding any items.

Now, that is said with reservations because when you think of this, most of you right here, right now, have an adequate auditing presence and handling of the pc in order to achieve this fact. I'm not talking about anything that is totally beyond you. But, the better your auditing presence and ability to handle the pc, the easier it is for the pc to find items. Don't you see? Because you see, his ability to confront is raised by the fact that somebody's helping him confront.

Now, help very easily goes on an inversion. It gets covert help which is actually destructive. There's real help high on the scale and of course like all things it has its lower-scale mockery. You see this in psychoanalism. You do. That's a lower-scale mockery of help. They tell the person all about it. They're helping him out all right – only they don't see this as anything bad, that's just a built-in procedure. Well, we know that's quite destructive. That's evaluation and so forth.

So the pc has really got to be helped. In other words he's got to be guided into areas where he can confront things and find out what they are. He's got to be guided into areas where he can confront things and where he can find out what they are. But he's got to be guided into those areas – not shoved, beaten, pummeled.

Now, what area are you guiding him into? You're guiding him into this channel toward the Rock when you're doing it by rock slam. You're just guiding him in that direction and he goes in that direction.

And the first items you get are not the biggest items of the bank, but they're the items that the pc finds it feasible to confront at this particular time. At this stage of his case he can confront those items.

Now, you find one item, he's finally – says, "Ha-ha! What do you know!" you know? Part of his cognition, which he never speaks, is, "Hey, you know, I can look at this and think about it, you know?" It's a locked out area. It's been a locked out area to him. And he all of a sudden finds, "Well, hey, what do you know! I can get into that valence; I can look at that valence. Ha-ha! It isn't as dangerous as I thought." And that's sort of part of his cognition. So he tells you all about it, he's very interested in it, you know? "Here I am, standing in the middle of this powerhouse with a million volts flying all around me and look at-look-look at me, I can talk to you and I can think in here. Ha-ha!" You know? There's a bit of triumph involved in this. Don't you see? Because always before he has established this item at the level of reality. His last intimate acquaintance with this item was a dim memory of how awful it was in real life. So therefore, he doesn't want very much to do with it. Now, he finds that the item can be confronted in the bank, just as you get somebody – you start him in through the beginning of the engram, let me put it this way – start him in at the beginning of the engram and he – he protests, "Heh-heh-heh-heh-heh. Go through that – oh, no, man! Go through that opera... Oh, no! Ha-ha-ha, not me! Uh-huh, not me!"
And it takes a little bit of skill to get him in there and get him going through this thing. And he runs through it and the somatics run off and you do a smooth job of auditing, he eventually winds up, "Ha-ha! What do you know! That wasn't anything." You know, got the somatic, confronted the thing, gee, what do you know! You get the reaction, as you – you probably had this. Ask somebody to look at something in the bank and they say, "Oh, I'm not so sure about that. Oh, no way." Most pcs you get are that way about their whole case. See?

So you, the auditor, are overcoming this first reluctance and that is the highest level of your skill – overcoming that first reluctance to look.

There are all sorts of gradients we've had in the past on this. We stress this much harder in the past than we have these days. We kind of take it for granted that an auditor will be able to persuade somebody to look. But actually, there are all kinds of mechanisms which – you can do this.

Remember "Look at me – who am I?" That was your first auditor process. "Look at me. Who am I?" And you get pcs that are having a bad time, why they eventually come up in their level of confront and they say, "Ha-ha! My auditor." You know, first recognition, you know? You were Aunt Grace and Uncle Bill and you were almost anybody. You were a policeman and – God almighty, what you weren't! And then they eventually look at you, you know, and they say, "my auditor," and you thought that was a good time to begin the auditing session.

Actually we've undercut this in many ways. We don't demand that he confront the auditor by "Look at me. Who am I?" We just sort of say, "Well, if you'll not be too uneasy with me I will show you a piece of the bank you can confront." You see?

Now, what can he confront? Well, he'll confront what he – what registers on the meter. It doesn't register on the meter, he won't confront it. Now, an example of this in your assessments, an example of this – and a very good example – is the fact that early in auditing your pc will put items on his list which turn out not to be the item. Has no cognitions or anything on it; they're just part of the list. And now we find an item, and then we find another item – we're still listing on more items, you see – and we get down and maybe with the third item or something like this, we find as one of the pc's items something he put on the first list. See? Now, this suddenly is his item, you know? "A black bear." He says, "Ha-ha! Black bear. Oh, yes! I was down in camp one time and I all of a sudden – so and so and so and so on, and yeah, oh, they've been terrible to me – and so on, and that's probably why I have a craving for sweets, you know? I often think of that and I get – catch myself every once in a while doing this on tablecloths and that sort of thing. Yeah, it's probably right. A black bear. What do you – ha, well, a black bear – well, that's funny."

Why didn't this happen with the first list? You know, he put it down on the first list, didn't he? Well, why didn't we get it on the first list? No, we got something else. We probably got "a teddy bear." In other words, the more items we find the more the pc can confront. See, it's his state of mind versus the actual mechanics of the bank.

Now, many philosophic schools of the past have erred in trying to say that it is 100 percent state of mind and that there is nothing else. Well, where are these guys on the scale of confront? See? Well, let me tell you that these things are. They're not imaginary, they are.
Don't you see? One of your biggest arguments you will run into with some dean of psychology or something like this, when you're talking about it, is his insistence on the imaginary character, what you're handling. The fantasy of this or "Hubbard's fantasies about these things" or something like that, you know? They're totally unreal to him.

Well, in the field of, well, Christian Science, gives you a ne plus ultra on this. Wow! "All is mind and it's nothing and the physical universe is nothing and there is no more of that." Don't you see? Well, look, look: the thing is, see? There is something in the bank. You see? It isn't that the pc gets afraid of biting it so that it bites him. If you were to shove him in at it hard, it'd bite. You understand?

You got the same thing as when you shove somebody into the tiger's cage and he keeps – if you were of this extraction of thought, this just "all is mind and there isn't anything else," you know, "there is no world; there is no mind; all engrams are really just imaginary. Ridges, you see, don't exist, these dumbbells Ron is talking about are just conceptual things."

You get that, all that kind of thing.

Supposing you had that frame of mind as you had this poor "Joe" outside of a tiger's cage? And you said, "Well now, I'm going to throw you in the cage."

And he says, "You-go-gonna-go-gonna throw me in the cage?"

And you say, "Yes, yes – it's merely illusion. Tigers are just illusion, you know? There's – they're really not real."

And he says, "Well, looks awful damn real to me!"

And you say, "Well, just, just calm yourself now, calm yourself and just realize that if you have faith, you have faith, now, why you can just go into that cage, because you see, tigers really don't exist. You see, the bars here are just an illusion and so forth and I'm just going to open the door – and the door, that's an illusion, too. And supposing you did lose a body, a body is just an illusion of one kind or another. So what are you – what are you raising so much fuss about?"

And you finally sell this poor Joe, you see, on the idea that there is no tiger, there is no tiger cage, it's not dangerous, you get the door open, you pitch him in. There's a large snarl and a piercing scream. That'll teach him to buy your brand of religion, you see? He got et.

And somewhere up the track we find it as an engram. See? It even made a real engram. [laughter]

Now supposing if he had an auditor sitting there, supposing this had happened to him, he'd been persuaded on the not-is-ness of it all, and supposing he came up the track and got audited by an auditor, said "Now, well, now, there really isn't anything in the bank and this is just illusory and there is – really isn't anything there that bites, you see, and you can go into this with perfect bravery, and because there's just nothing there, you see? That's all ..." so on. You throw him into this thing over his head, with a terrible insistence that he do this, that, or the other thing – and it bites! Don't you see? And this disillusions him. He's got his second disillusion.
The truth of the matter is, the meter is your best sorting out mechanism of this. Your meter won't give you something the pc can't confront. Well, the reason it can't give you – it won't give you something he can't confront is kind of interesting, because if he's not in the vicinity of it, it won't read. See, it's kind of an idiotic reason. You can't enter buildings unless there are buildings there to enter. Don't you see? Well, you have a fair guarantee that the pc can walk in that door with impunity if it will read nicely on the meter.

Now, a slam on the meter is the mostest confrontingness that he can do at the moment. So the first slam that you get on the pc is at one level of ability to confront the bank. Then you find a second item – that's another new increased ability, by having been increased by finding the first one and he'll find a bit more, and the next one up the line he'll find a bit more he can confront, don't you see? I mean, this new thing that he can confront is bigger and more beefy and more powerful than the first two, you see? And then the fourth one will be bigger and beefier and more powerful, you see. You see how it goes?

And it – this individual is actually increasing, and oddly enough he's being met halfway because the bank that's there to confront is decreasing. See? So it makes a very happy combination. Your pc doesn't have to grow nine feet tall all that fast. See? It's good enough to be six-foot tall and look at a six-foot bank. Because then your pc is, next time is going to be six foot one, and the bank is going to be five feet eleven. Don't you see? You already unsettled this balance. And then he's six foot two and the bank is five feet ten. You see how you're approaching this?

So a successful discovery of an item that the pc is permitted to cognite on is marvelous. Your Problems Intensives are absolutely phenomenal because the pc finds out he can confront this later section of his life with equanimity. He discovers that. He discovers he doesn't have to handle it with a crush and a protest and a this and a that and the other way, see? The Problems Intensive is a very good gradient on this sort of thing. But understand, you're not asking him to confront anything very tough.

When you start clearing him by finding items and then finding his goal, you're asking him to confront nice, great big bangs. See? You're asking him to do quite a bit. So as you start on this procedure you should then fully expect to have some trouble. Because you're jumping at one fell jump – you're asking the pc to do something the pc is very doubtful that he can do. His confidence is just about, well, that tone of voice, "Heh-heh. Others can, but I don't know, I – per theory – I can do this perfectly well. There's nothing much to it – you just confront these items in the bank and I could confront almost anything, I guess." But you say, "Who or what would not be part of existence?" Well, that's a long, tall order. Why does he get this reaction?

Well, the pc believes he's being asked to confront more because he's already kind of quasily aware of this spook standing over there, see? And you're saying, "Well, what isn't part of that – what isn't – what isn't over there?" Therefore, you're not sure. See? He isn't sure.

Now therefore, if any fumble is connected with clearing, if there's any real fumble, it'll slow down the process. You might even lose ground that you have to recover. In other words, it might – a badly audited pc is harder to audit than the pc who wasn't audited when it comes up to finding items and goals. Don't you see?
Now, he might have become convinced that he had less confront than he thought in the first place. In other words, he slid down in the well. Now, fortuitously ...

Well, let me make this one point: that the faster you clear somebody, the easier it is. So you see, one of my efforts forward in all this is not just making it easy so you can do it. I'm making it easier to do by your doing it faster. Don't you see? That's part of it. You take a couple of years to do this job and you're going to have an awful time, if only because of the intervening PTPs.

So the – interestingly enough, the faster you find a goal, the easier it is to find.

Now, that has only this proviso on it: that your pc has got to be up to confronting some section of the bank where his goal is located. Now, the mind runs with wings of thought through the bank, you see – I mean, a thetan, you know, thought – easy. He can pick thoughts out of this bank, but he can't pick masses out of it. See, you can get the goal long before he can confront any masses – long before this, see, the goal will read. But the goal tends to pull him into areas that make it pretty necessary for him to confront things and so you'll find the goal easily and then the goal submerges if the pc is already pretty bank-overwhelmed.

It's quite common to find the goal and then have the goal vanish. And it'll have to be laboriously prepchecked back into position again.

Now, I can assure you at once that the prepchecking of the goal back into view again is a waste of time if it won't tiger drill in. The best way to get a goal to read is by Prepcheck, but if your Prepcheck is hard or arduous and the goal has gone out easily, you're frankly wasting time. Because somehow or another, either through a little bit of rough piece of auditing or something of the sort, you've already heaved this pc into a tougher spot than he can easily get out of.

Now, the reason why we're balancing around lines and trying to get lines that are easy, is not to get the pc in deeper than he can confront – that's the problem of lines.

Now, your suddenly rising tone arm, which goes up and sticks on a series of listing lines – as you're clearing the pc after you've found the goal – is as really a result of his getting too deep to confront it. He's gone a little bit further than he would really care to confront. Now, doing it by Prehav level, listing by Prehav level, gives us this monitoring influence: How deep can he confront? Well, it reads on the meter, so he can confront that deep.

I hated to have to come back to Prehav Scales, but they have been come back to. Because all too often the pc, left on his own with an arbitrary series of lines, will get in deeper than he can confront and then the case stalls and sticks and takes forever to list and you go on and on and on and on and on and on, and I finally had to make up my mind that we sacrificed the ease of listing a guy off with no Prehav levels, because it's taking much longer than if we found some Prehav levels to list him on, see? There's no choosing between these two things. You take a series of arbitrary lines – some pcs take so long on these things that it would have been infinitely faster to have found some Prehav levels. Hence, this slump back to Prehav levels. This is how deep can he look in the bank? Well, he can look as deep as this level of doingness.
Actually, what you're finally going to run out of the bank is "kill everybody for the hell of it." See? That's what you're going to confront up to – something like that, maybe, it – on this goal, some kind or another. "Just kill everybody for the hell of it." That's going to be his feeling. You're eventually going to get that feeling. And where do you enter it? "Not to talk to anybody with a frown on your face." See, "Don't talk to anybody with a frown on your face, that – it's an overt."

Well, of course your meter will register talking to people with a frown on your face. Well, he doesn't like that and he knows about it, so he'll run out talking to people with a frown on their face and then you get some other lower level of other doingness or action of some kind and you'll get down to being able to run that. But if it shows up on the meter it'll run, see? If you can get it on the meter, it'll run. That's your crux of the matter.

Arbitrary lines occasionally will throw a pc in too deep. And an auditor for instance who will take up an engram while listing ought to be shot. Because the engram probably isn't being confronted by the pc anyhow or wouldn't stick there, it'd blow, see? And an auditor suddenly listing and find a great big juicy item that the pc just hints at and following the old theory that we must make the auditor confront and this pc has just hinted at tigers: "I wonder if I blah-blah small cats, I-I – striped beasts, I-I ... Oh, I-I don't really care to put that item on the list at this time – pussycats, kittens so forth."

Now, the auditor would say, "Well, what were you going over there minute ago?"

"I was going over a – I was just – it – just something got very unreal." Got some sensation of some kind.

"No, but what – what were you – what were you trying to look at there?"

"Well, I-I-I-I'm not sure that I-I..."

"What is it? Confront it!"

Tone arm: wheee! Case jammed.

He isn't ready for this till day after tomorrow. See? And he'll go whizzing down the line and he'll say, "Carnivory, tigers, big tigers, ferocious tigers, tigers that want to get away, tigers that run like hell, tiger skins." You get your gradients of approach as he gets deeper in clearing.

Now, when we say the entrance lines – not as the playwright would use it, but the entrance question – we've got this pc, the pc's been prepchecked, no goal's been found or a goal has been found but it's gone down with a small bubble left on the surface of the sea. Goal found, something happened, pc had a goal found, the goal, can't get anything to read – that sort of thing. That's the same case as just starting a case down the channel. We have, then, a means of putting the pc closer to the goal, masswise and in terms of mental reaction, making him more capable of confronting the goal so his thought can fly around in that zone or area of the bank and pick the goal up again. And we have both of these problems. Either picking the
goal back up or the other problem of getting him closer to it or pointed in its direction, on making him confront it. These are the same problem. In other words, make the pc more capable of confronting the goal and putting him closer to the goal for him to confront and we do those two operations.

And they're done by this series of assessment that we've called Dynamic Assessment by Rock Slam and we're calling 3GA Criss Cross, which is better descriptive terminology.

Since were going to get an opposition terminal that he can confront and then we're going to get a ter... maybe another opposition terminal and the maybe a terminal that he can confront and then maybe another terminal an then maybe an opposition terminal that he can now confront – and we're just putting him within reach of where this goal is. We're just showing him which direction this is. And the meter will show us because as long as we can go the track of the slam and follow the slam, why, we're fine.

We don't care if those first things that he gets as items are highly conceptual. You know, we don't care if his first item – we don't care if his first item was "dreaming." See? We don't care if his first item was – we're not talking about – talking about items, see? And it's – he didn't get an item all. We got this as an opposition to what he's doing. This is a lot – this is quite up the line.

Then we get to an action. We don't get an item, a solid mass, we get an action. See? We get breathing. See, that'd be the action or then we get that as an item. It's on his list, so it's an item. Don't think that your item – it's – the reason I don't call them terms and oppterms is because they really don't have mass yet when you go at this gradient. This is a very, very slow gradient. But these things will all rock slam just as though they were – they were big, massy things. You see? And then the fellow has got the idea of pen scratches, see, and finally he gets to the item, and you've got him down the line – you've got an opposition terminal now of a tame horse. See, all these things will slam.

Slam doesn't mean violence – it means what's the pc up to confronting. Because he's – but – what's he up to confronting, with an effort. Get that? That's a differentiation, see? He can stand still at this point and gaze in spite of the snap, crackle and pop going on around his ears, see? The bank is going zzz-bing-click-prent-tow-pow-ssqqu-ssss-paawww-blmmp-glmpp-glmpp-glnkk-glnkk. And he can sort of – you know, it's like a guy walking uphill against a high wind. He feels he can make it. But unless you get him pointed uphill against the high wind, hell go around and confront things that are too easy to confront. Don't you see? Why, it'd take ten thousand hours of all things he can confront. The gradient would maybe be thousands of items between, you see, this first point you pick him up and the first item, if you were just doing it on some – some queasy idea, "Well, what can you confront? What would you rather not confront?" See? You're getting him in that direction, but you get a thousand hours of auditing maybe, to get him up to the point of your first item.

You actually find out for him that he can stand there – he actually gave you the items so he must be within reach of them. See? He can stand there in a high electronic breeze, man, and he can say, "That – that is a soup bone. Ha-ha!" See, feels brave. You know? Great!
Now, you take him from that to the next thing. Well, these happen to be key points on this channel, if they slam. Because realize, that he's approaching closer to the basic center of commotion, which is caused by the basic terminals originated after he made the postulate. See?

He made this postulate called a goal, and he's actually approaching the core of the situation, and he's walking inward – he isn't blowing outward. And although it's sort of uphill, has a lot of wind around here, he sort of gets the idea a tree's going down every once in a while, you know? House roof just went by. He's sort of queasy about all this and all of a sudden he sees "soup bone" and he's made it. See? Because it was "soup bone" that was causing a lot of commotion. He can stand there and look at "soup bone" and know that it's the source of a tremendous amount of commotion. You get the commotion commoting, but eventually he's located the source.

It wasn't an evil witch who cast spells with soup bones. See? It was just a soup bone. See, it's actually devaluated at the moment he grasps it and cognites on it. The mystery is gone off of it – it doesn't look so tough to him now, see. He knows now, see? Those are the things that are important.

So, all right. It doesn't matter how you enter, as long as you enter it on a slam. No slam registering on the meter – no electronic windstorms going on. Little dirty needle – probably there's the soup bone to be gazed at and he's standing way over at the side there and he's examining this little green pebble. And he knows the pebble, he's heard of the pebble before, it's a good, safe thing to look at. Or it might very well be that it's a saber-toothed tiger. He's only up to looking at the soup bone. See? And he's got this little *bzzz-bzzz* – occasional dirty needle that goes on and off, you know. And if you said too strongly and violently, "All right, we've assessed it all on down here now to a saber-toothed tiger. Now, why the hell don't you agree that that is your item?" You've added your force and power to the force and power residual in the saber-toothed tiger and you've got a very overwhelmed pc. He goes "Aggggh!" Because you let the tiger right in on him. See? A saber-toothed tiger.

He knows it isn't real. That's one of his basic mechanisms. He's standing there with wide-open mouth and gleaming teeth and he says, "Oh, well, it's a rug." "What do you want me to look at the rug for?" *Rrrrrr!* Protest. "To hell with you." See? That kind of a reaction. Not real. Later on you'll get saber-toothed tiger and he'll say, "Yep. Tiger. Well! Tiger, yeah! Yeah. Tiger. Big tiger. Bigger tiger. Going into tiger caves – rugs, tiger rugs, putting tiger whiskers in your gun case for luck. Yeah, lots of uses for tigers. We used to hitch them up to channels back in Pooh-bah Planet." Tell you all about them, see? But at this stage of the game on this assessment, man, he's not up to it, so he tells you it isn't real – it isn't so. You get a little, tiny *zzzz*. Tiny needle. See?

So you either have an item that it wouldn't do him any good if he could confront it, like a green stone, or if he could – if he did see it, by your trickery of auditing, it would be huge and tough and too much for him and he'd shut it right off – just like that. You persuade him to see it and off it goes.

That doesn't mean why your rock slam turns on and off. Your rock slam turns on and off because he's saying, "Well, I'm not sure. Well, I'll get brave now, I'll look-look there – a-
ha, I'm not sure about that. Well, I'll look – uhhhh. It's awful murk... ah, well, we shouldn't get into that." You know that's why it is, he's suppressing it and he's protesting and he's doing this and that, and all of a sudden he says, "Soup bone! Aha-ha-ha-ha! Soup bone. There it is." Perfectly comfortable now.

Actually at that point, the rock slam that he's confronting must be from something else deeper in the bank. Although you say "soup bone," you've turned his attention toward the center of the bank again and he gets the benefit of the rock slam. But the soup bone now isn't rock slamming. Even though a soup bone now turns on a rock slam – follow me closely – soup bone turns on a rock slam and you'll find that pcs very often get haunted by slamming items you haven't found yet. This is the bane of the auditor. This is when you should take out your insurance that doesn't refuse to pay off in the event of suicide or something. Because that's mean, man.

You start getting the pc that every time the pc has the slightest withhold, has not told you all and you get a wide slam, you're going to find nothing but item after wrong item after wrong item after wrong item. There's going to be no cognitions to amount to anything or the pc is cognizing and the pc feels all happy about it and is trying to please you, you know? Pc, though, is getting no better and no slams and you just apparently find goals forever. Till you finally, knucklehead, get smart enough to go back to your last reliable item. What was the last reliable item? Well, you have to sort out the items you've found by "What wouldn't you give to a ___" on each item. And find out if they turn on a slam and if the item doesn't turn on a slam, then it wasn't an item even though it slammed when it did.

In other words, you can be fooled by a lurking item that the pc has not confronted but is straight in front of his face. And it'll – every time he picks up the slightest withhold, didn't tell you that he actually was uncomfortable with his legs crossed, at that moment you're reading "fisherman."

You say "fisherman. The pc says, "Well, my legs aren't very comfortable," and you get slam-slam-slam-slam-slam-slam-slam, and you say, "Boy, look at that – look at that rock slam. Ho-ho-ho! That's a nice rock slam." And you get the next item or two and you think the rock slam is merely persisted. And then the pc gets a little bit of withheld or like he says, "I wish I had a drink of water," and at that moment you're reading "A man-at-arms." So it goes slam-slam-slam-slam-slam-slam-slam-slam. Then you go back and reassess the list and you can't find any slams on it. You tiger drill "fisherman," you can't find anything. You tiger drill "man-at-arms," you can't find anything.

What happened? Well, those are known as false items. They're slamming because the p... they're charged up enough to make a rock slam on the part of the pc's actual item show up on them if he gets a withhold at the same time they're read. You follow that?

A real item slams – there's a very easy rule on this – a real item slams when the rudiments are thoroughly in. And a real item will always – can always be coaxed to slam again, within reason, in the same session. You can coax the slam back in the same session. A false item slams only when the rudiments are out. If the rudiments are wildly out, why, the false item will slam some more. If the rudiments are then put in, it doesn't slam. See?
A real slamming item slams only when the rudiments are in. There's not a ghost of, "don't knows" or "failed to reveals" in the session or on the item.

And it's for that reason that the exact, proper procedure for nulling a list is asking the pc the auditing question that you're going to ask him, "Who or what ...," and making your list of his answers, and then nulling it down to the last three – sometimes you can't cut it that close and it's the last four – and you suddenly notice that you're down that low and taking your last three or four items, and then taking them one at a time, and thoroughly tiger drilling them. Tiger drill each one – Big Tiger, see – tiger drill them hard, man. Oh, yes. Work those things over. Coax them, man, because it may be in with the tiniest, little tsk that disappears, too, as you're tiger drilling and you say, "Oh, there's nothing left on this item." Then you ask just that one more question and all of a sudden it ticks again. And you ask one more question. Then you get bright. And you say, "In this session, have you protested anything?"

"Yes, I'm protesting you using all of these rudiments and that sort of thing, because they all seem to me to be very silly."

"Well, what are you doing? What are you doing?"

"Well, of course, each time you start to tiger drill, I'm just hoping they won't be in. I'm postulating they will not now be in."

You get all these little things sorted out and little minor casualties that you have and you get them all sorted out, and all of a sudden you look at that item and it goes slam-slam-slam-slam-slam-slam-slam-slam – like crazy, see? And then the pc, all of a sudden, gets a "Failed to reveal." It stops slamming.

You say, "What's the matter?"

Pc says, "Well, I was looking at it in your magnifying glass. I was watching and I didn't tell you, but I was looking at it, heh-heh, the reflection in your magnifying glass. It was slamming a little bit, wasn't it?"

You say, "All right, thank you very much." And you say, "Tiger." Slam-slam-slam-slam-no slam. What happened? Well, actually what happened mentally with the pc, the pc is sort of – they got – you know, they remind you of putting a periscope around the doorjamb to look into the place, you know and then they get – they get brave enough, see – they get brave enough to eventually stick one eye around the doorjamb and then they get brave enough to open the door a little bit wider. You eventually got them – get them brave enough to walk in the room. See? And every time they get unbrave, they suppress, they protest, they don't want to look at it again and so forth.

So a real item goes off when the rudiments go out. A false item is lurking around. Let's say you bypassed an item. You should have found item 3 and you just didn't find item 3. Instead of that, you went off on a wild tear, did something very unusual, picked one off of the hat, got one off of the beginning goals – this is a mistake I made the other day and wasted about an hour and a half of auditing – get one off the goals of the session. Slam-slam-slam-slam. My God! I looked this over as to reasons one couldn't get Clear and all that sort of thing. The second I got the rudiments in, it all blew up. It was the real item slamming.
real item was slamming. But neither the pc nor I could have told what the real item was at that particular time.

The real item required the pc to sit quietly. So every time the pc sat quietly, the real item turned on. So if the pc was sitting quietly while giving me the goals of the session, you know, consciously sitting quietly, while giving me the goals of the session, I'd get a slam. Got the idea? Real cute.

This is your problem. This is your – your problem is, that if the pc is sitting in a real item and you've monkeyed around with it and brought it up to maybe – you've found one and you've found two – you should have found three, but you didn't. Then three is liable to linger around and trigger every time the pc has a withhold from you. This should happen to you. See?

The exact procedure, then, is to ask the pc the proper question, list that thing out till the pc says, "No, there are no more." Get your mid rudiments in. Ask the question to see if you get a bang on the meter at the question being asked – see if it instant reads, the question. If it does, make the pc list some more, get on down to a point where you can get the mid rudiments in and get no reaction on the question itself on the meter. When this occurs, be very happy that you've got a complete list or total rudiments out. You can always be certain about these things.

Now, having gotten that, you go back and null the list with an appropriate question. The questions are not all the same questions for all the same lists, so let's not say the question at this point. Null it down to the last three or four items left in – that's by elimination – and it's instant read, very sloppy, loose instant read, you know? It can happen before, it can even happen afterwards – if it disturbs the needle.

If you're trying to do a pc on a dirty needle, you ought to be spanked. You've got to clean that needle up. That needle's got to be a nice, beautiful, smooth flow before you do any list. And that puts an awful burden on you because the pc is under very heavy agitation during this whole time. The pc just stops talking to you for a moment and says, "Well, I won't disturb the auditor," and you get a dirty needle. See? One of the ways of getting around that is "Did you want to say anything?" you know, and don't try to keep your mid rudiments in.

You see, your – I mean, just don't keep punishing the pc with mid rudiments or something like that. Be more graceful about the whole thing. And here the needle was free and smooth and you say, "To shoot redcoats. To shoot redcoats," you know? Something like this, we don't care what you were saying. "Consider committing overt against redcoats," is the way you would interpret it right this minute, until I'm going to tell you this other. And it's very beautiful, and you read this and you leave it. It read instantly, you left it in, you left it, and then all of a sudden, you're looking at this needle pattern, you know? And you can't read through it and what the hell.

And if you start chanting at the pc every time this occurs, if this is the type of pc you're auditing, "In this session, is there anything been invalidated? All right, in this session, is there anything been suppressed? In this session, has anything been protested? In this session..." so on, every time you get a dirty needle, I tell you, on some pcs you're not going to be
doing anything but sitting in session and saying, "In this session. . ." on and on and on and on
and on, see?

There's a smoother way of getting around this. "Did you want to say something?" You
get over – you're sort of hypnotizing the pc into believing he didn't have a withhold, see?
"You want to say something? Did you want to say something?"

"No. Oh, yes! Yes. I thought of redcoats. I thought – ha-ha! That couldn't be my item!"

You say, "Good," and you go down three later and you've got "tiger," and you read,
"Consider committing overts against a tiger." It read very nicely, you know? Very fine. You
mark it in. Go on to the next one, "waterbucks." You know, "Consider committing overts on a
waterbuck." Yeah, they're very often same list, wrong side, you know, the pc mixing up the
terminal and oppterm. And you say – you say, "Consider committing ov... What the hell was
that?" See? "Co... – co... – In this session, has anything been suppressed? In this session, has
anything you have been careful of? In this session - in this session - nyah-nyah ..." Of

Graceful thing to say is, "Did you want to say something there?" He didn't want to say
anything – he thought something, see? If you ask him, "Did you think something?", why, you
get a slightly different response. But if you say something like "Did you want to say some-
thing?" You get something on this order: the pc will say, "No..." That's true, too. He didn't
want to say anything. "Oh, well, I thought – I thought that that couldn't be my item.
That-that's-that's too late on the track. That's much too late on the track and I thought there for
a minute that you looked kind of cross at me. That's-that's what I thought."

And you say, "Good," and your needle cleans up again and you can carry on. Got the
idea? But don't you ever try to do any of this with a dirtied-up needle, man. You get your
auditor presence up so smooth that you can put that needle back in smooth. Put it in smooth
gear, man – put it in smooth gear.

And you try to get somebody, and the pc says, "Oh, that's my heart beating." You
know, tick-tick-tick, the needle's going. Sure it's their heart beating! But what the hell is their
heart doing cooked up, connected to the E-Meter? Takes a withhold – takes a withhold or a
Protest or an Assert or a Mistake or a Suggest or an Invalidate or a Suppress to make that – or
Careful of – to make that needle register a heartbeat. Don't forget it.

Pcs don't have needle patterns. Pcs have out-rudiments. So his rudiments have been
out for the last couple of hundred years. Well get them in, man, get them in! But learn to get
them in smoothly, not abusing and bumping the pc around about them.

All right, now, let's go just a little bit further here. That's your right procedure for get-
ting those things in. And by the way, don't give up on one because it reads faintly, because it's
liable to bloom into the most gorgeous rock slam you ever saw in your life. Be wary of those
that rock slam and then they don't rock slam and you haven't done anything. And neither has
the pc, apparently. And you can't find any rock slam and then you clean them up and there's
no rock slam of any kind whatsoever. Well, they were rocks – you – it's a missing item.
There's something missing here and the pc just keying it in. And at the moment that item keys
in, if the pc has a withhold at that exact instant, it rock slams. Don't you see? That's a floating item. It no longer registers the moment you get the rudiments in.

So a real – a reliable item is one which registers with the rudiments in and man, that is a very severe definition. Well, that's how you do this.

Now your main problem, is how do you turn on a rock slam in the first place? And this is an experimental licking of that problem. I have learned, through a great deal – you know, I have been auditing my brain to the bone here, lately, and I finally found out that with – that "oppose" and "overts" are sometimes too strong and sometimes too weak for the pc and so you overshoot the item. This item would not commit overts against tigers. This item would go back in the brush, get under a bush and natter plaintively about tigers. [laughter] And that's not directly committing an overt on a tiger while actually being an overt on a tiger, but it won't rock slam or answer up on the word "overt". It'll answer up on "natter."

And so we move into some use for the Secondary Scales of last year. Two Secondary Scales: One is scale number 21, the Secondary Scale of Withhold and scale number 16, the Secondary Scale of Overts. This is a long, arduous, gruesomely long scale, this Overt Scale, and would undoubtedly be able to shorten it down, but these scales do exist at this exact instant and you're indebted to these Secondary Scales – to have these.

Now strangely enough, there would be another way of entering this whole thing – is just to do a Prehav Assessment on the pc, find out where he wound up and then do that Secondary Scale on the pc. There is that method of handling this. But look, look: rock slam is peculiarly withholding and peculiarly committing action. It's peculiarly a withhold and peculiarly an action. It is action. Now, I don't think, and I'm speaking experimentally, that we have to go to the lengths of doing a Prehav Assessment and then finding its Secondary Scale and moving into the Secondary Scale and doing some kind of an assessment, or balling it up in some way. It is my concept from what I have seen, which is not very much of this yet, to merely do an Overt Scale, because you're looking for the overt terminal – and oddly enough, the Withhold Scale, because these terminals are also withhold terminals.

And the case that won't slam, and you could just drive yourself to drink trying to make this case slam, is just a super-withhold case. You have a hell of a time making this case slam, man. You get down and uhhh! Well, the terminal they're sitting on, terminal number one, and it – by the way, the only one that is available is number one. There aren't 865 terminals available. There's only one that will slam first crack out of the box. Discouraging, isn't it? Actually not, because you can locate that one and maybe that is a withholdy-type terminal.

So if your pc consistently and continually doesn't have anything to say and never does anything to anybody, you possibly – you possibly could pick it up with the Withhold Scale much more easily than you could the Overt Scale. Because the withhold is the overt. Follow that? But oddly enough, anything that will flash on overts will also flash on withholds.

Now, supposing you've got a lot of items on the pc and sometimes they turned on and sometimes they didn't turn on and actually you don't know if it was the rudiments in or the rudiments out that was giving you these items and all that sort of thing. Well, just sit down and make yourself a short list on each item and see if you turn up a slam of "What wouldn't you give that item?" That is a proving action. You say, "What wouldn't you give that item?" –
you get the same slam. You'll at least get a -- get some of the slam back. But items that won't slam on that particular action aren't items. They're false items -- items that have been made to slam because some other session condition was present. See? Pс had a withhold. See, they're not actually the item. You couldn't get anything off of them. It drives you batty trying to get something off of them.

All right. Now, one of the ways of going about this, to find the entrance point of the pc, is, you just got a pc, you see, and you got a meter, and you know how to audit, and how the devil do you pick up the first rock slam? Well, here is a way to do it. There are many ways to do this. One is to just ask him -- ask him for somebody he detests and he gives you that and you notice that slams and then you check that one out and then you ask him for, well, what does that person represent? and so forth. And he gives you that and that slams and that checks out and then you ask him for what would oppose that, because it seems to be a very overt terminal. And it gets a slam, and all of a sudden you see that it kind of rocket reads, too, and you say, "All right, well what..." you haven't got much time that day and you simply say, "What -- if you were part of that, what goal of yours would be imp... were impossible to achieve?" On the second item or on the third item you just say, "Well, what goal would this waterbuck have? What goal would the waterbuck have?" and the pc says, "To -- to go on a spree." Rocket read, rocket read, rocket read, rocket read, see? "To go on a spree, to go on a spree, to go on a spree," and "on this, has anything been suppressed?" and nothing's been suppressed. Everything is all clean and so forth -- the rocket read, you know -- there it is: bang, bang, bang, bang, "to go on a spree," that's the pc's goal and that's it. And that's an hour and eighty-five minutes from the beginning of the first session, see?

But don't forget that there are lots of pcs like that. And you, operating with altitude, will very often land square on your feet.

Next pc that sits down is going to go ninety-nine hours to goal. Ha-ha. With the very best and most arduous item-finding you ever did in your life. What's the matter with this pc? Pc won't slam because the pc slams on everything because the pc is everything, because the pc is the item that does slam. That's one type of pc. I haven't met him yet, but I imagine he exists. He exists only in theory. He slams on everything you mention. I haven't met him yet. You've got to find out what he's slamming on in particular. I haven't met him, but I can imagine he will exist. I simply predict somebody will run into him someday.

Now, that'd be your total-overt pc. And then your pc who isn't saying very much, being very quiet, isn't answering up either -- mostly protesting what you say. And you're not going to find anything fast. And you after a while will just be able to ask the pc a few questions in the rudiments and the pc, well, "What have you done?"

The pc says, "Well, ah, oh, uhmmm..." Fifteen minutes later, they still haven't answered the question. Well, you better ask it on the Withhold Scale, see? You'll learn to estimate your pcs this way.

We just do a plain Assessment by Elimination on something like the Withhold Secondary Scale, scale 21, on that quiet pc. You take what you've got, and then you say, "Who or what would (whatever it found)?" You'd have to put "somebody or something" after it to make it make sense sometimes. "Who or what would chain somebody or something?" So you
did an assessment of the scale and you came up with the type of withhold is "chain." And they'll give you the item and it'll rock slam.

All right – or you start over here on the Overt Scale and you just run down – do an Assessment by Elimination of the Overt Scale. When you get down to the end you've got one line in, you've got one level in, just by instant read, don't you see? No trimmings. You don't have to say "Would you," or "Would the item," or something like that. You get on down to the end and you find out that "thieve," "thieve" is it. "Who or what would thieve?" And the pc says, "A roff and a rauff and rrhoof and a roff and a roff and a roff and a roff," and you finally get "magpie." Slams like mad. Get the idea?

Well, we can improve these scales and improve on the line, but that is by moving right into the middle of all this. Now, how about the next item? How about the next item? You could use exactly the same system. Don't you see? The same system that's adaptable to the next item that you find. You want to know "Who or what would withhold from a magpie?" Seems to be very quiet on this one. Or "Who or what represents a magpie?" is just your standard response. But a magpie being a chattery overt sort itself and so forth, would probably be something that's opposed. But you don't ask for who or what would commit overts or who or what would oppose a magpie, you'd want to know "Who or what would (Overt Scale) on the magpie?" And the funny part of it is if you – I think if you just do it straight by elimination you'll come up with the right answer. You don't have to say magpie or anything else. Then you do a list of "Who or what would wound a magpie?" He almost gives it to you at once. "Small boy," slams – there it is. Got the idea? Get this method of sorting it out? Not depending on the broad term of overt, "commit overts on," or something like this.

So all the way down the line, as you did that resulting list, which is made "Who or what would wound a magpie?" you say, "Would a – would a cat wound a magpie? Would a small boy wound a magpie?" or any other way you want to do it and it'll pick up the slam. Or you just do that one by elimination if it's a terminals list, just – almost the way you – you just did your list of items and you get the last four, tiger drill those and then test them. "Would a cat wound a magpie?" slam-slam-slam-slam-slam-slam. "Would a cat wound things?" slam-slam-slam-slam-slam. This isn't slamming on magpie – it's slamming on that cat. "Cat," slam-slam-slam-slam. "Cat" – you know, there you are. Now all of a sudden that disappears. "Small boy," and the whole read settles on "small boy" and freezes in, but it's a small boy would "wound" a magpie, not "commit overts" on a magpie.

The more particularized a case is, the tougher it is to find the entrance point. In other words, the case is more – is very differentiative in ideas on this and you don't get a broad – a broad class of anything slamming. It has to be quite particular. We have these two scales in existence – I'll turn them over, by the way, to your Auditing Supervisor. We have some more of these scales. I will be making up a more suitable scale from these old scales and we will see how this thing goes. But you get the idea how this is done? Rather simple.

Assessment by Elimination is the way this could be done, and you – I think you will – my guess is you'll be seeing slams you never saw before on pcs and seeing them faster. Doesn't take any time to do – for instance a Withhold Scale on a pc and then "Who or what
would...," see, whatever it was. "Who or what would cache things?" – C-A-C-H-E, see? And he gives them to you and the item will be on it.

See, you've assessed to find the zone of the item, then you assessed to find the item by rock slam and you've got it made from there on. Got the idea? All right.

Well, we're moving in to easier, faster – I want to set you up so that you can find a pc's goal in a morning; see, in a morning of auditing. If I can get that, that is an extreme, man. That's an extreme. But if I can set you up so that you can do that, I will be very, very happy indeed, and go take a vacation. So make some headway, will you? I need a vacation!

Thank you very much.

Good night.
Well, this is the what of what?

*Audience: 30th October AD 12.*

Not even Halloween yet! Thirty Oct. AD 12 and first lecture, Saint Hill Special Briefing Course.

[Part missing]

Now, it's a very fortunate thing that you are here tonight. Very glad to see you tonight, you knuckleheads! [laughter, laughs] I'm glad to see you in such a happy frame of mind.

Well, what this is about, actually, is we're turning the Z Unit loose on itself. And you've seen the policy letter by which the Z Unit is being turned loose on itself. And I just want to make an announcement; that is more than meets the eye. The auditing style, skill, boo-boos and that sort of thing of the Z Unit will be very, very closely supervised – very, very closely supervised.

And when you get out of here, Z Unit, you won't have Phil or Herbie or Fred or Reg and Mary Sue and myself to say, "Well, have you been sitting down across the table from the pc?" [laughter] You know? You'll be on your own. And you'll have to make decisions regarding cases and what to do with those cases, across a lot of miles. And the time for you to fall on your heads is here, not in lower north South Amboy. See? That's a mythical place. That's where we sent the chosen few from Johannesburg – they'll never be heard from again. [laughter, laughs]

Now, that opens up a new chapter in training. Your training, you should realize, is quite different than any training done on Earth to date. There are some parallels of one kind or another and here and there it's the same. Sometimes they'd let an engineer see a transit before they graduated him as a skilled engineer. That's about as far as practical application of engineering ever went. Sometimes in polytechnic schools, they let somebody build a small stool or something.

But were doing different than that. We've divided education into theory, practical and actual application of what is learned in theory and practical. And I'd like to bring it very severely to your attention that practical is not extended into the Auditing Section. You can't perform in the Auditing Section – well, you've had it. That's it.

Auditing is something that is performed. It is performed on a pc and it is performed with benefit to the pc. And these are very severe restrictions. It is something that is done, it's
done on a pc and it's done to the benefit of the pc. The Auditing Session is not someplace where one practices what one learned in Theory and Practical.

Now, the faster we upgrade that, the better off we're going to be. This isn't a lecture on training. This is just a prior announcement here.

We've just found out something that's very, very, very, very interesting. There could be other reasons for this that you could explore, but the only boo-boos of magnitude being made in the Z Unit were being made by people who had been put in it without their checksheets complete. That's a sweeping statement. It's more sweeping than it looks because it tells you that any staff training program that you conduct in any organization or District Office has got to be as tough as this course or the boo-boos are going to show up in the HGC! They're going to show up there right up front on the public. You understand?

There's apparently a direct coordination between the completeness of a checksheet, the thoroughness of its examination and the skill of the auditor. These things are direct in their relationship.

You see, there's a lot of feeling that somehow or another you get around a course and it sort of leaks in the pores. You hear a lot here and you hear a lot there and – you know, and you can kind of pick it up and you get it off on the fly. You know, there's a feeling that this can go on. And that is true, some of that does go on. You can get the inter – correct interpretation of this and that more easily on a course than anyplace else, that's for sure.

But if that were the only method of education, we would be turning out Oxfordians. Did you know people in Oxford get educated just to pick up the atmosphere? So they can look like an Oxford man? And they never have to pass an examination, they never attend any lectures, they just spend four years there and it sort of leaks in and they become an Oxford man. As an old Cambridge graduate I'm licensed to make libelous remarks about Oxford.

But the point that I'm trying to make here is although that takes place, it is not any substitute of any kind for thorough and severe theory and practical study and examination. If you want to know why some HGC is doing very badly, you can go round and round and round. You can try to audit all the pcs in the place yourself and you're going to get no place. Where it was, was right there, originally in the Academy, somebody wasn't tough enough. And then later on, on the staff training course, they weren't tough enough and then that culminates in no results in the HGC. And I just wanted to tell you this because I fitted it together and sniffed it out and I knew darn well you could benefit from it.

So sometime in the future, when you're tearing your hair out – and you will be! – over the total no results, you say, "Well, all I did was tell Joe to sit down there and run 'Since January the 3rd, 1938, has anything been suppressed?' and that's what I told him to run and here's his pc all spun in. There must be something wrong with Problems Intensives." No, there was something wrong with the staff training program. See? That's where it was wrong. You got to correct it before it gets to the session.

Now, those are just preludes. I have an actual lecture to give you this evening. But I just thought you would be interested in that fact. That goes contrary to some of your – some
of your feelings on the thing. It goes contrary to maybe some of your instincts on the thing and it certainly would go contrary to mine!

Why, the other day I sat down and took a tape examination and flunked it! [laughter] I missed the last question. Why'd I miss the last question? Because on that particular tape of October the 2nd, I think, or something like that, I had since put out new gen and suppressed the older. So, if I can flunk them, so can you.

Now, don't ever go feeling sorry for anybody on the subject of harsh, rigorous, positive training. Don't ever feel sorry for the pcs who have to experience auditing that wasn't so trained. If you're willing to take examination and you're willing to pass them, you'll make it, of course. But are you also willing to make somebody else take examinations and pass them? Make somebody else take drills and pass them? Are you willing to do that? Because you have to be pretty willing, otherwise you've got to take responsibility for every flub that auditor is going to make from here on out and for every pc that auditor is going to mess up. So that's something to think about. And that's something I very, very definitely do take responsibility for and I try to take the responsibility right here.

This course is getting better and better and better. And I'm very proud of this course. I'm very happy with the way it's going. So therefore, I'm making it tougher and tougher and tougher. I know now what all the people who have left here – I know what all these people have flubbed on. I know how they flub and I've known why they flub – not so much in the field of technology, but other little things, just like the theory, the practical that weren't passed.

Too soft on their TR 0. Fellow sat there tipped halfway out of his chair, you know? Nobody was quite tough enough. And when they came into actual auditing, why, they softened up quick and their TR 0 really went to pieces. You always see an auditor, he'll always look a bit worse off the course than he looks on it. Count on that, because there's just not quite that much discipline. See?

So that's where it's going and that's why it is and I'm very proud of what we're doing. I'm very proud of what we're doing with auditors and I think we're being very successful and I'm very proud of you. And therefore, I'm not going to let down one single tiny bit of it. Okay? All right.

Now were going to have a lecture. The subject of this lecture: Prehav Scales and Lists – how to do them.

There may or may not have been lectures in the past on this, but any former data that exists on the subject of doing scales and assessing scales was prior to a tremendous amount of experience on the subject of nulling goals.

Tiger Drill has been born since that day – a lot of data as to why things stay in and why things go out. All this data now tells us that things can mysteriously disappear off a list without being out and things can mysteriously appear on a list without being in and all of that data now must be integrated into every type of nulling that is done. And out of this we will get a very set procedure.

And that procedure is more or less as follows.
We have a scale – list, call it – scale or list. Now, it doesn't matter how we got it – if it was put in our hands from a bulletin or was taken from the pc or any other way that we get this – and we have a whole lot of terms or words or terminals or actions or verbs or something, and they're all in a column of some kind or another, they're lined up in this column.

Now, the Assessment by Elimination which we used to do is being superseded, here and now. You'll have a bulletin on this in a few days, but it won't be to the extent that I'm giving it to you in this lecture.

Now, Assessment by Elimination is infinitely faster than tiger drilling every level. You can do this much quicker – Assessment by Elimination – and that consists of taking this list or scale or whatever it is and reading it against the meter, with one or another wording. We don't care if we just read it, each one once, or "Consider committing overts against it," or whatever it is we're saying, whatever that wording is, it's all actually the same action. And that is to read it one item at a time and those that produce a disturbance of the needle – get that; that's used advisedly: disturbance of the needle. I'm not talking about instant reads. Because some of your rock slammers, the rock slam has already begun as part of the rise and you don't notice that it has begun to rock slam, so you get apparency of a latent read. You leave that out and you've had it, because you've got your rock slamming item.

So anyhow, it's any disturbance of the needle in the vicinity of mentioning the word. You got that? That's about as broad as I can make it. Now, disturbances of the needle that become before you mention the word are suspect. You don't think that's funny, but I do! The funny part of it is, a pc can go over a list two or three times and he knows what's in or he can go over a scale two or three times and he knows what's the next level.

Something very remarkable happened on this on goals. You know, I checked out a goal in Washington that wasn't it. After it was unburdened, it was it. Pc had to be checked – prepchecked like mad before this goal stayed in. I may not have the story entirely straight, because nobody gave me a blow-by-blow account of it. It just occurred in another list. And I saw that the old goal that I had checked out in Washington as not it, was now it.

Well, how'd that happen? Well, a goal has to instant read. That goal wasn't instant reading. I was that person's oppterm. Me, personally, see? So every time I would draw in my breath to say the goal, I would – you know, the PC would already get it running through her head and the goal was about a five-word goal, see? And I would say, "To be a" – rocket read! "To be a quee..." rocket read! Got the idea? And the goal was "to be the queen of the universe." And it should have rocket read after "universe." But because the PC was very disturbed and very out of session and I was the Pcs oppterm and a lot of other reasons, that read was occurring anyplace. Any time the pc thought of it, the read occurred. So my starting to say it caused the pc to think of it, which caused the read to occur. Do you understand?

Now, that is terribly unusual, particularly in a goal, for a goal to be this far out. Goals almost always do an instant read. Of all things that instant read, you can count on a goal. You see? But in this particular case, you couldn't even count on a goal. You see how far out this thing is?
So when you're doing a scale, the time to adjudicate whether or not it is a fair read or a proper read or an instant read or whether it is one twenty-seventh of a second after breath has ceased in the auditor – see, the time to discover that is when you've got it still in at the end of the list. See, that – I mean, after you've eliminated everything and it's one of the few remaining, now is the time to eliminate those factors. Now you start getting nice. See, now get nice about whether or not it's reading on the button, and so on. Now get critical. But up to that time it's just slop, man! It's just sloppy.

Now, what do you do? This term, list or scale, is any series of words. You go over that once: line by line, level by level and you take those that are in and you mark them in. You mean "in" – "in" means they disturbed the needle. I don't care whether they gave you a rocket read, a rock slam, a dirty needle, an instant tick, any – any valid disturbance of the needle. The needle was playing "Dixie" and it all of a sudden started playing "rally round the flag, boys," you see? All right, there it is. It did something else, so therefore it's in. You got the idea?

There's no adjudication necessary, except the ability of the auditor to see that the needle is disturbed. And of course, you disturb me – the number of times you miss disturbances of needle – it's too often missed.

All right. So here's our criteria: That means read, and "in" means disturbance of the needle and "read" means disturbance of the needle. Got it? Needle disturbed – in. Now, when you're dealing with the rock slam and the channel of the slam, down toward the goal, man, that pc is like a bear on ice skates, you know? Just all over the darn pond. You get anywhere around a rocket read, why, the PC will read pretty consistently. But you get anywhere around a rock slam, it's anywhere. It can be early, late, not. It can be all kinds of wild things because he doesn't read well – this pc doesn't read well on the auditor. Why? Because the item that is going to slam has far more authority than the auditor has.

You watch these items just tear this pc right out of session, you know.

They – whooo! Man, they introvert. And that's fine, but remember they can get so introverted they're out of your control. They might not be leaving the auditing room by the door, but they've left it by going in. Now, I've seen a pc not bother to tell me anything for minutes. See, pc cogniting, silently. Totally forgotten me. "Oh, that's a so-and-so mmm, hmmm, hmmm so-and-so hmmm, mmmm, hmm – off they go mmm, mmm." Of course, you're used to a pc cogniting verbally. That's only some pc who's still aware of you. You're almost hit him over the head with a Chinese gong and they wouldn't come out of it.

You understand, in the vicinity of one of these items, the power of the item then, has more command authority, very often, than the auditor sitting in front of the pc. So you say the item and anything happens. Got that? That's that – that's that much prediction. You say the item, anything happens or nothing happens. You get what you're dealing with, now?

Now, if all of this were reducible to a very, very neat situation – if we were just auditing robots and you could set the robot's chest, you see, and it says, "rocket read," you see. And then you'd say, "To be a robot" and you'd get a rocket read, you see. And then you turn another dial over here and it says, "rock slam." "Who or what would want to be a robot?" and
it gives you a wi... large slam. And then you have another button over here which you push on
the robot's chest and that says, "dwindling," you see. You sit there ... [laughter]

But, I assure you there is some reason why nobody ever found the trail to clearing. Well, you need all the tools of auditing to do it. Well, what you should realize, first and fore-
most (although I was going to talk to you about this in a second lecture), is you're not doing
anything ordinary. And that we can provide – and I can fix up and guide you in ordinary pro-
cedures to do this extraordinary, fantastic thing that hasn't existed on the track for two hun-
dred trillion. It's utterly fabulous! Yeah, that's a shocker – except you're used to it, you don't
look at it and so forth. Well, think of the command value of one of these levels that is the pc's
item – has terrific command value over the pc. And it's guided his life and kicked him around
for many an eon now. It's dictated his every action. It's made it so he couldn't eat cereal in the
morning. It's fixed him up so if he went to sleep, he had to have a hyacinth on the bedstead or
– so that only girls who wore Chanel No. 5 were acceptable. See, it's guided his life, man.
And you're sitting in a session and you say offhandedly, you see, "Cat whiskers," see, and the
pc says, "Lwaaaagh-ch-aaaaggg!", you know. Next time you say, "Cat whisker," where's the pc?
Well, he might be up in that corner of the room, you see, he might be totally introverted now.
He might be way down in the bowels of the Earth! We have no guarantee where he would be
at this particular moment, because he gets a sort of a – of a funny look in his eye, if you've
ever noticed, when you hit these things and he starts cogniting.

You do a list of dynamics, for instance. Well, you're foolish, on a good – on an
easy-working pc with a good dynamic list, to go down the list at a terrific rush and not pay
any attention to the somatics the poor pc is getting. Because on one of those levels he's liable
to feel like he's just been slammed into a brick wall at about 225 miles an hour. See? And
you're going to read the next level? Huuuh! What next level?

See, pc's going to stop right there with that, you know? You'll very often find the full
valence sitting right there when you're doing this kind of stuff. He's just sitting in it! And it's
never appeared to him before and you read the item and he's all of a sudden – you know,
there's the – cased in concrete.

"Huh? What's that!" He's liable to try to tell you, "What – wait a minute, what the
hell? I mean, I-I'm missing my head. I mean, wh-what happened to my, you know, my arms?
Uh – khmm. " You're going on down to the next level. And you get the next level and the next
level and let's get him tangled up, protesting the next level and protesting the next level and
trying to communicate to you that he can't talk. And you're just sweeping grandly on down the
avenue.

Well, it's little things like this that give you wrong assessments. So, theoretically –
theoretically, you just read each level off or each item off or anything on the thing – list that
you're reading off, one after the other. Theoretically, theoretically, it goes like this. This is
theoretical perfection. You've got a list and it goes off; Item one, item two, item three, item
four, item five, item six, item seven. And needle's nice and clean and it's going ping! and it's
going ping! And then it doesn't go ping and it doesn't go ping, and it doesn't do anything. And
then it goes into a little dirty needle, bing! And a little one there, and that one's in and that
one's in, dang, bang, bang, bang, down to the end of the list. And you go back and you take each level that is now in.

And you go over each level that is now – that was in the first time, you see – there's a little mark there, said it was in – and you go down that, and you take only those that are in now, and you read those. And theoretically you go down there, pang, pang, pang, pang, the remaining levels that are in, pong, pong, pong, pong. Now, those levels are in twice, some of those dropped out. You go over it the next time and you take the levels that are now in and you go over those, pong, pong, pong, pong, pong, pong, pong. And you go down to the end and you finally have one. You go – repeat that each time – you probably wind up with two. You go to the item and then the other item. And then one of them drops out and that thing remaining that produces an action on the meter is the found item or the found level or something.

Now, that's theoretical Assessment by Elimination – theoretical. That is the exact theoretical way it is done and that is the way previously it has been taught. But it won't work. If your pc is perfectly in-session, the chances of your getting correct levels on this pc are very good if you're a very good auditor. But remember very good auditing required to stay in two-way communication with the pc, without Qing-and-Aing and so forth. So a good auditor always got good assessments and a bad auditor got bad assessments.

And the bad auditor would say something to the pc and it wasn't two-way comm, it was an evaluation. "What do you mean, this level 'failed to withhold' is in?", you know?

Pc says, "I-I-I didn't put it in. I-is it in?"

"Yeah, well, it's in, and – heh-heh! – we know all that isn't alive. Why is it in? Why – why do you have this level 'Failed to withhold' in?"

Pc doesn't even know it's in, see. This kind of corniness going on, of course, would louse up anything, because it'll make "Failed to withhold" now read or something like this, don't you see?

So any rough auditing throws this thing out. Any roughness, any failure of two-way comm with the pc; any out-rudiments; any of these things would have thrown that assessment out. So it was almost accidental. A very good auditor, in good two-way comm with his pc, always got a reliable level.

But factors change the moment that you start dealing with items on the rock slam chains. See, it wasn't as important before, if you sometimes got an offbeat level or an item; it wasn't very important. It's important now. It's very important.

Therefore, although theoretically that is the way you do Assessment by Elimination, your pc can be sufficiently disturbed by the types of lists you're doing or the targets of the Prehav levels or other things of this character – he can go so blasted out of session – that you're liable to find yourself winding up with a wrong assessment unless this procedure is revised.

Now, this is all of the revision. It becomes very simple. It is very easy to do. It first requires that you notice when the needle of the meter does something else. That is necessary. I
wish to call that to some auditors' attention – that the motions of the needle have something to
do with the auditing session. I know this will come as a surprise. But some of those reads, if
not noticed, will cost the pc the level. Some of those reads not noticed will cost the pc his
item. Some of those reads not noticed will end up the whole goals-finding operation in the
well known cul-de-sac.

Miss one; you've – maybe, maybe that's all right. Maybe you're lucky; maybe it wasn't

the one. Because after all, there are hundreds of reads. Miss two, miss three, miss four – no,
I'm afraid we're way out! We're way out. We go down that list and we miss four reads on the
Prehav Scale. Well, that's pretty sour. So it does require very accurate, very precise meter
reading. That's the first thing that this requires.

The next thing it requires, of course, is your R-factor and your H-factor. Pc has to
know what's going on, has to know what you're looking for, has to know what you're doing.
Otherwise the whole list is a protest, so everything will read. Get your R-factor in, tell him
what you're trying to do, what you're trying to find. R-factor and H-factor, if not put in, can
cause the whole list to go hot or go cold or do something, because the pc doesn't know what
you're trying to do.

The next thing is make sure that you can read the list that you are trying to assess. You
get some other auditor's lists some time. Man, this'll throw it out like crazy, because if he
couldn't write very well and you can't read it, why, you'll stammer every now and then –
you'll say – you'll say – you're going down the line, and you say, "Waterbuck. Tiger. C-ca-uhm... cuh-ca-catchup? Catchup." Pc gets a strange look in their eye.

Actually it's all on record, it's supposed to be "catfish" see? Pc knows it's supposed to
be "catfish." And you hang him up right there. See, a mistake.

He'll say, "What was that supposed to be? What was that supposed to be? What was
that supposed to be?"

You go on down the list, see. You're going pocketa-pocketa-pocketa-pocketa, "Polar
bears. Wolverines," you know, we're going down the list, down the list, down the list.

The pc's saying, "Catchup? Catfish? Catfish? Must have been catfish. Catfish –
catchup. Couldn't have been catchup. Must have been catfish."

Hour later, you're still charging on, you know. The mails must get through! [laughter]
You know?

"Couldn't have been catchup."

You get back to it again. You get back to it again. Maybe you have the bad luck to
have a sleeper – a rock slammer who hasn't been detected as a real slammer on the subject of
an auditor or a session or Scientology, but can develop a rock slam. And you go past this
point and you say – next time through, you say, "Catchup," and, why the thing rock slams like
crazy! Beautiful rock slam! "Catchup! Ha! Boy, you know? I'm..." the auditor that ought to be
shot will sit there and he'll say, "Oh! Oh! Look at that! A rock slam! Well, we finally found an
item on you! It's 'catchup!'" [laughter]

Pc says, "Catchup?" [laughter]
Finally found an item – pc had never even put it on his list! Wasn't – wasn't even anything the pc ever had in the bank! See, you get a false slam on it. It will – it'll look just like a slam. Somebody else comes through, doesn't clean it up, for a little while it will slam. So, that sort of thing – that can happen!

Now, let's take it on a much minor scale. Going down the list, *pocketa* – this happened to me the other night – *pocketa-pocketa-pocketa-pocketa-pocketa*, down the list, you know, down the list, *whaaaaaa*. Everything's going fine. Getting the mid ruds in about every three levels, you know. Everything going smoothly, you know – dirty needle and, you know and tone arm keeps going up to 6 and 7. You know, smooth session and so forth. I'm going along the line, *pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa*. Pc, of course – we were doing it against an oppterm that was very restimulative. So of course this was going mad. And the pc already pretty introverted, you know?

All of a sudden I hit this level on the Prehav Scale, "Pull". It had absolutely nothing to do with the pc, had nothing to do with the case. And the pc's first reaction was that it had nothing to do with the case. I saw that it could have nothing to do with the case, so I just left it in to find out what the hell's going to happen.

It stayed with us, man! I even let the pc get off of it a little bit. You know, get off a little bit about it. Still with us! We'd of – would have wound up a Prehav assessment with the level Pull, which had nothing to do with anything!

You see why? Because as I went back, the pc says, "You know, that hasn't got," to self, see, says, "that hasn't got anything to do with anything! Nothing to do with anything in the session. This one is totally extraneous." Makes a big comment on it, protests it. Auditor, by reading it the next time, asserts it. Pc protests it – we get a lovely read. Do you see that? And that, amongst other things, was why the tone arm now really started to go up to 6 and 7 and get dirty needles and everything else. See that? So it became very difficult. Everything became very difficult.

All right. That's just one phenomena. That's the wrong item in. There's another phenomenon – much more gruesome. You're going down this list and it's "Tiger. Waterbuck. Catfish." See? And you get "Tiger" and it's in; "Waterbuck," it's in; "Catfish," it's in; "Wolverine," it's in; "Polar bear," it's in; "Deer," it's in; "Stag," it's in; "Mouse," it's in. You say, "Dog," it's in; "Cat" it's in. Everything's in.

Or we're – go down the list – we go down the list – we know very well this pc is allergic to cats. Every time a cat walks in the room, pc gets a black eye. We happen to know this out of the case history, see.

That, by the way, is old L. Sprague de Camp – one of my archenemies as a writer. I always thought that was very amusing, always offering to give him kittens. Even occasionally take one to a party and give it to him. He'd get two black eyes, just like that – bang! – the second he saw a cat. Most satisfactory result, you know, I've seen. [laughs, laughter] And the only reason I got any satisfaction out of it is he used to criticize my stories to my editors – mostly because they wouldn't buy his. Yeah, he had a couple of weak points. That was one of them. Anyhow ...

So this becomes very amusing. You, then, are asked to decide how many is the right number in? And I now look at you platitudinously and I say, "Well, my child, experience will bring you answers to these things." How long is a piece of string? How many should be in? Well, the proper number.

I don't know what the ratio is, but I know a page looks right – I know a page looks right for a pc. The reason you can't say is, it varies on pcs. But it looks right. There's one in every now and then. And there's little runs of one or two in at a time. It looks right. There aren't columns of Xs and columns of reads and all that kind of thing, see.

Now, that's a problem in mid ruds. So, you have in doing a list – listing this isn't true – until a pc stops listing you don't have to get mid ruds in, if you're getting the list. But that isn't the subject of this lecture. We're talking about assessment of the list. So you get in the mid ruds and the pc runs out and then test it.

No, we're talking about something else. We've got this list. Now, we're going down the list – bang, bang, bang, bang, bang, level by level by level by level. And if the mid ruds of the session go out, then the pc is hauling an invalidation, a suggestion, a failed to reveal or a mistake on down the column. And everything, as we go down the line, reads because it stays in. You see, because we're still dragging this error. For some reason or other, because he's got an error – see, one of these items I mentioned; he's got – one of these items is out – then the auditor's voice and the item creates a greater impression on the pc. Like in bridge, the pc is now vulnerable. He's got a withhold, so he's vulnerable. Don't you see? And this reflects on the meter.

See, if he – if he's got this invalidation that's floating along in the session – it's a session invalidation. He's invalidated some item or he's invalidated the auditor, he's invalidated something. We don't care what. Something's been suggested, he's suggested something, he withheld it, you get the kind of combinations of things. And then the auditor's voice, reading anything to the pc produces a reaction in the pc so that everything reads.

It is very disturbing to the pc if you suddenly start to say... You're reading a perfectly valid list and you suddenly start to say, "Hot dogs. Cat fur. Horns. Automobiles. Austins," just to see whether or not the thing is reading on your voice. That's quite disturbing because you throw the mid rudiments out further by being unpredictable to the pc. So this is not any kind of advice.

But if you were to just – if you were to – I'm just giving you the experimental action, see – if you were to just move over and just read a totally false list (you know, pick up some other pc's list and put it down there and start reading that against this pc who has this heavy invalidation, so forth), you get instant reads on everything. It's not even the pc's list. You get everything reading. That's the vulnerability of the pc because the pc has really got a missed withhold, you see? So the auditor's voice registers.
Now, if we increase that just a little bit further, we wipe out all reads. Let's say he's really got a missed withhold and it amounts to an ARC break and we cease to get meter reading at all. So we get nothing reading. Or if the pc suppressed something heavily or was very careful of something heavily, we also get a wipe out. See? So we get a whole column, a dozen at a time, go out; nothing's reading. You see those as liabilities?

Now, there's the liability of the session in one of these assessments. That's a session liability – that columns of them will read and columns of them will go blank, and the ones that reading are not it and the blank ones are not blank. You see? So that's going to throw your assessment out.

Now, there's one other factor you should know about this: You can get the mid ruds in for the session too often and drive the pc out of session. So you have some delicate balance here of getting them in when they have to be gotten in.

Now, actually, if you've gone down a whole long column without noticing that your rudiments were out and everything is in or everything is out, the only real danger – if it's all out and you don't recover it. So they're all in. The next time you're going to go over them all, why you're going to select those out. The danger – see, you'll select the ones that are really in. The danger is going down a whole long column of X's and not redoing them. See, you run into danger there.

You should actually just block out the Xs as though those things have never been done and continue your assessment and catch them the next time around. Just draw an oblong square around them – rudiments were out during this period. Because it's very disturbing to the pc to go back over the same levels you just went over. You get the idea? So just sketch a square around it and the next time through catch those levels. That invalidates all of your own Xs.

That's harder to do in doing some kind of a Prehav assessment where you're using the same scale over and over and over and where you're not marking them all out and that sort of thing. It's much harder to catch in that particular way, but I'll talk about that a little bit more later.

Your system then, consists of, basically, preventing reads from being wiped out by out mid ruds – that's the most dangerous action that can occur. See, you're not so disturbed about all these staying in because the mid ruds were out, because you're going to get a second crack at it with the mid ruds in – and then your selection of the right datum or the right level or the right item off of that list and that selection is done by Tiger Drilling.

Now, what you should actually do on an Assessment by Elimination is – let's say this pc – you're not in really good ARC with this pc or something like that and you're afraid of something happening and you feel nervy about it or something like that, then you'd tend to leave more in – you'd tend to leave more in at the end of the elimination than some pc you were quite confident of.

And I don't think in any case I'd leave more than eight in. And in no case would I leave fewer than three in. Now, I can give you an arbitrary figure, just so that we would agree on this and everybody does it the same. But we're being a bit arduous, because sometimes the
Auditor doesn't quite catch the moment when only three are in. He thinks there are a couple on the reverse page. And he happily turns the page over and by George, those went out the last time through and he's sitting there having nulled all of his items down to nothing. See? He can make a mistake this particular way.

So it is better to err on the numerous side and if you try to leave five in, you will catch it more often and more regularly than trying to leave only three in. See, you can tell when there are five in more easily than you can tell there are only three in, oddly enough.

Now, during your last pass through, you normally have four or five in, whereas you'd have to null half of the list or something to catch three in. You understand?

*Audience:* Yes.

The introduction of the exact number to be left in could be done only for the benefit of agreement that this is what we're going to do. Don't you see? Actually it serves no other purpose than that.

But to cut the whole list down on a freaky pc – pc's freaky, you know, got a false slam and a got a this and got a that and *huh-huh*, mid ruds go out and doesn't like to do the rudiments, and all this kind of thing. To cut that down to three, that's risky. That's risky. Because there are more items than that are likely to have been in because of invalidations.

Now, even though you got the mid ruds of the session in, you are left with the proposition that on that exact level it may still be out. In other words, the mid ruds are not out sufficient to now mess up the session. They're only out enough to mess up that particular level or item that they occurred on. Do you see that?

So, what do we – what's the best procedure? And that's to do Assessment by Elimination, keeping your mid ruds in, down to the point where you have a few left in – never less than three. And I'd be darned if I'd leave more in than eight, in any list. And somewhere in that zone start tiger drilling. And all you does, is you just takes it and you treats each level as a goal and that is all there is to it. You just tiger drill it.

Now, what Tiger Drill? Big Tiger? Little Tiger? Well, it's just the ordinary six on the left – three on the left and three on the right. In other words, the six button Tiger Drill. That's perfectly adequate for this activity – unless you've got a protesty pc, at which time you'd better add the Protest button, which gives you a seven-button drill. But you can swing these off awful fast.

Now, you just do all of those. Do all the buttons you have left – whether it was three or four or five or six, however many you had there and you just do those, each one Tiger Drill. And one is still reading – well, don't – don't be goofy enough to say that is it if you're looking for a slam and it's only got a little dirty needle on it. Draw a circle after it or something like that to indicate that it is still firing and go on to the next one and tiger drill that one up and polish that one up. See?

You're not trying to polish these up like a goal. See, you're just polishing these things up so you know darn well they aren't reading *because* of. And you come out with your biggest strongest read and you don't knock this thing out. Actually, tiger drilling a proper level or
item gives you an increased read and tiger drilling an improper item – this doesn't apply to goals – gives you a decreased read on items. It just – eventually just fades. Now it's just sticking the needle, so forth.

Well, you're – it's not with this precision that you're doing items or levels; that's the same precision as addressed to goals. You're getting right down there to that last point and you're fixing it up so that you can tell which one it is. That's what you're trying to do, see. You're not trying to polish everything up. See, on a goal you'd have to polish them all up, because you leave somebody stuck in a goal that's half out – that shouldn't happen. It shouldn't happen at all.

I heard one time an old-time Dianeticist of about 1950 vintage had become a psychiatrist. It shouldn't even happen to him. God, I never thought he'd stoop so low. Moment of silent prayer.

Anyway, the – the situation which you face then, in taking the item out, is you tiger drill them enough to prove it up which one it is. That's which one it is. You're not trying to wipe each one totally out. You're just making sure that none of them are reading falsely. And you'll find when you get the right one that it'll fade – the rest of them will fade, usually. Do you understand that?

_Audience: Yeah, Mm-hm._

You don't have the same thorough, half an hour per item. And, man, if I catch you taking more than three minutes, I'll – I'll swear! See, it's just a ... "On the item catfish, has anything been suppressed?" You know? "What was that? What's that? That, that, that. Oh, all right. Thank you. On the item catfish. Catfish. Catfish. On the item catfish, has anything been invalidated? Yeah, that. That. That. That. Anything been suggested?" Nothing. "Anything you failed to reveal?" Nothing. "Any mistake been made?" Nothing. "All right, anything been suppressed? Anything you've been careful of? Good. Good. Catfish. Catfish. Catfish. Catfish. Catfish. Yeah, that reads a little bit. All right, that's fine. What do you think about this? Got any pain? Got any sensation?"

"Oh, I've got this terrible sensation that's come on. I've been meaning to tell you about the catfish all the way along the line! Ooooh! Terrible!"

"Oh yeah? Is that so?"

Well, go on to the next three, because they might have even more than that! In other words, you just dust these things off, see. You dust them up very nicely and then you're sure that they're not in because the pc got stuck on them while you were going through and didn't say for the remainder of the assessment, "Catchup? Couldn't have been catchup." See? You get this method of Assessment by Elimination?

_Audience: Mm-hm. Yes._

Too many going out, too many staying in – you know, the pc is dragging a suppress or dragging a ... Too many going out, he's dragging some sort of a suppress or an ARC break on through the list, item to item. Too many staying in, he's dragging an invalidation on down the
line or a suggestion or something of this sort. So that's a mid rud situation – mid ruds on the session.

Get on down to the last few in, give yourself a good dust-over with a Tiger Drill. Give each one of those things a dust-over. Then you can't make up your mind which of the last two it is. Well, just tiger drill both of them harder, then suddenly, all will emerge and you'll have the right level. You'll have the right item.

Now, that's very sound auditing to do Assessment by Elimination. It could – can be rather rapid.

There's another condition for any such elimination list and this is a very difficult condition. It should be done on a clean needle. That's a very difficult condition, since you're saying something on the order of this: Let's say you've already found an oppterm and you're doing a Prehav level against the oppterm, so you say, "Would you (Prehav level) fail to withhold from an airplane?" You've got the oppterm and you're trying to find the terminal level. "Would you fail to withhold from an airplane?"

"You" sometimes clicks on pcs – quite often, as a matter of fact. "Airplane" was found because it rock slammed. Every time you say, "airplane" it upsets the whole needle characteristic of the pc. And you say, "Why am I ever – why'd I ever hear of this airplane?" Pc is very happy about this airplane, you understand. But it just keeps upsetting your meter and then your meter goes out and your needle gets rough and you have to get in your middle rudiments and that upsets the pc even further because they go into protest. Don't you see?

In other words, you got your work cut out for you and it's not an easy job and there's no reason for you to believe it's an easy job. And there's no reason for you to dust it off lightly to some poor suffering HPA and say, "Well, take this pc and find me the Prehav level and so forth. For this other, I haven't got much time here. And find me the Prehav level for this item oppterm 'airplane' that we found yesterday. I'm going to be busy," so forth. Don't be surprised if you come back at 2:00 A.M. and he's still at it. He's trying to read around the needle and he's trying to do this and he's trying to do that.

Now, the more you harass a pc about his dirty needle, the more dirty his needle is going to get. You start blaming the pc for his dirty needle and you're going to get a dirtier needle.

There's no sense in you sitting there saying, "What's the matter with you? Why are you doing this?" Because the pc isn't. You are! The pc does not have these items under control. You do! They're his items, but they're under the auditor's control and you're agitating them. So he or she isn't giving you the dirty needle. You are! So there's no sense in adding the untruth into the situation of "Why are you doing this? Why do you have such a dirty needle?"

Oh, jump a pc all over the place. He – you say – you're trying to run a Prepcheck on the pc for the last twenty-five years. Sheena was doing this the other day. I should have brought that dispatch along. I laughed, man! Some character that's been giving them all kinds of trouble over in the Washington area got onto their staff – their clearing co-audit. And she assigned some co-auditor, I think it was, to do a Prepcheck level and to flatten "done" on him.
and the period was the last twenty years. And the co-audit person, see, sits there – never au-
dited before in his life, apparently – and flattens it in five minutes.

Well, this was Mr. Natter from Yakville, see. And he's – the co-auditor said, "Well, the needle's clean." And Sheena put him on the needle and by George, it was clean. Everything was clean. "Done" was clean. "Done" was clean. First time he'd ever been run on "Done," but he's been yapping all over the place, but it's clean. So she knows more about the mind than this, so she rolls up her thetan sleeves and she let's him have it. Almost on the colloquial basis of "Just what the hell ..." you know, "You're going to tell me that in the last twenty years you've only done five minutes worth?" [laughter] "Well now, what have you done? Now, give! I'm tired of this, see." Off the meter and everything else.

He hadn't done very much – he'd spun a few pcs in. But he had been going around with a clearing process which he didn't dare let Ron find out about because Ron's reactive bank would stop it. [laughter] And he'd been secretly auditing pcs all over the place and spinning them in with this thing and that cracked the case – bong! It all went very nicely after that.

That was a missed withhold of such magnitude, you see. I thought that was very amusing. This Sheena is a very determined character. Said the pc was happy after this happened but she was a rag.

But anyway, the point I'm trying to make is, is you've got to be able to keep the pc well enough under control and in-session and unblamed and hopeful enough and calm enough about it all to get an assessment done in the face of the fact that you're assessing the most disturbing, upsetting items which he has in his reactive mind and which have controlled him utterly for eons. Do you see the problem in assessment?

So don't you start worrying because you particularly, find assessment a little bit rough now and then. Assessment is very often rough – very often. But you must not do inaccurate assessments. You must not do inaccurate ones.

The primary difficulties of assessment actually occur in listing. You do an incomplete list or you list on the wrong level or you list something you shouldn't ever have heard of and the pc wishes he hadn't, and you'll wind up with a dirty needle messed-up thing or something. Your list isn't complete enough and it's dirty needle the whole distance. Or you haven't asked the pc the right question to get the first slamming item and the needle is all mucked up – and it will be mucked up until you get that first reliable item on him.

All these various conditions exist to upset this business of listing. So that makes it in-cumbent upon you to be a very smooth auditor in whom the pc has a great deal of confidence. And that will get you over the hump in listing better than any trick I could ever teach you.

Assessment by Elimination, old style, is quietly buried. And this one I've just given you is very much in. Make sure that you have a proper number in for the pc and make sure that after you've eliminated them all, you take the remaining few and tiger drill them to make sure they're not in on the "catchup" principle.
And you'll always wind up with your right levels and your right items and it's very easily done. It isn't necessarily slowly done. The slower you assess by elimination the more trouble you're going to have with it.

It doesn't much matter whether you read them once or twice or three times or read one once – one level once and the next level twice and the next level three times. It doesn't much matter what your sequence is – just make sure that you have read what you have read and that what you have read is reading. You understand?

There are various tricks about it, these – I mean, as far as that's concerned, the types of question you ask ... What I mean to say – various tricks, the types of questions that you ask to assess a list, the types of lists, the types of scales, all of these sort of things – they have absolutely nothing to do with the principles I have told you.

The principles I have told you apply to: Prehav Scales, listing and assessing to find the rock slam on the pc (that's Dynamic Assessment by Rock Slam), unburdening the goal, doing any type of finding something – any type of finding something. You could even do it with goals with some success, although I don't particularly advocate it. You know, null the goals list except for the last twenty – tiger drill those.

All kinds of things can be done with this system of Assessment by Elimination which I've just given you. And those principles I'm sure you will remain – you'll find remain very sound now and quite reliable, because I've been working on it very, very hard for the last week or two.

And as far as I'm concerned, that's what you have to know to do an accurate Assessment by Elimination. You got it?

Audience: Yes.

Thank you.
LISTING GOALS

A lecture given on 30 October 1962

Okay. This is lecture two, Saint Hill Special Briefing Course, 30 Oct. AD 12 and we are going to take up the subject of listing: its theory and practice. And when we say listing, we mean listing of goals. No other type of listing – just goals.

How do you list a goal out? This is a specialized action. How far do you list a goal out? Why do you list a goal out? What happens? What's your target? What words do you use? Why? These are questions which might plague you.

Now, a goal consists of a bunch of black marbles around a nothing, as you see it, as in the form of the GPM.

Actually a goal (quote) seen (unquote), naked and alone, standing by itself, would be totally invisible and totally nothing and totally nowhere and totally no-charge and totally no. It'd be as evanescent as a thetan.

In other words, a goal does not have mass, but a goal in place in the pc's reactive bank is surrounded by mass and the way it looks is a tremendous number of black marbles impinged on black marbles, each influenced by a single postulate.

This is very interesting – very interesting because it has an anatomy. And the discovery that it had an anatomy is of great importance, because it is the anatomy of the reactive bank.

The reactive bank also contains pictures, but these pictures also depend to a marked degree for their force – if not totally – on the GPM itself.

Now, you could take off on a basic-basic of a chain and erase the basic-basic of the chain and get the rest of the chain to fold up. You see this in Prepchecking. Now, that's getting the earliest on the chain.

Now, we see this with a goal. It is the earliest postulate on the chain. And because it is a goal and because it is the earliest postulate on a chain, it then erases – in other words, evaporates. But until it is contacted as the earliest idea, postulate on that chain, it is resistive – resistive in the extreme.

Now, as we look over a bank, we see this phenomena repeated; phenomenon is repeated over and over again. If you take an engram, any engram, you can trace the postulate which occurred before the engram was had. Now, this would be wonderful therapy, except for this thing: that decision or postulate is not the basic on the chain – and the engram itself is not the basic on its chain, so by finding the idea or decision which preceded the engram, you do not achieve an erasure of the engram always, but you sometimes do.
It happens to be an isolated idea and it happens to be an isolated incident. And if the idea is isolated and the incident is isolated, why, then it'll go up in smoke. So we're on the free track basis. The individual has never before thought the interesting thought of, "I'm going to raise hell!" And he proceeds to do so and he never did before and after that he doesn't. Let's say something like this occurred.

All right. That's then a free, relatively free, idea or postulate followed by a relatively independent mass and the two together make a solidity. You have the solidity as far as engrams are solid and you have it preceded by the idea.

Now, you can take any engram or any lifetime or any period of existence and find it preceded by a decision.

You can find the decision, you can ordinarily do something about it. Now, oddly enough, the more independent the decision is from the remainder of the track, the more the thing will read on its own merits, until you walk up to rocket read, which is the total independent postulate at the beginning of an enormous number of actions and ideas and then, of course, you're dealing with clearing and the GPM.

In other words, in vignette in the bank, this can be found and studied. But because you'll never find ... Well I – pardon me, I shouldn't say "never." Because you'll so rarely find a free idea preceding an action and you so rarely find the action free of earlier similar actions, you wouldn't run into much luck in erasing it. It won't evaporate because it's too dependent on earlier incidents of the same kind.

Nevertheless, the phenomenon does exist and I have seen this phenomenon and I have seen a whole engram and whole series of incidents blow up, just by having found the basic decision that lies before them. And it tends to make an auditor rather weird. You say, "Well now, if I could just do this on every engram, why, I'd be all set." And you keep on trying to do it in every engram and of course the next one is 2,000,765,962 from the first time he had the idea "I'm going to raise hell." That's the number you picked up. Well, it hasn't got a prayer. It hasn't got a prayer of erasing.

And then the incident which consisted of getting shot, see, happens to be the seven hundred thousandth time that he's been shot in that exact place, under those exact circumstances. And, of course, you try to pick this off that late on the chain, it just doesn't erase. So the idea won't go out and the incident, if anything, merely becomes very painful and hangs – hangs up. You can turn on the somatic and it stays turned on. You turn on the idea and the idea remains obsessive with the pc for some days.

Now, look on that as a false goal. Look on that original decision there that decision I was just mentioning there, before he decided to raise hell and then he got shot, you see – take that sequence of events. Well, if you were to run this you'd get, in vignette, the same phenomena as running a wrong goal. It's too late on the track. The incident has been repeated too many times. It won't erase.

The bank, in other words, won't grow less, but efforts to do something to it cause it to increase. Now, in the matter of the GPM, this is a singularity – an oddity – that the basic idea, although it may be influenced by other ideas, is a basic idea. It's a basic idea, postulate, deci-
sion – whatever you want to call this thing. Because it is basic on a chain, has a peculiar read which we call a rocket read, therefore, is identifiable. It also tends to stay in consistently and continually without considerable address.

And the incidents which pursue or follow that have little or nothing to do with the previous life of the individual. Now we're dealing, not with an engram, we're dealing with some whacking big piece of track. We're dealing with the trillennia. See, we're dealing with enormous time span.

And the thetan got this idea, made this decision at a time when he could make an independent decision that would stick with that magnitude. And this is pursued by a series of adventures consisting of identities and their oppositions and consists of a whole series of complicated games and goes on off down the line into innumerable side goals, side ambitions, side ideas, side valences. You know, there's terminals and there's more oppterms. And there's more oppterms and there's more terminals and many of them seem terribly disrelated from this original idea.

Original idea: "to catch catfish." And you'll find in there something like "to be the Lord Mayor." What's that got to do with anything? Well, you eventually could connect it up, if you cared to. But it actually is connected to this basic postulate or idea.

In other words, we can find in the bank a small picture, in the decision before the engram, of the GPM as a whole.

Now, the individual has lived these lives and in living those lives has alter-ised this goal. The keynote of a goal is alter-is – why it hangs up in mass. If it were purely and completely observed and suffered no opposition and nobody did anything different to execute it than just execute it, why, it'd still be floating free. But because the thing was altered, it developed mass.

And you will find out the first factor of listing is: that listing a wrong goal adds mass. Listing a wrong goal adds mass. That is very important.

And alter-ising the right goal during auditing adds mass.

If you know those two data as the two dominating data of all the listing of goals, you'll be able to bring off free needles on your meter. But if you neglect either one of those two, you're not only not going to bring off a free needle, you're going to bring more mass to the pc, more discomfort, more upset than he's ever before experienced. We're at that crossroads where auditing must be done with complete accuracy and understanding.

Now, auditing the right goal is repairable. If we also alter the goal a bit and make the pc protest and that sort of thing – we can always repair this. Auditing a wrong goal can also
be repaired. But therefore, we should know the processes of repair as the first step of listing a goal.

If one is listing a wrong goal, various phenomena, which I won't go into at the moment, will turn on (I've already mentioned them in an earlier lecture). If we list a right goal badly – get a lot of protest and the sessions are rough and all this sort of thing is – everything's going awry, one way or the other – we get a similarity of behavior on the part of a pc. In other words, rough auditing on the right goal – and any kind, no matter how good, auditing on the wrong goal – give us a similarity of behavior on the part of the pc.

So an exclamation point rule is: that you never monkey with the idea of a wrong goal. You never approach this idea; you never run in the direction where this thing – wrong goal – will occur. You understand, wrong goal: man, that is as wrong as you can get.

That's very, very wrong, because it will beef up the bank, it'll distort the pc's ideas, it'll upset him no end. This is brutal stuff – running a wrong goal.

Now, in that you can audit a – not necessarily you, but somebody – can audit a right goal roughly, poorly enough to give it an alter-is in the process of auditing it, to a casual observation – you could probably study this out and there's more data connected with it – but to casual observation, badly auditing a right goal and auditing a wrong goal are alike. So therefore, we never take any chances on it being a wrong goal; we always treat it as though it were.

You can just mark that down without invalidating the pc's goal for him – which you've seen rocket read and you're very sure of – the thing isn't going right, the thing isn't going right. That's all, man. Nothing is going right. Pc looks worse and so on. You can't get the goal to read well and have a hard time putting it in at the session beginning and a whole lot of sweat and travail on the thing – we just immediately treat the thing as a wrong goal. See, that's your response as an auditor – not by saying to the pc, "Well, this isn't your goal."

But finding out if it is the right goal or finding the right goal are both the same action. Do you follow that?

They're both the same action. In other words, we're repairing a wrong goal and we're straightening out a right goal more or less in the same way.

One of the ways to go about this is to just head the pc in the same direction as though you're going to find a goal. Now, what I'm getting down to here – what I'm getting down to, is a minimal number of techniques. In other words, if you go in the direction of unburdening the goal, you'll find yourself very often in the same channel as though you were finding a goal. Do you see? By unburdening the right goal, which you are already auditing, it will read. And if unburdened, a wrong goal won't.

Now, a wrong goal never rocket reads, but right goals very often die out and don't rocket read either for quite a while and then come back in with stuff that looks like Cape Canaveral during a Russian inspection. You understand that to sit there and ask you as the auditor, on this pc, to adjudicate whether you're running a right goal or a wrong goal is asking too much of you. See, that's asking too much because the risk of running a wrong goal is terrible.
So therefore, your technology of unburdening parallels the technology of finding a right goal. They're just all the same technique – do the same things.

So, you have a right goal which can't be run because it's – in listing – because it's running into too much hot water and it won't go in and the pc is having too much trouble. In other words, he can't confront the items that are coming up on it. See, the goal is unreal to him; it won't fire well. I mean, it gets lost – all these kinds of things. I could give you – I could give you just dozens and dozens of clinical studies of whether it is the wrong goal or whether it is the right goal or how to tell this and you look at the left hand corner of the pc's tongue and you find out this. And you could memorize all these things. You become quite expert on the thing. But why do all that if you can say, well, quite normally, "Well, I can't get this pc's goal to fire. They say it rocket read once, but I've never seen it rocket read. What do I do?"

Well, you always take the viewpoint that it is a wrong goal until proven otherwise and then you'll always be safe. You don't tell the pc. You don't have to, because you yourself don't have to decide. You don't have to decide that it's a wrong goal; you don't have to decide it's the right goal. All you do is unburden what you've got – which is a pc.

You see, you never run out of the pc. You run – might run out of goal and you might run out of bank, but these things are invisible to some degree, but the pc is still there. So you got a pc, so the best thing to do with a pc to make a right goal read or to make a wrong goal stop reading, is to unburden the goal.

So actually, when you get right down to fundamentals, you can be as stupid as you want to and you'll never make a mistake if you just follow that one rule.

Can't get the thing to fire. You've never seen it rocket read, and – well, it did rocket read. You saw it rocket read last month, but it hasn't rocket read since. You yourself are getting very doubtful of what you're looking at. It fades out. No Prepcheck that you do on it seems to do it any good. Nothing seems to happen here. Well, just treat it as a wrong goal and go on as though you were going to find a goal.

Now, that would exclude tiger drilling long lists of goals because that's not very beneficial. So the repair method for the wrong goal is the only thing that would contain an address to a wrong goal on the basis of a Tiger Drill.

You can tiger drill a wrong goal and you can bring some relief to the pc. You can clean up a wrong goal and you can bring some relief to the pc, but the best way to clean it up is by Prepcheck – not by Tiger Drill – but by Prepcheck.

So, your first action when you're worrying over somebody's goal – "Is it his goal? Isn't it his goal?" – what – something like this; "And it stays in, and it never goes out. And Joe says he saw it rocket read and it was checked out in HCO Berkeley. I've never seen it rocket read or that one time I saw it rocket read maybe he was thinking of something else." You know, you get all confused on something like that. First action: Prepcheck. All that serves is an unburdening action. Prepcheck it.

Don't tiger drill it. You're going to waste hours. I've already put this to the acid test. You're getting stuff from somebody who has done one God-awful amount of auditing along
this line, you know. I'm not talking theoretical now. This is hard won data, sweated out in the auditing room.

Basically, it's a waste of time to tiger drill it. If you can't get it to fire in a reasonable length of time by Tiger Drilling – such as twenty minutes, half an hour, something like that – if you can't get that goal to fire, it's a waste of time to go any further. What you want is a Prepcheck.

Oddly enough, on a goal like that, even though you use the most buttons there are, see, actually the Tiger Drill is going to take you longer than the Prepcheck. Because the Tiger Drill is never going to get there and the Prepcheck is going to get there, if it's the right goal. Follow me?

Do you see this?

Audience: Mm-hm.

So it's better to prepcheck than tiger drill. That's your first unburdening step then, is take this thing and prepcheck it. Well this doesn't necessarily take sessions. This might – very well might all get wound up in one session.

All right. Your next action, if it didn't result in a good firing, rocket reading – and don't let anybody come around and say it rocket read a sixty-fourth of an inch, because that in my book – in my lexicon that is not a rocket read. I like to see that rocket take off and strew red flames out behind it for a little while. You know? I like to see a little smoke come out of the meter once in a while, you know.

I like that – you get the goal going along awhile, why, you find it won't rocket read more than about a quarter of an inch or something and it's almost gone and free needles are occurring; trying to get it to rocket read gets pretty desperate. It's almost impossible at that stage of the game, but you've got a free needle now and a down tone arm. You got other indicators. You don't need all this, see. You knew it was the right goal or it wouldn't have wound up there, because a wrong goal produces more mass, which produces a higher tone arm. See. And a right goal, alter-ised, produces more mass and more tone arm height. You see this similarity?

So, all right, we tear along here, we give it a Prepcheck, and at the end of our Prepcheck it's still going thwp-thwp-phsss! thwp! Nothing, nothing, nothing – pip! Nothing – stick! Nothing, nothing – kkkk! Tone arm's sitting up here at 4.75. Well, I tell you, you're a mighty foolish auditor to go on and monkey with that. It could be the right goal. Could be the right goal – could be! Nobody's saying it isn't. Don't get into any big argument with the pc. Just tell him you're not invalidating your goal and you're not abandoning the goal and you're not this and not that and put in the hope factor, which is the true factor.

They get spiny, man, when you don't make this awful clear to them why you're doing this. You depart from the Prepcheck into a further unburdening action and your next unburdening action is to find items. Find rock slamming items – just as though you're going to find a goal.
Well now, I'm not going to give you a long dissertation on how to find goals at this stage, because this lecture isn't on it. I'm just talking about listing a goal to Clear. That's what you do when you absolutely run into it and you just can't make up your mind and you don't know what you're listing and it isn't behaving right, and so forth.

Now, you've got a special goals preparation cleanup, little intensive that goes along with that. And when you're going to haul off and find a bunch of new items and that sort of thing, don't leave all this stuff lying around. Do that October 29th little action as the first action of unburdening and finding items. That gets all the listing that's been done on it and that gets other things, gets it out of the road and it smoothes things up.

So your Prepcheck is your first action. Your next action is an unburdening action. Well, one of the fastest ways to unburden it is that October 29th, 1962 Goals Preparation Intensive. It's a little assessment you do, you know – it's real cute. It's a little assessment and you do this assessment and find out what you've got to run on this pc and that cleans up some segment of his auditing that probably is the most burdensome and it brings the TA down and some other things will happen. And the pc will find this quite pleasant. They get good gains on this, whereas you saw a pc into just an ordinary Problems Intensive and you're going to have some kickbacks. Pcs don't like this. It isn't going to hurt them any, but they don't like it.

Why? Well, doesn't address their goal. Well, you'll find out that after a pc's goal has been listed for a little while and you're trying to put the thing together, you'll find out that your best bet is to clean up the section of auditing that shows up on that little scale.

You do this little Assessment by Elimination of this little scale on the October 29th bulletin and you'll find you're sitting pretty, because the pc is now really getting audited on the goal's channel. Because, of course, that'll hit the highest mass on the case. See. And, therefore, it'll bring the tone arm down. And you get some interesting results and he still has a sensation of being audited on the – on a goal's channel and he'll feel better.

All right. Now, this action is a preparatory action that permits you to take off – either to find a right goal or to re-prove the goal that has passed. Now, you can go ahead from there and clean it up and find the right goal and so forth. Now, all that knowledge is necessary to the listing auditor before he starts fooling around too much with listing. Because he should know what he's looking at and he ought to know how to repair what he's listed into a hole.

See, so he roughly audited it and it resulted in a high, stuck TA and so forth. Well, he messed it up one way or the other and he can't get this thing to read anymore. Alter-is on a right goal results in a high TA; running, even smoothly, a wrong goal results in a high TA, so these are your steps of takeoff and that's the direction you go – and you don't keep on listing.

Now, this is a funny lecture when I'm telling you what not to do before I tell you what to do. Don't keep on listing. You do these other things. Got that?

Well, you'll have a lot of happy pcs if you handle it this way because you eventually... Remember that old goal, remember all those old goals and that sort of thing. Call them out of mothballs every once in a while and read them. Say, "Well, I'm going to check some of these goals, you know," and so on. And you got a new list of goals or something like that. Well,
let's check the old goal first. Let's not go and sweat ourselves to death. We may find it's sitting there, *rocket, rocket, rocket!* See? Three cheers!

All right. Now you're set for listing.

So, your first action before you list some pc is to establish the rightness of the goal and if the goal isn't right and the goal isn't rocket reading, to then take appropriate actions either to make the goal rocket read or to find a goal that will rocket read. Got that? That's *vital* to an auditor's know-how. There is no sense in doing anything else.

Don't sit there grinding away on a goal that won't rocket read.

Now, I'm going to tell you why. If'n da goal, she don't rocket read, she too much for de pc.

Once upon a time, he could play marbles with planets. And now a child's marble falls on his big toe and it takes him to the hospital. He's not up to regarding as much force as there is on that backtrack. And you start listing. This goal temporarily and momentarily rocket read, and oh, you're just fine and you've got this goal and it's all rocket reading, and now you're going to list. Anyway you put lines together you're now going to list this thing, and so forth.

Now, no matter how you put lines together, you have only one purpose in view and that is to undo the alter-is which has occurred on the original goal. That is the purpose of listing.

The purpose of listing is not to read lines to the pc. It's to undo the alter-is on the original postulate on that channel. That is what you're trying to do.

Whatever else you're trying to do, that one you're sure trying to do. Now, all listing methods are more or less adapted to that action – more or less. Some of them are better, some of them are worse. But your listing methods are just based on the undoing of alter-is.

Now, he had the postulate and he wanted to carry it out. This was his goal, his basic purpose. He had the postulate and he assumed an identity and then he was going to carry it out, but his purpose was alter-ised because he ran into a "wumph." And he couldn't go any further because there was the "wumph." So he had to have now a purpose to overcome the "wumph" before the "wumph" could overcome him and now, therefore, in order to overcome the "wumph," why then he's got to have an ally called a "bimph" and he's got to also have the "bimph." And then the "bimph" get – he can't be "bimph," because the "bimph" has got something that confronts a "bimph" and opposes it. So therefore he's got to be an enemy of the "yip" and so there he is... (I don't care what you call these things.) And there is his life, and he sounds like a bluebottle fly in a milk bottle on a hot summer day. You know? Bang, bang, bang, bang, bang, bang, bang.

He's had nothing ever since but an alteration of that basic intention. And the alteration of the basic intention resulted in mass and every time he picked up a terminal that was going to do it, it didn't do it, so therefore, it developed mass.

So we have mass terminals. And these things, as I mentioned earlier, are actual mass and then they're bumped up against alter-ised opposition terminals in his own thinkingness.
and these confront these, and then those have others that confront those and so on, and they're all in pairs. There are pairs and pairs and pairs and pairs.

Now, there are four basic forces, four basic forces. There's the force out, the force which restrains the force out, the force in and the force which restrains the force in. You can draw these four basic flows. These are the basic forces.

There is the effort to carry out the intention. There is the effort or anything else, to oppose the effort to carry out the intention. There is the effort to retard the effort to oppose the intention and there is the effort to retard the intention itself. There are just four and they can be drawn by four arrows, which are in opposition to – two in opposition to each other and the other two are going away from each other and you've got the vectors that you're trying to list.

Now, the anatomy of this is called a Goals Problem Mass and it's called a Goals Problem Mass because it follows the same anatomy as a problem. You must have postulate-counter-postulate, you must have force-counter-force; you've got to have mass-counter-mass and all of these things hung up.

Now, a problem which goes on with the pc for years and years and years and years and years is actually a mass facing a mass of the pc. If you don't believe this, sometime get a pc who isn't too stone-blind as a thetan and say, "Did you ever have a problem?"

Person says, "Yeah, I really did. I've had a problem."

You say, "All right, what was the problem?" And he gives you the problem. And you say, "Tell me a problem of comparable magnitude to that problem. Thank you. Tell me a problem of comparable magnitude to that problem. Good."

Well, oddly enough, he will see a black mass go floating away from him he never knew existed. It'll go way out there. Now, we've got him all cured of this, see; he's all cured of this problem. Now, we say to him, "All right, tell me a solution to that problem you just told me," see. "Tell me a solution to it. Tell me a solution to it. Tell me a solution to it." He keeps telling you solutions to it. It gets closer, closer and closer – and splat!

You say, "All right. Give me a problem of comparable magnitude to that problem. Problem of comparable magnitude to that problem. Comparable – comparable – problem of comparable magnitude to that problem," It'll go way out there again. In other words, you can bring it out – you can push it out, you can get it in – with those two commands.

Although, of course, this problem is just a little old thing, doesn't have anything to do with the price of fish, it's normally a valence of some kind that is parked on the track and the pc is in its opposing valence and he doesn't see its opposing valence and you actually have the two black balls – got these two things impinged on each other.

With the problem of comparable magnitude, you see one of them float off. With solutions, you'll see it float back. It's very mysterious. This was the first basic experiment of demonstration of the Goals Problems Mass. That's why it is called a "problems mass."

Now, a problem, anatomy of, is postulate-counter-postulate. All the reasons you must solve it, plus all the reasons you can't solve it and all the reasons from elsewhere why it mustn't be solved and all the reasons why they mustn't oppose its being solved.
Now, that's the totality of intentions, if you want to get right down to it, that is connected with this GPM. And you've got two valences, basically: the Rock and opprock and then you've got other confronting valences and... Ah, this pc will have had a game going on for oh, I don't know, several billion years, where he was being a farmer and he was being a soldier. And this soldier was against farmers. And you know, soldiers against farmers and farmers against soldiers and he'd lead very unhappy lives as soldiers and then he'd lead very unhappy lives as farmers and there was just this big game that was going on, and he didn't know what he was, and – except in those lives when he was being a soldier he was very dizzy, and in those lives when he was being a farmer he hurt like hell.

See, we could establish which his terminal and oppterm was, but while he was living them, he never really could make it out, see.

And he'll have this game going on for billennia. He'll just have gone on and on and on with this silly game. See, as a farmer he's agin all soldiers, and so on. Well, this of course is always a problem to him. And then of course, subsidiary to it are all the problems that a farmer would have. It makes plenty.

All of this is representative in black. Why black?

Well, I can't give you a real good reason of why black, except for this: It is drained-out energy which no longer emanates – this black masses – and it has a timeless characteristic because it is – it's got no more change in it – apparently no more change.

Now, if you were to attack one of these black masses and do something with it – well, old Black and White works – but if you were to do something with it, like try to confront it out of existence – that's a good one – just try to confront it out of existence. All right. "What part of the black mass can you confront? What part of the black mass can you not confront?"

You're just going to wear your voice out as an auditor because absolutely nothing is going to happen to the black mass.

I tore one of them up one time as a theta, after a great – melted it down and tore it up and I never did so much work in my life, and so forth. And I was horrified to find it was still floating around in fragments. Well, it's non-as-isable in its current state and that's because it's an alter-is of the basic postulate.

See, the basic postulate is part and parcel to every piece of that black mass – no matter what alterations there were to mass, why, there it is. It's going to wind up as a black, drained-out, squeezed-down, cramped-up mass. It's very amusing to take one of these balls and as they're resolving, you will suddenly start seeing things in them – and all kinds of weird things. Thirty-five-millimeter picture slides and all this kind of thing. But actually a whole lifetime of track is all cramped, see.

Got a nice straight time track and when you finish up and you pass in your checks, why, it all collapses and you've got it. And one day, why, you're being audited on listing and all of a sudden you say, '"What the hell is this, a picture folder-card of Niagara Falls or where to spend your honeymoon or ... What is this?" you know.
And like a pc up in London: He really sold the auditor one day. He was a brand-new pc, raw meat—never had anything to do with auditing before. And I've forgotten exactly where this was, maybe it was here. It wasn't here amongst you pcs, but I remember it was a raw meat pc and really gave the auditor a sales talk because a black mass had opened up in front of him. He'd seen through it and he'd seen a city — space-opera city. And he sat there giving the auditor one God-awful sales talk about the fact that it was real and that he had seen it and that it wasn't this lifetime and he'd never seen a picture of it before and he wasn't making it up. You know, that kind of thing. See?

He was trying to sell a Scientologist on past lives or something, you know? Very funny. Anyway, these things shred out into that sort of thing. They unfold and mysterious things appear. When you first see them, why, they're just wound-up masses. In Book One we call them circuits, valences, identities, items — they're all — all those things mean the same thing, see. They'll also talk; they'll also do things; they'll also look like they're God or something. All kinds of wild things occur with regard to these masses.

In listing you run into the lot. If you're listing properly, you run into all sorts of wild phenomena or you run into hardly any phenomena at all. Things just keep melting away, down to the last few feet of filum.

Now, all of a sudden, things really start turning up. Guy will go through an overt-motivator sequence: zzzzip! You know? Zzzzip, zzzzip! And he tried to tell the auditor about it, you know. He'll give the item, tried to tell the auditor about it, "Well, you see, let's see, I was a colonel in this regiment and I had stole this fellow's wife and so forth. And there was a battle the next day and I got killed. It was only poetic justice, because I'd left poison in his coffee pot the night before. That's one overt. Yeah, that's right. That, that..." And this is going by — bzzzzzzzzzz! Fantastic rate of speed! It's track unwinding. Don't you see?

It isn't the fact that he's confronting it that is causing it to unwind. It's the fact that he's un-alter-ising the basic purpose. You get the un-alter-ises off the basic purpose and the track unwinds. You understand? And then you can confront it. Confronting is a subsidiary mechanism to identifying.

First identification of the rock slam channel results in a lot of items. And these items are very interesting to the pc and they give the pc a lot of cognitions and they blow off and they get him closer to his goal channel. All of these various things are quite important.

But, why the emphasis on finding goals by rock slam? Well, it's what he can't confront. So in listing you must have some commands, that first and foremost, label or identify mass which resulted from the goal — what restrained that goal or that mass, and then what opposed that mass and then what restrained the opposition of that mass. Now, these factors are vitally necessary in order to get the ball of yarn to unwind.

Now, what confuses the issue is, is there are enormous additional factors. They are just beyond count. The task is: is how many factors can you get away with and still win? That is the actual contest. How few factors do you actually have to handle? I've told you how few, but what do you have to do to handle them?
Now, that's the contest of how you make up lines for listing. It's – you want as few as
you need to handle it, that will handle it, see – not as many as you can possibly dream up to
handle it.

Now, there's your basic fundamental problem. Because if you don't have ways and
means for the pc to identify all these masses as they peel up and come to his notice, if you
don't have ways and means by which he can identify them and say what their relationship is to
other masses in the goal, why, then of course nothing will happen because the alter-is won't
come apart.

That these masses are basically composed of thought is self-evident. That they are
manifest is also self-evident. They aren't imaginary masses. But it's thought alone that takes
them apart. How come they come apart at all, saying "waterbuck," you know, "Eskimo,"
"cannonball," "white man"? How come saying these things and recognizing these things takes
them apart? Well, that's because they're basically thought derived out of the basic postulate.

So it's the alter-is of the thought and the take-apart, of course, is the straightness with
which they're now being labeled. There's always a small amount of lingual alter-is, because
you probably conceived the – oh, separate parts of these were conceived in other languages
and you're now naming them in English. And there's a slight alter-is of the nomenclature and
so on. But that isn't going to do you any harm. But it's absolutely phenomenal that the thing
comes apart.

If you think of the number of reasons why it doesn't come apart, why, you're immedi-
ately confronted by the fact that it's a miracle that it does.

Now, therefore you're not up against a simple trick. This is not a simple trick. If it
were a simple trick, it could have been done many, many times in the last two hundred tril-
lion, you see? And it hasn't been done. You're still here, aren't you? You've still got the GPM,
haven't you?

Well, there's many a time that you've exteriorized out of the GPM and made a new
GPM. And there's lots of conditions have occurred which made life seem different. There's all
kinds of things been occurring. But if you' d been cleared on the track, why, you would go
back to that point, you see, as your basic postulate  and then that would be very easy from that
point on because there wouldn't be anything before that. Well, I think if you' d ever been
cleared you wouldn't have totally forgotten it anyhow.

The upshot of this is, is that listing must permit the pc to easily confront and label the
minimal number necessary to cure the alter-is of the basic postulate – minimal number of
terminals, items.

Now, thoughts and doingness and significances are not going to get your pc anyplace.
He's got to label terminals and things. He's – these have got to be things – things, people, va-
lences, bedsteads and bedspreads and blondes, and catfish and the Mississippi River – don't
you see? These are the things you're trying to label. And that you must know, in putting lines
together, that you mustn't have significances as possible answers. You're going to get them.
Oh, you'll get significances and so forth. But by and large you must have a predominance of
mass.
Now, your pc is going to go so far in this mass and then he's going to find out that he can't confront something. This is what happens to a bad goal. Oh, we got this thing rocket reading and everything is going fine and everything – oh, boy, we're – here we go. And all of a sudden, you tiger drill it the next session and it reads less and you tiger drill it the next session and it doesn't read at all. Then it sticks and then it kind of

Now, if you consulted this pc carefully you'll find out he didn't have much reality on this goal or how this goal had influenced his life or anything else. It might be his goal, but he doesn't have – not too real to him. And also the items he's been naming have all been sort of vague. He said "an Indian princess" and "a Turk," but he just said them. And it didn't – and he didn't have any idea of Indian princesses or Turks. It isn't that he's supposed to get ideas concerning them, don't you see, but they all kind of – well, you know, sort of in a smoke and a dream and they really didn't exist and he didn't exist and he hasn't got anything to do with them. See, his reality factor on these things is very poor.

In other words, he's not doing a very direct confront. His confront on them is bad. Because his confront on them is bad, you're all of a gonna sudden – get into an overwhump situation. And he's going to be sitting there saying, "A Turk..."

And you're going to say, "What's the matter?"

"Nec... Turk..."

"What happened?"

PC says, "Oh, I don't..."

"What happened? You tell me," you know.

"Huh! I don't know."

He hit something and he doesn't want nothing more to do with it. If you'd been watching the meter, it'd probably do a big rock slam and then that dies out. In other words, he moved in close to this thing and he doesn't want any more to do with it. And you tiger drill the goal the next time and it's firing less.

Then he hits another section of track that is going all biluuuh and he doesn't want anything to do with that either. He says, "An Indian princess, huh-huh-huh. Well, we don't want that item. Let's see, is something else here?" In other words, he chickens out on this stuff. He can't confront it. It's unreal to him. It's not there, don't you see?

These are the liabilities of listing. Sometimes your goal read bright and clear. You got it to read beautifully. The first listing session, it all goes up in smoke. So having a goal and having a goal ready to run are two different things. You can have a goal that isn't even vaguely ready to be listed. But how can you tell? By listing it.

Now, certainly I'd list any goal that was rocket reading. And I'd list to the final hanging dog. First choice: list – with the condition the goal must be made to rocket read at the beginning of the session. And the first choice is list. First choice, make sure you list.
Now, I'd only start doing something about the PC, see, when I could no longer get anything to rocket read. And then I would do something about the PC on the rationale that I gave you in the first instance.

I'd say, well, either it was the wrong goal – which we know it probably wasn't if we saw it rocket read well – or the PC is overwhumpped. And the two different situations are gotten out of by the same channel. You've got to over – unburden the thing one way or the other.

And I wouldn't give it an arduous Prepcheck, get it to read, run one listing session, have it fold up, do an arduous Prepcheck, get it to read, do one listing session, have it fold up. I wouldn't go like this, you know. I would think after that had been repeated as a cycle for two or three weeks, that a fellow would sort of get the idea that he ought to do something else.

Well, you've fortunately got another something else to do. That something else happens to be unburdening, and unburdening probably will take many forms. There will probably be a great deal of rationale with regard to this idea of unburdening a goal. It's an old idea, as far as the track is concerned – goes clear back to 53, 54. And I'm not now going to tell you the exact way to always unburden the goal and so forth. I'm giving you the rationale with regard to listing. So don't list one that isn't rocket reading. Prepcheck it. Now it won't rocket read? Unburden it.

If you've been doubtful about it from the beginning, well, for heaven's sakes swamp it all up with the October 29th little intensive and sail on. Sail on. Unburden it as though to find a new goal.

Now, there's – some intermediate step will undoubtedly arise where we get this goal, it rocket reads gorgeously, and then we apply step 79 to it which unburdens it by using the goal. And you'll probably find something like this being issued: that we list the first three hundred items of "Who or what" by writing them down. And then we null them and present the first item to the pc on the silver platter. And then we get the opposition item either by listing who or what would oppose this goal, or by opposing this other goal. Always an unburdening step, see. And writing all that down, letting the pc examine this, don't you see, and handing him that item on a silver platter, and then going ahead and keep doing this.

"Who or what would restrain your wanting this goal?" you know, or something like that. And then, you know, list about three hundred items, write them down, and then take and find the item in that mess that kicks the pin hard. Get all the charge centered on it. Keep this up for a little while, and then, taking off from that point, you'll find out that listing can just go pocketa-pocketa-pocketa according to the cards or the notebook, and there you go.

You can undoubtedly – I can forecast that something like that will be moving amongst you very, very soon. But that would be another action. That would be the action of finding the goal – it rocket reads beautifully – and that is not doing anything with it but unburdening it for the first many items, don't you see. Which all would come under a listing operation.

But then this listing is done by writing the item down and nulling the list. So that's still just a listing operation, don't you see. It's a listing operation that unburdens, don't you see? And that makes it very easy for the pc then, and then he finally comes tearing down the line at
a hell of a rate of speed, and he lists 18,765 items in one three-hour session by saying them all in Sanskrit, you know? It's brrrrrrrr! They're all real to him and everything is fine.

Now, some pcs will give you some items with terrific reality. Everything seems to be fine. Everything seems to be wonderful – the thing folds up.

But you understand that is a listing action? You got the goal reading and you list it so you can unburden and list at the same time. That is not the patch-up item – the patch-up procedure I've been telling you about such as: it fades out, prepcheck it, get it back in order, treat it as though it's a wrong goal and go find the right one.

So essentially, you're writing it all down, finding the item on that list. That is just listing a goal out toward Clear.

Now, anything that is listed, whether it is listed by writing it down and finding an item; I'm talking about a goal now. You found it; it's rocket reading; everything is happy with it. And we don't care whether we listed with check marks or we listed it by writing them down and nulling out the list and presenting the pc with the item. However you were listing this goal out, the end product is always the same.

You'll find probably the most difficult times of listing come toward the end of listing, not the beginning of listing. And the pc very often would rather be any place else than there. The last couple of days before the first goal goes out are peculiarly trying to the pc, very often. This has happened – I've observed it several times. They'd rather not have anything to do with it, thank you very much, because they conceive themselves as about to lose the only game in the world.

The goal is "to find pennies underneath the slot grates of gutters in Minneapolis," see. And this is the only game in the world. There's no other game in the world. These other games don't exist; there's only this one game of finding pennies underneath the grates in the gutters of Minneapolis. Don't you see? And they know now that if they get rid of that, they will have no other game. Games end at that point. Well, of course the reason they can't play any game... They can't even play that game. They're at a point of no game at all. And until they get that – rid of that goal, they can't have a game.

But they never look at it this way and you could sit and argue with them for some time. And the best way to handle this situation is just make them sit in the chair in front of you and finish it up. But you can very often – will notice – now, this isn't invariable – but you quite often will notice that a pc will use various mechanisms to convince you that you shouldn't go on listing. They do a balk. And beneath it is, "going to lose all games."

That comes over them. And then they want to know where the goal came from and they get very introverted and speculative, and so forth, as to who gave it to them and why and all this sort of thing and then the thing goes up in smoke, pop, and it won't do anything anymore and that's it.

But you get down to that last period – if your tone arm tends to stay high and that sort of thing, the goal is best prepchecked out of existence, not finally listed out of existence. In other words, it should have – it went free needle and then it kind of froze up and while you were checking around the thing it all kind of got stuffy and stuck up. But you know that it's
been listed for quite a while and you saw some free needles on the thing and all that sort of thing; your best procedure to finish off the case is a Prepcheck. A Prepcheck on the goal just as before. Because it blows up all the little residuals of auditing.

Now, auditing itself was slightly an alter-is of the goal and this left a certain amount of alter-is on the track. In other words, you didn't get rid of all of the alter-is on the thing. It was – some of it was overlooked and it tends to blow off in the last Prepcheck. So no goal should be considered a valid goal – a validly cleared up – no goal should be considered to be validly cleared up until it has been prepped.

And the best way to test one is to see whether or not you can find a Prehav level for it, not sit there chanting the goal endlessly. Let's see if we can find a Prehav level for that goal. We do a Prepcheck and then try to find a Prehav level and we can't, and we're – got nothing but free needles in all directions and so forth, well, that's good enough. That's the way you wind one up and that's your end product of listing.

And there are probably some cases here that a simple Prepcheck would knock the goal right out of existence.

Now, here: why are you trying to find this goal and get rid of this goal by lining and get rid of it, and so forth? That's because the pc has no game until that game is out of the road. Now he can have a game. And the next thing is, is so you can get the next goal.

Now, there is no such thing as trying to get the next goal before the first goal is reason-ably out of the road. But there is such a thing as overrating a first-goal Clear. Don't try to make it all happen with one goal. I gave a lecture on this last year. Don't try to make it all happen with one item. Don't think because you're going to get an assessment down the list on who or what have you detested, and find out that it's General Pilsudski, that the whole pc's life is going to change. It isn't. It isn't!

It's going to materially better, but it's not going to completely change. In other words, don't try to hang it all on one action. And similarly, don't try to hang the whole case on one goal. Don't try to solve this pc's whole case on one goal. That is idiocy. You won't be able to do it! Because there's a goal back of that goal. There's a whole new GPM sitting back of that. And it can't be touched or monkeyed with till you got the first one out of the road.

Now, you're going to get the second one. And that's going to run off all the alter-is and you're going to find a lot more bank. And that's going to blow and then you're going to find the third goal sitting back of that. And then when you've listed that one – of course, they do list out with great rapidity when you get back that early – and now you're looking at an official Clear.

Three goals listed out – we start hanging medallions around the neck and plumes on the guy's cap. Up to that time, why bother?

There's lots of reasons for that. It's because finding the second and third goal are so much easier than finding the first goal, that you might as well do it.
There's the direction of case stability. First-goal Clear normally has a mighty vague notion of the third and fourth dynamic, let me assure you. It's pretty vague. But they have a darned good idea of the first dynamic. You get a first dynamic Clear.

All right, fine! That's wonderful! But why not push them on up the line? And why not, before you say, "Well, I cleared Bill" – just as he comes out having robbed the bank – why not spend just that little extra time there to find that second goal and find that third goal. Because they're actually quite easy to find. Second and third goals normally should be expected to be found just by tiger drilling a goals list. You make a fresh goals list, you tiger drill it out. You find the goal sitting there someplace. Easily the fastest way to do it.

Now, do you understand what listing is all about? That's what you're trying to do. I hope you're not trying to sit around waiting for Ron to give you the magic list of lines which clear your pc. Because the pc is going to get cleared on the lines that clear the pc, and pcs have gone first-goal Clears to find their second goal, and have found their second goal and cleared that on four lines. Interesting, isn't it?

You're sitting in an absolute cinch right now. You've got 3GA. You list 850 goals on the bulk of your pcs, you go down that list... Actually, on any pc, you're going to go clear out to the end of 5,000 goals, you're going to find this pc's goal on that list someplace. And you're going to set it down with four lines and you're going to list it. If it's the right goal, you're going to have a Clear.

My whole interest is speeding it up, making it easier, smoothing it out. Remember, you're working from a cinch and a certainty which has happened. You haven't got time to clear everybody the wrong – long way. So I'm trying to find you some shortcuts. But because I'm trying to find you some shortcuts is no reason you shouldn't use your noggin and realize that it has happened rather well and rather easily on four lines. Okay?

Thank you very much.

Good night!
Thank you.

When you were building this country, why didn't you fix up the weather? You know, really, I have my opinion of planet builders that go around designing weather like this, and that sort of thing. There's a great deal to be said for rain, but it quickly becomes hyperbolical.

Well, now tonight, I've made notes for lectures, so I probably won't talk about that. And this is the 1st of November, isn't it? What year is it?

Audience: AD 12.

AD 12. All right. Lecture number one.

This is a brand-new subject to you. It's an entirely new subject to you. You have never heard of this subject before. In fact, you have never run it or handled it or had it done. I want to recommend, then, this lecture to you very, very seriously. There have been several bulletins out on it, but you apparently haven't read those. Now, therefore, this is new material here. And I want you to take to heart what I tell you in this lecture.

And the subject of the lecture is missed withholds. Now, it may surprise you that the first bulletin out on this particular subject of missed withholds is February the 8th, HCOB February 8, 1962, and it's marked, as a bulletin, "Urgent." And it says, "The one item Scientologists everywhere must get an even greater reality on is missed withholds and the upsets they cause." That's the first paragraph of this. It says, "Every upset with Central Orgs, field auditors, pcs, the lot, is traceable to one or more missed withholds." That's what it says. Well, anyhow, on February the 12th, because nobody got it then, I issued another one – rote formulas for missed withholds, and so forth. That's HCOB February 12th. It's *How to Clear Withholds and Missed Withholds*.

Well, they didn't get it then, so we issued another one on February 22nd. And on February 22nd, 1962, we had *Withholds, Missed and Partial*, see? And it has a lot to say on that particular subject. And it says, "I don't know exactly how to get this across to you except to ask you to be brave, squint up your eyes and plunge. I don't appeal to reason, only to faith at the moment. When you have a reality on this, nothing will shake it and you'll no longer fail..."
cases or fail in life. But at the moment, it may not seem reasonable, so just try it and do it well and day will dawn at last." Well, day didn't dawn. Well… [laughter]

So, on May the 3rd, 1962, you have the HCOB *ARC Breaks and Missed Withholds*, and it says, "How to use this bulletin: When an auditor or student has trouble with an 'ARC breaky pc' or no gain, or when an auditor is found to be using freak control methods or processes to 'keep a pc in-session,' the HCO Sec, D of T or D of P should just hand a copy of this bulletin to the auditor and make him or her study it and take an HCO Exam on it.

"After some months of careful observation and test, I can state conclusively that: All ARC breaks stem from missed withholds.

"This is vital technology," and so forth.

It says also, "There are no ARC breaks when missed withholds have been cleared up." And it goes on, technically.

Well, on May the 21st, we have one: *Missed Withholds, Asking About*, and so forth, but that's just a little more data.

And on June the 28th, 1962, we have *Dirty Needles, How to Smooth Out Needles*. There it is, and it talks all about missed withholds and so forth. It's not obviously and directly on the point, but it does mention withholds, missed withholds, overtss and secrets and so forth.

And on July the 4th we have *Bulletin Changes* which include missed withholds, and then on July the 12th, 1962, we have *Motivatorish Cases* and so forth, and that goes on talking about how to get missed withholds out of people.

And then on August the 13th we talk about *Rock Slams and Dirty Needles*. And there's some more about missed withholds then.

And then on August the 30th, while I was stateside, why, Mary Sue got desperate and issued some bulletins. And of course the first subject that she picked up was missed withhold handling. Well now, that is a lot of bulletins. Let me call to your attention, there's weight here, man. There's weight. There's been a lot said on this subject, see?

And it's just about the most important subject in an auditing session and keeping the show on the road, short of actually clearing and helping people, you see, it's just about the most important subject there is. And there isn't one here got it. None of you. You haven't got it. So I'm going to give you a lecture on it.

And I might as well start this lecture with, "The one item Scientologists everywhere must get an even greater reality on is missed withholds and the upsets they cause." Do you see? That's out of the February 8th bulletin. And "I don't know exactly how to get this across to you except to ask you to be brave, squint up your eyes and plunge," on February the 22nd.

Listen. All you're doing and all you go on doing and all you keep on doing and all you do, endlessly, every time you're told to pick up a missed withhold, all you do is pick up a withhold. Honest. You're picking up withholds. I don't think you have ever picked up a missed withhold off of a pc in any session you've ever run. You've only picked up withholds.
You ask the auditor to pick up the missed withholds and the auditor promptly picks up all the withholds. You got the idea? Everybody says this, and I guess it's because of the semantics of the word missed. It says they're missed withholds, and by God, they are! Everybody misses them! See?

You see, it is so pat and it's so plain to the naked eye that this is what happens: Pce has a withhold, and you haven't picked it up. So therefore it's a missed withhold. No! That is wrong.

So, when I tell you to pick up the missed withholds, all you're doing is picking up withholds. You say, "Well, he wants us to pick up the missed withholds, so therefore I better pick up the withholds I've missed. So therefore, 'Do you have a withhold?'" When sometimes you even say, "Have I ever missed a withhold on you?" "Has anybody missed a withhold on you?" and the pc gratuitously gives you withholds; gives you more withholds and more withholds and more withholds.

No pc has ever given you a missed withhold. I'll bet you you've never picked one up. Now, I may be very harsh on this line, but let's get down to tacks here, man! Brass, iron and otherwise.

A missed withhold is a withhold that people nearly found out about but didn't. And you're only looking for the nearly found outs. You don't give a damn what the guy did. You don't care what the person did. You only want to know what people almost found out!!

Honest! I've been talking since February, you know? I'm getting hoarse.

You see, a withhold is something the pc did. That is something the pc did – do you understand? – that he isn't talking about. See? He did it and he isn't talking about it. Now that is a withhold and that is all a withhold is. And please don't keep saying also it is a missed withhold just because you didn't get it in a session.

You see, it's all very neat. You got it all figured out that if you didn't get the withhold in a session, why, therefore, it's a missed withhold. And that's not what a missed withhold is! A missed withhold has nothing to do with what the pc said. Nothing! Not anything to do with what the pc did and then withheld. It actually hasn't a damn thing to do with what the pc is withholding.

The missed withhold is something people nearly found out. It's an other-person action! Look. It's not the pc's action! It's nothing the pc did or is doing! You keep trying to pick up missed withholds by asking the pc what he's withholding, you never get anything but withholds and then you miss some more of these and you've got a pc even further upset!

Look, here are – here are absolute pearls on a silver platter. They're actually beyond price. And I've never got it across to you. A missed withhold has nothing to do with the pc. But nothing! It is an other-person action and the pc's wonder about it. I just know right now I'm not making any sense to you even this minute. I'll betcha I'm not making any sense to you.

It hasn't a thing to do with what the pc is withholding. Let's just sever the end off of the "missed." Let's forget that it is even a withhold.
You're looking for exact moments in the lifetime or lifetimes of this pc when somebody *almost found out*, and he's never been sure since whether they did or they didn't. And we don't care *what* they almost found out! We only care that they almost found out something! And that is the address to a missed withhold. It's an other-person-than-the-pc's action. It's an other person's action.

I really didn't realize that I hadn't gotten it across to you in bulk and in gross form till not too long ago in a catch-as-catch-can session I said to a pc – this pc was going natter, natter, natter, natter, yak, yak, yak, yak, natter, natter, natter, natter, natter, natter, natter, natter, natter, yap, yap, yap. So I just routinely was running a little bit of – I said, "Well, what have you done?" "What have you withheld?" "What have you done?" "What have you withheld?" "What have you done?" "What have you withheld?" "What have you withheld?" you know, that sort of thing. And got stuck in this area of the track and started saying natter, natter, and natter, natter, natter, and natter, natter, and natter, natter, and natter, natter, and natter, natter, and natter, over and withholds and withholds and withholds out of that area of the track, and withholds and overs and withholds out of that area of the track, and they would have been going yet if I hadn't – that's one of the dangerous things is Instructors are actually going to stop you sometimes practically running it. Because once you shove this down the pc's throat, it looks just like a Q and A. It's almost in the teeth of the laws about Q and A. You understand?

But the pc isn't clearing this. You've got this thing called a recurring withhold. You understand? You run into these things all the time. You were auditing a pc, so they're going to run some withholds, and they run the time that they locked their husband out. And you say, "Ha, ha. Thank you very much."

And you note down this fact, and a few sessions later, they tell you they locked their husband out, see, and they didn't tell him that they were the person that had locked him out, you know? Never confessed to it since, and he got pneumonia, and it was all pretty rough.

And so, a few sessions after this, you know, why, you're running down the track and they tell you they locked their husband out. And a little while later some other auditor is auditing this same pc, and they tell him they locked their husband out.

Look. Sometime or another, won't you get tired of hearing the same withhold? Isn't it boring? It's like watching a "C" movie that wasn't very good in the first place for the tenth time. That is a *missed* withhold.

Look. It has a very *special* anatomy: It isn't the moment they locked the husband out; it isn't when they withheld it from the husband; it isn't when they withheld it from you. These things have nothing to do with the reason this is charged up! That it is an overt, that it is a withhold – ahhh, yes. But there's this special thing called a *missed withhold*, and it hasn't got anything to do with either one of them. It merely uses them for fodder to feed on. And the overt and the withhold won't blow if a missed withhold occurs.

Now, what is the missed withhold? The only thing you have to ask this recurring-withhold pc is "When did your husband *nearly* find out about it?" Not "When did he find out?" – see, that would have blown – but "When – when did your husband *nearly* find out about it?"
Now, here's the actual mechanics of it. A few days later while he was lying there suffering with a fever of 118, why, his eyes opened slittedly and suspiciously and looked at her and glanced toward the lock on the door. Now, that was his action, not hers, see? That was his action. And ever afterwards she hasn't known whether he knew or didn't know. Ever afterward! She doesn't know! And that's why the recurring withhold hangs up.

Now, I lowered the boom on this pc, and I said, "All right. Fine. Thank you. Thank you. Good. Now, tell me the exact moment you suspected somebody knew what you are telling me."

"Ohhhh." And that was dead easy. It was right there. The whole package blew, and that was that.

Somebody had made a comment which might or might not have been interpreted as the fact that they knew about it. And the pc goes off in this fantastic confusion. Now, how can it be a confusion? Well, it's a confusion because there is an overt and there is a withhold. And these are the primary mechanisms which sit back of all this. But they actually aren't very serious until they get a mystery on top of them.

Now, you take an overt, a withhold, plus a mystery, and you've got a missed withhold. It's a mystery! Now, did her husband know about it or didn't he? "Did-did-did he find out – did he re – and – and is he withholding? And is he – did he – as he was lying there in a fever and so forth, did he – he really mean that look toward her and toward the lock of the door as an accusation for having accidentally locked him out in the snow storm? Or did he – did he ever know, or-or-or wasn't that? Or did it or didn't it? Did he fi... No. He couldn't have known about it. Oh, he – he did – no. No. He couldn't have. He-he did, but still he looked straight at the lock of the door and he looked at me. He must, I-I-I-I don't know."

Do you understand this? Now, that is a missed withhold, see? Had nothing whatsoever to do – you can say, "Now, what have you done?"

And she says, "I locked my husband out in the snow and he got sick with pneumonia and he was sick for seventeen months and eighteen days. Lost his pension."

A few sessions later, you say, "All right, rata-ta-tatta-tatta. What have you done?"

"Well, I locked my husband out in the snow, and – and he – he got – he got sick, and – and he was sick for eighteen months and eighteen days and he lost his pension."

You say, "Good. Thank you. Thank you very much. Good. (Maybe if I acknowledge it this time, maybe the pc will find out that I heard it, see?) Good. Thank you. Thank you very much. Thank you. Good, good. Good. Tha... thank you. Thank you. Thank you. Now, I got that. I heard exactly what you said there. I heard exactly what you said. Thank you."

Next morning in session you're running some General O/W, see? "I locked my husband out in…" [laughter]

Now, of course, that isn't as comprehensible as some offbeat – because this society is a bit offbeat on the subject of the second dynamic – you get some juicy second dynamic withhold of some kind or another. Get this girl, and she's making love to a dog, you know? You get this, you know? And then you, the auditor, get pulled right in on this. You say, "Well, of
course this is heavily charged! Of course the pc is having trouble getting this off. Of course, of course, of course!"

Don't be so damn reasonable. There isn't any reason why the magnitude of the overt has anything to do with the readiness of its blowing. The magnitude of the overt has nothing to do with the speed of its evaporation. I don't care if you've blown up a husband or a planet. It's an overt. And it – one doesn't blow any harder than another.

Well, therefore, we have to ask this question. "How come this doesn't blow?" Don't sit there and say, "Well, because the society is rigged the way it is and because so forth, and it's on her terminal chain, and it's probably something that rock slams. It's on the oppterm side, dogs are oppterms, and – and so forth, and I'll fix that. Actually she is stuck on the se... and that's why that overt won't blow, see?" Figure, figure, figure, figure, figure, figure, figure, see? That's why you get this second dynamic overt ten minutes deep in every session, or every third session. Or every Prepcheck, it comes up.

Wouldn't you be a little bit curious why this thing keeps recurring? Well, don't be so reasonable. It is not recurring because it is badder than other overts, see? It's not recurring because it weighs heavily on the pc's conscience. I don't know where people keep their consciences – lunch boxes or something like that. Obviously, it's very dangerous to squash a conscience because things are – shouldn't be kept on the conscience, and so forth. It's all a very interesting mechanical problem to me, this whole problem of consciousness. Because you see, everything that is on a conscience is unconscious. It's all confusing. And you can just figure yourself into a grave with this if you don't know this mechanism.

One day they had this elderly man and he came to the house for dinner. And he had a rather false smile. He had false teeth, see? And he had – [laughter] and he had a false smile, and he looked straight at this girl, and he says, "You like dogs, don't you?" [laughter] And that's the missed withhold, see? The pc that you're auditing didn't do it. And ever since then: "Did he know? Did he really know? No, he couldn't have known. Yes, he…." [laughter]

Now, you getting hold of the corner of this thing's tail, huh?

All right. I – maybe I haven't been as articulate as I could be.

Actually, I figured and I figured and I thought and I looked at it and so forth. And on this demonstration the other night, I actually couldn't believe it when the pc said, "I never thought you had to remember a specific moment in time to get off a withhold." Even the pc had missed it, but the thing had evaporated. There was no more natter in that area. There were a whole bunch of overts and a whole bunch of withholds. But this was just pursuant with natter until the exact moment when somebody was standing there – see, this is the moment we had to find – and I said, "All right. Let's look for it. This is the exact moment I want, see?" Pc is just going off answering questions, answering questions, getting no place, see? I say, "This is the exact moment I want. Who almost found out you were doing that?"

"Oh, well."

And we picked up this exact split instant in time and it was just somebody making a casual remark that it indicated that they might know about these overts. You get the idea? They might know. But they didn't. But did they? See, there's the mystery sandwich.
If you want to see what is sticking a pc to something, always look for the mystery sandwich. Mystery is the glue which sticks thetans to things. Mystery is the glue. Even overts wind up in mystery. You shoot somebody. Now you don't know whether you shot him or you didn't shoot him or if it was a lucky shot or you should have shot him or if he was a bad man, or if, if, if, if, if, if, or if you should have done it. So it's the "if you should have done it" which causes you to pull back the withhold and sort of withhold a further action like that.

All things boil down to right conduct. Here is the crux of this situation. If you go on asking the pc, who doesn't understand what you're asking for, "Have I missed a withhold on you?" or "Have we missed a withhold on you?" and the pc is glibly giving you withholds, you ain't gettin' noplace. You is on the Arkansas Special with its wheels locked, its brakes on and the rails torn up. You're not going down any track anyplace.

Now, you can take the edge off of a case. I salute the fantastic workability of General O/W, you see? See, it is – it's the woof and warp of the GPM itself. And it's right on down the line. That's why it's totally unlimited in the amount of run it can have. But I don't think you'd like to run out a GPM with General O/W. You're perfectly welcome to try if you've got a few centuries. Numerically, to count up the number of withholds that the person has, pursuant to the number of overts which they have committed, gives us some figure that if we were to write it up on the wall behind me in very tiny figures, starting at that corner and then just keep on writing across the whole top of the wall with groups of three zeros, you see, and then without ending the number, come just down below it and start right straight across the wall again, and then come down another quarter of an inch and start writing zeros there, you'd get some kind of an idea of what this guy has done and withheld.

Well, that many answers is not necessary to clear somebody. So although the overt is very powerful in its ability to aberrate the individual – the withhold which follows it is locked up by the overt itself, of course – and although this mechanism is the mechanism underlying the gathering up of energies which results in solid-mass terminals and gives you the game in the first place (see, the whole anatomy of a game is O/W).

In spite of all that, why, you don't have time and the pc doesn't have enough body years to run out all those overts, even if you could keep him in-session that long, even if he could spot them all that long. And you don't even have time to run them out for one lifetime. How do you like that? And you haven't got time to sit around watching a pc's dirty needle go bzz, bzz, bzz, bzz, bzz, bzz, and try to settle it with General O/W. Recurring withholds will result.

General O/W, of course, is enough to straighten out the thing and get the session running, and all that sort of thing – a very valuable process; don't think I'm running it down. I'm just going to say it's too lengthy for that sort of thing.

And when I tell you to pick up somebody's missed withholds, I want you to pick up another person's action and not the pc's action. And it's best characterized as "nearly found out." Don't ask the pc for a missed withhold because he obviously, I have learned lately, he doesn't know any more of what I've been talking about than you have. See, you'd have to explain the whole anatomy to him. So there's got to be a better thing, see?
It – "What did we almost find out about you?" It's got to be that "almost." It's got to be "might have." It's got to be some conditional word. And then you will see a case suddenly go *spoing!* *nyyow!* and pick up the – a funniest, funniest series of disrelated incidents that that case had never looked at before, never had anything to do with it before. You'll see the tone arm do peculiar things and the needle do peculiar things that you've never seen it do on O/W because you're running a different track. You're running the "almost discovered" track.

Now let me give you an example. Once upon a time I was up in the wilderness and wilds of Montana, and for some reason or other, a wolf, gray timber wolf, showed up and I shot a bullet over his head. I don't know just exactly why I shot at him because I never have any trouble with animals. I was very young at the time. And he heard this bullet go by over his head and he reached up and he snapped at the place where the bullet had been. And he decided to come my way. It upset him to be missed.

Honest, you never quite see anybody quite so upset as somebody who has been just barely missed. Look at a pedestrian who was not hit. [laughter] The examinations flunks which you're most upset about were those which you passed all except for the last half of the last question. See? That's the nearness of the miss. In other words, missing things upsets things. It's a misestimation of effort or thought or something of the sort.

Now, a thetan's main attention is on estimation of effort, estimation of thought, estimation of look. He wants to know how much look is a look and so forth, and his certainties are all based on proper estimation of how much look is a look and all that sort of thing. See, just look at your Know to Mystery Scale, you see? How much knowledge is knowingness, see? That's an estimation. University is very simple. University hands you an old school tie, and you now know that you have the knowledge necessary, see? You can wave a pennant with your right hand so many motions to the left under the sis-boom-bah, and you're all set in life. That's how much knowledge, you see, is necessary to be knowledge. So that's an estimation of knowledge.

Now, you can go right on down the scale and how much emotion does it take to be emotional? How much emotion is emotional? Well, you get lots of answers to that: enough to create an effect on somebody. If you're a TV actress, it's very simple: enough to please the sponsor. You can go on down and take another one at random. What is a proper symbol? How proper is a symbol when it is a symbol, see?

Well, you can estimate everything, except "How much mystery is a mystery?" And of course that's a mystery. You're into the no-estimation-of-effort band. No estimation of the think, no estimation of anything; it's all mysterious. You don't know. The not-knowingness of it all is what is upsetting.

But now you take a not-knowingness which is probably known and play it both ways. Now, they knew but they didn't or couldn't have known, and you knew that they knew but you knew they didn't know.

Now let's just get the four-way flows on a not-know and you've got a missed withhold. And it's very painful to a thetan. So I really don't blame you for avoiding it like a plague.
See, the fellow walks up to the girl and he smiles and he looks at her in a sort of a false smile and he says, "Well, little girl, I understand you like dogs." Well, right away, her concept of him is – is "Did he know? Didn't he know? He couldn't have known," she thinks to herself. "He must know." But then complicated into this is the fact that he looks like he knows but he hasn't said enough to indicate that he did know, so he doesn't know. It's strictly ding, ding, ding, here comes the wagon, you know? Strictly. This is the stuff out of which insanity gets made, see?

It's a can't reach, not reach, must reach situation, and so forth, in the effort band. When you get insanity in the mystery band, it's a "did know, but didn't know, but mustn't know," you see? But he must know, but he mustn't know, you see, and it's the sort of reach and withdraw, only it's not a mechanical thing. And there it is and it's just pure mystery mucilage. And a thetan will stick right to it, man. Now, in trying to pull off the overt and the withhold in the presence of something that has a missed withhold on it does not accomplish an as-isness of the section of track in which the pc is stuck. Because the pc is not stuck with the overt and is not stuck with the withhold; the pc is stuck with the "almost found out." So, of course, nothing as-ises and you get a recurring withhold, see, because he isn't looking at that section of track where he did it or where he's withholding it. He's only looking at that section of track where it was almost found out. And you ask him for what he did and what he withheld, you don't as-is the section of track he's stuck in. So therefore, it just perpetuates itself and goes on forever.

And if you want to see something very remarkable in a pc, just very remarkable in a pc, just sit down in apropos of nothing, after you've got the pc in-session and so forth, just start running in any command sequence, "Well, just get the idea of nearly being found out." See, it has to be nearly being found out, see? "Get the idea of somebody nearly finding out about you." "Get the idea of you nearly finding out about another" – that's an unnecessary leg to the thing, but you could make it up – and the next thing, more track would be going by that this person had never heard of before. Didn't matter what else you'd run. That's got a brand-new track area. They've never seen this track before and it's been with them all the time. It's what's stuck out in front of their noses. Directly in front of their noses.

I could just ask you at this exact instant to "Recall a time you were nearly found out." Now go ahead, think of a time you were nearly found out. ... Having any trouble finding this time you were nearly found out?

Well, I shouldn't think so because that's the bulk of the stuff in front of your schnozzola. Most people can't even find an engram, merely because there are so many missed withholds in front of their faces. They can't get any clear view of anything, because they got missed withholds in front of their faces.

"Did they really know or didn't they? Was I actually discovered at that time or wasn't I?" See, that is the question.

"Who has nearly known about you?" Think that over for a while, you'll come up with people you have been leery of or felt nervous around.

And when I tell you to pick up somebody's missed withholds on Scientology, I don't want you to pick up the overt's that they have been withholding. See? I couldn't care less about
these overts, don't you see, that they have been withholding. That they have been withholding them, oh, all right, so they have been withholding them. You can get TA action by finding all the things the fellow has been withholding. That's good. That's fine. But this is a junior action. That would be asking you to run General O/W on a pc. That'd have nothing to do with missed withholds.

Now, when I ask you to find out something about missed withholds, get this pc's missed withholds. Don't you dare come up with any withholds. Just don't you dare! I want the name, rank and serial number of the person who missed it. God, I couldn't care less what was missed. You understand? I don't want the pc's actions, I want the pc's guesses about the other guy, see? That's what I'm asking you to find out.

Now, this is very arduous to run, because sometimes you actually have to bear down on it if your command has not been sufficiently explicit. You have to direct the pc's attention rather heavily. Let's say you've run a lot of O/W and so forth. Well now, you think you've got this all licked, you see? This person has been taking things from their company, you see? And you've run this – and they're taking things from their company and stealing them, actually, and you think you got it all licked. You've got the number of fountain pens and the number of stenographers, and all these things they've stolen from their company, you see? And you think you've got a tabulated list now and you say, "Well, that cured it" and so forth, and next week, why, they take a typewriter.

There's something missing here, something – something went wrong. You got all of the overts, and you got the fact they were withholding it. They're not now withholding because they told you – see, there's the rationale. And so therefore it's now all hunky-dory, and so they go back and steal a typewriter and the week after steal the boss's secretary, see? They're still nervous about the company. The person is not in a forgive-or-forget mood about the company. See, that's because they've gotten off these overts, why, you have a feeling, and your feeling is quite right by the way – you're not totally stupid – your feeling is quite right when you suppose that after they've gotten this straightened out in their mind they'll feel all right about the company. And they very often don't. They feel propitiative or they feel sort of guilty, or they feel some other weird misemotional way about the target of these overts and withholds, and you don't feel this is right. And so you keep plunging and asking for something else they did. And if there's anything guaranteed to drive the pc round the bend, it's after he has told you everything he has did, you insist there must be something else the pc has did-did did. You're in essence cleaning a clean, see?

Now, actually, because you sense that this pc is still a little bit "mnyah" about the company, why, then you assume there must have been some other overt. Well, he can always dig up another one or two, or something like this, and the basic on the chain, and... And the trouble is you so often have a near win on this that you really never get your win. You sort of quit eating just before dessert.

And there was a lot of people that were with us in 50, 51, that sort of thing, are starting to write me now and they're starting to get in contact again and that sort of thing.

I just sort of laugh rather raucously, by the way. The last one that did, I said he quit before dessert, you know? I'd realized after I had mailed the letter that I had missed a wonder-
ful sort of an epigrammatic sort of thing that he deserted before the dessert, you know, but it's – that's what you're denying yourself. You're denying yourself a forkful of strawberries and cream, see? You quit with the gravy and mashed potatoes, you know? There's still one more course.

So, he stole a typewriter, and he stole an eraser, and he did this, and he withheld it from this person, he withheld it from that person, and he stole the boss's secretary, and he goes so, and yes, all fine. Yes. And he's withheld it all these years, and now you know about it, and that's fine.

And he's sort of still kind of blowy and sort of nattery about the company a little bit. A week or so later, you see him; he really doesn't feel good about the company, and so forth. Well, you just quit before the dessert was served, that's all. You've got to find out who nearly discovered this, when and how often? And he'll give you exact split instants. Now. Now. Now. Now. All of a sudden he goes "Uu-huugh-coooo. I should say so. Ohhhh!"

See, the idea is you've gotten off all the overts, you've gotten off all the withholds, and he still doesn't like the Materiel Executive. Got the idea? He still feels a little peculiar in some parts of the organization. You see, you really didn't clean it up. Because the key-in – the bullet that passed almost into his ear but not quite, you know, just fanned air – was one day the Materiel Executive stepped out of the back door putting an inventory sheet in his pocket and looked at him rather frowningly and went on by into his office. Like somebody who has been in a hotel that has thin rooms and floors, you know, and the guy upstairs drops one shoe, you see? Five o'clock in the morning, he's still waiting there for the other shoe, you see?

Next action, you see, never proceeds from this point. We have started a piece of time track here which doesn't go anywhere. Next action is he's – you see, he's doing all this quite reactively, and it's down underneath the surface of analysis, you know? I mean, at the surface of his analytical processes. And he saw the fellow do this, and he knew it made him nervous, and he goes back in, and he doesn't want to have the phone ring. Because he knows what's now going to happen, you see? If the fellow did know, this is what's going to happen: You see, the phone is going to ring, and he's going to be sent for by one of the directors of the company, and then one of two things will happen. They will either hand him the pink slip, or there will be a policeman standing there, see? And then there's two choices that come out of that, and if it's the policeman, that's got one choice, you see? And you get a big dramatic sequence about the trial, you see, and he has to have all of the bad things the company did to him, and how it's actually one of the junior directors trying to cover up. See, he's got to have all the whole story manufactured for this, but is there any reason to manufacture the story? Did the Materiel Executive really know? See?

Here we've got the track that goes nowhere, don't you see? And it could develop into track, but is it going to develop into track or isn't it going to develop into track? Here's where this thing – just as far as time is concerned, it becomes a mystery sandwich and there's no time in it because those events don't take place. So therefore, there is no time track for it so the – which hangs it. It's not spotted in time. It doesn't fire off right, don't you see? There's nothing goes right about it at all because this isn't any estimation of it. You can't figure out what you would do because it didn't happen. You can't figure out what you would have said
because nobody said it. You can't figure out what explanation was the right explanation because you never had to explain it. You see? But you should have explained it, but you didn't. So there's just nothing known and you just get this terrific area of just total – it's not even hardly a positive-negative. It's just *thaah*. And that's a missed withhold.

And the missed withhold depends on the other guy – the accidental action of another person.

Sometimes it'll be a piece of paper, or something like that. He's sitting there. He's sitting there in conference and he suddenly notices that just showing in the boss's in-basket is a memorandum with his own name just showing above the covering pieces of paper. That conference is ruined for him. You see, he never has another thing to say during the whole conference. He sort of sits there and sweats, you know? But he really doesn't quite realize what he's sweating about. You see, there's his name on a memorandum. He doesn't know what the memorandum is about except that it concerns him in some way and he can't see what the subject of it is, do you see?

Now actually, three people are standing together in the hall, you come by and they shut up. There's a very good missed withhold situation. If that was preceded by an overt which the person wasn't telling anybody about, if that was the morning after the high-school girl's first raw escapade – see, the truth of the matter is that they probably had their mouths full of candy and couldn't talk when they went by. [laughter] But then one never really knows what the truth is, you see? No, there's no truth contained in any of it. It's just one huge glob of mystery. And that is a missed withhold.

It's a "should have known" as it has been described, but you will pick it up and be able to relay it much more ably if you call it a "nearly found out." It's a nearly known, see? Nearly found out.

Now, if you wished to clear up somebody's missed withholds on Scientology and you said, "What have we failed to find out about you?" he would give you a whole string of withholds. And this would then go no place, see? No. You want another word, and this will clarify it to you and this will clarify it to the pc and everybody will be as happy as clambakes. Now, "What have we nearly found out about you and when did we nearly find it out?" comes much closer in to what you want, see?

See, you want to know what. Well, he's not likely to give you the rest of it until he has identified, to some degree, what. See, "Well, my escapades with young boys," see, or "wild women or something," see? "That's what you failed to find out about me," you see? That's what he kind of answers. "What did we nearly find out about you?" "My escapades with wild women," see? Oddly enough, that doesn't clarify the situation at all. That doesn't make him like you any better, or anybody else. That doesn't keep him from getting ARC breaks. You've got to follow it up with a second question. Now you've got the missed withhold, see? You've merely identified what the missed withhold was about. You haven't got the missed withhold. Takes some additional step. All right.

"When did we nearly find out about it?" Now you could follow that through a little bit further if it wasn't blowing well with "who?" you see? "Who nearly found out about it?" "When was that?" You get the concatenation of questions – the series of questions – that
would deliver all of this data into your hands. You're looking for moments in the HGC's, D of T's office. You're looking for the instant when the PE Instructor all of a sudden paused. Fellow realized that he'd better cut this short because actually, he's gonna miss his ride home, see? This thought suddenly strikes the PE Instructor, you see? He's liable to miss his ride home, you know? So he'd better cut this short. So he's looking over the class and he fixes his beady eye on one person. Seems to lose track of what he was saying, don't you see?

Said, "Well, all right. Now you understand ARC and we're going to have to conclude the talk this evening. And so, good night," and hurriedly walks out the door. Now, the person his eye accidentally lit on in those pauses goes, "Eeenk," see? Nearly found out. "Did he know? Didn't he know?" See? "Wa-wa-wa-was he on the ri-ri-ri-uh-uhohhh. What did he guess at that moment? What did he recognize about me at that moment? Which one of my various crimes?" You see, here's something else, see? Now he doesn't even know which one of his crimes have been identified. Maybe the Instructor has been talking about the fact that people with big heads have more brains than people with little heads or something, you know? And this person gets some kind of a rationale about this thing.

He couldn't make up his mind whether he had lots of brains or little brains because he's always realized that he had a medium-sized head. See? Now, that's already got a little mystery connected with it, which is just nothing. Then all of a sudden the Instructor seems to completely look down, seems to completely change pace, and then abruptly leaves. And you know there'll be some people leave that PE class very, very nervous, because they realize when they go out the front door that the police are going to be waiting for them?

What did we nearly find out? Well, it isn't good enough to find out just what was nearly found out. We've got to find when it was nearly found out or might have been found out, but doesn't know if it was found out, don't you see? When and by whom? We got to spot these points. And all of a sudden, why, this person, tah! Everything is marvelous. Everything goes off beautifully, smoothly, and there it is.

Now, you can give me a gold star tonight, at least, for trying.

Audience: Yeah!

Thank you.
THE ROAD TO TRUTH

A lecture given on
1 November 1962

All right. Here we are, lecture two, Saint Hill Special Briefing Course, 1 Nov. AD 12.

I could give you a very masterly lecture now on the subject of truth. Truth. You see, I don't really feel up to it, but that's one of these histrionic-type activities – giving lectures on truth. I've stated it much better in other times and places; I didn't keep any notes on what I was saying. It's very difficult. Go around remembering everything, you know, you get stuck.

It's very applicable to talk about truth. If one knows anything about missed withholds or really got the idea of what missed withholds are, why, you have to get some grip on this thing called truth.

There was a fellow by the name of Pontius something-or-other; I think he went around washing his hands all the time. He had some kind of a fixation on it. Freudian complex. Before Dianetics. And he asked this "propoundous propunderance": "What is truth?" And it was a very good thing that he asked that at that particular time: solved everything.

But the point here is that truth is a very near ultimate. See, it's quite close to an absolute in its most severe interpretation. And if you were to say that something is true and not know at the same time the Axiom that absolutes are unobtainable, why, you would fall into the error of putting positives where there existed only maybes; and that is a very, very severe error.

Ah, there's been a lot of blokes on the track of one type or another, some of them wearing kimonos and some of them wearing togas and some of them wearing sandals and some of them wearing nothing at all, and these fellows were always going around telling people what truth is. Chaps like Plato and Socrates and fellows of various moment – philosophers, religionists, vast numbers of people – have been peddling a commodity called truth.

Well, truth is a relative commodity. And the best approach to truth is contained in a mathematics that you probably will have very little knowledge of and I have very little conversation with – it's almost pretentious of me to discuss this mathematics – but it happens to be the mathematics which is used to connect up your telephone switchboards in major cities. It's how they select out subscribers and so forth; they don't select them out with arithmetical truth.

Arithmetic is a theoretical truth but only so because there's no commodity or definiteness connected with it. It is a truth of symbols as long as the symbols remain symbols, and the only errors turn up when people say the symbols mean something and then they get into a great deal of trouble.
They say, "Two minus two equals nothing." Now, that's a very true statement as long as it remains totally in the abstract and is not applied to reality. As soon as we say, "Two apples minus two apples equals no apples" – I don't know, I think this is a pretty good magician's trick. Let's look it over.

A "no apple" is a relative thing. What happened to this apple? Well, the chemicals which composed the apple are still intact. I don't care if it was eaten or boiled or baked or burned or buried, there is still something of an apple.

We say, "Well, there's two apples on the table, so we take two apples off the table and we have no apples on the table." Ah, well, that's true. That's true, there are no apples on the table – providing time is right. Providing we can accept time as a truth, which I consider rather adventurous, too. Because there were two apples on the table. So we have to say, "If there are two apples on the table and we took two apples off the table, there are now, at this moment of mention – which is coincident with the exact removal of and with no reference to the past or future, and with reference only to this table in this place at this time – no apples." Now we're getting much more positive about this, you see? And yet again, that passes as a truth. Well, it probably is, relatively speaking.

But the idea of saying, "Two apples minus two apples equals no apples" is very, very adventurous indeed, because nobody – no thetan since the beginning of the world – if an apple existed, ever totally as-ised an apple. It presupposes the total as-isness of something. See, it presupposes the perfect duplication of a somethingness. It presupposes all kinds of magic. And yet in the course of fact digestion, study, all that sort of thing, over the trillennia, we have become accustomed to accepting such things as true.

Now, the figure two minus the figure two equals the goose egg, nothing. Well, as long as that is an abstract "think," we can say it's true, but then it's only true because we have set it up to be true. And the second we write it on the blackboard, we have pieces of chalk now which are representing the symbols. We have the symbols represented by a symbol. There's a commodity has entered into it and a somethingness has entered into it and it doesn't go someplace. You ever erase a blackboard? You have to wash it pretty darn hard to get rid of the last problem in arithmetic that was written on it. See, you get all these relative facts, relative truths.

Now, the person who adventures out on the road to truth adventures with great desperateness. And I wish to pull a long, gray beard at that particular statement because no statement about truth was ever relatively truer than that one. A person who would adventure on the road to truth is taking a terribly adventurous step, very adventurous. A philosopher who seeks to teach – discover and teach truth, is taking his life in his hands. And that wouldn't be very important, that he is taking his life in his hands. What is far, far more important than that is he is taking his hands the lives of a great many other people. Therein lies his responsibility. I'm not speaking about me. I'm just speaking about philosophers.

Now, what do I mean by "It's a very adventurous thing"? What do I mean by that? It's because that is the only track you have to go the whole way on. There is no short stop on the road to truth. That is the only track that you have to go all the way on. Once you have put
your feet upon that road, you have to walk to its end. Otherwise, all manner of difficulties and upsets will beset you.

There is no such thing as a relative philosophical truth which is safe if it does not approach the actual composition of the subject matter it addresses.

Now, to be just a little less pedantic about it, you address the subject of this universe in the subject of the physical sciences – the sciences, and you're going to find that there are many weird things in your path if you are going to simply address it through the savants of the various (quote) sciences (unquote). Heh! The insouciance of these people, you see, to actually use the word "exact science." It's an incredible impudence.

You walk into the chemistry department, you find one construction of an atom. There it is; it'll be sitting up there someplace around the department or the laboratory, and it'll show you the exact relations of molecules, one to another, in any given element. And there it is; it's all in model form; it's put together with wires – and students can go and look at that, and they're all very fine. And that student will be perfectly all right unless he goes over to the physics department. Because in the physics department they have an entirely different model and that is the same molecule of exactly the same element.

This is marvelous to behold because these two departments are, each one, departments of "exact science." And yet they are very often across the hall from each other. The student gets very confused. He goes into the chemistry department and if he doesn't say, "The atoms are composed this way, that way and the other way," he's gonna flunk, man! And he goes across the hall and here's an entirely different model, has no relationship to the first model, and that is the atom of the same element that he's just been studying. And he's going to get flunked in physics if he doesn't say it's *that* way! I think that's very fascinating. These are exact sciences, are they?

In the *Encyclopaedia Britannica* at the turn of the century, there's an article there about time and space which is highly informative. A very wise man wrote that article. And he said he didn't think many people will ever find out very much about time and space until they studied in the field of the mind and got the conceptual basis which preceded time and space. Now, that's in the *Encyclopaedia Britannica* at the turn of the century.

With that much wisdom confronting them, you would have thought that the exact sciences then would have pursued some interest in where all this came from. But their mud theory got in their road; they got all stuck up with it, you know? And there was that mud theory. And, oddly enough, it isn't even a new theory. It is found – oh, I think, about three thousand years ago in India, is the origin of our modern, "exact science" mud theory. And I think it originally was described "and it was mud from there on down." They got tired of explaining all this.

Now, there are the boys with their exact sciences and their exact truths, and they're playing with fire. Actually, it may be called "exact science" to them, but when they start telling people that these are truths, that these are absolutes, and then make a model of the atom one way in the chemistry department, and make it the other way in the physics department, I think it's time for somebody to decide they didn't know what they were doing.
The world right now is in most of its trouble because of the (quote) advances (unquote) in the field of physics. In the field of physics they know how to blow something up but not how to keep it from blowing up or retard its blowing up at a distance. See, they have all the overt weapons but none of the preventions for those weapons. I consider this very fascinating because before you build an atom bomb, you should have built a sane man. A sane man precedes the structure.

Now, you have a subject known as workable truth. If you put glue on one piece of paper, you can make it stick to itself or another piece of paper; and that's a workable truth. You can use that. Post Office Department uses it to keep stamps on envelopes and – all kinds of uses for this, you see?

If you dig a hole through a mountain, you can pave the bottom of the hole and cars don't have to drive over the top of the mountain. Don't you see? And a whole series of workable truths go into the construction of this tunnel and this roadway.

Those are workable truths. And this gives the "exact sciences" (quote) (unquote) a very bloated notion of themselves, because they deal with workable truths.

Now, in the field of man, the first workable truth that anybody will try to give you is that "Nobody can do nothing about him nohow," see? "Nothing can be done about it." No truth exists in this field. "Man is an animal based on chemistry." Where the hell did that come from? It's an animism of some kind or another. It's some kind of an odd theory or philosophy that grew up in a revulsion against the control by religion of men's faith.

Psychology – psyche-ology – is a study which is peculiarly religious and is entirely and completely so up to 1879 when a fellow by the name of Wundt at Leipzig, Germany, concluded that men were animals and had no psyches. And he has taken off from the point of no psyche as a theory – but just mud – and has gone forward and you have your modern psychology. Don't let anybody tell you that modern psychology is a product of the physical sciences. Psychology, in general, is totally a product of man's religion of yesteryear; the only place it's been taught has been in seminaries. You get faculty psychology is taught in religious universities. You get Saint Thomas Aquinas, 1200 and something, writing textbooks on the subject and so forth. This was entirely a religious affair.

Well, nobody moved in on it sensibly; somebody moved in on it in a spirit of revolt, just like religion has been blown up here and there down the track, as the years have rolled on, by the advances of the exact sciences, so-called. There had been an awful war in these two things. So the exact sciences have now entrenched themselves in a total falsehood in the field of the mind, at the same time developing a totally unworkable psychology to back up the exact science of blowing up the planet. Isn't that an interesting area to dead-end?

Well, that gives you some of the liabilities of embarking on the track to truth and not going toward truth.

Now, Buddha – Gautama Siddhartha – nobody should say any hard words about this man, because he told everybody he was just a man, he was trying to set men free and he was

---

4 Editor's note: Maybe a pronunciation error and LRH wanted to say "animalism".
trying to help people out and so forth. And all that was perfectly true. And he discovered how
to exteriorize without being able to stably exteriorize, without discovering any of the rules or
laws of exteriorization, without making it possible for anybody else to exteriorize at will.

How many hundred million people, since twenty-five hundred years ago until now, did
Gautama Siddhartha totally condemn to utter and complete slavery by not walking down that
road all the way?

Because that – those half-truths have been used and used and misused and abused and
booby-trapped and monkeyed up and so forth. That's merely because he didn't go all the way
down the road, don't you see?

Now, knowing this sort of thing, it takes a rather brave man to walk in the direction of
truth because he knows very definitely that he must go on down the road. If he knows any-
thing at all, he realizes that the traps of existence and the upsets of existence are composed of
half-truths, and that all work to amuse or enlighten or something is susceptible to being em-
ployed in the field of enslavement.

The slave makers always use it; it serves as the mechanism to trap by the two-way
flow, don't you see? Somebody comes along and want to set everybody free and naturally the
reverse flow on it is to trap everybody. One has to recognize this as an action.

Well, we take this fellow, Aesop. You've heard all about Aesop; you've read about the
fox and the grapes, and you read about all kinds of Aesop's fables of one kind or another.
Now, I'm sure that you are today a much more moral person, and much better for it.

The only trouble is that the original manuscripts of Aesop were recently located and
there's not a moral in the lot. They are just amusing stories about animals. There is no final
lesson in any one of the stories. Every one of those lessons has been added to Aesop's fables.
And we today are accustomed to think of the moral as a sort of an Aesop's fable thing, you
see: he tells a parable and that teaches us to be good. And that wasn't what Aesop's fables
were; they were simply something to amuse people and lighten the tedious hour. I think it's
quite wonderful. It even enters the field of fairy tales.

Now, all of this is extremely – not apparently very pertinent to what you are doing, but
in actuality it is, because in the microcosm of a single human being, of the single person, you
have the pattern of the macrocosm of the universe. And one could deduce that the universe
exists from a series of basic postulates and proceeds on down the line in development from
those postulates. You could even spot the goal of gold, the goal of lead. You could even spot
the methods of livelihood of quartz, serpentine schist, hornblende, to name some combined
elements – the rules of what they do. It's not that these things are alive at all; it's that they fol-
low a certain dictated behavior pattern.

I was sitting looking at a fly this morning while I was eating breakfast. And he washed
his face in exactly the way that all flies have washed their face for a long time. And he fixed
up his wings in exactly the way flies fix up their wings. And I thought, "I wonder how many
hundred trillion scrillion quadrillion flies have washed their face that way." And I thought to
myself, "By golly, it's wonderful the way some postulates stick." [laughter]
You get dead matter, the world of insects, lichen, moss, man – it doesn't matter; you're actually looking at the same cumulative structure based on certain intentions and dedications. The whole world of chemistry could be reanalyzed on the subject of postulates and intentions. The world of physics could be similarly analyzed.

Instead of sitting there wondering how many "microjilts" are supposed to be imposed into the ohm, an electronics man would much better spend his time, if he really wanted to make some progress, in an effort to analyze the pattern of intention which goes up and constructs a certain power behavior. What is this? And if he could grasp that, then he would grasp electricity. But he shirks his duty by the simple reason that the first statement made to him, as he walks into his polytechnic school or as he joined his Boy Scout troop – doesn't matter where he connects with this stuff called electricity, he always connects with it – and his first postulate on it is "Nobody knows what electricity is."

And this is said to him as though it means something. I think that's wonderful. In fact, everybody knows this statement, but exactly what have they said? Analyze what they've said. They've made a remark. They haven't said anything. They've just remarked something. They haven't even given anybody any reason why nobody should; they haven't told you nobody could.

They just say nobody knows anything about it. Of course, everybody is willing to agree that everybody is stupid, so they let it ride.

That's the craziest thing I ever ran into: "Nobody knows what electricity is." I imagine that's taught that way in Japanese today; I imagine it's taught that way in Swedish, German, French, Italian, to say nothing of English. It'll be soon taught that way in Africanese, Ghanaese, or whatever they talk down there. I can hear it now: "Now, this stuff that goes snap, crackle and pop – you see it here, you know; goes snap, crackle and pop. Well, now, the first thing you should know about this" – they always say this, you see – "the first thing you should know about this, is that nobody knows what it is."

Well, that effectively keeps one from entering any road of truth; that just puts one in a bracket where he can be shocked, blown up, exploded, fried, where he can run out of batteries, where he can go out in the cold morning and start to start his car and not have one start. The direct and immediate results of this statement are everywhere around us today.

Well, that isn't a road that has not been walked down; that is a road that is effectively barred. Everybody said by inference that you can't walk down that road. That's the wildest thing I ever heard of! And yet people have been telling people they couldn't find out about truth for a long time.

And the only reason I really make fun of Immanuel Kant is the outrageousness of his premise. I've even used some section of it – to my shame, but I've really used it – but it's nice stuff to explain with. You say to somebody, "You don't have to know – to begin this subject and to look it over and get some result in it – you don't have to know the totality of everything before you can begin on it." You know, in other words, you don't have to have walked the whole path before you start to walk the whole path. Well, to that degree, "the unknowable" has some use.
But Immanuel Kant didn't use it that way; he used it entirely differently. He said there was the knowable and there was the unknowable; and he said the unknowable ain't never gonna be known by nobody. And what I want to know is how did he find out about it? [laughter]

And yet people at this minute are sitting in universities in the world listening with reverence and awe to those outrageous words: that there's an unknowable that nobody will ever know anything about. That's one to really tangle with, man. It's outrageous even by philosophic examination. If you can't ever sense it or experience it or be in time with it or have any clue of its existence, then how do you know it exists to not be known about?

Now, I think you will find that there is a considerable effort on the part of man, wittingly or unwittingly – aberratedly, certainly – to say that certain roads are closed and that those roads must never be opened. "It is very bad to know about the human mind." Well, let me tell you something: if you're alive, you know something about the human mind. And I'll tell you what's dangerous: is never to find out any more about it. That's dangerous!

And man today faces that danger. And in just the last few days – just the last few days – the cobalt 60 was very close to spreading its fallout far and near over the steppes of Russia, and "made in Moscow" (or its suburbs) was about to be scattered, trademarked on scrap iron, all over America.5 Because of what? Because it is so dangerous to begin to know anything about the human mind.

Now, people recognize that it is dangerous to some degree, but don't really realize what really is dangerous. Because they know of the existence of something, not to know all about that thing is dangerous. And they are conceiving that they don't know anything at all about it. And let me propose that to you as the most idiotic premise in the field of the human mind.

There's little Joe Blow down here. And you say, "Do you understand women?"

He says, "Hell, no. No man'd ever understand women." He says, "You can't figure them out. One day they're this way; one day they're that way."

You ask his wife, and you say, "You understand anything about men?"

She said, "Yes, they're a pipe. You know what they're doing. You know what it's all about. Except you never get your way."

What are they talking about? What are they talking about? They're talking about knowing something about somebody's mind, aren't they? Somebody's behavior pattern, aren't they? In other words, they're aware of the existence of think, figure, calculate, in other beings. Well, that has already started on the road to research and knowledge in the human mind; and it is very dangerous to go no further.

So where do we get this thing if you embark upon a line of truth as a special action only proposed or done by a few select individuals. No, it's the shopkeeper and the bus driver

---

5 Editor's note: This refers to the Cuba Crisis which reached its climax in the late October of 1962.
and everything else. They've all started to know something about it. But it would be very dangerous indeed. In fact, it will cause their deaths not to know any more about it than they do.

I mean, that's such an acceptable fact to you, it doesn't even seem to be a startling fact. Not knowing any more about the mind than they do will bring about their demise. They will die from this! Everybody says, "Yes, of course." You see how accepted it is? And yet it's quite a startling fact. They're going to get an ultimate extinction through starting upon this stupid line.

But let's take a specialized case where a group of individuals decide to go for broke on the subject of knowing about the human mind. They're going to make a clean break; they're going to go through this, and they're going to go down the line, and they're going to know all about this, and somebody amongst them is going to tear the answers up left and right, and dig them out from underneath this and that and the other thing, and they're really going to make some progress along that line. Listen, the more they know, the less dangerous it is.

The really dangerous entrance point is to suppose that people think, and know nothing more about it than that. That's dangerous! Not to walk off that point further in the direction of truth, is a dangerous action.

But any philosopher who singles himself out, or any engineer or any research person who singles himself out as the person who is going to be spotted as the person who is walking that track – now, that becomes very, very dangerous if this person doesn't walk the whole track. See, that's selectively dangerous. You share in some of that dangerousness.

It's been so booby-trapped that everything is very suspicious of anything being known, because people who have jumped up and said something is known, have very often lied. Now, if they have pretended to know more than other people on this subject, they have then committed overt. And if they have then turned up some little piece of bric-a-brac and have never gotten any further than that, but spread this bric-a-brac in all directions as "the true wisdom," they have committed the overt of committing perhaps millions or billions of human beings to slavery. And I think that's a considerable overt.

So there's no substitute for walking the track. You've got to go on down that road, particularly in a spot such as mine. You got to bring this off, man.

Now, there's never been any doubt in my mind about bringing off this particular study. This is not something I have engaged in any doubts about.

I've sometimes wondered whether or not the time factor wouldn't upset things, because we also have another time factor involved over here called a "world situation" and I've needed a few clear years, and that has sometimes worried me a little bit.

But the fait accompli was pretty easy to envision, because we'd already made the seven-league boot strides necessary to put us way on down the track toward the end of track anyway.

But now, if you have a reputation for knowing, you enter into a mechanism known as the missed withhold. And as you go down this track, separate from and distinct from your fellows, as being one specially gifted in the subject of knowing about the mind, you have en-
tered into, now, a peculiar liability that has nothing to do with the reaction or liability for simply treading the track of truth. That has nothing to do with that. This is a reputational action. People think that you know the truth and to them the only truth that exists is themselves. It's a first dynamic truth; their conception of truth is their own aberrations, misdeeds and ideas of right or wrong conduct.

Now, every philosopher has more or less been engaged upon a selection of ideas of rightness of conduct and wrongness of conduct. Particularly the Oriental philosopher has been engaged upon this point. It is totally missing and totally absent from the Western philosopher. He doesn't much talk about the rightness of conduct. He talks about behavior patterns and he talks about social sciences, and he talks about other things. He doesn't even talk about ethnology; this is an almost unknown commodity to him except as he applies this, maybe, to some savage race down on the banks of the Bongo-Bungo. He doesn't realize that ethnology is equally applicable to a savage race living on the banks of Forty-second Street. He actually doesn't approach this subject very closely. He talks about behaviors and he wants to get away from this.

Well, one of the reasons he wants to get away from this is he's totally blind to the possibility that there could be an exact right conduct. See, he speaks of a behavior pattern, not a rightness of conduct, whereas the Oriental philosopher, wishing to lead people in the direction of better ways and that sort of thing – Lao-tse, Confucius, particularly – these chaps are fixated on the idea of right conduct: the right conduct and the wrong conduct.

And it's to a point where, in Japan, if you drink out of the wrong side of the tea bowl, you know, you've practically had it; you're socially ostracized. There's another island country where if you don't cross your knife and fork in an exact way in the middle of your plate, nobody ever invites you to dinner again. These are rightness and wrongness of conduct, and it's adjudicated in those particular ways.

The crux of the situation is that all behavior is built – all considerations of behavior, all considerations of the O/W mechanism, are primarily based on ideas of right and wrong conduct. Back of the O/W mechanism is the idea that right conduct can exist. This is the only saving grace of the human race or of any race of beings. It's a rather touching thing if you get down and think about it: the idea that right conduct can exist. It's quite remarkable.

Of course, right conduct according to whom? It's the group mores, your survival factors are put together on this. Your Polynesian with his taboos was trying to maintain a very compact population in an area that raised very little food and therefore was incapable of supporting overpopulations and so forth, so he invented a taboo system, and he made a whole series of rightnesses of conduct. Actually, survival is your monitoring factor of rightness of conduct.

But it is not that an individual acts for his self-preservation and commits overts because of his self-preservation. That is too direct a look. He commits overts because of survival. It is his rightness of conduct, see? It's a slightly split-hair difference, if you follow the thing.

The behaviorist would try to tell you that it was – he is a – there is a school of activity known as behaviorism; I didn't refer to that. They try to say that it is totally and only and al-
ways a first dynamic existence, and therefore it isn't survival, it's self-preservation. And by this, they miss the whole boat. They don't even put their foot on the gangplank. They hardly even walk up to the right dock, you know, and they go right on off into the river. No boat there. Never intended to be one there, either. I mean, that's really missing the boat. Because right conduct is always a group activity and is never an individual activity.

No matter how much the individual speaks about integrity to himself, it breaks down eventually into a group activity because his ideas of his own rightness of conduct are based on the group to which he belongs.

So we get the third dynamic aberration of right conduct as underlying all O/W, underlying even missed withholds. The only thing senior to it is the pure, pure mechanics of existence: There is a thetan and a thetan does these things, you see? Your very early Axioms are quite unrelative as truths. They're just about as close to truths as anybody will ever be able to push it, see? They're right up there pushing the Axiom "absolutes are unobtainable" so close that there is hardly any distinguishing it at all.

But the aberrations which he then engages upon are his efforts to discover right conduct: What is right conduct in self? What is right conduct in others? What is wrong conduct in self? What is wrong conduct in others? And, of course, from lifetime to lifetime he lives in different groups and his sets of mores change and change and change and change.

So there is no road to truth on the subject of right conduct. You just study nothing but what is right conduct and then take what the group says is right conduct and you're not going to wind up with truth.

Now, if you realize that it's a search for right conduct and an effort to adhere to codes of right conduct and breaking of codes of right conduct, which then bring about the aberrated condition, then you are walking a road to truth.

Now, let's get this subtle difference; it's quite important to thee and me. Borrowing liberally from the Book of the Winds and Book of Changes and so forth: Confucius, he say, "Young man who support elderly parents, he good man," see? Well, that's perfectly all right, right up to the moment when somebody says, "This is truth," because this is not truth! This is only a species of right conduct; it's only a belief of right conduct. In other words, it's actually an entrance of arbitraries into conduct. And therefore, if the entrance of arbitraries can be considered truth, I think we've all had it.

That would make all the laws passed by the US government, the English government, the Chinese government, true.

Particularly today, the US government is always trying to legislate truth into existence. I think it's the most marvelous activity; highly complimentary. I mean, fellows trying to lift elephants with their little finger should always be patted on the back and so forth. But I think it should also be pointed out to them that those elephants are a little heavier than the stress-analysis structure of the small finger.

They're always trying to say their laws are true. They no longer consult the customs of the people in order to pass their cotton-picking laws. And man, how crazy can you get? Where are you going to go for law? Because any law professor I ever had that was worth his
salt and was a good Joe always made this practically his first point: Laws are evolved from customs of the people and are eventually solidified in the form of Legislation and become a law of the land. A law which does not so progress either operates as a total tyranny or is totally unenforceable.

You want to know what's a tyrannical law or a law you can't enforce? It's a law that doesn't evolve from the customs and mores of the people. That's unenforceable. Can give you numerous examples of this sort of thing. Prohibition: Somebody came along and said, "It's evil to drink." I don't know what the population of the United States was at that time; must have been upwards to a hundred million people. And there were only a few of them who agreed with that. They waited till some ten million men were in uniform, or something like that – or maybe it wasn't that many – and couldn't vote at that particular time, and then they passed this law into existence. And these fellows came home and found out that it was illegal to drink and they didn't agree with this.

So Prohibition was a mockery. I don't know how many lives it cost, how much revenue it cost, how much property it destroyed and so forth, and finally even the great and mighty government threw in its sponge – said, "Lap it up; we can't do a thing about it."

In other words, not the whole Army, Navy, Coast Guard and everything else – nobody could enforce this thing. Nobody. It wasn't borne out of the customs of the people. In other words, it went straight in the teeth of what people considered as right conduct. In those days, if a man was a man he held his liquor. What if there was no liquor to hold? He had no definition for a man. [laughter] In other words, you just pull the rug out, man. Pull the rug out.

Well, this concerns you very vitally. At a very – I very seldom talk to you at a high level of theory – but actually does concern you considerably. It does, because all around you, people are determining truth from what people say right conduct is. See, they say, "Well, you're supposed to do this and supposed to do that and supposed-to's, supposed-to's, supposed-to's, and these things are true."

I'll give you one of these data – one of these data that's very, very interesting – a datum concerning kleptomaniacs, developed in the field of psychoanalysis. "When a kleptomaniac can't steal anything, he always burns down the house." That's a scientific datum in psychoanalysis. You think I'm joking, you know. I never actually throw a total punch in this particular line till I can get these textbooks and open them up and start actually reading them at random.

You want to really have a ball sometime, get somebody like Karen Horney, textbook, and sit down with four or five – well, fairly sensible blokes of some kind or another, and just start reading them, with a straight face, from any point in the book forward. Anything I've ever said in the field just turns pale. You see, I'm a moderate in this line; I don't like to exaggerate. But they won't believe you. If you sit there with your face toward them, the back of the book toward them, and actually just read out of the textbook, they will not believe that you are reading the latest and best school of psychoanalysis. They'll think you're pulling jokes. They'll think it's just nothing but solid gag from one paragraph to the next.

I finally one day saw an engineer – to a group of engineers that were being treated in this fashion – actually, just in a rage, get up and go around back of the fellow who was read-
ing it aloud, and jerk the book out of his hands. And he didn't even want to read it! And that engineer that pulled the book out of his hands had to actually be forcefully held up against the wall and the book had to be shown to him, and that the person in that chair was actually reading exactly what was in that textbook on the subject of psychoanalysis. And when he did, at that moment the engineer, for the first time in his life, realized there wasn't a science of the human mind extant on the planet. Up to that time the reason he paid no attention to Dianetics and Scientology: he thought there was a science of the mind.

Now, that's one of the primary things that you run into. People have a whole bunch of data over here which are what they're supposed to do, and these are right conduct – and that to them is truth – and what you're not supposed to do.

For instance, the law defines sanity as the ability to tell right from wrong. I consider this marvelous. In what land? Well, don't ever try a Zulu in an English court. And don't ever try to try an Englishman in a Zulu court. Because there's going to be some things messed up, going to be some withholds missed.

Now, here's your peril (your period of peril is past, to be alliterative): It was over a period of time as to whether or not – taking you as a unit of truth – you, individually, could have your state of understanding of yourself and those around you materially improved by study and processing. Now, if anybody will sit still long enough and if the auditor will do the right things at the right time, why, this is going to happen today; this is going to happen.

You could also carry it out to very nearly an ultimate, very close to it. You can get the fellow back to a point of his total realization and recognition of exactly what he has done and where he has gone – in other words, clearing – and exactly how he's done it, and how it formed up, and so forth. And if you were to take raw meat and push them up to a three- or four-goal Clear, why, they might not tell you for other people, they might not be able to articulate it (which is the main trick, after all), but you hand them a book of Axioms and they say at that time, "Of course. What are you showing me these for?" Or "Oh, yes. Yes. Oh, yes, of course, of course. That. Oh, yes, yes. That, right. Of course, naturally. Yeah, that's right, that's right, that's right, that's – of course. Yeah, that's pretty good." And mostly what they're saying is "pretty good" is "That's fairly well stated. Yes, I'd say the same myself if I could." All they're doing really is expressing some kind of an agreement. You're not teaching them anything, because they now have a subjective reality on it.

We've got a reverse-end look on this thing and we're starting at the point which is hardest to start, as everybody is stupid as hell on the subject, see? And originally and basically that included me, see? So you see where we have went to.

Now, we are essentially in the business of individuals and you must never forget that. On the road to truth, you are in the business of individuals. I could give you a long and tiradious lecture on the subject of the third dynamic and how it gets loused up, but I don't think it'd serve anybody's purpose. Just let me say en passant that most organizations, as they exist on Earth today, exist, in their first instant of genus, on the fact that they could not handle an individual, one individual. The failure to handle that one individual then brought about, not their demise, but their construction.
All organizations on this planet today can be evolved from the first moment of failure to handle one individual. They couldn't handle him, they couldn't understand him, they couldn't reach him, they couldn't help him, they couldn't solve his problems, and so they set up an organization to do it. That organization directly and immediately evolves from the failure to handle that individual.

Now, this doesn't tell you that this is true of all third dynamic activities. This only says "Earth," and this only says "aberrated third dynamic activities." But it's an inversion. You're on the lower scale. You're way below the first dynamic. They couldn't handle the first dynamic, so they developed an organization not to do it.

Oh, I'll give you an idea. An organization tends to grow up even around me, to this degree. Yet we're the one organization or the one activity on this planet at this time that doesn't follow this. But it gets pulled in toward it every now and then, as you – every one of you – know, to your experience. At some time or another, an organization in Scientology has not given you an answer or sent you a book or done something or served your needs at that particular moment or purpose. See? Well, it's all based on this thing. It's just not enough MEST or time or space or speed or something of the sort, in order to have delivered that service. But we are the only group that would be capable of doing it and that do succeed in it. We are handling the individual.

And you will never, in your whole history, handle more than an individual. I don't care what you're trying to handle or if you've set up a government for the planet. You will only be handling one individual; not one individual multiplied many times. Russia shoots individual and loves the masses. I think that's quite marvelous. How did they get that way? Well, it's a total aberration on the subject. You follow what I'm saying now?

Now, you can do this if everything you do do, does serve the individual, individually and peculiarly tailored to his needs so that he is not overlooked in the process. But you set up an eddy and an upset every time you have failed to handle one individual. You handle one individual and everything is fine; and you handle – you fail to handle an individual and you will set up an organization to try to do it. You'll set up all kinds of things to try to do it! You'll set up all kinds of brutal laws and jurisprudence and everything else to try to do it! Where you have failed to handle an individual, you will set up all sorts of O/W.

In Scientology, we're probably the only organization that has any capability at all of going in the direction of a clear third dynamic, and we're going in that direction. We use O/W today to park somebody till we can handle him. We never forget we're handling an individual. And I never forget I'm handling an individual. I'm not handling "people," ever. I'm handling you and you and you and you. Because you are truth. I don't care what you look at as truth to begin with or what you will look at as truth at the end of the line; if there's any truth to be found, you're it. If there's any truth to be known, it'll be you who will know it. And beyond that and outside of it, there isn't any truth.

Now, you see what I'm talking about as the road to truth?

_Audience: Mm-mm._
Now, don't you worry about missing withholds on Joe and Pete and Bill as they come into the PE class. Don't worry about that. You won't suffer from it. People won't do bad things to you because you don't know all about them instantly. As somebody just said to me, your confront is very high. A Scientologist's confront is way up and very often when you look at somebody you almost cave him in, because he says, "What-what-what does he know about me?"

Well, your only mistake at that point is not to reach him as truth. You are confronting, that moment, a road to truth and you've got to travel it because you've already started to! You have looked down it!

There is many a pc you'll start to process, or many a human being you will try to tell about Scientology, that you will say, "Why did I get up this morning! It must have been – I knew something was going to happen, because when I put on my left shoe I found it was designed for the right foot. And from that moment on, I could have taken warning and simply gone back to bed. And I didn't. And here I am arguing with this person in this PE Course. And he's saying, 'I understand Ron doesn't believe – doesn't believe in God.'" And you're trying to make some kind of heavy weather out of it or make conversation out of it or trying to fend off this accusation or trying to straighten it up or handle it – you're going to find yourself at that moment on the road to truth.

Well, I'll tell you the wrong thing to do, is unload – jump in the ditch. That's the wrong thing to do. Your success in the future totally depends upon your ability to walk that road and not to jump off of it because all of your disasters anyplace will stem from that exact instant when you failed to walk that road and turned around and did something else and set up an organization to handle this jerk. You see that?

Audience: Yes.

There's this guy. He's saying, "Well, Ron doesn't believe in God. And I understand this. I heard this every place. So how can – you can say he's a truthful man?" See, this guy knows what truth is. You have faith in the big thetan, see? It's kind of a 1984 in... with a cross above it, you know? And that's truth! He's been taught all his life you must have faith in this thing. He's been taught that as right conduct. He sees somebody isn't instantly following down this, and snapping and popping and making the sign of his particular cross. I know of several crosses and how to make several signs of the cross, but we're not making his sign of the cross. So therefore we are not truth.

See, he's got "right conduct" mixed up with "rightness of conduct is the source of aberration," and these are entirely different remarks. He doesn't realize he's nuts! That's one of the first things he has to find out. Well, you're going to find there are many ways to teach him this initial step, and you will fail and you will succeed and you will do this and you will do that. And listen, you will only be wrong – and I'm not now talking about right conduct of a Scientologist; I happen to be talking about survival in the early Axioms at that level – you will only fail if you don't try, if you don't make some stab at it. Because if you make some kind of a stab at it, you'll be surprised; he won't go away even though if you didn't handle him in that first fifteen seconds and you put him on the shelf to pick him up somewhere on the track.
You'll be surprised. This happens to me every once in a while. I processed somebody one day; he was lying in a sickbed. I thought he was going to die. I thought I flipped the whole thing; I thought it was gone, sunk, that was it. Never processed such a lousy session in my life. You know? I couldn't even get the pc practically to answer the auditing command. I got him to say it a few times, you know? And I finally patted him on the shoulder and said, "Well, I hope you'll be all right," and so forth. Tried to put in a little hope factor before I walked out of the room. The man was dying, see?

I actually felt bad about it for – you know – a little bit bad about it for several days. I couldn't get through to the guy. I couldn't do anything for him, you know, and so forth, and there it was, and his whole life all busted up, and that sort of thing. I almost fell off the top of the HASI steps at Notting Hill Gate – and that was a long flight of steps, if you remember. There was this guy, hale and hearty, just having finished another intensive. He'd been alive and well for two years, and he all dated it from that moment of being processed by me.

You'll many times think you fail when you haven't. The only mistake you can make is to try to go backwards on this road to truth. It's not possible without completely caving in. A very, very dangerous thing to do.

So this fellow stands up in the PE class, and he says, "How can you people know anything about truth? I understand Ron doesn't believe in God." What are you going to say? What are you going to say? What are you going to say at that moment? Took you by surprise. You didn't even think he was going to talk! Well, at least be inventive enough to say, "Well, you know, I think you ought to write him about that. Post box out there in the hall. Next question." [laughter]

Well, at least you've made a start. At least you've done something. The wrong thing to do is to back up and construct an organization which handles masses and never handles an individual. Because it is very certain that if you fail to handle this guy who stands up in the PE Course, if you fail to push home your confront on your friend who says he hates you because you might have missed a withhold on him, if you don't say to him, "Well now, just count off the number of times I've nearly found out something about you, Joe. Count them off" – you're not even asking him what you nearly found out, see? – and press it home. The guy finally says, "Well, aziziz-da-da-da-umm," you know? Shatters him! You say, "Well, I failed!" and you probably didn't. You only fail if you didn't try.

So don't worry about the fact that you know more about them than they know themselves. They only stand up to be handled. The only way you're going to build up some kind of a clumsy, stupid mess of a nonfunctional Scientology administrative system will be totally and completely based on the one guy you didn't handle; the one case you didn't solve. Your retreats are all based on that.

Now, I can only tell you from this point of view that every once in a while somebody kicks the bucket and goes totally beyond reach. That doesn't make me feel good but I know very well we'll pick him up later. That's all part of the road to truth.

Various things happen, various catastrophes occur, people get mad at ... You would be utterly amazed how many people write me today who were furious about me four years ago! Utterly incredible.
Now, there is no truth in the mass of things; there is no truth in moral codes. Truth isn't to be found there; only agreements. But in the final analysis, there is truth to be found and there is a road to truth. You have that within you and every time you look at a human being you see it in him. And as you know what it is about, the more you know about it, the more you understand it, the less these factors will trouble you.

But even the little fellow in the bakery shop who's doing nothing but wrap up bread has already started on the road to truth. And his only stupidity is he hasn't got enough sense to keep going.

So don't worry about you being on the road to truth and that it's a very adventurous line or me being on the road to truth; shucks, we're almost there.

Behind us lies the most thorny, messed-up track you ever saw in your life. Wouldn't navigate it again for a – for a box of biscuits. But the truth of the matter is, well, we're there; that road's behind us. Possibly take us quite a while to sit down and find out where we are, now that we're there. [laughter] But that's allowable, too.

But we'll only retreat from our position to the degree that we don't realize this fact: that you can't start a case, you can't embark upon clearing a planet or an individual diffidently without to some degree seeing it through to a final conclusion. And your only disasters will simply stem from your failure to follow that road all the way through.

Think them over and mark them up sometime along the line and you'll see how true those words are.

Thank you very much. Good night.
THE DIFFICULT CASE

A lecture given on 13 November 1962

Thank you.

Well, we haven't seen you for a long time. I took pity on you. I had a lot of material of one kind and another, and I put it into bulletin form last week. I wrote six highly technical bulletins last week – the better to teach you with, my dear.

Okay. This is what?

Audience: 13th of November.

Thirteenth of November, AD 12, first lecture, Saint Hill Special Briefing Course.

Nobody has given me a list of goals found or not checked out or anything recently, so I can't give you much of a report on that. I can, however, read to you a very interesting - nonapropos to the lecture I'm going to give you – a very interesting letter which I have received. Undoubtedly it's a personal letter, and I thought you would all be interested in this.

He says, "Dear Ron." We, by the way, are a new address. We're a new address here. We're Saint Hill, England. [laughter] After a while, anybody addressing anything to England will simply write "Saint Hill," you see? [laughs, laughter] Only they'd better not write "The government of Saint Hill up to London."

Anyway, this letter follows: "Dear Ron, As the fellow that won the door prize at the congress, I would like to have some more... like you to have some more reality on me and I want to tell you my view of how things have gone. I am sure you have the auditor's reports.

"Prior to the congress, I was in a particularly bad, withdrawn condition, but I went to the congress with a purpose. After Jim found my goal, I was in a wonderful, euphoric condition. I was dramatizing my goal, but the most significant thing was a complete separateness from bank. The second most significant was a thousandfold increase in communication with people.

"I made arrangements with the Center to start listing. I went Clear on 16 lines in forty hours. During this time I felt increasingly better and more stable. There was a low point at the end of fifteen hours. I wrote a letter describing my case and the auditing. I went out the bottom for three days until I cognited on what had happened. Your advice on not discussing your case in any fashion is absolutely right. My reality is that pcs during goals listing – that is, listing on the goal – are exceptionally sensitive in this regard. It isn't like any type of case auditing.

"I, of course, got many cognitions. The most important resulted in a change in beingness, a change of direction in my life and establishing definite goals as opposed to sometime nebulous goals.
"After the clearing of 16 lines, there were still little edges of uncertainty – doubt on my stability and wonder about reaction to my environment. The next week – I went Clear on 29 September on 16 lines – we proceeded to do the 114 lines. These went free in three hours. The uncertainty and doubts, and so forth, cleared up. In my reality, the final key to Clear was acceptance of total responsibility for me, my body and my bank.

"I have been going back to the Center each Saturday for a check – Tiger Drill and so forth, and a few buttons which might have something in present time on them – but after one or two interrogations the needle cleared. Last Saturday there was nothing. I picked up the cans and according to the auditor read 3.0 with a free needle. I was and am stable in my reality, and all the buttons were clean.

"There seems to be some confusion in the org and HCO about a final Clear check by a Class III Auditor. I have not had the final check as yet, so end-of-cycle is dragging a bit."

That's merely the formality of checkout.

"Now, Ron, about the month since I've been Clear, my environment has gotten very busy and very active with Scientology. I find that my postulates work fantastically quick, easy and without enturbulating problems. I was able to extract my sister from a very messy personal situation that I could not have handled previously. And I was able to communicate with my environment and her without any difficulty and accomplished her enrollment at the Academy as a student in the HCA. First, she took a fifty-hour intensive and made MEST Clear, and this is now an enthusiastic student."

I'll tell you more about that in a minute.

"My wife, Ethel, has completed a fifty-hour intensive and has started listing goals. My family life has never been so smooth, communicative and real. My family responsibilities – all this used to be a problem; it isn't now; it is easy and I love it – my family responsibilities (five dependents) require continuous, sizable income as well as continuing them all in auditing and the HCA. My enrollment in the HCA will be delayed pending the completion of the latter.

"I retire in three weeks from the Air Force, and I will move immediately [laughter] – and I will move immediately into a management position in industry. There I can still contribute to the national defense as well as expedite the progress of my family and myself in Scientology.

"I have, since 1955, occupied myself with Scientology and do consider myself a Scientologist and live accordingly.

"It's a good game, Ron. Let me postulate more good hunting for you and all Scientologists.

"ARC, Bob."

[applause]

Very good, huh? All right. Now the ... Shows you what I can do if I set my mind to it.
Anyway, there's this mention about this girl going MEST Clear. Now, I'm having this looked into at once very thoroughly, but this was done by Fred as an auditor in the HGC in Washington, and he has already given me a very thorough report on this and it was merely a standard Problems Intensive. But it was run very, very permissively, extremely permissively. Not so permissive as somebody in Y Units have been known to do, of leaving the button red-hot and passing on to the next button. But no Q and A of any kind.

It was just cleaning it up, you know. I mean just a standard, smooth auditing job. There were no frills on this thing. And this girl was stuck up at about 4.5 or 5, very rough, very wobbly, sticky needle, inclined to all manner of – well, poor auditing reactions we would call them – and life had been a bit of a this and that. And he just went in with this Problems Intensive. And he did the first twenty-five hours and she got quite a bit of good out of it. So he did a second twenty-five-hour Problem Intensive. And at the end of that time, her tone arm was at 2, her needle was free on all buttons, and nobody could get any kicks out of the meter. I think this is very interesting.

It opens up this chapter to us that a Problems Intensive is apparently capable of producing an old Book One MEST Clear. And it opens up this very suspicious – two very suspicious points for me: is what are they doing elsewhere with this Problems Intensive? How much Q and A? How many lousy assessments? How much no-follow-through? Well, somebody went back from here and gave his wife – who was stuck up at about 5 or something like that – he tried to find some goals, and he couldn't get to anyplace, so he went immediately into a Problems Intensive, and he brought her tone arm down to 2, and everything was looking much better and she was feeling much better and everything was fine. The dirty needle was gone, and all that.

Well, this is very interesting. It may just be that people don't know what a free needle is because there's people who've had as many as three Problems Intensives up in London.

Well, the tone arm comes down and everything, but they don't mention free needles. You understand? I mean this is either a fantastic piece of lousy observation on the part of auditors or there's something very rough about their auditing or something else is occurring that we don't know anything about. Well, I consider this very, very interesting as a sudden breakthrough.

And – some of you know Johnny, he's an old-time Dianeticist – and he heard about this in the HGC, so he says, "I just want to make sure that this is put down as a matter of record," and wrote me about the case. He evidently was the one who got everybody to report it. Now, this needle was inspected by person after person – Saint Hill graduates, see, and it was free, free needle. Problems Intensive – MEST Clear. Of course, that's a Key-Out Clear, but that grades up with what we were doing two years ago with Routine 3.

Now, I want you to put a little attention on this. I'm going to have some more to say about this in bulletins, and so forth. But if you're running Problems Intensives, apparently, they have a capability – when run right and assessed right and done right – they have a capability of producing a MEST Clear. So pay some attention to this. Why aren't they getting them? Why aren't they being reported elsewhere.
I think it was somebody like Johnny, who after twelve years of being around and knowing the answers to things, he said, "Hey! You better tell Ron about this, you know. I want this to be a matter of record, you know." Because he's very interested in special programs over there, and he's doing this health and suppress program angle. And of course, he looks for a lot of these Problems Intensives to be run on a co-audit basis.

So either everybody's been stone-blind or they're varying the procedure of a Problems Intensive or this is just a freak. But I don't think this is a freak because this was an extraordinarily rough case.

All right. You want to make some comment perhaps on the speed with which these lines cleaned. Don't think that this was an easy case. And this is the lecture I'm going to talk to you about here, the first lecture is "Cases, Types Of." As far as clearing is concerned, there are many types of cases.

But this was a rock slammer. He was a rock slammer, Bob. Rock slammer is severely defined not as somebody who rock slams but somebody who believes Scientology is in opposition to his goal or some part of it.

Now, he was not an easy case. He was not easy to assess. You couldn't even tiger drill a goal out on him except at the point of a drawn gun practically. And we picked off his goal on the fly. You know, there it went by on the E-Meter.

And I only got this, is what would be the – here's how we got his goal: I told Jim to ask him – we would have gotten his goal twenty-four hours earlier if this action had been reported to me when it was done – I told him to ask him, "What would be the consequences of our clearing you?" and to be sure and report to me the answers. The answers were reported to me much later than they should have been. I didn't ever see the – the needle was slamming when he first came up to be volunteered and tested, you see. But on what nobody noticed.

And "the consequences of our clearing you" were so catastrophic and so terrible that I merely says – using a term we use now to this effect – "The guy's a rock slammer. All right. List goals which would be in opposition to Scientology." It didn't even have to actually be picked off on the meter as it went by. That was not a fluke. It would have been on the list anyway.

All right. Now... The goal was "to live" by the way. Now, this fellow was not an easy case but he was very, very well audited. He had about three, four Saint Hill graduates sitting on the back of his neck, see. That thing was being piloted through with a very close hand. It simply amounted – nothing clever, but very usual auditing with nothing unusual occurring, you understand? Very usual auditing. Nobody Q-and-Aing. Nobody bullying him. Nobody doing this.

So therefore, we must take up this aspect of auditing: is, there is a case and then the aspect of the case depends on the way the case is handled in most cases. You understand? Now, that's the first, first thing that you must recognize in classifying cases or types of cases or relatively difficult cases. The first thing which you've got to recognize is this one, see: that the way the case is handled – even to the degree of sometimes you entered it unluckily – see, the way the case is handled gives you an aspect of relative ease or relative toughness of case.
That's about the first thing an auditor should learn about cases, that the way the case is handled has a great deal to do with how rough the case looks.

Now, we're talking now completely free of OCAs, APAs, graphs, tests or anything like that, see. Case A, Case B. They're both, you might say, similarly difficult cases. But Case A is handled with great usualness with very, very good, smooth, unexcited, unupsetting approach with a lot of hope factor, a lot of R-factor, and so forth, and runs like an easy case.

And then there's Case B. And this Case B, let us say, is handled with great unusualness. Well, they enter it from the wrong side and it's prepchecked on the wrong buttons and there's ARC breaks and there's present time problems running and they never kept the rudiments in, don't you see? And Case B pretty soon is sitting in the pc's chair self-auditing and getting his own rudiments in and coming down the can leads to the auditor, don't you see? Looks like a fantastically rough case. Becomes in appearance an impossible case. See, break anybody's heart. And yet they're similar cases.

Now, you should recognize that as an influencing factor in determining whether cases are easy or tough. Now, I'll give you a wonderful example of this. Psychiatric classification, psychiatric treatment, behavior in life, all these things have no bearing - within reasonable limits - have no bearing on the ease with which you're going to handle the case, see.

What the person does in life, person's psychiatric classification, neurosis - any of these things, don't you see? I mean these have no bearing on whether that case is going to be easy to handle or tough to handle. You can just throw overboard any preconception about the fact that he's a black five or she's a theetie-weetie, or any of your case classifications. I don't care whether it's our classifications or some, ha! classifications they've had in the past like the Kraepelin category.

You know, everybody thinks that's a joke, you know, and it's not, you know. That's the basic psychiatric classification of cases. It's the Kraepelin code.

Now, it just doesn't matter. This amusing example I'm going to tell you about - I've mentioned it in lectures before, but for other purposes. This girl stumbles in the front door. Some auditor up in Spokane had gotten furious with her in a session and practically spun her in. She'd had a long, bad history of treatment and mental nonsense. And so she stumbled in the front door - and Suzie happened to be doing some Registrar work and at that particular time I was auditing outside cases - and she came in and - it wasn't a question of her buying auditing - and Suzie asked her for her name. And so she offered several names so Suzie could take her choice because she didn't know.

She couldn't remember her name. She didn't know who she was. And, man, you talk about somebody that apparently was in foul shape, you see. Well, somebody would practically have put her in restraint. If she'd ever walked in front of a mental hospital, up to the front entrance, why, they would have sent for the butterfly nets, you see, at once. And so I just grabbed ahold of her. I think I audited her, in all, two hours and a half. I think I audited her two sessions - total about two hours and a half. It was - it wasn't any - it wasn't any purchased intensive or anything else. I just saw the girl and I called her in my office and audited her. All right.
And I really didn't run anything very sensible on her. I sort of asked her what she was trying to do, you know, and what things were. And I gave her a few tests, and so forth. She did anything I asked her to do in the way of a mental put-together, don't you see? And she realized that she was sort of trying to disgrace herself – what she came to realize. I was giving her kind of an SCS. That's what I was doing with her, and I wasn't even escorting her. I was telling her to walk across the room and notice she didn't run into anything. I remember that was one of the processes. And didn't run into anything until she ran into something, you know? It was a great relief to her to find out there were no barriers except where there were barriers. You know, she was getting oriented.

And then she finally found out she was trying to get even with her parents by becoming a prostitute. And this seemed to be a big cognition to her of one kind or another. And I know there must have been a couple of moments there when we shed items of some kind, and – because she recognized things. She all of a sudden remembered her name and all that. And I knocked out a bad auditing session she'd had up in Spokane. And she went out of there walking straight up, and beautiful shape, and she went out and met some nice guy and got married and that was it. Now, the length of time it took to handle the case does not compare, let me point out to you, with the terrible state of the case.

Now, you see, I've done this often enough now and had it happen often enough that I don't pay any attention to the pre-Scientology state of the case. I pay no attention to that at all. Quite fascinating. Now, some case or another which has a tendency of spinning or something like that is hard to spot, but let me tell you, it takes awfully rough Scientology to make them hard.

You see, now, I'm trying to bring this up to you: We're making our own hard cases, see. We get preconcepts of some kind or another as to whether cases are easy or hard. And you'll get some poor case that's got a terrible reputation in the HGC, you see, for being a horrible case. And then the auditors don't quite want this case, and all this kind of thing is going on. And this fellow gets a reputation for being a tough case, and he's a tough case.

Now, I'm not saying that all cases are easy. No, I'm saying quite the reverse: All cases are hard, you see? Basically, there are no easy cases. But let me stress this, that these preconceived notions of the roughness of a case or classifications of a case into this category or that category, "and therefore they're very hard to audit" have all been bypassed by existing technology. You can forget them. If you can get somebody to sit still and answer questions, you see, that's about all you ask of the case, and if you can't, you've got the CCHs. But relegating somebody to the CCHs and telling him he's got to have 8,762 hours of the CCHs before you can audit him, you're just manufacturing a tough case, don't you see?

I remember one girl – another girl one time in the same locale. I was doing a lot of research auditing at the time and I remembered she had been pronounced nutty as a fruitcake. She was straight out of an asylum, everything else. I brought her in and she could control her mock-ups. She could mock up something sitting in the corner and keep it sitting in the corner and do this and that. I told her she was an easy case. And she was. You get the idea?

I didn't say, "Oh, my God, you've been eighteen months in a sanitarium. And, oh, oh, that's pretty bad, pretty bad. Your record's here. Oh, dear. Look what Dr. Flunnelbottom says
about you. Oh, dear. Oh, well. Don't think there's very much we can do for you. You came to us much too late." Evidently, people were on the track before psychiatry, you know, because they're always coming to psychiatry too late, you know?

Now, let's get down to the basis, see. I'm not saying all cases are equal, I'm saying they're all rough. But the case you're going to have trouble with is always a spook and always a sleeper, and you never suspect it and it hasn't anything at all to do – nothing whatsoever to do, believe me – with the psychiatric classification or the psychoanalytic classification or what the OCA said or anything else. That's not the rough case. Yeah, we used to have a hell of a time getting these people up off the bottom of a graph and that sort of thing. Well, you've got the technology, don't you see? You can pull them up off the bottom of the graph. You can sit there and run a Problems Intensive on them, for heaven's sakes; they'll snap out of it. Do various things with these cases.

Now, the very – the case you're going to lay an egg with, see, is the same case you've always laid an egg with. That's just a spook case. And they look sane and they look able, and they lie like hell. And it's just a matter of they don't do your auditing commands. And so you never get the auditing cycle completed with this case, you understand? But this case is already very touchy and if you bear down too hard and you're too nasty and Q-and-A too much if they find – to find that they've done it or not done it, you're going to upset the case and make the case rougher than it is. You harass the pc and make the pc worse than the pc is, see. They respond less well to auditing because you're always in there saying, "Did you answer the auditing command? What did you do with that?" You know, suspicion, suspicion, suspicion, see?

Now, the way to judge this case is simply if after a short period of modern auditing the case hasn't recovered, then... This is honest to Pete, I mean – I sound like an echo of myself. This is a lecture 1953. First time this has been... The case hasn't done your auditing commands or you haven't audited the case. Sounds very peculiar, see. Now, the case hasn't done it. That's all.

Now, these characters will take a command, do something else with it and then say yes or they've done it. Now, there's an old HGC auditor sitting over here. I can see, he knows that one well! You sit there for twenty-five hours, see, and you're saying, "Tell me a time you really communicated," you know, and the case is saying, "Mm-hm, yeah, yes. With Joe and with Pete. Joe and Bill, yes. With Mama. Yes, with Daddy." I don't know. They've got a machine out here. It says Joe, Bill, Daddy, you know; hadn't anything to do with what they're doing. They never heard a thing you've said to them.

See, in other words, this case interrupts the auditing cycle, and that's the only case that you're ever going to find tough or have anything to do with.

Now, let's look at the most extreme condition of this. The guy is sitting there going 纰纰纰纰. See, he's been around psychiatry too long, you know. He can't communicate at all anymore. He's sitting there. He can't even tend himself in the natural functions of nature. He's sitting in the corner of a padded cell, you know?

And you say something to him and you get no response and no execution. Got that as the extreme end of this case, you know?
Well, another extreme end. The guy has no perception. He can't hear. You say something to him, of course, he doesn't do anything.

And there's another example of the foreign-language case who can't speak any English. You're telling a Japanese to make that body lie in that bed and, of course, he doesn't know any of those words.

You see, those are all communication breakdowns.

Well, you understand those. See, that's dead simple. You're not going to stand there like an idiot looking at this bird sitting on a stool in the corner of his cell going buuuuuu, you know. He's had the very best treatment the FDA, the Food and Drug Administration, could possibly authorize. Very best. Yeah, I wonder if you realize that they okay all the electric shock machines as perfectly valid shock machines that kill patients. We're going to take care of them. Well, anyhow... We got them on the list over here. Anyway... We already sent them a bill for interrogation and consultation services and we've now got the government crying faintly and nattering and wanting to - it to be itemized and specified or something of the sort before they pay it.

They came around and investigated FCDC so we - I had them send them a bill for $275 for consultation and briefing. [laughter] They're apparently going to pay it. You should realize the magic of billing.

Anyhow, so there he sits with the very best the Food and Drug Administration could authorize, and you'll say, of course, "I would have to take his hand and make him touch the wall, and do it and do it and do it, and take his other hand and do it and do it and do it, and get him into communication with his environment," and so forth. Yeah, you'd recognize it would do absolutely no good to stand there and say, "Recall a time when you communicated with somebody. Thank you. Recall a time when you suppressed something. Thank you." You know? You recognize, see. That's lights, bells, everything, see. You know there's nothing going to happen.

All right. And you take this guy that's stone-deaf, and he's got a great big hearing aid of some kind or another that goes off at fifty-five decibels between his ears, or something. And there's an on/off switch on the thing and it's off, see. [laughter] And you know better than to sit there and say, "Recall a time you invalidated something," see. You know better than that.

And you got somebody who speaks only Igloo, and you know that there's no sense in saying this. Well, that's so obvious that the next obvious thing is you miss: There's many a fellow who sits there who ostensibly speaks English, who can hear, who never executes your auditing commands. That's the one you're going to lay an egg on. This person doesn't execute your auditing commands and doesn't give you a factual report on what's happening in the auditing.

Now, you'd be amazed, because that goes on a gradient on up till it really includes every case at its top level. Every case sooner or later doesn't quite do the auditing command, don't you see? Well, the spook that you're going to have trouble with is the one who just never does the auditing command and is always doing something else.
Now, I'll show you how crazy this goes. The auditor sits there for seventy-five hours of auditing and keeps giving him this command, you see – "Who haven't you ever helped?" see? "Who hasn't ever helped you?" you know; some failed-help process – and sits there, and the tone arm moves and the needle moves occasionally on the E-Meter, and so forth. And then at the end of the intensive, why – the first twenty-five hours – the fellow says, oh, he feels lots better. And the next twenty-five hours he says, "Well, I didn't... It hasn't worsened any." And the next twenty-five hours, well, he's sort of scraping off the floor now.

Now, the auditor's been sitting there giving him commands that whole time. And he has yet to do one. And actually that happens. That happens, and that's the only case you're going to have trouble with. It has nothing to do with diagnosis or... He's got itemosis. He's got an item here, and it hears and then it relays it to him and then he says to this item over here that it should do it. See? He's wired up a set of valences. Pc isn't there at all. Pc's backed way out here someplace, don't you see? Pc hasn't got anything to do with all this.

If you ask the pc about it, if you communicate with the pc at all, why, the pc would just be sitting back there in sort of a comfortable, relaxed puzzle about the whole thing. And nobody's answered the auditing command.

Now, auditors sometimes sense this and they become desperate. And they start pounding the pc and harassing the pc and chopping the pc up and just going up in a small balloon because they know there's something wrong. After all, you're not always wrong. You have been known to have correct intuitive feelings, and you just feel intuitively that this isn't all it should be. You don't feel in good two-way comm with the pc, you see. You don't like the way this soup tastes, you know? You can't quite isolate whether it's got too much salt in it or too much pepper or too much butter, but it just isn't quite right.

And you start chopping the pc up. You start moving in on the pc, you know? You start getting insistent. You start getting this. You start getting that. And the tone arm moves even less. Moves less.

Now, this case is the last one in the world to admit in any way that he has misappropriated the auditing command. Last one in the world. All cases to some slight degree do this and you don't harass those. Well, why harass this guy? Because he's always doing something else with the auditing command.

I'll give you an idea some of the things he does with the auditing command. Some are really gorgeous. He hears the auditing command and that reminds him of something that he ought to do that will make him better, so he does that. He hears the auditing – this is rather uncommon, but is an actual manifestation. Every auditing command the pc receives, he runs through an electronic incident because he knows if the electronic incident changes in character that he will get well. He knows what's wrong with him. It's an electronic incident. So every time you give him an auditing command, then he runs through the electronic incident a little bit further or tries to take the auditing command and apply it to the electronic incident and he's sitting there auditing an electronic incident. And you're not auditing him. You follow this?

Well, you say, "Well, how the – look-look-look-look now, Ron, you've just told us, you know – wait a minute. You've just said ... Look, you mustn't Q-and-A, and you mustn't
jump down their throats" – I've sure inferred that – "and you mustn't harass them, and you
mustn't bother them. Well, how the hell are you going to find out?"

You see, if he's running through the electronic incident, of course, you're going to get
tone arm motion. It won't be very much, but you'll get some tone arm motion. See, he's run-
ing himself through an electronic incident while you're auditing him. And you think the tone
arm motion is coming from the fact that you're auditing him, see. But it's not. It's coming from
the fact he's moving through an electronic, see. So you even get tone arm action and we're not
supposed to Q-and-A and we're not supposed to ask the pc what he's doing particularly. We're
not supposed to harass him particularly. Well, hell, it couldn't be any possible road out of this.

Oh, yes, there is. Yes, there is. It isn't grabbing him out of the chair and racking him
over to the wall and start doing the CCHs either; it's you watch that when you are running the
pc's right Havingness Process. And if you want to be extreme and you want to make a test out
of it, you run a separate process which has something to do with the physical universe around
the pc. And if that gives you a great deal of tone arm action, then you damn well flatten that
tone arm action against the physical universe! I don't care whether you use SCS, Op Pro by
Dup, CCH 1, 2, 3, 4. I don't care what you use, you understand. It'd be a matter of "Pat the
desk. Thank you. Pat the desk. Thank you. Pat the desk. Thank you. Pat the desk." You're
going to get tone arm action, see.

Now, the reason you don't often notice this is because the pc hasn't got his hands on
the electrodes when you're running a touch or a Havingness Process. See, very often on most
– on lots of these processes, pc doesn't have his hands on it.

Now, look. If a pc gets a lot of tone arm motion in the rudiments – and that's not a very
good statement, because there's not much of the rudiments contain – the beginning rudiments
contain the MEST universe, see. But if you were to get lots of tone arm action in the rudi-
ments and damn little tone arm action in the body of session, you know at once that the pc
never does your auditing command. Look at it. Isn't that self-evident?

You say, "Look at the wall. Look at the ceiling. Look at the floor. Look at the wall.
Look at the ceiling. Look at the floor. Look at the E-Meter. Look at the beam. Look at the
floor. Look at the mike." And he's sitting there holding the cans, and this thing starts going
brr-brr-brr, and the tone arm starts going all over the place, and then you're going to move
into the body of the session. You're going to start up this 155-horsepower diesel tractor called
a Problems Intensive, and you're going to get an eighth of a division motion? Now, look, I'm
just appealing to your common sense. This pc is capable of tone arm motion. You have
proved it. You said, "Look at the ceiling, look at the floor and look at the walls and look at the
room and look at me and look at you and... " There you are, see. And you got tone arm action.

You talked about his environment and asked him if he had any problems and you
started getting tone arm action. Of course, that's starting to get a little subjective. Not really as
valid a test, don't you see. But he's looking straight at you, and you say, "Since the last time I
audited you, have you done anything you are withholding." He's looking at you, and he's talk-
ing about present time.

Now, listen. Such people have a span that goes back very shortly into the past. The
past starts closing in on these people awful soon, back from present time, don't you see?
their span of reality on what's going on in the world ceases maybe five minutes ago in extreme cases, two days ago, five days ago. See, in back of that there's no real reality.

So you ask him in the rudiments about the realest area of their lives which is very close to present time. You know, "Since the last time I audited you, yesterday." You're going to get tone arm action. And, brother, if you don't get as much tone arm action auditing the pc in the body of the session as you do in running the rudiments, please realize that we would be clearing people with the rudiments, see, if this were true. We'd never do a body of a session. We'd only do rudiments. You follow that reasoning? Because tone arm action mirrors directly and immediately the amount of change which is being secured on the pc. That is your direct index of how much this bank is changing and shifting, is that tone arm.

Now, when that tone arm is going up and that tone arm is going down and that tone arm is going back and forth, you know you're getting change. And when that tone arm isn't doing anything, you know you're not getting change.

So we start running the rudiments. We get into the Havingness Process at the beginning of the rudiments – where it isn't anymore. Do something.

We all of a sudden notice, as we're starting to break this case down and straighten this case out, we run a rudiments and havingness session. Now, you start going in for a goal finders Model Session and the listing of items on this case – well, you could do a lot for the case that way – but you've immediately lost all your indicators for the case. You start doing a Problems Intensive without ever finding his Havingness Process or anything like that, you're never going to know any of this about the case, are you? It's going to evaporate.

So, you want to find out what this case is going to do? You want to find out what kind of a case you're dealing with?

Find out how much tone arm action is produced by a process which has to do with near present time and the immediate environment. And when that gives a tremendous amount of tone arm action, you've actually got somebody who is drifting far away, because the case that had good reality on the bank, was in control of the bank, would not get that much tone arm action on the present time. You see?

Do you realize what tone arm action means? If you get tone arm action on a Havingness Process, a lot of tone arm action on the right Havingness Process or any contact process or any CCH – if you're getting tone arm action – do you realize that he is actually becoming aware of the walls of the room. Oh, we're not kidding when we say "what wall?" See, this case is really faded out. It isn't bank mass that's causing the tone arm action to go. It's the increasing mass of the walls of the room. Must be. That's all you're having him look at.

Now, of course, we know very well it'll move bank. But look, look, if we have him start looking at the wall and looking at the floor and looking at the ceiling, and so forth, and we all of a sudden see this tone arm go up here to 4.9 and then break down to about 3.5, and then start up again to 4.5, what's shifting it? His concept of mass is being shifted by confronting the environment in which he finds himself. Well, he sure is in no shape to be audited because where is he going to audit from, to?
You're auditing a case who does not have the stability of present time to audit against. So any address to the track throws him in total confusion and he can't answer your auditing commands. He has no point of reference.

Cases are audited against the point of reference of present time.

Oddly enough, the memory of eight million years ago totally depends on knowing it was eight million years ago from where? From where? How come we say eight million years ago?

Now, this guy who is stuck in the electronic which occurred three million years ago and is still in it, will get tone arm action when you get him to look at the environment in his immediate vicinity. Otherwise, he will run a Problems Intensive from a point three million years ago, which is a non-stable point. So you're running a confusion against an instability. And two confusions never made a stability, man. So, of course, he really doesn't know how to answer your auditing command.

You say, "Recall a time you communicated." All right. Recall a time he communicated. Well, if the time he communicated is up the track from where he is, how can he recall it because it hasn't happened yet. So, therefore, he knows he can't do that auditing command, so he does one that he can. And he says to himself, "Well, the auditor just communicated to me. He said so. So, therefore, I will recall the auditor saying something to me." So he does that a couple of times.

He's heard of mock-ups, you see, and he decides that he'd better use this auditing session for something – there's no reason to let this auditing session go to waste. And so the best thing to do is to mock up his psychoanalyst alongside the auditor so as to match the terminals, and if he holds this psychoanalyst very carefully up alongside of the auditor during the auditing session, then he knows he'll have gotten something done. So he trains himself up to say "Mm-hm." Every time he says he has answered the auditing question, he says, "Mm-hm." Or he says some irrelevant object or something of this sort while he is holding this thing.

You'll find some guy sometime or another who's holding the two back corners of the room. That's what he's doing in the auditing session. He doesn't want to waste the auditor's time so he holds the two back corners of the room during the auditing session. He's not doing the auditing command.

And as far as I am concerned, tone arm action on the rudiments and present environment of the pc is the only indicator I know of that uniformly isolates this case for anybody. That isolates it for anybody. You can tell if your TA is moving against the environment.

Now, it becomes very important, then, to prepare a case. And although it's all very fine to have this case come in and sit down and you find some items and the case straightens up like mad, and everything then goes along swindiferously, and all that; you're kind of trying to plow ground with a Cadillac, you know. And the funny part of it is the Cadillac won't do it. You get a Cadillac out amongst the plowed furrows and I don't care how much horsepower it's got or how many cigarette lighters, it's not going to pull a plow. It's going to bust its springs and it's going to knock off its exhaust pipes. It's going to do something weird. Ah, you're just using the wrong vehicle.
Now, basically this gives you an answer on the subject of clearing. Hardly anybody hears me on this or pays much attention on this, but a case that is wildly out of present time seldom answers the auditing command or executes it. And auditing depends exclusively on getting the auditing command executed.

Unless the auditing cycle of action occurs every time the auditor opens his face in a session, you will find the whole thing starts stacking up. If the auditor is saying, to a person with a hearing aid shut off, commands, he knows they're not going to be answered. But how many other of his pcs is he saying commands to who never executes them? Well, the answer is not to harass the pc. The answer is to run objective-type processes, put in rudiments, do things, and watch that tone arm because if that tone arm is moving well – three cheers. It's moving well.

Well, all right, let's move it well, huh? Let's just keep on doing some more of the same. Let's get the motion out of that thing. And when the motion comes out of that thing, then you'll get motion in the body of a session. But your body-of-session processes, when they demand a subjective reaction only on the part of the pc, may have missing present time – that area against which the pc must relate everything. And if present time is missing, why, the pc is not going to get very far. Also, he won't - really won't be able to answer or execute the auditing cycle.

Now, your trouble is the same trouble with a pc that you've had for a long time; that is you don't recognize your auditing cycle is not occurring.

But there is a positive test. Now, I've scraped the bottom of the barrel looking for a test as idiotically simple as this that requires no equipment of any kind whatsoever, and you'll find out that the gradient scale of toughness of cases is directly proportional to the amount of action they get on the tone arm using present time or near present time addresses. You know, like, "Do you have a present time problem? Anybody in your environment you're worried about?" That sort of thing. You're getting tone arm action, man. Huh! See, it's the old-time beginning-rud type of approach and you're getting tone arm action. That's a direct index. The case is as tough as he gets tone arm action on present time or the environment. Simple, isn't it?

Audience: Yes.

Now, if you want to get a good subjective reality on this, take somebody with whom you have had an awful wrestling match with 3GA Criss Cross and run him on some idiotic Havingness Process and watch the tone arm. Get in their PT – get their PTPs off for the last couple of sessions, see. Watch that tone arm. You're going to see that thing move.

Now, if you want all cases, then, to be easy, then you will audit only cases which have had all tone arm action taken out of the present time environment. And then, of course, all cases would audit easily with 3GA Criss Cross.

Now, why does one girl sit down – rough shape – get a standard Problems Intensive, go down to 2 with a free needle on all buttons; and another character come along and sit down in the chair and all buttons are run, winds up at the end of seventy-five hours and very far from totally straightened out? What's the difference?
Well, one of those auditors was getting a cycle of action – the auditing cycle of action was occurring – and the other auditor was not getting the auditing cycle of action. And therefore, that other auditor should have done something. I don't care what! He's got the CCHs and everybody thinks they're supposed to wind-up-doll and go through the CCHs. All I want you to do is understand what you're trying to do. Not go through some motions. Understand what you're trying to do. You're trying to call his attention to the workaday world in which he lives; call his attention to the walls of the room in which he's being audited. I don't care how you do that. You do that, you run the tone arm action out of that, the guy's sufficiently in present time to get the auditing command.

You've got to get a pc there before you can audit him. And in most cases you're neglecting that elementary step. The auditing cycle cannot occur in the absence of a pc. It just can't. That sound reasonable?

Audience: Yes.

Well, it's very true and that actually has practically everything there is about the relative toughness or hardness of cases. Because basically what have we done? We've gone over the top of the toughness or the hardness of the case. The techniques will take care of it. But the cases which you have trouble with are the cases which, of course, the auditing cycle isn't being completed on. There's something wild going on here of some kind or another.

I can tell you dozens of ways to enter cases and get rock slams and to do this and to do that. But when you ask, "Who or what would feather a nest?" have you any guarantee that you get a list that has to do with feathering the nest? Or do you just get an automatic shuffleboard? Have anything to do with the case at all?

Well, let me tell you, if you have to do that too often and too long, then those lists don't have very much to do with the case. If you've gone on and on and on and on and on and on and on and on and you're not even in a vague reaching distance of it, recognize the condition of the pc before you began – what it must have been. Yes, you've improved it. Yes, you've listed lists and you've improved it. But you're actually doing it the hard way.

The easy way to do it is clean up PT, you know. Easy way to clean up PT would be a Problems Intensive with a terrific amount of present time contact. You know, lots of rudiments of one kind or another. Lots of Havingness. Give them things that are very easy to answer. You'll find out the problem assessed is probably day before yesterday if you really did a good job of assessment on it.

And run it, and all of a sudden, present time – needle moves like mad, and the pc moves into present time. Life looks much more this and that. And then the pc's there and you can audit the pc and you can run the rest of it.

That is the basic analysis behind what is wrong with a case that doesn't move fast. It isn't the relative toughness of the items. They're all tough. Why make a distinction? They're all stinkers. Why make a distinction? All the somatics are horrible. Why make a distinction? Sen is ghastly. Why say some sen less than others?

But you start plowing a guy in when he'd get tone arm action on present time, pushing him on down the track, shoving him into hot masses of one kind or another, pushing him
around one way or the other, man, you're going to get *sen* like you never heard of. It's all sen, because you just move him two days ago, and it's so unreal that everything gives him sensation. Of course, he's got sensation. He's in the middle of a confusion because he has no referral point called present time. And having no referral point called present time, how do you expect him to be anywhere but in a confusion. And that is the basic thing that *sen* is: the pc in the confusion. At least give him present time for that. And then you can run him.

Has any of this made any sense to you?

*Audience:* Yes.

Good enough. Thank you.
ENTRANCE OF CASES

A lecture given on 13 November 1962

Thank you.

This is lecture number two, Saint Hill Special Briefing Course, 13 November, AD 12, and I want to talk to you somewhat about entrances of cases.

Now, I'm getting together the material for bulletins, and so forth, on the number of ways to enter cases. And although I took off last week and put in a lot of hours getting the material together for your various bulletins of last week (modernizing and wrapping up material is what I'm mainly engaged in), I haven't spent much time getting cases in a – how you enter them in 3GA or 3GA Criss Cross, and so forth. This is something I have neglected to some degree because there are just too many ways. And it's getting to be a broad subject. It's getting to be one of these very, very encyclopedic subjects. I haven't counted them up, but I can turn on a rock slam on cases with this question or that question or do this with them or do that with them, and so forth.

The main thing that I wanted to get out was your HCOB of November 11th, which gives you straightening up 3GA Criss Cross cases – straightening them up, those that have been run.

Now, you've got a new routine, and this new routine is quite important. It's Routine 3-21. Now, 3GA as such was insufficiently delineated. But the original 3GA was highly workable. So what I did was take all of the additional flurries that I knew of that would function well, new things learned such as Tiger Drilling and that sort of thing and just rolled them into the original 3A and gave you Routine 3-21.

Now, Routine 3-21 will probably work on any case that was well prepared. We can't, however, count on cases being well prepared, by which I mean... I think somebody was just mentioning Presession 2 – Confront and Havingness, you know, Havingness and Confront – that type of approach; CCHs and a Prepcheck is what you would be doing these days. You'd be doing CCHs and a Prepcheck, and so forth and smoothing the case out to that – in that way. And a case that was thoroughly prepared would actually have, to a marked degree, keyed out their present time difficulties.

Now, their present time difficulties is what's going to give you trouble in old-time 3GA. You'd have an insufficiently well-prepared case. The number of hours required would not be given by the auditor. You'd have somebody's skimp it here. Somebody was doing very, very rough CCHs, you know, and so on. And do you know that very, very rough CCHs will build the tone arm up and dirty up the needle? You know, never let the guy execute the auditing command and all this kind of thing, you know. I mean you'd really have to work at it hard, but very badly run CCHs can build your tone arm up and dirty up the needle and accomplish exactly the reverse to what they're supposed to accomplish.
And because there have been frailties in the preparation of cases here and there – bad auditing and so forth; the number of hours that could be afforded and so on – we walked forward into a great deal of developmental work, beyond the point where it was vitally necessary. You get the idea?

I rode this bicycle down the beach many a league beyond the point where I had to get off the bicycle. You understand? This was in the interest of speedup, interest of tougher cases. And I came back to the conclusion, finally, which is an old time-worn conclusion. We find havingness, you know, every six months. Well, it's been six months since we found havingness, you see. [laughter] And I came to the conclusion that this was your better track. Because it doesn't matter how tricky your auditing question is; if it doesn't get finished in the auditing cycle, why, it isn't going to do anything.

Someday you'll learn this. You can nod at me now, but listen: Someday you'll be sitting there, D of Ping a bunch of pcs and for the fifteenth time somebody has come in and asked you for an unusual solution. And for the fifteenth time you've dreamed up a very, very fancy crosscut, short approach to the situation. And for the fifteenth time you give it to him, and you make sure that it's used, and then you find out that didn't do any good either. And you'll suddenly wake up and maybe remember this lecture.

Well, if in some of the cases the auditor didn't even deliver your fancy technique, and in the remainder, if the case needed a fancy technique, the pc didn't execute it. See? First and foremost is the fact the auditor wasn't using it and then second on that, why, if he was, the pc wasn't doing it. So, of course, you got no place in a hurry because the reason the auditor was asking for it is because the pc wasn't doing it in the first place. See?

That sounds like one of these terribly redundant propositions, you see. But the reason the case became an unusual case is because the pc wasn't answering the question in the first place. So for you, then, to dream up a new question to ask the pc is to court the exact same fate as the first question the pc was being asked. See, he didn't do that either. And that is why you make this statement of "When faced with the unusual, do the usual." In fact, get even more usual. Get very ordinary. And by getting very ordinary I mean start patting the walls, man.

Now, the tricky developmental work in Scientology is very much to our credit. And we have learned a great deal, and we have gone forward a great distance by ignoring some of these fundamentals. That is to say, well, all right, we auditors couldn't do a process, or something of the sort and instead of trying to force through and say auditors must do this process, don't you see, we tried to get something additional that an auditor could do, that a pc could execute and that sort of thing.

Similarly, that same thing has happened in clearing. Now, you write out 850 goals and you start in at the beginning of these 850 goals on this well-prepared case and you will find then that it is very simple indeed to tiger drill these goals. And if you hit one, it isn't going to hang up. Well, it isn't going to hang up because when you ask, "On this goal, has anything been suppressed?" you don't get the pc instantly protesting. Well, do you see that as a variation of the auditing drill?
You say to the pc, "On the goal 'to catch catfish,' has anything been suppressed?" And the pc says nothing, but in actual fact doesn't even inspect "suppress" but protests. You just disturbed him from examining a goal he has just thought of that has nothing to do with the goal which you are tiger drilling. See, he just thought of another goal that his father must have had, and he wonders if that couldn't have been his goal, and you're trying to do "to catch catfish," don't you see. And he's busy auditing three other goals that he has accumulated as you came along. See, he's not in-session; he's not completing an auditing cycle.

Therefore, he will have a dirty needle all the time, all the time, all the time. Now, that's just from lack of preparation of the case. This guy's got missed withholds; he's never been straightened out; he never completes an auditing cycle – all kinds of wild things are going on. And because he doesn't complete an auditing cycle, of course, the needle is dirty all the time. He always thinks of something else. Or he thinks of nothing.

You say, "On this goal 'to catch catfish,' has anything been suppressed?"

And he thinks "To suppress things. I wonder – 'to suppress things.' Do you suppose 'to suppress things' could really be a goal? I wonder if I do have a goal to suppress things. I think a goal 'to suppress things' would be an interesting goal to have. See, I used to squash beetles and so forth and so forth ...

And you're going on and you're saying – you're saying, "On the goal 'to catch catfish,' has anything been invalidated?" and he's – you say, "Ah, that reads."

And you say, "Yes, has anything been invalidated? Something's been invalidated. That reads. What is it?"

And he says, "Nothing's been invalidated."

And you say, "Well, yes. Yeah, there – there is a read here on the meter. There. There. There. There."

Actually, all the time you're doing that, there's no more thought going on, there's no more effort to look, there's no more effort to confront, there's nothing happening. You even get an automatic circuit going sometimes, where you say, "Has anything been suppressed?" and the pc says "No," and then you bear down and you say, "There. There. There. There. There. What are you looking at? What are you... "

"Oh, well, that. Yes. Well, of course, I suppressed the goal."

See, any kind of an action of this character. You have to drive it home. See, you're not getting across to this pc. What's the immediate result of all this? Well, you're not able to tiger drill the list. That's the immediate result of all that.

But now, let us say the case is well prepared. Let us say the case's needle has smoothed out and the case is doing all right and present time is quite real to this case and everything's fine. Now, could something still be wrong with this case so that you couldn't do 3-21? And the answer's yes, there could still be something wrong. The goal is not on the list or, if on the list, is so unreal to the pc that if you confronted it, it would never answer up.
Now, let's take this in *extremis*. Let's just say, all right, it's impossible to fix up a lot of these cases. You — with beautiful preparation, smooth them all out and spend 150 hours smoothing them all out and preparing them, because people are going to be clamoring at you, asking you to do things about this or that, in environments and atmospheres, and their present times are all enturbulated, and they're going to ask you to find their goal, and that sort of thing. Therefore, you need a technology which overshoots the elements and the elementary things which I've been telling you. And in that you have 3GA Criss Cross.

The end product of 3GA Criss Cross is to so seize upon the pc's attention that the pc couldn't possibly do anything else but give you exactly what is sitting in front of his face. He can't do anything else but answer the auditing commands. This is far, far too interesting to him.

Now, the tip is that interest follows the rock slam. Where you have a rock slam you have interest. Therefore, you follow the rock slam. You also have the goals channel and you also have the consecutive set of pairs which lead actually from the dimmest beginnings of this GPM forward to the tiniest terms and oppterms in present time. In other words, they're pairs and they come all the way forward. And the route between these pairs is traveled by the auditor from present time clear back to the earliest beginnings. He does it first by finding the goal and then does it by finding the items which have been built up by the existence of this goal. In other words, it's a path, it's a track which is marked by a rock slam. All of its mileposts are designated by rock slams.

Now, you can pretty well overwhump almost anything in the pc if you can get on the trail of the rock slam. Now, you're going to be asked to do miracles; you're going to be asked to do cases that are improperly prepared; you're going to be — asked to do this, you're going to be asked to do that; going to be asked to audit cases in noisy environments; all kinds of things you're going to be asked to do. And you can do that only with very, very powerful procedures. And the most powerful procedures that we have now are — is a combination of old 3D Criss Cross and some of the item-finding steps of later processes. And this we call 3GA Criss Cross.

Well, it has certain rules — certain rules. And I've just given you one of them, and that rule is that the pc's interest follows a rock slam. And if the pc's interest follows the rock slam then the pc will be in-session. You see that? In other words, this is a sort of a forced in-sessionness. This pc has no business being in session, don't you see. In many cases the pc — you know, it's kind of a "What wall?" situation. And yet the pc will follow the auditing cycle, the pc will answer the questions. He has no other choice. Do you see that?

Now, you'll get it — sometimes the pc is in very, very great protest of mirds. And either the mirds have been abused on the pc, grossly abused every time the pc originates, the auditor gets in the mirds; this is the fastest way to spoil a pc ever invented.

Pc says, "I just thought of another item."

And the auditor says, "In this session, has anything been suppressed?" See?

That's the way to cure them — cure them of being audited. You can use mirds, then, to drive somebody out of session. But you start in — you start in and even though you've used
mid ruds very carefully, even though you've used them very well, even though you have been extremely careful of this pc, you've handled the pc very nicely, you haven't cleaned cleans, you know, and you haven't neglected reads, and you haven't gotten missed withholds and all this sort of thing... You've just been going along just dandy and yet the pc's still protesting the mid ruds. Yeah, isn't that – isn't that interesting? I mean, you're following the rock slam channel right on down the line, but every time you depart off the rock slam channel you get a stack of protests about mid ruds.

Now, realize what you're looking at. The rock slam channel is so enchanting, is so interesting, the pc has no choice but to hand out answers and complete the auditing cycle as long as you are only on this subject, as long as you are only calling off these items – there's only – you're only asking for these items or you're only calling off these items. The pc gives every evidence of being in-session. But you suddenly pull off, just to the short distance of the session itself, you've asked the pc to confront present time. The pc says, "Yo! Nope! Mm-der-brrp! Screak!" Smell of brakes. See what happens?

Now, you can't say that every pc who does this, does this only because he's in indifferent contact with present time anyhow and is improperly prepared. You can't say that because in many cases pcs have had so many cleans cleaned and so many reads missed and nobody's cleaned up the missed withholds and the auditor – in spite of listening to all my lectures and reading all of my bulletins on the subject – still doesn't know what a missed withhold is. They still exist.

All right, what have we got here? Well, we've got the other alternate that the pc has been beaten up with rudiments and so forth, and mid ruds and so on, to a point where they do have a protest, don't you see? Pretty hard to tell the difference. The pc has been artificially put into a condition where he is responding with the same degree as the pc of great unreality. You follow this? I mean, you can always audit a case into a hole. See, this can always happen.

Now, you notice this, then, that as long as you're asking the pc... You found the Prehav level "smoke," and you want "Who or what would smoke?" And man, you ask, "Who or what would smoke?" and it's right, you did your assessment right and everything. The pc is actually just dealing them off the top of the deck, see. Bang, bang, bang, bang, bang, bang, bang, bang – "That would smoke and that would smoke and that would smoke and that would smoke and that would smoke and that would smoke and that would smoke and..." He hasn't actually any opportunity to do anything else. Because you're dealing out the circuit he would normally operate with. You see that? Sneaky.

You see, in the absence of havingness, when his havingness is low, his circuits key in. You understand that old mechanism. You know, all you've got to do is run somebody's havingness down and you key the circuits in. All right, somebody who is in different contact with present time has all of his circuits in.

What are these circuits? These circuits are GPM items or their cousins or sisters or aunts. So naturally, with his havingness down, he's got all items in. But you can still audit him. If you're on the rock slam channel, you're on this channel of circuits. You see this? You're actually auditing the circuits he would normally be dramatizing. So, of course, they can't dramatize because they're being audited. So you do get an auditing cycle.
And all of a sudden you pull off of this and you – you got your last three items, and you call his attention to present time. And you say, "In this session, has anything been suppressed?" and you have one god-awful time trying to clean this up. And you just can't – you can't quite get anything clean. Everything is just kind of gluu-umm, zrrp-um, non-registering on the meter and goes off the meter and on the meter and off the meter and on the meter.

Well, what's happened here? Well, a roughness of auditing could do this, too. Let's say you were busily charging down the line and supposing some kind of a blunder like this happened – it'd never happen here – supposing some blunder like that did happen. "Who or what would smoke?"

"Well, a big man, and a little man, and a little man trying to look big, and uh..."

You say, "Well, I don't think that's right."

And he says, "What?"

"I don't think it'd be a little man trying to look big."

"Why not?"

"Well, that one gives a funny wobbling motion to the needle. So it couldn't be that one, you'll have to give me another item."

If you did something like that crude to him, see, all of a sudden there he is, and he's all of a sudden plunged into the middle of this item. And he'll dramatize it and he'll do all kinds of wild things and your session will just go to hell in a balloon. And you haven't got much of a prayer of getting this pc back into action if this pc is also allergic anyway to present time and its environment.

Look at the difficulty you're running into. You've got a pc who isn't well acquainted with PT, a pc that under the best circumstances would be in high revolt against being put into present time and now cause a hell of a flub of some kind or another, which would put any pc into revolt against anything you said and you practically spin him! You see? There you've compounded the felony.

So all these things like 3GA Criss Cross are given to you with the understanding that as you do them they are done with considerable expertness, because they can actually overcome and bypass the unreadiness of the pc to be audited on them, and you can get away with it. See, you're auditing in depth on a pc that couldn't get his big toe wet without practically dying of pneumonia. So it takes tremendously skilled auditing.

The natural defenses of the mind, so called by somebody who had withholds, are instantly overwhelmed. You cut right straight by those. This fellow will go out and plunge into the Arctic Sea and swim several miles and come up shining at the other end, providing you don't run alongside and jab him in the back with a boathook. You see? So it takes a very flawless brand of auditing to pull this off.

Those are the exact mechanics, by the way, from which these cautions about "untrained auditors shouldn't run these upgraded processes" – see, those are the actual mechanics behind it. These things actually will reach far deeper than the pc could ever reach.
Now, if he hasn't got an auditor there but the auditor is just saying things to him and he is being pushed in over his head anyway and he suddenly triggers and does follow out the auditing cycle with no auditor present and then all of a sudden something bad happens, well, the guy just sort of goes down for the third time, don't you see?

So a person who is unskilled using these processes – well, you get something like happened in Johannesburg before we really raised the devil. There was practically nothing but wrong goals in the Johannesburg area. They're just catching up with them – how many – and they're just stacked. The way goals were being found down there by this character was... He's talking about making Scientology a racket in South Africa, see? Well, what kind of a racket do you call this? Somebody comes in to get his goal found and he's going to pay a lot of money to get his goal found. And he walks in, gets put on a meter, and the guy just reads a list of goals at him, and the first one that rocket reads he says, "Why, that's your goal," never checks it out – and sends him out to get it listed. Well, that was what was happening, man. That's why the old man suddenly took a few heads off.

There's wrong goals all over the place, see? And one girl throwing up every time she turned around and has been for months, you know; couldn't keep anything on her stomach. Pretty wild things happen. Just criminally bad auditing, see.

Well, that sort of thing can happen with these. So therefore, we lay down all these provisos, and we say, you know, it takes very skilled handling and you do it just this way and you have to be trained and all that sort of thing. Because you actually can bypass this.

Frankly, if you did Goal Assessment by Elimination – by elimination; that's old 3GA; it's not the 3-21 where they're done by Tiger Drilling – if a pc was pretty ready to have his goal found you would find his goal by elimination. But if he wasn't ready to find his goal, you know, if he wasn't ready to have his goal found, why, you wouldn't find it. You see that?

Now, when you get into 3-21, if the pc isn't ready to have his goal found, you can find it. You can find it by tiger drilling those first 850, providing the goal is on the list.

Oh yeah, you can whipsaw him around, get this thing to rocket read and prepcheck the thing and so forth. But, man, he has no more – he has no great reality on it. To walk down this track amongst the great black boulders which will cave in on him in all directions, he looks upon as something which James Bond would approach with trepidation. And he says that's pretty tough. He looks at the first three or four as something that could only be performed at a circus by a hardened acrobat, see. And you're going to make him walk down the whole track to the vicinity of this goal, and it's just huh-uh! See?

Well, he's too stuck on the track, he's too overwhumped, he's too this and he's too that. And the odd part of it is that when you get to 3GA Criss Cross, you can do it, and you can get away with it and you can bring him out. But recognize, for God's sakes, what you're doing! Please recognize that you are short-cutting and saving on the preparatory steps, that you are taking a pc who isn't ready to be audited on "Touch that perambulator," and you're going to make him walk the death mile straight down to the middle of hell, see. Dramatic as that. It looks much worse than that to the pc, when he starts looking at this, man.. And you're going to make him do this. So therefore, it's pretty smooth, pretty tricky auditing that's required.
Now, the number of ways that you can get him to walk the death mile and start on that street that has machine gun emplacements in each window embrasure – to say nothing of the mines under the road and the diving Spitfires, and so forth, overhead, this is – they're quite incidental, see – are many. And one of them, the earliest, is just to ask somebody to put down his idea of the dynamics and assess it. I mean, that's the earliest and most simple version of it. And then oppterm – represent it, the earliest one – represent it and get some sort of an item and then list some goals against that as the oppterm and you would wind up with it.

Now, there are very many refined methods of getting this and getting the slam. In each one of these cases you had to get the slam. The next one up from that is, "What isn't part of existence?" You got him to do that. You even snaked him up into that's – what does he wish wasn't part of existence, threw that list away and wrote, "What isn't part of existence?" got some sort of a list there, and when you null that list out you're going to find something that's slamming.

And if the pc couldn't do that, then you say, "What – who would – who or what have you detested?" And he's got somebody he detested. And you represent that and you're going to wind up with a dynamic list and so forth. And if the pc couldn't do that – you didn't find your rock slam – you got your next one "Who or what would you prefer not to associate with?" And you're going to get something out of that and then there's a way of tackling this with Problems: "What problem would you rather not face up to?" That, however, is a package all by itself. I wouldn't use it in that particular lineup.

And these are all various methods of getting a person to turn on a rock slam, which, of course, is his entering interest level. And he's so interested in going down that line that he doesn't notice all those machine gun embrasures. He just says, ouch! when the bullets hit him, and he keeps walking. Got the idea?

In the presence of a good auditor he keeps walking. He doesn't get lonesome. He doesn't get hung up on the track. And he doesn't get the right item taken away from him and the wrong one handed to him. And a lot of other little refinements helped him to do this.

So here he is and these are all methods which get him there. And you've got now an additional method which I think you'll find is pretty darned reliable and that's "Roll Your Own" Prehav.

This is a version of the old Primary-Secondary Scale. And that of course, is just take any standard Prehav Scale or any Prehav Scale or any I will write – one of these days I'll get around to writing a special Prehav Scale for specific reasons, you know, like types of scales – and you find a level on that and then get that level represented. And of course the pc will lay on a silver platter the exact level that he's supposed to have there providing you came anywhere close to it on the original scale.

In other words ' he will give you the Prehav level of whatever you're asking for and it will be tailored to his perfect understanding because he gave it to you. And this wipes out Prehav Scales of... Let's see, the English language, I think, has a quarter of a million words; therefore a complete Prehav Scale would be that proportion of a quarter of a million words which consists of verbs. And you know, I think that's too long an assessment.
So this gets you out of these very long assessments. You don't have to do these long assessments. It wouldn't matter if you took the full Auxiliary Pre-Have Scale, even with its few additions and did that, and rolled your own with that. You would wind up with a very reliable level.

Now, the original idea on this is not as workable. You simply made yourself up a little series of the gradients of overts and the gradients of withholds. You just made yourself up a little scale, you know. You know, like "Would you keep to yourself?" you know. Or you know, "Would you – would you rather not others weren't after you?" you know, I mean, that as the withhold, and run that up to putting down some little item like, "Getting after everybody you run into," you know, "Everybody and everything you run into." Maybe just six or seven of these, you see. And you assess those and find the one which sort of sticks with you the most. And what you're doing there is an old Flows Assessment, if you recognize it.

And you use that and roll your own from that. And just ask him, "Who – if somebody was trying to attack everybody and everything in sight, what would they do?" And you'd get a whole bunch of list. And then you assess the list he gave you, and you wind up with a highly accurate Prehav level.

Now, if you've done that you probably will wind up with a rock slam. That's your – that's a very specialized method of getting down into the rock slam channel, getting the proper thing, getting it going – just using the roll-your-own level. And you want to know who or what would do that – whatever it was, whatever you found out, see? You want a who or what would do that. You make a long list of those things, and they may be terminals, they may be oppterms – we couldn't care much which. And you wind that up and you just do that list and you're going to get something there that rock slams. A high probability is that you'll land right in the middle of the rock slam.

Now, there are various ways that you could handle that. I've been working with this lately and you know, you can do, actually, any list by simply calling it off once. You don't have to say "committing overts" or anything else, actually. You don't have to turn on all that rock slam. If the thing is going to rock slam, it's going to tick. So just take everything that's in. Just do it by elimination, and tiger drill the last few the way I was showing you. I'm just talking about the wording of the – of the assessment. You can do it that way. If you have qualms about it, why, by all means, "Consider committing overts against..." and "Would something commit overts ... ?" whatever it is. But you can actually just call it off once, bang, bang, bang, bang.

And if it's going to rock slam, it's going to tick. Then when you've got it there, when you've got the last few, why, you'd say, "Would so and so ..." after you tiger drill them, you know, you finish the Tiger Drill and you say, "Consider committing overts against ..." and you get your slam, you see. Your slam can develop in that particular way.

This actually, by the way, isn't as reliable as doing it the other way. I have goofed on this when I didn't goof the other way. But I still have confidence in it and I'm still – doing it that way and getting away with it. Auditing is what you can get away with. And if you don't have to put that many words into nulling a list you can of course null the list a lot faster. You just go down the list, "Tiger, Waterbuck," you know, and see if it reacts, just calling them
once. Because the item is going to do nicely, thank you. It's going to react well if you're right on the track. So anyway, you get down to the end of this list, you go over it, you select it out, you've got an item.

Now, what the hell is an item? Now, it's the protagonist or antagonist in the game, which pursues from the fellow having had a goal in the first place. It's the dumbbells. Now, in actual fact there's another pair of dumbbells on it. And I haven't figured out what to do with these in assessment, and I don't know if they're needed, but they're the "not" pair. They're there, pinned onto it electronically. And you quite often can find this "not" pair. N-o-t, you see. You've got, one of them was, "Who or what would smoke?" Well, actually, there's another list, a sleeper, back of that list, you could say, "Who or what would not smoke?" – just arbitrarily add your not – and you'd get a brand-new list and you'd get a brand-new item sitting out there, see. It actually isn't a pair. It's principally a pair, you understand? In actual fact it is four. There are two dumbbells lying there. But the other two you could ignore.

Now, auditing is what you can get away with and 3GA Criss Cross is what you can ignore. What can you safely ignore? Because, of course, if you start 3GA Criss Cross on this basis of finding the rock slam channel, listing it, finding a slamming item and then do an opposition to it and find the slamming item and then do an opposition to the item you just found and then do a represent for the first item and an opposition to it, and a represent for the second item and an opposition to it, and a represent for the third item and an opposition to it.

Well, you – it's something like they do in Baltimore. They have a tremendous number of white stone steps in Baltimore. It's one of the dirtier, dustier cities you ever ran into. So they have nothing but white steps in Baltimore. We're not sure why there are nothing but white steps there, because it's such a dirty town. But they scrub these off every morning, with an enthusiasm which has often held me in great awe. You see, they sweep them off and then they scrub them off and then they lather them off, you see, and then they hose them off and then wipe them off. Of course, a half an hour later they're dirty. But it's such enthusiasm. And, actually, they wouldn't have to work that hard. They just wouldn't have to work that hard to accomplish it.

Now, you're not trying to clear somebody with this 3GA Criss Cross, but the funny part of it is if you did it expertly you'd wind up doing so. You could clear somebody and never find the goal. The goal would be the last thing you found. You understand this? It's – you're clearing a person backwards.

You theoretically could keep finding items that rock slammed and finding them nicely so that you could keep going and you would eventually wind up with the bottom of the channel. All this is very interesting. You recognize that there's a possibility in that direction. But it would be very hard and there'd be a lot of guesswork about it and you'd make a lot of wrong guesses, and you wouldn't have the guiding constant common denominator that you're going with, which is the goal. So it's easier to go down the channel a short distance until the goal is available and then pick up the goal and continue to list and null with the goal.

Now, this is trying to get the case discharged sufficiently so that you can do something with a goals list. Now, if you kept discharging the case and at the same time disorienting the case even further, you of course are going to get further and further from finding a goal.
see how that could be? Instead of discharging the case all you're doing is enturbulating the case.

You keep finding items and handing them to the pc that didn't slam. I'll give you ways of doing this. Tell the pc that's his item and he never cognites on it, he's just going to get fuzzier and fuzzier. He's going to get less and less real about things, see. There's less and less happening. You follow how you could go at this? You're going to get less and less likely to find these goals, you see. You're going to find wrong items, you're going to find items that don't slam, and he's just going to get buried and confused.

Now, I had to decide what you could get away with. And my first guesstimate was more closely based on what I myself thought I could get away with, as it normally would be, and that was simply to get a couple of items and you'd get something else. See, it's as simple as that. I mean, if you're going to have to go to all this nonsense just to know what your goal is – you get the idea – why, then of course, the most you'd need would be an item or two and you could list some goals against it and that'd be that.

Well, that didn't turn out to be too workable, so we stretched it out to about three items, don't you see. Then we started listing goals after three items and unburdening it, and I finally woke up to the fact that we were leaving pieces of the package behind us unidentified. And that this was raising hell with several pcs.

We were actually into the GPM. We were actually handling pairs. And even though these pairs were the pair of the detested person... Ah, but the detested person had a terminal that detested him that was just that much in present time. It's sort of like picking pebbles off the beach so you can get to the boulders, don't you see. Well, all the pc could tolerate at that stage of the game is the pebbles. So he's not quite able to confront pebbles and he's worried by the fact that there's a pebble left behind him. You found this detested person. This detested person is Joe, see? See? All right, detested person – Joe. So now from that you get the dynamic list and you get the dynamic, "spirits." And now you get the item that spirits represent, and you wonder why this pc isn't progressing well and why you're really not having a good time of it in trying to add up these goals and list goals and tiger drill them and that sort of thing. Hell, he's worried about what would oppose Joe! See, he's clear back there.

See, you've gone into this factory and you've showed him everything and you've ex-postulated and you've pointed to the machinery and the dustbins and the wastebins and the employees' room and the guard rooms and how they file everything and so forth, and you look around and you say, "Hey, hey, where are you?" You know? And you go back. He's just inside the main gate. He doesn't want to know all those things you were telling him, he says, "What place is this?" See? He wants to know who hates Joe. So you get the idea there, because you've left an unmatched – an unopposed pair.

So, to be on the safe side doing this because it helps any case, why, you make a rule about it. And you've got that in November 11, AD 12, 3GA, straightening up these cases; well, you always make a pair. If you get something, you oppose it. That's just your rule. And if it's still red-hot, you represent it. That's actually all you need to know. It isn't a question of representing, always. If you get something that slams you oppose it. Well, if you got something that was a terminal and you oppose it, of course you're looking for an opptermin, looking
for something that's agin him. And then you've got a terminal, you've got an opposition terminal. If you got an opposition terminal, you've got to get its terminal, don't you see?

Well now, this isn't all that smooth. Actually, after the person has been cleared, he has it all straight. But this, oddly enough, doesn't do you a bit of good. And you sometimes will find yourself in this weird squirrel cage: You find this item and it's a terminal. And you've gotten it by opposing, let us say, the detested person. And you've got it, you see, and it's "a slave driver." And the pc says, "Well, you've got that now, you know." There it was, opposing the detested person, you've got this "slave driver," and we're very happy about this and now we've got that packaged and... Pc doesn't seem very responsive about this, and so forth and the auditor evaluate, evaluate, and the pc's being pleasant and propitiative. And the pc ventures and he says, "You know, a while ago there when we found uh – when we found uh – 'ships' – 'ships,' you know, we found this item 'ships' – we were doing this a while ago, you know. I think that's what 'slave driver' opposes." See, that's three down the line, see. He's all mucked up on this subject, in other words, and you've got to pick your way through it.

And the test by which you pick your way through it is what is still slamming. You can always make something slam again if it's going to slam. You can say, "Get the idea of withholding from it," if you've been running overts with it all the time, if it's going to slam again. Now, if it's going to slam again, why, it hasn't been opposed. I don't care if you got the opposition to it – now, hear me now – I don't care if you got the opposition to it and you wrote it. That's what you did. You're always supposed to be auditing a pc. I'd like to call that to your attention. And although you opposed it and you wrote up, "Who or what would oppose Joe?" and you got "a slave driver," when it all winds up and you start looking these – these items you've got on the line plot again and you find "Joe" is still rock slamming, you have not opposed "Joe." You have probably opposed something else.

And you could do the pc a world of good, if you've got several items around, and say, "Well what..." you know, "Here's a – here's 'a catamaran,' and here's 'ships,' and here's this... And what – which one of these does 'a slave drive oppose, if any?"

"Oh, ho-ho-ho! 'ships!'"

Yeah, but you now have the burning question of what opposes "Joe?" You haven't found out yet. So you've got to do something about "Joe" now, again, because "Joe" is still slamming. Do you follow that? You haven't got the rest of the package.

Now, these two, you see, are aided and abetted by others. There's other mysterious ones hanging out in the shadowy darkness. There's all sorts of stuff around. There's no lack of quantity of items. If you think you're going to find four or five items and the pc's Clear – ha-ha-ha! You see, he accidentally goes Clear on 10 or 15 thousand items but in actual fact he has probably blown closer to 150 thousand. You see this? He only mentioned these few. Or he only ran these few. So you think you're going to get six packages and then the pc should be Clear, you got another thunk coming. Because it's quantitative, man; this GPM is quantitative.

But similarly, in your contemptuous eye as the auditor, you know you could confront all that. You know you'd have no trouble of confronting this, so why should the pc have any trouble? Well, you're not in his bank is one of the reasons. And you've sailed on by a pair and
you haven't made a pair. You haven't got a terminal and an oppterm sitting back there, and that's going to start pulling the pc back to it, and that's going to keep the thing – keep the thing snarled up.

I don't know if you heard any of the lectures about the – what the GPM does. But the GPM as it comes up in these pairs then starts making question marks and crisscrossing itself and tangling up and the bottom starts fitting up against the top, and *pluuhh!* You keep on fooling with it and eventually it'll come straight, and all of a sudden it'll make sense. But remember, it only straightens out because you've got the pc to recognize the matter, energy, space and time that the item consists of. In other words, this item now has been recognized, and it has been placed where it should be placed and he sees what it is opposed by and so forth. In other words, he's gotten sensible about it.

Now, this whole thing goes back to the earliest laws I developed in the field of the mind, back in 1938. This is out of "Excalibur." And that is that things are composed of identities, similarities and differences. In other words: identification – can't tell the difference; similarities – nearly-alikes, you could tell them apart if you looked hard; to differences – any fool can plainly see. You see that a chair isn't a roof.

Now, the GPM is in a state of a total identification when you greet it. And every one of these items is every other one of these items. And when you list, you are bringing about a similarity from an identity. You've got a complete identification, A=A=A, so you list this thing down. And when you've got this listed down, you have already, by listing it, brought about a step of achieving a similarity where you had an identification. Now the pc knows they're similar. And now, by causing him to find the item they were all pinned to in the first place, differentiation takes place and the thing starts blowing apart. Now he finds out what ailed him.

Now, you take a rock slammer. You're busy testing this rock slammer and you say, "You come in every night and you tear all the files apart and throw them in the waste basket and so forth and do other progressive things with the organization. We think you slam. We think you're a rock slammer. And we think you'd slam probably on Scientology." You recognize the moment that you put him on the meter and isolate the fact that he is a rock slammer, he goes a lot saner at that moment. Did you recognize that? If you did it – if you did it calmly as an auditor, not accusatively, he all of a sudden – he was mad at the whole environment; now he knows what he's mad at specifically. Now if we find who or what was mad at whatever he was slamming on – Scientology or Scientology orgs, something – we would have a pair. And this would tend to blow. See, but if we just found out he was a rock slammer, we'll do him some good.

Now if we find out who or what is rock slamming on it, of course the slam deteriorates because what makes the slam? A slam is the meter manifestation of a games condition. It's the unsuccessful effort to withdraw from the thing he must attack. So you get a games condition and that games condition is the manifestation called a rock slam.

Well, it takes – the Norwegians say it takes – one stick won't burn, and it takes two to make a fight. One stick won't burn; takes two to make a fight. That's absolutely factual. No more sooth was ever soothsaid. It takes two items minimal to make a package.
Now, if you wanted to find the rest of the immediate package, you would have to find out what wasn't against Scientology and what Scientology wasn't. And of course, this immediately – by the positive – negative polarities of the electrical current that goes through this thing – you'll find out that this would discharge like mad.

But you recognize that the moment you have found out that a person is a rock slammer and the person sees that he's a rock slammer on something, you realize, that he has to that degree ceased to be a rock slammer. To that degree, he's ceased to be a rock slammer. Now, we find out who is rock slamming against this and, of course, you've started to neaten this thing up like crazy. And of course, he's much less likely to be a rock slammer, you see. And all the time – the fact of testing this is discharging the condition.

See, a rock slammer is only bad off before he's been detected. See, at his worst state – he's at his worst before you find out. But just as soon as you find out on the meter, he finds out, too. So he's got all kinds of things explained now, don't you see. Makes sense. Well, he knows now what he's fighting. He doesn't have to fight the whole environment, he's not fighting the waste baskets and he's not fighting the files and he's not fighting roofs of that particular line; he is fighting Scientology. "Oh!" you see, kind of "That's my target. Oh! Oh, well, that's silly. Well of course, yes, naturally I can see how I would be, yes, that's true." Now find out what's fighting Scientology and of course, you've shed this little valence that is fighting Scientology directly, and he realizes he isn't fighting Scientology but that psychiatrists do and he had a kind of psychiatric valence, something like that. See, it deintensifies.

Now, if you went on by and simply tested him as a rock slammer, and then never found out what defied something, a lot of his attention is hung up and he's unable to put his whole attention on the next item he's got to confront. And you haven't improved his confrontingness to any great degree. And the more rock slam you leave behind you as you walk this track, then the less attention he has to put on the items ahead of him. And having no greater – not enormously increased ability to put his attention on things, his confront therefore has not improved up to a point where he can confront. So by leaving items behind you, you get into the interesting conditions of the rock slam diminishing, dwindling and getting lost.

Now, why did it diminish and dwindle? Why does it disappear? Why does it turn phantom on you? Why does it do this, why does it do that? That's because you've left items behind you and therefore left his attention tied up somewhere near PT in some fashion or another, and he just hasn't got the ergs, or whatever attention's composed of, to confront what he now must confront to get a slam on the next item.

See, he only slams on those things which can become real to him. The beauty of an E-Meter is, is it spots the things which have a potential reality to the pc. You're going to find item after item after item on lists that don't rock slam and the pc will list them – oh, God, you're running the goal by this time and you're listing the goal and so forth, and the pc still comes up with "a pullet." This is still going on the list. You look back on the list, he's been putting "a pullet" on the list since the detested person. Never slammed before, and all of a sudden, why, you're about twenty items down on the goal itself, see – you're listing for the goal – he puts down – he says, "A pullet," you know. Crash, crash, crash! Tremendous rock
slam. Always previously he was not really up to confronting "a pullet," so, of course, it never rock slammed. You see that?

So you'd better get all of the things the pc can confront. And if you've got available parts of his – of his line plot, which aren't opposed, you've got – you've got availabilities of confront and you can capture some of his attention and give him back some of his reality, and get him up to the point where he really will be able to confront his goal.

So I can define then, what you're doing this for. Why you're doing this. You see why you're doing your 3GA Criss Cross, is you're releasing sufficient attention of fancied opposition in the environment so the pc can have the environment and you're going backtrack from the referral point of the environment. In other words, by finding items you increase the amount of attention the pc can put on the environment. And he'll get less and less confused and be able to come up with his goal. And of course, he's getting closer and closer to the identity of his goal, his goal is less barriered out, and you'll be able to list and find his goal.

Now, the number of ways there are to find a goal after you've had a hatful of items – these things are getting too numerous to go into very rapidly and easily, too. You realize that you can take a goal that fired, which is "to dance on eggs" – let's take this goal that fired, "to dance on eggs." It only fired three times. You realize that you've got a good opportunity, without prepchecking that for the next thirty-five hours, to find out if it is the goal. You look it over, it doesn't seem to be very lively, except it rocket reads once in a while or it rocket read. You know you can do a represent list on that goal – a represent list of goals. This is just "What goal would represent the goal 'to walk on eggs'?" or "What goal would be like it?" "What would be a similar goal to this goal?" Got the idea? And you get these goals pulled apart.

Some pcs are listing on goals with one word wrong in them. They just don't go free. Well, that's an awful good step. The goal "to catch catfish," they've got their goal, "to catch catfish." You say, "All right, give me a list of goals similar to catching – this goal 'to catch catfish.'" "What goal would be similar to the goal 'to catch catfish'?" See? And you just make a list of those things and go over those things rapidly and you'll find out there was a comma out of place. Something like this can be done. Or it was a near thing. And some pc will sit around for a long time and he'll say, "I wonder if there's really a third word on the end of my goal? Suppose there really is? Suppose there really isn't?" see? Well, this step gives him an opportunity to find out.

In other words, there are just tons of ways that you can find goals and go out for goals. You could get a whole bunch of terminals, and they all seem to have – these terminals all seem to be in rags. He's got terminal after terminal – pc's terminals – you know, and they all seem to have rags connected with them in some fashion or another. So just turn around, write them all down and say, "Now, look. Look, pc, see all of these guys here, so forth – well, what kind of a goal would such people have? And give me a list." You know? You know? Just read them off there, and so on and so on and so on and so on and so on and one will fire. Got the idea? It's crude, see.

Because he's got such an idea now, these are all reliable items, you see, on the terminals line. What's the goal of them? Of them? See? And you'll find out there's a great similarity.
amongst them. You take one single item on the terminal side, he'll give you a goals list for that and it'll have the goal on it.

There's all kinds of ways to find the goal. But unburdening must improve the pc's presence. It must improve his alertness, must free up his attention. Otherwise, don't do it at all. You'd come off much, much better by just giving the pc some Problems Intensives and some CCHs, don't you see?

All right, this is how you get into – into the case, into the channel. This is how you use it. I'm giving you a very, very rapid summary of showing you just about where we are. This is a lecture – more an orientation than a bunch of data, don't you see, although there are some new things here. I wanted to give you the data very specifically on some of these bulletins. I've given you how to straighten out wrong goals, and I've given you somatics, how to tell terminals from opposition terminals, and I've given you this straightening out line plots and dirty needles and incomplete lists.

Boy, you guys, some of you make me laugh. You never expect a needle to go clean; list five items – what's the missed withhold? The item, of course! Give a dirty needle every time.

And then the whole of Routine 3-21 – your Routine 3-21 will be something that you will use far more often than you think right at the present moment.

So there's dozens of ways that you can approach this particular thing, we're there as far as technology is concerned. Adapting it to the individual cases, trying to get people listed out and straightened up and smoothed out and all that sort of thing – all this requires is good auditing. It takes time, it takes careful craftsmanship, it takes doing the usual, it's keeping your pc alert and in PT and between sessions, making him better all the time. It takes a lot of things. And this grade – you can climb this hill. What I'm trying to do is teach you to climb the hill, teach you to get somebody else to climb the hill. And I personally feel I'm being very successful at it and think your Instructors are having very excellent progress out of it. I never felt better about a course in my life.

What the kids are doing who have gone out of here, hardly without exception is absolutely miraculous. My God, what's happening right now – two Saint Hill graduates in Johannesburg and another one in Cape Town – would make him gasp. They've really got things on the run. The only thing I'm worried about is they're doing their own co-auditing after ten o'clock at night. And that sounds kind of poor. But they can't plan it any other way and at least they're getting some auditing.

Okay. Well, I hope that brief summary of things will be of some use to you.

Thank you very much.
Thank you.

Well, how are we, tonight? [laughter] Doesn't that sound cute. Of course, that is referring to you and your valences.

This is lecture one, Saint Hill Special Briefing Course. What's the date?

*Audience: 15 November.*

Nov. 15, AD 12.

[part missing]

And there's another item that's posted on the bulletin board, has to do with one R. – I think it is – R. M. Nixon⁶. You notice that on the bulletin board? And John [part missing] is attributing the fact that we clobbered Nixon to the fact that he's clobbered. I don't know to what point this extends, but it's interesting that that is the first political figure in the United States that we really have clobbered. Of course, we hit him hard.

Mary Sue isn't here. Mary Sue isn't here, so I can tell you that actually I hit him because he hit at Mary Sue. It's almost that corny. But this fellow was using the United States Secret Service as a sort of a private Gestapo. And he'd been doing this all over Washington and so forth. So I just didn't think it was good political – I didn't think he had the right political color, somehow or another. I thought that ...

But you notice this sort of thing happening, that after country A has defeated country B, you will see not just the spoils of war but the customs of country B showing up in country A. Very interesting thing, here, you see?

Now, actually, almost anybody unwittingly will take on the color of his oppterms. That's horrible to behold, but true! Now, I want you to become very expert with that bulletin on somatics – last week's bulletin on somatics. For this reason: is, people tend to rank themselves individually as the cowboys in the white hat. And the oppterm as the cowboy in the black hat. And the only thing that tells you which is which, is whether it turns on pain or sen. You see? Turns on pain, when you chant it one way or the other, as per that bulletin, why, you get – that's a terminal. And if it's – turns on sensation, why, of course, that's an opposition terminal.

---

⁶ Editor's note: Richard M. Nixon, 1913-1994, president of the United States from 1969-1974. He was vice-president under president Eisenhower 1953-1961. In 1962 he ran for governor of California but was defeated. He retired from politics for several years before he reemerged and became president.
Well, they're quite distinct. But remember, as in the case of a rock slammer, you have separated them. You have already differentiated it for the pc. And now he sees what the score is. But some people also work this in reverse. They consider themselves only the cowboy in the black hat, you see, and the enemy always is the cowboy in the white hat. All of which is quite amazing. And they will get terribly tangled up. And if you get an oppterm on the terminal side, or a terminal on the oppterm side, the consequences of it is great confusion.

Now, when you get one that turns on both pain and sen, you mark it in the middle of your line plot as a combination terminal. They're quite legitimate, and it merely says that you got hold of a deteriorated package. It isn't that this package has collapsed. It's that we now have a new terminal which has the attributes of both terminal and oppterm. You see, it's a sort of the end of the road. Pain and sen turn on with that. Well, that's a combination terminal. Recognize it. It's not a package which has just pushed itself together, it is a new thing which belongs as a lock on both the oppterm chain and the terminal chain. In other words, he's picked up a new identity which had both their characteristics.

When we get into national life – to revert to what I was talking to you about – you get the succeeding generations of politicians performing as combination terminals. You see, you're looking there at combination terminals. The war happens in generation A, and then in generation B we tend to get a combination terminal, see. So the US busily defeats Germany and there'd be a tendency up where – somewhere up the track to – somebody to have a democratic fascism. This all logical, see, we have a democratic fascism. It's perfectly all right for democracy to exist as long as we're capable of also operating the Gestapo.

Well, it's that sort of thing that I tend to keep an eye on. But of course, you may not realize it, but you're all members of a secret society. You've been a member of it for a very long time, most of you. And it doesn't matter whether this shows up in your oppterm line or not, sooner or later, why, you pick it up on the track. And that's the "SPG." The "SPG" – it is very nice. And you're authorized, you know, to enlist anyone as a member of the "SPG." There are no dues, only performance is expected. And the "SPG," of course, is the "Society for the Prevention of Government." Of course, any time you natter about your income tax or something like that, you to some degree are preventing government, don't you see. So you willy-nilly are members of this organization; you might as well go in whole hog, you know.

I find it quite interesting that man hasn't realized yet that government is the source of his wars, see. They haven't taken that one extra step. Man as a whole. But the other day I was quite interested to receive an invitation to become a member of a board of people who were being recruited, willy-nilly, any way possible, to make a consultation panel that should get together and figure out what should be done with governments and man and atom bombs, and all this organization, this society, that's putting this out is doing – it's quite interesting; it's quite interesting – all they've decided to do is just get a bunch of fellows together, see. They haven't postulated any solution. They're trying to get together a bunch of fellows who will correspond with one another and meet with one another, in the hopes that these boys will come up with some kind of an idea or a solution. And all they're taking responsibility for is putting all these people in contact with one another. And they've picked up a few hundred people around the world, and they're now busily trying to get them into communication with one another. That's all they're doing, see.
Well, they haven't stated it, but they realize themselves that this idea of government, you see, is – must be at the cause of it, because they haven't approached governments. I thought it was very interesting, see, that somebody would actually take this effort. Apparently they're spending quite a bit of time and money on it and so on, and that is the total purpose of it. There is no other purpose, except let's get these fellows together and get them talking to one another and get them writing one another and they may come up with a solution. And then we'd be very happy to publish the solution. That's the totality of it.

Now, of course, I was worrying about this a few weeks ago. How come government would get into this kind of a mess? Well, naturally, war and antagonism and that sort of thing gets these things going. And then some very pure government – is doing a very good job – tackles some government which is doing a degraded job of some kind or another, and afterwards we get a combination terminal, you see, and the thing isn't – the first government wasn't quite so pure, now, you see. Now we get this compounding up the line, and combinations of this sort of thing, and we eventually get what we now got.

Now, the essence of this thing is that I wondered why was it that government would occupy so much of people's attention and newspaper space, and I suddenly realized that government has a salesman but the individual does not. See, the individual does not have a salesman. You're supposed to personally erase yourself, you know, even in common social courtesy. You don't have to go as far as the Japanese, you see, but you self-negate. You know. You mustn't blow your own steam or sound your own horn – that sort of thing, you know. But governments have spokesmen. And every politician that runs for office is selling the idea of government. And that is the chief idea which is being sold. And it's sold now by radio and television – completely aside from soap boxes, and so forth. And everybody is supposed to get out and buy this idea, certain number of times, and vote, and all that sort of thing, you see. It's a heavily sold idea.

And of course, a democracy has got it worked out to a fine-feathered fury, you see. Everybody is persuaded that they choose their leaders, you see, and therefore it's the people's fault, which of course makes no government. If the head of government – it isn't the head of the government's responsibility to find out what's going on and do the right thing, but the people's fault. But the people have no say about who's the head of government, really, you see. That's a mess.

Anyway, it's the only supersalesmanship that is now going on. And man, it is supersalesmanship. Everybody is selling this idea. So of course you get more and more and more and more government. And you're going to get more and more and more and more government, see. So eventually the individual becomes nothing, the government becomes all. And you get some sort of a communistic, socialistic super-mess of some kind or another, where nobody must spit without asking permission of the government and, you know, have a license to breathe, and all that kind of thing. And I worked this out. You might think that government is one of my oppterms; doesn't happen to be. That's why I can still think on this subject.

It's interesting to me, though, that you collide with government on this single front and basis. The only time you find something wrong with the idea of government is because you are selling the idea of the individual. Unwittingly, willy-nilly, whether you have ever ex-
pressed it to yourself or not, you are still selling the idea of the individual. I consider this quite interesting. Now, because you can make things better by handling the individual, of course, you fall into the channel of workability. So you see this as a workable action. You see that this is a workable channel. So you don't even beat the drum and say individuality is everything, you know. You don't have to. But you are to some degree pushing this forward because it is a line of truth.

You want to make some group better. The optimum way to make some group better is – you can't stand back and process something called a group – you've got to get ahold of the members of the group, one after the other, and say, "Where's the wall?" Because the only people you're going to get to talk to in that group is the members of the group. Don't you see? You recognize that as truth, and therefore, it makes you a promoter of the individual.

Now, this, of course, will make you get in the road of governments. You see how this works out? You immediately will get in the road of governments, because they're selling the idea of THE – that's underscore – with Old English and Old American and Old German capital letters – THE government, see? The government must be all. The government must own everything, you see. And you're in the road of that, because you simply say, in your action, that you're going to process some individuals. Well, this is giving individuals attention, and probably a government can't take too much of that. And just the fact that you give some individuals attention will cause you to go against the governmental line.

Someday, somebody will swoop down and say that you're a wild-eyed revolutionary. And I just wanted to make these few remarks so that you'd understand wherein you are a revolutionary. You might not realize that treating the individual in a totalitarian world where the government must be all, is in actual fact almost a revolutionary action. Whether you intend to revolt or not – I don't even intend to revolt. It's beneath my dignity. But somebody'll say, well, you – they kind of feel that you might be in revolt, and so forth.

If you ever want to get along with a communist, I'll give you a little tip. You're scattered all over the world and someday you'll be talking to a communist. I hope that he won't have guns in his hands at the time you're talking to him and have overwhelmed the particular society in which you exist, because that is the last dregs of individualism. All he can think of is self-criticism in his highest level of psychotherapy. Of course, he's trying to wipe out the individual. And if you're ever talking to a communist, I can give you the perfect answer, the perfect answer to his communistic arguments – is just tell him you're an anarchist. You don't even have to know too much about what anarchism is. Just tell him you're an anarchist, see. And an anarchist isn't somebody who throws bombs, that was the way the capitalists handled them back around the turn of the century. He's simply a fellow who believes that no government should exist.

And you take the poor communist, and he's drilled up, one-two-three-four, his arguments are perfectly laid out, they're all wonderfully grooved, he's been taught them by rote; how to handle the capitalist; how to handle the social democrat; how to handle the royalist. You see, he's been taught all these things, and he's there giving you more or less the common denominator of those arguments, and he gets just about so far, and you look at him innocently
and say, "What are you talking to me like that for? You probably don't realize that I'm an anarchist."

And watch him shift his gears, you know. It's one of these... He can't even make a racing shift out of it, you know. Gear teeth spitting out of the crankshaft, you know, and everything going to hell. And long ago, why, they realized that the anarchist was probably their greatest foe, and they had to cultivate him, and they have fantastic overts on anarchists all over the world, because, of course, their overt is against individualists, you see. And you will get one of the fanciest songs and dances, after he's wrecked the transmission, that you ever wanted to listen to, as to how government is really necessary.

See, he's been talking about tearing down the state, tearing up everything, trying to – you know, destroy it all and so forth – and then you say you're an anarchist – he has to shift gears, and tell you, "Now, look, some government is necessary." You see? And you immediately make the poor guy become a conservative. [laughter] And he has to shift from the wild-eyed revolutionary, of course, to the long-jawed conservative.

Of course, I never branded myself as an anarchist, but I have told anarchists that I thought they were far, far, too far to the right. And that was – kind of settled the argument – too conservative for me. Ha-ha! Of course you don't know where to go with that argument, you see, because there's nothing over there but a cliff!

But the funny part of it is the communist, because of this collision of term-oppterm, the first thing he's got to destroy is the individual. And anarchy has always been rampant in countries just before communism took over. And they're the one political breed of cat that the communist respects and fears. That is the one thing he fears. He will always try to get the anarchist's cooperation. He isn't likely to stand anarchists up in front of the firing squad, not of course until he's taken over completely, see. But if he feels any security – insecurity whatsoever in his push, he'll always butter up an anarchist, see; always very careful of anarchists, you see. Very, very careful.

Down in Spain, during the Spanish Revolution, and so forth, why, there were anarchists all over the place, you know. And the communists were pushing them on and patting them on the back, and of course they'd eventually get rid of all the anarchists, you know, out of public office and that sort of thing. But they never could quite come up to... See, it's a matter of too many overts. The thing is almost becoming sacred to them.

But you watch these evolutions of government, it becomes very amusing. I didn't mean to give you a talk about it, but you have a world here which is tipping over this way, and tipping over that way, and it's kind of hard to understand some of these things. What are these fellows after? What are they doing, and so on. You find many communistic principles are safely ensconced now in US law, you know. The principles of taxation, principles of ownership of property and that sort of thing are going more and more and more into US law. And they're taken straight out of the textbook of Karl Marx.

Not me saying so – I said so one day and the Wall Street Journal picked it up, which is quite interesting – that the tax laws now used by the United States are taken directly from Karl Marx. This is all very, very fascinating, but it gives you the idea of terminal and oppterm, how these things then become combination terminals and mix up in general.
Makes it quite a fascinating picture. Because things won't get straighter in the political arena. You can forecast that they will become progressively more confused. And it'll always be that way.

In the absence of processing, in the absence of somebody straightening out people, in the absence of somebody informing people, they will just become more and more tangled up; more and more confused. Lord knows what political philosophy would emerge out of this, but you could predict it. You could take those political philosophies which are opposed to those political philosophies, take the common denominators of the two – probably the worst points of both – and it'll become the combination terminal which is tomorrow's politics. If you ever want to forecast it, just take a look at the GPM and apply it to mankind on the fourth dynamic, and you probably will have a fairly reliable answer.

It's rather awe-inspiring. Fortunately, it takes sometimes upwards to a hundred years for this wheel to turn, you see. Sometimes two or three hundred years for it to turn completely, but you can see what will eventually be in charge. I said that and you thought I meant a joke – actually it is the least desirable characteristics of both terminal and oppterm, and you will get the combination terminal that will become. A rather sorry look. But it's on the basis of that which is least admired tends to persist.

And if you can imagine the worst characteristics of the United States and the worst characteristics of Russia, see, combined, and the good characteristics vanished, why, you will get a superstate that will ride up the line someplace or another and is likely to materialize, unless somebody like us comes along and shows 'em da road. Say, "What you goin' down for in that coal pit? Why don't you walk out here on the grass?" Unless somebody does that, that was – that's exactly what would occur.

The situation in handling cases – I've been talking about the fourth dynamic, that gives you a look – when you look at the third and fourth dynamics – at the eventual fate of any individual you process. This is in the argument to the refutation that people give you that you have to do a lot of livingness and if you did enough livingness you would eventually come out with some new, high, desirable state. Well, I'm sorry that that doesn't seem to hold good. To get the data you would clear somebody up so that he could carry on a bit further without it happening.

But supposing that without processing you could find a terminal and oppterm in the individual. Well, you know, you didn't relieve it in any way, you just located these things, you see, in some fashion. Not in any way that was therapeutic. If you located his chief terminal and his chief opposition terminal, and then you took the least desirable characteristics of both, you'll get the combination terminal that this person will become in a few generations.

That's a gloomy look, but it happens to be an accurate one. Now, a lot of you have had terms and oppterms found. And of course, those that were found first were nearest to the top of the stack and therefore would be the ones which were most likely to produce the next pair. Well, they will actually produce a single unit, ordinarily, before they produce anything like new terminals and oppterms. And if you take your first terminal and your first opposition terminal, and then figure out what's the worst characteristics of both of them, you have got a life
of yours somewhere in the future mocked up that you're not going to have to live. I know that sounds like it's gloomy and pessimistic and so forth, but there it is. It's not. It's quite accurate.

And as your GPM flies off, if you sat still long enough to watch it go by and added it all up, you'd find out that this had been taking place rather consistently. The amount of horsepower and freedom which is there to be freed is fantastic. Because you never touch a case that isn't in a tremendously deteriorated state.

Now, when we made the first discoveries – I'm talking to you now about rock slammers and cases and oppterms and so forth – of the tremendous power exerted over the individual of his basic postulate that created each section of the GPM, when we first ran into this, we had a tendency to recognize it as something brand-new. Something brand-new.

And I know it's in the first book – that is, *Dianetics: Modern Science of Mental Health*. It talks about the individual and his basic purpose. It's quite a discussion of that in there. I hadn't – wasn't aware of the fact – Suzie was reading *Dianetics: The Original Thesis, 1947*. I wasn't aware of the fact that it went earlier than that. But it goes back here to the definition of the first dynamic as written in *The Original Thesis*, on page 14 of the Wichita printing of that. And apropos of nothing particular here we find, startling enough, all eight dynamics on page 14 and 15, and all completely defined, and so on. All properly numbered. This wasn't rewritten for publication – this was published back in 1951. And we get the definition of the first dynamic, is: "The dynamic of self, consists of the dynamic thrust to survive as an individual, to obtain pleasures as an individual and to avoid pain. It covers the general field of food, clothing and shelter, personal ambition and general individual purpose."

I'd forgotten myself that it was woven into the woof and warp of the subject right from the start. Now, this general individual purpose is on top of any mass or general purpose of, you might call, the basic... Well, theta has, and follows, certain general laws. We find these in the Axioms.

A thetan does these various basic things. But he also splinters off and postulates some portion of them or some specialization of them. And he postulates this all off his own bat, and then tries to go forward with this as an individual purpose, aside from the basic Axioms. And he tries to go forward with this, moves onward, trying to effect it and builds up a tremendous amount of accumulated mass and all sorts of oddball items, you know: terminals, oppterms, combination terminals, upsets of various kinds or another. And he builds up a section that we call the GPM and then he will postulate something else, and then he builds up another section of the whole GPM, and then that finally dwindles out, and he somehow or another gets himself free of that – that's – I don't say he gets himself free of it, he sort of, you know, he gets out of it someday. He gets blown up thoroughly enough that he forgets it utterly. Let me put it that way. And he makes up a new individual purpose and goes on from there.

Well, actually all these things are in controverson to the basic laws of this universe and theta and the purposes of thetans and so forth. And if there is any reason why it builds up mass, it is because it's an alter-is of the Axioms. Ever think of it that way? See? Fellow's being an individual, but he's being an individual with an exclamation point! He already is in some kind of a games condition with his fellows and the universe at large, and being in this state, why, he decides to be even more different. And he postulates what we're digging up as a
goal. His basic purpose, his goal. And then this, of course, is counter to the behavior patterns and former agreements and construction of the universe as contained in the Axioms, and so he is individuated out from that to that degree that he now has pitted himself against the whole lot – the whole works. He's flown in the teeth of every agreement he has previously made, which I consider quite adventurous. But that's all right.

What we're finding out when we talk about clearing – we're finding out as we turn on somatics in the individual; as we find items in the person; we find terminals and oppterms; what we're finding out is, is he hasn't gotten away with it. Do you see that as an interesting sidelight on the situation?

There's the GPM and it's killing him, see. He's got a goal, he's got an individual purpose and he can't even execute it.

Find it very difficult even to execute his own individual purpose. Well, of course, to execute it, he's flying in the teeth of all the agreements. And then remember, he's part of these agreements, you see. He's part creator of these original agreements we call the Axioms. So he's called himself a liar to that degree and he is now departed out into the zones and areas of superindividuality and there we go.

Now, as the individual goes forward, postulating a new goal, he of course is flying in the teeth of and alter-ising all of his former agreements. So now he gets up to a point of where he explodes out of the bank or something of the sort and he says, "Well, the bank is over there and I'm here," and he now postulates, again, a new individuation. He postulates a new basic purpose for himself. And he lives that one on out and it accumulates mass and then he adds it to the first mass and somehow or another one day, why, he manages to get an unstimulated environment, or get blown up or something of the sort, and he suddenly says, "Well, all right, I'm free of all that and that's all gone and that's all passed and so on." He manages to get quite free of it, in actual fact. And he postulates a new basic purpose for himself, you see, and then that's in the teeth of all of his own basic purposes and then that's all in the teeth of all of the basic purposes which he agreed on with everybody else to have anyhow. And you see, so it doesn't take too long for that one to get in a ball. That gets in a ball much more rapidly, actually. It's much easier for that one to create a GPM section.

So he's actually going on a shorter and shorter cycle track. The cycles of the track are becoming shorter and he's finding more and more things that he can't do, and more and more things that he can no longer confront, and one day he says, "How come it's all black?" – will be practically his sole comment on the thing. He won't explode out of this mass again, don't you see? This fortuitous circumstance which momentarily freed him from the GPM that he'd already racked up, well, he's just so dug in it just doesn't happen.

Now, the person who is sitting there saying, "Well, I don't really want to be Clear," is just being a ruddy idiot. He's almost beneath an auditor's contempt. If he had the data before him or he'd looked it over, any subjective reality on it at all, and then he said no, he doesn't want to be Clear, or he doesn't want to be free of this, or he doesn't want to be on the straight road again, or anything like this, the guy's an idiot! That's all.

Now, somebody who gets very angry at Scientology and won't be processed again and has got fantastic personalities getting in his road – how he just can't possibly be processed
because the Central Organization's Org Sec Sec, or something like this, has blotted the stationery of the last letter that was written to him, don't you see – has caused this terrible ARC break. Wow! He ought to be glad there is an Org Sec Sec, even though he says – even though the Org Sec Sec says to him whenever he walks in the office, "You blankety-blank-blank." He ought to say – not necessarily take it, but certainly, that from somebody who is perfectly willing to help him on his road and out of his mess... Look, he's got this stacked up against, not the next two hundred trillion years, really, he's got this stacked up against an oblivion, an oblivion of total pain and sen.

You want to look and find out what hell is, what's this thing they're talking about? Usually in religions they'll have some metaphorical method of trying to communicate. And if they were ever talking about a hell – this is hell. See, this is hell. They recognize there's something waiting for them in the future. They try to shorten it up, you know, and say it's the next life and this time you die and you'll go to it. Well, that's just enthusiasm. But sooner or later the individual does reach that hell.

Now, it's very interesting for somebody to persuade people into believing that he can offer them heaven, and that there is a heaven. I imagine down through the Dark Ages, at one time or another, why, I imagine I must have gotten drunk and kicked off or kicked off while I was drunk, and maybe spent hours going around trying to find the Pearly Gates. I imagine that I've done this. I have no clear recollection of it. I have clear recollection of sneering, but not of doing much looking.

But it's often occurred to me: how about this Joe that has bought pie in the sky, you know. He just bought it by the slab, you know. And he kicks off, you know, and he backs up through the window with the whole GPM dragged after him, you know, and sticks to the walls and does various other things, and sits down and waits for the heavenly messenger or something, you know. Or for somebody to blow a couple of toots on an air horn. And supposing at that moment, why, somebody in a Jaguar came by and pushed the button on their horn. Why, he'd be sure, you see, that's Gabriel. Imagine the bird; he wanders around and caroms off the trees, and looks for Pearly Gates, and that sort of thing. That's why I've always been very careful to have black gates on houses and that sort of thing. [laughter]

But the essence is this guy's been sold, see. He's been sold a bill. And he eventually says, "Well, I must've had my map wrong," or something. He comes back and picks up another body and then somebody starts talking to him about pie in the sky and they're going to save him and he's liable to go to hell. Well, he instinctively knows that he is going to go to hell. That much of it's true. If he lives long enough, he'll be in hell, don't worry about it. And so he'd just as soon have some heaven. And eventually he gets to the point where he can't be sold heaven. See, anytime you say, "You can be free," he gets it tangled up with the number of times he's been up knocking on somebody's wrought iron, thinking that was the Pearly Gates, you know, and nobody let him in, and no harps or halos being issued today, you know. I imagine they get into some awful confused areas, probably wind up over here at Hobbs Barracks, in front of the – [laughter] in front of the Uniform Issue Department, or something like that. You can imagine. They get tangled, see.
Anyhow, you don't know what confusion they get into, but they get into this confusion: that they begin to regard the real thing as pie in the sky. So you say to somebody, "All right, well, I can straighten you out," and even though he's sitting in the chair he sometimes has a very wide reservation. He's been straightened out before!

Sometimes down in Spain they used to straighten them out with pine fagots. They fixed them up. If they confessed at the last moment, why, they let them die without putting ice on their chest as they burned them at the stake. I think that was what they gave them. And they said they would be saved and wouldn't necessarily go to hell. Yeah, the auto-da-fé, the way they used to slow down the person's death with wet clothes, and that sort of thing.

Rather gruesomely got restimulated out here the other night when we did a Guy Fawkes celebration for the kids. Little Arthur was complaining about it, he wanted to put the clothes on one of his dolls or his teddy bears and we insisted on burning them up, and he was rather provoked about the whole thing. He probably was being more smart about it than we were.

Anyhow, this fellow's been saved in innumerable, painful ways, which have wound him up a great many cul-de-sacs and blind alleys with his feet full of tacks. And so you walk up to somebody and you say you're going to clear him and save him and do something for him, you see. And you're liable to restimulate all this. It comes out in "reasons we can't clear you," you see. "What would be the consequences of our clearing you?" Actually, no matter what he says, it's sort of based on these failures.

Now, you get somebody who has really been made to fail on the whole track, with magnitude in exclamation points, and he's going to – he's going to fight it all the way. He's going to have a lot of trouble. He's going to sense all the time something is wrong. Right up to the time you give him a reality on the fact that something is happening.

The kindest way to handle such a person is to give him a fast reality on the fact that you mean business. Not by pulling a magic fire out of the top of a vase and giving him a bunch of overwhump, and that sort of thing. He's seen that before. But actually doing something for him subjectively that he can realize that he is on a road to truth.

People that this has happened to, to too great a degree have always got one eye sort of squinted, just a little bit, waiting for the payoff, see. There is liable to be a trick involved with this, and so on. And frankly it makes an auditor's life rather uncomfortable sometimes. The pc is sitting there and the pc has no trust. His trust level is just shot, you know. And therefore, he doesn't answer the auditing commands, he alter-ises them, he does this and that with them. He knows he'd better not put himself in your power, because too often when he has kicked off he's gone looking for those Pearly Gates and he hasn't found any.

But the trust level – the trust level on what we are doing, of course, generally is not very, very good. The healing sciences today are frankly almost beneath contempt. They aren't doing anything very much for anybody. They're pretty good plumbers. They can normally set a bone or do something like that. They're not bad at things. Sometimes they can do plastic surgery and so forth. These things are nice. Mechanically they're not bad.
But just go in to one of their offices sneezing, the most awful things are liable to happen to you. You know, probes going up your nose and all this sort of thing. You know. You're wildly allergic to one of these wonder drugs, you know, and they shoot you full of it and you break out with the hives and... It's marvelous, you know. They have very few specifics. Of course, they're handy to have around when they work, but it's no great general level. It's almost fantastic, the degree of clutch which this type of healing has on the environment, until you realize that the environment always accepts it as just sort of a fake anyway. They don't approach it with any trust anyway and so on. Well, it's the type of society you're going up against and this pc you're auditing is bred in that kind of a society. So it's no wonder he doesn't follow your auditing commands.

You see, he sort of pretends to. He's like the maiden with a large cold bath before her. And she doesn't even put her big toe in. See, she wants to get the temperature of the water by intuition. And it takes quite a little bit to build up against that. You get the most remarkable kickbacks. It is that single thing which is the hardest thing for an auditor to go up against – is just a very bad trust level.

Now, the mechanics of how it got that way are very valuable and very important to you, but don't overlook the fact that its importance, the importance is actually great in that your dissemination is stopped by practically nothing else. There's hardly anything else stands in the road of dissemination, except that, just that low trust level.

The people that scream that we're quacks and bums and rats and dogs and fakes and all that sort of thing are usually themselves operating in this. The only people that really get enthusiastic about it are yelling at you as an opterminal situation, don't you see, in a very remarkable way. The psychologist, of course, must realize – must have realized long ago; the psychoanalyst must have realized long ago, that they had little or no freedom for man and quite often deteriorated his condition beyond all recognition. They must have realized this a long time ago and yet they're the first to call us fakes, you see. The birds with the dirtiest hands are throwing the most mud. And it's always a good way to identify the situation. That is a general factor.

Now, this individual has already fought the physical universe, and the basic laws of the physical universe – after agreeing to them – he now alter-ises them and, of course, those laws concern matter, energy, space and time, so he starts accumulating matter, energy, space and time, and that's what puts it in his bank, you see. Then he makes an individual purpose, which has nothing to do with these other purposes, don't you see? And he tries to go up against them with this individual purpose, and this, of course, accumulates more mass than you can count. And now he's going to think up another individual purpose and that goes against his first individual purpose and all the purposes behind him. And now he's got a third goal that he postulates up there. Oh, this gets very, very interesting.

But all that's true, but it must have been based originally on a very low level of confidence and trust anyway. He must have had a very, very low level of confidence to have gone to all this trouble. See, he couldn't possibly have trusted what was going on. He must have thought that it was detrimental, or he wouldn't have taken all this trouble to have individuated from it.
You find most pcs are mad at the physical universe, to some degree or another; they'll find some complaints against the physical universe. Well, let me tell you, the physical universe is going to stay here for that individual, until that individual... Now, here's something I've never told you before, but it follows sequitur. It's actually understood in the sixty-four Philadelphia lectures of 1952. I've never mentioned it in connection with modern clearing.

And that is this: That after you get goal number one... Now, you see, we're numbering goals backwards, just for the sake of nomenclature. We don't know how many goals the fellow has postulated for himself, so we can't call this – the first goal we pick up – as "number thirty-four," don't you see, or something like that, because we don't know what number it is. So we're calling that the first goal. I'm talking about the first goal he postulated after the Axioms. And after we get back to that – what was, for him, the original individuating goal – you think you're going to have a total OT. Well, actually you're not, you know. You've got the Axioms.

Now, you're going to back up, up the Axioms. Recognize that? Now, sooner or later, this pc's going to start talking to you about the Axioms. You could carefully have hidden from a pc all lists and conversation concerning an – Axioms, and then clear him on up the line, he'll sooner or later start telling you the Axioms. Well, at this time they're getting ready to blow. But his agreement to those Axioms, his contribution to that degree, is of course, you know, the greatest probability, his first basic trap. You may have to get back to them and run them. See, they may not blow at all. Sooner or later he'll collide with them going backwards. And those are all individuating purposes from the basic purpose.

It's a funny thing, but you have to go a long way back to pick up more than the first dynamic. You start picking up more than the first dynamic waaaaay back on the track, see. A fellow's usually on an – even on today – he's on an inversion of the first. And you'll find out there are about seven dynamics going to invert on you, you know, reverse the inversion process, before he gets to a straight first dynamic. And then when he gets to a straight first dynamic, he's got to go quite a ways before he gets sight of the other dynamics. There's what you're tackling. There's what you're running up against in the bank.

We're the only people who can go up against opposition terminals or masses or something like that and get away with it. Only a Scientologist is safe in his attacks. See that? A hell of a thing, but it actually gives you an unlimited license for overts. You can always run them out. Nobody else can. Interesting, isn't it?

But here is a basic thing that lies in every pc, whether this pc is a rock slammer or otherwise, it's a deteriorated trust. Not only a trust in his fellow man has deteriorated, but also his trust in organizations, in group activities, in any effort whatsoever to do anything for him – he has to some degree or another deteriorated at his level of trust. And he's sort of nervy about it. He gets very nervous when you start going in that direction, because he knows that's always been dangerous to him. And you're reversing his experiential track, so he's going back into areas that he thinks are dangerous. And thinking these areas are dangerous, he's sort of nervous.

Now, this applies to every pc you process. It's just your skill as an auditor and the smoothness of your Model Session and the positiveness of what you're doing and the fact that
you can produce a result in the pc on which he has a reality. And he realizes you are going in the direction of freedom. Now the funny part of it is he may be sufficiently low downscale that the fact he is going in the direction of freedom, it looks so good that he can't have it. And you get into another *rickle-rackle,* you know. He won't let himself have it now, because it's too good, you know. That's unobtainable and you know he – so on... It's like you pushed a three-story cake at a little kid and said, "It's all yours," you know. And he'll stand and look at that thing for hours! He won't touch it. Can't believe it, you know. Probably made out of cardboard and paint. Very suspicious.

Now, if you add to this, this other idea, that if you existed and if you freed man and if you did things for the physical universe, then this person couldn't execute the first and foremost goal or individual purpose that you're going to run into in processing him, see, the first one you're going to pick up on him, that he couldn't have this and he couldn't do it if you or freedom or anything else existed – you got a rock slammer.

But I just want to make it clear to you, that when you look at a person who is fighting the auditor or Scientology or the organization or having a hell of a time and can't tell why, and it's – he's just getting all messed up about this thing, and you look at this person; recognize that that distrust is not just built on this individual goal that you're going to run into as goal one. No, that's not built on that. That is built on a quicksand of distrust that goes earlier than that. Of course he's got goal after goal that goes before that, and he's got stuff, stuff, stuff, stuff. So his level of trust, of course, is very poor to begin with. Then you pop up and you say, "Well, yeah, I'm going to clear you, I'm going to clear men, I'm going to do things for people," and this is all contrary to his basic purpose that you're going for; is the first goal you're going to find – you got a rock slammer. That rock slammer is already built on quicksand that everybody's made out of.

As soon as your auditing deteriorates and becomes less than perfect, as soon as you start fumbling and mucking it up and failing to deliver some reality of some kind or another to a pc, you rekindle, or permit to remain – if it's already going at full blast, which it usually is – all of this morass of distrust that has been generated by all the pie in the sky the fellow has ever been promised. A man's reality on hell and his certainty on hell is far, far better than his reality on heaven, because heaven has never existed and hell has.

And all you got to do on this track is flub a little bit. Actually, you have quite a broad margin of the amount of flub you can flub. You don't have to be absolutely down the line, you're not whipping at it on a total perfection, you see. But you let this case drift too far without a good positive result – you let this fellow go hours and hours and hours of sessioning without any kind of a win – you're not keying in just his basic purpose, you're keying in the whole background of "there is no heaven." And you pay the penalty.

And the longer you take to produce a result on a pc, the more difficult it is to produce that result, just because of this distrust factor which I've been discussing with you.

Now, I don't know whether rock slammers deserve it or not, and I probably ought to keep this to myself and never give you the solution to the rock slammer. We're being very hard on rock slammers, and we should recognize... Actually a lot of people who are simply
nattering after they've been processed for a while, will turn out to be rock slammers. You know, there are a lot of people around who are below being rock slammers.

Your intuition for an individual, that this guy is not all right and he doesn't mean all right, is actually more reliable than your E-Meter where it comes to this, because you may have to process him for some hours before you find out he's a rock slammer. You recognize that's not a vital test, see. That's not totally valid as a test. It's rather conclusive when it does occur. But that it doesn't occur absolves nobody. See, it's sort of like the heaven-hell situation. You see, hell exists, but heaven probably doesn't.

Similarly, people probably aren't, until they're proven to be. But you couldn't say that nobody is. You can't say positively that this person isn't. You get the notion there? Because there's no absolute test of absolvence, except the person's ability to measure up and your feeling about the person, their progress in processing, when you add these things up, why, you say to yourself, "Well, this guy can't possibly be a rock slammer."

Well, what about this? What about this rock slammer? What about this manifestation? Well, all it is, is his degree of overt in your direction and his weird belief that if you or whatever he's rock slamming about exists, then he will never be able to achieve his basic, individual purpose. He believes this, so he fights you. Realize that the first moment you find it out and he finds it out has a tendency to pull its teeth. You never really see a rock slammer going full blast after you found out he was a rock slammer and he knows it, too. Quite interesting. Just the fact of discovering the fact and he discovers it the same time you do. He didn't know it before. Sometimes he won't believe you, but he's got a pretty good idea.

Now, I don't know whether a rock slammer deserves it or not, for me to give you this other tip. If they cause anybody any trouble, of course you can always forget this. But it's just this: all you have to do is opposition what they're slamming on. Say they're slamming on "an auditor," you know, just the whole subject of "an auditor," all you've got to do is write your opposition list to "an auditor" and you'll – you've – just all you've run into is your first package in present time. And it tends to blow up in smoke. Frankly, an auditor capable and able, with 3GA Criss Cross, would not really require any time at all to straighten out a rock slammer. I don't know, two, three hours, at the outside. You see, you've got the list and find the item. And actually, the case folds up as a rock slamming case, as such.

But, of course, this person can have goals listed against any terminal, you can list a goal against any terminal that rock slams, and you can list a goal against any oppterm that rock slams, see. You can list a goal against an item that rock slams. If it's an oppterm, you say, "What goal of yours would be impossible to achieve if this thing existed?" you know, or something like that. Lists headings already exist for that. You can use that terminal directly. Sometimes you just get the guy's goal laid on the line.

But even if you've got the guy's goal laid on the line – this was the only other point I was making – even if you've got this person's goal laid on the line, opposition it. Get your opposition to whatever he was slamming on. Now, you can always – let's say you have some person in an organization or in your group and this person's been causing quite a bit of trouble and you take him and give him a rock slam test and you find – don't find a rock slam, you only find a dirty needle on Scientology. You tiger drill it for a moment and it doesn't clean up.
That thing's going to develop into a rock slam someday. All you've got to do, actually, is opposition it. The person's whole viewpoint on the subject of Scientology will shift. This is a very easy one to handle, in other words. You shouldn't worry about it too much. It means more than it appears to mean. And probably you would neglect it, ordinarily, that elementary step. You would use the rock slam to find the person's goal and you would go on. You shouldn't do that, because the person will give you a lot of trouble. Not as much as they were before, but if you opposition it, the trouble will evaporate. You see?

So the whole case, anyway, is built on quicksand of distrust, and when it comes up to the fact that we are the oppterm and we're the cowboys in the black hat and he's the cowboy in the white hat – the way he looks at it – and to us we're the cowboys in the white hat and he's the cowboy in the black hat, you recognize that you can blow this whole thing up rather easily. You realize the rock slammer most consistently goes out and becomes a squirrel, says he practices Scientology while doing psychiatry or something, see. He gets – he makes himself into a combination terminal, promptly, because he realizes instinctively that he's crazy as a loon to be attacking us.

But you can solve this, and it's pretty easy to do. I hope there's some data in what I have told you that gives you some assistance in handling cases.

Thank you.
Thank you.

All right, this is lecture two, Saint Hill Special Briefing Course, November 15, AD 12. A lot of things I could talk to you about, by the well-known ton, actually. Very hard to select any particular point to discuss because we're pretty well there technologically. All of these points have to be talked about more, have to be sorted out more; there's got to be more data on these things. I'm at a point where I'm getting ready to condense old tapes into bulletins and that sort of thing. I'm in a very patch-up state, you know, of making it all neat.

But a lot of data continues to appear and naturally would. Once you've climbed a mountain, why, you idle around and look down the mountainsides and you can find a lot more ways you could have gotten up the mountain. There are always more visible ways. So you can look forward to all manner of stuff like this and speculations. The one thing you mustn't forget is how you got up the mountain in the first place and how you can get people up the mountain. And you start getting too many alternate routes going up this mountain and the next thing you know people start falling in crevasses and so on because the road isn't mapped.

But this first thing I'd like to talk to you about is – it's sort of hard to choose which is what – is a method... This method, by the way – I have not found a goal by this method; I'm just going by data known. This method is an experimental method. But I'm about to plow in and use it like mad and I'm sure that it will work, as you will be sure in just a moment, too.

And that is, one of the reasons you don't like to see long goals lists these days is because it takes quite a little bit of time to tiger drill every goal. And it's sort of hard to go over long goals lists and so on, whereas an auditor in the past was perfectly willing to cover 250 or 300 goals, and didn't think this was very much. You suddenly give an auditor a list of 300 goals and tell him he's to tiger drill those 300 goals and he tends to blanch. Because he's actually looking at quite a little span of auditing. And particularly if a case is not ready... This lecture isn't totally concerned with 3GA Criss Cross, therefore I've just given it some notes, and it's just some notes on current processing, is about the only title you could give this lecture.

Now, he's going to take an average of a minute per goal to get these three hundred goals down, see? But if a case is running very hard and if a case is terribly burdened and should be unburdened before it's audited on 3GA Criss Cross, you're going to have two phenomena occur. While you're doing a goals list, you're going to get a dirty needle.

Now, understand the – remember your somatics bulletin of last week. Dirty needle is a persistent activity, and a dirty read is the instant manifestation of a dirty needle. And so when
I say "dirty needle" I mean the persistent dirty needle. I meant to straighten that out with you tonight because I think we've got an auditor who's got them mixed up. He thinks if he gets dirty instant reads on the ends of goals that then this list has a dirty needle. No, no. No, it's those reads that occur during and amongst and after and before and they're all going tickety-skricket-scratch, and you can't read through the stuff, you know, and so on. It's like trying to tune in Tokyo on a crystal receiver, and it just won't do it. Now, that's a dirty needle, which makes a quite different manifestation than a dirty read.

You know, your dirty read – it just goes instantly bzzzt. There's a little brrrt to the needle. So what. That doesn't mean anything at all. That – the most that means – well, it – you can get "Fail to reveal," "Careful of's," "Invalidates," things like that can do it. And goals themselves will sometimes give a dirty read and so on. That doesn't mean anything. Most it means is your rudiments are out for the session. That's the most it means. And if you're getting too many in and they have all got dirty reads, well, the pc's just got a missed withhold, that's all that's wrong. You'll get used to this and get it sorted out, now I've called some of this to your attention.

No, I'm talking about the persistent static on the needle. That's a dirty needle – persistently staticky. And when you've got a dirty needle and you're trying to go down the list, we used to call it the pc's needle pattern. Only sometimes it's much more serious than just a pattern. Any pattern means something is wrong. Pcs shouldn't have patterns. The pc isn't prepared and the pc hasn't got his rudiments in if you've got a needle pattern. You don't audit with needle patterns. You go around auditing with the belief that there is such a thing as a needle pattern and you'll get in trouble right from the beginning, because of course it merely means that the pc is improperly prepared; it means a lot of things. Some pcs have very, very filthy dirty needles before you find the first item. That is just at the drop of a hat, why, the needle dirties up, and so on.

Well, to that degree – to that degree, you have an awful time getting in your rudiments so that you can get a clean enough needle to list and assess something, or assess the Prehav Scale so that you can find some level to get an item from or something like that. There is your toughest struggle.

But you'll find out that if after you've listed a list and started to null a list, that you have a dirty needle – not dirty reads; you have a dirty needle, a distinct pattern – and you try to get in your mid ruds and you've got a dirty needle still, and that sort of thing, you just – you'll learn better than to box around with a dirty needle with mid ruds. You'll just realize that your list is not complete. And after you've gotten skunked a half a dozen times, maybe you'll remember I told you this. They read with a dirty read. Every item you read reads with a dirty read. There's nothing rock slams. You get down to the end of the list; you've got several reading with a dirty read, you tiger drill them, and it goes bzz-bzz-bzz, and there's nothing in. Oup! Nothing slams. You've gotten nowhere.

Well, the first manifestation you get of that is, given rudiments in and pc prepared – if it has a dirty needle, you see, if it's a dirty needle situation as you start to null – you've got an incomplete list.
Now, there's two things you can do. You can list from the wrong thing to list from. You've done a Prehav assessment and it's wrong. This pc can't be approached on "What isn't part of existence?" In other words, your A of that bulletin of last week that gives you the steps of assessment – your A is just dead-wrong. This is a gone dog, you know. You've listed this pc way over his head. You've said, "Well, I know what's wrong with this pc: he blames everybody." And you couldn't get a Prehav assessment anyhow, so you just took, Blame, and say, "Well, who or what would you blame?" or "Has he done something weird?" And you listed this thing out and so on, you go back and start nulling it, why, you're going to get a dirty needle all the way, and it wouldn't matter whether you extended this list to China, you're not going to get an item on it. Do you see that as a liability?

Now, supposing you take off fortuitously in the right direction. When you list the list and an item does and is going to occur on that list, you'll find out when you start to null it you don't have dirty needles. That's the first list you list on a pc, and that's every other list, too. But it even takes care of this phenomenon of the – of the case that's chronically a dirty-needle case – at the drop of a hat he turns on a dirty needle, see? You take it from the right source, you list that list, you start to null it and you don't see any vestige of a dirty needle – you have got an item on that list, you have cured his dirty needle. Follow that? You understand what I'm talking to you about?

Audience voices: Yeah.

Yeah. In other words, this even takes care of your first thing. In other words, your jump-off from part A of that bulletin on what – what's the line you're going to list, you know? "Who or what would you rather not have anything to do with?" See? All right, that's correct. And you've listed your list. When you go to null it out, if the list is complete, and everything else, you're not going to have any dirty needle on the thing. And then that follows for all additional lists.

When you've listed from the proper question and you're going to have a slamming item on the list and that question is proper, the only reason thereafter that you will get a dirty needle, and the mid ruds don't put it in, see, and you just have to practically rack the pc up one side and down the other. You just chew him to pieces with mid ruds if you keep going like this. You're never going to get rid of the dirty needle. It'll just stay out two items and it'll be back again, you know? And you give him the mid ruds and the thing is – your needle's nice and smooth now. And then you say, "Waterbuck, tiger," it's dirty again. Your list is not complete. There's no item on the list. The missed withhold on that list is the item. It hasn't been put on it.

So there are two – two variables there: Either your list isn't long enough to include the item or you're not listing from a proper question that gives you the item. Either way you're going to be in trouble and have a hard run of it from the pc – with the pc, you see? You're going to have a tough time of it.

Now, because there are two variables it makes it a little harder on you, because you don't know which one is really out. And – but by trial and error consider that one is out and then consider the other's out. You understand? I mean, you just take it from some other question. Consider the first step, the question there, as wrong. So you take another question. Man,
when you've got the right question, you list that thing down, you list it to a complete list, there's an item on it; the whole characteristic of the pc as far as the meter is concerned looks entirely different. This is the easiest running pc you ever saw in your life.

One of the reasons some of you have trouble trying to find items is, is you've never asked the right question to get the item and have – then have never completed a list long enough to include the item and then never null down to the item. And of course, you always are going to be in trouble. You is a gonna say, auditing is impossible, there isn't any way at all to audit. You can't enter the case, you do nothing for the case and so forth.

That just stems from two sources: (1) the question you're listing from is improper, or your list isn't long enough to include the item. See? It's just those two things. There's the only two things that can be wrong on any list that you're nulling. So this also applies to goals.

You get this pc to write 850 goals in Routine 3-21. Now, you've been asking me for a long time, what do you do with these goals. Well, I hated to tell you, you have to take 850 goals and tiger drill them on down to the – to the raw depths, see, because this looked to me – like an awful job to me. I spent about fifteen hours on a pc doing this. And I consider this is quite a lot of work. Because it was a dirty needle all the way. I didn't know this rule at that time and that was why I was continuing on down the line.

But this rule of the complete list and the right question applies to the goals. Except there's one other rule you get with goals: If goals go out hard on Tiger Drilling, why, the case is too charged for you to be assessing for goals. You're not asking the right question to get a goals list and you're not writing a long enough list to get the goal on it. You see, all these things apply. You actually have two manifestations: You've got a dirty needle on a goals list, you've got a dirty needle, and goals go out hard when tiger drilled. In other words, you sit there and you ask them questions and "Suppress" and you ask them "Invalidate" and "Careful of" and you ask them and ask them and you ask them and you ask them, and they give you more answers, and the thing still reacts, and you get the suppresses off, you get this off. And you say, aah ...

You know that can go on for three three-hour sessions on one lousy goal that will eventually go out in the end? Well, consider what it is. It's just too heavily charged a case to find a goal on. See, that's an additional manifestation. You find goals going out hard, you'd better start finding items. See, that's your rule. Goals go out hard, don't spend the rest of your life... By all means wash out the goal that you're working on, otherwise the pc'll dramatize it or something. But goals go out hard on the pc? Well, get yourself going on a new lineup.

Now, the experimental action here that I was talking to you about... None of this is – none of what I've just been giving you is experimental at all. This other one is this: You can tiger drill a goals list all the way from the beginning to the end, but the truth of the matter is, that unless a goal has been tampered with – we found the pc's goal and it submerged; see, we found it and prechecked it, it disappeared from view – it's going to come back in someday if we keep working at it and so on. That's the liability, see: that a badly handled goal will disappear from sight and you can't get a trace of it again. That's a liability.

But let's take the pc, now, whose goal has not been found. Well, you could do this with a goals list – and this is the experimental step, and you can see at once now you won't care
how long a goals list the pc has – you just go ripping down the list saying each goal once. Just
go down the list, bang, bang, bang, each goal once, you know? Pow, pow, pow, pow, pow, pow,
pow, pow. Don't even tell them they're in or out. And those that react – those that react, put a
slant on them. Just mark those that react. Don't mark the goals out, because it's liable to give
your pc a bit of an ARC break or something. You can also use that, too – I will tell you how –
if you did want to mark them out.

But you go down the line, you're going to find, 850 goals – if your rudiments are in
and if the goal is on the list, why, you're going to find that that goal – the residual at the end
of your list, reading them all once, may be as few as 40 goals. See, the theory is this – that a
goal, if it's the goal, will be somewhat charged. If it's somewhat charged, it's instantaneous in
its reaction and it'll fire the first time and the only time you read it, see? So you just make sure
you don't miss any reads and just go on down the list reading each goal once, pow, pow, pow,
pow, pow, pow, pow, pow, see? Keep your eye on that meter. See, don't say it's in or it's out. And if
the thing quivers, why, give it a slant mark. Too many stay in, your mid ruds went out.

Now, that gives you a condensed goals list. That gives you the best chances out of this
list, and on a short list, of course, you only get two or three staying in, or one or something.
That's the one you tiger drill. If you got a reaction on it when you went down it the first time,
you tiger drill it. You relegate your Tiger Drill, then, to the residual. The goals that remain
after you've read them once.

Now, that kind of opens the door to an interesting view, here. We don't care how many
goals the pc writes. And we're going to take care of all the pc's goals lists. Just take care of
them all. And the pc's got goals lists, well, do this with them. Goal may be on it.

Now, if you're not scratching them all out, of course you're not invalidating the pc's
goal. Funny part of it is you're liable to turn on a somatic reading that goal just once, so you
want to be very careful for the pc to tell you if he gets a pain. And about the bottom of every
page of goals remind him to tell you if he gets a pain. This is quite important. Because the
pain runs deeper than the meter. Pain goes deeper than a meter. And the funny part of it is that
even though the pc's goal has been manhandled, the probability is that a little attention to it
will turn on pain before it shows on the meter. It's dead as a mackerel on the meter but you
can make it show a somatic on the pc. That's quite interesting. So you want to tell the pc al-
tways to give you the hot dope if he got a pain.

Now, allow for the comm lag of the beast. Allow for the pc's comm lag. He probably
didn't wake up to the pain, until two or three goals have gone by. So the pc says, the goal the
pc says the pain occurred on – the way the old song went, "Ain't necessarily so." It may be
three, four or even five goals earlier than when he noticed it. It's quite remarkable that if you
read a series of five goals from a goal which bears pain, and the pc is not advised of it in ad-
ance, you may be at goal three, four or five before the pc will say, "I had a somatic." You
say, "What one did it appear on?" And he'll usually point to the wrong one. He'll point late.

So what you do in that case; the pc says, "Ow! I had a pain."

You say, "Well, where did it turn on?"

"Well," he says, "just as you read that goal there, 'to shoot game wardens'.
You say, "All right. Thank you." Now, just count back up from that several goals, go upstairs, and say, "Now, let's watch for this somatic again. I'm not calling you a liar or anything, but we want to move into it the same we did before, see?" So – so just read him that, and now read them three – just read the thing three times. This has run it long enough for the individual, you see, to find out if it's turning on a somatic. And then see where you are. You might have passed over that goal.

Now, if you were marking all the goals out that you didn't get a reaction on and you mark the pc's goals out, he'll ARC break within a page and a half. You could use that to find a pc's goal, too. You could! You could say, "That's out" – X. You're going on down the line, *pocketa-pocketa-pocketa-pocketa-pocketa-pocketa.*

Pc says, "Rarrarr."

"What's the matter?"

"Well, I just never had such a lousy auditor in my life, and it's too cold in the room, and everything is going to hell in a balloon."

Do the last page and a half, see? For good measure, do the last two pages. Now, don't – don't underestimate this. The ARC break is *exclamatory,* man. It'll be the wildest ARC break you've seen in many a day. Some pcs whose goals have been passed over on some list and nobody has found them to this day, have been ARC breaking from that moment forward and they're almost impossible to audit. Did you ever put your two and two together and recognize that somebody's goal was probably ticked last November, and this November they are still yapping? And that's how much force and power there is in the situation, see?

One of the things you want to inspect on a chronically ARC breaky pc is when somebody did a goals list and where is the list. Pc won't know the goal, but he'll be ARC breaky about it. Which is quite, I think, remarkable. Talk about mental mechanisms! So you actually could use that mechanism. Mark them out, read them once and mark them out, read them once and mark them in, you know? If you mark his goal out, man, page and a half, two pages later, you're really going to hear about it certainly by that time. He'll just be getting worse, you see. He'll be smoldering for about a page, you see, and then nattering for a quarter of the next page and then about halfway down the next page he explodes. Most gorgeous thing you ever cared to watch in your life. Not reliable to this degree: you can't count on it having been found last November and the pc still ARC breaking. He probably gave up ARC breaking on it by February and he's been in apathy ever since. He's not necessarily demonstrative on this subject, because he can go below antagonism – as anybody who knows the Tone Scale can see.

All right. Now you've got – you've got yourself a situation then where you can take any quantity of goals lists and if you're worried about how you find a goal after you find items, I just refer you to lists 1 to 10 of the original 3GA, see, on the Criss Cross steps. Those lists with their headings, see. If you were (an oppterm), see, or if you were part of (oppterm), why, what goal of yours would be impossible to achieve? See? What goal of yours would be impossible to achieve? If you were a mason, why, what goal of yours would be impossible to achieve? And so he gives you a list, see. You don't even care if he writes them in session or not. Well, you can always take this list and you can rip on down the list of thirty, forty goals, something like that – just read them once, see? Find out if anything fires. Nothing fires, aban-
don it, see? One fires, tiger drill it. Starts going out hard, wish you hadn't started tiger drilling it. [laughter, laughs]

Now, you understand, you're not looking for a rocket read on that first elimination. You're not looking for the rocket read. You're just looking for something in. Now, it'll do all sorts of things. A real goal seldom rock slams, but it – they've been known to. And they tick, they stick, steep falls. They just react on the needle – usually your first manifestation on most of them.

So therefore, any time one of these stays in, you simply mark it in, and you've got – you've got a goal that you can go back to. Now, I don't know that I would stop right there and tiger drill it. I don't know that I would necessarily do this. But you'll find that you're doing this on a lot of short lists. There are thirty, forty goals, and so forth. And I'd tear down the lot. Because you might get into trouble, tiger drilling every time something flicked. It'd be sort of a bad course to pursue, because most of your short lists, you're only going to have two goals left in – going to have two that reacted slightly.

Now, on all assessment, when the mid ruds are out, you can get a persistence of read, so that every time you say something to the pc it stays in. And I look at some of your elimination – I mean, some of your elim... your lists – nulling of your lists, and on the first one: in, in, in, in, in, in, in, that one's out. And then in, in, in, in, in, in, in... Wake up, man! The pc invalidated about the second one in, way up above you someplace. Of course, everything is in since. See? You're not – you're not doing an elimination of goals or items, you're doing an elimination of mid ruds. See, that thing has been out.

Now, the more complete the list is, the less tendency there is for that to happen. You know, so the pc gets an invalidation of something. Pc says, "Oh, that wasn't it." Your next one – he says it to himself, see; he doesn't say it to you.

And the next one seems in and the next one is in, and the next one in. In, in, in, in, man – I never see more than three in's in a row and I start blowing up. See, I start saying "Ha-ha-ha-ha! Well, now, what happened there?" I'll even hand the list to the pc and say, "Which one of these things, now, did you invalidate? Which one of these?"

And he'll look up the line, "Well, it's that one. Oh, yes. Yes, yes. I thought so-and-so and so-and-so."

"Thank you so much," I say sarcastically. And then do the next two again. They're all invariably out.

Now, if your list is complete, this will happen to you very seldom, and your needle won't be giving a continuous dirty manifestation and all that sort of thing. And you really can sail if you've got a complete list and your mid ruds are even vaguely in. The most it takes, if you've got a complete list, to keep your mid ruds in, is, "You want to tell me something or say something?" to the pc. You notice you have three consecutive ones in.

I got – I've gotten fooled. I have cleaned up the mid ruds, straightened everything up, had the pc ARC break, straightened it all out – I was cleaning cleans, you see – and you know, and the pc didn't have anything to say and go back to the list after everything is all straightened out and find out that those three are still in. Is my face red, see! That should hap-
pen, you know? I had five, once, consecutively stay in. Almost blew up the session. So of course, the next time I had five in I said well maybe it could happen and then when I went around again found out that none of the five were in. The first had simply been invalidated.

All right, now you're going down a column and the pc says, "Oh, well, none of these could be me. This has no relationship to me whatsoever. And I just hope nothing reads, because it hasn't anything much to do with me. And if I sit here carefully enough, why, we'll be able to get through this." And you go three consecutive pages of Xs. Well, long before you get to three consecutive pages of Xs, it should occur to you to ask the pc "Suppress" and "Careful of." Not all of your mid ruds, just "Suppress" and "Careful of." Should long since have occurred to you.

I don't let more than about eight or nine Xs go by before I throw a "Suppress" and "Careful of" in there just to make sure. Then imagine my embarrassment to have a totally complete list, an absolutely flawless reading needle, no rudiment even slightly out and the only one which was going to remain in at the end was the item. Drives you mad, because of course you think the pc is suppressing all the time and you just sort of grit your teeth and hope, you know? It's an interesting rolly coaster.

Anyway, this gives you an opportunity – this method of elimination of goals; just by reading on down the list of goals once – it gives you an opportunity to get the pc to list lots of goals. And you can tell the pc, "Why don't you list some goals. If you were an (oppterm), you know, what goal of yours would be impossible to achieve?" you know? And you've gotten four or five oppterms, so get him to list a raft of them. You know? List against each oppterm.

And then, of course, terminals – that's dead easy. You just say, "What would be the goal of a (terminal)?" See? "What goals would a (whatever the terminal is) have?"

You've got several terminals there, all more or less the same breed of cat, the same sort of thing, and you say, "Well, this sort of terminal now – what sort of goal would this sort of terminal have?" You know? And you get yourself a goals list. Lots of ways you can approach this.

You probably ask yourself, "Well, I know we find items, items, items, items, items; but when do you ever come in and find a goals list, see?" Well, the reason I haven't told you very much is because there really isn't any good answer to it. You can just get yourself a goals list most any time. And the reason I hadn't given you a lot of packaged ways to get goals lists out of it – well, it's just because I felt bad about all this Tiger Drilling of great long lists and I knew I had to get down and solve that.

In the first place, a pc, knowing his auditing is going to be tied up by all this Tiger Drilling, becomes very loath to give you long lists of goals. But if that isn't going to take any time at all, why, you've got it, you see? Pc doesn't mind how many goals he gives you if it isn't going to take any time to scoop them up, see? It's very therapeautic for a pc to write goals. I mean, they do just fine. You can sit down and say, "I wonder what's my goal?" and tear off a couple hundred and feel beautiful. It's very good. You can straighten out cases. Nothing like getting rid of a wrong goal if somebody's been run or hung with a wrong goal or something like that. You straighten it out, they really start shining.
But – oh, you get somebody off the street, raw meat, and you say, "Write me up some goals you might have had in life." And they give you a long string of them. Gosh, they feel wonderful. They think this is great. They think this is the most. Quite interesting. Mustn't overlook that in the shuffle.

But because we didn't want to do all this Tiger Drilling by the hour and the pc didn't want all of his auditing time all devoured by it, why, I myself was rather loath to advise tremendous things. I thought I might come up with some method of copying the goal off in an awful hurry in some tricky method to avoid all this Tiger Drilling. Well, there is no method that will avoid it except find the goal, see? That avoids all further finding of goals, you see, on that particular GPM and that's the best way to avoid it, is to find the goal.

Now, the funny part of it is, supposing you went into the pc's goals list, and you read the first page of his 850 goals. Just read them, once at a time. Find out if any of them are in. One of them's in. Tiger drill it. Goes out hard, man! Don't do the second page. Don't do the second page. That case has got to be unburdened before you go any further. See the idea?

All right, now supposing we had – we took the first page, and we start tiger drilling the first page. Pc up till now has been in pretty good condition. We start tiger drilling the first page of the 850 list – dirty needle. Dirty needle. And we straighten it all up and we get the mid ruds in, we polish it all up and we read two more goals; we got a dirty needle. You might as well get off that dead horse. He's going to fall flat on his face in the middle of the pavement. That goal isn't on that list. Never seen it fail. That goal is elsewhere. You've missed it. It's not on that list. You're not going to run into it on the consecutive list of goals which you're now going to do. It's an incomplete list; it hasn't got the goal on it. So the idea of incomplete list still hangs out there.

I did a beautiful job of this one time. When we were over in Washington, I did a gorgeous job of this. I thought the pc's old goal was not the goal. Did this time after time, actually – twice, very notably – man! Found the pc's goal was not the – thought the pc's – couldn't get it to read, to react, see. So did a couple of – found an item and listed goals against the item, and goal number one on list six rocket read and did beautifully. And after some four or five hours or something like that, of – it just evaporated. It was gone! Never saw such a thing in my life, you know? It left me just bug-eyed. Because, boy, was that goal reading beautifully! I told everybody I'd found the pc's goal. Well, I had, actually, but hadn't realized it.

Pc all of a sudden – things aren't going well, needle's dirty, and you know, everything is getting goofy and so forth. But still I drilled it out and it rocket read, oh, marvelous! Couldn't get it to stay in, you know. It kept going in and out and couldn't get it to read well and most of the time it didn't rocket read. Pc all of a sudden comes up and says, "That is the end of my goal. Every goal I have put on this list – these lists for you, actually is the end phrase of my goal." And it was, too. The pc had written nothing but modifiers for their own goal. Fascinating.

And with that realization and using "in auditing on the goal," using that phrasing – I today, would have prepchecked it, you see, and it would have come in faster and I wouldn't have made this error, by the way. My goodness, that goal came up and fired just gorgeously. And there it was shooting rockets all over the place, you know? And what I'd been running
hard and what was rocket reading, was the last – an additional phrase that could have been on
the goal, but wasn't – a sort of a modifier, only it wasn't that either. It looked like a totally
independent goal all by its lonesome. You get the freaky things that'll happen when somebody
has already found the pc's goal. You get that? The tail of the goal still reads but the beginning
of it doesn't; but the tail of the goal isn't on the goal anyhow and you wouldn't use that to list
it anyway. Oh, my! Complicated.

Anyway, as we go looking over this vista of finding goals, you can list all ten of those
lists against any reliable item. You can list all ten of them against any item. You just take the
best item the pc's come up with and list lines one and six against that best item and the pc will
probably lay his goal right in your lap, see? That's after you've done an unburdening.

But how about before unburdening? How do we find out if the case has to be unbur-
dened? Well, you take that first 850 list, read each goal once, mark those that are in, in, and
go back and start tiger drilling them. Won't take you too long to do that – frankly, won't. Just
going to read it once and see if it reacts. Don't miss any reads. And you'll be able to cover an
awful lot of goals in an awful hurry.

Pc comes back in, gives you a whole bunch of goals, you know, they've got as a –
they've got as a "tiger" oppterm, see. Give you a whole bunch of goals against a tiger. And
they've got a "filibuster" as an oppterm, see, and a whole bunch of goals against a filibuster.
They come in, give you this goals list and so on. There are ten goals on it. All right, fine. How
long does it take you to read ten goals? None of them rocket reads and nothing upsets the
needle, you can set that aside very nicely and quietly right now.

Now, here's the clue: Reading something once has minimal restimulation. You can
usually give a pc an auditing command – one auditing command, without restimulating them.
You can actually give them up to three without killing them. Beyond that, you're in trouble.
You've started to process somebody for sure, after the third command. You are now running a
process. But you can always ask them once. Therefore, you can go over a goals list and the
only thing that would be hot enough to restimulate a somatic would be the pc's actual goal, in
most cases, although you'll trigger somatics that are – on goals that are close to it. So watch
for the somatic while you're doing the read once, see? The end of the run – if your rudiments
are in and so forth – at the end of the run what have you got? You've got 40 goals out of 850.
Start looking them over.

Maybe – maybe when you got up that morning you found your shoes in the right
place, you didn't get shocked while connecting up the water kettle, the car started – you know,
just a wonderful lucky day. And you're reading down this list of 30 goals the pc has brought
in to you and so forth and number 20 has a rocket read, and you tiger drill it up and it reads
and reads and reads, and it reads every time and everything is fine. That gives you then a vast
opportunity to take a crack at a lot of goals. You see the benefit of that?

Now, I'm going to give you another method of goals finding. This is another method
of goals finding known as the Prepcheck. A lot of people sit around not looking. They do not
look. That is their motto. And just as I told you the other day that it was very, very mysterious
that a MEST Clear had been made with two consecutive Problems Intensives – it was very
mysterious that this hadn't been reported from elsewhere – why, we've had another one.
They have run into a problem up at HASI London, a very bad problem, it's worrying them. After a few Problems Intensives the person keeps saying that such-and-so is his goal and they want to know what to do with it. [laughter]

Well, I sent a message back to Ray up there, and told her she had to work it out, that I was tired of contributing all the time. But there was a clue, you see – there was a clue – and that was contained in 3-21. I could give her that hint.

But actually, she should have reported this, because it's only in Central Organizations now that you're getting large numbers of consecutive actions taking place. And a Prepcheck will not only produce a free needle... They haven't noticed this in London. They notice that they're terribly loose. Making MEST Clears, you know – I mean, that – this is a killer, you know? Everybody sweating away, at it – Jim said last night, he said, "Well," he said, "that's right." He said, "A Clear that would not be connected with a goal wouldn't be real to me." And he's right. He's right. You think of clearing somebody, you think of a goal. Well, how about this character who doesn't have any goal and all of a sudden he's free needle, well, that's still a type of Clear. That is the earliest type of Clear. For heaven's sakes, don't ignore it. It has all the attributes of Clear. Of course, the fellow's liable to cave in in two months or two years, or something like that and he'll be fuzzy around the edges occasionally. But for heaven's sakes don't invalidate it; it's a very valuable state, as I think somebody here could tell us.

And trying to stabilize it and get it up along the line and keep it stable and so forth requires that you find the goal and finish it off, but that doesn't say the state doesn't exist. And apparently, wherever Problems Intensives have been run with a fair degree of technical skill, and following down the line in a minimum amount of Q and A, why, apparently they're getting free needle MEST Clears. I think this is quite interesting. And you could say this and the report is not as precise as I would like it – but you could say that after three or four Problems Intensives the person may start handing you his goal. That's a new method of goal finding, isn't it?

In other words, you tiger drill the pc until the goal reads. [laughter, laughs] That's another method of goals finding. Quite an amusing one. Sitting – sitting here at Saint Hill and going nowhere near a Central Organization, why, I'm finding out that they're clearing people and finding goals in a brand-new way and getting all set to use this data and all they're doing is worrying about it.

You see, some of these needles get so free that you can't read them to get the rudiments in. [laughter] It's like this fellow keeps complaining, you know, he says, "You know," he says, "every time I put some of this cracked ice in this glass – every time I put some of this cracked ice in this glass it doesn't dissolve, you know?" And you look in the glass and you find out there's a refrigerator full of perfect blue-white diamonds. And he says, "Well, it's no good – it won't cool drinks." I mean, they're in that kind of a weird situation, apparently.

If your technical was way up in an HGC, and you weren't getting a lot of guys jumping down the throats of the pcs and they were doing all right and they were going along the line... And apparently it's quite vital that the problem be properly assessed. The assessment of the problem is the only place they have run into trouble. They run in two or three areas. I don't know what else they did, but they have assessed the wrong problem and run it crazily and
madly all over the road, see? And run a pc up the tree. That's the only dynamite contained in a
Problems Intensive, is assessing the wrong problem.

But if things were done smoothly and the rudiments were put in and the pc was not
Qed-and-Aed with and was permitted to originate and everything went off, apparently – ap-
parently you run enough of these Problems Intensives, twenty-five hours each, and the goal is
delivered, apparently. That is what you should expect to have happen.

Now, what happens is that the needle's stuck up around 5, you give the person a Prob-
lems Intensive, and the needle will come down to the person's Clear read. You give them an-
other Problems Intensive; it wobbles out one way or the other and then comes down to the
Clear read again, and the needle is very floaty, and you give him another Problems Intensive,
you see, and the needle stops reading properly on the rudiment so that you really need another
meter or something because you can't just read through these free needles. No use for them,
you know? And instead of telling the poor Joe he's a MEST Clear, you start nagging him and
nattering at him, "What do you mean? You're fixing it up so your rudiments can't be checked
out. You can't be checked out for missed withholds and so forth." Apparently you give about
four or five of these things and you – Problems Intensives – and the guy starts putting his goal
in your lap, you know? "Yeah well, this is my goal. Now, what do I..."

And the auditor says, "Well, what the hell are you doing offering me that? I've got
nothing to do with that. You just go on here, answer the next question."

You can see some pc going straight up and a mile south, all ARC broke.

The auditor wouldn't listen to the fact that it was his goal, wouldn't put – even put it
down in the auditor's report, you know? Director of Processing would have nothing to do with
the pc because he wouldn't answer the auditing question, he'd just sat there and argued all the
time about this thing being his goal. Can't read the meter because the meter has a fairly free
needle except for these spurts reads! [laughter] I mean... Oh, you could just imagine this poor
organization. I mean, they're just in trouble from one end to the other. These diamonds won't
cool their drinks. It's very amusing.

Anyhow – anyhow, that opens the door to another way to find goals. And this would
be about the happiest way to find goals that anybody ever heard of. Just – you just keep deliv-
ering Problems Intensives until the guy volunteers his goal. Pretty wild, huh? Must be valid
because that's what's happening in an HGC right now, see?

I don't know if all cases would do this or not, but I don't know if all cases would uni-
formly sit down and be audited in an auditing chair. But the point – the point I'm making here
is maybe if we added to this some Routine 2 – remember old Routine 2? Very badly neglected
now. But supposing we added a Routine 2 button or two to this. It would certainly happen the
person certainly would go Clear, added into the normal buttons that you use in your Problems
Intensive. I know that would happen, because I've already seen Routine 2 going on down in
this direction. It's just rather lengthy and auditors had an awful time finding the right level,
and we didn't at that particular time have a problem – have an Auxiliary Pre-Have Scale. But
now that you've got "Roll Your Own," Routine 2 becomes a rather fantastic activity. See, so it
forecasts there that there's another zone of operation. But still, the best form to use it in would
be the form of the Problems Intensive. That is still your best form.
Now, there's only one thing I know of that's wrong with a Problems Intensive. On the Queen Elizabeth, Reg was trying to assess me to find out a self-determined change. And I looked it over very clear-eyed and clearheadedly and finally determined that, I think, twice in this lifetime I myself had independently, without further guidance, made up my mind, twice in this lifetime. The – I find two points which were purely and completely self-determined changes. I went over this rather long, and looked them all over very, very closely and very carefully. And therefore I can assume that most pcs are answering this question fallaciously and realize that the Problems Intensive has a trick built into it. And realized at that time that it had a trick built into it. And the trick is that you expect the pc to give you a change which he believes to be self-determined and then you find the prior confusion and the determination for that change. See?

That's a trick assessment. But while he was trying to find one of these on me, he kept asking me the question and I kept telling him the truth, see? So we finally wound up with the fact that there were two of these. That's pretty good in one lifetime, I found two times I'd made up my mind totally independently and uninfluencedly. Of course, I took the severe definition of the auditing question. He asked me for self-determined changes and I gave him two, after about two hours, I forget what it was, something like that. We were able to find two.

So there's probably something wrong with the question. And the question probably shouldn't be asked with a trick to it. Now, I've been meaning to put out a bulletin or something and do something about this ever since. There shouldn't be a trick in that assessment, since the assessment becomes that vital. Probably should just be asking a person for changes.

Now, the reason we were saying "self-determined" changes before, and emphasizing that, is because we didn't want to run them into engrams. But in actual fact a Problems Intensive will run a person through and out of engrams. I mean, the button collection now has gotten sufficiently powerful to do some rather wonderful things with his track, you see? And he's not going to get stuck in an engram anyhow, if he doesn't have a missed withhold.

You want to know why pcs suddenly curl up in a ball while you're tiger drilling them sometimes and go into the engram – and it'll happen to you sooner or later – pc just has a missed withhold, and instead of going on and butchering the pc through the engram you should ask the pc for the missed withhold. Get the missed withhold and he'll come right out of the dramatization, which is quite interesting. That's – we've done that around here quite a bit, to our great advantage. It's the missed withhold that pulls him back in to the solidity of the picture.

You get some auditors – all the pc's got to say, "I've got a stuck picture in front of me," and the auditor's going to run it, man. Of course, he hasn't got a prayer of running it, because it's the confusion that occurred before the stuck picture that causes the picture to be stuck, you know? But even asking for the confusion that went ahead of the stuck picture isn't good enough to release that engram. You have to run a whole series of assorted buttons on it.

But if the pc started to dramatize an operation or an incident or a prenatal or something like this, don't keep charging him on through it. Also don't suddenly change the process just because he starts shivering – that's very bad auditing. But let's say the pc curls up in the ball, and goes into a catatonic bluhh state and so forth. Well, you're justified in shifting off to
the random rudiment and back into the process, see? That'd be your only shift, which is all part of Model Session. You're not doing something very different, you're just getting your random rudiment in.

You get your random rudiment in on a dramatizing pc in a session, he generally will drop right out of it. That's well worth knowing, because I hadn't realized till Jim was talking last night ... He didn't have this answer; Mary Sue told him what the score was on it. But he'd been tiger drilling a pc up in London; the pc curled up in a ball and went straight into a prenatal. And this was quite startling. But actually could only – so, it refreshes some earlier data which we had on this. Pc'll only dramatize like mad if he has a missed withhold. Because, of course, his effort to withhold from the session, or with... you know, keys in his going into the incident. See, he actually can't stay in the session and he retreats into the incident, don't you see? It's the withhold that pulls him back into the incident, if you can figure it out – very elementary.

Anyhow, to give you a clue as to your Problems Intensive, use of, the assessment undoubtedly should be based on a question which simply gets the person – changes in a person's life. And you start asking for too many vagaries on this, see, self-determined changes, he starts answering the question absolute, you're going to have a ball. I mean, you're not going to be able to get any. And it depends on this kind of a tricky question. But if you ask him, now, because you don't want other-determined changes, if you just ask him "Times you decided to change," why, you probably have got it pretty close to a dead-center question. I've been meaning to tell you this for some time, when I hadn't written a bulletin on it or gotten around to it at all. Had a few other things on my mind.

And well, it – just ask him for times he decided to change, or his decisions to change; why, you'll wind up with a more reliable assessment. Because the pc doesn't have to tell you any lie then, to assess it. Of course, naturally he decided to change – the house fell in on him, you know? A bad assessment will sometimes wind you up in this kind of a situation and the tone arm won't move. It's, "Will the tone arm move?" that is the criteria of a reliable assessment. If your assessment is good, the tone arm will move. If your assessment is bad, the tone arm won't move.

So in handling Problems Intensives, or in handling auditors running them, why, just lay that point in with a small club and you'll be all set. Keep your eye on that tone arm. Right after the assessment is done, the first action's taken after the assessment is done, using that date. That tone arm doesn't move, you get that guy out of there so fast that the E-Meter turns pale, see? You get him – you get him off of that. You get another assessment quick.

In other words, you want to – you want to know if in the first twenty minutes of run on the first button if you had tone arm action. And if you didn't get tone arm action you get him the hell out of there, man. See, you have to leave – if you're running this in HGCs, you have to run this on a standing order. All right, after the assessment is done – usually done by a goal finder, or the D of P or somebody, see; a confirmation of the assessment or the assessment is done by them – and your first orders after that is, "All right. We've got this date and it's January 3rd, 1941. All right. We've got that date." That took it the – by all the rules of the game, you see, the incident, the decision and the month before and all that. "All right. Now, go
ahead and start your question on this thing. 'Since _____,' so forth, and for the first twenty minutes, why, you watch your tone arm, keep your needle to center very, very carefully, and give me those tone arm reads. At the end of twenty minutes, if you have inadequate tone arm action, you come back and see me fast." You see, that's your guarantee.

Because it's apparently only those pcs who didn't get tone arm action while running the Problems Intensive that got into any trouble because of one. See, this is a guarantee that your pc isn't going to get into trouble running the wrong problem. So what you want to do, uniformly, is watch for tone arm motion and the rules of what is good tone arm motion and what is poor tone arm motion apply as given in an earlier bulletin.

So this is a killer as long as it's done right – a Problems Intensive is. But apparently you tiger drill the pc, and he will eventually give you a goal. Or you prepcheck the pc off the goal, and you eventually had a goal sitting in the chair. I think it's very worthwhile knowing that – that this can occur. Even if we don't know at this moment that it can occur with every case in every place, it is very interesting that we know it can occur. And by telling you in this lecture, giving you some idea of the number of goals that you could cover just by reading them all at once and marking those that were in and only tiger drilling those, relieves you from, I hope, a fear of letting the pc write goals and getting goals off the pc. I hope that relieves you to some degree.

A lot of you are asking, "Well, what do I do with the 850 goals?" Well, what do you do with them? If you're doing 3GA Criss Cross and you find a couple of items and a terminal or something like this, or you want to list the goals against the oppters and list the goals for the terminal, get a little list like this, and you start down that list and you don't immediately have a goal smack you in the face. Well, man, you've got 850 of them sitting back on the original list. You've unburdened the case so it would probably run anyway, got the guy under control, nicely. Just read the 850 list off to him; you're liable to find the goal sitting right there. Oddly enough, sizing up the pc, perhaps if you hadn't unburdened it, and you had read the 850 list of the pc, the goal wouldn't have read. See? Or if you did find it, nothing could've happened. A lot of conditions could have existed around it.

On some pc – looks pretty good, he's riding down well, and so forth – just pick up the 850 list and read it to the pc, one each. Won't take you very long to do that. Mark the ones in. The chances are you'll just be reading down the list and you'll see a rocket read. And if you got up that morning and you made the proper obeisance to the rising sun and put your necklace on right end to, there you are. And you say, "To catch catfish" – pow! "To catch catfish" – pow! "To catch catfish" – pow! You see it go pow again and say, "What'd you think of?" He says, "To catch catfish." Take it down to the Instructor, pc sits there calmly, Instructor says, "To catch catfish," and there it goes. "To catch catfish. To catch catfish." It reads – rocket reads. Bring it back. List it for sixteen hours. The pc goes Clear, find his second goal; it's number two on the list. You – can do this, too! [laughs]

Okay. Well, I hope that's – will be of some assistance to you. Okay.

Good night.
Thank you.

Well, how are you tonight? You mean you are still alive?

*Audience: Yes!*

Oh, gee! That's rough. That's rough. This is the what?

*Audience: 20 Nov. AD 12.*

Twenty Nov. AD 12, Saint Hill Special Briefing Course lecture one.

All right. You might be interested that a couple of goals have been found this week. I don't know how this happened; must have been an accident of some sort or another. Let me point out something to you: they were there all the time to be found. Horrible! You don't realize what a horrible crack that is!

Now, there is a very distinct possibility that the – with finding these bypassed items you'll start getting some free needles. You bypass a lot of items in listing. Got a rock slam and didn't find out anything about it and there it was, and so forth, see? And once you've got those picked up, why, you'll have a free needle.

Now, a free needle is a needle that doesn't read. It's not stuck. The E-Meter has to be turned on – and when you ask questions it doesn't respond. It differs from an ARC broke needle basically on the aspect of the pc. And if any of you have ever accidentally looked across to the chair across from you there, you will see there's a great deal can be learned from the pc. Really, a great deal can be learned from the pc. I want to point that out to you as one of the fundamentals of auditing. You might have overlooked it. Okay?

All right. Well, enough of these pleasant preliminaries, let's get on with the lecture, huh? Now, I'm not going to give you *the* basic lecture on the fundamentals of auditing. But I'm going to point some few things out to you which you might find of considerable use in auditing. The auditor who isn't getting anyplace basically isn't perceiving the existence of the pc. He isn't perceiving the pc. That's the crux of the thing. Therefore, you can absolutely count on the fact that an auditor who has an oppterm on the third and fourth dynamic – that an oppterm on the third or fourth dynamic is liable to make a lousy auditor.

Why? It's not that he's in a games condition – not that he's in a games condition, that's not the point. It's something else. It's perception. And I want to tell you something about these items you see busily rock slamming. I don't think you know very much about these items that rock slam like crazy on the meter in front of you. You don't adjudicate the rest of the stuff that can be picked up off these items. These items mean a great deal more than simply a rock slam on a meter.
You get rock slamming items, you're getting the pc toward Clear. That is the road to Clear – is milestone by rock slamming items. He isn't going anyplace else, he's going Clear. And it doesn't matter – it doesn't matter how you find these items. It doesn't matter a bit. I can tell you 8,767 methods, almost off the bat, to turn on a rock slamming item. It doesn't matter how you turn on this rock slamming item. You got an item and the pc is on the road to Clear, and that's all there is to that.

And now I've looked this thing over very, very carefully and I have found out that when the pc doesn't get the other side of the package, huh-huh-hee-hee, he's going to stop right there with that rock slamming item you just found, ha-ha! There it is.

He knows now! Now, how does he know? What does he know? What? What? What does he know? Do you ever realize that the way to make somebody feel like they know without knowing anything is just give them a good, swift kick. Now he knows.

As a matter of fact there's a disgraceful comic strip in the Herald Tribune about the army. And it's disgraceful because it brags up the army all the time, all the time, all the time, advertise, advertise, advertise, you know? And it's got a sergeant and it's got a character named Beetle. And seems like this Beetle, who is a goldbrick ...

He's not as good as I used to be at goldbricking, but he's pretty good, in an amateur sort of way. Goldbricking is a fine art, man. It is a fine art. Now, it's that action taken by an individual who, finding himself in a position which he doesn't like, decides to make the best of it. And he can do this so artistically he even winds up with a medal.

Anyhow, Beetle was apparently complaining about all of the rough go and how he was sick and couldn't go out on the obstacle course or something like this, so the sergeant took him out to the door and kicked him, good and hard, down the steps. Good swift kick. And Beetle is sitting there amongst the soup-kitchen stuff saying to his pal, "And you know, I do feel better." Of course, the sergeant had said, "I'll cure it!" just at the moment of impact. So of course he gave him an engram and he feels better, and there's Beetle. I thought that was very, very subtle for a comic strip to pick up.

No, an impact gives a sensation of knowingness. People think they know something. "That will teach you a lesson," is one of the greatest clichés ever uttered. But it is quite fundamental. It's based on this same business. Two automobiles come together with a crash and those that survive it now know better. But they have an actual sensation of knowing something.

Now, the pc is in a mystery sandwich. There he is and the mystery glues him to the GPM, see? That – what's it all about? He doesn't know what it's all about. So you've come down the line and you've found something on which he has impacts and from which he has suffered impacts. His overt and withhold at this point are accompanied by not – a rock slamming item. It does not run like this: "I don't like little girls." See? After that the item "little girls" doesn't rock slam. You got the idea?

So when you find this you haven't got – you haven't got the result of having said this. Nor have you got the result of him having slapped some little girl's wrist. See? Or having taken some candy away from some little girl. I hope I'm making my point here.
A rock slamming item has mayhem with exclamation points behind it. It's got impact like mad! And it's much to his amazement as he runs on down the track and he thinks he's cleaned all this up, to find out that one of his pastimes, you see, was eating little girls after cooking them slowly alive over fires, you see? There was something went along with this rock slamming item.

Now, the amount of drama that I have pointed out to you contained in the overt or contained in the withhold has nothing to do with it. See, the significance, the dramatic story behind the overts of the pc as you pull overts off of him have nothing to do... It's what he considers at that particular time an overt and what he can take responsibility for. And you'll pull as much as he can take responsibility for; you won't pull any more than that.

But there we're talking just about overts – talking about nice little overts that don't have anything much to do with the price of fish. You've got to pull them in order to get a pc on the road. Now, you're talking about overts there; you're not talking about items. Now, a rock slamming item doesn't have drama behind it, it has "banned in Boston" behind it, see? It's too brutal, too inhuman and too this and too that to suffer print. And that applies to any pc you'll audit on the GPM line.

Wasn't the result – this rock slamming item is not as a result of accumulated slappings of wrists, you see. This is wiping out the countryside every now and then, don't you know? That rock slam means something.

Now, in view of the fact that a rock slamming item can impart its rock slam, as a lock can be hooked onto an engram and then read, you see. This lock doesn't have any – going back to Dianetics: Modern Science of Mental Health – this lock doesn't have any punch in it. He saw a man with a bandaged face, you see? And this clicks on the meter. Why does this click on the meter? There's no impact in it – just saw a man with a bandaged face. Well, that read is borrowed away from – is borrowed away from an engram, which has impact in it. See, force is involved here. But that force can impart up the line so that things without force then tend to borrow some of that force and give you a read, see? What you've got is a restimulation of the force, is what's reading.

Now, similarly you can very often get a reliable item – apparently reliable item – that doesn't have very much force in it, which has borrowed its rock slam. But on assessment you'll find out this person is rock slamming like mad on Scientology. There's no impacts involved in Scientology, don't you see? That isn't because there's any impacts involved or any force involved. It'll be something that's quite like Scientology but it really has force in it. See? And you get that rock slam has been borrowed from this other item. Well, you could get that other item by representing Scientology.

But you take a rock slamer, all you've got to do is oppose the thing you find him rock slamming on. You know, he's rock slamming on Scientology or an auditor or something like that. You find this person rock slamming on that; you want to cool that off or get the case anyplace, you've got to oppose that rock slam. "Who or what would oppose ... ?" whatever you found rock slamming.

Now, if you represent this item you will find out he was really rock slamming on something else. You see, you get the real item that underlies it. But that doesn't matter. Be-
cause he's in the atmosphere of Scientology, it's in restimulation all the time, and you're never even going to get down to pull that other item until you give it an opposition. You see that?

So you could use a rock slammer against Scientology or against a Scientology organization or any of the parts of Scientology – you could use that rock slam just by listing goals against it. "What goal might you have that'd be an overt against Scientology?" You see? You could list goals against it directly.

But look at it: it's a soft item. See, it really doesn't have the violence back of it. It doesn't go very far down the track. Very short-term proposition. So its rock slam is liable to fold up under a little bit of treatment or a little bit of listing or a little bit of that or something of the sort. It's not a good item to list goals against because it isn't firm, because it has no force behind it. It doesn't matter how well it rock slams or how repetitively it rock slams on the meter, see? It must have borrowed its rock slam from something else that did have force in it. See? Do you follow this?

The character of the rock slam doesn't tell you. But the ease with which the slam folds up tells you. Now, some of these rock slamming items fold up – prrrrt! You find them in a session and they slam-slam-slam-slam-slam-slam-slam-slam-slam-slam-slam-slam-slam-slam. End of the session you can still get them – slam-slam-slam. You pick them up next session it's, pnyeh. Nothing. What happened to them?

Well, obviously, merely the exposure of it brought it, as a lock, into view and so evaporated it. You must have been next door to a rock slamming item. See? It must have been a lock on top of it. Just like Scientology... Let's say he has a long history of burning hospitals – you know, a good military background of burning hospitals – you know, a good military background of burning hospitals. Every time he saw the Red Cross he said, "Well, obviously using that as an HQ," so he bombed it, you see. He just couldn't ever resist. Because he knew that all hospitals were false.

Well, after he's gone on for a long time the mere breath of the idea that anybody's going to heal anything, see – as far departed as the FDA is from the facts in the United States, see – and he'll rock slam on Scientology. But it's a lock rock slam, don't you see? That doesn't make it any less a reliable item. You use it in all ways that you would use any reliable item. But just remember, it's going to fold up awful fast. See? It's a cousin; it isn't the thing.

Now, you've got to oppose it, though. If it rock slammed, if you found it, located it, checked it out and it slammed, you got to oppose it. Because there is some other terminal or oppterm which is right next door to it which is also a lock which will slam as heavy as it. And if you go on down and find something else on the case, you find another oppterm – you found that "Scientology" is an oppterm – now you found another oppterm, below that by "represent," he – you've left some kind of a lock-up over here which the pc is. And it's got some pain in it, and the pc's going to hang right there. Doesn't matter – it's going to be light, it's going to be nothing, see? But nevertheless, it's there. And the case hangs up right at that point.

Now, the case starts in to this rock slam channel, then, at any little point. That – and there's just dozens and dozens and dozens and dozens, countless dozens of ways to get him into the rock slam channel. You can take almost any part of Scientology and get him into the rock slam channel with it. You can take "mid ruds" and get him into the rock slam channel.
You know, every once in a while this pc has a withhold from me and then "session" is consistently dirty as a – "session" is consistently dirty. Get a dirty read every time I say "session." Sometimes it doesn't and sometimes it does, and sometimes there's a dial-wide rock slam. When anything goes wrong with the session, or the pc has a little withhold in the session of some kind or another, we get a dial-wide rock slam. Well, that's an open bid to get the rock slam channel. Get whatever you can that is closest to it, "session," "auditing," something like that, opposition it – anything that'll turn that rock slam on, see? Just fish around till you get something, turn on a rock slam, oppose it, put the two down on your line plot. You've entered the rock slam channel.

You see, if it slams you can enter the rock slam channel. And at the end of that channel is the goal. And that channel leads down between terminals and oppterms. If you figured a road which had large black balls getting progressively bigger on the left-hand curb and the right-hand curb, and as you drove down that road with these great, big, black spheres to the right of you and to the left of you, a pair each time, and you kept driving between big, black spheres, a pair every time; you'd go over a horizon sooner or later down to the end and find a puff of nothing and that would be the goal, see? That's the way the thing maps.

However, the pc, by getting it all locked up and messed up and keyed in and monkeyed up one way or the other has got this roadway pretty well twisted up from where he sits. But it is never twisted up from where the auditor sits. To the pc it looks like the end of the road is at the beginning of the road is at the end of the road, that it's all tied in a bowline on a bight in the middle of the road, that it's all a black mass.

No, no. It is not to the auditor. It is just a road and it's got a black ball on the right and a black ball on the left. And all the black balls on the left are oppterms. And all the black balls on the right are terminals. And these things are always in pairs, and when you find a pair of them they rock slam against each other. And you go down the road and you keep driving down the road, and you drive far enough down the road you're going to run into a goal. And then it's easy to drive down the road because you know what you're driving on. And you keep on driving and you get to the end of the pairs of black balls and you get the Rock and the opprock and everything goes poof! and you've got a Clear on your hands.

That's an easy road to travel. It is far easier than you are making it – far easier. I've been conducting a whole bunch of series – a whole series of test audits of one kind or another. I've been going over this subject – wow! Really – diving in here and there and straightening out this point and that point about it. And the only reason the auditor can only drive one pair, two pair of black balls down this road is because he hasn't driven by pairs. He got an oppterm and an oppterm and then he got a terminal and a terminal, and then he got an oppterm and all of a sudden the road is barriered. There's a landslide.

Why can't he go any further? You might say it's the magnetic attraction of those terminals and oppterms which he didn't pair up. And when he didn't pair up a pair, he left something that will drag him back. And he will see that drag-back expressed in a rising, sticking tone arm. The tone arm will go up four and a half, five or go low. It can also go low. Case making no progress. Case gives you the same items over and over and over.
It's like you were driving down this highway, see; you're going lickety-split down the highway and you're doing about eighty, and you say, "Oh man, this is really the most, you know. Flat. Easy. We're getting terminals." And, oh, everything's going along fine and so forth. And all of a sudden it's just like somebody put a jack under the rear wheels. And man, you step on that accelerator, you know, and that engine roars but there's no traction. And you just keep punching the accelerator.

Of course, a good thing to do at that time is vent your temper on the pc. Why? What's all this? Well, it's just the fact that you passed one of those spheres back there, and it's still back there. Pc can't go any further. His attention is being dragged back to that.

Now, what is this sphere? What is this sphere? The sphere is something the pc knows. The pc knows. Why? Because in any one of these pairs – unless they're lock pairs; and you can't tell the difference between a lock pair and a real pair – there's impact. And that rock slam carries – even if there wasn't any force involved and it was just a lock, you know, it still carries the idea of knowingness. But you get one of these with real force in it and try to bypass it, and he thinks of knowledge as behind him. There's something over there he should know about. And he just sticks to it. He sticks to the mystery of it all. What is it?

Any time you get him into one of these terminals or oppterms he says he knows something and he cognites like mad. He's telling you he knows and actually during the ensuing – the ensuing day or two he's liable to try to add up his whole life into this, you see. He's found "little girls," you see, as an oppterm. And now he's added up all of his life and his whole track and everything from two hundred trillion years ago and everything he does and the significance of the way he holds his teaspoons, you see – this is all added up into this one terminal or this one oppterm. And, of course, he's trying to integrate his whole case into about one-thousandth of his case. Not to give you an idea that there's a thousand of these things, but you – it's that small a percentage.

Why does he have a feeling like it contains all the answers? It's because of that force and impact in it, don't you see? Give anything force and impact enough and somebody thinks it has all the answers. If you were to take somebody out in the middle of the sidewalk and kick him for half an hour, every time he passed the spot – if you could get him near the spot – he would have an idea that he knew. He wouldn't know what he knew, but he'd have an idea that he knew something.

The result of impact is a sensation that one knows. It's a sensation of knowingness. That's why people teach a lesson by punishment. This is one of the big mechanisms of this whole universe, is the lesson by punishment: "If we spank Johnny he will know." Of course, you get Johnny through his spankings and he'll run off a sensation of knowing. Even if he only knows his father's no good. See, he'll have got some knowingness mixed up with this, don't you see?

His knowledge is not actual knowledge but something dragged through force. There's no real knowingness about it at all; it's the illusion of knowingness. The Russians have got this so badly in dialectic materialism. That's not an electronic activity; that's the whole philosophy of Russia's forward progress, is "All knowledge comes from two forces." Oh, you – I could be very erudite on the subject, but I don't think anything as horrible, as illogical, as dia-
lectic materialism should be given the courtesy of a "proper" rendition. They're dramatizing the GPM. "Knowledge is the product of two forces." It's funny, see?

Of course, you get some zone or area of the world where it's hot all the time and cold all the time – in summer it's roaring hot and in the winter it's roaring cold. I've seen horse biscuits jump up in the air and explode in Vladivostok. It gets cold, man! You think it's cold in England, you've got nothing, man! Nothing! It gets cold. It's very difficult sometimes knowing, after you've shaken hands with someone, if you've taken your hand back, you know? Might have just snapped off in the process.

And of course this gooney race would be so keyed in they wouldn't know whether they were coming or going, and they would deal a whole philosophy off the GPM. They're aberrated. "All knowledge is the product of two forces." If you really want to know something, get two tractors, rush them at each other at a thousand miles an hour and you'll have the political answer to the situation, obviously. Well, that's how silly this dialectic materialism is as a study.

You have to have two forces and they have to come into collision and if you get these two forces into the collision, why, then you can figure something out and then you can go from there. If you want to know how to repair an automobile, run it over a cliff. Then you will know that it's busted. It's one of these idiotic things. It's taken straight out of the GPM, see?

So a pc knows there's knowledge over there someplace and he wants to know what it is and he holds up and he won't accompany you in your automobile eighty miles an hour down this line, he'll go out thataway and you can't get any further down the track because you've got no pc. Where'd the pc go? Well, he's still looking at oppterm one, which you didn't find.

He says, "What is this thing? There must be some wonderful knowledge connected with all this, you know? Must be. What is it? I hear something. No..." and you can talk to him all you want to. You can say, "Why isn't your needle clean?" You know? Good – good auditor presence, you know? "You're just doing this because you're mad at me because you haven't got your old auditor," see? You know, things like that.

He just doesn't unglue at all; just keeps saying, "What's this? What's that? That?" It's because the thing is charged up. You found half of it and he knows there's another half.

Call those items which are neglected "bypassed items." Those items are bypassed, and the bypassed item is what hangs up the case. Now, this is what I was going to tell you about this research auditing. It's very, very interesting to me. But it doesn't matter how you find the pair, they go onto the line plot in the exact place they're supposed to go, in sequence and that's the wildest thing I ever saw.

Doesn't matter how you find them. If you find them from one line or another line or something, and then you put them down on the line plot and then we ignore that pair – we find both pair, see – and we go off in some wild race across the countryside and we pick up some brand-new way to get a pair. And we find, you know, another rock slam, and now we opposition it. We put it on the line plot; they're exactly in the right sequence. Well, that's amazing.
You didn't skip a pair, see. It's amazing. I mean, you're lucky. They're always the next consecutive pair, no matter how you found them, if you found both of them. But you won't get the next consecutive pair if you only find one of one thing and then one of another. You have to opposition the thing you find. Whatever you find, opposition it. And then you keep getting proper pairs.

When you stop oppositioning what you find and just try to combine two rock slamming items – heh-heh-heh! – maybe they're a pair and maybe they're not. So that's the lesson. But a case in clearing hangs up when you bypass an item. That gives us the rule that everything you find that rock slams must be oppositioned. See, it's oppositioned as itself, not in some other way or with some other command or with anything else. Just opposition it. It's that simple. Who or what would oppose it?

I think this is quite remarkable. I think it's quite fantastic that the highway lies there with a sphere on the right and a sphere on the left, and they match together and they're both at the same location. And when you've got that sphere you can drive a little further down the highway and you'll find a sphere on the right and a sphere on the left, and they match each other. And if you get both of those spheres then you can go on down the highway a little further and you can find a sphere on your right and a sphere on your left, and you can get that pair. Then you can get down the road a little bit further and get a sphere on your right and a sphere on your left.

And it doesn't happen to matter whether you're getting them from the goal or from a wrong goal – as long as it gives pain. Well, you won't get very far with a wrong goal, the case will spin in. But nevertheless you can get a pair off a wrong goal. And if you abandoned it at the point where you got the pair and didn't go any further with it you're still all right. Sounds funny.

The rule is as long as it gives pain, you can list it. And when it stops giving pains, skip it. You'll just have the goal, probably, of one of the pairs you're now looking for, see?

It all depends on this interesting fact: The E-Meter will read on what is real or realizable to the pc. The E-Meter reads on what is realizable. If the pc can have a reality on it, it'll read on the meter. If the pc can't have a reality on it you won't get a read on the meter. The rock slam, being the biggest manifestation on the meter, is that thing you get the biggest reality on.

A funny thing: He'll put the pairs on – he'll put pairs on which are three sequences down the line – three pairs down the line, you see? He's at pair A, B and he'll put stuff on the list which is at H, I. But it won't slam. It may tick, but it won't slam. And you'll say, "Well, there it is."

And if you've got one of these pcs that's got to be original, never dares repeat an item, something like this, well, sometimes you have a little bit of trouble. Because he knows he's put "alligators" on it, every list he has so far done, and it's never come up yet. So he's apathetic about "alligators" just at the time when "alligators" is about to come up.

In other words, the progress which you are making down that track of pairs toward the end of the line, the progress which you are making is milestone by pairs, not milestone by
single items. And if you go and bypass one of these items and then never find it and so forth, you've had it. You're not going to go any further. You might find the next pair and that's it – end of track.

Where is it, then? It lies behind you. All you've got to do is equate it up into pairs and it'll roll again, as easy as that. You're dealing with a fantastically precise mechanical electrical fact. It's just in these – these things are in spheres. What are these spheres? These spheres are old identities. These spheres are held together by the nicest, neatest balance you ever heard of. It's impossible that they have held together all these millennia. But they have; they've just been exactly and neatly balanced. The forces from A to B are the same as the forces from B to A, so they hang up.

This is reinforced, then, by the negative pair. The positive pairs also have negative pairs. Frankly the reason I haven't brought this up or said very much about it is because it's one of these pedantic points. Because they just look like pairs to the auditor and they do the same thing.

There's the not-oppose pair – the not-oppose pair. And that's the secondary pair. They really don't oppose each other. They oppose the other two in some peculiar way and so they do oppose each other so they rock slam. All of which is very complicated and they're what render the thing up in a ball.

But frankly, you needn't pay any attention to them, unless you're going to ask a pc just for a pair. You start asking the pc for pairs and you rapidly learn, as I found out, that you can't ask him for just two pairs which oppose each other. I'm talking now about an auditing command to Clear. A clearing command. Like there's no E-Meter, there's no assessments, there's no nothing. I'm searching on this line because we've got something – to have something here for Clearing Co-audit, see?

I've been looking for some method of driving down this track in a Clearing Co-audit that would take a long time but would one way or the other wind the pc up there on just raw-meat-type muzzled auditing, see? I'm looking for this. Apparently it would be a very lengthy procedure. But it – nevertheless, I'm pretty sure it can be done. That's as far as I've advanced on that.

And one of the things I learned doing that is, if you ask him for two things which oppose each other and then ask him for two things which oppose each other and then ask him for two things which oppose each other and then ask him for two things which oppose each other, he'll turn on some of the nastiest somatics you ever wanted to have anything to do with. Thuuuh! Oppose, oppose, oppose, oppose, see? Uh-uh-uh-uh!

Of course, he gives you little things, you know. He gives you items in the room and he gives you stuff out of his present time problems and he gives you stuff of this character. And you nevertheless are getting pairs. Of course, he finally comes up with the sixty-four dollar pair, because this is all done by gradients which the original clearing is. You would, in other words, improve his ability to confront to a point of where he can confront the first pair and recognize them without the assistance of the meter. And that's really asking you something, man; that's asking something.
But you can't do it that way. You have to ask him, "Tell me two things that oppose each other. Tell me two things that don't oppose each other." "Two things that are not in opposition" is the better wording. "Tell me two things that are in opposition. Tell me two things that are not in opposition. Tell me two things that are in opposition. Tell me two things that are not in opposition."

The full package, by the way – that doesn't work very well; you've got to beef it up – is: "Tell me a problem. What two things in that problem oppose each other or are in opposition? What two things are not in opposition? Tell me a problem. What two things are in opposition, what two things are not in opposition? Tell me a problem... ." Get the idea?

Of course, it's the Goals Problem Mass, and you theoretically could graduate him up the line and he could run it. But if you just asked him for two things in opposition, "Tell me a problem. Now, tell me two things in that problem that oppose each other," you're going to get some of the nastiest non-turn-offable somatics you've seen in a long time. Because you're asking for the fundamental pair every time, you never get the secondary pair.

Now, how much this means in driving down the road I haven't equated. I know that for a fact, however, that you have to ask for the oppose and the not-oppose.

Now, in view of the fact that you're finding things on oppose and not-oppose lines when you are listing from the goal, you of course are getting things that are not in opposition to each other, even when you oppose things.

You see, you say, "Tell me something that's not in opposition to catching catfish," see. "What would not oppose catching catfish?" You do a list, you get a rock slam on it, when you oppose that thing you got – you've got a pair of non-oppositions. The – it's very complicated. But it's actually worked into the four lines, so that you get the – you get additional pairs, and then you can oppose these pairs. You understand? You get an item, you oppose the item. The same rule holds. You get the item, you oppose the item.

Now, this opens the door to something interesting: that if you were going in and just listing lines and you never did find the pc's goal, you would undoubtedly have to introduce some other data into his auditing to keep on going indefinitely. You follow me? That opens the fact that but – you didn't have his goal and you've driven halfway down the line between these pairs and something might start hanging up; well, you might have to get the non-opposition lines because you probably skipped some items that didn't oppose. Do you understand? Do you – you get this?

You see, it's a four-way flow, not a two-way flow. And the four-way flow is introduced by the other pair. And they still show up in general auditing just as a pair, when you're listing from a goal. When you're listing from the goal they just show up as a – as a ordinary pair. You don't recognize to the degree that they're influenced by the last pair you found or by the next pair you're going to find. Pc doesn't have to recognize this to any degree to get going.

Well, let me put it this way – I see you're in a drift: You've got two pairs. From the auditor's viewpoint, you are simply driving down the road and you'll find A on the right and B on the left; that's one pair. And C on the right and D on the left; that's your second pair. And
you've – from where you sit you simply passed two pairs. You got it? That is the way it looks from the auditor's viewpoint.

In the actual bank they're not arranged that way. A versus B is crossed by C versus D. Actually, it looks like two dumbbells, the handles of which are held together. Look much more like this. They expel. They expel the things. You've just got, see, pair, pair, pair, pair, see? They have crushed themselves together on this particular line and this has to do with types of charge. Two of these are retreating so hard that they come together. And the other two are attacking so hard that they come together. You've got various electrical phenomena.

You go into the electrical phenomena of this, though, and you'll be blowing your brains out in no time. See? I was trying to tell you why we're not worried about this electrical phenomena. I only introduced this other thing, that by the time you were going to try the idiotic action of clearing somebody without ever finding his goal... You understand, that's not something that you're engaged upon. See? If you went into that you would have to pay attention to this crossed-handles effect of the dumbbells, see? Now you've got to pay attention to it.

We're not going to find the guy's goal. So therefore we're never going to have the four lines, "want," "not want," "oppose," "not oppose," see? We're never going to ask for the "not want" and the "not oppose," and those are the two that'll crash together.

Mostly you'll find the "want" and "not want" go together, and the "oppose" and "not oppose" go together. That's the way they normally get found. After the – after you got through oppositioning some item the pc will say, "Well, that belongs on the 'want' line and the other one belongs on the 'not want' line." They tell you where they belong on the lines.

But say you picked one off "not oppose" – you were listing "not oppose" and you got a rock slam. So you listed the rock slam out very beautifully and then you nulled that list, and you came up now with a nice, beautiful, rock slamming reliable item. Then you said – depending on if that thing is an oppterm – you say, "Who or what would oppose that nice, big, beautiful item?" see? You – it's always that. If it was a terminal, why, "Who or what would it oppose?" see, to get your next list. But that's an opposition to it. Then you do your new list with that, "Who or what would oppose it?" and so on. Got that list. You'll find out there'll be something on there rock slams. Null all this down, beautifully polish it up and what do you find yourself sitting with? You find yourself sitting with a pair.

Now, the pc will tell you that this new one belonged on one of these other lines. Also liable to tell you, "I never under God's green earth would have put it on that line." See? That was the startling part of it. You actually discovered this thing he would have overlooked. And that is your level of confront. In other words, the pc's level of confront is not quite up to these rock slamming pairs, and it has to be graduated up scale, gradually, to see more and more rock slam, more and more pairs and more and more and more and more. And you get further and further down the road. He's seeing bigger and bigger things. Do you understand me?

He can equate these things; he can put them together. And he'll say this is the way it sits, and he'll give you the whole game connected with them. And he'll say, "Here's the priest and here's the vestal virgin. Ah, yes. Oh, yes. The..." If you let him he'd spin you quite a tale – if you'd listen. You could ask him questions about it.
Now, you can do all kinds of things with these pairs. You can do anything with them you can do with any process in the last twelve years. Because that's the basic line that you're going toward when you are auditing somebody. You'd head in toward these things. When the pc would have a big gain, you'd hit one accidentally, and when you didn't have any big gain you didn't hit one. That was what your auditing results to a marked degree depended on. It's whether you got into this rock slam channel or didn't. It was that happenstance with the pc.

These pairs have got force in them. The force is from the A to the B, don't you see? The force is *between* the two of them and they're held in balance and they remain very badly discharged when you don't find the other half of them and so forth and that consists of a game. And A is in a – always in a games condition with B. You see? One side of the pair is in a games condition with the other side of the pair. One of these pairs is the pc. The other one is the enemy. Invariably that's the way he equates it, except when you get a combination terminal and that's a rock sitting in the middle of the road and you drive around that.

Now, here they are, as you go down the line. The amount of force contained in these things is invariably underestimated by the auditor. If he does a rough job of auditing, the rougher the job of auditing, why, the force is going to hit the pc hard or that much harder. Now, it's already almost unbearable, because you're auditing the pc in a body which wasn't there at the time he accumulated the mass. So the mass, then, impinges on the body in some crazy and weird way and tends to disrupt and upset various portions of the body. But remember when he was the priest and chasing the vestal virgins he wasn't wearing "John Smith, deacon of the local Presbyterian church." So you've always got a body in the road during auditing. It gets in the road.

Now, he'd experience these somatics as a than when he was somewhere outside of his head. He'd still experience them because he's still got mass, see? But your mass is complicated by the presence of a body. And the body goes hot and the body goes cold and the body hurts and the body this and the body that and so forth. So you're actually clearing somebody over his alive body. [laughter]

He has no business wearing that body because it had nothing to do with the dramatis personae of what you're auditing. That you can clear somebody at all with a body kicking around is a monument to your ability, because it's an extra, massive, hard, solid valence which is sitting up in PT, which in itself every time you find a pair of items does some discharging. It's always a third factor in the middle of every pair.

Now, because this third factor gets mixed up in it, the pc will flinch. He probably wouldn't flinch if you were auditing him out in space someplace with a couple of beams on the E-Meter, don't you see? But in a body he tends to flinch more because he's afraid something's going to knock that body off.

And you'll hear a pc every once in a while be very, very chary of going into that any further because, ha-ha-ha-ha... Part of it is, is he just can't understand how the body could keep going with that much pressure on the heart, got it? "Well, I don't understand it either" – you might tell him that. But I don't think it'd encourage him.

Truth of the matter is, the liabilities are slight. But the fear that something horrible might happen lends him all the potential of having something bad happen. He flinches, he's
still protecting a body – the body he's got in present time – and he's liable to back off and back out and get out of there. Flinch. You'll see pcs doing it every once in a while.

Now, probably he would straight list to Clear. You'd find his goal any old way and he'd just straight list to Clear if it weren't for this body factor in present time and rough auditing and other little factors that enter into it. Because these make him flinch off from confronting and putting together the total packages as he passes them.

Here he goes down the line and you find an item and you get the opposition to the item and you find another item and you get the opposition of the item. You find the goal, and you've got the goal, and he lists very ambitiously in the first forty items on each of the first four lines that we were originally doing.

And if nothing got in the road of his body – that is to say, it didn't look to him like his body was suffering too much and if he wasn't suffering to that degree and the auditing was very smooth and a lot of other conditions, why, then he'd get the next forty or fifty items. And he'd get the next forty or fifty items, and all of a sudden he'd pair a couple of them up. And then he'd go to the next forty or fifty items and he'd go to the next forty or fifty, and he'd pair another one up. And he'd say where this was and the next thing you know the needle is getting looser and looser and floppier and floppier. And all we had to do at the end of that line was clean up a few of the bits and pieces and he was Clear. Do you understand that?

All right. Let's take some other pc, and this pc – we get a terminal and we get an opposition terminal. We get it any old way. We find his goal and we've got his goal, and now we're going to list from the goal: "Who or what would want to catch catfish?" "Who or what would not want to catch catfish?" "Who or what would not oppose catching catfish" and "Who or what would oppose catching catfish?" – the wrong order, the last two. And we busily list him down the line, clackita - clackita - clackita - clack. And he gets down to twenty and the needle went di-di-di, clack-clack, clack, bang-bang, bang-bang, bang-bang, ba-bang-bang-bang-bang. And there was a horrible pain at that moment went straight through his brain. And he knew that he was going to go deaf or something of the sort if it stayed there.

Well, he put the truck into full speed astern. He restimulated this item, see? Now, he's put the item down, flinched from it and the next item up the line he simply puts down – and it's a little bit further away from it and a little bit further away from it – and you've got a partially restimulated item versus a totally non-found, bypassed item. He isn't going to go any further.

He's going to go pocketa-pocketa-pocketa-pocketa, and he'll give you items, he'll give you items. We know now he'll give you thousands, tens of thousands of items. He'll keep going. His tone arm goes up and sticks and ...

And then you give him a Prepcheck and it comes down. It goes up and sticks again. And it goes up and sticks again. And you straighten him all out and get the goal to firing and everything is fine, everything is beautiful. And then you list a few more lines on some other pattern of lines, and the tone arm goes up and sticks.
What's happened? All that additional listing had gotten him no – not five feet further beyond pair E and F. See, that's as far as he got. He ticked E and doesn't even know of the existence of F, so he goes five feet further than that and that's it. The car is just stuck on the road, and it's just like having a jack under the rear axle. Doesn't matter how much acceleration you give it, it doesn't matter how much you fool around, doesn't matter how smoothly you audit or how you try to persuade the pc on down the road, he's going no further. He's stuck in a – the mystery sandwich.

What's the repair, then? Repair is actually very simple. By any means, find the bypassed pair. If he was lucky enough to have been doing a written list at the time all this began, all you'd have to do is null the list. Find the rock slamming item and oppose it.

If you weren't doing a written list, why, just get him to list a few more. He'll give you the same bordering item again. He's been giving it to you every session. Every session that had six hundred items in it, one of them had "a polecat" in it. He's mentioned this "polecat" a lot of times. "Polecat" is very suppressed. This "polecat," he – you know which one it is because he'll sigh before he puts it down, see? It produces, actually, a physiological reaction. He isn't going to go close to that polecat, he suppressed that polecat, see;

Well, you do that and you take over the list, and you'll find out it'll stay in with a tick. And when you tiger drill the last three or four items that are left in, one of them will be the polecat and the rock slam will open up again because the suppression will come off of it, and it'll go wham, wham, wham, wham. And then you want, "Who or what would oppose a polecat?" or "Who or what would oppose a polecat?" depending on whether or not it turned on pain or sen. You've got the pair and now he's ready to go on down the road. And he won't go until then.

Now, all good auditing aside, all bad auditing aside or anything else, that's the basic mechanism of what happens to a Clear, when clearing hangs up. Now, there's many ways you can make the pc not confront items. You could get the pc so ARC broke, you could get the pc so upset, you could get the pc so worried, you could get the pc this, you're auditing could be so lousy – all kinds of things could happen that would distract the pc off his case so he couldn't list, don't you see? It all bags up to the fact that he – the worse he's audited the more likely he is to bypass a reliable item. That's all that adds up to. But even with fairly crude auditing you still should be able to find the item.

Now, supposing you couldn't get him to list from that goal anymore, you couldn't get the thing to – it's so submerged that you couldn't find this item and so forth. I've got good news for you: Just find the next pair that is due to be found any way you want to find them and that'll be the next pair and that'll be the pair that he bypassed when you were listing originally. Quite remarkable. It's... We should be so lucky. It's very astonishing: If you take up the line plot with the pc and plot every pair that you find and so on, it doesn't matter how you discover the next pair, you won't ever find a pair beyond the pair that you hadn't found. Now, you can press your luck. Early in the case you can press your luck. You can find an oppterm and an oppterm and even an oppterm, by represents or some such fashion. And all you're doing is hunting down, there, the – you're getting closer to what was really slamming. And you got these three now and now you can get a ter-
minal. But the funny part of it is that you ask for the terminal against the last one and you get the terminal that belongs to the first one. You get what I mean? In other words, that goes onto the line plot where it belongs, not where you thought it went. You understand?

You've got A, B and C as oppterms. See, you've got opterm A, B and C, see? And then you say, "Who or what..." You're going to find a terminal now; you're going to say, "Who or what would oppose C?" And you list it out that way, and you'll have yourself a ball listing it out that way. And of course those of you who indulge in the novelty of asking the pc something about his case would find out, after you had listed it and found it... Yet oddly enough you can list it; you can list, you know, this, "Who or what would oppose C?" and weirdly enough wind up with what opposed A.

It belongs up here at opposition to A. But after you've found this thing you say to the pc, "Look-it-there! Look-it-there! Look what opposes B or C," you know? "Look what we finally found what opposed C." Of course, you wouldn't do that; that's direct evaluation. If you ask him, "What does this oppose?" and just gave him the three things, he will put it in the proper place right now, and it'll be A.

You sometimes – you sometimes can go – early in the case only – you can go well past and leave two or three of them behind you, but the first opposition you find belongs to the first pair, so you really never got by the first pair at all, did you? The pc was just hung up to that degree. And the more you find out of sequence and the more you try to find them out of sequence and the more desperately you try to avoid finding them in pairs, the harder it is to find them and the smaller the rock slam will become and the more difficult it is to go down that road – the more difficult it is to find goals, the more difficult it is to get anything to slam, anything of the sort. But as long as you find them in pairs, you're clearing the individual.

You can clear somebody by finding that sequence of pairs. But you'd have to start paying attention – if you were never going to find the goal, you'd have to start paying attention after a while to the not-opposition factor. You'd have to get things that didn't oppose things. You'd have to get the other parts of the dumbbells because you'd be likely to pass them after you've gone a while, because you're not being assisted by the pat wording of Step 6 in R – Routine 3-21. So you'd lay an egg to that degree.

But you theoretically – allowing for that factor – theoretically could clear somebody clear on down to the end. The time he found his goal, it would simply be a small explosion in the middle of nothingness and the whole bank would fold up and that would be the end of that and he would be a first-goal Clear. See, in theory you could do this.

So as long as you're finding these pairs, you're advancing the case. And it doesn't matter whether you have the goal or don't have the goal, if you can find pairs you're advancing the case. Because clearing is not a matter of finding the goal, clearing is a matter of straightening up the Goals Problem Mass and vanishing it. It most easily vanishes from the goal, by taking the goal. That's the easiest route. But other routes exist by which this could be done.

Lately we have been finding some. We find out that you sort of erase the pc and he will – the goal sits there in the chair. In other words, you give him Problems Intensives and Problems Intensives and Problems Intensives and you wind up with something that looks like you got the goal.
Apparently there are other ways of springing the goal and there are other things that would happen along this line. Old Routine 2 apparently was capable of making a Clear. And that was a goalless Clear, don't you see? And I've been working on something that without finding the pc's goal you would clear a person in a Clearing Co-audit.

Now, of course the joke is, of course, that you would just go so long and the pc would lay this goal in your lap. That would be inevitable. I don't think you could go a third of the way down this track without the pc discovering his basic purpose, because he is now totally surrounded by it.

You see what you're doing? See what you're doing? So you think that you're wasting time up to the moment when you find the pc's goal. Not if you've got a balanced line plot. All the goal is going to do for you is give a balanced line plot that is more easily gotten. Do you see that?

It's very funny. You found maybe six pairs and it's all fine. And then you find the pc's goal in great triumph and list the first four lines from that goal, and you say, "Now we're really going to go someplace." Of course, you're going to get this faster and so on. And all you wind up with is the next pair in sequence. Of course, after that you can find pairs in sequence with the greatest of ease. But that's the way it goes.

Now, there is the layout of the GPM. That's actually all you're trying to do. If you integrate what you know and what you've been fumbling with and integrate it around this fact – that it only takes perfect auditing to achieve it – why, you've got it made. There is a way to audit this, there is a way to be smooth about auditing, there is a way to handle pcs. These things have all been figured out. And if you've got those things taped, you do this other of just getting matched pairs, you wind up with a Clear – inevitably and invariably. You couldn't possibly get away from it. You see that?

So you're trying to not split the atom, you're trying to split the GPM right down the middle. And when you split it right down the middle the reactive mind disappears down to the point of the first goal. Then you split it the additional distance to the second goal and so forth. These pairs evaporate and discharge when they are found and when the goal is found and re-integrates into them. Do you understand this?

All right, thank you very much.
Fundamentals Of Auditing

A lecture given on 20 November 1962

Thank you.

Okay. Here we are with Saint Hill Special Briefing Course lecture number two, 20 Nov. AD 12.

There's a lot of material that you could have and memorize and do things with on the subject of auditing. There are probably thousands and thousands of rules that you could go by in auditing – thousands of them, probably. And the way to audit – the way to audit has only a few very fundamental rules.

When you look at these thousands and thousands of rules of thumbs and maxims and what you do and what you don't do and so forth, if you haven't got these few little basics down, you're not going to audit. Auditing does not occur.

In other words, there's what you might call some very, very senior data on the subject of auditing. One of those is: Auditing is a third dynamic activity, basis of it is communication and you have to audit the pc in front of you. And frankly, you violate those and you've had it. I don't care how many other thousands of rules you have followed. If you have violated those little rules, well, you've had it, that's all. You won't ever have any auditing occur.

Somebody comes along and he tells you this, that or the other thing in auditing, and to you, it seems to make sense that you handle your E-Meter on the right rather than on the left or something like this – the reason you aren't getting anywhere is because you're handling the E-Meter on the right or – and you should be handling it on the left. Or you have to take up the pc's present time problems and that's what you're not doing and that's why your auditing is bad. Or pcs ARC break and therefore don't read on the meter and that's why you're not getting anywhere, and that, frankly, how can you expect to audit a pc if you have dirty fingernails? You must improve your diction in order to audit a pc properly, and so forth, and go practice with diction. Your E-Meter reading must be more rapid. And if your E-Meter reading was more rapid, why, then you could audit a pc better. You could just go on down with innumerable items – all of them quite valid – which if you repaired them, without repairing the first three I have mentioned, would not make one damn bit of improvement in your auditing.

You can be told that there are thousands of things and some of you, and some auditors, get into a complete fog of the fantastic number of things they have to do and remember in order to audit. And in doing and remembering these thousands of things which they must do, they neglect those little fundamentals. They cease to audit the pc in front of them. They start auditing thousands of fundamentals. They neglect communication as the primary function and action in auditing and they sit there as a totally individuated item – island – a first dynamic auditing a nowhere. And, of course, they never get any auditing done. Those fundamentals have been totally overlooked.
If those fundamentals are overlooked, it doesn't matter how precisely you turn your toes in as you sit in the chair doing TR 0, it doesn't matter how much Listerine you gargle before the session, how many advertisements you put out about what a good auditor you are, hoping the pc will hear them and be impressed. It wouldn't matter a doggone what you did; you've neglected the fundamentals of auditing.

The fundamentals of auditing don't even consist of an E-Meter. They're very simple. Auditing is a third dynamic activity. There's the auditor and pc and they're basically a group. The activity they're engaged in is communication and the auditor is auditing the pc in front of him. Those things are occurring, auditing will happen. If those things are not occurring, you could handle these thousands of rules... Actually, I could go back over them and check them out of various handbooks, lectures and texts. And I'm sure I could count up thousands of them. You could follow all the rest of these rules letter perfect – and you would never make any auditing take place.

Of course, a Saint Hill graduate goes out of here and goes back to an organization or goes back someplace or another, they always make the inevitable remark. They don't make it because I have said they make it. Usually they don't make it at first – they're being polite or they're being something or they're being something. They're being nice about the area or zone they're in. And sooner or later, because they've withheld it or overlooked it and are withholding it and so forth, they will break down in a letter to me – it'll be the fifth or sixth or seventh letter they've written me, or something like that and they'll say, "But the auditing that is being done around here – oh, my God! Oh, my God! Oh, my God!" It's very expressive.

Now, of course, you say, "Well, this is a Saint Hill graduate, he knows all these tricks and he looks good and he's this and that and the other thing." Somebody out in the field will say this, you see? They'd say, "Oh, well, of course, they've just learned all these little tricks and all these little nuances and that sort of thing. And therefore, they look good." Now, I don't think that's it at all. I think around here you find out that auditing can occur. I'm usually telling you that it must occur. And out of sheer agony of trying to get off the hot seat, why, you have to audit. Because nobody's putting up with it if you're not.

And basically your case gains are coming on up the line, other things are occurring. And through practice, through interest in what you're doing, through these various things, you start auditing the pc in front of you. All of a sudden a long, blue spark hits you one day and you say, "Maybe if I asked the pc I could find out." So communication starts to occur. Then you get so many changes of auditors that you can't conceive of auditing being anything but a third dynamic activity. [laughter]

So, in the final analysis, you are being driven, actually, in that direction, until you recognize it. And what a Saint Hill graduate misses when he gets back into an area or an organization, what he misses, is any feeling that auditing can happen. He's surrounded by people that really don't think auditing can happen. They've very seldom seen it happen. See, they very seldom run into the fact that there is a right way to do it. They don't think there is a right way to do it. They think it's something they dream up as they go along.
They think this and they think that. They do an awful lot of thinking. They do an awful lot of figuring. They don't know that there's a right way to audit; that's what it boils down to. They don't know that there's a right way to audit.

And you get any unpracticed auditor who has not been very ferociously schooled on this subject and that is the first thing he overlooks – that there's a right way to audit. And the right way to audit is to consider an auditing session a third dynamic activity that has to do with communication, and that you audit the pc who is in front of you. And then auditing occurs.

Another thing you get over around here is being self-conscious about auditing. There's so much auditing going around and so much being demanded and your brains are so strained – trying to avoid you, a thetan, probably – that you get into a state where you haven't got any time to be self-conscious about it. And one of the things that happens around here quite routinely is, an auditor at Saint Hill looks very relaxed when he's auditing. It's one of the points you look for. He's stopped worrying – whether from apathy or otherwise. [laughter]

But if you neglect these fundamentals, then you can add thousands of things to do. Now you have to have rules to handle pcs' origins. Now you have to have rules to handle this and rules to handle that and rules to handle something else, because these fundamentals have been neglected.

I'm very obliging. If somebody demands rules of me – if they're foolish enough to demand rules of me – I'll give them rules. And they'll learn better after a while. That's about what it amounts to. Uniformity of an auditing session is highly desirable. A relatively muzzled state on the part of the auditor is highly desirable, if an auditor is going to add a bunch of nonsense into the lineup. But this is all curative, isn't it? That's a curative measure. That's trying to keep people from multiplying and adding nonsenses which have nothing to do with auditing.

The other part of it is that the human race wots not of a third dynamic activity – doesn't know anything about it. And as far as communication is concerned, to this day I'm still kicking myself. When I think about it, I get very cross with myself, and knowing better than to run motivators, I don't get angry with Reg. But if I didn't know about motivators I would be furious with him. But I didn't take a tape recorder, a pocket tape recorder, to a cocktail party that was given on the Queen Elizabeth. The officers give cocktail parties. I'd just love to have that tape! I could turn it on right now and play you ten minutes of it, and honest to Pete, you'd hardly be able to sit in your chairs! You'd just be dying with laughter. Because there isn't any communication in the lot of it. All they do is evaluate and invalidate. And no communication; nobody ever finishes a cycle of communication; things they talk about are non sequitur – never follow up any subject with any other related subject. It's a dispersed mishmash of invalidation and evaluation. And that's what passes for communication.

The most marvelous condensed example I ever heard of it in my life was at that cocktail party. As I walked out of the door of the cabin Reg said, "Well, I don't know, you don't look very good there – tuxedo with this tape recorder. It makes your shoulder, you know – bunches your shoulder up and so I wouldn't take it." That's what he said there. So I didn't get the recording and you can't have an example of what Homo sap considers... Wild! I mean, you
can't duplicate it. You'd have to get out a slide rule and figure this thing out. How many evaluations and invalidations can you get in per given remark? Everybody's trying to stop everybody else's communication – no communication involved. Communication is basically cause, distance, effect. Well, you can add a few more of the rules and duplication and things like that in – you got the whole definition of it. It never occurs in Homo sap.

So an auditor, or a person learning to be an auditor, has his first strike on him because he's been associating with Homo sap. He would make a perfect auditor if it weren't for that. We've got to cure him of it. Therefore, we have the rules, like TR 4. We have rules like Q and A. We have other things that we have to put in. What are those things doing there? Well, they're trying to bypass and not let into the session a number of human aberrations which already exist in the communication habits of the person who is trying to audit.

Now, I had somebody just do something very astonishing. They didn't realize that when the pc originated that the cycle should be permitted – that the auditing cycle occurred when the pc originated. They thought it only occurred when the auditor originated. And that's why they Q'd-and-A'd. Only the auditor was supposed to begin and end a communication cycle. Well, that immediately is not a third dynamic activity then, and you're not auditing the pc in front of you, because the pc in front of you is not permitted to originate a communication. Follow this?

What is an origin? The pc says, "Black is white." Well, an auditor who is still – he still has the cramps and coughs of being a Homo sap; he isn't, case-wise, up the line as far as he might be, lot of those things – he tends to handle this a la Homo sap. But don't think that that makes it any less a violation of communication. A communication is just a pure cycle and a communication cycle can go two ways.

This is not the fault of auditing that he's doing that; it's because he's developed bad habits. Somebody says, "Black is white." This violates his sense of something-or-other, so he writes script. So he says, "This person is nuts." So he says, "You're nuts. Black is not white." That's Homo sap at work, you see? A big figure-figure is added into the middle of the communication cycle. Where the hell do you find any think in a communication formula? It doesn't exist. You find most auditors, learning to audit, have difficulties with pcs in direct ratio to the amount of think that they add into the communication cycle. That's the extraneous action.

Pc says something, so they think something. Well, unfortunately, "to compute" was part of the definition of an auditor. So we just have to throw it out. Because an auditor actually doesn't listen and compute. The less computing he does, the better off he is, man. Pc says, "Black is white." What is the proper response to "black is white"? – "Thank you." It's just a pure communication cycle.

And do you know that every time a pc has ever asked you to do something in an auditing session has been after you have goofed the cycle originating from the pc about four times – at least once. Pc originated and you took it up and did something, the pc originated and you took it up and did something. So the pc, now being in auto-control, says to open the window. The only reason you need any definitive action between a pc wanting you to do something and the pc originating, is because the pc wants you to do something after you have failed to accept his origins.
You've queried his origin, one way or the other, before he starts thinking about the environment. Don't you realize that's a symptom of being out of session? Well, how did you drive him out of session? By not letting a communication cycle occur, of course. Every time you break down the cycle of communication, you wind up with a pc slightly and increasingly on auto-audit. Every time you break down the communication cycle, to the degree that you break down a communication cycle, you break down the third dynamic activity, individuate the pc, and after that, he starts running the session.

The reason you have trouble with a pc is directly related to the number of times you have not permitted the pc to originate. Pc only starts asking you to do things after you have failed to accept the pc's origins. So you fail to accept the pc's origins, he winds up in auto-control. He individuates out of the session.

Now, in view of the fact the pc is aberrated, and I wish to call this to your attention, the pc very easily individuates. It is quite a trick to keep a pc from individuating and going onto auto-audit. How many of you consider a pc in-session when his thinkingness is under your control? Same question, exactly the same question, is how many times do you have to get in the middle rudiments? You have to get in the middle rudiments as often as you don't have a pc in-session. It's very simple. You have to get in the middle rudiments to the degree that the pc's thinkingness is not under the auditor's control.

What's this pc doing? He's sitting over there commenting on this and commenting on that and doing something else and thinking something else and thinking something else and invalidating this and evaluating that and suppressing something else and failing to reveal something else. What's all this, man? That's a very non-third dynamic activity, fellow. That's two highly individual individuations in contest – something that looks like a games condition.

Now, of course, your pc – being a bit aberrated as he comes along the line – getting better, he is less susceptible to this individuation; therefore you can't expect the pc's thinkingness to be totally under the auditor's control in the first session. But after three or four sessions, it ought to be pretty smooth. What would you think of the auditor who took a pc whose thinkingness was under the auditor's control, and then three or four sessions later had a pc whose thinkingness was not under the auditor's control? The auditor had to do something to bring this about. And what the auditor had to do to bring this about is just interrupt the communication cycles as many times as possible in as many ways as possible and get as little auditing done as possible. You eventually will wind up with just that occurring. Pc's thinkingness goes out from underneath the control of the auditor.

Number of times you have to get in mid rudiments is a direct index of the amount of thinkingness going on in the pc, individuated from the session. And that's a direct index to how much individuation the pc has from the auditor. And that's how that third dynamic is broken down. Two first dynamics actually do not make a third dynamic. Any way you want to – you want to paint the barber pole it still is not going to work out. Two first dynamics don't make a third dynamic. An auditor's perception is not the perception of an individual looking at another individual; it's a third dynamic perception.
Now, I hate to build up the whole subject of intuition, because a lot of people say, "I don't have to use an E-Meter. I don't like an E-Meter. As a matter of fact E-Meters are no good, and they're very, very bad for auditors." It usually starts off in that gradient scale and gets more and more into a rave and they start talking about why they should use intuition.

Well, intuition is something that you could step all over, and probably be better off for it if it was that type of individuation which a person develops so that he won't have to confront anything the other person is doing. Now, we're not talking about that type of intuition; we're talking about pure, actual intuition. There is a knowingness about whether the pc is in-session, is not in-session – hasn't very much to do with looking at the pc. The auditor sitting there feels, knows, that the pc is in or out of session. Well, that's just a piece of perception. It's a perceptivity. And the perception of the auditor is good or bad. And it's bad to the degree that he has departed from the third dynamic back toward a first dynamic.

In other words, you get a deterioration of perceptivity. If you're real hot and you haven't got very much on the third or fourth dynamic and you're not in any big games condition with the pc – you know, you haven't got lots of oppterms on the third and fourth dynamic and you're in pretty good shape as far as pcs are concerned and you're not fighting the session all the way and that sort of thing. You're auditing along and all of a sudden the pc gets a withhold, you don't see it here, man, you don't see it on the meter. There's the pc sitting over there, and the pc's eyes have gone – kind of gone a slate gray. And you could probably track it all down. And a scientist of the purest modern school would say that you could detect this by various characteristics.

I spent a number of years trying to figure out what these various characteristics were, studying it on the basis of whether or not I was noticing something peculiar. Because in 1950, I had a bunch of people around me who were nagging me about the fact that there must be characteristics that told me what the situation was. And I finally have to come to the conclusion that there were no indications. You could study these indications till hell froze over and you still wouldn't have explained this very interesting fact – that I know when a pc has an ARC break before the pc finds it out, without even looking at a meter, and without looking at the expression on the pc's face or the position of his hands or how he's twitching his fingers. He hasn't found it out yet. But I find it out. How do you explain that?

Perception. On what wavelength? Same wavelength as in space opera. Dolls, by the way, seldom have names. They know each other. How do they know each other? Well, it's very simple. How do you know it's a red light or a green one? See? Joe always feels like Joe. Bill feels like Bill and Pete feels like Pete. In other words, you're talking to Pete and Pete feels a certain way. So that's Pete. Actually, a much safer way of identifying people. You can forge passports – try and forge a wavelength! No, there's no doubt about it – thetans communicate. Thetans communicate, not through MIEST. You don't even have to talk about wavelengths. Thetans communicate.

Now, there's some jerk by the name of Rhine... Oh, excuse me, I didn't mean to say this. I know he's an honorable man, and so forth. There's some bird's got a racket down at Durham University. And he runs a big swindle of getting funds to investigate extrasensory perception. And all this is very fascinating, but he's copped most of the coin. Well, we have to
speak in these terms, because after all we're talking about this bird. And actually, the number of validities which he has done in this are all MEST communication lines. On some fashion, he tests it all against MEST. He enters MEST into it at every hand. And then he enters something else when he isn't entering some MIEST: he's entering proof. See, when he isn't entering MEST to test out whether there's extrasensory perception, then he's entering proof.

"I'm going to test whether or not you can read my mind. Now, I am thinking of a number. Now, after you've read my mind, I want you to write the number down on a piece of paper, and then you show me the piece of paper and I'll tell you whether or not that was the number I was thinking of." How cuckoo can you get? That's proof, man, which is one of the biggest aberrative buttons on the track. You're going to test extrasensory perception through the aberration of proof!

Now, you start walking through the forest in some wild place and you try to explain it, but you don't see a bird. You've got a gun in your pocket – it isn't even available – but you just don't see a bird, you don't see a squirrel, a deer, a chipmunk, nothing. You see nothing! And you go out next time without a gun in your pocket and you see birds, squirrels, chipmunk, deer, rattlesnakes. What goes on? You're emanating menacefulness as long as you have a gun in your pocket. It isn't whether they see the gun or not; that's modern science, you see? They just know, because you know, that you're dangerous.

Honest, I've seen old-timers out on the frontiers, up around the Rockies and so on, comment on this when I was a little kid until it's the most threadbare record I think I know anything about, you know? They're always up to this. They would carefully take a gun out to get themselves a deer and they would see no deer.

Now, apparently some thetans emanate more than other thetans. Apparently BBC has more broadcast variety than radio Jersey or something, or... You get the idea? I mean there's apparently a difference here. You can know more about one thetan than you could about another thetan. And you apparently get relays from one thetan more about another one. Well, you're talking about various communication factors which are beyond the immediate recognition of matter, energy, space and time. And this in itself is a very, very interesting subject as long as you don't try to drag it down into MEST, because then of course you're talking about MEST communication. See?

It's a fascinating subject, communication without MEST intervention. This is a very fascinating subject. And it can't be studied by Doctor Rhineswine. Because all he can do is drag extrasensory perception down into MEST through the button called "proof," and then say, "Well, there it is," and so on. Well, that, I'm afraid, doesn't have much to do with it.

We've tried to use this in processing. Tried to process people along in this. The biggest button we have that it exists is this fantastic fact, which has occurred and occurred and occurred: We take pc A who is having trouble with human B. And we process pc A. We never go near and he doesn't write, he doesn't communicate in any fashion, with human B, and we straighten out the problem, and all of a sudden it evaporates with B. This has left a lot of auditors blinking. We have done this time after time after time.

I mean, first time this was ever called to my attention was an early ACC down on 17th Street. Golly! This was so interesting. So I've counted on it since and when it doesn't resolve
with human being B after processing A, I generally get after the auditor that processed A. I mean, it's that tight a situation, see?

It works reversely. If you are deathly afraid of oil companies, they're going to short-change you, give you bad stock and sue you. That's for sure. You're going to be in constant trouble.

Any time you've got a reliable item, you can rely on its producing a lot of trouble for you. And when it's evaporated, it ceases to produce this much trouble. This is what is so mysterious. Because you haven't processed it. All you've processed is the pc. Now, how do you account for this? And yet that is susceptible of "proof," if you want to put it that way, because there it is.

Auditors are very familiar with this particular mechanism; I shouldn't be beating it in the head. But I'm showing you that there is a perception factor.

Now, when the individual is in a games condition on the third or fourth dynamic, or on, let us say, with women. Let's suppose a big reliable item on the track is "women." We've got this fellow and he's an auditor and every time he audits a woman he just somehow or another, he just – things happen. It's just rough, that's all. It's just tough. Tough on all concerned.

He comes in and he's scratched from his ear to the groin, you see; he's in a mess. He can audit men, gets along fine. Why? Well, we say, "Well, actually, he's just chopping them up because of this." We can explain it. You know, we can give all kinds of reasons. But the truth of the matter is, he's in a games condition, and the truth behind that truth is the one we're interested in, in this lecture: He can't perceive. And actually that's all that's wrong with his auditing. Because he's auditing one of his own reliable items, his perception can't bridge across that games gap. You see, it is an enemy and therefore he doesn't dare confront or read it. His perception on the subject stinks. Now, he'll do two things with that perception – as you know all things will invert – he'll have – this pc will feel good and then the pc will actually invert the interpretation. He'll get an inverted interpretation.

In other words, the pc's sitting there – the pc's sitting there and saying, "My, what a wonderful session. First session I've had for days."

The auditor says, "Oh, my God, I'm killing him!" You'll see this happen, too. Well, what is that? He can't perceive it. So he dubs it.

Now, the manifestation of dubbing is writing script. That's where you get the auditor's figure-out, the auditor's think. And the more bridge, more gap, the more games condition there is between the auditor and the pc – the more of this there is – the less reliable perception there is and the more substitute perception you will find. And that substitute perception takes the form of *think*. This is a case of "look, don't think." You see?

Well, this guy doesn't look, he thinks. And he writes script! And he'll come to some of the most remarkable conclusions you ever heard of. Pc is sitting there, feeling as smooth as a banana split, see? And the auditor says he's got an ARC break. Well, that's how this perception gets invalidated. It's – only gets invalidated by those people who are to some degree in a
games condition with what they're trying to audit or perceive, because they do a think, not a look.
