You see, it – the reason they can't perceive is because they can't confront. If they can't confront something, how can they perceive it? So if they can't perceive it then they must get a substitute perception – and this is a think, a consideration. They write script. They figure it all out.

Now, it's true in guiding a pc down through such a thing as the Goals Problem Mass, you have got to consider which way this thing is going to go and how this thing lies. You can't stand up and guess at all this, because it's a highly complicated track and it requires metering, and it requires this and requires that. Even on a Problems Intensive, you're going to run into trouble to the degree that you don't absolutely, mechanically ascertain this. One of the reasons for that is, is you're reading aberration; the pc can't read it either. You see? Aberration – it doesn't emanate. So you have to have highly mechanical means to attack this sort of thing. But as far as the pc is concerned, you should be able to read him pretty directly.

But if you can't confront him and if you don't want to confront him, you don't want anything to do with him, you're going to get a substitute in there, and that substitute is think. So you're going to go into a consideration of what is going on. And now we've got script writing at its worst. And the pc will be sitting there smooth as glass and the auditor insists he has an ARC break. The pc's got a horrible roaring ARC break and the auditor insists everything is going – and he's got it all figured out that the pc is just being mean today.

The auditor takes some fantastically weird action as far as the pc is concerned. Why? Well, it leaves the pc aghast and it leaves everybody else aghast and pretty soon it'll leave the auditor aghast. "How the devil did I start driving down that road?" You know? "Gee-whiz! We were going along so nice, and here I am running down this road and what happened? What happened?" Well, what happened is his perception dropped. See, he wrote some script. He made a bum guess. It'll be as clumsy as this, don't you see.

For instance, I find out that on a demonstration audit, my perception of the pc is worse than my perception of a pc in an ordinary session. That's because I have the additional action of trying to protect the pc, keep the pc from embarrassing or damaging himself in some way, make the session look good, make the pc look good, and hold it all under control under a rather extraordinary environment, see? Well, that splits up your attention. You're actually liable to make more mistakes and do less reading of the pc. So the pc originates and you tell him you will do it. See? You miss. You miss the TR 4, see?

You'll suddenly make a mistake. The pc says, "I think that list is too short." And you say, "All right, I will add some items to it." Oh, man! See, it's by giving demonstrations and that sort of thing (rather high-tension auditing situations) that I've come to realize what a short-perception auditor – the mistakes he makes. See, that's a curtailed-perception situation. The pc didn't want you to add anything to the list. The pc wanted to tell you that the list was short! And what's the matter with you that you didn't say, "Good. Thank you," and go on doing what you were doing?

You wouldn't permit a communication cycle to be originated by the pc. It's very embarrassing to me when I do this. I know I've flubbed across the boards. Every once in a while
the pc looks up and I – in a demonstration, something like that, very brightly – and this happens sometimes with more – with some pcs different than others – looks up very brightly and says something-or-other, and so-on-or-other, and I say, "Well, let's do something about it," see? I could step on my tongue the moment I do it because I've gotten a misread intention. I read the intention of the pc as just directly interpreted from his words, meaning I should do something and therefore I do something. In other words, I wouldn't let a communication cycle exist.

Actually, once you've done that, the next time you're likely to have a demand that you do something. Do you see what the gradient is? See, you didn't let the pc originate, so now you're going to Q-and-A, and now this is going to result in the pc demanding that you do something, because the pc is already on a kind of an auto-audit.

The number of times that you Q-and-A with the pc is directly related to the amount of auto-audit that the pc is going to engage upon. Because you've shown him that he is not in communication with you and therefore you've broken down the third dynamic situation. You've also reduced his, you might call it, theta potential, or something weird like this. You – well, he isn't emanating – although he isn't emanating anything anyhow – but he isn't emanating to the degree that he is. His mind isn't free, you see. He's clouded up.

You can't read him as easily. That's about where that goes. See, you cut down his horsepower, his wavelength or his megakilotrons or something, see? So he isn't transmitting so good. You've dropped him a curve.

So therefore you're going to make a worse mistake next time, see? Compounding the felony, he's walking out into an auto-audit. You eventually have two individuals conducting a disrelated activity. One fellow is busy nulling the list and the other fellow is trying to keep his rudiments in. That's a totally disrelated activity, although you've looked on it as a rather common activity. It's very common for a pc to try to keep his rudiments in while you're nulling the list.

What's he trying to keep his rudiments in for? You're trying to null a list. Well, let me guarantee, to that degree, you've Q'd-and-A'd with him. See, you've done something that interrupted his communication cycle.

Now, this might not have happened in the session. It might have happened between sessions, it might have happened in living around this person or being his roommate or numerous other conditions. But you have Q'd-and-A'd with that pc. And that pc tends to individuate to the degree that you have Q'd-and-A'd with him.

He walks up and says, "Oh, I feel terrible! I got a telegram this morning from my grandmother and she was dying of lumbosis."

And you said, "Where's she live?"

Well, of course, you aren't his auditor and so forth and this is not very offensive and so forth and this is the way Homo sap communicates and that's it. But you didn't let him get something off. The fact that you said something told him that he hadn't blown it. A lot of auditors go around thinking that if a pc mentions something, then it's – he has to do something about it so the pc can blow it. No, it's a communication activity. It's all communication, the
auditing is. It's a communication activity. And being a communication activity, when it's communicated and the cycle of communication is completed, it's blown. You understand that?

Now, the degree he can't blow things is the degree he's been Q'd-and-A'd with. That's a direct relationship. Some individual has been Q'd-and-A'd with and Q'd-and-A'd with and Q'd-and-A'd with, you find out he can't blow anything. He has a hell of a time.

Now, after you've Q'd-and-A'd three or four times in a session, what the hell's the use of trying to patch up the session? There isn't any way you can patch that up. What are you doing Q-ing-and-A'ing in the first place? Ah, but we get a bunch more rules now, don't we? How to cure an ARC break. You do this and you do that and you do something or other. Oh, yes, it cures the ARC. What the hell were you doing getting an ARC break? Do you see my point of view?

See, I'm writing a bunch of rules now on how you get out of a swamp. Well, what were you doing in the swamp? Here's a corduroy road marked with tape on both sides of it, and arrows, and it's bright daylight, and there you are over there a quarter of a mile away standing in the middle of a black swamp. And you say, "Ron, give me some rules. How do we get out of these swamps?" So I say, "All right." And I Q-and-A with you and I give you some rules. Or I even say, "What the hell are you doing in a swamp?", that sort of thing.

And, of course, you can hope for the day that you say, "Hey! How do I get out of this swamp?" You've asked a question, don't you see? And I don't answer it at all. That would be a sad day. But you've asked a question, I'll give you an answer. But I get a chance to originate at that point, too, to make it a complete cycle, which is, "What the hell are you doing in the swamp?" How'd you get there? Auditing must seem like a very complicated activity to you if you're over there in the swamp. How many rules did you follow that got you into the swamp?" [laughter]

Now, an ARC break occurs anywhere from fifteen minutes to an hour and a half before most auditors perceive it. Now, that's a hell of a condemnation. Because I can take a pc who is in the middle of an ARC break and find the auditor trying to cure up an ARC break which occurred anywhere from fifteen minutes to an hour and a half after the ARC break.

Now, let me give you a very fast one here. I want to give you the data on this. I've talked to you lengthily about this, but I think it's important to you. Let me give you an illustration. Now, this, what I tell you is true here. It's an hour and a half, half an hour, fifteen minutes, something like that, after the pc has had the ARC break, that you'll find the auditor trying to clear up the ARC break. He isn't trying to clear up the ARC break of an hour and a half ago, he's trying to clear up the ARC break of one minute ago! Ah, but it doesn't exist there! Why is he trying to clear it up there? This ARC break's an hour and a half old. He's cleaning up an ARC break two minutes old.

It's one of these remarks of, "What the hell are you doing in the swamp?" You understand? There's an ARC break that occurred an hour and a half ago and the auditor is trying to clear it up as having occurred two minutes ago. Ah, but there's an ARC break one hour and twenty-eight minutes before the point the auditor is addressing it on the track. And I get this kind of a weird feeling: What the hell did the auditor do, go stone blind? How did he miss this?
Well, the first time he missed it is he just wasn't on the pc's wavelength, that's all. He just didn't feel something very peculiar about this session. And he almost always committed this deadly sin if he's in trouble: The pc found out he had an ARC break before the auditor did. And that is inexcusable! Absolutely inexcusable for a pc to find out he has an ARC break before the auditor did. Where is the auditor?

Well, look at what the criticism this is of the auditor's perception – look at the criticism. Here's a pc mired down and mucked up in a bank with more perception about what is going on than an auditor who is sitting across the auditing table from him. Ooooh, man! You mean the auditor's perception is no greater than a pc who is totally mired down in the bank? Just think of – over that for a minute.

The auditor is supposed to be there all bright and alert, see? And the pc finds out about this ARC break before the auditor recognizes there is one. I'm not kidding you, this is unforgivable. It's never forgiven by the pc. You just check over the next ARC break you see in progress, no matter who it's between – you and the pc or another pair – and just go in there and check it over and you're going to find this to be the case: If it's really raw, roaring, screaming ARC break, it occurred an hour to an hour and a half ago – the actual incident – the auditor is trying to clear it up as though it happened a minute or two ago, and the pc found out about it before the auditor did. And those unforgivable circumstances, of course, are not forgiven by the pc because it's been proven to him conclusively that he's not in a third dynamic situation. It's proven to him conclusively that he hasn't got an auditor, that the auditor is individuated.

What is the auditor doing, not noticing this ARC break? Do you see how that adds up? Well, I couldn't say it too emphatically. Now, you understand, I'm saying it's an unforgivable situation because the pc doesn't forgive it – not because I don't forgive it. So, of course, you have an awful lot of trouble with pcs if you're always noticing the ARC break after the pc does. And if you're trying to clean up the ARC break when it became vocal and visual, and you pick up that point of the track to clean it up, you're always in trouble. You'll always never have sessions, you'll just have dog's breakasts spilled on the deck. You won't ever have sessions. And you'll wonder why you get so little done.

No, if your Martian antennae – which I'm sure you have a facsimile of; somewhere on the track you've worn antennae (off one of your favorite items) – is just properly tuned in or, better still, you are alert, you'll find out ages before the pc that something is wrong.

Now, if you're in a state of writing script and imagination, you'll start badgering pcs. The pc hasn't got his hair combed right or something like that, so you start saying to the pc, "What's wrong in the session and what's wrong in the session and what's wrong in the session?" There isn't anything wrong in the session except you're asking him what's wrong in the session. See how he could read this out, see?

But, at the same time, you'll get pretty good on this sort of thing. If your own perception is up and the pc is sitting there and – it isn't any way the pc looks, it just doesn't feel right to you – you say, "What's – what's happening? What's going on?"

And the pc says, "Nothing."
"Well, you think something here recently – something come up there?" You're not getting in mid ruds, or jamming him around on it, just two-way comm. "Something come up there?"

"Uh – no – no, uh-uh... Oh, well, yes. Hey, yeah. As a matter of fact, you're reading the wrong list." Nothing wrong with you making a mistake in the session. The only thing that is unforgivable is the pc catching it before you do.

Actually, you see, perception comes above technical perfection, because you can always handle a mistake if you find out about it before the pc does. But you could be doing "flawless" (quote) (unquote) auditing and be reading the wrong list. And the pc finds it out and man, you're not going to clear that up in a hurry. That's just going to ARC break all over the place.

The degree of the ARC break is related to the number of ARC breaks which have directly preceded the apparent ARC break. The first ARC break, the basic on the chain for any given session, is quite previous to where the pc thinks it is. And that's another law, is: The pc never notices where the ARC break really starts. The pc always picks it up late. And that is true in lists. You're running down the lists and saying, "Waterbuck. Catfish. Mack Sennett cops."

And the pc says, "I got a pain, pain, pain, got a pain, pain, pain."

Aw, what are you doing? You put it down after Mack Sennett cops. Waterbuck. You start tracing it back. One of your smart things to do is say, "All right. Mack Sennett cops. How's – how's the pain on that?"

"Well, that didn't get any worse."

"Oh, it isn't any worse."

"Waterbuck. Waterbuck."

"Haah! Gh-uh-1-1-ha, uhill-uhll-uhll. There you-uh-ull... There you did it again." See? He's always late.

Pc is monkeying with an instantaneous reading bank and he's always slower than the bank. That's what you can count on. Pc is always late. He's always picking up the item after the right item. He's always picking up the ARC break which occurred after the ARC break. See? He inevitably wrongly attributes what's happening, because after all, you're dealing with somebody who's attention is fixated on this, that and the other thing all over the bank and all mixed up in the middle of their items, and it's a wreck. And to ask him to think anything at all is miraculous.

Of course, a lot of auditors never recognize the pc as anything but old Joe and old Joe is always pretty quick on the draw, and doesn't realize old Joe isn't sitting there. He's auditing Mick Slan, Commandant, Sector 89, Extraterritorial Empire, whose penchant is killing small babies. This guy is being more that than anything else.

And all of a sudden you say, "Hey, hey, hey, hey, hey, Bill."
"Uh – Bill. Um – Bill?" You know, it takes him a split second to disconnect, you
know? "Da – oh! Where? Yeah, here! Ha! Here! Ah. What the hell? What's the matter?"

It's very funny, you know? You whistle the pc up to present time. Very often if you
don't say "Hello," they get an ARC break. Did you know that? Of course, you don't practice
that these days, because they're not going down the track and coming back. This is quite re-
markable – after you've gotten rid of an item and you've gotten this and that out of the road,
and so forth, and you got the pc into the room and so forth – if you said, "Hello," how accept-
able that hello is to the pc.

Now, I'm not telling you to do that as a practice. But he's gone somewhere. He's into
something. And that is out of time and space than where you are. And you expect this guy to
be an auditor, two hundred thousand years before he ever heard of it, it's no wonder he's a
little bit slow. But he's always – almost always slow – almost always slow.

He will sit there and explain to you carefully that the ARC break that he is talking
about is the fact that when he asked you if it was cold in here, you said, "Shall I close the
window?" And what he wanted to know was if it was cold in here or if it was a somatic that
he was in the middle of! And if you'd answered him, why, then he would have known whether
it was a somatic that he was in the middle of and that was the cold he was trying to locate!
And that's what he's ARC broke about. And he'll tell you again and he will tell you again and
he'll tell you again.

What's really remarkable is how many times they will tell you without it blowing. And
somewhere along the line you should get suspicious that you aren't dealing with the basic on
the chain. And you're not. You say, "Well, before that, were you trying to tell me anything?
Was there a question I didn't answer before that?"

"Well, yeah, yeah, I uh..."

And you'll find out there's a question about ten minutes before the session started. And
he asked you something and you didn't answer it. And that has been the source of all the upset
and ARC breaks ever since. And he's pointing to one that is an hour late. Isn't that remark-
able?

Now, you're only a knucklehead when you don't recognize the fact that the pc would
not need an auditor if he knew what was going on. Why does he need an auditor? See, if he
was always right, it would always blow. But it doesn't always blow so he can't possibly be
always right and that's why he has to have an auditor. And that's why you've got to have ESP
and a few dozen other things in order to ride this track.

The various rules of the game is that it is a session, that auditing is based on commu-
nication, the basic communication formula is much simpler than Homo sap makes out. "I
originate and you invalidate" – I think that's a Homo sap communication. "Then I evaluate
and you negate." No, it's just a pure communication cycle and that the pc who is sitting in
front of you is the pc you've got to audit. You can't audit a meter and get a Clear pc – can't be
done.

You try sometimes to put a GPM series of items together without asking the pc where
they belong. Just try it. You're not going to get anyplace. You've dug them all up for him, but
the final step of matching them up can only be done by the pc. You could test them and figure out and so forth. But if you had to fit them all together in the end, they wouldn't be the GPM. The pc wouldn't be blowing the GPM either. And it would have no value for you to do so. So sooner or later you have to face up to the fact you're auditing a pc.

Now, if you go consistently and continually on the basis that if the pc says it, it isn't true – this is just another Homo sap evaluation and invalidation on the communication formula. The pc very often is right. And there are certain things that only the pc is right on. ARC breaks aren't one of them. The pc is never right on a misemotional points – never right on a misemotional point. But where it fits and what the score is and if it's the item and that sort of thing – yes, he's right.

You could do a meterless assessment of an item, by just putting the meter aside, taking a list and then going over that list, very carefully asking the pc to tell you every pain that turns on, go over it and sort out the thing against the pc until you had the one that turned on the most pain and ask the pc if that's it and the pc says that is it, you have found an item. And if you put it then on the meter, you would find that it would rock slam if your question was correct in the first place. Are you aware of the fact that it is that easy? It's that easy.

There's no substitute for putting the pc in-session. There's no substitute for giving him an auditing session. You're going to get yourself tangled up in 8,765 hundred rules. Well, that's just that many rules between you and the pc that are forbidding auditing. If those rules are being used – those rules are quite valid – but if they're being used by you to prevent a third dynamic, to interrupt or upset a communication cycle, or to get out of auditing the pc in front of you, then those rules are not for that session. There's many ways to audit pcs, there's many styles of auditing, but there is no substitute for auditing.

What does the pc consider auditing? Actually, an alleviation of his upsets and reaching his basic purposes and driving that road down between the GPMs – those things are auditing to the pc. Oddly enough, he won't let you near his bank and won't forgive you if you don't run it out. Nevertheless, you audit the pc, the pc is getting someplace, the pc is making gains, the pc would take anything off of you. Your auditing could be apparent technical perfection, with the last word of the finger held just right and you're not using that technical perfection to get anyplace with the pc, you'll have nothing but a busted-up, ARC broke pc the whole way. Interesting, isn't it?

Now, there is a right way to audit. It's good, direct, straightforward, audits the pc. And the basic patterns of auditing that you are using are very, very refined patterns. As you're sitting there auditing the pc, you're in a very fortunate position of not having to develop auditing. The test of a good auditor is when he has learned this. He just uses the tools he's got and carries on down the line, and he uses them sufficiently well, the pc is getting auditing, he's getting something done.

The bad auditor doesn't know that these things exist. He thinks there are thousands of ways to audit and that he's got to dream up a thousand-and-first one, right in the middle of the session. That's just another way of figure-figuring your way out of giving somebody a session. There are right ways to audit. We're teaching you the right ways to audit, and you'd be surprised how many rules have been lopped off of auditing. But the most direct approach to
auditing happens to be the very pattern of auditing and the equipment of auditing that you have right at the present moment. And there is a way to audit.

The more you embroider that, the more you add to it, the more unnecessary stresses you put on it, why, the less it'll work. But you could sit down and say to a pc, "Start of session," – just this, no R-factor, nothing, you understand? You just say, "Start of session," and pick up the list you were doing in the last session and start in the middle of that list where you were – stopped nulling, and go on and nulling, you know? "Waterbuck. Tiger. Catfish. Crayfish," so forth and so forth, right on down through the end. And as long as you were technically perfect and you were... in doing just exactly what you were doing, as long as nothing else went astray, you wouldn't have a bit of trouble. There are a few things that could go astray, you handle those one way or the other before you start the session, because they can go astray and make it tough on you, you understand?

But oddly enough you would be better off doing that than you would be to take a two-hour session and use an hour and fifteen minutes of it to get rid of a Q and A which you shouldn't have put in in the first place. Do you see where the emphasis of auditing is? There are right ways to audit, there are right things to do, the auditor who audits according to pattern in the smoothest way gets the furthest in the long run, so long as he isn't violating those three basic rules that I gave you in this lecture. I invite your cooperation.

Thank you very much.
Q&A Period:
Tiger Drilling, Clears

A lecture given on 22 November 1962

Thank you.

Well, we have a – what's the date?

Audience: 22nd.

Twenty-second. Of what?

Audience: November.

Gee, you're in present time! Twenty-second of November, AD 12, Saint Hill Special Briefing Course, lecture one.

[some cuts!]

It hasn't been officially announced and you might not have seen the Mark V, but this is the Mark V E-Meter. And all in its pristine gray. It requires astronaut training to run this one. [laughter] But this is a smasher and has nothing to do with a sales pitch; this is not a television commercial.

But we can't ship meters into the United States. And if you're getting out of here and if there is a Mark V available and you're going back to the States, you'd better take one. Because the FDA has now got several departments of mental – ha! – health. Interesting, isn't it, that the US government is going in very heavily for mental health with exclamation points. But by "mental health" they mean the electric shock machine, psychiatric incarceration instead of prison punishment. It had nothing to do with mental health at all. But they're very, very active.

And there's some organization called the HEW – H-E-W – it's brand-new to me, Health and Education and Welfare, I think it must stand for, but it certainly sounds like HEW to me! [laughter] The Washington organization's going round and round with these characters and we won't drive them into the hole – we'll drive them way down in the hole and then we'll pound the hole in on top of them because we're tired of them. We lick them, left and right. But they never learn! They just never learn. They never learn. We're bad people to attack.

But it's quite interesting to me that the color and tenure and aspects of the United States are changing very, very rapidly and going over in the direction of super thought-police type think, you know? And I hate to see it go that way because it just means a little more work for us and we'll have to pound them in their hole and pound them down deep in the hole and then pound the hole in on top of them and we will do so. I hate to have to even bring up the subject – particularly in front of ladies!
Well, we've got quite a bit of stuff and agenda here. Now, I put a notice on the board. This is a question lecture here, this hour, and I put a notice on the board that they had to be legible – written and legible. So, if your question doesn't get answered, I couldn't read it.

And first question is, is "Will Mark Vb be available to anyone who wants one?" Oh, well, why not. You can't do very much about it one way or the other. As far as controlling the meter is concerned, when you control a meter you control nothing. That's not a good point of control in Scientology. They can be built all over the place. The thing is a hundred years old. I mean, they've been monkeying with the Wheatstone bridge for a hundred years.

We have copyrights and patents on these meter circuits and nobody can put one together like this. But they can still get kids' toys and toy lie detectors and junk like this and you actually can't control from the point or area of meter. Where you control from is copyrights and registered marks and that sort of thing. Yeah, anybody can have a meter.

My motto is, is if they're that ambitious, let them get in trouble and they'll have to go to an Academy and learn how. Okay.

"What pcs do you audit when doing research auditing and what time do you do research auditing? This has puzzled me for quite a time." [laughs] Puzzled me, too!

Research auditing: I learned quite a bit from being audited – have across the ages – otherwise I'd have no subjective reality on what we were doing at all. I'm a rather easy audit. But the research auditing which I do are divided into two classes: One is pcs I directly audit and pcs I indirectly audit. And I normally will get some auditor – you, amongst you here, have done some research auditing for me. I have told you to do a certain thing and then I've sort of watched the lines to make sure that it was going all right and then it has come up to an end and I've decided something about that. Not necessarily experimental, but it is to prove a point or to prove some oblique point.

For instance, Williams was used as a research pc. I think he knew it at the time. At the time, no better goals action was in prospect – he wasn't getting very far – and I had a list of "Who are you?" and "Who opposes you?" and so forth, listed on him for a very long time, just wondering if you could totally bypass a goal. He will tell you that it did him some good and anybody who wanted to get some items on his case could take that old list and they'd undoubtedly find some things that slammed on it. I'm sure it didn't louse him up particularly, but it showed us that we – it was pretty certain that you couldn't just list straight items through to Clear.

My own auditing – I was auditing on a research line; audited Reg going over to America – but this is partially research auditing and partially just trying to give somebody a hand, you see?

I keep up with all modern techniques. That is to say, anything that you're using now, I am using. Any type of session you are using, I am using in research auditing. I try not to depart from these things. I could probably audit without using any of these things. Nevertheless, I know then what frailties you will run into. That is one of the facets of research auditing. When I run into dead ends then I know that you're running into dead ends, don't you see?
And audited three pcs in Washington in addition to one that Reg audited. He's probably forgotten Fairchild. I was testing him out for entrances. And had been auditing Mary Sue hot and heavy and hard along the 3GA Criss Cross line. Not just going in the direction of finding a goal, but in actually peeling back the items one right after the other; and will go on doing so until a goal flies up. That is a research audit proposition. Possibly I could have found her goal a long time ago, see. Found various methods of entrance.

"And when do I do this research auditing?"

Usually from about 10:30 to about 1:30 in the morning. Answered? All right. There are other people that get audited from time to time, some of them know it and some don't.

Your case reports are always of assistance, always of assistance. Particularly it tells me what you can do successfully. That is what I watch that for. I seldom bluntly assign something new or strange to be done, but I want to know if you can get results with what you're using. And when I see that too many auditors are not getting results with what they're using, why, I then do something drastic about it.

That is another entire, different channel of research, by the way, is: What can an auditor do, what will he use and what results can he obtain? Now, that is an entirely separate thing. I've never kidded myself about that at all. And one of the reasons we've made success is just because I can make a technique work or just because I have a theory, I don't ever classify that as true at all. Never do.

Most scientific research is team research. It is done mostly by cross-coordination of records. Modern research all has a certain pattern. It's done by cross-coordination of records, it's done by various – following various lines through. It's a very expensive procedure and basically we can't afford it. And perhaps if we had fifteen or twenty billion dollars, why, we'd be almost as far as we are now. We don't do that type of research.

What we're doing is a research line which is directly empirical, but we will be able to achieve a result and then we try to broaden the number of people that result can be achieved on and then try to get it into some form so that an auditor can and will apply it and will be able to achieve that result himself. And those are about the steps which it ordinarily would take.

And the auditor is always a quotient in this. He's always a factor. If I had two or three bugs, as practically every research scientist on Earth has, we would be nowhere. And amongst those bugs is scarcity of theory. A theory is something valuable; a theory is something you get down and worship, particularly if you yourself have thought of it, you see? And he says, marvelous theory, and then you do nothing the rest of your life but peddle this theory, you see?

Man, I can think up more theories and throw them out more windows than we've got. Never hold on to a theory, never hold on to a technology if it appears weak. Just dream up another one, go along another line.

This way, you see research being done over a period of a dozen or fifteen years – the concentrated research of Dianetics and Scientology, which – I don't know, is possibly two or three hundred year development, maybe two or three thousand, as far as I know. But it's quite rapid. And that's the basis of why the research is rapid, is I have no enamorment of theories. If
a theory is right, marvelous. But it is never so right that it can't be wrong and it certainly — there's no slightest desire to hold onto it. And then I don't give a damn whether people think I'm a good research man or not, see? I just couldn't care less. The only thing I'm interested in is a result — a result.

The whole woof and warp of Dianetics and Scientology is on the basis of "Does it work?" And it's the result that counts. No aggrandizement or anything else. The only time you'll hear me kick is when I've developed something and somebody else puts it out with an alter-is. Because then they, to some degree, have made me guilty of lousing somebody up at the other end and I squawk on that. You notice medicine in the United States has now adapted themselves over into early Dianetics. They're in the earliest of early Dianetics and they don't know quite where they're going.

Now, that's about the speed of Earth research. Somebody has dreamed up something and then in a dozen or fifteen years somebody else takes an alter-ised version of it and you start hearing something about it. And do you know where they've progressed to?

Well, they're not consecutively up to Dianetics. They haven't really started reading the first book, see? But they — I'm not even being funny now — they've now realized that silence is necessary in the operating room. But they are not willing to practice it. Now, there's where they are. They have already accepted prenatals as a spectacular action. And this has taken how many years? It's taken a dozen years, see?

Well, that works a hardship on auditors. That works a hardship on auditors. I'm very well aware of this and often very ashamed of it. I have to junk something that you're getting results with, see? I give you a new curve, I give you something up front, something more distant than that, you're perfectly happy. This class would be perfectly happy today if we had nothing more than I gave you just before I left for America, on 3GA Criss Cross, you see. You'd still be sweating around on this and you'd still be finding some goals and it'd be all right. You'd muck it through somehow or another. Well, I gave you tremendous extensions on this, see?

Well, it has a tendency to overwhelm you slightly with data. But if you understood why this is happening and the rate of advance — if you understood those things — then you wouldn't feel so overwhelmed. I won't be happy in cutting off intensive research on clearing until you can sit down and find somebody's goal with great speed and great accuracy, do you see? And right now we're dealing with something that's just a little bit tough for an auditor. I recognize we're dealing in 3A — GA Criss Cross with something that's just a little bit too hard. You're making mistakes, see, and it's taking you a little bit long. But I'm confident that you'll get the hang of it.

The main things you're doing wrong is just not completing lists. And I told you to dig out those lists and you didn't. Give her a flunk — flunk her. I wanted to show you a right list
and a wrong list. Let me show you that right now, regardless of these questions. I must get
this across to you. Particularly you guys that are departing – you're liable to make some horri-
ble mistakes.

Here's an item. [writes] This is an item. And this is another item. This is another item.
This is another item. This is another item, see?

This is a list, this is a roll-your-own, this is any kind of an item, see? Any kind of a list
you're making for assessment, see? Well, I opened one of your folders the other day – yours.
And I thought, "Oh, my God!" you know? "Oh, ha! How can anybody do this?" You know
what this list looked like? [writes something, seems like he puts many strikes (/) behind the
items on the list] [laughter]

Lists don't look like that! That's an incomplete list. Just the symptom of these things
on it; it's incomplete. What are you doing? See? Why are you pursuing it? Or it's coming from
the wrong source. You've got no business listing this line anyhow.

When you listed the line you got no TA action. Why'd you keep on listing the line?
Any list has got to give you TA action – except the goals list. Oddly enough the goals list is
completely in reverse. A goals list that gives you TA action is incomplete – goal isn't on it.

When you're nulling a goals list and you get TA action, knock it off and find some
items. There's a fast tip for you. Now, I'll show you how this thing ought to look, if I can get
this apart without collapsing the place. Now, this is something on this order. [writes]

Now – I'll show you how one of these things ought to look. It's very simple. Here's
your list, here's your item. You know, your item of lists, something like that, see.

Now, this is the page on which the item was found. You got that now? This is the page
on which it was found. So, you can understand how much less the other pages are. It looks
like this. [writes] That's the way it looks.

Your lists look like that? Well, if they don't, you're listing an incomplete list. That
thunderstruck some of you, didn't it? Well, if that – if you're listing and your final page does-

"Oh." You say, "Uh-uh-uh, oh-oh-oh, whoa-whoa-whoa-whoa-whooooooa!" You say,
"What'd you think about?"
He says, "Oh, nothing, except that first one up there, I realized that was silly."

And you say, "Okay. Thank you very much." Read the first one again, it's out, out, out, out, out, out, out. You wind up with eight, nine, ten in, out of about a hundred. And then they go out, out, out. You've got about four in; tiger drill them – rapid Tiger Drill.

And I noticed you doing something the other night that you must not do. Tiger Drill is Tiger Drill – Tiger Drill is Tiger Drill. It has never been modified. The original drill is just as it is in the bulletin you'll get there – you'll get there. Now, if you want to polish this up and get fancy, why, add Careful of; and if you want to polish it up and get fancier, add the Protest. And you've got what passes for Tiger. But actually, the basic Tiger Drill is just the basic Tiger Drill and runs something like this: You read the thing and it fires so you say, "Invalidate." You read the thing, it doesn't fire so you say, "Suppress."

Now, you don't prepcheck Suppress, is what I'm getting around to, see? You don't do anything with it. A Tiger Drill is a Tiger Drill, you understand?

_Audience:_ Mm-hm.

Anytime else you strike Suppress – mid ruds, you strike it in the mid ruds, you strike it in Prepchecking – and you want to make sure because this is a very suppressive pc. This is a very unusual circumstance. You know, they're very suppressive pcs so we're going to do it while we're trying to get items out, you understand? That's unusual. As you're going down the list you say, "To catch catfish." Reads. "On this goal has anything been invalidated?"

See? Gives you the answer; you say, "To catch catfish." It doesn't read. You say, "On this goal has anything been suppressed?" Doesn't read, you say, "Thank you, that's out."

Tiger Drill is just Tiger Drill, you understand? That's how you get these items out. And that's why you're going down the line and just sweating yourself silly, you know? You're taking five, ten minutes to tiger drill one of these things out, you know?

It says, "cowboy," see. "Cowboy" reads. "On this goal has anything been invalidated?" No tick. "On this goal has anything been suggested?" See? "On this goal has a mistake been made?" – or, "On this item has a mistake been made?" rather. Pang! Reads. "What was the mistake?"

"Well, you said so-and-so and I said so-and-so."

"Thank you very much." Read the goal again – don't even read "mistake" again, see? Why waste the extra read? Why test it?

You say, "Cowboy." Didn't read. "On this goal has anything been suppressed?" Didn't read, it's out. You understand?

Listen, anything that is in, is charged. You've read it too far. You think the charge comes from the Suppress or the Invalidate or from – you think that the read comes from the "Invalidate" or "Suggest" or the "Careful of" And it doesn't. See, the read doesn't come from there. The read doesn't come because he's invalidated it.

Did it ever occur to you why, when you say to some pc something or other and you get a rock slam – one time you get a rock slam, see, just random rock slam on the list! You say,
"Careful of" and you got a rock slam. Where's that from? What's that? That fades away, that washes, see? It's not in.

But on the next item he was careful of that one and he didn't get a rock slam. Did it ever occur to you to ask this burning question: How come on some items you get a rock slam, and some items you get a heavy fall and some items you don't get anything?]

Well, the pc invalidated each one. Let's say the pc said, "Oh, to hell with it," on "a cowboy" and "a tiger" and "a waterbuck," see?

Well, you read "a cowboy" – it's not his item, see? And he said, "To hell with it." It doesn't even read! So what, see?

In other words the thing has to have an underlying charge before the pc's invalidation does anything to it to give it a read. See?

So, the amount of action that your meter gets on an item is inherent in the item – not in the pc's ability to invalidate and make the meter read, see? You're going on the basis of the pc is adding charge to it. No, no.

He invalidates a rock slamming item – "tiger." You say "tiger." Slam, slam, slam, slam. See? "On this goal has anything been invalidated? On this item has anything been invalidated? On the item 'tiger' has anything been invalidated?" – slam, slam, slam, slam, slam, slam. Well, you had an invalidation earlier on the list, didn't you, and nothing rock slammed?

Well, so it isn't the pc's ability to rock slam that you're meeting. It's the fact that when he invalidates a rock slam – potentially rock slamming item-you'll get a rock slam. In other words, his invalidation only activates the charge that is there.

So the activation of the charge that is there is what he's doing. So naturally, you're not going to be able to clear up a really charged item. You say, "On this goal has anything been invalidated?" Pang!

"Well," he says, "Yes, I so-and-so and so-and-so and so-and-so." Well, that clears off Invalidate. But you read this item again, you say "tiger." Pang! See?

And if it's the item, you're not going to get rid of it. Chances of it submerging are very slight.

Of course, you can take some goal, and just cave in on this goal and it doesn't read anymore and then precheck it and it reads again, and so forth. But you never – that's why it's the goal. It has – you can't completely get rid of the charge. Sometimes it disappears and sometimes it appears and it's back and forth and it never cleans up and there's always pain on it, or something like that, see.

But that's what you're reading on the meter. You're not reading the fact that Joe, a pc – by invalidation – makes a tick. You're reading that when he invalidates an item which has a tick in it, you get a tick. You get that?

Audience: Yes.

So therefore, the most cursory tiger drilling will sort out your items.
Now, you get this main item – this is the one. You can't make it go out, you see? "On this goal," or "On this item, has anything been invalidated?" Pang!

And you say, "All right, what was it?"
And he says, "So-and-so."

"On this item has anything been invalidated?" It's gone now. You say the item again, "Tiger," crash! All right.

"On this item has anything been suggested?" Tick. You get the Suggest off. "Tiger," crash! See? "On this item has a mistake been made?" Tick.

"Well, I did, I thought it wasn't it."

"All right. Good. 'Tiger,'" crash! You say, "All right."

Now you've got to prove it up so you move upstairs with your Tiger Drilling, don't you see? Now you're going to get "Careful of," and you're going to get "Protest," and you're going to monkey with this thing. Next thing you know it turns on a rock slam, see, but ordinary tiger drilling of items – until you want to work something over with the Big Tiger, see? So you – what you've done is take Tiger Drilling and graded it up to Big Tiger, see? And then graded actually Big Tiger up to something horrendous. So you're still wondering what Big Tiger is.

We were talking to you about Big Tiger. You could say six buttons, with "Protest" occasionally used – Big Tiger, perfectly adequate. The original Tiger Drill is as published in the bulletin. That's little Tiger, ordinary Tiger.

And you go sweeping down that list, crash-crash-crash-crash-crash. Some marvelous thing happened today – where's May? Marvelous thing happened today, we had a rocket read on the goal "to catch catfish." [laughter] I mean, marvelous! I sat there and laughed. I knew sooner or later this was going to hook into somebody's goal line or something of the sort. Sure enough, the pc used to catch catfish ever since she was six.

But she was thinking of what would be the effect side. She was trying to figure out a bulletin while it was being done. What's the effect side of catching catfish? Well, to be caught by a catfish, see? And that was what was giving the rocket read. I think it's marvelous. Somebody's going to come up some day on one of these items lists and get a rock slam on "tiger."

"When is a rock slam recoverable? Am I right in understanding it is not when an item has been fully opposed and after it has been listed from, with a dwindling R/S? Would you please say more about the probable stability?"

Oh, no. When is it recoverable? Well, it – actually, it's always recoverable and you actually don't expect a rock slam to totally diminish on a very good reliable item by being opposed and by being represented. It won't diminish – it'll diminish, but it won't disappear. And you can always recover them.

If it was a reliable item you can always recover them. You say just, "What wouldn't you give it?" and get a couple and all of a sudden you've got your rock slam back again. You can always make these things recover providing you don't do it too often.
Now, the only thing that makes them disappear, utterly and completely is when they are paired. Now, as you know, you can't clean up a lock on a serious withhold. Let's put it this way: the guy has a basic withhold. And you're trying to run O/W on this person – the person has a basic withhold. All right. And you catch the with... The basic on it is when the person was eleven. You're trying to pick it off when the person was twenty-one. And it just sort of is a dirty needle mess, you see? And you never find the basic on this chain. This is this – the same structure exists whether we're using the structure currently or not, you see?

All right, similarly, you really can't get all the disturbance off of an item until you've got the disturbance off the Rock and opprock. It's going to hang forever. It won't ever completely wash. It'll submerge, it'll suppress, it'll do this. But you can take most reliable items after they've been handled and opptermed and everything – and if you were willing to put in time enough to prepcheck the reliable item – this is very extraordinary, you see; never would prepcheck a reliable item that is three pairs above where you're now working. You just wouldn't do it. But if you sat down and did it, you would recover the slam. That's quite interesting isn't it?

Now, it'll reduce, it'll be less charged and you can knock it out. You can kick the thing to pieces by pulling missed withholds – which you shouldn't do, by the way – you can pull missed withholds on it and it'll deintensify. You can deintensify it in numerous ways. But why do so? The best way to deintensify it is pull it right on down to the bottom of the chain. Because it isn't – hasn't gotten really enough residual charge in it to bother with. It's been opposed, it's been represented – particularly that. It isn't immediately recoverable as a rock slam; you have to work it over a little bit to get it to slam again. What do you want it to slam for?

The only time you really want one of these items to slam again is when you take a pc over from another auditor and you're suspicious of the reliability of those items – and you can get the things to slam.

Now, I don't – you should not go to the tremendous step of doing a Prepcheck on each item. That becomes silly. But you could make them slam again. Your most basic test is to make a very short list of "What wouldn't he give that thing," if it's an oppterm. And if it's a terminal, why, "What wouldn't it give," you see? You'll see the slam back. It's a very cursory test.

It frankly doesn't matter too much unless your – unless somebody has laboriously found about twelve items on some pc. Then you get the pc and you're not sure whether these were all reliable items or not – and pcs are the darnedest invalidators in the world. They're liable to tell you that these weren't the items, that they never cognited on them. You get some wild tales from pcs. You shouldn't believe them.

Because what's happened? The thing is submerged. It's done this, it's done that. They'll even invalidate them. They'll dramatize the invalidations of them. The only time you really get into trouble is when you want to list some goals! You want to start right out and list some goals, against one of these oppterms.

Now, as soon as you want to do that, you're stuck, if you had to prove up every one of them. Now, the one you will now find alive is the one which is most like the opp and opprock – the Rock and opprock, see. That's just the basic pair on the chain. The one that is now alive.
is most like the basic pair on the chain. List goals against it and be happy. Just read all twelve items, see. One of them rock slams, see. If twelve items don't – just start down and treat it as a goals list – just do little Tiger on them. See, pang-pang-pang-pang-pang. All of a sudden one slams. That's good enough. You understand? Do the rest of them if you want to find out which one slammed the best. All right, you've got one now that's slamming very nicely; list goals against it. You see how you would do that?

Frankly, you will – the point is well taken – because you will take over pcs who have a complete line plot which has nothing to do with the price of fish. And one of the quickest ways you can tell them is, is the needle dirty. You take over this pc who has had ten items found and you take a look at the needle and you start to ask the pc some question or get the pc in-session; you got a dirty needle. It's going bzz, bzzz, bzz-bzz-bzz, bzz-bzz.

Ah, there's something wrong. There's something wrong with that plot, that's the first thing you do. And your best remedy is not to go back over and check somebody else's work but to do some effective work on it. Just find some more items. See, it's relatively unimportant, then, to prove up somebody else's plot. That's real, real weird. Also, there's another sign that I could give you, the pc will be senned up. Lots of sen. Lots of sen and a dirty needle and the pc's line plot was for the "boids". Something wrong with that plot.

All right, enough of that. The next question is, "Could you please say more about the probable stability of a first-goal Clear. When next goals key in old one, expect totally different valences and so forth and a black – and a different aberration type."

There is no study on this. I haven't even thought any study had any necessity at all. A first-goal Clear is about three goals from the basic pattern that started him out being aberrated. And actually that person will dramatize something to some degree until the third goal is listed clear. And it'll be in the same pattern line. It'll have different names and it'll have different words and different music and it won't have as much – he won't have anywhere near the influence over the pc.

But I know a pc right now that I'm just praying the day will come when she gets her fourth goal. Because this pc is still chopping in certain directions like acid. And it's still from that first channel, you understand? That was an indifferently complete job on the first goal, an indifferently complete job on the second goal, you see. I mean, this wasn't very good work that worked this pc up there, so there's still residuals there, don't you see? And I should think to bust the whole thing up it'd be about the fourth goal. If you're going to get indifferent clearing of this particular type to blow the lot, why, you'd have to get about the fourth goal up the line, see?

Now, if the person had been very well, thoroughly brushed up and cleaned up on the second goal, why, you should sort of expect this dramatization of various sectors to cut down. But let me put it to you this way. You know how much your own or your pc's conduct changes on the finding of one item. You find one good reliable item and you're going to get some change. Well, that pc's still having some trouble in other sectors, aren't they? Yeah, that change is quite stable, it'll stay that way.

All right, now let's take the pc's first goal cleared. Well, that's going to introduce an awful lot of difference to this pc, you know? But let me count it up for you. Let me count it up
for you. The pc probably won't have a lot of physical troubles. If they exist, they will go away. But they may still exist. The pc won't be mad and choppy and violent and beyond control in certain directions. They'll just snap in those directions. Maybe before they were too apathetic to snap, see? So now they'll chop. The world around them looks much brighter, they're much more sensible and they can work their way through it much better. They're still having a hell of a time perceiving the other man – the other person over there – they're still having trouble with that.

First dynamic is almost analogous to a first-goal Clear. Doesn't matter what dynamic it was on, the first goal basically cleans up a person's concentrated worry about himself. Put it that way. And it might not be too awfully observable. Oh, people would observe it, yes, there'd be an awful difference to them, but, I mean, as far as he's concerned other people haven't changed yet and there's a lot of reservations here one way or the other. He feels stable, he feels happy, you're not trying to degrade this state. But it's a question of how far has a man got to go?

Now, if that's listed out and has given a free needle – the way you were listing now on your Routine 3-21 – I'm very sure that is very stable. Because I've seen stability increasing every time we did a better polished job of it, I've seen the stability better. That's pretty good.

But as – let's take now this fourth-goal Clear. Let's just skip those intermediate states. You realize that a fourth-goal Clear probably needs a body to talk? That's aberrated, man! I don't care how else you look at it, that's aberrated. Needs a body to talk. May still eat; that's crazy, man! Breathes; what do you want all this drafty stuff pouring in and out all the time for? [laughter] Influenced by gravity; drops his watch and it'll hit the deck – break, too. You get the relative state of affairs. You see, you're going on up there – you're up throughout the sixth dynamic. And he'll be still having trouble with the sixth dynamic. Do you get what I'm talking about? I needn't go over it in any hideous state.

I think the present stability of a first-goal Clear is absolutely remarkable. But you can get your idea of the situation this way. Get the idea of pinning your whole hopes for a complete change of this pc on getting one item blown. Get the idea of that. Now, you know how much the pc changed in getting that one item blown. Made a big difference to the pc. Something that could – that's not negligible.

Well, of course, a goal like this is astronomically greater than just the one item, see, because there are dozens and dozens of these pairs. But you can't put all your hopes on this first goal, either, see? It's always a mistake to make the big – to make one thing do it. And you're going to make this mistake sometimes when you're deintensifying a rock slammer or you're going to oppterm – they're rock slamming like mad on Scientology, see, so you're going to oppterm this and you get the oppterm, see? And this cools them off and so on. But you've put your whole stake on just this, see? And Scientology now makes them unhappy. See? They're not trying to cut it up and they don't think it's cutting them up, but it makes them unhappy, do you see? In other words, there was something left, see, and there will continue to be, until they're up there a lot of packages, and so on.

You can make an enormous change – can make an enormous change and the only thing I must warn you against is making a mistake of absolutes – believing they are obtain-
able. Believing that this person who is an alcoholic, after you've gotten three items off, will cease to be an alcoholic. See? He'll probably be queasy on the subject of being an alcoholic right up to the second goal. See? He'll have little moments of queasiness. He may not even tell you about them, you see. Oh, he's cured of it. He isn't doing that now. But you say, "Well, I'll cure an alcoholic. I'll just oppose alcohol and I'll get one item and then he's absolutely – never afterwards he's going to be an alcoholic."

Well, if you compute like that, you're going to get lots of loses. Similarly, if you expect that every first-goal Clear is going to be able to fend for himself on all dynamics, you're going to get lots of loses.

Because the first-goal Clear won't fend for himself on all dynamics. He'll generally fend for himself very ba... very, very well on the first dynamic – do infinitely better. It isn't they become more first dynamicy than they were before; they just get a first dynamic. They become aware of themselves, or something like this. It's the first time this has ever happened, don't you see? Before that time, they're withholding themselves. So that's the story of stability.

As far as stability is concerned, how long will the state last? Well, boy, we've had some of these going for quite a while now. And we've had some of them checked out after the fact and so forth, and they seem to be staying remarkably stable.

A case has to be pretty well cleaned up before it stays stable. The degree of – the second goal doesn't operate as a key-in against the first-goal action. That might be something interesting to you. You sometimes are going to have trouble to get the second goal to key in so you can list it. In other words, you're going to have trouble sometimes killing that free needle.

Imagine trying to get the rudiments in on a very well cleared first-goal Clear that you can't read a meter on. The best thing to do is to get them to read a goals list because that'll key them in faster than anything else. They'll now – they won't dramatize their second goal any more than they have been, however. Dramatization doesn't increase by reason of restimulation. They just go on that way.

The speed with which the second goal cleans up is what's got me startled. I've seen several of them now and I'm just – gee! You know? Do an eight hundred and fifty goals list-just your Routine 3-21-do an eight hundred and fifty goals list and so forth. I'd seriously doubt you'd have to do very much with items. But on the other hand on some cases you might.

I'm thinking of the case who made up his goal last century. Did you realize, I mean, that we might hit a case that the first goal was postulated in 1810, and all you've cleared is back up to 1810 and then it's free as a bird? Then the second goal is what you'd have trouble with, wouldn't it? Well, we don't know too much about that, but those are some hazardings.

All right, let's get a few more here. Ah... I think I just answered that question.

Oh, "Dwindling rock slam." You had a hot item. "What does it signify?" You had a hot item. Don't worry about it. Sometimes you get a dwindling rock slam; sometimes you don't. And you're doing very fine, now, without finding any. So it's just a phenomenon.
Now, you could have used it before when you had a limited number of items you were going to find goals on, right? See, when you had a limited number of items you're going to find goals on, therefore, you had to find a particular kind of item in order to list goals against it, see? Well, therefore, you needed a dwindling rock slam. Well, sometimes you're going to get dwindling rock slams and sometimes you aren't. But you're not going to use them to find a goal with anyway so why bother with them?

You don't necessarily only use that you have a dwindling rock slam on to find the goal from, either. In other words, dwindling rock slam is actually a phenomenon. It now indicates that it exists. You'll see it, but if you don't get it, so what? Doesn't mean anything, doesn't mean you haven't got – you're going to get an invalid item.

But let me tell you, the line that you get that dwindles will give you a honey. You always get a better item on a line that dwindles than a line that doesn't. That doesn't mean you should go around looking for dwindling ones because you get perfectly good ones that you have to get anyway on lines which when listed, don't dwindle. Non-dwindling lines – no dwindling rock slam on the line – give you a perfectly usable item. You understand?

"If when oppositioning a rock slamming Scientology terminal, a very persistent dirty needle turns on and the list is five hundred items long and it'll still dirty needles, and missed withholds does not immediately remedy the condition, what should one do?"

Well, there's a missing datum here. Did the thing turn on any rock slams? If while you're listing you got some rock slams, why, you got a pretty good chance of finding an item on it. And you certainly better list the dirty needle out. But let me tell you that if it didn't turn on any rock slams – you're just going up a blind alley.

Remember that it – your nulling bulletin is absolutely correct – it must come from a fruitful source. And this particular item is not from a fruitful source. See?

There is a missing datum here – the question is unanswerable just to this degree. So a dirty needle turns on. Well, if it's from a correct source that it's going to get you an item, the dirty needle will turn into a rock slam, turn into a dirty needle and then dwindle out and vanish and you'll have a complete list and you can null it and find a rock slamming item.

Well, let's just take at random, "Who built this house?" Let's just pick one out of the air, see, and we're going to list "Who built this house?" from a PC, see? We're going to run this. It's way out of time, space. We haven't assessed for it. It makes no sense anyhow and now we're going to get a list. And let me tell you, that list will go dirty needle, dirty needle, sen, sen, sen, dirty needle, dirty needle, dirty needle, sen, sen, dirty needle, dirty needle, dirty needle, sen, more sen, dirty needle, dirty needle; needle maybe clear up. Something might rock slam for a moment

Pc's protest over the charge, see? Just an instant, you know? And – dirty needle, dirty needle, dirty needle, dirty needle, dirty needle, dirty needle, dirty needle – five hundred items. Dirty needle, dirty needle, dirty needle – six hundred items. Dirty needle, dirty needle, dirty needle – seven hundred items. Dirty needle, dirty needle. You'd better wake up! It's from nowhere. Literally and factually true.
Now, we'll run the case for a while and someday come back to the list and null the list and what do you know. We now have rock slams on it. But now the case has been unloaded.

That's a case of – that's, by the way, auditors are going to make mistakes on that, I suddenly realize. Auditors are going to make mistakes on it. They're going to do this. I myself just picked one off the PC and did a list exactly like this – and I wish I hadn't started it. But the sen dwindled. I eventually wound up with no sen on it. I listed the sen off the list, which I think is quite remarkable, but it was not a properly picked-up thing. It was just an arbitrary test line. Sen came off of it and PC felt mighty sick listing it, but at the end of the line sen was off, pretty well – and I took items – it had R/Sed a bit here and there, once in a blue moon – and I took those and I tiger drilled the R/Sing items, and the second I did a dirty needle came back on the list. I said *ah-ah-ah-ah-ah-ah*! We're out of here, see?

Otherwise it'd looked good, see. The sen dwindled. I mean, you haven't got any sen on the pc now. And you had a rock slam in, I think, six items on this list of many, many pages – rock slammed slightly for a moment. Pc thought of them. When the pc thought of them they rock slammed. Obviously this was a very heavily charged list, but it was leading no place. At the end of something like fifteen or fourteen pages or something like this, why, still got a dirty needle on it.

What is this? What is this list? You might say it's premature. That list you ought to have been listing on after the pc has had another thirty items found, you got the idea? It's too far down the track. Pc wouldn't have any reality on it if you found it. It's not going to slam. The item that is on the list is not going to slam. It's too suppressed. It's too much in the package. It's – see, it's too early. There's too much force in it. The pc can't confront up to it. Don't you see all these things?

Therefore a great deal of good sense has to be used in choosing what lines to list. And by choosing the wrong line to list, why, of course, you get dirty needles and you get everything else and you get yourself into a lot of trouble and you get the pc into a lot of trouble and you don't know whether you're coming or going. That's listing from the wrong line.

Let's say you do a lousy Prehav assessment. Let's say you do just a *stinker* – horrible! It should have been "prevent knowing," and you came up with "tell everybody," see? This thing is just lousy, see? And you go in there with great ambition and you list away. This is the condition which you're going to find – just the conditions I've just described to you. You can go on and on and on. I think you could list ten thousand items on it and you would still not have listed it out. Because the item itself is not going to appear to the pc on the list. The pc will never recognize the item, even if you found it.

Supposing you had some method of finding it and handing it to the pc on a silver platter and say, "Here it is – Homo sap." You know? Pc would say, "It hasn't anything to do with me."

Now, you've got the pc's goal listed down and you – case is way advanced – case can tolerate and confront a great deal much more force, you see. You've got dozens of items in addition now to this. All of a sudden, mysteriously, on the list will appear "Homo sap" and the pc will say, "That's my item." See? That's a very premature action. Most of these wrong lines,
however, give you just exactly nothing. They don't give you a dirty needle or anything. But you can get ahold of one of these lines that someday will come up on the pc, but not now. And that's the way it behaves. Okay?

All right. Time for one more before the break, huh?

The question is, "Must this pc who is listing on the goal have rock slamming items found, or could he go Clear by continued listing on the four lines?"

Answer: Pc did not go Clear with the four lines, so therefore pc must have rock slamming items found and those items must be opptermed. The reason this pc didn't go Clear is because of bypassed items. Got it? He just couldn't list out to Clear, so you must have bypassed something. You have to go back and find it, okay?

I dare say some day you may be clearing that way. Them as list straight out onto Clear and so forth, you never bother to. But a case that's been listing for a while and he isn't Clear yet; somebody certainly better get interested. Okay. Aw, we've got time for one more.

"Will we be able to take meters back into the US without trouble and when will the Mark Vs be available?" Actually, Mark Vs are available – a few of them are available right now – some more of them are coming in. Edgar could tell you more about that. When are Mark Vs available, Edgar?

*Male voice: Tomorrow.*

Tomorrow? So there's – there's Mark Vs available. As far as taking them into the US without trouble is concerned, the people have never stopped a meter which was by surface package mail or was in somebody's paws as a personal effect. No meters have been stopped.

The only meters that have been stopped have been by air shipment and in bulk. And that's big enough for the FDA's myopic little man eye to see, and it comes in with much higher velocity than they at their state of case can tolerate. And so they're stopping those madly. You don't even have to make a point of taking a meter into the United States. The fellow says – customs is poking around and he says, "What's this?" Well, don't tell him it's a time bomb, because they've been known to arrest people just for saying it. But say, "Well, that's just a – I'm a minister – that's something which we use in confessionals."

"Oh, is that so?"

The only trouble is, the only – that's the best way to classify it. [laughter] The actually, look where the Catholic church had been if all their confessionals had been done with an E-Meter. Look at the missed withholds they must have missed. Anyhow – that probably shattered them. So it's a good explanation.

The only liability – the only liability you get into, Tom, is the fact that when you've told them this, they will probably call over a buddy who is interested in psychology and he will want to talk to you about it. Not because he wants to find out anything, but because he'd like to get out of the racket he's in. That's a fact. That happened to us the last time in New York. We almost couldn't get through customs. We were being too bothered by customs men who wished to join the club. Expect no trouble in that direction. Tell them it's your personal
property and that's a tool of the trade and you're all set. They won't say anything more about it.

Okay?

Let's take a break.
Q AND A PERIOD: DISTRICT OFFICES, CO-AUDITS

A lecture given on 22 November 1962

Okay.

Here we have the second Saint Hill Briefing Course lecture of November the 22nd, AD 12.

Now, our question period progresses and continues.

[part missing] [further down also a big part missing, certificates]

Okay. I've got a question here which is – I don't dig. Oh! It's a question, "Has some – has somebody been terminated or retained?" That is to say the fact of termination. This person is mixed up about the co-audit. The co-audit has ceased to exist. Termination is simply just termination. There is no further co-audit after termination as far as the course is concerned. You want to sit down up in East Grinstead or something like that and drop around once in a while it's perfectly all right with us. But as far as termination is concerned, that is just termination.

Now, as far as auditing a pc outside, there was an offer there to the December 1st and so forth. Well, by all means hang around until December the 1st if you're not assigned classes or anything. But this doesn't constitute a co-audit. Termination's a termination. It means we have no further responsibility for your training and that I demand exclusively that you now operate. The termination says you are now an auditor.

And here's, "When do I think this auditor's District Office would be likely to materialize officially?" Well, this whole question of a District Office, the Scientology 1970 should not be understood as first we redesign HCO WW and then we redesign Continental Offices and then we redesign city offices, and eventually get around to building up District Offices. The District Office has yet to evolve. There are no orders at this moment as what a District Office is supposed to do or what it constitutes. There has only been a thought of what it might be.

The person operating a District Office might take off in numerous lines. Might do numerous things. I notice that Melbourne was a bit mixed up on their clearing co-audit which is also a health co-audit which will also make you live longer and it's all on the same HAS Co-audit. See? Well, I would say a District Office shouldn't do that. See, that's four things that are combined into one activity. And that's hoping that everybody will come in on the same activity and go out the same way, you see? Actually, it's not designed that way. If you're going to run a clearing co-audit as a District Office, well, run a clearing co-audit as a District Office. But nobody in your district or area has heard of clearing – you can't seem to get anybody very interested in clearing – you've got a health co-audit, don't you see?
You've got a springboard that you can take off from. But for a District Office that is now operating as a private practice – a fellow in private practice wants to go over into a District Office. What do we do? Cut off his head and make him totally insolvent? And say that he must take on no private pcs forevermore and that he can only run a clearing co-audit? But he hasn't any candidates for a clearing co-audit. He hasn't built anything up.

Now, these things are not done with great suddenness and exclamation points. These things are evolved. We have yet to find out stably how can a District Office best survive? I know a lot about this because I know what made the Dublin office survive and not survive – and it came very close to being a District Office. It was little or no private processing – it was all group activity of one kind or another and if it had gone along and had good leadership along the line after I left it, it would have been very, very successful.

Had quite a bit of experience with this kind of an activity, but these things come down to economics. And before there are shifts, we've got to pioneer this action. Now, we have some things called District Offices. But there is nothing specified as to what they do. What is specified is that they are part of Scientology – that they are a regular Scientology office – various other conditions could be made concerning this, and have been made concerning their legality – part of the administrative framework. That sort of thing. But exactly how do they give service?

Well, that has got to be evolved. And you see that it'd be folly for me to say that they give service in just exactly this way, this way and this way whereas the matter of the data at hand is so slim that one couldn't say this. So maybe one District Office is a little sort of an HGC and another District Office is a co-audit for health addicts – and another one, they get a lot of things going on the subject of clearing, don't you see? And they gradually get their feet off the ground.

Now, anybody in his district or area at this particular time has some income line or some flowing line on the subject of Scientology. There's already some action taking place in that immediate area. Well, the question is to build that action and evolve that action, as a District Office. And you'll wind up with a very strong District Office. But you're not going to kill off the interest, the enthusiasm in various lines – then put in an arbitrary thing and try to smash people's enthusiasm into that – because it never smashes. It just smashes. You can't detour this enthusiasm – you can – you can gradually shepherd it. You can do other things with it. Let's say we have twenty people in Riverside who are very, very interested in their auditor coming back from Saint Hill. So we say to this fellow, "All right, you're a District Office. You're going to be a District Office." And fine, he says, "Swell." That's good with him. He never particularly liked the franchise setup and it's left him in a great deal of – with no financial resources or anything like that. So he's going to be a District Office. All right.

Now he goes back into this district or this area. He's got twenty people. Well, he's certainly going to have to talk it over with these twenty people what they're going to do. And then his District Office does what they're going to do. Get the idea? That's the criteria on which you build it.

Now, when District Offices are straightened out and all of that is very smooth, then we'll start putting together city offices to take care of that service sphere and then we'll put
together the other offices to take care of the lower offices. You cannot build a house by laying in the roof tree first. It just can't be done. So any question about a District Office – yes, we intended every auditor's activity anyplace should be a District Office.

What is the activity of a District Office? It is what they make it. What service does a District Office get? It's what they've got to be given. You get this? And that way we'll build a strong structure from the bottom up. And the services that are given will be real and the people who will be supporting it and doing it will be real and their interest and service they'll consider real, don't you see?

Now, if I were going to set up a District Office – this is a different proposition, see? If I myself were going to set up a District Office – and I'm just an auditor now and I can clear people or run co-audits and I've had experience in this various lines – I'd probably go rent a store. I probably wouldn't take the front room of my house. I'd probably go rent a store, an old empty store someplace or another. They're wide – pardon me, they're narrow and deep. You can put auditing room partitions in the back of them, you can put book displays in the front of them, you can make them look good, you can curtain off an area just inside the door from the street. You've got a big room there you can set up two lines of chairs in and people can do co-auditing. In other words, this is fine. And it also gives you street visualness. And you put up a proper book display and some other displays in the window that says what you're doing and that sort of thing.

And then I'd go into it hammer-pound and I would pick up – I would send out a great many feelers. I would get some lines going out of one kind or another. And I'd see which one of those lines responded. And that one I would hit hard and then I'd build it. I'd build it from there. And I wouldn't change it as long as that line was successful. I would just keep it building. I wouldn't split or disperse my interest. See, all of a sudden to find that all the high schools in the vicinity are so juvenile delinquented that they don't know whether they're coming or going. Then I find that everybody's terribly interested in this. Everybody's fascinated with this. Everybody listens to it. Find out they understand what I say on the subject.

Well, I don't run this District Office, then, day and night, on this subject and that subject and another subject and another subject and another subject and... No, I'd just reach out and I'd grab three hundred and eighty-five high school students and I start them through the thing, man. And as far as persuading the student – high school students to go through it, well, I'd – that's fine. But I also persuade other people to make them go through it. You get the idea? And I arrange for certain set charges and they all come in and they co-audit and they gradually get so they can see the wall, you know?

And everybody'd be very happy with me. I'd go around to parent – teacher's meetings every now and then – get three or four auditors to help me – HPA, HCA level auditors to help me. Knock their heads in if they don't give proper technical supervision. Don't let anything get weird on the subject. There's certain fellows there that have to have a certain amount of help, which is individualized help. They're much too tough – they can't even sit in the chair, you know? Well, I'd pray to have a city office running an HGC to turn them over to. Because frankly, I would not have time to do it.
I mean, that is about the way I would go in along the line. But it's a matter of feeling your way. And developing what you find. And not staying on a big dispersal – and hitting every line all over the place. Because you start following an interest line in the society, it actually requires all of your interest, all of your attention, to keep that one line going. And you can keep it going very, very well.

In Ireland, oddly enough, what happened to the office is quite interesting. It's – because it happened to it after I left there. It was quite solvent and everything was fine till I left. The idea got home that longshoremen were not quite nice. I was developing a land office business in longshoremen. These were tough mugs. It was quite remarkable. These characters were coming in and somebody disagree with the Instructor or something like that – well, their full answer was to throw him out, bodily, see? They didn't even talk good English. They weren't educated, you know? They probably sweated a bit, you know, down on the docks.

That was developing at a high roar. These characters and their union and everybody else was getting very interested in this, you know? And it was a matter of, "Well, Tim, I think you ought to go down there tonight, since I'm not – Tim?" He'd be down there that night.

These guys were very solidly behind us. And the people – not necessarily the people that followed me there – but some of the people who were there decided this was not quite nice. And they got in some intellectual louses who were very intellectual. And in spite of my telling everybody that an intellectual is defined as somebody who thinks about things – and we didn't want anybody thinking about anything – we wanted people doing things. And these longshoremen were absolutely ideal. But the next thing you know, why, these crude characters and types were being discouraged and so on – and then there were other little nasty things like this fellow wasn't quite nice because he was a member of the IRA – and this other fellow wasn't quite socially acceptable, you see, because, because, because. And next thing you know they didn't have a solvent office.

Now, the only thing that happened there is I found this track in the society. I found this zone of interest. And I was busy driving this thing home. Think of it. If every longshoreman in Ireland had gotten very interested in this and that had gone over into the drivers and teamsters and think – and taxicab drivers and this birds and that birds and the other birds and – and if it had hit there at the doingness strata of the society, think of what would have been the final result of all this. Instead of that we finally wound up with fifteen or twenty people sitting around talking about it. And I thought it was awfully sweet, and we closed the office. I was no longer there. I'd been gone for ages. But that was an interesting thing.

You have to look into the society and find a track – find a place where you can drive something through, you see? And then you don't keep hammering around at other places where you can't drive something through – you keep adding up all of your hammer blows on that one track, if you're dealing in a small area. And when you finished it up, man, you've got a hole driven through all of the results, all of the objections of this and that, you see?

And the only times I've ever seen Scientology on a dissemination pattern fold up is when a specialized proven line was not forwarded. And I've seen something come off of that. I've seen time split up. I have seen something else happen in that area that shouldn't have hap-
pened, see? A dispersal of interest, a dispersal of activity – and then it failed. So that's the criteria, actually. That's all I can almost – all I can tell you about a District Office, see.

Who's to man the District Office? Well, the people that man the District Office are people necessary to take care of the business of the District Office. What is the business of the District Office? Well, it's that business which best disseminates in that particular area for that particular office.

Now, you ask me what and I say at once, well, there it is. And who should run a District Office, who gets a District Office? That's very interesting. What do you get for getting a District Office? Well, I got the answer to that one the other day. We've now got several District Offices. They were fairly successful franchise offices. And, let me tell you this. A person who has been a party to or has formed up a District Office has now this: He has the rights to that post or position in a District Office. You think that over for a moment. That's quite revolutionary. That's quite revolutionary, if you think it over. He has a right to a District Office or that equivalent post in the District Office.

Let's say somebody was a Receptionist in a District Office and it built up to a very successful District Office while that person was there. All right, what are the rights of that person in that District Office? Well, they're the rights to be a Receptionist in a District Office. Now, what does this take care of? This takes care of the people moving from – well, somebody gets awfully tired of lower South Amboy and they want to go to lower Chicago. And, all right. What do they do, just give up any rights to anything that they have built or constructed or something? No, it's up to the organization to give them an equivalent spot in a District Office. That's what they own – that's their right, don't you see? They've earned that right. They have a right to one such spot, don't you see?

Now let's say somebody went in there and hammer and pound and so forth and he was head of a District Office and so forth. He'll always be head of a District Office. If he got made a successful District Office, he always has a District Office. All right, he wants to go to lower Chicago, and nobody in lower Chicago has built anything up, there isn't anything in lower Chicago and so forth. Well, obviously the organization would have to finance – well, it was agreed that lower Chicago was a good place to put it in – the organization would have to finance him a District Office in lower Chicago. They would appoint, however – and this is what covers the one point where we've been missing on dissemination – and believe me, this is the only point we've really been missing on dissemination – lower South Amboy is not suddenly without a District Office just because this fellow wanted to go to lower Chicago.

And that's our biggest point of failure. Auditor pulling up stakes and going someplace else and he doesn't have anybody to turn his group or his connections or anything else over to, and listen – when that happens, I hear from people or I don't hear from people, and they're usually all ARC broke. And somebody spent – we spend a lot of our time individually building up some particular area and then, very often, just go off and leave it. And it collapses and nothing picks it up. The District Office is basically an idea formed – that after an interest and so forth has been built up in an area that it will be continued in that area without nailing that auditor down in that area. Because auditors are shifty-footed – they go places.
And so all right, so he's built a District Office. It must have an address and it must have this and it must have that and must have the other thing, naturally – always does. Structure of activity. And this person, this person isn't going to stay in Riverside forever.

Well, all right, so he gets in touch with his next immediate area – you see every District Office doesn't necessarily have a city office over it. He gets in touch with his next contact up the line and he says, "I'm leaving Riverside. I want to leave Riverside. And I want to be out of here by the first of November." They're going to have to find somebody in Riverside, that's all. They're going to have to put somebody down in Riverside. You see how that would work out?

Therefore, that territory which has been conquered stays conquered. You're not always abandoning territory. I mean, the amount of work which auditors have done to straighten out or fix up various areas in the world, it'd break your heart. Because when they move on, when they change interest, when they do this or that – then that area and zone collapses and that ceases to be conquered territory, and it's quite interesting. So the District Office is basically a design which will not nail the auditor down in one spot for the rest of his life and which continues that area as a going concern. And that's what it's all about.

Financing and that sort of thing is a delicate point. It's sometimes hard to take care of. It's got to be done on a give-and-take proposition. The amount of money which can be made by a District Office is basically made by the developed patterns of approach to people. I learned an awful lot about this in Ireland – I really did, in Dublin. It was quite amazing. I had a ball over there. I figured if you could put one together in Ireland you could put one together in hell. [laughter] Let me tell you man, that's marvelous! I mean, that's – that's fantastic. You had groups of people who could not define or encompass create. They could not define it or encompass it – couldn't talk about it, couldn't agree or admit that it existed. How do you like this? Fabulous! Blow your brains out.

They had people at work who were all the time telling them it was against the church for them to come down to that particular horrible place. They were running up and down the streets with placards. "We have never heard of those people across the street," see? And they were making a big noise about it, you know? Oh yeah, had everything you could think of against us. And we still climbed the hill. And I thought, "If you can do it here, you can do it anyplace."

Hope that answers some of your questions on it. Didn't mean to get too lengthy on it.

"Please, will you let us have suggestions for handling co-audit listing. Would an amplifying system with earphones, each audit coupled with a panel meter control be practiced and so forth?" Very burning question. A very, very interesting question. And it's asked directly and immediately in the middle of the development on the answers to it. I hate to see you nailed down with that much electronic gear. See? By the time somebody sits down in the seat he looks like an astronaut, you know? [laughter] I just don't think it should be that complicated.

But what I'm trying to do – what I'm trying to do is, at the expense of it being much longer and taking much longer – develop a clearing technique that could be run very, very solidly in a co-audit by just maybe two or three repetitive commands. I know one right now
that would probably do it in three commands. Same as the old HAS Co-audit. You write the commands up on the blackboard and if the – if the pc says something or does something the auditor frightenedly puts out his hand to the back of the chair and an Instructor goes up and handles it, you know? That kind of an action. He's just supposed to say these three things.

And I don't envision any listing on written pages in a co-audit. You're rapidly breaking down certain percentages of pcs. Rapidly breaking it down here into what types and kinds of pcs there are, and so on. Well, they're all the same kind of pc, but some of them list easier than others and some of them this way and some of them that way, don't you see? And there's about 25 or 30 percent of the pcs have no business on a co-audit, a clearing co-audit, see. They would just fumble and dumble. Well, I'm trying to hit at that level of case for the tests I'm making on these three commands. And I'm trying to handle the toughest case that you could get to handle it.

Now, we wouldn't have a clue as to how many years this fellow was on a co-audit before he went Clear. We just have a guarantee of progress. Now, the main – the main thing we're after in a co-audit then – the direction we're trying to take – is a repetitive command basis which is relatively unsupervised. That is to say, as far as listening directly and immediately through meters and earphones is concerned. The remedy is policing the co-audit as it occurs. Auditors – HPAs and so forth – are quite successful in doing this. I like the way they handle this sort of thing. They do it well. They get a number of raw meat pcs lined up in the pcs' chairs and the auditors' chairs and so forth and they handle it from there. And they've always been very good at this. So that's something auditors do well.

Now, it could possibly be improved by having a meter, a line and a bunch of electronic gear and a microphone and all that sort of thing. Probably this could all be improved in that particular way. Is it justified to do so? That is my only question. Because the direction of research which is where I hope it will wind up, will be in the direction of not requiring it. The way you handle a co-audit, the way you've always handled HAS Co-audits, you'd handle them all the same way. Be the same old pattern. It's gotten creaky. If you don't know it, ask somebody who's run one. There must be a dozen people here who've run them for months and months and months or years on end. See, you just put them down in the chair and, I mean, the guy's supposed to utter the auditing command, and, actually the Instructor who is present audits the lot. It's his responsibility, and the raw meat audits beautifully as long as there's somebody there that they can put that hand out and say, "He-he-he didn't answer the question." That's the direction of development. It's not the mechanical direction. Or not this particular direction.

We have more need of this here than in a co-audit. I would like to see supervision capable of being done in paired chairs in a room here, in the Z Unit only. Boy, you know, you're awful lucky, those of you who are leaving. You're terribly fortunate that you got through the Y Unit. Because you know, probably never again in the history of Saint Hill will anybody get through the Y Unit. Do you realize that? Isn't that sad?

Do you know what the Y Unit, those coming up to the Y Unit face? Some people face firing squads. Others face other things. But the people who are coming up the line now are not going to get out of the Y Unit until they get a clean needle on their pc with the pc's tone arm.
at the Clear read. And when they've got their pc like that, they get out of the Y Unit. Do it with the meter, I mean, we're not going to keep meterless auditing in, see? Going to be very standard auditing and probably never again will anybody ever get into the Z Unit. [laughter] I thought you would be cheered. That puts a – puts a cheery light on your termination here. See, you can go away with a smile now, because you at least have gotten through the Y Unit.

Future concentration of auditing supervision will be the X and the Y Unit. The X Unit is going to be tougher than the Y Unit. But we're going to let people through into the Y Unit. Up to that, the only thing that lets a person out of the Y Unit is pc's TA at Clear read – needle clean, free, pc's goal has already come up, it's all ready to be listed – on the second goal. [laughter]

No, we're not going to be quite that extreme. We don't absolutely demand that the pc's goal have come up in the Y Unit. Also the Y Unit's auditing hours are going to be expanded enormously. There'll be a minimum of twelve hours a week in the Y Unit – minimum – given and received. Because that's where auditing skill deteriorated here a little bit – was in the Y Unit, see? So we just go to extremes and let it ride that way and let people cope with it. So you're awful lucky to get out of here.

That's all I can answer off of that one. Let's see another one here. "When a t-e-r . . ." I suppose that's terminal, "in the bank is visible to the pc and it is constant, can this be used as a shortcut to the goal?"

That isn't any guarantee that that is the goals terminal. That is no guarantee that it is a terminal. It will have the goal somewhere in it. Now, how it could be used as a shortcut of the goal – if it's identified and if it is checked out with a rock slam and if these other things are true – that is, if standard procedure also backs this up – yeah, that'd be a very, very likely terminal. That would be a honey. If it's backed up with everything else. It, of course, every item you know has its own goal. Doesn't necessarily rocket read or anything like that. But it's quite amusing that if you have – if you have a rock slamming reliable item and it's "a tiger," see. And there it is, rock slamming item, "tiger," and everything's fine, you've got it, found it, reliable. And it's a terminal. If you listed its goals, amongst its goals you would find its goal.

Before every engram a person had a goal. Before every difficulty in life that he was confronting he had a goal. And similarly, every valence and item he runs into has a goal. And the weird part of it is if that goal is very, very close to the main channel goal, it'll rocket read – once, twice, six, eight times. And folds up, and you never see it again. Did you ever notice in going down a long goals list that you'll strike goals occasionally that rocket read? It goes pssww! There it is, there's a goal rocket reading. And you check it, and by golly, it'll go pssww! You say, "Boy, that's really something, you know," and you tiger drill the thing out, and you trot out Big Tiger, and you're going to groom this whole thing up, and it goes, pssww! And then it goes tick. And then it stops. And you say, "On this goal, has anything been suppressed?" No read. "On this goal, anything you have been careful of?" No read. "To catch catfish." No read. Sad story.

I mean, a lot of you have attended the funeral of goals that went like that. Well, what you've struck there is the central goal of one of these items. You see, it's on the channel of the goal, see? It's very close to the goal. It's not much use to you till after the case is Clear. You
could go back and see this circled X, and you could say, "What relationship did this goal have, 'to spit,' have to do with 'catching catfish'" you see? "What was the relationship between these two goals?" And he could tell you. Well, naturally the best way to catch catfish is you spit first and that tells you whether or not you're going to be lucky or not, see? And he tells you all about it. Doesn't do you a bit of good. At the time you first find this he won't be able to integrate it worth a nickel, he'll give you some wild tale. And he actually doesn't know which way to go to find these goals.

But do you understand what I mean? Occasionally these things'll rocket read. And it's quite amusing. It's not really amusing, after you've seen four or five or six rocket reads or even eight or ten rocket reads, off of some item, and you're big tiger drilling it, and everything is fine and you're going to come back and you check it, and you come back the next morning and you check it and it doesn't do anything. It goes tick and phumph. And then you precheck it, you know, and you keeps asking the pc, "Do you have a pain? Do you have a pain?" you know? Pc keeps saying, "Yes, I do have pain, on the end of my nose," and so forth, and the end of the session or something like that, it doesn't tick, it isn't suppressed, nothing. There are no pains, there's no sensation. And it's gone.

That's fine. That's one of the – one of the liabilities of auditing. But that was the goal of a terminal or an oppterm. Mostly terminals rocket read, I don't know that oppterms ever rocket read. But I don't know that. They might. Now, the sad part of it is – this is the – this – you think that's – is a sad story. Well, there's a sadder story than this. After you've nulled another thousand goals and found thirty more items – you take all goals that went out hard and you accidentally put that goal back on the list. And you check it out and it's got pain and it rocket reads. And you look at the intervening thirty-five hours of hard labor, as totally useless. Actually, it's not. The thing was never in a condition to rocket read till you unburdened it. But it gives you a horrible sensation.

I had this happen to me twice in Washington. Pcs were delighted and I was spitting my teeth out. "What do you mean having that goal back again? That was out three days ago!" By the way, I'll give you another parting shot on goals. Pain reads below the meter. If there's pain on something it might not show up on the meter, but it'll show up on the pc with pain. And it is characteristic of all these goals which have faded out and then come back, that when you got the pain, (quote) all off of them (unquote), on Monday, you found pain on them on Tuesday. And when you got it all off of them on Tuesday you found pain on them on Wednesday. And then thirty days later you've abandoned it because you cleaned it all up – and thirty days later you happened to hit it again and it's got pain on it. This isn't a – this isn't a wonderful test, because also phony goals that are almost right will follow this to some degree.

But on a bad – on the wrong goal, if it's going to be the wrong goal, if the pain does persist for quite a while and you can get it several sessions and you can get pain back and all that sort of thing – it will eventually disappear and you can't get any back. But on the right goal you can never make this happen. You can never get the pain to go away and stay away. You can get it to go away, but you can't get it to stay away. It'll be back next session, it'll be back next week, it'll be back and so on. As long as that goal remains unfound it'll continue to give the pc pain. And that's something you might use sometime or another. It's a very, very useful point. You find an old list of goals and somebody says, "Well, I cleaned up Joe's goals.
I just got them all clean and Joe's just clean as the driven snow with his goals, see. All tiger drilled and so on, we precheck a couple of them, been listed all clean and so forth."

You say, "Well, that's fine, then I don't have to bother with any of those." Boy, have you made a mistake. Go back and read your Routine 3-21. It says you haul out the old goals, doesn't it? Why do you haul the old goals out? I'll let you in on why that step is in there. You haul them out and you just go down them as a list. Well, if they've all been cleaned up – see, you haven't found the pc's goal yet – and they've all been cleaned up and one of them's got pain on it – it isn't that the former auditor didn't get the pain off – he did. But the pain's come back. And boy, I would walk around that goal with the greatest of care. I'd really cuff that goal up. And I'd see, if after I got it all cleaned up, the pain came back – or if I could get it cleaned up. And I'd be very disappointed if I could get all the pain off of it and no pain came back, because obviously from then on it's no good.

But let's say those goals were all cleaned up last month and you've now got the pc to audit this month. You go down this list and so on, and there's "to catch catfish," and it's just like all these other goals, and you read "to catch catfish," and the pc goes ...

You say, "What's the matter?"

"Well, I've got a pain." Doesn't show on the meter. See, he – it hurts. And you just keep working it then. Work Suppress and other things, just kind of precheck it, you know. Next thing you know, its showing on the meter. And two things can happen: It is either the goal or will fade out – forever. But you mustn't omit the fact that there's a chance that it is the goal. That's why you always go over all those old goals again.

Now, on doing the second goal, there's a possibility that you had it on his first goals list, but it wasn't time for it to come up and take its bow. So it's always a good idea to go over goals that went out hard when you're looking for the second goal, as one of your first areas of action. And that's why 3-21 is written the way it is. You do everything on it that you did the first time when you're finding the second goal, including assembling all the old goals.

Actually, finding a second goal is ordinarily a very simple ... It is just exactly Routine 3-21. It is exactly what you do. There's no variation off Routine 3-21 on the second goal. There might be on the first goal because you have to find items and unburden and work like mad and you have to do 3GA Criss Cross where Step 4 is, you see. Second goal – why, you just write yourself a list of goals and start tiger drilling that list and that goal will be on it someplace. And you go on down the line and you might not have to find one or – more than one, two, three items and oppose them, before it's just Prehav level, Prehav level. Where's the goal? Where's the items? Where's the mass? Where's the meter reads? Dust it off with a Prepcheck and there she goes – she's gone. Second goal, by our experience, goes much, much faster. Oh, I don't know, by about a tenth, or a twentieth as fast as the first goal. And there's just that much reduction ratio apparently on the third goal. Fourth goal may start to go by inspection. What's your goal? And he says, "To catch waterbucks."

You say, "All right, let's check that out on the meter. Let's check it out on the meter. We're going to check it out on the meter now. All right, here you go: 'To catch waterbucks. To catch waterbucks.' Well, let's write a goals list." You're already doing the fifth goal and you
don't even know you're doing the fifth goal – the fourth one blew, see? [laughs] It had – it had three fires in it and they all went before you put him on the meter. Horrible, huh?

All right, here's another question. "How do you know which buttons of 19 buttons to use, when testing for pain or sen?" You don't use any buttons for testing for pain or sen. You don't use any buttons for testing for pain or sen. You don't test for pain or sen on buttons. Where did this come from? Who said this? What happened?

*Female voice: It's in a bulletin. It's in the bulletin on pain and sen.*

Must be a misprint. Must be a misprint. I don't mean to shame you. But I will tell you exactly how you test for it. You test for pain and sen only by saying the terminal or the oppterm, the item, to the pc. Now, there's numerous ways you can say it. You could say – you think it's an oppterm – so you say, "Would you consider – or would you – would you commit overts against a (blank)?" That's another way of saying it. If it's a terminal, well, "Would a (blank) commit overts?" That's just other ways of saying it. What do you want to do there is you want to just say it. You say all right, you say, "Hangman. Hangman. Hangman. Hangman. Hangman. Hangman." See if pain turns on. End of session. [laughter]

It doesn't matter how you say it. It doesn't matter how you say it. You understand? It doesn't matter how you say the item. But the only way you test the item – the only way you test the item is by saying the item. There are no buttons. The one most likely to turn pain on on an item is the one most fixated on the item. And the one most likely to turn on sensation on an item is the one most fixated by the item. You'll find in every Problems Intensive one or two buttons will run hotter than the rest.

*Female voice: The bulletin says you use – you could also use the seventeen buttons ...* Not to test for whether it's a – not to test for pain or sen.

That's just ways of asking it. See, what she doesn't get is the first part of it is it's just the method of asking the item.

*Female voice: What she's wondering about is ... [inaudible, seems to show something in the bulletin to LRH]*

Oh, dear! Oh, on page 3 of this – what this mystery is all about – is she's thinking that you ask many Prehav levels for this. No, you ask the Prehav level – let's say you've listed "Who or what would determine?" Let's say "determine" was the Prehav level. And you said, "Who or what would be – determine?" And you finally got an item, and now you want – you – you just use that "determine" in the test line. That test line – it's just "determine" would be the only one you use. But that's just a way of asking for it. You understand? You sure you do?

*Female voice: Well, I – I do understand that, but it says down here – uh – you're using your buttons – the Tiger Drill buttons. ...*  

*Female voice: She's asking you – the Tiger Drill buttons, you know, like would you say "Consider protesting." That's an overt, like a "Fail to reveal."

Listen, Listen. Don't leave this course thinking this. But the pain or the sen has nothing to do with the button. You understand? The button has nothing to do with it. It is the *item*
which turns on the pain or sen and you can ask the item in various ways to get the pc's attention on the item. So we don't care what buttons or levels are used with the item, it's just a mechanism of getting the pc's attention on the item. And when-but basically it's just "Waterbuck. Waterbuck. Waterbuck." And he says blaahhh! – sen, see? And you say, "Tiger. Tiger. Tiger." Ow! – pain. That's a terminal. Tiger – terminal: waterbuck. He's reversed. Now, you know, a reversed pc – tiger's always an oppterm. Every Scientologist knows that. All right, that's all there is to that. That's all I can tell you about it. But it doesn't matter, the other – it would just be a point.

[big part missing]

One thing I want you to know about all that is some people make it faster than others. And the best way—the best way to get cleared is actually to be a good auditor. You'll find that there's a direct relationship to this in most cases. Best way to get cleared is to be a good auditor. Of course, the way to be a good auditor is to deliver a good session.

And although the averages on this sometimes don't look like this to you, there'll be a lot of people asking you this question as to how to do it all, and so forth. And although they don't sometimes look like the averages are right—you're auditing well and you're getting lousy sessions—remember that you've given some lousy sessions when you were getting good auditing, too. The average balances out to a marked degree. And the very best way to get Clear is to give good auditing. Actually and truthfully so. Those people who do not give good auditing actually, oddly enough, are those who are making the least progress. Which I think is quite remarkable. It's sort of poetic. They sort of get averaged out along the line.

But more important than that arithmetical figure is just this—you can get Clear, yes, you can get up to the first-goal Clear. But how are you going to get to the second-goal Clear? All right, that's fine. That's fine. Now supposing you get to second-goal Clear, and you go along ten lives and so forth. Now let's ask the burning question: How are you going to get Clear? Well, your very best chance of getting Clear ten lives from now is having given good sessions now and taught good auditing now and kept it going. Because it'll still be here and it'll still be clearing people in ten lives.

I've looked at this any way I could look at it. And I've come to the conclusion that there is no substitute for good auditing and good dissemination. And also I see very clearly that there is just this as a factor. There is no arithmetical equivalent. There are people around who have been clearing people, who've been auditing like mad and who haven't been receiving good auditing, and the average isn't up. See, the average is not good for that particular person. Actually, to a marked degree it isn't for me. I've gotten some lousy sessions and I've given lots of good ones. You understand?

All right. But as time goes on that could reverse, too, couldn't it? Because actually, as far as my getting OT with exclamation points is concerned—it actually totally depends on me continuing to give good sessions. Do you see from that point of view? See? Now, whether or not I can hold out long enough to give enough good sessions to eventually have enough auditors so that I can have some auditing, too, this is one of the things which I have to worry about. But nevertheless it's true. As long as I go on auditing and giving good sessions I will someday make OT.
That's the way - that's the way the cookie crumbles, that's the way the wheel turns. And if you're worried sometime, desperately worried about getting Clear or clearer or something of that sort - you're really desperately worried, then audit like hell. See, that's my best advice to you. Because it's advice that I myself take.

All right, so you've audited many times longer and far better than the auditing you have received in your opinion. All right. Well, that's just how long you have to audit to get some. You see, who said it was an easy hill to climb? It is not an easy hill to climb. I think with horror of some of the kids in LA, 1950, used to tell me that the ideal clearing was to be able to insert a needle into somebody's gluteus maximus and give one single shot and that would make the person Clear. And they were actually hoping that some chemical research of some kind or another would wind up... Well, of course, at our stage of development we know that'd be totally silly. But they thought this would be ideal clearing. Well, actually, it wouldn't be ideal clearing because it wouldn't have done anything for anybody. It would have exteriorized them, wouldn't have returned anything to them at all.

Now causation of clearing breeds clearing. And that's all I can say about it. It does. Definitely. Now, to some degree, I have been laggardly in giving you techniques and so forth, in somebody's opinion - but in actual fact you got them about two or three thousand years before they were due. So, give me the credit of having developed them before any normal course of research procedure would have developed them.

Now, it's never an easy job to clear somebody, don't ever get the idea that it is. Don't ever try to persuade somebody that it is. This guy walks up and "Clear" - the worst thing in the world that you can say to this person is "Oh, well, yes, yes. Just pay your money over on the right, there, and come on through here, and we'll clear you."

Honest, you would find that the person would work much better in the line of clearing - would work extremely better in the line of clearing - if you looked at him with an entirely different approach. And said, "Are you sure you want to tackle it? It's a hard road. Once in a while somebody is just terribly lucky and finds it fairly easy, but ordinarily it's a very, very rough road. It has its ups and downs and it has its heartbreaks and it has this and that. The end product, well, if you stay with it, it can be delivered. It's well worth having at the other end of the line. Well worth having. But we don't want you coming into this co-audit or we don't want you coming into this HGC thinking that this is an easy thing to do. That all you have to do is roll up your sleeve and we punch you with a little needle and you are promptly Clear. Because that isn't the way it goes. Now, as long as you've lived and as much as you've done, how could it be easy?"

Person says, "Well, there's something to what you say." That it can be done at all is absolutely miraculous. Because it's never been done before on this planet. Never. So their approach to clearing, of course, is in the degree they seek clearing with the ease to the degree that they themselves cannot confront furnishing any effort. See, if the person can furnish no effort, can have no causative action of any kind whatsoever, you'll also find the person has never done anything, ever. And then you will find in addition to that, that this individual has also the longest road to go. The individual who's seeking the shortest route has the longest road to go. And the first way and easiest way you could break somebody's heart, now that we
— you know that people don't clear easily — and I think most of you've got a high reality on it that they can go Clear. You see yourselves approaching this on a gradient. It's a reality that it exists.

But you make it harder for somebody telling him how easy it is. Because he has the heartbreak — I can tell you this out of experience, of telling them all ways — all the different ways you can tell him. But he'd have the heartbreak of learning out that it was a tough road, having counted on it being an easy road.

Now, I think you would get a far better response from people if when they said, "Well, that's fine, now here's all this money and I've got five hundred and sixty-two pounds and I want you to audit me and I want you to get this wonderful thing called clearing, and so forth..." And so you say, "Oh, nothing to that. Sit down in the chair, and so forth. And here's the receipt and everything's fine." Instead of you going something like — just let the five hundred and twenty pounds sit right on the front of the desk. Just don't touch it, see. Have him sit down and say, "This — I want you to understand this. This is not an easy road. This is a tough road. It is not a short road. Its end product exceeds anything that has ever been exceeded — but it is not an easy road to travel. And it's going to have ups and downs and it's going to have heartbreaks."

And if that person puts that five hundred and twenty pounds back in his pocket and walks out the door, thank your stars he did. Because it would have cost you a thousand pounds in time to have gotten an adequate result. You see the difference here?

Now, there's a difference between certain clearing and easy clearing. Do you know the world wants from us — to know that we are doing something about things? You know, that's really what the world wants from us, that we are actually doing things about things. We're doing something about the world, we're doing something about man. We do know where we're going, we are getting someplace, we are making progress and so forth. We actually are living up to that degree of what people expect of us. Don't add to our burdens the fact that with a snap of the fingers, they're going to all be Clear. Because it isn't true and it never will be true. If it's only just the somatics a person is experiencing during the period of clearing, it'd drive most people off. They say they know they've got to go on through it, but do they have to?

Now, people expect of us to go on forward and do something about it. Yes, we're going on forward, we're doing something about it. We're doing something about it in a remarkably short period of time. This is very remarkable. That something can be done about it, proportional to the skill of administration of the technology, is absolutely certain. Things can be done. The only thing that's letting us down at all today is weak or imperfect application of technology, providing the auditor is willing to realize that a few lines dead-end and a few terminals don't represent and that he can get skunked and lay an egg and go on in and pitch again. He knows he can carve this way out. Sometimes goals are hard to find, sometimes the goals are easy to find. One fellow, the first goal he found on somebody took him fifty hours. Next goal took him three hours. Was that because he was more skilled? No, No, it just happened to be in a difference between the pcs. Next goal's going to take him seventy-five hours, maybe.
But the point I am making here is the goal can be attained. And if you tell people with that certainty we have attained it, we can attain it and it is attainable – and don't interpret that as something that is easy to do, because it is not. If it were easy to do, it would have been done many, many times before in man's history. And it's never been done in man's history. So, of course, a fellow has to be smart to do it, and of course it is a rough thing to do.

Now, there's where you sit on dissemination, and you sit along those lines – you'll be far, far better off than saying, "Well, all you have to do is sit down in the chair and I'm going to make a few magic passes." Seventy-five hours later, well, you're still making those few magic passes. You're heart's broken and now so is the pc's. So you told him it was a hard road and he gave you his goal in the second hour. And he listed out in twelve. So you made a liar out of yourself. Well, anytime you want to make a liar out of yourself that way, do so. It's the other way that you can't retract.

Well, I wish you all, those of you leaving, lots of luck. I'll probably see you before you go. And that's all we have from here tonight.

Thank you very, very much.
Thank you.

Thank you. Nov. 27, AD 12. I read my notes before the lecture! I have notes tonight. That's nice! Hasn't anything to do with the lecture, but I have notes. [laughs]

All right, this is lecture one, Saint Hill Special Briefing Course,

and I have an announcement here, very interesting. Maybe you ought to go get audited at the HGC DC. Maybe you ought to go get audited there. I mean maybe you're just wasting your time here. Maybe you are. This is a letter from Voight. The fellow whose goal was found at the congress. And he'd been listed on the 40 lines, the 114 lines, and it had gone clear, and everybody ... Well, let me put it this way; go get audited at the HGC in Washington, DC, as long as I'm consulting on the cases there, see – have to add that, because it wouldn't be a true statement otherwise.

Anyway, he wrote me, and it looked like it was all clean lines as far as I was concerned. He was free needle everyplace. And instead of overrunning it, and instead of checking it out for four or five months, and instead of trying to find out if you couldn't key him in again on the goal, I said, "Well, go on and find his next goal, and get going."

So he says, "Dear Ron, thank you for the wonderful news that I can proceed with my second goal. I had cognited on my second goal on 24 October and didn't know what to do with it. It was checked out today at the HGC. We all agree, I have my second goal. I start listing in the morning. I'll take you up on that first OT in industry." There you are. Pretty good, huh?

Audience: Yeah.

Now, we get down to business. Ohhh! [laughter] Poor R2-12! This is a lecture on Routine 2-12. Now, for you cats that have been clawing around with 3GA Criss Cross, the first and fundamental error of R2-12 showed up. Now, I can take credit for making the first mistake, so you needn't feel so bad about it, see. I could admit that I made a mistake. I myself gave you a little length and breadth on List One. I shouldn't have done that. I should have put a – not a snaffle bit – but I should have put a curb bit in your teeth. Because what do you do? You right away find ways and means to add motivatorish items to the list and of course they are an additional damage, so of course that will wind you up with no item.

So I've just done List One, Issue Two. And I can tell you the ramifications of the first list. It must contain only nouns. It must not contain any verbs, adjectives or adverbs – only nouns. And you can take the one which you've got and strike out everything on it that isn't a
noun and strike out its adjectives and adverbs and strike out all of the lines you're supposed to fill in. Just strike those out at the back and you have List One, Issue Two of Routine 2-12.

It had escaped my notice when I expanded that, that a lot of 3GA Criss Cross practice would of course invite a lot of things to be entered in on the list by the pc, even though it says in R2-12 itself that it is not the pc's list, that it is the auditor's list. So a lot of items were entered in from the pc and of course a lot of people wound up skunked; or endless dirty needles or something of the sort, and didn't wind up nice and clean and clear the way it is.

Now, there's your List One, Issue Two. It must only contain Scientology nouns. Scientology, Dianetic organization nouns and no adjectives, verbs, adverbs on it. The big reason for that – I'll tell you more about it in a minute.

Now, the next mix-up on it brings us right straight to where we should be. When you're used to doing 3GA Criss Cross you get the illusion that you know something about R2-12. And you might as well just part company with that, because the actions are similar, in fact they're the same as far as Listing and Nulling is concerned. But R2-12 is a rote procedure, and is not susceptible to variation or auditor guesses.

This procedure was put together for HPA and HCA. Now, that's a big difference. And it's been my experience that if you could drill a HPA or an HCA in on a procedure, that he would do it. That's been my experience. Now, you can drill them and correct them and correct them and correct them, and all you have to pay attention to is the fact that: Is there a factual channel of action? Is there a factual series of actions to be performed?

Now, R2-12 is this kind of an activity. And listen, it's a beautiful, concrete causeway through the deepest muck that anybody ever tried to never come out of. And just about a sixteenth of an inch off the edge of that causeway brings you to nowhere. It is a rote procedure. The rationale back of 2-12 is quite different than that back of 3GA Criss Cross.

3GA Criss Cross is an activity engaged upon by the auditor to unburden the case and locate goals. That's 3GA Criss Cross, which is step 4A of Routine 3 -21.

And Routine 2-12 is to put the case in condition so that it can show progress toward clearing, specifically toward clearing, and does actually progress the case toward clearing, and is a clearing procedure, oddly enough.

But without 2-12 you will find a great many cases will make very slow progress. And that is what we are fighting today in clearing. We're fighting slow progress.

This slow progress combined, on the one hand, by auditors not getting in and pitching – to be critical – and on the other hand, by the mechanics which 2-12 is arranged to perform. Sooner or later you would get the item which was holding up the case with 3-21. Sooner or later you would get this item – sooner or later, sooner or later. And you're mostly getting it later.

And it's much better to get a clean fire off the launching pad and get the item straight away, because it's a very peculiar set of items that you are looking for. It's a very peculiar thing. And they are not items which necessarily lead to goals. They are items which unpin the pc's bank from present time so that he can be audited.
And the action of Routine 2-12 is not the key-out of the pc's bank, as in Prepchecking, but the actual eradication of those items which have been keyed in by present time, which then and thereafter keep the pc in the grip of a present time problem. We'll go into that further.

But this is a different thing you are doing. And although it looks the same, and the actions are the same, it isn't the same. Routine 2-12 is not Routine 3-21, step 4A, 3GA Criss Cross. It is not. They are not the same actions. You can even use similar lines.

Now, where they merge is in line of 2-12, 1B, C, D, E, F, see. Those additional lines merge and go over to 3GA Criss Cross. But you can't get to those lines and unpin the case from present time unless you do a very thorough over and over and over of List One and List 1A.

Now, this is all very esoteric to say they are this different, but what makes them this different? And I'd have to go into the mechanics – which I will do later this evening – of 2-12 to show you why they are this different, and the exact thing you're trying to do. Let it suffice, at this moment, that they are different, and that your approach is a terribly rote approach.

Now, we have a Security Check on Maisy Q., over in HCO, and she is found to rock slam madly on the subject of HCO Secretaries. So now she is sent to the HGC or staff clearing, or something like that, and in staff clearing we would get goof one.

Now, you almost universally made it today. Goof – goof one is they don't do 2-12. They take "HCO Secretary," see that it rock slams, and oppose it. And then they think they're doing 2-12. 2-12 is upsetting just to this degree: an almost-done 2-12 will produce some results, and that's what'll fool you. If it's almost done it'll produce – it'll still produce some results. See, that's why it's a perfectly safe technique to release, to – as long as they're not fooling around with goals on it – to release broadly to HPAs and HCAs and let it be taught in Academies, you see.

Because you can just list something, and you can get some results, you see. That however, that aspect of it tends to whip you. Because you say, "Well, that's a nice process. That's a nice process. It's nice. Case looked brighter at the end of session."

Well, look, the case wasn't sitting in it – a foot off the chair at the end of session. Well, that's what we expect out of the process.

No. The auditor grabs the item that he has heard the pc rock slams on, sees that it rock slams and then oppose it. Well, he must be doing 3GA Criss Cross or something. He's not doing 2-12.

No. The auditor has to start from scratch. We don't care what who found or anything of the sort. He just starts from scratch. And the first thing you want to learn about 2-12: you always start from scratch.

Now, this person sails in from lower Chicago, and says that he's had 2-12 run on him, and they found the items "Ron," and "pie," and a couple of other things, and it's all set, and he feels wonderful now, ha-ha, and everything's fine.
As a matter of fact he looks good and his TA is down and that sort of thing. And you are going to find goals on this pc and you're going to do this and that. All right, go ahead. Go ahead, go ahead – run 3-21 on it. We don't care anything about that. But, if you're going to do 2-12 on him you don't say he had List One run on him in lower Chicago and therefore we're going to start with List 1A. You just never do 2-12 that way. You take List One on this pc.

Now, there's several reasons for this. We don't care if he ran the whole gamut and found a pair of items on each one of the subsidiary lists. Well, he probably would just be ready to have List 1 run on him again. So you just never pick up anybody else's auditing on it, that's all. Just don't ever do that, and you'll all be always riding high. You'll be feeling wonderful about it.

Now, there's another difference. A 3GA Criss Cross item – you understand, just because he slammed against the HCO Secretary, means that you do List One assessment, see. Doesn't matter, see. You always do that. Why? Because the Security Check was probably done on an abbreviated set of items, and the rock slam would probably settle down somewhere else on the list, if you did a full list.

See, your rock slam probably will settle more securely on something else. There's that possibility, don't you see. And maybe she just rock slammed on the person being – that was security checking her, and doesn't have a rock slam on HCO Area Secretary. See, there's all kinds of wild little possibilities that could enter into it that would upset your 2-12 progress.

So what do you do? You just start from scratch. And you do exactly what it says. Now frankly, there is nothing more canned or rote than 2-12. It's just absolutely canned. If you find a rock slam on the first list – by the way, you call it the first list no matter what List One you use. But List One is the Scientology list. The others are List 1A, List 1B, and so on.

So you start in on the first list and you find a rock slam, and it slams like mad. All right, you oppose it, and you get rock slamming items and so forth. Well, that's just a bonus. You didn't have to do four, five and six. That's just a bonus; just three steps you didn't have to do.

But the main discovery here is that any time that you can get a whisper on a list, you can represent it and turn a rock slam on with it. Very interesting. Because then you don't have to be a supergenius at getting your first list.

Let's say you had some long, drawn-out list of, "Who's upsetting you these days?" you see, and so on. And you didn't get a key person on it at all. There wasn't a key person on it anywhere. No rock slams. There was hardly even a dirty needle.

Now, I'm trying to cure you of your skunks, see. This takes your skunks out. You won't get skunked as often with 2-12 as you do with 3GA Criss Cross.

All right, you go down this list, this first list, and you assess it – you've gotten it from the pc, now you're assessing it. And if you can find on it, after tiger drilling the last three or four items, a sporadic ghost of a speeded rise which is almost undetectable at the highest sensitivity of a Mark V, you can represent it and you'll find a rock slamming item. It's marvelous.
Now, that's the discovery that I suddenly broke through with, and therefore could put it together. The number of times which you will miss on this thing are far less.

Now, the rationale of 2-12 is based on the interesting proposition that so long as the GPM is keyed in, in present time, the pc is left with a full present time problem and will show no case gain. We're no longer interested in the rock slammers. We're just not interested. So Joe, or Pete or Bill or... So they're rock slammers. That means somebody won't have to do four, five and six with them. That's all that means.

Behaviorists will be very interested in rock slammers. But it becomes an ethnic study. It's very peculiar. If a person rock slams, why, they will do all sorts of very interesting things in their vicinity and all that sort of thing. But the fact of the case is, is you could straighten them out too fast to worry about it.

Now – actually, basically, it means their goal lies in some other direction, a lot of other things. But you don't have to find their goal to set them up straight.

So we're not interested in this aspect of it. We're even more interested in the tiniest dirty needles. See, we're – that's – we're very interested in that.

Now, this is all based on an observation I made in 1949. We're really – we're really inheriting now the benefit of tremendous quantities of research. In 1949 I made this interesting observation. There was always a little flag showing up. The key engram to be run on the case was always waving a little taximeter flag. There was a still picture of an empty chair. And the pc would often run across it. And one fine day we get him to run this as an engram. We'd just start into the beginning of this thing.

Oh, my God, what we'd find lying underneath that still chair in that little picture – it was just fascinating. You know? God! Tonsillectomies and murder and rape and arson, and all kinds of wild things. But always the reactive bank leaves out a little tag.

You've got this little tab there. It's like a little index card. The file may be a thousand feet thick down underneath it, and here's this little, tiny quarter-of-an-inch by quarter-of-an-inch blue tab, see. And you say, "What's this?"

Now look, there are thousands of these little blue tabs lying around in the bank, but if you went around pulling each one of these, pulling each one, the most of them would throw away, see. Just, you know, locks, little things, mannerisms, dislikes, upsets, so forth – most of them just throw away. And all of a sudden you'd get ahold of one, and you'd look like a very young robin trying to get ahold of his first worm, you know. And it just isn't going to come out of the ground, that's all. That's tied to something.

Now, that worked with engrams, but I didn't see any reason why it wouldn't work with a GPM. Because this horrendous calculation occurred: A case change won't occur in the presence of an unhandled present time problem.

And if you don't believe that, go ahead and get somebody who's having a lot of trouble with his wife, or her husband or something; get this person. And every time you see this person clang! on a present time problem, on that rudiment, why, just ignore it. Just say, "Well, we'll take that up later. That's – after all, we're processing the things that will handle your
problems, and we're not interested in hearing about that. Now let's get down to business here."
And then get your graph done at the end of that intensive. And if you haven't also ARC broken the pc, you will have gotten no graph change of any kind. This is an experiment that you could make with the greatest of ease.

Well, what would be the biggest present time problem a person could possibly have? The GPM is composed of mass-counter-mass. Actually it's in a bundle of four, but you can regard it as mass-counter-mass, a pair. So you have A versus B, and B versus A. And they're items, identities, circuits, whatever you want to call them. And here's one of them opposing the other one. And that is the GPM. And man, that's in there with concrete. To get Clear this fellow's got to pass all the way through the GPM.

So, why not have at it? Certainly it looks like a present time problem. Also we have the idea people who have overts against Scientology or against the auditor and so forth won't go Clear. Why is this?

Well, actually, it sets up a kind of a present time problem. There's the pc versus the auditor or something in the pc versus the auditor, and it sets up the idea of the personality versus the personality, the mass versus the mass and so forth. It looks like a present time problem.

Because this is so neatly and nicely balanced, the person can't slide out of it. Nothing unbalances it unless you actually locate it and identify it. The only way you get rid of the GPM is to get it very well identified in its various parts. Now, as soon as you get it identified in its various parts – particularly the goal and so forth – why, it tends to lose its bite.

But let's look at this, now. We know quite a bit about the GPM and its various formations and fundamentals and so forth, but let's look at something here that may not have met the eye. Supposing one piece of the GPM is walking around in present time. Supposing one of these masses is walking around in present time, and the other one is hidden in the bank. One of them is visible. He knows that's part of the GPM. Maybe it's his auditor. He knows that's part of the GPM. So he says, "That's why I'm not getting Clear. There! There! Over there! There! Over there! Over there! Over there!" No pc alive ever turns around and looks over his shoulder to find out what's opposing over there.

And now hear me: that item actually will remain so undisclosed that the person could go all the way Clear and still have it – if you could imagine going Clear while having a PT problem of that magnitude.

But by some fluke he might actually key out the rest of the GPM and still have this thing sitting in present time. And you'd get the crème de la crème of the bypassed item. This would be a bypassed item with exclamation points.

Of course the probabilities of this person keying out anything or going Clear of course are remote, amounting practically to zero. But in theory, allow it, you see.

He isn't actually going to go anywhere. He's got a present time problem. And he knows what's wrong with him. See, it's all these buildings or something, you know. There it is, all these buildings, and he knows it's the buildings, and he knows it's the buildings. But his
blindness never tells him what he is or what is opposing the buildings. And of course he isn't opposing the buildings, some item is opposing the buildings and it's on automatic. He never sees the item, he just goes on blaming the buildings.

You don't know somebody for two or three years and then have a rock slam on them. Let me assure you of that! The person could have hit you over the head every morning for breakfast, and you still wouldn't have a rock slam on them. See, that takes a while to build up.

So obviously the pc has confused something in present time with the opposition mass in the bank and hasn't even seen the terminal in the bank which faces the opposition mass. Have you got the idea?

He's made a mistake. Let's put it that way. He's just made a mistake. He's mistaken something in the environment for something in the bank and then he never looks over his shoulder to find out what he is that is opposing something in the bank, and of course that is the perfect present time problem.

And with that present time problem in existence he will not go Clear and he will not show case gains. If he does, they will be very slow gains and you have your finger on the slow gain – actually, also the slow student case. That is it.

I knew it was the bypassed item. I found the mechanism of the bypassed item, knew that people weren't listing themselves to Clear every time they bypassed an item. They would put some item over here on "Who or what would want to catch catfish?" They'd put that item down there, and then the opposition of that item would go begging, see, and it'd never be located, and they'd never confront it. And it's very hard to get a pc to confront a slamming item, by the way. And would never confront it. And they can be right in the middle of the slamming item. They can join up with the slamming item. The guy hates the United States Army, so he goes and joins it. But he never perceives it. You see, being in it and perceiving it are two entirely different things.

So you see, he's in this oppterm, and he never puts it on the list. He's got half of it. He's got "Who or what would oppose..." or, "Who or what wants to catch catfish?" He's got half of that. He hasn't got the other half, so it never blows.

You get a recurring item. You see this in verbal listing. The guy'll go a few hundred lines and then he'll say, "game warden." And then he goes a few hundred more items, he'll say, "game warden" again. And a few hundred more items and he'll say, "game warden," and "game warden," and "game warden," and "game warden." It's not quite the same thing as the rabbit; it's the recurrent item.

Well, why the recurrent item? Well, that's because there is something missing. The other half of the package is gone and he hasn't confronted it, and he hangs right there in mid-air. He keeps saying "game warden," "game warden," "game warden." And it just never occurs to him to turn around and look and see "fisherman." He just never sees "fisherman." "Fisherman" never occurs to him. Doesn't matter how often you ask him the question, "Well, who or what would oppose catching catfish?" He just never thinks of "fisherman." You see, he is a fisherman.
I don't know how many of you lately have inspected your own forehead without a mirror. But it's something like doing that trick. Things that a person is stuck in he doesn't look at. In fact that's how the bank stops to accumulate, and is the basic cumulative factor of a bank, is the person is too close to it to as-is it. He never looks at it. Somebody's walking around being a body, and they never as-is that body, don't you see. They can as-is other bodies, but they never as-is their own body.

So the mass the person is in, whether it's a term or oppterm... You see, a pc can be in his own oppterm. It doesn't matter much whether it's a terminal or oppterm, or any other kind of a mass, if he's in it he doesn't perceive it so he never announces it and never lists it.

And we call that a bypassed item. It's bypassed in the process, and so of course leaves a big chunk of the GPM sitting there non-as-ised. And actually, he now has a present time problem. It's the recurring item. He can't find the other half to the item, so he can't make a package out of it. This gets to be a present time problem, if it isn't at once, and that present time problem keeps him from going Clear.

All right, well, that's just in the process of just ordinary listing. Supposing the pc weren't even pinned to present time. He'd still have some of this trouble, and you'll run into some of this trouble in any listing that you do on a pc.

Now, let's look at this thing more fundamentally. Let's say that a rock slammer is somebody who slams on any item in present time that is part of the GPM. In other words, just instead of calling it a dirty word – just say he slams on a present time item.

Well, at first we can't tell what the present time item is and neither can he. That's it. You say to somebody, "What don't you really..." This person is nervous, see, person walking down the street, and nervous. And we say, "What's going on? What's going on here? And what are you nervous about?" And God, they'll say it's the cops. They'll say it's the store windows. They'll say it's shopkeepers. They say it's a wide-open space. They'd say this and they'd say that. And they never really will be able to tell you exactly what's making them nervous.

And the funny part of it is, one fine day, one fine day, you make a list of something and a part of that list doesn't immediately go out with the Tiger Drill, and so forth. The Tiger Drill is what saves our bacon. Because it tells us whether or not the worm is still half in the ground. This little tab is stuck.

If the Tiger Drill won't immediately knock it out, then the thing is stuck in something. And the only thing for it to be stuck in is the GPM. So of course, then it is very safe. This would not be safe to do by Assessment by Elimination – show you how rote this procedure is.

If you did Assessment by Elimination and had something that stayed in, the pc might have had a little ARC break on it, or something like that, and you hadn't given it the test of: Does the other half of this worm stay in the ground? See? We haven't given it that test. Tiger Drill gives it that test. The thing doesn't blow up at once on Tiger Drill, it must be part of the GPM. That's how you tell if it's a tab.

And one fine day, why, we get a list off this pc, and the pc accidentally puts on the list – it's marvelous, but he does it consistently; he does this accident consistently – but he usually
comes along afterwards and says: "You must have put that on the list, I didn't." And there's all kinds of arguments ensue after you found the item.

Well, that's an attestation of the fact that he couldn't have faced it. And he's rattling off the thing, and then he accidently says "fireplugs," you see. And he goes on down the line and "fireplug" is on this list, and you go down this list, and "fireplug" is one of the last four, and you tiger drill the other three, and he says, "Fireplugs, fireplug? Hey, what do you know! It's fireplugs." And right away he's no longer afraid to walk up and down the street. He knows what he's afraid of. It's fireplugs.

Well, that's so good, but he doesn't know why he's afraid of fireplugs. See, so far, so good with Routine 2-12. Now, you see, you just asked him for everything in his environment, and he gave you this long list and accidentally put in fireplugs. All right, well, when you assess it down the line, you've found fireplugs – it slammed. And so you opposed it, and now you find out what opposes fireplugs, you see. And what opposes fireplugs is "People who want to park." And you've got a package. And now the odd thing about it is he doesn't even avoid fireplugs. He says, "To hell with them," see. You've discharged the mass.

Now, here again is where Routine 2-12 varies from 3GA Criss Cross, is Routine 2-12 blows up. It just goes pfff! And you're accustomed to 3GA Criss Cross, to items staying in there in concrete and brass. That's because you're reaching for deeper items. That's because the pc is more concerned about his bank. He's not concerned about present time. And you're picking up deep items in the bank, and you're picking them up for goals and all that sort of thing, and so actually you get items that will deliver goals, but not present time.

When these packages are picked up, part of which is present time, it's the most squizzely-squib firecracker you ever ignited. You go down this list, and let's say it's List One. Pocketa-pocketa-pocketa, down the list, and you find this ghost – ghost of a needle disturbance. When you read this item "fireplugs," well, the needle doesn't act the same as it does when you read other items. It's going slightly slower. And you just pick up the trace. It can be that faint. It isn't always, see.

You say, "Fine." So you list this item out. And you'll pick up a slamming item. You see, if it was accurately assessed it must have been stuck into the GPM or it would have blown out on the Tiger Drill. And if it stayed in even that slightly you can represent it. And now, in representing it, if your list is complete, you should have picked up slams on it. If you didn't pick up a slam on it, there was a goof in the assessment.

Now, the two goofs of an assessment are, of course (1) wrong question – the list is proceeding from the wrong question – or (2) the list isn't complete.

Now, there it is, and in 3D Criss Cross we'd expect that thing to hang around, but not in 2-12. We don't expect it to hang around at all. When we find it, we tiger drill it and it goes BAM, BAM, BAM, BAM, BAM, BAM, BAM, BAM, BAM, BA-BA-BA-BA bam, bam, bam, hamm-bam. And we say, "All right, now, consider committing o verts about" – bam! "Consider committing o verts against" – bam!

And you say, "Well, consider not giving things to this item." And it goes BAM-BAM BAM BAM, BAM... Bam... Bam. And we say, "All right, now, let's really get in there and
sweat now and let's clean this up and let's clean this up good. On this item has anything been invalidated? On this item has anything been suppressed? On this item..." – Bam! "On this item is there anything you failed to reveal? On this item 'fireplugs, fireplugs,' " or whatever it is, see. You haven't even found the other side of it yet, see?

You clean it up some more – "Anything been suppressed?" – and it goes dirty needle. Where the hell's the slam? Well, you idiot, you got rid of it. What are you auditing the fellow for if you don't want his bank to discharge?

And you start finding these things that are cozily up into present time and they go like that. So you oppose this thing industriously, see. I know, it went to a little dirty needle, but you saw a slam on it, didn't you? It slammed when you found it. When you tiger drilled it, it went blam, blam. All right, that's enough. Don't knock yourself to pieces on it.

Now you get the opposition to it. That opposition list slams like crazy while you're listing it. Slam, slam! And you go down over the list again and you don't find any slams on the list. And you find one final item, and you're tiger drilling this one item, and it goes SLAM SLAM, Slam, slip.

Now, this is one thing that is not given in the bulletins on R2-12 in detail. You must package the item with the pc. Now, you can get into an embarrassing situation on R2-12, where the opposition list which you have just been nulling has four items left in it. And you can't – and they're all worn out and you can't get anything to do anything and so forth.

Actually, what you do is ask the pc, one after the other, if they would oppose the item which you've listed them from. Which makes the package. And the pc says, "Well, that doesn't, and that doesn't, and that does. And that doesn't."

And you say, "All right, well, that's good. Now, it's this, is it? 'A man who wants to park' and 'a fireplug.' That's right. Is that the package?"

"Yeah, that's the package."

Now, you look at the fireplug and you can't get a whisper out of it. And you look at the man who wants to park and you can't get a whisper out of it. You've lost it, man. You can't get a whisper out of anything. The whole list went. The last dirty needles on the opposition list are also gone now, if you wanted to care and give it a look – mysterious. But you'll see an evaporating rock slam.

Now, trying to do something with it is where you'll get into the most trouble. Because it's gone. You've blown it. It's something like trying to run last year's engram. You're just not going to make it.

And that's where a 3GA Criss Cross artist would get into his most trouble. Because he's used to seeing the item there, he's used to seeing it hang around for a while, at least till the end of session, and R2-12 items off at the first couple of lists, for the first list, you know. List One and List 1A, the final combinations of those things are quite unlikely to do this. They're much more likely to go bzz-zzzz-pffft! Hhh! Pc's cognited and feels happy about everything.
Now, here's your other thing, is your case gain is disproportionate. I mean it's almost inverse to that. Because the whole slam evaporated, the amount of your case gain is sometimes absolutely fantastic. This individual's been worried sick. And now it's just evaporated, see.

My God, he's been walking down streets, and he's – all of his life he's been walking down streets, and they've made him very, very nervous, these streets have. And now, rather rapidly, in the course of four, five, six, eight hours of auditing or something like that, you've found the fireplugs. That took care of streets. And then, quite by accident, you also got maybe a bonus package. Maybe there were two items on that list that slammed against each other which had nothing to do with the final item. Because that happens very often in handling these near present time lists. In other words, you've got another pair out – a bonus pair.

There was "people who got angry at traffic," and "people who stopped traffic." And you saw both of these slam when you went down against them. You care to go back and ask the pc – and this is the other point about packaging it. You saw these two other items and they slammed wildly, and then they seemed to evaporate and so forth, remember which ones slammed that way.

Actually your nulling ought to be done with a different colored pencil, and what you do is take the wild R/Ses that you'll find that are marked "R/S" in the same color as your nulling slashes, and ask the pc if these fit together in any way. And you'll very often find a bonus package you wouldn't have suspected. And the pc didn't quite suspect it either.

And it'll go slam, slam, slam! And all of a sudden, why, his anger at police evaporates. And there he is. You've really blown something, you see. You've blown something well within his own reality. You haven't gotten "a knight in shining armor," and "a damsel in distress," you see, or something like this that he hasn't met for centuries.

See, you've got something nice like a fireplug. And boy, he can recognize that fireplug. So his gradient scale of confront comes in here, and he gets rather a terrific case gain.

Therefore, if you do it right and go right down the groove, you can expect a very rapid case gain if it's done just exactly right. And you can expect the pc to say, "Hey! What do you know, you know. Hey, whoa! This Scientology's really something. What's that? Uhh!" It's fast. Because you get this evaporating slam.

But you'll sometimes make a misassessment and you'll get deeper than you intended to. That's more likely on a list that the pc gives you in great detail. Let's supposing you were doing List 1A, and he lists "dragons." And man, he's got no present time problem about dragons. He hasn't seen a dragon for ages and ages, you know. But just somehow or another he put an associative item on the list, see, you're spattering along. "In present time, is there anything you're upset about?" see, and he put "dragons."

Well now look, he didn't answer the auditing question. And to that degree you're going to get in trouble. In 3GA Criss Cross you never interfere with the pc's listing. You just never do. And you've been taught that very thoroughly, and now, we get to 2-12, and we do.

On the first list he wants to put on it: "Auditors who are trying to ruin me." And you say, "Thank you very much." Write it on a piece of scrap paper and throw it away after the
session. On that second one, List 1A, why, he's giving you something-or-other, something-or-other, something-or-other, and "dragons."

"In present time what have you been upset about?"

"Dragons."

Well, the smart auditor of course can just scratch his fingernail on the paper for a moment or two, you see, and say, "Good." [laughter] But don't put it on the list! Because that list has got to be accurate and it'll lay you an egg. It'll mess you up.

You're going down the list, "Yes! Dragons." And it's got a much bigger reaction than anything you've got in present time, and these present time list reactions and the List One reactions are very faint, ordinarily.

It's actually quite rare for you to get rock slams and fireworks and so forth off those first two lists, there – first list – your Scientology list, and your 1A list – very rare. You won't see that very often. You just get a little ghost of some kind or another. And that thing will really open up.

And so he's given you "dragons." And there are no dragons in present time, so you're not doing R2-21 for present time items. And you get way back on the track in Marchipides or something, and you find yourself sitting there with "dragons." "Who or what would oppose dragons?"

And you get "blast pistols," and you get "knights in shining armor," and "women's screams," and so forth. And now, you've got two items that stay in and they go slam, and they'll slam, and they'll slam. You can use them to find goals with, but they're not going to do the pc as much good, you see, as if you'd found present time items. See how you can be led astray?

You have to have the rationale of 2-12 down pretty good or you could go astray with it. It is simply an effort to locate one of the GPM items as it seems to be in present time to the pc. It's an effort to locate that item in present time, and find its opposition. And if you succeed in doing that, you've taken away the present time problem.

Now, I suppose it's getting home to you that if you get a backtrack item, you're not solving a present time problem and therefore don't speed the case. You're actually – you got better materials to find a goal with. You've got all kinds of – it has a lot – it has uses, you understand?

But as far as solving this problem you're trying to solve with Routine 2-12, you don't solve it. You're trying to get rid of the present time problem for the pc. And if you don't get rid of all of those present time problems, why, the case isn't going to make a gain.

Now, this is below the surface of the pc's recognition of what problem he's worried about. And we've taken the hidden standard and all those other things that we've worked with in the past and we've gone right down below the surface.

Pc would never under God's green earth put the problem, if it was his problem and it was attached to the GPM, he just would never put the problem down if you were running present time problems. He just never would put the problem itself down.
He wouldn't put down any part of its elements. "Trying to park in town." See, he just would never put down anything like that problem. It would be something on the order of "to destroy all cities," or "get away into the country," or "to have an airplane that would fly high in the sky forever," "how to acquire enough money never to have to go for my own groc- eries," see.

You could trace it afterwards that he had thousands of problems associated with this problem, the elements of which were the fireplug and the guy trying to park. He would never see it. He just never perceives it.

You can list these things into being and it's rather easily and gently done. But never just talk the thing into being, which is a quite interesting thing. Even if he said it he wouldn't believe it was a problem of his. So all of a sudden there it is, clank.

You see, this is a whole subject of charge. And you've got charge on these things. It's heavy charge. It's remarkable the amount of stand-offness, a rock slam actually contains in it. There's stand-offishness connected with it.

Well it's – I don't know, did you ever try to look at – ever try to look at some guy who was throwing a flashlight in your face? That's a good example. Dark night and this guy's got a flashlight in your face and you're trying to see the guy. And you would very annoyedly tell him to "Take that thing out of my eyes!" you know. And so forth. But you don't see him. And you keep trying not to look toward the light. But notice that you always try to see who has got the light.

That's idiocy. What are you looking at it for? Well, the pc actually can't look away from one of these slams and can't look at it. And he's in a tremendous confusion of perception. And that perception has to be cared for very, very smoothly. If you don't care for the percep- tion smoothly, why, your pc isn't ever able to confront the thing.

So you rapidly see what the pc is up against in the business of trying to live in present time. He's got two or three items around him which have flashlights, very bright ones, shining in his face all the time.

And he's always trying to see who's holding these lights, except he doesn't know if anybody is, and he's not even aware of the fact there are any lights in present time. But he's sort of nervous and he goes around, you know. And he walks into buildings, and so forth. There's always somebody got the light in his eyes. And he's not sure what.

Unless you get that out of present time, he can't put enough concentration on the bank to lift his – list his bank out. Because it's pinned in present time. He has the – he just hasn't got enough attention units available to blow the rest of it.

I've been studying this for a long time. I couldn't conceive that some of the people who just went Clear on listing – mysteriously and marvelously – that some of these people were just less aberrated than others, more able to do this than others, able to do that... No, there was no vast difference except they just happened accidentally not to have a GPM PTP. They didn't have one.
And how faint that can be is also going to escape your notice. How faint that trace is. How faint that little blue tab is. How unnoticeable that worm is, that tail of that worm. And you say, "Well, that couldn't possibly be aberrative."

Well, you'd have the wrong idea of it. Actually, that it tabs at all, that it stays there at all, means you've got a piece of the GPM on the other end of it, and you can get it with a represent. See, if it stays at all it's a piece of the GPM.

Now, it might be too deep a piece of the GPM for the pc to have any reality on it. See, there's that possibility. But that would only happen in actuality if you were very crude.

Supposing we took the natural land animals of planets, and just arbitrarily assessed these things – nothing to do with the pc, not even in restimulation. We assess these things, and we find one, boy, that sticks there with a beautiful dirty needle.

And boy, we list a represent list on that, and we list for pages, and we list for more pages, and it's still a dirty needle – it never slams. And we list for more pages, and we list for more and more and more pages, and it never has a slam. And it's always got a dirty needle, and we can't get the list complete, and there we go, there we go, there we go, and so on, and you finally say, "To hell with it."

Later on in processing he comes up with it. You're trying to list a piece of the GPM that is completely beyond his sight, he can't even slam on it. You understand? Too tough for him.

Well now, if the person can recognize that he has a present time problem in present time without recognizing it, then it is within the zone or realm of his cognition.

In other words, a piece of his GPM floating in present time, that he is aware of enough to be nervous about it and react on it, why, therefore he will cognite on it, don't you see. So therefore you get very rapid, fast cognition, and the pc says, "Oh, yes, of course!" you know, "Fireplugs," and "Why didn't I think of that before?"

But this other thing, "Komodo dragons," he reminds you of somebody that hasn't even got enough sense to be scared, see. There's no recognition of them at all.

Later on, his confront's up – you find the item "Komodo dragon," and it goes wham! See, but his confront is way up, and the GPM has been very much tamed down. You understand? That's time for that.

Well, that's what makes 2-12 remarkable, is that it's run broadly on a great many pcs. It can be run broadly on any God's quantity of pcs, because if the pc is capable of finding a slightest trace on your first lists as you're assessing them, they're within his zone or realm of cognition. And if you do an accurate assessment, why, then he comes up with tremendous numbers of cognitions, and so forth.

I'd like to have a lot of these old cases that never cognited, never cognited, and run them on 2-12. Blow their silly heads off.

The score that you put up today, just on that, two auditors out of twelve this morning attacked R2-12 – they were all under orders to do it – head-on, and it was evidently going very successfully and very nice. Ten didn't. They did something odd or offbeat. But the odd
and offbeat things which they did can be all summed up in a few errors. And Mary Sue and I went to ground about this. She was looking over folders and picking up this data today.

But the errors that were noted in doing R2-12 are very noteworthy: Is auditors grabbing an item which R/Ses without assessing List One or completing assessment of List One. In other words, so the item R/Sed and they just grabbed it, and they went on from there. That's an error.

It's also, by the way, a tremendous error to take any item the pc simply gives you, I don't care how it performs on a meter or anything else. It just – so he gives you an item. So what? You take your items from assessment and you'll never lay an egg. But you just take these gratuitously handed up items, or heavily sold items... You see, you've only got it to slam for a minute, and now he's trying to sell you "popcorn," you see. And you – "popcorn" sort of dirty reads, because he's selling it to you, see. And you ignore the one – you say, "Well, it isn't slamming anymore-the one item I found isn't slamming anymore, so therefore I'm going to take 'popcorn.'" Kkk! See, never, just never take one the pc hands you gratuitously all by itself

Two: auditors allowing the pc to complete and add pc items to List One. Now, we've cared for that already by giving you a more canned, circumscribed List One. That is with exclamation points itself.

Three: auditors assessing out a motivator on List One. And page two additions and doing a represent on it which produces no R/S. Well, of course in view of the fact that R/Ses are – consist of – we don't care about people listing motivators or otherwise; it just happens that if you do list a motivator you never get an R/S. You're probably listing from the pc's oppterm, see.

That's what basically we find wrong with somebody getting rid of motivators all the time. In actual fact, a person who's getting rid of motivators is being an oppterm to himself. He's out of valence. He's not even in his own terminal line, see.

I had an interesting example of that. Last night I accidentally listed one in reverse – there was not really any accident about it, I'd already determined – an item that had pain and sen on it. And I listed it in reverse, after I had gotten it straightened out so that it was 99 percent pain.

See, it should have been listed the reverse way. So I went out and relisted it as though it were an oppterm. And man, let me tell you, the terminal is always at cause. I never saw a stucker stuck needle in my life than trying to list that thing in reverse.

You want a confirmation of this, take some time and say: "Who or what would the oppterm do something to?" see. "Who or what would the oppterm oppose?" you know. Instead of "Who or what would oppose the oppterm." Just "Who or what would the oppterm oppose?" And you'll have a ball. You sit there and look at a totally stuck needle and a totally stuck tone arm, and that's it.

If you ever wanted a confirmation of how the pc must be at cause, that's certainly an interesting little sidelight on it. So any time a pc's giving you motivators, he's giving it to you from the oppterm side, and if he gives you a motivator item on your List One – it doesn't matter so much on the others, because you haven't gotten motivator or overt items, you see, and
you're liable to get either one – but on this one, if he puts a motivatorish thing on first list, why, of course he gives it from the oppterm side. And man, he'll turn on sen all over the place. We had somebody do it today. Sen, sen, sen, sen, misemotion, upset, misemotion, sen, see. Goes half around the bend.

So, and four, which is quite interesting, and this is the main crime – is auditors not doing it at all. And that was – that condensed any little flubs or upsets that went into here in R2-12.

I did broaden the door here a little bit, and I closed it back, because all experimental data on it contained nothing but nounal lists. And they never contained adjectives or verbs. Just didn't occur to me; it just got by me. I thought I'd give you a little more complete Scientology list, you see, and let you complete it a little bit.

Well, up went the balloon. R2-12 itself is very precisely worked out. And so I am the one who added the first additive. I let you put a few additives on the first list. We have now taken them off.

All right. Now, you recognize that if you get rid of some problem on which the pc has a great reality, that he will get a tremendous resurgence as a case. That's pretty obvious, isn't it?

Let's say he's going around just sick – you know, just sick, about this thing. The cops are going to get him or something of the sort. He's just sick about it, all the time, all the time; he's just dying in his tracks, you know, just quivering, and so forth. And all of a sudden you handle that as a present time problem. So all of its elements disappear. He'd go, "Whew! Hu-hu-hu," you know.

And the funny part of it is when you do a very skilled R2-12, that's exactly what happens to the pc. He's very nervous, but it's about a problem he doesn't even know he's got. And he's so nervous on the subject of this problem that he's just about out through his skull. And you can take him and grab that and handle it.

Now, actually, he mustn't have a problem in order to get the problems in his own personal environment. He mustn't have a problem on Scientology. And because the session is closer than his environment while R2-12 is being done, therefore you have to take the Scientology problems away before you take the environmental problems away. Always has to be in that sequence. And you just get these problems that he's really panting and upset about and so forth, that are right there quivering in present time, and of course he says, "Whew! What a relief, man! Hu-hu." If you don't get that kind of a result, either you're doing assessments wrong, or something is awry, or you're not completing lists, or something of the sort.

I'll go into the mechanics of doing R2-12 a little more thoroughly in the next lecture.

Right now, thank you.
Routine 2-12,
Part II

A lecture given on 27 November 1962

Okay, here we are, second lecture November 27th, AD 12, Saint Hill Special Briefing Course. And this is a talk about R2-12.

There have been an awful lot of queries about R2-12. I have actually audited this procedure and audited it and audited it and reviewed it and given out pieces of it to be audited, actually for about eighteen months. A long time to audit a procedure. And I've made every mistake that you're going to make. I made them all and followed them over the hills and far away and finally found out why they're mistakes. And the only thing that I have mapped here is an invariable procedure. I have mapped an invariable procedure. I have not mapped all the mistakes. There isn't enough paper in Christendom; there just isn't enough to map all the mistakes that you could make with this.

People can always dream up more mistakes than you can circumvent. And the only thing you can do is to try to get it down to a terrifically invariable action.

Now, as training becomes advanced you of course expect people to be able to exercise judgment. You give them more judgment factors to handle and so on. Remember that this one is designed for the HPA/HCA level of action and it is very, very close to a totally muzzled, totally invariable procedure. And if you just stay on it as a line, why, you will arrive at the other end. Now, that it is an invariable procedure does not mean that it occasionally won't lay an egg. You're going to get an occasional egg laid with it even though it's done perfectly.

Now, why is this? Well, put it this way: You've picked up an item on your first list by some sort of an assessment which was not part of the GPM. You could almost classify it as a mistake, but a mistake that you would make. You tiger drilled it, and it had some withholds on it, and it stayed in. See, it wasn't well cleaned up.

Now, it actually isn't worthwhile to well clean up these items. You don't have to sit there and polish up one of these items with a Tiger Drill for three hours and a half, you understand? You're mainly interested in the session withholds and suppressions, you understand?

Now, in view of the fact that you're not going to tiger drill these things forever with Big Tiger and run a Prepcheck on the first list assessment item, you're occasionally going to get one that is simply held down by a couple of withholds or a misdemeanor that's not connected to the GPM, at which time you will lay an egg. That's all right, if you know that you can lay an egg with it, why, fine. And that is the phenomenon which we have been calling in 3GA Criss Cross "currying a dead horse."
You can go on and curry this dead horse, and polish up and gild his hoofs and polish his harness and do all sorts of things with him and buy him wreathes and so forth. But it doesn't make him any less dead. And you're not – also – you're not going anywhere while you are currying the dead horse.

So you have to learn to recognize a dead horse. Now, the source of the dead horse is just what I have just given you. There was something in on the list because it wasn't well cleaned up on the Tiger Drill and therefore the thing continued to read as the only thing in. So you started busily and methodically to list this thing, and so on. It'll happen sometimes that somebody will miss a read or something like that on it or imagine he saw a read or something or the meter will need new batteries or something goofy will occur, you see, that doesn't have anything to do with the technology. And it gets something like this.

So you have to know this one. It doesn't matter how come you've got a dead horse, you have to recognize what is a dead horse. And it's an integral part of 2-12 – dead horses. It is a list, whether a represent or an oppose list, which contains no wide slams. And that is a dead horse.

You've gotten this thing – you see, you don't have a slam on your List One. It's rare that you would have a slam on your List One, but three cheers, you do have a slam on One and you just omit 4, 5 and 6. But that's the only thing that happens. So you have a big slam going along on List One. All right, well, you just omit 4, 5 and 6 and directly oppose what you had on List One. But that slam, of course, only occurs after assessment. Because that slam can shift around, as you will rapidly learn.

What I mean by a dead horse is a represent or oppose list that does not slam after you've given it a chance in listing. If no slam occurs anywhere on a listing list, with the mid ruds in for the session, that's a dead horse.

Well, how far do you have to go on a list to find out if something is going to slam? Well frankly, you can go as far as fifty. If you haven't got any – if nothing has slammed by the time you get to fifty items, (that's by the way about twice as long as I go) but if you haven't slammed – if you haven't read a slam on this thing by the time that you get up to fifty items or something like that, there's just little dirty needles, dirty needles, dirty read, dirty read, I should be saying, you're going to lay an egg. That list is going exactly nowhere. And the best thing to do with it is carry it to fifty; if there's no rock slam has appeared and the meter is hooked in, abandon it.

Now, how do you read – if that's the case – then, how do you read a slam while you're listing? Well, it's very simple. On a Mark IV meter you turn it back to sensitivity 8 and carry your tone arm so that it is somewhere around the middle of the dial. So you've got a sensitivity 8 is your best action on a Mark IV meter. That doesn't mean then that the needle is going to wander so far off that while you're listing you're in a continuous and continual nervous prostration about catching up with this meter.

Now, what can throw you off? A pc who does calisthenics in the auditing chair can throw this off. The best way to handle the pc is to say, "Put the cans in your lap and sit still." These pcs that scratch their head with cans and scratch their knees with cans and do this with cans and that with cans are actually in a kind of a rock slam all the time. But you can cope
with this and there's no particular reason why you should permit this to be loused up. Just – you can put it in your R-factor and it won't surprise the pc, you see. "You start throwing these cans around while I'm listing on a list and I won't be able to see whether or not it's a valid list or not, so I'm going to have to tell you to sit still, put the cans in your lap." And it won't break your pc's heart. But don't go along with a superpermissiveness that permits this all the time so that you never get a rock slam visible.

Now, on a Mark V, you set it at sensitivity 8 with the knob furthest to the left. In other words, you set that knob furthest to the left and sensitivity 8. Actually the sensitivity could be a little bit lower than 8. It could actually be down to about 6 and you would still be all right. You would still see your rock slam.

That keeps your – that's to keep your needle from drifting around so madly and so wildly that you can't keep it on the dial and you're always having to adjust it and so forth. Well, you can very visibly see a rock slam if your sensitivities are as I have mentioned.

It's necessary that you list with the pc on the meter. Otherwise you will never notice this. And the meter should be turned on. There are lots of – lots of ways that you can get a dead horse list. You can get them a lot of ways and the most popular of these ways is not the way I mentioned, but to get a wrong assessment. You get yourself a wrong assessment and you're liable to get all manner of dead horse lists.

A fellow can't go down and just sit there comfortably and read these things off, bark-bark-bark-bark, and mark those that are in and winds up – misses a read, misses two reads, misses three reads, as he's going down the list. Doesn't repeat, find out if they did read or not, just made up his mind that they didn't read. And of course the item that he missed is the item which would have stayed in and he gets down to the end of the line and he becomes very wroth with the pc because he can't quite get anything to tiger drill in. So he ARC breaks the pc enough to get one of them to read. Now, that is a successful action in getting an item to read but it's not going to be successful in listing that item. And you're liable to have some item that shouldn't be reading anyway.

An E-Meter has the peculiar characteristic of spotting for you what a pc can have reality on. It's actually a reality indicator, and if the thing reads well on an E-Meter or reads at all on an E-Meter, you can get somewhere into the pc's zone of reality. But supposing you have an ARC broke item, which is simply because the pc's never heard of it. Let's say MEST. We're auditing a raw meat pc and "MEST" were on List One. And he's never heard of MEST. And he doesn't know what it is.

Well, it's been a long time since we've stressed clearing the auditing command and somebody was writing me as an emergency from an Academy that all around him he saw pcs trying to answer questions in the Academy that they didn't understand. Well, I don't know anything about that. I do know that somebody had neglected this old factor of clear the auditing command. If the pc can't answer it, why, you have to word it up so the pc can answer it. And you're going to get something like this sooner or later. You're going to get something like MEST. Let's say that was on the list – it isn't. And the pc doesn't know what it is. So every time you say it he wonders what it is. And then he withholds asking you and of course at the end of the assessment it stays in.
Now you say, "Who or what represents MIEST to you?" And this is going to be a wonderful mishmash, believe me. That will breed more dead horses that can be easily buried. That is going to be a tough one, is the misassessment, the misassessment. Now, a misassessment will be caused because the pc didn't understand something. It can also be caused because when the pc gave the word, the auditor mistook the word and wrote down something else and of course when the auditor's nulling the list he calls down the something else. The pc doesn't recognize that as being in proper sequence and so tends to protest it, which will therefore make it read.

There's another way of getting a dead horse. If you don't understand what the pc says, even though the pc ARC breaks every time you ask the pc what he said – you understand – if the pc ARC breaks every time, the way to really ruin his case is to put down something he said that you didn't understand. That really ruins the lot, you understand? It's much better to ARC break him every word that he says than to write a bad one on the list. You'll at least get a list of sorts that has some possibility of having an item on it.

But you get one of them with an improper item on it, the pc said "cats" and you wrote down "scratch." You're in a mess. I don't care if he says "rrrh" and that was supposed to be "cats." Now, the way you ask a pc to repeat something is of interest to any auditor. The way you ask him to repeat something is, don't say, "You didn't say that clearly. Say it again," see? The pc's in-session; is very susceptible to comments of this particular kind. You always say, "I didn't understand that, what was it?"

Now, a pc very often believes that you have challenged him on the properness of the item on that list. See, he said, "bwrrr" and that was supposed to be "cats." Then you say, "I didn't understand that, what did you say?" He very often thinks that you are telling him that cats don't belong on the list and that he shouldn't put it on the list. So if a pc is getting of this frame of mind, you say, "I didn't understand – I didn't understand that. Would you please spell it for me?" You're going to be a lot better off. Got it? Then you do want it on the list, we want him to spell it. If he can't spell, you've had it! [laughter]

Now, you mustn't – you mustn't say, "You didn't say it clearly," and put the burden of responsibility for its incorrectness on the pc. That is very improper. And another thing that you mustn't do is repeat the item after the pc. You just mustn't repeat the item after the pc. He says, "Cats," you say, "Cats, thank you." He says, "Game warden," you say, "Game warden, thank you." He says, "Tiger," you say, "Tiger, thank you." Man, it'll drive him round the bend.

The highest point of psychology, the tremendous zenith that they reached in all of their researches was a machine that drove people crazy. You said a word into it and it said the word back. And after that they had achieved the zenith and they stopped their researches. But they did achieve something. It's wicked of you to continue to insist that the psychologist never, never accomplished anything. He did do this. There's a monument I think, somewhere in the Middle West – been covered up during these last centuries – but it says, "On this spot they invented the machine that drove people mad." We put it there back in 2052 – anyhow, space opera.
No, I just – all jokes aside, the idea of repeating something back – particularly a little bit out of phase with the pc – can make him feel like he's spinning, particularly in a susceptible condition in-session. So you mustn't repeat items to the pc. It's all right to null them, but repeating them back to the pc every time he says them has a tendency to shut him up.

I know you can play this game with little kids and they get a big gag out of it. Remember you're playing it in the spirit of a big gag. It's a quite different proposition when you're just in there and you're writing down solemnly: he says "Cats," you say "Cats," so forth, see?

Now, the wrong way, really, to get an item straightened out is to say, "Did you say 'interim'?" He says "anteroom," see, and you say, "Did you say 'interim'?" Now he immediately has to protest that, doesn't he? And it will leave a mark on the list that will show up during its nulling. He'll sometimes forget that he did it and it'll still register. You'll get it off eventually, but it takes a lot of time.

So the saying words back to him which you didn't underst... saying words back to him always carries the liability of your not having understood them and saying them differently – aside from its factor of making him feel spinny – why, it looks like you're correcting him. And hell take vast unction to it.

Now, that goes so far as never point to an item on a list. Not: "Did you mean this one?" Just never do that. In the first place you should never make motions toward the pc anyway. His anchor points are peculiarly liable to being driven in by you, the auditor, to whom he has granted a great deal of responsibility and power. And you start pointing up the list in his direction he gets feeling – his whole theta beams will be pressed down against the end of your finger trying to bring your finger down to the point on the list where your finger should have stopped. And you get the effort of that will read on the item you're discussing.

That's a marvelous way to get a wrong goal. I myself have had a wrong goal found on me that way one day. The auditor pointed to the wrong goal and said, "You mean that one?" I made a remark – I made a remark and the remark was misinterpreted as to applying to another goal and the auditor pointed to the other goal and it stayed in by protest. And it took the devil's own time to find that protest when it was finally cleaned up. It was just dug in but deep. And you'll find a lot of items can be pushed in on a list by the auditor pointing to items.

Now, the pc can put anything he likes on a list but he must never take anything off of a list. He can put anything he likes on one; he must never be able to take anything off of one. He wants a word changed. You write the whole thing down with the changed word in it as a brand-new item. That's an invariable action.

He says, "To dance the hornpipe." And then he says, "To be able to dance the hornpipe is what I meant." And you're nulling "To dance the hornpipe."

You say, "Thank you very much," and you write, "To be able to dance the hornpipe" down underneath the one you're clearing, and go on and finish clearing "To dance the hornpipe." And then take up the next one. If it's completely disrelated you put it at the end of the list. He's got a new one, so you put it at the end of the list.
Now, that's – he wants a "the" changed to an "a." Well now, if you're sitting from the high pinnacle of always having put it down right first, then this is a change of the list. And you won't run into any ARC breaks to amount to anything if the pc tells you, "Well, that's 'to be able to dance the hornpipe.'"

And you say, "All right, you want that on the list? Thank you very much." And you put it on the list, see.

Pc says he doesn't want it on the list, don't put it on the list.

"No," he says, "Just change that one." And you say, "I'm awfully sorry, the rules of the game, I can't do that. I've got to put it on the list down below here, and I will, I'll write it down 'To be able to dance the hornpipe.' We'll see if that isn't it, or not, okay?" It's usually okay with the pc.

These are the little – the little points of listing that get overlooked that hang pcs with wrong items and that give you dead horses and other things like that. So you just do the thing, do a good clean job on listing it and then do a good clean job on nulling it and with right assessments it just runs like a ball.

We haven't made allowances for all of the ways that you can go reverse-wise. See, we haven't – we haven't said, "Now, these..." It so happens that if you null a list which has given you a consistently dirty needle and you take a dirty needle final angle on the thing and then you oppose that, that you won't wind up with very much and so forth and all of that has more or less been cut out of this thing. We say, "You get a clean assessment, you take what stays in, and you represent it, you get a rock slamming item and you oppose it." In other words, you've got an invariable action there.

If you can't carry out that invariable action don't try to carry out something else. Scrub your dead horse, in other words. You've been listing on this thing, and man, it's just going no place. There's no slam on it. Get your mid ruds in. Get your mid ruds in. "On this list has anything been suppressed?" and so forth. Get your mid ruds in, make sure they're nice and clean, everything is fine. And by the way, never put mid ruds in when the pc originates. That is absolutely against the law. Pc originates, say, "You know, I had an interesting thought then, I thought that – I thought that cats never got that big, actually."

And the auditor, "All right, on this list has anything been suppressed?"

Man, if you want to drive a pc out of session, just try that. He's keeping his own ruds in, so what? So what? He'll eventually get so he won't. It's not you – up to you to use mid ruds for punishment. But at the same time don't shy off getting mid ruds in. You know, the reverse can happen. "Every time I open my mouth..." If you operate from the armor-plated turret of always doing a good helpful job and doing everything you can do for the pc and doing everything you're supposed to be doing right and using very reliable processes, believe me, you don't have any qualms about heading the pc's attention this way or that or straightening out something or other or going on and doing something.

If you're auditing with a guilty conscience of not knowing quite whether you're doing right or not, you are very vulnerable as an auditor, because you think you might be commit-
ting overt. And therefore you tend to withdraw from them. And even an auditor who's audit-
ing almost letter-perfectly can sometimes be shaken up by a pc who says, "Oh, there goes those damn mid ruds again! All I'm doing is sitting here getting in mid ruds and mo-raooww!"

See, mid ruds.

Well, all right, so you had to get in your mid ruds too often. Tell your pc, "I'm awful sorry. I'm sorry." Treat it as an origin, don't ask him – don't punish him now with the random missed withhold question. See, that's the other – that's the other mark of a tyro. Say, "I'm aw-

fully sorry. But just exactly what are you doing there?"

"Well, I just... and so on and so on."

"All right. What haven't I found out about that?" see?

"Well, so-and-so and so-and-so and so-and-so – and that's what I'm trying to tell you."

You say, "All right. I'm trying to get these in so I can get this needle straightened out, and we can go on, you know? And I've got to put them in. I'm sorry." And go right on in and put them in.

Well, that's good auditing, see? But I've actua lly had pcs try to scold me out of getting my rudiments in and yap at it. And I don't care whether it was one reason or another, I found out the way to handle the pc was to go ahead and put them in. And the way to mess it all up was to try not to, you know, try to Q-and-A with the pc's objection.

Nope, if you're operating from the certainty of being right – you're doing your best for the pc, and so forth, and your pc starts to ream you out. And you know very well you haven't been using mid ruds to punish his withholds, you see. You know, to punish him every time he originated – excuse me. And you know you haven't been misusing this and you've been handling him all right and the pc's going straight through the roof. Well, don't Q-and-A by going straight through the roof yourself. Go on and do what you're supposed to do. He'll simmer down. Sometimes has a legitimate beef; most of the time not. Get in your mid ruds.

Now, the next big source of dead horses is this incomplete list. And I don't know how to tell you emphatically enough what an incomplete list is, because actually I've been bleating and nattering and beating my gums and splintering bits of enamel out here for a long time on the subject of incomplete lists and really nobody hears me. But I finally caught up with one thing that I mean to be very emphatic about. I have caught out the auditor who says: "The pc said he put it on the list and therefore I stopped the list." I've caught up with it. If the pc says the last one he put on the list was it, I will guarantee you that the list is not complete. It's that reversed. Pc says the list is complete, just volunteers it, I will absolutely guarantee you that the list is not complete.

I will guarantee you also that this has happened, that coming right over the horizon is a nice big rock slamming item and the pc has just chickened. The pc hits the silk, Man. He unloads right there. And part of the sensation is, is that he has put it on the list. He's fooled himself. What he really has said is he's put the last safe item on the list. And I've tested this out some times now, and I finally got the number. Because I've heard this for a long time. And I finally got this thing straight, and made some tests on it. And it's ARC broken the pc I made the test on, "Well, it does no good for me to tell you the list is complete, because then I
put that on the list, because you just keep on going on," and that sort of thing. Yeah, but here's the test of the pudding: are we getting the package? And that's always the test of the auditing. Have we got the package that made the pc well?

This pc could have screamed, bawled, howled, shouted through the entire session, and if at the end of the session you have got an item to show for it, I guarantee you that if it was the good item, that everything is fine – the pc will just – it'll all evaporate. All the bad, everything evaporates. The one thing you can do wrong is not to get a package. Not to get items, reliable items that's what you can do wrong. You knock off doing that and the pc will never forgive you.

"What do you mean," he's liable to say to you. "You mean just because I yelled and screamed and so forth, you knocked off and didn't get the item? What are you trying to do, get even with me?"

Unreasonable beast, see? You're handling a very unreasonable breed of cat. The pc is not forgiving you for getting the item and will never forgive you for not having gotten one. So you take your choice.

Now, this is particularly true on a Scientology list where somebody is slamming a bit on the list. Maybe they're not slamming enough to make it really interesting or have a rock slamming item, but there's just quivers, you know, and "zzz" and quarter-inch "zzz" and you go down, zzz, bang-bang, dirty reads, big dirty reads, you know, that sort of thing, and you're going on down the line.

Man, when you start representing that, you're liable to run yourself into more tears and protests and upsets than you've seen in a long time. Pc just digs their heels into the auditing room floor and just isn't going to go forward from there. Won't list, and so forth.

Well, anything short of mayhem, make them list. That's the answer to it. The answer to it is to get the list because that's the only road out, unless the pc has a legitimate beef. Pc might have a legitimate beef, say, "Well, I – you – you just keep doing that, you – you just keep reading that particular item, and I tell you that's in because I'm just protesting it. I don't believe that is it."

Get the protest off the item and then test it again. Pc may be right, see. Don't throw it down his throat. But you're listing something and it seems to be quite a legitimate list, the pc all of a sudden sets his heels, he isn't going to go on. Well, I don't know what you have to do to make some pcs go on. But let me tell you that whatever you have to do to make them go on, the only thing you'll never be forgiven for is not having made them go on. That's what you'll never be forgiven for. That will really shock them and upset them.

I don't care. So a pc cries. So the pc emotes. So the pc gets mad. So the pc does this. So pcs are pcs. Get the list. Pc says, "I'm not going to list any more and that's it, that's it. That's the last item. That's the last item you're going to get out of me."

You say, "All right, I understand how you feel. Let's see, what are we listing from, now? Turnip seeds. All right, listing from turnip seeds. Okay. What do you think about them?"
"Well, I think it's silly! The whole thing is preposterous."

"All right. All right."

Don't turn their cases around, just keep them talking, see, keep them talking. [laughter] And more times you'll be startled out of your wits. They'll suddenly say, "Well, there's field hands, there's feed stores, there's this, and..." You're back there listing again, see. Don't try to take words out of what they are saying to you and list them. They consider that a terrible betrayal, because they didn't give you the item. Therefore you have robbed them.

But you get yourself a good – a good list, that list is going to look in a certain way. As you are listing a list – now here's the way a list looks – as you're listing a list, and you go down the line, you're liable to run into a dwindling rock slam. Or you're liable to run into a sporadic, occasional rock slam. We don't care which you run into. But if you don't get an item that slams when the list is being written down by you, you've got no list. There's got to be some on it that slam, man.

Now, how many is some? Well, three or four in a row, one or two occasionally on the thing that aren't attributable to the pc's moving his hands, and you'll find out that very often you run into the textbook dwindling rock slam. Every one rock slams a little bit less. Every item he gives you, you get a little smaller rock slam on. Starts from a dial wide or something like that, goes to three-quarters of a dial and goes to half a dial, goes to a quarter of a dial, goes to dirty reads. Dirty reads dwindle on down and go absolutely clean and slick as a whistle. And you say, "Boy, we've really done it now." And you close your book and you start nulling and you are horrified to behold that you get a dirty needle. Not dirty reads, but you get a dirty needle. What the hell's this dirty needle all about?

Well, it's the list isn't complete, that's what it's all about. Lists go in through phases of looking flat. Now, there are various tests. You can get the mid ruds in and ask the question that you're listing from to see if it produces a read. That is really not an absolute guarantee that that list is listed out. That is a good indicator. That's a good indicator. The absolute guarantee that it is an incomplete list occurs on this test: When you go down the list nulling items you can clean up a dirty needle – not a dirty read, but a dirty needle – by simply asking the pc if he thought of something.

You say to the pc, "Did you think of something?" Pc fishes around, finally digs it up and says yes and your needle goes clean again. If you have to use more mid rud than that, that list is incomplete. You see, it's not even mid ruds. It's just the off-hand two-way comm question. You just say, "Well, did you think of something?"

Pc said, "Yes, so-and-so and so-and-so," and your needle cleans again.

Now, even that one, if you have to pull it two or three times for ten items or twelve items, no, man, that list is not complete. So you want to go at it this way, is "Did you think of something?" This is also – this is an invitation, you see, it's a two-edged sword. It's an invitation to give you his withhold or what he just thought or what he invalidated or something like that. It's an invitation to do that. Also an invitation to give you more items. See? "Did you think of something?" And then you can write this new item down at the end of the list.
But let me tell you that a pc's ARC breaks about not completing the list do not stem from the auditing or auditing flubs. They come entirely from the pc's unwillingness to confront, because when a list is complete the pc will list forever. So when he ends listing is not a test of complete list. If a list were complete he would go on listing. But when a list isn't complete, he blows his stack. He balks.

So any balk by the pc is an indication of an incomplete list. Simple. Just over the hill – you watch it. You'll see this manifestation from time to time. You'll be going down the line, pocketa-pocketa-pocketa-pocketa, and all of a sudden the pc will say, "Well, that's strawberries. That's it."

You say, "Huh?" You know, your pencil screams to a rubbery stop.

He says, "Yeah, that's the item. That-that-that's-that is the one. That-that is the one."

Well, just for fun sometimes, null the list you've just done. You want to get skunked? Just null what you've just done. You aren't going to get anything. It's going to be one of these horrible things. I'm going to put this in some bulletins so it can be spread more broadly. I'm going to put some actual patterns of incomplete list nullings and some actual patterns of some actual complete list nullings. Boy, they sure look different.

I did a list the other night that was a real complete list, man. I think on the whole list there were five items in and some fifteen pages on the first pass. And boy, the one that showed up at the end of that was the nicest juiciest matched-up item you ever saw. Yum-yum, you know. Was just out, out, out, out, out, out, out, out, out, out, "Did you think of something?", you know.

"Oh, no, no. So and so on. Suppressed something, I thought that was funny."

"All right." – Out, out, out, out, out, out – "All right, did you think of something?"

"Yeah, it was this brrt ..."

"Good. All right." Third, fourth page, all of a sudden one's in. That's all right, mark it in. Next one, in. Uh-uh, uh-uh-uh.

"Well, what have you been up to here? What do you think about it?" and so on. "Here's the list. Have you invalidated any of these things or anything like that?"

"I don't know. Oh, that one! That one. Ha-ha-ha! Yeah, ha-ha! Thought that one was awful funny. Ha-ha-ha!"

An auditor gets an awful lot of "you clowns" and that sort of thing, suppressed in doing this sort of thing.

Anyway, they just go right on down the line, pocketa-pocketa-pocketa-pocketa- poketa-pocketa-pocketa. One read out, one read out, one read out, one read out, one read out, one read out, one read out, see? Just nothing, nothing, nothing. Two in consecutively, mid ruds went out.

Imagine my embarrassment on one sector of it, though, I had two in consecutively. Two were actually in, one after the other. I'd gotten so cocky by that time I was pestering the pc because the second one was in, of course. You know. Then you say, "Pardon me!" you see,
and really – really apologize, and keep on going. But that's – that is a very ideal situation to get into.

And Mary Sue dragged out, the other day, some of the old 3D Criss Cross lists, and I really am going to have to post them for you because you'll scream, man! Twelve items long, this list is, up to the point where the pc said didactically, "Well that is it. I have now put it on the list." And then we have as many as twenty-four to twenty-eight slant marks after each item.

Oh, you thought I was going to say, "The one that was in." Oh, no, no, it went around to the back of the page. And no items resulted. And we could never understand why the case wasn't getting anywhere. That was why the case wasn't getting anywhere. Every time the pc'd say, "Well it's on the list," the auditor would stop and that was it. And then start this arduous nulling, you see. Three sessions later still trying to null twelve. Wild business, man!

So anyway, the pc – the pc actually slows down, sees that just over the horizon there is the smell of danger. One shouldn't go over that rise and so instantly gets up the one that's it, presents it to the auditor and says they aren't going to go any further than that. They'll say it in various ways. When you try to persuade the pc to go further than that they say it in various ways. They just don't want to go any further.

Now, you shove them – well, this is the other test you should make – you shove them just a few inches further and they start listing again – slam! You won't go four or five items beyond where they put it on the list, before you are looking at the first rock slam you saw in the session, in many cases. That's quite amazing, see? Marvelous. And now here's another one for you. You can have as many as about three groups of slams and a slam will dwindle two or three times on a list. That's not common but it can be expected. So that you have had a dwindling slam is no test at all, except that's a valid thing to list from. You just keep going.

Well, how far do you keep going? Well, until you don't have to get the mid ruds in to null it. Well, how far is that? Well, that's as far as it is. How long is a piece of string? Some pcs seem specialized in terribly long lists. They just love these 589 lists, you know? Let me tell you, no pc has short lists.

There aren't no such things as lists of ten, twelve, fifteen or twenty, twenty-five. There are no such lists. You don't get short lists like that. The person would be almost to OT before they'd give you lists like that. You understand? And then their confront would be up so high that you wouldn't have anything to know. They would have blown them all anyhow.

So you just don't get short lists. You get these longer lists. And a pc that works somewhere in the neighborhood of eighty to a hundred and fifty on a list is just dandy. You can have a list complete as short as sixty or seventy, but not very often. It's eighty up.

Some of these pcs go five hundred – I think there are some who have gone as long as a thousand – are actually habitual. They're habitual. I mean, you ask for their next list and they give you five hundred, you know? Well, I'm sorry for it and I'm sorry that they do this. They happen to be rare. It's much commoner to have a pc that will run around a hundred, see. But you've had it, I'd up their auditing rates at once.
But anything that restrains a pc or tries to keep the pc from doing a proper length list will wreck your R2-12, just as it will wreck 3D-3GA Criss Cross. You say, "Well, your lists are too long. I don't want to audit you." They'll give you short lists with no items on them. Then you're really wasting your auditing time, see. You find out they'll suppress items, and put them out of sight. Then you never can get the needle cleaned up.

And you finally say, "Well how come you suppressed all those items? I mean, you know, they seem perfectly good items and we've now got them on the list. But how come you suppressed them?" If you asked them something like that, that's too jabbery and talky to for an auditing session. But if you were to say something like that they'd say, "Well, we'd get through so much faster if the list weren't so long."

See, if they'd given you their normal list you would have gotten through it and nulled it and found their item in two hours and a half, you see. Everything would have been dandy, you see, so on. This is the second session which you've still been battling with this. You've now burned up five auditing hours. And the pc is trying to save you time!

I'm afraid as an auditor I never have quite measured up to the ideal auditor. The ideal auditor would never say anything about it. He would never say anything about it. And I'm afraid, after a pc has done this to me a few times, and so forth, I'm liable to say to the pc, "Thank you so much for your help." [laughter, laughs] I'm afraid I'm not completely – not completely proof against doing that.

That's the one that really gets me, though. The pc is trying to help you out so that you can't even vaguely do your job. Oh! What can you say, you know? And you sit there and you sweat it out and that's as far as I'd go there, is just to thank them a little too loudly. They sometimes get the point. And they say, "Oh well, you didn't want me to do that. You mean it would have got done faster if I'd just – just gone ahead and let you do it?"

"Yeah, that's what I mean."

"Ah, well. I'll help you out next time."

"No thank you. Just – just sit there and answer the auditing question, will you please?"

But actually, the more you beat up a pc, the less you're going to get done. The more you harass a pc, the more you worry a pc, the more you yap at a pc about a dirty needle, and so forth, the less you're going to get done. You should never yap at a pc about a dirty needle. Now, you'll rapidly come off of that and it won't be one of your sins. As soon as you learn to complete a list, you'll stop chopping up pcs for having a dirty needle.

Now, although the ideal auditor, the perfect auditor, would never cause any ARC break at all, a good auditor inevitably causes a little bit – inevitably. It's just part of the business. You're going down the line and there you sit there and you're going down the line and you're checking this and that and you're saying, "Catfish, tigers, waterbucks," so forth. And you're going down the line, and all of a sudden this thing is going bzzz, bzzz, bzzz, bzzz, bzzz, bzzzzz. Your list is already 320, see.

Now, the ideal auditor would have completed the list in the first place.
But an actual auditor very often finds it out in mid-flight. In other words, there's a difference between perfect ideal form and the form that you can achieve. You can come awful close to perfect form but this one will always throw you. The thing was clean, everything was clean, there was no indicator, no clouds on the horizon, everything was beautiful, the sun was shining, you're going down the list like mad and all of a sudden, *clank!* You got a dirty needle.

Now, if you say to the pc, "All right, let's list some more items," you're not going to get too much cooperation. But frankly, the more monkeying around you do, why, the less cooperation you're going to get. So it's almost that abrupt. You say, "All right, now I see here you've probably got some more items that you thought of in progress and we're going to turn it over to the next page and now, all right, just give me some more items."

And the pc says, "But we've done that twice!"

And you say, "Yeah, I'm awful sorry, but we have..." and so forth. "We'll just go back and, you know, kind of pick up one item there that you – that you thought of when I was going along."

"Well, 'gophers'."

And you say, "'Gophers,' yeah, give me some more."

And the pc's all of a sudden going a-a-a-a-a-a, you know, straight down the line. Marvelous to behold. Sometimes they overlist. Five would have cleaned it up, see, and they give you twenty. But never stop a pc from listing. You'll – because it's too hard to get them started in the first place. You never stop a pc from listing. Never. They go on and on and on and on and on, well, just sit there and take the items down.

Now, you can have as many as three dwindling rock slams from the same item. That is a little discovery that is quite interesting. You thought there it was and it disappeared and it went to a perfectly clean needle and you say, "I've got it made in the shade." Don't be too smug. You keep on listing as long as the pc wants to list. And you get your mid ruds in, make a test of the thing and so forth, and watch that carefully because any slightest disturbance of that needle on that test means more items on that list.

The test simply consists of getting your mid ruds in and asking the question from which you were getting the items. And you just ask that question, and man, watch that meter. Because if there's any rough-up ... That needle was flowing and you asked the question and it stopped flowing, and just sort of souped. Didn't read. There's more items on the list.

And you say, "Well, all right." Try to sound happy about it. Say, "All right, good. Well, all right. All right. Well, I see you've got some more here. And here we go." And let's just write them up, see. Get your mid ruds in and test the thing again. It's always an invariable action. You get your mid ruds in and you test.

Now, on List One there is an accidental that you must know about. On 3GA Criss Cross, on all other steps of Routine 2-12, you probably won't notice that before you start to null you have put in your mid ruds. You see, because you wrote the list and then you put in your mid ruds and tested the list, so your mid ruds are in, aren't they? And on List One, the
Scientology List, before you do it, you haven't completed any list so you haven't put in the mid ruds. So it becomes absolutely vital to get your mid ruds in on the Scientology List.

Now, one of the reasons why you can't add anything to the Scientology List turns up that if you ask the pc to add as much as one, two or three items, you have started the pc listing and will have to continue the pc listing it to get rid of your dirty needle. But if it never occurred to the pc to list, you won't have a dirty needle. But you get your mid ruds in, not on the list, you just get your mid ruds in for the session, so forth. But that becomes a little extra piece of stuff that has to go on ahead of it, just because in all other lists it occurs inevitably that you accidentally have gotten your mid ruds in at the beginning of the list, see, before you started nulling.

Now, if you add nothing to the Scientology List you won't have a dirty needle to worry about unless it's just the dirty needle of missed withholds or the dirty needle of out mid ruds. Otherwise than that, there's nothing different on handling the first list than handling any subsequent or successive lists.

Now, the thing to do in doing Routine 2-12 is just keep your eye on what you're trying to do. You're trying to find a trace first in Scientology because – areas, because that's closest to the session and then in the present time environment of the pc. You're trying to find a trace of the GPM and where it might be keyed in because the individual will then have a chronic and consistent present time problem. Now, having found this trace in present time, you recognize that the other side of the package – the second sphere, the second valence – that is opposing that thing in present time is keyed in all the time.

But also recognize, please, as an auditor, that it is a complete lie that it is in present time. It is only keyed into present time. So the moment you start listing a represent list, your pc is going to fly out of present time. But of course the thing isn't in present time; where else could he go but out of present time.

He only thinks it's in present time. It only appears to be into present time to him, and as soon as you represent, why, you'll carry him out of present time. But don't get too disturbed if for all his understanding of present time somebody starts to list backtrack like crazy. Well, what else is there to list?

You don't think this life had enough duress in it, even with the Democrats in power, you see, and the Republicans about to succeed them. You see, I mean even with combinations like that, you still don't get masses of the GPM in this lifetime. Let me assure you of that. There couldn't be anyplace but the backtrack.

Probably the thing he thinks is keyed-in in present time actually was a million years old, at the very youngest. So, of course, you're going to go backtrack. That you're going backtrack doesn't invalidate it as wiping out the present time problem.

Now, one other thing you should realize is in 1938 there was this matter of identities, similarities and differences. And you saw it first in *Dianetics: Modern Science of Mental Health*: $A = A = A$. See, $A = A = A$. In other words, everything is identical to everything, see. Everything is identified with everything. Well, of course, this is the reason the present time problem is in present time. He has got the GPM mass identified with the present time item.
Nothing is wilder than this one that occurs in Scientology organizations. You're trying to help this guy out, you see, and he keeps shoving a dirk in your back.

Why? Well, because you're the king of the "Glu-Klocks" or something. Of course, he's been dead several million years, but somehow or another you restimulated him, minds being minds.

Now, the $A = A = A$ factor is terribly interesting to you from the viewpoint of the represent step of 2-12. You can represent anything and you will peel identifications off of it. So the representing alone is auditing. Listing is auditing. And by taking anything somebody is worried about and just representing items – you see, oppose, no, no, no. See? You can't say, "What would oppose it?"

This fellow says, "I'm awfully worried about ice cream cones." I'm showing you now a little shortcut, goofball assist use of this, just to teach you the principle, see?

You can't say, "What would oppose ice cream cones?" and wind up anywhere. Because there is no such package as something versus ice cream cones. It doesn't exist. He'd have to invent it. But you can say, "What would represent ice cream cones to you?" and he'll give you the scale of substitutes for ice cream cones. This helps him to differentiate so he sees they're only similarities, not identities.

Now, you can always use represent as an assist. The fellow's got a bellyache. You say, "All right, now, what's a bellyache represent to you?" See, you haven't got him on the meter, you haven't done anything with him, so "What's a bellyache represent to you?"

"Well, it represents this and that and the fact that I am dying, and-ha-ha! That's real funny, I'm not dying," and he feels better. You understand?

But you're handling now one of the most fundamental fundamentals there are with that represent list and any time you say, "Who or what would (do something)," you're still writing a list and it's still got some represent in it. And you're actually using items to separate them out and get the pc to differentiate. And therefore he can see what is what and what is true and what is false. So you're handling all of these factors while you're handling R2-12. And the factors are in there and hidden, but they're quite startling. When you get a full parade of how many factors you're handling in R2-12, it's dizzying. So the best answer to it is just do it and you'll see those things peel off.

But it's very funny. Somebody will be absolutely sure his wife is an ogre. You've heard of this, you see. Well, actually he's just got an $A = A = A$. And you say, "Well, what does your wife represent to you?"

He'd say, "A thuh and a thuh and a thuh and a thuh and a thuh," well, he'd feel better just from doing that. And, of course, that's very short of what R2-12 could do and the wrong way to do it, actually. But you could use it that way and he'd differentiate.

So remember now, while you – while you're cursing there at the length of a list, remember the more identification on an item, the more items are going to come off on the list. The more identified the person is with something, the more items you're going to get coming
off of it. And all the time you're listing those items you're auditing him like crazy – whether it's represent or oppose – because the oppose, too, is stripping down a certain idea or concept.

And don't lose sight of the fact that all the time you're listing you're auditing him like mad. And now we'll take nulling and every time you go down this list he thinks there and he reintegrates this stuff and you're auditing him like mad. So it's all auditing, solid auditing, and about the soundest and most condensed auditing that you could do – gain per unit of time.

Now, done right, and arriving with items, this is absolutely wonderful. I mean, you get someplace with this – it's fabulous. Now where – how many, how fast should something like this go? Well, I'd say, in an HGC, an auditor who was accustomed to it or something like that should be able to get two packages very easily in a twenty-five-hour intensive. Two packages. That's four items. You know, A versus B and C versus D, in a twenty-five-hour intensive. He would really be loafing, see. He would have run into a lot of hard luck. He would have had to have done this. He would have had to have done that. It was a tough pc. You understand, all these things.

But I notice, I notice that to get a complete package that I'm – with long items and 2-12 and that sort of thing and with not being too careful or meticulous or trying to make time, actually loafing a bit on the job, and so forth – I notice it's going about 7 1/2 item – hours per pair for me. That would be for you 2 1/2 sessions of 3 – hour sessions for a pair. That's really loafing. You understand? And so I say, then, for 2 pairs, for a twenty-five-hour intensive, that is – should be pretty close to a minimal expectancy. Of course you can always go up from there.

Of course you can gear in, and of course you can really get flying. I can do a list and get an item, if I want to really sit down and sweat at it, in one hour and ten minutes. But this is, of course, putting on the pressure of this, really, really knocking it out, man. Your voice is such a blur you can hardly hear it yourself, you know – but just to give you some kind of a level of expectancy.

And when you get two items you've got to make a package out of them, so when you say two packages you mean two pair. So you get two packages in a twenty-five-hour intensive, that would be very slow going indeed. Actually, you'll find your better leading auditors will get up to about six in twenty-five-hour intensive.

But, actually, in terms of case gain, two packages of R2-12 well listed, perfect, they are the items that should have been gotten, and that sort of thing, do more for the pc than a thousand hours of anything we've ever had before. Because you've removed the present time problem out of his road and now he can get gains from auditing. Those are the reasons for fast results.

Now do you understand this technique a little better?

*Audience: Yes.*

Well, I wish you lots of luck with it.

Thank you very much.
R2-12 Theory And Practice
Part I

A lecture given on 29 November 1962

Well. I've got some notes tonight. And again they have nothing to do with the lecture, they just have to do with you.

All right, what is this?

Audience: 29 November.

Twenty-nine Nov. AD 12, Saint Special Briefing Course, lecture one.

All right. This is a talk about R2-12. Now, there's – the first thing you should know about R2-12 is there are many indications and few stabilities so far as the condition of a list. And I only know of one absolute rule about lists. A list must be nullable. It must be susceptible to being nulled. You must be able to be able to null a list. That isn't you the auditor, that's the list.

Some lists are not nullable. Now, right away we should make a differentiation here between an indication and a rule. An indication is something like tracking, and there's a bit of grass bent over and that's an indication, you see, and there's a stone disturbed in the middle of the sand pit and so you decide that something went across there and so forth. Those are indications. They're not like signposts. And these are some indications. If there's no R/S on the list, if there's no rock slam on the list, why, you're in trouble, that's just a dead horse and there's no particular reason to groom it up and gild the hooves and polish the harness and wash the teeth and all that sort of thing; it's – you just – it's just a dead horse.

And if you suddenly look up as you go along and find out the ground is awfully close to you and – and the – it doesn't seem that it's moving any, why of course you'd unload off that dead horse. And sometimes you can save some of the harness, but that's about all. And usually you don't even bother to pick up the harness, don't you see, you just skip it. Dead horse. And actually dead horses are what consume most of the time in R2-12. You will spend two and three times as much time on a dead horse as you will spend on an active list, so therefore these indications are of interest. They are not rules, you understand, they are just indications, and they're of interest.

So, although you say that if you don't develop a rock slam in the first fifty items, although – that's an indication, you see – and the pc's still awfully interested in the list and so forth, well, go on up to seventy, eighty-five items, see. Go on up a ways. Go on further. The pc seems to be interested and engrossed and that sort of thing, why, go a little bit further, still no rock slam, why just unload. Because a list that doesn't rock slam occasionally, here or there, sporadically, once in a blue moon – doesn't matter whether the slam is a dwindling slam
or otherwise – won't produce an item. It just won't do it. So, although it is true that a non-rock slamming list, a list without rock slams on it, will not produce an item, it is not true that because it produced a rock slam it will produce an item. Got that?

Just because a list rock slams is no guarantee of anything. It's just a better indication that there's an item on the list. Look at it in reverse, if a list doesn't rock slam it won't produce an item. You've got to have an occasional rock slam on that list to get a rock slamming item off the list and of course you're only interested in rock slamming items.

Now you go on and list, of course, and as you go on and list, so it produces a rock slam. Well, that's a hopeful indication, that is not a rule that it will produce an item! That it produces no rock slam, it is very positive, very positive that it will not produce an item. But that the list rock slams simply is an indicator that it might produce an item. You got that? If you just – if you get these indicators in their right focus, why all becomes easy.

Now, what do we mean by a nullable list? Well, it means one that you can go down without getting your mid ruds in every few items. Now, you'll want numbers, but unfortunately the number varies from pc to pc; but if you can't go on a list more than eight, nine or ten items without putting in your mid ruds and cleaning up a dirty needle, once more you have a very, very good indication that the ground is getting closer to you and it isn't going by at any speed at all. And what you do about that time is start loosening your feet in the stirrups.

Now, it's all right to go down a few. Now, let's talk about the sources of these non-nullable lists. A list that cannot be nulled. What are the sources of this? They are three in number: (1) That thing from which they are being listed – that thing from which the list is being listed – was improper. Well, oddly enough there is no establishing this on your early List One assessment. If something kicks or activates, you of course, represent it and get a representing list. But there is no indication of any kind from that original indication, that original needle read, that original indication, that original needle read, that will tell you at once whether this list is going to produce an item.

In other words, sometimes you get the faintest trace in the world, it's a sporadic speeded rise or a sporadic speeded fall, and you list the thing down, it slams like mad and winds you up with a nice big juicy reliable item. And the next time you have one that dirty reads and it's clicking and it even looks like it has an occasional spit!, you know, a sort of a reverse rocket read, or something like that, the beginnings of a slam, it looks hot, it looks tense and you go on and you list it and you list it and it list it and list it, it produces a slam, and you list it and list it and list it and list it and list it and list it and list it, and you go back to the beginning of it and the pc says that's it and you say that's it and it's a clean read and you start nulling and it goes out, out, dirty needle, dirty needle, dirty needle. So it's, well, we'll add to this list.

So we get in our – we add to the list, you see, and we get in our mid ruds again and we test the question, bzzzzt, question goes, whatever the list question was, and you add to it and add to it and add to it and you go back, it's all – test the question again. Flat. Not a whisper. And you go back and you start in at the beginning of the list, you're all set to go and it goes item null, item null, item null, dirty read, dirty needle. Dirty needle.

Now the unwise auditor at this point begins to hound the pc for missed withholds. Now the missed withhold is, is there isn't going to ever be anything on this list, you see. The item which you are listing from is not really going into the GPM. It's just paralleling it. And
it's going to go on forever. Well, you've already got this list out to 585 items and the question is still bzzzzt. There were slams on the list, everything else, but you can't list more than a handful before you get another charged up dirty needle, as opposed and different than the dirty read, see. Just dirty read, dirty needle, dirty needle. That ground has now greeted the soles of your shoes. That horse will not go any place else. It doesn't matter what you do to this horse, you can feed him full of phenobarbital, calm his nerves, Dexedrine to speed him up, hormones, and not a thing is going to happen.

That list would probably go to 1,595 items and still be producing the same confounded manifestations, driving you stark, staring mad. Now, that's wrong source. That's wrong source. See? That – there was no telling whether or not that thing you were going to represent, off an assessment, was going to produce a good list or not. There was no indicator in that, it just didn't produce a decent list.

All right, now there's another type of wrong source. There is the – what you're opposing is wrong. That can be a wrong source. Well, let's say you've wound up with the item "waterbuck" and you saw it slam and it faded away and it isn't there any more, and you can't get a single click, tick or snick out of "waterbuck." Yet because it slammed you're hopeful. So you say, "Who or what would oppose a waterbuck?" You've tested it out and you found out that it did turn on some sen, actually it's still turning on some sen, and you say, "Well, it's still turning on some sen so therefore, of course, there's still something there, and maybe the rock slam has just been eaten up in the middle of it all." So you say, "Who or what would oppose a waterbuck?" And this list of 300 is apparently ended as far as the pc is concerned, the question is clean, everything appears to be going along fine, it produced a slam, it looks wonderful and you start in at the beginning of it and it goes, item null, item null, item in, item null, item, dirty needle.

So you continue the list, to be safe for another hundred, which is perfectly legitimate. The question's clean again, everything is fine, everything's marvelous so you go up to where you ended off and it goes, item null, item null, item null, item null, item in, item null, item null, dirty needle. Dirty needle? Put in the mid ruds in a hurry, say, "What are you thinking about?" The pc says, "Well, I thought of an extra item. A goon." You say, "All right. We'll put a goon on the list." About this time you should be getting nervous, you know, because you can get your leg caught underneath a horse, you know, and... [laughter] So you put this on the list and you go a little bit further and you test the question and it's fine and you go back and you start to do this and it's item null, item, dirty needle, dirty needle, dirty needle.

Let me tell you, that can produce a dwindling slam three, four and five times as you list, and that list will never be nullable. I cannot give you any other characteristics than just that, it's just not nullable. What in actual fact is occurring? Well, as you see, a rock slam requires something to lean on to finally wind up with something.

Now, you've got this wall here, see, that was the reliable item and you're listing against this wall. Man, those rock slams are discharging, those rock slams are doing interesting things, you finally wind up and you're going to find the item that is pressing against that wall. That's because it had something to lean on, but this other thing, it was a clean read you were getting on the thing finally, although it did slam; and it was an item and it looked like an item
but it's a clean read now, you can't get anything off of it, and you just adventurously go on and oppose it. Of course, it's just going out into thin air. There's nothing for that list to lean on, you get the idea?

Nothing for it to come up against and so it's never going to end. It's just going to constantly miss on the GPM. What you're doing, kind of, is cutting out paper dolls that are hanging on the concrete lampposts in the GPM, don't you see? And every once in a while they come on close enough to the GPM to make something slam. And actually what you're doing is just walking round and round the GPM picking locks off of it and you can go on and do it forever. Now, sometimes the pc turns on sen, very, very heavy sen, while you're doing such a list and you would be very, very unwise not to list the list till the sen turned off.

Don't stop listing because the pc has a bad stomach or something. You'll find out that these lists, even when they're going no place and will result in no reliable item, hold the pc's interest, are producing cognitions, everything is dandy except they're never going to be nullable. And if you stop listing them at the moment the pc has a sick stomach or he feels all caved in, or you've made a mistake, actually if you keep on listing the pc will pass out of it to a light case of sen. That's the time to unload. And then unload from that horse, push the horse in the ditch, or do anything you please with the horse, but go and find another horse. And of course you have to go back to your – a first list again to continue on. Do you understand?

As you have been seeing here then, that a list rock slams is not a guarantee that it's going to hand you an item. That a list produces cognitions is only an indicator, like the rock slam is. So the pc's cogniting, fine. But that's only an indicator; it doesn't guarantee a thing. But if the pc doesn't cognite at all while listing the list or seem interested in it, that's an indicator, that becomes a rule. You see? So again you have, no rock slam on the list and no cognitions from the pc. Well, this amounts to a rule: That's going to be a dead horse for sure. But again, that the pc does get cognitions is not a guarantee of anything; it's just an indicator. You understand? All right.

Now, wrong assessment, that is to say a wrong assessment divides into auditor mistake, which winds up with a wrong assessment – the auditor just didn't assess right – and also unfortunateness. The failure to get out of bed and make the magic sign in the air before you start the day. That's just unfortunate, because you can make a right assessment and wind up with a non-nullable list. So, proceeding from the wrong point includes, for either reason, a wrong assessment or a nonreliable item. Using a nonreliable item, you see, to oppose – and that's going to wind you up in the soup.

Then of course, there is this one. There is auditing the case in the presence of tremendous missed withholds. And that's going to louse you up, but believe me, that is the rarer thing. That is a rarer thing than you would at first think. You start in a session, you pull "nearly found outs" on the pc, that's enough, man, just like you'd handle it in ruds. Don't go using missed withholds to comb the pc apart in the body of the session, because the missed withhold is the fact that the item isn't there. Now, you could drive him round the bend. He'll feel like he has missed withholds! He'll be certain he has got a missed withhold. You'll be certain of it, too! But the missed withhold is the missing item and that missing item may never
arrive on the list. You understand then that missing your missed withhold does play a role in this, but it actually plays no further a role than getting your rudiments in.

That is getting in your beginning rudiments. Make sure your pc doesn't... isn't being audited with missed withholds and you won't run into this one at all, because you don't suddenly wind up in the middle of the session. In one case out of a thousand the pc may suddenly say, "Oh my God, I'd forgotten it myself, you nearly found out I'd robbed the bank." But the funny part of it is he'd just remembered it and he told you. It isn't something you have to dredge for.

Now, your third source of travail, trouble, upset, is the incomplete list. Now, you see this incomplete list. I do wish and I must get hold of some of the old 3D Criss Cross folders to show you a real incomplete list. Man, they are championship lists; they are just marvelous. You've ju... I've looked at them and I've laughed to myself since – at it and so on because they'll have something like twelve items, you see, and about every third time over the list one of them would go out, which resulted in every item on the list having tremendous strings of slant marks, tremendous strings of slant marks, long things and of course, they wind up with exactly nothing.

Now, your incomplete list is in contest, however, with the non-nullable list, which introduces an interesting point of confusion for you. Now, it is a rule that a list must be nullable. That is the rule. And that is a stable datum. The list you get must be nullable, or you unload. What you do with a non-nullable list, which is eventually proven to be non-nullable, is you just unload off that list. You go back then and do a new first step. You don't do anything else that's fancy or try to patch this up, you just throw your blowout patches, and all of that kind of thing, throw them in the garbage can, you've got no use for them. You can spend the rest of your life trying to figure out why something is, why the thing didn't null out to that. You can drive yourself batty. You get down to the end of a list, you didn't find any item on the list and the pc all of a sudden in a frantic state of spurt thinks they're guilty for not having put the reliable item on the list, so they start giving you spates of reliable items.

Well, go ahead, put them down – well, go ahead and put all of them. They'll give you five, six, eight, ten variations on the last item that was in on the list and they just keep fading and folding up, and – oh, you can do this forever. You can come down to the last item on the list, it doesn't have any action on it to amount to anything, but you decide that you'd better represent it, and get yourself some place, don't you see? You decide your assessment might have been wrong and you missed the boat in doing your nulling, that something was in and you missed the read, something like that, so you decide you're going to do the whole list again, oh, that's just currying dead horses, man.

The proper action on Routine 2-12 is when you wind up at the crossroads of nowhere, the only map you have left is the step one of 2-12, whatever you're using for the first list, whatever should now come up as the first list, don't you see. That is always your guiding post. Now you can waste more time and do less for the pc, in all cases, by trying to patch up something you believe must be pursuing from an error, and the more time you use patching that up the more trouble you're going to get into.
The thing to do, if you get nowhere, straighten out the pc, straighten out the pc, put in your mid ruds for the list that you did, you see and so on, explain the situation to the pc, go back and take off again. You see. No crash will find – wind up fatal. That's quite interesting. The only time you can get the pc into serious trouble is you're listing a list and the pc is kind of sick and you don't go on and list the sen out of the thing, or the pc is terrified or something like this, and you don't list that sen out. Then you're in trouble. And then the only remedy is just keep listing when the pc feels horrible, just keep listing till he doesn't and then if you can't null that list even yet, and so forth, just unload and go back to your first step. I'd say that's the only thing that I would do if I found I was on an un-nulable list, so I'd ask the pc, "How do you feel?" and the pc says, "Oh, my God, ohhhhhhhhh.

You say, "All right, who or what would oppose a waterbuck?" see. And after a while, "How do you feel?" "Oh, I feel much better." "All right, you got some sen, anything like that?" "Yeah, I feel a little bit dizzy." Oh, I'll settle for that, to hell with it. Unload. Realize you're carrying a dead horse that whole length of time. You got hold of his bridle and you're dragging him down the road with one hand, you see.

Recognize what you're doing; you're not about to get an item. It is not that... a pc can turn on sen and you can get an item, but this list is already proving un-nulable, non-nulable; the list is not going to be nulled. It can't be nulled. Every time you try to null it, dirty needle, $bzzzz$, $bzzzz$, $bzzzz$, $bzzzz$, $bzzzz$. Oh, to hell with it. See what I mean?

Now, when you run into that ask the pc how the pc feels, and if the pc feels ill, sick, dizzy, terrified, furious, misemotional, any of these connotations, or if the pc has pain, why, just list it till the pc feels better and then get off of that dead horse – you're not even on him, see – and go on back to your first step. See, that's a very simple adjudication you can make.

So what you should do is keep fully in mind that a list must be nulable. A list must be nulable. And now a nulable list is one where items just go out very easily, and the needle doesn't dirty up to amount to anything and usually can be put back in by just saying to the pc offhandedly, "Is there something there you wanted to give me or something you want to tell me?" You understand? Just that, just that. And it cleans up, and once in a blue moon there's been a jam-up. You yourself should recognize these jam-ups and what they do to rudiments.

You've said – this thing has got "a helper" see, that's the item you're reading – and you've gotten cross-eyed in the thing somehow or another and you've put "a scalper" and the pc dimly remembers that this is wrong, and you say, "a helper" – you should have said, "a helper," you say, "a scalper," and a scalper has nothing to do with this list. It's "Who or what would be pleasing to mother," or something like that, you know. And "scalper," the pc says. And if you happen to look up and see a pc looking dazed or upset and your needle has gone dirty and so forth, there's always a chance that you made a mistake on the list somehow or another in reading it, and you've muddied it up, well, you go and get your mid ruds in and get your protest off of it or your mistake off the thing and keep on going, you'll find the thing will keep on nulling.

You can go on nulling this thing, you get on down to about four items and they're all giving a dirty read, and you don't have a rock slam on anything. Well, that didn't mean you got skunked, not on these light, surface readings which we're taking here on 2-12. You can't
do anything with these. Well, just ask the pc, "Does the first one" – that's on an opposition list – "does the first one oppose a mother, does the second one oppose a mother and the third one oppose a mother?" And the pc finally says, "Ah, ah, oh yes, the second one, ha, ha." And you go and you look at this mother, and it's evaporated, there's no read on "mother," there's no read on any of it. That's the packaging step which we are not particularly covering at this time.

You'll find out that blew up. Well, you've finished, that's it. That's how to get rid of the read off the last three or four when they've all evaporated; that all comes under packaging.

So that is not part of the nullability of a list. When I'm talking about the nullability of a list I'm talking about being able to proceed down this list, pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa, one call you see, out, out, out, out, out, out, out, out, out, out, in, out, out, out, in. Whenever I strike a "in" and then an "in" and then a "in," and then a "in," I get in my mid ruds. Imagine my embarrassment occasionally to find out that those three in a line were all hot. But there'd be no telling.

Now, its very, very good practice to occasionally, and I'd say once a – once a page or something like this, ask "Suppress." You see, a complete list is going out just skit, skit, skit, skit, out, out, out, out, out, out, out, out, you see? And a suppressed list will also go out, out, out, out, out, out, out, out, out, out, you know. So it's good practice, it's good practice to ask the pc, "On this list is there anything you've suppressed?" And you just – you don't take him by sudden storm, you just – you're running your meter and you say, "Well now, on – I'm going to ask the Suppress button." And you say, "On this list is there anything you've suppressed?" and you say, "That's clean," and you carry on. Got the idea?

Don't even bother to prepcheck it. See, you don't do anything with it, you just ask it, because if it's that lightly suppressed the butt on will read and if it's suppressed then you clean that suppress off of it. And then you'll find out that you're fairly safe. Now do you go back and go over anything because you found the Suppress button out? I haven't been and I haven't gotten in trouble. Usually carry on.

A nullable list, that becomes a stable datum with you. And therefore a study of what makes lists non-nullable gives you a point of orientation from which to study assessment. You're trying to achieve a nullable list. Well, if the pc's got beaucoup missed withholds, you're not going to get a nullable list.

In fact, you're not going to be getting an assessable anything. That's going to produce lots of dirty needles. If the list proceeds from a wrong source whether it was by the first assessment or because what you're opposing has no charge on it, you're going to get a dirty needle list. And that's going to be not nullable. And your incompleteness of the list is going to produce a non-nullability. Your judgment is only invited at this one point, is how long does the list have to be to be complete? And that's a question like how long is a piece of string? How high is the sky?

Now the more jammed up the pc is, which we'll go into in a moment, the more jammed up and messed up is the pc, the longer the pc's going to go with the list. The list is directly proportional to the difficulties the pc has. Therefore to lay down a rule that you must produce a rock slam in exactly so many items is a little bit adventurous. That is again only an
indicator. After a while even on the pc you're doing, you say after a while, "There should have been a rock slam here someplace. I'll carry it on a little bit further." Well, how much is a little bit further? We know this pc is not really producing very much of anything. You know, I mean, identification is fantastic on this case. Ahh, I don't know you might list 150, 175 on some very strange, peculiar case; this would be the odd case, you see.

And all of a sudden there's a rock slam, wow, wow, bang, bang, bang, bang, bang, see? And this other case is not so superidentified in the bank and you soon learn that if this case doesn't produce a rock slam in the first fifteen or twenty you've had it. So you see, cases vary. It's actually case density, and that density isn't even tone arm density, unfortunately; I wish it were. Just because a case is a high tone arm case is no particular reason why they're a totally identified case, you see.

Mass is simply mass and although mass is also produced by identification, that isn't the only source of mass, so therefore we don't have a reliable indicator in the tone arm. You get that? This fellow has an item called "solid steel" and that's a reliable item. Man, that's really reliable. And when you get anywhere in the vicinity of this item, or if you're sitting on this item for several lists before you finally arrive at the thing, you're going to get one of the staggerest highest tone arms you ever wanted to consult. And all of a su... there isn't anything wrong with the case.

And all of a sudden you're getting items, everything's going along fine, the pc's feeling better and then one day you're saying, "Who or what would oppose the government?" And he says, "Solid steel." And actually at the moment he says this you'll see this arm start to come down; then it will come down and down and down and finally when you get the item out and pair it up and so on, it goes, phooof! Clear read. Got the idea?

It happens to be a very massive item. So the tone arm is not an indicator of how dug in a case is, which is unfortunate. Now, we have a case that starts out in a total apathy of Clear read; this is the dead thetan case spoke of in E-Meter Essentials. Now, this character will require – and let's get into the rest of this thing – this case is going to require represent list after represent list, assessment after assessment, represent list after represent list! There are no slams anywhere, you're just listing, listing, listing, listing! The case is feeling a little bit better and case is feeling a little bit better and you finally decide that's a dead horse and you go on to the next one and you list that one all the way down, the case is feeling a little bit better, and you couldn't get anywhere with that one.

You go on to the next one and so forth and you'll see all of a sudden the thing you're assessing from is beginning to go live. In other words your Scientology List One is getting hotter and hotter and hotter. You've actually done list after list after list and you didn't get anything on any of them.

Now, all of that is very interesting, but what are the mechanics involved with all this, and why? Well frankly, it's the invention of a new therapy. Although we've had it for a long time we haven't recognized it as a therapy, and I finally spotted this thing for what it was. And, I didn't recognize it completely even when I gave it the definition the first time, which is: listing is auditing. Listing is auditing.
Well, I knew that listing on a goal was auditing, and that was for sure auditing, but how about the rest of this, how about the rest of this? Just listing is auditing. Simple. Listing is auditing. And let's not worry about goals or anything else. Just listing is auditing. And listing an opposition list to anything that rock slams, anything that rock slams, that continues to rock slam, it's a reliable item definition, listing an opposition list to that, is auditing. That's auditing.

Well, how much listing is auditing and what is this new process that's called listing? Well, you just sit there and list. Well, how is it circumscribed? You've got an E-Meter, the pc can get a reality on something that will read on the E-Meter. All right, he can get his highest reality on that which rock slams on the E-Meter. The more read on the E-Meter, the more capable of reality on that he is. If for these purposes you call it a reality meter, you've got it made.

Well, I think you'd find out if you haunted a hospital that you would be doing better with your meter than they were doing with their scalpels. It's taking a lot less time and you didn't get – nobody's getting their hands bloody. Now, that's a great deal of benefit, of course, to some parts of the society – laundries and that sort of thing, but it doesn't do anybody else
any good. Now, let's do it without a meter – let's do it without a meter. Let's take it at its earli-
est gradient.

We say to this individual, "What's bothering you?" "Cough, well," he says, "cough, cough, got lung trouble, cough, cough." You say, "Well, anybody say you had lung trouble you were talking to?" "Well yeah, the doctors all say so." "Well, what trouble do you think you have?" "Oh well, it, ahhhh, it's my back actually." That's interest. You find out he'll go on and on and talk about his back. So you could assess it without a meter by interest. And you say, "Who or what represents a back to you?" And you'll find out he'll spew out items down the chute man, they just avalanche out of him. And you'd make him well. And there's with no meter.

Now, the thing that combines interest and reality is the rock slam. So that if we really did a searching one, searching for the pc's interest and where it lay, and we had him on the meter, when we finally hit that point you're going to get a rock slam. Now he not only has a high reality on this, he also has a great deal of interest in this and along with these two things it is jammed up like a Sherman tank hitting a concrete bulkhead. It is cram-jam packed. You're looking at a ridge. Now everything is identified with this. He will tell you, "Actually if people in the world took better care of their backs." What's this tell you? This tells you the fourth dynamic is collapsed on his back!

Gayelord Hauser, you could run him for a day or two on the subject of food because he's got everything identified with food, don't you see? He's very interested in it, selling it like mad, attributes everything to food. Well, what's food represent to you? Oh man, he wouldn't even be able to not answer your question! [laughter] Now, the second that you hit this button you get an automatic release, and you think the pc's thinking something when he's releasing this, but he is not thinking anything when he is releasing this; he's just shoveling it out, man.

Now, I can give you an indicator for a nullable list. It comes out with interest and posi-
tiveness. So we find another rule – this is a rule: That a list must not be continued that is be-
ing invalidated by the pc. Now that is overlisting. There are several symptoms of overlisting. In R2-12 you run into the first one and skip it, which is comm lag. Who cares. But it's the be-
ginning of an overlist. We don't care about it, however. You would if you were listing goals, but not with R2-12.

The second one is: He is groping for the exact name for it. You're now getting near the danger point, but once more we're not interested in this in R2-12. This we can force and be all right. The one we can't force is the one the manifestation which immediately follows those other two manifestations. See, it's the cycle of manifestations: You see the pc there, the pc first starts to comm lag, then he starts to get the exact word for it and he hasn't quite got it, and the next line that he goes into is invalidation. If your pc is invalidating items then you are not taking them off the front of the cash register, you're trying to pull them out of the back of the machine or something.

And it just tells you that there's no list, the items of which are being invalidated by the pc, will ever prove to be a nullable list. Now, what do we mean by invalidate? Well, it's as faint as this, "waterbuck, well I don't know whether that would do that or not – ah, tiger, no, I don't think a tiger should belong on the list, let's see. It really doesn't seem too real to me that
a waterbuck would belong on the list but you say go on listing, so all right, game warden, game warden, game warden, you can put it on the list... I guess.”

Any such manifestation as that is leading to a non-nullable list. If the list is not nullable at the time you get there it might have been nullable and he's now just invalidating. Now you can go back before he started invalidating and take that much of the list and see if it's nullable. But you've sure overlisted. Don't pay any attention to this grope around for the right word, don't pay any attention to the comm lags. We are getting very esoteric. You can pay attention to those when listing goals but not in R2-12, see, it's getting too esoteric.

The pc is indifferently in-session; this or that or the other thing's going wrong. You can't be that nice. But for sure if the pc is invalidating and being unsure of what item is on, just recognize you're trying to pull them out of the back of the cash register and it's just not going to wind up in the GPM. The most uncertain person in the world when listing from a proper source will be the most certain person you ever saw on listing. So you're looking for this old factor that we used to have over here in England, certainty. You're looking for this factor. Interest, certainty, rock slams – these things are beautiful indicators.

And a list then is not nullable if it does not produce a rock slam, and a list is also not nullable if it is being delivered with great uncertainty by the pc. So the big factors that you look for are no rock slam and uncertainty. And then if you're lucky and you got out of bed that morning and you've made your peace properly with the church and a lot of other things, why, you will get a list that will wind up in an item.

But we're actually not terribly fascinated with whether this thing on R2-12 winds up with an item or not. I've just given you an example here of how you could cure somebody's back. Well, you get a lot of cases that are below rock slam; you have to audit them quite a while before they rock slam. All you do with such a case is, you just keep assessing. Taking the most you've got, doing your best to get a complete list, you never make a list that is apparently going to result in anything, and they've got no rock slams, pc's interest is, well, it's good in session but out of session it might have collapsed, see. In session they're going, "Pow, pow, pow," and "Bang, bang, bang," and "I've just this," and "Pow and bang, bang," and "Yes, yes, and bowwow-wow, yes, yes, bow, bow, bow, bow," they get out of session and, "I don't get any gains out of this; I don't know what the hell you're talking about. Totally unreal to me."

See, you can expect some kind of a manifestation like that. You don't care what the manifestation was. You get what I mean? You don't care what the out-of-session manifestation of the pc is ever on R2-12. You're only interested in his in-session manifestation. He's sailing, he's interested, he's this, man, you're sailing. So he falls on his head and develops a cornea of the thrombosis and a lumbosis of the cornea and – after the session, who cares? I say you're not interested in out of sessionness, because if you're going on auditing him and you've had to quit in the middle of an opposition list, you can expect some of the fanciest somatics you ever heard of. All you want to do is complete each cycle to the best of your ability. You understand this? Complete each cycle to the best of your ability. If you're satisfied, that's it.

Pc can turn on fantastic coldness. The room could be eighty-five degrees and the pc is just shaking to pieces with chill, cold, and you had to end the session and they go around for
the next twenty-four hours shivering their nuts and bolts loose, and you give them a fancy
goal the next day, bang, folds up, and the list is not a nullable list. I don't care; it ran out this
cold. You get what I mean?

See, we care nothing about that. We care nothing about actually whether the list was a
nullable list or not, we did it and it did something for the pc. We did that and may have tried
to the best of our ability to make it a nullable list. We tried to the best of our ability to get an
item, but if we did not get an item at any time, this is not reason for auditor suicide, D of P
criticism or anything else. You should get that fairly straight because you're going to find pcs
that'll go fifteen lists off of List One, fifteen of them without producing a single R/S. And then
all of a sudden produce one on the list itself. You find your reliable item was Scientology.
You're all set to give up. And the next time you assessed, you just said, "Scientology" and it
began to rock slam and then it didn't stop rock slamming either.

You see what you're heading for? In the first place you're doing a tremendously thera-
peutic action. That's the first thing that you've got to drill into the heads of people who are
doing R2-12. No matter what you do, if you do it anywhere near right, you've got a therapeu-
tic action which is marvelous. Going to make the pc feel fine. You just keep it up and do it to
the best of your ability. Now, that's what we expect of R2-12, just what I just said, see. Now,
if we also wind up on that represent list with a reliable item that just goes on slamming, and it
slams like mad – marvelous, and we take off from that and we do an opposition list and that
thing winds up in a... You see, that's already good that we got a reliable item, that's pretty
darn good, you see, that doesn't happen every time you do it but, there it is, see. Gorgeous. All
right. And then we take it out on the opposition list and so help me Pete, the exact reliable
item shows up on the opposition list that should have been there, and it all packages up and it
all goes bzzzttt, phump. And the pc says, "Wow!" you know, "Wowwww," see. That's pretty
marvelous. He'll feel like he's going Clear and he is, if you kept up that sort of thing.

Now, how often should you expect to get both items? Well, this is a factor which is
monitored by the accuracy of the auditor. The accuracy of the auditor. An auditor who makes
an inaccurate – inaccurate assessments, who doesn't have his pc in-session, who is making
mistakes – I mean, making mistakes in his session form, and he's Q-and-Aing and he's doing
things, he's got the pc on protest. The pc thinks of a lot of items but doesn't put them on the
list and the auditor never finds out that the pc was thinking of and suppressing items. That's
pretty corny.

An auditor should be able to find out things like this without big Qs and As and upset-
ting the pc. An auditor who does those things is going to find far fewer reliable items and
packages than an auditor who is sitting right there on the ball, bangity-bangity-bang. Now, for
an auditor who is definitely on the ball and doing everything right and using good judgment
and being careful about the thing and doing his stuff accurately and easily and so forth, for
that auditor how often – how often should you be dead on the beam? About fifty percent. This
is your perfect auditor, because that fifty percent is the pc's bank.

And the pc's bank has been a crazy quilt for a long time, wadded up and thrown in a
dark closet and the things that start to lead in from A to B actually go from A to Z, and it –
everything looks exactly as though this course from C to D – you couldn't miss on this course,
and you suddenly find yourself at R or G. Now why is that? That's the A = A = A = A factor which we'll talk about a little more later. So if you're batting 50 percent, in other words, half of the represent lists you do wind up with a reliable item – and that means, that means you're a pretty doggone good auditor – and if 50 percent of the opposition lists which you do after you got the first thing wind up with a reliable item and therefore you wind up with a package, man, you're a gee-whizzer from a way back. You're good. You're good. But what should be your expectancy about that?

Now what about what about the guy who's terrible? You know, he picks up the meter and you're there as the Instructor running the co-audit or whatever it is being run in, you don't know whether you ought to let him pick it up or not, you know, because he's sort of picked it up like this, you know. Well, about 10 percent of the time he will wind up with a reliable item. He had to make enough mistakes to equalize it out, about 10 percent of the time he'll wind up with a reliable item, and about 10 percent of the oppositions he does will wind up with a reliable item and somebody sooner or later will have to straighten out the case. But the odd part is – but the odd part of it all is, the case will feel better and be making gains. That's why it's a safe process and that's why it's been released to the HCA/HPA level of auditing.

Now, of course you guys who know your business and who can audit and that sort of thing, why I expect 50 percent. See, I expect 50 percent just like that. I mean, you should be able to deal that out pretty good, without too much trouble. Except on pcs who are obviously so dug in that a tremendous amount of action of representing has to be done before they can tell the auditor from the pc. You'd be surprised, but these people don't even know they're in an auditing session. And you do enough represent on them they eventually differentiate, and they say, "Ohhh, I'm over here and he's over there and ohhh, what do you know."

On such a pc, well, I might forgive you and give you – let you drop to 45 percent. Now, that's about the way a nullable list goes. That's actually the key data of nullable lists. Then when you look over the lecture, your notes, I think you will find there are not too many oddball variables along this line, that they're fairly easily assimilable. Now, if any more data turns up which are – which make rules out of anything, I'll sure be the first to let you know.

Thank you.
Okay, this is lecture two, Saint Hill Special Briefing Course, 29 Nov. AD 12. And going now into some more of the theory and discussion of Routine 2-12.

Routine 2-12 bridges over into 3GA Criss Cross, Step 4 of Routine 3-21 very easily. But the purpose of finding items in Routine 2-12 is to cure the present time problems which might be impinged upon the GPM.

Where you have an individual with a great, big gorgeous fixation on the National Insurance Company and how it must be destroyed before the end of the world can take place, he will continue to be fixated on the National Insurance Company.

Now, what you don't recognize, that he is looking at something which represents to him one-half of a dumbbell package of the GPM. And he will never look at the other side. He will never say, "Who am I?" He will only continue to say, "Damn the National Insurance Company."

Well, this appears very reasonable to everybody because everybody knows that the National Insurance Company has been doing all kinds of frauds and swindles and so forth. And everybody gets so reasonable about this that unless you really bear down on the new auditor, he makes a very fundamental error in doing 2-12 – makes a very fundamental error. He does an "of course," and ignores that thing reading on an assessment.

Let's take somebody, who is having an awful lot of trouble with her husband, being audited by somebody who has an awful lot of trouble with her husband. And we will get one of these reasonable "of course" situations. And the funny part of it is that this auditor, who has the duplicate problem of the pc, will say "of course" and not pay any attention to it because it doesn't seem aberrative to her and will ignore it.

This is most manifest when you can't find – you get rock slammers that can't find rock slams on rock slammers. See, this is the mechanism behind it, it's an "of course."

Of course everybody would be mad at a Scientology organization, you see? They both slam on the same thing, you see, naturally. So that – we needn't pay any attention to that. And this oddly enough, aside from all the mechanics of it will be your most fruitful source of error, is this "of course," not this reasonableness. We're only interested in the mechanics of the thing, not the ethnic difficulties.

So we have this fellow mad at the National Insurance Company audited by somebody who knows that the National Insurance Company is no good.
And they're going to assess everything in the world but the National Insurance Company and they're going to miss. You'll find this will happen, and when you're using this in Academies, and so forth, it will happen all too often – the reasonableness of it.

Now, what the actual mechanic of the situation is, that's all we're interested in. If this fellow has his attention, his overtness, fixated on any present time thing, then we assume that that present time thing represents a piece of the GPM. And that hidden and out of sight is it's opposing piece. This person never asks himself, "Who or what would oppose the National Insurance Company." That he never asks, because in the first place he is Joe Jones and he is opposing the National Insurance Company and he's keyed in the terminal arsonist and the opp term is insurers. See, it's a nice game and it's buried right there in the GPM.

But this thing is so keyed in to present time that this individual is being audited continuously with a present time problem. In session he always – some part of some session his thinkingness will fixate on the National Insurance Company. He'll compare all this as to how it relates to the National Insurance Company. He will want to get well so that he can be powerful enough to blow the top of the building off. All of his auditing is being coned in toward this.

In other words, his fixation on present time is such that he never goes backtrack. He's trying to audit himself up to something or other. In other words, he's dramatizing the companion dumbbell, see? The other ball there that is opposing that thing, insurers.

Now, the National Insurance Company is not part of the bank. It is a key-in. It is a substitute for, a lock on, this GPM thing that keeps it in continuous restimulation.

Therefore, because one side of it's in restimulation, hidden and out of sight we have the pc's terminal. And there's the pc's terminal. Pc never recognizes it. Every time he strikes a box of matches he always holds the match too long or drops it on your favorite carpet. Or he's always in trouble, one way or the other. You see him with burned fingers. And he strikes a match and it ignites the matchbox and he drops that on your carpet. And he lights a gas stove by turning on the oven full blast and then he looks around the kitchen for a while for some matches. [laughter]

You see this bird day after day, month in and month out, without his eyebrows. [laughter] But in spite of this occurring all the time, all the time, all the time, he will never dream, think of, assume, nothing, about this terminal arsonist. And yet there it is in full restimulation.

Now, your little tab that shows up is his dislike of the National Insurance Company. And as you're running "Who or what would bilk people" or some question, he puts down the National Insurance Company. And as you go down the line with an assessment you suddenly find yourself looking at an item – National Insurance Company. And this thing rock slams, which means fixation, overts against, withholds from, games condition, that's what that rock slam means. It means the pc has a terrific reality on this thing. And it means the pc will shell out items on this thing like a Las Vegas blackjack dealer.

So there he is, that item, National Insurance Company. Well, we test it out and we find out when we say to him "National Insurance Company," that he turns on sen. We say, "National Insurance Company," he sort of gets gritty toothed, you know. And he sort of at the
same time feels a little dizzy, feels a little tipped over. Anchor points seem to be kind of out of balance. Things begin to go into motion in his vicinity – sen.

So, this thing still slamming nicely, we say, "Who or what would oppose the National Insurance Company?" Man, we get a beauty. This list goes bangety-bangety-bangety-bangety-bang, and finally item number 289 – or something like that – he puts on the list his arsonist. We go ahead. The list is obviously complete, reacts to it because it's nullable and we go down and we null the thing out. And there we're staring in the face arsonist, and it's rock slamming like mad.

All right. Now, if National Insurance Company was a reliable item you would just go directly at it. But supposing National Insurance Company is just a tick-tick-tick-tick on the assessment when we finally find it, doing a represent or an assessment of a represent list. And we do a represent and it gets down to insurers, see. Then that will slam.

All right, the final end of it is, is regardless of whether we had to represent it to get the rock slam or whether it was just rock slamming in the first place, we've got a package. And this package means that we have found the two ends of the dumbbell. And this thing will discharge. Now, it won't necessarily evaporate totally. But usually if it's that close to present time we can count on it going absolutely numb – nothing. It'll wash right out as he begins to think this over.

There are other things we could do with these if they kept on slamming and so forth. Why, we could represent the slamming items and they'd lead us deeper into the GPM. We can do other things with these. We could even list goals against any – either of these reliable items, you see. We've got other uses for these. We're not interested in those uses in R2-21 – R2-12 rather. Only in 3-21 are we interested in that, which is Step 4A, 3GA Criss Cross. So our main concern in doing 2-21 [2-12] is that there are two pieces of the GPM.

Now, why is it called a GPM? It's called a Goals Problem Mass. It is a mass which is composed of identities which oppose identities. And they are so delicately faced against each other on the track that they don't slip. They're right there and they finally compose a great big, gaudy, black mass.

And you are going to have pcs tell you, "Oh these black masses that Ron talks about and so forth, probably he has an oppterm religion or something like that. And he probably – black masses," so on or something or other ... Then, "Nobody's ever seen one of these things." After a while, all of a sudden this – all this phenomena will start showing up for the pc.

I had somebody tell me that, "Well, I sort of parted company with your work back in 1952 when you started talking about ridges and things and I had no reality on that," years later all of a sudden collide with a ridge. They are black, they are round, they do oppose each other. In other words, these are not allegorical or metaphorical actions. They do have mass. And the anatomy of a problem is item versus item, postulate versus postulate. It's a game, in other words, where you have two sides equally opposed.

A problem does not become a problem as long – until one is unable to overwhelm and won't be overwhelmed. In other words, a problem is a matter of balance. You don't find peo-
ple having problems with the government of Russia. In Russia you have no problems with the government. You are simply completely overwhelmed all the time. No problem.

You talk to a Russian, "Do you have any problems with your government?"

"No, no, no, never have any problems with the government. Fine government, fine government, fine government. What other government is there?"

"You mean you're free? How do you stand it?" You know, you find all kinds of weird arguments.

Now, in that case you find some girl who has won in a marriage. Marriage is no problem to her. Got her husband completely overwhelmed. He cooks dinner, he earns the money, takes care of the children, everything. And she never lifts a foot, sits in the dining room, sits in the living room eating bonbons. She's got that licked. Marriage is no problem to her. You see here's your case of overwhelm or be overwhelmed. Well, that doesn't make a problem.

No, her husband works and makes money. And she works and makes money. And the husband doesn't like housework but thinks the other party should do it. And she doesn't like housework and thinks the other party should do it. She likes to go to movies and the husband likes to sit home and read books. They are more or less of equal strength; Saturdays she wins the fisticuffs, Sundays he does.

This thing is never resolved – never resolved. Nobody ever overwhelms anybody. It goes on and on and on. If you spoke to either one of them and you said "a problem?" – they would say "wives" or "husbands" or "marriage," something like that. See, it's got to be an equally balanced affair. That's the point I'm making here.

Well, now, don't underestimate the age of a pair of items in a – in the Goals Problem Mass. This thing – this whole thing is built up, basically, on the alter-is-ness of goals. So you say at once, "Well, why don't we just find the pc's goal and then everything will resolve."

Well, unfortunately that is not the case. Because even if you found the pc's goal on the bulk of the pcs, he has still got two items which are present time problems. And the goal doesn't instantly and immediately resolve those items. And so you're trying to audit somebody with a screaming present time problem, even though you have this person's goal. And you'll find out this goal just doesn't ever list to free needle. And he just doesn't ever go Clear. So that's why. Now, these bypassed items, and so forth, are pinned into PT one way or the other and they're beyond the pc's reach or confront.

So here – here is what we get. We get this equally balanced pair, one against the other. And being an equally balanced pair there's no slip. Neither one of them has ever overwhelmed the other one. But the age of this, how long has this been going on? Well, it may have been going on for trillions and trillions of years on a single pair. And the game just before that – all based on the same goal – is another pair and it has gone on for trillions. And there's another pair before that. And how long has that game gone on? Trillions. And there's ... See?

Some pc who tells you that he has totally accumulated his aberration in this lifetime because you've been mean to him – never been done and it never will be done. It takes a long time to get in that kind of condition. Takes a long time.
Now, let's take this one that's right up at the top: arsonist and insurers as a package. Take this one right up to the top of the bag of walnuts. This thing is a billion years old, see, or a trillion. And boy is it massive and boy is it beefy and boy has he lived a lot of lives in that pair. Lots of types of lives. Why, this guy has even sunk so low as to become an employee of insurers. Had the most seniest life of all. [laughter]

He's been anything and everything, you see. But these items are cumulative. So you have two principal valences, perfectly balanced, one against the other. One is thrusting just as hard as the other is thrusting. Neither one of them are overwhelming the other. And to those are accumulated thousands of additional little ones. And those things also oppose those things. And you can just – it's just almost endless, numerically. You get staggering figures out of this sort of thing.

Now, this – this composition of the GPM would be very nice if it just consisted of a dumbbell and then below that a slightly bigger dumbbell. And below that a slightly bigger dumbbell and below that a slightly bigger dumbbell. And there were sixty dumbbells in numbers – sixty pairs – and that was the whole lot of it. And then we went into the second goal below that and then there were forty-two pairs that went into the second goal, you see, and so on. And this was all laid out and perfectly plotted against the time track and so on. They'd be very easy to find. But they aren't plotted that way. If it was all straightened out it would be plotted that way.

But this pc is a case of scrunch. The characteristic of the reactive mind is instantaneousness. There is no time in the reactive mind. This happens to be one of the highest characteristics of a thetan. Actually a thetan has no time. And the lower scale mockery of that particular characteristic is no time, everything in this instant.

Now, you've got the whole of this Goals Problem Mass, to the pc, is dated this instant. It could be sixty trillion years' worth of this instant. There is no time differential in this thing. Therefore when you null, you say one of these things to the pc, it reacts on the meter as this instant. One of the reasons we call them instant reads. Soon as the thought gets across it reacts. How could it possibly react? Well that's the marvelous thing about it. It's just the instantaneousness of the reactive bank.

The analytical mind would require a lot of time. So you'll find out that your latent reads are analytical reads. The more time is connected to a read or the more time is apparent in reads – and this is only a rough approximation, not a hard and fast rule – why the more analytical it would be.

But you don't find slow reads on the reactive bank. Now, the motto of the reactive bank is A=A=A=A, à la Book One. And according to the Dianetic Axiom, time is the single source of human aberration – and it is. You have this A – prime thing that is the most aberrative about it is the time. So that time equals time equals time equals time; 1870 equals 1920 equals 1736 equals the year zero. They're all the same instant – not the same year. The pc isn't confused about these things. On this level of reactivity they are all the same instant! And a hundred trillion years ago is this instant. And everything is this instant. It's the most gorgeous, instantaneous current reaction that you ever wanted to have anything to do with.
Well, if time is all the same, what differentiation can we find that we can work on? The differentiation we can find is in reality on. Actually, in theory, every time you say *boo* to the pc the whole reactive bank reacts. Every item in the reactive bank reacts. But this is one of these "absolutes are unobtainable" and it's a nonsensical statement. You see, it's like "you stamp against the Earth, the Earth stamps against you," you know. It's this type of statement. In actual fact, the situation as we look at the meter is only saved by the reality of the pc – saved by the reality of the pc – because the meter reads on what the pc has reality on, not what the pc is momentarily in.

As far as the GPM is concerned – you see, there's free track running alongside of the GPM and the pc can move up and down that track – and Dianetics is the study of that free track. We're now studying the GPM; we're not studying engrams. What we're studying is covered in Book One under valences and circuits. And all that talk about circuits in one chapter there, those are all items right out of the GPM. They are right there in Book One.

I was aware of this thing but not to the extent that it pervaded the mind. And not to the extent that the free track can be neglected. You can do a lot for somebody running free track, but it's this instantaneous track. See, free track is timed.

The reality of the pc is governed by the pc's tolerance of force. So your pc is not recognizing that which is closest to him in the moment of time or any of these other things. It's not that one thing reads because it is later than the other or earlier than the other. It's a thing reads because it most closely approximates the pc's limit of reality on force.

And you can always run against the ceiling of that limit; just the ceiling against that reality on force. And that ceiling is marked by the rock slam. That's how much force can this pc bear to confront? You'll find out a person is as sane, not as he uses force, but he is as sane as he can tolerate force. A direct relationship between force and sanity.

You start running around banning bombs. You run into a very interesting proposition. You're not going to get very much support because the bulk of the population of Earth doesn't believe in them. There's too much force contained in an atomic bomb and they just can't confront it so it just isn't real.

Actually, if the population were capable of tolerating force they would have long since have torn both the governments of the United States and Russia to pieces, limb from limb. The reason wars can occur is because people can't tolerate force. So they have no reality on what they're doing. They don't know how much force they're going to turn loose. It's an irresponsible action.

So a sanity is very far from measurable on the degree that an individual can throw out force – not handle force but throw out force, see? The amount of force that an individual will let loose is no index of his sanity. But the amount of force that the individual can confront or tolerate is a direct measurement of his sanity.

And as the individual has come down the track through the GPM he has been less and less capable of tolerating force. And so the PT terminals and oppterms that are stuck right in present time are usually quite insurmountable to the pc until you've audited him with 2-12. Why?
Well, all preclears suffer from some sort of a reaction like this: They think there is more to it than there is. It is inevitable. That's one of the – one of the guiding idiocies of a thetan. A thetan has several nuttinesses. He was born that way. And one of the things he was born with is just the – he thinks there is more to it than there is. He's always trying to make more of it than he can make out of it.

Now, you'll have many a pc – you've had this experience – you've had some pc sitting there – his pc is saying, "Oh well, let's see now, I'm trying to get off this withhold and it must be pretty bad," he's saying to himself. "And if I just get off this big withhold," and so forth, "I'd smooth out the needle. And I'm just always having to have mid ruds put in on me. And I must have done something very, very bad and I must have some big, dramatic withhold of some kind or another."

He goes on and on and on and on and on with this nonsense. And then eventually says, "Well, I noticed your tie was crooked," and the needle straightens out. You get what I'm – what I'm driving at here.

Now, this – auditors do this sometimes, they will hound the pc trying to pick up the missed withhold because the pc's got a dirty needle. And they – this girl, why heavens, she must have had all sorts of clandestine second dynamic withholds of various kinds and considerations which are catastrophic and fantastic and so forth. And the auditor is in there trying to straighten out with magnitude of dramatic effect, what in essence, would straighten out simply with a confrontation of something rather minor.

You've sat there sometimes, I'm sure, and had been certain that this pc must have done something gigantic. And if you were lucky you eventually got what the pc did and it was very often neither gigantic nor not gigantic. And sometimes the pc upset you by giving you something gigantic. But the point – but the point I'm making here is it bore – actually the amount of dramatic content had little or nothing to do with the aberrative effect apparently on the needle. It just didn't have that relationship.

Well, similarly, the only thing that will react on the needle is what the pc can get reality on. It isn't what's there or what isn't there.

In this lifetime this pc has got very little drama. That I can assure you. But now we go into the GPM; I'm afraid that life was not quite as represented. This person is putting on a marvelous show. They go down and they always, inevitably are the first volunteer on the scene to sell poppies on Poppy Day. And they're nice to stray cats. And they do this and they're all subscribing to this and that and – crutches for aged policemen, and all kinds of fun. And they're always around working, joining the United Nations, you know. Going to straighten out Katanga and all kinds of wild, incredible things these birds are up to, see?

And you look it over and you've got this pc in the auditing chair, see? And this pc is good, this pc is kind, this pc is sweet, this pc is that. Well, your ideas of this are rather excited. You say, "Well, it can't be this true," and if you try to pick it up as straight withholds you're going to lay an egg. Because boy they've been good for a long time. Hundreds of years, see, they've been good. And underlying all this will be the exact reverse of something or other, you see?
They were – they were the person – they were the person who solicited the bribes for
the axman from the relatives of the about to be deceased. You know, a gold piece for a good
clean stroke. You know, this kind of thing. And then that was the deteriorated end of some-
body who made a profession out of getting nobility murdered so they could have their estates
given to them, see? You find out on the whole track they've been pretty, pretty interesting.

Now, you do find dramatic stuff in the GPM. The overts are with magnitude. But you
don't pull them bit by bit, don't you see? They turn up as a whole package. There you got it.

And we've been disappointed for so long – been disappointed for so long – in looking
for something gargantuan out of the pc on a Security Check or something like that, that we
may have gone into apathy about this point – and we shouldn't. Because your reliable items,
as you pair them up and keep going, why the blood starts flicking out of both sides of the
E-Meter after a while, you know, because they inherited the GPM quite honestly.

And the reason they're trying to make much out of it or more out of it, they're trying to
match up with what's in the GPM, don't you see? The GPM restimulates them to believe that
they have done something, but they can't put their finger on it. Well, it's in the GPM. There's
drama in that mess. But frankly it isn't drama which happened over the last two or three hun-
dred years.

It's been going on for a long, long time. And it's accumulated an awful lot of identities.
And to be able to cut into this thing at all and release it as far as it exists in present time as a
present time problem, is utterly fantastic. And to think that somebody was – knowing the exis-
tence of this – to think that somebody was going to go Clear by sitting and reverently re-
garding his own navel for a long enough period of time becomes utter asininity. It does!

Some of the technologies or techniques which have existed on this planet that were
supposed to free people, you begin to wonder who the hell was swindling who? Because just
try and represent some of these lists some day. Know how much skill it takes to actually strip
one of the things down, look at the resulting items, put the thing together, recognize what the
mechanics of the thing are and you become stonied. And you say, "Somebody was going to
get well by sitting in a chair and saying the number of times he was interfered with as a little
boy?" No, couldn't possibly have happened.

And for us to get an inroad on this, to even get sight of the GPM... You realize we
would have done enough just to have a description of the GPM, say "This is what's wrong
with me," much less tackle it. So actually we're really doing something here which is quite
fantastic. Because when the pc starts getting mixed up with this, an auditor has to go steady
on sometimes. Pcs actually get pretty upset, sometimes, in handling this because it's very up-
setting, very. So it requires an auditor who will complete the job. He's got to go as far as he
can go, honestly, before he goes and goes as far as he can go.

And there is no room here for an auditor who quits because the pc twitters or because
the pc's got a somatic. There is no room here for an auditor who won't complete a cycle of
action. He's got to complete a cycle of action to the degree that he can complete it. Or recog-
nize arriving at a point where you realize that it's a non-nullable list – you did complete the
cycle of action. Particularly if you nulled it out long enough to take most of the sen off the pc.
You've completed the action that was in progress to the degree that it could be completed. And you should always do that.

Now, R2-12 tries to unpin these great big PTPs out of present time. And people are going to say this very interesting thing to you countless times. You're going to get sick of this. I've gotten sick of it already. They're going to say, "But look, the pcs gives the list that goes backtrack when you're trying to solve a present time problem."

One of the reasons I've been giving you this much anatomy of the GPM is simply this: where the hell else is there to go? [laughter, laughs] Somebody must be operating on the basis that this person has had enough sin, crime and overts since he was born in this lifetime to aberrate himself. I assure you that isn't the case. Couldn't be the case.

Some fellows I know have put in some good licks, and some of them find this lifetime as a little, black ball. They've got no track. They can't go back earlier than this. They will have done something there, sometime or another, that already have started or put a wart on one of the main dumbbells. See, you'll find this; you'll find this every once in a while, not rare. But for one to have formed a whole sphere, a whole black mass in one lifetime? Oh no, not possible.

Had somebody – say on old 3D Criss Cross one time, "I don't think that I have thought up or found out a new idea for the last million years." He suddenly collided with what was his thinkingness. And all the ideas he had in this lifetime were in that lifetime. Well, if he'd kept on going he'd have found them earlier than that. He hadn't thought of any original ideas for a lot longer than that. It isn't that it's impossible to think of original ideas, but to have original aberrations is pretty far flung.

Now, what we want to take a look at here in the GPM is not only that we could clear somebody by continuing to find item versus item, because we could – if we found reliable item versus reliable item and then found another reliable item and got its oppterm and kept going and going and going – slow job, but we could clear somebody that way. A point you mustn't overlook.

You're walking down the rock slam road. Person eventually, you get about – oh, I don't know – you get twenty, thirty pairs and this person is saying, "Well, here's my goal." You couldn't go any further than that without him giving your goal. I mean he'd just say, "Well, that's my goal." Well, of course you can use the goal to find reliable items easier than you can use arbitrary lines. And you just go on with the same thing. I mean, you just could go on using his goal as the source of lines in all cases. But now you would be into 3-21. You'd have shifted gears over to 3-21, bypassing 3-21 Step 4. See, that's where you'd be.

So, 2-12 cuts into Routine 3-21 at a place which is determined by the extent that 2-12 is run. The more 2-12 is run the lower it cuts into 3-21. I mean, if you just undid the present time problems of the pc, snap-snap, and got a couple of reliable items and they paired up and so forth, and you find the pc's tone arm now moves and a lot of other things occur that's highly beneficial, then you would cut into a Prepcheck and then you would cut into a goals list and you could go right on with 3-21.
See, in other words we straighten it out so the case would get a rapid gain. Just got rid of the present time problem and so forth. We move right over into top of 3-21.

All right, or let's supposing now, that we went ahead with problem 2-12 and we got six items. That's three packages, one kind or another. These are all pretty surface packages. Well, we've already done at least one package that could be used in Step 4A, 3GA Criss Cross of Routine 3-21. So we take one of those oppterms, the – one of those advanced oppterms – and we just list goals 1 to – list goals list 1 to 10. Usually it would simply be 1 and 6 of the old goals list of 3GA Criss Cross. We list it against that beefiest oppterm and we turn up with the pc's goal. And then we would carry on from there.

But if a case were even rougher and harder and we didn't succeed at that... Well, actually, you would go into 3GA Criss Cross from that point there on, just getting more items. Quite a similar operation but you would be using the Prehav Scale with which to do that.

And a little more succinctly, supposing we did 2-12, and boy, we really had this case flying. We had found a dozen items, six pairs, and they were nice reliable items and the case was really flying and everything was swell and here we go. That would be about the earliest you could expect the pc to be laying his goal on the desk. There's – you've bypassed assessment. You've arrived at Step 5 without ever finding the pc's goal because he gave it to you. You go very much further with 2-12 and you're going to start getting the goal whether you would it or not it. Pc will tell you what it is.

Well, now, some pcs are so stacked up and identified and so much into the bank and so forth, that it might take many more pairs than that before the pc gives you his or her goal. But averagely along somewhere around a dozen items, reliable items and so forth, why pc's speculating – even raw meat will start speculating – and very often just hand you his goal and checks out bang, bang.

Now, this then could be carried to a ne plus ultra. Let's supposing we completely neglected the pc's goal. Let's supposing we never gave the pc a break. Every time the pc has hazarded on the goal we acknowledged him very politely. And we didn't do anything with the goal at all. And we kept on finding items that paired with items, and so on, and we just kept on finding. We'll eventually get the Rock and opprock on the first goal. And the pc then would blow the rest of the bank and go free just by the recognition that is his goal with total reality. Don't you see?

Now, which is the best one of those things to do? Well, you just do what you do. There is no best one of those things. You don't necessarily – you wouldn't see eye to eye with sitting there on your hands while the pc gave you his goal. And you certainly wouldn't drive a pc halfway round the bend – but he says, "My goal is to catch catfish."

And you say, "Well fine. Now, we're going to list another Prehav Scale here. We're going to see if we can't get a couple more items. I think you've got a problem in present time. And we've only found twenty-two pairs, and so forth, and..."

"But-but this is just-just-my goal is to catch catfish!" see.

He won't go Clear then either because he's now got a protest on his goal and that would effectively stop the whole operation on the same basis that any assessment or anything
else would be stopped; the mid ruds are wildly out and they'll be out from then on. And you just wouldn't advance because the pc is out of session. So sooner or later the practicality of 2-12 ceases because the goal is being laid in your lap.

Now, that give you some kind of an idea of its uses?

Audience: Yes.

All right. Your next point of examination here, that might be of considerable interest to you, is that 2-12 is usable as an assist. Now, there's one process which is senior to and superior to 2-12 or 3-21- although it is part of 3-21. There's one process that is superior to it, and outranks it when these conditions exist: When the pc has had found or been run on a wrong goal, or you suspect that the condition of the pc evolves from a wrong goal that has been found or run on the pc, you get rid of that wrong goal.

That is senior to any action of 2-12. Even if you suspect it – you understand? Because the pc may still be in some kind of a fog on the subject of "Is it his goal?" and "Isn't it his goal?" and "Does it or doesn't it?" or something like this. And try to bend 2-12 over into trying to do something with his goal and he's worried about it.

Well, what's your present time problem there? See, the present time problem is the pc's goal. You're not going to find that with 2-12 because a goal is senior to items. So you suspect wrong goal? You run wrong goal. You don't run 2-12.

Now, how do you run wrong goal? Well, the rule is that you run it with Big Tiger. And you run a wrong goal with Big Tiger if it's just been found. And you run it with a Prepccheck if it has been found and listed. Those are very easy things to remember in the handling of a wrong goal. If a goal has just been found and nothing much has been done with it and yet the pc thought it was his goal for a while and so forth, why, just Big Tiger, slam-bang at it for a while, get rid of it and slick it up. But in actual fact if it's been listed you've got to do a Prepccheck.

Now, that – if a goal has been listed it is senseless to do Big Tiger against it. It isn't just relatively ineffective. It is senseless. It won't move anyplace.

So, now, when you got a pc who has bad auditing as his history – this isn't a question of goals now – when he's got bad auditing (it must be so because he says so), and when the pc is all fouled up ever since that session in which he was run on an engram or ever since that session, etc., etc., or ever since the first Foundation when, etc., etc. – R2-12. We don't care how much bad auditing he's had; R2-12 will handle it. This is one of the things that gives this an importance: is despite the fact that it won't handle a wrong goal, which it won't, it'll handle every other breed of auditing there is.

And the reason for that was – because I don't care if the auditing was good auditing or bad auditing or any other kind of auditing and the fellow felt loused up about it – an item was loused up, not the pc. An item was loused up. It was the item that ARC broke, not the pc, you understand? It was the item which was getting its engrams run, not the pc. See? You see why this is then?
Goals are senior to items and items are senior to every other kind of auditing we've ever had. So that gives you your seniorities of use.

Now, because everything is $A=A=A=A$, this can be used as an assist as its lightest action as goofily as, "What illness of yours have you been interested in?" This is just crazy, see.

"My lumbosis."

"All right. Who or what does lumbosis represent to you?" Unwritten list, unnull, anything else, see. That's a meterless assist using the principles of 2-12.

I want you to recognize that 2-12 has certain principles connected with it, don't you see? That's why I gave you that assist. Not so you will use that assist but so you will get the idea of what you're doing on it. Well how come? Well, the pc must have been interested in it so it must be identified like mad. He must have an $A=A=A$. If he's got a psychosomatic illness he must have the past in present time. Therefore an instantaneousness is in connection with it. See, the present time is the past time. Therefore it must have some impingement on the GPM because it has an instantaneousness; isn't in a proper position on the time track. Must be held there by some instantaneousness. What's he doing making a mistake like this? What's he doing with a scar? That's an interesting question isn't it?

$A=A=A$, and the first "identification of" is where you put time instead of $A$. In other words time equals time equals time. What's he doing with an engram in restimulation? Well, if he's got an engram in restimulation and it stays in restimulation – it doesn't go out of restimulation – then one tag end of that engram must be headed into the GPM. Otherwise it couldn't be in restimulation forever.

Those engrams which don't fade out in from three to ten days after being contacted, run, butchered, bad session, anything else you want to call it, didn't key out because of the GPM. Somebody got ahold of a piece of the GPM and tried to erase it. Any other engram would have disappeared.

Supposing you have an automobile accident and this brings you back and all of a sudden you've got a mysterious backache. Well, from three to ten days if you've still got a mysterious backache and it doesn't disappear, then that automobile accident must have keyed in the GPM. If you easily got well and don't have a backache three to ten days later, of course it wasn't part of the GPM. You see how you separate the sheeps from the goats.

So all right, now let's get a more practical assist. Let's look over the chronic somatics of this individual. Chronic. Chronic, man, that have been going on and on and on and on. It is *timelessness* we are looking for.

"Ever since I was a little boy I've had this tic." See, it's an indicator, see? Must be hooked into the GPM. Must be, otherwise it would have – whatever happened to him – would have disappeared in from three to ten days. He's still got it, some kind of a psychosomatic something or other. Therefore it must be hooked into the GPM.

A little kid contracts some sort of a habit. This habit has been going on for years. Spits at everybody. Nobody can cure him of spitting at anybody. Part of the GPM, man. I'm not kidding about that, I mean it is. It just is part of the GPM. And the GPM can never be edu-
cated out of anybody. Can't be done. What no society has been able to cure anybody of is part of the GPM. That you can make up your mind about.

All right. This fellow stole a bag of groceries and went to jail for eighteen months. And he's come out and he's been straight ever since. Well, it happens to people. Nothing to do with the GPM.

This fellow stole a bag of groceries, went to jail for a year, came out of jail, stole a bag of groceries, went to jail for eighteen months. Got out of jail, stole a bag of groceries. And we have the common order of action which occurs in our modern societies, which is considerably interesting, the repetitive character of criminality. The two-timers and that sort of thing. These birds didn't become criminals in this lifetime. They've been like that for a long time.

And let me tell you, the State, cops, hobbyists, prisons, psychologists [laughter] – none of these things are going to cure any part of it.

And let me tell you that you'll wind up just as much criminals in this lifetime, next lifetime, next lifetime, next lifetime as you ever want. This is what breaks the heart of the do-gooder; this repetitive action.

Of course they have some wins. They have the guy that's had a bad break. And the identity which he seems to have because of this bad break isn't part of the GPM. It passes away and it keys out and that's it. So they've had a break, they actually helped this guy out, see. So they know they helped him out. And it straightened him out and everything is fine. So they're led on. They're given a win. They get stuck with a win.

Next guy they picked up is straight in the middle of the identity of the GPM, man. He knows what stores are for, to put in trucks at night. And you could help this guy out. And you could help this guy out. And you could help this guy out and it's just the same cycles would happen again and again and again. You cannot educate the GPM out of anybody.

Now, some of the processes we have, when properly used, oddly enough are capable of keying it out, which is a fantastic attestation to the power of Dianetic and Scientology techniques as they've existed in the last dozen years. I'm overawed. We actually have been able to key out this confounded thing without direct attack at all.

The interesting thing is, is our first-goal Clears, MEST Clears that have sprung up from time to time along the track. That these people can be made at all is fantastic because we had no process that could take apart the GPM, which I think is quite interesting. Some of these characters are still having a marvelous run of it.

But because A=A=A, both in time – we should look at the other three factors of the GPM: matter, energy and space. Now, those three things are also in the GPM. And probably the GPM has mass simply because time becomes nothing and the energy and so forth isn't yet nothing.

This adds up in very interesting mathematical proposition. It'd take Einstein to wrap his wits around how exactly this would occur. You see, if time were actually zero, if time were actually zero, then there would be no matter, there'd be no energy and possibly no space.
So it's an *apparency* of zero that we are handling in the A=A=A. So although there's an *apparency* of no matter, there is mass. Although there's *apparency* of no energy, there is energy. Although there's *apparency* of no space, there is space. And there's *apparency* of no time, there is yet time.

So, you find matter, energy, space and time are in this GPM. Now, the moment that you restore any differentiation, no matter if it's just from identity to slight similarity or, you know, it isn't quite exact anymore. Apple A doesn't equal apple B. Person vaguely sees there might be a little bit of difference between apple A and apple B. And if that's the case, heh! It's interesting but you get more matter, more energy and more space because you've got more time.

So this fellow's sitting there saying, "There are no black masses." And the second that you establish a similarity, they seem to materialize from nowhere. And there's many a dub-in case is going to be very upset with 2-12. And it's true what auditors over in England used to observe, that a case very often goes black before it goes back to pictures again.

Well, here's this case with all kinds of dub-in pictures like crazy and everything is fine and they dub, dub, dub, dub. And all of a sudden it all goes black. And then all goes white and then all goes this and all goes that. You see what's happening here. As you add differentiation you get more mass apparent – greater apparency of mass then takes place. Stuff ceases to read exactly and instantly on the E-Meter.

You'll see a goal do this. The goal is the thing which actually drifts on the track harder than an item. And you'll see the goal as it's being three-quarters run out will all of a sudden begin to read early and late and on and then very early and then very late and then on. And you won't quite know what the devil this goal is all about.

Now, smooth auditing is absolutely required in the handling of the GPM, otherwise the individual's ability to confront the matter, energy, space and time which is increasing in his bank is not invited, but repressed. And so the individual would tend to hang fire if he were being beat up at the same time he was being audited. In other words, auditing could take the place of a present time problem.

There'll be some cases that will hang up. They'll see things will – all of a sudden are going to become tougher for them. They're being asked to confront more pain than they care to confront. They're being asked this. They're being asked that. And they all of a sudden try to turn off the reality that has been turning on. And all cases go over a sort of a roll-y coaster. It keeps getting better and better; their confront keeps getting better and better, but it sometimes will get worser – momentarily get worser. They'll come into session and they would rather be whipped than list another single goddamn line on that blankety-blank plot.

Why? It's getting tough. The more they list, the more matter, energy, space and time is materializing. Of course time permits them to escape from the pressure of it. It was probably the only thing that makes the process work at all; it's because time becomes less identified and therefore the pc isn't being subjected to all the matter, all the energy and all the space that is there incipiently in the bank ready to tear him apart.
But sometimes your pc will be sitting there with a blinding ball of fire heading straight for him. And the next thing you know he's sitting there very calmly. He's just slid himself down scale, hard. He's ducked. He's done a bunk. You can still dig it out, but every once in a – it requires no special action. That's just the kind of roly-poly action he takes. He just didn't feel like having his head knocked off with a meteor that day, see? Because there is no meteor. It is only the mental image picture of a meteor which burned out a trillion years ago. It's just because this bank was opening up and it's what this valence was knocked off by. You've gotten to the death moment of a valence or something like that. And he dramatizes the valence and does a bunk. You've still moved on the time track but he still made it less visible. He's still gone less confront on it. Don't you see?

So if we use this on any kind of an assist, we are increasing the pc's ability to differentiate. And our bacon is served because he's also differentiating moments of time and this gives him more time to go into than he had before. And so he is now capable of being there or not being there as the case may be.

There is still this factor of increasing ability to confront which must be handled in 2-12. And the only way that it is handled is just give the pc good sessions and don't hit him over the head every time he has a win, and his confront will keep coming on up.

There are many pcs will have to go on and on and on and on and on before they get a win. Because they open that eye just a little bit and they decide they'd better not look today.

You can do a half a dozen, ten lists from List One without a rock slam on any one of them. The list getting more and more alive before you finally have a rock slam. That's very extreme, but that can happen. Right now you have some statistics: sixteen out of twenty-five people on this R2-12 are successful with either items found or listing on lists which are producing rock slams.

Error: One auditor had three items in with rock slams after nulling a list and didn't put the package or anything together as the R/S went and disappeared. Well, of course, the package slithered together, somehow or another. He simply should have put it together.

We have four out of five cases listing on items who have been listing on 2-12 who have found no R/S as yet. That's four of the five cases mentioned here. But that is actually four out of twenty-five or one-eighth in the first few hours of doing 2-12 have yet to turn on a rock slam. Those cases are benefiting, however. And two cases have such a dirty needle or stuck needle that no assessment has occurred since a dead horse was listed on each.

Well, naturally, that's a mid ruds situation on that particular list. That could be cleaned up like a bomb. Or the list could be further run or you listed a little bit further. Something like that could happen so as to take the charge of the thing off.

The summary on it is R2-12 is a great success as even those who have had no R/S are making gains with the exception of one pc who is making gains in session, but out of session is not.

Now, the – in other words, with minimal checkout, with minimal action in training – and disallowing for the fact that the auditors here are pretty good auditors – you haven't got a
bunch of loses on your hands. You haven't even had all the gen, you haven't been checked out on the gen and that sort of thing; you're still winning on the thing.

With a little bit of experience you find out how to really fly with this thing because most of your time is wasted on dead horses. The auditing – the amount of time the auditing takes in relationship to the amount of time wasted by dead horses and so on, you'll find quite disproportionate. But all of a sudden you will be able to get these things into better focus.

Now, from where I sit, why, we've got some cases cracking right now on R2-12 that have been on everything else in the shop, even 3GA Criss Cross. And you say, "Well, how can a case benefit from R2-12 that was not – when it wasn't benefiting on 3GA Criss Cross?"

Well, R2-12 has this listing, is auditing, it's listing directly from something which is giving the pc an awful present time problem. And it's actually easing up the pc's present time problem and the pc is starting to make a gain for the first time.

In other words, it's attacking the present time environment of the pc, which of course 3GA Criss Cross doesn't even pretend to do.

So there is where we sit with this particular technology and I wish you very well with it.

Thank you very much.
Thank you.
Okay. This is the what?

*Audience: 11 December.*

The 10th Dec.?

*Audience: 11th.*

The 11th? How did you get up into the 11th? The things you've been doing!
First lecture, Saint Hill Special Briefing Course, December the 11th, AD 12.

Okay. Well, if it hadn't been for the work done in the V Unit, I wouldn't be able to give you this lecture. There was a little bit of an odd bit. I wanted to know if these oppose lists that have been laying eggs on Routine 2-12 – and you just didn't get anything – if those things, extended, would give you an item. And on case after case, both on the oppose and represent lists, when you think you are skunked, all you have to do is continue the list. Very simple. Very simple.

Now, a lot of you think 2-12 is very complicated. You think it's a very complicated activity. Frankly, you can get experience with great rapidity on 2-12; I'd say within 150 hours of auditing on it. If you're doing it right, you ought to become quite an expert. I said 150 hours of auditing because that's how long it took me. But of course, remember I was piloting it from scratch and didn't know anything about it at the beginning. So I think you ought to make it in a hundred and fifty hours knowing all about it before you start. Isn't that terrible?

That's not a snide professorial comment – that's just fact. Now, your troubles aren't with 2-12. That's what we're learning. You're not having any trouble with 2-12 – you're just having trouble with auditing. I think that's quite interesting.

Mary Sue pulled one tonight at the supper table that really had me laughing. She said offhandedly, she says, "Well, they're still using mid ruds for style." That's marvelous, you know. Gives you this gorgeous picture, you see, of the auditor sitting there busily getting in mid ruds for style, see. [laughs] And it's little things like: pc's got 1,825 missed withholds, and 16 overt on the auditor, and the list is incomplete, and – there you're getting into 2-12; the list doesn't even have to be incomplete – and the auditor gets in the mid ruds and the needle is still good and dirty.

Oh, we had a remark on a report the other day – actually we're having a ball with this stuff – we had a remark on a report the other day that is an indicator of using the mid rud for style. The auditor said, "Well, I got in the mid ruds for the session and got in the mid ruds for
the list, but I still had a dirty needle, so I determined..." and he went off in some other wild direction. He's already handed you a complete imponderable: How in the name of God could you get in the mid ruds, see, for the session and get it in for the list and still have a dirty needle? See, it wouldn't even matter if your list was incomplete. You're not talking about a list, you're just talking about mid ruds to this pc, and so there it is.

Might take the random rudiment or something like that on some cases to pull the missed withholds, but you sure couldn't wind up with anything less than a clean needle.

So what I picked up about the middle of the week – what I picked up about the middle of the week was the fact that people were trying to start nulling lists that had dirty needles, see. There was a dirty needle, and they take the thing, and the needle's going zzz-zzz-zzz-zzz, and they start the first one, "Tiger, waterbuck." I don't know what they're doing. I don't know what they could be doing, because they couldn't tell if it was reading or not reading.

Now, the only time you have to be able to learn to read through a dirty needle is when the needle is so dirty that you can't tell what mid rud is out. Now, you can do that. That does pose a problem. It's going tick, tick, tickety-tick, tickety-tick, and you say, "Has anything been suppressed?" and it just keeps up the same tickety-tick, and you say, "Is it invalidated?" and it keeps up the same tickety-tick; and then you get to Suggest, and it's doing the same tickety-tick, and you say, well, it's probably Fail to reveal, and you get Fail to reveal and it's still the same tickety-tick, and actually it was the Suppress and the Invalidate, but he had answers but didn't...

This is wild, see. Trying to read through one of these needles to get the mid ruds in – that I'll grant you takes some doing as an auditor. That is sometimes a little bit hard. But I will tell you how to do that. There is nothing much to it. You just put the E-Meter aside and put in the mid ruds. Then come back and see if your needle's clean. You understand? And very often you will have caught it. The needle still won't be going tickety-tick.

Now, a variation of this is "Have you thought of anything?" But have you ever realized that this puts an awful lot of responsibility on the pc? If you overuse that or try to make that substitute for the mid ruds, you get this kind of a situation: "Will you please self-audit for a moment to straighten things out so that I can go on auditing you?"

Pc has no guidance or anything like that. You just say, "Well, I'm having a rough time here. Let's see if you can help me out," something like that – "Anything been suppressed?" and he tells you something. "Anything being invalidated?" and he tells you something. "Anything been suggested?" and he says no. And you say, "Well, anything you failed to reveal?" and he says, I "Well, yes, as a matter of fact there was..." and so forth. Well, he's giving you some answers, isn't he? Well, it certainly is going to change the characteristics of that needle.

Now, you come back and look at the needle, and it's in – it's sufficiently clean so that you can read the remainders. Now, you can run a cross-check – something like that.

You say, "Let's just – now, let me make sure that all the suppressions are off of this." This is the one most commonly neglected by the pc, because suppress equals forget. And you saw me on a demonstration one night, and the pc did wonderfully. I actually cleaned up every question I asked except the Suppress. Remember that TV demonstration? I had about a quar-
ter-of-a-dial drop on Suppress and the pc said that's clean. Now, why is that? That's because suppress equals forget.

You realize, some pc says to you, "I had an item a moment ago, but I sure don't know what it was." He's told you that he's suppressed something.

Now, that's no time for you to jump in there with all four feet and try to do this and that. You make awful mistakes when the pc said, "I had an item but now I've forgotten it," and you say, "What was it?" Oh, brother. That's the time to wish that you hadn't gotten up that morning because your rudiments are going to go out from there on in, see, because the pc will earnestly try to remember this thing, see. Actually, it's just an origin – so you just acknowledge it, see. Later on he'll think of it. You've listed a few more items and all of a sudden the pc will probably startle you out of your stance as an auditor, say, "Hey! Hey, wait a minute, wait a minute! That was a pig. Pig!"

What pig? You see, you've forgotten about the whole thing. That was fifteen minutes ago, you know. It eventually percolates on up to the surface.

But oddly enough, if – I've made a direct test of this for your benefit. The pc says, "I had an item a moment ago, but I've forgotten it."

And you say, "Okay." It doesn't now show up as a missed withhold or it doesn't show up as a withhold, which is very peculiar.

All right, the pc says, "I had an item a moment ago, but now I've forgotten it."

And you say, "Well, what was it? Does anything suppress it? Did you suppress it," or something?

"Well, I must have suppressed it. Let me see what it was." And now it registers as a missed withhold. In other words, you can key it in with your question of "What was it?"

You get too busy. That's the trouble with you in handling your mid rudiments and that sort of thing. You're using them for style – a wonderful gag. "He looked awfully good using the mid rudiments," you know. Didn't have any effect on the pc's needle, but it looked awfully good.

Your most flagrant fault then is just failing to get a clean needle, which is an element of auditing, before you start in. You fail to get a clean needle, that's all, and you're trying to take off and null a list with the needle dirtied up with things that have nothing to do with the list. And then you wonder if the list is complete or not and try to use the dirtiness of the needle to test whether or not the list is complete. Well, it all – a great many faults and errors can stem from just this one fact: that you haven't got a clean needle. What are the mid rudiments for? Clean needle. That's what they're for. They clean it up.

Now, Goal Finder's Model Session is actually better than old Model Session providing you always put in big mid rudiments.

Now, in R2-12 there is no substitute for an auditor who knows his basic mechanics. And we're talking now about the basic mechanics of auditing. Auditor knows TR 0, 1, 2, 3, 4. Auditor doesn't Q-and-A. Auditor knows an E-Meter. Auditor can smooth out a needle. Used to say "put in the rudiments." Well, actually, don't care whether you put the rudiments in or not – smooth out the needle. And then that makes sense, see. Putting in the rudiments is not
something that can be plumbed, measured and weighed. But you can sure take a look at this needle and know that the rudiments have been put in – or not. If that needle has any kind of a pattern of any kind whatsoever, the rudiments are not in on that pc, period. That's all.

Well, that makes it pretty tough, because most of the pcs that show up have got some kind of a tick and a tock and a plish and a plock. Well, that's all caused by missed withholds. So we're back into the basics of auditing – pulling missed withholds and so forth, that sort of thing. These are just fundamentals of auditing – has nothing to do with 2-12.

Now, we utterly neglect the fundamentals of auditing and let some guy fumble all over the place with the fundamentals, and then we add 2-12 on top of it as a complication, and of course, we've got a cow's breakfast, man. It is a mess. Well, your needle is dirty from the fundamentals of auditing, and it's being dirtied up by an incomplete list and the last list you didn't complete. Now, how the hell are you going to make any sense out of this?

Well, you've got to start in at the beginning and get in the fundamentals of auditing, that's all.

Now, posing the problem of how to clean up a needle: How do you clean up a needle? You of course are just posing the problem of fundamental auditing. And don't ever make a mistake about this, see. You're just saying, "This is fundamental auditing." You pull the missed withholds, you straighten out auditing on this person, you do this and you do that. You actually could do it this way: You could take an old-time Prepcheck, take some period, or no period. You just say, "In auditing, has anything been suppressed?" or something like this. You run an eighteen-button Prepcheck; something like this, and you're going to clean up the needle. Of course, that's the long way to do it, but it sure can be done.

It's – you could – you could do it meterless except for the Suppress button which would get you in trouble because it means forget, and you'd wind up at the other end of this… Well, if you just did Suppress and Invalidate on this guy, you know, gave him a "Prepcheck assist" – this is getting very popular in New York right now. People turning up after a lot of auditing and the CCHs and that sort of thing, and their needle is just filthy and one of the boys in! New York got the idea of a "Prepcheck assist." He straightened out one or two of these needles, and he noticed that they were straightening out in just, you know, just four or five hours, and he'd had them straight – you know, it was all smooth and fine. So he's got a… they're given a Prepcheck assist, whereby they merely clean up Suppress and Invalidate. And that's quite interesting.

I don't know how far they'd get with that sort of thing because out of the eighteen buttons there's always one of them that's hotter than the remainder, and it's not always Suppress and it's not always Invalidate. But if you were to take an assessment of the eighteen buttons and get the couple that fell the most, or get one that fell the most, and then ran that for a couple of hours, and then assess it again, and get the other one and ran that for an hour or two, or whenever the pc said it was flat, why, you'd clean up a needle.

Now, this idea of a needle pattern, then, is not something that you should be blowing your brains out over. Similarly, a very, very high tone arm is not something to go on worrying about because the exact activity, which I just gave you, will knock a tone arm down. This has nothing to do with 2-12, the data I'm giving you here. It just has to do with basic stuff. I mean,
we got a lot of this stuff around. I don't know, maybe you can straighten out a dirty, needle with a Touch Assist. Well, we've had a lot of stuff here for a long time. Now, just add this up and benefit from it and here's riches for you, you see.

So this pc, it goes tick-tock, bzz, brrr, bzzz, tick-tock, and he's sitting down there, and you try to put "in this session," see. Oh, man, that isn't going to go anyplace because it was dirty when he came into session, see. And you say, well, let's pull some missed withholds and this sort of straightens it out a little bit and it's still going tick and it's still going tock and that sort of thing. Well, you could sit down and pull missed withholds until it got clean, but you also could run a couple – the first two buttons, just Suppress, and you know, just "In auditing has anything been suppressed?" you know. We don't care if he's been audited for twelve years or one year, see. You're going to get someplace with this thing. And then pull some missed withholds, you see. This is all basic, fundamental stuff. You put it all together and you don't get a dog's breakfast, you get a very nice looking clean needle.

In other words, don't try to run something fancy on a case before the case is ready to run. Well, how many hours should be invested in straightening out a case before you start auditing them on something, and so forth. Well damn few, let me tell you, very, very few. Very few indeed! If you're very good at pulling missed missed withholds – "missed square" withholds – you're very, very good at that, you could probably straighten up the whole needle on that.

But I'll tell you something else, I've straightened out a needle with 2-12. And that's a weird one. Well, how do you assess it? Well, just genius! [laughter]

You know, you can read down a list of stuff and if you're not stone blind and a rock slammer, you can see that something ticks more than something else. You know, that dead-easy.

So let's just be sensible about the thing, you see. Let's take the old-time rock slam test, and let's hope we've got a rock slammer sitting in front of us. That's the easiest one to straighten out. Anybody can straighten out a rock slammer. That's dead-easy, because you just simply find out whatever slams, and oppose it, see. And crash, crash! The only time a rock slammer gives you any trouble is when some other rock slammer has been trying to give him a clean bill of health and hasn't reported that he slammed on "Scientology," "Ron," "Auditing," and "Sessions," see. He hasn't reported this fact, but he says he's clean.

Well, by this time the guy has got this all suppressed and you don't catch it right off the bat and then the case lays dead horses, and after a while in desperation you just suddenly pull it out of the hat; decide to give him the old test – tiger drilling the buttons and see if one dirty-needles.

Well, if he's had a lot of dead horses and so forth, do you know you'd practically be justified, even though it laid another egg, just in picking the biggest read on the fundamental items and just opposing it.

Just supposing the guy has been a rock slammer. See, he didn't make progress so let's – well, let's just treat him like a rock slammer. See if we make any fun there, see?
I've been working on it – this isn't a rule that I can forecast, but it very well may become one – that if a case makes no progress on 2-12, you treat him like a rock slammer and oppose Scientology – if you can't get the first three, four key buttons, you know. See, "Ron," "Auditing," "Scientology," "Scientology organizations," something like that – if you can't even pick out a dirty needle, see, a read – a dirty read or something on one of those things, well, hell, just at least oppose Scientology. That looks like it might, one of these days become a rule, because we've wasted quite a bit of time on just this factor of somebody says we'll save this bird's bacon.

Well now, today nobody gives a damn whether anybody was a rock slammer or not. Particularly after you see that after a person's been audited for a little while he starts rock slamming on List One.

I don't know. I'm going to get checked out on me myself. [laughter] So there's no disgrace in this. This is a cute trick some people have been pulling on this. They say – because they don't want to seem socially déclassé, they say it turns on pain, and then you list it as though it's a terminal and it's actually an oppterm, and you just get loused up like fire drill.

So I have a little rule that I will do on that sort of thing. After somebody tells me pain or sen on List One... See, if they tell me pain then I'm going to give them a lie test. You know, "Is there anything here that you disagree with now?" "Have you told me anything in session that you thought I'd like to hear?" you know?

We've laid two or three eggs on this lately. Two cases right in this room, opposed wrong way to, see. Opposed as though they were terminals, and actually it just gave the pc hell, see. Because you oppose them – you've opposed an oppterm as though it's a terminal. And of course, you're writing a backwards list. You're putting the pc at effect. And if you don't think that doesn't tear up their ears! You get what I mean?

This thing actually is an oppterm, and the pc says it's a terminal for some reason or other, and then you treat it as a terminal. "Who or what would that terminal oppose?" And it just puts – of course, it's an oppterm, so in actual fact you're putting the pc at effect; you're not putting the pc at cause and it messes them up.

Well, those are just some little things in passing on 2-12.

But this needle is dirty. I can't seem to make any headway out of the thing. I'm not going to spend the next twenty-five hours straightening out a needle, because with one list with 2-12 it'll get all dirty again anyhow. See, it'll go through a cycle of being clean and then getting dirty and then going clean again. So you certainly don't want to waste the rest of your natural life poking around just trying to straighten out this needle. So you need some method of straightening out the needle.

So you pull enough missed withholds off the pc so that you can do some kind of an assessment on List One and get into 2-12 as fast as you can – if you take my advice on the thing – and the first reliable item you find would deliver into your hands one of the cleanest looking needles you've seen in many a day. It's as simple as that, see. I've seen a needle, now – I've seen a needle that was just bzz-bzzz-bzz-bzz-bzzz-bzz-bzzzzzzz. Everything's stuck up, couldn't get old Model Session rudiments in. You know, everything sort of hung up and messed up
and so forth and I couldn't do any assessment and I couldn't even go over the dynamics, and so forth. One list that rock slammed and at the end of that list I had a clean needle. I hadn't even nulled the thing out yet. You get what I'm talking about now?

I just listed it out till it was clean. And there it was, clean. Well, what happened to all this pc's withholds and everything else? Well, I was sitting dead center in the case, and I actually found an item – took some charge off the bank – and there went a clean needle, see. There went your dirty needle – disappeared.

So, here are two ways of approaching this thing. There's not knowing any 2-12, not being able to enter the case, not being able to assess, being balked, not having anything that... way to turn, something like that. And not having an auditor around who can pull missed withholds or something – they haven't got the word yet, you know, something like this.

There's still something you could tell this auditor to do. Well, just spend a couple of hours on, "In auditing has anything been suppressed?" and "In auditing has anything been invalidated?" when that's flat. A couple more hours of that and you'll probably see the needle straighten up. Then coach the auditor in to say, "Is there anything we nearly found out about you?" and "How did you know the person thought that?" or "Why did you think so?" and get the rest of it up and you can straighten up a needle. So this is not a twenty-five-hour proposition or the next seventy-five hours or something like that.

Because listen: There's a point at which the pc's anxiety is rekindled on a no-auditing basis that dirties the needle up again. In other words, there's a point here where your efforts to clean up the needle dirty the needle up.

Now, you can always count on no-auditing to dirty up a needle. Always count on it to do so.

Have you ever noticed this fact? You're sitting there, getting ready to null a list. You're sitting there getting ready to null a list. Everything was very fine. When you finished up that list you just had a clean, flowing needle – everything was fine. But you stop at that point to make a note on your auditor's report to the effect that the tone arm is now at 3.5, and that this is this and that is that and the time is so-and-so, and then you glance up and you look at the needle, and it's going tickety-tock, tickety-tick, tickety-tick, tick, tickety-tick, tick, tick.

Well, you could sit there then and get in your session mid ruds; and you can clean up the needle – don't think you can't. You can clean it up and then you turn back to your auditor's report, you see, and... [laughter] next time you look at it, it's going tickety-tock again.

That's anxiety. The button Anxiety is keying in there, and the pc is in a no-auditing bind, and so on. Actually, the way I've been handling that particular phenomenon lately, of the clean needle turns into a dirty needle just because there's – I'm taking a breath to say the first word, you know, that's too long, you know? And I'm saying – like this and the dirty needle turns on, see. Well, it's just the pc's anxiety that's doing that kind of thing. And I'll just sail into the first one, and then say it two or three times, and say the next one two or three times, and so forth.

Now, by crossing everything out as you go down through a list, you can also sometimes turn on a dirty needle. The pc gets anxious. Nothing is in. You just keep making those
Xs, you know, making those Xs, making those Xs, making those Xs, making those Xs. Well, sooner or later, you're going to decide that it has to be tested for Suppress. You test it for Suppress and you promptly have a dirty needle. Where did that dirty needle come from? Well, it comes from the fact that the pc probably did suppress something, but your asking for it keyed it in so it now registers and it wasn't active before, but it is now.

But the main thing is the pc is scared you're going into mid ruds. Scared you're going into mid ruds. So, because they're scared you're going into mid ruds they pull off, and you now have a dirty needle. So this tends to discipline you not to put in the mid ruds so you do the whole list with a heavy suppress on it.

Well now, those are the... those actions actually aren't related to 2-12. They're the actions of auditing. You see, they're the actions of the pc being controlled and handled by the auditor, don't you see? This is the pc's anxieties about auditing, the pc's confidence in the auditor, the pc is in-session or isn't in-session, and so forth.

The only thing I really get very alert for and really go to the mat and slow the whole session down to nothing is the pc, in putting in mid ruds, gives me a "critical." I get a dirty needle and when I pick it up, I find out it was the pc said that I had shuffled the paper loudly. I know I won't have any luck, now. I know I won't be going anywhere now, because that pc has got something I nearly found out. I don't care if it was in the last three days or the last two days or in the session, that pc has a withhold from me because that pc has given me a critical utterance. And critical utterances are always underlain by an overt/withhold.

And that's the only thing I go alert for. Why do I go alert for that? Because that one critical utterance or that one attitude on the part of the pc will multiply and multiply and multiply and all of a sudden I'm going to have a screaming ARC break.

That is the same situation that you run into an hour later, with the pc trying to blow the session. You see that? I'm not being sarcastic, but most auditors don't catch the missed withhold; don't catch that ARC break for an hour or an hour and a half. It's long after they've happened.

And you've got to become alert for that. These are the fundamentals of auditing I'm talking about, you see. You' got to become very alert for that.

You're putting in your mid ruds, and you say, "Well, in this session has anything been suggested?" See. And you get a tick, you say, "All right, what was that?"

And the pc said, "Well, yes, you actually were saying some word a little louder than the others, and I thought you were suggesting that that was it."

That's enough, man. My next rudiment is nearly found out. I don't – I don't play the motordrome game of riding the motorcycle on the vertical wall just for the cheers of the audience like some of you do, if you will pardon my French. Because that's the one thing you can't monkey with, is a missed withhold. See, that's a critical; that's a direct indicator! Great big black arrows immediately drop up in the sky and point directly to the pc's bank and they have engraved on them in gold letters which flame, you see: "You've nearly found out something about this pc."
Any indication of a missed withhold causes me to go after missed withholds. Pc a little critical; pc upset. I go on the basis: Doesn't matter what I do as an auditor, as long as I'm trying to audit the pc, I don't merit criticism. I'm not trying to punish the pc because the pc's criticizing me and I'm not doing this because I don't like criticism. I'm doing this because the session is going to blow up if I don't. That is your first symptom of a session blowing up. Pc's feeling a little critical.

Now let's move over into 2-12. You do a couple of things wrong and you're going to be in a mess. And one of those things is you find a slamming item and it's slamming like crazy, and you don't know what a rock slam looks like so you don't… I know that sounds incredible, but there are two people here who didn't know what a rock slam looked like.

Now, that sounds incredible, but it's true. And don't you ever make that mistake in a co-audit or teaching a bunch of HPAs, HCAs or something like that, that you know that they know what a rock slam looks like. Because you say, nobody could miss a rock slam. Well, let me tell you, people can miss a rock slam. They can miss 'em, and just learn by that.

So this item is rock slamming like mad, and for some reason or other the auditor doesn't want to embarrass the pc by pointing it out that he slams on "auditor" or something. I don't know for what reason – or he doesn't know what a rock slam is, or something like that – but he knows the thing was active so he represents it.

Now, listen, it isn't always catastrophic. You can get away with it often enough to make a fool out of yourself.

All right, I'll give you the exact example: You're standing in a room, a burglar comes in the door with a drawn gun, and the telephone rings. Now, you'd feel a little distracted, wouldn't you? And I think that if you picked up the telephone and found out it was unimportant, that you would have a tendency to swear as you slammed it down to take care of the other situation or something there – you'd be in an agitated state. You get the idea? Split attention.

The command value of Mr. Burglar with a gun in his hand is terrific, and somebody's saying, "Look away from this thing." All right, the command value of a rock slamming item is terrific, and the person's attention isn't on the item that is slamming, it's on the reverse item. It's on the hidden item. That's where their attention is mostly absorbed. They're slamming on "gooney birds," and the opposition terminal to "gooney birds" is "hunters." And you ask him "Who or what would a gooney bird represent to you," you've told them to take their attention off this hidden item "hunters." You don't even know what it is, see. And that's like the telephone ringing and they have to take their attention off the burglar, see. And it drives them around the bend. They practically go out the bottom.

And when you get a List One item and you don't oppose it; if you're really mad at some rock slammer; if he's really cost the organization thirty-five thousand Rand or something like this – I won't mention any areas – [laughter] and you really want to drive him potty, and just have him so he'll be out in the street waving guns in his hands ready to shoot somebody down or something like that, find "Scientology" rock slamming and then represent it. All you've got to do is put a represent list on "Scientology," a rock slamming item, and he'll go right around the bend. He practically goes out through the bottom.
See, there's a hidden item there, he's got his attention on this item, and you tell him to put his attention on Scientology and represent it and he can't do it. It's just nyahh! see. He doesn't know what he's got his attention on, he just knows there's something dangerous there. And you're telling him to take his attention off this dangerous thing and then to do a represent on something he's only got his attention from or at, don't you see. You've messed up his attention.

See, here's these two items smashed against each other. His attention is totally fixated on the interrelationship between these two items, this package, these two reliable items against each other, see. That's what his attention is on, and you take one of these and you start representing it, you're telling him to take his attention off the other item and take it... Ahuuuu-zzzzz-zzz. And he practically goes gibbering.

We've had two cases here, slamming on List One that have been represented, and boy, they both almost went out the bottom. And their antagonism on List One went up by the square. Zooooom! Don't you see. They couldn't take this.

Now, if somebody had sat down and opposed the rock slamming item – just like it says in 2-12; did it right, in other words – why, it just would have been as right as rain. Everything would have been fine and sweet and everything. But a case practically goes out the bottom.

Now, you got somebody who's slamming on three or four points of List One and you do nothing but represent lists on them – oh, brother! That's happened here a couple of times. Hardly anybody knew they were slamming on List One, you, see – this hadn't been isolated. Agh! And they didn't know whether they were going or coming. They just started out the bottom.

So it's a good way to get even with somebody. If you find an item slamming nicely, why, represent it.

Now, if you really want a case to fold up sooner or later, if you find an item slamming nicely and you oppose it, why, stop listing just at the moment when you can barely null it to nothing and not find an item. Because now the item you took it from, will not slam, all the other slam seems to be gone and you don't see anything there, and the case feels fine – feels much better – but you've got a sleeper now; you've got a hidden pair in present time. That's about the only big mistakes you can make. Of course, you realize I'm just taking up 2-12 mistakes with you here.

If you – after you null the thing out, if you continue to list the opposition items against the thing – it's not now slamming, see. You listed it out, everything disappeared, there's hardly even a dirty needle left, everything's gone now. It all looks fine, but you didn't come up with a reliable item. That's the only thing that's spooky about it all. It just – you didn't have an item after you opposed it, see. You start listing again on that opposition list and all of a sudden the nicest, biggest rock slam will turn on the original that you ever saw, and you'll get a rock slamming item, and all of a sudden you'll wind up with – you'll have a very nice big rock slamming item and you'll have a package.
In other words, you can quit just short of getting a package. That, probably, would be the most puzzling mistake that you could make in 2-12. That would puzzle you.

This also happens with a represent list. You've got some dirty needle or something and you're representing it like mad, and it represents into a slamming list and – nice, long list, and it nulls – everything is out, you have a little bit of a hard time keeping your mid ruds in, but you get it, you get it all nulled and you get clear on down to the bottom of it, and you're there – got no item. And there's nothing there now, and it's all gone and everything's gone. And you thought it was "shoe trees," or – but that was sort of the last one in. You don't know… "Well, it all must have… I know what it was. They were all bonus packages."

You see, you'll always get an odd number of items; one, three, five – I don't care what it is, it's always an odd number of items. You get an even number of items that exactly match up on a represent list – that's very suspicious, and probably has never happened, and probably never will happen.

You get two items on a represent list that go against each other, and the whole thing folds up. I think that would be almost too rare for you to include in your calculations. The basic thing is, the pc doesn't know about it. In other… if you got a bonus package you can practically count on the fact that there were _three_ items slamming and that one of them is not yet on the list.

In other words, if you do one of these washouts that you've been calling skunks; if you think you've been skunked – it rock slammed and it all disappeared and now you haven't got anything to show for it and you cant put anything on the line plot… Well, you can put something on the line plot but it doesn't now slam. You'll be amazed. All you've got to do is continue that list. You've nulled it all, don't you see, and maybe you couldn't have continued it before you nulled it, but the nulling of it helps you to continue it. Even though the pc has a little bit of a loss and so forth, he can continue it much more easily now that it's been nulled. And hell give you a stream of items and you'll come up, and there'll be one going bang, bang, bang, bang, nice R/S, everything's fine. Got a reliable item, you've got something to oppose.

But let's say you were opposing this item on, on, on, on, on, on, and it comes to the end of the list, and you can null the list, so on – the danger point in 2-12 is at that point where the list is nullable but the item isn't on it. And oddly enough, that point can exist – so powerful and good are mid ruds. See, your auditing can be good enough, actually, to null a list that isn't complete.

There's a point where you couldn't null it, don't you see – that's just before this point. But then you finally complete it up to a point. It's got enough charge off of it so that it can be nulled, and you have a little hard time keeping the mid ruds in and you get it on out, and then all of a sudden, everything goes flat. Everything goes flat. Everything disappears.

Now, this is contrary to an earlier lecture I gave you. I want to give you a point at this. Because I said if you exactly matched the things up, this would – pardon me, it may sound contrary to an earlier lecture I gave you. I said if you'd match the thing up exactly, it would go _pssww-pssww-pssww-pssww_, and you wouldn't have much left of the package.
But let me tell you something. That can be interpreted as: Just by listing the thing out and nulling it, it all disappears. And you ask the pc what confronted what, and the pc says, well, he guesses... and so forth, and that just isn't good enough. The pc's got to know. He's got to know for sure. "Waterbucks-tigers. Yeah, those two went together." Bang! You get the positiveness of the pc. It's very positive. Pc's never asking himself questions about this. "Man, that's it!" you know. "Oh yes, all my life I've just been terrified of water..." and so forth, and this sort of thing, "...and of course those things go together, because I used to have a bearing go down every once in a while in my car and it'd sort of make a snarling sound and it would upset me a great deal." On and on and on, see. He knows those two fit together. "Oh, yes. That 'waterbuck,' that goes just up against 'tiger,' nothing else," see. Well, if you don't get that kind of phenomenon you haven't vanished it down at the end.

Now, you just continue that list, whether it was an oppose list or a represent list, and you all of a sudden will see a rock slam. Where the hell did that come from? See, you'll see another rock slam turn on. And now your list will null down to an item and the rock slam will come back on what you were opposing or come back on what you were representing – it won't come back on what you were representing, but it'll come back on and make an RI. And if you're opposing, it will come back on the thing that you're opposing. That is the correct statement.

Now, here's another mistake that is made. People are abandoning lists which rock slam. They had rock slams on them, and so forth and they're just abandoning them. Why?

Well, you'll get disabused of this and you'll get confused about what the score is – and life in general – if you've taken a rock slamming item and represented it rather than oppose it. Now, if you've done that one, you will now get a rock slamming list – this is very baffling – which will go to nothing. Or it'll just dirty-needle forever, and you can't seem to complete it. And then you never go back and check the original item. The item you're taking the represent from is slamming like crazy. Has been all this time. The more you unburden it the more it slams.

In other words, you had the item in the first place. What the hell are you doing representing it? In other words, a rock slamming item does not find another item by representing. The only thing you're going to come up with on a represent list – you may get a bonus package or something – but the only thing you're going to come up with in actual fact is the item you started with. You've got the rock slamming item, why the hell are you doing 2-12, see. Why are you doing 2... ? You see, what are you trying to find? You've got it!

It's sort of like a bunch of firemen come up, you know, in their firetrucks, and here's this whole apartment building on fire, you know, and the guys run around asking everybody in the neighborhood and phoning city hall and so forth, trying to find out where the fire is, you know – paint's blistering on the truck.

So they start a Fire Prevention Week in the area and start putting up fire prevention posters and that sort of thing, and never take out a single hose or do anything with the fire.

The pc gets very upset when you do things like this, see. How can you find an item that you've already got? That's the question.
Now, here's a sneak that happens, which is not a criticism of the auditor. You've got an item, it's doing just a little bit of a buzz, and you list, and you go dirty needle, and you get messy, and you've got rock slams, and it's quite a list, and you go on, and it doesn't seem to complete or something or other's happening with it, and so forth. And you fail to test the item you got it from. That item has been rock slamming for some little time now. Because you represented it, it rock slams. So although actually it does contain the modifier of "When you get a dirty needle and can't finish the list, you do this," in actual fact, if you're a very clever auditor, you would always check what you're representing, because it might be the item, suppressed, and the representing of the item cleans it up and lets it slam.

You see, representing is very powerful auditing. When you represent something, you as good as prepcheck it and everything else. You could probably take a wrong goal and represent it and have it vanish. See, you get the idea? I mean, you could do a lot of funny tricks with this thing called represent. You do a lot of odd tricks with this thing.

Well, don't then be surprised that you start out with something that is giving a dirty needle, and you do 280 items, and you just don't seem to be getting anyplace, and you go on to 500 items and you just don't seem to be getting anyplace, and you go on to 750 items and you don't seem to be getting anyplace, and so forth. And all the time from about 50 items onward, you have had the item. It's the one you're representing.

Now, sooner or later the pc is going to get kind of bug-eyed as you go down that list; it's going to dirty needle; and it's going to be upsetting to the pc, and so forth, because now you've got his attention in a bind. See, you're asking him to represent a package. It's: the burglar has walked in the door and the telephone rings and it's his girlfriend telling him that she will be five minutes late because she didn't get a lipstick from the store and could you remember to get some ginger ale as... Burglar says he's going to shoot in the next five minutes, you see, if you don't immediately write him out a check for eight million quid or something. [laughter]

Fellow's liable to bark at the girl, under those circumstances, and the pc's liable to bark at the auditor. So you've strained, actually, the pc's attention, because the pc's attention is what causes that rock slam.

Now, the earliest lecture on attention units was given back in Elizabeth, New Jersey, in 1950, in very early June. All about attention units.

Let's say that a pc has a certain number of attention units available, total – you know, theoretical availability – and he's got 90 percent of these tied up in the bank. Therefore, he's got 10 percent of his attention units around in present time or available. Actually, it's not like that at all. It's something on the order of about one one-hundred-millionth of his attention in present time and the remainder in the bank.

But that was the earliest lecture on this particular subject. Of course, that's just an illustration. That's just an illustration, a graphic sort of a picture, of what happens to the pc. In other words, his attention is trapped, residually, in certain portions of the bank, and therefore he hasn't got much attention to spare elsewhere.
A nervous or anxious or frantic individual simply hasn't enough attention units to put on present time, or what's come up. And they're all trapped elsewhere and you're making him take his attention off various places and things are collapsing in on him in these other places in order to handle this, and he gets very frantic. It's simply a symptom of... or he goes into apathy. It's a symptom of not having enough attention in present time, see. And the less attention one has in present time, the more one is likely to go down Tone Scale. This exactly matches the old Tone Scale. The less attention in present time, the less... the lower the tone of the individual is going to be, and his concept of reality, and all this sort of thing.

Actually, you can add up all of Dianetics and early Scientology and so forth, just under the few words I'm just giving you here. Just giving you a picture. Of course, you know you've covered that ground.

But apply this now to the fact that we have found those things which have, without any doubt whatsoever, ensnared the greatest part of the pc's attention. And those are attention traps to end all attention traps. And when you've got a rock slam you have spotted one of these attention traps. And the rock slam is caused by the fury and franticness of his attention and opposed attentions. And that – zzz! That's what causes it.

Now, that amount of attention then is absorbed in the bank. Now, you stir that up, you put his attention on one of these items, and then you go off to find another pair. And you only find one of those, so – you haven't found a pair yet, see, you only find one – and then you go off and you find another item. Get the idea now. You couldn't find a pair that time either for some reason or other. And you finally – you list that out, you see, and you haven't opposed it, you see, you've had to go in with other lines, like "What would you rather not think about?" and "Who or what has been shot lately?" or something like this, you see. And you kept going in, and you'd find a rock slam each time and then you only find one of the items, you see.

How many of these single-sided items or half packages do you think you're going to find before the pc will get no R/S? See, that's the burning question. What can the pc tolerate? Oddly enough, the tolerance is sometimes very good and sometimes very bad. It isn't constant.

If the thing is directly in present time – and the second lecture is about the phantom slam – but strangely enough, if the pc has a thing right in present time that you haven't found the package with, but have ticked it, and it's right in present time, and particularly if the thing he expects to help him, and then you neglect this thing, it's a lead-pipe cinch that his attention has been all gathered up now. He won't have any attention left to put on anything else. And you just lay dead horses from there on. I'm going to give you more lecture about that.

But right now I'm talking about the auditor who finds an item, then doesn't find an opposition for it; finds another item, doesn't find an opposition for that; finds another item; almost finds another item; gets a list that's rock slamming, abandons that and then all of a sudden says, "I wonder why this pc doesn't rock slam anymore? I wonder why this pc..." – pc's getting better, and so forth, says he feels better, and so on. What's happened here? See.

Pinned his attention here, pinned his attention there. You know, these, this, that, uh, ub, ub. He's got no place to look now. You know, he's just sort of – there he is.
You say, "Why don't you rock slam, bud?" In other words, you can tie up a case so that it won't rock slam by just making too many bypasses. Now, this isn't really terribly serious.

Now, we now know what... you see, you can take the case's folder — that's why, my God, always save all the pieces of paper. And always put the date and the pc's name on it, and what you did on that piece of paper, for heaven's sakes. And this is why. In my auditing over the past couple of months I finally have left three things which have got to be completed. There are three, back along the track. There are an awful lot of packages, but I know now that those three packages are not complete.

Now, that isn't enough to catch up with it and stop everything over the number of items that have been found, the amount of attention that has been freed. But brother, I thank my stars that the records were complete. All I've got to do right now is write a few more things on the list and null them and I've got the item, do you understand? I didn't understand it earlier, I was studying this. But they're... I still had three of them.

Now, the number of these that you miss add up to the amount of stuck attention the pc has got on the track near present time. And you can add that up to a point where the pc won't go Clear. But if you've kept all the records, it can very easily be straightened out. That's what's important.

Actually, some auditor comes along and gets all the residual gain — bang! All the poor, first auditor had to do was list five more on the oppose list, you see, and he would have had the rock slamming item and it would have gone together as a package and the pc would have flown, see — 2-12 is a sneaker.

It produces better results done wrong than old techniques done right. So auditors become too easily satisfied with its gains. The pc is very happy about it. And my God, he's got the — he's got this thing, he just had to list five more and get the item, and really package it up, see, and the pc would have taken off like a Cape Canaveral — not a Cape Canaveral rocket — like a Russian rocket. And everything would have been gorgeous. See, that's all he had to do, but he didn't do it.

Now we know, now we know what a Class II Auditor is that knows 2-12 very well and is well trained and classified. We know what he is. He takes the folders and guides through the auditing of cases that have been done by Class I Auditors and straightens them out.

So this tells us at once what a Class III Auditor is, you see. He straightens out the incomplete lines and the failure to package of the Class II, you see.

Now we know what a Class IV Auditor is, see. And he takes the cases that have not been completely packaged and straightened out by Class IIIIs, you see, and he straightens those out.

And we finally find out what my class is. I straighten out the Class IVs. [laughter]

In actual fact, it is not dangerous to put this technique in clumsy hands — not at all dangerous to put it in clumsy hands, because it has residual gain. With this one proviso: pro-
And the next thing you insist on, that common, ordinary, good auditing gets done, you know. That's the next thing. That hasn't anything to do with 2-12, don't you see.

Now, the next thing after that is that 2-12 is done right and effectively, and that's about the order of importance. And if that order of importance is followed, why, anybody will be able to pick up some case and put it back together again. He can see – he's got – he looks in there and he sees these... they've got a list of five items, as opposing the rock slamming item, and there's thirty-eight strikes after each one of the five, you see, and right away he has some idea of what happened. All he's got to do is complete that list and he's got it squared up. Those are your orders of importance.

If a case can't do the basics of auditing, then the auditing the case must be permitted to do is the simplest auditing that can be done. In other words, you just omit the mid ruds, you just omit all of these odd balls, and you get 2-10. That's a heavily supervised co-audit sort of a process. You just omit everything that the auditor is goofing with and carry on from there.

But this is the way – this is the way 2-12 stacks up at the present time. It itself is not complicated. But somebody who is still learning to audit while doing 2-12 can find it very harassing and very complicated, particularly when they've missed rock slams. And particularly when… Well, they had all of List One slamming, so they represent a think item. "What would you rather not think about?" Pc goes halfway around the bend. They say, "There, you see, 2-12..." But they actually never can quite say that it doesn't work, because even if they did that, that badly, the pc still registers some gain.

So 2-12 is actually the first technique that falls into all these categories. And it's quite new. It opens up new doors to auditing. It opens up new doors to results.

Supposing an auditor almost did it right and got lots of lists, and he almost had items and so on – but he never checked anything out. You took the pc's folder, you studied it from the beginning, found exactly where it is, and the case – with four or five hours of auditing you find twenty-four items. You'd suddenly get a gain that'd make the pc just practically thetan exterior right there, don't you see? Residual gain would all take place in a very short period of time.

But the auditor that did it, if you ask him, would have been very satisfied with his own auditing. Saw the pc gain all the way.

The only thing that gives you trouble sometimes is you cannot quite make up your mind whether the item that you're going to oppose is actually a slamming item or not. And that's the only list you will ever lay an egg on, because it gives you a cyclic rock slam, dirty needle, clean, rock slam, dirty needle, clean, rock slam, dirty needle, clean, and will probably go on doing it for the next fifteen thousand items. That's the only bug there is where it really takes a little bit of judgment, because sometimes you say, "It isn't rock slamming anymore," and you should have opposed it. And sometimes you say, "Well, it was rock slamming so therefore I'm going to oppose it," and you shouldn't. So in that particular case you just learn –
one of these cyclic, dirty needle sort of lists that go on and on and on, on an opposition – you learn what one of those things look like, and after that you'll know what you're listing.

Okay. Thank you.
Okay. And this is the second lecture, Saint Hill Special Briefing Course, 11 December, AD 12. And the... this lecture concerns 2-12. The first lecture here was – this had to do with the basics of approaches to 2-12, some data on it. This lecture concerns a special manifestation and some other odds and ends on 2-12. This special manifestation is called a phantom rock slam. Sounds like something out of the Lone Ranger or something. But that's so you won't forget it.

Phantom slam. It's going to cause you more trouble than anything else. You're going to get somebody all grooved in, and they can go through all the notions of 2-12, and then they're going to run into a phantom slam. And now they're going to have trouble.

Now, I mentioned this phantom slam, many, many, many lectures ago, many, many weeks ago. And I said I was studying it. There's more to it. Now, I now have studied it. I know what a phantom slam is – given a great deal of lime to it and a lot of auditing on it and a lot of work with it.

Now, this is not a rare manifestation. To give you some sort of an idea, Staff Staff Auditor Number One in one of the Central Organizations, on the first three staff pcs, found each one of them with a phantom slam; didn't now what it was, and started burning the teletypes. Didn't know what this thing was. The teletypes got burned for another reason, and that was requesting permission to grab what was slamming in the rudiments and oppose it.

Now, this permission is about the same as asking permission to step off Empire State Building without a parachute. Now, this is first and the foremost – the first thing you must know about a phantom slam is just this: that you mustn't grab slams out of rudiments and mid ruds because you now know what the pc is slamming on. You just mustn't do that. You must get your rock slamming items off the record.

In other words, get those things either by straight 2-12 or old Security Checks or something of the sort – case data that is fairly consistent and fairly straight. Because peculiarly enough, the phantom slam will attach itself to anything and everything in the rudiments. And today the pc is slamming on "Joe," "Bill" and "Pete," and tomorrow is slamming on "mistletoe." Only the pc never slammed on "Joe," "Bill" and "Pete," and never slammed on "mistletoe." And you can wind yourself up with a peculiar phenomenon. The only touchy point in auditing of 2-12 is opposing something which isn't a rock slamming item. And when you do this, you may get a rock slam in your opposition list but it'll be a cyclic sort of a proposition. You will get a rock slam and it'll go out to a dirty needle and then it will go
clean, and then you will get a rock slam and a dirty needle and it'll go clean, and you get a rock slam and a dirty needle and go clean.

Sometimes the rock slam will even dwindle. And then you get a rock slam and a dirty needle and then it goes clean. And this I'm talking about is every two pages or every three pages worth of items you go through this cycle. And you just keep going through this cycle. And you go on and on and on through this cycle. And this cycle never ends. And you start after you've got three hundred items, you say, "Well, that's pretty good, I'd better try to null this and..." – not nullable. You can't get the ruds in, you can't do anything and so on. Pc perfectly willing to give you more items. And pc perfectly willing, you see, to put things down. You've got rock slams, everything is fine – apparently, you see. But you can't null the darn thing. And you get three items, four items null, and then bang-bang, and everything is in, and bang-bang, and the needle goes dirty and so forth and you add to the list and you try to null and you can't do it.

This is peculiar to the opposition list, by the way. You got this confounded cycle going. I'll tell you how to get a list like this, is let's carefully take an assessment of items the pc does not react to. Let's very carefully sort this out. One of the ways of doing it would be to say, "What objects are in this room?" and make a little list and then ignore all those that react on the needle and take one that doesn't. Pick one that you're sure doesn't react on the needle. Now insist the pc oppose it. And oddly enough, the pc very often will be very glib and oppose it and feel much better and you'll get this confounded cycling thing, and it may even rock slam. But you will just about go daffy with this list because it never becomes a nullable list. That phenomenon does exist.

You have to know about that phenomenon because very often it is necessary to take a List One that somebody said rock slammed last August, during a Sec Check, run in upper lower Bulawayo – that they rock slammed on "PABs".

Now, you wouldn't pay any attention to that until you'd laid three dead horses on represents – dead horses, no rock slams, no rock slams, no rock slams. You can't seem to turn on a rock slam during listing on this case.

Well, now you must assume that this case rock slammed at sometime or another on List One. One of the things that's going to be upsetting about 2-12 is people are going to go around – rock slammers are going to go around, they're going to say, "You see, the reason we use List One is just because Ron is fixated on this idea of security, see? And he's – of course, you can understand how he wants to protect Scientology and its organizations and Scientologists and so forth – but he's just got this bug, don't you see? And actually you don't need to do List One at all. You never have to have anything to do with that. It doesn't matter, Scientology benefits anyway and you don't pay any attention to that because that's just nonsense and we will only use the auxiliary lists."

And then you're going to have somebody laying dead horses and being very unhappy and the longer they audit the more miserable they're going to get and the case is not going to make any real progress, and they've just been let in for it, man.

Well, the phenomenon is this, and this is also very much – very pertinent with the phantom slam. That which is helping the person is the enemy of the person and so he never
will accept the help. He's got an enemy mixed up with the auditing session. There it is, right there in the session – it's right here, right now, in present time. It isn't some esoteric thing like an auditor gypped him out of some money back in lower Chicago, see? That had nothing to do with it. It's right here, it's right now. And that's what you have to know about the phantom slam – it's right here, it's right now. It isn't yesterday and it isn't the wife and it isn't this and it isn't that and it isn't a pr... PT problem he has out of session that he came into session with – it's right here! It's right in this session.

Now, List One is where? It's right here. It's right in this session. See, it's Scientology that is being used on the person, don't you see? It's the rules of various specific personnel that are being used on the pc, don't you see? They're being run on an E-Meter. They're in a session. Got that? And if those things are neglected, it just goes on – that slam is just... they're never located. Never, never, never, never located.

Now, the most crude manifestation of this is the phantom slam. And there it is, you see it, and now you don't see it. And you see it and now don't see it. So here's – let me go into this a little bit further. Somebody's going to – just to finish off this other thought – somebody's going to say, "Well, that's just security, and that's just so those damn Scientologists come out and us psychiatrists can really make something out of this, you see?" All of a sudden they start auditing themselves into a hole. It doesn't work, nothing works for them. It all goes by the boards! Plaghh! Understand?

It really is true that a person cannot have – I don't care if he analytically and intellectually can have the help – he can't have the help if he's rock slamming on it. See, if it's a mortal enemy of his, he just can't have it. Because his attention on the help is what he gets fed back into the bank from an enemy. And he just can't stand this. And if you ignore this, he'll just go on – dead horses, dead horses. He'll feel a little tiny bit better and he'll feel a little tiny bit better.

This is so much the case that sooner or later on just a dead-horsing case you just have to assume that at some time or another he rock slammed on List One; he does not now rock slam on List One; we cannot now find the rock slam on List One; it is submerged in some way, and we don't know how, so we're just going to take three or four or five or six key points of List One and we're going to tiger drill the things and get any one of them to tick, and then we're going to oppose it just for the hell of it. And then all of a sudden it'll turn on a rock slam and so forth.

Yeah, but it doesn't turn on a cyclic slam, it turns on a slam that goes on out and produces a reliable item, see, and bang! gives you a nullable list. All of a sudden these two things go together; the case starts to fly at once. You understand that phenomena?

All right. Now, the most flagrant and the most baffling case of this, is he phantom slam. Now, you see the case I was just talking about, it doesn't slam at all. Now, there's quite the reverse. There's the case that just slams slams and slams. The auditor sneezes and the case slams.

I can tell you an awful lot about this phantom slam. It is really goofy. It makes lists look like they're slamming when they aren't. And eventually, the auditor won't be able to tell whether he's got a phantom slam or a real slam. He's just done a list, but every time the pc had
the tiniest little withhold in he session – moved his foot and didn't tell the auditor – he's got a rock slam. At that moment the auditor is saying, "Pigs." So he marks down on the list, "R/S, pigs. R/S." See? And then the withhold continues to have force till the pc changes his mind or something, for the next few items, so he's got R/S, R/S, R/S. This is nice. You know, R/S, and then it's gone.

Now he goes over the list again, and although it is not always true, that – it's seldom true that something that R/Sed while being written down, R/Ses during nulling. As a matter of fact, it doesn't mean a thing if something that R/Sed when it was written down doesn't R/S when you're nulling. Just forget it. Don't even expect it to. Your test is whether or not you've got it... one R/Sing item while you're nulling. That's the one thing you've got to have, see?.

But in this particular case you just never get... you got these R/Ses and as you're nulling, the ones that had R/S all marked with R/S, they no longer R/S. But this one – this one, "willow wand" which didn't R/S while it was being listed, R/Ses. Only you now say, "willow wand" and it doesn't R/S. Man, this is stuff for the nut house. You know? And you just get kind of baffled after a while. You say, "What the hell is going on here?"

And if you keep on auditing this pc you will eventually realize that the R/S has nothing to do with what you're doing with R2-12. The R/S turns on incidentally. And it's likely to turn on more powerfully on a charged list. If the list is a heavily charged list, natively, that has its own R/S on, now you'll get far more R/Ses because of the phantom slam, see? See, you're busy listing something that does have some rock slams on it. Well, the presence of the phantom slam makes practically everything on the list rock slam. There's real enthusiasm.

And then you get right on down to the end of it and you say, "Well, there's my item, pigs." You know? "There's my item, pigs." And you get right on down there, bang!, pigs. "It rock slammed the first time I went by it." [with a pleading voice:] 'On pigs has anything been suppressed? On pigs has anything been invalidated?" Man, they're the deadest pigs you ever had anything to do with. You were betting your bottom dollar on "pigs" because you saw it rock slam the first time through and you come back and it never rock slams again. You just chased an R/S all over the place. It chases all over the list, it chases over Tiger Drills. It chases here and it chases there. And that's the phantom rock slam. And it can really louse up 2-12.

Now, you see this is not very rare. This is not very rare. If I tell you the first three cases run by Staff Auditor – Staff Staff Auditor Number One in a Central Organization on staff were all phantom rock slam cases. So, by George, we had better know a great deal about this.

So I have practically audited me eyeballs out trying to find out everything I could find out about this confounded manifestation. And the test is this: Does the pc R/S in rudiments or mid ruds? Particularly in this new form of Goal Finder's Model Session, where you're putting in "Since mid ruds," "Since big mid ruds" to start the session with – "Since the last time I audited you..." in other words, put your big mid ruds in. And you'll find out that needle will be awful smooth an awful lot of the time.

Particularly – I don't care whether they're put in that way for a listing session, but for a nulling session they must have been put in that way. "Since the last time I audited you..." or
"Since the last time you were audited..." (if it's a new pc), "...has anything been... " you see? And then you just move in your big mid ruds right straight across the boards.

All right, that type of operation will get more rudiments in than you can shake a stick at. It's actually more powerful rudimenting than old Model Session. This is really, really gunned up. And if such rudiments are put in at the end of the session, you're putting in more end ruds than you've ever put in before, too. Particularly if you're careful with the room and havingness. But that's beside the point. Because, that's details that are coming up and it's simply a smooth-out of Model Session. You see these various changes of one kind or another. But they have bearing, and I mention that just in passing here only for this reason: If you're using any type of mid rud which gets from the last session, or covers any type or period of livingness at the beginning of session or during the session or something like this, and you see R/Ses turn on, an R/S turn on, or if you're using old-type Model Session, you saw an R/S turn on – watch it, man, because you're auditing a phantom slam.

Now, sometimes the pc graduates upstairs to having one. And you feel you're perfectly safe and everything is fine and so forth. Actually your pc was below rock slamming. And you unburden the case and the case is making good advances and one day you sit down and find yourself facing a phantom slam. In other words, the pc can move upstairs into one.

Now, a slam on a case will go through a cycle. As you unburden a case it can come into rock slamming. See, it didn't rock slam on a certain subject or area before but it moves into rock slamming, then the rock slam becomes very frantic and very intense – this is plotted against quantities of hours of auditing, don't you see, numbers of sessions. I'd say... let's say over a period of a couple of weeks of auditing you're liable to see one of these things which was a very tame R/S turn into a very frantic one. And then start to cool. Now we're talking about a phantom slam, you see? And then it gets cooler and cooler, and finally is almost a lazy rock slam. It's hardly a rock slam at all. You keep unburdening it.

And then one day you hit the actual item right on the button, and all the characteristics of the slam come back for that item. Crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash. Because you hit it right straight on the button. So, it can appear to go away. It can appear to get more frequent. It can appear to get less frequent. It can all of a sudden develop on a pc who is moving up scale by reason of finding packages. It can tend to disappear because you're finding packages.

In other words, the characteristics of this thing can change, and there's no particular way that you can spot and say, "That is the pc's phantom slam." See? That – it will be more or less the same width but different speeds. And it can simply materialize out of the blue. You know, he never had a phantom slam before in his life and you've found three consecutive sets of packages on him and one day you sit down and you say, "Since the last time I audited you, has anything been suppressed?"... Guess I left him stuck in the last item.

All right, and it... finally gets the suppressions off and it goes off, you know. "All right, since the last time I audited you, has anything been invalidated?" – Crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash-crash. And he gives you an answer, and that's all.

Here's the – here's a horrible mistake. "Oh." he says.
"Since the last time I audited you has anything been invalidated?"

He says, "I invalidated what Joe said about his pc." And the slam turns on.

And you say, "Joe" and you'll get the slam back because you haven't got all of the rudiments in. So you say, "Joe. Joe." And because you've changed it and he objects to it, his withhold turns the slam back on, and you say, "Joe. Joe. Hey, what do you know! I've got a slamming item, here, 'Joe'! Ho-ho-ho-ho." God help you! You have no slamming item named Joe.

Now look, I've kept records of these things. I've taken goals lists and have spotted every type of goal the pc slammed on and they all bear a relationship. It's all understandable, it can be measured up. You can figure it out within two or three dynamics. I mean, you can get close, see? It's either the 2nd dynamic or the 3rd dynamic or mankind or God.

You can drive yourself halfway around the bend trying to figure one of these things out. I'm not kidding you, man. I really had the old wits tuned up to a high whine on this one – wheels skidding all the way, too. Now, I've seen these things turn on. They are just not related to one case here. Inexplicable. How the devil? How come? How are we missing on this case? How's this going? Well, it's just this phantom slam. Makes everything look like it rock slams if the pc happens to have a withhold and you're saying the item at the same time, then you get a w... you see? But the more heavily charged the item is, the more likely you're to get a rock slam on the item. So that item is charged today. "Joe" is charged today. So all today we've got a rock slam on "Joe." Soon as we clean up "Joe" we haven't got a rock slam on "Joe," we now have a rock slam on "peanuts." Not even the same dynamic area.

And you can hunt one of these things down and my whole message to you is – don't! What is a phantom slam? A phantom slam is a rock slam that turns on in the rudiments. Any rock slam that turns on in the rudiments, any pc who consistently has rock slams turn on in the rudiments or running general O/W, that's a marvelous one to get phantom slams in. Oh, you can just drive yourself round the bend, you see. "What have you done?"

"Well, I've uh... been mean to Joe today." Rock slam.

"Joe. Joe. Joe. Ha-ha! Joe. Hey, what do you know!" "What have you withheld?" You see, you eventually get back to that, you know.

"Uh... well, I didn't tell Joe something or other and so on."

And you say, "Joe. J – Where the hell? It's gone. What happened?"

As long as he had a slight withhold from Joe, "Joe" rock slammed. Oh, how cruel! But it's during the rudiments, one that turns on during the rudiments. Now, you're safe as long as you never get rock slams when running general O/W and during the rudiments. You're perfectly safe. But you get any occasional – even an occasional – rock slam while doing rudiments, you've got a case that'll phantom slam. And that case will make a liar and an idiot out of you in listing. You'll be listing away...

Don't think you can't make any progress at all, because you will. Every now and then you accidentally find a real rock slam. The rest of the time it's just the fluke of whether or not the pc has a tiny withhold from you or the remainder of the dynamics. And that creates a rock
slam. Pc feels a little bit chilly at the time you're going down the last part of the last five items. Oh, man, you've had it. Because you go... every one of them's in. They're all slamming beautifully. And then you say -- you decide to put in the session mid rudiments, you see. This is after you've already said, "Well, four items are slamming on the list. This was marvelous, you know! Oh, we had a wonderful session, you know." And the pc looks like hell, but, "You know, I had a wonderful session," and so forth. And you're putting in the end rudiments, you know, I mean, you're putting in mid rudiments for the end of the session, you know. Pc says, "I was cold." Slam. Slam. Slam. Slam. "I was quite cold earlier in the session."

And you go back and you say, "Tiger. Tiger. Waterbuck. Fireman." There isn't a slam in the lot. Disheartening! Every so often you'll be patching up somebody's line plot that's been done in a co-audit and you'll be taking this line plot and you'll find out that there are twenty-four listed items that have been found over a period of eight and a half years of auditing or something. And you'll find out that only one of them slams. Twenty-three don't. And you say, "Well, the charge all dissipated." No. The poor auditor was bucking a phantom slam the whole way -- was making a liar out of him. So you see how important it is to know about this particular thing. It is important.

Now, this would all be pretty desperate if I hadn't figured out the solution to the thing and got the thing taped. But I wouldn't tell you of the ghastliness of the whole thing unless I had some resolution to the thing. And the resolution is very, very simple. You get the rest of what a phantom slam is: A phantom slam is turned on by something in immediate, instant present time of the session by something immediately in, or in the vicinity of the session. You needn't memorize all that, just remember, I'm just trying to tell you, it's right here! See? It isn't the fact that they just had an argument with the D of P, see. The D of P is down the hall. How the hell can they rock slam... ? See? The D of P isn't in the room. No, it's got to be right here, man.

And the way you smoke one of these things out... Now I've altered your List One so it will contain practically anything, but if you don't find a sl... if you've got a phantom slam, and the pc doesn't slam in anything you find in List One, do something. And this is what you do: You get, with the pc's help, very possible element of which a session consisted. You would make a special list. And on that list you would make damn sure that you included every part of the pc such as "me", "Joe", "you", "yourself," "my mind," "George P. Aloysius Doakes" -- full name, see. You lay all this down here, see, and you get a list of this thing. You've got the meter. You notice on the back of a meter you've got "HCO," so for God's sakes, get HCO down on it. Don't you -- you see what I mean? You get "badges", "symbols," tables," "chairs," you know, auditor," "men" -- with the pc's help, you know. The auditor can list as many of these things as he wants to. This is one of these peculiar lists. Then he has to get the pc to complete it.

We get everything in this session and you're going to find the phantom slam. That's everything in this session that is right here, right now. And you'll find the phantom slam.

Oh, yes, he has overts on what it will be. If it turns out to be the E-Meter -- yes. Now, for the first time you begin to get enough realization. You see, because he slams on it, he can't recognize it, he can't perceive it, he doesn't even know it's there. There's -- there's been -- al-
ways been a hole in the session called an E-Meter. See? And he won't give you any of the... he won't give you any, any help on this, really. You have to say, you know, "Is it this, and how about putting... putting 'a table cloth.'" See? "How about that?" "Wood," "roofs," "rooms," "air" – got the idea? That's the phantom slam.

Now, my bet is that the greatest number of these will turn out to be "me," "myself" – first dynamic. My bet is that you'll have a majority of first dynamic things. Could be, for instance, "me," but translated over into "my mind," don't you see, or something. It's something right in the vicinity of the first dynamic, it's that close to home. Pc fighting himself, that kind of thing, see. I think your greatest majority of them will be that.

But this one – now, you're saved by the bell with this, because you can fumble through and you'll find out the phantom slam will get more... and you do find some items. Your items... you've got to be awful careful in auditing a case like this, but you do find some packages. You do make some progress with the case. See, you gra... really can't help it with 2-12. You push it ahead one way or the other.

Case isn't going to make as much progress because he's got a PTP that's right present in the session all the time, but you couldn't find it. Don't blow your brains out. Because just the process – don't worry the pc about it either – just the process of going on and finding some packages and finding some packages will show you that this slam is changing in characteristic, as you find it in the rudiments. And it changes and it gets more and more to PT and it gets more and more sudden and it gets more and more constant and you theoretically could find packages till one day the pc blurted it out. Pc says, "It's 'neckties.'" There it is. Slams.

Now, the only test of whether or not you've gotten the phantom slam – this is the only test – is it doesn't reoccur. That's the only test. So you really don't know for several sessions whether or not you've got the phantom slam. But you'll see one of these things, and the only thing I could hope won't happen to you is, halfway through auditing somebody, he makes sufficient improvement one way or the other for the thing to turn on, then you don't recognize that a phantom slam has occurred and now you just find all kinds of rock slams and you find all kinds of slamming items, but nothing ever stays in. Except now and then, one slams consistently. And you say, "Isn't that nice!"

But when you oppose it, it's still there. There's no way you can sort of wash this one out. Because everything you're finding is a phantom slam. See, you're actually not finding its opposition at all. Hideous to contemplate, isn't it? The only thing that could be bad luck about this is you didn't notice that you were getting a phantom slam in the rudiments. That's the point that you could miss.

It's liable to start on a pc that it has not been happening on before. So that is very, very pertinent, and that's the only place you should really look for one. And don't plunge. Please don't plunge. Don't go diving overboard and grabbing these things which come up in the rudiments so that we can use them and oppose them. Uh-uh. Hideous to contemplate that some poor auditor, some poor auditor up in upper Podunk, he doesn't know anything about this and he's doing marvelous 2-12, and he's just getting packages and packages and packages and packages and packages and packages. He just gets packages and packages. And you look at his folders one day and he's got ten items compose a list. And he's just taking what slammed.
In other words, every time he had a withhold from the auditor, the auditor had a (quote) "reliable item" (unquote). Dzzz! And every time he had a withhold on anything that was opposing it he had another reliable item, didn't he? So that gives him a package. [laughs]

Yeah, this is a real goofball proposition here. A real goofball thing to have. But where you've got one of these things right in the session – right here, right now and so forth – it would be a very good thing to try to round it up. Without driving the pc matty and – into a nattery heap. Just try to rind... wind up the case that way, because, listen, that's so close to present time and it's so close to the environment of the session that the pc has such a screaming PTP about it that he's always being audited in the presence of a PTP and so therefore he's making no real gain at all. That is also the secret of List One. Because List One items are so close in to the session, the pc is always being audited over the top of a PTP. And we know darn well that nobody makes any progress – PTP.

The way to test that datum, by the way is – nobody will make any progress in the presence of a PTP – on a research basis, wait till somebody had a real, good, honest, authentic present time problem. Then don't let him tell you about the problem. Don't really go into this problem at all. And then insist on running a Touch Assist on him. Or run an old Communication to the Parts of the Body Process. Honest, you just won't make any progress at all, see. He won't be able to ans... he'll answer the auditing commands and he'll grind, and he'll grind and he'll grind and he'll grind and he'll grind, and it'll go on and on and on and it's all the same thing and maybe he'll even get a little benefit out of it, something will stop hurting for a while.

And then take the present time problem that he's come in with and run Problems of Comparable Magnitude or some old process of some kind or another. Dispense with this problem, get it cleaned up real good and go back and audit the same process you were auditing before and you'll see all of a sudden he'll make very nice gains. This is one of the silliest phenomena associated with auditing – that pcs don't make gains in the presence of present time problems.

Now, I've seen, oh, scores, scores and scores and scores of graphs on this. I... the data on this is very sound. And these graphs all demonstrate that where the auditor didn't handle the pc's present time problem, you didn't get any gain in the graph. And then this kind of an action was taken, you see, that the auditor was then made to handle the pc's present time problem, got hold of that problem – it'd be some nominal problem with the wife or something like that – get rid of that thing and then you might get a graph change. You didn't necessarily get a graph change, because the present time problem might have been more fundamental than the one you handled, don't you see? But where you handled the present time problem of the pc and the pc's told you that it had been handled and that sort of thing, you'd thereafter get a graph change.

So, I had to isolate what was keeping cases from advancing. This was back in 1955, 56. And I finally worked it down to the present time problem. And therefore for over the years have studied present time problems pretty closely and then was eventually able to smoke out the whole of the GPM, just on that data that comes up from that zone of research, and the anatomy of the problem.
Now, the closer to present time and the closer to auditing the present time problem is, the less gain can be expected from auditing. It's a direct proportion. And that's why List One is a killer. Now, List One has been made now to include all the dynamics. Now, it's -- it's rather stretching one, but if we realize that matter, energy, space and time are all part of the auditing room and are all part of the session and that the word "auditing room" is also part of the sixth dynamic, realize that there are a couple of thetans present in an auditing session. (Some pcs think there are more, but...) And when you realize that some pcs are totally sold on the omnipresence of God -- he's everywhere, you know -- also, you see, if he's real mad at mankind he can have an oblique ax out for Scientology. See, it's liable to help mankind and he hates mankind and you're a member of mankind and he's sitting in a mankind body, don't you see? So, that becomes part of the session. You're both living things, and in some sessions, even the second dynamic has been known to raise its head.

Now, this situation, then, makes part of List One the dynamics. But that ordinarily should take care of the phantom rock slam. Ordinarily, just an assessment of List One and a careful attention to "did it turn on a rock slam?" -- that ordinarily would take care of your phantom rock slam. You'd get it -- do List One, you get the phantom slam with your present amended list and you'd sail right from there. Everything would be fine.

You might not have even noticed you had a phantom rock slam, you'd have it off so soon. Well, that's -- that's all well, but after you've done this and after you've cleaned up all the slamming items on List One, you then have a phantom rock slam -- what are you going to do? You see, you have to have the total security of an answer. Well, you certainly better go over it with the pc and take up every single bit that the session consists of. And just get a long list of them, we don't care how much of List One he repeats, we don't care about any of these things. Because it might be something a little bit off base. He might call himself "Joey" and it might be "Joey" that he rock slams against, but not "Mr. Jones." See? "Mr. Jones" -- pc's name, you see -- "you" -- all that sort of thing. No, it's "Joey."

Quite weirdly enough, this is the character he most despises in the whole world -- Joey -- himself. But "me," pointing at him... By the way, this is an interesting thing. The way you assess those things is, you really shouldn't point at things in sessions on lists and that sort of thing, but you can point at the pc when you say "me." You can point at the pc and say, "Me." And point at yourself and say, "Me." And you can get this across.

Now, there, aside from not being able to audit, is the greatest trip rope that you will find in R2-12. That one can really throw you because it could throw a veteran, if you didn't know about it. I mean, a fellow could know all about R2-12, making marvelous success with R2-12, tearing right down the track with R2-12, getting packages on pcs, straightening out everything, everything is going gorgeously, and all of a sudden he finds himself across the auditing table from a phantom rock slam. Doesn't recognize it for what it is, all of a sudden picks off, out of thin air, 'Ha! Joe! Ha-ha! Guy rock slams on 'Joe,' I guess we'd better oppose 'Joe.'" Oh, this list is going no place.

Odd part of it is, he could oppose Joe and he could oppose Pete and he could oppose the fellow's wife and he could oppose this and he could oppose that and he could oppose
something else and about… He could do forty or fifty lists, actually, trying to trace this slam and oppose it. He would lay an egg on that preclear, that's for sure.

If you can't find it and if you can't turn it off, well, just to the best of your ability… You see, I've given you now three solutions to it. Your first solution is your expanded List One, that normally should catch it. If you notice after you've done List One and you think List One is pretty clean, that you still have a rock slam turning up in the fellow's rudiments, you know you've got a phantom slam, you know that guy's got a PTP right in that session. Right here. It's a PTP with the E-Meter, the auditor, with wearing clothes, with having to breathe air. It's a PTP with something.

Then your next action is just sort it out – sort it out. Get a new sort of a List One. But actually, it's the "session list." And it's just everything that this session might possibly consist of. And while you're listing this thing, keep your eye like mad on that meter. Because he might think of something that turns on a rock slam when he's concentrating on this session, you might be able to steer him into telling you exactly what it is. And it's finally, "your hair." Got the idea? See, you could steer him into it if you saw the slam turn on. So it's listing against the meter, as you always do, but very pertinently.

All right, that's your second remedy. And your third remedy for this if all else fails, is just go on finding items to the best of your belief, and don't buy items that just go flash-flash and then disappear. Go on and find some item that tends to stay in. Because this above all else will tend to make you do incomplete lists.

You'll say, "Well, it flashed, you know, I've got these last four items at the end of the list and they all rock slammed and then the rock slam turned off. So naturally, they packaged." Naturally. And you don't put those extra twenty items on the list that gets the real item, see? It leads you to incomplete lists and so forth. But do the best you can. Get your packages and so on, and all of a sudden you – that's climbing uphill, very hard – but you'll notice that this slam will get more frequent, turns on easier, gets less frantic at the same time, and then one day the pc, you're doing some kind of a list and the pc says, "Heads! A head. A head!" See? "Yeah! Yeah! It's this head!" See, it slams like mad and you've got the phantom slam. Got the idea?

That would take care of it all. But I would make a special effort to do something about this as early as you noticed it. Now, I'm sure that some of you right now are auditing pcs who have phantom slams. And that you are just a little bit puzzled as to what happens to this occasionally and how come you got down to the end of the list and then you had to say, "Well, actually, there were two packages on the same list and they both blew up, and there was no item, really, which came out of it because everything packaged and they were all bonus packages."

That's for the birds, you know. That's just for the birds. You should go back and take any list that… Well, actually, if you have a phantom slam, is you go ahead and find out what the devil it's slamming on – whether from this new issue of List One, or the second method of making up a list of the session – and find it, get it out of the road, and then go back, and then go back and pick up all those lists that resulted in no item, really, that all sort of went out suddenly and mysteriously, that… it was nullable, but it all disappeared and you didn't really have
anything, and you... the last one in, you guessed. You know, that kind of thing. Complete those lists. Null – you don't have to null the whole list, you just null the stuff that you've added to it. You're going to find yourself some nice RIs. Maybe at the expense of only listing a few hundred items on a half a dozen lists, maybe you'll find yourself about six reliable items. Slang! Slang! Wouldn't that be nice! Bonus package.

That'd be a good way to show up some HPA someplace, by the way. Take this folder, take the folder he's been working on on this pc for the last 195 hours, you see, and then you only audit the pc for something like three and a half hours or something like this and you find twelve new items, you see, or something like this, and you say, "You see, it's very easy. What you do in 195, I do in... " Dirty. Dirty trick.

But now, 2-12 should result in a positive result. You should have something to show for it. Don't think that everything goes up in smoke. It doesn't. You should have something to show for it.

Now, there's one little other phenomenon I want to talk about, which is really not part of phantom slams, but something I ought to mention is indeterminate things. Opposing indeterminate things. Now, you'll find out that you can represent indeterminate things. Definition: No mass. Massless. It's an idea or a condition. And now, you can represent these. Oh, by all means, represent them, you see, and you're going to get rock slamming items and you're going to get nice, massy things, you know, and they've got mass, meaning and fixidity. And everything is getting along fine and you're getting these things and then one fine day... You know, that's from this indeterminate – I mean, it's just a doingness, it's a significance. Let me call it a significance. That communicates to you better. We already got a word for it: Significance.

You represented significances and that was fine. But when you start to oppose significances, you're going to get in trouble.

Now, it isn't that you don't oppose significances – you do. If you find a rock slamming significance, why, you oppose it. We don't care what we oppose. The only thing we have to know about – if it rock slams, oppose it, see. That's all we have to know. But this peculiar thing, this significance that is rock slamming will occasionally throw you.

Now, you do the Zero A list. You assess the Zero A list, and you get – you get something about "attack." You know, and you've assessed out "attack" and you're going to do a represent. You're looking for something to do a represent list on, to find something to get a first list, see. And you hit "attack" and it says "attack" and it rock slams. And you say "attack" and it rock slams. You say "attack" and it rock slams. Well, now, the Zero A lists, of course, are made for representations to get first lists out of, aren't they? But even that is junior to the law: If it rock slams, oppose it. If it's a reliable item, oppose it. Don't ever represent it. Oppose it.

But this significance produces an oddity, because you're actually opposing nothing. See, you're opposing an idea. And you find yourself sometime opposing "attack." "Who or what would oppose 'attack'?" Oh, wait a minute, that's a doingness. There's no mass at the other end of this thing. Well, you can actually come up with an item. But you have to oppose it right back to get a package. Because "attack" versus "a defender" is not a package. You
understand? It's got no mass. So you don't have "attack" versus "defender" equals a package. You have to swing back on the trolley and oppose what you've just found.

Now, the easiest thing in the world is to oppose a significance and wind up with a vzzz, where the significance doesn't read, and you didn't find any item opposing it. That is the easiest flub to make anybody ever made. You just list a hundred more opposition items to it, and you're going to come up with a great, big juicy reliable item that you missed the first time.

In other words, you could null that list down to nothing, and it apparently took the charge out of "attack" but you didn't come up with an item to oppose "attack." Now, you've got to swing back and get the item that opposed "attack" by opposing what opposes "attack." Do you see that? Otherwise you're just going to have a – you're going to have a significance opposing an identity. And that isn't a package. A package is... are opposed identities.

Now you, of course, can have an idea opposing an idea and call it a package because they both rock slammed. Now, that's four items, perfectly all right with me. But actually it isn't very much of the GPM. It's darn little. But you get "a bricklayer" opposing "working hard" and try to call that a package. It's not a package.

Now, you can get the bricklayer by opposing "working hard," but you've now got to oppose the "bricklayer" to find out what the package consisted of. Got to get the zig-zag of this. This is old, original 3D Criss Cross. But this particularly applies to the significances. Significances very easily go blank, so that it doesn't rock slam, you don't find an item to rock slam against it and you say it evaporated. Couldn't evaporate. You found an item with mass opposing a doingness and of course that was no package, and it didn't evaporate anyhow; it's just submerged.

All you've got to do is keep on opposing it. Just get your list. Complete your list. And you're going to find a nice, big slamming item, and it's going to stay there this time. And boy, when you find that item, man, it'll really stay there, it won't evaporate, you couldn't hit it in the head with a sledgehammer and do anything to it. It just goes on slamming. See?

Now, to do anything with that and get your package you've got to come around backwards, and you've got to find out whether or not, using your same opposition rules, whether that produced pain or sen. Now, if it produced pain or sen, why, you oppose it accordingly and you're going to come over here and you're going to get the nicest package you ever saw. When you get those two packages, they're going to sit there right together and the pc knows all about it and then they might have a chance of blowing.

Now, you see how items could get submerged in 2-12 and appear not to have anything there and – and so forth? And the only rule you have to follow is, if the list is nullable, you can find an item on it that will be a good, strong, beefy item – if a list is nullable. It has to be a rock slamming list in order to find an item on it, of course, and it has to be nullable. It need only have one rock slam on it. We've just had some lists start to rock slam after a thousand items. Isn't that horrible? It's not giving this cyclic manifestation though, that I've discussed and you have no reason to suspect the source is wrong and it did rock slam. Now, that list won't go down to nothing if it was nullable. It won't go to nothing. It will go to an item. If it
looks like it's going to nothing and there's just four dirty needles left in – four dirty reads, you know – man, that list isn't complete. Just because you could null it is no reason it's complete.

Now, there's another goofball one about invalidating the list. Invalidating items. You're too prone to use invalidated items to dig up this and to dig up that and to dig up something else. Why don't you just forget it? The pc's invalidating the items he's giving you and that sort of thing – yes, that's a perfectly valid test. But now, why, some students have begun to use that for other reasons. And we have already found two pcs who already knew the rule, who didn't want to complete the list who simply invalidated two or three items and then got out of it. But when the list was completed, produced an item.

Ah, my faith in pcs is deteriorating here.

The list we're talking about – that is the freak list, that'll give you trouble – is the list you can't null. So your basic rule, you see, is, "Is the list nullable?" If the list is nullable, it'll have an item on it. If it hasn't got an item on it by the time you've finished nulling it, then complete the list.

How much should you pressure the pc into listing when he doesn't want to? This all comes under basic auditing. What are you doing as an auditor sitting there with the pc out of your control? The usual phenomenon is something like this: Pc says, "I haven't got any more. But I tell you the list is complete. I-I've said it's complete. I've said it's complete four times, and now you want to go on and on and on and on and on. I've said the list is complete."

And you say, "Well, all right. Well, all right. Okay," you say. Surrender, you know. "Okay. On this list, has anything been suppressed?"

And he says, "So-and-so and so-and-so, another two items I didn't tell you and so forth and oh, yes! There's 'iceberg,' 'reindeer,' 'Santa Claus,'" so forth.

And the other day we had a very disgraceful scene. A very disgraceful scene. The pc kept on listing and the auditor couldn't stop him to get in the midruds to finish him, you know? [laughter] It's just basics of auditing.

Oddly enough, after a list is completely nulled, completely finished and completely dead, a pc very often will be able to complete it. And very often the pc is not really able to give you more items until you've finished nulling the list. Well, that's one for you to know, isn't it? The pc says there are no more items, he actually can't think of any more items – null the lot, tiger drill the last two and all of a sudden the pc's got twenty more items. You haven't got an item yet. So just go on listing, listing, listing, listing, listing, and list your needle out clean and just take that new section and just – just as though it's a brand-new list. Null it down, this time you've got an item. Sometimes you haven't. Sometimes it happens again. If you can null a list, there's an item on it.

Main trouble you're going to get into – the main trouble you're going to get into, however, comes under the heading of the basics of auditing, not under the basics of 2-12. You'll think there are endless rules to 2-12, you'll think there are endless things to know about 2-12. In actual fact there aren't. These rules are pretty hard and fast about 2-12. The basics of auditing cover most of the difficulty that a person will have. He knows 2-12 pretty well, basics of auditing is what he's probably light on. The danger of 2-12 is that an auditor can get a result
on 2-12 that he is satisfied with and that the pc is satisfied with and the auditor has not yet completed his 2-12, has not yet got proper items on 2-12 and has not done it right at all. And the residual gain there is about a thousand percent worth. That's the main danger.

People... you're going to find – someday you go down to Oklahoma here, twenty, thirty years from now, and there'll be somebody down there in Oklahoma, and they'll be busy auditing on the original 2-12 and that sort of thing, and in all those years they have never found an item on a pc, never found a reliable item except by accident and their pcs are all happy and they're all happy and they think 2-12 is wonderful. That's the main danger with 2-12.

All right. You know, actually, we're very, very happy with the way you're doing. You get a lot of – you get a lot of knocking about, you know, and you get a lot of snarling, but in actual fact, why, we're very, very proud of the way you're doing. I'm very proud of the way the Instructors are handling this. We've gotten this thing off the launching pad at a – at a fantastic rate. We've got people in here very new to the course who are doing very, very nicely. They're doing fine.

Somebody came from another organization, from an organization, one of these – other day – to ask about the trouble we were having with 2-12. And they were getting ready to get it trained and they were getting ready to get out checksheets and they were getting ready to get auditors to study it so that someday somebody could do it. And they were quite surprised that we weren't having any trouble getting 2-12 into action. They were quite amazed, as a matter of fact, rather insulted. We should have been having more trouble than we've been having.

So, I think you're doing fine with it and you're looking much better. The number of items found are fantastic. And you've got a whole bunch of residual gains coming up now, and the gains are right there, because you go back and look at those unfinished lists where you didn't find the item – finish the list and find the item, and all of a sudden the pc will take off.

Okay?

Thank you very much.

Good night.
R2-12 DATA:
NEEDLE BEHAVIOR

A lecture given on 13 December 1962

Well, another evening. What – what's the date?

Audience: Thirteenth.

Thirteen Dec., AD 12. Have you been lucky today?

Audience: Yes. Yeah.

Saint Hill Special Briefing Course, lecture number one.

This is a lecture on 2-12, needle behavior.

Nomenclature: a clean needle. What is meant by a "clean needle"? What is meant by
"cleaning a needle"?

Well, not what you think. We want a free, flowing needle. We want a needle which,
when it comes up the line, doesn't go tick-tock. Not when we say anything! Now, let me get
this point across, here. I'll be calm. The auditor is saying nothing. Do you understand? The pc
is sitting there. The auditor is not doing a thing. You got that? He's not even reading the meter
probably. And under those circumstances there is no faintest trace of irregular or reacting mo-
tion on the needle.

I knew I could get this one across. I just saw a couple of cognitions. Now, you've been
thinking that cleaning a needle had to do with when you said something it went bop, and then
when you said something again it didn't go bop. And that's not cleaning a needle. I make my
point?

Audience: Yes.

That is just taking a read off the needle. You can clean a read off the needle, but that
doesn't give you a clean needle.

If you will watch a needle on a preclear, at some time or another in the source... in the
progress of processing – at some time or another in processing, probably during listing – you
will have finished a list and will not yet have Qed-and-Aed, see? And at that moment you will
see a needle undergoing a slow, pleasant rise and, less usually, a slow fall. It would be flow-
ing. That's all it will be doing – a flow. You can see that needle flow.

This is particularly true of a Mark V. I... a Mark IV doesn't even begin to express it
like a Mark V. But a Mark IV will also express it. And there's that needle, and it's just... you
can't even begin to approximate it with your finger on the tone arm because that is too irregular a rise. You understand?

It is a total uniform speed. There is not the faintest tick in it! There is not the famous – faintest speedup! There is nothing. It is just like molasses pouring out of the barrel. And there it is. And that's a clean needle! And that's how I want you to get your needles before you start nulling, and you won't have any more trouble.

And I'll bet you right now there's several amongst you who don't think it's possible.

Well, I can tell you that it isn't possible to null with a needle any other way. If you put your big mid ruds in, your needle will look like that unless you clean a clean or miss a read. Absolutely faultless mid rudiments will give you that needle. And if it doesn't give you that needle, you've missed one or cleaned a clean! You've goofed!

There isn't a pc that you've been auditing lately that I couldn't have a clean needle on in the course of fifteen or twenty minutes, no matter what they've been up to, with just the weapons you're using – big mid ruds. Just that, nothing else.

Look, please. You're in over your heads on 2-12, trying to figure out what you do on 2-12. And your trouble isn't with 2-12, see. 2-12 actually is very simple.

There's various things about 2-12: You always oppose a rock slamming item. Opposing is senior to representing. If you don't get an item which is unmistakably it, you extend the list. I mean, these things – these things are easy. These things are easy.

The trouble auditors have trouble with is the fundamentals of auditing, the fundamentals of auditing. And let me tell you, you start goofing up with your TRs, you start goofing up with your meter, and you now have a process that somebody looks down your throat and knows you have been.

If there's anything wrong with 2-12, it is so positive in its gain that anybody can tell you've been goofing. In other words, 2-12 starts showing up any fault you have with your TRs, your Model Session and a meter.

Before, these could be submerged into the upsets and vagaries of the pc. You'd say, "Well, he's having a hard time, but he'll come through it."

There's only one period during 2-12 when a needle looks some other way or when a session looks awry. And that's when you're about a third or halfway through a list, you're getting up toward the end. It's hot. The pc doesn't want to confront that next string of rock slamming items. He starts throwing little brakes on, little protests and that sort of thing, and you clean it up and it goes dirty and you clean it up and he goes dirty. Or when you are – as you inevitably will – try to null an incomplete list, a list which is almost nul- lable. It hasn't got the item on it, but it's got enough charge off of it so it looks like it can be nulled if you keep your mid ruds in. When you get yourself into that situation, yeah, your needle will look rough, but you smooth it out. And then it looks rough, and then you smooth it out, and it looks rough, and you smooth it out. You should make up your mind sooner or later that that list is incomplete.
But the point is, yeah, there are periods during 2-12 when somebody is snarling, see, and when the needle is this way. Because after all, the pc is undoubtedly going to get misemotional. Undoubtedly the pc is going to develop some somatics and say no. Undoubtedly some great big crashing rock slam is just over the horizon.

The pc sits there and he says, "Well, that's – that's complete. That was the last – the last item I put on was it. Yeah. 'Fuddy-duddies.' That's the last one. That's a – that's it. I know it's on the list now." Sell, sell, sell, sell.

You look at the needle – looks all right, nothing wrong with it. Make a few tests one way or the other – looks all fine. You go back and try to null the thing and now it's dirty and it's this and it's that and it's the other thing, and you're in trouble all the way. You decide to extend the list and find out three more items later he had a dial-wide rock slam. That was what he was trying to get complete before he reached.

Oh yes, there are periods during 2-12 when the meter looks awfully, awfully gummy and messy. But when you've got the list complete, and when you put in those mid rudiments to test that list for completeness – which test, by the way, is only a conditional test now. You've got to make a full test the way I gave you in the first place to really find out. "Is it complete? Are there any more items? Have you thought of anything else that should have gone on the list? Could there possibly be anything else on the list?" – Any of those questions produces a reaction, the list is incomplete.

Just stating the question itself, which I gave you to try to help you out was – made it too easy for you, because it doesn't deliver the goods.

We're talking about, now, a clean needle – a clean needle. And a clean needle looks like molasses being poured out of a bucket by a statue. There's just no slightest vestige of anything on it. So there's another E-Meter characteristic. There's another meter characteristic that has not been stressed, because one has talked about it, and it has apparently been so obvious, but there's a lack of communication here. And I realized last night that there was a lack of communication.

I'm not blaming you for this lack of communication. I mean, I'm not blaming you for not having – its not having gotten across uniformly and universally. Not blaming you much. Of course, you don't know what the hell's the matter with you. But it's all right. I'm being calm about the whole thing – within reason.

There's this thing called a clean needle. And the definition of a clean needle is something which flows at a uniform rate of speed at a period when the auditor is doing and saying nothing. That's a clean needle. And dat's da way they ought to look.

Now, you should realize that there's a reverse to this. It's something called a needle pattern. Well, a needle pattern isn't exactly a good statement of affairs. Pc comes in and he's always going tick before he goes tock. And the needle's going up and it goes tick and then it goes tock. And then it goes pit-pit. And then it goes tick and it goes tock, and then it goes pit-pit and so forth. And he always does this. Well, that's what's meant by a needle pattern. It is a chronic and constant needle behavior on a particular pc, when the auditor is saying and doing
nothing. We have to add that. It's not a needle response, it's a needle appearance when the auditor is saying and doing nothing.

Now, a needle with reaction on it is a dirty needle. And that's why we don't need to re-qualify the definition "needle pattern." A stage four needle is just a big needle pattern, and people will have these chronic patterns. But that's not really what we're talking about. We're talking about a dirty needle.

What is a dirty needle? You think it's a needle that's going bzz, bzz, bzz. It's a needle which doesn't look like molasses being poured out of a bucket by a statue – any tick, any roughness, any slight speedups as it goes. It's strictly a Cadillac with an automatic shift moving off on a perfectly billiard-table-flat highway, driven by an old lady.

A dirty needle is any needle which departs from the appearance of a clean needle.

Now, a dirty needle has nothing to do with the auditor. The auditor is not doing anything. All these needle patterns and responses and behaviors and everything else I'm talking about is with the auditor sitting there totally Japanese, withholding his foul breath from the pc's face, you understand? Auditor doing absolutely nothing. It's beside the point.

Now, add this into your auditing. Take that meter – pc is on it – take that meter, and just hold your breath for a count of five and watch that meter. You haven't put any question to the pc. All cycles of auditing are complete. All cycles of auditing are complete. And just watch that needle. And if that needle is doing anything but flowing at a perfect uniform rate – or could be still, but the probabilities of that are very, very faint – if it's doing anything that has any irregularity in it of any kind whatsoever, that is a dirty needle and your middle rudiments are out! You got it?

And you want to develop this practice of just sitting there for a count of five and watching the pc's needle. It tells you a libraryful. And that is the state of the needle. You observe the state of the needle. And the state of the needle is not where the tone arm is. It is not how sticky the needle is. It is not how unsticky it is. It is whether or not it has any ticks or tocks on it.

And if it's got any ticks or tocks and halts and zzppps, and anything else... And you understand, those are to a microscopic degree! You understand... this is a very extreme statement I'm giving you. Anything beyond perfect, unchanging, uniform action is observable – that is a dirty needle. And that means your mid ruds are out!

Now, if you've audited 1,865 hours on a pc with the rudiments out the whole way, it'll probably take you 25 minutes to put the rudiments in. You understand? It not only can be done, it is what I expect you to do. And if it isn't done, it's what I would consider a goof!

Now, that assigns some very difficult problems to you at various times in auditing. You get this raw-meat pc or somebody who has been audited by, oh, Frank Sullivan. And you
get this character, and whaaaaa! Man, that... you can't even tell which way the needle is going, because it's going both up and down at the same time! It is a mess. Goes bzzzt and tick, tick, zzzp! tock, tick-tock, pawk, as you sit there and watch it, see. Daah. That's going to maybe be a little bit rough now and then, until you get your first reliable item.

On such a needle of extreme filthiness – on such a needle – you actually can't expect too much till you get your first RI. You get a grooved-in list going, and you will see that needle go bzzrp-zzp – clean. Just, the list is going. And you've got the list about three-quarters complete, and you'll start to see this needle come clean. Marvelous!

I must remark on that, because that is the easiest way to clean a needle. That is the easiest way. But it offers this slight difficulty: You have to assess – you have to assess before you can list it. And of course the needle is so filthy that the assessment... assessment is almost impossible. See, so it's that period when you're doing that first assessment on this case that is rough, rough, rough, see – that is probably your most critical time in auditing. And that period, on any pc you will do, lasts only the length of time it takes you to get an accurate first assessment. It shouldn't last any longer than that.

In other words, in the total time of auditing the pc, the tendency of the needle to be or become filthy should not last longer than the hour or so necessary for you to find the takeoff point. You know, not per session, not every assessment. Going to have this pc for fifty hours, it's one of those fifty hours, and it's the first hour. And you hit it right on the button, and you don't miss with that assessment – that assessment is dead center – and as you go down listing that list, you'll all of a sudden notice that needle, and you'll all of a sudden notice that needle, and it's... be cleaning up. And by the time you've got the item you're going to find eventually on the list, ifs a rock slamming item. And you've got that item on the list, and so forth, that needle – when you go back through for the nulling ifs just nothing.

You say, what happened to the dirty needle?

Now, sometimes you'll be unlucky and you'll hit a dead horse, and then you'll hit another dead horse, and you'll hit another dead horse – something like that. Well, every one of those first assessments is ghastly. Because the dead horse is doing minimal to change the needle from filthy to clean, see. It's doing a little, but hardly anything about it.

When you find your first hot item on this pc – just in the process of listing, even before you null it out – you're all of a sudden going to see the needle go hhhha; all the tension come out of there.

That doesn't mean the next time you go up the line that it's not going to charge up. But after that you find it's very easy to get the needle clean by putting your middle rudiments in.

And before that time, that's the only case that I would think – I wouldn't make any brag of getting it in, in fifteen minutes, see. During the first hour, I would make no brag about it at all. Nor would I spend any time on it.

I'd decide, if anybody's needle was that dirty, and he'd been around auditors that long, he probably rock slammed on List One. I'd be much more likely just to read off List One, bang, bang, bang, bang, bang, looking for the – looking for the slam. And then it slams, and I might or might not even finish the list. I'd just find the slam, and I'd say it a few more times
and I'd pull a suppress or two, and I'd make it slam, and I'd say, "That's good enough for de old redhead. We going right in, right here and right now, and we gonna oppose the living daylights out of this." And I'd have my item, see.

I wouldn't waste any time on this. You start doing picky... And by the way, those two facts go together. The odds are very much in favor of this pc rock slamming on List One if that needle is that filthy and that hard to clean up. So you're kind of saved by the bell on that one, aren't you?

All right. Now, we go into this situation of what is a clean needle, and let me say this: There is nothing which will substitute for pure observation. Needle characteristics have a tendency to become misinterpreted. One of those needle characteristics is this: a rock slam. And you want to ask how in the name of God can anybody misinterpret a rock slam, but it has happened! People have looked at a rock slam and said that isn't a rock slam.

Well, a rock slam is simply a slashing agitation of the needle, that's all. A dirty read is a buzzing agitation of the needle. A rock slam's always got a slash in it. And the dirty needle's always got a l-zz-zzp in it. But there's no slightest substitute for observation of one.

Now, there's a rocket read. Well, I can describe a rocket read very well. Figured it out. It takes off – it always which goes to the right – it takes off with a very fast spurt and does a rapid decay, like a bullet fired into water. It's very fast. It goes psswww! It looks like it's got all of its motive power from its first instant of impulse, with no additional motive power being imparted to it by anything. It's kicked off and it has no further kick, so it just rapidly dies out. How wide is it? That's a silly question. I've seen them from a sixty-fourth of an inch to a dial. See, they're any width.

Now, a rock slam can have its first slash mistaken for a rocket read – if the auditor has never seen a rocket read. Because that first slash looks like a very rapid, hectic motion, and they say that must be a rocket read. But actually, it doesn't take off with a spurt. It's of uniform speed, and it has power put to it the whole distance of its slash. In other words, there's a motor driving that one. It doesn't kick off and do a rapid decay. It's uniform speed. And it stops suddenly. It doesn't decay; it just goes bah – stops suddenly.

That first slash is more commonly to the left, not to the right. And you'll hear people talking about inverse rocket reads. Well, they're seeing the first stroke of a rock slam. There is no reverse rocket read. If you tiger drilled it up a little bit, you would see the second, third and fourth stroke occur immediately after that first stroke.

I was quite interested. They didn't know whether somebody was a rock slammer or not, because all they could get was the first slash going to the left. That's good enough, man. That's a rock slam. It's not a rocket read.

Now, we're into types of needle characteristics not covered in the _E-Meter Essentials_. And these characteristics of the meter have all emerged in the past year. Not the rock slam. We have known it for years and years and years. But the importance of the rock slam – oh, we've known something about that. But that a rock slam could be as small as it can get and be a rock slam – well, I'm afraid we didn't know that. It can be awfully tiny. See, you can forget
your "inches of measurement tells us how... whether it's a rock slam or not." A rock slam is definitely itself. I've been studying them lately, and they're definitely themselves.

The other day I saw one that was a – something on the order of about a sixteenth of an inch was its first stroke. And then it went into a dirty needle – dirty read. Sixteenth-of-an-inch rock slam stroke, and then the remainder of about a fifth of an inch, or something like that was a dirty read. I saw the two crossed right there in the same read. I was quite interested in – when I drilled these things up and did a little something or other to them – to find out that it held good, that that was what that was.

Gives us terribly interesting point: Should we have opposed that item then or represented it?

Well, we're representing it and it's delivering rock slams, but I don't know but what that shouldn't have been opposed. Time would tell.

So there is a point there, which you will strike almost never, where your adjudication can become confused about it. Was it a dirty read or was it a rock slam? And the only thing that's confusing about it is that a dirty read is quite different than a rock slam. It looks like an electric buzzer going and it doesn't look like anything slashing. And a rock slam always slashes. It's the difference between tickling somebody on the sole of his foot with a feather and chopping his head off with a saber. I mean, the two things are quite different.

And there's this business of – this business of the rocket read that should never be confused with even a one-stroke rock slam because of its fast decay. Now, this – we add to these data, here, the data of a clean needle. And that takes – that takes something – is something new that has been defined. It was one of these "everybody knew" things up until this time – and it's not one of these. I mean, nobody evidently understood this thing, because otherwise some people keep saying, "Clean up that needle." The Instructors around here have been saying, "Clean up the needle, clean up the needle." And the auditor, in many cases I am sure, has been saying, "Well, yeah, anything been suppressed? Yeah, there was a suppress on that." And pull the suppress and get the needle... gets a few things from the pc, and say, "Well, I've cleaned off several reads. So therefore it must now be a clean needle."

He didn't realize that the shirt on the line was not being worn or used at the time it was clean. See? I mean, there it was. It was either plastered with mud or it was snowy-daze, tidewater white, see? See, it was – it was the needle when nobody was doing anything that we were talking about. Nobody's doing a thing. Just sitting there looking at the needle. And that's what determines whether it is clean or not.

No, all those little ticks and tocks and so forth come under the heading of your big mid ruds, plus – which also includes missed withhold – plus perhaps a very, very heavy shake-down of... Well, a case might be so anxious, the case might be so this and might be so that, you couldn't get these things in, but nevertheless those are the buttons which make it dirty – they're the buttons contained in the big mid ruds. That's why they are those buttons.

Now, there are a couple – three other buttons that have influence on this. But actually, if you clean up the main buttons you get the others too. There's the matter of shifted attention. This is not a button that you would use. I'm giving you an example. You could have 135 but-
tons and all that big mid ruds, don't you see? And it'd all be very complex. But the truth of the matter is there are none necessary. This is one of them. This is a very – a very nice one. This is a very nice one. This'll lead you astray any day of the week. "In this session, has your attention been shifted?" See?

Well, that – that's almost valid. It's almost good enough to be part of the big mid ruds, because you've get somebody whose attention was yanked off his list or yanked off the auditor, or the auditor did something unexpected; you get all the points of surprise out of a session, see.

Surprise is simply shift of attention. I've known that for a long time. And you can clean a couple of little ticks, and a couple of little reads off the thing, and that sort of thing. But in actual fact, it isn't good enough, over a broad usage, to be employed as a big mid rud. It isn't good enough. There are a lot of others this way.

Now, every pc has a favorite button. They have a favorite. You learn this faster prep-checking than otherwise. You do an eighteen-button Prepcheck and you'll find out that every pc you – every pc you do an eighteen-button Prepcheck on has a different favorite out of those eighteen buttons, see. This guy runs hotter than a pistol on Decided. And that bird runs hotter than the devil on Suggested. And they tend to have favorites.

Now, you're getting up toward doing a Prehav assessment just to get your mid ruds in, when you expand beyond a very small number of rudiments. You go beyond eight or nine buttons to get in mid ruds in a session and you are being ridiculous. Because if you're going to go any further than that to get Big Tiger or big mid ruds, you see, why don't you do Prehav assessment?

Why don't you get the Prehav Scale out, and do a full roll-your-own – and that'll deliver the case right into your lap. Actually the needle will straighten right out, because you've got the exact button now that is causing the needle to be anything. Only the difference is, is you're – you're no longer doing 2-12. You're doing Routine 2. That was the earliest ancestor of 2-12, see.

Oh yeah, you can do Routine 2. You do a Prehav assessment and run this thing repetitively on the pc, in a fi... or, in a five-way bracket. Marvelous! A lot of cases gone right straight up the graph and everything. It's a nice – it's a nice process. It's pointless. But it's a nice process.

You can change somebody's graph all over the place. If you just wanted to be an HGC D of P and be able to shake paper in front of the pc's face… The pc'll be very excited about it, too. And you just want to shake paper in front of his face and, "You want to know what gains you've got? Well, good, good. See, you went from the bottom to the top, see?" Pc feels good and everything is fine. Probably be back at the bottom again next week, but that's all right.

Point I'm making is you really didn't do very much in the way of shifting mass or anything else for the pc that had any lastingness. It was lack of lastingness that sealed the fate of Routine 2. It didn't last. You have to actually find items. You have to find items, and those have to have some mass to them for a case to get any kind of a shift.
In the first place, this case has got item one bucked into item two. And the reason item one is held in suspense in time is because it is exactly balanced against item two, which is held in suspense in time. And actually, even do Routine 2-12 badly, you have still upset that balance. You're not going to murder anybody with this, and the case could get an enormously better gain, but sooner or later that balance is going to – going to shift. It'll stay out, in other words.

It's like – it's like the fellow's leaning on the wall. And he could lean on the wall, and the wall lean on him, you see, for quite a while. But you take the fellow away from the wall or the wall away from the fellow and you haven't got the status quo anymore. This situation is no longer this kind of a status quo.

Well, in view of the fact that it isn't quite the fellow leaning against the wall, but a wall leaning against a wall, you take either wall away, the other wall will fall down. That's more the architectural pattern of the two dumbbells of a package.

So you can unsettle that status quo, and you can unsettle it in a variety of ways and it's never the same again. It doesn't recharge. But if you wanted to get the full benefit and never have anything hanging in your way at all, you'd, of course, neatly pick up the package. And the benefit there is ten, fifty times more than just softening up one side of it.

You soften up one side of the package and the other one tends to be unbalanced and not be as effective and hang around and aberrating the pc, but it's still there. And you leave too many of those things, and the pc starts getting confused. He doesn't know what he's leaning against now. And he doesn't feel he's had much of a gain. And if you want to know – if the pc wants to know he's got a gain, you actually got to find both of them.

You'll run into 2-12 some guy that you list the whole thing out, you think, and then you don't find an item. And then you – you found an item, and then you oppose it, and list the whole thing out, but don't find an item. You don't find anything to lean against the first item. And you'll find the case – the case tends to feel funny. Well, the case will say, "Oh, yeah! Lots of gains, lots of gains." And two days later he'll say, "What gain?" See, he's not in the know that he's had much of a gain.

He might have gained, you see. The two noses that he ordinarily wears – one of them might have disappeared, you see. There might have been quite a change in the guy, but he won't know it. In other words, this doesn't affect the knowingness to the degree that finding both sides of the package does. Now, you've got to go ahead and find both sides of the package in order to do that.

If you kept on doing that, finding just one side, and finding one side, and never finding the other one, and one side… You go up the line about six – this – six unfound, bypassed items in 2-12-you think you've found them but you haven't; you know, they didn't – nothing rock slammed on the other side, you see – you'll find your pc starting to be nattery, starting to look kind of seedy.

You go back, then, and complete those lists and find the rock slamming item in each case, and this pc takes off, and you wonder how the hell you ever considered that you'd ever seen a pc gain before. Because the gain, now, that he – that he gets out of just extending that
list a bit and finding that real item there is phenomenal. He now knows he's gained, and the gain is terrific.

In other words, you could make a little old gain that compares to processing of years past. Everybody's satisfied with this gain; they're happy with this gain and so forth, but it's not a skyrocket gain. There'll be a lot of people around as time goes on – they'll be – they'll be further out on the fringes of Scientology, you see. You'll hear this receding as a statement: "Well-well, 2-12 is all right. It's as good as... Oh, it's probably better than a lot of processes we've had in the past." You'll hear that kind of a statement, see.

Actually, that statement will get more and more further out away from where people know how to do it, you see. Because if you do it right, and you get both sides of each package, and so forth, there isn't any doubt left in your mind whatsoever about the power of 2-12 compared to old processes, you see. It's tremendous.

But you know, when you are looking at somebody making that remark, you're looking at somebody who never completes a list. He just – he just confessed. He just signed, sealed and delivered a confession that he stops lists when the pc tells him to, and that he never finds the final item, and that he's perfectly willing to say, "Well, they both dirty-needled, so it must have been a package."

"I told the pc it was a package – didn't have much to say. I told him, though. I was very satisfied with the intensive myself, but he was having wife trouble at the time at home, I suppose, and therefore he didn't think he got much gains out of it. But I could tell that he got gain."

Any remark made like 2-12... you know, about 2-12 like that – that's simply saying auditor didn't complete the list, or always made a habit of representing that which rock slammed. It – oh, no-no-no, I beg your pardon. I beg your pardon. That's another breed of cat.

If an auditor goes on representing what rock slams, he'll have this idea of 2-12 – get a little better reality here: "Oh, that process. I don't see what you people see in it, you know? I don't know what you see. I was running it on a pc. I was running it on a pc, and as a matter of fact, she didn't look too bad. She just had sciatica. And when I finally finished up, she looked about ninety and had lumbosis. So I don't see what you see in that process."

Well, that's the direct result of doing one of two things: of representing rock slamming items – thing rock slams like crazy so you represent it (you do that very often, and particularly on List One items, and your pc just about goes around the bend) or you didn't finish the cycle of action. You see, before you got an item on action A, you got tired and started in on action B. And before you got an item on action B, why, you started action C, hoping somehow or another it would all come out all right. Now somebody'll have to come along sooner or later and complete action A. And it will all come out all right, long as action A is completed.

That's failure to complete a cycle of action, will produce an adverse result, particularly if the pc is very interested in the cycle of action and you didn't even vaguely complete it. That's the best. If you really want to cave somebody in with 2-12, that's my strongest recommendation. They're going there, pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa,
and you – you're sitting there, and you're watching the needle, and you don't know what a rock slam is. That'd be a good one. You think it's pc body motion or something and say, "Well, it's a dead horse."

The pc's saying, "Waterbuck, tiger…"

And you say, "Wait a minute, wait a minute. This whole thing's a dead horse. We're going to do a reassessment on some other list."

Pc – he's just left in a sort of a stunned state from there on. Actually, he will remain in that state until somebody comes back and says, "Well, who or what would oppose an ink pot?" whatever it was, see. And at that moment he'll take right off again. "Oh. You want them? Waterbuck, tiger…" clang, clang, clang, clang, clang.

Now, this idea of requiring a clean needle before you null – I've got to get it across to you. Because the beauty of a Mark V is that it expresses a clean needle much better than a Mark IV. And when you've really got the thing cleaned up, you can see a needle characteristic. That is to say, it's a type of needle on the Mark V. It is visibly a type of needle. And you'll get spoiled by a Mark V.

You'll see this thing, and it's just like turning on the light and turning it off, you know. And you'll see this needle, and it's just beautiful. It's just flowing. It's lovely. There isn't a ripple in the thing of any kind whatsoever. And this meter expresses that gorgeously.

And, boy, you know those rudiments are in. It'll spoil you the next time you'll take a look at the needle on the pc and you'll – it hasn't got that characteristic. And although the needle isn't reacting in any way, you'll start chewing on the pc trying to put it that way. You'll be absolutely right. There will be something – something that the pc has there that is making it some other way.

In other words, the Mark V, oddly enough, expresses a rudiments-in pc. It is a way it looks. And that description is just the ne plus exclamation point ultra of the definition of a clean needle. It really looks – it looks quite different. You'll see that needle – you'll see that needle one day on a Mark V and say, "What do you know." Actually, the pc is sitting there without a thought in his skull. He's just perfectly happy for you to go on, and not go on. It's quite interesting that the Mark V expresses a clean needle.

Now, if there's just the slightest suppress or just the slightest withhold or the slightest anything on the case – it isn't in a needle pattern; it doesn't go so far as to make a tickety-tock and a slickity-slock on the thing – it just doesn't look clean. It is still flowing, but it doesn't look clean.

It is a very interesting thing. I'm calling your attention to that on a Mark V because sooner or later you will – if I call your attention to it, you'll watch for it. And you'll suddenly say, "Hey, what do you know! This thing does. It tells you one more thing. One more thing than the Mark IV tells you. It tells you how clean the rudiments are, just by the fact that the needle is moving, and there it is." You want to look for that one.

Now, you can harass a pc in trying to clean up a needle until it looks like a game of battledore and shuttlecock. "Well," you say… You see a little tick on it, you see. And it's go-
ing tick and a tock, and so on. "Well, what are you thinking about?" This is one of those broad, wide-open-door questions that doesn't focus the pc's attention in any direction. He doesn't know what he's thinking about. If he knew what he was thinking about, it wouldn't tick.

"What are you thinking about?" you say. "Yes, well you must be thinking about something." And he'll try to – he'll think madly to find out what he is thinking about, you know? And he gets completely lost. He doesn't know whether he's coming or going.

So you'll see the needle now, instead of going tick and tock, is going tick-u-tock, tick-u-tock. And you'll say, "Well, I don't know; I really can't get on with this list, and I've just made up my mind that we will just sit right here until you tell me what you are thinking about."

And hell say, "Oh, my God, what am I thinking about? I must be thinking about something. Must be pretty powerful if he notices it on the needle, this particular way." By this – this needle now is going tick-hic, tick-hic, tick-hic.

And eventually, break down and ask him just the mid rudiment questions, one right after the other, and hell find out what he was thinking about. It's much better to put in the mid ruds than it is to give them supergeneralized questions.

Now, there's one exception to this. When you're going down a list, you're nulling away down a list, and all of a sudden the rudiments go buzzer! out from under – you know, more the heavily charged the list is, you know, the more a pc's think reacts on the meter. See, the pc's think associated with a charged list reacts more heavily than a pc's think on a no-charged list. And as a matter of fact, on a no-charged anything a pc's think wouldn't register at all. So on a heavily charged list – you're going down this list, and it's going to have a dial-wide rock slam when you finally find the item and you hope it's complete, you're not sure, you're going on down the line – you'll notice the needle is getting less and less flowing.

Nothing has happened to the needle yet. It's not doing anything peculiar. It just is less flowing. You see what I mean? It's just less. It hasn't done anything yet, but it's less right than it was. All of a sudden it goes all wrong, and starts hiccupping. Well, you can't do anything at this point.

Now, if you put in the mid ruds every time you did that, you would rapidly get into a great deal of trouble with the pc, because the pc just starts screaming. It's no-auditing, don't you see. Well now, the pc can't see that that needle's so dirty you can't null with it. Pc is unaware of this fact. So a very good stunt is not throw at the pc, and not push rapidly at the pc – never push anything rapidly at a pc – but just twist your paper around, and ask the pc which of these he has had any thoughts on. And let him go down the list.

Now, show him as much of the list as the needle has been getting worse on. And he'll say, "Oh, well, no, I didn't" – usual response – "No, I didn't have any thoughts. I didn't have any thoughts on that one or that one… Oh, wait a minute. 'Gladiator.' I thought wasn't that a hell of a silly thing to have on this list – 'Who or – who would cook well?' see? 'Who or what would cook well? 'Gladiator.' I thought that was a silly thing on the list. I don't know what's the matter with me, putting that on the list. That couldn't have been it. So that's all."
And you start to lean back – "Oh, yes! Oh, yes! Heh! Yes, this – this other item – this other item – I thought, by golly, you know, that – that's it. That's it, you see. 'Cook.' I said that-that-that that is it. And then I thought, 'Oh, no, that couldn't be it.' Yeah, and that's all I've done… Except this last one that you just asked me on. This – this last one down here. This last one down here – uh – I didn't understand what you said."

And you say, "All right, thank you very much," pull the thing back, and just continue nulling from where you were. You'll find out that is a very interesting little trick.

Now, a pc develops another allergy to that, by the way. The pc knows you're going to do that when he – you... he sees an in, an in, an in, an in. He knows that paper's going to turn around and come his way. [laughter] But actually that does far less harm than knowing he's going to spend the next half-hour battling with the auditor about mid ruds. It's all in the speed of auditing.

The rudiment that goes out on checking – and particularly goals checking – the rudiment that goes out is this "Anxious about." And that's really why it's in there. You're going to see a rebalancing of these rudiments very shortly into a very proper, better order. But it doesn't change your small rudiments, and it doesn't change your Small Tiger Drill. Those things are... compare one with the other.

But getting a needle clean – getting a needle clean is an operation which takes all needle pattern, all jerks and all ticks off, when the auditor is doing nothing, see. The – it has these things without the auditor doing anything, and it doesn't have these things with the auditor doing nothing. And then you see these character – this characteristic of a clean needle. And that's what a needle ought to look like before you start nulling anything.

That's what gives you in, in, in, in, in, in, in, in, in, in. And you say the list is incomplete. No, the list isn't complete. [incomplete] You're trying to null with a dirty needle, see? Maybe the list is incomplete, too, but even if you had a complete list, if your rudiments are out and your needle is dirty you say, "waterbuck," and it's – just the auditor speaking makes the needle tick. See?

The pc, in essence, has a withhold from the auditor, and thus is peculiarly vulnerable to the auditor's actions. He's just – even though he's just invalidated something, you see, the auditor doesn't know that he has. It isn't enough to make the pc critical of the auditor, but it is enough to make the pc think extra thoughts all the time. See, it individuates the pc. So he's not so well under auditor's control. And you've got an individuated pc, and the pc thinks there, pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa, think-think-think-think-think-think-think-think. Every one of these things will have to be picked up.

And the more they're out, the more the pc individuates, the more the pc thinks. So it just is a dwindling spiral. Now, you start to do a list that is complete with a pc with a missed withhold, the pc is individuated, the pc's going to think some crashing thought every five – every five items you say, and so of course these things are now going to react and stay in, and so on.

Now, the Mark V will be cursed by pcs who believe that the thing at 128 is unfair. In actual fact, the Mark V is not one bit more sensitive than a Mark IV. In spite of the guts of the...
thing. The guts are much more complicated in a Mark V than a Mark IV. But in spite of this, it actually doesn't register any more than a Mark IV does – if you've got fly's eyes. All it does is take what the Mark IV is registering and amplifies it.

And whereas it's almost undetectably tiny on a Mark IV – you don't know whether it twitched or not, on a Mark – you see it did register on the Mark IV – on the Mark V, when you turn it up to 128, why, that confounded tick was one to two divisions wide. See, that's what it does. All it does is amplify the read. The Mark IV always read it, providing you had fly's eyes. See, this is nothing more sensiti... one meter is not more sensitive than the other. But the tiny manifestations that would be microscopically small on a Mark IV are visible on a Mark V, and that's all. The Mark V is a more visible meter, not a more sensitive meter.

That's very important to an auditor. By the time you put a magnifying glass up on top of a Mark V, man, have you got it made. You can read anything.

Now, at that level, you pick up all the analytical thoughts of the pc. You pick them all up. And the pc who has been audited on a Mark IV and has been getting away with blue murder because the auditor didn't have fly's eyes, gets into a Mark V and he feels like he's going into a buzz saw, and he's liable to start cussing the Mark V. "Yeah," he thinks, "well, I hope that doesn't read." And the auditor says, "What was that?"

But let me tell you, if you never clean a clean, and you pick up every read and you clean those – in other words, you always clean up the needle, and don't erroneously clean it up – a pc's protest against mid ruds starts going out on the subject of the Mark V. It starts getting less, because the pc, of course, has less missed withholds from the auditor. And eventually they die out and stop yapping about it.

But at first, when you shift a pc over from being audited on a Mark IV to a Mark V, you can expect a little bit of trouble, because the pc's days of liberty are at end. The day when he could think all those nasty thoughts about the auditor and get away with it are over, because the auditor can see them.

But the Mark V does give you this flowing manifestation. The Mark IV does, too. But the Mark V, it becomes very, very visible. And you know that thing. "Boy," you say, "that's the cleanest set of rudiments I've seen in many a day." There's only one other way to get the same manifestation, and that's just ARC break the living daylights out of a pc! And you'll get the same manifestation. It has to be a very severe thing. You say, "You know that withhold that I – that you told me last week about Betsy Jo Ann – well, I – today I was on the phone to her parents, and they said..." see, something like this, you know. Multiply that by five or ten more, and you will get a very nice, flowing needle. I don't recommend that you do that. I recommend instead that you audit the pc.

Thank you very much.
REPAIR OF R2-12

A lecture given on 13 December 1962

Okay, this is Saint Hill Special Briefing Course, lecture number two, 13 December AD 12.

Well, there's nothing much to talk to you about now, you know everything. And I noticed at the end of the last lecture you looked a little bit disheartened.

And there is a direct law concerning your disheartenment. There's a law that embraces this. It's the more you goof the more disheartened you will get! That's a law. We're now not dealing with a – an area of "we hope the process can be tailor-made for the pc," "we hope the process works on the pc." We're not dealing with that type of material right at the present moment. We're dealing with open and shut material.

And it's always very dismaying for an auditor to fool around with something like that, because there's only one person that shows up, and that's the auditor.

Now, for a little while, an auditor who's being shown up has a tendency to try to kick back against the material. He's – not producing a result, he thinks, or he's goofed up, so he doesn't know that the material will produce a result. So on a technique such as 2-12, it is necessary that somebody be shoved hard through to a win. Actually, it requires a subjective and an objective win on the part of the auditor.

If he wins on a pc, and he gets a win on it himself he consistently gets some more wins, showing that it wasn't a fluke, now, he knows very definitely that it is the matter of his auditing, and it is not the technique.

Now, this is a hard thing to confront. It's something like somebody saying to you suddenly, "Be responsible!" And heh-heh-heh-heh! That's kind of a nerve-wracking situation. You could always lay it off on something else.

Now, R2-12 has the characteristic however, of producing results if it is done right. Now, oddly enough, it'll produce results when it's not done absolutely right. And therefore is fairly hard material. You will at first regard it as very critical material, and you will hear – have people around in organizations and so forth, telling everybody that it is very, very difficult, and that they have to study very, very hard, and they have to this and they have to that. And after they've passed 115 checksheets, and run around the block on their hands and so forth, then they will be permitted to sit in and watch a session in which an item is being found, you see. You'll get this kind of stuff.

Actually that is not the approach which I advocate at all. The approach I advocate is: take the guy by the scruff of the neck, throw him into the session, say, "Produce a result."
Make sure he's getting audited on it at the same time. So he gets a subjective and objective reality. Then his interest is piqued. He sees something is happening around here. And then he wants to know why it's happening around here, and therefore he studies it not just as a grind or a rote, but he studies it as something that will do something.

And that's a lot different than the attitude of, "Well, if I study this very hard I will get a Class IV," see, or, "If I study this very hard I'll get a Class II," or something like that. No, it's "If I... there is something here. And if I study this, why, I will be successful with pcs."

Therefore the pc... the auditor wants to know all about it. He will – "How does this thing work?" You know, and obviously it just has an unlimited number of variables. It's just obviously, when you first look at it, you'll say, "Oh, my! Heh-heh-heh! Oh-oh-oh! This thing must have hundreds of laws, you know, and there's all kinds of special cases, and special conditions, and there's all kinds of this and there's all kinds of that and how devastating, you know!" And nevertheless, he still stays fairly willing. And just like I did on you in the last lecture, I throw something brand-new in your lap and say, "Get a clean needle before you start nulling."

That's pretty grim! And it'll be grim right up to the moment when in your next session you get a clean needle. Then you take a look at the thing, and you say, "Hey, what do you know! Wha-ha-ha-ha! Here's one of the damn things!" And you say to the pc, "Look! Look! I cleaned your needle!" [laughter] Goes tick, tock, thud! [laughter]

But the process, the routine, R2-12, is specially designed in training, and its training is based on that. Walk before you read a book about walking. And then you want to know how to walk, read a book. In other words, get the auditing done. Get auditing done.

Now this only has one liability. You've got to have somebody around who has to know how to untangle a case. And that's the subject of this lecture. If you're going to let all these people sit there in a co-audit and audit, why they've got to have somebody there who's backing it up. And who can untangle all these wild goofs that are being made. Because these goofs are going to be made, man. And this, of course, is all part of it.

This person is sitting there, and it's kind of a rock slamy kind of auditor anyhow, and he's sitting there and he says, "Now look! Ha-ha! Heh-heh! Look, look! I – I opposed it just like you said! Ha! No item! Pc looks like hell! Ha-ha!" You got to know the right answer. You say, "You do so-and-so and so-and-so and so-and-so." And then hover over him like a dark, vulture shadow, make sure that he does just those things. And he finds himself sitting there looking at a result.

This kind of surprises him. And when this happens to him and so forth, fine. But supposing several of these goofs got by, as in any large group doing a co-audit, supposing several of these goofs got by. And you've got a case that's hanging its head. Well, now, the basis of the training of 2-12 is: use it; see that it produces a result; and let that auditor get a subjective reality on it. That modus operandi is totally defeated by one mucked-up case.

Well, R2-12 won't muck up one case and be beneficial to fifteen more, providing somebody knows how to untangle them. Well, as many of you, right at the present moment, are in the stage of getting a good solid reality on R2-12, you're not yet up to the stage of un-
tangling a case. And I threw you an awful bomb, in the last lecture saying you've got to clean up a needle and that's what a clean needle looks like. And in fact it laid you out cold. I might as well do the same thing in this lecture, and say, "Well you think you're going to know all about R2-12, well, there's a special technology on top of R2-12 of how do you straighten out a case that's been goofed by R2-12." See, so it isn't enough to know how to do R2-12, you got to know how to straighten out a case that has been goofed on R2-12.

So you'd be very interested that this whole technology consists of simply then doing R2-12 right. And the only crime that is irreparable – there is one irreparable crime – is to lose the guy's papers and reports. Tih, you can't do very much about it if you do that. So that becomes the one thing you have to safeguard.

And one of the ways of losing reports is careless labeling. You don't have the pc's initials and the date and the page number and the question being asked on a separate sheet of paper, see. This piece of paper then can drift. Here's a long sheet of paper and it's got all kinds of names on it and items on it and it goes down to the bottom, but it joins up with nothing else and you don't know where it came from. One fine day somebody drops the folder. Hah-hah-hah-hah-hah-hah-hah-hah! That's all that can wash up a case in R2-12. Take my word for it, that's all that can wash it up.

So it doesn't become just a weird idea to label each separate sheet, see. It's not the top of every page. It's just let's make sure that every sheet, see, every separate piece of paper, has the pc's name, the date, and the question, even in shorthand. Let's suppose he's opposing roses. It's at least says, "W/W Op Roses." See. And maybe that's a four-way sheet. One of these big folds. Well, actually, it only has to be on that sheet once, because nobody's going to tear that sheet in half. That's... makes it an identifiable sheet. And you can get the folder back into some kind of shape.

Now, it's very interesting that in the last two or three days – oh, not the last two or three days, in the last week – I've sorted out several cases, two of them very noteworthy. Mary Sue was sorting out one last night, or night before last, rather. And let me tell you. If it hadn't have been for those labeled sheets, why, we just would have been from nowhere, see. But because those labeled sheets existed, and the thing could be assembled back into sequence, which it had fallen out of, we could find out what the devil had gone on from the lists.

And in one of them there was a demonstration – had actually picked up a slamming item. The item had never slammed since and that was what the case was hung on. Heh-heh-heh-heh-heh! See? Just a fluke that was right there in that demonstration. There it was, R/S slant, R/S slant, R/S and then out. All right, so it went out in a demonstration, that doesn't mean very much, because the case had several dead horses, one right after the other. So looking for a List One item, which was R/Sing.

So, in patching them up you want the papers. And when – you let anybody do R2-12, as long as they'll keep the papers. But they've got to keep the papers. That you got to impress people with. Because you can really goof a case, irreparably, if you haven't got the papers.

This compares to goals. One case has gone on and on and on and on and on and on and on. Went on and on and on, I don't know, the case must have written two-three thousand
goals. I finally got very, very curious about it, and sent cables everywhere, and I finally picked up the terminal that gave the pc's goal. And that was the pc's goal. See? Finally managed to run down, in other words, the piece of data in folders, that delivered the pc's goal into our hands. It was on another list, see.

You will run into that, too. You'll be looking for the pc's goal, and the pc's goal, and it isn't on any other list, you start going back and nulling lists. Looking and looking and looking and looking. Then you remember there was a goals list in a *Handbook for Preclears*. Pc's goal appears as number one on it. See?

You get kind of nery when you realize that most of those *Handbook for Preclears* that people have been filling out over the years have been thrown away, and they're not any longer available. There was a little goals list.

But with R2-12 it is even more important. We now have the techniques that if you did them long enough on the pc and followed down along the track long enough, the goal would finally dump out in your lap. He isn't totally stopped. But supposing somebody has stopped R2-12. R2-12 then becomes, in its papers and administration, becomes more important than a goals list.

Now, I was down digging through folders – some of your folders – in the last few days. I was very, very, very impressed, with the near possibility of not putting the case back together again and in one of these cases the *key list* was only two pages long. *Heh!* The auditor had called it a complete list, see. We didn't know what it was or what question had been asked; it didn't appear on the auditor's report. And that list had been picked out of the pc's folder by the auditor and had been put in his own papers.

We were tearing the place apart trying to find that one sheet of paper. Now, when you figure out the number of sheets of paper that go through your hands on R2-12-any one of them, you see, might contain that one piece of data. And we found out what we had to know: that that list was only two pages long and that *two* items had been found on it, neither one of which R/Sed. The list was not complete and we had found where the bypassed item was. Very, very interesting. Case had hung up there. That wasn't what we immediately started to work over the case with. We started earlier than that on another bypassed item, which we got record of, which I myself had remembered. I remembered it. It was not part of the pc's record.

That's how touchy this sort of thing can be. Mark down what happens. Mark down what R/Ses. I don't care how many notes and scribbles that you add to sheets of paper and lists – how much data there is there. The key data that you want is: Did it R/S? Were things R/Sing when they were written down? In other words, was it a rock slamming list? Was there one rock slam on it, at least? Pain and sen isn't as important in listing or nulling, it isn't as important to note pain or sen because you can make a special test for that. But it's sure important to note down when, what, which R/Ses.

DR is not as important as an R/S. But a DR tends to become important on a list that you're going to represent. But what this list came from, what was being listed, how many pages does it consist of, you know, numbering those pages as you go down the line. And what did you do with it? What did you do with that item? That becomes very important. The tiger-drilled items, and this in almost every case, auditors don't make enough notations on. When
they tiger drill it what happened? Did it R/S during cleaning buttons of the Tiger Drill? And then not R/S when they said it?

You know, little – little pieces of data. The observation of what happened while they were tiger drilling this thing can be of considerable benefit. The auditor's report is not as important as the list. Because you always confirm the auditor's report by finding the list to which it relates. My auditor's reports on 2-12 are rather sketchy. I'm usually going very fast and too – too much on the fly to get very much down on the auditor's reports. So I tend to put it down on the lists. But I sure try to put lots of data down on lists. And then I'll go back and summate the session as to what the results of everything was, and put any piece of data that I had on the auditor's report. In other words the auditor's report doesn't become a long column of TA reads.

Matter of fact, TA reads are relatively unnecessary. We don't much care what happened during the – during the listing or during the nulling. We really don't care whether the TA moved or didn't move. It's relatively insignificant. But what is significant – the needle behavior. That's very important. And go back at the end of the session, I've got the TA at the beginning of the session, I've got the range of the TA during the nulling, and I just make a note of that, kept it on the list, see. Just say, well, it was high and low and it was moving fast, or something like this, any kind of notation. And then very detailed results of the session. Res-

The auditor's report, then, does not become an action report which is blow by blow during the session. It becomes a summation report, which is just what it is. It says "report." Meaning, "This is what I did during the session." And he writes it up with great rapidity. And he said, "We tiger drilled wedding bells and it all came to nothing. I guess the list is incom-

And then some hint as to where it should go from there in the auditor's opinion. Fu-

And the results of what the person did should appear on the auditor's reports. In other words, that auditor's session either added up to nothing, or it added up to maybe, or it added up to a win. And it doesn't matter what it added up to – the auditor shouldn't be sitting there trying to give anybody a sales talk. All you want to know is, did you get anything done? And the pc says… Of course you've got your goals, you got your LOL, Life and Livingness, you got your gains, you got these things noted on the report. You've got a couple of cognitions the pc had, something like that. Generally they give you some horrendous cognition or another, generally enough to give the cognition that they recall in their gains. That – if it's that big it'll last over to gains, you see. Not interested in the little tiny cognitions. But basically what did we get done in this session? See.
"We nulled three quarters of the list and had a hell of a time keeping in the mid ruds. List looks like it's incomplete." Now that isn't anything more than a guess, he'll find out tomorrow the list was complete or he won't find it out. In other words, it doesn't have to be a proven fact what his guesses were on the thing. In other words he doesn't have to be right in these reports. But the report consists of basically what was accomplished and what should be done. And if you get those into the reports you'll save a lot of pcs' bacon.

Also, an Instructor looking it over can say, "Hey, don't you know that – that's a bum one. You say this ought to be represented. It's slamming, man, it's slamming. You never represent a slamming RI. You just never do that." And he can catch this up, don't you see, on marking reports.

Those are the important things. The list itself stays as an integral part of the session, of course, and usually when I'm through with a list I'll pin the report to it. You know, give it a staple or something. I know you don't have many staplers available. But that's when I'm all through with a list. I'll keep a list I'm using floating on forward in the folder. It's perfectly safe for that to happen, don't you see.

But the point I'm trying to make, here, is the first point of repairing a case is having the data with which to repair the case. And you look back, an auditor's report, if you say what should be done with the case by end of session you've made up your mind what you should do with a case. The auditor's reports of that period say… I don't care if somebody's D of Ping it, see. The director... somebody is – somebody is saying, "Now, now the thing for you to do is, you've got to represent these three additional items which you found on List One," and that sort of thing.

If the auditor thinks something else should be done, well, put it down. It doesn't come as a source of argument. Nobody will be insulted about it. It's on the basis of, "We'll go ahead and represent the remaining items on List One, but I think personally that 'cat whiskers' should be opposed." At least somebody trying to put the case back together again goes back through that thing, and he says, "Hey! That auditor there thought 'cat whiskers' ought to be opposed at that time, it must have been quite a slamming item at that time." So he goes on in and investigates "cat whiskers," don't you see. And he says "Aha!" See? You could pick up a point there, with which to put the case back together again.

But now, lay aside the idea, as of now, that there are endless rules in R2-12 – there are not. If you got the idea that there are tremendous numbers of special cases and awful variables, and all kinds of things like that, and there are special things that you do here and there, and so on, you'll – you'll be in a state of defeat about putting a case back together again. Because you say, "Look at all the tremendous variables which could be done with this case."

First thing you start out with is there are only… Well, the chief thing that will louse up a case, really louse a case up, is to take a rock slamming item and represent it. Now, I can tell you from experience that that will louse a case up. It won't louse all cases up. It won't louse them up every time. You understand? But every – every few cases the thing that should have been opposed was actually represented and you get the roof coming off! Particularly if it's a List One item. And that's peculiarly true of List One items.
You want to make your pc look like he's eighty, and the roof has fallen in, why you just take something that's slamming like mad, and say we'll make the pc look good and we'll represent it. Yaoww! You just done him in! See, that's the tension... the attention factor, see. The pc should be watching at this fist coming toward his nose, and somebody's saying, "Dear, do you want your coffee?" Splits his attention up. He has kind of a feeling like he's going nuts all the time he's doing this represent list.

He knows he shouldn't be representing it; he knows he should be staying in there with the fixed bayonets, you know? And he'll go along with it and do it, the idiot! He'll be... tell you he's feeling fine, you know, and he'll look older and older and rougher and rougher. So then naturally if that's one of the things you mustn't do at the highest level, then that's the thing you should look for as having been done, in patching them up.

Did we represent something we should have opposed? That's your first question. Opposing things is senior to representing them. And that will account for a great deal. You find that somewhere along the line, it'll stand out like a sore thumb. You look on the auditing of the second of the month, and the auditing says, "Checked out List One, HGC R/Sing." Or you find that old assessment and it says, "HGC R/S." And on the auditing of the third of the month we get the piece of paper and it says, "Who or what does HGC represent to you?" You see?

Wrong wording, messed up, what's this? Oh my God! See. Should have been opposed, man! See? So you say, "That's it."

Now in repairing a case, always take the first List One mistake as your first repair action. List One. That has priority. Not because we're trying to safeguard Scientology, but just because it does... has more bearing on an auditing session than any other single list. So it has priority. You patch up the List One goofs before you patch up some other goof. And you'll find out that someday this guy – oh, you'll find a folder that will look something like this. It's almost impossible to even estimate the number of goofs numerically, the combinations of goofs, you see. Combinations can just be infinite.

Auditor plunged, found something R/Sing, see. Found something going R/S, so just took this, and represented it. Well, you don't quite know what it is. And it was his mother's aunt. Mother's aunt. Well, you say, that's a hell of a mistake, see. It R/Sed. If he found it. He didn't find it on any list. Where'd he get it? Well, he probably got it in the rudiments. Oh, well, so that's a highly suspect item already and actually will have very little goof-up for the case as a result. We don't know whether it was right, so on.

But we find out that the following Monday somebody got on the auditor's neck, and said, "List One! List One, assess out List One." And we find out that we had a DR on "Scientology books." And we look over the next folder, you know, the next list, and it says, "Who or what would Scientology books oppose?" That? DR? Scientology books – oppose? Pwt! Nuts! It may say, "Scientology books, sen." And then "Who or what would Scientology books oppose?" See. Now, that's a nice basket, see, of errors. DR – well, you don't oppose DRs. The thing had sen on it, so it would, "Who or what would oppose Scientology books?" would be right. You see how you can patch it up again. But you've still got "My mother's aunt" back here, rock slamming. Well, just brush her off. Return her to the poorhouse or
wherever she came from. Because it's your List One, your List One goof takes priority. That's the first one you put together.

The first goof you correct is a List One goof. And the biggest goof on List One is to represent when you should have opposed. Now oddly enough, you can oppose anything with less damage than reverse way to. In other words you could oppose a DR with less damage than representing an R/S. Quite interesting. But you don't even have to know a refinement of that particular character. You know that R/Ses should be opposed. That's just a rule. The thing R/Sed, so you opposed it.

Now, there's your – there's your first rule of patch-up, is take the first goof you can find on a Scientology list. Now, how many of these goofs can there be? There could probably be an infinite number of goofs, but there are fortunately just a few things to do right. Rule – head light rule is: If it R/Sed you oppose it.

Now, which way you oppose it has some bearing on it. And if you can't make up your mind which way – if it was opposed right, just tell the auditor to oppose it both ways, till one is going well, and then just keep on opposing it that way. Pcs often tell you fibs or they can't tell the difference between pain and sen or something like this.

Now, the closer things are to present time, the more possibly they will be coterms. See? Now a coterm is opposed both ways. "Who or what would it oppose? Who or what would oppose it?" And you'll find one of them after a little while will run smoother than the other one. So you use the one that runs smoother and seems to be producing more interest and action. Opposing a coterm is quite tricky. And therefore R2-12 has more of this trouble than 3GA Criss Cross because you get more coterms.

The guy's knees are in sen, and his skull is in pain. And it's rock slamming. All right, which way do you go about it? This is the commonest goof I'm giving you right now: didn't complete the list. That is the commonest goof and will probably be the commonest goof to the end of R2-12's days. And tried to figure out some way to make it oppose without completing the list – actually spend more time on trying to match it all up than in completing the list.

Now, one of the reasons the list doesn't complete is this coterm thing. Opposition lists must be completed because there's the perfect way to leave a bypassed item. You could actually keep on dumping represent lists without much liability. Don't worry about how many represent lists got dumped. No, just don't worry too much about it because the pc's attention is not very thoroughly fixated on them. There's lots of R/Ses to be found in the bank, there's lots of items to come up, and that item will probably come up again on some other list. But the opposition, when you start to oppose something, you key it in. And the commonest goof on that on R2-12 is the auditor didn't hit it both ways to – I'm talking about the commonest goof is incomplete list – but the auditor didn't hit it both ways to.

See, he didn't say, "oppose it" and "it oppose" and sort out which one was slamming best. But just went at the thing in reverse because the pc said he had a pain in his back and neglected to mention all this sen on his skull for the excellent reason that he always has that!

So your patch-up action so far – let me trace this for you again – is to find the earliest goof you can find on List One. That's your – that takes priority. And get your opposition list –
takes priority over represent – get your opposition list completed, and one of the reasons it didn't get completed is that it was a coterm and it was being opposed wrong way to. And the remedy for that, of course, is just to continue the list, swapping it around the other way. And you can actually swap it back and forth.

You can do half a page on "oppose-it" and another half a page on "it-oppose." You all of a sudden find that thing is just running like hot butter on "it-oppose" so just don't bother to turn it around the other way again, just let it run.

That's not infallible – that is not infallible, because the item may be – by this time has deeded down, so you can't tell whether it's R/Sing or not, or if it ever R/Sed. And it might be wrong source, don't you see? But if it's wrong source it never becomes nullable. That's your infallible test for wrong source. Never becomes nullable. Nullable is different than find an item on it.

Actually, a list which is from wrong source, if it's a goofed-up list, you can't get – you can't get ten items down it. You just can't. Just a dirty needle comes on, and it just all starts going to hell in a balloon. You're lucky if you can get three. That's a non-nullable list.

So, extend that list. That's high priority. And you must remember that there's a trick in extending an opposed list, and that is you reverse it the other way to. And if the thing has gone for a thousand items of opposition, and was nullable – if it was nullable on opposition it was not wrong source, don't you see? You can null anything that is an opposition list, if it was going up against a rock slamming item. And you get on down the line, it's gone a thousand items into this auditor's hands, and it hasn't produced any RI, well, you can just bet your bottom dollar it's been opposed reverse way to.

In other words, you were saying, "Who or what would oppose Scientology books?" And the pc is a Scientology book. It should have been, "Who or what should Scientology books oppose?" Now, what do you do with that list? Do you tell somebody to null it all over again? No. Here's a rule: Never re-null. I see on your papers you occasionally do. Why? If the commonest error is an incomplete list, why don't you just extend it and null what you've now got? Don't say that, "Well, the guy just missed the item."

Now, let's get over into another department, now, I'd finish up what the – extend that oppose list. Represent lists, don't pay much attention to them. Remember we're patching this case up. So we're going to specialize in Scientology list first, we're going to specialize in opposition lists and the commonest thing wrong with the opposition list is somebody's got it going backwards.

So that's not very much we have to patch up here, is it? Well, look it over. Can you... you got those little points I just sketched over? That's actually not very much to look for, and not very much to patch up. That's what you're going to look for.

Next thing you're going to look at is another type of case. No, I'd better tell you the rest of the patch-up on this other case. You just keep doing just what I said. You take the next List One goof-up and the next opposition goof-up from it. See the guy had a long represent list, he had a rock... he had a reliable item on that and nobody opposed it! See?
So there's goof-ups. And you just keep doing this, see. Finding the List One items that had been neglected or List One phenomena that have not been properly reported or cited or something of this sort and then patch up the opposition lists that go along with it. See? All those opposition lists, get those all patched up. That's actually the basic fundamental of patching up a case. Just doing those things. No more than that. It's not very complicated.

Let's take, now, a different type of case. You take any new group on R2-12, you'll have a – several members of that group who will be... come charging in to you telling you that it doesn't work, in one phraseology or another. And this is another type of case to be patched up. You understand this is another type of auditor; that it's not going right. This is the not-going-right.

Now, in actual fact, you don't have to do too much to trace this one back. The case that isn't going right is simply not going right because one of two things have happened: An R/S has been missed on List One and has not been opposed or somebody shifted the cycle of action. It's just those two things that can be wrong with it. Just those two things. R/S has been missed. And the other one is, of course, that somebody has knocked off a cycle of action.

Now, opposition cycles of action are always more important than represent cycles of action, so if you want to put the case back together again in a hurry, you specialize in opposition cycles of action. Which opposition cycle of action was not completed first? And you simply go back and complete that cycle of action, then take the next one consecutively and complete that cycle of action, take the next one consecutively – you got the idea.

In other words somebody wrote up an opposition list of twenty and it should have been two thousand. Something wild like that, see? And you get those cycles of action completed consecutively. The only thing that falls out of sequence, of course, is your List One. Maybe the guy didn't get onto List One until the fifth list was done. Some reason or other. Yeah, well, you're going to find all kinds of things. Didn't do List One, said that, "Well, we're only doing raw meat and they've never heard of Scientology, so therefore we'll omit List One," see. Something like that. And then finally decided to get onto List One, just to make a clean job of it, and then you see a great big goof, you see. You see "Scientology R/S" and then you see a represent list. Well, you push that one back to the first action which you undertake. And then from that one come forward with all the other incomplete cycles of action.

See, it's just List One that spoils this rule of take the cycles of action which haven't been completed from the first cycle of action to the... that was incomplete, till now. See, it's just List One that pushes this out of order. If you ever get one like that you'll be scratching your head, saying, "I wonder which one I take up first." Well, you answer it with List One. And if you've got it answered on List One, which goof on List One was first? And you do that one.

See, it's List One first, or the first goof on List One first, and that's the way you put it together.

Now, you're going to see the dead-horse case. See, this case has been... this is dead horses, dead horses, dead horses. Nobody can see an R/S. Nobody can find an R/S on this case. And this just about drives everybody daffy. Well, this already is an incomplete-cycle-of-
action case possibly. You're getting a lot of dead horses, look for that failure to oppose, particularly on List One. That is the big, exclamation point blunder.

Not because I say so and not because the gods say so and not because of any other authority, it just so happens, actually in this very room, there were about four cases that were laying lots of dead horses – highway was just getting stacked up with them. It was getting so the sanitary commission was going to complain – until the R/Sing item on List One was found and opposed. And at that moment the dead-horse phenomenon ceased.

See, that was... there's at least four cases that I know of right in this room that did just that. So that shows you that's fairly important. So important that on one case we simply just picked it out of the hat and said, all right. So the list at some time or another must have R/Sed. We're just going to write an opposition Scientology list. And we did and it R/Sed and it's the first R/Ses ever seen on that pc. Hah, this was done very indelicately, by the way. If I myself had been doing it as an auditor, I would have gotten ahold of the pc and I would have sort of tiger drilled some of the key things on List One, see, and so forth. But I decided we'd just do this one blundersomely. And I said, "Well just oppose Scientology," and they did and it's now rock slamming like mad. Interesting huh?

Now, so it isn't because anybody has said so that this is true. If you can actually get these dead-horse cases. Now, oddly enough, the only dead-horse cases which we have are all under that category: R/Sing item on List One which wasn't opposed. That's every one we have. But then remember we're kind of a special group. You've had lots of auditing and lots of this and been around Scientology and orgs, lots.

So this is not – this is not a pure proof. So we can extend it over to saying that a case that is now laying dead horses has an R/Sing item which hasn't been opposed. This is a raw-meat case, he was a member of the 137th infantry, and he was just sent in by his commanding officer to be processed, and he's never heard of you or anything else, you see. And you're trying to patch up this case, after he's been run in a co-audit or something like that, all you're going to do is look for the R/Sing item that was goofed. It must be in restimulation. Must be in restimulation. Remember this is a patch-up lecture, it's not what you do with this guy. Whatever was done with him, there must have been an R/Sing item that wasn't opposed, and the case has hung up ever since. This case is just laying dead horses now.

So, if a case is doing nothing but dead horses, one of two things is true. First and foremost is: an R/Sing item has not been opposed or if opposed was not completed. And the other one is: the auditor needed a white cane. This actually happened right here, that an auditor who was reporting no R/Ses was getting them. And wasn't seeing them. Didn't know what the R/Ses were. It's happened twice here. That sounds pretty impossible, but it has happened. So it's something that in case patch-up has to have some allowance made for, particularly in a co-audit where you don't have highly trained people. You'd have to watch for that one. And the question you ask, "Is the case laying dead horses?"

Now, what you do, you have to do an observation of this one. You let him extend one of the dead lists and see if it R/Ses. If you're auditing the case to get it patched up, why, nothing is easier.
Let's take one of these so-called dead-horse lists; let's sort it out this way: We find no evidence of any kind that the case has R/Sed on List One, we can't pick up anything with regard to that. We've even opposed something on List One, and told them to. Nothing seemed to happen, and we're just getting R/Ses, then we assume that the auditor can't see an R/S. That's sort of simple, isn't it?

Now, how you catch up with that one to patch it up, that's something else, because it takes observational time, and it takes this, but this nevertheless can exist. Now, you mustn't overlook that as a point. Needle is falling off the pin, you can hear it hitting both sides of the meter clear across the room. "No, the case hasn't R/Sed," see?

You also will get complaints about cases R/Sing too much. R/S so much you can't get the rudiments in. Now, I just answered a question on this sort. Would a case continue to R/S while you represented something they weren't R/Sing on? And the answer is no. Fastest way in the world to turn off an R/S is just start representing on something that would become a dead horse. By the time you've asked the pc for three items you'll have no R/S.

In other words, the rule is that a case will only continue to R/S when the subject from which the R/S is coming continues to be addressed by the auditor. In other words, you have to stay on that subject to keep up with the R/S. A phantom slam doesn't do this. You have to be listing the right list to have the R/S on it. I'll give you that security. In other words, there aren't a whole bunch of cases whereby somebody just continues to R/S forever, even though you're listing peanuts. The case actually is R/Sing simply because they're protesting listing on peanuts. No. By the time you'd gotten the third item on peanuts the R/S would be off. You see what I mean?

In other words, your rudiments won't continue to R/S just because they are out while you're listing on something else. In other words if there is an R/S on the list, as you're coming down the line, you haven't got an R/S from something else which is lousing up your list if it's a nice continuous R/S, do you understand? There isn't too much R/S, in other words. People don't talk about peanuts and R/S on chimneys.

Now, even the phantom slam tends to behave. This is what's peculiar also. You don't ever get a phantom slam on an uncharged list, which should be very heartening to you. The list has to be hotter than a pistol to turn the slam on. And the phantom slam may turn on, however, and louse you up here and there on the list, as to which item is rock slamming while you are trying to straighten them out. But a phantom slam always comes on and goes off, and comes on and goes off. And a phantom slam has this characteristic: that it never obeys the auditor. The phantom slam never obeys the auditor.

Your basic impatience with this type of case is they'll never do what you tell them, also. That's completely aside from the phantom slam. You say, "Has anything been suppressed?" and they don't think about suppressing something. They think about something else, and so forth. But right along with this, a phantom slam never obeys the auditor.

You've got a rock slamming item, catfish. And you say, "catfish." A phantom slam does not turn on when you say "catfish." But "catfish" turns on when you say "catfish." See, you say, "catfish" – "catfish" is a slamming item, it slams. It start... it keeps on slamming until
the pc's mind shifts, attention shifts, and the pc does a suppress. And you pull the Suppress and the Careful of off, and it slams again.

But because you're working with present time items, you can over-tiger drill your items. You can tiger drill an item to death. Tiger Drilling must be brief on 2-12. That's - that's a good one to remember. You can kill an item with Tiger Drill.

I've given you most of the data now, on case patch-up. Not very painful, was it?

Audience: No.

Now, you want to get fancy, you're going to get fancy now. And you're going to go back, and you're going to try to patch up this case, case isn't doing too badly, you're going to look for List One oppositions, failures to complete cycle of action, incompletes. And the case that has dead horses, you're going to assume something must have slammed at some time or another on List One has been missed - that's your primary source of dead horses - or to some slight degree, that the auditor needs a white cane. Now, that's patch-up. That's not very tough.

Now, you in running a case are a different situation entirely. That's how you patch one up. How can you misrun a case? Well, I won't, give a lecture on the subject. We haven't got enough time! And we haven't got enough tape. Tape costs money! Time you've bought forty, fifty reels of tape, you feel it. We just would have scratched the top of the subject. So it's very lucky that case patch-up is so simple. Because the number of things that you can do wrong in 2-12 I'm sure have not been estimated. I'm sure that nobody could possibly do it. Because there'll be variations, variations, variations, variations. And I've long since ceased to try to outguess the number of variations there could be of a simple procedure. They're almost infinite.

I have had loses on this, man, my you... my self-confidence in my imagination has been staggered by this! I think I've dreamed up all the reasons why, all the variations that can be done. And my God, I'm always outcreated! I don't say that sarcastically, but it's just a little game that I sort of play. Well, I keep my eye open. Somebody's going to dream up a new one. And they always do.

But it'll be something is real in crosswise. You know? Like opposition lists actually should dirty read. Shouldn't they? Now if opposition lists consistently dirty read, why, then, shouldn't you represent what dirty reads, on the biggest dirty read that you get, in order to establish whether or not it had any rock slam on... You could – you could get these things without count. You'll have all of these things pulled on you. So you better not get an idea that there are infinite numbers of special cases to 2-12. Otherwise you will feel like you're drowning. Because there are infinite numbers of things that can be done wrong.

This is one of them. And this is, by the way, the commonest. Somebody goes on representing and representing and representing – and this is also mentioned because this is part of case patch-up – representing and representing and representing and representing, and they get some slams, doesn't null, they go on representing, and they never check what they are representing. And they will leave a List One, particularly, item slamming like crazy! It didn't slam when they did the assessment. It just got a little tiny scrub. And they never, never, never go back to find out if the item that they're representing is now slamming. Because it will, being
unburdened. Of course doing that – a listing, a represent list from an item, if the item's ever going to slam, *that* will make it slam better than Tiger Drilling.

If you wanted to make something – if you wanted to make something fire better, it was firing yesterday, it isn't firing today – it wouldn't louse up the pc if you got ten or fifteen items off of it on a represent. I don't advocate that. I'm just saying it would do that. Instead of tiger drilling it, get ten or fifteen items off You'll find out it produced the same effect. This thing is now slamming again.

So – but that's just ignoring a slamming item. They never check it. Nothing is ever checked out. Another thing that happens sometimes, and this is something that you should do with 2-12. Well, let's see, it's part of the rules, is when you're doing a represent list on something, well, check the item to find out if it is now slamming. You very often will find that the item that you're representing is now slamming. Quite often find this!

You've got – you've got situations where the auditor has just gone totally knuckle-headed about anything and everything in the book. But normally false reports will give you the least difficulty. False reports. They – you very seldom get a false report. There's only one thing the pc says that has been found out to be not too accurate. Pcs will tell you the truth in all cases but pain or sen. And they'll do a big sell on pain or sen. They can have that dull pressure against their forehead and say it's a pain and knowingly lie about it. See, they don't even make a mistake. I mean there's been too many of that. And pcs will tell the auditor lies. And also will tell the auditor lies about the fact that they're invalidating items. We found pcs doing that.

They don't want to list on the thing, so they invalidate the items as they hand out the auditor. Well, they can only do that to somebody who was not demanding a clean needle before he started nulling or something, because all that material would have to be pulled up. But in final essence, the repair of a 2-12 activity is very simple. It just follows the exact materials I've given you. Doing 2-12, of course, follows that same thing in order of importance. The more items you bypass, the more gummy the case is going to be. That's for sure. The more incomplete cycles of action you stack up on the case, why, the less luck you're going to have.

So, running the case parallels repairing the case. That is the same rules of running the case. It's fantastic how an auditor will sell himself on the completeness of a list, try to put together items, how the pc will go along with him, there are only six items left in, each of them were DRing, and we finally packaged them up. You did? Where's the RI? It never occurred. And that, of course, you know right there, was an incomplete list. You never had a rock slamming item come off the list. Well, that rock slamming item never came off the list because the pc never put it on the list. Very simple explanation! List is incomplete. Which all comes under the heading of the patch-up I gave you.

This is relatively simple once you break yourself down on the amount of randomness and importances which you think you see around in it and actually groove it down to exactly what it is. It's a process of opposing rock slamming items and represent those that don't, in order to get rock slamming items so as to oppose them and so take apart the GPM.
The closer you enter to the auditing session, the less PTP the pc is going to be audited over the top of, so you have R2-12. There are other things you can do with R2-12 and you're going to get into an embarrassment someday, a horrible, horrible embarrassment, and that embarrassment will be this: Is you keep getting rocket reads on items. Supposed to be doing 2-12. Don't get rock slams, you get rocket reads. And sooner or later somebody's going to come to you with this terrible problem. Well, the first thing you do is establish whether or not it was a rocket read. And if it was a rocket read, a rocket read is superior to a rock slam. That's all there is to that. So the item rocket read, so you oppose it. Simple.

And then you do that and you're very, very embarrassed by the whole thing because the pc keeps continually intruding his goal into the session. What do you do with that? Well, the best thing to do then is to get the goal checked out and tell the pc whether it is or isn't and then go on running 2-12. That's your best repair for that embarrassing situation.

If you find a rocket reading item, your first action is to oppose it, of course. And then use it to find a goal with. If the pc hasn't already laid his goal in your lap. Or if you find a goal, get it checked out. Don't leave it in doubt! Don't have the pc sitting there for the next seven days wondering if that's his goal. Because it acts just like a wrong goal, all the way. No, get it checked out, get it checked out right now, and if you can't check it out, why, fine, clean it up a little bit more and check it out. Then the pc's got his goal, and you'll find out he'll do 2-12 better.

Remember that even though you do have his goal, is no reason he can run on his goal. We've had case after case that couldn't go Clear mostly because they had too much 2-12 bric-a-brac sitting in the session. And they were trying to clear across the top of a PTP. And you know that they could be forced all the way to free needle. But it never quite stays free. And that can go on for hundreds of hours – we already know – just because actually there's a PTP connected with the sessions. PTP connected with Scientology. They can't get across it, and it's always still there, and it never blows clear, and it's sort of like trying to empty a pot with the lid on. Can't be done. We've seen case after case after case. In fact about 80 percent of all cases that have tried to go Clear are hung up on that exact one right there.

That's how important R2-12 is. It isn't a case of something that an HPA can do, or a simple thing, or a simple way to produce a good result on a pc, it is simply that people will never go Clear unless 2-12 is run right.

Okay?

Audience: Mm-hm.

Thank you very much.
Thank you!
Well, how are you tonight?

_Audience_: Fine!

I'm glad to see you again! I arrived just in time to save you from a fate worse than auditing!

All right, this is the what?

_Audience_: 8 January AD 13.

Eight January AD 13. The Saint Hill Special Briefing Course, lecture number one. The year started out beautifully; [laughter] for days I received nothing but good news. On New Year's Day I had, oh, I think there must have been six or eight telexes, nothing but good news. You know, the most good news I'd ever seen. The next day of good news, next day, I think, then the fatal fifth arrived and we don't know but what, that isn't good news, too. And before I get on with this lecture where I have something important to say, I'll take up the US government. [laughs]

The story is very, very briefly told. I've got it all in now, and all the returns are in and the casualties have been counted. But in August I wrote Kennedy; he was offered by me at that time help in the space race – speeding up the IQ, straightening out pilots.

And this, the White House has already asked us twice for presentations of Scientology and we've granted them, and they have done weird things like fire the fellow who asked for them and that sort of thing. But actually the president of MIT himself was fired, I think for trying to suggest that – at least it was within the same twenty-four-hour period.

And anyway, in August, thinking that it would be a good gesture I wrote him a letter concerning this, at the White House and time rolled along and the FDA suddenly became very interested and the organization was sniffing around the corners. And suddenly the US government – let's not compartment this thing down, see, it's just the government – issued a smear campaign in the Washington press, calling us all sorts of hard names, organized this thing completely, down to the last detail and actually the papers were on the streets before anybody appeared at the organization. Interesting, isn't it? Hours later somebody appeared at the organization.

Anyway, they raided a church and seized philosophical and religious texts for burning and meters. Armed raid on a church. Stop and think about it for a moment. How could they
get away with this? How'd they do this? Well, the way they did this was lie to federal court! And they're in trouble! Today are they in trouble, man! They didn't tell the right name of the organization to the court and so got a warrant. But there is no doubt about who issued the warrant. It says right there, "The president of the United States," issued the warrant. Says so, right on the warrant.

And they didn't tell the federal court who the warrant was for. They said it was for the Distribution Center and the Hubbard Guidance Center and the Academy of Scientology. The premises of which are all rented by and under the name of the Founding Church of Scientology of Washington, DC. And they avoided the mention of books. So in the papers, no church was raided, no books were seized. Not in the papers. So they carefully corral this and they broke into the organization and actually made quite a mess of things.

They burst into sessions and snatched E-Meters off the auditing desks and they just had themselves a ball. They got down to the DCI, by that time somebody in HCO said, "Do you realize that you're raiding a church?" And this kind of slowed them down. And they got down to DCI and bucked into Anton and he was wearing his cross that day and they got much calmer. In fact they got awful quiet. And they came in like a lion and they went out kind of tiptoeing. They knew they'd collided with something and they figured there would be repercussions. Of course there will be repercussions.

The immediate thing that – it will happen – there's supposed to be – we're supposed to go to court to claim our property and give reasons why and actually this is very easy action to win. The warrant is false, all of the titles seized, almost without exception, predate the E-Meter. And they cant connect the E-Meter and these titles because the E-Meter wasn't even in existence at the time of most of these – like Dianetics: Evolution of a Science. Furthermore, they're Dianetic titles and Scientology is practiced at the church.

These things are very easy to win, this thing'd be a hands-down, our New York attorneys say crash-crash, all we ought to do is go in and grab the property, and so forth. But our Washington attorneys say no, we had better use this to unseat the current administration. [laughter] So they're not going to fight on the court day of the twenty-fourth, they're going to delay that and the – bunch of ads are being placed in newspapers in the Bible Belt, giving the salient dates and data which I have just got through giving you. Kennedy isn't in much trouble, you see.

And today something was mailed to Congress which is just reconvening. Every congressman's - senator I think the program said, would receive a statement by me saying I would like to have a meeting with President Kennedy, because I'm sure that we could settle our religious differences and that… [laughter, applause]

Anyway, it may be very well, we may even make them Scientologists. I frankly was getting worried, you know. We'd been ignored too long! Here we are, sawing away at the very foundations of "man is mud – man is an animal," you see, chipping away at the sacredity of psychology and things like this, you know, and nobody paying any attention at all, sooner or later was going to break someplace. I didn't, however, expect it to break on the note of complete insanity. And it couldn't have broken on a better note.
They... I don't think they did one thing right. See, once they got the error rolling they really did it up well! And they'll probably be hearing about this for years. Well anyhow, the main danger of it is that we get very fixated on the US government, frankly it isn't a big enough target to be worried about. And we spend a great deal of time, working, sweating, slaving, trying to push over the government when as a matter of fact it's halfway over on its back.

The thing which we should do is to, of course, get on with the job of good processing and so forth, and there's where we have it made. Not fighting the government.

The government [laughs] – the government turns out to be its own worst oppterm! But I think – I think maybe if a few of the guys and I were holding a war council over in my office at 1927, trying to figure out something to get the government to do that would call some attention to Scientology, I think this suggestion probably would have been offered and we probably would have polished it up and I don't think we could have done a better job than the government did off its own little bat. So there we are!

Now, actually no auditor, no organization, nothing is threatened. They didn't – they didn't threaten anybody. And as far as that's concerned no warrants were issued for anybody, nothing like that, see. They did just a half... a half-delirious job and did it halfway, and – strictly straitjacket stuff. So anyway, the organization's going on as usual, everything's going on as usual, except those kids over there are doing meterless auditing right at the present moment.

I'm sure a few of them were smart enough, although they haven't put it on the wires because they're afraid it'd be inspected – I'm sure a few of them were smart enough to have their meter parked underneath their desk – or left home that day. And I'm sure there are meters around. Actually, there's quite a stock of old 57 meters and I imagine those things, [laugh-ter] you can – you can read a rock slam on one of those, you know?

So anyway, that's the sad story. Now, let's get on with something important.

You have been wrestling around now, with Routine 2-12, and this is a lecture on 2-10 and 2-12. And, show you what raids of that sort of thing do: they actually just slow down technology. I have a bulletin on my desk right now, which is one – about half-written – on a very fast, simple Routine 2-10. And you need it. But here's the gist of the situation on 2-12.

I put it in your hands, you've been wrestling with it, you find out what it's doing, what it can't do, what are the difficulties with it, and some of you have had considerable success with it. It's very, very good success you've had with it. And some of you have had moderate success and some of you have darn near chewed the pc to pieces with it, and some of you have almost spun in on it. This is a very varied set of results from one process.

Now, it's quite important that a process not give a varied set of results, so I've been taking complications out of this whole technology that you're doing, watching the mistakes you've been making, apprehensions and misapprehensions about it and have been boiling it down – boiling it down to its essentials and giving you far more indicators. When you see this, why this is true. And when you see that, that is true. Not leaving it up to any kind of de-
cision on the part of the auditor, he just sees— he sees the needle is acting this way and there-fore he does so-and-so.

This—this is much easier to learn. Now before you go into eight thousand nine hun-dred and sixty-seven questions, all of which are based on a complicated comprehension of Routines 2-10 and 2-12, let me give you a dissertation on the simple, pure version of what this came from. Okay?

All right. The basis of this technology is as follows: You do a list—and this is not as it was, this is as it is—you do a list. You don't take a list, see, you do a list—this is the pure technology—and get that down to a point where only one R/S is seen on nulling. Only one R/S on the list on nulling. If you had more than one R/S on the list on nulling, your list is in-complete. Now, what do we mean, tiger drilled? No, no, just seen the first time you go over it. You call an item off, if it's going to R/S, it'll R/S, and that's all there is to that.

You got that as a step. You take a list. A list. Not—you don't take an arbitrary list, you take a list question. And having taken this list question, you complete it. And having found the item that that list completes to, you oppose it properly. Now, you could oppose it two ways. In view of the fact that you make mistakes in opposition—and you do, most any of your long lists comes from mistaken right way to or wrong way to, such as, "Who or what would a catfish oppose?" when it should have been, "Who or what would oppose a catfish?"—those are your long lists.

Why, just list it both ways. Just list it both ways for a page, just a page. And notice which one the needle was stiffer than the other on. In other words you'd list, "Who or what would a catfish oppose?" and noting the character of the needle and tone arm—tone arm plays very little part in this—and then turn your page over and list "Who or what would oppose a catfish?" for a page and, "Who or what would oppose a catfish?" gives you a looser needle than "Who or what would a catfish oppose?" The wrong way to always gives you a stiff, jerky needle. And the further you go on a wrong list the more the pc surges on cognitions and in-validations and that sort of thing.

In other words, if he thinks a thought and you're running a wrong list, why that would have been a tick early on the list and if it's...if you keep on going for another dozen pages it's a half-a-dial fall when he does this, you understand? In other words your needle manifestations are increasing and on a wrong list you have more R/Ses toward the end of the list than you do at the beginning of the list.

Let's take the second page of the list and compare it to the last page of the list: there's more R/Ses on the last page of the list than there are on the second page of the list, you probably have been listing wrong-way-to. The reason for that is the bank beefs up on a wrong-way-to. In other words, the bank is getting more solid, and so forth, and therefore your R/Ses become more frequent and et cetera, et cetera, et cetera. You understand?

Now, in other words, you could tell, there, right at the outset, a pretty good guess anyway, because you listed "Who or what would a catfish oppose?" and this needle is, see, stiff! And it goes: Bzzz zzz zzz! Bzzz zzz zzz zzz zzzzz! Bzzz zzzzzzz! See, and then it maybe goes a rock slam. Maybe not! Who cares! But it's just stiff! That thing is not going anyplace. It is not rising. It is not doing anything. It is stiff, man!
And the other one, you turn around and you list it and the needle is stiff for a moment and then – then starts – starts flowing and drifting around and so forth and you say that's right way to. And you'd think it was the other way around, but it isn't. Okay?

And that's your second item and then you get that one the same way – to one R/S, when seen when nulling. One R/S seen when nulling. Nobody said anything about Tiger Drilling. One hasn't even mentioned Tiger Drilling. This one R/S seen when nulling.

And when you get to the end of the line, that's your package. Now, what should happen when you find an item? On that first list or that second list, what should happen? I got some nice indicators for you here; you'll be very happy with these things. This makes it a little – make life a lot easier to live with. I've been looking for indicators like mad. In other words, I've been trying to put up signposts. I had a half a dozen signposts up on this road and I… There was this rock, see, this big rock and it was a white rock and I said, well that's good enough. You just go down to the white rock and there you are, see.

And a lot of you are having trouble with white rocks. So I now – been putting up signposts around the white rock, you understand? And then signposts beyond the white rock directing you back to it. And this indicator – this indicator you'll be very, very interested in.

If you give the pc the wrong item, he will instantly have more mass, perceived by him than he had a moment before – markedly, this is. Now, that's not pain, that's not sen, he doesn't have more pain or sen. He's got more mass. See, he – where'd this mass come from? Well, it came from the fact you just handed him a wrong item.

In other words, you say, "Catfish! Well, I got your item here, Joe! Ha-haha! Ho-ho! I got your item here! It's catfish!"

And Joe says, "..."

And you say, "All right, did you perceive something when I said that?"

"Yeah! Ruddy thing with a tail showed up in front of my face!"

You right away – wrong item. Now, let's not worry about what he perceives. Let's not get into this one, see? Now, we say – now, you understand, he had item... he had some mass there and he perceives it. But it's not more mass than he had before when you say this first item to him, you understand? He always knew he had this little mass there. See? But it's this kind of action, see? Here's your pc's vision area, the top of the desk here. And you say to him, "catfish!" [demonstrates something, gives a thud]

He says, "Where the hell that come from?"

Got the idea? And actually it's this visible! Now, you may only perceive it by something crushing into him hard. But, you understand? I'll do that again, see. Here he is, he's got a relatively clear field, see. You say to him, "Well Joe, I just found your item here! It's catfish!" [demonstrates something, gives a thud]

He says, "What? Where'd that come from?" You know, that sort of thing. "That's very interesting. Yes, I guess that is my item, I've always sort of been like that..." See, it's that kind of a reaction. "Oh yes, that's my item, yeah..." You know, wild burst of enthusiasm, you know! [laughs]
Well, that's wrong source, wrong way to, or incomplete list. Of course you understand that a wrong way to is also wrong source. It's "catfish a opperm" and it should have been "catfish a term." And... but a wrong source, wrong way to or incomplete list. Well, with this test, whereby you're going to list it both ways, on your opposition, you shouldn't be making many wrong way to's. So it usually would boil down to the fact that you just haven't got a complete list.

Now, if your list is incomplete another indicator shows up. Your pc, in the next few minutes will ARC break inexplicably. And you won't be able to get your rudiments in. And you can run General O/W and stand on your head and wiggle your ears and do all kinds of things, try to amuse him and get him out of it, but he's still ARC broken.

You find that the very reasonable auditor says, "Yes of course, I can understand how he is ARC broke, because I did goof and so forth." They don't realize that this extreme ARC break is from Routine 2. That's a Routine 2 mistake. It's not an auditing error. It's nothing the auditor did, except he didn't complete the list.

The usual fact is that when an ARC break occurs, it isn't really that you've gone by the item, in my experience it's been it isn't on the list yet! I'm prepared to find an exception to that, but I have not found any exceptions so far. It just isn't on the list yet. Now, here in essence, you get completely the reverse aspect when you package.

Here sits this thing here, see. Pc already – always known it's been there. And you come along and you say, "Well Joe, I've got your item here. It's a waterbuck!"

And he says, "Oh, yes? Where'd it go?" Right item, mass diminishes. Wrong item, mass increases. That's a handy one, isn't it? And you'll find that's quite invariable, that is the McCoy.

Now, if it's incomplete list – not wrong way to, but incomplete list – wrong way to he won't ARC break because he's been ARC break the whole – ARC broken the whole time – a little bit, but he won't – he won't go up in smoke. Now, when I say ARC break, I mean up in smoke. I mean he goes into complete apathy, or blowy, or something – it's quite misemotional. He'll be misemotional all through the time to the next session, and so forth. He's liable to blow up in your face. He goes out of gear, fast. And that's usually incomplete list. That's usually incomplete list.

You get all kinds of puzzles – I've got a puzzle right now. Where's Ray? Yeah, I got a puzzle right now, on his pc. I just wrote in there – I just wrote in his folder – he... doing beautifully, see, he's been doing just this. He's been doing just what I described to you, as this Routine 2 activity. And he's got two R/Sing items, ah-ha-ha, on his list, ha-ha. And, the items are on the first page of the list and he's gotten many R/Ses that follow, but those R/Ses evidently don't fire on nulling or he hasn't nulled them, but – or – but they're not firing on nulling.

Now, that list is incomplete, or he hasn't got the item. He has not got the item yet. And the pc says, "Oh yes I'm fine, I'm not quite up to understanding what this is all about," and so forth. There'll be reservations of this particular kind.
He just hasn't got the item, that's all. It's either later on the existing list, but I don't think it's ever been put on the list, because he's got two R/Sing items. He saw one of the items kind of go pffff! and he took a little tiny "suppression of" off and it started to R/S about an inch wide. And he already found one of the other items an inch wide. And he – because he confused the second list he was doing with first list on Scientology, because the other item was Scientology. So he started to pick it up off the list. Oh, no! So I've got in there, big red letters, "No, no, no!" exclamation point. "Complete that list!" See?

Now, there's only one place where a pc knows, exclamation point, knows. A pc really – a lot of the time doesn't know whether it's pain or sen. A pc, a lot of the time doesn't know what he's worried about. And he doesn't – certainly doesn't know what his present time problem is, what is really eating him up – this always comes as a surprise to him. But he does know something. He knows whether or not it's the item.

Now look, if he didn't know what the item was, then the process would have – not be working. See, the item – see, it's only against the pc's knowingness. See, you're only auditing up to the pc's knowingness. So if he doesn't know it's his item, well, that's it. You've had it. That's good enough test right there, so that's another test. See.

Pc queases around even slightly on the thing. You haven't done it, man. Something's wrong here. He's got to say, "Oh, well, yes... catfish, always has been my item," and so on. You don't get that kind of response when you get the catfish, man. "Oh! Catfish! Oh! What do you know! Yeah! Yeah, catfish!"

See, a pc's knowingness is paramount in knowing whether or not it's the item. Not the – not the item you're representing perhaps, or something like that. But when you find an item, the pc knows it is it. And when you package it the pc knows that's a package. He won't even discuss the matter with you, that's it! See? But, if he isn't quite, "Oh, yes, yeah, oh yes, they go together as a package, yeah, yes..." That's not good enough, see?

"Oh well, of course! Yes! Ha-ha! Waterbuck-Tiger! Ha-ha! Golly! Funny I never recognized that before! You know, I often thought those that..." So on and so on and so on and so on. "Oh yes, of course that!" That's the kind of response you want. Got the idea?

Because if you don't get up to the pc's knowingness, where have you got to? You haven't got any other place to get to! Now, the funny part of it is that Routine 2 carries forward a little miracle all by itself, when it's done in this fashion. Now, you understand, I'm talking to you now, about just this Routine 2 I'm talking to you about, see? You do some sort of a list and complete it. Now, not – now understand that list is – I'm not even talking about it being from anything, you understand? See? Just do that list and complete it and then you oppose it and the two items go together and the pc knows all about it.

When you do that you get the funniest little miracle you ever wanted to see. They go pffssssffffflf! Gone! Where the hell's the mass? You no longer got a rock slam on one, you no longer got a rock slam on the other one, you might have a little dirty needle if the pc had a withhold or something on it. But it's gone pffffssss! But the mass is gone, too.

So properly done Routine 2 delivers less mass, and wrongly done Routine 2 delivers more mass. Now, this is so marked you can even put the pc on a scale day by day. If the pc
gains three pounds on Tuesday, he had wrong Routine 2 on Monday. See that? This is the old havingness test, you know? The thetan does develop energy. And the way he got that energy is you saying to him like this – this is where the energy came from, this is the three pounds that he got, see?

You said: "Well, well Joe, that's – got your item here, it's a catfish!" Three pounds' worth, see? Catfish! [laughter]

Says, "Where the hell did that come from?" See.

Now, actually you didn't materialize it, as the auditor. Don't get spooky about the thing. Because the thing was there to grab. See, it was there to grab and it did have mass the moment his attention went on it, but the reason it had mass is it was not fundamental.

See, it's like grabbing the third withhold from the bottom of the chain. It sticks. Now, the fact that you've grabbed a nonfundamental mass and told a lie about it, that it is the fundamental mass, brings about this instantaneous solidity. It doesn't take place tomorrow; it takes place right now. Bang! Funniest looking thing you ever saw. Funny – funny experience.

And then let's take up the next step, then, of – you might say, this is pure, theoretical and can be done, it's not just in theory, it actually works right out in practice – Routine 2. Then we find another way to list another complete list. See, we make another complete list and we oppose that. And this has not been completely carried forward, but maybe one of the easy ways to do that is to reverse the first list. Now we're invading 3-21.

One of the ways of listing a goal and crossing up Routine 2 with Routine 3, is one of the best ways you can possibly list a goal. This is a – this is a doll. You say, "In present time, who or what would your goal (whatever it is) influence?" See? And you make a list "influence." And that list has got to be complete to only one R/Sing item on that first list you do of it, see? It's complete to one R/Sing item and there it is.

And then you take that one R/Sing item, you determine whether it's the terminal or an opposition terminal, and at that time you oppose it, get yourself a complete list to only one R/S, seen on nulling – see, there could be a dozen R/Ses you see, on writing it down – but only one R/S seen on nulling. Now, how do you see this R/S? Well actually just by calling them off. You say, "boots, saddles, catfish, waterbuck, uh-gulp!" There it went, R/Sed. Didn't do anything else to it. You understand? We're talking about R/Ses you don't do anything else to it to get them to R/S, when we say only one R/Sing item. You got that?

We're assuming that your pc is sitting in the auditing chair being a pc. Not completely snoring with missed withholds, you understand? And we assume that the pc is not being audited up against a horrendous and screaming ARC break that you could have figured out that your Routine 2 was bad, day before yesterday and you haven't solved it yet. You understand? We're talking about a pc, he's in shape to have something nulled, not necessarily a clean-as-a-whistle needle, but he's in shape to have something nulled and you're nulling it and you just see that thing.

Now, oddly enough you call it the second time and the R/S maybe won't be there, but just – that you saw it the first time is enough to say the list isn't complete. The way you do that – I'll give you the exact way you do that. You come down here and you say, "Waterbuck,
tiger." Now, let's just get the idea of forty items between each one of these, see. But we say "Waterbuck, tiger," tiger goes ﬂfffl! Little R/S. And then forty items and then, you're nulling, see, so far, it's tiger, see. And then you said, "Willow wand," ﬂfffl! Ha-ha-ha! Your list is incomplete! And at that very moment you don't say to the pc, "Willow wand is your item," or anything stupid like this, see. You don't say anything to the pc, except, "Well, I think it'd be a very, very good idea if we added some items to this list." See?

I don't care if we got two more pages to null. Don't null a list down to the end before you add to it. Stop at the second R/S. Always at the second R/S! You got it? And after you've added to it, if you see no further R/S on your meter as you're adding to it, you either missed it – missed seeing it – or the pc hasn't put it on the list yet, so you better go a little further – heh! The pcs will sometimes argue about going further on a list when they got more to put on a list, too, don't forget that. It's the delicacy of the auditor to get him to list further without making him list under protest.

Usually the pc lists under protest, usually only when the auditor's really goofed, the item is on the list, or is answering the auditing question some other way. "Well, let's see if I can get enough items on this list in order to get away... 'Who or what would oppose catfish?'" so that I can get enough items on this list so that we can get away from it and do something else?" That's the question he's answering. See, he's not actually thinking over, "Who or what would oppose catfish?" at all! And you have to get that question there straightened out.

But anyway, it's always the second R/S. Now, after you've – after you've got... seen an R/S on your meter, here, you've gone down the line and you've seen an R/S – and by the way I'll bet some of you are pulling a gag I saw an auditor doing the other day. And here was the way they were doing this. This – this'll amuse you. They were listing with the meter over here on the extreme left. And writing over on their extreme right. In other words their pad was over here and their meter was over there, so they'd only occasionally be able to look in the direction of the meter. You got that?

Actually the meter belongs up there almost in the pcs chest. And this list, you can actually put your meter on the clipboard if you have to do it on a small restricted area. But for God's sakes don't be writing anything on a list further than about six or seven inches out in front of that E-Meter. You understand? Because as you write, the needle is in your field of vision, and you can see it out of the corner of your eye. So you never miss these R/Ses when it goes down. Do you see how you do that?

In other words, you keep your listing up close to the dial, and the dial in line. And if you can get the list, the meter and the pc in a line, you can keep them all in order. Just one line, see, straight out from the auditor, list, meter, pc. Why you won't miss these R/Ses as they go down. Do you see how you do that?

All right. That's just a point.

So anyway, you've had your second R/S. So you added to the list. You saw an R/S as it went down, you say that's good enough. All right. You go back and you test your first R/S. Even give it a little Tiger if you want to, you know, just on been suppressed or anything of the sort, you know. This thing is now quiet. It's quiet when being called, quiet when being tiger drilled, it's quiet! There's no charge on it. See?
You go to your second one. Now, you understand, if there were two of them, neither are it! You want to... I got an auditor the other day on this, and the auditor couldn't get this either. Now, listen: *Neither one can be it.* Why? Why can neither one of these be it? Because putting the second one down didn't take the charge off the first one. So the second one can't possibly be it. It's never going to be either of the two that R/Sed. And you'll know if your list is complete now, if you can't get either of those two to R/S. Got it? So you test both of them. And if either one of them gives you an R/S your list is incomplete.

You could go on cycling like this but ordinarily you don't. It's usually just you find two R/Ses on the list and you continue the list and the R/S disappears off of both of them no matter what you do to them and you go on down the list and null the new part of the list now, and you'll find out it R/Ses like mad and there aren't two R/Ses on it, or anything of the sort. There's just one and that's your item, you tell it to the pc, you get the less-mass phenomenon, pc's happy as a clam with the thing, you oppose it, runs like a well-oiled dream. There you are. You understand?

But it's never either one of those that R/Sed. If you can get anything on a list to R/S by standing on its head, by shaking it in a paper bag, by putting brown sugar on it – I don't care how! See? If you can get anything on a list to R/S except the item, the list is not complete. You get two R/Ses on a list regardless of how you get those two R/Ses on the list – I'm not telling you methodology now, I'm just telling you the basic truths of life about the bees and birds. Two R/Ses – item not on the list. If either one of them R/S after you've added to the list, your list still isn't complete, because it can never be those first two. Got that?

And ordinarily those R/Ses are perceived just by reading. Someday you'll have the bad luck of having a very suppressed pc and you'll go down the list and when the pc listed the thing they suppressed it like mad and you'll miss the R/S and you'll know then, that you goofed. And you will have to do something extraordinary. And also, as far as I'm concerned the item is not on the list, because the pc inexplicably ARC breaks. There is no explanation as to why the pc ARC breaks and yet he ARC breaks.

You say, "Well it's a waterbuck."

And he says, "Well all right, it's a waterbuck... What do you know, I never noticed that over there before, anyhow, you know, it-it's-it's right all right, I got an item here that... Yeah," [sighs] "It's a waterbuck all right. Yeah, guess it is... But you know, I haven't been getting any of your acknowledgments lately! I wish you'd speak up!"

And you, *heh!* Don't do this, man! Don't do this, "All right, in this session, have I missed a withhold on you? Is there something I've nearly found out? Have I missed a withhold on you? Have I missed a withhold on you? Have I..."

"Well, yes! You missed a withhold on me. Of course you missed a withhold on me! Naturally! You haven't gotten anything I've said in the whole session! You don't acknowledge! Naturally!"

You say, "All right." Finally got him to say something, see? "Have I missed a withhold on you? Have I missed a withhold..." Two hours later: "Have I missed a withhold? Is there something you nearly found out?"
You could go on like this three sessions later. Trying to clean rudiments, "In this session has anything been suppressed? In that session when there was that terrible ARC break, is there anything you invalidated? Is there anything you failed to reveal?"

Now, that's taking the course of auditing to heal up gone-wrong Routine 2. And auditing won't heal up gone-wrong Routine 2, believe me. Take it from me, it won't do it. That's one of the troubles you're having, is your Routine 2 goes wrong and then you try to cure it up with auditing. And of course you're trying to put out the fire by spitting on it. It just doesn't go out, that's all!

Finally you get smart enough to say, "Somewhere around here I'll bet I've missed an item." Which of course is the biggest missed withhold the pc can have. And you say, "All right," so on.

"Well I don't want to list on that list, I've answered all the questions on the list, you got everything."

"Well just for fun, let's list on the list."

"Oh but I haven't got anything, yeah," and so on. "That's the whole trouble with the thing right now, is I'm listing under protest!"

I, about this time – say, "Well what question have you been ask... answering?"

"Oh, I've been answering 'Who or what would doodlebug a wup-wuk,' or whatever it is, whatever question you've got, that's what I've been answering."

And you say, "Well all right, now, at any time have you answered it for some reason? Have you deeded something about this answer? Have you decided?"

"Oh well, yes! I decided I put it on the list when I said 'tiger.' And, heh! I've been listing since, well, heh! What would oppose a tiger, heh? Heh-heh!"

He hadn't been listing "Who or what would oppose a waterbuck," see. Or he's been listing, trying to get enough on the list to make the auditor shut up. See, it's... there's something different going on here with the auditing question. Now, we're just down to the basics of auditing, don't you see? You finally say, "Well I don't care whether it's tiring you or not. It's evidently right way to, we've already stressed that. Apparently the source was okay. Apparently that. And the only thing we've got here that could cause this is you're not putting enough items on this list. So you just sit there and start giving me items, no matter whether you're ARC broke or not, goddammit! Come on, next item?"

"Oh, well, if you put it that way." [laughs]

Pc goes on, all of a sudden puts the item on the list, you'll see the thing R/S, as a matter of fact he's been fighting the item, don't you see? And see the thing R/S and boom, he's got it on the list, you check it out and it's all of a sudden that phenomenon happens, see? Where'd it go? You know? Whole package, if it's the second item, goes psssss!

And you say, "Well, how's that ARC break?"

And he'll say, "ARC break? ARC-? What ARC... oh, oh, well, oh – oh that! I don't – I don't know why you were worried about it, I'm not worried about it!"
That's almost the only ARC break you get in this. Actually you can take it from a wrong source and the pc'll grind on forever just muttering, a little bit now and then. But you get these spectacular ARC breaks just when it isn't on the list, that's all. You got a few indicators now, on this? See this?

All right. Now, I said the stylized, the pure method of all of this was very simple, in that you completed the first list. Now, the more arbitraries you introduce in it – I'll take my hair down here and give you a few of the facts of life – the more arbitraries you introduce into any pure technology, well, the more trouble you're going to have with it. I'm not talking about signs, rules and indicators as to how to do it right. I mean the more arbitraries as to how it is done – that you introduce into something – which are unneeded, unnecessary to its execution, the more trouble you're going to have with it.

At the time that R2-12 was developed we were having a lot of trouble with rock slammers, and we were having a lot of trouble with this and that and the other thing. I coped with this best way I could and knew and found out – now listen very carefully – that R2-12 could be done at several levels of action. It... you could get several different kinds of results out of it. If you do R2-12 right, even against an arbitrary that's quite arbitrary, as your first source...

Well, let's say they had five rock slamming items on List One. And you pick one of those closest to the session; you do that, you're going to make a change in the pc – just listing it, regardless of finding the item. And you list that out and so forth and you get the thing more or less complete and you find an item over there and you oppose it, see. All right, you're going to get change in the pc.

Well, let's say that this was kind of poorly done. And you found one of these rock slamming items and you listed it out and all of a sudden a huge mass materialized for the pc and you oppose that and so forth. Hell, man, you've still changed his mind! With regard to this situation, see? You still have. You'll still get a result.

Now, nobody, in what I'm telling you now, is invalidative of this, because I'm telling you on the basis of a – of an improvement of something that was already pretty good. Now, therefore, you could get a mediocre result that'd be quite impressive to the pc simply by listing a list, not even nulling it. See, you can even list the wrong thing and get some kind of a – of a result.

There are a lot of results to be had here. I'm here tonight trying to tell you how to get the purest, best result. I'm trying to tell you how to get a miraculous result. Now, I found out in doing these other things you ran into more trouble than I ever thought you'd run into. Quite a few cases around ran into a lot of trouble – probably a lot of trouble in organizations right now, as they're doing it on staff.

So, let's move this thing down to its absolute essentials. And let's take a look at the source of any of these difficulties you have had. Now, any time you pick something, there's either of two sources of lists, actually. There's the present time – three sources of lists – there's the present time environment of the pc. There is the auditing environment of the pc, we're talking about his livingness environment, don't you see, that's one list source. And then
there's his auditing environment. You know, the auditor and Scientology and that sort of thing. And then there's parts of existence, as a source – so these three pet sources.

You'd say number one and number three might overlap and true enough they very often do, but nevertheless you can ask for them separately. Now, I gave you this in... this influence for the goal and this not-influence for the goal. That's... You already have the pc's goal, so you get two entirely separate attacks on the situation, "In present time who or what would your goal influence?" and you'll get a rock slamming list. And then you get – you've packaged that all up, see? That's all packaged, you want to take off again. Well, you're not likely to get much on influence in present time, but you can get a not-influence in present time gives you a rock slamming list, don't you see?

So you could say: "What is part of your life and livingness in present time?" and "What is not part of it?" This gives you two separate sources from life and livingness. Each one of them could be handled as a complete list. And each one of them damn well better be a complete list. That's your first list I just described to you, see.

Now, if one of them doesn't rock slam, the other one will. But usually if the first one did, the second one also will. So you've got two separate entirely different list sources in life and livingness. Now, let's take the session. Now, we got to find something that isn't rock slamming in order to get a list. Now that's a new look, isn't it? You never represent a rock slamming item. Just never never never. I don't care if it was done in 3GA Criss Cross. We got away with it then, for various reasons, because it wasn't long and we weren't packaging and we weren't doing it for keeps and we were just using it, it was softened off by goals.

But it becomes fatal to do this in a Routine 2. You just never – must never, never, never write "a represent" or "a consist," or "an influences," or "an upset about" from a – or anything like that – from a rock slamming item. In other words, "In present time, who or what does your life consist of?" Well, that's a somewhat clumsy question but I'm just giving you an example here, see. And the pc'll go downhill like a toboggan, if your "life" rock slams. You got to test the source. Just make sure the source is not rock slamming. DR? That's okay. Rock slam? Boy, that is definitely not all right.

See, actually, you should tiger drill your source a little bit, see if you get a rock slam. If you get a rock slam, you do one of two things. You can either oppose it or skip it and take something else. And the best thing to do is skip it and take something else, you got that? Don't be so triumphant that you got that thing to rock slam because you'll be representing a rock slamming item and that's fatal. And you mustn't – that's a big rule – you mustn't ever represent a rock slamming item. You only oppose those. Never represent, always oppose, a rock slamming item.

All right, so, "Your life…" Bang-bang-bang-bang-bang! You better not write "Who or what – in present time who or what does your life consist of?" you know, nothing like that, no, no, no, no, no, no. Because that's representing a rock slamming item, I don't use – care if you use "consist of" or any other such word, or "associated with" or any such wording will give you the same mess. No, you'd better say – you'd better say something or other that doesn't rock slam.
You'd better say "Who or what do you associate with..." associate with – associate with – it's all right, see "...in your life?" No, no, no, no, no. "Who or what do you associate with?" That's all right, you'll get a list there. Got the idea? This... in other words, you avoid the R/Sing source for a represent list. That's another rule. Avoid it.

Now, why do you avoid it? Because it's always out of the context of another list, which is always incomplete. So, you actually, to do pure, beautiful, magical Routine 2, you never pick something out of midair that the pc hasn't listed. You all of a sudden find "me," you know? Ho-ho! You say, "'Me!' Hey, that slams! Oh, well, heck! Now, we got to oppose that." No. You had better avoid it. Why? Because "me" is a part of a list you don't know the heading of and which is incomplete. You got that? That list is incomplete. And "me" is probably right out of the middle. And if completed would probably give you something else.

So just any out-of-the-blue rock slamming item that the pc presents to you, just consider it as part of a list that hasn't been completed. Now, it may or may not have been completed.

Now, actually there's no great destruction to doing something with that. But it doesn't give you total and optimum Routine 2. That's not terribly destructive. You've been doing it. But you notice how long those lists can run? You notice sometimes they don't complete? And you notice the great percentage of coterms that you get out of it. You notice that? And furthermore I'm finding out that it takes you longer to handle one of those than to find out what the original list was in the first place and get it completed.

Now Routine 2 goes very, very fast, on raw meat particularly. It's... well, you take a session, you get a list. You know? Take a session and you null it. I'm talking about two, three-hour sessions now. I mean that'd be slow sort of Routine 2, but pocketa-pocketa-pocketa, see, you're always coming up with a result.

All right. What if you – what if you found that Scientology was rock slamming. Now, from a security measure and in actual fact, you could oppose Scientology and the case will make a gain. See, that's in actual fact. Even just oppose it and write a long list and abandon it and the pc'll do better. But that's got a liability. That list is liable to go forever, it's liable to be out of a context of another list. What's the title of the list? So we've got our life and livingness, see, type list and there can be positive and negative life and livingness. Unless one of them rock slams, at which time you'll have to find some way to get around that rock slam. See, don't do anything with a rock slam from source.

Avoid that random rock slamming source that came from no place, see. No matter how attractive it is. And your second is your positive-negative Scientology list. Well look what you're up against. Supposing the pc rock slams on Scientology. You can't say to him, "Who or what does Scientology represent to you?" See, because that's doing a represent. Now, how are you going to get around that? You're going to have to take some part of Scientology, or some way of stating Scientology, so that you're not representing Scientology.

It'll be... have to be something identifiable by the pc that doesn't rock slam, and then you've got the positive and negative side of that. What does represent it? What doesn't represent it? See? What is part of it, what isn't part of it, I don't care how you state it, you – it's the same list in actual fact.
And then, you have as your third category, also positive and negative; you've got existence, parts of and you're actually asking him now for anything on the whole track he can dream up. You not asking for a present time anything. He usually gives you the present time item that's next to come up.

Now you go back over some pc's folder. And you find out you did a Dynamic – Dynamic Assessment on this pc. And here are the dynamics all beautifully written out. And four of them rock slammed. That tells you your source. It's from an incomplete list. And it'll behave like an incomplete list source. And you say, "You rock slam on Scientology" and he's instantly got this mass. Where'd it come from? Do you see that? In other words, it obeys all the rules of an incomplete list. It's not something different or special.

Well it's up to you to complete the list. How're you going to do it? Well, you're going to get clever. If Scientology rock slams, how are you going to complete a Scientology list? Well, you'll just have to find something about Scientology, that is broad and embracive – "Mental activities," or "Ron's work," see, something! We don't care what it is. Avoid that R/S. And then you can list it positive and you can list it negative.

See, you list it positive and get your whole package. See, you do your original list, see, that's that complete list, down to whatever it is and then you do an oppose to it and that gives you your package. Now, that saves you one list, doesn't it? And it saves you the hardest, toughest list, so it's much shorter to do it this way. So you get this, that packages, and, if you do it right, just like I've been telling you, here, see, it'll go bzzzzmmmm! A lot of mass disappears and the pc feels great. In other words that will blow. That will blow with rapidity. He won't feel somewhat better about it, you understand? He'll feel terrific.

All right. Then you can do a negative. "Who or what isn't part of Scientology?" If Scientology didn't rock slam. And then you can do a Dynamic Assessment. And you say, "What are the parts of life and existence?" And "What are not the parts of life and existence?" And it gives you two more potential packages – two more packages, not two more items, you understand.

So there's a source of six packages, right there. Now, I would say that they were the basic packages of Routine 2. Six packages – twelve items. You should be able to get off that. If you can't change a fellow's life with those twelve items you ought to quit.

Now, you... the degree that you will succeed in this, the success that you will have in this, is monitored this way: As long as you repair Routine 2 with Routine 2 and not auditing, you're okay. If you do right Routine 2 and repair things that go wrong with Routine 2, you can keep everything beautifully polished up and flowing beautifully with a little bit of auditing. But with a little bit of Routine 2 and an awful lot of auditing, mid ruds and general O/W and preparing the pc and getting the rudiments in – boy you're just going to get that pc no place. See?

Because you can straighten up the case with Routine 2, where auditing will fail. Routine 2 is more powerful than auditing. Why is Routine 2 more powerful than auditing? Because it is hitting at the present time problem and the hidden standard of the pc. The hidden standards of the pc and the present time problems of the pc are the things which has gotten in
the road of pc progress from the beginning of Dianetics and Scientology. That's the one thing the pc can't get across: that he doesn't know these things exist.

He really doesn't know what present time problem he's got. He appears that he has know... does know, the moment you've gotten it. But he actually didn't know until that moment. A case makes no forward progress to amount to anything in the presence of a present time problem. A hidden standard is another thing.

He is finding out if his sciatica still twinges. And that is everything he is doing. In all of his processing he only compares it to his sciatica. That's the hidden standard. You ask any pc you're processing, to some degree, he has a hidden standard. You say, "Do you feel better because of processing? All right, how do you know you feel better because of processing?’ And he... if you drum at him for a while, he'll come up with his hidden standard, and sometimes these things are quite interesting- whether or not the tips of their ears burn. See, he knows he's getting better because he gets a warm feeling in his chest and so forth. And he's actually sitting there in session waiting for the warm session to turn on so that he knows he is better. It's quite amazing!

It's a very interesting little – little side alley of research some HPA Academy student should undertake sometime to do. Just ask them how – ask – go around and ask his fellow students how do they know they're feeling better. And an Academy Level without any 2-12 at all, why they'd have abundant answers! "Well what would – what would – what would some healing have to do to you, what would some healing have to do, to you in order to – that you knew you were better?’ And you'll get an almost automatic response on the part of most people. Sometimes they have to think for a while. And they finally tell you, "Well I'd... back of my neck wouldn't be tired anymore.” Well, they're telling you they're trying to find out if an item is shifted – that's what they're actually telling you.

Till you get the hidden standard out of the road, he does everything through this. And oddly enough, because it's really a circuit he's consulting, all of his answers as to whether or not he's better are from the circuit. And this goes much deeper than you would think. He's in consultation with a circuit. Supposing it was a member of the FDA! Ho-ho! [laughter] Any case gain – it'd tell him he's worse! Do you see, that's the hidden standard.

Well, a present time problem, it's just – present time is just plowed in. He is so fixated on present time, you see, that, huh-huh, he can't take his attention off. Be quite painful for him to invest any time in improving. He's just got to be totally alert and up here in present time, bug-eyed fighting this thing all the time. You've seen pcs come into session worried about their... the wife, or worried about the husband, or worried about their job or something like that. You actually could process them, bang! Bang! Thud, thud! Crash, crash, crash! On and on and on, with the most violent and wonderful processes and so forth and take a graph on them afterwards and they got absolutely no change whatsoever on the graph. We've done that many times.

You run a liability now, with omitting your Model Session, of not catching that momentary PTP. That momentary PTP can keep the more fundamental PTP from showing up sometimes. But, Routine 2-12 is usually worth taking a chance on. It's usually worth taking a chance on, because it is so much greater a PTP and it is so much greater a withhold and it's
got so many more overts in it than you could possibly get off with rudiments, that most of the
time you can get away with not using a Model Session on it.

All right, so what do you do? You get, you pull the dumbbell to pieces, you make it
disappear; there goes their PTP. Another dumbbell; there goes their hidden standards. Maybe
the same one went both PTP and hidden standards, don't you see? Then you get another one;
here's their fixation on this, that or the other thing. Here you get another one; and they can all
of a sudden see the walls and didn't ever know they couldn't before. You work it on up, you're
suddenly at a position where if you list goals on them, they won't give you these first eight or
nine items.

If you had listed goals on them before, they'd just give you the intentions of these PTP
circuits. And you'd just get nothing but on and on and on – intentions of these circuits. I got
some actual case history on this, which is quite interesting. I don't care how long the goals list
was, the pc was just listing their PTP circuit goals. They never listed back of that, which I
thought was fascinating. So, of course, you could never get the pc's goal on the list.

Now, they can move on the track enough now; in order to put a goal on the list, you
could do 3-21 after you had a few packages out of the road with Routine 2. Now, that is actu-
ally the purpose of Routine 2. There isn't any other purpose back of it. It's not really to make
the pc feel better and it's not to make the pc fly and it's not to make the pc get a big reality on
Scientology, nothing. It's none of those purposes. Any of those that add in are simply bonuses
and they're all very, very worthwhile; and you do perfect Routine 2, you will get some very,
very miraculous results. It's very well worth doing.

Now can you get a goals list? You get a few packages off of somebody and you get
them off of him well and he all of a sudden just starts presenting you with his goal. Various
things of this character occur. But you're trying to clear up the PT environment to a point
where the individual can be run on a Goals Process and cleared.

Now, there is your essence of the thing. Now, the repair of a case, or anything like that
may be another story entirely. And it has nothing to do with this very pure rendition of Rou-
tine 2, which I've just given you. If your auditing can compare to the very pure rendition
which I've just given you, you'll have marvelous success in auditing, there is no doubt about
that at all. Okay?

Thank you.
CASE REPAIR

A lecture given on 8 January 1963

Thank you.

Lecture two, 8 Jan. AD 13. Saint Hill Special Briefing Course. This is about case repair.

Now, I've given you a very pure rundown in the first lecture on the exact plot of what you can do with a case with listing and opposing and so forth. And if you were to do that – succeed in doing that and so forth – you would get a very miraculous gain on a case. This would be less mass as opposed to more mass.

Now, if you goof you will get more mass and things will become more solid and the first symptom of goofing is actually more mass. More mass has shown up on the case than was there before and consequently more R/S than was there before. Those are the things that you know you are going wrong with. You know you're losing with the case if on Tuesday you have more rock slams on the case than you had last Wednesday.

Let's say you went over the Scientology List originally and it had no rock slams on it, but from some other sources – 1A or some of the other list headings that we had like "What are you upset about?" – and you did a lot of that and you got a lot of packages, and then you go back to the Scientology List and you'll find out Scientology and Central Orgs and things like that are now rock slamming. The case is not improved up to a point where it can rock slam. The case actually has become massier and that is reflected in more rock slams than previously.

Now, you get these two symptoms of case worsening. These cases – case bettering, case worsening. You get these two aspects then – more mass and more rock slam – as being a worsening symptom.

Now, along with this is your best indicator for visual inspection of the pc is tone of the skin. Pcs get discolored skin tones. They go gray or green or yellow or black and this happens sufficiently rapidly to be noted in a session. Actually you can list a list wrong way to and sit right there and watch the mass close in on the pc and the pc gets blacker and blacker and blacker and at the end of the session the pc is more black than they were at the beginning of the session. Well, something is very wrong.

2-12 does not work that way, or Routine 2 does not work that way. They should be lighter. Their skin tone should be better. And actually it's about this – you should be able to tell halfway through a session whether or not their skin tone is better than at the beginning of the session.
Now, you can also tell with the eyes. And the eyes look like they have more sen on them halfway through a session than at the beginning of the session, I would check over what I was doing. I couldn't necessarily abandon it because it merely means they're running through a sen period or something like this. So the eye is not as reliable as skin tone.

Skin tone – inevitably, invariable a darkening or worse-off skin tone halfway through a session than at the beginning of a session shows that you're doing something very wrong. So you should learn to spot a pc's skin tone at the beginning of a session – at the beginning of auditing and get a fixed idea of what it is so that you could use that as a point of comparison. Beginning of the session take a look at your pc. Pc a light shade of yellow? Well, at least at the end of the session they should be a lighter shade of yellow not a darker shade of yellow, do you see that? So remember to pick up a point of reference by which you can compare what you are doing.

Now, the other symptom here is age and that is very easy to look at. Does the pc look older or younger? And that is also progressively easy to compare. It isn't whether the pc looks older at the end of an intensive than at the beginning of an intensive. It's not that gross. It's whether or not the pc looks older halfway through a session. See? And it's quite gross as a yardstick. You should be able to sit there and see the pc look slightly younger halfway through the session than at the beginning of the session if you're doing Routine 2 right. And the pc will look slightly older halfway through the session.

Now, this goes down to such a thing, and don't laugh now, but it goes down to such a thing as gray hair. Suzie used to be very amused at me on this because my hair would turn gray and turn red and turn gray almost at will. And this is quite easy to tell, but you see that a pc's hair is grayer at the end of an intensive than it was at the beginning of an intensive, why, something really went wrong.

Now, this also refers to mass. Now, that is a fairly – that is a less gross – age itself is very gross. That has big differences that you can see. But I'm just talking about this – it's just a little part of age, see? Weight is another factor and that goes – that's not quite as gross a yardstick – but weight goes something on the order of two, three sessions you should be able to markedly tell a weight improvement.

Now, the pc actually should weigh less. How much less can a pc weigh? Well, on some pcs who are obsessively thin and too light, actually a little more weight is an improvement, but you have to use your head on that one. But ordinarily, why, an increase of weight means an increase of mass.

Now, these are the things you tell by, because the graph is not available to the auditor midway in the session and midway in the intensive and so forth, so these are very precise mechanisms by which to tell improvement. But I'm talking about the auditor's mechanisms to tell improvement and they fall into just those categories, no others. Don't bother with any other categories. You can usually look over charts. You can usually look over the pc's auditor reports and find out if he made his goals. Well, if the pc has consistently made his goals in the session, why, you can conceive the pc is getting better, so forth. Those are indicators. But the things I have just told you about, such as skin tone and age, they're exclamation point. See?
They're right. They're dead-on. And mass, to a slightly lesser degree but very positively, is an indicator.

Now, all of these things add up to an auditor's observation of the pc.

Now, a meter should behave better. I don't say that a meter – a meter has a good way of behaving on a pc. I'm not trying to set that up as some hidden standard to you. But when you ask the pc for a withhold you get a response when the pc has one, you understand? Whereas last week when you asked them for a withhold you couldn't tell. In other words, it's simply a matter of the meter doing better by the auditor. This meter is easier to use, that's all.

Now, the needle's cleaner. Just... it's the meter is better for the auditor and it's always for the auditor. Meter behaves better. You don't have any meter trouble with this pc. See? You used to have meter trouble. Three sessions ago we had more meter trouble than we have now.

Now, height of tone arm or obsessive lowness of tone arm are alike indicators, but in actual fact Routine 2 doesn't give us a perfect score on the tone arm. The tone arm can almost be neglected. We're more interested in needle behavior than we are tone arm positions to show bettering in Routine 2. This tone arm can actually consistently ride at 5 with the pc getting better and better and better. That's interesting, isn't it? Not even tone arm motion means anything in Routine 2. So you list and get no tone arm motion; so you list and get tone arm motion. There is no adjudication can be made out of that. But sometimes you'll find an item that rock slams on the tone arm; but that is so rare that we're not particularly worried about it.

But if, after a while, our E-Meter has not changed in its position we begin to worry about what's going on here, you understand? After a while. At the end of a... the pc has consistently ridden at 6 and we've gotten three packages and it's still at 6. Well, we conceive, then, that we must have been plucking things out of the air. Something here is not fundamental on this case. We conceive this pc still must have the PT problem the pc has. It isn't the pc isn't getting better. Yes, the pc looks better, the pc acts better, the pc does better, but he still must have some kind of a present time problem here or that mass that's giving that 6 wouldn't be that visible, you understand?

About that time we go back and review the living daylights out of the case. What would we review? We'd look for a wrong source on a list that should be completed. Now, the only one I'd worry about is the fellow that rode at 1.5 and we found two packages on the pc. Two packages, that's four items, and the pc still riding at 1.5, I'd sure review the living daylights out of that case and find out what earlier item because there's something here that's real weird. And if I didn't find anything and the pc is feeling better, and his skin tone was better and he looked younger, I'd go on and find another package. But I would treat the case with considerable "hu-hu-hu-hu-hu-hu," you know? And sooner or later this pc's going to go bzzzlt and go up through 7 and around down the line. But if I didn't make it happen after a while I'd start worrying, you understand? That's all the tone arm means.

That the tone arm doesn't pump madly up and down while you're listing, that's nothing to worry about. It remains motionless while you're listing; that's nothing to worry about, see. We don't care what the tone arm does. Needle, on the other hand, when we are listing wrong way to, the needle invariable is stiff and jerky and the longer we list the more jerky and active
and \textit{rrrrrrr} the needle gets, and that's wrong way to or wrong source. There's something really going on wrong here. Your needle behavior should soften up, loosen up and eventually when the list is complete and for some little time after that... You shouldn't just stop a list the moment it gets clean, by the way, it should go about, well, I don't know, as many as fifty items beyond that point.

A list will go clean before the item will get on the list. That will happen. So just because the needle stopped going dirty and so forth is no reason that the list is complete. I'd let it sit there and flow for a while. Not beating the pc up to a point where the pc goes into a super protest, but I'd get as many items on the list as I could. I would avoid short lists and after the list was complete avoid listing. When is the list complete? Well, when it can be nulled to one R/Sing item seen on the first nulling through that stays in and that's that, and the pc is happy with it and knows it's it. That's how long the list is.

These lists that go to twenty-two pages, twenty-five pages, forty-two pages are wrong source or wrong way to, either one or the other. They are just too long. Lists that run four pages should be quite adequate. Lists that run – I'm talking now about your big double pages where you have your – lot of them. My pages have about – only about twenty items on a page. I list five, six of those pages, that's plenty. If it goes much beyond this there's something wrong. The source is wrong or the list is wrong way to.

Now, don't go on listing forever on something and butchering up the pc. Your case repair should be done in time to avoid this sort of thing because you'll waste more time on a case running wrong on Routine 2 than you will on scrapping the lot. You can waste – the only time you really have a long time of it is when you're doing something wrong. And the funny part of it is, the wronger you are, the longer you'll take.

The right way is fast. The wrong way is long and slow. 2-12 being done right just goes swish, swish, thud, thud, \textit{list-list-list-list-list-list-list-list-list-list-list-list-list-list-list-list-list-list-list}. Pow! Pow! Pow! Thing rock slams. Pow, pow! There's another rock slam. \textit{List-list-list-list-list-list-list-list-list-list-list-list-list-list-list-list} Pow, pow! There's another rock slam. \textit{List-list-list-list-list-list-list-list} Blang! There's one isolated rock slam! Blang! Whole page without any rock slams on it! Pc says, "I've just run out." You say, "All right, let's take a crack at it." Down the list \textit{pocketa-pocketa-pocketa-pocketa-pocketa-pocketa}. All those items that rock slammed when you wrote them down no longer rock slam and you get to one toward the end of the list and it rock slams like crazy! \textit{Bang-bang-bang-bang-bang-bang-bang-bang}. You say it again, \textit{Bang-bang-bang}! You didn't Tiger Drill it, just \textit{bang-bang-bang-bang}! And you take a look at it, and you say... I'll tell you what to do wrong at this time, I'll tell you what to do wrong. You say, "Well, that item R/Sed," to the pc and then call the next item. You just about knock the pc's head off every time. You finish nulling before you tell the pc anything. After you know for sure, tell him, and then keep your attention on the pc. Don't do anything else to find out if it's massier or less massy or what is going on, but don't shift the pc's attention after you've told him the item. Don't! There's the source of more ARC breaks and upsets. Pc is going to ARC break if it's the wrong item so stand by – stand by for boarders! Get your boarding nets out right there. Just prepare to say, "That's fine, thank you very much!"
He says, "Well, I don't know. I guess it's a great big item," and so forth. "I don't know what these lightning bolts are that are going. Yes, it must be the item because of these light..." and so forth.

And you say, "Well, all right. That's fine. That's good. Thank you very much! All right. All right. Well, just come to notice here this thing, this list appears to me to be just a little bit strong. Do you mind if I prove the item out by listing a bit further?"

"Oh, well, ha! Yes."

As a matter of fact every time you get "Oh, yes! Yeah, that's fine," see, it's a wrong item. You're going to list further when it is the item? *Pow!* Pec's skull all over the ceiling! Do you know what I mean? Pec knows it's his item.

All right. Now, what are these various manifestations? What do they amount to? They amount to auditor observation of the pc and auditor observation of the meter. If it is hard to do, you are probably doing something wrong. And if you're doing something wrong with Routine 2, you're not going to put it right with auditing. Just make up your mind to that. Make it up now! Because there just isn't any auditing process run in present time that can overcome the strength and power of one of these items in Routine 2. He's just not going to be able to make it. You can smooth the pc out, you can make it feel better, you can groom up Routine 2 with auditing and good auditing – there is no substitute for good auditing – but something goes wrong with Routine 2 it won't heal with auditing. So you better have your Routine 2 right. So if your sessions are just going all wrong don't look at the auditing. I don't care if you think the auditing was lousy. Don't look at the auditing. Look at the Routine 2!

So when do you repair a case? When it won't run right. Don't try to – don't try to make this case something new and strange and peculiar with auditing. You're not going to do it. Why, I'll give you an example! Last night I patched up an incomplete list with auditing to make the pc feel better – didn't know quite – quite know what to do about this thing. Pec completely unwilling to go on listing on it and yet obviously it's an incomplete list. *Hehheh.* What do you know about that? So I patched it all up – I got all – you just – very rapid Tiger Drill. It didn't take me any time and so forth, but I got the list question beautifully clean; big, beautiful, flowing needle. Pec today ARC broke. Didn't know about what; just ARC broke! Pec ARC broke. I said, "Well, obviously we didn't have the item on the list!" Pec brightened up at once, but last night was saying, "Well, it's a complete list and I can't think of any more." You know? Pec brightened up right now. Do you get the difference there?

All right. What is the commonest source of error in Routine 2? Wrong source is the commonest source. And what is the commonest source of wrong source? It is an incomplete list.

All right, does that mean a list you took from source? No. No. It means the source list was incomplete. Always regard, always regard any rock slamming item as having come from a list. There are no prime movers unmoved. You got that? The big worry of the Greek was how did God build the universe if nobody built God, see? Well, we haven't got that thing in lists. Lists inevitably and invariable are built. And even though they've never been listed, any item is viewed as having come from a list. You got it? Any item is viewed as having come from a list. And that gives us one of the most imponderable pieces of nonsense anybody ever
heard of, because you are inevitably and invariable starting a case, then, from a case that has somehow been started. Now do you see why you have trouble with the source?

But the three areas where the pc can be in trouble is in his life and livingness, in his parts of existence or in his session. Well, his session is a part of Scientology, and his life and livingness is a part of his life and his associations in present time, and parts of existence are what he has considered existence to be composed of.

So they give you three different areas. One is more backtrack than the others and that's the parts of existence – that's more backtrack. What's his life and livingness composed of? In other words, what is he associating with? What does he connect with in present time? What does he bang up against in his life and livingness present time? This is different than when is he banging up against in a session?

So you've got your present time of his life and livingness and you've got the present time of the session, do you see, and there's where you are at.

Then, of course, you've got all the parts of existence and that goes back on the whole track.

Now, there's all of your zones that are immediately available. There's present time life and livingness, there's session connections and that goes out to organizations and books and auditors and all that sort of thing, and then there's your third one of what is existence all composed of in his estimation for everybody.

Now, the one that is most intimate to the pc and will most prevent him is sort of a tossup between one and two. If he rock slams on auditors or an auditor, but is every day being invalidated by his wife and rock slams on a wife so in session he catches hell from the auditor and out of session he catches hell from the wife, which hot brick are you going to be pick... is going to be picked up first, because oddly enough both hot bricks have to be theoretically picked up at once, but that's impossible.

Well, let's at least let him get some help from the auditor. Now, you see why the arbitrary stress on List One existed. But see, equally, that somebody who rock slammed on three portions of List One was listing from a wrong source. Somebody had three rock slams on List One – obviously he's listing from a wrong source.

Now, to List One has also been adjoined parts of existence. So if he had three rock slams on parts of existence and two rock slams on List One he now has two incomplete lists. So your sources are being taken from two incomplete lists and those sources are not complete. The odd part of it is, is they might be mixed. That is to say that might be two lists under the heading of what you're calling List One but in the pc's estimation they should be two. They should be the technical aspects of Scientology and the administrative or organizational aspects of Scientology. See he might have them subdivided in some fashion. Well, how are you going to tell?

Well, this is the old Greek problem of the prime mover unmoved. All source item – you're taking one source as an item – that has to be regarded as having come from a list. That has to be regarded as having come from a list.
See, it's a list that never got written, but it's still regarded as having come from a list. So you're always starting from a list that has never been written.

There is always a list on the pc that has never been composed by the pc. The auditor's responsibility in this merely goes this far: He makes sure that the list source question does not rock slam because if it rock slams that means it's obviously part of a list – and he can't use it.

I'm talking now about doing pure Routine 12... Routine 2, that is absolutely grooved in that you'll never make a mistake with, see, have no trouble with. Let's say – let's say, offhand, that you're going to pick up, "What does present time consist of?" You've got to test present time. That's a source, isn't it? Present time actually belongs on the parts of existence list. But if it doesn't rock slam you're all right; you can represent present time. Therefore all lists start with a represent.

Your first list is always a represent list, but how do you find out what to represent? Well, sometimes you're going to lay an egg on this. You're going to say, "What does present time consist of?" and you're not going to get a rock slamming list. Whereas as you say, "In present time, do you have any problems?" and you do get a rock slamming list.

Now, let me give you a real imponderable imponderable. This is a real interesting imponderable. We say – we're going to assess now those little Zero Ones and we find one of them slamming. What does this mean? The slamming one is part of an incomplete list and we don't have any way of knowing whether or not it is the final item on the list or not, so we avoid it like a plague – or we run a list. How many list headings could there be?

Then after a while we check "list" and find out it's slamming. We're wrong. That's wrong. Got more slams than you started with. You did something wrong. You missed. You always wind up with slams but they shouldn't be as frequent, they should be getting less frequent. Do you see the problem?

So "reasonable about" slams. You say, "Aha!" – the way we were thinking before, see, and I'm trying to make life comfortable and livable for you, which I think you'll have put your vote in for – those of you who aren't rock slamming on yourselves will vote for this.

We find "Reasonable about" slams like crazy, so what do we do with it? Ho, ho. We get out of there, man. We've two things we could do, theoretical: One, we could complete the list of what is a list – what is a list heading; but the best thing to do is to take something that is not in its immediate vicinity or instantly and immediately associated with. "What would you be reasonable about?" You wouldn't ask that question at all. You don't dare pose it because you see you don't know that it's the item on the last list.

All right, let's supposing that you found out that this character slams like mad on Scientology. Well, obviously if he slams on Scientology there is something wrong with the session. There is something going to be wrong with this session, obviously. So, therefore, it's very much in your interest to put together the session list. But can you say at this stage of the game, "What does Scientology – who or what does Scientology consist of?" Oh, no, because you're doing a represent on a rock slamming item, you see, there's your enigma. So what kind of a question are you going to use to get a Scientology list from? Well, you could ask this, you could say, "What question, if I ask it to you, would cause you to answer it "Scientology"?"
That at least gives you an anatomy of how you would go about it, you see. You've got to work the problem out backwards. You've got to have some other thing. You just can't say, "What does Scientology consist of?"

Now, once in a while you've got to check your source. So you ask your source once in a while and watch your meter and that's the best way to do it. Don't get so TR0ed that you ignore the meter, see. There's no sense in saying, "Who or what does present time consist of?" see, with good TR0, you know? No good at all, see? "Who or what does present time consist of?" with your meter centered up there to see whether or not you get a slam. This thing starts to slam, you're in trouble. "Present time" slams.

Well, I'll tell you a mistake you could make. Saying, "Aha, 'present time' slams, let's oppose it." Cut your throat, man. That's prime mover unmoved that you're looking for and it doesn't exist. Present time must be coming from a list.

Now, you could chase this thing backwards, of course, and say, "What question would I have to ask you for you to answer 'present time' to?" and get a list on which "present time" would occur. You may find yourself doing that some time or another because the pc keeps laying dead horses, see?

But this is your – this is the enigma. "Present time" began to slam, you'd better get out of there man, you'd just better just quit that right now because you're getting more rock slams than you had before. Didn't slam, now it does slam equals wrong source. Bank must be beefing up. See, you can work your way through that one rather easily. Didn't slam, now it does slam; something's wrong. It isn't that the pc unsuppressed, so what you've got to do is find a negative question that will produce rock slams – a negative rock slam question that produces rock slams – that's the whole trick and that, sometime or another, is going to be found to be quite a trick to you.

Now, you go back on the dynamics of existence of the pc and you find an arbitrary – this is case repair now – you go back and you find an arbitrary assessment of the dynamics and somebody took a "whiffinpoof" as parts of existence, you see, under living things there were "whiffinpoofs." Aw, more than that, let's say the pc rock slammed on groups and the pc rock slammed on mankind. You've had it. Two R/Ses on that third type of list, and you'd better say, "What are the parts of existence?" son, and you'd better complete that list and again it's "What question would I have to ask you for you to write all the dynamics down on?" And maybe the pc also slams on the second category, which is "session material" and "dynamic slams," so you have to get the session straightened out before you can straighten out the parts of existence.

You might find yourself in some silly circumstances here of some kind or another but you'd be able to work them out if you just realize that you had to have a virgin negative slam item to proceed from which if it began to slam tells you that you are wrong. In view of the fact you've got three zones from which these things could come, there it is. There's the present time life and livingness of the individual, the session present time and sessions in general and Scientology and all its ramifications and then there's parts of existence as a whole which tends to give us bank and whole track. You've got three sources to work on. You've got positive and
negative for these three sources and you should be able to turn yourself out quite a bunch of packages.

If you found some raw meat out on the street that was in trouble all you would have to say to that person is, "Present time, present time." And they'd say, "What? Well, what about present time?" And you didn't get a rock slam on it, you see? And you'd say, "Well, I just wanted to know what present time consists of." No rock slam, it's okay. And you write a big, cracking, long list about what does present time consist of and you carry it out, but when you null it you only get one R/S and you get one and continue it until you only get one R/S on nulling and, just like I gave you before, and you find out that a package is a terminal or oppterm, list it both ways to find out if you get a loose needle, and what have you got? You wind up with a perfect package. It'll go phhff! No mass. What happened? Where did it go? Where'd they go?

Actually, the fellow will improve and get an awful lot of ideas and so forth even if you miss, which is kind of wonderful. But why miss? Why not get the full gain the first time. I'm just talking what you do to a raw meat person.

All right, supposing present time consists of, and "consists of" was brrrrrr. You'd say, "What did you just think of?" "Oh, nothing; what you're saying." You say, "Consists of," brrrrrrrrr. You'd better find some other question to ask.

"Present time – what do you connect with?"

"Present time – what do you connect with?" No R/S.

There we go. Do you understand? Or you could go back and say, "What would be the list heading of a list on which the word 'consists of' would appear?"

You might be able to actually, to figure out some way to work it out.

You've got a slamming item so you know you'd have a slamming list. Either way to, you'd wind up with a complete list and that's what you want.

Now, that's raw meat.

Now, supposing somebody is – absolutely will not under any circumstances get an R/S on parts of existence. Well, you've still got the negative side to try. "What isn't part of existence?"

Supposing he just having an awful time, oh, he – it's nothing but dead horses and he doesn't get anywhere in session and he's crying all the time about it and he's chop-chopping the auditor 100 percent and you haven't even started anything so how could you have missed anything on him, you know? And it's all this and that and he's had a terrible bad history and he had some 8-C run on him back in 1949 before it was invented and… I'd assume about this time that he was a rock slammer on List One, see, and that he isn't going to get anywhere until we do a List One type of list.

Now, the job is how do we work out a List One type of list heading that itself doesn't rock slam. And that's going to change from pc to pc, so I just hand it to you as a problem.
Now, let's say he doesn't rock slam on that list. Oh! Well, let's shift it slightly and ask the negative. See?

"What isn't part of the activity us guys are engaged in?" Slam, slam, slam, slam, slams all the way down. You find Scientology isn't part of Scientology. Now, you've got your item, whatever it was. But it's still the last item on that list – the last R/Sing item on the list.

These are your methods of introduction into cases. Now, remember that a case has got to be able to answer an auditing question for Routine 2 to run on. The interest is usually so great that even an untrained pc usually falls right into it and answers up very, very well. However, sooner or later you're going to run into somebody who won't answer any questions at all and sooner or later, I don't say under what conditions they'd be under, or why, because I've seen it run on, now, little kids and everything else, and people who wanted nothing to do with processing and all that sort of thing. I've seen all the stylized cases, the types of cases that couldn't have been run on earlier processing, running on this. But I just say in fun, let's say we – supposing we have this person and they can't give you a list and they can't list anything and they can't do this and they can't do that. I think they'd be booby-hatch types, you know, strictly booby-hatch, or perhaps members of the government or something like that, see? You know, utterly unreal dogs, and you've still got all of your – you've still got all of your background music on your CCH type processes and all that sort of thing. You'd be surprised what that stuff can do. So you've still got a case entrance – see, we're still talking about case entrances – you've still got a case entrance.

All right. Now, how about a case that's been run for a long time with wrong sources, wrong way to, and every time anybody said this was the item, a four-foot-thick block of concrete showed up and knocked out their front teeth. Is there any hope for this person? It's pretty sad. Actually, the funny part of it is that even a random slam taken amongst five slams and opposed just as a list, would have cured somebody from being so edgy in sessions as long as that list was complete, see. But it would have given them a bit more mass and it would have made them unhappy but it might have made them auditable.

You understand? We're very far from invalidating what we have been doing.

How about this guy who already has six packages? All right, so he's got six packages. Fine. Probably doing better than he was. Everything's fine. So he's got six packages. Nobody's – I'm trying to show you now how you can undercut it. And every place it went wrong it will wipe out with a bzzz. And that's simply find the first incomplete list. You understand, even though it's a suppositional list that appeared on the case. Now that could be 3D Criss Cross. See? What didn't he agree with or something, see? Could have been. Could have been. But it's much more likely to be these arbitrary lists – the Dynamics or List One – and you treat those as incomplete lists. Look them over. So one of them had two slams on it, must have been an incomplete list. In other words, just start from there.

Get some kind of a list question that itself doesn't rock slam, test it and complete that thing. Now, what do you have to do? Do you have to go back and null it all? Well, no, usually, if things that were marked in that R/Sed on it before. So you only have to take those – so you just add to it and null what you've added and then try to tiger drill alive afterwards what was there originally. So you don't null all the way through everything and so forth. But look,
it's a simpler test than that. If, while adding to it, you get a rock slam, you have two choices: That was either the item that just went by or you're getting more rock slams than you had before.

Well, one of the ways to test it very thoroughly is to keep on listing, and let's list a page on which we get two rock slams, then we list the next page on which we get three. *Di-di-di-di-di-di.* Something wrong. It's either wrong source or wrong way to. Got that?

Well, you again take a grip on the situation and turn it around the other way and list it the other way and your needle goes loose. So that meant it was just wrong way to and your source is probably all right. But let's turn it around the other way and have the needle misbehave just as thoroughly. Brother, that's really wrong source. When it won't list right either way and your needle is just raising hell with you and it isn't cleaning up and so forth, that's wrong source.

So *in extremis* you've even got a test for wrong source – is: either way to, it won't list. You only have to list a page or so to find that out. You don't have to list forever to find this out.

All right. Now, as we examine the – as we examine the case, then, for case repair, we want to get rid of all of the dust and nonsense, all of the bric-a-brac, all of the items that are solid and all of the bad auditing and all of the mid ruds and all of the this's and all of the that's that has occurred on the case so far. All we've got to do is to go back and find the earliest list and complete it, that can be completed. That's all we have to do. And find the right item for that list – find the last, single one R/Sing item, oppose it and take off and go ahead and do a package. And you'll find a lot of bric-a-brac will drop off the case if that thing was really completed as a package. See? Both lists were nicely completed.

You find this bric-a-brac that the pc had been complaining about on some of that later stuff that came from that wrong source. Well, let's say it was a List One and they'd gotten a lot solider stuff on opposing Scientology. And you went ahead and completed List One in the pc's own words and found something else, and that was rock slamming and then you opposed that, Scientology, and any list proceeding from Scientology, drops out. They become null. Simple?

In other words, it eradicates itself. So if any of the pc's packages are wrong why bother to check up whether the packages are right or wrong? Just find your earliest list – your earliest incomplete list that can be completed and complete it and proceed right from there.

Now, you'll find that lists have genus, they generate from something, and you only examine the generators of lists. This is the easiest way to repair a case. You don't go over endless lists that have been listed on the pc. You only look where the list came from – where did the item come from. And you're usually examining and completing understood lists, lists that have never been listed. See? Like List One, he never listed List One. Parts of existence, he never listed the parts of existence. He took a canned package of dynamics, don't you see? So you've got to complete that dynamic list. You've got to complete List One. Or you've got a 3D Criss Cross list of some kind or another and he was busy listing what didn't he like. Gosh, there are a lot of rock slamming items. And after that the pc got on it "judges" and the pc still talks about this one. Well, if the pc still seems interested in this one is no indicator whatso-
ever that it was right. That's no index. Because if it's still slamming after all this time, even though it was opposed at that time, it must have been an item which was on an incomplete list.

So all you've got to do is complete the list from which "judges" came, get it properly opposed, and the package goes bzzz, and you'll never hear him open his yeep about judges again.

So where the pc's interest hangs up is a sure index of an incomplete source list. This is a tricky thing. You say to a pc – I've told you all this trick now so it probably won't work on you very well – but, you say to a pc, "Now, we've really found quite a few items on you, now, from time to time, which one are you still most interested in so we can do something about it?"

"Well, I'm still interested in goats, we found goats on that list and I find them very fascinating." And his eyes get somewhat lambent and the slits lengthen, you know? Well, you don't want to do anything about goats, don't oppose goats! God help you, don't oppose goats! I've already put this into great practice, see. No, let's find out what list goats appeared on. It was an understood list or an actual list or otherwise. But let's find out what that list was, and if we possibly can, complete that list to its proper item and oppose that proper item to – with a complete list that packages in the total knowingness of the pc and go bzzzz, and then you say to the pc, "Ah, all right, what – how do you feel about this 'goats' ?"

"What about it?"

"Well, how do you feel about goats?"

"Well, goats, goats, goats. How do you feel about goats? I suppose I've been one at one time or another, hasn't everybody?" No interest.

Now, let's say the item which we did find on the thing was "milk pails." You say, "How do you feel about milk pails?" He'll say, "Ha-ha-ha-ha, yes. Yes, sure gave me hell during the war." You just milked a little bit of cognition on the milk pails, see. Every time you mention the real item to him, why, he'll give you a cognition. He won't discuss it with you. He won't have an opinion about it, but it still is not effective on him. In other words, that's an erasure. It's an erasure of interest. He can always cognite on it.

He often had time – a hard time remembering the right items, but they always remember the wrong ones because, brother, they're stuck there in pillars of stone.

Now, these are all indicators and indexes and so forth, but you can use these various indicators I've just given you for all kinds of case repair.

Now, I want you to forgive me for giving you a process which could be done wrong or that could have a limited application or could have this or have that, but I won't forgive you if you think I've invalidated all of everything we've done because I actually have no intentions of doing so and I don't want to and I'm certainly not invalidating what packages have been found on you. Packages that have been found on you did some good. Now, if they stay erased when you complete a list some place, fine. They won't beef up, so that's dandy.
But there's one thing that you have taught me is that we needed a faster, harder set of indicators, a better set of indexes to telegraph to the auditor this and that, and we needed to reach just a little deeper technically in order to get a pure, sure-fire gain out of these things. All right. I've been working for a couple of weeks now watching you sweat around. I've been working for a couple of weeks' improvement. I recognized a couple of weeks ago that you weren't about to get some of these lists straightened out. And I started to say, "All right then, on all cases we have to cut to the ultimate and we have to get back to an ultimate foundation and begin from there and so forth or auditors are going to have a hard time with it."

All right, that's fine. But this is gain. Now, what you realize that you should be realizing here is you're actually simply opening up the present time problems, knocking them out, and knocking out the hidden standards, because these things have been stopping clearing in some enormous majority percentage of cases. These are the important things that bar clearing. These are the barriers. And that's why I've been working on Routine 2 stuff. You actually probably could keep on getting packages if you could keep on getting sources. You could probably go right on back down the track and you'd finally hit the rock and opprock, and there'd be the guy's goal.

All right, fine. There's easier ways to do it. You can clear away the chaff from PT and untangle the GPM, you can get back there and find the rock slamming goal and run it and life becomes much easier. But of course, remember that pieces of the GPM can still key in after you have found the goal and you can still bypass items, you can still miss things, you can still do this and still do that but if PT is cleaned up and if things are knocked out of present time consistently that are going to barrier the pc onto a free needle and so on, even with more Routine 2, he's going to clear easily. So long as you've got Routine 2 you can always find an entrance point. That's the purpose of Routine 2.

You haven't got a devil's chance of finding the goals on a lot of cases without clearing away those two things: the chronic PTPs and the hidden standards. You haven't got a prayer. And if you did find the goal you haven't got a prayer of running it because the PTP will clonk... bang in on him and wipe it out.

Now, therefore, we've got to keep a wide-open track on the pc and therefore the use of Routine 2 does not necessarily cease on having found the pc's goal. You might run everything his goal influences in present time and package it up and the things his goal doesn't influence in present time and package that up and he's going fine and he seems to be getting free needle. Then all of a sudden he hits some terminal, like somebody did in Perth the other day, motion with exclamation points, or something, hangs up like mad, can't quite see which way he's going, whole thing caves in, goal read disappears and now he doesn't know what is happening and so forth. Ah, well, you don't know that the pc simply hadn't caved in on a brand-new present time problem. And instead of spending hours and hours and hours of prepchecking, you've got another weapon called Routine 2. You just use Routine 2, not with any difference at all. You don't change Routine 2 just because you're running it on somebody who is back down the line, see, on a goal. No, you just assume that something's caved in on this pc in PT or something.
So you just, "What does present time consist of?" That's all, see? And you're off to the same races. Or "What doesn't it consist of?" or "What does auditing consist of?" Or, she's a temple priestess and all of a sudden, by George, by George, there's only one way to get Clear, see, and that's by jumping into the maw of the flames. Everything hangs up, there are no flames or something.

See? The pc – the pc has, perhaps, missed an item in goals clearing. Now, everything that applies to straightening up lists also applies to your Routine 3-21, everything I've told you about it. Everything I've told you about having a list complete applies to 3-21. You do a list from a goal, you've got to get down to one rock slamming item.

Now, one of the hardest things you will use to get a rock slamming item from is a goals list. Let me put this two cents' worth in. Goals lists almost never run out of rock slams. When they do, fine, but they behave just like any other list of items. They don't behave any other way.

Let's say you had a lot of slams early on a goals list and then had one slam late on the goals list that's still slamming, see?

All right, in that case you could take that last goal and oppose it because it's just an item from a list, if you want to call it that. The funny part of it is, because the pc skips all over the place with a goals list and can run all over the bank with a goals list, you get some very wonderful complications with these goals lists and probably the hardest list to straighten out for a purpose of doing Routine 2 with, but not goals, of course, is a goals list. It's the spottiest and the least satisfactory of them. But you will still some day be prepared to find the earliest list done on the pc, a goals list, which has – now has only one rock slamming goal on the end of it and use that to oppose and the whole case blossoms.

Now, remember that a rocket read is senior to a rock slam. And for your purposes you do everything with a rocket read that you'd do with a rock slam, except the rocket read is accepted above it.

Let's say you have four rock slamming items on a list when you start to null. Boy, you're not about to have a complete list so you complete the list and get it down to one rock slamming item and there it is, beautiful, single. You go back and find out those four no longer have rock slams on them. You've now got your item. This is fine. It follows through all tests. It doesn't generate a lot more mass – it generates some pain, sen or something like that, but not lots more mass – and you go ahead and you oppose that properly and you get your list out and you find that item and it all blows up. Fine. That's just Routine 2.

But what if you found four rocket reading items on the list? You better complete the list to one rocket reading item. This has already happened, by the way, and they had four rocket reading items on one list. And I told the auditor to complete it – a Saint Hiller, just left here a short time ago – and I told the Saint Hiller to complete it. He went ahead and completed it and he found one rocket reading item and the other rocket reads disappeared.

Now, that's perfectly valid for opposition. It's also valid for goals finding. You can do a lot with a rocket reading item, so you mark those down rather special in caps. But remember that the four – that more than one rocket read on a list – now we get something complicated.
whereby you have three rock slams and two rocket reads on the same list – well, what's perfectly answerable is the rocket read is senior.

But all those rock slams and earlier rocket reads have got to disappear before you accept that last rocket read. You got it?

Anyway, there's your case repair factors.

Now, I've tried to give it to you in such a way that you don't have to memorize 8,645 bulletins. But I'll still write all those bulletins for you to memorize anyhow just so you can't miss it. [laughs]

The... now, to show you how you can make mistakes, you can take a perfectly elementary case, sail down with enormous cockiness, be just absolutely grooved in and you know you're just sailing, you've got the first item and the pc is singing and everything is fine and then you get your opposition list. And you get down the line on the opposition list pocketa-pocketa-pocketa-pocketa-pocketa and there was one rock slam and there was two rock slams and there was three rock slams. And that was the first page. And on the second page there was one rock slam and there was two rock slams and there was three rock slams and there was four rock slams. So on the third page there's one rock slam and two rock slams and three rock slams and four rock slams and five rock slams. And on the fourth page you have rock slams.

The funny part of it is your needle, because you've picked the case up to the stars by finding the right item, doesn't cave in, and neither does the pc. The pc just becomes a little doubtful or something like that, and you say, "Well, it's merely anxiety." You're listing the list wrong way to. The needle is so beautiful that you don't notice it. You say, "Well, it's better than I've ever seen a needle on a pc before." Well, list it the other way to and the needle would still be looser. You've got to watch it.

But this test of the frequency of rock slam, I think you will find quite valid because it says the pc's bank is beefing up by reason of the listing. Of course, we expect sometimes the list to go a page, a page and a half, before the first rock slam occurs; then we expect a whole spate of rock slams. That's quite normal. But down on the last page we don't expect the rock slams to be more frequent than they were on the second or third page of the list. That tells us we've got a wrong way to.

Now, if our first line was so beautiful and came out so lovely, we certainly aren't dealing with a wrong source. We're just dealing with a wrong way to list, you see? Everything checked out and there we were. But if we still listed it the other way to and couldn't make sense out of it, then we would decide that that list just before that we just did, that we grabbed the item prematurely. And the way to test that is to add to the list and see if some new rock slams came about. We might find that that was the one that was wrong way to.

You see how we could straighten it out? We'd have to be pretty knuckleheaded to be wrong, but be prepared to be wrong. Be prepared to be wrong. Don't be so persistently, cockily right when you are so horribly, devastatingly wrong. And always straighten out Routine 2 before you straighten out auditing. Spend ages straightening out Routine 2 and briefly straightening out auditing. If your auditing is perfect and you never have to straighten out
auditing with auditing, your Routine 2 is perfect, the auditing is very, very rapid. But the paramount importance is get the Routine 2 done first.

All the cases that are here at this particular moment are easily straightenable just by the rule of finding the first understood list – the list that was never listed from which you took an item. I mean just if we went back to that.

We didn't even have to go back to 3D Criss Cross or anything, see. I mean, just if we did that, we would be in clover. We take List One. What's the question that would complete List One? We simply complete List One, get all the rock slams off List One down to one rock slam, oppose that, then everything that has gone wrong earlier on the list fades out. Got that?

I think that takes care of most of the cases present. You talk about case repair, that's about all the case repair there is. Sometimes an item has been found as the single rock slamming item on a list and it's never been opposed! You'll find that kind of thing going on. I know one case right now where that is true. All kinds of assessments have been done since. Here's this bypassed item sitting back there, see?

All right. Well, I hope you have good luck in straightening these out. I think you're getting to be much better auditors and I want to give you one small compliment. You turned me in a whole bunch of papers on what you do with case repair and in the understanding – in the complete understanding that you had at that time – the incomplete understanding which had been issued to you at that time – the case repairs which you advised were right on the button. I had to then make up my mind and realize that you could learn even a complicated a procedure as you were handling and that you could repair a case under the headings of that complicated procedure then.

I was very happy to know that and I got very proud of you and I even said it in a bulletin a short time ago.

So, thank you very much.
All right, this is what? The 10th of January.

Audience: Yes.

AD 13, Saint Hill Special Briefing Course, lecture one.

A little bulletin here – Aussies, hang your head in shame! All through the Commonwealth with the greatest of ease, I was able to slow down this government raid on the church in Washington, but not in Australia. You see, the lines go straight from Australia to the United States and back and forth. And the whole rigged government release in Washington landed scram-bang into the press in Australia. So Australia is a seething mess of "God 'elp us" now, and somebody from the Australian syndicate is coming down to see me tomorrow, and they want to know all about it.

I'm not going to tell them very much beyond "a fascist government raided a church." I'll tell them, "Be very, very careful, though, because apparently there's a million dollars in the offing to fight this in the United States. They actually got all kinds of leads and money pouring in like mad from all directions, and the situation looks very dark for the United States."

[applause]

You should really understand this a little bit. You see, they've done everything they could do. They've shot all the women and children, you see, and kicked the dog – there isn't any more they can do. They've shot their bolt. And having lied to a federal judge and done a few other things like this, all they can do now is stand and take it, and man, we – we're loading up the guns! [laughs]

You shouldn't expect the situation to deteriorate anyplace; actually, we'll handle this in Australia with the greatest of ease. But isn't it interesting that Australia takes orders from the US to that degree. Only Commonwealth country that has published a line. Interesting.

Well, regardless of all that, let's get down to something important – something important. Such as why your pc ARC breaks, you knucklehead!

Ah, this is very interesting. All this cost us today was the bulletin I was going to write on the subject. That's the second one that has cost us.

But there's some very, very important data here. Some extremely important data. 2-12, 2-10, the Routine 2, has a liability and this is a very, very, very important liability. It's one that you must not lose sight of. Otherwise you're going to lose pcs like mad! And Scientol-
ogy's going to lose people like mad instead of gaining them. I'm not joking now. Somebody can be put off but good if you miss an item.

Now, what is a missed withhold? It's a nearly-found-out, isn't it? All right, now you just apply anything you ever heard of to missed withholds – to this other activity. And boy, a missed withhold of the size of a missed item – when it turns up and comes to view and isn't picked up by the auditor – is really grim. And I do mean grim.

Because not all the pulling missed withholds in the world are going to straighten it up. You've got to get that missed withhold – which is the missed item.

Now, you think I mean one that isn't opposed. No, I mean one that isn't put on the list. You stopped listing too soon and this is under the whole subject of incomplete lists. Now, fortunately – fortunately, you can bypass items and incomplete list and maybe 60 percent of the time, 70 percent, something like that, get away with it. This is on one pc, not 70 percent of the pcs, you see. Most of the time you get away with it, I'd say even higher than that – 85 percent, 90 percent. You get away with it.

And the time you don't makes up for the whole lot. You can go ahead and do a sloppy job of Routine 2 and incomplete lists and oppose them and have a ball, endlessly list, and so forth. Nothing catastrophic occurs.

And then on one particular list – there is no telling which list this might be; you didn't need to finish all the lists, and you could abandon some of them, and so forth – but on this one list that you're doing, you grab the item before it's been put on the list. After that your pc's unauditable. Your pc becomes unauditable. Right there. Right now. And you as an auditor get your head knocked off and say, "I'm tired of auditing," and the pc natters and screams around and says he's tired of being audited and that ends the whole thing, if you don't know what it is.

So this becomes the most important single piece of Routine 2. How to patch that one up is very important.

Yeah, you can be reasonable and you can say, "Yes, I've made a goof. Yes, I've goofed. Yeah, I goofed. So therefore, of course, he's ARC broke. Or he's got missed withholds. Maybe he was, one time or another, a member of the US government." See, some other scurrilous action maybe has taken place on the part of the pc. And you say, "If I just sit there and pull missed withholds, well, I'll be all right, because obviously it's a missed withhold. He's been sort of dopey in sessions, and he's been this and he's been that. Now, all right. 'Is there anything I nearly found out about you?'"

And the funny part of it is the pc doesn't know what it is. He doesn't know why. He will give you missed withholds; and if you go on with pulling missed withholds to cure this ARC break, then you will drive him around the bend. Then you compound the felony.

Why? Because the missed withhold is the item he didn't put on the list. Now, give any ten lists, see, on the same pc – we're not now talking about an odd pc that behaves this way, we're talking about every pc you will ever audit – and you have ten lists, and like a complete chump you didn't complete any of the ten – any of these nine lists. They weren't completed, they weren't the right item, your opposes were all wrong, everything – nothing ghastly happens. But undeterminedly, and just for some reason, because of the peculiarities of that list…
This – one of those lists out of that ten, you don't complete that one, and that's heading right for the center of the bank. And you don't complete the list. You get to an item "odd bod," and it must be it because only five items before that R/Sed.

And you say, "That's your item, 'odd bod'."

Big mass immediately appears in front of him. And he says, "Well, I-I… Yeah, I guess I can see how this is. I… it adds up. Yes, it… I guess that's right. It adds up. I guess it packages up all right. Eh-eh-what are you wiggling your pencil for? All the time you sit there wiggling your pencil. I've been trying to – trying to tell you for some time, the motion bothers me. Uh-yeah. Well, you say were going to have another session tomorrow. I'm actually going to be pretty busy. Uh-well, all right, I'll come in for the session."

And you know what he does? The only place you can really detect this – I don't mean to be sarcastic like interjecting such comments as "even you can detect this," and so I won't put it in there. But there'll be a fee.

Now, listen very carefully. His session goals the very next session will not be as brisk and bright as his session goals have been in the past. And as you continue to oppose this wrong item, which you've found on this tenth list – you're now doing an opposition list to it – his goals will get worse and worse and worse.

And the way you patch this up – the way you patch this up is you look over session goals and you find what set of goals for a session did this pc set that were less optimum than his previous goals. And then if the auditor has been very clever and if he's heard a rumor that you should write things on auditor's reports – like what list you were listing, what's the name of the list you're listing; in other words, other pertinent information; or dated the lists, if he did that, dated the lists, all of which he's supposed to do – all you have to do is get the list he was listing on immediately before and complete that list.

You understand? It is not – not eight days before, you understand. It's the list that he completed in the session before he set the goals for the next session. You understand? Or the list which was abandoned. You got it? And you watch those session goals, and it'll tell you every time.

Now, actually, you'll also see him looking darker, blacker, older, looking like hell; all these other manifestations go right along with it. And he's very ARC breaky, and when he was given an item or not given the item, from that point on, why, he is ARC broke. In other words, the list was abandoned or it wasn't complete or he was given an item off the list, but it was something wrong with that list.

And that's what causes that deterioration and that ARC break. Now! Now, listen to this very carefully. That he ARC breaks or is upset because you tell him to complete that list doesn't have anything to do with it. Because you go back very often and try to complete that list, and he natters and screams and tears his hair and bites his fingernails and says to hell with it and bashes the cans, but he'll go on and complete the list. And then all of a sudden you'll get his item on the list and there it'll be.
A wrong-way-to list actually doesn't act this way. It doesn't act this way on the pc. The pc – just under strain and looking older and so forth – but he isn't ARC break Wrong source very often – wrong source actually doesn't cause ARC-breaks like this.

So this is a peculiar manifestation having to do with completeness of lists. And your indicated action – your indicated action is to watch a pc like mad when you abandon a list. And to watch a pc like mad when you give him an item. And watch for that ARC break that may follow within the next few minutes or certainly at the beginning of the next session. You understand?

Because pcs are sometimes quite propitiative and they don't blow up in your face. They just go out the bottom. But, you can see it reflected in goals. That's the easiest place to see it reflected – right in goals.

Now, you get this as a single indicated repair item. Now, let's say somebody has been listed against one of these things, setting sour goals for the last eighteen sessions. Well, all right, it was eighteen sessions ago. Eighteen sessions ago, that was when it happened. And if you've got his auditor's reports nineteen sessions ago, you'll find a bright... you know, good goals, you know: work hard, get in and pitch, find this, do that, you know, bang-bang, get better, snap to, get the tone arm down, find my goal, get Clear, see. Next session: "To see if I can't improve my case." Single goal set. Huh-huh-huh-huh-huh-huh.

Well, what was he working on at that time? See? What happened? And you'll find out in that last one that has the bright session goal – just before the bad one, see, the bright session goal one – either a list was abandoned or it wasn't completed before the item was given to him. And it just all comes under the heading of "You missed a withhold." There's a missed item, and that's all it amounts to. The missed item. Right there. Bang!

You missed the item – maybe you didn't notice at the end of that session or the rest of the session, and so forth. Maybe this pc is so propitiative you didn't really – really notice, or you weren't on the ball that day or something, and you didn't see this. Or you felt your auditing was a bit off that day and you're prone to blame your auditing or something like this, See.

You adjudicate, "Well, I better pull his missed withholds." Well, the first thing you better pull when you pull a missed withhold is to go find the item, and pull the item that was missed. And that is paramount in missed withholds.

This all comes under the heading of missed withholds, and it all is incomplete list. Because naturally, if he was given the wrong item on the list, the list was probably incomplete. Of course, you could grab the wrong item off a list – the item on the thirteenth page was slamming like the devil, but the auditor thought that some other item looked better and you know, did something like that. But that we're – we're looking at goofs there that are too magnitudinous to even be included in the perimeter of auditing, you just understand. That's just ylaah! That's just auditing goofs. We're talking about 2-12 goofs, see.

So, something happened that had to do with an item being missing. That's all you got to know. Because, believe me, there'll be many ways that items can be missed – many ways. I'd hate to try to invent all the ways items will get missed between now and the year 2000,
you see. And they'll probably be multitudinous. You're going to find some new and original ways yourself.

Now, you understand, if the list was backwards, that he was listing, you won't get quite the same thing. You'll just get a continuous strain. And he won't necessarily ARC break because you missed an item on the backwards list, because that's all missed. You see, you're not going in the direction of it closely enough to cause it a near miss. So a backwards-listed thing won't give you the same manifestation. It gives you another variety of strain on the case.

Now, you can always tell a backwards list – always tell a backwards list with the greatest of ease – because the rock slams get more frequent. The frequency of slam increases as you keep listing. There are more and more slams. And theoretically, if you went to a hundred pages, they'd all be slamming; everything would be slamming. You get the ne plus ultra.

I'll give you an idea: There's two slamming items on the first page; there's three slamming items on the second page; there's four on the third page; there's five on the fourth page; you see, there's fifteen on the fifth page; and then the whole rest of the list slams. Now, that's an exaggeration of it.

But just count your rock slams. As you're coming down the line, those end rock slams, if there are more than there were on... per page than there were on just the preceding page, you can figure out there's something wrong here. That's backwards to – that list is backwards to, because the bank is beefing up. And the bank is beefing up, indicated by these gratuitous rock slams – there's more and more rock slams. Of course, you... the pc might be wearing two rings of a certain magical constituency that gives you a rock slam on everything.

Did you know that some pcs with a ring on each hand, holding the cans, will rock slam for a phantom slam all the time. It's quite remarkable. We had an audi... a pc here that was doing that a few months ago.

But the crux of the situation is that slams are becoming more frequent as you list. But on a right way to list, the slams are becoming less frequent as you list. Always less frequent. So that you'll see maybe three slams on the first page, and then he could have four or five slams on the second page, because he's just warming up, you see, but on the – on the third page, why, he's got two slams and on the fourth page he's got one slam, and...

Now, here's one for you that joins right in – and why I'm talking about this – it joins right in to the missed withhold situation. And this you can shudder in your boots about; I'll let you quietly shudder in your boots about this one. The next rock slam on that list may be as much as six pages away from the last rock slam on the early pages. You can list six pages, in other words, with a relatively clean needle, and then all of a sudden get a slam, and that's the item. And that's on, particularly, one of these hot lists.

But sometimes, as an auditor, you're going to be knocking your brains out. Or you're going to be supervising a whole bunch of co-audits and you'll see some of these... one of these co-auditors knocking his brains out. The pc is going yap, yap, yap, yap, yap, yap, yap! Howl, howl, howl!

And you're going to sit down to try to pull the missed withhold. Ha-ha-ha-ha-ha-ha-ha. You're not going to repair with auditing what's been done wrong with Routine 2, let me
tell you. You'll find out ordinarily that a few minutes before, the pc's been told he had an item and was apparently satisfied with it. Or the session before, something was abandoned. The list was abandoned as not being complete, or something like that. Something of this sort has happened in there.

You look over the Routine 2 and you raise hell with people who don't put the pc's name, date, and page number on the list sheets. The pc's name, the date, and the list heading that they're getting the list from. "Sheet," I have said, not "page." Each separate sheet of paper has got to be so marked. Otherwise you can never trace this back.

Now, when they're doing auditor reports, for God's sakes make them mark in what they are listing! "Who or what would a catfish oppose?" "W/W wd catfish op" is the way it's usually written. Doesn't take any time to write it down. Why leave everybody in a mystery? Because that may someday become of the greatest importance. Three days later: pc, "Yow, yow, yow, yap, yap." Or just total apathy: "Oh, I don't know what's gonna happen or what's gonna happen to me. I always felt all right before Scientology came along."

Well, you set it back and let's look at the day before – the pc set bright goals? Then it happened yesterday. Pc set bright goals day before yesterday but not yesterday? Ah, well, then it was day before yesterday. Get the idea? It'll be in the session that the pc set the last bright goals for. You got it? It won't creep up. It won't sneak up on you. It's not on a gradient. This thing is about as gradient as dropping all the crockery in the house, two stories! See, it happens now! And your cycle of action on the thing is you say, "Well, here we are, we've got 'an upchuck.' That's right. We've got this item, 'an upchuck.' And does that sound like it's the right item to you?"

"Oh, yes, yes, I've always been vitally interested in that." [laughter]
"Well, do you have any mass?"
"No, no, no, no. Never have had any mass."
"All right. Upchuck. Upchuck. R/Ses very nicely."
"Yes, I suppose it does."
"All right. Well, that's that! We'll – glad we found an item for you," and so forth. "Now, did you make any part of your goals for this session?"
"Oh, yes, I guess so," and so forth.
"Is there anything you'd care to ask or say before I end this session?"
"Well, yes. Has your meter been plugged in during the session?"

You say, "What the hell's happening here?" See? I mean this would even be a propitiative pc. One who is less propitiative just takes your head off and throws it up against the wall.

But it'll be something like this. It's just offbeat. They really haven't had time maybe to really get this going.

Now, the next session you start to oppose it. The pc sets some sour goals like, "To get well, I guess," "To get through the session, somehow."
And you'll say, "All right. Now, we're going to list 'Who or what would oppose an upchuck.' That all right with you?"

"Oh, yes, yes."

"All right. Well, who or what would oppose an upchuck?"

"Do you have an ARC break?"

"No, no, I feel fine."

And it'll just go from there on, man. It'll just keep going, from worse to worser. This pc will be violent about three sessions from then, or just go into complete apathy, "Uuuuhhh." And the goals will continue to deteriorate. And that's all there, back there on that list that you got "upchuck" off of.

Now, the funny part of it is -- the funny part of it is, you'll occasionally say to a pc, "All right. This list here 'Who or what has been agonizing in present time,'" or whatever it is, "that we got the upchuck off of," you see. "Now, we're going to complete this list!"

"Oh, the hell you are. I just don't see anything. It's complete! You already gave me the item, didn't you? I can't think of anything more."

"Well, we're going to get the rudiments in on this list, and we're going to continue it anyway."

"But I just can't think of anything more!"

Quite ordinary; you'll get that kind of a response. They won't complete the list. It's incomplete. They're now getting even with you, sort of. That's the whole motive.

You talk to them a little bit and persuade them. They say for a while, "There aren't any more items. There aren't this… Something."

Then all of a sudden, why, they go, brrrrrr, bang-bang! Just... almost in the middle of the time when they're telling you they can't add to it, see, why, they start adding to the list. And they add to the list and add to the list and add to the list and add to the list and add to the list and add to the list. And you're liable to go four, five, six, seven, eight pages, without a single R/S on it. And then all of a sudden there's a crashing big R/S. Well, null it down, in case you missed an R/S, just by reading them, pocketa-pocketa-pocketa, "Hey, we may -- I really got one on you."

Talk about nulling of lists -- for a week for a list, you know? I clocked myself the other night on a -- on a six-page list. And it took ten minutes. I wasn't wasting any time marking Xs and things down, you understand. I had it clean enough so I could just write "page Xed out" before I turned it, see.

And you don't have to wait any time to see if an R/S is going to develop. If it isn't an instant R/S, it only takes you something on the order of about a tenth of a second of lingering
glance still on the meter to see nothing is happening. And what do you mean you take your eye that far from a meter just to read the next line, you see?

You can really null these things down if you get in the groove, bow, bow, bow, bow, almost that fast, see. So you don't care how much you null.

And it's just on the off chance you might have missed one or something was up, something like that. Sometimes one that you can't really tell which one R/Sed, or something like that – there was just a big R/S going on during the time.

Anyway, you get down here to the end, and bow! you see, there it is. And it's "a tigerbat." Wasn't "an upchuck!" at all, you know? There it is, "a tigerbat."

All this time the pc has been very cheerful. Where was the ARC break? Where's the hopelessness? All the time you were listing, all the time you're nulling. And you get down, and you say, "Well, we've got 'a tigerbat' here. A tigerbat, tigerbat. Yes, it R/Ses very nicely" And the pc says, "Could've told you that all the time".

Actually, he's been swearing, you see, all the time that the thing was "a baseball." But, actually – yeah, he could have told you it's "a tigerbat," and he's all perfectly happy. And you oppose the thing, and he's happy. And what happened to all this going-to-commit-suicide-tomorrow-morning and all that kind of stuff? That all just evaporated.

Now, here's another test you can make sometime and that's quite interesting. I don't say to do this intentionally, but sometime when you find you have done it, mark this very carefully! You say to the pc, "Well, got your item here. It's 'an upchuck.'" And the pc, "Does that sound like it's real to you, and so forth? You think that's it?"

"Oh, yes, yeah, that sounds quite real."

And then the pc starts to kind of scrape at you a little bit, one way or the other, and just watch the pc do a tone curve. Just watch that curve go down. If you knew damn well it wasn't the item, and you did that, you'd see that curve down. I'm not telling you to do it intentionally, but sometime or another you'll do it accidentally, and you might as well sit there and watch the – watch the thing curve. And then do this: "Well, did mass show up?"

And the pc says, "Yes, some mass showed up, and so forth."

And you say, "Fine." Now, you say, "Well, I'm sorry but I don't believe that was your item." See, you watched the curve. He didn't know. You watched him start to ARC break, and some mass showed up. What more do you want, see? And you say, "Well, I don't think that's your item, we're going to have to continue the list." And watch the pc bright up – brighten up, right now. Bang!

"Oh! Well, are you?"

"Yes!"

"Oh. Is that so? All right. Okay. Matter of fact, I got a couple right now."

It's very funny. The pc apparently has bought it, you see, to some degree – no cognition or anything. Sometimes he'll even cognite a little bit, you know. Because it is a lock on the real item. And you kind of watch him go down. And if you – if you just held off giving
him the good news about the fact that you were going on, anywhere up there to thirty seconds, 
you can start to watch that ARC break. You can start to watch that thing. If you let it go, the 
pc will be tearing up the auditing room, see. That's a missed withhold of an item. That's an 
item that is missed, and that's all that it takes. That is all that it takes.

That's interesting, isn't it?

Well, this has much more far-reaching potentials than you would think. There are a 
few pcs around – they are very, very rare; up at HASI London we know of four or five of 
them, I think, in all the years of operation up there – who just are ARC breaky as hell! And 
have been for two or three years.

They come back and get audited, but it's absolutely gruesome. You know some of 
their names. It's gruesome, man. Every time they get audited, I get letters, too. It's horrible.

You know what I'll bet's wrong with them – every single one of them – I'll bet you, 
somebody left an unflat repetitive process, years ago, perhaps. That interesting? They didn't 
put the answer on the list, you understand? There wasn't even a list! They didn't put the an-
swer on the list! No list. They never enunciated it. Somebody didn't flatten the process. 
Somebody was running – somebody was running something on the order of "What would 
knock down a bodybuilder?" You know, way back. Well, they've assessed something like "a 
bodybuilder," or something. All right, "What would knock down a bodybuilder? Thank you. 
What would a bodybuilder knock down? Thank you. What would knock down a bodybuilder? Thank you. 
What would a bodybuilder knock down?" And then the auditor for some reason or 
other was changed or got tired or got bored or something of this sort, or something new came 
out on a telex the next day, and nobody flattened that process and that pc hasn't been auditable 
since. Now, that rarely... but I think those cases do exist here and there. That isn't every case 
by one awful long ways. But there are some of those cases around.

Now, a Problems-Intensive-type approach would handle that very well. Just search it 
out to find out when they were happy about auditing and pinpoint it down; help with the me-
ter. See, you wouldn't even need the guy's auditor reports, only they very often are available. 
And pinpoint it on the meter, "When – when was that?" Help the guy out. Run a little bit of 
Suppress, you know, on auditing, or something, and keep finagling around trying to get this 
period. You can fish the command with some care, and running Suppress, and so forth, and 
Careful of, something like that – just the suppressor buttons – you all of a sudden, the pc 
comes up with what process it was!

Now, you theoretically could prepcheck it out. And I say theoretically, because in ac-
tual fact I haven't seen one of these missed-item ARC breaks mended by auditing alone. Why 
not let him complete the process? See, you understand?

Now, that doesn't mean... This answers a burning question for some of you guys. 
Would it be best to go back and complete every process that had been left unflat on the pc? 
Well, this gives you – this gives you an index. And a very, very neat, nice index it is. Only 
those processes that left the pc in a complete state of bedraggled ARC break with the auditor 
or the organization should be picked up. Because they've got a missing item on it.
There's some item answer that the pc didn't give. Something happened. It was probably some very significant session to the pc, like "From where could you communicate to a foot." And he just didn't put the answer that was the completed list, you understand. There's a missing answer there. He never flattened it. And there's possibly, maybe, no more than one of these on any Scientologist's case line. I mean, you, as a pc, sometime in the past, audited over the years, have undoubtedly had a nonflattened process on you.

But not in all cases would this necessarily have admitted a missed withhold. But you get somebody who is pretty upset about auditing, and rather ARC breaky; well, find a time when they were not ARC breaky about auditing, flatten that process, and they'd smooth right out.

Actually, it should turn up on opposing "auditing," or something like that, if "auditing" rock slammed. But I'm giving you – and I'm giving you something here. Now, this is not necessarily something that would be done on a case, you understand, unless this case had a long history. There – as I say, I think there are either five or six through the HGC of HASI London over all these years, but those five or six actually ought to be looked over on this basis of the missing answer on the question sequence. They should be looked over from that basis. Rather than try to do a new list on them.

See, it'd be a freak that a repetitive process of some kind or another actually left an unanswered question that was severe enough to cause them to severely ARC break about auditing from there on. But that can exist and it's something that you should be aware of just as a pro. You just should be aware of it as a condition that can exist.

Now, as far as Routine 2 is concerned, this can happen on every case you audit. It's not a selective case condition. You can do this to every case you audit. You get some kind of a manifestation like this: Case is improving and improving and in beautiful shape, and you've got two packages now and then you go for the third package and you're getting the first item of the third package and ifs just all running wonderfully, and the pc comes in and says – sets some goals like this: "To get through it. To see if I can't get well after all."

You say, "What the hell's happened here?" Well, what happened here is that third list that you were doing, that you were working on just the day before, whatever it was, that thing was – something wrong. Something wrong. But it all added up to a missed item. Whatever's wrong with it, it had to add up to a missed item. That's the common denominator of all these mistakes.

Now, all you have to do to square this up is not necessarily to go back and get the earliest list that ever got earlied on the case, or get the earliest complete that ever got uncompleted and go back to China, patch this up – no, it's yesterday. And you just watch those goals. The big indicator is goals. And catch that one, right there, the one – the one they set a good goal for that session, and then a bad goal for the next session.

What was done in that good-goal session, right there, achieved a missing item. Whatever it was, it achieved a missing item.

Now, there's another source for missing items, is failure to oppose. And the basic rule of failure to oppose is this: Here and there in organizations and field, and so forth, people
were only getting the first item off List One, you see, getting it opposed and then leaving it. And then everything crumpled up like scrap paper for the pc, because they didn't oppose what they had now found. You see, actually they'd taken it from a locked package.

The rule is simply this: That anything that keeps on R/Sing after you try to package it has to be opposed. Now, that could give you four oppositions. It could give you only two. A real Routine 2 that is perfectly done, perfect source, perfect everything – the real thing – actually blows up into a whoosh! and you can't find any trace of anything. But one that's a bit done off – the source wasn't quite right, something like this; the... you took the source off of an arbitrary list, let us say, something like that, and what you wind up with is something that has still got a DR on it, and the other side of it is still slamming.

Why, I'd look it over awfully carefully to make sure that we didn't have incomplete lists, is what resulted in all this. But for sure, you're going to have to do something about that slamming item. Unless the slamming item came from a rock slamming item by represent. If you... you know, you never represent a rock slamming item. And you can actually get a pc in the soup. This is delicate. This is delicate. You can get a pc in the soup by taking a rock slamming item represent list and getting a rock slamming item and then opposing it.

If it is a real reliable item, it'll be the only one that occurred on the list, and it'll be an opposition-type thing or it was on there... But it would constitute a missed dumbbell; half of the dumbbell is missing.

I'll give you an example. Under old 3G – this is wrong – old 3GA Criss Cross, we get an item "groups." And it slams like mad, and the auditor did a represent list on it, so he could have something to find goals with, and he got "Rotarians." And "Rotarians" slammed like crazy. And that was seven... six months ago, or five months ago, or something like that, and it is still slamming like crazy. Well, you just let it go on slamming! It'd be very wrong to oppose that. Because it's in an incomplete list.

Actually, the only action you can take is to oppose "groups." You see, there's that great big, constantly slamming item staring you in the face, and you say, "Boy, we better do something about it." Ah, but if "groups" was slamming – if "groups" is slamming – ah, well, that's a different proposition, because you can pull something proper with "groups."

So you have to look at an item's source. The source of an item has everything to do with an item. And you take an item that comes from a wrong source – yes, it'll go on slamming for quite a while till somebody straightens the source out. But an item from a right source, if it continues to slam... It's off a completed list. Everything is fine. You examine those little elementary things: Is it from the right source? Is it right way to? Was the list complete? Was it the last and only R/S on the list? Yes, yes, and the thing is still slamming. Oppose it, man! And if you don't, you'll get another ARC break situation.

Oddly enough, you can abandon this crashing slam on "Rotarians," and the pc is relieved, if anything. Pc says, "Oh yes, I'm very interested in that. I'm very, very interested in Rotarians. Yeah. Oh, yes, I'd really like to know what opposes Rotarians." The first time you try to oppose "Rotarians," the pc will ARC break a bit. Because there's something wrong there, you see. It's not really an item. It's just held there because it was taken between two other items.
It's actually some kind of a lock item on an improperly opposed item, "group" – "groups," see. Then when you get "groups," and get that all straightened out and that list is totally complete, you'll find out "Rotarians" will probably mysteriously vanish and won't rock slam anymore. You see how that would be?

Now, R2-12 is something that is very easily done right, from scratch. If it's right, from scratch, and it goes along right, all the way, see man, you've got a winner like mad!

The only thing that's going to cause you trouble is where you did something wrong as you were carrying it along, and now you've got a pace... a case-patch-up situation, or it's somebody else's case that has been run wrong, and you've got to put it back together again. And those are the difficulties you run into.

Now, that's why I've been trying to find indicators, indicators, indicators by the ton. Been trying to find all the ways you can tell if it's running right, see. And I've been picking up new ones every time I turned around. There are lots of indicators now. And they're more clear-cut as indicators.

Now, another thing that... about this is, there is no doubt about this that it can do some really marvelous things. There is no doubt about it. It can do some marvelous things. But it has enough boot to it that if you run it off the rails, it'll wrap somebody around a Telephone pole.

It's something like driving a racing car, you know. He can really get there in that racing car, you know, but it isn't – it isn't... Well, as a matter of fact the only thing that'll get you there is a racing car, don't you see. But by God, those curves! You know, every time it comes to an unbanked curve, why, it leaves several dollars' worth of rubber on the concrete. And you can very easily wrap it around a Telephone pole – very easily.

Now, this makes an auditor have to have two skills. Not just the skill of driving a racing car, but the skill of putting one back together again after he's wrapped it around a Telephone pole. So, you're not only an auditing pro, you see, you're also a case artisan. And at no time has artisanship on cases' repair ever been as important as it has right now.

If you're going to take these cases and get them out of the woods and square them up and head them on the right road, if you're going to do that, be fully prepared that all of a sudden you hit this unbanked curve. Pc has just been going marvelous. The pc is... now looks fifteen – looked seventy-five before – pc looks fifteen; pc is doing beautifully; rave notices to the family; everything is going along fine, you see. And my God, there you hit one of these unbanked curves, you know. Pc comes into the next session and says – you say, "All right, what goals would you like to set for this session?"

And the pc says, "To get through it."

"All right. Any others?"

"No."

Well, for heaven's sakes, be alive. Don't try to repair this from last July. See, the time is readable on your wristwatch. It was just two clock winds ago that that unbanked curve connected with the wheels.
Now, you sometimes will tend to say, "Well, it must be my auditing, because after I've been a little bit crude lately, and the pc's been fighting the mid ruds, and there's probably some various things here which I -- so on, so on. So I'll be reasonable about the whole thing, and I'll try to pull the missed withholds which are causing this pc to ARC..." And now you want to really see an ARC break? Because the pc sort of conceives you're asking for the item, and boy, it just keeps restimulating and restimulating and restimulating. Only, of course, he's got no way to give you the item. You're not listing. So every time you ask him causes another missed withhold on top of the thing, you know? He gets very upset!

The only way to patch up Routine 2 is to patch it up with Routine 2.

That's the way you patch it up. And you just go back there and you say, "Well, that's a sour set of goals." Now, instead of trying to tie the pc even more thoroughly around the telephone pole, you take a look at the pc, and you say, "All right, now, let's see, we said we weren't going to continue listing that list last session, but I've changed my mind about this, ha-ha, and we're going to continue listing that. Were not going to abandon that one. Were going to continue that one."

And the pc is liable to say, "Aw, are you really." or something. And then, all of a sudden, brighten up.

It's very often the pc will tell you they can't. Very often they'll tell you, "What are you doing, trying to invalidate this beautiful item, 'an upchuck'? I mean it explains my whole life, except I haven't been explaining it."

And you say, "Well, we're just going to continue that list."

Sometimes you'll be horrified to find out how many pages you can go without a single R/S on it before all of a sudden the vital item goes blang, blang! That's about the only discouraging thing about all this I know, but you... just be sure it's there. Just be sure you get that item on the list, you understand. That's the criterion. Be sure you get it on the list.

Now, knowing 2-12 and knowing other things about it and being able to run it in the first place, that's the only one you can go headfirst into the snowdrift on, see. Now, any auditor can make this mistake; and can happen to any pc. So this is very, very interesting as a datum, isn't it?

And you can do it, and you'll pull the pc right out of it, and so forth, if you know exactly what it is; and if you don't know what it is and you try to take some heroic or auditing measure to correct the thing, and boy, you're going to be in awful shape trying to figure out this, see.

But I finally studied this down to its common -- simplest common denominator. It's just right there in the session goals, is where you'll find it, and you can trace it back.

And I don't care how ridiculous it seemed as an action. Don't let anything like that get in your road, you understand. You say, "But, my God, the thing is... Actually, what we were listing in that session was just a brandnew consist-of-present-time list." How the... the pc was going around the bend trying to add items to it, and there hadn't been a rock slam on it for -- you know, at all! There were apparently no rock slams on it at all, and couldn't be vital to the
pc, and must be something else. No sir. What I've just told you takes precedence over all the something elses. It's right there. That's it. It's that one where the pc shifted and it'll be a big shift.

Now, if you know that one, if you study up that way, if you keep good auditor's reports and you make very sure they are kept, you make darn sure that you keep an eye on these session goals as you go along and do straight Routine 2 – keep it as straight as you possibly can. It's, by the way, been getting straighter. I've been working with you, and watching what you've been doing, and so forth, and working, also myself, to make it easier to recognize what it is. Removing all possible things that might be going astray. Grooving down – it's getting there. But that, this error I've been telling you about in this lecture is something that you can make. You can – you can have this happen to you. It can happen to me. It can happen to anybody. You understand? For some reason or other we missed the item.

Now, here's one that you must remember on missed items: If there were two rock slams on the list, it might be when you went over it one didn't slam. Pc might have been distracted or something. So therefore, you say there's one item on the list. And because it's the last item on the list that slammed, you – and because it came after a page, or something like that, of no slams – you say, "Oh well, that's obviously it." You pick it up – no sir.

Never unload an item on the pc without great care – and this is my last message on this basis. When you tell the pc that it is his item, go ahead and tell him so with hope and enthusiasm, and anything else. We don't care how you tell him as long as you don't do anything else immediately afterwards. You want to be a real chump or a real knucklehead and practically spin the pc in, do something else at once.

Say, "Well, your item is 'an upchuck.' Now we're going to test for the next one. Consider committing overts against an upchuck. Consider an upchuck committing overts agai... What's the matter with you?" He'll be halfway around the bend if it's the wrong item, because you've given him a distraction of attention.

He's already trying to grip this situation. He's already trying to cope with more mass than he had before. You've hit right into the center of his bank – you might as well have hit him with a sixteen-inch shell, don't you see – and then distracted his attention.

I'll give you another method of doing it. "Well, I've got an R/Sing item here, uh – a tigerbat, and uh – here it is, and so forth, and now, we'll go on finishing er – the list. Uh – a waterbuckbat, a catfishbat, a klughflat, a klu... What's the matter with you?"

Even if it was the right item, man, he's going to be having a time. See, you gave him the item, and then you shifted his attention and you just mustn't do that. That you said, "A tigerbat R/Sed," has practically presented him with the item, don't you see?

Or sometimes you're writing out here with your pencil, in very clear view, and he sees you mark the R/S down late on the list, and he says, "Haha! That's it! It's a tigerbat!" And you go right on to the next one, and you just pull him through the hawsepipe, see. Brrrr! You understand? You've shifted his attention badly. That's why I say that the meter in line with the pc – the list in line with the meter face in line with the pc, and all obscured on what that pencil is doing, is actually your best action.
I've been adopting a rather slippy one of making a strike, a noiseless strike, after an R/Sing item, which, before, when I close the page, I go back and write R/S on it. There's so few R/Ses you see when nulling anyhow. Use red pencil, you know, and make a strike on it. Just a single strike and mark nothing else. I'm trying to get this down to speed.

I'm not advising you to do that. It's just a method that I'm testing out. I find it works very well – as long as you don't miss marking the strike and marking in afterwards "R/S." That's the crime.

Well, what I'm saying here is don't give the pc something and then distract his attention, because it'll aggravate the ARC break if it's the wrong item. It'll really aggravate the ARC break; it'll tie him up in knots.

You say, "Tigerbat," and all of a sudden he has a new hat on his head he'd never heard of before, you see, and it's out this big, and kind of furry ears up here, and he can feel wings out in back of them, and "Where the hell'd all this come from?" you see.

And you say, "Well, have you made any part of your goals for this session?" He says, "Waggllaglugh." You could say "Squeeze the cans," or something. He just won't know what the hell to do, see. You give him a hell of a discombobulation. Now, that will catalyze the ARC break if it's the wrong one. He'll go right into that ARC break. You can throw him completely into apathy; you put him in a screaming fit right now, if you pull that trick, See.

What you want to do is make darn sure from where you sit that it's the right item. Then you check it, and you tell the pc, "That's the item. That's your item." When you say, "That's your item," or "Your item is a tigerbat," don't you look back at the meter; don't you look at your auditor's report; don't you look at another damn thing – you keep your eye right on the pc. Why? You want to see what effect this thing had. Because you just… What's the matter with you? You fire a sixteen-inch shell into somebody's midriff and you don't want to see the explosion. All right, so you've got guilty consciences from other things you're doing in the past. [laughter]

No, you give the pc the item – you give the pc the item, you keep your eye right on the pc. Because, actually, if the item is wrong, you can see his face go dark; you can see him age right in front of your eyes; and you can see the ARC break and the uncertainty. Even though it's very tiny, you'll see all of that. And then ask him, "Do you now have markedly more mass than you had before," or "Do you have – do you – are you sensible of – lot more than you were a moment ago?"

"Yeah," he says, "there's this big thing out in front of my face. I never realized it was there before."

"Well, does that seem like your item? Does it make sense to you? Is that real to you?"

"Oh, oh, yes, yes, yeah, that is. Ah-was your E-Meter plugged in during this session? Ah..."

Well, you've got all the signs there, man, for a wrong item, you see. As second by second the time he has that thing as an item is increased, his tone curve will be going down, down, down. You can watch it descend by the second! I mean, it's that – it's that rapid. And
you just see this is for the birds as far as you're concerned. And then boy, don't use the fact that it can be a wrong item to invalidate a right one! This is touchy business, see.

And you say, "Well, if it's all right with you, I'd like to list on this list a bit longer, because I don't think that's your item."

And you see the pc pick right up and get brighter. Or if it's the right one, he'll tear your head off – but you can take that. "What the hell do you mean? It's my item! What's the matter with you?"

Sometimes in desperation when they are so nervous and upset, and so forth, they'll sometimes protect a false item for a short time. And you say, "Well, we're going to list a little bit longer just to make sure, if it is all right with you. What is the next item for this list, 'Who or what would derogate present time?'"

"Well, you put it that way," and he'll give you some perfectly nice items right away. Do you understand this?

This is the art of presenting the item. And the art of detecting whether or not a list was left incomplete, or an item, more pertinently – an item had been missed by an auditor in the immediate past history of the person's auditing. If you can do that, you can repair any case because, by and large, you can get a lot of wrong sources and abandon them or finish them or list them or package them. Nothing happens to the pc, but he improves. But on this one list in ten on any pc, if that one isn't completed, cut my throat! That one's really going to go to hell. He comes back, dragging in – ha-ha-ha-ha-ha.

I think we have one person here who had a wrong item on the 21st of December, or an incomplete list or something, and then went to the 7th of January to the next session. Sounds a little rough – sounds a little rough. Told that the item was abandoned, or that list was abandoned, on the 21st of December, and has evidently been sitting in this ever since then. Because as far as I can make out from the auditing reports, that's apparently the day, the last day a cheerful audi... set of goals was set by this pc. So it must have been.

All right. Well, there's a – there's a brand-new – a brand-new look at this. There's some better indexes. There's a way to really see this, and so on. And it'll also – it's also a good thing to keep your eye on the pc and do nothing – and do nothing right after you've given him the item anyway. So you might as well be observing the pc as doing that, because otherwise if you shift his attention, and it's the wrong item, you'll practically cut him in half, man. You just presented him with a bunch of gruesome mass that he hasn't had before, and he's very doubtful, and he's sort of lost and half spinny on this thing, and it's going down wrong way to, and all that sort of thing. Now, if you shift his attention in the middle of that, hell have a screaming ARC break, and you just won't know what the hell to do with him.

But there, as far as I'm concerned, is the basic danger – let me not minimize it – the basic danger in Routine 2. That's the basic danger in Routine 2, and right along with it there are the indicators to tell you if you run into it. And there, as well, are the cures for having done this thing of missing the wrong item on the pc.

Okay?
Right! That's it!
Thank you.

All right. This is the second lecture, Saint Hill Special Briefing Course, 10 January AD 13. And I've told you all you have to know now, so there isn't anything here to lecture about in this particular lecture. And you have become wise beyond measure, here, in the last hour.

I'll talk to you about the implications of processing. We have had a problem for all these years of auditing somebody and everything was fine and then auditing another guy and everything was fine and then auditing a third guy and he starts tearing up the neighborhood. Well, this comes under the general heading -- and only this heading, only this heading -- of missed withholds. And the biggest missed withhold you can have, of course, is the missing answer to the auditing question. He didn't give you the answer. He didn't put the item on the list. That is the biggest one.

This is so gigantic, that if you did that right all the time, you practically could omit pulling missed withholds. But you can't omit pulling missed withholds and I'll tell you why.

On your May third bulletin, I think it is, a great many manifestations of missed withholds are given. And amongst those are dope-off, boil-off, ARC break and that sort of thing. Now, in Routine 2, you're pulling missed withholds by the carload lot. How many missed withholds do you think are in one Routine 2 track item? See, that's ... Well, when you miss that whole package, this of course makes a terrific, crashing missed withhold, see, because it's a conglomerate mess, as well as a mass.

Now, you however, have to pull and continue to pull the little icky-dicky ones, you know, about "I bit my fingernails last night," you know? Because you're liable to make this mistake: You say, there is so much unconsciousness in the bank that of course a pc will go anaten -- to use one of the old-time words -- will go unconscious, under the impact of this list. And brother, that isn't true.

A pc won't go unconscious under the impact of an item, even when you fire it straight to them and shift their attention. They won't go unconscious by simply reading lists. They won't get dopey or groggy simply by reason of reading lists. None of these things are going to happen.

It sounds so reasonable to you that under this much impact -- and reading down one of these very vital rock slamming lists back to them again -- because of the anaten contained in the list itself, natively and naturally, that they're going to dope off a little bit, that you tend to
miss the fact that that's the little "bite the fingernails" missed withhold that you didn't get in the session.

Any time – now, mark this – any time that you see a pc go dopey, boil off, anything like that – or even go groggy and start shutting their eyes and slumping down on nulling, you pull up right there and get those nearly-found-out's.

Now, of course, this is aided and abetted if you have just got through missing an item on a list. But the missing item on the list doesn't cause that anaten. It merely gives it body. They've got to have a PT type nearly-found out before they will go under on a list or as a result of an item. In other words, an item won't do it all by itself and a list of items won't do it all by themselves. Now, just mark my words, here: It's just not possible! I can't say this too strongly, I know this phenomena of boil-off and that sort of thing. It is just not possible for a pc to go anaten, groggy, boil off, without a near present-time missed withheld.

You give them an item, pc thinks of an item, goes anaten; you give them an item, they go anaten; you read a list to them, they go anaten; they groggy and, you know, thuuh. That's not items! Now listen to me: that's not items! They've been biting their fingernails last night, that's what that is! They haven't told you, that they've actually been haunting the door of the theory room, getting the questions being asked currently on bulletin so-and-so, you see. They've been doing something. They've been carefully contemplating busting rule 28, see? Something is awry, here. It takes that present time booster to knock them out.

And the ordinary behavior of a missed-withhold-free pc during listing and nulling and receiving of items and thinking of items, is bright awake! That is the expected behavior. Not grogged-out at all. Bright awake. Oh, they can close their eyes so that they don't watch your pencil wiggle, or something. But they're bright awake. That is your expected attitude on the part of the pc.

Now, during nulling this is terribly, terribly important, because you are depending on reading an item once to get it to R/S. And although, on test after test, Prehav Scale ticks would register, even though the pc is out, a meter will not rock slam while the pc is anaten. Now, that's pretty dangerous, isn't it?

You're counting on that meter rock slamming just by reading the item once. And you won't see the rock slam if the pc is boiled off. Pc can't tell you the last six items, five items, three items, four items, didn't hear them, because he was boiled off. Hm! He wouldn't have rock slammed on them, either. So that is enough for you to have some cold chills about.

And you see that pc sitting there and he goes zzwaawel-youummgo-mummm-khh. [snores] Somewhere – anywhere on that gradient scale you cannot count on the meter rock slamming. You can count on it doing a tick; you can count on it doing a tiny reaction, if you hit something significant, which is all we were counting on, on doing Prehavs – assessments. But you can't count on it rock slamming. There's just insufficient attention present to charge up the package so it'll slam. So that is a marvelous opportunity you have there of missing a slamming item. That's enough to give you cold chills, unless you know it. Now that you know it, that's easy.
Now, that will work the same way on rocket reads, and so forth, on goals checkouts, and this is still data for 3-21. An anaten pc won't rocket read. Anaten pc won't rock slam. Ticks, yes. But not – not a good healthy, crashing manifestation like a rocket read or a rock slam, see. They're not that active, because they're not there.

Now, you get yourself an accustomation of keeping pcs bright awake. Not using the Dianetic method – Dianetic methods are frowned on these days. The FBI thinks that they're very bad, so that ... used to kick them in the soles of the feet. That was the method of bringing a pc awake. That's right! That's right. You didn't audit them when they were boiling off – you kicked them on the soles of the feet and woke them up.

There were two schools of thought on this. One, you went on auditing them, even though they were boiling off and wait until they woke up, and the other school of thought was that you kicked them on the soles of the feet and woke them up and went on auditing them. And finally I remember during Suzie's day, in the Wichita Foundation, I think the accepted method was if they began to snore, was the borderline. And you kicked them on the feet if they began to snore, but otherwise you left them alone.

Had a Director of Training there in those days – he used to blow bubbles; his method of boiling off – how to keep from getting audited.

The point here is that, that was way back when. Now midway along the line, I found out why people boiled off, what boil-off actually was. It actually is a flow which is run too long in one direction. That's what boil-off, anaten, and so forth – a flow, running too long in one direction. That is to say, this person audits – gives an auditing command too long in one stuck flow, he can eventually walk into a situation where he is groggy. Now, that's essentially what it is.

Now, where does this fit in with the missed withhold? A missed withhold is a restrained flow. And because it is a restrained flow, any effort to outflow by the pc while he is busy inflowing causes him to inflow harder, and when the pc has a missed withhold, he's inflowed as far as he can go and he's very, very prone to boil-off. In other words, he's holding back a flow, see. So he gets a stuck flow real quick. Anything sticks! You get that?

The withhold that has been excited, that is restimulated, see, the restimulated withhold there, causes this flow to lock up. Right now! And it's a very funny thing. You might get a subjective reality on this someday. Somebody is very, very industriously pulling these things and you all of a sudden find yourself bright awake. You give him the one which was knocking you out. You go thuu! Bright awake. Room gets bright, everything gets bright, see?

And you're sitting there holding on to a withhold and things start to get dim, and very often a trained auditor being audited... A trained auditor being audited actually doesn't do the same things that raw meat does. You know, I've noticed that they keep their own rudiments in [laughter] and do various things and they always have – no matter how deeply interested they are on this and that – and there's always a small section of one eye cocked on the professional skill and aptitude of the auditor auditing. [laughter] Always is, he can't escape it! Anyway, not even an ARC break involved – he's just keeping an eye on it.
Found Suzie out of session here. A few weeks ago I was auditing Suzie and I found her out of session, I just knew it wasn't quite right, so I pulled a missed withhold on the thing and she'd been sitting there very brightly and alertly, finding out how I was getting that many items called. [laughs, laughter] Tricky. So even she'll do it.

Now, any pro will do this kind of thing and it doesn't constitute very much. But it's probably a bigger trick to keep a pro in session than it is raw meat. Raw meat is attitudinized and they don't know how you're supposed to do it right, and auditing is... Even rather crude auditing looks flawless to them and you give them some real smooth auditing, my God, they don't know what hit them! There's no thought of any criticism in this department, don't you see.

But there it is. The fellow's sitting there, he gets this little withhold and – now mark this – the session withhold quite commonly keys in a pre-session withhold. You almost never get the session withhold as the sole source of the anaten. So that's very interesting. See? In other words, session withholds tend to key in missed withholds.

In other words, we didn't have any missed withhold at the beginning of session. See, we had – it wasn't keyed in so you hadn't been missed. And then something happens in session, and... You see, we've cleaned it up beautifully, "Since the last time I audited you is there anything you have failed to reveal?" You see, that's fine. So we obviously got the last twenty-four hours clean as a wolf's tooth. Nothing showed. This will explain a mystery to you, maybe, if you've ever wondered about this.

And then halfway through the session, the fellow starts to say something, doesn't say something, forgets what it is, then remembers and then thinks he'd better not say it and starts to look a little groggy and then you try to pull this missed withhold: "In this session, is there anything you've failed to reveal?" And it doesn't pull.

And you say, what's coming off around here? Pc just gets edgy. Well, of course, the withhold you're looking for is not in the session. Got that?

Audience: Mm-hm.

The key-in is in the session. But the withhold isn't. Well, nearly found out, "In this session, is there anything I have nearly found out?" is quite fortuitous and usually takes care of the situation. But an auditor should know this as part of his bag of tricks.

PTPs don't necessarily key in. Willingness to talk to the auditor remains the same. Actual overts and that sort of thing, they tend to come off at the beginning of session. But a session, something happens in a session can key in a missed withhold that happened before the session. So that's why that has to be kept as a random rudiment. And fully expect, in a session, that something the pc did and was missed day before yesterday will key in. See, it doesn't happen every time. But it happens often enough to get in your road trying to make this person wake up. You got that?

You – you'll see that every once in a while, you'll see that every once in a while, it isn't every time. But, pc holds something back, doesn't give you an item. You're listing, doesn't give you an item. "Is there anything you failed to reveal?" Gives you the item and gets groggy. Says, "Yeah, I didn't reveal this item, so-and-so," you expect him to brighten up, see.
You say, "Whoa, wait, wait. Why doesn't he suddenly come up here, you know, and start in here battin'?" Instead of that he gets groggier.

Somehow or another this item keyed in – every once in a while, enough to make it part of the auditor's bag of tricks, see – something keyed in that he did last week or yesterday. So, never fail to – never be completely unwilling to uncork a whole track sort of withhold question. Oh, dangerous, it'll keep you busy! But listen, it'll get you out of more trouble than it'll get you into.

Like, "Has anybody missed a withhold on you?" you see, or, "Is there anything anybody nearly found out?" Horrifying! Here we expect this guy to sit there and give you now two hundred trillion years' worth, and make it a terrific missed withhold all over the doggone place. Well, in actual practice, in actual practice, it will get you out of more trouble than it gets you into. Doesn't say that it won't get you into trouble! But it'll get you out of more.

Sometimes I'll date it on this, you know, on the basis, of "In the past week..." even though I've got between-session rudiments in, you see. Now, that's used that way only when you can't wake up the pc. You got that? You start uncorking this kind of a trick – you understand this – and you uncork this trick of just broaden that missed withhold question, if you can't wake the pc up, ordinarily and generally. Like "In this session, is there anything I nearly found out? In this session, is there anything I nearly found out? In this session, is there nearly found out? You got that? Fine." The pc's bright. Oh, well, don't break anybody's back, see. That's fine. So that did it. So you're all set.

But, let's supposing the reverse happens. "In this session, is there anything I nearly found out?"

"Glug. Uh, so-and-so."

"In this session, is there anything..."

"Aonnowsmmsdunn..."

"In this session, is there anything I nearly found out?"

"Uyuhyuyu ..."

Or worse than that, you put it in at ten minutes past the hour and you find him boiling off at twenty minutes past the hour again! Now, you just got to wrap that thing up, and fire it, man, because you've got a keyed-in nearly found-out. It didn't exist, to amount to anything, during the session, up to this point. But the session for some reason or other, which we needn't even bother to inquire into, is keying in this missed one. And it's now keyed in. And it wasn't keyed in at the beginning of session. And that causes and causes and causes.

Now, something else you should know about a missed withhold that I hate to have to tell you, but you're old enough to know the facts of life. One of them is that not all missed withholds are on the second dynamic. I thought that might... [laughter] People have been known to let air out of other people's tires. And you start steering missed withholds, by dynamics, or something weird like this, you're going to get yourself into more trouble, you're going to start more unfinished lists... So you just keep this question pretty broad and pretty general.
Now, you do have to know this about the nearly-found-out question: It is a left-hand button. In other words, a suppressor-type button and does not necessarily read on the meter.

So, you run into a situation where your pc looked a little bit groggy early in the session and you said, "In this session, is there anything I nearly found out about you?" and he gives you an answer and that's good enough, he brightened up, and fifteen minutes later he's twice as groggy as before, you know exactly what's happened: He's got a pre-session, earlier-than-the-session nearly-found-out, of some kind or another, that your question is not capable of eliciting an answer to. And the thing for you to do is to prepcheck the nearly-found-out question.

I don't care whether you give a time limit or not. It's going to do you a lot of good to straighten this pc up to that degree. Doesn't come under the head of no auditing. Auditing a pc who is boiling off, while you're reading lists to him or trying to get lists from him, amounts to no auditing. See, this is the point where no auditing is not no auditing, definitely. Well, you can't do anything with a boiling off pc, his needle won't slam. So, what have you got to do with him? You've got to... Because it's a left-hand button, you know, Suppressed, Careful of, Nearly found out – Failed to reveal comes under that heading, too. Those are all left-hand, suppressive, buttons. They do not cause a thing to read, they prevent things from reading. All the other buttons cause things to read unnecessarily. So that's fine, you can see all those. These are visible to the naked eye.

We've added one button recently, to big mid ruds, that I ought to make some reservation about, and that is Anxious about tends also to be a left-hand button. But now we're getting into the very big mid ruds, when we add that. But Mistake, Suggest, Decide, Protest, these all make things read. They don't keep things from reading. Your suppressor buttons over here, they prevent a read from occurring.

Actually you realize that you can check out a rock slamming item with Suggest, Invalidate and Mistake just about as alive as they can get. You realize that? The ones you've got to worry about are Suppress, Careful of, and Nearly found out or Failed to reveal and, to a less extent, Anxious about. Now, of course, a Protest follows on the heels of a Nearly found out, or something of that sort, or a Failed to reveal and so it tends to be the point where these two tie together—the left and hand-right-hand side. You actually, you know, can use Protest as a random rudiment. Did you know that?

All right. Now, as we inspect the pc during nulling... Of course a pc who is boiling off can't list, because he won't talk. That's very obvious. But it is less obvious – a pc slumped back in the chair, particularly if he's not snoring – it's less obvious that this pc is suffering from lots of unconsciousness, see? That's less obvious. You got to keep an eye on that. Got to keep an eye on that. And the only cure you have today is not kicking them in the soles of the feet – they've been known to ARC break when this occurs and it doesn't do much good because it'd just ARC break and close your meter out – the thing to do is to get off the nearly-found-out's. And if the session nearly found-out's don't cure it, why, expect a lot of the time, if it goes down to severe a thing as boil-off, to have to cure it with a much broader time base.

Now, there is – there's fairly important data in running Routine 2s. And the way you prevent this thing from happening in a co-audit – you go down the line of a co-audit well,
HPA student, something like that, or public co-audit of some kind – one of the things you must watch as an Auditing Supervisor is that somebody hasn't grogged out, particularly during a nulling session. That you must watch. And the way – the best way to cure this – the best way to cure this, is to sit in on it. Don't try to teach the auditor how to get the missed withhold off the case, for God's sakes. And take it for granted, if it's happening, that it's out of the session. Don't even bother to put in the session mid ruds, don't you see?

Just swing the random rudiment right in against the guy. "Is there anything we nearly found out about you?" When you say "we," you also give it a time limit, because he's probably only been around for a week or a month or six months or something like that. And see if you get a response on the part of the guy. Worm it out of him. Or get his auditor to run it totally repetitive. Say, "Just sit there and run this for the next twenty minutes," see. Then when you finally see the pc is starting to ARC break on it, decide it's flat and tell him he can go on listing.

I mean, there's crude ways of adjudicating and handling these things as rather... as well as neat ones, you know? See, the pc's starting to look desperate. You know? You look down the line and see this pc, kept your eye on him, he's looking desperate by this time! "Is there anything we nearly found out about you?" The auditor's been going on.

Go over, peer over the shoulder and grab hold of the guy's meter, "Is there anything we nearly found out about you? Yeah, that's – that's good and flat, go on and list. That's it." Something like that. Doesn't take any more than that.

Because, let me tell you, it's pretty gross – you get it on the public like that, it's a fairly gross manifestation. But it's a very fine thing, what really put him to sleep. That's what's amusing about it: the slightness of the thing that actually kicked him off, the slightness of the key-in. Maybe it keyed in something important behind that. Maybe you got that, maybe you didn't, maybe it won't key in and maybe it will. That's beside the point.

You sometimes ask – you get this down searchingly and the pc has just got through saying, "Well I – I uh – I nearly found out – I-I nearly found out something! I-I nearly found out what the item was!" Or something, you see? "Then I realized I hadn't," and so forth. This'll be the type of answer you'll see him suddenly brighten up a little bit, you know? "I nearly found out." You know? The thing is reverse end to. But that's perfectly acceptable as an answer, on a broad, generally, "Was anything nearly found out?" And then you... he still.... you could see that if you went on doing whatever you're doing he's going to go off again. So you press this question, just another time or two, and all of a sudden he says, "Well, actually, this morning, Herbie offered me a ride and he nearly found out that I thought that it was too dangerous." [laughter] You know, a little thing like this. It wasn't any vast deeds or anything of the sort, you know.

And all of a sudden the pcs bright, as awake as a gopher, see? "Where's the list?" You know? "Well, fine! Where's the list?" You read sometimes too much significance into these things. It's how it locks into the bank, don't you see?

Maybe the guy is about to give you an item that you won't get for another session or something, or maybe he's about to give you an item, "a coachman," you see, and anybody
refusing a ride in a coach, this is a terrible moral break, or something, you know, or something like that.

You don't care much how it adds up, you actually don't care about the significance of it. It's just that is what knocks the pc out. And you just mustn't audit a knocked-out pc. That's all. You got all the cures for it, why not use these cures?

Something else – you're probably all at sixes and sevens: We've been knocking auditing around and giving it a bad name lately. Doesn't mean you shouldn't be able to do it well. You're probably wondering these days what is a Model Session? What is a goal finder's Model Session? What are all these things, you know? Well, I'll tell you. I use as much auditing as I have to. And that's what I use as a Model Session these days. And it certainly has these elements. You can't really reduce a session now, for safety's sake, knowing what we know about goals. You can't reduce a session below this and still be fairly safe.

Before session, ordinary, usual routine is, of course, you get the room all right and adjust the pc's chair, get his can squeeze and put in the reality factor. You certainly do those things, because this thing could go very awry if you didn't do at least those things. Look around and see if the room's all right. Adjust the pc's chair, get a can squeeze and put in an R-factor for the session. Now, that's certainly minimal action. You'd get into trouble if you took any less action than that.

And then you have to give him a start of session. And you give a pc a start of session, of course, with a Tone 40 and you have him there and then you find out if the session started for him. This is – also you could get into trouble a little bit if you didn't find out. And then, "What goals would you like to set for this session?" You certainly can't avoid that, now. But, in actual fact, that could stand a trifle of an overhaul. It's distracting to have goals for life or livingness come after the session goals. They probably should be in reverse. I wouldn't say that we're putting them in reverse, I'm just pointing out that that improvement would be an improvement, but we are not at this time using it. Got it? Be released in due course, if it's ever released. I'm just pointing out to you there's a possible improvement there.

Goals for the session, goals for life and livingness. All right, you're fine so far. Now, it depends utterly on whether or not you are going to do a listing or a nulling session. Depends utterly what you do now. But let me tell you, that if you had a good complete list yesterday and the needle was very free and flowing and you thought you were all set to null in this session today and the pc's needle is free and flowing today, and you do more than take down the goals and say, "All right we're now going to null this list: pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa." You're taking a risk if you do more than that because it becomes no-auditing. You see that?

Audience: Mm-hm.

You thought the list was complete yesterday and the needle's clean as a wolf's tooth today, and the pc is all eager-eyed and bushy-tailed, and we're all set to fire here and so forth, just – well, you got the goals down, all right, you say, "Now, I'm going to – going to null this list."
There you go, start nulling! Take your chances on whether or not he has any between-session mid ruds out. Because generally he's so interested in the list that these are more or less pushed aside.

Now, only get worried if he starts to boil off. Now, he's going to boil off, why, there you are. You better get in your – not mid ruds – you just better get in your random rudiment on a nearly-found-out basis. "Since...," we don't care how you word it, just as long as you pull those missed withholds and get them quick and get back there to doing what you're doing. If your missed withholds didn't do it, the list isn't complete and that's all there is to that. Simple – add to the list. Now, that's what's known as really short-handing sessions, right down to nothing.

All right, pc – now, let's take a listing session. We do exactly those things, in other words, we give them the basic form of an auditing session, listing session. Pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa. What are you doing on a listing session ever getting in a missed withhold or any other damn thing.? What you doing? What – what are you doing? Why? "Start of session. What goals would you like to set for this session? Any goals you'd like to set for life or liv- ingness?"

"All right, we've got this list, 'Who or what would oppose a catfish?' All right. What item would you like to put on this list now? All right, here we go. Who or what would oppose a catfish? Po-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa-pocketa." I don't care whether the needle's dirty, tying itself in knots, rock slamming; to hell with it, who cares what it's doing. You understand?

Audience: Um-hm.

Because that action is far more therapeutic in cleaning up the needle, than anything else you could do and it's probably dirty because of the pc's thoughts about doing it! You got that? So, listing session – list! Don't do anything else. If you can't hold the pc in-session or something like that – or something like that – the pc won't sit there and list, why that's another thing. Now, if the pc stops listing... And I say it's another thing, that's a missed withhold situation... But if the pc stops listing, what are you doing getting in a dozen mid ruds? You know there's only two mid ruds that stops a pc from listing – Suppress and Invalidate. And those are the primary mid ruds.

They're the primary rudiments, as far as mid ruds are concerned – Suppress and Invalidate. Very often, if a pc is on a fairly hot list, you never have time to get in more than Suppress and Invalidate and he's off to listing again. Well, why try to get in anything else? Why try to get in anything else? Just call those two the primary rudiments and if your listing interrupts and the pc stops listing, get in the Suppress, get in the Invalidate and there we go. Suppress is by a Prepcheck, by the way. And fire on down that list. And! And-and-and-you get in the Suppress and he gives you a suppress and a suppress and then you ask Suppress and he gives you an item. You want to get the case tied in an absolute knot? Don't take the item. Just abandon Suppress and Invalidate right there. You're not going to do anything more with them. Just go and go on listing. Got that? You're not going to say another word about it!

"Anything you suppressed?"
"Well, actually, I was suppressing here – I got an item. I got an item. A waterbuck. Yeah. There's a waterbuck and a caterwumph and…"

You just – to hell with it, see. Skip any of that other stuff, see? Go right on listing, see. Because why did you put them in? You put them in to get the pc to start listing! Now, you're not going to sit there and try to get your auditing question cleaned up. He hit something and there was something he failed to reveal there, or something of the sort, in actual fact. But it'll all come out on Suppress and Invalidate.

Now, if you can't get him to list again, get in the rest of them. But I've never seen it happen. I've yet to see this happen, where you had to get in more rudiments than Suppress and Invalidate to get the pc back to listing. See? So, what I know is – I'm talking now about just cutting short corners around auditing, see?

All right, we get down to the end of the day's session and we discuss what we're doing here and where we have gotten to and we put in a bit of a reality factor on where we are going and what we – don't necessarily put it in for the session tomorrow, but just say where we got and that's it. And then say that's the end of the body of the session, you see. And that closes off the body of the session.

And now, what I've been doing, is cock the meter up here to 64 on a Mark V and say, "In this session was the room all right?" And pull any stuck reactions on the thing and get the needle back to flowing again. In other words, get him out of the auditing environment as the most important thing that you could do for the pc to keep him from being stuck in the session.

Just that one. "In this session was the room all right?" Clean it. Sometimes you find a pc starts protesting this question and that sort of thing. Well, take it easy and do it next session, too. You know, say, all right, he's protesting the thing and he's probably nervous and there's probably a missed withhold, something like that. Don't beat his brains out because of the thing. But you can also assume there's probably something wrong with the room. Get your auditing question answered, but don't necessarily clean this thing up, you know – grind him to death.

Here's what I'm trying to do. I'm trying to give you the answer to the pc who is inventing answers, so he can answer the question, you understand.

One of the best ways to clear that up, "Is this question being protested?"

"Oh, yes."

"Have you invented any answers?"

"Oh, so-and-so and so-and-so."

"Oh, well, thank you very much."

And then just don't touch it. Don't ask the question again. Just come off of it, see. You understand? Because it's more important to pull the protest and the invented answer, than it is to try to get the auditing question driven home between his ears, because it's just a courtesy. You're trying to get him out of the auditing environment.
I refer to you... to a book which is not liked at all by the... phew. The – the department of the government, phew – Scientology 8-8008. Now, that talks about a thetan in the physical universe, see. And actually all the thetan is doing is stacking himself up against the physical universe and batting around like the blue bottle in the cage. And if you want to do something to free him up out of his session, well, you just ask him if the auditing room was all right. You get the modus operandi? Then you've got the thetan and the physical universe, and you've got the sixth and seventh dynamics – these straighten up and the pc feels better, you understand?

Sometimes they become very, very gratuitous and start inventing answers for it. Why, then, you're in trouble and you don't bother to clean the thing up, you assume there's probably a missed withhold or something of the sort, or he feels nerved up because of the session. You're not going to do anything about it anyhow with the room. You got it? See, you're not going to do anything about the room. So get the invent... invented answers, the protest off – get off of it. Go ahead and do it next session again. Don't be scared off just because the pc has objected to it, because he probably was objecting to it because his mind was on something else, see? In other words, you don't have to kill that one with shotguns, axes...

Now, we move over into the next action, which is the can squeeze. And normally, you ask this other question, "In this session was the room all right?" to cut down the number of times you have to run Havingness. Because very often, if the pc has answered this question and cleaned it, "Is the room all right?", his havingness will snap back, quite often, and you'll save auditing time by answering the question. This is all in the direction of saving auditing time.

And then you get the can squeeze and you ask him to squeeze them up. Make sure that you've got the same thing. And if your pc has actually been beat up in this session, about the best thing you can do for that pc toward the end of session is not beat him to death with a lot of rudiments. You know, you normally are getting short-timed, toward the end of session. You could very easily – because of the time nature of your sessions, you see – you could very easily leave him with only part of the mid ruds squared away or something like that. Or in an HGC, and so on...

So your – actually your best trick is to run some Havingness. If you don't know the pc's Havingness Process – what are you doing auditing a pc whose Havingness Process you don't know? "Feel that," "Touch that," and "Notice that," are the best Havingness Processes there are. And normally any pc will respond to one or another of those. It's a very funny thing, though, they very often don't respond to "Touch that," when "Feel that," is their Havingness Process, and vice versa. You tell me why, but it's true! It's true. I figured out the other evening it might be – I was auditing – it might be that "Feel that" requires more confront than "Touch that." There might be something in that. It's only a few commands of this thing.

I was watching a TV Demonstration you were given the other day, and so on, and some – whoever it was who was running that Havingness on that pc was going far, far too long, man. It only takes a few commands. You just want to get that can squeeze restored. How long does it take to get a can squeeze restored? Well, let me tell you something. You can start running the bank with Havingness with the greatest of ease. We're talking now in the direction of about a dozen commands or slightly less. See? And if we're not sure of the pc's
Havingness Process, we're certainly not going to run more than five commands of a strange process.

All we're trying to do is just run this pc's havingness can-squeeze test back up, that's all we're trying to do. And that takes very little time. So, you snap him back to battery with Havingness and that's your... and then take up goals – never take up life or livingness – never, never go over your life or livingness goals with a pc. Just go over the goals: session goals.

Now, you take up gains and you take down whatever gains the pc says and you make your own comments over on the side of the thing and the pc can sit there and hold onto the cans while you scribble down whatever comments you make, too. And don't take the cans out of the pc's hands until the session is ended. Don't fall for a practice like that. Because it gives him a double change. It ends the session materially before it ends the session mentally. And it tends to kind of throw him out of balance a little bit.

All right, you got your goals, you got your gains, you say, "Is there anything you care to say?" and the pc says, "Oh, yes, yes, so-and-so and so-and-so and so-and-so and so-and-so." Something like that. Usually it's a question. "Did my tone arm go down?" or something like that. Answer it! Be crisp.

Now, because you're started – you've started the cycle of ending the session, don't err... I myself make this mistake occasionally, I all of a sudden get interested, you know, again in the session. Confounded thing rock slams, you know. You say, "What – what was that?" You know? That's bad practice. You're ending a session. Sometimes it's so vital that you have to know what that is, though, and you still ask him. But end the session, and "Anything you care to ask or say before I end this session?" and so forth, and he says it. Well, don't prompt him to say anything else, is the point I'm making here! Cut that off, man! Usually it's a, "Thank you," or something like that. And you say, "All right, here it is," and give him a good Tone 40 end of session that leaves no doubt in his mind whatsoever! Tell him, "Tell me I'm no longer auditing you," so as he shakes out of that, and that is through.

Pc who continues to talk about his case to you, it's almost inevitable the PC will make some kind of remark about his case. Give him an entirely altered aspect – is the best trick of ending the session, now, visually, too.

I never put it... doubt – much doubt in the pc's mind, but if the pc looks... is shaking his head when I've said, "End of session," going like this – I'll end session again for him, see? I'll ask, "Has session ended all right?" You know, I take a little care, if it's kind of obvious he didn't get out of session. I'm not going to spend any time on it. I'm not going to put him back on the meter and do various things of this particular care.

If I've given him an item and said, "That's your item, and now we're going to end the session," and I see the pc isn't coming out of session, I say, "Well, what's the matter? You – you having doubts about that item?" He'll say, "Kind of." Well, all right, you don't have to have that for your item, well go on listing on it next session." Pc brightens right up. And you say, "Good. All right. Got that now? End of session!" Pow! And he's out of session. See, that missing item can hold him from coming out of session.
And then you're through. Now, when I say an altered aspect... You've been an auditor and so forth, and you've been willing to listen to him, you're still willing to listen to him, you're not going to ARC break him, you're not necessarily going to give him a wisecrack or invalidate their case or something like that, but look more cheerful and natural than usual. [laughter] Ask him something like, "Hey, you got a cigarette?" you know, something. It's an altered aspect, an altered tone of voice, and it helps them come a little further out of session. You got it?

Audience: Yeah.

Well, now, you say, "What's Model Session today?" Well, Model Session is still Model Session. And it's got all those rudiments and it's got everything else in it – that's Model Session. Now, we're talking about a very shortened Routine 2 session, see. This is a Routine 2. It isn't goal finder's Model Session. That was itself, too. This is Routine 2 session. It just fits for Routine 2. Honestly, if you use much more session than this, you'll get into trouble.

Now, you're trying to null, you're trying to null, the list is obviously complete and so forth, use this other trick – just to get back to it a little bit – of handing the pc the sheet, and saying, "What – what cooks on this sheet here? What... any – any big thoughts on this sheet, here?" or something like that.

Pc says, "Oh, well, yes, and I invalidated that and I did this and I did that, and so on. And kind of suppressed that and I didn't think that was it."

And you say, "All right. Thank you very, very much. Thank you."

Don't ask him any rudiment on it, just give him the sheet. You understand?

Oh, you don't know about this trick? Maybe it's not worked well for you.

Audience: Yeah. Yeah, it has.

Yeah, all right. It's a nice trick. It gets all the rudiments in, Brrrr! Bow!

Bring it back over, and go on going.

Now, but aside from that, I would assume, if a pc became agitated in a Routine 2 session – I would assume immediately that there was something wrong with the Routine 2, not something wrong with the auditing. That's the first thing I'd assume. I'd assume he was getting no auditing or something or he thought he wasn't and so forth.

A pc who starts to act very self-audit-ish in a session, I wouldn't pay any attention to it. You know, he's starting to get his own rudiments in and starting to fill everything in, I just give him a cheery "Yes. Okay. Fine. Thank you." And so the pc starts interrupting me while I'm nulling, and so forth, to getting his own rudiments in. I'd just stop and give him a cheery "Aye, aye," and go on again. See, I don't start snarling at him, and frowning, and...

I sometimes have been known to frown at a pc who scratches their head with the back of the can when they're listing – while giving me four items, you know? I very often say, "Well, that's four we don't know whether they rock slammed or not." [laughter, laughs] "Oh, oh!" says the pc. [laughs, laughter]
Well, that's the extent of the importances of session. I guess you could have called this lecture, "What you do in an auditing session these days and relative importance thereof." And of course, as you see, the manifestation of boil-off, and therefore pulling missed withholds, is paramount to everything else. Because you – of course he can't list while he's asleep. And you can't null, because he won't rock slam while he's asleep. So, there you are. That makes Routine 2 impossible. But within those limits, why, that's about as much sessioning as I would use these days.

Now, something very funny – I've got to tell you one little other piece of data and we'll end this lecture. You start on a list that is incomplete, or wrong way to, and you start nulling it – if you use the 2-10 type nulling, of just call, call, call, looking only for rock slams, you see, bark-bark-bark-bark-bark-bark-bark-bark-bark-bark-bark and you get about halfway down the front page of that list and that needle starts getting dirty, you would normally assume that the pc's rudiments have gone out. I lately have begun to assume the correct answer: It's either wrong way to or the item isn't on the list.

You never saw anything as – quite as agitated as a needle goes on nulling on a list that's got something sour about it. Now, the faster you call off items, the more briskly you enunciate them, the less the pc thinks. So at the speed I've been nulling lately, the pc didn't have – no pc's had a chance to do any thinking. So I've managed to sort out this other datum. And that is, that I've taken some lists that are wrong way to and so forth and tested them. And your needle will dirty up. And it's an indicator – it's just an indicator – it isn't a rule, but you should always be leery that if you're calling down a list fairly rapidly, and you straighten out the list, give him the page, let him straighten it out, and you're calling this off again, and it goes dirty almost at once, you should be – get very alert, man. There is something wrong here. It isn't just the rudiments going out. The Routine 2 is wrong. Wrong source, wrong way to or item isn't on the list, and usually, all else being equal, it's the item isn't on the list! That's the only place that an auditor can foul up.

Now, you can also – somebody has done it here, in this unit – list endlessly, way beyond the point where the thing could be listed. Way, way, way, way beyond – thirty pages or so beyond the point where it ought to be nulled. That's a very extreme look, but it's a fact! And if it hadn't been for the vacation and the snow and so forth and another auditor taking over the case, we never would have found it out. The auditor – the pc to this day would still be listing. Because, of course, a needle starts going dirty on the protest. You overlist and overlist and overlist and overlist, the needle goes dirty on a protest.

But you know that an incomplete list, the needle doesn't go dirty on the protest. You know the person really never protests it. They snarl, they sound ARC broke, they sound this way and that. You can't find any protest! They go on listing, one way or the other, even though you've had to say, "If you don't list any further on this list ... You get the message?"

"Oh, well, you put it that way!" and so on. [laughter]

No rudiments in see, just list! Not recommended. But sometime when you know damn well the list is not complete, and the pc won't add any more to it, you know, and the pc's getting all ARC broke, and all this way and that, why, your rudiments fail to get him to list again,
why, "list!" you know? The only crime you can actually pull is not completing the list. You realize that?

All other crimes fall short of that crime.

And in essence, there's minimal sessioning. Oddly enough, it's going to take you more mid ruds on 3-21 than it does on Routine 2. You're going to use mid ruds a lot more on 3-21.

Now, as soon as you've got the PT problems out of the road – as soon as you got the PT problems out of the road – a case actually is ready for 3-21. You recognize that? You could overuse Routine 2 if you're a clearing auditor. You realize this? You can overuse it. It won't do the case any harm. He goes on, he gets Clear and so forth. But there's a point where you get the present time problems out of the road as far as this pc's concerned and so on, he's ready for 3-21. He'll go right down, find his goal, as nice as you please. All you'd actually have to do on him is a brief Prepcheck and he'd practically present you with his goal. You see where that borderline comes?

It is safer for an expert auditor to do goals on a case, than it is to do Routine 2. He will actually make less mistakes doing goals on a case, if he is an expert. But it is more catastrophic for an inexpert auditor to do 3-21 on a case, than it is Routine 2. Do you see how those two points add up?

Audience: Yes.

Now, in actual fact, an expert does 3-21 more smoothly than he does Routine 2, because Routine 2, after all, is not running on the pc's goal. What you want to do is get the pc's goal and run it against PT, if you want to get the rest of the problems out of the road – and you do all kinds of things. You can do more with his goal any day in the week than you can do with Routine 2, but you – of course, you can't get most people's goals without getting some packages out of the road.

I want to give you one change in Routine 2, just as one final remark here. That List 1A, "In present time, who or what are you upset about?" would probably run more easily on a pc, just as any version of, "In present time... or – who or what does present time consist of?" Let me give you that as the basic model. "Who or what does present time consist of?" You see? "Who are you in contact with in present time? Who or what are you in contact with in present time?" You understand? Any such version.

Now, one more remark, about missed withholds and this changed line. You realize that you can list the wrong universe. Remember there's the wrong universe ... There's the universe of the pc's life and livingness, his auditing universe and the parts of existence. And do you know that it'll constitute on some pcs a missed withhold if you don't list that one first which is ready to be listed. You got that? There's another way that you can miss an item: is choose the wrong sphere of interest for your first list. That's not a very fruitful one, but it can happen, so you should be advised of it. And that is pertinent to what I've been telling you tonight.

You insist on running auditing-type universe, see? And actually his present time universe has got him caved in. You know, his life and livingness universe got him caved in. You try to do parts of existence on him and his auditing universe is kicking his head in. And the pc
will act like he has an ARC break. He'll act like a missed item, by choosing the wrong one of these three universes to do first. So that has to be sorted out with the pc on a real expert action.

It's not common, but it can – it could actually louse up a case. Somebody screams like mad, running about auditing. Ah, he's about to be divorced or shot or President of the United States has heard his name and is therefore in a rage. See, something of that sort has happened. Then his attention is so stuck on that type of a universe that he can't even think about being audited, don't you see? And you can't get that one out of the road – if you don't get that one out of the road, he won't be able to get any of the auditing things out of the road. So there's another source of a missed item. Okay?

All right and that is it and I hope it does you some good.

Thank you very much and good night.
Thank you.

Sorry to keep you waiting. There's an operating climate of emergency these days. And sometimes the emergencies are great and sometimes they are small, but they're all emergencies. And that's because they weren't predicted. That's what makes an emergency. Did you ever know that? That's just a failure to predict. Everything else is life. [laughter] All right.

Well, this is what? The...

Audience: 15th.

...15th of January, AD 13, Saint Hill Special Briefing Course, lecture number one.

All right. Well, you probably came in here tonight to hear something clever that'll resolve all of your cases very easily, and I regret to tell you that in the Washington raid tonight's lecture notes were seized. [laughter]

Well, this is – this is a lecture on the subject of Routine 2-12. And there are several things in this lecture, but amongst them is what to do about dead horses. I finally taped this one. Life now becomes very easy for you. If I make life much more easy for you, you'll collapse for lack of problems. I'd hate to do that to you.

Well, let me state the problem first. Very often you do a "represent" or a "present time consists of" or "what are you upset about" list. Those are all represent types of lists, don't you see. And the confounded thing behaves like a wrong way to list. They are very, very difficult to complete – very, very, very difficult to complete – and they cycle.

And when I first noticed this, why, I didn't know whether to send for aspirin or the auditor. How the devil could a represent list be wrong way to? How? It's not possible. So I've actually been worrying about this and trying to do something about this here, now for, oh, I guess about ten days or so. I've been studying this above all other things very, very hard, because this was a puzzler. I "was poozled."

Now, a wrong way to list cycles. Now, somebody's going to – somebody's going to see a right way to list, sometime, and it's going to sneak up on an R/S, you know, and before it gets to the R/S it's going to give a dirty read and then it'll rock slam and then they will see a couple of dirty reads or something like that and then they won't see the dirty read for a little while and then when they get up to the next rock slam, so they say, "Ah-ha! That list is cycling." No, the essence of a cycling list is that the needle periodically goes clean. It's the fact the needle goes clean. It isn't whether it R/Ses or DRs. It's the clean that you should concentrate on there. Needle goes clean, beautifully clean, very fine, very nice, very clean and you
do another half a page just to make sure that it's good and clean, and you've got a complete list and all of a sudden, it isn't clean.

So you roll up your thetan sleeves and you go on and you list further, and the next thing you know, you got maybe a DR. Maybe even an R/S. Then it cycles out and it goes clean again.

How long will it keep doing this? A long time, I'm afraid. Probably forever. The needle will never go clean and stay clean – always dirties up. Now, this is quite periodic. A list which is right way to runs a cycle as well, and that cycle goes... Probably you're sitting there, before you start to list you've probably got a clean needle. And it'll go into a dirty needle and then you get a dirty read on an item or two and then you get a rock slam and then maybe you get a dirty read, and then – then you... it's kind of a dirty needle that looks kind of messy, and then after a while you get another rock slam. And then after a while you get another rock slam. Never really goes clean. And it goes on and on and you finally find yourself with less rock slams.

Now, this is in an oppose list. And if you are listing wrong way to in an oppose list, you will find that the frequency of R/S is increasing. And if you're listing right way to, the frequency of R/S is decreasing.

Now, wrong... this is quite marked. On a wrong way to list on an opposition – this is an opposition list, wrong way to, every... I'm only talking about opposition lists at this moment. On a wrong way to list you'll have something like this: You'll have one R/S on page one and a couple of R/Ses on page two and about three R/Ses on page three. And as far as you can tell up to this moment, there is no right way to or wrong way to, because a right way to list looks exactly the same way. But let's go on and describe the right way to list now. You see, that's one rock slam on page one, two on page two, three on page three, see. That's either right way to or wrong way to. You can tell by the needle tightening with just a few items. But this isn't this type of test. I'm just talking about needle manifestation.

And if your list is wrong way to, along about page four you have four slams and page five you have five slams and page six you've got six slams – you get the idea? The incidence of rock slam is increasing.

Now, oddly enough, along with the increase of the incidence of rock slam, the periods of clean needle are increasing. See, you're liable to get a rock slam, dirty read and a clean needle, see? And a dirty read and a rock slam, and a dirty read and a clean needle, see? You've got clean needles starting to show up here and the incidence of clean needles starts increasing. But that's not an important test. The important test is... and you can tell this by looking at any pc's list. This is what is important. Because you think you are just going to be worrying about your auditing and you ain't.

I'm worrying about your auditing right now, see, and it's time for you to get it all down real good right now, because you won't have any time to worry about your auditing after you get out of here.

Every one of you is going to be worrying about other auditors' cases.
Now, your own worry about cases, that ends very soon up into the future. You'll have this bicycle so that you not only could ride it on pavement, you can ride it – ride it on a rutted street, you can ride it on a tightrope, you can ride it on a tightwire going between the poles of the two main top peaks. You could probably ride it backwards, you know, ride it standing on your head on the seat, peddling with your ears. [laughter] That you won't be worrying about anymore, because all of a sudden it'll all go straight and you will say, "Blithh, there it is, see."

One of the reasons is I'm finding you indicators, indicators, indicators, indicators, see. I'm taking all your bugs out of it so you get maximal gain all the time, see. And you're learning those, and you're very lucky, you've made a lot of boobs, you know, you've made a lot of goofs. You know how agonizing it can be. You know better than to let somebody else make all those goofs, see? I come along and tell you how not to do those goofs, boy, that's important information, see.

Well, you're going to be teaching somebody in Santa Ana County, something of the sort, or you've got a co-audit running down there and you're trying to take care of it over the telephone. They don't know these goofs are important. They don't know what important goof is being made. They have no idea of the importance of goofs. They don't know R2 bulls are more potent than auditing bulls, see. They don't know these things, see? They don't know these things, see? They haven't lived through this, see? And under your direction they've got to live through it – and somehow or other without losing any pcs. That's the important thing, because in the field, in R2-12, and in organizations with R2-12, unless you're very slippery and you're very quick and you don't let them go ...

You see, you guys, it didn't matter, you see – you couldn't get out of here. There was no transport. No transportation has left England since the Mayflower, you know? But – but somehow or another – somehow or another – you've got to keep it degooed and you've got to ungoof cases so that you don't lose any and so forth, because a case can get awful sick on 2-12.

You can put him awful well in a hurry, but he can also get awful sick, man. And he can feel like he's lost his last enemy. He can feel terrible. And it can just go out through the bottom of the floor, you see, just bong! He was coming along fine, then this person said, the Registrar said you had too many pcs, so they got somebody on the third week in the Academy. This is very illegal, but it happens every now and then. And this person in the third week in the Academy was put on this HGC pc, and the pc was doing fine and did fine up till Wednesday and then when they went down – didn't appear Wednesday, and somebody went down to the hotel to find the pc and the pc can't get out of bed. Two black eyes swollen up like baseballs.

Well, you're going to have some bad moments. And the questions you ask is, "Was it wrong source? Was it listed wrong way to? Or was the list incomplete?" See, those are the questions you ask – wrong source, wrong way to or list incomplete, see? And what I'm telling you just now about this frequency of R/S is your best friend. It isn't the length of the list, although you look at lists of forty, fifty pages, you say, "Oh, zut! Thlah! Horsefeathers!" – to use an archaic expression. "That's just a goof. That's just wrong source or something stupid."
No, no. You've got a list there and it's thirteen pages in this guy's folder, see. And it's a thirteen-page list, and because you have been on the ball, anybody you talk 2-12 to, you've practically hung them up by the ears for not putting down the data in the folder. The pc's name on each sheet. We don't care about each page, but certainly each sheet. And the date it was listed. See? And the question that was listed. And whenever he saw an R/S on the meter, put it down, get the meter up close to him someplace while he's listing, so he won't miss it!

I'll show you how... This'll probably be a favorite method of auditing. [demonstrates something – laughter] "No. No R/S." Oh, you've seen it yourself Marvelous. Meter completely out of the auditor's range. He can't see if the thing is R/Sing while he's writing, you know?

So anyway, you've already impressed on these characters – I don't care if they were in a co-audit or in the Academy or the HGC or it was a field auditor you were – you were briefing in and training; you've – we assume this – you've already impressed on them with branding irons, to keep the data, keep all the papers together, write legibly so somebody can read it, you see? You've already... because that's your only saving grace. If they haven't done that, cut your throat, boy. Oooh! You won't know nothing no place. Because they're going to goof. Just assume they're going to goof, see?

Don't go off on the happy idea that nobody's going to goof, because 90 percent of the time the first auditing on this is done with somebody who already R/Ses someplace where it'll do the most harm. And he, well... so let's say he has an item; it isn't an RI or anything, but he has an item which will come up someday, known as an amanuensis as an oppterm. It's a secretary. And the mere fact of sitting there writing restimulates this horrible oppterm, see, to him. And he somehow or another can't keep track of it all, see. And he starts to audit, it's sen. You look for it in auditing, you look here and you look there and eventually it turns up.

Anyhow, that's the kind of thing you're running into, see, so you impressed them on that.

Now, the only thing that'll save your bacon is that folder. And you get ahold of that folder and it's just about the first thing you look for – increasing incidence of R/S. Just look for a list where there are more R/Ses on the end of it than there are at the beginning of it. And when I say the very beginning of it, it takes the pc a little while to groove into it and there's very seldom very much R/S on the first page. So we're talking about the fourth page or fifth page in comparison to the second page, is what you want to look for. And you want to look at about the second page and along about the fifth page – let's say the fifth page was the end of the list.

"Oh," you say, "look at that. There's more R/Ses. Why don't you turn it around and list it the other way, the way you were supposed to?"

"Well, the terminal was 'a gruesome killer' and the pc said that couldn't be him. So of course, we had to say, 'Who or what would oppose a gruesome killer?' Otherwise it was too painful." [laughter]

Oh, you're going to hear some, man. I've heard some beaux. I started to collect them and then I was too busy writing up decent lists so I didn't bother to collect them. You'll hear
something like this. It isn't that I don't trust my fellow man. The funny part of it is, I wouldn't put them into their hands if I didn't think they could climb the hill. All I'm trying to tell you is, you got two hills to climb, see, just like I had two hills to climb. Get so I can do it and then get you to do it, see? You've got exactly the same hills to climb. Get so you can do it, and get so the other fellow can do it. Get the other fellow to do it. See, you've got the same hills to climb. We'll always be climbing these two hills, see, to some degree.

But the first one can be climbed and that's dusted off. You know you can do it, because there is a finite end to Routine 2-12. First time we've ever said that about a process. You realize that? There's a finite end to learning it. There isn't some new rule going to turn up in the card game. What I'm trying to give you now are indicators. Indicators. I'm looking for things to look for. I'm looking for things that explain certain oddities that you are running into.

All right. Now, this frequency of R/S, the needle that keeps going cyclically clean, is another part of this. All right, that's wrong way to. Now, you get what I mean about it? Of course, you've got it wrong way to – you list it right way to.

Actually, the easiest way to test a right way to or a wrong way to is simply to list a page or half a page each way and find out which one tightened the needle – and that's wrong. Take the one that loosened the needle, always. And the funny part of it is, that's a wonderful way to get accustomed to inspecting pcs' appearances for skin tone. That's marvelous. You see, it's all a trick of spotting then and now. So you've got to have a now to become a then, see. You've got to look at them, and say, "All right, this is the start of listing." How did they look? You know? And then list yourself a half a page and look at them again.

See, those are the two points of comparison. And you will very rapidly become accustomed to seeing what a pc looks like if he's listing in such a way as to cave in his bank. It isn't just wrong way to that caves in, you see, you can list the wrong item and cave it in, you can take the wrong source and cave it in. See, almost anything you do wrong in Routine 2-12 darkens the visage and skin tone of the pc, mucks up his eyes, does this, that and the other thing to him. It's all facial and it's very visible.

But it gives you good experience, listing right way to and wrong way to; you're picking out which one is which. You just take these two opposings and figure out which one is which, and inspect the pc very closely as you are doing that, and you will actually see the pc's skin darken.

Now, oddly enough, it won't lighten on the right way to list as fast as it darkened on the wrong way to. It's going to take maybe a couple of pages of listing to get his skin back to where it was before you wrong-way listed it. Nevertheless, it gives you a comparison, gives you a very good idea of it.

Now, you want to become an expert on this, on skin tone and eye and so forth. And the expertness is totally on selection of points of time, you see. You can't compare this piece of paper to this piece of paper. See, look at your axioms of knowledge. There must be data of comparable magnitude for comparison, one with another, before you can know something, you see. You can't say this is a big meter unless another meter exists to be smaller or bigger, see. You get this idea?
So you have no data of comparison on a case unless you mark a moment in time, zzzt, and you say, "Well, that's how he looked." You see, you do this several times. You do it for the overall process, you do it for the right way you're listing, you do it for this and that, but you keep in mind how he looked – you take a good look at him, you know; you take a photograph of him – and you say, "There he is." And now fifteen minutes later you compare that first "there he is" with how he is now, see. And you get a then-now comparison. Is he lighter or is he darker? Those are the only questions you ask. It's as simple as that.

This is the doggoneddest darkening mechanism you ever saw, but I didn't say that he went black. He actually doesn't go black. He just goes darker. Because some pcs go yellow, some go green, some go gray, some go black, and the lightening process could possibly sometimes be confused with – in gray. But you just have to get used to these things.

But frankly, they get whiter and whiter, which is a very interesting thing. You'd have to have a lot of sun lamps to keep up with it. They go lighter. And there's your best index.

And you should be able to get to be an expert on this, so that you're supervising five, six pcs in an HGC, or you've got fifteen or twenty of them in a co-audit ... Just get practiced on this kind of thing. It's not a very difficult trick. And you say, "This is the beginning of the session." Just look all around and see how they all look and... best way to do that is choose the one who looks worst, you know, and relate everything to him.

And you don't want these guys being listed backwards and upside down and out through the roof, so after everybody's been industriously listing or doing whatever they're supposed to be doing about a half an hour passes by or something like that, take a look through the room and compare it to that first look you took, see?

You see this guy over here: he actually is not much greener, but he's greener, see? So you take this bird and you know that it's wrong source, wrong way to or an incomplete list, and you immediately make it your business to find out what's wrong over there, see? Then you can keep everybody's head out of water.

This is terrific processing when done right. And the righter it's done, the more terrific it is. You can't oversell it, done right. See? But boy, you could sure shoot holes with it done wrong.

And you'll hear people saying, "Oh, God, so this is Scientology. Oh, no. Oh, God. Oh, jeez. Never felt so bad in my life." You know? It's a wonder they keep on getting processed at all. But you can do these things real wrong with 2-12 and you can really pull the rug out from underneath somebody. And let me make a little comment here as we go by this: Until you get to be an expert or until somebody is expert, don't let them process children. Why?

Well, actually, the kid's having a hard time concentrating his attention and you could put a kid off much quicker and the – his doggedness is not there. He won't keep plowing into it, he'll just know he felt bad, so he doesn't want anything more to do with it. It's just a snap adjudication, don't you see? So don't let anybody who doesn't know 2-12 backwards process children. Make it an absolute requisite that they get perfect results on adults before they are ever let near a child.
With that proviso, 2-12 works on children around five, six, seven, eight, nine, in that range. I don't know about the five, but we already know about the later. It works like a dream. They just sit there and they just saw wood and they work right away, and they'll list like mad and so forth. They're cute as a bug's ear on this stuff. Quite remarkable. They R/S perfectly and so forth. But don't goof them up, because they won't sit still long enough afterwards to be patched up. You see why? So don't let anybody be processing kids until they do very, very, very flawlessly well on adults.

All right, let's get back to this dead-horse proposition. I'm talking about all this opposition listing and frequency of R/S and frequency of clean and so forth just as a rundown of what I was up against in the represent list. Imagine my embarrassment to find a represent list doing the same thing as an opposing list – slightly less violent.

In other words, it wasn't with exclamation points that it was doing it, like it does it in an opposition list, but all the signs were there. Now, here was my question: How in the name of common sense can you have a wrong way to represent list? Well, the first thing you'd say, "Well, who or what would represent Scientology to you?" Then your wrong way could be, "What does Scientology represent to you?" I mean, that's the same thing. So that isn't contained in it.

"What does Scientology not represent to you?" The same thing. "What does Scientology represent to you?" See, I've just been going around in circles here for days. That's why you haven't seen very much of me; I've been wearing out a rug. I've been walking in small circles. How in the name of God ... ? I won't – I won't say what I really said. I'll tell you exactly what I said. It's this exactly: "Goddamit, how the hell can a represent list be backwards?"

You know? Pow!

And I'd go back at it again, you know, and I'd take a look at this thing, and so forth, and these lists can go on and on and on and on and on, because it was a hole in 2-12. You guys had discovered it. [laughter] You, too, have made discoveries.

Anyway, that's what I said, and even though it was profane, I don't want withholds from you. It's so preposterous it took me about ten days to wrap it up. And it's so simple. Heh-heh, it's so simple. It was very little to do with the wording-heh-heh-heh.

A flaw in man is that he does not know himself. You ask this guy, "Have you got any enemies? Name your enemies." And he says, "Oh! Joe, Bill, Pete, blah, bo, blah, zaaa, blah, blah, and thuhh, and thuhh, and zaaa, and zaaa, and zaaa, and da-da-da-da-da-dah." Automaticity, see. Always can name enemies.

You say, "All right, name yourself."

He says, "Name's Joe." End of list.

In other words, the person is much more capable of observing enemies than selves. So he gets on a stuck flow of listing terminals, and you've got to fix his represent list so he will list... He gets on a stuck flow of listing opposition terminals, don't you see? Stuck flow of
listing enemies because they're so easy to list and you've got to give him a list wording which permits him to list terminals. And that is the wrong way to represent list. I think somebody ought to take their hat off. It's taken me about ten days to figure this confounded thing out. That's what it is.

You say, "What is... what does Scientology represent to you?" And he right away figures in terms of enemies. So he lists oppterm, oppterm, oppterm, oppterm, oppterm, oppterm. Once in a while he accidentally puts a terminal on it – very accidentally. "Oppterm, oppterm, oppterm, oppterm," he lists. "Oppterm, oppterm, and oppterm, oppterm, oppterm, and oppterm, and I can't think of any more, really. That's the end of the list." And you didn't have any R/Ses. Where's the silly R/Ses? Furthermore, if you keep doing this you will see that the needle is going clean and then dirty, and then clean and then dirty. And every time you try to go down this silly represent list you find you can't make it. It goes too dirty to be nulled.

So you abandon that list and say, "Who or what does present time consist of?" or "In present time, who or what are you in contact with?" or anything like that.

So, he leans back and he says, "Oppterm, oppterm, oppterm, oppterm, oppterm, oppterm, oppterm, and oppterm, oppterm, oppterm."

And you say, "Where the hell are the R/Ses?" And you'll find once more the needle goes clean, and dirty.

Now, if you're lucky, you'll have some R/Ses on it and you'll find one. Once in a while it's almost impossible to get one backwards. He'll list a terminal every now and then and it R/Ses. Not just because it's a terminal, but he'll list an R/Sing terminal frequently enough to give you some R/Ses, see. But he'll give you an interminable list. And he's liable to get down to the end of it and feel rather badgered by the auditor and the process and because he's now on a stuck flow against his enemies.

And you watch those faces go black or green – in other words, they'll darken. He'll start to look older, faces will darken. See, going on a stuck flow. Dzuh, dzuh, dzuh. Eyeballs get big, red as fire. It's very visual. These manifestations are not really tiny, they're quite marked if you know what you're looking for.

And you say, "Well, we didn't get any list with that – uh – 'What does present time consist of?'" Let's – let's do one now – let's be very smart. Uh – uh – let's see. 'In present time, what have you been reasonable about?'" or something like this.

And he'll say, "Oh, yeah," and he'll list that. "Oppterm, oppterm, oppterm, oppterm, oppterm, oppterm, oppterm."

Well, it's very simple: The case that gives you a wrong way to-looking represent list – even with rock slams on it; you know, it behaves like a wrong way to opposition list – or the case that gives you dead horses, (see, that's the same case actually) is merely somebody whose next item up is a terminal. Isn't this idiotic? The next available item on the case is a terminal. You've got nothing but lists of oppterms. Grim joke, huh? I think it's kind of lucky I figured this one out.
In other words, before you get the terminal off the stack, he hasn't got a prayer. And yet he's listing oppterms, so of course you're never going to get the terminal off the stack. You understand? So he'll just go on plowing himself in. And the more he lists oppterms, why, the more it plowed into the mass he gets and the unhappier he gets about the whole thing and the more MEST he feels, the more hopeless he feels. Because what's the bypassed item? It's the terminal he is being right this minute in the session. That's the bypassed item. You got this now?

You see the circumstances of the wrong way to list? Of how this thing looks like a cycling list; it takes forever; you can never get it cleaned up – the wrong way to list. Of course, you know the dead horse type of list. This also takes in the skunk list. You know, it keeps running out to no item. See? Those oddball lists are all under this same heading, on a represent basis, which is "present time consist of" or something like that. The pc is being asked questions which result in oppterms, whereas the pc, next item up, and his case isn't going to go anywhere past this item – the next item you've got to find on the case to make it whiz is a terminal. And you're not asking questions that give you any terminals. You only get opposition terminals.

Supposing his terminal was "a bad boy." You might as well be asking a... we don't know this terminal "bad boy," you see, because we haven't found it or anything. But we're busy listing a represent list. We're asking, in essence, "In present time, to a bad boy," see, "what does life consist of?" And he'll give you schoolteachers, masters, truant officers, police, juvenile delinquency squads, see, and he goes on and on and on.

And you want – just to make my point here, sometime – you – when you've patched up a pc where this is occurring, find the item, see, and go back and take a look at his two or three earlier dead horses; you'll find out he's done nothing but list the same item. They're all what a... whatever you found, see. You found "a rabid skunk employed by the government" or something like that, you see?

You know, he'd fallen low, man, and you'll find this one. You go back and look at those early dead-horse lists he was listing, they'll all be what this thing opposed. You actually have done its opposition list. But because he couldn't get a grip on it these things weren't R/Sing properly or anything else.

That doesn't mean you take the early lists now and compare them to the later lists, you just go on with 2-12. You oppose this thing; now he knows where he is. Obviously he knows where he's going. But of course, in view of the fact that he can't see from the terminal point of view what is the enemy of the terminal, he then just is giving you such randomness that it is fabulous.

This again is not an index of how you find this. But in actual fact he doesn't know from what point of view to look at the enemy. So then, of course, he can't give you the right enemies. He can just give you all of existence. And there are quite a few items in all of existence. Some of you may have found this out.

Well, that's how you can get a wrong way to represent list, which is the confoundedest thing I think I ever had anything to do with. It sounds impossible when you look at it, as a piece of Chinese puzzle work, it just sounds impossible. How could you possibly have a
wrong way to represent list? Well, you could say, "represent" and "not represent." That unfortunately does not solve it. It does to some degree, but it won't immediately give you a long stream of R/Ses. It'll make the pc feel better. "What does present time not consist of?" may not give you R/Ses, but it'll make the pc feel better, see. But you don't get your item and we're trying to do 2-12, see? We're not trying to make the pc feel better or worse. We're just trying to get our items and get the pc's bank in some kind of a condition to find goals on, actually.

What we're trying to do is clear away his PTPs, get out of the road his hidden standards and open the highball for 3-21. And most – most cases – in fact, practically all cases have got PTPs and hidden standards, and those that have been cleared, have been cleared in spite of these. And in at least one case I know of – after the case had gone Clear, couldn't quite stay Clear, you know, keep falling off of it about every two weeks. The PTP had never been gotten out of the road.

In other words, the technique was powerful enough, actually, to clear somebody without removing the PTP. And... but boy, it had really taken some doing. She slams on "LRH." And her... she's been getting less Clear and less Clear and less Clear. I'm a problem to her. She's committed some overts, you see? She deserted her post and intended to cave in the place down there, before she got Clear, and then she's never – never straightened this out. You see what's happened?

But this is pretty tricky. It's almost impossible, see, to clear or audit a pc sitting there with a PTP. 2-12, oddly enough, can be run on a person with another PTP than the one you're picking up and you can still get the item. I know I've had that as subjective reality lately. Suzie hadn't been bothering to clean up any PTPs on me to run the session. And just before the session, you see, I get fifteen, twenty telegrams – "Kennedy threatening to commit suicide unless you ..." [laughter] You know, that kind of thing.

And I come into session, you know – PTP. And I try to get them off and put my rudiments in; she pays no attention to it. And goes on and it all lists up and packages are perfectly all right. Although the pc gets a little dispersed at times.

In other words, you're auditing the central PTP so actually you can audit beyond and by and along with current PTPs, you see?

Well, man, you can't run 3-21 currently with a PTP, particularly a PTP of magnitude. To find a goal, the pc's attention has got to be all there. So you have to get the big, the big, the big PTP that is unknown to the pc, actually. He doesn't know what his present time problem is. He'll give you lots of present time problems, but he'll never tell you what it is.

That one's in his road, and then the hidden standard. You know what a hidden standard is. The individual's hidden standard is, if Scientology is answered by this, you can get a list of hidden standards, by the way. "What would have to happen to you for you to know that Scientology really worked?" That is your – the perfect question. That gives you a whole list of hidden standards.

You'll be surprised. "My left ear would have to stop burning." Actually, every time this person has ever been processed, they look at their left ear, see, to see whether or not it is still burning. Now, if the left ear is still burning, then they know the process hasn't worked.
But if their left ear is burning a little less, then they know the process has worked slightly. And they give you all of their goals and gains straight off an index of the burning left ear. I'm not joking.

You'll find this in a vast majority of pcs, if you search for it. "What would have to happen to you for you to know that Scientology really worked?" Just for fun sometime, and as an exercise to understand a hidden standard a little better, you ought to take somebody and have him list a few. But of course, if you don't complete the list, he's liable to have an ARC break.

But anyhow... He'll give you a whole bunch of these things, you know – his stomach would have to stop hurting, or something. Well, actually, this hidden standard is quite interesting. It is a circuit which is telling him what to think. And that's the 100 percent definition of what a hidden standard is. It's a circuit that is telling him what to think. And it's got some kind of a signal system rigged up. You know, it works if. That's actually a communication-type system. It's quite involved. It's like an automatic trainstopping-signal system put up by the Baltimore-Ohio or something, you know? Like a train stops at section 83, and the brakes – potential brake shoes and lights go on in all other sections in that particular zone and area. And a small man jumps up with a flag and waves it in the nose of the engineer and knocks his coffee cup out of his hand.

All kinds of super systems, you know, they're very complex. A hidden standard is not a simple system. It's a circuitry response. You see, that is an item, in other words, that he consults. And he says to this item, "Is it true?" And the item has a signal system by which it tells him whether it is true or false.

And most people you are expecting to leap up in the air and tell you, "Oh, yes, I understand Scientology works," have first had to ask one of these systems. Quite interesting. They don't think at all. They read the record on one of these systems. The FDA – give you a rather degraded example. They think the whole world is composed of two valences. There's two valences. The world is composed of victims and victimizers. There are no other items.

The fellow manufactures cars; he's a victimizer. Fellow buys a car; he's a victim. So of course, he's dead against industry. Because all industry or manufacturers or managers or something are baddies, and all consumers are victims. Everybody's a victim that isn't an emanator of some kind, see? And those guys are victimizers.

Lacking any other than these two terminals, of course, they themselves are victimizers and the only thing that they will ever create is a victim.

Those people will never create anything but a victim. And the more power they get the more victims they create. Nothing ever works out. You finally get communism, socialism, super-liberal-osis of some kind or another, where you've got all of the – the whole country, the population is a victim, see? They're all victims.

Now, a fellow who stands on his own two feet – this solves a lot of riddles, by the way – the fellow who stands on his own two feet in such a government is regarded as – there must be something very wrong with him. In other words, self-reliance, the worker who wants a job or likes his job or something – there's something wrong with him. So they just move him
aside. He... something wrong with him. They just get rid of that one quick, because there can be no such terminal. Life is a sort of a dreary game that goes on between all of these victimizers who have to be stopped, and all of these victims, and there's nothing else goes on in life. It's one of the weirdest looking pictures you ever wanted to take a look at.

That's a do-gooder in first, second, third, fourth and overdrive. [laughter] And that's all the tune he plays. And he's trying to protect everybody from himself. He gets down to a point where everybody is his own victim. That's all the – all the way anything categorizes. And this gets to be very, very, very upsetting to these boys, because they eventually can see no purpose in life except making more victims, you see, or holding off more victimizers or something.

Look at all the elements of life that are missing in this type of a combination, you see. Nobody ever likes to buy cars, nobody ever likes to make cars, you see. All those elements are missing. There might be billions, hundreds of billions of other types of valences, but they miss all these. So it gets down to this two-pole proposition. Of course, they're a pushover for anybody who comes along and says, "The poor worker."

"Oh, the workers are victims, huh? Oh. Oh, well, yes. Well, let's see if we can't cut their hours and raise their pay."

And that goes on, but it goes over a whole cycle, and as these boys pass into charge, they take away all the pay and give them twenty-four hours as their daily schedule. They've done it in Russia and all over the world. I'm just not talking through my hat.

I really got one into the Bantu down in South Africa. They were talking about "Communism! Communism! Oh, marvelous stuff, this communism! Oh, boy, ug-ug-ug-ug-ug!" you know.

And I said, "Do you realize that you don't get paid for working in a communism?"

And he says, "Is that so?"

I said, "Yeah." I said, "They don't give you any salary."

And they thought about this and they walked around in circles about it and that was the end of communism in South Africa. That's why it isn't down there now. [laughter, laughs]

The white man – he's not quite that smart. He doesn't grasp this that quick. He's not quick like that. He doesn't recognize that the end product of this sort of thing is no pay of any kind whatsoever. But the Bantu, he was plenty smart. He grabbed that in a hurry. Actually, you could just see them unload off the bandwagon in all directions. I'd get to talking to them on a street corner, you know, or the back lot or something like this, and they always bring up these burning questions. And I let them have a few data.

Well of course, that's a do-gooder gone mad. He's got nothing but victims left. The way to handle him, of course, is to sympathize with him. [giggles] You know, "You poor fellow!" You know, "Fate has not permitted you to get ahead the way you should've." And he'll go right from the victim-maker valence in which he is in, see – he'll go straight into the role of the victim. He's defeated instantly. That's a valuable datum for you to know.

Because you'll run into them plenty. The world just abounds with them. The UN practically consists of nothing else. They've made all the main Congo victims now. Now they've
got all of Katanga. Katanga was the victim maker, you see. They made victims out of the – out of Katanga. They fixed them but good. And now everybody can be a victim. And you watch it, the next boy that comes in there to take control will be a real victim maker. He'll be a honey.

This has nothing to do with whether or not you like humanity. If you like humanity you leave that kind of politics alone. You think I'm a rabid Tory if I talk like that. No, I'm just as rabid on the subject of Tories! I'm what's called indiscriminate and unspecialized in the number of oppterms I can list. [laughter]

Now, you've got to look this over and recognize that one – that the thing man is tuned up to see first is an enemy. And when they go completely potty, they can see nothing but enemies. Everything is an enemy.

I've seen a little beetle crawling across the floor and wondered whether or not he rock slammed on PT. See, that'd make everything was an enemy. You know, probably that's true. This probably is your last rung of case. You say, "Present time," and it rock slams like crazy. See? That immediately tells you that you've got nothing – you've got nothing you could list as a represent list. See, because they all depend on present time as an understood factor. That'd be pretty grim, wouldn't it? You – they could only oppose.

And here's the type of question you would ask: You see, your do-gooder never recognizes he's a victim maker. He loses that. That's out of sight, that's missing. He'd never put down a victim maker. You'd have to ask him a question... You haven't got victim to list from, don't you see, so you have to ask him a question – a simple question like this, is: "Who or what in present time would have your problems?" And he'll put terminals.

Now, you've got numerous variations of this. Nobody recognizes what he is being as easily as what he is facing. In other words, terminals are harder to pick up than oppterms at the entrance to a case. So you get wrong way to represent lists and you get dead horses and you get skunks. And that's the source of all of these. And you must ask a question which delivers into your hands, terminals.

You have somebody rock slamming on "reasonable people" and the list doesn't go anywhere or it cycles, there's something wrong with it. It's going to be an endless list, there isn't anything going to wind up on it, it doesn't R/S; if you did null it, it skunks. That kind of thing. You're going to ask him, "Who or what would object to 'reasonable people'?" In other words, you can swing – you understand that you can run a represent either way. See, you have... that's not an oppose. That's a rather oppose-type question. I wouldn't recommend it. But I'm just trying to give you the idea.

You say, "In present time, who or what would have your problems?" You've got to ask him, "Who or what in present time would live the life you are living?" "In present time, who do people... who or what do people think you are?" You... I'm trying to teach you the method of thinking, not give you a bunch of pat lines to list, see? You've got to ask him a question, see, by which he will list terminals.
It could be as simple as this: "Who's looking at me?" You wouldn't say, "What are you that is looking at me?" you know. You could ask him for something like this: you'd say, "Who's looking at me?" or "Who might be looking at me?" or something like this.

And this character that had laid dead horses like crazy, wrong way to represent lists, nothing could null, the thing always skunks and so forth, would lay you down probably a very nice rock slamming list, which would rapidly terminate in a reasonable number of pages, would have less rock slams on the last page than the first page, would be very nullable, and you would be able to take off from there.

It's just the accident. Some cases have an oppterm – probably the majority – have an oppterm as the first item up. In other words, all this is... you not only see the pc deal cards off the top of the deck – you know, he's just like he's dealing a deck of cards as his items. Pock-pock-pocketa-pocketa-pocketa-pock. He'll just deal them out. Well, that's actually just like a deck of cards. The first one comes first.

Pcs very often dramatize the next item to the one that you are calling. In other words, that card is ready to come up next, so it's being restimulated. All right. Similarly, packages come up the same way. And you can get a hold of a pc – the majority of pcs, the first item up is an oppterm. They're a bit overwhelmed, don't you see. So they're being an oppterm, and so forth, and they name an oppterm and it comes up very easily. That's the side of the package that's going to materialize. So you take it from there and you list it out and you oppose it and everything is fine.

Ha-ha, yeah, but these other characters that have been giving you a bad time – and they're not few – that list wrong way represents and cycling lists, you see, and skunks and dead horses and any one of these manifestations; endless lists that won't null on represent – these characters simply have a terminal as the next one up. And of course you're asking an oppterm-type list question. So you must ask a terminal-type list question.

The crudest rendition of it would be, "Who the hell are you, bud?" [laughter] That would be very crude, but is in essence what it is. You say, "What problems do you have in present time?" Remember that "You, you, you, you..." See, that... there's a "you" there, and that's an undifferentiated pronoun. So you have to back up back of it and differentiate that pronoun. You say, "Who or what are you?" in some way or another. "Who'd have your problems?"

You've listed a dead-horse list. Ask him, "Who or what would oppose all these things?" You'd get a valid list, see? Give him the list so he could hold them. You'll get a rock slamming list. You get the idea?

There's too many tricks in this, there's too many ways you could do this for me to overburden you with rote. I just want you to firmly get the idea of what this is all about. And that is that the majority of pcs can deal off an oppterm and go sailing, see? And you've got that as a rock slamming item, it's reliable, you oppose it, and 2-12 works gorgeously. That's the majority of them. The rest of them that you're going to have trouble with have got a terminal there as the next one up, and unless you ask for that type of list – bang!
So you more or less count on the fact that they're an oppterm-type case, until proven otherwise. And all of a sudden you find this case is *oaaugh-umba-rupp!* Dead horsing, haven't seen any big R/Ses, doesn't look good to you.

Do a flip. List something else.

Give you an example: One of them was, "Who or what would you hold off?" It's liable to get a terminal on it yet.

All right, let's reverse this list and do it the other way to. "Who or what would hold off things?" That'd be good enough, you see, to get a terminal on the list. They all don't that smoothly translate. But you do a type of list that gives the terminal, and you wont have any more dead horses and wrong way to lists. And that's how you can have a backwards represent list.

Okay?

Thank you.
R2-12 NEVERS

A lecture given on 15 January 1963

Okay. This is lecture two, Saint Hill Special Briefing Course, January 15, AD 13. The planet Earth, as much of it as be... will be with us for awhile.

I don't know, I've told you everything I know. Haven't got anything else to tell you. I can punch up a few points for you, however.

There are a bunch of nevers arising. You're getting nevers in 2-12. And you avoid the nevers and you'll make somebody nervous. You've got "Never represent a rock slamming item." That is something you just never do. And that means anything you have ever seen rock slam. See, it might not be rock slamming now, but it might have rock slammed. And that makes you nervous.

All lists have a source. All lists have a source. The source is something. And that is an assumed arbitrary. And that is the most dangerous point of 2-12. There is the point where you need a little bit of luck. You say, "In present – what does present time consist of?" Something like that, you see. You get a nice list, it's perfectly nullable, it goes out to one rock slamming item seen during nulling, everything is fine. You oppose what you get, that all travels beautifully. No – no strain. You wind up with a nice rock slamming item and then you oppose it, because it's still rock slamming – the rule is, of course, that if the thing is still rock slamming you oppose it – and you get your perfect package. All that is fine.

But where does this list come from? In other words, all lists have a source. Now, we find out that an arbitrary source is pretty dangerous. It isn't somebody has interpreted this already, the misinterpretations will fly around like mad! But somebody's already interpreted this. You take an arbitrary list and if you see more than one R/S on it then you – it isn't complete and you complete it. That isn't what we did recently. That just came down on telex today as an interpretation. That's wrong. If you just don't use arbitrary lists! That's that. See, that just takes care of the whole question. So you never use an arbitrary list – just never do it.

Every now and then somebody sees an item, "waterbucks." Crash, crash, crash, crash, crash, crash, crash! "Oh, will you look at that beautiful, beautiful item! Oh-ho-ho! Oh, that's marvelous! This guy's got sen on it. Ho-ho." They just can't keep their paws off of it, you see. They've got to oppose it, right now. The pc's probably rock slamming on "auditor" at that moment, but that's beside the point.

So, they oppose "waterbucks" and this goes on endlessly and interminably and horribly, and the bank is collapsing on the pc and all is getting more and more ghastly and life looks worse and worse. And the main danger is the auditor says, "Well, just look." If he's very new, he says, "Well, 2-12 doesn't work." Now, I'm sure all of you, each one of you, some time
or another, since the advent of 2-12, has said, to himself or to somebody else, that it doesn't work. See, that includes me! See, I too have said, "Ha-ha." I've said, "Well, it can't be taught." You know, that was my adjudication, you see.

I've also said, "Boy, it just can't work, it doesn't work." You see? Well, what that is, is you're running into bug factors – bug factors of one kind or another – and either the answer hasn't come your way, or you have missed something someplace or another. Because actually nothing caves in a pc quicker than 2-12.

So we've got our next never. Never abandon 2-12! Because nothing else is going to patch up what 2-12 has mucked up. This is one of those – this is one of those gee-whizzers that only patches itself up. The reason why we know it is an ultimate-type process is because it repairs itself. And that, of course, by Definition, is an ultimate-type process. The ultimate process will repair itself. In other words, run right, it repairs what has been run wrong.

Now, the other never there is – never try to patch up 2-12 with something else. Because you won't ever make it. I'll give you an instance. Wrong list, wrong way to, pc ARC broke, the item picked out was not the final item on the list and then it was opposed wrong way to. You know, I mean it's just a good mess-up, see. And said, "Well, that's – that's fine, now the best thing to do is just to prepcheck this whole thing out. And just forget the whole thing." I proceeded to do so, got the needle clean as a whistle, pc smiling, cheerful, everything was fine and next day was four feet below bottom again. So I patched it all up again, got rid of all of the auditing, straightened it all out beautifully, and so forth. And within a few hours the pc was four feet below the bottom! In other words, it just kept going like this. I finally went back and completed the list and the pc was fine. You know, I fixed up the original list that had had an item grabbed too soon on it, got the right item for that list and opposed it properly and abandoned the list that was wrong way to. Everything's fine.

Actually, you inadvertently will make this test some day. You inadvertently will do so. You'll sweat it out, trying to patch up the pc at the end of the session. The pc seems all ARC broke and you just don't seem to be making the grade at all, you see. And you've found an item – you found an item, "a gut-shot bear," you see? And the pc's always complaining about his guts and he's always saying he "can't bear it." [laughter] So you say, "Well, it must be the item." What you've missed is all items have an influence on the pc, whether they're reliable items or not, you see? It isn't that a – the item you choose didn't have an influence on the pc.

Anyway, you took this thing and you're trying to do something with it and you gave it to the pc and then you tried to patch up the ARC breaks. You think they're coming from someplace else. And finally in desperation you say, "Well, that item, 'a gut-shot bear,' that is not your item. We're going to complete the list." And all of a sudden the pc's right up there, right up top, face clears up, goes white, everything! Magic! See? Just telling him it's not his item, when it wasn't – in other words, telling him the truth of the situation – accomplishes more in just that short breath, than, frankly, twenty-five hours of Prepchecking! I think it's quite remarkable, see?

And that's the degree that 2-12 only patches up 2-12. It's one of those self-resolving little miracle whizzers. It solves itself. And there's no other processes that completely do. Yes, they solve what they do but they don't also solve all cases. That's the slight difference. We've
had processes and all Scientology has solved itself. But in actual fact they don't... haven't solved rapidly all cases.

Now therefore, for that reason alone, it's worth taking these risks, it's worth knowing it, it's worth studying it, it's worth getting good on it, it's worth an awful lot of things, but you remember that there are a few nevers. I've given you the chief never – is, never let somebody lose their records or keep inaccurate records or fail to note down what happened on the auditor's report and on the lists. And never, never scamp the problem of records. Just don't do it. Because nobody will be able to patch up anything easily.

Now, there is a method of straightening up a case where the records are lost and that is of interest to you. It's an E-Meter job. And you go back and you carefully trace down to the minute and, you know, time-spot the time when the pc's case caved in and then go back and trace very carefully the session in which it occurred and then put your mid ruds in for that session. "That session on the 21st of December," you see, "1955, 63..." or something, whatever it is "...has anything been suppressed?" Well, by putting the mid ruds in, his memory returns and he can give you far more about it.

And then having patched this – it doesn't patch up the case, see. It just – he tells you more about it. And you'll recover the missing data, and the missing list, and it... you can deduce by some guesswork or another, synthesize if you have to, what the name of the list was and sometimes there wasn't a list – it just was a number of items. And there was no list title. And you have to synthesize what the list title would be in order to complete the list. You get the trick?

But this is pretty grim, this – but patching up 2-12 without the records is so arduous that you can just lay down a rule. That never lose and never miskeep records. Such a thing can happen, you see, as some utterly green auditor someplace is... he nulls the list and it had rock slams on it and he missed the thing. He missed the rock slamming item. It'll be missed from there on out. The pc'll be all upset, so on.

And here's another never. Never Attribute a violent ARC break to anything but a wrong item or a not-found item – which means a complete list. The ARC breaks are always attributable – whether they're demonstrated by despair or violence or anything else – but ARC breaks are always attributable to 2-12, not the auditing. Don't ever make the mistake of thinking it was because the pc had a missed withhold in the session that he finally blew up at you. The item is right but the pc had a missed withhold and therefore got an ARC break. Ha-ha! Don't make that mistake. Because when you don't complete the list ...

Oh, you get away with it often enough to make you foolish. You actually can get kind of foolish on this. Because you can make some of these mistakes, you see, and still get by. And then when you really run one into the brick wall, then you say, "Well, probably, that can't be it." But let me tell you, if a pc ARC breaks badly in doing 2-12, 2-10, any of this Routine 2, he ARC breaks badly, you attribute it to the Routine 2. Don't attribute it to the pc's current life and all that sort of thing. Never, never attribute a violent ARC break, a violent decay of case, which is the same thing, I mean, pc gets so apathetic, won't talk to you, something like that. Any manifestation of an ARC break of a violent nature, never attribute it to anything but the Routine 2.
Actually, that's a very sound rule. It sounds very extreme when you first take a look at it, but it's a very sound rule. You see an ARC breaky pc come – this applies to you not just as an auditor, you understand, this applies to you in the workaday world of Scientology – you see this character come out screaming out of the HGC, slam the door, you know, and "Oh, this is just terrible!" and so forth, everybody's robbed him and all that sort of thing and it's terrible and it's terrible and ...

Well, don't stand around flat-footed! See, just, what the hell? See, who didn't complete the list? Who missed the item? That's your – that's your immediate response, see. Don't attribute it to something else. Don't get reasonable about it, see. You'll find out you're true every time.

And – pc's feeling bad and upset and so forth. Well, they can have the most fantastic things. Well, they got in an automobile accident and wrapped the car around a cop's neck and they're going to have to go to... By the way, if anybody ever sends you to jail, by all means, go to Alcatraz. They're tearing it down. I'm just thinking of the Federal government. Even their prisons are going to pieces. Have you – did you know that? We've got to audit those people, that's all there is to it, you know, because they're in a violent ARC break. Somebody's missed an item on the US government.

I think, personally, they missed it with a no-auditing situation. We haven't had any plan for auditing the government. We got one president audited. That was Truman. We ain't had anybody else audited. Now, I just think they're suffering from no auditing. Course – so of course, that leaves all items missed. And that's another way of missing items. But it isn't to a violent state. Somebody must have missed a list or something on the FDA. They must have. They must have. "What crumb are you?" or something like that – something. [laughter] "What type of insect egg did you come out of?" You know?

When you see these violent – these violent manifestations or swift alterations of case, or if you think it's a slow alteration of case, go back and find where it was swift. Never consider that an – case altered slowly. It didn't. It didn't deteriorate slowly on 2-12. It deteriorated fast! And you've got to go back and find the earliest item missed. Doesn't much matter how the item was missed, it got missed, that's for sure! There are several ways of missing an item.

Listing wrong way to, oddly enough, doesn't so much miss an item. You list right way to and don't complete the list, well, you'll get your biggest picnics when all of 2-12 is absolutely right. And then the list got extended. In other words, they had two rock slamming items on the original list, so they extended the list, found one rock slamming item and said that was it because they didn't have another rock slamming item, did they? And nothing else was now rock slamming, was it? In other words, that one rock slam seen on nulling is very valid, used the first time. But on further study here, it is of very poor validity the second time it's used. That's sad but true.

In other words, you had two rock slamming items on the list, as you nulled it. You're nulling the list, get two rock slamming items. Oh! Of course. Obviously the list isn't complete! Obvious! Now, going on nulling – pardon me ... By the way, going on nulling is senseless by the time you reach the second rock slamming item. You've got to continue that list.
And then go back and check those two items to find out if there's anything left on them. They can DR or something like that, but must be very slight indeed.

Now, you go on down and you get your final rock slamming item, and you say triumphantly, "Well, no one of these others – rock slams that went on are anything, nothing else – I didn't see anything else rock slam, so therefore that is the item and therefore, there you are, there is your item. And we now have your item and we've checked it all out and it is gorgeous." And the pc, makes sense to him and he looks brighter and he looks lighter and everything – and everything is fine, but we're checking the thing out – and let's say it's the first list, which is your – sort of your source list. This was in opposition to it or something – and the rock slam vanishes off the thing. It goes down to a DR suddenly.

This is rather typical. You haven't opposed it, but it suddenly dropped down to DR. The thing you got it from went out. But it still had a rock slam on it, but then all of a sudden, as the pc cognited, that disappeared. You'll find out right after that as long as it rock slams the pc is happy with it. But the second it ceases to rock slam he's unhappy with it. I mean the interest is accompanying the rock slam, don't you see? And the pc will all of a sudden find out something you're doing wrong with your meter, or something about you. Pc gets unhappy with the auditor, the auditing session, he never attributes it to the wrong item. He'll go on and hang onto the item. But there's a tone curve here. There's a shift. Well, don't ever attribute it to anything but the Routine 2. There's something wrong with the Routine 2.

You got to continue that list. Now, once in a blue moon you'll get yourself in the serious situation of having a list you can't continue, "In present time who or what are you upset about?" Now, you continue and the pc's upset. Well, you can go on and continue it and you eventually don't find a rock slamming item. Well, don't make the foolish mistake of going on and list fifty-five pages on it to find your next rock slamming item! Because it isn't there! You already got a pc that's overstrained on listing oppterms. List something like, "Who or what'd be upset about these problems that you've listed here on this list?" Something of that sort, but get it over on the other side of the picture here. You'll come back and find the item that was going to be there anyway. Pc couldn't confront it, didn't put it on the list.

Now, there's your main danger as you train auditors. One, that they don't learn that mild ARC breaks and upsets stem immediately – and little ones – stem immediately for just corny auditing. You know, Q-and-A, Q-and-A, Q-and-A, Q-and-A, Q-and-A, Q-and-A, Q-and-A, Q-and-A. Pc a half an hour later is still trying to tell the auditor, "I thought you said 'express,' not 'suppress'!"

"But I didn't say 'express,' I said 'suppress'!"

"I know, but I'm trying to tell you... "

"Well, but I didn't, you know. I-I know. Awfully sorry if I did, but I-I really didn't, you see? I really huh, ha-ha, oh..."

Now, I'm talking about those things that don't pass away with the session. You know, these things that are – this guy is, "I-I don't know whether I'm going to live or not, you know? Huh-huh-huh. Life looks pretty hopeless to me, now." You know? You see somebody walking around that's been run on Routine 2, man, don't assign it to auditing skill, lack of, see? Just assign it to Routine 2. And you'll always be right.
You start to go into the end of the session, the pc was happy with the item and it rock slammed and the pc had some cognitions. And all of a sudden, the pc has an ARC break because you didn't have the meter plugged in for the can squeeze. Say the item again. It isn't rock slamming. Well, you just grabbed one too quick off the list, that's all. Isn't the pc's item. Check to find out a lot of things.

Now, never run a pc darker and darker and darker and more compressed and more and more caved in, and so forth. Just – when you notice that this is occurring, come off of it! There is no cycle, they don't get darker and lighter.

Just come right off of it. Second you notice something like that. When you... Now, here's another never. Never give a pc an item and do something else. Oh, I see somebody's had that happen to them! That is about the most distracting thing that can happen. Your chances of giving him a wrong item are great even though you can really ride the bicycle down the middle of the road. The reason why is, you see, you've got this five-page list and it had two rock slamming items on it and you extended it to seven pages, you got a beautiful rock slamming item. There it is, it matched the same thing that it came from, everything is fine and it's just fine and we say to the pc, "All right," we say, "Okay, now, there's your item, 'tiger.'"

Pc is going to have some things happen that are right or he's going to have some things happen that are wrong. And it's up to you to make that test of observation. And let me give you the never. You see, never do something else. Never give a pc an item and do something else, even when you think it's conditional. And never make the pc think that you're giving him an item when you aren't. That also you will... may goof with someday. Pc understood that you were giving him his item. And you were simply tiger drilling out a little DR that you had found, to make sure.

The pc has glommed onto this thing as his item. He didn't understand. Because pcs are not in a good state of comprehension when they're in the midst of a long list and all that sort of thing. You know, you can get into the most asinine windups and foul-ups that you ever wanted to get into. Make sure the pc knows what you're doing, see? Give him his reality factor. Tell him lists rock slam, tell him they don't rock slam, don't tell him what rock slammed, though. See, he'll fixate on it.

Don't – because this is this other never, see? Never give a pc an item, whether it is the item or other item that is going to be the pc's item or that the pc is going to think is his item and then do something else. This is a very serious thing for you to do. I'll give you an example: "Well, we found your item here, now. It's 'tiger.' Okay. All right. On this item 'tiger' has anything been suppressed? Okay. Oh-ho, that was clean. Anything on this item, 'tiger' – anything been invalidated?" and so forth. Don't be surprised if a chair hits you over the head!

Honest, this is just not a safe thing to do. I'm talking now about personal safety as far as the auditor's... *It's just not safe!* In the first place you've already put him in a state of shock! [laughter] Now you've given him, "On this item has anything been suppressed?" "Huhh, duh, huhh, huhh." It's, "Who are you?" you know? Even if it is his item or isn't his item. If it is his item you can get away with it once in a while. And brother, if it isn't his item you're liable to get his chair around your head. You really are.
See, you haven't allowed that minute or so there of good observation. What effect did this have on the pc? Your eyes must not be on the meter and you mustn't be doing something else when you give a pc an item like that. You've had this final R/S, nice thing, it seems to be a reliable item, and so forth, you've gone down the list, you've checked two or three of them. You say, "I'm just checking over some items here to see what they are." Put in the R-factor and "Everything's coming along all right." A little H-factor. And you know now, you know, pc doesn't know yet.

You make that a bit of a ceremony, see? And you pull that E-Meter up to you and then you look at the pc. You don't look at another thing. And you say, "All right. Apparently here your item is 'a tiger.' You got that? 'A tiger." And you watch that pc. And you watch him like a hawk. Because the wrong item, in those first few seconds, his face is going to darken. His eyes are going to go back in his head. His certainty level is going to alter. He may be in a comm lag for quite a little while before he has a certainty. And then it very well might be the item.

But you got to know some things. Did sudden mass appear? When you said it did he get a sudden mass? Sudden... does anything else appear in his perimeter? He'll say, well, yes, he's seen something, but it always seems to have been there. Well, take that with a grain of salt. That doesn't disprove the item but it's an indicator that it's wrong. Face gets dark after you've said it – uh-uh, that ain't it.

Another thing, pc may look sort of stunned – they usually do. Because you've hit them with something that they haven't been aware of for ages. The – actually the shock of getting one of these items delivered into your paws as a statement by the auditor. You can go over them on lists. Even then sometimes they get a shock from it. Sometimes a pc says, "aghh" And you say, "What's the matter?"

"Well, I don't know, you read 'a cat whisker' there and a horrible shot went up my spine!"

Well, that again savors of some of this other stuff I'm giving you. Don't let the auditor go on down the list to the next item and the next item and the next item. Let the pc tell you about this cat whisker, because, by God, there may be a cognition on it which has got it held up, see? Just say, "Well, how about this – well you – you got something to say about that item?" So forth.

"No, it's just this terrible spine, you know, it went up my back, and went zzzupp and wuff!"

And you say, "All right. You okay now?"

"Yeah. Oh yeah, it's all right." Go on down with your list. You understand?

But you can do a sudden shift of attention on a pc and put him into a hell of a state of tension. You hit this thing "cat whisker," see? It's followed by – it's followed by "waterbuck tiger," see. All right. "Cat whisker" and the pc says, "Ulp-eeep!" And you see the needle go off the dial – frown at him for the needle having gone off the dial, you know – and say, "Tiger. Waterbuck." You want to see a pc go right on in a cave, see? He's... you've fixated his attention and then slapped him, see, by shifting his attention.
So, the strongest item, even though it doesn’t produce bad effects on him, the strongest item you can give him, the one most calculated to stun him, is an RI. So you just don’t dish this thing out, you see, like an old plate of soup, you see. You really serve him up this one on a silver salver, you know. Take your... don’t take your eyes off the pc, you hear me now! Don’t take your eyes off the pc. Don’t go into a lot of chatter.

Sometime he will wonder, he will ask you, "Why are you sitting there so quietly."

"Just thought you might have something to say about it."

This gets him into thinking about it, you know. And he says, "Oh well, yes, a tiger." He's looking doubtful. You really can't tell what's going on yet or not. You haven't really been able to ascertain if he was getting darker or lighter, you're still in a little state of doubt yourself with regard to this thing, you know. He'll go on, "Huh! Wonder if that's why I've got fur on my ears! You suppose so?" Then recognize what you're looking at, see?

Now your next test: Does the rock slam continue as he talks about it or does it suddenly vanish? Ware shoal, if it suddenly vanishes. Now, get that meter so that while you're – while he start – after he starts cognition, you see, that's the second period. You've already got your period of inspection, then you've got your cognition period, if you want to get real technical, following that. You'll see that thing R/S, as long as he has cognitions on it.

And actually, if it's a real RI his cognitions on it are endless. It just goes on R/Sing. That's perfectly safe.

But you can get an item which is not the last item on the list – there's one still on the list to get, which R/Ses for a moment, the pc cognites for a moment, everything seems to go along beautifully, all tests are in. And then you sit back all ready to shape it up or find out whether it's a term or an oppterm, getting ready to list something to it, and the pc says, "Well, there've been quite a few times I've suppressed things in this session."

Oh, yeah? Here we go! Ha-ha-ha-ha! That was not the last item on the list. That was not the item. You didn't have your paws on the item. And that there is this funny condition where everything... there is one – this can happen – that the inspection is all right. He doesn't seem to get more mass. He seems to be cogniting. His skin tone is lighter. Don't you see? All this seems to be fine. And the R/S was there. And he gives you this cognition. And you look down and get ready to drill the doggone thing, you know – to find out whether or not it's this way or that or commit overts, you know – and he just ran out of R/S!

In other words, it blew as a lock on the right item. And at that moment it will follow the whole chain of sequence of a wrong item. Mass will show up, he will get darker, the R/S vanishes down to a DR. It's interesting. So that period of inspection is very important – very, very important. And never shift the pc's attention during a period of inspection. Just never shift his attention onto something else or doing anything else. Never do anything during this. It's quite important. And that way you'll save a lot of heartbreak on the thing. He won't get all tangled up and very ARC broke, then, if it's the wrong item. And you say, "Well, did any – any mass show up there?" Of course, this is not shifting his attention – he's right on it, you know?

"Oh, well, yes, this big, big round sphere showed up on the end of my nose."
"Yeah. Well, all right. Seem like your item all right?"

"I guess so. I-I-I guess, possibly."

His face is getting darker, just as you watch him, see. Thing to do at that moment – thing to do at that moment is just don't let it go any further. Say, "Well, all right. Now, I myself would like to make just a little bit further test on this if it's all right with you. I would like to list the list a little further."

He brightens up. You can add the fatal words, "That's not your item," and he'll brighten all the way up. You understand? But boy, you have to be pretty good. Because if it is his item and you tell him it's not, you also got an ARC break.

You get – you get how this little period goes? This is – this period of the presentation of the item to the pc can be the difference between a case that runs smoothly in spite of goofs and a case that compounds the goofs into a real – a real upside-down, backwards-and-forwards God-elp-us, see. The longer you let a pc keep a wrong item, the longer you list a wrong item, the more collapsed the pc is going to get. So in all patch-ups, when you decide to patch something up, patch it up accurately and patch it up now! Don't ever let your heels drag on patching a case up. Do it straight away.

The longer you let that case go, with everything wrong way to and so forth – in other words, you're not quite sure so you – I... this is the way it is. This is another never, is just never persist with a wrong action because you don't know what to do to correct it. Just never persist with a wrong action.

Lot of your difficulty comes from the fact that you persist occasionally with a list when you don't know what else to do. Well, you've got to do something. Actually, it'd be far better off... Somebody was telling me the other day he didn't have time to study the pc's case. Well, I don't know. I... you can take a pc's folder and look it over. It doesn't require any vast amount of time.

But in actual fact, rather than persist with a wrong action it is far, far better for you to say, "Well, put your cans down on the table there. I want to take a look at your line plot and go over this with you, right now." And it's far better, if the case is running wrong, to straighten out the case on session time. I'm not recommending this. But you would be far better off to straighten it out on session time than to persist with some kind of a wrong action just to put in auditing time! You understand?

You... it's a good – it's good sense to find out what you're doing before you do it! And it's very, very necessary to come off an evident wrong action the moment you discover it is wrong. Now, I'll give you an example. We say list the list both way to. "All right," you say, "Well, how much is a list – how much of a list do you have to list?" So I say to you a page. All right. That is actually one of these "dumb-ox" type responses, see? How do you ask a pc if he's tired, you know? So you say, well, you say – ask him, "Are you tired?" You know?

Now, let's look at this thing sensibly. You list it wrong way to, when do you come off of wrong way to list, in actual fact? Keep your eye on a pc. You'll see him getting darker. He starts to get – his skin tone and so forth starts to darken, well, his needle starts to tighten up, it's less loose than it was and so forth. This is only four items deep on this list. Oh, hell, get
out of there like a scalded cat! You say, "Well, that's fine. Thank you!" He's still listing, you know. "Thank you. Thank you. Thank you. Thank you!" And he manages to get the brakes on and he stops.

You say, "Well, that's all of that. We're going to list this list the other way, apparently it is the other way." And you start listing that and you say aw... or tell him the truth, you know, "I'll have to confirm it the other way," if you haven't listed that yet – "And we'll go on with this."

In other words, don't persist with an action which is obviously worsening the case, hoping for the best. Now, there's an example here... This does not mean somatics. Brother, somatics have nothing to do with worsening a case. Cases improve up through somatics. Something that's wrong with some of the cases you will audit from time to time, is that they don't -- aren't getting any somatics. No pain. They don't get any sen. Well, it's a happy win, when all of a sudden they start to get pain or sen, don't you see? Somatics turn on, so you're winning. So, just because a case is getting somatics don't think it's getting worse.

I only would add that if I'd -- had not -- on occasions been remarked to me: "I had to stop the process because it was giving the pc so much pain." And I think of this poor pc sitting out in North Umbrella, California – ha-ha-ha! Who somebody stopped a list on because they were -- you know. Ho-ho-ho! It makes me feel bad.

So somatics aren't this. These are these other signs. Mass is obviously closing in on him. He's obviously getting darker. His eyes are going way out of gear. There's something going on here. The pc is looking older, and so forth. You'd better make damn sure what you're doing. Now, on occasion, a pc has gotten quite sick at his stomach. But actually, this has only been from a questionable source. There's something a bit wrong with the source or a wrong way to. There's been something wrong with that, when they get very violently sick at their stomach and start throwing up or something like that, or diarrhea or something. There's something wrong with the source. In other words, some -- usually it was an item which was picked out of the middle of an arbitrary list. You wouldn't expect that normally as a reaction.

But if it did happen as a reaction and I was absolutely sure of why I was doing it, I sure would go on with it. But don't ever persist with a wrongness. Now that you know that thing is wrong, knock it off now! See, just skip it! Pc is turning a bright green, don't keep on until he's a brighter green. Don't consider that you're always flawless and that you never make mistakes. You're going back, patching up neglected items, bypassed items. You're looking at this line plot and you're patching them all up and you're -- you're opposing all the bypassed items on this case. Getting it all up to present time. Everything is fine. And the case is coming along right. And you're listing and the case starts to look slightly yellow. And you list another -- this, if you didn't follow this rule would be what would happen, see -- you list another ten, fifteen, twenty items, the pc is now pretty yellow!

Now, you list another thirty, forty items and the pc is just... now got much yellower and starts to turn black around the mouth. "Oh," you say, "well, we really haven't proved the point yet, so we will list another seventy or eighty items on this thing." Pc's tongue starts to swell up and he can't get it out because he can't get his mouth closed over his tongue, so forth. You say, "Well, that doesn't prove very much, everything..." [laughter] "This list ran it in and
therefore will run it out." [laughs] No, it won't! Oddly enough it'll only run out when you take the source and complete the list the source came from, you know? You've got to complete the source list. That's what's wrong.

You're doing something wrong with an item. You can also do this with a wrong way to from a right item. There aren't too many things here that go wrong. You're working with a finite number of things, but they can add up to several combinations.

Anyway, you go back and you take a look at this to find out where this doggone source came from. And by God! A represent of a rock slamming item has gotten by you! Somebody at, well, some time or another had done 3D Criss Cross on this character and had left this item sitting there and it wasn't identified immediately to your view as having come from a rock slamming item. Or maybe you did it yourself at some time or another and you hadn't noticed this interesting fact – wrong source. So everything is going into the soup in a grand fashion.

No, when you see something going wrong, don't be nervous about it, you're not going to kill anybody if you know your business. It is only the amateur surgeon that leaves his tools inside and joins the AMA or BMA. You know? It's only the amateur. You know, something is wrong with the fellow's knee, so they cut off his foot, you know. And then they find out they've cut off the foot of the wrong leg! [laughter] So they cut off his arm because he irritates his knee by scratching it. [laughter] And a low-toned government, of course, gives him medals for doing it.

But the main point is here, they get into some wild thing of really not knowing what the hell is wrong, but trying to look good and trying to go on and not try to go back and understand what the hell they're doing that makes it go wrong. So therefore, you want to develop a very bright eye on the subject of the pc's appearance. And you can get it down to where actually you can tell a pc's difference of appearance, the then-now, you can tell it in any given ten minutes. It starts to worsen in any given ten minutes, let's find out what's going on. It's not – nothing to be nervous about. Nothing to be nervous about, but it just picks a pc up, it saves auditing time like mad, See?

Actually, a pc can take an awful lot before he kicks the bucket. He can. He can take a terrific amount. He can take an awful beating. You'd be amazed. And recover from it. If you remember the earlier never, is don't try to heal it up with something else. If he got bad on Routine 2, then he'll get better on Routine 2. Providing it's patched up properly.

Now, you can start compounding a felony by the case has had three case errors on it so you add a fourth. Now, that's wrong, so you add a fifth. Now, you find that's wrong, so you add a sixth. Well, the never here is to never let case errors accumulate or multiply. Don't let case errors accumulate or multiply. It's all right to have had two or three errors on a case, so what? But the second that you're aware of the fact that there is an error on the case, why, put it together. Remembering that one of the errors on the case is to fail to complete a cycle of action.

You're going down the list "pocketa-pocketa-pocketa, it's a right way to list, it's going beautifully, it's "Who or what does present time consist of?" Pocketa-pocketa-pocketa-pocketa, you're going right down the line, everything is fine, rock slamming, you're going to
get an item. And halfway down that list you happen to get – halfway through the list, you happen to discover that the pc is – "My God! This pc has been upset and rather ARC broke, ever since we found 'Valhalla.' I hadn't noticed that before. And 'Valhalla' has never been opposed, and it probably came from an incomplete list. Ulp!"

Well, the way you multiply the error is abandon the list that is now running all right and leave that as an incomplete cycle of action and go back and patch up this earlier action, you see, because that's liable to lead you to another earlier action and then you abandon the patch-up of the first one you found and you go back to the second one, the earlier one and patch that, and you're just multiplying errors, don't you see?

Now, it is a toss-up. Let's say the... it's the whole question is answered by, "Is the case running all right?" And it's a toss-up. It's a toss-up. Apparently the pc seems to be interested in the list we're doing. We're all of a sudden aware of the fact the pc's apathy is probably coming from something a bit earlier. And we look this up.

Well, in that case the pc isn't running all right, is the pc? See, there's your point of judgment. And there's a rule that can go along with this, is before starting a new action make sure that all of your earlier actions are correct and complete. And you'll always avoid having to make that gruesome decision. Now that we know why represent lists look so funny sometimes and now that we know we must never take an arbitrary list – and I mean never.

You know, all lists stem from an arbitrary source. They all do. And you can be slightly unlucky. Well, you take an arbitrary list. Just like the List One we're using, the Scientology List One. That's an arbitrary list. And you assess that thing and it's not a complete list. The reason we got away with it to the degree we did is because the pc had never listed it and therefore was not complete or incomplete. But the pc very rapidly restimulates on that list and you get more than one R/Sing item on it or something like this and of course, it's obviously an incomplete list, because it follows – whether the pc listed it or not – the rules of a complete list. So therefore, we have to find out what it came from and complete it.

But look, what it came from is an arbitrary point. See, although we're abandoning arbitrary lists or precanned lists and aren't doing them – see, good training, and so forth. In desperation sometime you're just going to get tired of this pc and you're going to say, "Well, I'm just going to oppose 'auditor' and see what happens." And you're going to get away with it and that's all right. Auditing's always been what you could get away with.

But remember the point you depart from to get his first List One listed by the pc is also an arbitrary point. You had to select it. Now, to reduce this, clearing the auditing command is always good sense. There are three universes for listing. There's the present time physical universe, right up in PT, that the pc is cheek by jowl with in his life and liveliness. There is the second universe which is the universe of auditing. And that's the auditor and the meter and that sort of thing, and now the reason that has to be separated out as a separate universe is, you know, some pcs will sit there rock slamming like mad and never realize they... there's anything wrong between them and an auditing session, and making no gains at all. You'll run across this phenomenon often enough to make this an important division.

And then you've got your third universe of the parts of existence. That's slightly less than whole track. Then in view of the fact that we've got positive and negative on all these
things, here are six potential lists. The three basic universes, positive and negative on each one, six potential lists. I've just given you another variation tonight. List each one of them as a terminal list or each one of them as an oppterminal list, and of course, you have a brand-new series on the thing, and you have a total of twelve. You get why the variations are, because you can have an oppterminal negative and an oppterminal positive, and a terminal negative and a terminal positive.

Now, you can also make an error – there are two errors you can make here – one is failure to clear the auditing command from which you're getting this arbitrary source point. You're already using an arbitrary source point, see. And to fail to test it and clear it – let me put it that way – to fail to test it and to clear it. Now, what do you test it for? Well, you're going to test it for R/S, because you're just never going to list a... represent a rock slamming item. Never. So the first thing you're going to do is test for R/S. I don't care what it is! Test it for R/S!

Now, you can segment it and test the segments. Sooner or later somebody's going to – going to rock slam on, "Who or what..." You read him the question and see a – see a vit! of a rock slam and read him sections of it and you're all of a sudden going to find some section of that thing R/Ses. Well, if it's a represent list you better omit that section, man! See, that's a never represent a rock slamming item. So therefore, that continues over into never represent a rock slamming question. And beyond that point you rather takes your chance.

But here's a way of narrowing the number of chances you take. Clear the auditing command with the pc and vary it around until it gets real to him. "In present time who or what are you associated with?" He can't make it. But "In present time what is he in contact with?" That makes good sense to him. He seems to be able to list that. You got this?

So, as far as the list is concerned, is never try to list a list question that the pc cannot answer. That sounds awfully elementary, but it's already happened. In other words, clear it with the pc and get it squared away so the pc knows what he is supposed to answer here. Get his agreement to answer this thing. And you can have an ARC break or an upset or a wrong list and so forth, just on that crazy little point.

You just make up your mind carelessly someday, you just carelessly, bang! – or you'll see some auditors do it that you're supervising – carelessly bing! He'll say, "All right, what's present time consist of?" He just audited a pc a short time ago, you see or you have, and he had very good luck with this list. So you know it's... And case is going no place. The guy can't list and he's obviously having trouble, and so forth. This is – this is an auditing error, not an R2 error, more than anything else, because "clear the auditing command" has always been part of auditing. Although we haven't been doing it or stressing it very hard lately, I'm stressing it hard here, because it goes right over into a Routine 2 error.

And you get some little boy or something and he can't answer this, it's just too many words and too much this and that for him. And he cant list it. He doesn't understand it. And you finally say, "What's here?" or "What's life?" You know? And he lists it like a bomb. "What life are you living?" you know, or something. You know, you clear it around until it's something he can answer.
All right. Now, you can get a missed withhold effect – this is quite important – you can get a missed withhold effect by listing in the wrong universe of these three universes. And as I told you in the earlier lecture, you can get various dead horses, skunks, cycling lists, and so forth, by taking a wrong way to. You know, you're listing a terminals – you're listing an oppterm list, you should be listing a terminals list. You get the idea. The "Who or what would have these problems?" is what you should be listing. "Who or what would have these problems?"

Now, you can get a similar mess by choosing the wrong universe. You should be listing the auditing session and you're listing the present time environment, the life and livingness universe, you see, of the pc, or you're trying to list the parts – the wheel of life type of thing, you know, the dynamics list, and so on, when you damn well ought to be running his life and livingness. And he'll actually ARC break – this is an important point to you – he'll ARC break just as though you'd missed an item. That's worth knowing.

He won't ARC break the same way just by reason of not clearing the command or something. He'll go on and try and he won't ARC break. But you should be listing the auditing session and you go and list the parts of the universe, you know, or the parts of the dynamics. The guy's acting just like you missed an item. And you can't quite figure out what the hell's wrong. Well, the thing is, is you missed the whole universe. See, the next item ready to come up was an auditing item and you didn't ask for it. So that is a danger. It won't be regular and routine and you won't always be doing it.

So there's always a little bit of luck and a little bit of thought goes into choosing what type of a list to list on this pc. So it's got to be the right universe and it's got to be the right terminal or oppterm – whatever's going to come up next. Don't feel too bad if you occasionally hit a dead horse or something like that.

But, the final never on this whole list of nevers – I don't pretend that this is a complete list of nevers – well, they haven't all been invented, you know? But these are some principal ones that are quite interesting – is never in your anxiety to clear somebody or pacify somebody who demands auditing, never fail to get out of the road his hidden standards and gross unseen present time problems before you try to clear him. That is what Routine 2 is designed for.

Actually, it's designed only to get out of the road his PTPs, only to get out of the road his hidden standards, clear the way, open up the track and get the fellow so that you can find his goal and clear him. Well, never omit that step. Because the only thing that's been chancy about clearing and the only thing that's been sour with clearing, general, on a broad basis, have been wrong goals. And the source of wrong goals are the existence of present time problems and hidden standards.

On a very few pcs, no goal at all could be found, it was so serious. No goal at all could be found. Endless, endless, endless, endless, endless lists! Well, those endless, endless lists are not caused by a charged up goal list. You're listing on by a present time problem and you are listing straight on by, all goofed up, a hidden standard and that is squarely in the road of everything you're trying to do.
Because it is: goals go out hard, cases messing up, pcs sort of ARC broke, you can't quite... your liability of getting a wrong goal is very great. Now, you get such a good clean, clean goal, when you've done your 2-12 real well on a pc, that it's very well worth knowing. It's just happened, I just got a despatch just before I came over here. It was rather remarkable, but they'd run this pc on 2-12 and they'd gotten something on the order of about six items, three packages. And they did a goals list and the goal is right there! See? I mean, you know, practically number one or two on the list. Rocket read every time! No suppresses, noth... every time you say the goal – beautiful rocket read.

Now, as you know in your experience with 3-12, I mean with 3-21, the number of times you find a virgin goal, when just found, it reads and then it flicks and then it reads, you know? That kind of behavior. You almost never can get one of the confounded things to read, pow, pow, pow! Every time, you know, rocket read, rocket read, you know? And then you don't have to worry about suppresses or fight with the pc at all, you just keep reading it and it keeps reading.

Well, they've just found a goal like that and it's the first one that's come up the line. It's got reported in here from California. And I think it is quite, quite interesting, because it's in actual fact, the first Central Organization goal that's been reported after the fact of having run 2-12 on somebody. Interesting.

Well, most of the troubles you are having – you go back and review lectures and notes and so forth from 1961, 1960. The troubles which were recounted are centered around PTP and hidden standards. And that's talked about and talked about. There were innumerable methods used to get by these things – nothing got by them. Now, that we can get by them, with Routine 2 – it is not a simple process, it is one which is – requires precision, but it also doesn't have endless bugs in it.

It's got plenty of indicators, and I'm grooving it down to where the indicators are better and better, and more and more noticeable. That's my job right now. And to cut down the amount of work done before you hit the nail on the head.

So happens, that this process – Routine 2-12 – also does more for a case than anything we've had before. But understand the relationship here. See, that it does more for a case, that's just dandy. We're very happy with that. That isn't what we expect of it. But it just so happens it does more for a case. So it's a natural to run on almost anybody. Raw meat or anything else. You're not telling them, "I'm going to run this to get your goal." You tell them, "I'm going to run this."" When in actual fact, you're trying to sweep enough items aside so as to pave the way toward the goal. Therefore, it is up to you to run very smooth 2-12 and very rapid 2-12 – very smooth, very rapid. Because the more you goof it the harder it will be to get a pc's goal. The more wrong items you find, the more garbage you're leaving in PT, see? You're really strewing the track. Fortunately 2-12 takes it apart. So the final never turns up and that is: Just never mistake the purpose of 2-12.

Thank you very much.

Good night.
A TR demonstration given on 16 January 1963

LRH: This is Ron and we're going to do a series of demonstrations tonight of TR 0. And these demonstrations are made with the coach, who is a senior student, and a student in the thing is the newcomer.

Now, your attention is put on this because the teaching of TR 0 is quite important. It's the number of TR 1, 2, 3 and 4 that a person does, actually, which makes his auditing presence. And it's the best way we've ever found to make auditing presence and so this is the way we make auditing presence. And you should get used to these because you will be taking back to your area a good concept of what the TRs are all about.

We'll – probably at a later date we'll work hard on the CCHs so that we can give you those as well.

The essence of TR 0 is to teach a natural confrontingness. You go into an Academy where new students are first beginning to audit and you will see a tremendous stiffness, a fantastic stiffness. Now, actually, it goes this way: They go into the co-audit and they are not so stiff, they don't seem to be so stiff. They seem to be more relaxed. But, nevertheless, you will see them sort of lose their grip on their confront because it isn't indoctrinated into them.

And it's like golf. Very often a brand-new golfer goes out, picks up some golf clubs and away he goes and he starts making holes in one and so forth. And then he, all of a sudden, cracks up and he's totally incapable of striking a single stroke; it's not possible. And from that point on he has to be taught. And for quite a little time then he's a complete duffer. He's become self-conscious about his grip, he's become, oh, all kinds of mechanisms he's learned and all this sort of thing.

Well, actually, our present TRs are calculated to bring a person up through this with the greatest possible rapidity.

Now, the basis of the TR is simply to get the person to sit there and confront. You ordinarily find out he confronts with something. He's confronting with his belly, he's confronting with his nose, he's confronting with his hands, he's doing everything else.
A little bit later stage, why, you've got him confronting with a professional attitude and an interested attitude and, other things of this character.

And the best way to do is to have him put these things on. Just hour after hour of sitting there confronting the coach and the coach doing nothing is not going to do very much TR for anybody. No, the coach has got to be good.

Now, the TRs are actually as good as the coach. If a coach gives too many flunks and too many loses, of course, the quality of the TR goes down. And if the coach gives the pc, or gives the student, rather, some wins, why, the TRs goes up.

All right. Well, we're all set now. And we have Gordon who is a very senior student here and he is going to give TRs. And here we go. Start!

Coach: Okay. All right. Ian, this is TR 0. Confronting TR. Right? You're familiar with it, I assume.

Student: Mm-hm.

Coach: Okay. I'm giving an echo back here from myself. All right, now, I want you to relax and just confront me. Just straight TR 0. I won't be doing any bullbaiting on this. I'll just be here for you to confront.

Student: Mm-hm.

Coach: Okay. Just relax and confront me. Just you do that. Okay?

Student: Mm-hm.

Coach: All right. Now, we haven't started yet. When I give you a start, you can start. When I say, "That's it," that's the end of the drill for a while. Okay?

Student: Yes.

Coach: All right. Now, are you read? All right. Start.

Okay, that's it a minute. Now, just relax. Relax.

Student: Mm-hm.

Coach: Don't ...

LRH: This is an interesting case, this student here. He actually is doing a not-confront with several parts of his body. Quite interesting.

Coach: Okay, just be here. Okay? Relax and just be here. That's all you've got to do, and confront me. I'm not going anywhere. Okay?

Student: Yes.

Coach: All right. Start.

Okay, flunk. That's it. All right, you're not really being here. Get here a little better. Okay?

Student: Mm-hm.

Okay, flunk. You're staring at me. Start.

Okay, that's it. Relax. You're sitting there and your shoulders aren't straight. You're... Okay, just relax. Okay? What? To hell with the television, just confront me. This is a TR. All right.

Student: Yeah.

Coach: Okay. Restart.

That's better. Get here some more. Just relax and get here and confront me.

Flunk. You moved your mouth. Start.

LRH: Now, here's a trick. Let's find out from this particular student – he's sitting there with his chest sunk in withdrawn, his throat withdrawn, and so forth – let's talk about not confronting. Let's get this student to find out what he's not confronting the pc with there.

Coach: Okay. All right. That's it a minute, Ian. Now, are you aware of not confronting me with anything? Any part of your body?

Student: Yes.

Coach: Is there an actual effort not to confront me with something?

Student: No. Not an effort not to, no.

Coach: Uh-huh. Okay. Any part of your body you're aware of doing this with?

Student: No, not ...

Coach: Mm-hm.

Student: ...nothing I'm deliberately not confronting with. No.

Coach: Okay. Now, I want you to confront me, you know, not without anything and not with anything. Just you confront me. Now, you seem to be using – actually holding back parts of your body, all right, chest, throat

Student: It just feels like something...

Okay, that's a bit better. Now, relax some more. All right, relax. Okay. Get your whole body here; you get here. All right? Okay.

Student: Um.

Coach: Start.

That's better. That's better. Okay. Just be here. Okay?

Don't hold things back from me.

Okay. That's it a minute. I feel like you're still holding back from me. It's getting better. I can feel you better over here.

Student: Mm.
Coach: But you're still holding back from me. Okay?

Student: Mm-hm.

Coach: Just be here and relax. That's all. Okay?

Student: Mm-hm.

Coach: All right. Start.

Okay. That's it a minute. All right. Relax in here. Okay? Relax all that. I feel like you're drawing away in that vicinity. Okay, start.

LRH: And Ian is sitting there with his chest very badly sunk in and sort of going to retreat through the wall. And actually looks a little bit more like an hypnotized subject than he does an auditor. So I think we'd better walk him over here on the subject of a professional attitude.

Coach: Okay. That's it. All right, now, what is your definition of a professional attitude? Yours.

Student: Of my professional attitude?

Coach: Yes, your definition of a professional attitude.

Student: An interested attitude.

Coach: Okay. Now, what I want you to do is confront me with a professional attitude. Okay?

Student: Mm-hm.

Coach: Let's really be professional about this. Okay? Give them a good show. All right. Okay, now what are you going to do?

Student: Uh…

Coach: Okay. Well, how would you confront me with a professional attitude?

Student: Just look as though I'm interested in you.

Coach: Okay. Now, I want you to really do this.

Student: Yes.

Coach: Not just act it, you know, or pretend. I want you to really be interested. That's your definition, right?

Student: Mm-hm.

Coach: Okay. Really – really be professional. Okay?

Student: Mm-hm.

Coach: None of this, you know, holding back from me. You know, you've got to have command over me if you're going to audit me. Okay?
Student: Yeah.

Coach: All right. When you audit a preclear, you actually confront them. Okay. Now, I'm not here to – to overwhelm you. I'm here to help you get better TR 0. Okay?

Student: Mm-hm.

Coach: All right now, I want you to confront me with a professional attitude. Okay?

Student: Mm-hm.

Coach: All right. Start.

Okay, that's it a minute. Relax while you do this. Okay?

Student: I find myself sort of suddenly jump that way.

Coach: I could see your body jerking back and forth then virtually …

Student: Mm-hm.

Coach: Relax and be professional. You know? Know what you're going to do here.

Student: Mm-hm.

Coach: All right. And be interested here. Okay. Start.

LRH: Well, this student has a pattern here which is quite interesting. He's been made to sit very, very quietly for TR and he's obviously been flunked for batting his eyes so that he sits there with a very glassy stare and so forth. It's very funny – amusing watching Gordon there, because it's no doubt who the auditor is: Gordon obviously is. And yet Gordon's TRs are very good. He's sitting there in the chair all slopped over and that sort of thing, but he's really all over that student. You see? And the student is sitting there about ready to back through the wall and he's just got a complete, unwinking stare. And it'd drive any pc around the bend very fast.

All right, let's find an interesting attitude here. A more interesting attitude. Let's get him to do that several times until he himself starts laughing at this interesting attitude. Because he's really – we got to pick this to pieces. He's really got some kind of a notion there as to what he's doing, you see? He's all gimmicked up like mad: you don't wink your eyes, you sink in your chest, you withdraw, you're self-effacive. He's got a lot of things there if you could just get him to talk about them. Okay?

Student: Mm-hm.

Coach: All right, now, you've got, I've noticed and Ron has also – you know, I can hear him through these, he comes through occasionally – got mechanics to the way you're confronting. You're really staring a good hole through me that time. You know?

Student: I guess…
Coach: It's confronting. You know? And I want you to confront me with an interested attitude. Are you afraid I'm going to flunk you, here? Are you sitting here scared to death I'm going to flunk you?

Student: No, I'm – no.

Coach: Okay. Well, don't worry about it. If you flunk, you flunk. You flunk a million times, why you flunk a million times. And you have to have more, well, power than I do in this situation. You're confronting me. I'm the pc here. Okay?

Student: Yeah.

Coach: You know? You've got to be controlling me here, not me controlling you. When I say start, I want you to confront me with an interested attitude. And be aware of what you're doing.

Student: Mm-hm.

Coach: Okay?

Student: Mm-hm.

Coach: All right. Start.

Okay. That's it a minute. Okay, want to get comfortable?

Student: Yes.

Coach: Okay. You comfortable?

Student: Mm-hm.

Coach: All right. Now, I want you to confront me, not stare at me.

Student: Mm-hm.

Coach: All right? I've got a whole body here.

Student: Mm-hm.

Coach: All right. You can confront the whole thing, if you want. Okay? All right. You don't have to just stare at me. All right. And be interested. I want you to assume an interested attitude and confront me from that viewpoint. Okay?

Student: Mm-hm.

Coach: All right. Start.

Come on, man, relax. Relax.

LRH: The pc actually here has a look of just pure horror on his face. In some way he just looks completely fixated. Now, if we could get him to give us a dissertation on what he ought to be doing, it might be very interesting.

Coach: Okay, Ian, that's it. Okay. What should you be doing in this drill, to be doing TR 0?

Student: Just being aware of you.

Coach: Okay. But then, are you aware of any mechanics of how you should be doing this?
Student: No, as – as soon as I start being aware of you I sort of lose awareness of my own body …

Coach: Mm-hm.

Student: …as a property, you know.

Coach: Okay. Well, what do you do over there when you start confronting me? What do you really do?

Student: Just look at you.

Coach: At me?

Student: Yeah.

Coach: Okay. Are you aware of confronting me when you do that?

Student: Mm-hm.

Coach: Okay. Are you aware of anything else going on, of using things to confront me with or trying to look like you're confronting me, anything like this?

Student: Mm-hm.

Coach: Okay. Now. Good. Now, I want you to confront me now and be interested. And, I want you to be aware of what you're doing also. But I don't want you to introvert here on this.

Student: All right.

Coach: And I'm going to ask you in a few minutes what have you been doing? Okay? To confront me.

Student: Mm-hm.

That's a bit better.

Student: Mm-hm.

Coach: Flunk. You've got something going on with your eyes. You know, you're trying to do something there. Start.

Okay. That's it. All right. Now, what did you do then to confront me with an interested attitude.

Student: Looked at you, tried to look alive.

Student: Not very.

Coach: Not very. Okay. All right. Now, I want you to really be interested. Okay? Now, do you think you can get better at doing TR 0 here tonight?

Student: Yes.
Coach: Good enough. All right. You know, I really want you to get some good out of this. All right. Now, I want you to really be. No acting. Really.

Student: Yeah.

Student: I looked at you.

Coach: Okay. Did you do anything else to confront me? How about this interesting part?

Student: Yeah, I tried to outflow interest.

Coach: Mm-hm. Okay. Good enough. Can you find anything over here in which you can get interested, anything about me?

Student: Mm-hm.

Coach: Okay. All right. Well, really be interested. Okay? And you find something interesting over here, you'll be interested. Okay?

Student: Yeah.

Coach: All right. Okay. Start.

LRH: All right, this is the last one. We'll end this demonstration in just a moment.

Coach: Very good. You're looking a bit more relaxed there. Flunk. I didn't tell you you could move your head. Start. Flunk, you didn't start. Start. Okay. That's it. Okay, now what did you do then to confront me?

Student: Looked at you.

Coach: Okay. Did you do anything else? Good enough. Okay. How was the interest that time?

Student: A lot better.

Coach: Okay. Do you feel that we got anything out of this drill?

Student: Yeah.

Coach: Good. All right. Well, that's the end of the drill. Okay?

Student: Thank you.

Coach: That's it! Good! Well, there you go.

LRH: All right. That demonstration there was quite interesting because, frankly, this student is pretty badly gimmicked up. Finally figured out the – what this was all about. The mark of a good coach here, and Gordon did very well there, but the mark of a
good coach is a... his ability to find out. The mark of a good coach is the ability to find out what the – what the student is doing. And to poke it full of holes so that the student will come off these special things. And that last preclear, the last student, actually, was in the attitude of a pc to a marked degree, but was confronting with an idea. He was confronting with an idea. And that idea was what he was confronting with. Somebody told him at some time or another that all he had to do to confront was be aware of the pc and ever since that time he's had "be aware of the pc" sticking out in front of him. He himself has not been doing anything with the pc. Well, we'll cure him of that here at Saint Hill. All right.

Well, now, we've got another demonstration. Now, you just carry on. Start.

Coach: All right. Okay. What we'll be doing here is just simple TR 0 to start with.

Student: Yes.

Coach: And all I'm going to do is ask you to sit there, be comfortable and erect posture and simply confront me there. Confront me over here. You be here and be aware of me.

Student: Fair enough.

Coach: Okay. Is there anything you'd like to say before we start?

Student: No.

LRH: They're moving on into this. I noticed that Ann has the – some of the same tricks of her husband.

Student: Sorry.

Coach: Okay. Flunk for talking. Start. Is it okay if we start?

Student: Mm-hm.

Coach: All right. That's it. Are you aware of not doing something in order to confront me here, you know? You know, something that you should – that you are avoiding doing here?

Student: Yes, fidgeting.

Coach: Okay. Is there anything else here that you're avoiding doing?

Student: Yeah, it's uh-uh – crossing my legs and, you know, just to, you know, shift them.

Coach: All right. Good enough. All right. Just put your attention over here on me.

Student: Mm-hm.

Coach: And be aware of me – of me, don't too much care about that. Just confront me. Start.

LRH: Apparently both of these students have been trained on a "You don't confront, you suppress." And I never saw such a suppressed auditor valence there in my life. And
well, let's give her the works on a professional attitude, an auditing attitude. Let's give her the works on that.

Coach: All right. That's it.

Student: Mm-hm.

Coach: Let's move on over here to the professional attitude portion of this.

Student: Mm-hm.

Coach: Now, what – what to you is a professional auditing attitude? Tell me about it. What's a professional auditing attitude?

Student: Well, having your attention on the pc.

Coach: Mm-hm.

Student: Uh – and uh-uh just looking like an auditor, I suppose.

Coach: Oh, very good. All right, what would – what would looking like an auditor consist of?

Student: Uh …

Coach: Well, just tell – just tell me what looking like an auditor would consist of to you.

Student: I don't know, I sort of think of um – well, I don't want to use Ian's term, but it is being interested in a pc…

Coach: All right.

Student: I don't know, I sort of think of um – well, I don't want to use Ian's term, but it is being interested in a pc…

Coach: That's true.

Student: Uh …

Coach: Well, not having attention on yourself.

Student: Well, not having attention on yourself.

Coach: Mm-hm. Good. Anything else a professional auditing attitude would consist of?

Student: Well, not sloppy.

Coach: Just how do you mean that, not sloppy?

Student: Um – not slouchy. Uh – I don't quite get that, sort of, I would say, to be relaxed.

Coach: Okay.

Student: And without looking sloppy. That's all.

Coach: Well, good. Perfectly all right.

Student: Relaxed and interested is about …

Coach: All right. Fine. Then I'd like you to confront me with a professional auditing attitude here. All right. Start. A professional auditing attitude.

Student: Uh …

Coach: Confront me with a professional auditing attitude.
Flunk for laughing.

Student: Huh-uh.

Coach: All right. That's it. What did you do to confront me with that professional auditing attitude there?

Student: Uh, I put more effort into it, which I sort of, you know, realize isn't what I'm supposed to be doing.

Coach: Mm-hm.

Student: It was – it was an effort. Yeah, very much so.

Coach: Mm-hm. Okay. Tell me a little more about that. I'm not quite sure what you mean.

Student: I think of my face, it sort of tends to fidget and moves around here and uh – I try not to have, well, my attention on me rather than on you.

Coach: Uh-huh. All right. Now, tell me again just what a professional auditing attitude would be.

Student: Having your attention on your pc.

Coach: Mm-hm. Good. Anything else would be – anything more that would be a part of a professional auditing attitude?

Student: Just looking smart.

Coach: All right. What was that again?

Student: Looking smart.

Coach: Oh all right. Fine. Okay. Confront me with a professional auditing attitude. Start.

All right. That's it. What did you do to confront me with a professional auditing attitude?

Student: Looked at you.

Coach: Very good. Did you do anything else?

Student: Yeah, I do seem to be aware of doing extra things.

Coach: Such as?

Student: Uh – well, having quite an effort to just sort of put my body there.

Coach: Mm-hm. Okay. Is there anything you're aware of not doing, you know, just avoiding doing to have a professional auditing attitude?

Student: Uh – yeah, having attention on my face.

Coach: Mm-hm.

Student: That sort of, does tend to, well, I don't have a great deal of control over it. And often …
LRH: We've got a student here, by the way, who has buttons. And you would ordinarily have a button-punching approach here to this type of pc. Because this type of pc's a liability in an auditing session.

Student: I'm trying not to have my attention on my face or on this.

Coach: All right.

Student: That's one thing.

Coach: All right. Thank you. Now, what, again, is a professional auditing attitude?

Student: Having your attention on the pc.

Coach: Very good. Anything more on that? A real professional auditing attitude, you know, just a real pro.

LRH: The student is breaking up a little bit on this professional auditing attitude. I mean she can make it.

Student: I'm not totally certain on it, you know …

Coach: All right.

Student: It's just sort of having all your attention on your pc …

Coach: Mm-hm.

Student: … and not any on yourself.

Coach: All right. Fine. Then confront me with a professional auditing attitude. All right? Start.

All right, that's it. What did you do to confront me with that professional auditing attitude? What did you do?

Student: More attention on you.

Coach: Very good. Anything else you did there, to have a real professional attitude?

Student: No.

Coach: Okay. Anything that you didn't do there in order to have a professional auditing attitude? Avoided.

Student: Yeah.

Coach: Mm-hm. What?

Student: Avoided having as much attention on myself as I did have.

Coach: Ahh.

Student: I want to try it again, on that thing.

Coach: All right. Thank you. Okay. How is that different than simple TRs?

LRH: This student, by the way, is getting someplace under this coaching. Now, let's pull an interested attitude.
Coach: Okay.

Student: Ah …

Coach: Do you notice any difference in how you are doing this than sim... than confronting? Anything – this is above confronting and beyond.

Student: Yeah. A bit more relaxed.

Coach: All right. Very good. All right, we're going to move on to an interested auditing attitude. Now, just that, you know.

Student: Interested?

Coach: Yeah. Interested auditing attitude.

Student: You mean the auditor being interested and sort of being an interested auditor.

Coach: Yeah, that's – that's the idea.

Student: Interesting or just interested?

Coach: No, interested.

Student: Ah.

Coach: Interested auditing attitude. Could you sort of describe to me an interested auditing attitude?

Student: Well, I get the idea of a pc, you know, cockeyed listening with one ear. But you know, just listening to the pc, with your attention on him.

Coach: Very good.

Student: Mm.

Coach: Good. All right. Is there anything else that you – that an auditor would do to have a real interested attitude now? You know, interested attitude there.

Student: We'll just make sure he listens, that's all. To have his attention put there and not sort of all around the jazz around the room.

Coach: Uh-huh. All right. Very good. Then confront me with an interested auditing attitude. Okay?

Student: Mm-hm.

All right. That's it. What did you do to confront me with an interested auditing attitude?

Student: I moved forward a little.

Coach: Mm-hm. All right. Anything else you did to uh – to have a real interested auditing attitude?

Student: No.
Coach: All right. Very good.

Student: Not anything else I can think of.

Coach: Okay. That's fine. Now, tell me again, what is – what is an interested auditing attitude? You know, just…

Student: Well, a person who looks as if they're interested in the fellow at the other end of it.

Coach: All right. Very good. Is there anything special you'd do to look as though you were interested there?

Student: I don't think so.

Coach: All right. Fine.

Student: There's a…

Coach: Mm-hm.

Student: I think, no, there shouldn't be, but I think – suspect that, yes, I do. Uh – I get the idea I cock my eyebrow, I think.

Coach: Hmm. Very good. All right, we'll see how this goes then.

Student: I didn't get that.

Coach: We'll see how this goes and we'll do it again here, go back and see if there's anything else that comes up.

Student: Mm-hm.

Coach: All right. I'd like you to confront me with a – just – a – you're the auditor here, you know?

Student: Mm-hm.

Coach: Very interested attitude. Okay?

Student: Mm-hm.

Coach: All right. Start.

Student: Uh – I'm not doing it. Sorry.

Coach: All right. That's it. What happened?

LRH: Of course, it cracked her up and she gets flunked of course, she gets flunked for grinning.

Coach: Hm.

Student: Hm.

Coach: All right. Thank you. Now can I have a confront with an interested auditing attitude. Start.

I'm the pc, you know. Just be interested.

Student: All right.
Coach: All right. Just confront me. Interested auditing attitude.
   All right. That's it. What did you do to confront with an interested auditing attitude there? To be – be an interested auditor?

Student: Um – looked at you, yeah.

Coach: Okay.

Student: Well, I was sure I put more attention on you than other things.

Coach: Uh-huh. Okay. Is there anything you didn't do or avoided doing, you stopped yourself from doing, you know, that you held down yourself from doing – held yourself down from doing something?

Student: Shifting.

Coach: Uh-huh.

Student: And uh – being aware of the rest of my body.

Coach: Uh-huh.

Student: This is sort of hard for me to have to sit here.

Coach: Very good. All right. Is there anything that you shouldn't do beyond this to have an interested auditing attitude? That you really shouldn't do?

Student: Keep busy shifting.

Coach: All right. Fine. Is there anything that you shouldn't do to have an interested auditing attitude?

Student: Um, yes…

LRH: As soon as you get her flattened off on that a little bit, why, give her a "That's it, end of demonstration."

Coach: All right. I didn't quite hear that.

Student: Have your attention on yourself; you haven't got your attention on your pc.

Coach: Well, very good. All right. I'd like to do this again now. Interested auditing attitude – could you tell me again just briefly what it is.

Student: Having your attention on your pc and not on yourself.

Coach: All right. Fine. All right, confront with an interested auditing attitude. Start.
   All right. Very good. That's it.

Student: Mm-hm.

Coach: Okay? Did you notice anything there that you did in order to confront with an interested auditing attitude?

Student: No, I thought it was a bit – a little bit better perhaps. I sort of got more interest on you than – than I have had.
Coach: Very good. All right. We're going to end this off in a couple of seconds. What was that again? I cut you off.

Student: I seem to have more attention on you now than I had on you before.

Coach: Very good. Okay. Is there anything different, anything more to having an interested auditing attitude than simply to confronting? You know, anything – anything you noticed there that's additional to an interested auditing attitude?

Student: That I'm doing as an additional auditing attitude?

Coach: No. I'm sorry, I'm not getting that across to you. Is there anything that is more to an interested auditing attitude, you know…

Student: Than just sitting there.

Coach: … than just – and confronting – is there anything more to it?

Student: Listening.

Coach: Okay. Anything more to an interested auditing attitude than confronting?

Student: Oh, yeah, being willing to duplicate the pc, sort of willing to have him as he is.

Coach: All right.

Student: Without alter-is-ing him all the time.

Coach: Okay. Fine. All right, I'd like to end this off here.

Student: Mm-hm.

Coach: Thank you. All right. That's it.

Student: Thank you.

Coach: End of demonstration.

LRH: All right. This was a very interesting demonstration in view of the fact of tremendous difference between the advanced student doing the coaching and the person being the student, because the last two students have only been here since Monday, just three, four days. And we've got a big deal here of some kind or another of – there's a lot of systematized confrontings. And you understand that this idea of telling them to be interesting and telling them this and telling them that and so forth is simply to run out the buttons so they just don't keep on confronting by a system. And really, this can be stepped up to where you can break up almost anybody's confront. All right. Now, we've got another one going here. All right. Start.

Coach: All right, Ian, what we're going to do is some TR 0.

Student: Norman.

Coach: Sorry. Norman, what we're going to do is some TR 0. And I'd like you to tell me what you understand about TR 0.

Student: Just to be here and confront you.
Coach: All right. Very good. Now, I'm going to give you a "Start" and a "That's it" when I want to tell you something. All right? And I want you to just relax – just relax your body. All right. Fine. And just sit there and confront me. All right. Start.

All right. That's it. Now, how do you feel about the space. You know, how big...

Student: Fine.

Coach: All right. Well, how big is your space?

Student: The room.

Coach: Good. Well, am I included in your space?

Student: Of course.

Coach: All right, very good. Now, just relax your body, a bit more. Terribly tense over here. Just relax, okay?

Student: Mm-hm.

Coach: Just let go. Just let your body flop a bit. Go on, just relax your body. All right?

Student: I feel relaxed.

Coach: Okay. Very good. Now, I want you to be there and confront me. Start.

All right, I'm going to flunk you. Uh – you're staring at me. I want you to confront me. All right?

Student: Okay.

Coach: Start.

LRH: She's got him into pretty good shape there. Actually, he's a caved-in chest sort of a confront. He's not confronting with a lot of things. And it's a similar case: He's got a lot of not-confront going on here. He's probably confronting with an idea and not confronting with the chest, with the body at all. So, it might be of benefit to find out what idea he is confronting with.

Coach: Okay. That's it. Now, Norman, I'd like you to tell me what, you know, you're confronting me with? What do you feel you're confronting me with?

Student: Fine, just confronting you. But I was sort of trying to listen to what he was talking about.

Coach: I get it.

Student: Okay.

Coach: All right. Well, just – just relax a bit more, get your body you know, in the chair…

Student: Yeah, I think it's the word "relax" that might have a hypnotic command. You know?

Coach: I see. All right, well if I used "easy" would that be better?

Student: That's fine, I know what you really mean; it just bugs me because I used to use it.

That's much better. All right.

All right. That's it. Now, you're sort of tipping over to the side there. Can you feel that?

Student: Yeah.

Coach: All right. Just get your body relaxed…

Student: I'm confronting you more with one side of my backside. You know?

Coach: I see. All right. Very good. Well, just, you know, just get your body easy, nice. You be there and you confront me. Start.

That's it. You're still tipping over to the side there. Can you feel it?

Student: I always sit like this.

Coach: Oh, I see. All right. Well, just – just straighten up, you know, prop yourself up a bit. That's much better.

Student: Am I okay now?

Coach: Yeah, that's much better.

Student: I can't always tell when I'm doing it.

Coach: All right. Now, just relax.

Student: Mm-hm.

Coach: Okay. Start.

LRH: This student's confront, actually, is pretty grim. He's got some kind of a glee, g-l-e-e, going on there. You could very easily break him up, and so forth. And actually, the coach ought to walk forward to shattering the false composure he is sitting there in.

Coach: All right. That's it. Now, I sort of feel there's something real solid sitting there in front of me.

Student: It could be my bank.

Coach: All right. Fine. Well, just, you know, just get your body relaxed. Okay?

Student: Yeah.

Coach: All right, some more.

Student: I need to …

Student: I wouldn't be comfortable.
Coach: Just try it.
Student: I don't know how.
Student: I don't understand – let what go?
Coach: Forget about the people.
Student: No, I'm not interested in them.
Coach: All right.
Student: I'd like to know how to do it.
Coach: All right, just let your body relax. You know? That's much better. All right. Now, I want you to be there. All right? Just you be there and confront me. Now – now …
Student: Okay. Yeah.
Coach: ...I was – just before I was going to give you the start, I just felt you building this up again. Now, just let it relax. You know, just you relax, sorry.
Student: Yeah.
Coach: And you confront me. All right? Okay. All right, start.

Now, that's very much better.
All right. I'm going to flunk you for thinking, now, uhh …
Student: I am. I didn't feel as comfortable as when I started.
Coach: I see. All right.
Student: I felt I was very here when I started. But I don't feel like that. I feel like I'm trying to do something.
Coach: Mmm.
Student: You know, I'm trying to confront. And I – I don't want to try to do it. I – I was comfortable, sat up straight …
Coach: Mmm.
Student: ...and comfortable just sitting here, like when I started.
Coach: All right.
Student: I did – to try to collapse, I'm trying to do something and I don't like it.
Coach: Well, how are you trying to do this?
Student: Well I'm trying to sit the way you want me to.
Coach: Mm-hm.
Student: And I'm trying to sit the way you expect me to, you know the way you're telling me.
Coach: I get it.
Student: Uh – I – I sit up. When I sit down anywhere I sit up. I sit erect. I'm comfortable.
Coach: All right.
Student: I'm very comfortable.
Coach: All right. Well, are you sitting relaxed now?
Student: Yeah.
Coach: All right. Very good. Now, I just want you to be there now …
Student: Mm-hm.
Coach: … and you confront me.
Student: Yeah.
Coach: All right. Start.
LRH: He's having quite a time here. I said he could be rattled. And you heard how rattled he was starting to get. Now, he'd rattle the same way under a pc that started to fall to pieces. So it's much to his advantage as an auditor to get this broken up as early as possible. And, actually, he ought to be wracked up even more than he is being wracked up there by Mazie.
Coach: All right. That's it. Now, which way are you sort of aware of holding your body?
Student: This way.
Coach: That way. All right. Uh – you're tilting it which way, which side?
Student: I'm intentionally tilting it uh – so that this lowers because this shoulder is lower than this one.
Coach: I see.
Student: Normally. And I know in TR 0…
Coach: Mm-hm.
Student: …I'm going to get flunked for it. So I purposely push myself forward like this and raise this shoulder. I'm intentionally doing that, but when I'm auditing I just sit with this shoulder lower than the other one.
Coach: I see. All right. Well, let's see if the body can relax, let it relax …
Student: Yeah.
Coach: …so that you are there and you communicate across to me. All right?
Student: Okay.
Coach: Okay. Are you feeling more relaxed now?
Student: Yeah, I feel fine.
Coach: All right. Fine. Now, you be there and you confront me. Start.
All right. I'm going to flunk you. You've still got your body tilted over to the side.

Student: Mm-hm.

Coach: So I'm going to correct that for you. All right?

Student: Mm-hm.

Coach: Well, how does that feel?

Student: Feels fine.

Coach: All right. Are you aware of any change from before?

Student: No. Not much.

Coach: Okay. Just going to get this straight over there. All right. Now, just relax. Okay. That's fine. I feel you're much more here than when we started. All right?

Student: Fine. Yeah.

Coach: Good. Now, you communicate across to me and you confront me. Start.

LRH: I think we ought to ask this student for an amused auditing attitude. How would he look if he were amused. Because he actually looks like he's on the verge of laughing. And actually, it'd be murderous for a pc to be audited with that expression.

Coach: All right. That's it. Now, Norman, I want you to show me an amused auditing attitude.

Student: Oh!

Coach: All right?

Student: Christ! Really?

Coach: Mm-hm. Well before you...

Student: What do you mean amused?

Coach: Oh, well, you tell me what you understand by an amused auditing attitude.

Student: Well, immediately I thought of a joke I have with somebody, about an acknowledgment. It goes: Yeah, okay, yeah, all right, I heard what you said. And I sound somewhat amused, I mean, for me to be amused I'd have to sit with my legs crossed like this and just sneering.

Coach: All right. Very good. Well, you show me an amused auditing attitude. Okay. When I say "start," you can do anything you like to show me an amused auditing attitude. All right. Start.

Student: Well, that's ridiculous.

Coach: Go on. Very good. Carry on.

Student: Just take my frowning off.

Coach: All right. Good. Fine.
Student: Okay.

Coach: Just give it a go, you know. Just show me an amused auditing attitude. Let yourself go.

Student: This twitch is purposeful.

Coach: Mm-hm. All right. And some more. Let it go.

Student: I think this is better than the way I confront the other way, you know.

Student: I don't think I can do that now.

Coach: Uh-huh.

Student: I'm not really amused.

Coach: I see. All right.

Student: I don't know what an amused auditing attitude is.

Coach: Mm.

Student: I really don't.

Coach: All right. Well, that's it. Okay. Well, that was very good. Okay? How did you feel doing that?

Student: I was acting. Because I don't know what an amused auditing attitude is.

Coach: I see.

Student: I really don't. When I think of an amused auditing attitude, I think of my – me being amused, at an auditor, who has some type of sarcastic attitude. You know?

Coach: Mm-hm.

Student: But I don't see one.

Coach: And as an auditor, what do you understand by amused auditing attitude?

Student: Well, if the preclear told me something funny I'd laugh. I'd be amused.

Coach: All right. Very good.

Student: I think it would be all right, you know, if the preclear thought it was funny and uh – when we're in session and I felt like laughing, I'd laugh. I'd be amused.

Coach: All right. Very good. Well, how about showing me that.

Student: I can't laugh now, you haven't said anything funny.

Coach: All right. Well, I'd like you to put that on for me. Okay? I'll give you a start and I'd like for you to do that.

Student: Oh, boy.

Coach: All right? Start.
Student: That's very funny, you know.
Coach: Mm-hm.
Student: Well, that's it. I would always smile and be amused.
Coach: All right. That's it. That was very good. Okay? All right. How are you doing?
Student: Okay. That attitude that I just showed you is closer to my normal attitude when I'm auditing than when I first walked in.
Coach: All right. Very good. I'd like you to relax and let's get back to TR 0…
Student: Okay.
Coach: …and see how you do now. Okay?
Student: Yeah. Mm-hm.
Coach: All right. Now, you be there and you confront me. Start.
That's very much better.
All right. That's it. How do you feel about your body now, you know …
Student: Well, I'm feeling more comfortable.
Coach: All right.
Student: And I feel better. Uh …
Coach: Mm-hm.
Student: I did what I was normally expected to do for TR 0 – is to sit erect. Well, I always sit erect anyway as I said.
Coach: Mm-hm.
Student: But, um – I have to try to please the – the coach.
Coach: Mm-hm.
Student: Now, that was what I was trying to do.
Coach: I see.
Student: This way I feel much more relaxed. I'm doing it – I'm confronting you.
Coach: Okay. Very good. All right. Now, I don't want you to try…
Student: No.
Coach: …or try to impress me or anything like that.
Student: Mm-hm.
Coach: I just want you to be there and you confront me. All right?
Student: Yeah. Sure.
Coach: And you just get your body relaxed again. There's still a tendency to…
Student: Sometimes I can't tell which way my head goes.
Coach: Uh-huh.

Student: Uh, I – I can't always tell when it's tilted.

Coach: I see. All right. Very good. Well, now you just relax and you confront me. Okay?

Student: Uh-huh.

Coach: Start.

You break up.

All right. That's it. Well, that was very much better. Now, I want you to relax even more. You know? This tenseness is coming across to me terribly. Okay?

Student: Okay.

Coach: All right. Now, just relax your body. Even more. You know? Just get there real easy. That's good. That's much better. How do you feel?

Student: Fine.

Coach: Good. All right. Now, I want you to communicate across to me. All right. Start.

LRH: All right. Get him to do something there. And find out if he's had any gains from the session. And then close it off.

Coach: Okay. All right. That's it. Okay. Now, what I want you to do this time is be even more here. All right? More relaxed.

Student: Mm-hm.

Coach: Can you do that?

Student: I'll try. Now, the thing that bugs me is you keep saying communicate to you and...

Coach: Uh-huh.

Student: ... and I've always considered that – should uh – my willing... commun.... uh – my confront is the willingness to see what I'm looking at and to receive communication. And you're sort of twisting that around a little bit; I never thought of it – that isn't to say I haven't communicated to...

Coach: Mm-hm.

Student: ... a preclear, but ...

Coach: I understand.

Student: ... you know, the idea is that – the willingness to receive communication.

Coach: All right. Very good. Well, as the auditor ...

Student: Mm-hm.

Coach: Um – who really sets the session up?

Student: Do I get a pass if I answer?

The auditor.
Coach: All right.

Student: Okay.

Coach: Well, very good. Okay. Now, let's just have this once more for a few minutes…

Student: Mm-hm.

Coach: …and I want, you know, real good TR 0 here. And I really want to feel that you're there, you know, confronting me.

Student: Mm-hm.

Coach: All right. Start.

All right. That's it. Okay. That was very much better. Okay. Now, how did you find this coaching?

Student: Very good.

Coach: All right.

Student: Very good. Yeah. I'm glad you didn't ask me for a professional attitude, I'd have charged you a professional fee.

Coach: Okay. Anything else about the coaching?

Student: No, it was very good. I felt much better towards the end than when I started. I was a little nervous, but other than that I'm still better at the end. I felt more relaxed at the end than the beginning.

Coach: All right. Very good.

Student: Thank you.

Coach: All right. Well, it's the end of the coaching now, all right?

Student: Fine, yeah.

Coach: That's it.

Student: Thank you.

LRH: Okay. He had quite a difficulty there of one sort or another. This – he's very easily broken up. And in actual fact, why, in a tense situation, and so forth, he would tend to shatter, he would tend to go all to pieces on a pc. Now, he'd have to be gotten out of that. Of course, these are very short demonstrations, you understand, very, very short demonstrations. All right. And we're just going to do TR 0. Uh, go right ahead, Tony.

Coach: Okay. Well, I've just been given the go – ahead. And what we're going to do is, for a short time, some TR 0.

Student: Mm-hm.

Coach: Now, do you know what the purpose of this is?

Student: The purpose of the drill?
Coach: Yes.
Student: Yeah. It's just to confront you.
Coach: Very good. Now, that's all I want you to do.
Student: Uh-huh.
Coach: All right. You ready?
Student: Yeah.
Coach: Good. You relaxed?
Student: Yeah, I think so.
Coach: Okay.
    Start.
    That's it.
Student: Mm-hm.
Coach: All right. Now, I said "start"...
Student: Mm-hm.
Coach: it took you a little time to get there.
Student: Yeah. That's right.
Coach: Okay. And you're still doing that.
Student: Uh-huh.
Coach: All right. Now, really be there…
Student: Uh-huh.
Coach: …and confront me.
Student: All right.
Coach: Start.
    That's better.
    That's it. You've gone off again.
Student: Mm-hm.
Coach: Now, be there and confront me.
Student: Mm-hm.
Coach: All right. Start.
    That's it.
Student: Mm-hm.
Coach: Flunk for moving. Also, you had gone off again.
Student: Uh-huh.
Coach: Now, you get there.
Student: Mm-hm.
Coach: Is it all right to be there?
Student: Yeah. Sure.
Coach: Good. All right.
Student: All right.
Coach: Start. That's it. You didn't start. You didn't confront me immediately when I said "start."
Student: Mm-hm.
Coach: When I say "start," you confront me immediately.
Student: Good.
Coach: All right. Are you feeling pretty comfortable with all this…
Student: Yeah. Sure.
Coach: …jazz and so on.
Student: Yeah.
Coach: All right. Start.
That's good.
Flunk. You're going off again. Start.
LRH: The difference here watching coaches who have been here for a long time at Saint Hill and watching these students who have just come recently is quite remarkable. Because, of course, the coach is doing a fabulous job of confronting and makes the student look awfully bad. Actually, Joy isn't doing too bad a job here, but she's confronting quite woodenly and she'd be very easy to break up. Now, let's find an auditing attitude on her, or a professional auditing attitude, or an interested auditing attitude. Let's break up that graven-in-marble.
Coach: That's it. All right now.
Student: It is?
Coach: All right now. Did you hear that?
Student: No, I didn't.
Coach: Okay.
Student: I was all agog to hear, but I didn't.
Coach: All right.
Student: Uh-huh.
Coach: Well, now, we want, first of all, what is a professional attitude?
Student: Well to me, a professional attitude is knowing your onions.
Coach: Very good.
Student: Uh-huh.
Coach: All right, well can you show me that?
Student: Uh – yeah., I guess so. It would include feeling fairly confident…
Coach: Yes.
Student: …and I realize it's a via, but I think that if you try to put across – in an endeavor to put across confidence, that would be a via of being professional.
Coach: All right. Very good.
Student: All right.
Coach: Now, I want you to show me…
Student: Yeah.
Coach: …a professional attitude.
Student: All right.
Coach: Start.
That's it. How did you do?
Student: How did I do?
Coach: Yes.
Student: Well, I felt there that I was actually putting the idea across, "Well, but I know what I'm doing, I know my onions. Can you see it?"
Coach: Mm-hm.
Student: Uh – that was the via I was using.
Coach: Mm-hm.
Student: Uh – confronting with an idea there. And trying to make the idea solid that there was this professional quality around.
Coach: Mm-hm. All right. Now, I want to point out something to you here – I got what you said there –
Student: Yeah.
Coach: When you're talking to me…
Student: Yes.
Coach: …there's something different going on to when you're just sitting there. Now, what is it?
Student: Something different going on?

Coach: As far as your confronting is concerned. Now, what's the difference?

Student: Oh, well, the difference when I'm talking to you is that I'm just totally relaxed and just being myself, just being quite willing to be here and talk to you.

Coach: Mm-hm.

Student: Uh – when I – when I put on this confronting attitude for you I'm actually taking the via and putting it there, well, to put the apparency there.

Coach: Okay. I get that.

Student: Mm-hm.

Coach: Now, what you're – what you're doing here or – or not doing when you're talking to me…

Student: Yeah?

Coach: …can you just sit there and do that? Or not do it?

Student: Well, then I wouldn't be uh – laying on the professional attitude.

Coach: Well, let's just say…

Student: This confuses me a little.

Coach: All right.

Student: Uh-huh.

Coach: Well, let's just – are you getting what I'm getting at here?

Student: Well, I don't think I am actually, uh, Tony. Because when I'm not laying on the professional attitude for you, I'm just, you know just being.

Coach: Hm.

Student: And, what I – what I understand here is the idea of actually putting across the professional attitude…

Coach: Mm-hm.

Student: … uh – to show up the via.

Coach: Mm-hm. All right. Well, I just want to try this for a minute. I want you to just…

Student: I see.

Coach: The difference I see is when you're talking to me you're with me.

Student: That's right. Yes.

Coach: Now, I want you to just sit there and be with me.

Student: All right. Very good.

Coach: Just see how this goes for a minute.
Student: Okay.
Coach: Start.
    That's it.
Student: Mm-hm.
Coach: How did that seem to you?
Student: Well, that seemed more relaxed. It didn't seem particularly professional. It just, you
    know, just seemed me.
Coach: All right. Very good. All right, now, let's get back to this professional attitude.
Student: Mm-hm.
Coach: Just once again define what is a professional attitude.
Student: Well, a professional attitude could be the idea of putting across that you know your
    onions and you're very confident and uh, well, dressing yourself up in fine feathers, I guess.
Coach: All right. Good. Well, show me a professional attitude.
Student: All right.
Coach: Start.
    That's it. That was good.
Student: Mm-hm.
Coach: Did you notice the difference then?
Student: Yes, I felt the difference.
Coach: Yes. That's the best you've done.
Student: Well, the point is that I felt like I was getting across what – uh – the idea or the via.
Coach: Mm-hm.
Student: Mm-hm.
Coach: Very good. All right. Now, let's take a couple more of these, here. What is an in-
    teresting attitude? Define it.
Student: Interesting or interested?
Coach: I'm sorry, I flubbed it.
Student: Yeah.
Coach: What's an interested attitude?
Student: Um – well I feel an interested attitude, uh... well, it's just – just putting across being
    interested. But I feel that if you have to put it across, you're not really interested.
Coach: All right.
Student: Anyway, an interested attitude is trying to emanate interest or emanating interest to the person in front of you. Trying to put across the idea that you are very interested in — uh — in him or her.

Coach: Very good. All right. You show me an interested attitude.

Student: Mm-hm.

Coach: Start.

LRH: We've got an awful lot of gimmicks and tricks here mixed up in this confront. It's got to be worked over pretty hard, actually. Pc — I mean the student there is sitting there looking alluring at the present moment.

Coach: All right. That's it.

Student: I felt an absolute fraud, Tony.

Coach: All right.

Student: I felt I was pulling all sorts of things out of the bag.

Coach: All right. Well, have you got any different idea here on what an interesting attitude is?

Student: Um, uh — well, um — as I said I just felt an absolute fraud when I was laying that on. I felt I was pulling tricks out of the bag and, uh…

Coach: Yes.

Student: …you know, I felt that I was putting across using my eyes in order to convey interest and, um, using a slight facial expression in order to convey interest.

Coach: All right.

Student: The whole thing just felt like a total fraud to me.

Coach: All right. Fine. Very good. All right. Now, you observed that.

Student: Oh, yeah, sure I did.

Coach: Now, now, you did tell me a little while ago about the difference between real attitude of some sort and something that's laid on.

Student: Uh-huh.

Coach: What's a real interested attitude? What is that?

Student: Well, a real interested — well it — well it would just be an interested attitude, just being there.

Coach: All right. Can you show me that?

Student: I'll try to.

Coach: All right, well, don't try, just show me. All right.

Student: Very good.
Coach: Show me that…
Student: All right.
Coach: …an interested attitude. Start.
That's it. Flunk, you're moving.
Student: Mm-hm.
Coach: Start.
That's it. All right.
Student: I felt I was using exactly the same vias again. I don't seem to be able to get away from them.
Coach: All right. Well, I'll tell you what I'll do here.
Student: Mm-hm.
Coach: Um – we'll do this again.
Student: Yeah.
Coach: And any vias that I see you using, I'm going to flunk you for them.
Student: All right. Very good.
Coach: Let's see how we go with that.
Student: All right.
Coach: All right. Now, show me an interested attitude. Start.
That's it.
Student: Mm-hm.
Coach: Flunk. Your eyes are moving around.
Student: Mm-hm.
Coach: And – uh – actually you were confronting me with movement there.
Student: I see.
Coach: All right. Now, from now on I won't say, "That's it," I'll just say "Flunk." You keep on doing it.
Student: Very good.
Coach: All right.
Student: All right.
Coach: There something you wanted to say to me?
Student: Uh – no. But, uh – you're just going to flunk me and not tell me what you're flunking me for.
Coach: No, I'll tell you what I'm flunking you for.
Student: Oh, all right.

Coach: But I won't say, "That's it." I want you to keep doing it.

Student: Good. I'll do that.

Coach: All right. Confront me. Start.

   Flunk. You're moving your head.
   Flunk. You're blinking your eyes; fluttering your eyelids.
   Flunk. You're confronting me with movement.

Student: Mm-hm.

Coach: All right. That's it.

Student: Mm-hm.

Coach: Now, around your neck here, all around here, it's turning red.

Student: Yeah.

Coach: Now, you're confronting me with that part of your body.

Student: Actually, I'm not surprised at that. I've got terrific masses around here. I have had all day. I've been totally aware of them.

Coach: All right. Well, now, uh – are you aware of doing anything with that part of your body?

Student: Yes, I am.

Coach: Good.

Student: I – I'm actually aware of – uh – tremendous mass around here, uh – tremendous heaviness. I'm actually aware of using this part of my body here.

Coach: Hm.

Student: Pushing it out. You know? I'm holding out and pushing up all around here. I'm totally aware of that.

Coach: Mm. All right. Well, let's see if you can confront me now …

Student: Mm-hm.

Coach: … without doing that.

Student: Very good.

Coach: All right. Start.

   Flunk. You're pushing the side of your face out.

Student: Mm.

Coach: Start. All right. Now, be here. Confront me.

Student: Mm-hm.
Coach: You're going off.

LRH: All right. Finish that up and find out if she's had any gains and end it off.

Coach: That's it.

Student: Mm-hm.

Coach: All right. Now, how did you do then?

Student: Uh, well I came off the actual laying on of interest. But – um – I feel that I've actually – um – I've got something out of this.

Coach: Very good.

Student: I do feel that I've come through quite a bit. And it's – it's real to me how even a short period of – of this confronting drill can actually get you through and help you to be there.

Coach: All right.

Student: I feel very much more here than when we came in.

Coach: Very good. All right. Well, is it all right with you if we end off the drill now?

Student: Uh-huh.

Coach: Good. All right. Thank you. End of drill.

Student: All right. Thank you, Tony.

LRH: All right. Take a ten-minute break and I'll give you a talk on this.
TR 0 Lecture

A lecture given on 16 January 1963

Okay, this is a few words on TR 0. This is the 16th of January, Saint Hill Special Briefing Course.

Well, let's give all those coaches some applause, huh? [applause] And let's give the students some applause. [applause]

Thank you.

I don't know if you noticed it, but the upper unit student confront comparison with the newer student confront, well, was quite marked, wasn't it?

Audience: Yes.

I thought it would be something like that. That's why I chose them up that way.

Now, you know the rules about TV. You know, if you've been on TV, you know, it's popularly believed, if you've been on TV, then you're not on TV again. [laughter] That's – that's normally believed. But actually that's only if you're cancelled before the program. You probably didn't know that part of the rule. A lot of rules about it. They change from week to week. [laughter, laughs]

You might as well get used to it because TV-type training is going into Central Orgs and you'll find out it's very beneficial. TR 0, the original TR 0, was simply to be there and be aware, and that was all there was to it. And in actual fact, apparently people have begun to confront with that definition. See, if you don't let them confront with their noses or their big toes or stomachs or something like that, they can always confront with that definition.

These are – nevertheless, the definition is still valid and the original TR 0 is still valid, but there's some other things that have been added in on top of it. The – you can make somebody confront with a professional attitude. And usually, you find every here and there that some student's got a real professional attitude that he is confronting with and see, it's a confront with – that's the trouble with it. And an auditing attitude and an interested attitude and so forth, these things are all fine, as long as they're run out.

And the trick in coaching TR 0 – it all depends on a good coach – is spotting something the student is doing, getting him to be aware of it and run it out. That's in actual fact, the system – all there is to the system of coaching. But, of course, you can give a student so many flunks that he just caves in. He – "So what, you can't win anyhow," and goes into apathy.

Now, you can give a student so many wins that he never learns how to confront. I mean, you can do this both ways, too. Takes a little wisdom in the matter.
But what you're actually trying to get him to do is to stand up to the duress of auditing. Let's get off of our basic definitions and let's get into a little bit of the whys and wheres of TR 0.

I well recall one of the Upper Indoc TRs that somebody was trying to teach somebody in an ACC, and it was the one that teaches 8-C with violence – you remember that old one – you know. And all of a sudden the student quit. The student quit and walked out and an Instructor stopped the student and said, "Why, what's the matter?" And very, very grimly and primly the student said, "Pcs never act like that."

See, she... the coach had actually been giving this student a bad time, you know. And, well, just – people just don't act like that. Well, a couple of years went by and this student showed up for a retreat in the Academy or something of this sort, but – or it was for some auditing – and came around and had an apology to make on the subject. She had audited an actual pc who had acted much worse. [laughter] So, pcs did act like that.

Well, in actual fact, in actual fact, one of the things that is most disturbing to a pc is to have an auditor whose confront is cornered up in some way – is a very unnatural confront – and who shatters under an upset in the session. Well, normally these upsets are assignable to TR 4 and nearly everybody gives TR 4 the medal for auditor upset, don't you see? I mean, the auditor Qs-and-As and Qs-and-As. Every time you Q-and-A, you see, you make the student miss a withhold – I mean, make the pc miss a withhold, see. One Q and A – one missed withhold, see.

So, therefore an ARC break gets worse and worse and worse when an auditor Qs-and-As. Very, very simple mechanism goes on there. The pc says – in answer to some question or in origin – "Well, I thought a moment ago that you were nulling too fast."

And the auditor says, "All right. I'll null more slowly."

Now, you see it isn't the actual fact that the auditor has followed the order of the pc, in TR 4, that's not what is important. What is important is that he's failed to acknowledge an answer to an origin or an auditing command, you see. He's failed to acknowledge that answer.

And with some auditors, you work and work and work and work and work to stop them from Q-and-Aing. It's so bad that the auditor says, "In this session is there anything you suppressed?"

And the student says, "Well, I suppressed thinking that you were a bit untidy with your paper."

And the auditor says, "Okay, I'll straighten it up."

Well, of course, that's a missed withhold at once. Now, the student is... I mean the pc can't get this off because every time the pc tries to repeat this answer, the auditor starts arguing that he's perfectly willing to tidy up his papers, you get the idea?

Now, let's look at – let's look at why an auditor very often – and some auditors do – take a long time to get up to a point where they never Q-and-A. And it isn't in actual fact the TR 4. It's the TR 0 that is shot.
This auditor can't stand up to an auditing session with TR 0 and is so, in that fashion, on a sort of an inflow or something, you see, and isn't really there and being aware, but retreats any time anything looks like it's a little bit odd in the session – the auditor retreats and that's the basic sin.

Well, you can see these Upper Indoc drills they – somebody knocks the student all over the place. The coach knocks the student around and the student has to stand up to it and retain control of the situation if he can. You know, we can see that. That's all very visible. But those same mechanisms are present in TR 0. Exactly those same mechanisms are present.

Now, what we've seen in demonstration here is a rather smoothly polished TR 0. Two people who have had quite a bit of TR 0 run already can be polished further. But there's this additional element which isn't on those demonstrations – is pushing buttons. And finally a person will harden into it and then lose the hardening and then find out he can do it, you know. And he'll be able, actually, to sit there with an auditing presence and have a pc blowing up without getting rattled.

Pc starts to have an ARC break, the auditor doesn't go into an instant lost TR 0, see. TR 0 doesn't go up the spout.

Now, therefore, TR 0 can also – after you've led a person forward to getting rid of all the junk – can be stepped up, can be stepped up. You can start to rough it up. And this is particularly what I wanted to add to this, not talk more about the demonstrations but to show you that there's an additional step you can use.

Now, it requires a considerable perception on the part of the coach in order to step this up accurately. And you had one example of a step-up. Now, I was actually stepping it up on Norman's dander when he was the student there. He was blowing up. See, but he settled back down into it and it was okay. But in actual fact, do you see there – do you see, he was breaking his confront. Do you see that?

Now, you can lead on that type of a gradient to higher and higher step-ups. You get him just fine so he can stand up to that and then you'd uncork something else. But let's look at something they're doing or something that they are incipiently doing and start punching the button and get the person to explain it – explain how he's doing it and then he starts to as-is it, don't you see? He becomes aware of it and in essence takes over the automaticity of it.

And you can keep leading out that way further and further and further, well, until it'd be a matter of the coach jumping up and poking the chair, you see, at the student to get him to break his confront. Do you see how – to the degree that that could be stepped up?

I've noticed that in the presence of an ARC break, Q and A becomes very, very grim. This auditor never Qs-and-As but in the presence of an ARC break, Qs-and-As. And I'm pointing this out to you: the reason he Qs-and-As is not that his TR 4 goes to pieces but his TR 0 goes to pieces.

So therefore, there is a great deal that can be said for stepping up what there is there to be confronted. Now, anybody can confront a completely motionless pc. See, anybody can confront a motionless pc. But how about confronting a pc in motion? Well, the first thing you would think of is somebody shaking his hand in front of the student's eyes. The coach shaking
his hand in front of the student's eye and get the student to stop flinching. See, that would be a very easy gradient on the thing, you know.

But how about dodging E-Meter cans? [laughter] Hm? Do you realize that in general practice, particularly due to the ARC breaks which can sometimes come up under Routine 2-12, that I would say if you went six months without having a pc throw the cans down, why, you – you must be either very, very lucky or have very apathetic pcs. [laughs] And I'd say once a year, an auditor can certainly expect to get the cans in his chest.

Now, you don't want to train an auditor to a point where he doesn't dodge the cans, [laughter] but you certainly want him trained to the point where the cans do not interrupt his command of the session. See, that his action of dodging doesn't interrupt the command of the session.

Now, this gets pretty grim after a while. You see, it's just – the sky's the limit. It gets up to one of these Tom and Jerry cartoons, you know – buildings falling down and holes going through the center of the Earth. But the main thing I'm trying to put across is that your gradient is what there is there to confront. See, you could add more things to confront and get him to analyze what he was doing. You could actually take an old E-Meter can and throw it into his chest, you know, and get him so he would take care of the E-Meter can, you see, and still be able to confront the pc.

Auditors do very interesting things. Not good auditors – but I've seen very interesting things happen in auditing sessions. I have seen a person go into total silence. This is more common than you would think.

Pc all of a sudden seems to be in trouble and the auditor goes into total silence. That is about the grimmest thing that can happen to a pc. That's no auditing with an exclamation point. It's actually worse than Q and A. The pc has just lost his auditor. That is it.

Well, now, it normally happens on a freeze. In other words, the auditor freezes; becomes incapable of confronting and just goes into wood. Now, this is a much more insidious type of thing to break than action. See, you wouldn't want to specialize in your coaching your TR 0 in the fellow blinking, the fellow twitching, the fellow moving, so forth. Don't specialize in that. Let's give at least 50 percent of our coaching to the fellow going into wood. You see what I mean there?

Audience: Yeah.

As you go up in upper drills, if he's liable to clam up on a pc, you can also make him do it on TR 1.

Now, that... it's an odd mechanism – this one of just freezing – just goes into wood. Now, a good coach can recognize the fact that he hasn't got a confronting pc, that he's just got a solid piece of granite in front of him. And remember, that person who thinks that confrontingness is just becoming a solid piece of granite may some day merely stop auditing in the auditing session and just say nothing. And that's just about the grimmest thing that can happen.
All right. Now, your next action on this is an actual flee by the auditor. That's not as bad as a total clam up, but it amounts to the same thing. You see, the worst... Frankly, the more motionless or inactive a person is, the worse off he is, but that doesn't mean that the more active he is the better off he is. You see that. You – you take uh – you take the "p-sy-atrist," the "p-sy-atrist" – he hasn't got the faintest grip on this. He hasn't a clue about this. This has totally escaped him. He's always trying to put people into apathy so they will look all right.

Now, he's totally sold on the idea of insanity is motion. Where, as a matter of fact, it's far more often no action at all, see. It's much harder, now, hear me now, it's much harder to do something for a very apathetic case than it is an angry one, see. Your Tone Scale tells you that, of course, and you've known that for a long time. But I'm pointing that out in TR 0 that you can very easily, very easily slip a cogwheel here. And just because the guy is sitting there in a total apathy, think that he's doing TR 0. And let only the very apathetic and the very granitesque student get by, see. That's not the case at all.

So you might as well add something to it: look alive. Does he look alive? You can add that, you know, be there and be aware, but that awareness, let's color that with a definition of – let's have him be alive, too, you know. Have the blood flowing in his veins. That's an important thing. And actually that one little point is the one which would be most often missed by a coach. He can spot the fellow who goes dzzzzu-u-u-uh, see. He can spot the fellow who's going, "Huh, huh, huh," you know. He can spot that dead easy. But the guy who's going [demonstrates something, laughter] – doesn't spot that, see.

Well, it's all right, he's sitting there quietly, see. He's made a "p-sy-chiatric" mistake. And this is a mistake that he's made. And you got to keep pointing that little point up when you're training people because it's a natural thing, apparently, to think that something is quiet is safe.

Now, of course, the "p-sy-atrist" is simply trying to make his patient safe. See, he's operating totally on the third dynamic and he's trying to protect the third dynamic, you see, from the first. What's bad is the first dynamic, see. That's why you don't easily understand this "p-sy-atrist," because he's not trying to make anybody any better. See, he's trying to make the third dynamic safe. So therefore, his (quote) "cures" are all cures which apparently are supposed to benefit the third dynamic. None of his (quote) "cures" are ever supposed to benefit the patient. He doesn't even think so!

You ask him, "Have you ever cured anybody?" and he will say immediately, "Yes." But you've never asked him probably, "What have you cured him of?" And if he doesn't give you some long imaginary name that was dreamed up by Kraepelin over in Germany and you get him down to it, he's cured somebody of being in motion. That's what he's cured somebody of, and that's all.

So, this is very important to point up. This is very important to point up because you'll find as you look down a whole row of people who are doing TR 0 that a certain number of them have gone to granite and dropped out the bottom and something like this. You want to know what their auditing responses are at that particular time, and so forth, and of course, they're zero.
They get into a session auditing somebody, something happens, they go into inaction because they're not confronting. They can't confront. This idea of the total withdraw, see. [demonstrates something, laughter] Watch it. You could actually put some kind of a meter on the back of the chair to find how hard the student was pressing the back of the chair and you would get an accurate measurement of how little he was confronting, because the more weight that goes against the back of the chair, the more he's trying to get out of there, man.

Now, this will go into a total apathy of "can't get away" and "can't speak" in a situation of duress. It'll go to... actually that's very lowsacle. Upperscale is, the auditor will actually run away. Flee. Flee the session. Get out of there.

Now, where good auditing shows up as different than bad auditing is in moments of duress. And somebody will get along beautifully auditing some chipper lady that isn't causing any trouble, at all and he luckily got on the right lines and he hasn't made any mistakes and so forth. And you look at him and you say, "Well, he can really audit. He's just doing fine," see.

Well, to really know this auditor, you have to see him in a moment of duress. What happens in that moment of duress to his TR 0? That's the first thing to go – TR 0. He'll start making mistakes and of course that's the one thing you mustn't make. Whether he makes the mistake of shutting up or the mistake of running away or simply the mistake of bungling the auditing commands or the mistake of suddenly transferring over to a new list, you got that one? Pc ARC broke so must be the wrong list, so well abandon it. And then we wonder why day after day thereafter the pc makes no recovery. Well, of course, he's ARC broke because the list was not finished, see. List was abandoned.

But he'll make a wrong judgment, no matter how well he's taught. If his TR 0 is terribly bad under duress, he'll make a wrong judgment. So you might say there are two or three TR 0s.

There's the TR 0 of the fellow doing the drill. Let's take that one as the first one. He isn't – hasn't anything to do with auditing, hasn't anything to do with anything else, it's something that the Instructor or the coach told him to do, so he's doing it. You got that? It's not associated with anything.

All right, your next one is the person who clams up and actively can't act.

And your next grade up the line is somebody who goes into an obsessive motion as a sort of a Q and A.

Take that as three grades of things which you have to cure when you're coaching TR 0. And if you're going to do a thorough job, cure all of them. Just take them in sections.

Now, he's – this first one that we're doing which is just sitting there and confronting, when you add to that confronting in certain ways, you're clearing up the first one. Well, you're curing up the second one, too, when you're doing that. But, no, very few drills go into a cure-up of this dispersal in action. But those drills are very easy for a coach to figure out.

One of the things is, you know that there are some auditors around who will obsessively laugh. Something goes off the rails, or something like that, they will actually laugh. They'll laugh in the wrong places in the session, too, I guarantee you. They've got an incipient
laugh and you can break them up. Well, you just go ahead breaking them up until they don't have to. It's all a system of taking over the automaticity. And you might practice someday just throwing E-Meter cans at their chest, see. And see if they can't keep on confronting while ducking. I don't care how you do this. I'm just giving you an action level, you see.

Now, one of the ways of doing this is a talking confront. You never heard of this before because it's normally TR 1 and 2, but TR 1 and 2 are, in actual fact, simply actions which get a command across to the pc and acknowledge what the pc said. Those are the purposes of those two.

So you can have a counting confront. Can the fellow go on counting while you're throwing E-Meter cans at his chest or does he lose track of his numbers? You see how he could do it? You could actually have a talking confront. He isn't trying to reach anybody with this. You're just using this as an index.

Now, there are various things then that you could do, but I've given you the three zones that you actually have to cure if you're really going to cure up an auditor of doing something weird because the session goes awry.

Now, today it would be to our great interest to beef up this one point. To make it stronger, to strengthen it up and hit it harder, because let me assure you that auditors are going to get more ARC breaks than ever before. At the same time they're going to get more rewards than ever before, but they're also going to get more ARC breaks than ever before. So, you're going to have to train people to expect ARC breaks and to keep on going.

Now, I recently had an ARC break in an auditing session that had me very puzzled. I went on and handled the situation, of course, but I was very interested afterwards that the ARC break had made me think less fast. I was aware of having thought less fast in that ARC break than I ordinarily would have. It was, basically, just get out of the habit of having ARC breaks.

Now, oh, I picked up the ball and kept it rolling, but I was – I was aware of thinking less swiftly, and realized that the mechanism involved was – is I didn't want to confront this, because you see it was not my intention to make this pc splatter over the ceiling. And this particular pc was splattering over the ceiling. Wasn't my intention. So, it was counter to what I was trying to do in the session.

So, there was a small impulse there not to confront it. Do you see? So I myself got a good subjective reality on what this is all about. It was a good subjective reality. And I said, now, all I have to do is multiply that subjective reality up to a point where I just stopped thinking, you see, and one would have goofed at that point. I didn't goof, but I was aware of the fact that, you know, what the hell am I doing, you know. What's the thing to tell this pc? All that just slowed right on down. What do I do now? It was rather rough because three lists were in question. I was simply trying to straighten out a pc on lists, see. And three lists were in question. I couldn't tell which one of them the pc was ARC breaking on. Because the ARC break suddenly distributed over all three lists and it just got worse. Oh, I wasn't trying to make the pc worse, so my confrontingness dropped.
So, actually keeping the thing going, I mentally sat back and confronted the situation and picked it up and kept it rolling. But I could see exactly what happens. I see somebody who's – who's got a pc, everything has been... Because these R2-12 ARC breaks are sudden, man. They can be sudden and catastrophic when you run into them. And apparently inexplicable.

And you're running along and everything's fine and in the best of all possible worlds you are nulling the best of all possible lists and you look up and you say to the pc, "All right, we got your item now. Ha-ha. It is 'willow wand,'" and watch the pc carefully and everything seems to be all right, you know. And the pc even has a bit of a cognition, we're being very smug about everything, and aren't we good, and we pick up our pencil to finish off our auditor's report and there come the E-Meter cans.

What the hell, you know. What happened? Well, you just picked the wrong item. You should go on listing a little bit further; that's the motto. And the faster you say, "All right, that's not your item, thank you very much. Now we're going to list a little bit further," and push the auditor's report out from underneath your paw and push the list under it and start listing, your pc will start listing instantly.

All right, that, or for other reasons, these ARC breaks rather take you aback, because they're quite violent. The slow-burning ARC break, the corroding type of all of this would hit somebody who tended to go numb in a most horrible way. The corroding type of ARC break is that you have successfully listed something, everything was fine and the next session you have trouble getting the pc into session and the pc is full of despair and it's all just despair and hopelessness and you try to spot where this began, you know, and you can't quite spot where it began, but there is the pc being rather critically hopeless, if you get the idea. And you didn't intend to do this, so your intention is off. Your confront then, bow, there it goes, right there.

So, TR 0 should get a lot of attention from us in Academies. If we're going to take HPA students and get them to do R2-12, then we've got to beef up TR 0, that's the conclusion I've come to on it. And we treat these people as though they fall into all three of these grades, you see. We treat them as though they'll go into a total wooden nowhere and that they'll flee and that they will go into violent motion. Treat them in all three grades, see where they break up and keep cracking the buttons until they – all of a sudden they're able to pull through it. It's a sort of an Upper Indoc TR 0.

I don't care what you do with the pc as long as you give him enough wins – I mean a student – as long as you give him enough wins to keep him going. That's how many wins you give one. You don't ever give them as many as they earn; that would be too reasonable. Just give them enough to keep them going and don't give them so many that they think they can do it. Because the actual fact is, they have to come to the independent opinion that they can do it.

How much and how long should you run TR 0? Well, actually until the person, while doing all other actions and TRs, can keep up his TR 0. And where he can keep it up under things going wrong and duress – keep up his TR 0 with Kipling's "If," you know, "If you can keep your head when all pcs about you are losing theirs and blaming it on you..." [laughs, laughter]
So, we actually are moving up into a higher grade requirement, and I think it would be greatly to our interests in all courses that you teach, to the interest of pcs and protection of things, to give a higher level of expectancy. Now, we know what 2-12 is liable to uncork in our faces, well, all right, let's beef up the training drills to match it. And we'll lose less pcs that way. They won't be going out and dropping off the Bridge before somebody hears about it, you know.

Funny part of it is the pc usually doesn't fall off the Bridge. We had an interesting… He usually comes back for more auditing even when he's so ARC broke. But the funny part of it is I had a – had a pc today – I had a pc today that was in an ARC break that was just doing a total suppress – was doing a big suppress and was in violent argument with a wrong item and so forth. Little Diana, she's ten. Very amusing. Suzie brought her down to get the item checked mainly so that I could see that a pc at ten would ARC break just as hard on a wrong item as a pc of fifty. I tried to get her to treat it as an opp term and tried to get the rock slam to turn on and that sort of thing and… For her, she had some pretty nasty things to say about the item and the whole thing. She didn't want that item, see. It was a wrong item on the list. Rock slamming item.

It was very interesting to watch this. And also to watch the complete brighten-up that occurred the moment I said, "Well, all right, that's not your item." She brightened right up and was very pleased and went right back upstairs and went on listing and so forth. That was it. It was interesting that you get this same pattern response. The list was not quite long enough to have the right item on it.

Well now, if this is going to happen invariably and inevitably, all you've got to do is flub a little bit or be auditing a pc who already has PT problems from some other quarter or is under a little stress or duress, make an accidental Q and A right at the exact moment, they blow their skulls all over the ceiling. It's very interesting then, TR 0 ought to be pretty good. Because bad TR 0 will lead to immediate Q and A, it leads to a lack of comprehension of what is going on – main thing it leads to – and it leads to a pc who is getting no auditing. And it might even lead to an auditor flying down the hall.

Now, actually, it's a big win for an auditor sometimes when they confront an ARC break and a lot of insults from the pc and all that sort of thing, to find out they have gotten through it, even though the tears were coming out of their own eyes and they were terribly upset, they were misemotional about the whole thing, but they somehow or other brought it off. They do one or two of those and they get lots of confidence on it.

Well, why, should they have to gain all that confidence in the session? Now, it actually takes a certain amount of time to get R2-12 down – actually takes a certain amount of time. The experience of delivery of Routine 2-12 is considerably desirable. You get so that you know more and more about it and feel more and more confident of what you're doing and so forth. But it takes a while.

Now, if a person, while learning 2-12, is also learning his TRs, you're liable to have quite a mess on your hands. Now, you can have somebody under guidance auditing 2-10 in the co-audit unit, something like that, but they're under such stringent guidance, that somebody's there to pick them up if they drop the ball. They're actually auditing with very little
responsibility and frankly they learn only that the technique works or is violent. But before they can independently run 2-12 and so forth, why they ought to have their TRs. And those TRs ought to be matched up to running such a process. And that means that what's expected of TR 0 has to be upgraded.

Now, I suppose that part of the training is you get a tape recorder – we're talking about TR 1 now – you see, and you go down to the zoo and throw rocks at the lion until he gets real mad or something like that; or go down on Sunday when he's just seen too many people and get a darn good recording of all of this, don't you see, and then put it on a high volume hi-fi system and have the student stand there putting intention into the middle of the speaker. You see, that would be... You get so that you could insert the auditing command into the pc's skull and get him to comply with it regardless of the volume of sound you were being greeted with. You see, that's another barrier that you'll find necessary. But if you don't handle 2-12, if you don't handle the ARC break, if you don't keep on doing the right action, if you don't carry on with it, boy you got somebody who's splattered all over the room and it just isn't necessary for a pc to get that splattered.

Actually, the splattering is in direct proportion to the confront of the auditor. It wouldn't be a very bad ARC break if it hadn't been accompanied by a no confront of the situation, a Q and A, don't you see, a drop the ball all over the place. Well, each one of these auditor flubs throws an actual auditing reason for an ARC break in on top of the basic reason for the ARC break and they don't just wrap it around the telephone pole once, you see. They practically put it in around the Telephone pole braided. There it goes.

And the degree then of the ARC break the pc will have on Routine 2-12 is directly proportional to the TRs of the auditor. Do you see that? You'll see it borne out if you haven't noticed it up to this time, why, you'll probably see it around. You'll certainly see it around training somebody in an Academy with this or something like that. You'll notice that somebody's TRs are very bad and they have much worse ARC breaks, their pcs ARC break worse. Any pc will ARC break on wrong items and that sort of thing.

But of course, the swiftness with which the cause of the ARC break is being handled is only part of it. In actual fact a Q and A on top of the bad Routine 2 flub, blarr, see, and then a mistake on top of that, you see, and blarrrr, and then a decision on the part of the auditor to go back and relist "Where do cats come from?" which was eight years ago that it was run, you see. Blaaaaaaa! All it is is an incomplete list and it needed another page or something like this, don't you see? Easily remediable, but the auditor is liable to run all the way down to the earliest beginnings of the case, you see, rather than simply complete the list that was right in front of him. His judgment goes.

So, the judgment of the auditor must be good in this particular spot and if his TRs are bad, his judgment is going to be bad. Do you see what you're dealing with here?

I've often noticed that I... a perfect "auditor" as long as everything was all right. Somebody is a perfect auditor as long as everything was all right. But the moment the least little thing went wrong, that auditor suddenly became one of the world's worst auditors to a point of just sitting there, uhhhhh. Finally the pc, you know, shake him, you know, tell him he needs a session.
Well, now those are the modern purposes of TR 0 and I think that all of your training in this direction couldn't be better than matched up against the necessities of Routine 2 at this particular time, because it will make Routine 2 that much easier on one and all, including the auditor. If his TRs are almost perfect, you know, he'll never have to use them. It's something like the fellow who walks out every night, he's got a gun and he never runs into any trouble. And one night he doesn't have a gun and everybody jumps him. See, this kind of an action. If his TRs are weak, why, he's got no gun.

But he'll get very severe ARC breaks and you can trace back the pc – the severely ARC breaking pc – to the non-confront and the Q and A and the out-TRs in general of the auditor. The worse these TRs are, the harder the pc will ARC break, and the first that goes out is TR 0.

Okay?
Thank you very much. Good night.
Thank you.
Okay. Now this is what? This is the 6th of…

Female voice: 5th, 6th – 6th of February.

It's the 6th of February 1963. And this is an Instructors' Conference, Saint Hill Special Briefing Course. Okay.

Now, you're into the middle of some of the most rewarding and some of the most dangerous processes which have ever been originated. And the reason I've called this conference is I just wanted to tell you that this is not the time for any private theories or anything else. These things go according to a set of very furiously fixed rules. And unless those rules get followed, pcs wind up in the soup.

Now, I don't want to minimize this with you because for the first time we are really (exclamation point) dealing with a complete reversal of the first statement made in Book Three of Dianetics: The Modern Science of Mental Health, which is that any auditing is better than no auditing. Lousy R2-12A auditing is much worse than no auditing. You see? We're dealing with something here which is violently dangerous, used wrong.

That's an astonishing thing to tell you. It isn't something that we particularly want bruited about from the housetops to the public and all that sort of thing. But it is our responsibility to make auditors who don't goof. Because, look, there isn't anything else cracks these cases. All right, let's just look it straight in the face.

All right. So you have to go off a high dive – high tower a hundred feet in the air to dive into an eight foot tank that is covered with flaming gasoline and that is the only way to do it, then, you have to learn how to do this. Don't you see?

Oddly enough in Scientology, there isn't any other way out: we're the only way out. You can size this up anyway you want to. So somebody comes along and he doesn't get results from processing so he goes to Subud. Well, look, that isn't going to take him anywhere. See? I mean, we're the only door there. See? There's a lot of phony doors. The FDA passes them everyday: pills and all this kind of thing. And the psychiatrists with their electric shock machines and all this sort of thing. Man, those are traps.

All right. So I've done everything I could possibly… That's the status of Routine 2 as of today. And I have done everything I could possibly do now and will continue to look for indicators and that sort of thing; but these indicators are very, very precise; they're terribly precise; they actually do not admit of any argument. List right way to: well, it's going to loosen the needle. That's all. It's going to give you some TA action.
List wrong way to and in the first few items you're going to see that TA tighten up and the needle tighten up. First you'll see the needle and then the TA. There's practically no TA action on a wrong way to. See? And we don't take 15 or 20 pages to find out it's wrong way to, you see, that's just a goof. And it's that kind of a goof that puts the pc in mortal danger. It's that kind of a goof, see.

We specialize in wide R/Ses. Big, wide R/Ses. Third-of-a-dial stuff. Don't go mucking around with any sixth-of-an-inch wide R/S! You see? Anything smaller than a third of a dial: you're too deep in the bank. And I don't care how good it looks as having been a complete list: if it isn't giving... if you haven't got that in your RI or didn't have it in your RI, why, you're listing too deep. And your pc's going to pull in a lot of mass; the pc's going to get in trouble. And so forth.

All right. Your next point here is that the whole house of cards can fall in if you grabbed a first list, RI, and listed the thing and then abandoned it. You got a nice wide R/S, you see, let's say it was "parts of existence" and you had a third-of-a-dial R/S. And now you go on and you're going to complete that list to find out if you get another one and you get a sixth-of-a-dial R/S: you damn well better take the third-of-a-dial R/S you had in the first place and you'd better list it right and you'd better keep it going. You understand? Because you're not going to get any more R/Ses on the case. The case is going to fold up. There's where the R/Ses disappear to.

So the rule here is a good, big, wide R/S. But that doesn't mean something that is taken from representing a rock slamming or a rocket reading item. You can get big R/Ses if you represent or... a rock slamming item.

Now, on a source list you're liable to get the appearance of the RI anywhere on the list. Your guess is as good as mine. I just had one turn up as item number one. The first item put on the list R/Sed. And it was the item although it was continued. See? There it was. So a source list – this is your first source list, see – that appears anyplace under the sun, moon and stars.

But within reason all other lists, each list taken from an RI, follow a very precise thing: it's always the last R/S.

Of course you can goof this. You can goof this. You can overlist and overlist and overlist and go 775 items, you see, beyond the last one and sooner or later it'll go. And there's another bug shows up that was inherent in something we were doing here. When we told the pc that something R/Sed, we were goofing. Because the pc now represented whatever R/Sed hoping to get his item on the list. You must tell the pc quite something else. Pc says, "But that R/Sed." You say, "Good, then your item probably won't have anything to do with it." You sow him with that propaganda, otherwise he will goof your list. The way he goes your list is he – let's say you tried and didn't find the R/S, you didn't find the RI. See, you listed it down and then you didn't find the RI. You understand? For some reason or other it didn't appear. But he now knows two R/Sing items, one of them fixes in his mind and he tries to do a repre-sent of that item in order to complete his list and get an R/S on the list. See? That is a goof.

So we disabuse him of the idea that this is of any use to him whatsoever. Actually, just educationally that we tell him so as an auditor. He's got "John Jones" now. Well we just warn...
him, "Your item probably won't have anything to do with 'John Jones.' Let's – let's get busy now, we obviously are nowhere near it. Now let's get some new ideas here." Make him list some more. Otherwise he represents a rock slamming item and you'll get an increased incidence of R/S and you will get all sorts of goofy looking things. But that – that's a piece of auditing, that's an error that has been entered by the auditing. Don't you see?

Well, the rule in 2-12A is that you come to your last R/S, still TA, and, you go 50 items beyond your last R/S with a still TA. See? Fifty items beyond. If you exceed that rule you're liable to start tightening the bank. And it'll start looking like a wrong list. It won't increase the number of R/Ses. But it'll start tightening up on the pc; that needle starts going tight, after 50. That's an interesting datum, isn't it? In other words, that 50 is a pretty absolute fact.

Once in a blue moon because banks are banks, you'll have to go more than 50 and suddenly find yourself there. You didn't have an RI on the list so you go back to it and you list a bit more and you find yourself staring into the teeth of an R/S that appeared from no place. Sometimes if you're unlucky and got out of bed that morning, didn't put your shoes on right and that sort of thing, it'll be item 51. I have seen it happen. It's the very next item the pc put on the list right after the auditor stopped listing. Very next one. Everybody tearing his hair out by the roots and the pc says, "a compounded felony," you know, is the next item he gives. It R/Ses like mad. The auditor tries to list further, goes on; the bank starts beefing up, everything starts going to hell in a balloon, you see. He now tries to put another 50 on top of it, he can't make it; so he finally goes back to test a compounded felony and it is the RI and there aren't two R/Sing items on the list and all is well. Don't you see? Goofy things like this can be expected to occur.

But in the final analysis, if a list is taken from a proper item, you know, a proper source list and you got the right RI: it goes on around just like clockwork, pang, pang, pang. You start having trouble and these rules start going astray when you've got an improper source list or you didn't get the right RI off the first list or you got the wrong RI on the next list so you start having trouble and these rules start going by the boards: go back one. See? This is the third RI you're trying for and it occurs as item number 3 on the new list and your lists uniformly here have been about 15 page lists for this particular gruesome package, one of these long listing packages. And all of a sudden on item number 3 on a checkover, of trying to find it and so forth – matter of fact you find it's on the first page. It's item number – what the hell! Well, don't consider that it's fortuitous, man: you scrub what you just found. See? Because you're off the wrong RI. Scrub it right then, you see: go back and continue that list a little bit further and you'll all of a sudden will find you didn't have the RI. See, it's the wrong source list or the wrong RI that causes this 2-12A thing to go awry. And every time it goes awry it piles up mass on the pc and gums up the pc. And that's all you have to be wary of, is, don't go gumming up the pc. Don't keep running things that pile in mass.

Who was it? Yesterday, apparently pulled a piece of screaming genius – which is why he's still here after all these God-endless months: because he pulls them. He has an RR (this is 3MX now, but it's the same rules), he has an RR that appears on page 12 and it's his last RR and he lists to page 17! Well, where did he think he was going? Were his brakes busted? See?
Couldn't be stopped? Because, oddly enough, this rule of 50, in 3MX becomes 25. In other words, 2-12A's 50 items – you use 50, you see. As soon as you get onto 3MX it's 25.

Now, all of your errors and difficulties associated in the vicinity of R2-12A come under these headings: complete asinine stupidity, just unbelievable stupidity. Guy is doing it; he doesn't know what he's doing and so forth. It – but when you look it over and try to find it, you look for something clever and you're going to find something that is just incalculably stupid. That's always nice and gross.

I had one I should have saved from Perth. This is an absolute classic, this is the most marvelous thing you ever saw. And I think I sent it back. Yes, I did. Well, I ought to have kept it. It's an actual quote found running in a session in Perth. "Well, now I'm going to read your item to you, uh – (whatever it was) a catfish. Uh – all right."

Then the pc said, "Oh, well, yes, catfish. That's very interesting. Did you get anything out of that?"

The pc brightly, finally says, "Well, did you get a nice R/S on it?"

"Oh, no, it didn't R/S."

Female voice: That happened here.

You see? How the hell do you think yourself around mistakes like this?

The auditor hasn't got the fantastic essential that you have to have an R/S! He never got that. You see, that's the stupidity that you run into.

Your next one – your next one is an actual or inadvertent failure to grab this one point: That it is the Routine 2, it is not the auditing that helps the pc. And you'll get this kind of a cycle going. When an auditor first starts in on this, Christ, he has mid ruds and "since the last time I audited you..." mid ruds and every page he turns over he gets in the big mid ruds and every time he gets an item he tiger drills it and, he tiger drills endlessly, Big Tiger, the item that he reads before and then he endlessly Big Tigers the other, and he never tells the pc anything but just keeps on auditing, auditing, auditing, auditing. And you find out 90 percent of your session is consumed in all of this motion. Now, is this auditor – this is to be expected, see, I – this we see. We've seen this continually so it will go on this way.

All right then, gradually as he gets a grip on the fact that it's Routine 2, well, you get a diminishment of the auditing and an increase, see, but he goes down to about 50 percent. He gets in his rudiments every – at the bottom of every page, don't you see, or something like this. And he has a tendency to cut them short here and there, you see. And he doesn't interrupt the pc from listing just so he can get his rudiments in, you know. He's learned these facts. Then, by God, he gets smooth enough in his presence as an auditor and holding the pc in session and so forth so you hear a drill of an item before it is listed. You know? And you listen in vain and you won't hear any beginning ruds, you won't hear any end ruds; you'll hear some Havingness. You know? And the thing has suddenly gone to 98 percent of the session – has become Routine 2. You can expect that evolution.

So don't try, particularly, to prevent it. But just put out the rather snide propaganda that, when they finally know their business, why, they won't be doing this. You see? That's
the best way to handle it. Oh, go ahead, put all the rudiments in you think you should. You'll eventually find out that most of your trouble is coming from your auditing, it isn't coming from that. So it's smoothness of presence. It's also the smoothness that they can put the rudiment in. The rapidity with which they can put these things in and that sort of thing. Get the idea?

It's the goodness of their TRs. This all keeps the session running and eventually you aren't occupied in patching up the lousy auditing the guy is doing. He's auditing very self-consciously so he knows he's goofing, so he expresses it in getting in mid ruds all the time. You see? He knows he's made a mistake so his first thing is, "Well I get – I'd better get in the mid ruds here to get that mistake off." See? He's called the item three times, each time differently. See, he's mispronounced it some different way each of the three... "Well," he says, "the best thing to do is get in all of my mid ruds." You know, just its – you just get this endless confusion. That's because the guy hasn't got the technology as a stable datum.

Now, you could expect such an evolution. Now, further, you can expect the diminishment of error, unless the student is permitted to disperse off lists. This is a golden opportunity, an absolute golden opportunity to audit wrong.

A student can audit so wrong that he never learns how to audit right. You see what I mean? It's such a narrow catwalk that he never does learn how to audit right because he can do so much dispersal on it. See? Oh, he sees the first R/S on the list and he calls it again, immediately, to the pc and he says, "Well, that's your reliable item," and he tries to represent it; but then that gets no place and it beefs up the bank and, so forth. So he decides he'd better invent something new, to go along with this and, actually, he just goes on a dispersal and he'll get worse and worse and worse as an auditor; and not only the pcs will get destroyed, but he'll be destroyed as an auditor. Don't you see?

So it is of great interest to us in our instruction here to get all these rules packaged up so they don't drift around in the air someplace. And then never theorize with a student. Just lay these things into him with an ax. Actually, they exist now. See, we've got these things. I can go back over all of these things and pull them all together into packages, and that sort of thing. We still, in the addition to what I've been giving you here, we know these things; these things, let me put it this way, are known so we can therefore embark on this kind of an action. But when you learn how: deviate. Until so: toe the mark. And, of course, the guy after he learns how and toes the mark, he sees there's no reason at all to deviate. You see, in his anxiety to get a result he will do something else, or wonderful and strange. Don't you see? Actually, it runs off very smoothly if it's done right.

Now your next thing, the next point here I'd like to make with you is: the things that bring in mass or beef up the bank and that sort of thing normally can be counted on as wrong; something is going wrong here. But it's not necessarily the source. You don't just keep picking on source and abandoning lists to correct this mechanism.

Well, I've just given you one way this can happen. And one of the ways this can happen is the pc is representing an R/Sing item: you'll get increased incidence of R/S and everything else towards the end of the list; you'll get a beef-up of bank; he'll start looking abso-
lutely haggard. And the list is from a perfectly good source. See? Well, it can be from a perfectly good source and listed wrong way to.

Now, one of the ways you detect a bad source is you can't tell which way to list it. There's no marked difference. You test it, "What would it oppose?" And you list a dozen items. And then you test, "What would oppose it?" and you list a dozen items. And you just can't tell any difference between them. That's your best test, by the way, for a wrong source. You can't tell the difference between these things, well, don't go beyond that. Say, to hell with it. Let's look it over – let's look the case over earlier than this point. In other words, let's look at this source and see if we didn't have a wrong source. That's when you get a wrong source, that's when the thing won't list. Don't go 45 pages to find out it's wrong way to. And don't go 45 pages "both ways to" to find out it can't be listed. See, the time to find that out is very early.

But watch this mass characteristic. Watch this mass characteristic. You can always expect a little mass to show up because he's listing. But, boy, when he starts getting dark it's these areas, these pouches under the eyes, that tell you the whole story. And when he starts getting dark under there something is going wrong. Well, don't make up your mind what's going wrong before you see what's going wrong, because, as I've just given you, there can be wild auditing goofs in progress. There can be fantastic quantities of auditing and nothing but total suppress and protest on the part of the – of the pc. Don't you see? There can be an auditor who never does anything but Q-and-A, for instance; everything the pc says, the auditor does something, see. And it can be something mechanically wrong; it probably is something mechanically wrong. However that's the one I would pick on. I'd look over and see what the devil is happening here. Look – look – let's see what is happening here.

And one of the first things, very important thing to check, is in any way at all this pc representing a rock slamming item? That's about the first thing to check. Because he isn't answering the auditing command. The way you check that is just – how is he answering the auditing command? And then you prod him a little bit on the subject of, "Are you representing any rock slamming item here?" or something. See? "Has the auditor given you an item and you're now trying to get that on the list?" See? What's going on here? And you'll find out that's out of gear more often than not.

But when they can't list and when it won't run right, believe me, it doesn't run right. It doesn't go on this cycle: pc pretty good; pc worse, worse, worse – you know, we're used to this in old-time auditing – and then it gets better and better and better and the pc comes out of it. That's going through something. Well, R2-12A doesn't go that way. It doesn't go that way. It can stay on a non-improvement, see; it can remain on a plateau. But once it starts over the edge of that plateau and the pc starts getting worse, there is something wrong.

Any darkening of the eye pouch, don't you see? Catch it early. Don't list five pages with him getting lower and lower in the chair and mass crushing in further and further in without investigating this thing.

Now, it's an interesting thing about the abandonment of lists. You abandon too many lists, you're really going to get the pc upset. But, let me tell you something about list sources. List sources is not anywhere near as critical as you think it is. The sources for a list are not
critical. You start in on a raw meat pc, you can make all kinds of errors and get packages. That's not a critical point. That is a point and it has bearing on it, but it's not that critical.

Now, if you find out suddenly that this list source that you're taking comes from a rock slamming item, an old – some old 3GA – get off of that, man, because the pc is going to list into a discolored skin tone and all of this kind of thing is going to happen. But I'm talking now about – let's say you went into the Scientology list and he found Scientology rock slamming like mad. How the hell are you going to correct a Scientology list? How can you increase and finish the auditing, the – how can you complete a Scientology list with Scientology rock slamming?

Male voice: Never tried it.

Well, you can – you can think of all kinds of dodges by which you hope you're doing it; but in actual fact you're not doing anything but representing a rock slamming item. You understand? So, what the hell? Buck into it head-on. So it doesn't list well. So the pc has a hell of a time. So the lists are all 22 pages long. Do it! Gave you a nice big R/S, third of a dial, what the hell, man.

And you'll find out that you'll more often come out right without being so damned gingery [gingerly] about that first list.

Sometimes a case folds up just because, on the first list, there were five R/Ses and the auditor finally grabbed one and then that got abandoned. You have to go back and finish that list. Parts of existence, anything like that. He had – he had "sex" rock slamming a third of a dial. You tried to complete the list and you came up with a rock slam which was a quarter of an inch wide. You'd be so much better off to take sex, see, and carry it on if it had ever been carried on, than to try to correct or rectify. Don't you see? If there's any way you can get a rock slamming item that is an RI from that first list or first approach that the person had in case repair: do it! And expect it to be fluky. It will – it will not quite follow the rules here and there and that sort of thing. So then's when you have to be smart; there's where you get your variations. Don't you see?

Something was done wrong in the first place and when you go back to correct it you find out that you've got to complete what you did. So this puts completing a cycle of action actually senior to avoiding something because it's wrong. See, completing a cycle of action is a bit senior to correcting the situation. You've got something that will list, God help us it lists horribly, but it will list: well, complete it and carry it all around four ways.

But if you're not going to, and this is a brand-new case, and you see that this thing is just going no place: don't try to pick an item off of it. Look, you've got to make up your mind, you see. If you're going to pick up an item off of it, you'd better carry it on. But if you're not going to pick up an item off of it, if he – if you – it's just going no place, you see – all the rock slams were only about three-eighths of an inch, that sort of thing, just tap the pc cheerily on the back and say, "That's fine, now we're going to take another list." You see?

But supposing this thing, all the way, had been delivering great big rock slams. Well, you'd better try to get something. Because it may be that you will never counter another rock
slam of that magnitude. Cherish those big, rock slamming lists. And do them even if they're a little bit wrong.

You see, the idea is simply this: Routine 3 has got to be as precise as though it's laid out with a carpenter's square. And it is. But what are you handling? You're handling the goal, man. And that handles all the mechanics of the GPM and everything will run off just like clockwork.

Not Routine 2. Routine 2, you're on the outskirts of all this and you're trying to cut yourself a channel through. See? And it's fluky and it'll go right on being fluky. And Routine 2-12A follows rules that are quite precise. But the rules only go astray when something is done wrong. See, the rules go astray when the rules aren't followed. You got the idea? But sometimes because you're on the outside of the GPM anyhow and tickling its edges, you've got to take something just because it is rock slamming like crazy and bear through with it because you can't get anything else. And you'll find out that's superior to leaving it alone. You see? There's a point of judgment involved in the thing.

But 2-12A because of the very nature of the thing, that it's only handling lock items on top of RR items, see, but an R/Sing item is only a lock on a – an RR item. Because you're only handling these locks... Well, with all the lousy auditing, you see, with all the goofs, with auditors reading the super-significance – and, by the way, never let an auditor monkey with a significance of anything. Particularly in R3. Because in R3, let's say the pc's goal was to be a dog, and the auditor will inevitably take the first RR that he gets, which is barking, and say, "Obviously, it's the pc's terminal." It never is! Never! It's always the oppterm. Because this goal has passed into the hands of the enemy. That goal is only resident in oppterms now. Isn't that an interesting point?

And the next item up the auditor of significance, you see: "to eat bones." Oh, goody, goody, goody, goody! See? Goody, goody! That's fine. That's a terminal. Don't even have to test it! Bull! See? So just the rule is significance. Never pay any attention to the significance of an item; just never do. Just neglect it utterly. Just do it by mechanical test.

But expect 2-12A to be random. And grab what you can get or grab what has been listed wide. Take allowances for the pc listing rock slamming items and that sort of thing. You can get something on that list to R/S widely when read again. And there aren't two things on the list that are... Grab it, man. I don't care if it came from item one, see. If you get something there or if something was taken off that list that R/Sed well and then was listed: somehow make that list come out to something. Because that pc will never be right until you have. Go all the way around, in other words. You understand?

*Male Voice*: Yes.

You can find the R/S, neglect it, list it, bury it, goof it and then get a nice, complete list with a little, tiny R/S that won't list, that tears the pc to ribbons. You got – get the idea?

So just specialize on that big R/S. Just make sure that it didn't come from a representing rock slamming item or a rocket reading item. Just go on! You can't miss. In other words, old 2-10 and 2-12 when they were originally put out are correct. You can just take the mostest
read that you found on List One and represent it all the way around and the person will be a much happier auditor. You see that? I mean, it's simple.

But with great precision, what is the perfect way to do it? Is to complete the List One.

You see that 2-10 and 2-12 were actually not totally invalidated by 2-12A. Just some new indicators and data came along. You can still take 2-12 and get someplace with it.

Now, we got to get results without knocking people in the head. That's – that's what we got to do. Now, we got to teach them to get results without knocking people in the head at these original stages. And the liability of the Routine 2 is that it will knock people in the head. But usually knocks people in the head when done goofily. You get to figuring too hard, you think too hard, you try to figure yourself to death on the thing, you try to get yourself into some kind of a weird state, of what the waw and if it woo and then it wrr. No, just settle it all down. "Did anything R/S here?" "Oh yeah." "And did we ever have an R/S here? Was it ever listed?" You know, this kind of thing. Well, did – well, God almighty, get something off that new list. We don't care if it's cycled. Get something off of it; find out if it's terminal or oppterm. Chase this guy around the block into a four-package of it and he'll be happy as a clam. This is actually how you settle it down.

See, it's actually a crude settle down. It's not a very precise settle down. Because it's not a very precise process. See? Because you're... you couldn't be – but if... that it has rules at all and that 2-12A could be evolved is fantastic. Because you're handling locks on the goal. Always has a liability. Always is slippy. But find a great big R/S and run with it. That's fine. If you can do it, do it. And you'll come out right and the pc will be better every time.

Find a great big R/S and do something else and try to be perfect with something else and find something else and try to find something else: you're going to wind up with a 3/8th of an inch R/S which when you try to do it pulls the whole bank in on the pc.

So we're trying to get the maximum gain with the least bank pulled in on the pc. And that is the rule you are trying to follow. See? And that rule is accomplished by finding the widest R/S and making a package out of it. We don't care how we got the R/S as long as it isn't from a representable rock slamming item. And you'll find out you'll have wonderful success with this if you follow it.

Now in 2MX... in the Routine 3MX we got an absolute doll, which is as – which is as different from 2-12, Routine 2 approaches as you ever heard of And it's an absolute doll. That thing is just a carpenter's square. It's just exactly on. The lists are shorter; they run more rapidly. It is very swift. It's always the last rocket reading item on the list. You know. If you overlist it tightens the bank, that's by the rule of 25. And the only variety which you'll find is if you haven't prepchecked the goal and the goal is slugged up like crazy and it won't rocket read well but it's persistent in its rocket reading, you know, it's tested Tuesday and it got one rocket read out of it and it's tested Friday and it got one rocket read – oh, to hell with it: list it. See? That kind of thing.

[This tape ends abruptly as did the original master recording.]
R3MX, PART I

A lecture given on 7 February 1963

We've – have a lecture here from my office. And this is the 7th of February 1963 and Saint Hill Special Briefing Course, lecture number one. Lecturing here in my office in front of the TV camera, and we've got a lot to cover here in 3MX.

All right. As you realize, now that we've gotten our materials pretty well lined up, the Saint Hill Special Briefing Course is going to be specializing in Routine 3. We're going to do a minimum of Routine 2. And therefore it's very much to our point to have a decent understanding of Routine 3MX, and that's what this lecture is all about. This is the first lecture on Routine 3MX and gives us our first fundamentals.

All right. If Routine 3 never went any further, and there was nothing else ever done, and nobody ever heard again of Routine 2-12A, it has served its purpose – because it has piloted the way in listing. All the rules of Routine 12A are – in listing and so forth – are followed in 3MX and it gives us a very good look at what a goal is, and what it's all about, and how it should be listed out. So that a brand-new method here of listing out goals has been developed, and it is evidently tremendously successful.

Now, of course, I have a subjective reality on what I'm talking about here. I also have a subjective reality on Routine 2-12A.

Probably one of the most spectacular sessions I've ever seen conducted, completely aside from the fact that it was conducted on me, was the session done by Mary Sue on, what was that, the beginning in the evening of 5th February.

Now, that was a tremendous session in terms of results. In that session we found the R/Sing item which began the goals entrance into 3MX, and just before that, completed a 2-12 package. So that the total score on that, in actual fact, the number of items found in that five-and-a-half-hour session, consisted of four 2-12A packages – that is four items – making one complete package, and four Routine 3MX items – making eight items in all in just that one session.

Now, that at once gives you an erroneous idea of how fast you ought to audit, and is of course an open invitation for you to just grab items all over the place to make a record; and it is very bad publicity. In the first place I'm very easy to audit, and the second place, Mary Sue can audit, and in the third place this was pretty well set up. To give you some of the more gruesome details of this might be very instructive to you. In actual fact the path was not as smooth as it might have looked at first glance.
I had a goal found back in August – the goal "to find" – and this goal failed to check out consistently, and folded up sometime in September. It was listed a bit under the old methods of listing and it didn't get too far. In fact, today the goal – that is not today, but last week – the goal wasn't even firing. It had collapsed completely. Nobody had seen any reads on it or anything of the sort for a long while.

Well now, having done quite a bit of 2-12A on me in the past month or so, why, Mary Sue and I decided that we had better take a crack at listing this goal properly, and we did some goals research. I very often am used as a guinea pig in this particular lineup. And we did some goals research by trying to list this goal one way, and the other way, and some other way in order to make the thing spark. And that was on Sunday night, the 3rd of February, and we listed this 3MX method amongst the other methods. But no rocket reads showed up of any kind whatsoever. And Mary Sue was quite disappointed about the thing and didn't do anything further with it.

And on the 4th of February, Mary Sue started out on a long, arduous, hammer-and-tongs pound, trying to locate something with Routine 2-12A. But in actual fact that didn't go anyplace in that particular session; we didn't do anything with it.

On the contrary, I had worked out a new theoretical process which goes as follows: that if you run out the overts on people's goals, your own goal will pop up. Sounds awfully good, doesn't it? It almost killed me.

The truth of the matter is that as you're listing goals you have overts on, the overts, themselves – not being given to the auditor of course, you're just telling him what goals you have overts on – anything like that gives you nothing but missed withholds, left and right. So there were something on the order – I think – I think she listed about five hundred items – that is five hundred goals or purposes I had overts on. And to give you something very amusing, it ran about twelve missed withholds per goal. So that was five hundred times twelve, or about six thousand missed withholds – that's in one session. That's pretty good, isn't it?

Well, that caved in masses, and an electronic mass that I got into in Dublin keyed in, and it keyed back in thoroughly and I was frying as though I – well, I was frying as well as the dream citizen of Kennedy's administration, you know. Totally fried, atomic fission – I was bright red, I was in terrible shape. So that was – that was really a cave-in.

So in the next session which occurred on the 5th of February, we tried to get back on the run again with 2-12A, and if you've ever seen nervous pcs, that was the one. I had more or less been steering this to a marked degree, but I was a very nervous pc. I didn't want anything overlister even one item, because the second we overlistered something just one item, in would come this fry-electronic, atomic mass, and it was really quite painful.

When I first ran into it, by the way, I became completely speechless, couldn't talk, and the auditor went on asking the auditing question. You see, Mary Sue has been demanding a fee on this, so I – I don't want you to think that all auditors are perfect. She's pretty good though.

Anyway, that thing really, really fried me, and I was very dangerously minded on the 5th, trying to keep this atomic mass off of me, and trying to keep the thing running on the
rails somehow or another – and she was listing various variety of beginning lists. You see we'd already run out of all of the old lists, all the old source lists. And here's a datum for you by the way, that we found out in all this: is you can't go further than the four, not – not with 2-12. You can go further on 3MX than four consecutive RIs, but you can only go four RIs with 2-12A. Don't try for that fifth one.

While we're on it, any RI that only rocket reads that much, you see that, only about that much, tiny, little, little RI; that's about a third of a dial, something like that. Well, this one only about so much. Anything less than a third of a dial is very dangerous. It pulls in mass like mad. Actually if you find one like that on a pc, it's only R/Sing that much, just pat the pc on the head and say, "That's dandy," and don't have anything more to do with it. Now, just skip it, just bail out. You want to go back and find something that did R/S decently.

Now, in 2-12A we managed to work around a first list, and I was listing "What isn't part of existence," I think "What isn't part of existence." By the way, there was another test list in there I just remembered, "What aren't you now?" Don't try that either, that – that's just dynamite. But 2-12A we managed to list on, and "Isn't part of existence" some such list, and we wound up with an item that had a good third-of-a-dial R/S, and so forth. And at the end of the session why, on the 5th, everything was very happy, and so forth.

She sailed into this on the 6th, and decided she was going to complete this package on 2-12A. Well, this was a very interestingly brief package. A source list on 2-12A, you must realize, can have its item occur anyplace. The source list does not follow the rules. Now, that's hard to cope with. That is to say, any of the R/Ses on the source list can be the R/S. You've got a problem here in where does it occur, because the pc's mind is not well channeled on present time lists, and what is part of exist... what isn't part of existence, and so forth. And in actual fact, the source list item that we got was the first item on the list. It R/Sed and she couldn't even separate the list question out from the item for a moment or two, and then I managed to suppress it and she got that out. And she ran about a page and a half of that.

I'm looking at these lists here. I'm not tremendously familiar with them.

Yes – here it is, "What isn't part of existence?" And in doing "What isn't part of existence," this – can you see this now? It – it's this list right here at the top. That's number one, that's number one item. You notice that R/S? All right, the list question was "What isn't part of your existence?" Now, that's fine, but it, the first item, "unlimited wealth" was there, and there – there it is. It was the item, it turned out.

But if you will notice, looking this over, you would list it normally, and you come down here and about eight or nine items from the top, tone arm 2, you have here an R/S and an R/S and a DR, and an R/S. And then you have on the reverse side of the sheet here, again you have the same one – the first one put back on the list again. This is back on the list again, and this time it gave pain. In other words, I put it back on the list. So that of course R/Sed, and then you notice here there is another R/S and an R/S – and by this time she didn't continue on over because the mass was pulling in so tight that there was just no continuing.

And she took that, on the 4th is when she did that, and on the 5th she took this as an item, and she ran it on around the clock, and so that we got a, a package out of this.
There's a lot of test, experimental and research lists here, one kind or another that I'm pawing through, and apparently the list I am looking for just... oh, here we are.

Now – now we come down to a test for pain or sen which is greatly superior to any test which you happen to be using. And instead of determining by pn or sen, you determine by mass. And you say to the pc, "Consider unlimited wealth committing overts," two or three times, and you ask him "Did it turn on any more mass?" And he doesn't know because he hasn't been looking. So you say it two or three more times, "Would unlimited..." or "Consider unlimited wealth committing overts." And then you say, "Consider committing overts against unlimited wealth. Consider committing overts against unlimited wealth." You say, "Did that turn on more mass?"

He says, "Well, yeah, there's something out here and it started to go out from my body," and – and so forth. And that's of course wrong.

In other words, you tested as term and oppterm, and the one which doesn't turn on more mass – of course these things all have a little mass associated with them – but the one that doesn't turn on more mass is the right way it is.

If you say, "Unlimited wealth oppose," when it should be "Oppose unlimited wealth," you of course are running a wrong item. You recognize that by using it as a terminal, or using it as an oppterm, you get a wrong item manifestation. All you've got to do is say that the thing is a terminal when it's an oppterm, or an oppterm when it's a terminal, and you've got a wrong item. You recognize that, and the thing behaves like a wrong item.

So here is a test. The right way to turn on less mass than the wrong way to. Because of course a wrong item turns on mass; that's your stable datum. The wrong item turns on mass always. You can keep that in mind.

Anyway, here is this very interestingly brief 2-12A package. We look on here and we see here this is "Who or what would unlimited wealth oppose?" And of course here we start in our list as we normally would, just go right on down here with this list, on down here with the list, and only is two more items on the other side of the page. Now, that should be of considerable interest to you that a 2-12A list can be that short, because very few of them are that short. But this is the equivalent that – we talk in pages, this is the equivalent of – of course one, two and a bit, pages. Fantastically brief. So it must have been right up on top of the bank. And she did this, and this is done exactly according to the rules.

Now, the rules are simply this: That you get down here, you're listing down from the top, down, down, down, down, down from the top to the bottom of the page. You take your next page, and you're at the top down here, and here your TA motion ceases.

Now, the characters have been having an awfully, awfully hard time of it. I sympathize with you terribly. You're going to think yourself to death someday. I – after my absence of being kicked in the head earlier a few weeks ago – I haven't been very alert on what's going on. And let me tell you, a rumor that there is no such thing as a still TA is more asinine than I have heard since 1950. Anybody that will take a meter – anybody that will take a meter and hold the meter on a cognition-surge basis, and every time, every time the needle ducks, duck the TA. You, you see that now. The needle does a cognition surge, so they think immediately
– I tell you, you're going to think yourself to death someday. I'm not kidding you, you know. You're going to think yourself right straight into the grave.

God give me a simple auditor who can just sit down and just list and pick up the item and pat the pc on the back and say, "That's it."

No, no, people got to get fancy. Every time the tone arm – every time that needle goes this way, see, needle goes – so, so. Pc had a thought, see, comes back to the approximate place. Then the auditor figures out, of course, that this tone arm would have gone that way, that way, see – there we go, so therefore didn't still tone arm. You nut. I mean I'm being very, very insulting, but when I heard about this I said, "My God, this can go on at Saint Hill, what the hell goes on in Keokuk?" Now, that's a – that's an interesting question isn't it?

Look, you don't count the surges. A still TA is a still TA. Where have you got to put the TA in order to read the needle? Well, if you don't have to put the TA any other place in order to read the needle, that's a still TA. You got it?

Do you know there have been two or three cases out here that have been wrecked with that – wrecked with it, I'm not kidding you. Somebody just figured himself to death, see. So you quit that.

You know I could probably dream up more problems for you to solve in Dianetics and Scientology than you could count in the next million years. But no, you've got to pick on something like this: "There is no such thing as a still TA, that's ridiculous, a still TA." No, a still TA is a still TA.

Of course, you did something better than that today as a class. There was a member amongst us who thought that an R/S was a tick, was a fall, was a dirty read, was a rocket read – and all the pc's items, all the pc's lists were beefing up because the R/S was on everything. And Mary Sue got bright enough, being an old D of P to look over somebody's shoulder and say, "What on earth do you think an R/S is?" And anything was an R/S. So of course it looked like the pc's lists were all beefing up.

Yes, I'm giving you – I'm giving you a bad time, but I'm giving you a bad time with malice aforethought. And that is because when I tell you something very simple like you put the pc in the chair, you say, "Start of session. Give me your goals. Now, here is the list we're going to list, and can you answer the question?"

And the pc says yes, he can answer the question. And then he... the auditor simply sits there and writes down the items, one after the other – without tripping the pc, without spitting in the pcs face, without dropping the E-Meter, without getting in the mid ruds for yesterday, without getting in the mid ruds for tomorrow, and so forth – just finishes the list and goes through the 2-12A routine and comes up at the end of the session with a nice item, and everything is firing – and there it is. Give me that auditor please, because the evolution – the evolution which you go through as an auditor is very interesting.

The first day you confront the pc, you do everything you can think of. You've heard – you've heard of 8-C, and you've heard of this, and you've heard of auditor control, and you've heard of this and the other thing. The more complicated the auditor is being the less certain he is of the tools of his trade. And you can just put that down in your book. And that's the only
thing that gets in the road of Routine 2, and will get in the road of 3MX. Mark my words, it's just somebody who really doesn't know what he's doing, so he's doing everything.

I heard this afternoon, with some horror, of a staff auditor in a Central Organization who couldn't get much done because the last two-and-three-quarter hours of the session, every session, had to be taken up with the end rudiments on 2-12. Oh, no. You know how you end the session? There's a reversal on this. If you just – if you could just end the session like you say, "Make any part of your goals? And you make any gains?" You got the item, see. "You make any part of your goals? You make any part of your gains? All right. Fine. Now, notice the ceiling, notice the floor, notice the walls of the room. Thank you. Is it all right with you if I end the session now? That's the end of session." You know, that didn't take two hours and forty-five minutes. You know it's infinitely better than anything else anybody's doing. You see what I mean.

Sabotage comes with uncertainty. If your TRs are perfect, if you can sit there and hold a pc in-session – listen to me, you don't need any mid ruds.

You know I've had people right here at this desk over here. I had them sit down and say, "What's your goal?" Do a goals list of fifteen, you know a lot of those goals worked out. And they did a little goals list, and I'd go over the thing, and they're happy about it and I'm happy about it, and...

Somebody was standing across the desk from me just yesterday and he said, "Do you know one of the biggest session gains I ever had, you brought me in here one day and you found something that might be my goal. And you didn't say it was, but you, so on, and it's the biggest session gain I ever had. Had a lot of cognitions on it," and so forth. Total session time – ten minutes. Total mid ruds – zero. There wasn't even a "start of session." Why? Well, he didn't have to be told he was in-session. I was auditing him. I'm sorry, but that's the way these things go.

Now, look-a-here, you can see this paper better here, all in one fell swoop. This is a list down here. I'm sorry to – to chew you out on such things as "There is no such thing as a still TA," because you actually just destroyed your primary indicator, don't you see.

Now, she got down to here – I'm not showing you these because these are mine, but I just happen to be a set of stuff that I know about on 2-12 and on 3MX. So I – I can show you very intimately and correctly exactly where these things are. All right, we come down here, we've got a tone arm read of 4 on this border here. On this border we've got 4.75, 4.75 and nothing moved, obviously, and there are no more reads. It's all 4.75, 4.75, 4.75. In other words the auditor did not have to move the TA in order to read the needle, so it was a still TA. That's all there is to that.

Now, you'll notice in all this that after you've gone in 2-12A, fifty items, your needle starts to tighten. Not only do you have a motionless TA, but you have a tightening needle. Now, here we go five items deep, we had an R/S. This is all still 2-12, see. We add another four or five items – we had another R/S. Four items – an R/S. About two items later – an R/S. Three items later – an R/S. Then an R/S, and an R/S, and an R/S, and an R/S, and an R/S, and an R/S, and then it skips an item and R/S, R/S, and then another R/S. You say, "This thing is
hotter than a pistol." Well it was. That's because the whole thing is being hit right there into the middle of the package.

All right, and we get up here to this second column here and we've got an R/S, and then we've got another R/S, we've got another R/S, and then we've got another R/S, and then it goes two – and there's another R/S. And there's no R/S, and no R/S, and no R/S, and nothing, and so forth. TA has already hit its still point. Now, she's got to list herself her fifty items, see. So she did. Actually, it was: needle started to tighten up so that she didn't finish off listing her fifty items on this particular thing, because it was just getting asinine. There isn't anything going to happen. Why finish listing the things?

So it's just a jump of that thing based on the smartness of the auditor not to list the pc into the ground. The needle is getting tighter, and tighter, and tighter – and the TA actually has been still for quite a long time, and there's nothing else happening here, nothing else happening – and there's nothing else going to happen either.

So there it is. There's the last R/S. All right. So she says – so she says right away to the pc, she says, "Now, I'm going to read the next to the last rock slamming item – the next to the last rock slam item I'm going to read to you." See it'... there's the R-factor. She's not going to read the pc's item so he can ARC break, you see, and say, "It's not my item."

"Well, I didn't say it was your..." I can hear you now. Omit the R-factor, see.

"Well, here's the item, Joe Blow."

"That's not my item."

"Well, I didn't say it was your item." How to not get along.

All right. So we... all those R/Ses ended up down here with one R/S, so she reads the next to the last R/Sing item to see if it reads. It had better not. And out it goes – bang. She marks it out – didn't read. She reads it to pc – didn't read. No, no Tiger Drill or nothing like that.

And then she says, "Now, I'm going to read the last rock slamming item on the list." Not even, "This is your item," see. And she reads "being homeless," see. She said, "That R/Ses."

You see she – she doesn't do this, and I don't do this, and you're not supposed to do this. You sit there, "Being homeless. Being homeless. Being homeless. Oh, well."

Pc says, "Well, did it, did it, did it, did it R/S?"

"Oh yes, yes, R/S."

"Well, how big was the R/S?"

"Oh, about a third of a dial, so forth." [scrambles with papers] "Let's see now, we've got to get over onto this, and so forth. I don't know if that's your item or not."

And pc's saying, "But, gosh, do you know, that's always what I worry about."
"Yeah, well just a minute, I – I've got to get some – get my auditor's report written up here. Now, let's see, let's see, that doesn't really seem to be your item, and so forth, because I can't figure out the significance of it."

That would be a bad show, wouldn't it? I hate to get this sarcastic, but I have some things reported from organizations particularly that make me hold my head in my hands. Something like this:

"Are... well here's an item here, irresponsibility: How do you like that?"

"Oh, it – it's all right," the pc said, "that's all right, all right, all right. Always been pretty irresponsible."

The Auditor Supervisor comes along and says, "Well, did it R/S?"

"No, no."

We don't know what this interlude was all about, don't you see. We haven't a clue. Why was he reading this item to the pc in the first place?

Now, it's just a direct positive action, and in 2-12A your rules are very direct. You take your source list – the item can appear on it anyplace – so you go over every item on the source list that R/Sed. Just make sure there aren't two R/Sing items on the source list. Take it wherever you found it. If it's not a big R/S don't do a thing with it, you hear me. Scuttle it. Find out why this pc doesn't have a big R/S. Something else has been done to this case in the past.

Now, take that reliable item, find out if it's pain or sen, and start opposing it. Do your pain/sen test on the one that didn't turn on more mass on "Consider committing overts against," and "Consider so-and-so committing overts." Then just start listing it.

Look, don't get in your – your beginning/end ruds with the mid ruds on the this-ruds, on the that-ruds, and so forth, unless the pc's fallen out of his chair, or screaming, or something like this, you see. Don't use the tools of auditing unless you have to use them.

You – how... what would you think of a plumber who went into a room and he sees an awful lot of fittings. So he gets out spanners and just work, working on all the fittings, and so forth. And pretty soon the whole place is leaking, so he gets out big spanners this time to repair it. And that's the way you'll go, you see. He's got to get out sledgehammers after a while and demolish the whole works.

No, the pc's sitting there, pc's interested, you start listing – pocketa-pocketa-pocketa-pocketa, bang-bang-bang-bang.

Now, some other genius around here someplace dreamed up one that you tell the pc what R/Sed. You say, "That R/Sed." This is an absolute invitation – a complete, utter invitation to the pc then to represent a rock slamming item. He's trying to get his item on the list, so you have something like "a penurious person." So he says, "A penurious person."

And the auditor says, "That R/Sed," you know, this hope factor, see.
So after that the pc says, "A cheap person, a person without any money, a person that ain't got nothing, a – uh, a broke person." You see why? He's representing a rock slamming item.

Actually you mustn't even let the pc see your list. You understand? I don't care if you've got to get a cardboard barrier across from you. That's better.

Now, when you flub and don't complete a list and read it to the pc – which you will do every now and then, the best of auditors will – the pc then, almost certainly is liable to take the next to the last rock slamming item that you read, and the last rock slamming item that you read that didn't. And he's almost certain, completely certain, to represent those unless you, the auditor say, "Now, that we have those, your item's probably nothing like them. Now, just answer this auditing question, 'Who or what would catfish oppose?' Now, that's all I want answered."

Because if he starts representing in order to get his item on the list, you are going to get a false increase of R/S. It's going to look like it's wrong way to, and it's not going to list out, and you're not going to get the item on the list. Do you understand?

All right. So those are the things you can do wrong. Let's take a look at what you do right. You come right down the list here. You start in, here you go, you are... list and list, and list and list and list – and there are your R/Ses. The pc seems anxious. He looks at you, and so forth. You say, "There are R/Ses on the list. It's okay." You do the same thing with, with 3MX. You say, "There are, there are R/Ses on the list. It's all right."

"Oh yeah. Oh. Okay." And he plows right ahead.

All right. You list on down your page, and keep your note of your TA over here on the side. Keep it – keep pegging it in, pegging it in, writing it down – whenever you see it, oh, every five, ten items, something like that. And when it doesn't change why you probably should make a list notation occasionally. Get on down here and all of a sudden you notice that about this place – and by the way most lists are much longer than the one I'm showing you. This is a freak list. This is a very short list. Lists usually go seven, eight, nine pages. This makes a good illustration for you. So right about this point here, tone arm motion ceases. You've still got a needle moving every time he cognites, you understand, but you don't have to move the TA to keep the needle on. So for all intents and purposes you have no tone arm motion.

And there we go, down the line, down the line – all of a sudden we see that R/S – ha-ha-ha, we see that R/S. It's the last one that we got. We don't see another one, see, we don't see another one. We keep on going, going, going, going, going, going, going, going, so on. Actually we count from this last R/S – fifty for Routine 2-12A, and twenty-five for 3MX. Never more than twenty-five for 3MX. Never more than fifty for 2-12A. That's fifty items after the TA stopped moving. Fifty items after the tone arm stopped moving, or after the last R/S, see – either one. But not fifty items after the tone arm stopped moving if you now have an R/S. See, your R/S cancels out the point from where the TA stopped moving on down to the last R/S – and you've got to have fifty items now from that last R/S. You got it?

And you just list them, and the pc says, "Isn't this getting awfully tough?"
And you say, "Yes, it's getting awfully tough," and so forth.

Count them up, you know – you know that's twenty, twenty-five, twenty-six, twenty-seven, twenty-seven [eight]; "You've got twenty-two items to go. Twenty-two, let me have twenty-two."

And the pc will sit there and snarl, and list the twenty-two for you. But nevertheless list them because every now and then he will pick up a rock slam, and then you should go on by the rock slam. Go on by the rock slam, and when you're safely by it so that he can't identify it, you say to him, "I'm afraid I got to have fifty more items: I've had a rock slam."

"Oh, you have. Well, fine." And he'll give you the fifty more items.

Those are the exact rules of listing. Now, look, there isn't any more to them – except in 3MX the difference is simply this: The difference in 3MX is just this one difference – that it's twenty-five, not fifty – because 3MX caves in fast, and 2-12A caves in more slowly after the still TA.

All right. So anyway, to get back on this other sprint. Just – I'm talking about this not because it's my case I'm trying to show you – because this was a research sprint and I'm trying to give you the stuff that we got out of it.

We got the rest of that package carrying it right straight on around, pocketa-pocketa-pocketa-pocketa-pocketa. And that gave us four RIs, and now having four RIs, why, we were all set. That was the end of that 2-12 package, and all of a sudden Mary Sue says to herself, "R/S." I had a big R/S on that, but she was muttering, and she went back to this goals list that she had been listing two days before and she decided to test the R/S. She tested the R/S. She tested the one before and found that the last R/S on the list fired as it should, and simply took off and opposed it. And what did she turn up with but a rocket reading item which was an RI. And we had to go to town right at that point.

In other words, the first part of the package started out with an R/S. Now, that's the goal oppose that we were doing, you know. Now, you have to have a question there that the pc can answer. And one of the ways that a pc doesn't answer the question is not be asked the right question. You've got to have goal oppose.

Well, that can have several wordings. There are several ways that can be worded. "Who or what would somebody or something with the goal 'to catch catfish' oppose?" Well, all right, he can answer that. But he can't answer "Who or what would catching catfish oppose?" You understand, you got to have a question that a pc can answer. And listing that on out the line – that was the one that had been listed two days before – we'd listed, she'd listed that out and she found an R/S, and this was a proper rock slamming item – the kind you'd expect to see in 2-12.

Well, turning that thing – testing it for terminal or oppterm, and listing it further produced another rock slam – rock... a rocket reading item; produced another reliable item, but it rocket read. And from that moment on, opposing and using the exact same rules that we had already worked out – it was a little bit tough being audited and working out the rules at the same time – but found out that the tightening of the needle is more rapid in the middle of the GPM than it is out on the fringes. You see, 2-12A is out on the fringes of the GPM, and when
you list a goal you go right straight into the middle of the GPM, and the tightening of the needle is much more rapid. So you get something that looks like this.

It also, apparently – I wouldn't say so at first glance – but apparently compared to 2-12 average lists, the lists of 3MX are shorter. They are a shorter list, but they're not lists of one or two, they're a little longer than that. Now, here's one of the item lists that came off of this, and here's one of these – now we're into 3MX, and here's the way 3MX works.

You ask the pc, "Who or what would consider committing overts against" – in this case – "detectives? Consider committing overts against detectives. Consider detectives committing overts." Say one one way two or three times. Say it the other way two or three times. Which one turned on the most mass? The pc tells you, and that's the wrong one, so you pick the one that didn't turn on any mass.

And he says, "That's right." And that is the item, so therefore it's an oppterm, see – whatever it was.

Oppose "Consider committing overts against detectives," turned on less mass, so therefore it is "Who or what would oppose detectives?" as simple as that. So we take this and we list this right on down here, "Who or what would oppose detectives?" We list it down against the meter.

Now, if that needle were tightening and we're getting no TA of any kind we would come off of it because there's something wrong. But you're not likely to get these items as wrong as you were 2-12 items.

All right, "Who or what would oppose detectives?" And we're listing here, pocketa-pocketa-pocketa-pocketa-pocketa-pocketa, we come down the line here and we're about seven or eight down the line and we get an R/S. And then we come about ten down the line here and we have another R/S. And then we got eleven and we get, twelve is another R/S, and thirteen, fourteen. Fourteen is a rocket read. There's your rocket read – first rocket read. And then we come down here fifteen, sixteen, eighteen, twenty, something like that – we have another rocket read – and at that moment TA action has ceased. It has ceased, there is no TA action.

And so she went on and on, and was just getting along fine with no TR action... no TA action, and almost had her twenty-five, and so help me Pete, she got an R/S on the list. So that cancelled the other twenty-five, and now she's got to have twenty-five more; much over the pc's dead body, you see. But gets the twenty-five more, pocketa-pocketa-pocketa-pocketa-pocketa, lists twenty-five more on down.

Now, this later thing was an effort to patch up a package. But there's a line drawn there to show distinctly that it didn't belong to this first package. Actually this first package was quite correct. This was just to come back as a – experimental test to see which way was what. We found out you could get TA action after you've listed something and found it's oppterm, you can get TA action back on it again. That's very interesting.

All right. So, all right, she gets down here, TA's been stopped all this time, there's twenty-five items past this R/S. There we go, all set. Let's go back here. Now, let's read the last rock slam on the list, if there is one, to the pc because we know that isn't it. But, of course, if that was rock slamming there's still charge on this list, so there's something wrong.
We knocked that out, and there she's marked it X, and we come back here to the next to the last rocket read and knock that out. Read it to the pc, say it's the next to the last. Didn't rocket read. All right. Then we say, "Now, here's the last rocket reading item on the list, 'a personality." And she says, "That rocket reads," you see. So she's got a rocket read, she reads "a personality" a couple of times, and that's all set.

Now, you'll find the cognitions are sometimes not as bountiful on a pc when they get rocket reading items. They sometimes merely say, "Yes, yes, that's the item, ha-ha, yeah, of course, yep."

And you sit there in vain waiting for them to cognite. Hell, they cognited, it blew. What do – what do you want? What – what do you want, Rodgers and Hammerstein's Oklahoma? Because you're not going to get anything, it's gone. But the pc knew it was his item.

Now, look-a-here, let's – let's get another one here now. You see how this goes. It's quite mathematical. There's nothing – nothing ever different in it. There's no variation in it. You do it the same way. And if it works any other way – you see your listing for 2-12A and your listing for 3MX are both identical. There is no difference in this listing.

And if you have listed something and you've flubbed the dub, and it doesn't follow the exact rules, the last rocket read doesn't read, the last R/S on the list doesn't R/S, somebody has goofed, see. Something you have taken it from is wrong. Your list isn't complete. There's something wrong, see? Your source item was wrong, something – something's wrong. That's the way you work this out.

And you watch these things, because here was a patch-up she had to do, and she was all ARC broke, so I had to come out of session and tell her that the auditor ARC broke. Everything had gone along, I think this was about the eighth consecutive reliable item – now we're into the session of the 6th of February – and this is the 8th consecutive or 6th consecutive, or something like that, reliable item found from this goal. Everything has rocket read, she takes this "personality," and she goes right in, she tests it, it works, everything works, everything is fine, everything is beautiful. She lists it and it goes down brrrrr, and you never saw so many rocket reads in your life, it's just rocket reads, rocket reads, rocket reads, rocket reads, rocket reads, rocket reads, rocket reads, rocket reads. Oh, my. Action, action, action, and then suddenly no rocket reads. And we go way down, and then some rocket reads, and then down here, and then some R/Ses, and then one R/S, and then way down here, and then the twenty-five from the last R/S, and she calls off the last R/S and it doesn't R/S. She calls off the next to the last rocket read, it doesn't rocket read, all is well, you see. Then she calls off the last rocket read and it doesn't rocket read.

In a hurry then – I had to hold her hand while she's doing this, this is nervy stuff, you know – she went back over all the RR's on the whole list, read them all. Like to blew my bank up – nothing. You know what the rule for that is – if you cant get the item on the list – she went and extended it after that, and she still couldn't get the item on the list – if you can't get the item on the list, you've lost one someplace. It's back of you. And that's true of 2-12A, and it's true of 3MX. It's true of all listing, in other words. If you can't get an item on the list, then there is no item to be put on the list because it's already been found, or something like that. It's been found elsewhere.
But in actual fact this would have been a catastrophe because we were listing right down the center of the GPM, rocket reading item, reliable items, one after the other, all of them following this rule: you list it all the way down to your last R/S or RR, still TA, twenty-five more items. The last rocket read is it, every time. Everything's just going like clockwork, and then all of a sudden here's one that doesn't go like clockwork.

Well, that's the time when you pass in the chips and try to commit suicide, or something, because that—that's a gruesome day. And pc feels a little ARC broke along about that time. So we sat down, we had a conference. I knew I had to think fast to save the auditor. So I dreamed up a rule which you'll be using, and I think you'll be very interested in this rule. And the rule is, is simply that if you suddenly draw a blank, well, go back and find the item, terminal or oppterm that the pc was less, least happy about.

In other words show him the items and say, "Which one of these weren't you quite as happy about as the others?"

And he will say—he will say, "Well, detectives, I just wasn't happy about detectives."

Look back and see where detectives came from and continue the list that you got detectives on. In other words, continue the list just before that, you understand. The one that detectives appeared on, let's continue that list because the pc says he's unhappy with it.

And here's the trick! You get your next item which belongs where you should have found it, here. In other words here's this "personality" list that didn't have an item on it—you've got this now—here's a "personality" list, couldn't get an item on this list. Went back and took an item the pc was unhappy about, and all the same he scrubbed that one and continued the same list that it occurred on. Another item did come up, a late RR—there's where the thing had gone astray, don't you see—and used that RR, not canceling out everything the pc has found on him, but just using that as your next consecutive RR.

Why did it come up in the first place? Well, it came up now because it's ready to come up, not because the auditor missed it. In other words this is another method of finding your consecutive line plot item that belongs on that. Here's a rocket reading item then, "convention" which gorgeously rocket read. Everything was fine, and it simply fitted exactly into the line plot where the oppterm of "personality" should have had a point, see.

Don't even tell the pc you've destroyed his items. Don't tell him you've scrubbed anything. You've just reached back, backwards, found something the pc wasn't happy about, continued the listing of that, found another item and just moved it up the line plot and used it as normal and just keep right on going.

Well, we're nine rocket reading items and one R/Sing item—which was the source that came off the goal—deep at this particular time. I've had quite a few R/Sing 2-12 items found. And over the period of time we're now nine rocket reading items deep into the GPM.

Now, about the only thing that showed up is a darkening of skin, a lightening, actually of body mass, and look a bit better. But, at first when you start into this you're liable to get a lot of black showing up on the pc anyhow, that's apparently one of the characteristics. And after he's been audited for—you've gotten a few rocket reading items, then he starts to lighten up. But at first, why, he's liable to look kind of black. That doesn't—doesn't mean anything.
It does mean something when the pc turns black. You start running a list, or list an item or something, the pc goes black on you. You just better get off of that now. Goes blacker than he was at the beginning of the list, you understand that. Any of you characters use this just so you can abandon the list, why I'll have your thetan.

Anyhow, there's your – your setup of 3MX is a very precise listing which is the same listing pattern as Routine 2-12, except that in Routine 3 you only use rocket reads except when you have to have an R/S on your goals opposition in order to start you into the bank. Sometimes that will be an R/S.

Now, an R/S and an RR fade into each other. That I have also found recently. They – an R/S, if it will become one, can become an RR, and an RR can become an R/S; but it doesn't mean that these are interchangeable. They definitely are not. You can't say, "Well, I'm running a rocket reading line because look at all the R/Ses." See, that's not true.

An R/S is a little bit further out than an RR. You get that? So an R/S normally is rather a lock phenomenon on an RR, and that's how these things are related.

So if you're running R/Ses you're really running locks; if you're running RRs you're running right in through the Goals Problem Mass.

So you see anybody that knew how to run 2-12A perfectly, could convert over and list with much greater ease, by the way – because its precision is greater – could move right over and at once list on 3MX, because it's twenty-five items beyond the still TA or the last R/S, whichever comes last; twenty-five items beyond that for 3MX and it's fifty items – now, 2-12A – in 2-12A.

In 2-12A you're dealing with less precision of action than you are dealing with 3MX. This is their main difference because in 2-12A you will occasionally be horrified having gone exactly fifty items, just like the book said, to start the pc listing again and have the item that he gives you, the very next item that he gives you – which is item 51 – R/Ses and is the reliable item for that list. You've gone around and round, holding your head wondering where it was.

In other words, that can vary. Sometimes if your sources are poor, and so on, you will find the R/Sing item is not the last R/S on the list, but is number fifteen on the front page. Oh, there must be something wrong there someplace. Actually the best thing to do is to bear on rather than to keep repair, repair, repair all the time.

Now, this is the score then with regard to 3MX, and I've given you this mostly on the basis of a personal experience of the material. I've seen how this material operates myself. Been over the jumps on it. I've been trying to find a goals line in that we could really give you and really square up. And want to get all those old goals straightened out, and so forth. Well, I'll talk about that in the next lecture. I just wanted to give you a good review of what's been happening here with the old man and research.

I've been getting killed daily for the last hundred and fifty hours, but that's not quite fair because the last fifteen hours of those were more processing than I have ever seen in the last twelve years. So it all paid off, and you have my bravery to thank for the whole lot.
So, thank you very much.
R3MX

PART II

A lecture given on 7 February 1963

Okay. Here we go. Second lecture Saint Hill Special Briefing Course, 7 February AD 13. This – a briefer lecture. This has to do exclusively now with the mechanics of 3MX. What is 3MX, and why? It's called 'X' because it's still experimental, and therefore its designation is really Routine 3M.

Who can run it? Well, anybody that's trained and qualified to run it. And that takes up your classification. This is a Routine 3 and a Routine 4, a Routine 3 process is run by a Class III Auditor, who, however, must get his material checked out, such as "did the goal rocket read?" and so forth, by a Class IV Auditor.

Now, the probability is that a great deal of listing under supervision of 3MX will occur, and therefore we have to modify it and say that a Class II Auditor under the supervision of a III Auditor with the essential points checked out by a Class IV can run 3MX.

This is a very precise process. And the main danger of all these processes is the gross auditing goof. That is the main danger of any process. This is quite remarkable the number of goofs that can be pulled in an auditing session, like somebody is marking every time the needle twitches, that's a rock slam, fall, that's a rock slam, so forth. That is just an asinine goof. And if you and I were to get together and think of the number of goofs which we could think of, working day and night for about thirty days, we probably would not have begun to cover the goofs which can occur under the gross auditing error. These things have to be seen to be believed, and that is the basic foe of processing at large.

Pc is never required to sit in the auditing chair, you know. Everything is going along fine, and you've got R/Ses marked on the list, and everything seems to be just fine, except we find out that the auditor has never used an E-Meter and doesn't have one in the session. Honest, honest, the... you can't outguess what goofs can occur.

Now, what you have to do is be very sure that your supervision in an area is adequate and knowing, that your technical people are anxious to pass on the information and to get people so that they really can audit. And your next big hump is to make sure that bulletins which come in aren't just read, the last paragraph, and put aside, "Well, I know that."

"Do you have bulletin so-and-so?"

"Oh, yes, I have bulletin so-and-so." They didn't add, "But I've never read it."
You've got to have good bulletin checkout. You've got to have tape listen, and things of this character. Staff training and auditor training, and so forth, has got to be very good and very straight. This is how you get along the... around these goofs.

So in actual fact it isn't the complication of the process, or the difficulties of the process which is our biggest foe, but the relaying of the proper information with regard to the process. That is the stumbling block.

Now, you'll find perhaps there's some chap down in lower north, southeast Bulawayo, or something of the sort, who never, never, never hands out a bulletin. He just won't let anybody see a bulletin, but hands out gratuitous information from the bulletins he has never read. Now, that kind of thing can occur.

Therefore, the liabilities of Scientology are basically those of gross auditing errors which are just unimaginably God-awful and... or ridiculous, and next to that, actually, is just no study of the information. And given those – you've already got good-hearted willingness on the part of auditors. Never doubt that. But given these other two items corrected, why, then you could have as complicated as a process as you wanted to have.

Now, 2-12, 2-10, apparently had a tremendous number of rules. They were just rules, rules, rules, and never, never, nevers, and all this kind of thing, and so forth. You notice those things are boiled down.

Well, now I haven't sat down and given you a long list of the exact codifications of these things, but they start to become obvious to you as you look them over. And you will shortly have a very precise rundown of this material.

You've got lectures on it. You've got lots of tapes on it. Most of this material is – not all of it is on tapes, or in the last bulletin I handed out on it, and we've got a long way to go with this information because we've been waiting for this – for this breakthrough.

All right, there's a breakthrough Routine 3. Fine. Some people went Clear. Then there's this fact that this case, and that case, and the other case just didn't quite make it, and they hung up in listing, so there must be bugs on listing.

So I started to work on listing, and worked on listing, and I've been working on that for some little time. Actually, you don't need too much new technology in order to find a goal. But the technology that was needed had to do with listing. And in 2-12, and 2-10, working with those I found the answer to goals listing. And goals listing becomes more precise and more exact than the goals [item] listing of 2-12 and 2-10, or 2-12A. There is much greater precision connected with listing on a goal.

Now, let's take a look at this 3MX and find out exactly what we've got. I just remarked here "Give me a rocket reading reliable item and I can clear the pc. Just give me one, off this case that I can make rocket read, and it is a reliable item; give me that, and somehow or another I will steer him right on down through by oppose, oppose, oppose, oppose, oppose, on a 'Spiral Staircase.' And after he's clear of his first goal we find out what it was." That's remarkable, but there's the look which you're taking right now.
So let's take a look at what we have. Here then, is not a process which actually completely depends on finding the pc's goal. More pertinently you've got to find a rocket reading item.

Well, supposing somebody was busily listing 2-12A and found a rocket reading item. The last – there were three rocket reads... reading items occurred on the list, and one of these still fires with a rocket read – the last one, and just one and there's no R/S fires; it's just that rocket read fires.

Now, if the auditor knew that rocket read, and it was checked out as a rocket read, the thing to do is to determine whether or not it is a terminal or opp-term, unload immediately from whatever other process one is doing and immediately go into 3MX just like that, bang. Just shift gears right there at that point because you've got pearls on your hands, man. Why, why bother with anything else because you can enter the "Spiral Staircase" of 3MX with any reliable item which rocket reads.

Well, that's good news. What's the "Spiral Staircase"? That's just oppose, oppose, oppose, oppose, oppose, oppose, oppose, oppose, oppose, oppose, oppose, oppose, oppose, oppose, oppose, oppose, and when you go off the rails go back and find an item the pc didn't really like, extend the list, find another rocket reading item, put it on the line plot as the consecutive one to the one you want, and just go on oppose, oppose, oppose, oppose, oppose, oppose, oppose, and you're just going right straight through the GPM. You'll get terrific relief, and terrific knockout of masses and pressures, and all this sort of thing. When you're dealing with rocket reading items you're not dealing with the liabilities – and if you're dealing with rocket reading items perfectly according to the rules of Listing and Nulling now – you're not dealing with the liabilities that you are with rock slamming items. A rock slamming item is quite a liability. You can only go around it four times. It leaves mass hanging, it does this, it does that. Oh, yes, it's good processing, but it is susceptible to error, and it is susceptible to going off the rails.

Not so – not so with a rocket reading. You take an R/Sing item that goes off the rails. A rocket reading, reliable item, give me that and I can keep it from going off the rails because it will go much more precisely.

The GPM is made up of a greater level of precision, of course, than its locks. Its locks can be far more random.

Therefore – therefore, when you get right down to it here, and look over the situation, 3MX is actually easier to run than Routine 2-12A. You say, "Well, why not run it exclusively?" Well, you sometimes can't find the pc's goal or even really get him to take much of a goals list, and their goals list go into the thousands on some particular cases unless you take some relief off the bank. So there is your purpose and function of 2-12A: it's just trying to unburden and relieve the bank.

Now, given the pc's goal which rocket reads, or a pc's goal which at sometime in the past was reliably observed to have rocket read – I mean reliably observed to have rocket read, Class IV Auditor saw it – given that goal, what do you do? Well, that goal is a terminal. Therefore, you list it as a terminal only on an oppose. You must never represent a rock slamming item, you know that. Well, that also applies to rocket reading items. Don't represent a rocket reading item. That tells you at once what was wrong with four-line listing that we were
doing with goals earlier. It is not as serious, but it is the same order of magnitude to represent
a rocket reading item. And on some of these cases they didn't – their goals listing didn't sur-
vive the represent of the rocket – the representing the rocket reading item. "Who or what
would have your goal?" All right, that's a representation of a rocket reading item; and so the
individual didn't get down to cases on the thing and there it is.

Now, frankly it didn't mess up the case. That's one thing you can be very happy about.
It might have eclipsed the goal so that you couldn't see it anymore and it didn't fire anymore,
but you take that goal, and wording it in some way that the pc can answer, "Who or what
would the goal to catch catfish oppose?" and just list that one line, pow-pow-pow-pow-pow; if
that was the pc's goal you're going to get rocket reads and you're going to go right on down
the line.

Sometimes you won't get rocket reads, but you're certainly going to get an R/S, and
you follow right on through. It's the last rocket reading or the last R/Sing item that you get on
that list. That's the last rocket read or the last R/S that you get on that list. And that's all you
do with a goal. You complete that list, and that completes, by the way, under the same old
rules that you've been doing with 2-12A. You'd better go beyond it about fifty just to make
awful sure, because it's not going to mess up the pc to the degree that the items themselves
will mess up the pc.

All right, though you're sure you've got this now, and this is a good R/S. Determine
whether it's a terminal or an oppterm by – ask the pc, "Which one of these lines... which one
of these questions turns on the most mass or feeling on you?" Well, we don't care what it is.
And the one that doesn't seem to produce any action on the pc, and produces the most action
on the E-Meter is the right way to. So you know now whether it's a terminal or a – an
oppterm.

Now, when it comes to opposing this thing, just make sure it's right. Now, you can test
anything, you can test anything with a few items, and if it tightens up the needle and doesn't
give you much TA that's wrong way to. That's the same way, isn't it? Well, you try not to test
these things. Just make sure that when you start to list, the needle gets looser, not tighter, and
you've got it right way to for the oppose. And you run right straight on down, you get your
last rocket reading or rock slamming item, go twenty-five beyond it. When you've got twenty-
five beyond it, take your rocket reading – take your last rock slamming item on the list, read it
to the pc, it won't fire. Take the next to the last rocket reading item, read it to the pc, it won't
fire, and (if your list is complete, if your list isn't complete they'll fire), and then we take the
last rocket reading item on the list, we read it to the pc and it goes phew, nice rocket read – all
right, every time we read it.

No, there's no Tiger Drill, there's no monkey business, there's no rudiments, there's
nothing, you don't do anything, you just do this, you understand. I'm getting impatient about
that. I swear to Pete, you know. The most auditing that you can do on anybody, the most au-
diting that you can do is just the auditing I'm talking about.

If a pc ARC breaks, your list isn't complete. I don't care what the pc thinks, or any-
body else, the list isn't complete, period.
Now, you can get an ARC break out of a pc by not finding any item on the list. The probability is his item wasn't on the list. You have to go back to the earlier trick I talked about where "Find something he wasn't quite satisfied with," and continue that list to get the item if you can't complete the list you're working on. But the point I'm making here is that ARC breaks come from the item not being there.

Now, I suppose you could goof it up this way. The auditor – this requires a considerable amount of watch – I better not go into that at the moment. You've got to watch your E-Meter carefully, I'll just say that at that point.

What you do is just keep carrying this on, this same rule, same rule, same rule. You find out if it's term or oppterm. You consider your first listing of it a test listing. If that tightens the needle, get off of it and get the other way around, and oppose it the other way to, in other words. And all right, that loosens the needle so you keep on then and you keep a record of your tone arm, and your tone arm, and your tone arm, and your tone arm. And you keep... and record rocket reads, and R/S and whatever it is, and you get down and finally you get your last RR or R/S, we don't care which it is. You've got to go twenty-five items beyond that, not twenty-one, or twenty, nineteen or something like this, you've got to go twenty-five beyond that.

You don't get in any rudiments, you don't do anything, just go twenty-five beyond that. When you've actually gone twenty-five beyond that, providing the tone arm motion is out, you see, why you read your last R/S, if there is one, and if there isn't one you read – or if there is one, you read your next to the last rocket reading item, and then you read your last rocket reading item. The last rocket reading item on the list is it, that is it, bang. "Catfish," bang, "catfish," bang, "catfish," bang, "catfish," bang, rocket read every time. You say, "Dandy, fine, three cheers."

Now, supposing it didn't? Well, that's no time to go into fits. That's no time to say, "On this item has anything been suppressed? On this item has anything been careful of? On this item is there anything you have failed to reveal? On this item is there anything been suggested?" Eighteen hours later, "On this item has anything been blah, anything blah, blah, blah." No, you goofed, man.

Now, how did you goof? Well, actually the pc could have been thinking of one item while he said another item. So you read the one above and the one just below it, and see if they rocket read. Neither one of them rocket read. All right, that's your first prevention.

Your next prevention on the thing is that you didn't see the rocket read. Read that last one again. The last rocket reading item, read it again. No, still doesn't fire. Take your pencil in hand, take your ballpoint between the thumb and forefinger and say to the pc, "Who or what would catfish oppose?"

And the pc says, "Oh my God, no more of those."

And you say, "Well, all right, what's the matter?"

And he's pulling in mass, "It's killing me," and so forth.

"Well, just give me a – just give me a few."
All right, so he gives you a few, and you watch that needle, and that needle is going tight, tight. Well, don't list the poor guy into the ground. It ain't there.

Well, if the auditor's very green I think I would then start nulling from the last rocket reading item on down to the end of the list. I think I'd actually do that. That's only thirty or forty or fifty items at the absolute outside, don't you see.

There's no reason to go earlier than that because if you saw a rocket read on the list, there is no rocket read earlier. You saw a rocket read on the list and it doesn't fire, there's no rocket read earlier on the list that's going to fire.

Now, how about this: it might be earlier on the list? Well, let me tell you if it's earlier on the list you've goofed somewhere. It almost isn't worth finding. It's got to be the last rocket read on the list, you understand. That means an earlier list was incomplete.

Now, I'd say if the auditor was awful green I'd ask him to null on down from that last rocket read. Just read each one off once and see if those rocket read. He might not have been watching.

Now, the point is, as you write, a rocket read is much more rapid and much less persistent than a rock slam, and you are liable to miss it. And a green, green, green auditor certainly will miss some of these rocket reads. In other words he was watching the chandelier when he should have been watching his E-Meter.

Now, you can't get around that, but I hope that someday we will have an E-Meter improvement that will actually throw a reflection of the E-Meter needle on – as a shadow or something – onto the paper the auditor is writing on. And maybe by a prism, or something of the sort, that could be effected. That would be very desirable.

But nevertheless you can do it this other way. A lot of your writing ought to be done without looking at the paper. And that needle should never be out of the corner of your eye. In other words, as you look at the paper, even if you look up at the pc, that meter dial must be in your field of vision. So you see that thing flick, you can see it flick if it flicks. That's the main prevention for this other thing happening.

When an auditor has a little experience on this line he'd never null on down from the last rocket reading item if he didn't find one. He'd always pull this trick: He'd say to the pc, he'd say, "Now, pc, I've got several items here, and, take a break – take a break here. I want to talk this over with you. I've got several items here, and which one of these things didn't you think fitted very well?"

"Oh," the pc says, "Eggs, God, I-I-I-I'm thinking now I don't know how you got eggs on the list, you know, because it – it just doesn't oppose the Empire State Building."

And you don't remind him, because an auditor's always tactful. That should be part of the Auditor's Code. He doesn't say, "But at the time you said you knew exactly how it opposed the Empire State Building." You don't do that. That's – we leave that for the psychiatrist.
When we get him into that position, he says he doesn't think that does, so therefore you take whatever eggs came off of, which was, "Who or what would oppose the Empire State Building?" And the item you got was eggs.

Well, he doesn't like eggs, so you add to that.

Now, don't be so alarmed as you might be if you didn't know this fact: There's going to be tone arm action. Now, you tell me why there's going to be tone arm action. We've loosened up the bank of course, and you're going to get tone arm action. And by extending that list twenty-five or thirty, you're going to get another rocket read. Take that as your item. Don't keep badgering the pc. Bring that item down to the list, and now terminal, oppterm, whatever it is, and just carry on with your oppose, oppose, oppose.

In other words, you can get back on this "Spiral Staircase" even when you're hanging over the well in the middle of the stairs. You don't want to get off of that "Spiral Staircase" so don't goof under these rules. If... only by goofing on these rules can you get in trouble. It's a matter of you find out for sure if it's a terminal or oppterm. If you're not absolutely sure, you determine it by what you're listing is not tightening the needle in the first few items, then you keep on going. You list all the tone arm action out of it. When the tone arm action no longer is showing on the thing, from that point on you are counting items.

And then if an RR or an R/S shows up after that tone arm action has ceased, (and that tone arm action does not include surges, cognition surges, in other words, "thinks" that are registered on the thing. You couldn't follow them with a tone arm anyhow. I don't know how this theory got in that there's no such thing as a motionless tone arm because there is) and you get this down the line, 4, 4, 4, 4, 4, it's 4, all of a sudden, pow you've got a rocket reading item. Bang, that thing goes, just like that, pow! You write it down, RR, and you keep going for a little while and the pc says, "How's it going?"

And you say, "It's going all right. I need twenty more items."

"Well, all right."

And you notice now, and you'll see – if you watch that needle – you'll see your needle start to tighten. Well, that means you're not going to get any more on the list, but you go ahead and put those twenty items down. And then you take the last R/S if there is one, and whether there is or not, the next to the last RR and you read those to the pc. You tell him what they are, not that they're his item, and then you take the last rocket reading item, you read it to the pc, it's going to fire. And you say, "That's your item," promptly and immediately, "Yes, that rocket reads, that's beautiful."

All right, and don't do something else. Keep your eye on the pc. Don't go off and do something else. Keep your eye on the pc. When you say that last item to the pc, don't shift the pc's attention.

Now, why don't you read the pc's item first, and then read the one above it? Well, because when you read that item that is the pc's item to the pc – see, you can determine now which one is the pc's item – and when you read that to the pc, his attention fixes on it and it is very confusing and upsetting to him to have his attention now fixed on some corny item that isn't his. You understand that. So you don't shift the pc's attention after you have read to him.
and found the rocket reading item. You don't do it. That's a misdemeanor of the first water. So therefore, any tests you're going to make are made before you do anything with that. Anything you are going to do here, do it before, that is the thing, do it before.

Now, when you read the item, keep your eye on the pc. Don't talk, don't write up auditor's reports, and don't expect him to tell you the story of his life, particularly. He'll give you a cognition, he'll say, "That's it," and so forth. In rocket reading items – he's liable to cognite for a half an hour on an R2-12A item, but not on a – not necessarily on a rocket reading item at all. He'll give you pow, "That's it."

We've had... been watching this out in the Z Unit now, and pow, pc says, "That's it."

And the auditor says, "But he never cognited. He just said it was his item and that was fine." Well, the idiot. What more do you want? The pc says it's his item, and of course he knows what it is. Well, but the auditor was expecting a cognition.

Now, today the pcs – wastes a half an hour of session cogniting. Well, the auditor I suppose, is very happy about that because it's always better... easier to listen to the pc than audit. But you – it's the uncertainty factor you're looking for, and the darkening of the pc's eye pouches, and so forth, that you're looking for.

You say this item, "catfish."

And the pc says, "Let's see, catfish, catfish. Uhhhhh. What-what-what's it supposed to oppose?"

"Well, it's supposed to oppose eggs."

"Eggs, catfish, hm, well, I guess I, yeah I-I – you could say – you could say that..."

"Well, we're going to list a little bit further," the auditor says, right about that point. I mean that's all it takes.

All right. Did his eye pouches darken? And, E-Meter again, did the tone arm fall down? When you said that item "catfish" to him, the moment before it was at 4.0, you say "catfish" and it goes phew, 3.25. If that doesn't happen you haven't got the pc's item. You've goofed. That's just the open and shut of it. I haven't seen it yet where you had on any of these items... where you didn't get a blowdown when you said them to the pc. That's enough cognition for you. That's mass blowing off like mad.

You say to him, "catfish." And it was 4, and it remains 4. The pc will also say, "Well I, catfish, put that on the list, catfish, that's a funny thing, I don't quite know whether that will oppose. No, let's see, catfish, two catfishes, say. I guess so. Well, if you say it's the item I guess it is." See, that will accompany a stuck up TA, your TA won't blow down. You goofed. List probably incomplete. Now, what... or gross auditing error, the auditor didn't know you were supposed to look at the E-Meter, get the read off of it. The... there'll be something wrong if you – if you keep getting things wrong with 3MX there's something awful wrong.

And it's not good enough for you to be sitting around at a desk looking at folders. You go out and take a look at the pc and the auditor in action, and you'll find the pc hangs by his heels from the ledge of the building blowing smoke rings so the auditor can be sure that he is
now able to confront space. And that's the direction they are auditing. Or you will find out some other damn thing, that the E-Meter hasn't had its battery working in it for the last month.

You'll find something *goofy* that you just never think of, and it's – I've seen a – I've seen a student here now go weeks and weeks and weeks, that nobody could get anything on, and they had to do new lists, and nobody could get anything on and they had to do new lists; and we find out that the auditor didn't know the difference between a dirty needle, a fall and an R/S. And so everything was an R/S, and so the guy's lists all looked like the R/S was increasing throughout. You see how that would be.

So, where you're... with this gross auditing error don't take – don't take no for an answer, because, listen to me now, depend on me in this instance, you'll find 3MX and 2-12A work by the rules of listing. And if they don't work by the rules of listing there's something wrong, and if there's something *wrong* you've got to straighten it out. You've got to go maybe earlier to a better source item. You've got to do something earlier.

Now here's another rule. If the pc ARC breaks, *go earlier*. Don't *ever*, ever, ever, ever, ever, ever, ever, ever, ever, ever, ever, ever start a new action. You hear that? *Never*, never. That is the most *serious* error you can do. Don't ever start a new action on a pc that is ARC broke. Don't ever start a new one.

We had somebody around here that was starting a new one every time the pc sneezed. "Oh well, the pc didn't have any action here, didn't have any action. He wasn't getting anyplace with this list, so we started to list 'Who or what does existence consist of?' Well, he didn't get anyplace with 'Who or what does existence consist of?' so we started to list 'Who or what are you in contact with in church?' But that didn't work out very well, so then we thought of a new list, and so..." Oh, bunk, man.

ARC break – earlier. Always go back from an ARC break. You understand, that's one of the basic, fundamental stable data you have. Pc ARC breaks, pc nattery, pc feeling sad, pc misemotional, not about his items. He'll say, "Oh, a poor little boy. Yes, that's a very sad item, isn't it, Joe?" That isn't what we're talking about.

We're talking about, "Oh, I feel so sad sitting here being audited. I wish you'd never started to audit me in the first place." We're talking about misemotion about the auditing session. We're talking about the pc going *splat* on the subject of auditing. We're talking about this. In other words, a misemotional ARC break, *go earlier*. The error is always *earlier*. You understand?

Now, when we say earlier, how... what earlier do we want? Five minutes, ten minutes, an hour, two hours, sometimes the last session, more rarely; actually never a session a long time ago. Pcs don't ARC break on last month's session; they forget those. But if you keep going, and inventing new things, the pc *never* has a chance to recover from the ARC break because it's all ARC break now, because nobody went that few minutes earlier to find out that a "hat rack" wasn't her item.
The auditor said, "hat rack." There was no R/S, gross auditing error. Pc was so pleased with the item at the time that the auditor said, "Well, all right, I'm sorry but I let her have it." Oh yes, that happened. It happened right here. Unbelievable!

If an item doesn't fire it isn't the pc's item. That's all. I don't care if the pc cognites. Pcs are liable to cognite on anything. Did you ever realize that they're all the pc's items? I know, look over one of your own lists someday and realize that you've had a leaning toward every one of those terminals. They're all the pc's items, so sure the pc will cognite on these.

You didn't see an R/S, it isn't the pc's item. That's all, period. And yet you can goof with magnitude by, "Yeah, well, it didn't R/S, but... I didn't really have a rocket read on it, you know. The pc would have been so upset if I'd said it wasn't his item."

Funny part of it is if you'd been watching the pc very carefully, and he had dark shadows under his eyes, if you'd been watching him very, very carefully, this would have taken place: He says, "A billing Joe, that's my item, oh yes, yes, oh man, that's my item, that's a beautiful item, oh I love that item, I just love that item, that's just marvelous. You know, I've always been-I've always been 'Joey Billings' ever since I can remember, you know."

You watch him. Note carefully the pouches under his eyes and the color of his complexion. Note it carefully and then say to him, "I'm sorry but that is not your item," and watch his face go lighter.

In other words, when he tries to sell you an item and you buy it, you make him worse every time.

So you go by the rules, and you go by nothing but the rules. And if the rules don't fit in 3MX – there is more flexibility in 2-12A – but when they don't fit in 3MX, boy, you're not there.

You can't even say what's wrong because we haven't now defined a list as complete or incomplete. We've defined a list as something which twenty-five – the last twenty-five items had a motionless tone arm, and there were twenty-five items after the last R/S or RR, and that is a complete list.

Now, that doesn't tell you that anything else is a complete list does it? That the RR, that on that list – that is the last RR on the list, is the pc's item, that's that. If that isn't it then it's not the pc's goal. The auditor has goofed. God knows what has happened, but it is wrong. And the error is earlier. The error is never later. That's something that you really must learn. It's just earlier, the error always is.

The pc just had been given an item, "dog's breakfast." And he had this item, "dog's breakfast," and the pc sat there and he said, "Dog's breakfast, yeah, that's my item," (he was propitiative that day.) "Yeah, I see, 'dog's breakfast,' that's a good item. Fine, fine, 'dog's breakfast.'"

And you list "dog's breakfast," it fired. You list the thing, and it didn't go anywhere. And it's just solid RR the whole way. Everything is an RR, and then all of a sudden there aren't any RRs. You say, "What on earth is this all about? This looks different than all the rest
of the lists." Yeah of course it's different than all the rest of the lists; there's something wrong with "dog's breakfast."

Well, you've got to go back and correct "dog's breakfast" if you really want this straightened out. You now got to go back and correct "dog's breakfast," there's something wrong with the item. And you will find out that you've hit once in the blue moon situation that item twenty-six rocket read. The twenty-sixth, you just stopped one short. Once in a blue moon it'll vary to that degree. But the error is always earlier.

This is quite interesting, pcs go on a hard sell. But the auditor who thinks the pc knows is goofy. And the auditor who thinks the pc has nothing to tell him is also goofy. It's "What has the pc got to tell the auditor?"

Well, the pc can tell the auditor how he feels about things, and he can tell the auditor this, and he can tell the auditor that, and these are all quite valid. But the pc says, "Well, actually the whole trouble with this package, the whole trouble with this package, the real trouble with the package is your earliest list there, on the package, 'Who or what would oppose Wheaties?' That earliest list, I... that's wrong, that's wrong, and all the items since are all wrong."

And then you put down five more items on the list you're completing. The pc's R/S goes on that list, that's it. It's very funny, five minutes later, why, he's forgotten that he told you that he was going to scrap all of his items. It's very funny.

You don't take the pc's advice on what to do, in other words. You take the pc's advice on how he feels about things, but you don't take the pc's advice on a remedy because he's more likely to be dramatizing his remedy than otherwise. He can't think clearly on the subject of his own case. You can usually think far more clearly than the pc on the subject of his own case.

That also occasionally has modifications. There's... that isn't always completely true, as witness many instances. Sometimes the pc knows very well what's wrong. Pc has been sitting there saying, "Well, I was... we can't list it this way, that's all." And the auditor keeps on listing it that way and the pc says it can't be listed that way.

All of a sudden the auditor says, "Well, all right, I'll try it the other way," and he tries it the other way and it's right. This does happen.

Now, 3MX goes on, and on, and on, and on, and on, on the "Spiral Staircase," oppose, oppose, oppose, oppose, oppose, as long as you can stay on it. You'll probably find out that you'll run out the whole central core of the goal, and that a simple Prepcheck on the goal puts you in a position now to find the next goal. And that's all there is to 3MX. You don't have to do any more than that. You always prepcheck a goal before you leave it, and make sure that it isn't reading. And make sure that it isn't reading because it's been squashed. You don't want a goal not reading because it's squashed.

So anyway, make a long story short, the guts of 3MX is listing, because you can do it without a goal, see. The guts is listing. Do without a goal, you can go all the way without a goal. I think that's quite fascinating.
But that's only in theory. In actual fact, although there are Prehav methods, particularly with roll your own Prehav where he could probably turn up a rocket reading item without the pc's goal, you will find that the easy way to do it is to find the pc's goal.

Now, how do you find the pc's goal? Well, just the way we've always been finding the way... the pc's goal. You could take – do you realize you can take any firm oppterm which is still reading on Routine 2-12, and get out of that by listing List 1 and List 6 of old 3GA Criss Cross on that oppterm – you can usually turn up with the pc's goal. It'll usually be goal number 1 of List 6. I mean it's easy as that – finding a pc's goal.

There... the best method of finding a pc's goal is the first method, which is you list goals. That's the best method. Why? Well, we've got several cases around here that had an awful time with goals, and they've had a terrible time with goals, and we've turned them loose on listing goals and we are absolutely fascinated. We are getting tone arm action on the goals list the like of which you never heard of. The rule is list the tone arm action out of the goals list. I don't care how long that goals list has to be to get the tone arm action out of it.

Somebody said here today, "Oh, well, I have twenty pages. You mean I have to go on?" Look, twenty pages is no goals list. I've seen a goals list of a hundred pages. How do you like that? So you just list all the TA action out of the goals list.

Oh, I remember there was another question on TA motion. If you had some two-way comm with the pc, and the tone arm went down, and then you returned him to the list and the tone arm went back up again to where it had been before, was that tone arm action? Well, tone arm action is caused by a fixation of attention to the pc, and if you change his – change his attention and you put his attention on something else, you're going to have that. You're going to have tone arm action aren't you? Well, you put it back on the list; it's the same thing isn't it? I mean you've got to go – you've got to ask better questions than this if you expect some idiotic answers.

Now, the best way to get a goal in actuality – because you're going to have too much trouble as long as the goals list is charged – is just to sit there and list goals.

Now, in 3MX it is preferred, and you'll find out it's much better indeed, to list goals on a meter. And you sit there and list goals on the meter looking for the RRs. And you mark them down, RR. You don't drill the goal. Pc says, "That's my goal," and he screams and beats the floor with his fist, and so forth. You go on listing goals because the TA action isn't out yet. You say, "I've taken good note of that. I've marked down the fact that it rocket read. We'll come back to that as soon as we have finished your goals list. Okay?"

And the pc says, "Okay." It's not his goal anyway.

Here we go on down to the end. All the TA action is out of the goals list. We now go back and take those we have noted rocket read, and we test those things out to see if they still rocket read. Actually the last... if it followed the rules of 2-12A – which it probably will not because it's too general a question. You see it's a source list, and therefore the thing can appear on it anyplace – if it followed the exact rules it would be the last rocket reading goal on the list would be the pc's goal. I think that will have some priority. It will be more often that goal than other times, but it could also be any of the other rocket reading goals.
Now, you don't go into five or six weeks of prepchecking and that sort of thing to make goals read or not read. Just go over those goals and read them to see if they rocket read. The main goal may be rocket reading like mad. There'll be one of those goals you can't really get rid of the rocket read. This is finding a goal without a Prepcheck. You just read it once, rocket read, you read it again, didn't rocket read, you read it again, didn't rocket read, you read it again, did rocket read. Hey, get alert. All right, read it again, didn't rocket read, read it again, didn't rocket read. Now, you've got a lot of suppresses off of the thing, and anxiety, fails to reveal – in other words you tiger drill it a little bit – by golly, you read it, pow it rocket read, then it didn't rocket read.

You know, that's really enough to run 3MX with. You can't get rid of the rocket read. Now, any goal that isn't the pc's goal, the rocket reads aren't that solid or aren't that good. And that's worth knowing.

Now, if anybody has ever seen somebody's goal rocket read, rocket read, rocket read, and now it doesn't rocket read and you can't get a peep out of it, if you can get reliable evidence that it did rocket read, or if you can get a sixty-fourth of an inch rocket read out of a goal that was found a year and a half ago; my God that goal will survive almost anything, won't it? Well, list it.

That isn't an invitation to list a wrong goal. I'm telling you that a right goal has a tremendous reluctance to give up its rocket read. In fact, you can always uncover a bit of a rocket read on the thing again if you plug at it. Of course, it may even only rocket read once.

What do you think of the strength of a goal that you rocket... it rocket read twice when it was found, was prepchecked and was found to rocket read again, and you, a year later take this goal, prepcheck it and get one rocket read out of it. What do you think about that? Well look, if it wasn't his goal it won't. That's only true of the pc's goal that the rocket reads can be recovered, and that are persistent and will continue to rocket read. On locks on that, they go off, pow! Gone.

So it rocket read. You read it again, half rocket read, you read it again, doesn't rocket read. You prepcheck it, you never get a rocket read out of it again. It just never yeeps. You can take it a year later and it still doesn't rocket read anymore.

But a real goal, it's very spotty. It rocket reads, and then it doesn't rocket read, and it does, and six months later you take the same goal and you drill it for a little while and you can get a rocket read out of it. Must be the pc's goal.

Then you just list that down the line according to the rules of 2-12A, and take the last R/S, or the last RR on that goal oppose, what is the goal oppose list, and you're going to have your entrance into the GPM. And after that the pc is going to go giddily right on down the "Spiral Staircase," providing you follow these rules of listing just as I've been giving them to you in this lecture.

The variability of 3MX is much less than that of 2-12A. How do you repair 3MX? Well, it's too soon to tell. It's too soon to tell. I don't know what errors are going to be goofed on 3MX. But remember this, if you will simply audit, and not make a whole bunch of goofs, you don't have anything to patch up, and therefore you don't have to patch up anything.
Now, there's the secret of auditing. Audit well enough and accurately enough so that you don't make a goof you have to patch up, because the case condition deteriorates from the first goof that you have to patch up. That's where the case condition starts going down.

Now, you get this goof, and then you get another goof, and then you get another goof, and then you patch up those goofs, and then you goof again, and you patch up that goof, and then you patch up the goofs; and then you patch up patching up the goofs, and by that time there's no room for auditing. The way to do auditing is just sail in and do it right.

Now, there's a few changes on 3MX in Model Session which are as follows. You put in the life and livingness goals before you put in the session goals. Reverse that around, and you ask the pc at the end of session for his goals and gains before Havingness. And you also, after you've got his – if he made any of his goals and gains, you ask him if there's anything he'd care to say before you end off the body of the session. In other words, push the goals and gains over into the body of the session. End off the body of the session.

When you do, then check the pc's havingness. Run a few little taps of Havingness just to exteriorize him into the room, and simply say, "All right. Here it is, end of session." And if you carry on a session like that you'll find you exteriorize the pc out of the session very easily.

As far as pcs carrying around items between sessions, and pcs missing items, and pcs suppressing items, I don't interfere with the pc unless he stops listing. I only straighten out those things which get in the road of the pc's progress. That's the only thing I'll ever straighten out in a session anymore. It's actually – he can't list, so I will straighten it out. I'll get off the suppresses and the invalidates, and halfway through my doing so he starts listing again, and so he sails.

I can't get the pc to hear the auditing question at the beginning of session. I just can't get him to hear it, so I run some general O/W because he seems terribly agitated. Don't you see? And at the moment he can hear the auditing question, and can answer it, I'm auditing right straight on down the line, bangety-bang.

Now, what you want to do is become a very accomplished auditor, not a sloppy auditor. The better the auditor the less he has to patch up. The perfect auditor never has to use any of the tools of auditing. Somebody sits down, he knows... the pc knows he's in-session. This is very interesting, the upshot of auditing is getting something done.

If you get the things done which you should in an auditing session, the pc will just walk forward with seven-league boot strides all the way. The less you interfere with the pc thinkingness and the less you distract him from the job of listing and the job of cogniting and so on, why the less tools you have to use. And it's the mark of a very bad auditor that he has to use the auditing tools all the time. That is the mark of a poor auditor.

Now, it goes worse than this. If an auditor is obsessively, continuously, and insistently, forever and aye butting into the session to straighten it out, he hasn't got any session to straighten it out. Why is he trying? The whole secret of auditing is getting auditing done.

Now, when you see a green auditor start doing 3MX, or 2-12A, you'll find out that they have to patch everything together and they have to do everything, and do everything, and
do everything in order to get around to doing some 2-12A. They may do that the first session, the second session, the third session, the fourth session. If they are capable of observation, if they are capable of being a good auditor, you're going to find something new is going to occur – that session by session they start dropping the tools of auditing. They start dropping these things, and they're doing less and less monkey business and more and more auditing. And finally when they are very confident of their Routine 2 or Routine 3, and they're very confident of these things, why, they have dropped the use of auditing tools to practically a minimum. They see that the pc is a bit fogged in, and the second that pc looks a little bit dopey they know that's going to stop their tone arm action and it'll give them a false, flat list. Well, it isn't that the pc can't list, it's the fact that the tone arm won't register on a doped-off pc. So right away pull the missed withholds, pull the missed withholds, pull the missed withholds. Soon as they are pulled, the pc is bright, alert and wide-awake. The auditor is off of that. He isn't pulling missed withholds as a profession, he's pulling missed withholds just to brighten that pc up and get that pc up there so he can get any residual tone arm action going.

These are the tools of auditing and how they are used. When an auditor is auditing like that he's getting something done, and he doesn't have trouble with the pc. He doesn't have ARC breaks.

The first thing to know how to do, however, is the Routine 3 and the Routine 2. You... to make these conditions obtain in a session you have to know your Routine 2 and Routine 3 perfectly, and have good confidence in it. And actually, to get to a point where you could have good confidence in it and perfectly, your auditing has to be very nearly perfect.

So there – there's where the thing adds up. You've got a situation here where you have terrifically workable processes if they are done. And that's the one thing you must keep in mind. Any of you who are ever supervising auditors, and so forth, that they are not going to be done in the presence of gross auditing errors such as, "You can't audit a pc who stays home." Gross auditing error.

"Well, we didn't make much gains in that twenty-five-hour intensive. Guess 2-12 doesn't work."

Say, "You didn't make much gains. What did you do?"

"Well, I don't know, just 2-12, 2-12, that's what I did."

Well, if you just let it pass at that, you'd say, "Well, 2-12 doesn't work," or something like that. Make a little bit of further inquiry and you find out the pc was only there for two hours of the first session of the first day, and was home the rest of the week.

Doesn't sound like 2-12 doesn't work. It sounds like the auditor never got the pc into the auditing chair. Never got him into the session. Never had him at the session. It wasn't a case of being in session, the pc never arrived in the same building as the session. You get the idea.

You say, "Well, they're..." You will encounter auditors like this. They'll make a gross auditing error. They're very green, and so forth, but they don't recognize these things are that gross. And the other thing is, is you cannot expect somebody to follow a technique or follow a procedure who doesn't know what the procedure is. Therefore you have systems of checkout,
you have systems of training, you have systems of observation, and you keep somebody under supervision until they get a good win.

All training of auditors has certain liabilities. You get people in the road, and things in the road, and cases in the road and all that sort of thing. But it can be done, and I think you'll find out that 3MX done as it can be done with a maximum of purity and snap and polish, and right on the groove as I've been telling you in this lecture tonight, I think it's going to produce you some Clears. And I think it's going to produce Clears with far greater rapidity than you ever thought was possible.

So there's what we've been aiming for, and there it is.

So okay, and thank you very much.

Good night.
ROUTINE 3M

A lecture given on 12 February 1963

All right. This is the Saint Hill Special Briefing Course, first lecture. And this is the 12th of February, AD 13, and you'll have only one lecture tonight. Reason for that being you—there's less data to put out now, more persuasion, and you're going to have to exercise this, and probably you get very tired. A lot of you get very tired and exhausted being talked to a couple of hours on a couple of nights.

So I'm going to talk to you tonight about 2-12A, and 3MX.

All right. I have a bit of a news bulletin, has nothing to do with the mental health empire that Mr. Kennedy is trying to create in the United States at 1.6 billion dollars, that isn't news. The Federal government, of course, always has wanted the right to incarcerate any citizen for... without trial, and of course, immediately they get their legislation passed, why, they'll be able to do that. In other words, they'll be able to incarcerate any citizen without commission... permission from his family, without a medical consultation and without a trial, and will be able to move him at any time without the consultation with the family or a hearing or a trial, and do anything to him they wish, such as electric shocks and prefrontal lobotomies. And of course that makes a very interesting political empire, and Mr. Kennedy is trying to create just that empire right this minute.

So I think that's very interesting. So I'm not going to talk about that. I'm going to talk about something much more important. Something much more important: me. I was a Clear, last night. It's a very remarkable experience. Very remarkable experience. I was a first-goal Clear. You say I was a first-goal Clear? Well, actually I was a first-goal Clear for all of about three minutes – and we went on to the second goal. What happened – what happened was quite interesting, is I got the last package of items, the last two, on the "Spiral Staircase." There were twenty-five items in all, and I got the last pair, and in listing the last item, actually the last two items, my TA sat exactly at 3.0. At about the eighteenth reliable item, the goal had already blown. I felt like an electron parade. I felt like a proton sitting in the middle of a heavily spitting electron. I thought that was quite fascinating. The goal was going bzzoom, bzzoom, bzzoom, bzzoom, actually. And on the meter, why Mary Sue was sitting there and she went completely out of session.

Sitting there, and she was just bringing the needle down and the thing was blowing down on rocket reads. Psww-psww-psww-psww! And it blew all the way down from about 4 to about 3, and that was about that.

That was at about the eighteenth. But the goal didn't give up the ghost until we had seven more items. And the... she got the twenty-fifth item, that includes finding the goal, by
the way, that's twenty-four RIs and the goal. And she found the goal, and went straight into it, went straight on through, I never had any time to cognite, because on some of these sessions she found some championship numbers. As a matter of fact, one of these sessions, in five hours and fifteen minutes plus some breaks, she found nine RIs.

This didn't give us much time. Actually, this auditing sprint goes from about the fourth to the eleventh, is about one week, something like that. The total time elapsed during that period is probably – because it was prepared, the goal had been found before – it was probably about 30 hours on this, something like that.

But I was a first-goal Clear, for 3 minutes. I got up and went over and sat down and... on the couch and I ate four or five peanuts and I drank a Pepsi-Cola, and, well, that was very nice, and I sat there and enjoyed this sensation of being unburdened and all cleaned up and I probably looked very young and very dashing. Everything was fine. And I came back, and she saw that I was sitting on a free needle. And I sat on a free needle while you could count one and two and three, and then she started opposing the final oppterm.

And all hell broke loose and I went through straight, bang. I cautioned her. I said, "Wait a minute. Wait-wait-wait," you know? "Wait-wait, I'm not sure this is the right thing to do." I said, "Test the goal." The goal she'd already tested, it wasn't firing, and so forth. So she opposed this last oppterm, and what do you think? What do you think? She found another oppterm, and then something that won't happen to you because it has already happened to me, we didn't make the test, she treated it as a terminal and listed it.

Of course, that was the end of the free needle. We'd gotten this all straightened out, finally. We had a very hectic time of it. But the bridge between the first goal and the second goal is very simple. You just oppose the last oppterm and you're in the soup. Actually, as I got the first pair, one of them listed backwards, I told the auditor what my next goal was. And that rocket read, and that's fine. So we're operating on this goal, and it was very hard to get these things – next item straightened around, because of course, they're in reverse to what you would expect.

So anyway, we're about two or three items deep now on the next goal – actually found one RI and we have a list going – and we've got to take this oppterm against the last oppterm I got on the first goal and we've got to do something with that and list it right way to. We made some progress.

But you never saw anybody nose-dive quite as fast from the sublime to the soup. That was really remarkable. Which is very good data for you. I'm not telling you just because it's me, I'm telling you because you undoubtedly, you knucklehead, I know you, I'm looking straight at you, I know you, you sooner or later will hear the pc say, "That goal is gone." Check the goal, find it doesn't fire, you'll be twenty or thirty RIs deep, and you'll say, "Well, I don't know," and then you will oppose it, and then you will fail to apply the terminal-oppterm check to the result, and list it backwards. And then your pc will be very unhappy indeed. So it – I know you'll do this sooner or later. Even I, I may do this sometime when I'm in a hurry.

But the funny part of finding the next goal, the pc presents you with the next goal. But let me tell you something. You actually can't list without that next goal. You've got to know what the goal is. Everything fouls up unless you really know what the goal is. So you can't
really, in spite of what I've told you, go very far on RIs without knowing the pc's goal. In other words, you can't take rocket reading RIs, just all by themselves, and list, list, list, and expect the thing to be very happy as an experience. Because the pc has nothing to align them against and is running in the dark concerning what his goal is. He doesn't know, so this leaves a tremendous mystery.

No, you had better find his goal. Actually, it's very easy to find his goal because he's sitting right in the middle of a terminal that has that as a central goal. So you just take a short goals list – two, three, four goals – and one will rocket read like mad and you check it out. That's his goal and you continue. It's very easy to do. Make sure that you do it.

Now, I didn't mean to be so hard on you with regard to your auditing. But when somebody in Z Unit can actually take the source list of a pc's goal, take the source list of this pc's goal, take it, extend it out and find an R/S – an R/S – after having found a dozen or two rocket reads, ignores the rocket reads and opposes this little tiny R/S, after the lecture I gave you Thursday night! Haaaa! Hanging and drawing and quartering – haaaa – that's too good for him! That's a completely knuckleheaded act. Its asinine. Goals are RR. If you got RRs on the list, you want RRs. You don't want R/Ses. And you never – get me now – you never take one of these little squirt, little tiny half-inch R/Ses on 2-12, or anything else. You carry one of those little tiny R/Ses around, aw, they're going to get you no place. They're going to pull in mass in on you and everything else.

When I was being hard on you a moment ago and said that you were liable to do it, when this kind of an error can exist after my last Thursday night's lecture, after a bulletin on the subject and, I'm ashamed to say, passed by an Instructor's view, and actually can be listed when the pc's rocket reading item lies on that source list all ready to be picked up and opposed, you understand, now, why I sometimes speak with – well, bitterly, shall we say, bitterly. I sometimes speak bitterly.

Because you couldn't do it. You try to figure out – try to figure out what a little kid's going to do with a coaster wagon, you know? And you never can figure it out. It becomes a tent or something like that. The alter-is is fantastic.

Now, we're talking now about 3MX. All right, it ceases to be 3MX, and become 3M. Because it'll carry right on through, right according to Hoyle, bangity-bangity-bang. But you are dealing here with a precise process. It's built like a watch. It has exact rules. It doesn't have too many rules. And it is very, very easy to do. Only you can make it difficult. Actually, it's a fact. Only you can make it difficult. It is probably the easiest process to do aside from the simple repetitive process of olden days that you have had. It's even simpler because it reveals its exact result, bang-bang-bang. And if you don't get that exact result, you're doing something wrong, that's all. You're just doing something wrong.

Now, for a very long time I've been looking for a process that invariable cleared pcs easily. Well, I know enough about how 2-12 works and how – so on, to know that this listing phenomena will continue. They all behave the same providing they have an auditor. It always helps – always helps to have an auditor. And there have been pcs here and there, from time to time, who have had an auditor.
Now, given an auditor and an invariable process, why we could achieve a process that invariable cleared pcs easily. And we've got that now in Routine 3M.

Now, we also had to have a process that was very precise and it was invariable. You didn't have a whole bunch of rules in connection with the thing that could be varied. On pcs with green hair you run sixteen items, except on pcs with purple hair you go seventy-two items, and then pcs with splayfeet from Puget Sound, only go fifty-nine items. See, that isn't what we wanted. "When you come to the crossroads, if there are several leaves on the ground, you always turn to the right except when you turn to the left, but on some pcs you go straight ahead." Well, I didn't want that kind of thing. I wanted the kind of process that was a perfect process. In other words, pc, process, same – same difference.

All right, you've got that now in 3M. But because you haven't had processes like that lately, you're going to have to learn to live with it, because it can call you an awful liar. You say you've done it right, you've done it right, and all of a sudden it all goes wrong. Something goes wrong. Well, it isn't 3M that went wrong. It was you. You took a terminal and treated it as an oppterm, or you took a wrong source of some kind or another; any number of plain-to-see goofs. But the wrong source just wouldn't have fired. And the terminal-oppterm wouldn't have passed the checkout rules for an item. These are the things that would have gone wrong.

Now, to settle those things and make sure they're right, we have to have invariable rules. And we've got those. It was through breaking one of these invariable rules, by the way, failure to check out an item as to whether it was a terminal or oppterm, applying the eight tests, that caused us to blunder as we dropped into the second GPM and made a much massier second GPM for a little while than I care to confront for a while.

But it was just dropping one of these rules. Getting cocky, you know. Everything's going along pocketa-pocketa-pocketa, bang-bang-bang, everything, and everything's falling into place. Why check them, you know? So, heh-heh! Didn't check one. Boom! It was wrong way to. The thing goes wrong way to when you drop from goal one to goal two, and probably will do the same thing on... between dropping from goal two to goal three.

The next rule is the process has to be teachable by rote. In other words, you had to be able to teach it by rote. In other words, you say, there's this, and there's that, and there's the other thing, and the other thing, and you do this, that and that and that. Doesn't much matter how complicated the road is, but you have to be able to teach it by rote.

And after that, why, it'll fire.

You leave much to judgment on such a thing and it can't be relayed. And the final thing is – would not be subject to change. Now, that's totally foreign to you in Dianetics and Scientology. You wouldn't know what to do with that. But there it is. The actual fact is I have been working toward it. I wanted something for the long haul, so that when we train somebody to do it, we train them to do it. And they do that from there on out.

I've been working and working. Several times I've thought I had it and each time you've proved me wrong. And I'm making very sure this time you don't. This one – we're holding the fort on this one, man. This is it.
Now, with 2-12 we had a "This is it." And 2-12 is just as good right this minute as it was when it was first released – with this exception: We have found it unnecessary to null and we have found there was invariability of the occurrence of the R/S as the last R/S on the list if the list was complete, and so we got 2-12A. Well, that simply dropped out some unnecessary points in 2-12. It threw away Tiger Drilling and so forth. And made it very good.

But out of the listing phenomena of 2-12 we now have the listing phenomena of Routine 3M. And you'll find out this is just as invariable, and it's very good.

It's invariable to this degree: In 2-12 you always go fifty items beyond. Fifty items. Never forty-nine, never forty-two. There're fifty items, count them, fifty. You do that with any source list whether it is 2-12A or Routine 3M or 2-12. Just do – any source list, go fifty beyond. And on all lists of 2-12, 2-12A, always go fifty items beyond the point where the tone arm became still and fifty items beyond the last R/S.

I'll give you an idea. The tone arm goes still, you count thirteen items, you get an R/S, now you go fifty more. But at the point where the tone arm went still, why, you didn't get an R/S after that, it's just fifty, don't you see? That's the way that works. That's invariable. Never go less than fifty. Never, never, never, never. If the needle is tightening up, you've probably got a wrong way oppose or something like that. Because it shouldn't in 2-12 tighten appreciably in that fifty. Seventy-five, eighty, hundred, aha, you're liable to get something going pretty tight. But that needle will stay loose for that period.

Now, in 3M, you go fifty items beyond in a source list. Fifty items beyond in a source list. Never forty-nine, never forty-two, never twenty-seven. That's fifty items beyond the still point, where the TA became still and the last R/S. Same rule. Same rule exactly.

Now, on 3M lists from RIs, you only go twenty-five beyond. That is adequate because you're dealing with rocket reading items and they are more closely compacted together, so you always go twenty-five. In other words, the source list to Routine 3M is fifty beyond and the lists for the reliable items taken from a reliable item go twenty-five beyond the still point of the tone arm and the last rocket reading or rock slamming item.

In other words, you get a rocket read or a rock slam, you go fifty... you go twenty-five beyond that in Routine 3M. You understand? It doesn't matter whether it rocket reads or rock slams, you go twenty-five items beyond that needle agitation.

Why is this? It's actually because a rocket read converts very easily to a rock slam, and vice versa. Actually, these things – many rock slams do not convert to rocket reads, but rocket reads, as they start blowing up, go into rock slams. It's quite interesting that a goal in the last part of its run may suddenly give rock slam, rock slam, rocket read. And then tiger drilled a little bit will give rocket read, rocket read, rocket read. And then frayed up by another couple of items and so forth, go rock slam, rocket read, rock slam.

In other words, these are cousins. These, well, they're worse than cousins. Actually, it's uncle and nephew, where the rock slam is the nephew. The senior of the two is the rocket read. So you only need to go twenty-five items beyond that, but always make sure you go twenty-five items beyond. Now, an Instructor is not to check out anything that hasn't been carried twenty-five items beyond. And you're not to muck it up or start calling the pc's atten-
tion to anything until you've got twenty-five items beyond. I mean, that's all there is to it – Routine 3M. And it's fifty is the figure for 2-12, 2-12A. Those are invariables.

See what I mean by an invariable rule? Now, the source list for 2-12, just the source list, can have the rock slam occur on it anywhere. The rock slamming item can occur anywhere on that source list. It's not the last rock slam, it's any rock slam on the list may be it, so long as you don't have two things rock slamming. You have one thing rock slamming, you apparently have a blank list, you check over those other rock slams and all of a sudden you've got a nice great big, wide R/S that you didn't suspect existed. And sometimes this is embarrassing because the source list – you're starting to list the source list and all of a sudden it R/Ses and you think the source wording – like, "In present time what are you in contact with?" - you think that's rock slamming. No, no, it's the first item that the pc's already thought of. You put that down on the list and you carry on and you get some other R/Ses and that sort of thing and pretty soon you really can't find... "What happened? What happened to your rock slam?" because nothing is now rock slamming. You go back, it was the first item he put on the list.

But does that mean – does that mean, then, that you shouldn't complete the list? Heh, well, it doesn't mean you shouldn't complete the list. You should complete the list and go fifty beyond the last R/Sing item because just as likely, the rock slam would have pulled out of that first R/S into another item.

The contest in a source list is to try to get the most fundamental item you can get for that list. You don't want any item on the list and you never want two reads on the same list. You don't want two items reading on the same list, rock slamming or rocket reading. That tells you the list is incomplete. There will only be one slamming on a 2-12A list and that will be the item. But it can occur anywhere on the list.

Well, similarly, similarly, in 2... in 3M, in Routine 3M, your source list, of course, is your goal oppose. You never list anything off the goal except goal oppose. And that source list takes you intimately and at once right down one of these rock slamming, rocket reading lists, if it's the right goal of course. And it goes right on down the line, bangity-bangity-bang, and you go fifty beyond the last rocket read or rock slam.

Now, don't go blow your brains out or try just to test that last R/S and say, "Well, it isn't on the list because the last R/S doesn't read," or "The last R/S reads a tiny little bit," and so forth, "so I guess – blah – we better go on," and so on. You've got rocket reads all over the list. Look, in 3M you don't fool with rock slams unless you absolutely have to. If there's nothing on that source list but rock slams, you'll have to take the rock slam. But if you've got rocket reads, you only examine rocket reads – or let us say you only use the rocket reads; you can examine the R/Ses.

Now, this means what? This means that the first rocket reading reliable item may occur anywhere on that 3M source list, so long as the list is complete. The only sin is not to complete the list. I remember we had a couple of students down here, I've forgotten when it was, 61, I guess it was. We had one of these students – she was always flying in everybody's face – and she used to go down, and the auditor would list on her a 3D list. Horrible. Terrible to behold. His 3D list, 12 items long. And then the pc would say, "Oh, well, that's it. I know
what the item is now and it didn't even have to read." The auditor would simply use it. Naturally, she wound herself up zangity-bang.

Actually, when a pc tells you that is the item, it's a sure thing you'd better list further. Pcs do cognite on items but not until they're well on their road to Clear.

Now, the point I'm making here is the rule consists simply of completing the list. And this completion of the list, or the item that comes off the list, has nothing to do with the pc's opinion. This is not up to the pc. It's simply a mechanical action. And when you do that mechanical action you look for the thing mechanically. Well, when do these rules blow up? When do these rules blow up? Well, they blow up when you've goofed and start relisting.

After you've opposed the wrong item or run one wrong way to, you'll find your lists and rules and things are wobbly. So you want to do them right in the first place. Occasionally you'll do one wrong. You'll get down to the end of the list and you won't find anything. And you'll say "Ulp! Oop. What happened?" You won't find anything on the whole list. Well, you probably listed something wrong way to. That's what it is.

Now, you go back and try to extend some lists, you'll find you've got more TA action and you've got more rocket reads and you've got more R/Ses. Where did they all come from? Well, they came from the fact that you've shaken up the bank. And it's not lying there neatly now, so the rules go out accordingly. All kinds of weird things happen. You got that now?

After you've done a mistake, then other things can start going adrift on you. But if you don't make mistakes, they won't go adrift. The most costly thing in time consumption is to make a mistake. That's terrible.

Now where – where you have listed something wrong way to, then you've gotten the item and you've opposed that item that you got wrong way to – it won't go anywhere. Now, look, in 3M, on items taken from a source list, it is always the last rocket reading item. It is never any other item on the list. It's always the last one. Now, if it isn't the last one, then, just before that, you goofed. You pushed one wrong way to or you didn't complete a list or you didn't complete it to a point where all the tone arm action was out. It was a real good goof, and so on. And it dead-ends you. In other words, it's something like riding a donkey and the donkey takes you over to the edge of the corral and he authoritatively dumps you over the corral fence. And you find yourself, you're no longer in the corral; you're no longer in the GPM; you're floundering around outside saying, "Where is it? Where is it? Where is it? It's gone, gone, gone." Well, you just goofed on these rules. And you'll stay with the GPM and clearing as long as you don't goof. But if you do goof, you know it, because you all of a sudden dead-end. You will do a list on which there are no RRs or R/Ses, or it's just gone. Or if they had RRs and R/Ses you go back and you check each one with great confidence. You say, "I will now read you the last rocket reading item on the list," you say. "A tiger." Heh! It didn't read.

First time it's happened, you see, gotten cocky. You've done twelve, fourteen items perfect, you see. Now, always the last on the list. You – cocky, you see – you say, "Well, I'll now read you the last rocket reading item on the list. A tiger." Ha-ha-ha. It didn't rocket read. Imagine your embarrassment at this time. You see the pc's face sort of screw up, you know, and he says, "What's this? What's that? Tiger? Oh?"
And you say, "Well, it didn't rocket read."

And he says, "Well, I shouldn't think it would. It doesn't mean anything to me."

Where did you go wrong? No, you didn't usually – you could fix it up so you hadn't completed the list – but usually it isn't that you haven't completed the list and ifs not that the RR lies someplace else on the list. The... you goofed on your source item. You've either done it wrong way to or you have taken it from one you've done wrong way to.

You've made a mistake or you failed two lists ago to take all the tone arm action out and go your twenty-five items, because the pc said he was feeling too dopey to go on.

I'd love to hear some pc say that to me. I would get in my mid ruds so fast it'd make his head swim. I'd get them in between the last sessions and I'd take all his missed withholds and his mother's missed withholds and his grandfather's missed withholds. Because the only thing that can knock you flat on one of these lists is to have your mid ruds out. You can get this pc who's doping, he's going dopey, he's going dopey, "Ya cowsow, and a clug-wug. Uh-wu-wu-wu-glgg-wlgg."

After he's done this for a half an hour, even somebody in V Unit might notice. He might notice. And then, by some miracle, remember Ron said that the person had missed withholds, and pick them up and get the mid ruds in, between the last two sessions or something. Do the works and straighten it all out and then get your list and your tone arm action picks up. Because a missed withhold is the only bug. That's the only thing that can... if your rudiments are wildly out – you've got a missed withhold which all amounts to the same thing – you're going to get no TA action and think a list is complete when it is not complete.

That is particularly patent. The symbol you want to look for is the doping pc. The pc goes dopey. He can't keep his eyes open and he... so on. And he says, "Well, the mass keeps hitting me in the face," and so on. Very reasonable. It's very reasonable, but he's just got missed withholds and his between-session rudiments are out. So put them both in.

Now, these are about the only variables you're going to run into. These things can be taught. I can see you teaching them now, with a knout and a ruler, but frankly, 3MX has its own discipline.

If you ever wanted to see a worried auditor, if you ever wanted to see an auditor dripping blood on the – on the report sheet, it's an auditor who has all of a sudden had 3MX go up in smoke. He's been going along, pocketa-pocketa-pocketa-pocketa-pocketa, everything's fine, everything's fine, everything's fine, you know, he's got about fourteen items deep, and all of a sudden the donkey moves over to the edge of the corral and dumps him outside. And he's sitting there and it's not the last rocket reading item on the list and you'll see the auditor start to go yahhh, and there's nothing on the list, and he checks – reads all the rocket reading items. Bank's beefing up on the pc, you see, more and more. More rocket reading items he reads, you see, the more the bank beefs up on the pc and the unhappier the pc gets.

And he'll say, "It's a – a tizzlybum, uh-uh – a Kennedy-killer, uh – a psychiatric swindle, heh-heh-heh. Where the hell, where is it? Didn't write anything on the back of this thing, uhhhh... Well, maybe we ought to complete the list. Yes."
Well, before he says, "Maybe we ought to complete the list," actually he ought to look over – did he run all of the TA action out and did he go his twenty-five items beyond the last rocket reading or rock slamming item? Did he do these things? If he did them, then there's something just ahead of this list, like the item it came from or the item that the item this came from came from, see, tracing it back, where all the tone arm action wasn't out. Or he didn't go twenty-five items beyond or where the pc doped off throughout the whole thing – there's something wrong there.

He either did a wrong way to oppose, he thought a terminal was an oppterm, didn't do his tests, you see, and did a wrong way oppose. He got an item, all right. And then all of a sudden he winds up with this list. It doesn't have anything on it.

Well, it doesn't occur to him to just step back two – two items and check those lists. Usually he shatters because it's so perplexing. What you want to do is just step back a couple and check up and find out if you did those right, run your tests on those items, find out if they still fire, find out what item you goofed up. It'll only be one or two back of you. Do the thing right way to.

But now, don't expect – because you've goofed, you see – don't expect the rules to hold good. That's my message for you. Don't expect the rules to hold good now. Let's say you didn't complete the list. Well, you've already opposed what you did take off the list, so you've loosened the bank up, so therefore the rocket reading and rock slamming count is going to go out on you. You see what's going to happen? In other words, this thing is not going to behave exactly according to Hoyle.

And I'll tell you what you do then. You pay the penalty for having goofed and you somehow or another get the car back on the highway, or get the saddle back on the donkey. Somehow or another. You do it by repairing the immediately prior items to this, straightening them out as best you can and proceeding on down.

Actually, there is a way to do this, but as long as you leave an item wrong way opposed, you're going to leave a jam in the pcs bank. So you're going to have to straighten that out anyhow. If you just lost track entirely and you couldn't find out where you went, you can still run goal oppose, and running goal oppose, you will wind up with your next consecutive item. But make sure that you find out by test if it's a terminal or an oppterm. Make very sure of that. If you don't make sure of that, you've had it. Because there's the one, it's the oddbeat one, which is most likely to fool you. You're listing for a terminal, you see, you're listing opposition to an oppterm. So in your head you say, "Of course I will get a terminal." So therefore your whole attention at this point is on getting a terminal. So you get it and then you give it to the pc and the pc is all too willing to buy this thing as a terminal, so he says it's a terminal. You list "Who or what would that terminal oppose," and it's wrong way to, and you can get an item, believe me.

For the moment, your rules will hold good. Because you're clearing the width of your needle swing and so forth, doesn't give you the same indicators of a tightening needle that you get in 2-12. It doesn't get that tight. It gets tighter. But what do you mean tighter? The thing is going this way and it's not very tight. So you don't – don't think that it amounts to anything. And you say, "Well, that's ..." See, your tightening needle.
You don't make these tightening needle tests, by the way, in 3M. It's too hard on the pc. You don't list it one way and then the other way, the way you do in 2-12 and 2-12A. You just list it right in the first place. And you've got several things that tell you whether or not it's right and those are given to you here. There are a lot of these tests as to what the thing is. There are eight tests, actually, and they're in a slightly prior bulletin to this.

You go down these eight tests, one right after the other, and you will get yourself full knowledge of whether or not it's a terminal or an oppterm. It's not very hard to establish it. You don't have to establish it by listing. You don't have to establish it by pain and sen. You can establish it by whether it turns on mass when you say "oppose it," or "it oppose," or... and you want the one that turns on the least mass. There are actually eight methods of testing this. And that's the way you do this, you always test these things.

Now, you'll tend not to test them because the pc complains. It upsets the pc every once in a while. He's sitting there, and he knows a tiger is his terminal. He's very happy about this, see, he knows it's his terminal, he's all set, fine. And you all of a sudden say, "Consider committing overts against a tiger," and he "Nyah, nyah, commit overts against a tiger?" and so forth.

And you say, "Consider committing overts against a tiger. Consider committing overts against a tiger. Now, did that turn on more mass or less mass?"

"It turned on more mass."

"All right. Now, consider a tiger committing overts. Consider a tiger committing overts. Now, did that turn on more mass or less mass?"

"Turns on less mass. It's a – it's a terminal! What's the matter with you, you idiot?"

And the pc will say things like this to you and you'll get to a point after a while where you won't test these things. And then one day, you'll be sitting there and everything was going along beautifully, and all of a sudden you haven't got an item on the list. Gone. Magic. Disappeared. What did you do? You didn't test. That's as simple as that. That's the immediate penalty for it.

Now, there's something you should know about a goal. Here's another part of tests on the goal. You don't find a goal, let's say – let's get this goal, let's get this goal: "To be a 'ero," see, let's take this goal, "to be a 'ero." And you're listing it and the first terminal you get on it is not an heroic man. Oh.

You say, "That's obvious, you know? Obvious, you got the goal 'to be a hero,' and therefore the first terminal of course would be an heroic man. And what would a heroic man oppose?" And you list that and you get "a coward."

And you say, "That's very interesting because that's the oppterm." And then you do your third list and all of a sudden you're looking at your papers and you can't find any RR that now reads.

You say, "Where is it? Where did it go? Heh-heh-heh-heh." There you are.

That's because you don't know this about goals: The pc's goal at the beginning of the run has always gone into the hands of the enemy. The enemy has his goal; he doesn't. That's
always an invariable. Actually, you won't even get the straight things if you – you know – if you oppose wrong way to you don't arrive with the right item. You arrive with some other item.

And so you're going along and you get your first item for this goal, and it's a "pusillaminoous punk." That's to be a hero, the goal, see, a pusillaminoous punk. You say, obviously it's an oppterm. Oh, no it isn't. It's the terminal. That's where he wound up with that goal. That's where he now is. He is a pusillaminoous punk.

And what is the oppterm? An heroic man! Ho, ho! Interesting, isn't it? That's his oppterm. That's his enemy. He's gotten to a point now where he sees anybody acting in an heroic fashion, and he says, "Snee." Interesting, isn't it? Whatever his goal is, he's in the opposite terminal when you first find it. In other words, he's not in the oppterm. Now, don't misinterpret this and think yourself to death. His first terminal designation – the less you have to do with significances, the better, but this will help you because you're liable to fall into this trap.

The first item you find may be an heroic man for the goal "to be a hero," and you go right along and you say, "Well, of course that's a terminal." No. If it's the first item and it says "an heroic man" and the goal is to be a hero, you know doggone well that's an oppterm. Invariable.

Let's get an idea now. The pc has a goal, "to be nice." And your first opposition item coming up is "to be a nasty, snot-nosed little brat." See, "Nasty, snot-nosed little brat." You say, "Well, obviously, that's the oppterm." No it isn't. That's where your pc got to on that goal. That's the pc – a nasty, snot-nosed little brat.

Now, the pc very often doesn't like this. Because he's found out that his goal was to be nice. And so he's going to sit there and say, "Now, let's see, I'll be nice. So therefore my terminal is obviously a nice person." No, it isn't. That's the oppterm.

Now, when he gets – now, listen to this carefully. When he gets halfway through these terminals, let's say he's going to have thirty terminals on this or some such thing, and when he gets to about fifteen, it's even-steven. In other words the terminal and the oppterm alike are, well, it's something like this: "A person who is all right, I guess," opposes "a person who is probably okay." Neither one of them "to be nice," see?

In other words, there's counter-balance here. And at the beginning, the oppters are all big heroic goal oppters, you see, that represent the goal, and then that comes down through kind of like an hourglass on a curve, and then gets to a middle ground. And then after that, the oppterm starts to lose. Don't you see? And the pc's items start to get more and more like the goal. You understand? And finally, the last oppterm, which explains to you why old Routine 3 ran when you got the right item, the last oppterm – and when it did run – that you get on the goal "to be a hero," the last one, see, that's number thirty, or something like that, will be "a pusillaminoous, cowardly, shaking piece of jelly." And the pc's item will be "a hero."

But that's thirty items later. That doesn't sound like it at the beginning, see. And in the middle ground – you'll see these things. The enemy is less and less the goal and the pc is more and more the goal on a fantastically gradual gradient. And it's quite remarkable. So that
when... you can count on this. You can use this. This is – this is very precise. You can use this very well.

Let's say "to be a hero" is the pc's goal, and you do "Who or what would the goal 'to be a hero' oppose?" And you finally come up with a rocket reading item on the list, which rocket reads beautifully, and it says, "an heroic man." Actually, you've arrived with the oppterm. Not because it was listed that way, but because that would be the first RI. Invariable. And the last one will be comparable to the pc when you first find him and start pushing him through the bank. The last oppterm is a pusillanimous punk, see, and the first terminal is a cowardly brat, you see?

In other words, they're at opposite ends of the pole, see. It's very interesting. And they cross in the middle and become quite similar to each other. You see how this goes? You can actually know where you're progressing on running out a goal by just looking at these items and seeing how they less and less approximate the goal in the oppterm and more and more approximate the goal in the terminal. And also, you can prevent yourself from making a God-awful mistake.

All this is very interesting. But how long does it take, how long does it take, actually, to clear somebody on a first goal? Well, given his goal and given perfect, rote, rapid auditing, everything going along fine, you're only looking at a maximum of about fifty hours. Unless you goof. Now, goofs are what cost time. Now, man, you could get five RIs, see, while you're straightening out one goof. It's fantastic. The thing that eats up time is the goof. Get one RI backwards just because you didn't have time, because you're in such a hurry or something like that, and list it backwards on a wrong way to oppose, and there you go. I mean, you're just – you're sunk! You're going to eat up five, ten, fifteen hours trying to get back on this donkey. You understand? I mean, that's what costs time in 2-12, 2-12A and so on. That's what costs the time. And in 3M that can be said with exclamation points.

Because the pc's been perfectly happy and now the pc is miserable as hell. He doesn't know whether he's going or coming. He's miserable! Terrible state. He says, "Well, I don't know," and so on. He's thrown for a loop. "Well, I thought it would be the – the item. I cognited on that item I gave you, a supercilious idiot. I cognited on that and so on. It's perfectly all right with me. And you say it doesn't read."

Well, of course, somebody who was trained in some far-reaching place would say, "Well, we'll just give him the item." Well, just commit suicide because you're never going to have a Clear. "Heh, well, we'll just give him the item. He – he liked the item. It didn't read, but he liked it."

Well, he might have liked it, but I don't. And if it... if you just want to not clear somebody at all, just give him a false item that doesn't read, and say there's good reasons why it didn't read, and all that sort of thing. These things read, man.

In other words, your goof is what's going to eat time. Actually, if you were very rapid and very slippy, and your pc was not having a bad time in his own environment while he was being audited so you didn't have to waste lots of time getting in all kinds of rudiments and all that sort of thing, and you're going along, you're probably looking at – oh, I don't know – you're probably looking at thirty hours with absolutely not a slip anyplace, you see.
But we'll say that it went a little slower than that, and so forth, and estimated it about fifty. All right. What do we rack up with some auditor who's driving all over the road and that sort of thing? Well, we rack up all of his auditing time lost plus all of the auditing time that somebody else has to put in to straighten the pc out. And it will take you a hundred to a hundred and fifty hours to straighten out a pc that's been thoroughly loused up by some lousy auditor. Yea! And it's... you're going to sit and swear, because you can't help but skid on the ice particularly when you're first starting in on this, once or twice, and you're going to sit there sometime for two continuous days trying to figure out, "Oh, my God, what – what did I do? You know? What did I do? Heh-heh! Where – where did it go? I mean, what – what was it? What was it? Hah-hah-hah-hah. Well, let's see, Ron said if you opposed a ...if you ran a goal oppose again, you could come up with an item."

You come up with an item and it doesn't fit anyplace and you get that one wrong way to. And that's happened. And you didn't know where to go with that. And so now you've got another item you don't know where it is, and oh, God! You'll wish that you had put in that extra ten minutes testing the item out each time. And you'll wish that you were a little smoother, and you'll wish you had paid attention to this exact sequence of delivering the item. The sequence is "Read the last R/S, if there is one. If there isn't one, you don't."

"Read the last R/S. Tell the pc, 'I'm now going to read to you the last rock slamming item.'" And he sometimes is doped off, and he thinks you're going to say the last rocket reading item or something. Pcs get educated like this. Don't worry about raw meat, just use the same parlance.

And he thinks it's his item for a moment, and he says, "Well, that's not my item." And you said, "Yes, I know. I said the rocket reading... the last rock slamming item," and so on.

"I didn't hear you."

It's no reason to get into sense like that, so just be positive, say, "This is the last rock slamming item, I have to see if it reads, it is not your item." And you read it, bang, you see it doesn't read. "Now, I'm going to read the next to the last rocket reading item – it is not your item – to see if it reads. And it is – bong." And you read it, and you see that it doesn't read.

"Now, I am going to read the last rocket reading item on the list, which is your item. A tiger." – Bang. Immediately tell the pc, don't monkey with it, see? "That reads. That reads. That's fine, that's your item," so on. You'll get back so you'll groove right in to that exact procedure.

What's the reason for that procedure? That's so you don't read the pc an item and then take his attention off of it to something else. Because the rule is: The last thing you do is read the pc's item to him. And you don't ever drag his attention off of that item, with anything.

Now, let me show you the difficulty you can get into. You didn't know – you had two rocket reading items together on a list, see? You had one rocket read on the first column of your list and you had another rocket read on the last column of your list and you had two together. So you say, idiot-simple, walking Simple Simon in the pies, you say, "I'm now going to read you the next to the last rocket reading item, which is not your item." And then read him the item of the – the upper item of the pair. Well, actually, the only way you had to tell when you first put this thing down, you see, he actually was thinking of the item while he said
the other item to you. So actually it looked like two rocket read and you've just presented the pc with his rocket reading item, see? And it goes pow!

You say, "I'm now going to read the next to the last item. It is not your item. 'A water-buck'" –pow! You say, "Uh-oh!"

And the pc says, "Yes, a waterbuck! What? What? What? What? What? What? What?" You've now got to say, "Well, I've got to read the other item now, I'm awfully sorry," and you'll find the pc will start going real sour on you and now you have to get in and get in some suppresses off and all this kind of thing, you just had trouble, see.

So there's an additional rule to this: When two lie together, you don't lay in any statement that it's the pc's, and you read the rocket reading item earlier than that pair. Read the earlier item than the pair. Don't call the next to the last rocket reading item, the one... the upper one of the pair, because you could be very wrong. This has actually happened in session, which is why I know about it. It'll be the pc... you've given him his item, you said, "This is the next-last... next to the last item. It isn't your item." You see, you gratuitously invalidated the whole thing, and there he goes. Wow! No, you mustn't distract the pc's attention. You mustn't distract his attention after you've given him the item. That's your nuance.

Now, these are – these are very simple rules. These are very simple rules. It's something like learning a number of addresses. You can read any God's quantity and memorize any quantity of addresses. You can memorize them in complicated ways, so long as they always come up in that series. Well, that's what you've got here. But there's something for you to memorize on it. You better get these rules.

Now, I know that this material is not immediately available to you and you haven't got it in hand. Actually, you now have three lectures on this subject. I invite your attention to them. I also invite your attention to some rules and regulations of HCO Bulletin here on Saint Hill Briefing Course, HCO Bulletin, I think, the 12th.* I invite your attention to those, because it says that ignorance of the technology is no excuse for a goof. And if you goof, you've had it. It isn't the Instructor's fault, it's yours. In V Unit, on your first day at Saint Hill, we hold you responsible for knowing the whole of everything you are doing.

And the Instructor comes along, and he says, "Well, that rocket slam looks big enough to me! Heh-heh! It's an eighth of an inch wide. Go on, oppose it."

And the person says, "Oh? Yes, well, all right, all right." And goes ahead and opposes it and the bank beefs up and the pc starts caving in and dark hollows underneath the pc's eyes.

And somebody happens to see this pc and says, "Who's your auditor?"

And he says, "Oh, that's – that's Joe Blow," and so forth.

Well, Joe Blow gets an infraction, and if it looks too bad, it's two weeks with no auditing, which is just two weeks lost course time, and which carries with it the same equivalent of

* [Editor's Note: This was issued as HCO PL 11 Feb. 63, AUDITING REGULATIONS, in OEC Volume 4]
a fifteen hundred word infraction sheet, and you can only have five thousand words of infrac-
tion until you get sent down from the course.

That's terrible, isn't it? In other words, you've got a bunch of new auditing regulations
coming out. Why? Because I want you to take responsibility for cases. And I don't care if
some Instructor came along and said, "Stand the pc on the head." You did stand the pc on the
head and it didn't work. You're for it, not the Instructor. You got that? I'll take care of the In-
structor. You see why?

Now, we've got to turn Clears out here. Now, the material I've been giving you follows
a one-two-three-four rule. And I've already seen that somebody Thursday night, listening to a
lecture, somebody with a bulletin in his hot hand, on a case on which the goal had already
been found, could disobey all of it and wind up in 3M opposing a rock slamming item a quar-
ter of an inch wide. And actually go ahead and oppose it!

Haaaa! Somebody's counting on the Instructor, man, somebody's counting on Suzie
telling them what to do. You're not going to have an Instructor when you get out of here.
You're not going to have Suzie. And we've just got to make up our minds right now that you
have to know how to clear people. And you're going to be able to clear people. And we're
going to make sure that you're able to clear people. And I start making sure of that on your
first day on course now because you saw into the entire complications of 2-12A, if your pc
looks bad, you're for it.

Yes, you say, "But I haven't had time to read the bulletins. I haven't passed them on
my checksheet." Ha-ha, I'm sorry. That has nothing to do with it.

"The tapes are all used up and we can't listen to them anymore." I'm sorry, that has
nothing to do with it. Makes you responsible for getting your own data.

Why? Why can we move up like that? Well, we've been talking for a long time that we
Scientologists ought to be an example in ourselves of the efficacy and working of Scientol-
ogy. And that's what we've been saying for a long time. And I'm sitting in the driver's seat
now. I was a first-goal Clear last night for three minutes.

Thank you very much, and good night.
TV DEMO: RUDS AND HAVINGNESS

An auditing demonstration given on 13 February 1963

Auditor: Okay. George, what I'm going to do here is run a rudiments and havingness session. Okay? All right.

PC: I don't see any cans.

Auditor: Don't see any cans. Here are some over here.

PC: Mm-mm.

Auditor: Now you take the cans. All right. Please squeeze the cans. Good.

LRH: All right. This is just a rudiments and havingness activity. And we're just going to have a rudiments and havingness demonstration here and see what's being done in the rudiments and havingness section. All right, go ahead, auditor, start your session.

Auditor: Okay. Is it all right if I start this session now?

PC: Mm-hm.

Auditor: Good. Start of session. Has this session started for you?

LRH: Eleanor, move a little bit over to the right. You're obscuring the TV set with your shoulder. Thatagirl.

Auditor: Okay. What goals would you like to set for this session?

PC: Oh, I'd like to find my havingness command. And uh, or how good I can feel on it.

Auditor: I didn't hear the last of what you said.

PC: How good I can feel doing it.

Auditor: Good. Mm-hm.

Okay. Are there any goals you would like to set for life or livingness?

PC: To go home.

Auditor: Good. Any other?

PC: Well - to get my case in shape.

Auditor: Thank you.

All right. What I'm going to do now is to put in the mid rud's.

PC: Mm-hm.

Auditor: I'll be doing it "since the last time you were audited," and when was that?

PC: Well, it was this morning at 12:25.

Auditor: Okay. Just put a note down here. All right.

Since the last time you were audited, has anything been suppressed?

PC: Well, you might say, my spirits. When I thought I was going to uh - go ahead and find some more item, as a pc, I thought, I was transferred here so that kind of dashed my hopes on finding my item.
Auditor: Thank you. Since the last time you were audited, has anything been suppressed?

PC: Mm, no, not that I'm aware of.

Auditor: Okay. I'll check that on the meter. Since the last time you were audited, has anything been suppressed? That reads. What was it?

PC: Ummm. Gee, I don't have the faintest clue.

PC: Oh, the only thing I was thinking of there was – I guess I suppressed thinking about him so I could just go ahead and study a bulletin.

Auditor: I didn't quite get that.

PC: I said I suppressed thinking about him so I could go study a bulletin.

Auditor: Uh-huh. Okay. Since the last time you were audited, has anything been suppressed?

PC: Not that I'm aware of.

Auditor: Thank you. I'll check that on the meter. Since the last time you were audited, has anything been suppressed? Do you agree that that's clean?

PC: Uh-huh.

Auditor: Good. Now, I'm going to fast-check the rest of these.

PC: Okay.

Auditor: Since the last time you were audited, has anything been invalidated? That reads. What was that? There. There. That.

PC: Well, I-I don't quite know I didn't quite sort it out, really.

Something about, uh - my auditing wasn't invalidated.

Auditor: Mm-hm. What was it?

PC: Well, it had something to do with uh… switching pcs and auditors around in the morning.

Auditor: Mm.

PC: I haven't quite pinned it down exactly. Something was invalidated. It wasn't my auditing because I don't know how good or bad it is.

Auditor: Mm-hm. Well, what was invalidated?

PC: Well, I was somehow. I don't see how that could be...

Auditor: Mm-hm.

PC: ...I just thought I was invalidated.

Auditor: Okay. Are you satisfied that answers the question?

PC: Uh-huh.

Auditor: Good. I'll check that on the meter. Since the last time you were audited, has anything been invalidated? That reads. What is that? There. There.

PC: Oh, studying that damn little stinky bulletin tonight. You know, one of them little CCH ones.

Auditor: Uh-huh.

PC: And it was one of the hardest ones I've ever run into. I couldn't seem to nail it down for some reason. And uh… I thought I'd be getting me one of those little ones, and get it after a reasonable length of time, but I sure couldn't get that one.

Auditor: Yeah, well what was ...
PC: Well, I felt invalidated. It's sort of a - it was such a little dinky one at that. Couldn't get that. And it was a sort of, you might say, self invalidation.

Auditor: Uh - what I don't understand is just what that was ...

PC: Well, my ability even to do a little thing like that.

Auditor: Mm-hm. Okay. Thank you. I'll check the question on the meter. Since the last time you were audited, has anything been invalidated? That reads. What is that? There. Right there. That. What's that?

PC: I don't know. I get - get kind of - kind of a question mark on my mind. I don't know what it is.

Auditor: Okay. That.

PC: Well, the same thing. It's kind of a, well, what - what could it be? But this happens in auditing all the time.

PC: Well, the same darn thing. A kind of a - a question again, well, you know, what could it be, what could I have invalidated?

Auditor: Uh-huh. Right there. What's that?

PC: It's the same darn thing. Every time I kind of pose it as a question ...

Auditor: Uh-huh.

PC: ...you know, what could it be?

Auditor: Mm-hm.

PC: I-I have the same trouble with auditing when I get run on rudiments. Uh... either the abruptness, or it pulls a question, you know, just an idea of what could it be.

Auditor: Mm-hm.

PC: But we're arguing with the darn meter. I get so disgusted with the meter.

Auditor: All right. Uh... thank you for answering that. I'm going to check it on the meter and we'll see if that is - is your answer on it. Okay. Since the last time you were audited, has anything been invalidated? There is another read on that. What is that? Right there. That. That. What is that?

LRH: Eleanor, you are cleaning a clean.

PC: ...let's see, familiarize myself with it, trying to figure it out completely. I found several things that might help me.

Auditor: Yes.

PC: But I didn't think – I didn't think I found them – not as well as I should have.

PC: Sort of a self-invalidation again.

Auditor: Okay. Thank you, George. All right. Now, uh... I made an error on that. That was a clean that I was cleaning.

PC: Hm!

Auditor: Okay? Do you agree that that question is clean?

PC: Oh, probably is.

Auditor: Okay. Now I'm going to check the next one.

PC: Mm-hm.

Auditor: Okay?
PC: Uh-huh.

Auditor: Since the last time you were audited, has anything been suggested? Do you agree that that's clean?

PC: Uh-huh.

Auditor: Good. Since the last time you were audited, is there anything you have failed to reveal? There's a read on that. What is that?

LRH: That was a clean, Eleanor.

Auditor: All right. I'm not going to leave you hunting for that. That was also a clean. I was – I was in error on that. Now, uh… do you agree that that question is clean?

PC: Okay.

Auditor: Very good. Thank you. Here's the next. Since the last time you were audited, is there anything you have been careful of? That reads. What is that?

PC: That was uh… now what came up there on this – um – not to show disappointment over things.

Auditor: Uh-huh.

PC: Um, several things have come up that I've been disappointed about. There – there's no use uh… complaining about it or particularly showing it.

Auditor: Oh, I don't understand what you've been careful of in that.

PC: I-I said I've been kind of – kind of a bit careful not to show my disappointment.

Auditor: Ah!

PC: Okay?

Auditor: Thank you.
PC: Golly, I don't know what that would be. It could – it had something to do with uh... processing I got this morning. Some mass on something moved into the head and...

Auditor: Uh-huh.

PC: ...made me real dopey. And just – it has – might have something to do with the headache now. I don't know what the connection is. But the "careful of" – I don't know why.

Auditor: Mm-mm. Thank you. I'll check that on the meter. Since the last time you were audited, is there anything you have been careful of? That reads. What is that? There.

PC: Well, I'm still thinking about that again, kind of puzzled by it.

Auditor: Mm-mm.

PC: I-I don't know all the reasons.

Auditor: And what have you been "careful of" about it?

PC: Hm?

Auditor: What have you been "careful of" about it? There. That.

PC: Oh, I guess – I guess I've been careful not to become too overwhelmed by it... I guess I've been careful not to uh... become too affected by uh... no results from processing.

Auditor: Mm.

PC: If I did, I would have gone a long time ago.

Auditor: Uh-huh.

PC: But, I guess a guy just keeps hopping.

Auditor: Okay. Does – does that satisfy you've answered the question?

PC: Yes. Mm-mm.

Auditor: Good. I'll check it on the meter. Since the last time you were audited, is there anything you have been careful of? Do you agree that that's clean?

PC: Yeah.

Auditor: Good. Since the last time you were audited, has any mistake been made? I'm – that is equivocal. I'm going to check it again.

PC: Mm-hm.

Auditor: Since the last time you were audited, has any mistake been made? There's a read there. What is that? That.

PC: Well...

Auditor: Right there.

PC: I don't know whether I made a mistake or not. I-I know I-I didn't make a mistake, I'm pretty sure, in picking the uh... universe for the pc to run on. I think I got the right universe. And if there was any mistake, the wording wasn't quite right.

Auditor: Mm-hm.

PC: That's what I was thinking of.

Auditor: Okay. That answer – that satisfy you you answered...

PC: Yes.

Auditor: Good. I'll check that on the meter. Since the last time you were audited, has any mistake been made? That reads. What is that? There. There. That. That.
PC: Hm! Just when I'm puzzled about things.

Auditor: Uh-huh. Okay George. What I want to do is – is check that question again.

PC: All right.

Auditor: Since the last time you were audited, has any mistake been made? Do you agree that that's clean?

PC: Yeah, it probably is. I couldn't find anything there.

Auditor: Very good. Thank you.

PC: Just rolling now.

Auditor: All right.

PC: I can see this can be a real auditing session because I'm surprised here.

Auditor: How are you doing here.?

PC: Yeah, I-I looked at a couple of things I-I had never thought of before. The way – the way I – uh… am quite bitterly disappointed that I'm not making more result from my processing.

Auditor: Mm-hm.

PC: And uh... I've got a lot of other things to do so I kind of shove it off to one side and don't look at it.

Auditor: Yeah. Okay. Well, how are you doing in this session here?

PC: Real good.

Auditor: Real good. Thank you.

PC: I've kind of forgot about that silly TV camera.

Auditor: Okay. All right. Here's the next rudiment question.

PC: All right.

Auditor: Since the last time you were audited, has anything been nearly found out? That reads. What is that? There. That. Right there. What was that? There.

PC: Uh… rocket reading item – items on my pc. And I would have liked to see that goal checked out to see if it was one.

Auditor: Uh-huh.

PC: It looked awful good.

Auditor: Okay. When was that nearly found out? That.

PC: Well, I was asked a time or two by different people about it.

Auditor: Mm-hm.

PC: And, some others around didn't say anything but uh… I-I-I don't know who it was, I don't.

Auditor: Uh-huh.

PC: You know, and it doesn't make any difference.

Auditor: Yes. Well when was it that you wondered if somebody had found out about that disappointment?

PC: I was going to say, oh ...

Auditor: You've got it, right here. There.

PC: Yeah. I think that would be about the time. Yeah, I think this afternoon.

Auditor: All right. When this afternoon?

PC: I was sitting at the table, I-I guess I was talking to Jim, I'm not sure.

Auditor: Uh-huh. Who nearly found that out?

PC: I don't even recall, really. There was a lot of people in there. And
uh… well, I talked to Jim some about it.

Auditor: Uh-huh.

PC: Someone did turn around and looked at me. I-I don't know – possibly is. Something like that.

Auditor: Okay. Now, who was it that you wondered whether they found it out?

PC: Well, I didn't even bother to see who it was. It was just some people around there.

Auditor: Mm-hm. Uh ...

PC: I mean, I-I didn't look at them. I just was aware there were people there.

Auditor: All right. Uh… what did they do that made you wonder whether they found it out?

PC: Aw, they just turned around and looked at me talking to Jim.

Auditor: Okay. Now is there somebody else that you wondered whether they found out about that disappointment? Okay, that's ...

PC: I don't think so, really. There might have been some of the guys right around. I don't think so. This is all kind of a vague incident.

Auditor: Mm-hm. All right. Uh… I'm going to check this missed withhold question to ...

PC: Uh-huh.

Auditor: ... see if we got it. Since the last time you were audited, has anything been nearly found out? Okay. Do you agree that that's clean?

PC: Mm-hm.

Auditor: Good. All right. Since the last time you were audited, is there anything you have been anxious about? There's a read. What is that?

PC: Well, sure. Getting the goddamned items so I can get moving.

Auditor: Thank you. I'll check the question on the meter. Since the last time you were audited, is there anything
you have been anxious about? I missed that read. I'll ask it again.

PC: Okay.

Auditor: Since the last time you were audited, is there anything you have been anxious about? There is another read on that. What is that?

PC: Well, I've been anxious about to try to nail down knowing more about 2-12 and 3 for that matter, too. To really know it. I-I don't think I know it well enough. Too many things I don't know.

Auditor: Yes. Thank you.

PC: I'm kind of anxious about that. I-I-I can't seem to get it down where I want it, either.

Auditor: Uh-huh. I got that. Now, do you feel you answered that question?

PC: Mm-hm.

Auditor: Good. I'll check it on the meter. Since the last time you were audited, is there anything you have been anxious about? There's another read on that. What is that?

PC: Oh, not being able to remember the damn bulletin.

Auditor: Mm-hm.

PC: They want, they want you to get it down to the fine print anyhow. You've got to know the whole thing. It's – it's right at this moment a kind of an obstacle to me.

Auditor: Uh-huh. Thank you. I'll check it on the meter. Since the last time you were audited, is there anything you have been anxious about? I'm not certain of that read. I'm going to check it again.

PC: Mm-hm.

Auditor: Since the last time you were audited, is there anything you have been anxious about? There is a read on that. What is that?

PC: Oh ...
PC: I'm kind of anxious about that.

Auditor: Thank you. All right. I'm going to check that question now. Since the last time you were audited, is there anything you have been anxious about? Okay. Before I just finish checking this off, I want to check another button here.

PC: All right.

Auditor: Since the last time you were audited, is there anything you have protested? That reads. What is that? There. That.

PC: Last time I was audited?

PC: Oh, sure. I-I protested to my – when they changed the auditing schedule around.

Auditor: Mm-hm.

PC: Of course, it didn't do any good. You can protest all you want to the Instructor and nothing happens.

Auditor: Uh-huh.

PC: And, uh… that's all I can think of now.

Auditor: Thank you.

PC: That's all that comes to my mind.

Auditor: Thank you very much. I'll check that on the meter. Since the last time you were audited, is there anything you have protested? That's another read on that. What is that? There. There. That.

PC: Oh, I guess I just kind of thought to myself, protesting like, about uh… we were cleaning up old lists and nulling them out and prepchecking on their old goal.

Auditor: Uh-huh.

PC: Odds and ends here and there. I just go from one thing to the other. I guess I kind of mentally protested that.

Auditor: Okay. Thank you very much. I'll check it on the meter. Since the last time you were audited, is there anything you have protested? Do you agree that that's clean?

PC: Mm-hm.

Auditor: Very good. Now, I left one rudiment question that I wasn't sure I had a clean read on and I'm going to check it again.

PC: Okay.

Auditor: Okay? Since the last time you were audited, is there anything you have been anxious about? There is a read on that. What is that? There.

PC: Oh, that!

Auditor: Mm-hm.

PC: Well, I'm moving from where I'm staying over to another place.

Auditor: Mm-hm.

PC: And I'm kind of anxious that I can get off and move Saturday, you know, clicked off.

PC: Everything like it should be. I finally found where I can, uh… especially gain some time. I spend the whole weekend taking care of myself and leaves no time, reasonable, for study so I got to have more time for it.

Auditor: Good. I'll check it on the meter. Since the last time you were audited, is there anything you have
PC: Oh, I-I decided I had to restudy the uh... latest 2-12

Auditor: Uh-huh.

PC: ... bulletin to see if I could get a little sharper on learning what the heck to do.

Auditor: Thank you. I'll check the question. Since the last time you were audited, has anything been decided? Do you agree that that's clean?

PC: Uh-huh.

Auditor: Very good. Okay. Now, I'm just going to make a notation here.

PC: I think it's been a long time since I've had my rudiments cleaned up.

Auditor: Well, good.

PC: We don't do it in the V Unit.

Auditor: Uh-huh. Now, what is the Havingness Process you usually are run on?

PC: Hm, I think they're running "Feel."

Auditor: Okay.

PC: Oh, I can run "Feel" or "Touch" or "Look around here and find something you could have."

Auditor: Okay. Now we're going to — I'll — I'll check this very soon, soon after I start, we'll — we'll run — we'll run, "Feel that object." I'll indicate the object.

PC: Uh-huh.

Auditor: Okay? Squeeze the cans. Very good. Put the cans down, please. All right. Feel that table top.

Thank you. Feel the sleeve of your sweater.

Good. Feel the floor.

Very good. Feel that board behind you.

Thank you. Feel the table top.

Good. Feel that can.

Very good. Now, pick up the cans. Okay. Please squeeze the cans. That's working fine. Okay? I'm go-
ing to run a little bit more on that. Put the cans down now. Okay.

Feel the floor.

Thank you. Feel the back of your chair.

Very good. Feel the end of the table.

Thank you. Feel your knee.

PC: Pardon?

Auditor: Feel your knee.

PC: Mm-hm.

Auditor: Very good. Feel that sweater.

Feel my sweater.

Very good. All right. Feel the back of your chair.

Good. Feel the floor.

Thank you. Feel that board behind you.

Very good. Okay. Pick up the cans. All right. Please squeeze the cans.

Good. That worked fine. All right. That was the last command.

PC: Mm-hm.

Auditor: Is there anything you'd care to ask or say before I end that process?

PC: Oh, yeah, I-I learned a few little things here. I kind of want to do it, but I sometimes I really want to do it, uh… something I don't particularly want to – get my confront up all the time – I kind of shove off behind me and sort of not-is it.

Auditor: Mm.

PC: And I picked up a few little things. I do that.

Auditor: Okay. End of process. All right.

Have you made any part of your goals for this session?

PC: Let's see, what were they?

Auditor: I'll read it to you.

PC: No, I got it.

Auditor: Did you get that?

PC: Sure.

Auditor: Okay. Very good. Have you made any other gains in this session that you would care to mention?

PC: I feel a little brighter.

Auditor: Good.

PC: I feel a little better. Sometimes I think what I need is a great big slug of Havingness run.

Auditor: Uh-huh.

PC: It always makes me feel better whenever I do any of it at all.

Auditor: Good. Is there anything you would care to ask or say before I end this session?

PC: Mm.

Auditor: Good. Is it all right with you if I end this session now?

PC: Uh-huh.

Auditor: Okay. Here it is: End of session. Has this session ended for you?

PC: Uh-huh.

Auditor: Good. Tell me I'm no longer auditing you.

PC: You are no longer auditing me.

Auditor: Very good. All right. Now you can go back – you can go right back over there, George.

PC: Okay. Fine. Thank you, Eleanor.
LRH: All right. There we had our rudiments and havingness session. Basic errors is asking the pc if he's answered the question – something we never do. That – that's a very bum show to ask the pc if you've answered the question. That's the auditor – the auditor's TR 2 tells the pc that.

Then the meter reading there was not too good. And when I asked the protest button to be cleaned up, the way you do that is, you simply say, "Has this question been protested?" and the read will come off of it at once if the question is reading merely because it's protested. Protest is a random rudiment on all of the mid ruds.

Other than that, that was pretty good and the pc felt a bit better and his havingness came up. So it was a successful session. So thank you very much.

Next team will be on in just a moment.

PC: Ron is talking?

Auditor: Huh?

PC: Ron is talking?

Auditor: Yes. He's waiting for us – waiting for us to ...

LRH: Put your earphones on. Got'em there?

Auditor: Yes.

LRH: All right. Here we go. Just do a rudiments and havingness session the way you ordinarily would in the unit.

Auditor: Okay. All right. Okay. Just take the cans, Mario.
PC: Well, to get out of here Clear and Class IV.

Auditor: Very good. Okay. Any others?

PC: Uh... to start things newly would be nice.

Auditor: Okay. Any others?

PC: No.

Auditor: That's fine. Now, what I'm going to do, I'm going to do Suppress repetitively, and I'm going to check the others straight on the meter. Okay? All right. Now, I'm going to use "Since the last time you were audited." When was that, Mario?

PC: This morning.

Auditor: Okay. Got that session in mind?

PC: Yeah.

Auditor: All right. Since the last time you were audited, has anything been suppressed?

PC: Oh, I think I suppressed anger this morning after my session.

Auditor: Okay. Since the last time you were audited, has anything been suppressed?

PC: I suppressed to communicating this evening.

Auditor: Okay. Since the last time you were audited, has anything been suppressed?

PC: I don't see anything.

Auditor: Okay. I'll check it on the meter. All right. Since the last time you were audited, has anything been suppressed? That reads. What was it? There it is. There.

PC: Yes, I suppressed – I suppressed saying the goal – a goal for this session. I suppressed saying: To keep my auditor in-session.

Auditor: Very good. All right. Well, do you want it to go down on there?

PC: Well, no, I don't think so.

Auditor: Okay. Good. All right. Since the last time you were audited, has anything been suppressed?

PC: I think I suppressed – however, this is not since the last time, this is – this was before or during my session.

Auditor: Okay. Would you like to tell me about it? Just ...

PC: Well, yes, I suppressed asking that the goal that I think I have found in the item be checked. Or maybe wanting to know or making tantrums in order to make it be checked.

Auditor: Okay. All right. I'll check again, "Since the last time you were audited." Okay? Since the last time you were audited, has anything been suppressed?

PC: Um... I suppressed being disappointed at not having received mail. For some reason I'm expecting a letter, and when I went back home there was no letter and I was a bit disappointed not having received the – this letter.

Auditor: I don't quite understand what was suppressed about it.

PC: Well, I suppressed, how shall I say – I suppressed – I did something else. I went – I came out of this disappointment. I suppressed being – staying in disappointment.
Auditor: Okay. Thank you. Since the last time you were audited, has anything been suppressed?

PC: I don't see anything.

Auditor: Okay. I'll check it on the meter. Since the last time you were audited, has anything been suppressed? Do you agree that's clean?

PC: Yeah.

Auditor: Good. Next one we're doing straight on the meter, Mario. Okay?

PC: Yeah. Yeah.

Auditor: All right. Since the last time you were audited, has anything been invalidated? That reads. What was it? There it is. There again. There it is.

PC: Uh... I don't know exactly what it is. But it has to deal, probably – it has to deal probably with uh... my auditing this afternoon. The auditing I gave this afternoon. I think this was the first time in which I really had pleasure in auditing, this afternoon. And – uh... this is the first time I had the – the feeling that I was doing something and not being told to do something. And even if I made a mistake... And the uh... somehow this evening I didn't feel... This afternoon I decided myself to do something in auditing – the auditing of Ken.

Auditor: Yes.

PC: And uh... I was very sure that things were going to be very good. I mean, an item had been grabbed off an incomplete list and you – I went back and looked at the list and the list still... I tried again the list and the list was still getting tone arm action. So I decided that this item had been grabbed from in the middle of the list.

Auditor: Yes.

PC: So I decided that we should go on listing. And the needle smoothed out very beautifully. And uh... my pc seemed to be bright and cheerful and uh... and tonight uh... somehow I had a kind of a critical subject.

Auditor: Yes. Yes, I understand this.

PC: And I invalidated myself for having done that, for... I'm not wrong, but this is the invalidation.

Auditor: Okay. Thank you, Mario. I got that.

PC: Okay.

Auditor: All right. Just check it on the meter. Since the last time you were audited, has anything been invalidated? Do you agree that's clean?

PC: Yeah.

Auditor: Good. Since the last time you were audited, has anything been suggested? Do you agree that's clean?

PC: Okay.

Auditor: All right. Just check it on the meter.

PC: Yes. I thought – uh... it's still on account of this auditing – a comment – was thinking that we should go on opposing this item that had gone – that had been taken off this – in the middle of this list. And I said, no, I think that we should actually do that – actually, I think that if I must make mistake – if I must make a mistake, it's better for me to make it myself rather than have it uh... I would have more reality on what – the mistake if I made myself
than just being told, "Do that," and then it turns out *mummm* – that it's not the right thing to do.

Auditor: Okay.

PC: Actually, I got uh… quite desperate, because this was my trouble with – when I was auditing Dick. That I was being told, "No, do that, do that, do that." And I got uh… quite miserable. I was given Dick – Dick to audit and I was told, "Do this and do that" and uh… well, things couldn't – I don't know, so – things went sour – I could not audit. And I suggested, I think, to myself this afternoon that I'd rather be mistaken myself than being right when told to be right.

Auditor: I understand.

PC: Okay.

Auditor: Good. All right. Since the last time you were audited, is there anything you have failed to reveal? I'll just check that again, Mario. I wasn't quite sure of the read. Since the last time you were audited, is there anything you have failed to reveal? Do you agree that's clean?

PC: Yeah.

Auditor: All right. Now what we're going to do – have you got a Havingness Process?

PC: I think I have been careful before coming here. Yes, a very strange thing: I have been careful of not protecting you as an auditor here. I decided that if I have anything to say, I would say it. And that this would help you more than if I... trying to – to be – careful as a pc.

Auditor: Thank you. All right. Just check it on the meter. Since the last time you were audited, is there anything you've been careful of? Do you agree that's clean?

PC: Yeah.

Auditor: All right. Now what we're going to do – have you got a Havingness Process?

PC: I don't know. I think it's "Point out."

Auditor: Well, what we're going to do, I'm going to check it. Okay?

PC: Okay.

Auditor: All right. Just give the cans a squeeze. All right. Just put them on the table. Right. Now, what we're going to do is point out something. Okay?

PC: Uh-huh.
Auditor: Here's the first command. Point out something.
PC: This camera.
Auditor: Thank you. Point out something.
PC: This microphone. This one.
Auditor: Thank you. Point out something.
PC: This chair.
Auditor: Thank you. Point out something.
PC: This... business.
Auditor: Thank you. Point out something.
PC: This earphones you have there.
Auditor: Thank you. Just pick up the cans and let's just check.
PC: Thank you.
Auditor: Okay. Now, give them a squeeze. Good. All right. Okay, give them another one please, Mario. Good. All right. Just going to continue this process. You can put them down.
Auditor: Thank you. Here's the next command. Point out something.
PC: This... business.
Auditor: Thank you. Point out something.
PC: This... business.
Auditor: Thank you. Just pick up the cans and let's just check.
PC: Thank you.
Auditor: Okay. That's fine. Here's the next command. Point out something.
PC: The light.
Auditor: Thank you. Point out something.
PC: The column.
Auditor: Thank you. Point out something.
PC: Your brooch.
Auditor: Thank you. Point out something.
PC: This table.
Auditor: Thank you. Point out something.
PC: The door.
Auditor: Thank you. Point out something.
PC: This chair.
Auditor: Thank you. Point out something.
PC: The floor.
Auditor: Thank you. Point out something.
PC: The ceiling.
Auditor: Thank you. Point out something.
PC: This wall.
Auditor: Thank you. Point out something.
PC: This wall.
Auditor: Thank you. Point out something.
PC: These racks.
Auditor: Thank you. Point out something.
PC: This camera.
Auditor: Thank you. How are you doing, Mario?
PC: Okay.
Auditor: All right. Just pick up the cans, please. All right. All right. Give the cans a squeeze. Fine. All right. Just put them down. We'll just do a few more commands. Thank you. Anything you wanted to say?
PC: No. I'm all right.
Auditor: Okay. That's fine. Here's the next command. Point out something.
PC: These wires.
Auditor: Thank you. Point out something.
PC: This chair.
Auditor: Thank you. Point out something.
PC: [sighs] This wall.
Auditor: Thank you. Point out something.
PC: This other camera.
Auditor: Thank you. Point out something.
PC: This wooden handle.

Auditor: Thank you. Point out something.

PC: This door.

Auditor: Thank you. Point out something.

PC: These tubes.

Auditor: Thank you. Point out something.

PC: This table.

Auditor: Thank you. Point out something.

PC: This floor.

Auditor: Thank you. Point out something.

PC: This wall.

Auditor: Thank you. Point out something.

PC: This cover.

Auditor: Thank you. Point out something.

PC: Uh... these, uh... I don't know how you call them, these things where - plugs, these electrical plugs.

Auditor: Okay.

PC: Uh...

Auditor: Did you want to say something?

PC: Did you give me a command?

Auditor: No, I didn't. I'll give it to you now. Point out something.

PC: This E-Meter.

Auditor: Thank you. Point out something.

PC: Uh... these, uh... I don't know how you call them, these things where - plugs, these electrical plugs.

Auditor: Thank you. Point out something.

PC: This wall.

Auditor: Thank you. Point out something.

PC: This wall.

Auditor: Thank you. Point out something.

PC: The books of "Alice in Wonderland" behind you.

Auditor: Thank you. Point out something.

PC: This contraption there. I don't know what it is.

Auditor: Which one?

PC: The round one.

Auditor: Oh. Thank you.

PC: Control thing, I suppose.

Auditor: Thank you. Point out something.

PC: This door.

Auditor: Thank you. Now, Mario, will you squeeze the cans and let's see how we're going.

Okay. Give the cans a squeeze.

Oh, that's fine. All right. Now, put the cans down. I'm going to give you two more commands and then I'm going to end the Havingness. Okay?

PC: Yeah.

Auditor: All right. Point out something.

PC: This collar.

Auditor: Thank you. Point out something.

PC: This wall.

Auditor: Thank you. That was the last command. Is there anything you would care to ask or say before I end this process?

PC: I was able to yawn. [laughs]

PC: Thank you.

Auditor: Pick up the cans. That's fine. Now, what I'm going to do, I'm going to
Auditor: All right. The first one I'm going to give to you and then I'm going to check straight on the meter. All right? All right. In this session, has anything been suppressed?

PC: Yawning.

Auditor: Okay. In this session, has anything been suppressed?

PC: Uh... yes. A certain amount of anxiety. I was a bit uh... I feel freer now than at the beginning of the session.

Auditor: Well, that's fine. Thank you. In this session, has anything been suppressed?

PC: A certain amount of stage fright.

Auditor: Good. In this session, has anything been suppressed?

PC: Telling you that I-I preferred being a pc than an auditor. [laughs]

Auditor: Fine.

PC: And even though I may have had to reveal my withholds and rather be - tonight, you see, I probably would, if I continue liking auditing as I did this afternoon, I will probably enjoy being an auditor...

Auditor: Very good.

PC: ... more than a Pc.

Auditor: Very good. Did I cut you off there, Mario?

PC: What?

Auditor: Did I cut you off then?

PC: No.

Auditor: Okay. Good. In this session, has anything been suppressed?

PC: I don't see any – any more.

Auditor: Okay. I'll check it on the meter. All right. In this session, has anything been suppressed? Do you agree that's clean?

PC: Yep.

Auditor: Good. In this session, has anything been invalidated? That reads. What was it? There it is. There.

PC: Uh... maybe uh... the beginning of the session I couldn't really – I didn't perhaps feel I was very much in-session as I am more now. Maybe that was the invalidation, that I felt that... I'm not sure it is that but I'm telling you the first thing that comes to my mind.

Auditor: Okay. All right. I'll check it on the meter.

PC: All right.

Auditor: All right. In this session, has anything been invalidated? Do you agree that's clean?

PC: Yes.

Auditor: Good. In this session, has anything been suggested? That reads. What was it? There.

PC: [laugh] That I had pleasure in being an auditor on TV. This ... [laughs]

Auditor: Very good. All right. Okay. Just check it on the meter. In this session, has anything been suggested? Do you agree that's clean?

PC: Yeah.

Auditor: Good. In this session, is there anything you have failed to reveal? Do you agree that's clean?
PC: Yeah.

Auditor: Good. In this session, is there anything you've been careful of? That reads. What was it? There. There. There it is. There it is.

PC: Uh... I may – I may have been careful of what I was saying during this session. But – well, I'm not sure. This is what I feel.

Auditor: Okay, well, I'll check it on the meter and if the read's still here I'll give it to you again. Okay?

PC: Uh-huh.

Auditor: All right. In this session, is there anything you've been careful of? Do you agree that's clean?

PC: All right, yes.

Auditor: All right. Okay, I didn't get the same read again, Mario.

PC: All right.

Auditor: All right. Now, have you made any part of your goals for this session? "To feel better at the end of the session?"

PC: Oh, yes. Yes. Yes.

Auditor: Very good. "To go through this..." Oh, that's a life and livingness goal. Okay. That was the only one we had for the session.

PC: All right.

Auditor: All right. Have you made any gains in this session you would care to mention?

PC: Uh... well I don't know if I could say that, but the gain was I was enough of a pc myself to – I suppose this would be protecting your auditor, but uh... I was enough myself a pc and I was willing to be audited and interested in my own case for you to – to be a better auditor at the end of the session and soon after the beginning of the session and really get a gain.

Auditor: Thank you.

PC: And I suppose this is both a gain for you and for me.

Auditor: Thank you, Mario. All right. Now, is there anything you'd care to ask or say before I end the session?

PC: That it is very interesting, to be on this end here.

Auditor: Anything else you want to tell me about that?

PC: I – no, I don't think so. There – there's more of a feeling than – that now I could go on for hours, I suppose. [laughs]

Auditor: Thank you, Mario. All right. Now, is there anything you'd care to ask or say before I end the session?

PC: That it is very interesting, to be on this end here.

Auditor: Anything else you want to tell me about that?

PC: I – no, I don't think so. There – there's more of a feeling than – that now I could go on for hours, I suppose. [laughs]

Auditor: Fine.

PC: But anything else, great.

Auditor: Okay. Anything else you'd care to ask or say before I end the session?

PC: All right. Is it all right with you if I end the session now?

PC: Yeah.

Auditor: All right. Here it is: End of session. Has the session ended for you?

PC: Yes.

Auditor: Okay. Put down the cans and tell me I'm no longer auditing you.

PC: You are no longer auditing me.

Auditor: Very good. Thank you.

PC: Thank you.

LRH: Well, that was pretty good meter reading and – not bad. Pretty good auditing. One thing I'd like to call to your attention is the Tone 40
characteristic of "end of session." Tone 40 end of session is very desirable. There's – was no opportunity for the pc to say that the session had ended for him. Well, you give him an "end of session," and then say, "Has the session ended for you?" And I don't know where this has disappeared out of the lineup. These little things get in and get wrong and get fouled up. Well, we're going to have this next one fairly brief. And then we're going to give you a break and I'm going to talk to you for a few minutes concerning these sessions.

Put on the earphones. All right. I want this session to be fairly brief and I want you to get in just the small mid ruds. You know? Just the four. And bash the thing off in a hurry. Loosen up his needle and change his tone arm position and end it. Okay.

Auditor: All right. Just talking to Ron, here. Okay. Okay. Want to grab the cans? Good. Okay, Stan, I'm going to be – going to be running the small mid ruds and Havingness in the middle. Make this sort of brief, you know. And that'll be about it. Anything you want to say?

PC: No. Fine.

Auditor: Okay. Very good.

PC: Okay.

Auditor: Great. Got any anxieties about being audited in here you want to tell me about or anything like that? You know, anything...

PC: Just physical reactions, that's all.

Auditor: Okay. Good enough. Okay. All right. Is it all right if I start this session now?

PC: Yeah.

Auditor: All right. Start of session. Has the session started for you?

PC: Fine. Yes.

Auditor: Good. Okay. What goals would you like to set for this session?

PC: Um – well, to feel more relaxed.

Auditor: Mm-hm. Any others?

PC: Um – be more in present time.

Auditor: All right. Okay. Any other goals for this session?

PC: No. That's it for this session.

Auditor: All right. Very good. Any others for life or livingness?

PC: No.

Auditor: Okay. Fair enough. Okay, got it all here. Okay... Right. I'm just going to check the mid ruds here. Check suppress repetitively and the rest of it straight on the meter. Okay?

PC: Fine.

Auditor: Good. Okay. Now, do you recall the end of your last session?

PC: That was this morning. Yes.

Auditor: Okay. Good. Well, since the last time you were audited, has anything been suppressed?

PC: I thought of writing a note to Ron, expressing my feelings about –
keep turning all the responsibility over to the auditors. And that's – it's great.

Auditor: Yeah, I didn't get quite what was suppressed with this.

PC: I suppressed writing the note to Ron.

Auditor: Oh, I see.

PC: That it was okay, you know.

Auditor: Okay. All right. Very good. Since the last time you were audited, has anything been suppressed?

PC: Nothing I can think of right now.

Auditor: All right. Fair enough. I'll check that here. (Clean this thing off, okay.) Now, since the last time you were audited, has anything been suppressed? Do you agree that that's clean?

PC: Yes.

Auditor: Okay. Very good. Since the last time you were audited, has anything been invalidated? Do you agree that is clean?

PC: Yes.

Auditor: Okay. Very good. Since the last time you were audited, has anything been suggested? That reads. What was it? There it is. Something you failed to reveal there?

PC: Only thing I can think of is uh… my auditor was taken away from me. She was graduated.

Auditor: Hm.

PC: Doing goals now or something. She's been listed for the B Unit.

Auditor: Mm-hm.

PC: And uh… I was glad for her, but sorry to lose her as an auditor.

Auditor: All right.

PC: I guess I failed to reveal that.

Auditor: Okay. Very good. Got that. Okay. Check that here. Now, since the last time you were audited, is there anything you have failed to reveal? That reads. What was it? There it is. Something you failed to reveal there?

PC: That's why I raised my hand.
There it is. Yeah. There it is. What's that? Yeah.

PC: Uh... a decision I made this afternoon on uh... some new idea on how – on how to organize the data. I don't know who I failed to reveal it to. Nothing comes in about failing to reveal. Except I failed to reveal it.

Auditor: All right. Okay.

PC: I made a decision. I failed to reveal it.

Auditor: Fair enough. All right. Since the last time you were audited, is there anything you have failed to reveal? That reads. What was it?

PC: I get a feeling I'm, uh...

Auditor: Yeah, that's it.

PC: ... suppressing something.

Auditor: Yeah. All right. Fair enough. Let's look for something you failed to reveal. There it is.

PC: Only thing I can think of it would be is feelings about being in front of uh... the group.

Auditor: Mm-hm.

PC: The feelings I had.

Auditor: Yeah.

PC: Feelings I had in the pit of my stomach. I guess that helps – by clearing it now.

Auditor: And you failed to reveal that?

PC: Yes, about that.

Auditor: Okay. Very good. All right, how are you doing?

PC: All right.

Auditor: Okay.

PC: That – that blows some of it.

Auditor: Okay. Good. Just check the question here.

PC: All right.

Auditor: All right. Since the last time you were audited, is there anything you have failed to reveal? All right. I'm not sure about that. I'll check it again.

PC: Every time you've asked this question, my left hand has started to shake.

Auditor: All right.

PC: So there must be something there or there's nothing there but a shaking hand.

Auditor: Okay. Now. Okay, now, since the last time you were audited, is there anything you've failed to reveal? Yeah, I get a read there. Something – another read here. Something you failed to reveal? Yeah, that's it. There.

PC: The thought I got is I feel clear, on failed to reveal.

Auditor: All right. Very good. Okay. Now, since the last time you were audited, is there anything you have failed to reveal? All right. Do you agree that that is clean?

PC: Yes.

Auditor: Very good. Okay. All right. Since the last time you were audited...

PC: Just a moment.

Auditor: Okay, sorry about that.

PC: Okay.

Auditor: Okay. Comfortable now?

PC: Yes. Better.
Auditor: Very good. All right. Since the last time you were audited, is there anything you've been careful of? That reads. What was it? Something you've been careful of?

PC: Well, I've been careful to keep these hands still.

Auditor: All right. Very good. Since the last time you were audited, is there anything you've been careful of? All right. Not sure about that, if it was body here or what. Check it again. Since the last time you were audited, is there anything you have been careful of? That reads. What have you been careful of? Anything you've been being careful of today?

PC: Uh… to do what I consider to be the optimum thing. I mean, nothing specific comes to mind, but from moment to moment that's a decision...

Auditor: Uh-huh

PC: ... of mine.

Auditor: All right. You've been careful to do that, have you?

PC: Yes.

Auditor: Okay. Very good. All right. Since the last time you were audited, is there anything you have been careful of? That reads. Something you've been careful of there?

PC: You get a read?

Auditor: Um.

PC: I just thought my hands start moving the minute you start talking.

Auditor: Okay. Well, we're not getting that same read here. I might have – I might have goofed that. Just check that over again. All right. Just keep them as still as you can.

PC: Yeah.

Auditor: All right. Since the last time you were audited, is there anything you have been careful of? Yeah, got a read there.

PC: Got a read?

Auditor: Yeah. What have you been careful of since the last time you were audited?

PC: Stopping myself.

Auditor: All right. Okay. Since the last time you were audited, is there anything you have been careful of? That reads. What was it?

PC: Avoiding present time.

Auditor: All right. Okay, actually, I didn't quite – I didn't quite – I didn't quite...

PC: Be careful to avoid...

Auditor: Yeah.

PC: ... present time.

Auditor: I don't quite understand.

PC: This moment.

Auditor: Oh, you mean right now?

PC: Yes.

Auditor: Yeah, I see.

PC: No, not particularly this particular moment, but just generally being careful. Since the end of the last session, I've been careful to avoid looking, confronting, being in present time.

Auditor: Okay. Thank you. I got that now. Very good. Okay. All right. Now, since the last time you were au-
dited, is there anything you've been careful of? Do you agree that's clean?

PC: Yes.

Auditor: Okay. Very good.

PC: The hands are still going...

Auditor: All right.

PC: ...but the question is clean.

Auditor: Yeah. Fine. It's clean on the meter; that's all we want. Okay. Very good. Now, we're going to run your Havingness Process. You had – what did you say that was? Point out something?

PC: Point out something.

PC: That board back there.

Auditor: Thank you. Point out something.

PC: Some paper over there. That paper over there.

Auditor: Okay, I got it. Very good. Point out something.

PC: The mirror.

Auditor: Thank you. Point out something.

PC: The table.

Auditor: Very good. Point out something.

PC: The wall here.

Auditor: Very good. Okay. Point out something.

PC: The lamp behind your head.

Auditor: Okay. All right. Grab the cans. Good, okay. Okay. All right. Squeeze the cans. Okay. Very good. Once more. All right. Okay, we'll just run a few more commands of this.

PC: All right.

Auditor: Okay. Point out something.

PC: The chair.

Auditor: Okay. Point out something.

PC: Your sweater.

Auditor: Very good. Point out something.

PC: My jacket.

Auditor: All right. Point out something.

PC: These cans.

Auditor: Thank you. Point out something.

PC: Your meter.

Auditor: Good. Okay. Point out something.

PC: Your sweater.

Auditor: All right. Point out something.

PC: That microphone.

Auditor: Okay. Point out something.

PC: Your – your earphones.

Auditor: All right. Good. How are you doing?

PC: Okay.

Auditor: All right. Good. Just want to check on this process. So grab the cans here, I'll make sure we're working on the right track. Okay. Okay, now squeeze the cans. Very good. Okay. How are you holding these cans here? Have you got – are you holding them all right? Are you gripping them or...

PC: All right, I think.
Auditor: Okay. All right. We don't want to – I don't want you to uh... grip them. I just want you to hold them in a sort of a comfortable position, you know? Okay, that looks fine. All right. Now squeeze the cans. Okay. Very good. All right. That seems to be working fairly well. It's, ah, increasing our drop so we'll continue this for a bit. Okay? All right.

PC: Okay. I'd like to move the chair, just back a wee bit.

Auditor: What seems to be the matter?

PC: It's just my feet are too tight.

Auditor: All right. Just move back a bit. More comfortable there?

PC: Yes.

Auditor: Okay. Good. Point out something.

PC: That microphone.

Auditor: Thank you. Point out something.

PC: Your face.

Auditor: Good. Point out something.

PC: My face.

Auditor: All right. Point out something.

PC: My hands.

Auditor: Okay. Very good. Point out something.

PC: The seat of this chair.

Auditor: Okay. Point out something.

PC: The back of my head.

Auditor: All right. Point out something.

PC: The wires on the floor.

Auditor: Very good. Point out something.

PC: The lapel to my jacket.

Auditor: Okay. Point out something.

PC: Your shoe.

Auditor: Thank you. Point out something.

PC: That piece of equipment over there.

Auditor: Yeah. Okay. Good, point out something.

PC: Those books over there.

Auditor: Okay. Point out something.

PC: My back.

Auditor: All right. Point out something.

PC: These two tables.

Auditor: Very good. Okay. Let's just take a look at that can squeeze now. Pick up the cans. Good. Okay. All right. Okay, squeeze the cans. Very good. Okay. Okay, that was the last command in that process.

PC: Okay.

Auditor: Good. Anything you want to say before I end it.

PC: No.

Auditor: Okay. End of process. Very good. How are you doing?

PC: All right.

Auditor: Good. How does the room look to you now?

PC: Better.

Auditor: Good. Okay.

PC: More here.

Auditor: All right. I just want to make a note here. Then we'll be on our way. Let's see... Okay. Very good. All right, we're just going to go straight into the uh... goals for the session. Do you feel you made any part of your goals for the session?

PC: Well, I feel more relaxed.
Auditor: Good.

PC: And let's see, more in present time.

Auditor: All right. Yeah, "to be more in present time."

PC: Yeah, I'm more in present time.

Auditor: Oh, very good. All right. Have you made any other gains in this session you'd care to mention?

PC: No.

Auditor: All right. Okay. Very good. All right. Is it all right with you if I end this session now? Oh, pardon me. I forgot: is there anything you'd care to ask or say before I end the session?

PC: No.

Auditor: Okay. All right. Well, is it all right with you if I end this session now?

PC: Yes.

Auditor: Okay. Here it is: End of session. Has the session ended for you?

PC: Uh-no.

Auditor: All right. End of session. Now has the session ended for you?

PC: Yes.

Auditor: Very good. Tell me I'm no longer auditing you.

PC: You're no longer auditing me.

Auditor: Okay. Thanks very much, Stan.

PC: Thanks, Wally.

LRH: Okay. Take a five minute break and I will – and then get back in your seats – and I will talk to you. Actually, better be back in your seats in eight minutes.
DISCUSSION OF DEMO SESSIONS

A lecture given on 13 February 1963

Let's take a résumé now of these sessions we have just seen. And the reason I'm at this particular angle is I'm looking at a camera which is on the next floor above me. This is pretty good.

Well, now, looking at our X Unit – looking at our X Unit as a whole, they're going along all right. They're going along all right. But their Practical definitely needs buttoning up in meter reading. Meter reading is very, very poor. And you can't live with meter reading as bad as the meter reading tonight. I don't mean to knock everybody in the head on it, but that – that's pretty – pretty bad show, as far as meter reading is concerned.

In actual fact – I know that's terribly condemning, but in actual fact you must realize – you must realize that just one, just one missed read, just cleaning one clean, knocks the pc off his stride. And missing one read leaves the pc with a missed withhold. And it's not good. It's not good. It's the direction of worsening a pc.

So you've got to get along a little better on this meter reading, that's all. You've got to brush it up. And I'm asking you in Practical to give a lot of attention to that. Because I won't even start to add up the number of missed reads tonight, because they were quite large.

All right. Now let's take these sessions up in detail. The first session, Eleanor's session: Now, her presence was pretty good. She seemed to be a little bit nervous and possibly we could assign that to TV. But in actual fact, that presence can be smoother and more assured and more confident. And I'd like to see it so. That isn't a good Saint Hill presence yet.

Now, there's a piece of missing data here. And that's how you use Protest in any mid ruds. You don't swing over to the Protest button and say, "Since the last session has anything been protested?" What you do is ask the pc – and this is just random, anywhere – when you maybe have cleaned a clean or done something – and then you get a read, and it doesn't seem to be going well – you want to ask the pc, if it doesn't seem to be going well, "Has this question been protested?" That is the whole wording of it. "Has this question been protested?"

Now, that you'll find is quite enough. And the pc'll say, "Oh, ha, yes!" You know?

And you'll say, "All right. I'll check the question again. Since the last time you were audited has anything been protested, or anything been... suggested," or whatever it was you were on.

Let us say you were clearing Suggest – "Since the last session has anything been suggested?" – pc can't seem to grasp this and you do have a bit of a read. And he doesn't seem to get across with it. And you're questioning maybe your own meter readings. You're not quite
sure what it is. And *in extremis* – you don't do this with every question, you understand – but the way you use that, you say, "Has this question been protested?"

And the pc says, "Ha-ha, yes! yes!"

You say, "All right. I'll check that again. Now, since the last time you were audited, has anything been suggested?" And it doesn't read. So obviously, it was the protest that was making it read.

You recognize that protest is the reaction – invariable reaction – when you have cleaned a clean or messed up on your mid ruds. You're asking him for one more than he's got. Well, his answer is to protest. And you get a read then. But the read is on protest – the read is not on the question.

And I heard a story – possibly not true – but nevertheless I did hear it. They were spending two hours and forty-five minutes at end of session, trying to clean up the question "In this session, have you protested the E-Meter," or something like that – some such question. And this went on for two hours and forty-five minutes. Well, the fellow was protesting the question because he didn't know that that was the name of the instrument that was on the table.

Now, that's a classic! But there's your answer. There's your answer, that protest is the thing that makes your mid rud buttons read when they're not supposed to be reading. And when you clean cleans and miss reads and all that sort of thing, after a while the pc gets into a protest. And you better clean it up for the question. Don't clean it up for the session or swing into your Protest button.

And then you take your Protest button in its natural sequence, just as before. "Since the last time I audited you has anything been protested?" That's that.

Now, supposing you can't clean that up. And somehow or another we just can't seem to get that clean. Well, we say, "Has this question been protested?" And the pc says, "Yes," so you say, "Since the last time I audited you, has anything been protested?" No read, you say, "That's clean." The test of it is, is did it stop reading?

You should realize also that a pc will suppress things like "suppress," and the rest of that. But that is not as common in actual fact as protest. Natural action of the pc when you've done something bad with the meter is to protest.

Now, the Tone 40 end of session and beginning of session here – got to be picked up. You don't shout at the pc or you don't speak at the pc – you simply get it in positively. It runs something like this: "Is it all right with you if I begin this session now? All right. Here it is: Start of session!" Good monotone, louder, more positive and Tone 40 and wrap it right around his head. And then drop back to a natural tone of voice.

Now, sometimes by shouting too loudly, you put the pc in a complete state of defense. So, you must realize that. It's Tone 40, it isn't the shout. And you end the session the same way. "Is it all right with you if I end this session now? All right, here it is: End of session!" Not "Is it all right with you if I end this session now, all right, end of session." Nothing happens!
This technology, by the way – of how you start and end sessions – comes out of many older things. It – a period of auditing track. An auditing time track is an artificial track. And the pc is actually in a slightly artificial state. You actually put him in that state with your "Start of session" and your "End of session."

Now, maybe the pc in this first session improved – maybe the pc didn't. I don't know. All in all, that sounds, Eleanor, like I'm giving you a very bad time. I'm not. I'm not, there is hope! There is hope. And I'm just asking you to bear down hard on your meter reading – and pull up – pull up your – your Tone 40.

All right. Now let's go to the next session. This was Vickie's session, and I found her presence very good. She will make a good auditor. She thought that she had been ruined completely as an auditor by the course a short time ago and in actual fact she'll find out that she has not been ruined now and that her presence can get even better than it is. And it's very good. She'll make a very good auditor. And the same remarks about Tone 40 definitely apply to Vickie's session. Good heavens, you don't start a session with "All right with you if I begin this session, all right, start of session." It... not hing happens, you see. No, you've got to come down on that. That is a special moment. And you get your Tone 40 up.

Now, your meter reading wasn't too bad, but you did something very peculiar. You know, when a pc is laughing and happy and cheerful and bubbling all over himself – the day I get in end rudiments has not yet arrived! Because you're in... reinteriorizing him back into the session. Very shortly there's going to be a shift, you know, where goals and gains are picked up and run before Havingness. You'll find out that works much better.

But here is a – here's a case in point. That pc is perfectly happy. You didn't have to get in any end rudiments – just end the session.

Now, definitely the pc was improved. That was registered on his tone arm. His tone arm was at 2.5 and at session end his tone arm was very much closer to his Clear read. And the pc was improved. There's a lot of hope for this particular auditor.

And now the last session, Wally's session. And I considered it a bit informal. I think that the auditor presence there was a bit informal. That presence can be greatly improved. There's nothing wrong with the auditor's address to the pc. It's just that the auditor ought to look a little more precise.

You know, they start in, in an Academy being stiff as boards. And then they come out of it – and they get less formal, less frozen. But you know, you can go too far. And it seemed to me like that has gone just a little bit far. So be just a little more formal in your auditing and it'll be okay. But you have good warmth and good presence with regard to the pc – so don't take what I'm saying here too seriously. It's mostly your TRs could be improved a little bit.

Meter reading was fair – but only fair. And I want to point out something to you. Did you see that pc put his head down? Your pc put his head down. "Duh!" he went. Did you see that? You know why the pc did that? And later on while you were getting in your beginning ruds the pc said he had suppressed something. Well, when you left Suppress, it was reading like crazy. He had a read on Suppress and he had a read on Invalidate. And by the time you
got across Suppress and Invalidate – and asked him a Suggest – he was down like this, boom! That's because you'd missed two things.

Now, that read on Invalidate was so tiny, as to be almost undiscoverable. But it was there! Now, the read on Suppress was quite bold. In other words, when you see a pc start in fairly bold and brash, and then all of a sudden go, "Well, thya-thya-thya." And you get less, and so on. Yes, you must have goofed up your meter reading – you must have done something. Because theoretically he ought to get brighter, not darker! You see what I mean? I was using that term slangly. It was... isn't that he would get dark in the face – but he just sort of goes, you know, "Well, so-and-so, so-and-so, so-and-so" That's what happens when you do bad meter reading.

Now, once more, the pc's end of session here was better handled than in the other sessions. But nevertheless, this Tone 40 start of session and end of session was pretty lousy – pretty lousy. However, the pc was more relaxed and felt better at the session end, which was a good win. And I think that was very fine.

Now, let me give you something that you're missing completely. There is a very formal way that you run a session. And the first thing you want to know about this session: Is the pc under your control in any way? Well, the way you do that is you place the pc's chair. That is your action. Now, if you want to go a little bit further – you would start it in, "Is it all right to audit in this room? All right." Your chair, so-and-so and now your can squeeze and now your R-factor. And it goes in that particular sequence.

Now, actually I use it in this sequence – and I think you'll find it outwork better from the practicality that the pc is sitting down. You say, "All right, your chair's all right" or "Bring your chair forward" or "Put your chair back" or actually seat the pc in his chair. But make sure that you adjust the pc's chair. That's a trick. That puts the pc a bit more under your control.

And then you ask the pc if it's all right to audit in this room. And he says yes or no and so forth. And – you needn't particularly clean this on the meter. But a very edgy pc – I do clean it on the meter. I know we're not auditing yet. But that's all right. I take a look at it. "Is it all right if we audit in this room?" It goes bang! Like that.

"What's the matter with this room?"

"Oh, well, it's so-and-so." We clean that up so we haven't got that falling over. And then we get a can squeeze – that's to make sure that the pc is connected to the meter. That's why we get that particular one. And it also gives us a look into his havingness.

So, we give him a bang – a can squeeze, and then we put in our R-factor and then we say, "Is it all right with you if I begin this session now?" and you give him a Tone 40 start of session. Now you ask him, "Has the session started for you?" And the pc says yes or no. And if the pc says no – you give him another start of session just like you did before. And you ask the pc if the session started for him. And the pc says no, actually it chops up the pc pretty badly to now say, "Well, we'll take it up in the rudiments," and so forth. That is apt to chop the pc.
If the session hasn't started for this pc in two starts, it'll normally be that something is wrong with the room. You understand? Or the pc is trying to tell you something. So by asking the pc if the room is all right you've gotten rid of that one, so your session is very likely to start. And when you give the pc a start of session – it didn't start for him – and you give him another start of session, and it didn't start for him – you better ask the pc if he's thinking about something. And give it to him again. That is actually a kinder way to go about it.

So much so, that you can count on the fact that there's either something wrong with the room, or the pc is withholding something – or he's got something to tell you – and he's holding his breath waiting for you to say, "Start of session" so he actually doesn't hear the start of session.

And he says, "Well yes, I've been sitting here waiting to tell you, I think my goal is 'excelsior!'"

And you say, "Heh! All right! Good enough. All right. Well, I got that now. Now here it is: Start of session." And off we go. "Session start for you?"

"Oh, yes! Session started for me."

Do you see what I mean? The two reasons sessions don't start is the room is lousy, or the pc's trying to tell the auditor something – is holding it back, waiting until the session starts so he can say something, you see. Unless you release those two valves there, you're not going to get a session started.

Now, here's another good point in all this is, your session is ended or it isn't ended. Now, I've been experimenting lately and I find out getting the goals and gains and what the pc has to tell you as you go there, then end the body of the session and then get your can squeeze and then run your Havingness and simply give the pc an end of session. Your pc is more exteriorized from the session than otherwise. That's... will be coming out here very shortly in a bulletin.

I've been experimenting with that and life and livingness. And I find that life and livingness goals are of use to tell you if a pc had a PTP. And that was the original reason they were used, and we no longer care about that. We're handling PTPs with other processes. All right. So if you don't need those for a PTP, realize that they actually exteriorize the pc from that session.

In other words, he's there to be audited, you ask him what goals he'd like to set for life or livingness, he instantly thinks of all of his PTPs – and you've got more PTPs to handle than you had before. You find out that will be omitted in your next goals Model Session rundown.

In other words, he's there to be audited, you ask him what goals he'd like to set for life or livingness, he instantly thinks of all of his PTPs – and you've got more PTPs to handle than you had before. You find out that will be omitted in your next goals Model Session rundown.

Now, therefore, the optimum way to start a session is – ask a pc to sit down, adjust his chair, ask him if it's all right to audit in the room. Whether you clear it on the meter or not I don't care. Most pcs will take it, but some of them object to it and there's no particular reason to carry on with it over an objection. Then get your can squeeze, put in your R-factor, start your session, get your goals and gains, and look to see if that tone arm is where you left the pc in the last session. Because if it isn't you're going to have to get in your mid ruds. "Since the last time I audited you..." If the tone arm is at the same place, don't bother. You understand the use of this? And you just go into the body of a session.
Now, get your goals and gains at the end of the session. Close the session. Get your can squeeze. Run a bit of Havingness and end your session. And you'll find out that'll save you an awful lot of session time.

Now, I wanted to look at this tonight to see how you were going and what you were doing. And it seemed to me that the worst faults here were simply the Tone 40 – lack of use, the no precise procedure on starting the session and the meter reading. And the meter reading was terrible. Really, that meter reading is just too bad to be borne.

However, you're making progress. And we know that this is better auditing than you have been doing – and this is better auditing than is done in the field – but it's not good enough for a Saint Hill graduate. So improve your presence, get your formality in and square it around.

You realize that an awful lot of your auditing gain depends on the pc's confidence in the auditor. And the pc's confidence in the auditor is born by the auditor doing those things which gives the pc confidence. Not necessarily doing the same rote thing, but doing things competently, talking to the pc competently, handling what happens competently and carrying it on through and remaining in control of the session.

Now, I think we ought to give the auditors a hand here. Would you do that? ...

Thank you. Thank you. And now let's give the pcs a hand. ... Thank you.

Now, there are many, there are many pitfalls along the way in this universe. There are many sad moments. There are many times when your luck is out and you're absolutely down, and you've been assigned to TV demonstration. It's all pretty horrible – but it feels awfully good when it's all over. Because you realize that you have actually put up a presence and put up a mock-up and nobody has shot you absolutely dead. Now, don't think that I've been trying to shoot you down in flames, I'm trying to help you be a good auditor.

So thank you very much, and carry on now with a very... better session presence, a better Tone 40, better meter reading. Let's get those things improved. And let's get some good gains and some good wins on these cases. We've got terrific processes – all they need is application. So let's get it done.

And thank you very much, and good night!
Okay. Here we are on 14 February. I think it's Valentine's Day, isn't it – 14 February AD 13, Saint Hill Special Briefing Course, lecture number one – just be one lecture this evening.

This is a lecture about 3MX. 3M, it has become, and I think it's extremely amusing that you've got a tiger by the tail called Routine 3M, because this tiger is going to surprise you very much. This is a very precise tiger and the only way you can make this tiger go the wrong direction and do the wrong things and upset things in general is by failing utterly to do the usual and to do what you're supposed to do.

Because the first time you do something wrong with this tiger he's going to claw you and after that he's not going to behave well. The – I'll give you an example.

Now, on a source list, you say, "Who or what does the goal, so forth, oppose?" or "the goal-ing oppose?" or "somebody or something..." doing the goal or with the goal, whatever it lists. The first time you get that out to the end there and grab an item off that line and try to do something with that item, you're going to find yourself in very, very interesting condition, providing you pick up that item, call it a terminal when it is an oppterm and then oppose it.

All you have to do is make a goof just once on a wrong way to or pick up the wrong item or do something like that, and all you've got to do is do that just once and after that the rules don't come off well. In other words, it allows you just one goof. And that's too many.

In other words, if you find the item, "a tiger" on this goal "to be a tiger" and you find the item, something like that, off this goals oppose list and then you say, "Well, obviously, if it's 'to be a tiger,' heh-heh-heh-heh-heh, 'to be a tiger,' why, naturally, that's a – that's a terminal. Naturally. It's the terminal."

Ah. That is the auditor auditing by significance. And you don't audit by significance, except to this degree. If he's got a goal "to be a tiger" his first terminal is not going to be a tiger. Think of that. It's interesting, isn't it? It's going to be "somebody who is terrified of tigers." It's going to be "somebody who runs very fast." It's going to be "somebody who is allergic to cats." That's going to be the first item up. And that's going to be his terminal. To that degree, you're on the right road with significances but technical tests, that is to say, precision tests, should be made on that first one. Just because you listed goal oppose, don't think you're going to get an oppterm. You're not. You may get a terminal. You may get a terminal or an oppterm.

And all you've got to do is take just that one thing, the one thing, and list it wrong way to and after that things don't fit together. Now, that means this: It means that you've done a
wrong way to, you find an item – oh, yeah, that first one will be all right. That's what fools you. Yes, it's the last rocket reading item on the list, taken from the source, "tiger," and then you take that as your reliable item, the last one on the list, rocket reading. Everything is fine and you oppose that and you list on down and you might get that one. You might get that one. Pc's starting to look rather green or purple or pink or black or something like that, but don't pay any attention to that. No auditor does. Pc starts turning some weird color, don't ever inquire! Just plow him in.

Now you've gone that far, you've gotten your next RI, that's your second RI, and then you list from that and you come up with no item. You go "ah," and it just disappears into the blue. Now you're in a scramble. Now, you say, "Well, maybe if I continued the list of 'Who or what would a tiger oppose?'" So you do, and the pc gets a very coal color. He gets... looks like a coal man who hasn't bathed for three or four lifetimes but, so on. And you do, you find another item and you oppose that and he'll wind up with no item. The list just – you've got a couple of rocket reads on it. And so then you decide, well, "Maybe I'd really better oppose this 'tiger' further." But now you get nothing but R/Ses. Now you go back and look at the goal and it's doing nothing but R/S – if it reads at all.

The pc is in pretty bad shape. Things are looking very grim. And finally lightning strikes, you get the tremendous idea, "I wonder if 'tiger' was opposed wrong way to?" All right, so you take "a tiger" now, and you treat it as an oppterm, which is probably what it should have been in the first place, and you list it out and you keep on going.

You'll get someplace. You'll go on and on and you'll get items and you'll fit them together. But you've upset the frequency of that section of the GPM. You've upset its frequency. In other words, you've messed it up to the degree that for a while nothing is going to settle down. And you're going to keep having lists which don't have items on them and then having to extend some other list to get an item and then wondering where that appears. And then doing a goal oppose again and wind up with another item and wonder where it goes on the line plot, and oppose that. And it's just hunt and punch from there on. Now, you get the trickiness of the situation? It's very tricky.

Therefore, I advise you to keep a very, very strenuous eye on the pc.

Goal oppose. All right, you've seen this goal rocket read, everything is fine, so you're going to list it out. "Who or what would the goal oppose?" All right. Pc can be expected to turn a little bit black on that. I wouldn't worry about that. But when you take the item which you get then and you take a very high-toned item associated with the goal and you say that's a terminal, and therefore run "Who or what would this reliable item oppose?" when it was actually an oppterm, you'll find the pc starts getting black or green or some other color, he discolors. He definitely goes down. He starts looking older, your needle gets tighter, and a lot of other undesirable things happen.

Now, when you notice that, you go back and start listing it right way to. Don't find an item. Don't find an item. Don't keep going in some bullheaded fashion. Just, just knock it off right there and list the thing right way to. And all of a sudden, why, it's running better and your needle loosens up and things look a lot better, and it'll come out. And if you've gone that far, you won't upset the GPM. See? You won't upset its frequency. Then you can go on get-
ting lists where the rocket reading item which is last on the list is the rocket reading item that you want and oppose that properly and so forth and it'll go off like clockwork.

Well, how critical is this? If you find the wrong item on the source list not knowing that the item can appear anywhere, you take... you don't complete the source list and then you take a rock slam that appeared on the end of the source list, even though there are rocket reads up and down this source list – you take this rock slam and you oppose it – you have upset the source list. That list is now upset. What are you going to do with this list? Well, you just have to somehow or another fumble through.

How do I mean upset? Well, the funny part of it is, is your efforts to complete it are difficult. You get odd phenomena occurring, such as something that rocket read when it went down on the list now rock slams. Little oddball things occur.

Now, you can always convert a rock slam into a rocket read if it's been a rocket read in the first place. In other words, you saw it go down as a rocket read. Some drilling – big mid ruds – on the item will turn it back into a rocket read. That isn't true of all rocks slams. You can't do big mid ruds on any rock slam and turn it into a rocket read. But you can take something which you saw as a rocket read which has become a rock slam and turn it back into a rocket read.

What I'm trying to tell you is – is, be awfully sure of what you're doing, and don't go plunging on and on and on, multiplying error after error after error, just because you're supposed to look busy and look like an auditor. You be sure of what you do before you do it. And it's far better just to sit back and give the pc a break and look it all over, doesn't look good to you, go ask somebody, get in touch with somebody, or if you're in some far reach of the world, suspend the auditing intensive until you contact Saint Hill or something like that.

It's far better for you to do that than to keep plunging on, on, on, on, do something new. You know the big mistake you can make with 2-12A is you couldn't find a big rock slamming item, so you did another list. So you couldn't find a big rock slamming item so you did another list. So you have a new source list. So then you did another source list. So you couldn't get anywhere there. So we did a new source list and then we abandoned that and we did a new source list. You see, that's just got to do, got to do, got to do, got to do, on and on and on. And I'm telling you, you can upset everything by doing that.

No, find out where you are before you go on. Your error is always earlier. You always got an earlier error. And a new action does not fix up this other error. See, you can't do a new action that repairs your old blunder. And that's true of both Routine 2 and Routine 3.

If something goes wrong, then it's something earlier that is wrong. And you're not going to repair it by doing something new. Do you understand that?

I'll give you a hypothetical situation of what could happen. You get this person's goal, that's fine. We know how to get goals, that's easy. At about the fourth item, fourth reliable item, we find using Routine 3... I received a most remarkable cable, today, by the way, a dispatch, rather. Somebody said that they had read the bulletin about canceling out Routine 3-21 and were in terrible condition because they had a clearing co-audit, and now didn't have anything they can do.
Give you some idea of how people don't read bulletins. It goes on to say that you convert the case at once and immediately, using the old goal, starting from scratch. You convert the case right over to Routine 3M. And this particular person who was trained here, he actually didn't bother to read the rest of the bulletin. He just went into a panic. And this tells him right there, just convert it. But that, aside from the fact, it shows you how people don't get points that are right there in black and white, or red and white. So you can count on the fact that this point will be missed.

Let me give you this hypothetical case, now. Four items deep, and everything starts running wrong. They do lists; all of a sudden there are no rocket reads on the listing. That's one of the things: no rocket reads, only R/Ses. They go back and look at the goal, it is now R/Sing. Not rocket reading, it's R/Sing.

They keep running out lists and they go totally dead. No item appears on these lists. They all have items on them when they're written down. But you read these items back to the pc – gone. You may find the first R/S on the list is now R/Sing, although there are fifteen RRs followed it. You know, this is all random stuff, see.

Well, that doesn't mean anything is wrong with the technique, that means something has gone wrong earlier. And now look, hypothetically, you could go on and you could find item after item after item after item, straight down the line, one after the other and try to patch it in and go back and oppose – get the goal oppose again And get a new item and then try to go down the line and try to push on out and try to keep going and keep going and going and going and then you're gone to hell, man. Because there's no way of straightening it out.

Now, after a while you can't tell what's an oppterm, what's a terminal, what's the package, what confronted what and the pc is sitting there saying, "What the hell? What-what-what – goes up against what? Which is who? Where – where is it?" And he's sitting there and he lists like mad and then you run down the list and there's nothing on it, so you extend the list and eventually something appears on it and you take that and oh, God! He... after a while he doesn't know what opposes what.

No, your goof is earlier. And there is no additional action which you can do to repair the goof. In other words, there isn't a new technique which you now do if the thing isn't run according to textbook. The reason it stops running according to textbook is you have done something wrong. One of the earlier items found is wrong. You understand that? Something has been grabbed wrong off of the list.

I'll give you the chronic errors. Didn't list the tone arm action out. Left tone arm action on it. Didn't go twenty-five items beyond the last R/S or RR. Grabbed a terminal and used it as an oppterm or grabbed an oppterm and used it as a terminal, in other words a wrong way to listing for your next item. And those are the commonest errors.

Now, in view of the fact the fellow's in the GPM and he's pretty confused, and you ask him if something is a terminal or something is an oppterm, he's liable to do the most remarkable things. He's liable to tell you the terminals are oppters and oppters are terminals. And actually, your mass test, you say it – the best wording, by the way, is "Who or what would oppose?" – just give him your question that you would use on the top of the list. And ask him...
if more mass turned on with this one, or "Who or what would ___ oppose?" other way to, that, ask him – read that to him two or three times, ask him then if that turned on more mass and then take the one with the less mass. That's all very well as a test, but sometimes he can't tell.

Well, a very, very gingery [gingerly] test listing can ensue. But in view of the fact that Routine 3 loosens up the needle, you're not going to see much needle tighten. In other words, that needle can tighten up enormously without your noticing it. That's one of the bugs. You have to look at the quality of item he's putting down.

You've – he's consistently had as his terminal "a skunk," "a bum," "a tramp," you know, that sort of thing. And that's the type of listing he's doing, you see? And all of a sudden he starts listing this next one as, "a high society swell," "a moneyed person," "a very cultured gentleman." Well now, it's bad for an auditor to get too significant about this sort of thing, but boy, that kind of thing, you see, he's listing for terminals. You call this thing an oppterm and he's listing for terminals. Actually, he's putting oppterms on the list. These have always been oppterms for him and it doesn't look right. It's a wrong kind of item he's putting down.

You should get suspicious. And start looking very closely at his face. Is he darkening up? Your next thing – your next thing is, is the tone arm action. Is the tone arm action less?

Now, the next thing you want to look at and ask him: "Is mass drawing in on him?" Because if he's listing wrong way to, the mass comes in, the mass comes in, and he has a hell of a time trying to keep the question in his mind. By the way, he can't remember, usually, the phrasing of wrong way to items. He can't keep the question in his mind as he's trying to list. In other words, listing is very difficult for him. And the more he lists, the more he's getting this mass. And in comes the mass, closer and closer, further and further, tighter and tighter. That's... he'll tell you about it too.

But with that, you will gradually see that your needle is not very responsive, you're not getting much action out of this, there's not much tone arm, the pc is getting darker in color. There are these very specific tests to look at. And remember, the first wrong way to list will behave like the textbook. You'll get your item as the last RR on the list. You'll have RRs; it will be an item. The pc will have reality on it as an item. You get the – you get the liabilities here? So it's a touchy situation. Which way to are these items?

I've given you how to – how to get around it and I've told you what happens if you don't get around it. You've got to always go back to where you did it wrong and now do it right. And something will happen and the case will straighten out and feel a lot better.

Well now, if that's all the tests there were, and so forth – we've left this to a large degree to the auditor's observation and we've left this to the pc's statement and so forth – and if all these things were wrong, you still might get a bad judgment on it. Fortunately, there's a mechanical test which is the proof of the pudding. Let's say you found three items and you're listing and everything goes into the blue. You don't get any item on the list. Well, you know something now is wrong way to. That's what you know. That one of the things you've grabbed... Even though the pc said, "Yes, I have always been a 'paragon of virtue.'" See, and that was the goal, "to be virtuous." "A paragon of virtue. Always have been." And so you said, "All right, his goal's 'a paragon of virtue,' so I'll list it and fine and everything is fine." And you've listed it as a terminal. No, I'll tell you, in the last stages of the goal, in the first
items which you get on the pc, "a dirty, betraying, rotten skunk that would cheat anybody" is far more likely. In fact it's probably the item.

Well, you – you go back to this thing and you say to the pc, "Well, I'm going to list this 'paragon of virtue' as an opptermb, now."

"Well, you already got an item off of it."

You're liable to get an argument. See, Routine 3 makes them better so much faster you don't have the real satisfaction of an ARC break. They just get a little bit cross sometimes, so they feel a little bit cross or misemotional, and they really don't even bother to take it out on the auditor. They just feel kind of nyah! And sometimes won't even express it.

So you say, "I'm going to do this the other way to. Now, we're going to treat this 'paragon of virtue' as an opptermb. Who or what would oppose a paragon of virtue?" Well, pc will list it and it lists like a streak of light. And it goes right on out and you find a new terminal. What do you do with these other two? Oh, well, don't upset the pc about them. Leave them on the plot. They undoubtedly fit in. But it's going to change everything, so you don't use them again. Have you got that? You just set those aside. Don't use either one of them. Because they'll give you trouble.

You take what you get from the "paragon of virtue" right way to, and you oppose that, but remember, it again – because you've upset the bank – isn't necessarily a terminal that you get off of that. You're liable to wind up with another opptermb, see. So from there on you've got to be careful. You've got to be more careful than you would be if you did it right the first time.

The difficult Routine 3 is the Routine 3 that is started wrong. We've already had a case out here, the source list... the auditor actually opposed a rock slamming item when there were RRs on the list. Well, that case isn't going to behave exactly according to the book. It's somehow or another – here and there, you're going to follow the twenty-five rule, and go back and find there's no item on the list and have to extend it another twenty-five and then find an item that sticks in. You get the idea? The exact pattern has been upset by the wrong action, so now be alert.

Now, the only thing that's going to happen is, is things aren't going to start appearing early on the list, it's going to have to be that the lists are longer. And sometimes they dead-end and sometimes you have to go back and list something else further, in order to get a new RR, or have to go back and get goal oppose, a new goal oppose list. You can always do that. It's very interesting. Every time you do a goal oppose list, weirdly enough, you wind up, intimately and directly... So here's some of the saving graces I'm going to give you here now. Everything is going to hell and you can't figure out which is right, and which is wrong, and what you did wrong and you can't figure out anything – you're shot. You – you're sitting there picking up pieces of paper helplessly crying as the auditor, don't you see? Pc is getting mad and everything's going to hell in a balloon. You can always do a goal oppose. And you will wind up with the next item, opptermb or terminal.

That's very amazing. I'll give you an idea of it. You've just done – you've just done a list which would come up with "Coventry" at the end of the list. Well, if you suspend that list
just before you got the item and did a goal oppose, you would come up with the item "Coventry" on the goal oppose. Interesting puzzle, huh?

Now, the funny part of it is if you've got "Coventry" and it is not opposed – and here we'll move into the next one – if you've got "Coventry" as your last item and you do a goal oppose and you haven't opposed "Coventry" and the only item there that's to come up – you're liable to do a goal oppose and come up with "Coventry." That's quite interesting.

In other words, you apparently could do this fantastic thing – this is only theoretical – you could say, do a goal oppose list and oppose it; you know, oppose the RI that you get. Of course, that item's liable to appear anyplace on a goals oppose list; and oppose that. See, do a goal oppose list, find a nice RR item, not two RRs or two R/Ses there, and then oppose this reliable item that you get. And then not oppose that, but go back and do another goal oppose list and you'll come up with the next item. And then oppose that and then go back and do a goal oppose list and you'll come up with the next item, and you can oppose that. Get the idea?

But if you oppose one of those things wrong, the bank will be upset and your goal oppose list will go a bit awry. But you can still go back and always do a goal oppose list. You got that? That's pretty good, isn't it?

Let's give you another solution to this situation. You have one of these on and on and on characters, see? Or you're supervising somebody who is one, see. "There is no action that I should repair; I should always do a new action." You know, you've had this. And the guy finally... he's... there's something backwards somewhere, there's something he should have said, "oppose a tiger" and he said, "Who or what would a tiger oppose?" you see, wrong way to.

And the thing has gotten into a mess and he's done another goal oppose and now he's not quite sure which of these channels to use and so he's just used both of them and he finally winds up with eight items and they don't quite fit because he's invalidated some of them, because he's gotten them by extending lists.

He ran a list all the way out, don't you see, to an RI and he got that RI but it doesn't fit now, or something, he thinks, is wrong and they can't figure out where it goes, so they go back and extend another list that they've already found an RI on, don't you see. They'll come up with a new item. And they think that invalidates the RI they'd already found on the list, which it doesn't – just because the thing isn't firing now is no reason.

So they've taken this new thing and the guy is sitting there with about eight items and you don't know what they oppose and you don't... what opposes them, or where they fit in relationship to each other. You've got a puzzle on your hands and it's a mean one. Because the pc is pretty upset. He can't figure it all out.

You see, you told him – you told him, you see, that a hangman opposed a judge. You've told him that and now you've extended the list out and you've gotten "chopping block." And he thinks, now, "Let's see, would a hangman oppose a chopping block? Judge would not oppose a chopping block, but neither would a hangman oppose a chopping block. And a hangman hangs people and the chop... And I ... " He doesn't know.

What you've actually done is found two consecutive terminals or something like this, don't you see. And you probably now have three items on the terminal side of the line plot and
you've got maybe one item on the oppterm side and he's trying to take two of these terminals and make oppterms out of them, and package this up, and he doesn't know which way he's going. He's having a hard time.

Here's how you straighten it out. You take these eight items and you give each one a brief Tiger Drill to see what fires. And you say, "Yes, well, they... what fires, they've all been opposed so none of them fire." Ha-ha! The wrong ones will fire.

The ones which have not been opposed will still fire. It's interesting, isn't it? You can still make them R/S. Even though they've been listed and you found an item from it, if it was all wrong and backwards or something of the sort, and it wasn't done right or the list was incomplete, you're going to get this weird situation where the thing is still firing.

So you go back and you take these eight items, you tiger drill each one in turn and you see which one fires. Then you determine whether or not that is a terminal or an oppterm and you oppose it, and then you determine whether or not the result is a terminal or an oppterm, and you oppose it. And then you determine whether or not the result is a terminal or an oppterm and you oppose it. And you'll get one of these 2-12 four-way packages. And that will box. And it'll give you something to go on.

In view of the fact that it will improve the pc enormously, why, he'll feel much better if you've done so. Now, you've got that, you've got the charge off, don't you see, the charge was important. Because where the pc's atten... rock slams or rocket reads, his attention still is. So you still got his attention on something up here and they're all his items, it doesn't matter how you got them, they're still all his items, you know. You can sometimes get more items than you needed to get. But they're still his items. If they rocket read, they're his items.

Now, do this: Take one – here's the way you package all this up, now, see. You've got the charge off it, so he's thinking straighter now – take one thing that you know dog... Don't go on finding more items than just taking the charge off, you understand? Go ahead and find the rest of those items in that little four-way package, and the pc isn't going around the bend now. Now, his attention can go onto the other items.

This is how you use a meter to do this: Take one terminal or one oppterm that you're absolutely sure of. You know, you were sure that one was a terminal. Or you were sure that one was an opposition terminal. You're sure of this. Take that one and then just read off the remaining seven to him, watching the meter. And when you read the one that it opposes or opposes it, you'll get a fire. There's just a little residual fire left there and it goes pssww! Don't hang around on it too long, because it's gone. And you'll get a drop of the TA if you start doing this.

Now, that's packaging them up. So you've got one here, now, that fired. Now, let's take another one that should come adjacent to it, that it might also oppose. And put that adjacent to it. And then find the remaining ... You've got three, now, in a line, you see? Now you've got – let's say you had eight, you've still got five items floating out around here someplace. Read the five to him and see which is the best one to go into the next position. And that will fire when you get it into position, you see. And then find one that's very likely as the next position, because the one you just find would oppose it, or something of the sort. And then, put...
that in that position, then find out what opposes this and it will psww! fire for a moment. And then you will get your line plot all back together again and the pc'll be very, very happy.

You can't do this until you've taken the charge off items. The way you take the charge off items is you find which one of those eight – I'll just go over this again – you find which one of those eight, as you read it to the pc (this is not in packaging) you just read it to the pc, and you'll find one of them's still firing like crazy. Little Tiger Drill and this thing goes pow-pow-pow-pow-pow-pow-pow. Take the one that fires best and regardless of whether you thought it was authentic or unauthentic or wrong way to or any other darn thing, you establish whether or not it's a terminal or an oppterm, make a four-way roundabout package out of that, just like in 2-12, and you've taken the charge off the bank.

Now, take the rest of these items and get them back together again. All of a sudden, the pc being oriented on this, your line plot starting in with your lowest item, which, by the way, the last item you found ordinarily is still firing – you ignore that one, in your other test – now, get that opposed and all of a sudden it will usually be found that it all comes back on the rules and finishes up very nicely. There's how you do it mechanically.

Now, the other mistake you can make is to overshoot. That happened to me, so I speak with authority. And when you overshoot, you're liable to get a double group into your next GPM. Let's say you overshoot like this. The pc is maintaining and the meter maintains by being at 3 and having a bit of a free needle and all that, everything is fine, and the pc maintains those are the last two items. You can't get the first goal to read, nothing like this. Everything is flat, everything looks beautiful and then you oppose – with an overshoot, see – you oppose the last oppterm you found. You're going to go straight into the next GPM.

Now, this is not necessarily bad, because you're going to – within two items from then, oppose oppose, you see, you're going to have the pc's next goal. Because he's going to tell you what the goal is and he'll tell you two or three versions of it and you just check these two or three versions out and one of them will rocket read like mad. That's his goal.

All right. You've got his goal. You'd better not list a pc very far without his goal. But actually, you can't find two rocket reading items without the pc telling you his goal, and the thing rocket reads like mad, so you see, that's no harm on anybody. In other words, you can find the pc's goal very easily. That's nothing to it. But to go on without it is a mistake. And also, to now go back and do a goal oppose list is a mistake of great magnitude. Why?

Well look, you took the two smallest – you took the two basic items of goal one and you opposed, let us say, the oppterm of those, and you shot over here into this other GPM. And then you got an item there, and you opposed – it follows the same rules, by the way, it's the last rocket reading item on the list and so forth; the list is complete. And then you opposed that properly, and you got over here and you got another item. The pc says, "Well, gee. My goal, my goal is to be..." "A scared person" is what the first terminal you found on this new one – is "a scared person."

Very often, by the way, it'll be something the pc is doing in his current lifetime, like a salesman. And he says, "That's me." Oh, no. If it's the first item at the top of a new GPM, that's not him. Even if his goal is "to be a salesman," it is the enemy. So you'll find his straight goal. His goal is probably "to be a salesman" and the first item is "to be a salesman" as the
oppterm. See, that's where you mainly make your mistake. You'll figure yourself to pieces on this, you know, you won't realize that the reason the goal isn't practiced any more; it's totally downgraded. He is now a "haggard buyer," don't you see? Something like this. That's as close as he can coming to be a salesman.

All right. And you've taken – you've gotten those two items and got the pc's goal; now the mistake you make is to do a goal oppose list. And you do a goal oppose list, you've had it. Why? Well, you've already got your two top items of the next GPM. Now you're going to get two more items. Except by doing a goal oppose, because you've entered the GPM, maybe at the non-optimum position, you don't know whether those new items that you get from the goal oppose are before or after the items which you have just found and you're going to find yourself carrying two packages down the bank simultaneously. The pair from goal oppose – where do they fit? And the other pair, you got from the last goal's oppterm – where do they fit? You understand?

So that if you do a sink-through like this, it's perfectly all right for you to do so and probably you will do it – maybe even recommended procedure. But I don't say that it is just because it happened to me. You do this oppose on this key reliable item, you do this oppose on it, and you fall through into the next GPM. See, you've gone twenty-five, thirty items, and that first thing is all run out, the goal isn't firing or anything else, and then you just one more time, you oppose, and you go right straight back into the GPM just before that. You can get the pc's goal.

Well, if you do that, don't do the goal oppose. You understand? Don't get fooled. Because you'll find yourself with two pairs of items which you're not sure where they'll fit. And the pc gets hopelessly bewildered. He gets all mixed up. Interesting.

So, if you do find your second GPM that lies under the first one when cleared up, by doing an oppose, you just go on oppose, oppose, oppose. In other words, the spiral staircase runs straight down through the first GPM into the second GPM into the third GPM and so on. There's the pattern of it. You can just do spiral staircases without ever doing another goal oppose. But if you ran totally out of items and couldn't find your way anymore, you can do a goal oppose.

The essence of all this is when you've found a lot of items, you want to know which ones are still firing because, having been opposed, they normally shouldn't be firing. Now, those items which have been opposed reverse way to will still fire. Therefore, you've got to actually straighten them out as terminal or oppterm and do a little four-way bing-bing, and you'll find a couple of missing – couple of missing items that you otherwise wouldn't have found.

This is very interesting, isn't it? Now, your second GPM, below the first GPM, is tougher than the first one. You should – you think it should be easier. Well, it may be shorter, but it is tougher. It's tougher on the pc. You see, you're running a section of track where he was that much bigger and he made his difficulties with more enthusiasm. And so therefore, you're liable to get into a more massy situation. In other words, it's liable to be more massive on your second GPM than on your first one. Therefore, your auditing by that time should be very perfect. You shouldn't start goofing on your auditing.
Now, the best way to do something like this is to get the fellow down to a point where the goal no longer fires. This is the sequence of a goal: A goal originally, before you start to audit the first GPM, fires very, very sporadically. It's easily put out. It's easily lost. It easily vanishes. You won't even think it exists sometimes. Goes, you see. And then you get some items from it with a goal oppose list and so on and then it starts firing with a great enthusiasm. Great enthusiasm. Lots of fire. Pow! Pow! You never saw such rocket reads as you can get off a goal after it's had a few items run on it. They run, oh, a third to half a dial – the most enthusiastic thing! Somebody asked me the other day – where from? Los Angeles – about reverse rocket reads. Reverse rocket reads were for the oppterm, and right rocket reads for... There is no such thing as a reverse rocket read, so this puzzled me very much.

But let us say that we went... the goal fired with a nice rocket read. Somebody else asked me out here, the other day, he said, "Isn't there... there's a slow R/S, so is there such a thing as a slow rocket read?" The answer to that is "No. All rocket reads travel by the square root of the um-bum theory and they are always exactly on the subject of electrosis." Of course, my answer makes far more sense than the question.

Now, a rocket read's a rocket read. If you tell somebody there's a slow rocket read, you'll get a fall. And he'll start running goals because they fall.

Well, I can show you any God's quantity of goals that fall. No, a rocket read is a rocket read. It starts out fast and decays slow. With great enthusiasm it goes pssww! And it's over here and going very slow by the time it ends. It's an enthusiastic response. It's very satisfactory. After an auditor has run a goal by 3M, he's seen enough rocket reads – he'll never be fooled again in his life. Because all the items rocket read.

Now, the goal goes into this period of very enthusiastic rocket reading.

I didn't mean to insult Los Angeles. Los Angeles is doing fine. Los Angeles is doing fine. Particularly, I see Los Angeles is the only one getting any good publicity around – which I appreciate.

The rocket reading enthusiasm of the goal after you've found four or five or six items is unbounded. In other words, you only could get this goal to fire by Prepcheck one time, two times, out of three, don't you see. A lot of times you'd read it and it'd do nothing. And then you'd read it and it'd fire with a rocket read. And then you... so on. And nobody could get it prepchecked up, you see. And so you listed it anyway, which is perfectly all right. You've seen it rocket read, and you've seen it rocket read again. It was rocket reading last month and it's... people have seen it rocket read and the only way you're really going to get it cleaned up is get the items off. Because the items going into restimulation have dulled its rocket read.

All right, anyhow, you never saw such enthusiastic three-times-in-a-row rocket reading from a goal, after you've properly run five or six items. Boy, you never saw a goal fire like this. Oh, a three-inch rocket read – pow! Real enthusiasm. Every time. Call it – bang! You get a big rocket read. Where does it go from there? Well, it goes into a period – when about half of the GPM is run out – let me say ten, fourteen, fifteen items, something like that – it goes into a period where it R/Ses. And it'll go this way: You call the goal, "to be a tiger" – rocket read, see. "To be a tiger" – R/S. Nice big R/S, but ... "To be a tiger" – R/S. So you say, "On this goal, has anything been suppressed?" And pc gives you something. If you want to get all
your suppressions off, you know, you run Suppress, Fail to reveal and Careful of. If you just ran those three buttons you could make anything fire.

Anyhow you'd run them sort of repetitive and get the real answers back. And you can get things to work because of course those are the three left-hand buttons.

Now, you get this goal drilled, perfectly, see, and it's now where you say: "To be a tiger" – rocket read. "To be a tiger" – rocket read. "To be a tiger" – rocket read. And you say, "Boy!" See, you worked three session-hours to get this goal to fire with rocket reads again. And you say, "Ha-ha, that's pretty good." And you fix it all up. And you get the session over and at the end of the line the pc says, "Would you read the goal to me just one more time to see if it's firing?" see? You say, "Oh, why sure!" You see? And you say, "To be a tiger" – rock slam.

In other words, this thing is getting frayed. It's moving out toward the edge of the now-existing GPM, and is therefore rock slamming as easily as it rocket reads. Well, you think, "Well, that's finished. That's finished." No, it goes through the next phase of returning to rocket reading. Now it goes back to being very solidly rocket reading, and it'll keep on rocket reading, but sporadic and early and late. You say, "To be a ti..." – and rocket read. "To be a tiger" ...rocket read. You see? Latent, early, it's not on the button. But they're all rocket reads.

And that goes into a period when you've got about two-thirds of the items off the GPM already. It'll hit a very brief period when you hit one of the items and the goal starts discharging. And the goal starts discharging, pssww-pssww-pssww! Auditor's not saying anything, you see. The goal just starts discharging. You've hit the key item. You've just found an item that is very, very important, you see? It's not the most important, or the first item, but it's a very important item. And you just watch that thing, and instead of the tone arm going down, markedly, when you find an item, boom, it rocket reads itself on down. And the pc will tell you probably that he can feel the goal firing. But it goes, pssww-pssww-pssww, pssww-pssww-pssww! And you just keep centering your tone arm and you see those rocket reads. They'll just go crash-crash, crash-crash, crash-crash.

Well, that's no longer a rocket read, that is a barrage. And you see this barrage of reads and it... the tone arm sinks down. Well, your goal, after that, doesn't fire with much enthusiasm, but still fires. And the rocket reads are still unmistakable, but as I say, they are early, they are late, they are one out of three, it isn't doing well. It's a sick goal by this time. And now, very shortly after this, maybe two, three, four items you get the first two items of the bank. And they'll be very fundamental. The first one will – let's say, "to be a tiger." Well, the first item on it is "a tigerish person," see? Or something like that. And the oppterm will be "a weakling" or "catnip" or something like that.

In other words, those first two will make very fundamental sense. They're quite recognizable. And the pc will say they're recognizable, too. What you really ought to do when you get that pair – you get that pair all straightened out, is read the goal to the pc and you'll find out it won't fire and you try – you try to drill it and it won't fire and you just can't get it. It just won't do anything now. But the last item you found of this earliest pair for that goal is still firing.
Now, what you should do at this state is just package up that bank beautifully. Just get that GPM all matched off so the pc's happy and you're happy. Don't go tampering with it particularly, but you still might have a reverse way to item in it. The way you find this out is read all the items off to the pc that you've already found, you see. Get the pc satisfied that they're all it. But reading those items, see that one of them doesn't fire. If one of them still fires it might have been wrong way to opposed and things might have gotten gummed up at that point.

Well, do another little oppose list and get that thing firing right way to and maybe a missing item appears or that whole goal bla... starts going up in smoke. That's the way you're going to get your free needle. If you want to take the time to get your free needle, you'll do it by straightening up those items. Now, it's not absolutely necessary, but it's easier on the pc if you do.

Then you go down here and find this last item, you'll find it's still reading, you carefully didn't include that in the number of items which you were assessing and you took that last item which was still reading and you find out if it's a terminal or oppterm, oppose it accordingly and you'll drop through to the next GPM. You find two items, after that the pc – you just ask the pc for his goal, he'll give his goal, that's all. He gives you maybe three or four versions of it. You find which one rocket reads, very fine, dandy and so forth. Make sure you've got the terminal or oppterm straight on that, by the way, because when they drop through, it's all upside down now.

In other words, the pc was a big person when you got to the bottom, you see, of this – because why? He'd had a long quiet period, he'd kicked that old GPM over his shoulder, he'd heaved out his thetan chest and he made himself very, very tough and he postulated a new goal and there he is into the next bank.

Well, he drops from that into the degraded character. He's the really degraded character. So you've got to be careful that you don't get taken in. I told you earlier, see? Is... the next goal, let us say, is "to be a dancer." And you get – you get as the first crack out of the box, you get a "ballet artist." And you say, well, obviously that's his terminal. You knucklehead! When you oppose a ballet artist, who or what would oppose a ballet artist, you get a – "a person who – a crippled person who hates the stage" see, that's his terminal. That's where he left that goal. That's why he never had any more to do with it, don't you see. He never had any more to do with it after that. He couldn't go any lower. He'd had it.

All right. So there's the way to find your next goal. But there's that little bridge there for you to worry about.

Now, I've answered most of the problems that you're going to run into. There aren't really more problems than I have given you here. But I'm sure somebody is going to dream up some problems that aren't germane. Like, should the E-Meter – I shouldn't be sarcastic like this, I get it from the Instructors, you know – but should the E-Meter be plugged in during the session? You know? Now, should we write up all of the items or should we only take those items which we think look good and write those up. Should we – should we translate the item into the original language in which it was postulated? I don't know, I could – I really couldn't stretch my imagination. You're going to run into that kind of thing. But as far as I'm con-
cerned, the only real trouble that you run into, you have to give attention to, I've given you in this lecture.

The GPM is very interestingly put together in that things oppose things and things not oppose things. And for some time I have been wondering whether or not we would ever have to use the not-oppose. And now I find that the not-oppose line is the second GPM. What the first GPM never opposed was the second GPM. And if you ran the not-oppose, you would probably drop prematurely into the second GPM, so this may have happened on the first four-line listing. So you probably don't do anything with this at all.

Now, can a person's bank be so scrambled by early auditing and so messed up, that 3M doesn't work? Well, for... only 3M loused up can louse up a bank. The pc may have been sunk in this bank, may have hit various parts of the bank, may have had great difficulty in handling the bank, may have had all kinds of things wrong, and got somatics that never went away, and they ran any process there was. But frankly, there is no earlier process that even made a dent in GPM. It keyed it out. That was the only thing that happened to it.

So you'll find the GPM is there intact, and Routine 3M run straight, cuts right into the GPM, and the interesting thing that happens as he goes along, is there were periods in his auditing when he would hit pictures and sensations which he never understood and never resolved. Well, those uniformly will come up in running the first GPM. That is the first goal. He'll get those pictures out of the road. And there they are.

When he starts running the second GPM, he will find out he has some other, what he would consider primordial-type pictures, more basic, more fundamental in his life, that he really never paid much attention to. Of course, we're getting down past the Freudian censor, and a good thing, I would say.

Now, in answering up how do you run Routine 3M, you use all the rules of listing that have been given in the various bulletins. How do you find the goal? Well, you can find the goal any way that we have ever found a goal. You can take 2-12 terms or oppterms or rocket reading items or stuff like this and make goals lists off of those things. We are rich in methods to find the goal, these days. What if we can't find the goal at all on somebody? Well, we – usually he's a rock slammer and we have to do a 2-12A package on List One before we can even get him into session. This is why he won't answer auditing questions or something like that, yet he'll answer them on List One, don't you see? We could prepare the case around. There are various ways of handling these, but these are all unique problems. They're problems of "how do we get the horse to water?" And 3M is "how do we make him drink?" And they've always said you couldn't. But in our particular case we've got it all taped, and we can make the horse drink very well, and there goes the GPM.

And it will run as easy as you follow its exact, simple rules and it will run as hard as you goof; and think nothing at all of wasting fifteen session-hours because of a goof or finding in ten session-hours ten RIs. You get the idea? I mean, one goof, there goes – there goes maybe ten, fifteen session-hours trying to set this thing to rights and finding things and plunging and being upset and all that sort of thing. It is only lengthy if you goof. So the thing for you to do is to get letter-perfect in the handling of it.
I'm very happy with this, of course, and one of the things that has been interesting to me about it is for the first time in history, probably in this universe, we have the adage "physician, heal thyself," come unstuck. Physicians have never been able to heal themselves. Look at the AMA, and so on. In this particular case, I am quite startled to find out that as messed up and cross way to as we landed into the middle of the second GPM, that it isn't fazing me. I'm handling it quite well. We've got items scattered all over the place now because we landed in the middle of it and did one... did two wrong way to and then compounded it by doing a third wrong way to and we're still making out and I can't even feel sorry for myself. And that's pretty bad. That's pretty bad.

Well, I'm getting along fine, now, and it's amazing to me when I see what we've been tackling over the years, I get a Ron's-eye view of it, right close up, and I'm quite intrigued. I'm quite intrigued. My goals, by the way, have more gotten in my road than they have assisted me, because I find in – every single instance where I have had difficulty working, it was because of my goal, and it wasn't anything else. I was actually working in spite of my goals, and was somehow or another surmounting the GPM all the way along the line. And it's great, you know, just to sit back and have it hit me in the face and blow off, because I've been holding it at arm's length for a very long time.

Anyway, that's enough about me; that's how you run Routine 3M. I haven't given you on a step to step basis, but I've given you the data that you most need, is how to do it right and how to square it up if you don't. And I think you're going to need both equally because it's very difficult to tell a terminal from an oppterm and pcs lie like hell and sooner or later you're going to do one backwards and wish to God you'd never been born. Well, I'm just calling it to your attention that that is straightenable if you don't carry it too far and if you recognize it soon enough.

Okay? Thank you very much, and good night.
Here we are. This is the what? What's the date?

*Male voice: 19th.*

February 19th, AD 13, Saint Hill Special Briefing Course, one lecture.

I have a little bit of news for you tonight. Of course, there's nothing but good news pouring in here from all sides now. And amongst these good newses, we found a goal in Z Unit today. Now, that goal, by the way, was really found in Australia, but nobody has been able to get it to fire, so nobody would do anything with it. And it wasn't until all the tone arm action came out of the goal list that the goal itself started to fire. And I think that's the way it was. And then they got the goal firing and proved it up and so he's away.

And one goal was found Sunday. Not necessarily germane to the course at large to give you a lot of data about staff clearing. You wouldn't care about that, you see. Because, after all, that's just Instructors and people of that sort. But in actual fact they're making very good headway.

As of right this minute, we have one, two, three, four, five - I think it is something on the order of five goals found out of which, I think, three are actually listing. And only about three more people on the staff to go. So you see, that's coming up close to a clean sweep for the staff on clearing. This staff probably will be Clear within six weeks or something like that – first-goal Clears. Starts happening fast, doesn't it?

Now, in the Z Unit... I haven't got the actual statistics in front of me, but in Z Unit we have quite a few goals being listed out to Clear and all those are moving very well indeed, except one that made a colossal blunder. The auditor bought a sell. The pc said something like this: "A tremendously intelligent, brave, good-looking wonderful person." That was, I think, was the first item up or something like this. So the pc said, "Oh, that's me! Ho-ho-ho-ho! That's me. Ho-ho-ho-ho! You know, that's me, ha-ha!" And the auditor says, "Of course that's you," and immediately lists it as a terminal, the knucklehead. And that GPM just is not running well. It's all out of gear and so forth, because of course the thing is an oppterm.

The first item up, if it is a very high-toned item, is an oppterm, always. That's the first one you find. Always an oppterm, if it's a high-toned item. If it's a low-toned item, it's the pc. Because that's the state his goal has gone down into. In other words, you're looking at the dwindling spiral of the goal.

And if you don't pay attention to that, you're going to get in trouble, because pcs go on a big sell. See, they say, "Ha-ha! A marvelous, philanthropic, cherished individual. Oh, yes, that's me, you see." The hell it is, ever. Never. It's never. Never. Never. Never. Never. Never. That's the oppterm. The pc's goal is "a dirty little funking rat." See, something like that. That's his
terminal, rather. And his goal is "to be a good guy," see. Well, the first one up, if it's "dirty little rat," see, something like that, that's going to be the terminal. And "a wonderful, sterling, beautiful, adored, saintly person" – that's going to be an opperm. You get that? Don't let any pc sell you otherwise.

Now, you can't use this significance as your final test. It's whether or not it turns on more mass if it's said wrong. If it's said right, it turns on less mass. Sometimes the pc can't tell very well, but you say the terminal to the pc, "Consider committing overts against____" "Consider it committing overts." Either way. Say it about three times one way and three times the other way, one of them will turn on more mass than the other and that one is wrong.

So watch this. In other words, the only ball-up we've got in Z Unit is somebody who went straight through his knucklehead and bought a big sell on the part of the pc and listed the first item found wrong way to. And of course, four items later they suddenly run out of items, nothing is going right, lists dead end, the item comes up in the wrong places. All kinds of things happen, all of them very difficult to handle and so forth, and it's all traced back to that original blunder of listing something wrong way to.

Oddly enough, those goals in Z Unit which we have had checked out very carefully, and those items which have been checked out very carefully by Instructors, all of those goals are running very well. But just before this we had a period when we weren't checking out the items. And do you know that hardly any of those are running well. They're running raggedly compared to those whose items were checked out.

So that tells us that auditors have been buying, occasionally, occasionally would fake up the fact that a read was there. The pc says, "Oh, well this is my item," something like that. Well, to show you how tough we're getting these days, an auditor in Z Unit ran a list, and only went twenty-four items beyond the last R/S or RR, see, on 3M – only went twenty-four. Didn't go twenty-five – got a five-hundred-word infraction sheet. That's the way it is.

Actually, the thing dogged out. If he'd put about one more item on there it probably would have rocket read.

Another auditor had a slight drift up of the TA during the last twenty-five, didn't note it on the report, said that it was flat on the report: five hundred word infraction for a false auditor's report.

This is the way things are these days. You just have to face up to it. United States has gone tyrannical, Russia's gone tyrannical, the world has gone tyrannical, so S-B – the Saint Hill Special Briefing Course has got to keep up the pace. That's the way it is. The difference is, is they're trying to ruin people and we're trying to clear them. There's a slight difference of polarity in what's going on here. And if we win they lose providing they don't join us. And we're no longer trying to join governments; we're trying to keep the governments sensible enough so that they can eventually join us. This is our spirit on the matter. We're being nice.

The truth of the matter is, everything else in the world is looking very fine. I've given you an overlong report on how goals are going here at Saint Hill, but I thought you would be tremendously interested. I know I am. And I've got my eye on all of these cases. And I don't know what you people are doing dogging around down there in the X and the Y and the O
and the B Units. I don't know, I think we've got somebody that's that far away from getting into the Z Unit.

And some of you, a very few of you, have been here much longer than you should have been here in these lower units, and you want to get up there into that Z Unit and get your goal whistled up and so forth. You won't get anyplace playing around in these lower units. I mean, we ran ARC Straightwire on you a long time ago and we didn't win, so we're not going to get anyplace till you get in the Z Unit. Just make up your mind to it.

2-12 original, for source lists, is the way it's going these days. All of you expected to have that wiped off your checksheets. No, I'm afraid we're going backwards now. We're going back to 2-12. And the 2-12 original issue is the right way to do it. 2-12A simply tells you how you list down better from an RI, that's all. But how you find items: the original issue of 2-12.

So you haven't even got the satisfaction of saying, "Well, new checksheets," you see? "New checksheets." No, no. We want you back on the old checksheets, see. It's the old checksheets. 2-12 is what you need to crack the uncrackable case. And that's what it's for, and that takes a rock slammer out of circulation, does a lot of other beneficial things. So it's a very valid technique, but its use is relegated, 100 percent, to just that minor role.

You can't run this person on 3M, so you do 2-12. And this person is a rock slammer, you can't keep him in-session at all, you run him on the original version of 2-12 and you will find out that they will take off.

In other words, if you can't readily find somebody's goal, put them on 2-12. 2-12A was a refinement in listing from RIs and that is still with us. Everything you have learned is now valid. This is the first time this has ever happened on the Saint Hill Briefing Course – it's the first time. Everything on your checksheets you need; the checksheets don't need any changing. I'm going to give you a few more lectures and bulletins and so forth and consolidations on this sort of thing.

But it, in actual fact – it is merely consolidating information and replacing existing tapes and bulletins. And I'm afraid that's all that's going to happen that is very dramatic. We're in for the long haul here, you've got a lot of time to learn this, you understand. Some people will still be learning this a hundred years from now. I can tell you that with accuracy. But it needn't be you here on the Saint Hill Briefing Course. So, get busy with your... get busy with your checksheets and let's get away and at least get up into the W Unit, huh? All right.

Now, I've already given you a considerable amount of data here concerning 2-12, and so on, and 3M. But what I think I ought to talk to you about is the interrelationship of processes: what processes are for and what they do and all that sort of thing.

There's a new scale of processes out in a recent bulletin that tells you the valid processes which are done and taught in Academies. Now, there isn't any reason for me to have a list of these things in front of me because I know these things too well. And I'm going to go into these various processes and just tick them off one after the other. This is not necessarily in their order as given, but these are the valid processes which you ought to have a very, very good grip on, because you will need every single one of them. And first and foremost...
amongst these – listed, by the way, first, not because it's the easiest thing to run, but because it's the lowest grade of case will respond to it – is the CCHs.

Now, the CCHs, done the way they were being done in 1962 – okaying people's physical origins, you know, acknowledging physical origins; running these things not as a grind, but up to a flat point of about three and changing off to the next process and so forth – those are the CCHs. And they're CCHs 1, 2, 3, 4.

But there are also some variations of these CCHs that you would find very, very valuable. And you're going to find these extremely valuable someday. You realize that as you run "Spot the wall," and so on, on people and your meter there is... got a lot of tone arm action, see – you realize, don't you, that this person is so unaccustomed to the physical universe that they have an awful hard time trying to follow a direction.

Now, if you had a great deal of trouble with a case – now, I mean a great deal of trouble, you just... nothing can happen and so forth – you've got the CCHs. And what you do in essence, even though you don't run the CCHs on a meter, is run the tone arm action out of the CCHs. Now, you can do that by checking the pc from time to time on a tone arm to get his tone arm read.

What you're doing there is hauling this fellow up to a point where he's enough in present time that he can follow an auditing direction. Now, this in essence takes care of the case who cannot follow an auditing direction. And you as auditors are far, far too prone to underestimate the ability of a case to run. Now, I know this, because I've from time to time picked up cases that have been pronounced absolutely unrunnable; there's nothing can happen with these cases, you see? And I remember a psychotic girl, she was pronounced psychotic by one and all. Everybody was unanimous on this particular subject. And in actual fact she would comply with every auditing command I gave her. Now, that is all you want.

Here is not a condition of whether people are crazy or not crazy. We're not in that business. We're not in the business of whether people are crazy or not crazy. It's just a method of calling dirty names anyway. The psychiatrists have no idea who's crazy and who's sane, and so forth. It's just a matter of saying, "This fellow's no good, and the US government wants to get him out of the way so he's crazy." It's just a matter of expediency. It says en masse, "We don't agree with this particular person. He sees spiders on the ceiling and we don't. Therefore he's crazy." Has nothing to do with anything we are doing. Nothing. Nothing. Nothing. Just forget those classifications.

We don't care how potty this guy's ideas of the physical universe are, you know, he just might have come down here from the Martian scout command or something like this, and they probably have very, very odd ideas, you see? The quality, the significance of the fellow's ideas are no business of the auditor's. I couldn't try to give you a better rundown on it. I mean, I couldn't say it sufficiently emphatically. It's just no business of the auditor's. Fellow walks down the street saying, "Gibber-gibber-gibber-gibber-gibber-gibber-gibber," and talking to somebody that's over on his right. Well, yes, everybody agrees there's something very eccentric about this person's conduct. But actually the auditor has no business with that at all.

The whole test is whether or not this person will sit across the table from you and answer an auditing command that is asked him. That is the whole thing. Now, there isn't even
any wiggles on this. There's no getting away from this. You understand? Don't refine that one down! You see? You realize I'm talking rather incoherently because I myself have had difficulty getting this point across for many, many years. And it's an old point I'm trying to get across.

You know, they say, "Well, he says it to himself, and then he repeats a circuit which says it to him, and therefore he's not following the auditing command."

No, no, no, no. We say to this fellow, "Put your hand on the table," and the fellow puts his hand on the table. We don't care if it took him a while to do it, but he will put his hand on the table. We ask this person – we say to this person, "Who don't you like?" And the person thinks for a moment, we don't care much how long he thinks, or how clearly he says it, but he's on the subject, don't you see? And he says, "Oooh, uh-wuhwuwhuwhuh ... My brother George. I don't like him."

All right. Now, that's an answer to the auditing command. We don't care if he goes this way all the time he's doing it or picks bugs off of himself while he's doing it or if he acts with perfect sanity while he's doing it or says in a beautiful, mellifluous tone of voice while he answers it. No. He can actually answer that.

We say to him, "Who else don't you like?"

And he thinks for a moment and he says, "Well, my wife. I don't – I don't like my wife." And so on. That's all, see. That is our total requisite. It's not whether or not the fellow can hold the cans. Some fellows get shaky hands and so forth. If they get too shaky, why take his shoes off and strap them to the soles of his feet. We don't care about that either, you understand? It's can this fellow answer an auditing question?

Now, if he can answer a listing auditing question and if he can tell you what his goals are in life and we come right down the line on his goals in life, and we can get those and we can somehow or another read those on the meter, we actually have no business running anything but 3M on that fellow. You understand? That's the only honest thing to do, you understand? If we can get his goal – get his goal, list it, get it to fire and so forth. Make a Clear. You get that? There isn't any point doing anything else. If he can do it, you can do it.

Well now, let's take this fellow at the other end of the line. And we say to this fellow, "Now, who don't you like?"

And he says, "Gob, gob, gobble, gob-du-da-da-do-whoo, whooo."

And we say, "Well, is that somebody you don't like?"

"Oh, ga-ga, woo-woo."

You say, "Well, do you talk American? Or English? Or French? Or something like that?"

And he says, "Yes, yes, yeah, well, no, yeah. Who? Where?"

He's not answering the auditing question. You get the brutality with which I'm defining this thing?
Yeah, a lot of pcs sit there and say, "Let's see, who or what would 'to be a catfish' oppose? Let me see. Maybe it – maybe it's 'oppose a catfish.' Maybe it is – so on. Maybe I better answer it for a while, 'to oppose a catfish.' Let's see how that works out. Havingness is getting down. I think I better run a little Havingness."

People do that sort of thing when they're being audited by some auditor who is low on control. That character is perfectly auditable. Go ahead and clear him, get him in a brace, make him do it.

But we're talking now about this other fellow, and he says, "Who don't you like?"

And he says, "Gob-gob, gaa, ya, ya, ya." What are you going to do? You're going to do the CCHs. You got that? That's what it takes.

Now, also, there's another side test on this thing. If the individual, in giving you items or goals and so forth, just continuously doesn't get any tone arm action, you understand, and there is no way we can get tone arm action, we can't get our rudiments in or anything like that, and yet by making him spot the walls we can get a lot of tone arm action, you have another excuse for another type of process which is a CCH sort of process – and that's rudiments and Havingness. You get that? This fellow... he'll answer your auditing questions, but he never gets any tone arm action on a list and you can't really find anything and it's all very tough. You've got another class of process – rudiments and Havingness.

Now, let's go back to CCHs for a moment. That goes down into unconsciousness. You can find somebody in one of these states of coma that they talk about in the hospitals and we cure those or do something with them. I mustn't use the word cure because the American Medical Association objects to anybody curing anything. It has become illegal to cure anything. I hope you appreciate that. Because they can't, it's now illegal to do so. I don't mean to be bitter about these people, you understand. I'm just being factual. In fact I'm being rather kind.

Anyway, they've got this hospital nailed down, you see, and there's somebody there in a coma. Do you know that you can actually... By the way, never make a rash promise to a person like this, like, "I'll come back and see you tomorrow," when you don't know you can. Because do you know that if you don't come back and see them tomorrow they're liable to kick the bucket. It's happened. Get ahold of their hand. And you can actually get into complete communication with them. You say, "Squeeze my hand once for yes; twice for no." That's a good gag. You ought to try it sometime on an unconscious person. They can't talk, they're in a coma, they're an accident victim, something like this. You say, "Squeeze my hand once for yes; twice for no." And then ask them two or three simple questions. "Are you in pain?" You see, and they'll go... give you a signal, yes or no, or something like this, and you can go on in a rather interesting communication line. That's with somebody who is incurably gone. Which is quite interesting to me.

You can get into communication with these people. They can't talk. In other words, they've lost control of their vocal chords, but they can get some kind of a muscular response going. It takes you a little while to get into communication with them sometimes, but they will get more and more in communication with them... with you, and you can go on from there.
Now, there's a type of CCH which is like 8-C, only you monitor the person's hand. And you can monitor it around on the bed, you know. You can put it up here on the pillow and on the sheet and on the blanket and on the side table, and so on. You say, "Touch the side table," and they touch the side table. You're monitoring their hand. And oddly enough it'll give them an orientation which will bring them out of their coma.

Don't go changing processes. It's a rather heartbreaking affair. Go along on the same process until you have stabilized a bit of a change, take the other hand, perhaps. You're playing it off the cuff, you understand? You're making up your own CCHs. Because this person is unconscious in bed and you can't contact them vocally and you can't check up on your auditing command, vocally; you've got to be smart.

So how many CCHs can you work out? Well, you can... The way to work out how you would do it is to do something like this: Take a doll and put it down on a bed and the doll isn't going to respond either and you're going to – how many CCHs can you run on this doll that's lying in the bed?

Now, there is a level above that. There's a person who cannot talk, who's totally inarticulate, who can't get around in life, you know, workaday world and that sort of thing. These are heartbreakers. They're spastics, people of this particular character, idiots. Very, very rough to do. I wouldn't kid you on this level; they're very, very tough to handle. You do regular CCHs with these people and just carry on, acknowledging them real well and so forth. But above all, never lose your temper, never become impatient and flatten what you start and don't run things that are flat too long, and you'll have some wonderful success with these cases. But you have to stay in communication with them.

Now, remember this: The worse off a case is, the easier it is to have an adverse effect upon the case. The old Effect Scale, see. Now, that's very important because that tells you that an unconscious person may very well – who is in a coma, let us say, for two weeks or something – expire on the breaking of one auditor promise. It has happened.

I'll give you an idea. This girl said, "I'll come back and see you every day at this hour. And also I'll come back and see you tomorrow. And I'll stay with this with you until you've recovered." And the medicos – well, I don't know if they had medicos or monkeys in charge of this hospital; there's not much difference. And the medicos wouldn't let this auditor back into the hospital the next day. The patient was recovering although still in coma. The coma got much lighter. Much lighter. And the person was beginning to heal, beginning to straighten out and the medicos barred the person out. The auditor had promised to be back the next day. Wasn't permitted to go into the room and the person lingered around for a day or so and died. The person was recovering, and died. A broken promise. That's all it amounted to. I have other evidence on that, not just that.

Now, that's how little it takes to have an adverse effect upon an unconscious person. Now, how about a spastic? Or a person who is classified as a moron? The common concept of these people is they don't know anything. Ah! But the thing which you do every day out here in auditing – just that moment of, you know, something on the order of the guy says no the session hasn't started for him and you say, "Oh, well, we'll take it up in the rudiments." Something like that. Look, that's too steep for a moron. You'd just blow him to pieces.
Now, it isn't that a case is bad off who is blown to pieces by this, but this would really, really ruin him. An auditor's frown, a tiny impatience – you just have worked and worked and worked and worked and worked to get this guy to lift his hand, you know, and put it in yours, and so forth, and he looks a little petulant for a moment. And you yourself become impatient and you say, "Oh, damn it, give me that hand!" You've ruined him. Bye-bye case! You understand? The worse off a case is, the easier it is to affect them adversely. If you run by that rule, you will also see that at those times when a normal, usual, run-of-the-mill pc is being a bit bzzh – and they all go bzzh at one time or another in session – at that moment, when he apparently is able to stand up to anything because he's maybe being cross with the auditor, he's being nasty or he's being this, remember that at that moment he is the most easily affected – in the most easily affected state. That effect is very heavy. Extremely heavy.

All you have to do is frown at him and he practically spins in. Well, you've got a reality on that. Well, it works similarly. The worse off, the more introverted, the more upset the case is, the more careful and cautious the auditor has to be about maintaining a good, even, friendly discipline toward the pc.

Now, on an assist, all this applies. Now, there are various kinds of assists. There are as many kinds of assists as there are Dianetic auditing and everything else. You ought to have seen an old HDA running a child's somatic out here a few weeks ago – of course I'm talking about Mary Sue. Diana's nanny got a little bit enthusiastic and shoved Diana around and actually chipped a tooth. Now, Mary Sue was quite worried about this, as you can see, since it was a permanent tooth, and she used about four or five varieties of assist and finally blew the somatic. Finally blew it 100 percent. She decided that she'd better blow it 100 percent so that the tooth could grow back a bit of enamel, see?

Well, how many – how many assists were there? Well, the first thing, was she withholding anything about it. And then touch it, touch it, touch it, touch it and oh, I don't know, any one of the infinite variety of contact and communication assists. And next day, second session, took the child down to the exact place that it happened, made the child touch the tooth to the porcelain bathtub where it had been cracked, see. Oh, boy, that kid was very gingery. Took her to the actual spot, see. All of a sudden, blew the thing high, wide and handsome.

Oh, yes, and another sequence of it – she made the child scan through the whole incident. Lock scanning, of all things! And got through the incident a lot of times – through and through and through and through and through and through. And then contact on the bathtub, and then pow! There goes the somatic.

Well, anyway, on assist almost anything goes. But this doesn't go: Sticking somebody in something with too great an enthusiasm when the person is in bad condition. Let's take an auto accident case, and this auto accident case is just about gone; he's in a comatose state and so forth. Now, trying to get too much done in too little time with that case will give you a lose. About the best thing you can do – about the best thing you can do is put the case in some sort of contact with the environment. And give the case a then-now. In other words, the automobile accident was then and you're now in now.
But even so, to lay a hard and fast rule down about this is difficult. Because I know of a case that was run through the engram of being hit and run over while riding a bicycle – car ran over a boy – a little boy, on a bicycle. His father stood there and while the child was unconscious, ran him through the engram over and over and over, and finally the kid that had a fractured skull and everything else opened his eyes and brightened up, and the father ran him through it a few more times and the kid was all right. That sounds adventurous, doesn't it? Well, it probably was adventurous. But remember, auditing in that way, is what you can get away with.

So there's any of these varieties of assists. But assist is something that directly attacks the condition in which the person is. Now, we know right away that attacking a specific condition is, well, it's fraught with many perils. Let me put it that way. It's not always a smooth road.

This fellow has a cold. You say with great enthusiasm, "All right, I'll cure your cold." See? Well, all right, you use some system or method or something of the sort. Any of the old processes. And you just lay an egg, that's all. You just didn't get there. Cold is still on, he's snoring and having an awful time. A few days later you uncover another person, he's got a much worse cold and you do the same thing and the cold goes off just right now and doesn't reappear, see? Well, that's the liability of it. It's whether or not the GPM is keyed in to that thing. That's the whole thing. If it's keyed in on that cold you haven't got a prayer. In other words, you'd have to run a GPM item to get the cold off.

But I ran into a girl on TV one time – I told you this story before – and just with one question of Straightwire blew the cold, you see? And I think it was "Who's left you in the last few days?" or something like this, and "Oh, my boyfriend, George!" Ta-bang! and off went the cold, see. I'd noticed that when loved ones are parted they normally come down with colds. Missing terminal in front of them, you know.

Anyway, assist, assists – these are the – these are the wide, wild horizon. They normally consist of contact and getting a person out of something and into present time. And that's more or less the definition of an assist. It's something that uses some type of contact, whether contact with the bank or with the physical universe, or both, and it uses... or it uses the mechanism of time track, to try to get the person up to present time. Well, sometimes he comes right up to present time and the rest of it drops away and sometimes you have to hit the point where he's stuck and bring it up. But the more you hit a subjective process, the more you use subjective processes in an assist, the less successful you will be. You get that? The objective process, just on an assist level, is more productive, so that if you... now, you can split them up. You can use 75 percent objective and 25 percent subjective, you see?

Let's get... the fellow's, "Oh, I have an awful time. I've got my hand caught in the door, and here it is, it still hurts. And here it is, two days later and it still hurts."

And you say, "Well, I'm going to help you out on this. Do you remember the door?" and so forth, and get him, you know, into it. And then use a lot of "get him out of it." See? As much get... use about three to one, actually. A little bit of "get him into it" and a lot to "get him out of it." You see that? That characterizes the assist. And you'll have very successful assists if you do that.
You say, "Now, what door was it?"

"Oh, well, let's see, what door was it? My bedroom. No, it was the front... no, it was the bedroom... front – front door. Yes, it was the front door. The front door."

You say, "Good! Now, how's your hand?"

"Well," he says, "well, it hurts right across there."

You say, "All right. Now, take your other hand and touch the places it hurts. Now, that's good, touch that place and that place and that place and that place and that place. Good. Now..." You always balance up assists. "Touch the other hand," see. Get that hand going. I'll bet you forgot that one, Mary Sue, on your – I'll bet you didn't take the tooth on the other side.

Female voice: Oh, yes. I did.

Oh, yes, she did, she did. Hah! Leave it to a Dianeticist! Anyway, so it's touch this hand and then touch that hand and touch this hand. "Now, what about that door? What about time of day was it, and when was it?"

"Well, it was Tuesday, I guess, about four o'clock... Oh, no, Wednesday. Oh, no, it was Monday." See, they're lost on the time track. He finally says, "Yeah, it was Tuesday! It was Tuesday. About four o'clock in the afternoon."

And you say, "All right. Well, good. Touch that hand and touch that hand," and so forth. And, "Touch that hand," you know. "How you doing now?"

"Well, just the little pains across there," so forth.

"Well, now, what – was there anybody around when that happened?"

"Oh, no, no, house was empty. There wasn't anybody present – except my wife. Well, yeah, my wife was present. She was standing right there as a matter of fact."

And you say, "All right. Well, thank you very much. All right. Touch that hand and touch that hand, and that..." you know. Give it... get the idea, see? Spring him and give him some Havingness.

And we get up to the next level, which is rudiments and Havingness. Now, what can – actually can you do with rudiments and Havingness? Well, I'm here to tell you, you better learn how to run rudiments and Havingness as a valuable process because you're going to need it on every raw meat process you ever do. Because the guy isn't in... is insufficiently educated to be processed at the time you pick him up. How's that? Oh, you're going to be good enough as an auditor to get somebody to reel off a list. But along about the time you've got him reeling off the list left and right, why, he isn't answering the auditing question and he thinks he's got to go home now and he gets up out of the chair and he leaves – that isn't a very safe way to go about it.

If you gave somebody a couple of rudiments and Havingness sessions – I'm not talking about you doing a private practice, in the HGC or something like that – give this person a couple of rudiments and Havingness sessions. Just any kind of rudiments. Doesn't much matter what. Things he actually could tell you. Clean up the problem rudiment for instance. You
know? Just clean that up good. And then give him some Havingness. And then clean up the
problems at the end of the game.

Well, that would do a lot for him, but actually you want this fellow to be able to run the
mid ruds and you want him to be able to run Havingness. So, I'm talking now about what's
therapeutic in rudiments and Havingness. Well, you clean up the problems rudiment, and give
him some Havingness, and clean up the problems rudiment and close the session. That'd be
very valuable.

But you're trying to get this fellow drilled in so that he can be audited and so that he's
getting used to it. In other words, most people aren't used to being audited, if you would ever
notice this. And although they break into it rather easily — and most of you, being good audi-
tors, have not ever had much trouble with this — the pc finds it rather strange. And a rudiments
and Havingness session, one or two, when you're going on a long haul like clearing, breaks
the pc into it. The pc's capable now of doing things that he was not... didn't think he could do
before. He can remember something, he can confront a problem. He can look at the walls. He
can feel better. Do you see that? That's the practical use of the rudiments and Havingness.

You can always make somebody feel better if you use the one rudiment of problems
and run his Havingness and then clean up his problems and then maybe run some more Hav-
ingness, and then close down the session. Something like that. I don't care what model you
put this thing on. It rather runs the pattern of an assist when you're using it therapeutically.
Don't discount it as a valuable process, because it is all by itself a valuable process.

But you wind up at the other end with an educated pc. He's educated just to this de-
gree: He knows that he's got to sit there; he isn't wrestling with his own bank while he's find-
ing out about auditing. Now, do I make my point?

He isn't — he isn't wondering, "What's this fellow going to do? What's this fellow going
to do?" And at the same time you're asking him some of the most challenging, overwhelming
questions you ever heard of. Well, the kind thing to do is just, you know, take up his problem
and find out about it, not a chatty thing, see. We want this to be a disciplined session. Because
what you're trying to teach him is discipline. And you want him to squeeze the cans and you
want him to answer up, and when you say, "What's that?" You know?

He says, "What's what?"

And you say, "Well, I got a read right here. What's that problem you're thinking
about?"

"Oh," he says to himself, "hey, what do you know! I think this, and he sees it on the
meter there. What do you know! Probably pretty good, you know. Wow!"

You know, he's thinking all these things to himself. Well, gosh, you know, if you're
trying to check out somebody's goal or find an item or a 2-12 item or something like this, and
this guy is all involved with the physical universe and he's all involved with his bank and at
the same time he says, "What's the meter? I mean, what's he doing with the meter?" Two and
a half hours, somebody reported, was taken to clean up the E-Meter in an end-session rudi-
ments, some time ago, and the fellow came around and wanted to know what was an E-Meter.
That was the main thing.
Now, in other words, familiarization. You can use rudiments and Havingness with familiarization, putting in the big mid ruds for a period of time. Put them in for "Since yesterday" or something like that, you see. And then run his Havingness and put in the big mid ruds again and close the session, something like that. This is also known as short-sessioning.

If you have got the idea that a session takes place per day, you're nuts. A session takes place during that period which elapses between start of session and end of session and that's the only thing there is to a session. That's how long a session is and that's what makes a session and that is actually the basic session. So that you can actually run a couple of sessions on somebody, or three or four sessions if you're doing an HGC. You can run two sessions in the morning and two sessions in the afternoon.

I myself, if I were just breaking in a new pc, would run two sessions in the morning, on rudiments and Havingness. As easy as that, you see. And in the afternoon, why, start listing something, like his goals. By this time he knows all about what I'm doing. And he's not going to be upset with me or the form of auditing. You see this value to rudiments and Havingness? Because it really exists as a value.

Now, Havingness processes are rather boiled down lately. You can get almost any process... any pc there is on "Touch that object" or "Feel that object" or "Notice that object." Very few pcs fall outside this category of Havingness. There is just those three. It's very funny, but they seem to reach almost any pc pretty well. You ought to put those up to the front of your list as the first three tested and then get fancy with the other ones afterwards. And you normally will succeed with the first or second one. Makes it very easy.

But the point is, you want to get a result. You want to get a result with your rudiments and Havingness. The main result you want with raw meat is the person becomes disciplined to sitting there and receiving auditing. And it's pretty crazy, trying to give somebody a high-level process – as I think it was Motts over in New York mentioned this to me, from the New York organization. And he said something to the effect of you're laying the pearls of Ophir out in front of this pc and they don't know anything about it at all, you know. You're doing a high-level process and they haven't even learned they're supposed to answer the auditing command. So that's very valuable in rudiments and Havingness. Very valuable to indoctrinate the pc a little bit with auditing and they also serve as a Problems Intensive varied over to where you only clear the problem. And don't just think that's a practice drill, because it isn't.

Now, there's another practice drill called ARC Straightwire. What's this ARC Straightwire? Well, it's the first time I ever turned off a neurosis – was with ARC Straightwire or some equivalent of it. It wasn't called ARC Straightwire then, but as time went on it became ARC Straightwire and I still was able to turn off two neuroses with it.

Now, we're talking carelessly when we're saying neurosis. What do we mean neurosis? Well, let's put it just this way. The fellow feels he's getting – he's going to get worse and worse and worse, and it's all going to get worse and worse and worse, and there's no bottom to it. You know, he's just going to keep going down forever. Well, you run an adequate amount – session or two – of ARC Straightwire and the person becomes aware of the fact that something is stopping him from getting worse. And in view of the fact that something is stopping him from getting worse, his hope resurges.
But I have seen people, you know, strictly on the bugs – pulling bugs off themselves – turn sane right in front of my eyes on ARC Straightwire. What are the – what's the commands? The same command as in the end of *Self Analysis*. Needn't be any vast change about it.

You could work out, from the cause angle, better commands and so forth, perhaps. You could say, "Recall a time you communicated with something or somebody. Recall a time you felt some affinity for something or somebody. Recall a time you thought something or somebody was real." Or, you know, that type of command. But it isn't so much the command; it's confrontingness. It's a confrontingness on the three principal buttons that make up life and understanding. And an individual will suddenly understand a little bit more about himself.

That has a ceiling, of course; you can't run this for days and days and weeks and weeks and expect to get very much out of it. It's one of these one-shot propositions. Somebody is feeling pretty spinny, run a little ARC Straightwire on them, and they feel a lot better. But it's something that stops the spin more than anything else. It isn't universally workable, it isn't an unlimited process that goes on forever, but it is a valuable process, and it jolly well better not be dropped out of the lineup, because it's valuable. Has its uses.

Also it has a very good training use. You can run this thing and run it and run it. It's unlimited to the degree that it can be run forever, but it won't produce results forever. You get the idea? It goes up to a flat spot and that's that. But you can keep on running it and the guy recalls the same things.

Only one thing I'd like to make a remark on is once in a while in Academies and so forth, you see ARC Straightwire being run in this particular line. This is really crazy. The guy says, "Recall something that's really real to you."

And the pc says, "Yes."

And "Recall a time you felt some affinity."

Pc says, "Yes."

And the auditor says, "All right..."

Hey, what's all this, you know? You find out after a while this guy starts stacking up with missed withholds and things. And he starts going out of communication and he starts getting upset. So you have to remember, when you're running a process like that, not to take these "yes" answers. The guy says, "Yes." Well, of course the question actually didn't demand he say anything but "yes." So you have to ask the second question. You say, "What was that?"

"Oh, that was my mother."

All right. You say, "That's good."

In other words, find out what. Stay in communication with the pc without nagging the pc.

Now, there's another type of assist has loomed over the horizon in the last few months, has been what we will call primary buttons – Suppress, Invalidate. And it comes under the heading of a Prepcheck assist. And all you do is flatten Suppress and Invalidate. They're just
the two buttons. And you'll find out that if you were giving a five-hour intensive (if you can imagine such a thing) to somebody who had been all loused up like fire drill, why, if you just flattened these two buttons in those five hours, you would have done a lot for the pc. Those are primary rudiments. They're one and two. Just Suppress and Invalidate. And they work wonders. They really do. I mean, you can just take those two.

For instance, I find increasingly today, when I'm trying to get the pc to go on listing, I just give him Suppress and Invalidate, and don't give him anything else. And before he can get Invalidate clear he's listing again, so the devil with it, why put in the rest of them?

So those are primary as far as the rudiments are concerned, are Suppress and Invalidate. And they make an intensive. But it gives us Prepcheck. And we enter into the level of what... this whole category called Prepchecking.

Now, what is Prepchecking? Well, it's preparatory to clearing, and you will always find it's preparatory to clearing, you'll always have to do it as preparatory to clearing or somewhere in clearing you've got to do it, so it becomes a very necessary skill. And there you see it, a Prepcheck assist, in its most fundamental form. You say, "Start of session. Since yesterday has anything been suppressed?" You flatten that permissively, repetitively, then clean it on the meter or don't clean it at all. It'll just depend on the pc. And then you go on and hit Invalidate and get that as long as the pc will answer that. And you say, "All right. Fine. End of session," or whatever you care to. You find out you have quite a remarkable effect. But that's sort of an assist sort of a proposition.

Well, that's actually all Prepchecking consists of, is just cleaning up these buttons. Prepchecking is different than fast checking. And the only thing that you repetitively use in fast checking is Suppress. You always get that in repetitively without consulting the meter. Unless of course, you're really trying to unload a goal, and then you take your last three left-hand buttons. (This is a trick you didn't know.) You take your three buttons over here, on the left, Suppress, Fail to reveal and Careful of. Those are your basic suppress type of buttons. They'll prevent the read. Everything else – well, there's a couple of them are middle ground – but the rest of them create a read, or steal a read. But these things Just make the read disappear entirely and they don't even come up. You don't even see it on the button sometimes. In other words, you can have a Suppress, you don't even see a Suppress read, and so on. So you clean those three repetitively on the goal. You see, or on the list or something.

You want this thing to read, you see, you can't get this item to read, you know this item ought to read. And you've seen it read, and so forth. Well, just ignore your right-hand buttons. You want to do a fast job, why, do a Prepcheck. You understand, it's different than a fast check. Suppress, Suppress, Suppress. No attention to the meter, see. All prepchecked. Suppress, Suppress, Suppress, Suppress, and he finally runs out of answers. You get any answers you can now find on the meter.

And then, Fail to reveal, Fail to reveal, Fail to reveal – Prepcheck, see? Fail to reveal, Fail to reveal, Fail to reveal. And he finally runs out of answers and you find another one on the meter; clear that. And then Careful of, Careful of, Careful of, Careful of, Careful of, Careful of, Careful of, Careful of. And bang! He says, "Well, that's all over here."
And you say, "All right." And you check that on the meter. And then you read this, "to be a catfish." *Psheww!* It's quite remarkable. That's a very, very – that's a quickie, see. That's a quickie. That's a Saint Hill Goals Prepcheck. You can make almost anything read, if it's ever going to be made to read, by going over and over and over those buttons, just ...

Well, you've got this item in the session and you saw it read, yesterday. And now you're going to list it. And you've got to get the thing firing before you list it, so you say, "Catfish." And it says, "Tsk." Huh! You say, "What have you been doing? You been doing anything?"

"Oh, no, no, nothing."

"Catfish." – *tsk!*

Oh, boy, you had it rocket reading half a dial. Well, the best way to do it is just get in these left-hand buttons, one, two, three. Each one prepchecked. And you come back and you read this. And you say, "Catfish." *Psheww!* It's a remarkable performance you can make an item put up and it's well worth knowing.

Well, that's your lowest level of Prepcheck. But how many ways can you use Prepcheck? Now, I've shown you Prepcheck as an assist, and I've shown you a Prepcheck in order to get goals to read, and I've shown you a Prepcheck which only uses the left-hand button. Well, all right... the left-hand buttons. And now let's go over and take a look at further Prepchecks. We can choose – you can choose any period of time and get in the eighteen-button Prepcheck, and when you include a goal it gives... you also get the counter-button to the goal. Any period of time. "Since you was a little boy, has anything been suppressed?" Rather indefinite, but it still gives you a Prepcheck. And of course, it's done within the ramifications of a session. You prepcheck the thing out. It means repetitive, repetitive, repetitive, repetitive, no consultation with the meter till the pc runs out of answers. Then you consult the meter. That's all there is to a Prepcheck. No matter how you use this auditing mechanism, there it is.

All right. There's unit-of-time Prepcheck. Eighteen buttons. All right, that's pretty remarkable, but how about a specific item? "On your mother-in-law..." see? You can do an eighteen-button Prepcheck "on your mother-in-law," and produce some rather remarkable results, too. And you – it's all Repetitive Prepcheck.

And how many other ways can you use this thing. Well, you can combine the two. And you get a Problems Intensive. And you find a specific item that you're looking for, which is the problem, the greatest change of his lifetime, and then you take a period a month earlier than that and you prepcheck on that date. But actually you're prepchecking at a problem, but you're prepchecking by command on time. Getting your eighteen buttons on the thing. All the same way. Marvelous results.

Now, you can take "On listing ____," "In auditing on the goal ____," "In listing on the goal _____." Doesn't matter how you phrase this sort of thing, you get these different varieties of Prepcheck.

Now, that's a whole category of processes right up to there and they're totally adequate for the education of an HCA. Totally adequate. Now, when we start running up into higher level, Class II and Class III skills, we have 2-12, the original version modified only as you list
from RIs, reliable items. We've got 2-12 and that's a... you'll find out the way you were doing it at first – you were finding items and all that sort of thing – well, you just go around finding items that way. Take the biggest, great, big, wide rock slam that you can pick off the list someplace, and oppose it and run it around into a four-way package, use 2-12A only to govern your listing and it'll always be the last rock slamming item on the list. Use this and you won't have a case that you've fixed their sciatica and you can... it's visibly fixed; everything is going along fine. You cured him, or something, you know. And then they say, "Well, I don't know whether auditing works or not. You know, Scientology might work and might not work. . ." so forth.

They get up, they've thrown their crutches away and so forth and walk out the door still nattering about how awful you are as an auditor. Well, that's a rock slam sort of a proposition, you see. That person's a rock slammer.

And you take a specialized list and you just find the biggest, widest R/S on that pre-listed list, and take it. Make a four-way package out of it. Then when you cure their sciatica they say, "Gee! My sciatica's cured." See? In other words, the person has reached mentally instead of resisting you.

In other words, that keeps the person... it's something like rudiments and Havingness, don't you see, at a much higher level. You give them rudiments and Havingness to get used to auditing; well, you give them 2-12 so they can appreciate it. They actually will never get well unless you do something like that. You wouldn't be able to find their goal or anything. I doubt it very much that you could crack through such a case.

So that's a marvelous thing to have. And now we take 3M, you've got the créme de la créme. You've worked it up, now. You've worked the case up along the line, you'd get that case in a state where you could knock these goals off and get rocket reading goals, and find the pc's goal by any method that you find the pc's goal. And list it on out on 3M and find your items and don't go knuckleheaded on picking the wrong item, wrong way to or something like that and it all runs off, and by golly you wind up with a Clear.

Now, that's your ramification of processes. And as far as I'm concerned, that's it. I don't need any more processes – you may think you do, but I don't – because I've been fooled too often by HGC staff auditors and things like that. They come in and they want a wonderful, wonderful new process from me see. I think them up marvelous, wonderful new processes – I used to, before I learned better – and they go off and they don't do them.

And now here's a series of processes that I know by great subjective reality, by excellent objective reality as an auditor, by consistent and continual reports out through the world of one kind and another, from here and there and so forth. I know all these things work. And whereas undoubtedly there could be a great fund of processes that remain utterly undiscovered, well, frankly, they can go on and remain undiscovered as far as I'm concerned, because we don't need them. We don't need them.

Processes are what they are because they depend upon the cooperation and participation of the preclear and his communication with the auditor. Now, therefore we'll never have processes whereby we tell the guy to drop his pants and we shoot him in the gluteus maximus with a horse needle and he becomes Clear. That will never happen! Because it absolutely vio-
lates the basic principles of self-determinism and cause. It won't ever happen! All right. So what do we need? We need a gradient whereby he can accept cause. And in the processes I have given you in this lecture, we have got that gradient whereby we can accept cause. He can accept cause and he can come on up the line and therefore he can be cleared. And we can get everything out of the road that keeps him from being at cause. What more do you want?

Well, there's ramifications of it, and I'm sure that auditing styles will change from time to time. Those of you who just passed Model Session, today, will be cheered to know that I have just issued a brand-new release this afternoon. You've got to put up with me to this degree. Actually, I codified a Goal Finder's Model Session into a much smoother package that puts the pc in-session a bit better by reversing a couple of things in it. It's actually not much different than anything else you had before.

But you will see there's little points like this get adjusted as we go. Fashions change. E-Meters will all get painted black at some period or other, you can be sure of that. You can be certain that auditing rooms must be at the temperature of 79.6 in America and 59.1 in England. You can sure that codifications of this kind of thing will be released. Auditing above the altitude of 6,800 feet is not beneficial, you know, big discoveries can be made from here on out.

But I've done my job because of this: Twenty-five hundred years ago there was a bloke by the name of Gautama Siddhartha Buddha. Now, whether he did or did not become bodhi and whether he was a first- or second-goal Clear, I don't know. As far as I know it has not happened on this planet. I'm very certain that it hasn't happened on this planet for twenty-five hundred years, or somebody would have found out something about it.

I see most of the material raised at that time has been booby-trapped. All right. Twenty-five hundred years after the fact, we've done it. Now, we've done it much more easily and much more understandably and much more applicable than it was ever done before, because I haven't been worried about number one. I've been worried about you and nearly all of our technology is directed toward training it or applying it to the other guy. Not sitting on a mountain contemplating one's navel till he blows out of his silly head, you see? So it's a very practical address to the situation. And the whole thing is tailor-made on this kind of an address. It's for you to do to him, you see, that's the whole address to the problem. Every bit of its research has come up along this line and so forth.

So there it is. There's been no breakthrough in the intervening centuries. We've come up to that point and we have made this breakthrough.

Now, because we are a very tight organization, a very tight, close-woven network of data and that sort of thing, it's interesting that within days, actually, within days of releasing this information, at Saint Hill, Clears were being made in Washington, DC. Now, how fast do you think this is going to go? It's going to go plenty fast. We've got an organization, we have the technology, we have the methods of training people as we go along the line. All right. We've arrived all at one and the same time. I kind of figured we would, but that's the way it is.

And there's the technology. And I've just outlined it to you. Now, if you're sitting around waiting for more technology to be developed and more technology to be developed and for somebody with a twenty-two-inch horse needle to jam into you and hit the plunger so
that you can get Clear, then you better apply someplace else because we don't do it that way. Our clearing doesn't put it all on you as a responsibility by a long ways, but it says that you must become cause before you are Clear. I think that's a very worthwhile thing.

All right. That's a rundown of processes and where we have gotten to.

And thank you very much. And good night.
TV DEMO: FINDING RRs

An auditing demonstration given on 20 February 1963

**LRH:** The main reason for this demonstration is the rocket reads. We are very, very interested in how they are doing in the Z Unit and we want to see some items fire, that's what we're mainly interested in. And see how precise their sessioning is. That's our main worry. Now, I don't know – nod, auditor, if you've got your earphones on.

**Auditor:** Yes, coming. Coming up. All right.

**LRH:** All right. Now, what we want is simply to get the session started and just see some rocket reads.

**Auditor:** Good. Thank you.

**LRH:** All right. Now, what we are going to do is, we are going to check out your last item again and see that we get a rocket read on it and I am going to precheck it for three buttons. Okay?

**PC:** Yeah.

**Auditor:** Good. Going to plug you in. Please squeeze the cans. All right. Please squeeze the cans. Okay. And again. Thank you very much. There is a third-of-a-dial drop at sensitivity 3 at 2 tone arm.

**PC:** Thank you.

**Auditor:** Good. Is it all right if I start this demonstration now?

**PC:** Yep.

**Auditor:** Good. Start of demonstration. Has it started for you?

**PC:** Yep.

**Auditor:** Very good. What goals would you like to set for this demonstration?

**PC:** To get the item firing.

**Auditor:** Very good. Any other goal?

**PC:** Well, to be willing to look at anything that comes up.

**Auditor:** Good. Okay, Allen. Now, your tone arm is now exactly where it was this morning so I am not going to put any mid ruds in. I'll go straight in on the item, prechecking it. All right.

On this item "a feeling person," has anything been suppressed?

**PC:** Not that I know of.

**Auditor:** Okay. Very good. I'll check that on the meter. On this item "a feeling person," has anything been suppressed? There's a read, what was it? There. There. There.

**PC:** Well, I suppressed thinking about it. Suppressed doing any self-auditing on it.

**Auditor:** All right. Thank you. On this item "a feeling person," has anything been suppressed?

**PC:** Well, there's a few somatics and a bit of a headache come on. It's been ever since we worked out the
heading of the question. I sort of would like to list. That's about all.

**Auditor:** All right. Thank you. I'll check that on the meter. On this item "a feeling person," has anything been suppressed? I'd like to check that again, I am not quite sure about it. On this item "a feeling person," has anything been suppressed? There is another read, what was it? There. There.

**PC:** Yeah. Well, when you started you went straight into the Prep-check, I wondered if you were going to try and find out if it would read or not, so I don't know whether it's reading or what it's doing.

**Auditor:** All right, thank you. On this item "a feeling person," has anything been suppressed?

**PC:** Just items that oppose it. I've tried not to look at them but you gave me the question and it's - so I am trapped into keeping them away from me.

**Auditor:** Okay, thank you. On this item "a feeling person," has anything been suppressed?

**PC:** No.

**Auditor:** Good. I'll check that on the meter. On this item "a feeling person," has anything been suppressed? That was equivocal, I'll check it again. On this item, has anything been suppressed? There's another read, what was it?

**PC:** Well...  

**Auditor:** There.

**PC:** ... I sort of cognited today that I have now got my goal and I've sort of gone over the hump. And my items are no longer going to be – like the terminal side, are going to be so degrading as they were earlier. They're getting better.

**Auditor:** All right, Allen. Thank you. On this item, has anything been suppressed?

**PC:** No.

**Auditor:** Good. I'll check that on the meter. On this item "a feeling person," has anything been suppressed? That was equivocal, I'll check it again. On this item, has anything been suppressed? There's another read on there. What was it? There.

**LRH:** Ask him if he is protesting that.

**Auditor:** Yeah.
Are you protesting the question, Allen?

PC: Yeah, I'm having a bit of trouble seeing anything on it.

Auditor: I didn't get that.

PC: I am having trouble seeing anything on it.

Auditor: Okay. Good. I'll check it again now. On this item "a feeling person," has anything been suppressed? There is another read, what was it? There.

PC: Well, I think I – I'm suppressing... Yeah, it is a protest. I protest about messing about with any of these items.

Auditor: All right.

PC: Just want to go straight on and oppose them.

Auditor: All right. Now, I don't quite get what is the suppression here?

PC: I was suppressing the protest.

Auditor: Good. Thank you. On this item, has anything been suppressed?

PC: No.

Auditor: Good. I'll check that on the meter. On this item "a feeling person," has anything been suppressed? There's another read, what was it? There.

PC: The exact opposition to it.

Auditor: Thank you. On this item, has anything been suppressed?

PC: No.

Auditor: Good. I'll check that. On this item "a feeling person," is there anything you have been careful of?

PC: Yeah. Not to go onto any audit on it. Not to think about the item. Not to try and do anything with it – just have the item as it is.

Auditor: All right. Thank you. On this item, is there anything you have been careful of?

PC: Hm. Wondering about it.

Auditor: Good. On this item "a feeling person," is there anything you have been careful of?

PC: Talking about it. Actually, I had practically forgotten it until the session again tonight.

Auditor: Okay. Now, Allen, I don't quite get what the thing that you have been careful of.

PC: Well, I have been careful not to talk about it and I've been... the item...
– you forget your items very easy, as they blow.

**Auditor:** All right. Thank you. Oh, sorry, did I chop you here?

**PC:** No, I was just going to say that the main thing is I am careful not to talk about them too much.

**Auditor:** All right.

**PC:** That's all.

**Auditor:** Good, thank you. I'll check that on the meter then. On this item "a feeling person," is there anything you have been careful of? Do you agree that's clean?

**PC:** Yep.

**Auditor:** Good. Very good. On this item "a careful person," is there anything you have failed to reveal?

**PC:** Well, it's not so much on the item but it's part of it. Uh – my goal is – one was just to be the first person completely cleared on 3MX. And after dinner I think I will be.

**Auditor:** Okay.

**PC:** That's about all I've failed to reveal.

**Auditor:** All right, thank you. I'll check that on the meter. On this item "a feeling person," is there anything you have failed to reveal? There's a read on there, what was it?

**PC:** Opposition items. That's all.

**Auditor:** Thank you. I'll check that on the meter. On this item "a feeling person," is there anything you have failed to reveal? I'd like to check that again; I'm not sure about the read. On this item "a feeling person," is there anything you have failed to reveal? You agree that's clean?

**PC:** Yeah.

**Auditor:** Good. A feeling person. A feeling person. A feeling person. A feeling person. All right. I had one rocket read here, I just want to give it to you.

**LRH:** There was no rocket read on that.

**Auditor:** All right.

**LRH:** That item is not firing, so run through and get the item to fire any way you can.

**Auditor:** All right, good. Ron said the item wasn't firing so we go through the buttons again.

**LRH:** There was no rocket read on that, don't – don't be ...

**PC:** All right!

**Auditor:** All right. I have a bit of difficulties here.

**LRH:** That thing didn't fire at all. It didn't even have a click on it. There is something wrong with this line plot.

**Auditor:** All right. I am going again through the buttons.

**PC:** Mm-hm.

**Auditor:** On this item "a feeling person," is there anything you have suppressed?

**PC:** Oh, really confronting the item.

**Auditor:** Good. On – on this item "a feeling person," is there anything you have suppressed?

**PC:** Well, being a feeling person. I haven't... I'm sort of not being the item, not that I know of. Not really looking at it. Just answering the... sort of being
exterior to it. Looking at the item myself. That's all.

**Auditor:** Thank you. I'll check that on the meter. On this item "a feeling person," is there anything you have suppressed? Allen, I want to check that again.

**PC:** Mm-hm.

**Auditor:** On this item "a feeling person," is there anything you have suppressed? That's clean. On this item "a feeling person," is there anything you have been careful of? ... I'm asking you.

**PC:** Hm. I'm just trying to look.

**Auditor:** Good.

**PC:** I'm careful to look. Careful to give up anything that's on it. I am still careful not to try... ah – bring up any other items – the opposition items to it. And you started me more or less on the list of it when you worked out the question. That's all.

**Auditor:** Thank you.

**LRH:** You've got to get right-hand buttons, too, you know.

**Auditor:** All right. I am going – I'm going to check the right-hand buttons too.

**PC:** Mm-hm.

**Auditor:** On this item "a feeling person," is there anything you have invalidated?

**PC:** As far as I know you just checked Careful of and never checked it on the meter, huh? I just invalidated that.

**Auditor:** All right. Thank you. On this item "a careful person," is there anything you have invalidated?

**PC:** No. Not that I know of.

**Auditor:** Good. I'll check that on the meter. On this item "a careful person," is there anything you have invalidated?

**PC:** Yeah. You are calling the wrong item. It's "a feeling person."

**Auditor:** I am sorry, Allen, I gave you the wrong item here, I goofed here. I am giving it to you correctly. On this item "a feeling person," is there anything you have invalidated? There's a read, what was it?

**PC:** Oh, invalidating having my attention taken back to this item now that it has gone onto the other list. That's about all.

**Auditor:** Thank you. I'll check that. On this item "a feeling person," is there anything you have invalidated? That's clean. On this item "a feeling person," is there anything you have suggested?

**PC:** Well, I just suggested that you didn't clean the Careful of button up and I also suggested you were calling the wrong item.

**Auditor:** All right. Thank you. On this item "a feeling person," is there anything you have suggested?

**PC:** No.

**Auditor:** Good. I'll check that on the meter. On this item "a feeling person," is there anything you have suggested? There's a read, what was it?

**PC:** I think... my attention went out there when Reg opened the door.

**Auditor:** Okay. I'll give it to you
again. On this item "a feeling person," is there anything you have suggested?

PC: No.

Auditor: Good. I'll check that on the meter. On this item "a feeling person," is there anything you have suggested? There's a read, what was it? There.

PC: Well, I suggested – when the item was called out to me, I suggested it was my item. Ah – when Brian checked it. And I also cognized that "an ironic person" is the one that opposes it and I thought, "Well, what's the use of being ironic if you don't have anyone's feeling to hurt?" That's all.

Auditor: All right. Thank you. I'll check that. On this item "a feeling person," is there anything you have suggested? I'd like to check it again. On this item "a feeling person," is there anything you have suggested? There's another read. What was it? There. There. There.

PC: Well, yeah. It's not so much on that item but there's two oppterm items missing off my line plot. And I have been suggesting for two days now that the – one of them is "a decent person" and the other one is "a mediocre person" and I felt they had been bypassed.

Auditor: All right. On this item "a feeling person," is there anything you have suggested?

PC: No.

Auditor: Good. I'll check that. Is there any protest going, Allen?

PC: No.

Auditor: Good. On this item "a feeling person," is there anything you have suggested? There's another read, what was it? There. There. There.

PC: That's, ah – well, those last two items – I've now suggested it out loud that ah – they've been bypassed, so I have told everyone about it now.

Auditor: Okay. Thank you. I'll check that on the meter. On this item "a feeling person," has anything been suggested? There's another read, what was it?

PC: Well, when Ron said there was no rocket read on that – uh – it's a sort of a suggestion that that's not the right item.

Auditor: Okay.

PC: And I disagree with that.

Auditor: Thank you. On this item, has anything been suggested?

PC: No.

Auditor: Good. I'll check that on the meter. On this item "a feeling person," has anything been suggested? There's another read, what was it? There. That.

LRH: The right-hand buttons, by the way, are not done repetitive.

Auditor: There.

PC: Yeah, well, when you called the item out when it first came up in the lists, that was the last thing I thought the item would have been. So when you called it, of course, it suggests that that's the item. And that – that's the only suggestion I could think of there.

Auditor: All right. Thank you. I'll check that on the meter. On this item, has anything been suggested? I'll have to check it again. On this item "a feeling person," has anything been suggested? That's clean. A feeling person. A feeling person. All right. On this item, has any mistake been made? There's a read, what was it? There.
PC: I am having trouble confronting the item as my attention is on the other list. So that's all.

Auditor: Uh – I don't quite get what uh – you mean by the other list.

PC: You started the list running on me when you asked me, "Who or what would oppose a feeling person," I think it was.

Auditor: Mm-hm.

PC: And I sort of have trouble jerking my attention back to look at the item "a feeling person."

Auditor: Okay.

PC: And that's a sort of mistake, I feel.

Auditor: All right, Allen, thank you. On this item, has any mistake been made? There's a read, what was it? There. There.

PC: Yeah. You never cleaned the Careful of button.

Auditor: All right, thank you. On this item "a feeling person," has any mistake been made? There's another read. There.

PC: Mm. When you said there's a rocket read there, there wasn't one there. That was a mistake.

Auditor: Thank you. I'll check that on the meter. On this item, has any mistake been made? There's another read here. There. There.

PC: I think it's a mistake to mess around with them once they've been checked.

Auditor: Okay. Thank you. I'll check that on the meter. Now, Allen, before that – before I check that, is there any protest going?

PC: No.

Auditor: Good. Thank you. I'll check that now. On this item "a feeling person," has any mistake been made? There's another read. What was it? There.

PC: The more you quote it the more my head aches or the somatic on my nose gets heavier and the mass seems to move in on me.

Auditor: Mm-hm.

PC: That's all. And so it's a mistake sort of, I feel, prepchecking this item. It is not making me feel better, it's making me feel a bit sicker.

Auditor: All right, Allen, thank you. On this item "a feeling person," has any mistake been made? Do you agree that's clean?

PC: Yes.

Auditor: Good. A feeling person. A feeling person. A feeling person. On this item, is there anything you have been anxious about? That reads.

PC: Anxious to have it read. That's about all. I sort of feel that the item is finished with now. It's the other list that is more important. What opposes it. I'm sort of anxious that they don't take the item away from me if it's not reading.

Auditor: All right. Thank you. On this item, is there anything you have been anxious about?

PC: No.

Auditor: Good. I'll check that on the meter. On this item "a feeling person," is there anything you have been anxious about? A feeling person. A feeling person. On this item, has any-
thing been invalidated? There's another read. What was it? There. There.

PC: I just don't seem to be able to look at the item. Uh – just can't seem to take the viewpoint of the item and I just can't get there and I sort of am invalidating having to do it.

Auditor: All right. Thank you. I'll check that. On this item, has anything been invalidated? There's another read, what was it?

PC: I'm sort of invalidating you trying to make me do it, too.

Auditor: I didn't get that.

PC: I'm invalidating you slightly trying to make me do it. That... in – look at that item again.

Auditor: All right. Thank you. On this item, has anything been invalidated? There's another read, what was it? There.

PC: Yeah. I'm invalidating my attention going off to the opposed list to this item. It's making me feel terribly uncomfortable.

Auditor: All right, Allen, thank you. I'll check that. On this item, has anything been invalidated? A feeling person. A feeling person. On this item, has anything been suppressed?

Auditor: Thank you. I'll check that on the meter. On this item, has anything been suppressed? There's a read, what was it? There.

PC: Annoyance at having to go backwards to the item. That's all.

Auditor: Thank you. On this item, has anything been suppressed?

PC: No.

Auditor: Good. I'll check that on the meter. On this item "a feeling person," has anything been suppressed? There's another read, Allen, what was it?

PC: Well, I was suppressing a protest I think, about the question reading.

Auditor: All right.

PC: And the item not.

Auditor: Okay. Thank you. On this item, has anything been suppressed?

PC: Not that I know of.

Auditor: All right. I'll check that on the meter now. On this item "a feeling person," has anything been suppressed? There is another read, Allen. What was it?

PC: Being sick, sen, feeling adi... agitated, bit – bit heavy, feel heavy.

Auditor: Mm-hm.

LRH: All right, get him off the buttons on this item. Read his goal. Let's see if you can make his goal fire.

Auditor: All right, Allen. We are not going to carry on with that. Ron just told me to stop the item Prepcheck and all I am going to do – I call out your goal and we see if that fires. Right?

PC: Okay, yep. [chuckles]

Auditor: Anything you want to say?

PC: I just suddenly noticed how my interest came back into the session.

Auditor: Okay. Very good. To be certain. To be certain. To be certain. To be certain. To be certain. Okay, we haven't got a rocket read here.
LRH: Now, you see why your item isn't firing, because your goal isn't firing. That's all. Close the session down.

Auditor: Okay, Allen. Good. Now, have you made any parts – ah – have you made any parts of your goals for this session?

PC: What were they?

Auditor: To get the item to fire.

PC: Well apparently, no.

Auditor: Good. To be willing to look at what comes up.

PC: Yeah. I was willing to look.

Auditor: Very good. Now, I'd just like to check – get a can squeeze.

PC: Mm-hm.

Auditor: Please squeeze the cans. Okay, I just want to get a few commands of Havingness in. Just put the cans down.

PC: Right.

Auditor: Here's the first command. Point out something.

PC: A TV camera.

Auditor: Thank you. Point out something.

PC: One up there.

Auditor: Thank you. Point out something.

PC: Wall.

Auditor: Good. Point out something.

PC: And that part of that wall.

Auditor: Thank you. Point out something.

PC: Ceiling.

Auditor: Thank you. Point out something.

PC: That door.

Auditor: Fine. Pick up the cans. All right, please squeeze the cans. Very good. Thank you. Now, is there anything you care to ask or say before I end this demonstration?

PC: No.

Auditor: All right. Is it all right with you if I end this demonstration now?

PC: Yep.

Auditor: Good. Now, here it is: End of demonstration. Has the demonstration ended for you?

PC: Yep.

Auditor: Very good. Thank you.

PC: Okay.

LRH: All right. We have an example there of the situation when the goal isn't firing, we can't get an item to fire and there is either something wrong with this pc's line plot, which looking it over it is – everything is "blank" person, a person, a person. Probably something wrong with his line plot. There is probably some earlier item firing here and certainly the goal is not now firing, so this thing has been suppressed or listed wrong way to someplace, or mucked up and it will have to be straightened out. Now there, you did not see a rocket read there tonight. Okay. And here we have May auditing Dick and what we want to have happen here is we want to see this new goal fire. This goal was just found today and may not have a lot of fire in it, but we want to see this goal fire. Pick up your earphones there, May. Got them? All right. Good enough. And all
we want to do is see this goal fire very nicely and if it fires without a Tiger Drill, well for heaven's sakes, don't tiger drill it. Okay?

Auditor: Okay. All right. Take hold of the cans please. Thank you. How are you doing here?

PC: Hmm. Not too bad. I thought I'd be as scared as hell.

Auditor: Okay. Anything you'd like to say?

PC: No. Let's get on with it.

Auditor: Good. All right. Give the cans a squeeze. Thank you. Okay. The tone arm is at 2.5 on a third-of-a-dial drop.

PC: Hm.

Auditor: Okay? All right, what we are going to be doing here is a Prepcheck session on your goal. Using the goal finder's Model Session.

PC: Okay.

Auditor: All right. We are just going to prepcheck the first three buttons on the left, Suppress, Careful of, Failed to reveal.

PC: Righto.

Auditor: And do it just until the goal fires.

PC: Righto.

Auditor: Good. Is it all right to audit in this room?

PC: Oh, sure.

Auditor: Good.

PC: Apart from the TV.

Auditor: Okay. Is it all right if I begin this session now?

PC: Yeah.

Auditor: Good. Start of session. Has this session started for you?

PC: Yeah.

Auditor: Good. What goals would you like to set for this session?

PC: Well, get the goal to fire.

Auditor: Okay.

PC: And uh – feel easy about the TV.

Auditor: Okay. All right. Any other goals for this session?

PC: No.

Auditor: Thank you. All right. I'll check the needle here a moment. Okay. The needle seems to be reasonably clean so I am just going to start in directly with the buttons on the goal.

PC: Good.

Auditor: Okay? Good.

PC: Suits me!

Auditor: All right. On the goal "to be able," has anything been ...

PC: I'm sorry, May.

Auditor: Oh, I goofed.

PC: Not my goal.

Auditor: Okay. That was bad.

PC: Oh yeah, well. Well, I can understand how you feel because that's two of us. I think.

Auditor: Okay. All right, it's all right that I goofed?

PC: Sure.

Auditor: Good. On the goal "to be right," has anything been suppressed?

PC: Well, sort of always had a feeling that I couldn't be right, so I was
sort of suppressing achieving it or that I could achieve it.

**Auditor:** Okay. On the goal "to be right," has anything been suppressed?

**PC:** Hmm. Hmm. Well, I can't think of anything at the moment. I – I feel there's something. But I – I couldn't get it connected up. Sort of had the feeling of sort of being in – like – like being in – sitting in a – let's say, in a bomber and you have bombed some city or something and it's not right. And you just have the... you know it's not right, but you want to be right. It's as though you've got to suppress being right to do things like that. Phew!

**Auditor:** Okay.

**PC:** That all sort of feels heavy.

**Auditor:** Thank you. Okay. On the goal "to be right," has anything been suppressed?

**PC:** I had a vague idea there about being criticized by teachers. It sort of makes you feel wrong. And you want to be right. And you want to be right. Ummh – being right like – it's sort of like holding onto a – a postulate that's uh... and all around you, people are sort of suppressing you or overwhelming you and pushing you back in. So, that seems like a suppression to me. That's sort of thinking of it as an overwhelming. That's all.

**Auditor:** Thank you. On the goal "to be right," has anything been suppressed?

**PC:** No.

**Auditor:** Okay. I'll check that on the meter. On the goal "to be right," has anything been suppressed? That reads, what was it? There.

**PC:** When – when you said the goal "to be right" then, just, you know, in doing that command I sort of felt it hit. And then I sort of suppressed any reaction to it following.

**Auditor:** Thank you. On the goal "to be right," has anything been suppressed?

**PC:** Well, I had decided to go out and see another fellow's wife one night and all the time that I was making this decision I – I could feel this, "It's not right" and I was suppressing being right, in order to make that decision.

**Auditor:** Thank you. On the goal "to be right," has anything been suppressed?

**PC:** No.

**Auditor:** Okay. I'll check that on the meter. On the goal "to be right," has anything been suppressed? Do you agree that is clean?
PC: Mm.

Auditor: Thank you. Okay. I am going to check the goal now and give it to you, right?

PC: Right.

Auditor: To be right. To be right. To be right. Okay, it isn't giving a good fire now but it is reading.

PC: Yeah.

Auditor: Okay?

PC: Makes me wince a bit.

Auditor: Thank you. All right, now I'm going to precheck the next button.

PC: Righto.

Auditor: Careful of. On the goal "to be right," is there anything you have been careful of?

PC: Careful to be right a lot of the times! And careful to insist, too, I am right when I know I am right.

Auditor: Good. On the – did you have a thought there?

PC: I think there was something else coming up there.

Auditor: Okay. On the goal "to be right," is there anything you have been careful of?

PC: I have a feeling I have been careful to go somewhere away from where I had been working in order to find a – a better place to be right in.

Auditor: Thank you. On the goal "to be right," is there anything you have been careful of?

PC: Well, yeah, I have sort of been careful to act right in Scientology so that Ron would know I was being right.

Auditor: Good. On the goal "to be right," is there anything you have been careful of?

PC: Um – I have been careful to take note of other people's ah – opinions about my behavior; careful to see how they, uh – look at me, to know then if I am doing right. If I am being right, rather.

Auditor: Good. On the goal – did you have another thought there?

PC: Hey, yeah, that sort of uh – sort of gets you outside your – sort of being here, looking out from here, sort of gets you to – puts you outside yourself looking – try to look through everybody else's eyes.

Auditor: Okay. On the goal "to be right," is there anything you have been careful of?

PC: No.

Auditor: Okay. I'll check that on the meter. On the goal "to be right," is there anything you have been careful of? That reads, what was it? There. There.

PC: To appear calm. It's – it's – it's right to behave in a calm, relaxed manner. I'm quite careful that way. It is sometimes difficult to answer the question now because there are a lot of things one is careful of. Just – just careful of as apart from on the goal "to be right." But still, a lot of one's behavior has to do with being right. Mores and all that.

Auditor: Okay. On the goal "to be right," is there anything you have been careful of?

PC: That seems to be all at the moment.

Auditor: Okay, I'll check it on the meter. On the goal "to be right," is there
anything you have been careful of? That reads, what was it? There.

**PC:** Well, I have a bit of a trembling in the little finger here and I was careful not to let it get out of hand.

**Auditor:** Thank you. On the goal "to be right," is there anything you have been careful of?

**PC:** I have always been careful to, uh – to track down any answer to any question when an auditor says, "That reads," because it's right!

**Auditor:** Thank you. On the goal "to be right," is there anything you have been careful of?

**PC:** Careful not to sell this goal.

**Auditor:** Good. On the goal "to be right," is there anything you have been careful of?

**PC:** Oh, I was at a concert once and I was careful not to cough during the – while the orchestra was playing.

**Auditor:** Good. On the goal "to be right," is there anything you have been careful of?

**PC:** That's all.

**Auditor:** Okay. I'll check it on the meter. On the goal "to be right," is there anything you have been careful of? Do you agree that that is clean?

**PC:** Hm.

**Auditor:** Okay. Again, I'm going to read the goal.

**PC:** Hm.

**Auditor:** Okay? All right. To be right. To be right. To be right. The goal is reading, but not firing. Okay?

**PC:** Okay.

**Auditor:** All right. We're going to continue the buttons now with Failed to reveal.

**PC:** Ah. Yeah.

**LRH:** Ease it off and close the session.

**Auditor:** Okay.

**PC:** Oh, you had some instructions.

**Auditor:** I have uh – just been told here that it isn't necessary to go on any farther with this because it isn't uh – coming up as it should here in the television area. Okay?

**PC:** Yeah.

**Auditor:** All right. Is it all right with you if we leave off this Prep... I goofed. Is it all right with you if I end - if we end off this Prepcheck now?

**PC:** Yep.

**Auditor:** Thank you.

**PC:** Shucks. Huh.

**Auditor:** Is there anything you'd care to ask or say before I do so?

**PC:** Mmm. Oh, I did wonder if there were any fires while you were saying the Prepcheck questions to me. I never asked you that.

**Auditor:** Thank you. Are you asking me that now?

**PC:** No, no.

**Auditor:** Okay. All right. End of Prepcheck.

**PC:** Hmm.

**Auditor:** Okay, have you made any part of your goals for this session?
PC: Well, I certainly feel easier about being on TV.

Auditor: Okay.

PC: It's not such a — ordeal as I thought.

Auditor: Good. Have you made any other gains in this session that you'd care to mention?

PC: Hmmm. Yeah. I had looked at some of my past behavior in alignment with this girl and uh — it adds up a bit.

Auditor: Okay. All right. Okay. Please squeeze the cans. All right. Put the cans down. Thank you.

PC: Sorry.

Auditor: Going to run a few commands of "Feel that." Okay? All right. Feel that table top.

PC: Mm-hm.

Auditor: Thank you. Feel the chair you are sitting on.

PC: Yep.

Auditor: Thank you. Feel the top of your head. Thank you. Feel the back of that E-Meter.

PC: Hmm.

Auditor: Thank you. Feel that end of the table. Thank you. Feel that end of the table. Thank you. Take hold of the cans. Thank you. Okay. Squeeze the cans. Good. That was the last command.

PC: Hmm.

Auditor: All right. Is there anything you'd care to ask or say before I end this session?

PC: Hmm, how much did we get there?

Auditor: Well, it was over a third of a dial, this time, definitely. Okay?

PC: All right.

Auditor: All right. Is it all right with you if I end this session now?

PC: Yeah.

Auditor: Good. Here it is. End of session. Has this session ended for you?

PC: Yep.

Auditor: Good. Tell me I'm no longer auditing you.

PC: You're no longer auditing me.

Auditor: Good.

PC: Thanks, May.

Auditor: Okay.

... [PC and auditor walking off]

Auditor: There you are. Been in here lately?

PC: Hmm?

Auditor: Have you been in here lately?

PC: I was in here about three nights ago, four nights ago -something like that.

Auditor: All right. Take the cans. All right. Good.

LRH: All right. All we want to do here is turn on a rocket read. Now, one or another of these items found on this pc or the goal will rocket read. And I see by your auditor's report here that the pc's in the middle of a bug list that didn't turn out with an item, so therefore that thing probably won't rocket read, but turn on a rocket read at least with his goal or with something. Okay?
Auditor: All right. Now, is it all right to audit in this room?
PC: Hmm.
Auditor: All right. Good. Now, squeeze the cans. Very good. Now, have you got your normal grip there? Hmm?
PC: Hmm. Yep.
Auditor: All right. Squeeze the cans. Very good. How's my voice to you? Is it soft, loud or ... ?
PC: It's all right.
Auditor: All right. I'm getting a bit of a flashback through these things. Okay. Very good. We've got about half-a-dial drop. TA is 3.4.
PC: That's not bad, but the havingness is down is peculiar. The cans feel peculiar.
Auditor: Mm. Mm. All right. Now, what we are going to do is get a rocket read in this session.
PC: Lots of luck.
Auditor: Ah, the first thing we're going to take up is the item we were attempting to get an opposition from ... 
PC: Hm.
Auditor: ...this afternoon. And we'll give that a working over.
PC: Mm-hm.
Auditor: And if we don't easily get a rocket read on that, we'll have a go at the goal or any of the other items.
PC: Mm-hm. "A commander."
Auditor: What's that?
PC: "A commander."
Auditor: Okay. All right. Is it all right with you if I begin this session now?
PC: Mm. Yeah.
Auditor: Okay. Start of session. Has the session started for you?
PC: Mm.
Auditor: Good. What goals would you like to set for this session?
PC: Oh well, a simple one: Get a rocket read.
Auditor: All right. Any others?
PC: No. I think that's all that's necessary for this session.
Auditor: Okay. Very good. Well now, let's take a look at this item we've got here. Perverting an agreement. All right. Perverting an agreement. Perverting an agreement. Perverting an agreement. All right, I'm not getting any instant responses on that. There's a latent fall on it. All right. Now we'll prepcheck this with Suppress.
PC: Hmm.
Auditor: On the item "perverting an agreement," has anything been suppressed?
PC: Well, I haven't looked at the fact that I don't like the idea of being in a position or a condition where I would go about perverting an agreement. Or perverting agreements.
Auditor: Hmm.
PC: And yet when we first came across it I think you will recall I told you that uh - it's very peculiar: I see it over there and yet I know that I do these things.
Auditor: Hmm.
PC: I'll make an agreement and then I'll sort of weasel out of it a little bit.
**Auditor:** Good.

**PC:** Maybe more than a little.

**Auditor:** All right. On the item "perverting an agreement," has anything been suppressed?

**PC:** Consideration and concern about what others would think about me if they knew that I had this as an item. I mean it's not an admirable item.

**Auditor:** All right. Good. On this item, has anything been suppressed?

**PC:** Well, there was a lot of worry and a lot of concern when Ron first came out with the datum that the first item up, if it were, let's say degrading, it probably was the terminal side. And for a long period of time I was concerned about this and wondering and wondering and wondering. I kept on wondering and then I'd suppress the wonder, then I'd wonder some more and suppress the wonder. He'd give another lecture, I'd uh – suppress some more.

**Auditor:** All right. Okay. On this item, has anything been suppressed?

**PC:** Well, a little concern because we seem to be going down on one side. If you remember it went down the one channel that we had the prime cause coming up.

**Auditor:** Yep.

**PC:** And I was wondering, and suppressed it a little bit and still wonder, if I just didn't back down that "Spiral Staircase" so that the oppterm would be a prime cause.

**Auditor:** Mm.

**PC:** And it came out to be something similar to that so far.

**Auditor:** Yes, yes. All right. Good. On this item, has anything been suppressed?

**PC:** Well, probably – to a great deal, the times that I have more or less perverted agreements where I would agree to one thing and then gradually I changed my mind. And I justify it by saying that as I change, my attitudes would change, my outlook on life would change and so how could I find myself in agreement.

**Auditor:** Mm.

**PC:** You know, it's a weasel way.

**Auditor:** Mm.

**PC:** Hm.

**Auditor:** Very good. On this item, has anything been suppressed?

**PC:** Well, a big concern I had today about why it was we couldn't get an item – that would match up with it. Why it was that I went into that – I can't really call it an ARC break, it was a sort of a despondency.

**Auditor:** Yep.

**PC:** ... in trying to match it up against the oppterm. Now, that might have been a misemotion from the oppterm or something, I don't know. It could be a missed item, I don't know. But all the considerations about it I sort of suppress – I figure that's your headache.

**Auditor:** Okay. Good. On this item "perverting an agreement," has anything been suppressed?

**PC:** I've suppressed looking to see exactly what do I mean by "perverting an agreement." You know, I really haven't examined that. When I gave it I
had a sort of a flash idea of what I meant by it. And of course, I was putting the blame over there, you know, oppterm ...

**Auditor:** Yep.

**PC:** ...and oppterm characteristics. I haven't really explored thoroughly exactly what perverting an agreement entails. So, what I've suppressed is the examination of the item to find out just what it means.

**Auditor:** Good. On this item "perverting an agreement," has anything been suppressed?

**PC:** I think a little bit of the feeling of unwillingness to look and see what it is that I'm opposing – that is, as a perverter of agreements.

**Auditor:** Yeah.

**PC:** There's a sort of a hesitancy to look and see what I've been attempting to destroy, damage, commit overts against. That sort of thing.

**Auditor:** Good. All right. On this item, has anything been suppressed?

**PC:** I don't get anything directly.

**Auditor:** All right. Good. I'll check this on the meter. Perverting an agreement. On this item, has anything been suppressed? All right. I'm going to check that again. On this item, has anything been suppressed? Do you agree that is clean?

**PC:** Mm-hm.

**Auditor:** All right. Good. All right. Now, on this item "perverting an agreement," is there anything you've failed to reveal?

**PC:** Hmm. The who's involved. That is the individuals involved on the other side.

**Auditor:** All right. Good. Did you want to say something further?

**PC:** No, what I am doing is I'm wandering around. You know, taking a look at different aspects here based on the question.

**Auditor:** All right. Good. Now, on this item "perverting an agreement," is there anything you have failed to reveal?

**PC:** Hmmmm. The who's involved. That is the individuals involved on the other side.

**Auditor:** Good. On this item, is there anything you have failed to reveal?

**PC:** No. But I just took a look – earlier today I gave "a dependent" as an item – and you'll remember it stayed in for a little bit.
**Auditor:** Mm.

**PC:** And I said, even though it stayed in it was not a proper item for staying in, you know. But I just realized that it is my daughter...

**Auditor:** Mm.

**PC:** ... who I haven't seen for some period of time. And I sort of have a tacit agreement with her that what I am going to do is audit her, clear her, and I'm just wondering if this being away from her, not communicating with her, is a perversion of an agreement.

**Auditor:** Good. On this item, is there anything you've failed to reveal?

**PC:** Well, some kind of a self-flagellation you might say because of, uh – these tendencies or things that I have done that I am ashamed of.

**Auditor:** Good. On this item, is there anything you've failed to reveal?

**PC:** Yeah, I've got a good one: um – starting to get a headache, a pressure headache, just talking about it.

**Auditor:** All right. Good. On this item, is there anything you've failed to reveal?

**PC:** A sort of uncertainty about the item as such. That is, it may rocket read and all well and good, it may check out. But still to me it seems like an awfully nebulous thing. It's awfully nebulous to talk about, uh – perverting an agreement. An agreement is something that is more or less understood, but then when you modify it, it's modifying something that is understood. It's, um – sort of altering an idea or - well, like I say, it's nebulous. It's a nebulous thing.

**Auditor:** All right. Good. On this item, is there anything you've failed to reveal?

**PC:** Hmm. That I'd feel better if it was something I could point to, hold onto, you know – if it had mass.

**Auditor:** All right. Good. On this item, is there anything you've failed to reveal?

**PC:** No, it goes back to the same thing of the times that I feel that I have actually perverted an agreement, because there are definite times when I do know that I have.

**Auditor:** Mm.

**PC:** And I've justified.

**Auditor:** All right. Good. On this item, is there anything you've failed to reveal?

**PC:** I think that's about it.

**Auditor:** Okay. I'll check this on the meter. On the item "perverting an agreement," is there anything you have failed to reveal? Do you agree that that's clean?

**PC:** Mm.

**Auditor:** Good. Perverting an agreement. Perverting an agreement. Perverting an agreement. Perverting an agreement. Perverting an agreement. It's rather dead at the moment. Occasional little tick latently. All right. Now, we'll work over the Careful of button here.

**PC:** Mm.

**Auditor:** On this item "perverting an agreement," is there anything you have been careful of?

**LRH:** Get over onto his goal. Give us a rocket read here.

**PC:** I'm sorry I missed that. I
got blown out.

**Auditor:** All right. Now, we've got an unanswered auditing question there, I believe. I'll give it to you again. On this item, is there anything you have been careful of?

**PC:** Well, the simple one is I've been careful to justify any time that I have perverted an agreement, but that's a generalized answer.

**Auditor:** All right. Very good. Thank you. Okay. What we're going to do now, we're going to leave this item and work on your goal.

**PC:** Fine.

**Auditor:** How's that seem?

**PC:** Well, that seems like a good idea, only now, based on the way things are going, I'm wondering if it's my goal or the opperem's goal.

**Auditor:** All right. Okay. Well now, we can work on this ...

**PC:** Mm.

**Auditor:** ... go flat out on it and see if we can get some rocket reads on it.

**PC:** Fine.

**Auditor:** Okay?

**PC:** Mm-hm.

**Auditor:** All right. I'm just going to make a brief note here. Okay. I'm going to check your goal.

**PC:** Mm-hm.

**Auditor:** To be a complete entity. To be a complete entity. All right. We are getting a reaction on the meter.

**PC:** Mm.

**Auditor:** On this goal, we got a fall and then a sort of a roughed up needle on it, so it's reading. We are getting some sort of a read on it. It's reading more than the last thing we were working on.

**PC:** Mm-hm.

**Auditor:** All right. Now, let's tiger drill this. I'll use the phrase repetitively right now. On the goal "to be a complete entity," has anything been suppressed?

**PC:** I've sort of tended to suppress ownership on the goal lately. Especially since we started down on these various steps, you know – the move over to goal oppose or whatever the version was.

**Auditor:** Mm.

**PC:** So, I've not really looked at it. But I've started looking at these various identities, whatever they happened to be.

**Auditor:** Right.

**PC:** So there's that suppression of the goal itself...

**Auditor:** Yeah.

**PC:** ... and, um – oh, for a period of time after the goal was actually checked out, I sort of suppressed listing, you know, based on the questions we had at the time, the various lines. Gee, there was another suppress I had in mind there. Suppressing listing and then just plain suppressing the goal itself because for a period of time there – because of the lines, the configuration of the lines and based on me, whatever the "me" is at that particular case

**Auditor:** Mm.

**PC:** ... all I started doing was getting a higher and higher tone arm, you know, more and more mass, more and
more crunch.

**Auditor:** Yeah.

**PC:** So, I tended to invalidate the hell out of the goal.

**Auditor:** Mm.

**PC:** Because if this was what is happening to me because of the goal, who needed it?

**Auditor:** Yep.

**PC:** You know, I'd just as soon stay aberrated.

**Auditor:** All right.

**PC:** Yeah.

**Auditor:** On the goal "to be a complete entity," has anything been suppressed?

**PC:** One thing I have suppressed is the – the longing – that's a good word for it – the longing, uh – implicit in the goal, you know, for reaching a particular state, or reaching a particular level of communication, beingness, doingness, havingness, all these things – I pretty much suppress that all the time, actually. Otherwise I would be walking around with my insides torn out.

**Auditor:** Yep. Okay. On the goal "to be a complete entity," has anything been suppressed?

**PC:** Sort of the grief involved in the failure. The grief involved and the degradation involved in ways that I have prevented others from accomplishing the same thing, which seems to be at variance with the, uh – with this first item.

**Auditor:** Yeah.

**PC:** I've got a weird mix-up here. I have a particular drive and then I have a terminal that has a different drive entirely, so I start thinking what the hell am I doing?

**Auditor:** Mm.

**PC:** You know, it's the raging insanity that you go through – I go through.

**Auditor:** All right. On this goal, has anything been suppressed?

**PC:** To a great degree ownership actually, because I don't know – I must be relinquishing ownership, because I don't know when I set it, what the conditions of setting it were, what I was attempting to accomplish by setting this goal, or what I was trying to overcome by setting the goal. The various steps in the degradation of the goal, the alter-is-ness of the goal, the modifications from being a complete entity to being a completely individuated individual.

**Auditor:** Mm.

**PC:** The individuality.

**Auditor:** Yeah.

**PC:** So there's this, um – uh – suppressed, mostly unknowingly, but to some degree knowingly also, the origination of the goal itself.

**Auditor:** Good. On this goal, has anything been suppressed?

**PC:** Sort of a peculiar type of suppression. I've suppressed telling other people they've got to have this goal because it's a good one.

**Auditor:** Okay. On this goal, has anything been suppressed?

**PC:** Anger, because it took such a long time to get to nowhere after I got the goal. Six weeks, eight weeks, steadily climbing tone arm, as a high-tone
preclear – 5.2, something like that. That.

**Auditor:** Good. On this goal, has anything been suppressed?

**PC:** Concern every time it was tested. Concern even now, when you call it. That is: Is it going to read? Isn't it going to read? Is it really my goal? Or isn't it my goal? You know?

**Auditor:** Good. On this goal, has anything been suppressed?

**PC:** No, I think that's about the size of it.

**Auditor:** All right. I'll check this on the meter. On the goal "to be a complete entity," has anything been suppressed? All right. To be a complete entity. Thank you. To be a complete entity. Thank you. To be a complete entity. Thank you. I got two ticks and a final null on that. All right. Now, I'm going to check some other buttons on this. On this goal, is there anything you have failed to reveal? That reads. What was it?

**PC:** I'm sorry, I don't – I don't get an answer there.

**Auditor:** All right.

**PC:** All I do is just pull a blank.

**Auditor:** Very good. All right. Now, I'll steer you on this. On this goal "to be a complete entity," is there anything you have failed to reveal? All right. Uh – I didn't get a read that time.

**PC:** Well, there you go.

**Auditor:** Okay. All right. Very good. To be a complete entity. Okay. Now, on this goal, is there anything you have been careful of? That reads. What was it?

**PC:** Has something to do with uh – in listing, listing the items, I've been careful to look and see in order to give you items.

**Auditor:** Right.

**PC:** That doesn't really relate to the goal, I believe, so items derive from the goal.

**Auditor:** All right. On the goal "to be a complete entity," is there anything you have been careful of?

**PC:** Not that I know of.

**Auditor:** All right. Very good. On this goal "to be a complete entity," is there anything you have been careful of? All right. Now, is there something being suppressed in this session?

**PC:** I'm just interested. I noticed before when you put down the tone arm reading there was – at 3.4. And when we ended session it was about – what? – 4.5 or something like that?

**Auditor:** Yeah.

**PC:** So apparently whatever ridge that was in during all that period of time of, ah, mislisting, whatever you want to call it, you know, listing the wrong way to and all this, that ridge apparently is gone.

**Auditor:** Yeah.

**PC:** Now, I don't feel tremendously different but there is a difference. And every once in a while I just think proudly, "Ah, my tone arm is down."

**Auditor:** All right. Okay. Very good. On the goal "to be a complete entity," has anything – I'll give you that again: On the goal "to be a complete entity," is there anything you have been careful of? All right. There's a read there.
PC: I'm careful to – I don't know how to – how to put this – to avoid putting up something or not putting up something, when you call the goal, in order to not prevent it from reading.

Auditor: All right.

PC: In other words, I'm – I'm careful to – not to do something. So, see, I'm careful in not doing something.

Auditor: Good. Okay. All right. To be a complete entity. To be a complete entity. On this goal, is there anything you have been careful of? All right. On this goal, is there anything you have failed to reveal? Okay. On this goal, has any mistake been made? Okay. To be a complete entity. All right. On this goal, is there anything you have been anxious about? Okay. On this goal, has anything been decided? I want to give that again. On this goal, has anything been decided? That reads: What was it?

PC: Well, I've decided to find the basis for the goal whatever the basis may be on the prime motivation for the goal. Find out what the intent was.

Auditor: Good. All right. On this goal, has anything been decided? That reads. What was it?

PC: That as it comes down the descending spiral – I don't mean the "Spiral Staircase" in this case – as it comes down the descending spiral, the tendency is to lead to absolute individuation. See? A complete entity means one thing. That is, to be a complete entity would mean to have total awareness and total recall, all your abilities and all this. When you start looking at it, a complete entity is one which requires no more inflow or outflow so becomes individuated.

Auditor: Yeah.

PC: So – what was your question? I got lost in my description.

Auditor: All right. We're on "decide."

PC: Hmm. Well, I decided that it may be a nice goal in concept but in practice it's pretty poor.

Auditor: All right. Good. Now, I'll check this question. On this goal, has anything been decided? All right. To be a complete entity. To be a complete entity. On this goal, has anything been suppressed? All right. On this goal, is there anything you've been careful of? All right. Tell you what: we're going to prepcheck these buttons.

PC: Hmm.

Auditor: We'll take up Failed to reveal right now.

PC: Hmm.

Auditor: Now. On this goal, is there anything you have failed to reveal?

PC: Annoyance, when I first started listing, at the fact that there was no tone arm action, that I didn't seem to cognize, that I didn't seem to get any recall. And I sort of suppressed this. I didn't want to make my auditor feel bad.

Auditor: All right. Good. Okay. On this goal, is there anything you've failed to reveal?

PC: A fundamental invalidation on the checkout when an "id" was added – id.

Auditor: Hmm.

PC: And it became "identity" instead of "entity," and it checked out! And so I always carry this niggling little doubt:
Well, if they could check out "identity" and it could read and you could check out "entity" and it would read, well, how well do I know what the hell I am doing? Is there some basic resonance here or what? Just what is my goal?

Auditor: Yep. Right. Good. On this goal, is there anything you have failed to reveal?

PC: Well, the hope that I could become a better person for blowing the goal, for doing what I want to do without having some compulsive reason for doing it.

Auditor: Good. On this goal, is there anything you have failed to reveal?

PC: Oh, something I haven't revealed to you lately, maybe. That when this was checked out I didn't get a great deal of pain. I got some few nigglings pains and stuff like that. But I haven't had any of these sharp, deep sword wounds that pass through me – through the chest, or where the head's blown off or anything like that.

Auditor: Yep.

PC: Nothing dramatic, you know.

Auditor: All right.

PC: I had a little pain in the toe or my finger would hurt or something like that.

Auditor: Okay. All right. On this goal, is there anything you have failed to reveal?

PC: Yes. I always ask my auditor if she would let me watch it rocket read. And she said she would let me do it someday. She never did. Id like to see it rocket read.

Auditor: All right.

PC: I never have.

Auditor: Okay. On the goal "to be a complete entity," is there anything you have failed to reveal?

PC: No, I think I've covered all the points we did with one auditor or another and the idea that – I've known this – this is a basic urge, basic drive – very fundamental mode – whatever you want to call it...

Auditor: Yeah.

PC: ... for years and years and years. So when I was finally listening to those and I suddenly cognited on what they wanted. I cognited on what they wanted. It wasn't that – a case of what goal, what goal, what goal. I found – finally understood what they wanted from me so I gave it to them.

Auditor: Yeah.

PC: I mean, that's the way a goal is, really. I mean, that's my understanding of it.

Auditor: Yeah, yeah.

PC: Once a preclear cognites on what you're asking for they give it to you because they know.

Auditor: Hmm. All right. Very good. To be a complete entity. On this goal, is there anything you've failed to reveal? All right. To be a complete entity. To be a complete entity. To be a complete entity. Okay, it's affecting the meter. We haven't got a rocket on it at this time. Now, let's get – take up Careful of. On this goal "to be a complete entity," is there anything you've been careful of?

PC: I've been careful to not push it that other people are being superior to their goals because their goals involved
what I consider short track and the fact of the matter is I've ...

**LRH:** Okay, close it off and close your session now.

**Auditor:** All right. Very good. Okay. Now, if it's all right with you we're going to leave that there.

**PC:** Leave what?

**Auditor:** The question ...

**PC:** Oh.

**Auditor:** ... and we're going to start terminating the session right now.

**PC:** Fine.

**Auditor:** All right. Anything you'd care to say or ask before we end this part of the session?

**PC:** No rocket read?

**Auditor:** All right. No rocket read. Anything else?

**PC:** No.

**Auditor:** All right. Did you make any part of your goals in this session?

**PC:** I only made one goal there.

**Auditor:** To get a rocket read?

**PC:** Yeah. No, no dice.

**Auditor:** All right. Very good. I'll check your havingness. All right. Squeeze the cans. All right. Is that the same grip as you started with?

**PC:** Yeah.

**Auditor:** All right. Squeeze the cans. All right, that's down a little bit. Put the cans down, I'll run some Havingness. Thank you. Point out something.

**PC:** That uh – camera right up there.

**Auditor:** Thank you. Point out something.

**PC:** The shelf in the corner.

**Auditor:** Thank you. Point out something.

**PC:** The stool, the bench – little bench.

**Auditor:** Thank you. Point out something.

**PC:** The all-seeing eye.

**Auditor:** All right. Thank you. Point out something.

**PC:** Let's see. Your necktie.

**Auditor:** Thank you. Point out something.

**PC:** The earphones.

**Auditor:** Thank you. Point out something.

**PC:** Microphone.

**Auditor:** Thank you. Pick up the cans. All right. Now, squeeze the cans. All right. That's higher than when we started. That was the last command. End of the Havingness Process.

**PC:** Mm-hm.

**Auditor:** Is there anything you'd care to ask or say before I end this session?

**PC:** No.

**Auditor:** All right. Is it all right if I end the session now?

**PC:** It's desirable.

**Auditor:** Okay. Here it is. End of session. Has the session ended for you?

**PC:** Yes. It has.

**LRH:** All right. Take a ten-minute break and I'll give you a few words
on these sessions. Okay?
TALK ON TV:
DEMO FINDING RR's

A lecture given on 20 February 1963

And we'll have a rundown now on these demonstrations.

Well, now, the first session you saw there was – there was a lot of noise and confusion and upset right there at the start. That was a very messy session start. The proper sequence of a session start does not include upsetting the pc. If you want to get a rocket read, keep the pc calm, show him pictures of pretty girls, smooth him out. But don't start banging cans around and so forth.

What you do, is you adjust the pc's chair, you clear the room with the pc, you say it's all right to audit in this room, you don't meter that, and then you get a can squeeze, and then you put in the well-known R-factor and then you start the session. And that sequence is never varied.

Now, as far as the meter reading is concerned here, you called a clean on an equivocal read. Auditor did that a couple of times, and of course the next time you call it, it's very often wrong. Now, I notice that you're doing something here which is quite interesting to me and which I myself abandoned some long time ago. It runs like this: You say, "On this list, has anything been suppressed?" Bang, you see. "On this list has anything been suppressed?" Finally the pc says, "No." And you say, "All right, I will check that on the meter," and you check it on the meter, if you get a read, you ask the pc again.

Now, the way you're doing it is a way that – I know you haven't been told this, so it's not your fault – for once it's not your fault. I mean, you want to mark this day down as the – a golden day in the history of the Briefing Course, because today we have found something that wasn't your fault, it was my fault. Of course I'm getting Clear, now, you see, and, already first-goal Clear, practically second-goal Clear, so you see I can afford the tremendous majesty of being wrong! You can't afford that yet, see. So this wasn't your fault.

But the actual right way to do this, so as not to upset the pc, is simply to repetitive, repetitive, repetitive, repetitive until he says no, and then say, "All right, I will check it on the meter," take it over to the meter, and stay on the meter. Don't go off on to repetitive again.

You see, you've got repetitive rudiments mixed up with Prepchecking.

Now, you ordinarily can expect over a long period of time in a Problems Intensive, something like that – you can expect a great deal of this kind of nonsense, you see. You can expect the pc to have a brand-new stream of answers and so forth.

So when you prepcheck, as you would be doing in the Y Unit, why, for sure, go back and say, "All right, anything been suppressed, been suppressed, been suppressed, been sup-
pressed, I'll check that on the meter," check it on the meter, still dirty, "All right," come off of it, "been suppressed, been suppressed, been suppressed," check it on the meter, and so forth. Because you've got tons of answers back of this kind of thing.

But not – not when you're running him on rudiments. When you say, "been suppressed," and he said no, you say, "All right, I'll check that on the meter," and just ride it with the meter from there on out, from there on out it's a fast check. You see? That will make life much simpler to you. And it'll save you a lot of auditing time, and it'll save you all of this nonsense about reads and not reads, and you'll stay with the meter and it'll upset you less. And I think you'll find out that's a very good way to handle it.

Now, this auditor – I hope you don't mind my mentioning this – actually you look like a bundle of nerves on – on there. Your presence, smooth it out, man, smooth it out. Get those overt's off, or something like that, because an auditor should look smooth and calm and inspire a great calm in the pc, do you see? That's much to be desired. And, work on your auditor presence there a little bit and get your overt's off on this, that and the other thing and you'll be doing better. Okay? No offense meant, I'm just trying to help you be a good auditor.

Now, the reason the item didn't fire here, probably, was because the goal wasn't firing. Now, the... if a goal isn't firing, the item fires rather poorly. And while it is true that if a goal is firing badly, or not at all, you get reads on the list and can check out RIs and that sort of thing, actually when the goal is not firing at all, the read is vastly inhibited. And, that doesn't say that if the goal isn't firing you won't get a read on an RI, you understand, because you could actually have a read on an RI with a goal not firing. But if you want to speed up this fire on the RI and have your list fire better and so forth, keep your goal cleaned up.

Now, in actual fact, in 3M the goal starts in, fires very sporadically at first, and then starts firing beautifully, oh, gorgeously. Big stuff. And then goes into one rocket read and two rock slams, and three rocket slams, and two rocket reads and one rock slam. You understand? Rock slam gets mixed up in this, you tiger drill it a bit, put in your big mid ruds, actually, on it, which is much better to make a goal read, and you'll find out those rock slams turn back into rocket reads again.

Now, you go a little bit further and the goal will start rocket reading again. Pow, pow, pow, it's reading fine, providing your listing is all right and not backwards and upside down. And the setup here, in brief, is that a goal goes from very, very hard to make it fire – a lot of prep checking and so forth, and it reads and then it's – pc sneezes and it doesn't read, and so forth – into bad read on the list but reading a bit better, reading more consistently – you're not paying attention to the goal, don't you see, but keep listing items, not wrong way to items and so forth, but right way to items, your goal will fire better and better, and better and then finally turns into rock slam, and in... versus, rock slam one time, rocket read – that's in the same call – you see. "To be a catfish" – rock slam, "To be a catfish" – rocket read, "To be a catfish" – rock slam. That goes from that phase, the chrysalis phase of the goal-it goes from there on down to fires well and then it begins to fire early and late.

You say, "To be a..." rocket read "... catfish," you see. "To be a catfish"... rocket read, you see. It starts firing way offbeat. That's by the time you've gotten three-quarters of its items off of it. And then when you've finally moved down to the line, your goal starts firing auto-
matically, and you'll find some item sometime, and that goal, particularly the first goal, starts
going pow, pow, pow, pow, and your tone arm is coming down, and you're not even saying it.
Just – the meter is just rocket reading itself on down.

Very interesting phenomenon, and it goes from there into no read at all, and that doesn't mean all the items are off of it. You find one more item, and the goal rocket reads, and then doesn't rocket read, and you'll find maybe one more item, or patching up the line plot, and for a moment the goal rocket reads, and then after that it is dead, you can't get anything out of it with a whip. There's nothing, nothing there.

And, speaking about getting something out of a goal with a whip, let's take up this next session. Now, May is... you're much better these days. I... your auditor presence is much better and fine. I'd cure myself of this glases trick, if I were you. You can't hypnotize him with those shiny lenses, you know? I know you're probably – got some kind of a glass that you can't see the pc well, but it's a mannerism you can do without.

All right. Now, this goal that was being checked out on Dick, has rocket read a couple of times, and is actually just being in the process of being prepchecked and checked out, and a goal in that queasy a condition probably is in no state to be shown on TV, so once more we didn't get a rocket read.

Now, I won't say the goal is it or isn't it, but I notice, with some horror, looking over this pc's 2-12 history, that the dance that was being played was to find an... write a list, and abandon it. And write a list, and abandon it, and write a list and abandon it. I don't know how many of this – times this has been done, but it'd been done – almost – something ridiculous, like about twenty times, something like that. And then they finally found an item, "Who would oppose being Clear?" something like that, and it did beautifully! Let's see, what's that item? Give me that list over there.

Female voice: It's, "A person who wants to do the right thing."

Yeah, the item was, "A person who wants to do the right thing." And I think after they listed 8,765 pages, they decided the pc was turning black, so they didn't do anything about it. Well, that's an exaggeration, they only listed 20 or 30 pages, you see. Pure idiocy! I mean, you'd get the last R/S you see on the list, and you go 50 items beyond it, and if your tone arm is flat during that period, or if it isn't flat, just that – that's it, take it!

Now, that actually should be completed on this pc. That thing is... should be packaged up. Now, if you can't find the R/Sing item on that oppose list to this, or this opposing, well do it the other – other way to, and find the item which opposes it. Because I see, very peculiarly, that the goal is being checked is, "To be right," and the item here is "A person who wants to do the right thing." I think they're so mixed up that you're going to have an awful time trying to check the thing out. So I think you ought to get a four-way package on that pc, and then check out the goal, that's the easy way to do it.

Now, if you can get the... an oppterm, a proper and correct oppterm, you can actually list goals against this oppterm the way we were doing it with 3GA Criss Cross. "If that were..." "If you were the oppterm, why, what goal couldn't you have?" And you'll come up with that pc's goal like that. Those are trick ways of finding goals.
However, you still apparently could keep on listing. This goals list is only about a thousand long, and you could go right on listing this goals list from there on, watching your meter very carefully, and you would see that some goal would fire on the thing. There have been RRs on the goals list, in spite of all that.

Now, what I was getting around to is you can't make a rocket read read better by shouting the goal to the pc. This must be in a calm, even tone of voice. You don't want... honestly, the meter doesn't respond better, the louder! As a matter of fact, quite the contrary. Look over your Effect Scale. And if you say the item in a normal tone of voice, you're much more likely to get a read. So, don't say it in a conversational tone of voice, say it in a crisp tone of voice. Like, "To be a catfish. To be a catfish." Now, this is something that auditors do that I'd better call to your attention. They say, "To be catfish." Didn't read, you see. So, then they say — they say, "To be a catfish!" And that didn't read either. "To be a catfish!"

You know? I caught myself doing it once, and I thought I'd better warn you. I didn't do it again, so you don't have to either. But there is no point in calling the goal louder, it won't make the read come on better. So on.

Well, I think May is doing fine, there. I think the pc — I think the pc, with all those lists — how do you survive them? But anyway, they've got a fine item there, and all it needs is to be opposed and a four-way package run on the thing and the pc will feel fine. As far as rocket reads are concerned, as I say, you could go right on with the list and list the things out.

Now we come to this last session and aside from a missed suppressed read, and a couple of other things like that, Peter's auditor's presence there is very good, he has very good control of it, and so forth; I think he did fine. I have actually no comment to make beyond a couple of fluky reads, on the auditor's auditing.

But I do have a great deal to say about how he didn't get a rocket read on this one! Now, he didn't get a rocket read on this one because — well, the pc is listening to this so I — I'll ask the rest of you to listen and I'll only talk over on the right side of the room, all right? Your — the right side of your room there. I'm only going to talk over there, and then the pc, he can listen over on your left! All right?

Now, this pc has done a sales talk, apparently, and everything that comes up — he was even bringing it up in the lecture tonight — I mean in the demonstration — he has a whole stream of oppterms here which are all the baddies. There isn't a single creditable oppterm, from the top to the bottom. And all of his terminals here are all creditable.

You mean that pc's goal never deteriorated, is that what we're trying to say here? And of course that goal won't read. There's at least two or three of these items — one, two, three, four, five, six, seven, eight, nine, ten — ten items, perhaps as many as five of them been listed backwards. And that's very, very certain to knock the goal out.

Now, the way — the way you straighten up a line plot like this, you've got over here on the original line plot the oppterms, baddie, the terminal, good. Bad oppterm, terminal good. Bad oppterm, you get the idea? Now, the pc of course wants to keep up his social caste. And so, naturally, he will try to give you an offbeat on that kind of thing. But in actual fact, he's doing himself in. You don't care, really, about the significance of things, but you can take one
of these line plots. You can take one of these things and look it over and find out why the case is blowing up. And it's blowing up because at the top of your line plot, on the terminal, you have at the beginning of one of these things, at the top, it comes right on down the line from discreditable, halfway down the plot, sort of neutral, and all the way down at the bottom, very germane to the goal. Very germane.

Quite opposite at the top of the terminals list, you see. Not germane to the goal. And that's the way it goes. That's the cycle. It starts in from degraded... Some fellow the other day, picked up the high-toned one and said, well, it was really degraded; the auditor bought it. Auditor evidently doesn't believe in the mechanical test that you make. Mechanical tests are what's important. This is what you do as an Instructor when you're looking these things over. You just make your mechanical tests each time, and you'll be there. Your mechanical tests consist of reading the line question, one way oppose and then the other way oppose. Read it one way three times, read it the other way three times, see which one turns on the most mass or so forth. The one that turned on the most upset isn't it.

Now, on the oppterm side you get the exact reverse cycle. You get a high-toned oppterm as your first oppterm and then that dwindles down halfway down the list, to maybe ten oppterms later, or something like that. That is turned into a very opposite thing to the goal. It's now completely opposite to the goal. So, and in the middle ground there, why, maybe five, six oppterms from the top of the plot, and you will find that it's a neutral thing. So you have a sort of a neutral versus a neutral there in the middle of the graph, and then it goes down and it becomes very opposite to the goal. Not necessarily degraded.

One shouldn't use the idea of degraded terminal if you don't understand it. It is – it is the idea of a counter-button, really. It's counter to the goal's sense and meaning. That's what we get. Now, that's what's wrong with that pc and that's why you didn't see that, but of course he was reading an item that had already been listed.

Just take up this last item here. This thing will have to be straightened out and this auditor has only one fault, and some of you... don't tell him I said this, don't tell him I said this, because I'll leave that up to somebody screaming it in his ear with a foghorn one of these days. He just won't list twenty-five items beyond the last R/S or RR. And also he's having an awful hard time telling whether something rocket read or not. And, looky here, now, now...

Don't pull this one: This really is not proper. Because your face gets so far away – gets so far away from the meter face that you can't see it. Now, here is what the HPA aspirant, in the course, in Darwin – this is the way he does it: He comes over here, and he's got the E-Meter over here, see. So he looks over here and he looks over here, and he lists over here, and
he looks back here, and so forth. In other words – too far apart. The way you want that is that paper – *bang!* See, you understand? Right there, up against that meter. You see that? And slide it up as you go. And you'll find your eye, you see your eye course here, is looking right straight across that meter face, right across the meter face.

And you're – you're always writing with the meter face – you understand, your paper moves up, not your pencil down, you understand. You move your paper up. And in that way you get yourself a sight across the meter face.

Now, you try that the next time you're auditing, and you'll be – you'll be much better off. I know you can't see something like that, you can't – you can't see anything better than this, you can't see anything with that meter downstairs, because of course the meter's way out in front of somebody and a person is listing this way. It's perfectly all right. The meter has to be placed that way so that you can see the meter. And the only way you could do that is get the meter propped up and slide this paper underneath the corner of it and keep it going forward. You could do something like that.

But look at – look at the point. As long as you have a meter face over here and your list over here, see, here you are on your list and you say, "lawp, dwa, raw, wy, daw zaw – well, I missed that one, so here's a question mark RR and is it something happened there, and I can't quite see it..." and so forth, so, question mark, question mark.

Oh, you're not going to get anywhere, man! Keep that together. And this is wrong, in front of the meter here, that's wrong, don't bother with that. Get it right over here at the side. I've been watching an expert do it that way, so I know it works; I myself have been doing it that way. And by the way, by the way, just to give you another good point here, you have some trouble with this colliding with this corner, because that's flat on the table. And you know these rubber feet, that come on the bottom of the meter – if you'll screw one of those rubber feet down here at the lower edge of the meter, the meter tips up and leaves a gap – see? There's a little bit gap left in there, and your paper can shove up through the gap. You got the idea? Pretty good.

No, you've got to keep your eye in line with that meter face, while you're writing. If you don't you have all of these other difficulties and you've got to go fifty beyond your last R/S, I don't care if the tone arm is what you call flat or not. It – you've got to go at least fifty, you've got to go twenty-five beyond those RRs and fifty beyond the last RR or R/S, on the source list. And you've just got to do that. You'll continue to lay eggs if you don't do that.

I notice on... that two RRs gave a tiny read. Now, please! What does that tell you? It tells you the list is incomplete. All right, he comes back later and tries to complete the list. But in actual fact, there is a question mark RR here, a question mark RR on this list, which is...

*Female voice:* Twenty.

...only twenty items from the end where the pc – where the auditor stopped listing and then he continued the list and, of course, the tone arm now is high on a continued list and that sort of thing.
I don't believe the pc's very much in-session. I should think the pc would be getting his head knocked off with all of these things backwards.

You know, as a pc, you ought to... any one of you as a pc, where it comes to these items, don't get so socially conscious and go out on a big sell. It's what the auditor says it is, and you just answer up to the tests and you'll do much, much better. We got two auditors as pcs out in the Z Unit who always march forward to the hard sell. The second an item comes up we've got a hard sell going. They hire Batten, Barton, Durstine and Osborn to sell this item, and so forth. We got another pc out there, that it doesn't matter where it occurs, and if it RRs, why, apparently it's some other thing on the list. Well, the auditor, of course, sensibly takes the read and carries on and he'll probably find out that there's an item which is doing this.

That's beside the point. Now, we didn't see any RRs tonight. Why? Well, you're just not going by the rules. The middle one, we can't expect that, because the middle session – middle demonstration, because the goal had not been found. The goal was being interfered with the item. Perhaps if that item were tiger drilled it might rocket read and she'd be away without a goal, you understand? If she's getting an occasional rocket read out of this all she might have to do is just tiger drill that R/S that was found and it will subside to a rocket read, and she is away. And she can do two or three – she can do two or three items there and then ask the pc what his goal is and she'll get it.

But the point I'm making here – the point I'm making here is your RRs aren't coming on, not because your rudiments are out, but because you're not following close enough in on the laws of Routine 3M. That's all there is to it. Well, let me tell you, if after you've got a half a dozen items, you haven't got a rocket read, oh man, if you haven't got a rocket read two or three inches long after you've got two or three packages off of one of these goals, you ought to quit.

The best way in the world to make a goal read is to get three right way to listed packages all going off according to the clock and then go back and read your goal. You'll be surprised. You haven't done it – tiger drilled it at all – you call it and it goes bang.

Well, I've taken a look here, and none of you have seen a rocket read. I meant to demonstrate one, so I said to Suzie, I said, "Would you like to go down and put me there in the pc's chair and read my last item up?" Of course, you're not going to get a – you're not going to get a rocket read on something that's been listed down. But, the last item I had doesn't happen to have been listed and it's about that long and it's one of these pow rocket reads. Most of my rocket reads on the second goal look like something that should be sent down to Cape Canaveral so that they can get their rocket program off the launching pad. Because your meter really starts functioning when you come out of the first goal area.

All right. Well, I thought your auditing was pretty good and nothing detrimental can be said about the auditing that has been done by this auditor on this pc. But the other two are simply suffering from just not being steered in the right direction with 3M – not going according to the rules.
Now, it took me about 150 hours so I could run something that vaguely looked like this — included all of the pilot work on Routine 2. And I really wasn't feeling comfortable about knowing how to run it until I'd done that much auditing on it.

Now, I allow you a certain leeway. I allow you a certain amount of fumble. But what I want to see is less fumble day by day and more accuracy day by day. And if I don't see some improvement I'll come to the conclusion that you're your own best opp term.

All I want to see is an improvement in what you're doing. And I think we can see that. If you don't understand 3M better on Wednesday than you did on Monday, and if you don't look and sound like a better auditor on Friday than you did on Wednesday, or getting more done, then I'd say you were wound up in some hopeless confusion back on the line someplace and you didn't know what you were doing in the first place and you better get your check-sheets passed. Because your progress as an auditor ought to be fairly rapid and you're not going to have anything shifting under your feet now. So there isn't much reason to do other than have good progress as an auditor.

Now, you'll run into problems as an auditor, problems of getting on an R/S which has disappeared. Now, that's a tough problem. I'm fighting that problem. All R/S to no R/S, you know, that kind of a — of a — of an action. And you have to get back and settle it and square it up. But it can be done and I expect that you'll hit these difficulties and carry on. But where you have a pc's goal and where you are finding items, honest, it's the most easy, certain, mechanical job you can do. And you just should be going on pocketa-pocketa-pocketa, and tonight I should have seen in two of those sessions all kinds of rocket reads. So I know that your Routine 3 is being done with a big fumble.

Now, get on the ball, learn how to do it, straighten it out, and you'll have pcs firing off as though they're being sent to the moon. As far as the quality of the auditing is concerned, as can be expected in Z Unit, the quality of the auditing is very good. I have no fault to find with it.

All right? There is your demonstration and thank you very, very much and let's give the auditors a big hand.

... Thank you. Now, let's give the pcs a big hand.

... Thank you.

All right. So here we are, that's the end of our Wednesday night demonstration, and good night, and see you tomorrow.
Okay, here we are. This is the what? Twenty-one February, AD 13. I know the year, anyway. And here we are with Saint Hill Special Briefing Course lecture.

Now, frankly, you're here to make it. We expect you to make it and you're not going to make it without data and – even though some of you are trying. You've got to keep up on your bulletins and keep up on your tapes and get your checksheets done and do a good job of auditing, because the better job of auditing you do, the better auditing you're going to get, that's for sure.

In auditor assignments we have a very nasty habit of pairing off the poorer auditors against each other and the better auditors against each other. So the better job of auditing you do, the better auditor you get. It's all these little persuasions. And while you're still in the universe, why, we have to use some of the laws of the universe to get you going and push you along. We don't like to use these laws but that is persuasion and duress and other things of that character are definitely indicated in some of these cases.

In other words, we – we're not against you. We're just against the bank. And if you get along, why, it's because you've overcome your bank. First thing I want to tell you in this lecture tonight is I've received quite a few congratulations on being Clear, and so forth. Actually, I'm just a first-goal Clear but – and almost a second-goal Clear, I've got so many items left on the second goal. But I've received quite a few congratulations and all of them very warm. But I'm also receiving here and there in the minority, some distinct shocks from people. They, "Aha, what do you know! Well, I thought you were seven times as Clear as anybody else ever would be," and so forth, and they're very shocked to find out that I have gone Clear. Well, for a long time my needle's been free, sporadically, and I very often use E-Meters or use my Clear read, that's been for years, to check out an E-Meter. I'm sure there are people around here have seen me do it.

I'd say that E-Meter's not right because it isn't reading at 3. I take a hold of it and so forth. But that's beside the point. Those that have, have sort of missed the story. They – the people are shocked about this, they – they've missed the story. This idea of somebody full-armed from the brow of Jove or something like that, coming down and helping man, and so on, that's an old story. That isn't even news. But somebody by his own bootstraps even as you, pulling himself up through this thing, that is news. And whatever you have done and been on the whole track, or whatever I have done and been on the whole track, it still amounts to the fact that a guy just like you made this. And has made it, and also "physician heal thyself," has been broken all ways from the middle. Because it never happened before. That's what's news.
I suppose my bank to a large degree's been keyed out but over a period of time has been keying in harder and harder and about knocked my head off, and I was working out technology by which you could get Clear, and I hadn't had any auditing to amount to anything for a couple of years, actually. Mary Sue rolled up her sleeves and there we went and here we are. And this is a very satisfactory, well, I won't say an end to the story, because the story is a long way from ended. But I will say it's a very satisfactory denouement on the question, "Can one lift himself by his own bootstraps and beat all the laws of God and men in this whole universe from one corner to the other?" And the answer, of course, is yes.

Now, where you have a will, why you don't always have a way, but a way can be worked out. I was very interested to hear today from Louise who left here some little time ago, a Saint Hill grad, and she was telling me what she'd been doing, and it's the wildest story I think I've read in a long time. This girl, without any training on 2-12 but having learned how to study and audit here, has been banging into cases where she is at the present time and has apparently divined the fact that as long as a pc is ARC breaking and screaming and feeling bad and so forth, it just must be that the list isn't complete. And so she's gone on and on and on and on and nulled and looked and nulled and gone on and listed, and she's not been abandoning lists. And she finally turned on great big rock slamming items and so forth on each one of these pcs and they've come up really smiling. And she's having some resounding success with 2-12, and probably all she's equipped with is simply the original 2-12 bulletin. And with what she already knows about auditing and 3D Criss Cross and the rest of it, why, she's been able to somehow or another sweat her way through this, and she doesn't even know about the four-way package. But she's been having some enormous success.

She isn't abandoning lists. She says, "Well, this list is running and it's making a change on the pc, and I can possibly see the tone arm moving, and so somehow or another there is something on this list and I mean to find it. And she has been going on in that fashion. Rather interesting approach, a sort of a dogged, persistent approach. And she's been getting some rather fantastic changes in cases. And it shows you that the school of, well, "List half a page and it didn't work, and abandon that, and list another half a page on something else and it didn't work and abandon that, and list half another page on something else and abandon that," that school isn't succeeding. That's definitely a losing school.

I myself am up against this in auditing right now and I just mean to push on through on the list which gave us trouble originally, and I'm going to finish up that list.

Now, when 2-12A came out, I gave you some data that you should go back and repair some of these lists. I should have said at that time, "On those cases which were having trouble, go back and find the widest rock slam which has been seen on the pc and finish off a set of packages with that and you'll be far better off." Well, that's true. That's true. On cases you're having trouble with.

But let me tell you something now. And this – this lecture is mostly about R2 and R3, and current auditing on these. And also I'm going to give you a step by step of how you do R3M.

But let's take this now, and let's observe something here. That the more you monkey around with what's been done on the pc, the worse luck you're going to have. Do you under-
stand that? You've got this pc up here to about his fourth list and he's getting someplace, and it's going along not too badly, and you all of a sudden decide to duck back to the first list that you did on the pc and examine that and redo that and do it some other way and start patching up a case, crashity-crashity-crash, by going back, going back.

Now, it's true that the error always lies behind you. But taking a case that can be continued in the run and going back is very bad. Now, that is something you should pay some attention to. In other words, if there's any way to keep the case running, if there's any way to continue to get new items on the case, if there's any way at all to continue the forward progress of the case, then you continue the forward progress of the case. You understand that?

Because the more you go back and patch up yesterday, the more items you invalidate for the pc. Let's say you have ten on a line plot. We saw one last night, and I was commenting on this. Actually, I owe that pc a bit of an apology. He may have gotten the idea I invalidated all of his items. I didn't. I merely said that somebody is putting the items down on the wrong side of the line plot, and this is causing trouble. And the pc was in trouble. But I didn't mean then that that pc should scrap all those items.

Now, listen, any item that reads is the pc's item. I don't care whether you can – whether it's matched or packaged or not. If the item reads and continues to read, it's a... and it isn't a represent of a rock slamming or rocket reading item, if that item is reading, it is the pc's item. And you can find opposition to it and so forth. That's true of all items.

Now, let's say that we listed something early on the case wrong way to and we listed the item "will-o'-the-wisp" early on the thing, and we treated it as a terminal and we eventually find out it's still banging like mad, and we have to list it again. But when we listed it as a terminal, when it was actually an oppterm, why, we got an item, "whippersnapper." Well, now, that is the pc's item, and it does have something to do with will-o'-the-wisp, even though it was listed backwards. Do you understand, this is no excuse for listing it backwards, but it just says just this and no more: Don't throw away this item you found, "whippersnapper." Don't throw it away and say... give the pc the big idea that now because it's been listed backwards he's got a wrong reliable item. He hasn't. That belongs someplace on the line plot. And you just put it there and keep on going.

So even those items found by something being listed backwards are valid. They're valid items. And you'll find out eventually they'll fit into the line plot. So you don't scrub all of a pc's items and go back and dodge around and patch up and this sort of thing. The best patch-up for Routine 3MX – or 3M – rather, the best patch-up that you can do is when you've run out, fresh out, of rocket reading reliable items, which produce no rocket reading reliable item. You know, you've got it – rocket reading reliable item – it tells you that in the original R3M, by the way – you are fresh out, you can't find one from this reliable item. Everything just evaporates and it doesn't matter what you do to it.

You go back and do another goal oppose. And it'll land you right where you should have been. It'll give you the item in sequence. But just because it's goal oppose doesn't mean it gives you an oppterm. It doesn't. It gives you a terminal or an oppterm. You have to test it out just the same.
Don't go scrubbing everything you have found on a pc because you find something is backwards. That's the message here, see? If you found something off of it, by doing it backwards, inadvertently, that's still an item and it still belongs to the pc and it still fits in on the line plot. Do you understand? So it isn't a matter of scrubbing everything.

But you shouldn't go into a wild wing-ding of trying to make nothing out of the line plot by scrubbing it all, just because you have to do something in reverse. That's the whole message I'm giving you here. And if you have a cycle of action which is continuing and you can do something with it, you continue that and you do something with it. Don't keep monkeying. Get something done. It's very discouraging to a pc.

Now, I had an example of this last night. We socked into one and did it wrong way to. I notice, by the way, that basic case changes – is something can be done wrong way to and upside down and my recovery level from this is very rapid. It's getting very rapid. You could list me backwards for, well, you could take one of these first Saint Hill V Unit lists, you know, a hundred and ninety-five pages because they wanted to know if the original item that was coming from had ever rock slammed, you know?

One of these arduous endless pieces of nonsense. And so it'll practically spin you in, see, and formerly, why, I just would have hung on with me for days. And now, I notice – oh, a few days ago I was noticing that a bum steer or something like that, I would be all over it the following morning when I woke up. It'd be gone. And now I'm noticing that it evaporates in about half an hour after the session. You see what I mean? Recovery is getting better. Resilience, bounce back, that sort of thing, that is one of the most marked improvements which I have noticed.

Some of you will be wondering what happens to weight. Weight goes down, but it rather goes down relatively slowly on 3MX, and may or may not go down at all on 2-12. You may get a lowering of weight on 2-12, and you may not. But you certainly get a lowering of weight on R3M. The more you do R3M, the more of it you do, why, the more weight drops off. But it starts dropping off very slowly at first. And whenever you do one wrong way to on the pc, he loses his weight ground. You get the idea? I mean, you've gotten six items now, and – on the spiral staircase, and the pc has lost something very small, like three and a half pounds, something like that. And then you take item seven, and it is "a beautiful – a beautiful guardian angel who is pleasant and sweet and loved by everybody," you know? And the pc goes on one of these hard sells, and says, "Oh, that's me! Oh, that's me! Oh, ho, that's me. Oh, ho, that's me. Oh, ho, that's me. Oh, yeah." And the auditor, not being an auditor, you see, just – you see, the auditor's there because he can think, see, and if he doesn't figure this out for himself, he's not being an auditor. He's just being an automaton.

So he buys this hard sell, and of course the thing is an oppterm. So he'll list this thing, this beautiful angel that is loved by everybody, you know, and – and you list this thing as a terminal, and the pc's getting blacker and blacker. It helps to be observant as an auditor, you know. I just wanted to get that in, get that in just as a little tip. And the pc goes blacker and blacker and blacker and blacker and blacker, and then, there he is. There he is. All the problems of racial consciousness and everything else on his head.
And by this time you say, "I wonder if that terminal is false? See, the needle tightened up, mass pulled in on him, he went black. Let's see now, there was no tone arm action from the beginning of the list to the end, and I didn't get an item off of it. And it's still – the item, a guardian angel who is beautiful and sweet and loved by everyone – is still rocket reading half a dial. Do you suppose that it could possibly have been an oppterm?"

Well, that's pretty good. I mean, even if the conclusion is that stupid and drawn out and so forth, it still – the guy came up with the right answer. So you list it as an oppterm, and this time you... of course, you kind of mucked it up, so it doesn't behave just right. You know, the tone arm action isn't good, and the needle frees up slowly. Actually, for the first 15 or 20 items he – he's having an awful time listing at all, you know?

Then all of a sudden you get it listed out and you find your item. Well, even though that's packaged up, you put your pc on the scale, you find out he's just lost that three and a half pounds gain. In other words he weighs three and a half pounds more. He's right back to where he started. Do you see that? I mean, he's lost three and a half pounds by your earlier packages but when you got up to item seven you listed one in reverse. Well, you cancelled out his win, and he'll go back up and weigh the same as he did before you found the first package.

But then he gets a rather fast recovery, and you go on down the line, and he starts losing weight more rapidly than he did before. In other words, you don't ruin his ability to lose weight but you simply gain back by alter-ised mass the weight which you already had taken off the pc.

This is interesting. Very, very thin people at this stage, of course are going to worry. Very thin people are going to worry at this stage. And I will tell them a little fib. I don't know this, but I will tell them a little fib and say I hope that an optimum amount of weight is put on by reducing the GPM. Very probably is but we have nothing on – no test data on it at all.

But we do know about the more weighty side of it. Now, in other words, you make a goof, and you undo some of your gain. But even then you don't completely ruin the pc.

In the area and zone of case repair, one of the favorite actions that people undertake is to find a pair of items and then decide to go back and patch up something. And it's all relatively unsuccessful, and then they come back to the pair they've just found and take the last one, it's still rocket reading more or less, and then list that, and they find out that all the time they've been fooling around, the pc's been sitting in the somatics of the pair that were last found. You see that? I mean, finding a pair of items, number, well, let's be mathematical about it, numbers 11 and 12 on the line plot, term and oppterm, and then going back and straightening out wrong way to number 3 and wrong way to number 5, and then coming back to 11 and 12, you'll be rather struck to find that your big upsurge comes when you simply oppose what you should have opposed, which is number 12 and get number 13. And all the somatics that you started looking for on 3 and 5 actually were sitting right there on 12. Even though they were backwards opposed.

That doesn't say don't straighten out a line plot, but only straighten out a line plot if you have to. Now, what do you mean, have to? Well, if after you've found all of the whole GPM and all the packages in it, it doesn't blow free and won't prepcheck out, you'd better go back and patch up all of the – all of the misaligned items. That's more or less the time to do it.
How do you patch up one of these 3M cases? Interesting technique here, is February the 1st, I think first one out, this was about 26 January, something like that. Hasn't been out any length of time at all and we're talking about how you repair one. Some commentary, isn't it?

Actually, the best way to repair one that isn't running right, you've just run fresh out of – you've just run out of items, I mean, you... the pc lists down what you've got and he can't find anything, and he lists down what you've got. I know I told you goal oppose, but I'm talking now about a severe case, now. You just can't seem to get your hands on anything, and you don't know where you are or what you're doing, and so forth. You have a choice here. One method is just do another goal oppose and you will land there right side up with the next consecutive item, always, whether it's a term or an oppterm.

But maybe the pc's sort of ARC breaky and maybe he doesn't take kindly to all this and so forth. Well, your other method is to go over the line plot and read every one of them, and give each one of them – of the items on that thing – a big mid ruds Prepcheck very rapid, and just give them a big mid ruds Prepcheck on each one of these items. And you'll find that one of these things is reading madly. In other words, the whole case is tied up in one of these items.

Actually, you have to continue to list every item that fires – if you want to do a patch-up. If you find that there's still a dirty read on item number 7, what's the proper thing? It doesn't mean that it was wrong way to listed. It just means it can be listed again, and another item found on it. Now, how is that?

Well, every time you do a wrong way to on the GPM, it upsets the frequency of the GPM and loops the whole thing over and puts it down into a good solid bing-bang pack, see? In other words, let's say this – say, here's your lineal GPM, see? All right. And you list one wrong way to, and you get something like this. And it'll tie something up down here, see. And then you list another one wrong way to and you get something like this.

Now, now what happens? Well, every time you list something, you get something down here. And then you could list the same item again and get something here. And eventually you've got to undo the ball-up that you've done. Well, you haven't worsened the case by doing this, it just makes the frequency with which you get the items wrong, so they don't appear in the right sequence on the line plot.

In other words, after you've listed something wrong way to, you've upset the frequency because you have jammed up the GPM, see? So that anything you get here, now, is getting something up here, when actually it should have been getting something here, don't you see? So, you – you've balled the thing up. And you can't expect your frequencies to work.

So sometimes you list an item, let's say number 7, you list number 7, and you get a cat whisker, or something like that. And that's fine, and you list that and that's fine, and you oppose that, and that's fine, and then all of a sudden you're out in thin air and you don't quite know what to do. Funny part of it is you go back and read number 7 again, and it has an additional fire on it now. You've got to list it the same way you listed it before, it wasn't done backwards if it's just got a dirty read. Backwards gives you the full read back, you understand. So just your little dirty needle on number 7, you just do another list on number 7. And you'll
find up... you'll come up with the consecutive one that you should have found by listing down number 11, see? That's when you've already looped the GPM. The thing to do is don't loop it.

But after you have, why, then you have a little bit of a picnic. You have trouble. And you just have to remember these things. The rules actually aren't upset. The frequency of listing rules, and all that sort of thing, that isn't upset, it's the sequence by which they go on the line plot that is upset. And you sometimes have to list one twice, you know? I mean, you list number 7, it appears to be clean and everything is fine, you get down here to number 11 and you all of a sudden can't find an item. The thing to do is to go back over the whole line plot and test each one of the items on the line plot and see which one is now firing.

Now, take your biggest read as the one you fix up. You got a big rocket read, the probability is it was listed backwards in the first place. So list it the other way to. You understand? That's just conditional. You test it again. It's no guarantee it's backwards, it may be frontwards. But you understand, you got – you take your biggest rocket read that is on the list, and if it's as big – if it's a good, big strong powerful rocket read, the chances are the item was listed in reverse in the first place. That's no guarantee that it was, but just the chances are.

It also may be listed the same way and pick up a brand new item, and behave exactly as though it had never been listed. You understand? Well, that's the first one that you take. You make sure, just apply all your tests again. Just treat it as though you've just found an RI, you got the idea? You just found a new RI.

"Well, where'd you find it?"
"Well, I found it on the line plot. Yeah."

Well, he'd just found an RI. It'd already been listed and everything else, but there it is, firing, so we'll just treat it as though we just found an RI. We have to find out if it's a terminal or it's an oppterm, and we list it again.

Now, these little, little fellows, the dirty reads that pick up as you go through there, you can continue your biggest dirty read just as you did before. It'd be a mistake to do it in reverse. It isn't in reverse, it - it just... because of this looped up character of the bank, which I was showing you, the thing now can be listed another step. Yet another list. And it'll go 25 items beyond the last RR and R/S, or – plus the no tone arm action, and you – you'll wind up with a brand-new item. And mysteriously this brand-new item fits right down here as opposing number 11. Very mysterious.

Now, you can go back and run a goal oppose list, see that it'll just avoid all that, and go back and run a goal oppose list, and you will wind up with the item which opposes number 11. Or you will wind up with the item that opposes that great big rocket read that's left on the list.

In other words, I'm giving you – there's a number of ways to enter this thing. But if when you're entering it you have the idea, or your pc gets the idea that you're just going to take his whole line plot and tear it up, and all fifteen items which have already been found are all invalid and no good any more and so forth, because they were all from a wrong way to list, or something like that, boy, you want to get an upset or ARC broke pc? Actually, you can just
take a pc and say... and tell him halfway through one of – "And I don't think this up here is very valid. And I'm going to change all this."

And all you have to do is cross out the old GPM, after you got the new GPM written and he'll blow up. Just the action of invalidating his items by saying we're writing a new line plot, is enough to knock a pc off his base. That's interesting, isn't it?

Well, sometimes, as we had to do today on one of the cases, the first demonstration last night, go over the line plot and look it over and find out what on the line plot is still firing. And we found the first item found on this pc was still firing, and I looked at the line plot and it didn't look right to me, and today, why, they went back and found the first item had never been opposed properly, and they just handled that as though that was the RI which they'd found and proceeded from there, and that case will be in good shape. That's why you didn't see a rocket read last night. Do you understand?

Our rocket reads don't disappear like that. They... you should be able to see a rocket read during a Tiger Drill – just tiger drilling. So, you're tiger drilling, and, on Suppress, you know? You say, "On the item 'a happy schoolgirl' has anything been suppressed?" – Pssww! See?

You see those on a real live item on an actual RI or something like that, or a goal, you will see on the buttons, you will see these fires. And in 2-12 you will see the buttons do a rock slam. You see, what's happened is the buttons have stolen the read, and then you gradually get back and put it on.

Once in a blue moon – now, it's on another subject, on 3M – you'll find that you get an R/Sing item. And one of the items which R/Sed when it went down on the list is the item. That's interesting, and worth knowing – once in a blue moon. That will come from a shattered up wrong way to listed GPM, or something. And by tiger... it's the only item on the list and it appears on the right place on the list, and you read the RR and it didn't fire, well, for heaven sakes read the last R/S, see. And if the last R/S fired and nothing else fires, then you start on that and put in your big mid ruds on that item and it'll turn into a rocket read. That's quite interesting to know.

That's only after a bank's been clobbered and run backwards that it starts to misbehave. You want a perfectly behaving bank, do everything perfectly and don't bust the rules anywhere along the line, oppose everything right way to, you'll never have any trouble at all. It'll go off with perfect frequency.

But where you've done something wrong way to, you've left one of the items rocket reading like mad and there's no telling exactly what's – what's what. It doesn't mean that the rules of listing are now disobeyed. They're not. You do the same rules of listing. But it means that you start finding terminals which have no apparent oppterm, and you start doing a line plot that has holes in it. And then you will come down from the top of a line plot, and all of a sudden, as you're finishing up the case, you think, you'll find out you've been going backwards up the line plot to join what you had already found, and then you are left out on a limb because it all joins and you have nothing left to oppose. Well, then you go over your line plot, find something firing, oppose that thing, properly again, and it'll put you in business again and
then you start down the line plot. That's because somebody has got the line plot all jammed up.

The way to do it is to do it right in the first place. Now, it is, however, easy to do wrong. Very easy. All you've got to do is – well, aside from such crimes as faking a read, you know, saying you saw something and didn't, or losing an item which is actually on the list, and you know, I speak of these as corny errors, see. Just corny. Aside from that I'm talking about a proper and valid error. The biggest stumbling block in R3, the one that you'll have most trouble with now, is differentiating between a terminal and an oppterm. And that's the most trouble you're going to have.

We used to have a rule by which, before we said the list was complete and stopped listing, we read the source item. Do you remember that rule? Well, you'd better invoke that rule. And every time you want to know if the list is complete, you read the question of the list back to the pc and then read the item the list is proceeding from.

Let's say we're getting a list "Who or what would oppose a will-o'-the-wisp?" Well, before we hand the pc any items or consider our list complete or do anything else that-a-way, we had better read the "Who or what would oppose a will-o'-the-wisp," and "will-o'-the-wisp." I'm not saying you've got to drill them and all that sort of thing. If it's got a little dirty read on it, you continue your list, you understand? And you will be in lots less trouble if you start that type of thing. And if after you've listed it a considerable distance, and you've listed it to a flat TA, and you read it and it rocket reads, that list is wrong way to, so you just abandon it. Don't do a thing with it. Because it'll upset the frequency of the GPM if you throw the item into relief. And quickly list it right way to and you'll be much better off.

Pc ARC breaks, go back on the other list and give him an item off of it. But the point I'm making is, is you should test the item that you are listing down. And if it rocket reads, it's – after you've more or less completed the list – you know very well that it was backwards. So don't monkey with it, just turn around and list it the other way quick. And if it does a little dirty read, why, you continue it.

Now look, that you get a dirty read on an item is significant. It means something very definite. It means that the list is not complete. You got that? I mean, that – that's the long and short of it. But that it is clean is not a test. Do you understand, the reverse is not true. Just because you get a clean needle you don't – you don't have a test. It's not a valid test. Just because you get a clean needle doesn't mean in R2 or R3 today that your list is complete. It simply means that the test of 50 items on a source list, for both R2 and R3, and 25 items on a – an opposed RI list in R3, no tone arm action, tone arm action ceased and you listed 25, about 5 deep into the 25, you had a rocket read so you promptly started in and counted 25 from that rocket read. In other words you had to add 5 to your count. Make sure, always, that you have 25 beyond that R/S, the last R/S or last RR, or in R2-12, 50.

And read the item that you're listing from. Read that item. And if that's got a dirty read, continue your list and start testing against that. Now, you know very well that you will get a complete list. And if it rocket reads like crazy, after you ostensibly have completed the list and before you've given the pc anything, if the item you're proceeding from still rocket reads, naw! Naw, you've got a wrong way to oppose. So oppose it the other way quick like a
bunny. And if it doesn't work the other way, well, I guess you better assume that the list – the item you got the list from, or something crazy, was all wrong. But you will find out that one way or the other, you will get the charge off of it.

Now, any item in the bank is the pc's item if you can get it to behave like an RI, providing it doesn't come from the representation of a rock slamming item. Let me pound that home. That's very important. Any – any item you find is the pc's item, will fit someplace in his line plot, I don't care how screwy the thing sounds. The only thing that happens here occasionally is after you've listed out the whole GPM, it's all gone free, it's all gone Clear, and then you continue to oppose items, you'll go over into the second goal.

That's inevitable. That happened to me. And the second GPM is much rougher than the first GPM. That's much rougher. Probably has more items in it, much tougher, has more mass on it, and of course you're much better able to – to brush the tide, and you'll find out your pc by that time is behaving much better on the meter, and so you can get through it easily. Actually, it's easier to audit, but more formidable at a glance, than the first GPM. That's worth knowing, that after you get to be a first-goal Clear, why, then you start up the mountains. That's a grim foresight. Actually, it's much easier done on the second GPM than it is on the first one.

Now, what – what are the steps? What are the steps of 3M today? Well, let's go into these very rapidly, and I'm not taking these off of a sheet or anything like that, so I'll just give it to you off the cuff as though I were auditing it.

First thing we'd want to have straightened out on this pc is we want this pc capable of getting an RR and R/S. Well, we depend on 2-12 to hand us that. We want to know if this pc's reading on the meter, and so forth, so that we can tell whether or not there is an RR or an R/S capable on the thing. That's probably more im... less important than I'm giving it stress. That probably is not very important. The thing about it is to find a goal. Well, the old 3GA methods of finding a goal are quite valid, except you don't have to represent the rock slamming item. You can take any R2 material, any oppterm, and so forth, and list goals against it as in 3G.

How do you mean that? Well, "What goal of yours would be an overt against (whatever the oppterm was)," see? You can list "If you were (whatever the oppterm is you choose, that's been still reading like mad), If you were (oppterm), what goal of yours would be impossible to achieve?" There are a list of about ten, ten goal categories. Well, that's possible to find a goal with those, and using any of the 2-12 material which you have on a 2-12 line plot.

And it's also possible just to sit down, and taking your meter in hand, taking your meter in hand, just go on and list goals. Just go on and list goals and go on and list goals and go on and list goals and goals and goals and goals, watching for the rocket reads and very carefully putting down anything that rocket reads. You see that? You can just go on and list goals.

On some cases that is not tremendously successful, but those will be cases that you – you can't get an RR on and can't get an R/S on, and so forth. Those cases, however, do respond to this other 3GA Criss Cross method. With a 3GA method of finding the goal, you just do some 2-12 of some kind or another and you get a rock slam turned on on the case and find
one of those oppterms, and then list goals against the oppterm. And you'll wind up with some
goals that rocket read and so forth.

I've seen this, by the way, case after case, I've seen – work out like this so it's a very
good method of finding goals.

Your easiest one is just to list goals. It's the least time – maybe more time consuming
at first glance, but you list all the TA action out, and so forth, and pc, even if his goal's been
found before, will eventually put it down on the list and it'll go pow.

The worst goals to handle are the goals that have been found and been monkeyed up
or been neglected and don't fire anymore, and then you start doing this and that. So always go
over the pc's old goals. Use the beginning steps, in other words, of R3-21. Go over the pc's
old goals, look these things over, see what you've got.

But don't depend on a big mid rud Prepcheck to turn on a goal. Don't depend on that to
give you a rocket read. Because frankly, it won't always do it. In fact, there – I've seen goals
around that have been listed and so forth. The big mid ruds are run on it like mad, and what
did we have left? We had a no-firing goal. And then, I have used a method of finding some
items that we're now calling 2-12 and so forth, and then having found some items on the
thing, all of a sudden the old goal turns up and fires. And we've – we've done that several
times.

So there it is. You did the 3GA method of finding the goal, the pc will put his goal, old
goal, back on the list. He always will, and you get to it this time and it goes pssww! And nothing
else on the thing is firing.

Now, the liability is that there are some goals that will rocket read for about an hour
and a half, as long as that. There are some goals, particularly after the pc's goal has been
found, you can get one of these confounded things, and you start tiger drilling it and straighten-
ing it out, or big prepchecking, big mid rud prepchecking it, and the thing fires. And it'll go
on, you'll see several rocket reads on it, and then it expires.

Therefore, don't so much worry about this happening with a goal, just be very, very
chary indeed of proceeding on a goal channel. Be very, very chary of proceeding down the
line on your first goal opplist. And if you don't see any rocket reads on that list – there's no
item can be found on that list, and you see an R/S and you oppose the R/S, along about this
time you better start getting very, very leery of what's going on. If you don't get a rocket read
now, well, there's something wrong with this goal, that's all. I'd get very suspicious of the
goal. I wouldn't carry it too far. I'd start treating it as – don't abandon it – start treating it as a
2-12 subject. You understand? And I'd go ahead and make a four-way package out of the
thing, neat it all up, tie the strings around it very neatly, and go on with my business.

Otherwise, you're going to park the pc right on the track where you found it. The
chances are too, that this can happen – this can happen: You can take a wrong goal that has a
sporadic rocket read, you can list it down on goal oppose, you can find a rocket reading item
and you move right in to the GPM, but it isn't the goal. See, that's a possibility that can hap-
pen. Well, the thing to do with that, don't interfere with it, you're getting along, you've got
spiral staircase and so forth, the pc will start nattering about is it his goal. Well, let the pc give
you a few goals that it might be. And you're liable to find that – not just liable to find, I mean, I haven't seen this happen, I'm just saying it's a possibility; the pc actually has a different goal than the one he started in on.

In other words, you just used this goal, and you found an RI, and you started down the spiral staircase, and then the pc is nattery and unhappy about the goal and so forth. Let him give you a short goals list of what he thinks the goal really is. And you're liable to find that you're – you were offbeat with this goal. That's a possibility. That's only when the pc starts nattering and says, "It isn't my goal and I don't know anything about it."

Now, you start running too many RIs without the pc's goal, and you get an unhappy pc. He can't handle these things. You always want to equate the RR... RI on 3M against the pc's goal.

You say, "Well, does this have anything to do with your goal 'to catch catfish'?" You see? You find "a milliner." "Does this have anything to do with your goal to 'catch catfish'?"

And he says, "Oh, hm, no. Uh-uh."

If that sort of thing keeps up, you'd better do a little goals list and find out where the devil you're sitting. Because it might not be the pc's goal that you're running, you see? You might have something that led you into the GPM but isn't the pc's goal. That's a faint possibility.

Your usual response is, you get something like "milliner," and the pc's goal is "to be a bird," you know? And you say, "All right, does this have anything" – you always ask him this about an RI, and you say, "Does this have anything to do with your goal?"

"Oh, I don't know. Oh, well, hell, yes! Hell yes, hell yes. You look at these women's hats, and these big peacock feathers, and so forth, yes! Yes! Definitely an oppterm. Oh, they're terrible people, milliners. Terrible people. They pull out your tail, and so forth."

He'll cognite, see. Always give the pc the chance to orient that RI against this goal. Don't pester him with it, just call it to his attention. And then you always give a pc a chance by saying, "Would the item" – you've just found a terminal, you see – "Would an item 'game warden' oppose the item we've just found, 'fisherman'?"

And the pc says, "Yes, yes, yes, oh yes, yes, hmm."

In other words, does the item have anything to do with his goal and does it oppose or couple up with the package that you're finding? And you ask the pc to do this and he'll blow a lot of mass and so forth. It's coaxing a pc to look at it, don't you see? Sometimes a pc doesn't. Pc says, "Oh, that's marvelous. Millinery. Yeah, that's fine." And you go on down the line, and the pc is just not really in as high a tone as he could be in. So call his attention to the packaging, ask him, you know, "Does it oppose," or "Is it opposed by," and call his attention, "Does it have anything to do with the goal?"

There's, those – there's... are your provisos. But as far as steps are concerned, the ordinary step, not looking for trouble, we just take somebody in off the street and we list goals on the meter and list goals on the meter and goals on the meter and goals on the meter and goals
on the meter, and then we get a rocket read every once in a while and we mark down the rocket read, and we keep listing goals, listing goals, and we mark these things down.

Then we go back, when we've got the tone arm action out, and we check these rocket reads, one after the other, and we're going to find out one of them fires like mad, and we prove this thing out and we're all set. Let's say we've done that, see? All right, we've got a goal now that rocket reads, we get it checked out by somebody and everybody agrees that this thing rocket reads and so forth. And we now list it on goal oppose.

Now, we've got to sort out with the pc – is whether or not it's "Who or what would somebody or something with the goal to catch catfish...," or is it "Who or what would the goal to catch catfish...," or "Who or what would to catch catfish oppose?" See? We've got to sort that out. One of these things you'll find reading, if you care to take a little summary and the – possibly there are other wordings, such as "catching catfish," "Who or what would catching catfish oppose?" You take such readings and you check them off. Do a little assessment on them, you see, and one of them reads nicely, and the others don't. Well, that's what you list.

And you've got to clear the command with the pc. The pc sometimes will not be able to answer one and so therefore he will protest it, and you get your read on protest and so forth, and you're all messed up before you begin. No, you've got to clear a command with the pc. Please clear it intelligently but also clear it on the meter. Because pcs go on a hard sell sometimes, and give you a bum steer.

Now, we list this thing, and we list it down to a still TA, unless the pc is jumping around, and so forth. And if we've got too much jump-around and we can't tell what a still TA is, and we have a large argument about whether or not there can be a still TA, and all of that. Well, the thing to do with all of this is to take it beyond the last RR or R/S. Whichever it is, it's the last RR or R/S, see? It's a... there's the last read on the list, big read, is an R/S, we take it 50 beyond that R/S, see, and it also must be 50. That's not in addition to that 50, but it's also 50 from the stillness of the TA. But if we can't even tell if the TA is still or not and it's all kind of gluey and the pc is doing this and that and he's running Havingness on himself while eating striped candy or something, you know, I mean, there could be reasons why the TA isn't motionless. We still only continue that far – 50 beyond.

And that's for R3M, that also is to – true of R2, when we're listing stuff. Fifty beyond that item.

Listen; don't you go on overlisting endlessly till the pc goes black, purple, green and pink, you understand? Because that's – that's just being 1.1, see? Just knock that off because there's no sense in it. The time to extend the list is this next step.

Now, we go back and we test this thing. We say – we got 50 beyond this. Now, we don't do anything with the pc, see, we just say to the pc, "Who or what would catching catfish oppose?", whatever it was, see? And it goes tick, dirty read. And we're not sure, so maybe we drill it for a moment or two. "On this has anything been suppressed? Invalidated?" and so on. Rapidly, though, rapidly, lightly, you know, not the rest of the day and next week and next month and next August, you know. I mean, this is a three-minute operation, see, at the most, absolute outside.
And we find out the confounded thing still has got a dirty read on it. All right, that's fine. Let's continue our list. And you'll find out you're going to get a new R/S, or you're going to get a new RR, see? And then go 50 beyond that and test this thing again. And this time you're beyond it, the thing isn't reading, everything is fine.

Now, the hell of it is, the read can be any one of the RRs on that list. You don't pay any attention to the R/Ses. If there were RRs on it... Mind you now, you can have a goal oppose list with a perfectly valid goal which has no RRs on it. You know, it has nothing but R/Ses on it. But you test that, and you test every one of those RRs, every one of those R/Ses.

Now, if you don't find it – bang, then you go on this over and under, see? You read the next one above and the next one below each R/S or RR. And the next one above, the next one below, the next one above, the next one below. You understand? And you're going to find that item.

And you get that item, it could be an R/S. You put in the big mid ruds properly, it'll probably RR. But you remember your goal is fresh, your goal isn't firing well, it hasn't been unburdened very much, so don't expect too much of it. If you can't get it to fire, RR, you still determine whether or not this item you have found off that source list is a terminal or oppterm, and you now oppose it accordingly.

You understand, it can be an R/S or an RR, because there won't be two R/Ses or an R/S and an RR, or two RRs firing on that list. If there are, the list is not complete. Simple. So you complete the list.

Now, you've gotten this item, that is the pc's first RI. And don't keep mucking around with it and deciding it's this and deciding it's that and taking a week to find it out. It takes me about five minutes, so you better take no longer than ten, you hear me? I'm getting cross, actually, about this. I really am, I'm getting cross, because I tell you, man, it doesn't take a week, it doesn't take a session to find out if it's somebody's item, you know? That's just corny. Because you're going to kill the item. The pc gets so damned tired of this, he goes on a protest, you actually can't get anything to read at all, see? That's just monkeying.

Look; if you were listing well – if you were listing well, reading down across your meter, with this alongside of your meter like I was showing you last night, you know, put that paper alongside of the meter and get your eye so it goes right straight down across the meter face to the paper and keep shoving the paper forward with your other paw as you write, and with your sensitivity down here at about 4, you're going to see all the RRs and R/Ses you want to see. And those things should be clearly marked on your paper and they should be legible.

Now, you've got those things, they're clearly marked RRs or R/Ses, it's a very, very fast job to go back over and just read off each one of those. That's a source list you do this with. Just read off each one of those things, bang-bang- bang-bang-bang, on down the line. The chances are if you have any degree of accuracy in listing at all, you're going to find it just now, bang. You say, bang, that's it. You've read several more, they didn't read, so it's the only one that's doing it on the list, well, bang, that's it. You understand? I mean, there isn't any reason now to fool with it. What are you going to do with it? Paint a wall with it or something?
No. All you're going to do is ask the pc if – what his goal would have to do with it or some-
thing like that and there it is. You got your item.

Now, what's – what's the matter with you? Haven't you got some new paper or some-
thing, you can put a new sheet of paper under there, and get all ready with your RI list – see?
Stop wasting time. Do you know that you can find in a – five and a half hours of auditing, do
you know that you can find R... nine RIs off a goal? Nine! That's not one a week. That's not
one every fifteen hours of auditing. You understand? And it is all in the speed with which you
do it.

Now, look, the more competence you have, the more speed you operate with, the more
positive you are in what you do, the better you know what's doing, the less nonsense and time
you're going to spend. Also, on those sessions where you've made a gruesome error, you're
going to waste the whole session. So it's worth time not to make gruesome errors. But what do
you mean by time? Well, take time to test the thing, in other words; that doesn't mean drill
forever.

Some of you people are getting in Tiger Drill and then big mid ruds, and then Prep-
check, and so forth. All for what? The thing is reading like crazy; all of a sudden it doesn't
read any more. Why? It wasn't the item that wore out, it was the pc. Now, you go right on
down the line, here. And let's get going on this, man, you haven't got forever. It takes 31 hours
to clear the first goal. I'll let you have 50. That – that's right. It doesn't take any longer than
that. Do you realize that if a goal is found out here on Monday, the guy ought to be his first-
goal Clear two weeks later? Well, where's the – where's the thing going? I mean, where are
you losing your time? You're losing your time by goofing, and you're losing your time by just
plain foolishness. Monkey business, all the wa y along the line. You've got the thing firing,
you've got everything going, just keep on listing, man, keep on listing. Take those things, get
the next one. Get... take that, get the next one. And just not get so sloppy. Let's not go – this,
"Well, the TA moved a hundredth of an inch, and so forth, when the pc coughed, so therefore
we have to list 20 more pages..."

Who are you trying to prove wrong, huh? Now, you just adhere to this other rule and
just get your 50, test the item to see if it still dirty reads and don't continue it if it doesn't read.
And you'll get those items. And get them! And then start opposing them. All right, what's
your next step here? You just start opposing. You have to decide whether the thing is a termi-
nal or oppterm. Well, there are many tests by which you do this, amongst these things, and
I'm not going to go over these tests because these things are very lengthy to list, the number of
ways you can tell. But look-a-here: you read it, you read the list question. Forget "consider
overts" and "commit overts," and that sort of thing, forget that. Just read the list question:
"Who or what would oppose a catfish? Who or what would a catfish oppose?" see? And it's
going to read better one way than the other.

That's still not a complete guarantee but it gives you an awful good indicator. It reads
like mad, "Who or what would a catfish oppose?" Therefore the chances are the thing's a ter-
minal, you see? It just – it's just the chances are the thing is a terminal.

Now, when you start listing, when you start listing this thing, "Who or what would a
catfish oppose," the pc says, "Hey, mass is pulling in on me." Take a look at the pc. You
know, the pc – I'll show you where the pc is. The pc's across the table from you. And you can find him, and you can look at his face. See, you can take your face up off the meter.

Now, the pc... an auditor will sometimes say, "Well, I'm so busy writing, I'm so busy writing, I haven't got any time to look at the pc, I keep watching the meter." Well, I don't know, my pcs are usually in control, and I say, "Well, that's good, thank you, thank you," and the pc... guy sort of slows down, and you can sometimes smell his brakes smoking. But I say, "I want to take a look at you, and see how it's all right, how's it going?"

"Well, it's going all right," and so on.

"Anything happening there?"

"Everything's going along fine."

Take a look at the shadows underneath his eyes. Are they darkening? Does the pc look worse and so forth? All right. So, you say, "Well, you'll interrupt the pc and you'll interrupt his listing." Sure, he kicks. Who cares about a pc kicking?

"Yes, aw, I... you just threw me off! I had some wonderful ideas."

You say, "All right, I'm awful sorry, yes, yes."

Actually, I'd rather throw a pc off than list him reverse way to. What is the record around here? Eight hundred seventy-five pages beyond the last R/S? I – beyond doing something stupid and corny, see, I would rather stop the pc and actually put him in-session and start and stop him in session. You understand now? That's the best thing to do, is be careful.

Now, the fact that you had a satisfactory answer still is no test that it was absolutely right. After you've gone down here a page or so, you ask the pc the question, "Who or what would oppose catfish?" Or "a catfish oppose?" And you see this thing, it goes ppsww! "Ha-ha-ha-ha-wha-wha-what the hell? What the hell? What's this? What's this? What's this? You mean you've listed a couple of pages and this thing is still firing?" We'd better ask the pc some searching questions as to what this is all about and turn around and list it the other way for a while and find out if that fire disappears. It might. You might have had it right the first time. But don't take chances on these backwards lists, you understand?

All right, so we take that, we go twenty-five items beyond our last RR or R/S. You'll see there's – it's twenty-five, no tone arm action and so forth. There it is, read that item, read the list question again, "Who or what would a catfish oppose?" Dirty needle – continue the list. And then you read it again, aw, it's a dirty needle, you say, "Are you protesting this?" and the pc says, "No, I'm really not protesting this, Christ-almighty, I... rrrrr."

Well, use your head. He's probably protesting it so give it the big mid ruds. Now it doesn't read. And you say, "Fine, that's all right, that's the end of the list." All right, read him the last R/Sing item, read him the next to the last rocket reading item, and then read him the last rocket reading item on the list. Bang! It should fire, just like that – bang! And you say, "All right, that is your item."

Now, don't do anything else at that point. Just look at the pc. But if it doesn't fire, if it doesn't fire, go the over and under. Read the one above and the one below. And if they don't fire, read the one above those and the one below those. And I don't mean the one RR above it
or the RR below it, I mean exclusively and extensively just the item above it, because you might not have got it on the same one.

The furthest away I've seen one is 3 below. In other words, the pc had it in mind all the time he was listing the other three, see. And it's the furthest away I've seen one of these things occur.

All right, there's your – there's your item. You say, "All right, that's your item. It fired." Well, you know the others didn't fire, you say, "That's your item, that fires, that's fine." You say, "All right."

Now, don't do anything. The pc sits there and he thinks so and so on bwa, bwi, gaa, wuudrup, he says, "Yeah, yeah, well, yeah, yeah, yeah, fishhook. Ha-ha! It sure would oppose a catfish!"

You say, "All right, that's good. Now, what's that have to do with your goal?"

"Oh, uh-huh, well, what – you kidding? You kidding? That one has a lot to do with the goal," and so on.

And you say, "All right, that's good. Now, would a catfish oppose a fishhook?"

"Oh, yes! Yes! Oh, boy! Sure would oppose a fishhook!"

And you say, "Well, that is all fine. All right. Now, we're going to take fishhook, and here we go!" see? We're going to take fishhook, we're going to establish by test whether or not it's a terminal or oppterm to the best of our ability, and then we're going to write it down there, and we're going to find out that it happened to be, oddly enough, because we had the bank fairly straight, it's... was an oppterm. "Who or what would oppose a fishhook?" and so on, and here we are right back in the run again.

Does that sound like a two or three hour, next session, "We will take it up two or three days later?" Well, in this particular case I know you've got to get it checked up by an Instructor. That's all right. But it isn't going to take him any time to. All you've got to say is "fishhook," and it goes pssww! And you say, "Oh, boy, that's – that's right. All right, let's get back in there and get right to it again, and let's find another item."

Now, actually, the further you go, these lists tend to get shorter. The rocket reads appear earlier on them. And they get shorter and shorter and shorter. And the shortest they'll get, however, is about two and a half column pages. You won't see a list get much shorter than that. If they start getting shorter than that, why, you want to be kind of suspicious.

Now, the pc says, "Oh, well, my item is something else. I cognited on it, because actually it wouldn't be a fishhook."

You – just think to yourself, "Well, he would... I'd hate to have to confront a fishhook, too. It read on the meter, it's his item, and that's it."

And he says, "Well, actually, actually it's a fish market. It's a fish market. It's a fish market. I know, I've cognited on it," and so forth and so on.

You say, "Good, I'm awfully glad of that, I'm awfully glad of that."
But take this in point: He starts protesting items and saying they aren't it, then you've done something on a reverse oppose someplace or another, and you say, "Well, all right. All right. Catfish doesn't oppose a fishhook in this particular way, all right. You still have this item RI for a fishhook, that's still a valid item, and there it is, and we'll find out something else that opposes a catfish some other time. But we've still got this item, and we'll come back and we'll adjust that on the line plot. Now, that's very fine. Now, who or what would oppose a fishhook?" and here we go again. You understand? This is the way you do this thing.

Now, when the pc gets down along the line, he says -- he'll start... may start telling you, "Geez, you know, this is awful fundamental. This is awful fundamental."

And you better keep check by reading that goal every once in a while. You'll find out the goal goes through the cycle I described to you before. You'd better read that goal once in a while. That's the thing to do. See if it fires, and actually, a goal ought to fire better and better and better, and items ought to fire better and better and better, if you're just doing nothing but R3. You know, no mid ruds, nothing. It just fires better and better and better, you know, if it all is going well.

And all of a sudden it's fire-fire-fire-fire, and boom-boom-boom, and you - the goal sort of goes, and so forth -- and you find an item or two more, and all of a sudden the pc says, "Well, gee, that's it. That's it. To be a catfish, the first item's a catfish. There it is."

And you know, he opposes water, and that's it. And you check it up, and you check it up, and so forth, and you do a little Prepcheck on the goal, and -- a little one -- and you all of a sudden see you're sitting there with a free needle, go test all of your items, make sure that they are all straight, and you've got the line plotted, and you've got a first-goal Clear.

And it works the same way for the second goal, there's no difference in the operation. Well, that's the way you do it. That's the way you do it. And the more nonsense you put into it, and the more goofs you put into it, and the more figure-figure you put into it, and the more you try to be absolutely sure even though the pc is screaming and protesting and you've already gone 175 items beyond the last RR or R/S, and so forth, and pc has turned black, but you've got to be sure because somebody said the tone arm action is out, and imagine your embarrassment when you find out that it's because the knob is loose!

Now, that -- stop trying to think yourself to death! Listen. Let's just quit it! Quit it! And then just sit down and do it, huh? That's the thing, you know, I -- every time I turn around and see any trouble, some auditor's got it all figured out -- all figured out wrong. And they say, "Well, it really couldn't be his item, you see, he's not really an Indian." And they just never let him have this item "Indian" and so forth.

In other words, they aren't addressing the pure mechanics of the situation, pow-pow-pow-pow-pow. Well, the mechanics will get you through. Now, sometimes you can tell by certain indicators, like all the baddies are opp terms and all the goodies are terms. Bull! Never happened to anybody in the history of the universe. They've been bad and they've been good. And you see some disproportionate thing like this occurring, and you say something's wrong with this line plot. Or supposing everything that he puts down ends in "pad." Well, there isn't that much constancy on the line plot, that's all. "A burmapad, a catapad, a matapad, a bootapad, so forth." You say, "You know, there must be something wrong with this line plot
because I can't understand it." Well, the thing to do with it when you can't understand it is read all these items back and see if one rocket reads. One rocket reads like mad, it's been op-posed wrong way to, and there you are, oppose it right way to, and the case will get underway again. You've always got the trick of goal oppose.

Well now, as rough as I sound, as rough as I sound on that, my insistence and my roughness is only in the direction of trying to pound through one simple set of facts. They are mechanical facts. This is a very rapid technique. This is a rapid technique. This is not one that you find a rocket reading item once every two weeks and that's enough. You understand? That's because – I don't know how you do that. It's rapid, and you get there fastest if you do it the mostest.

Now, if you really don't understand what you're doing, don't go anyplace. And most of your difficulties and the longevity of time that you're putting in on this is because you're doing when you should be sitting back wondering what the hell you're doing. And you say, "Now, wait a minute, wait a minute. We've gone fifty, we've gone seventy-five, and this item up here is still reading. As a matter of fact it started out with a quarter of an inch rocket read and it's now got half-a-dial rocket read. And we've opposed it, and yet it's still got its firing on it. What do I do?"

Well, let me tell you, the wrong thing to do is to go on auditing. You hear me? That's the wrong thing. Trying to look good and that sort of thing. Give the pc a break! Go on outside and lean against the wall and smoke a cigarette or take a chew of tobacco if you're a lady. And think of this thing, "What the hell, now, what the hell, it's still rocket reading, and I've gone this far," and so forth.

And all of a sudden the lightning will strike. "My God, I've done it backwards!" And you go back in, and you say to the pc – now, don't let the – don't let the grass grow underneath your feet, you see. Now, let's do. Now, we know. Let's do and let's keep on doing unless all of a sudden this isn't working. The thing to do then is to give the pc a break, and go on outside and lean up against the wall and take a chew of tobacco and think it over again, you understand? "Now, what the hell's happened?"

Don't you sit in there trying to make do with the pc and trying to look interesting and interested to the pc, and so on, andreviling him and racking it up, because you don't know what you're doing and so forth, and what are these pieces of paper, and... Nothing drives a pc crazier, man. If you've got to shuffle paper, send him someplace else. You've got to redo his line plot because it's all wrong, don't sit across the table from him, redoing a lot of line plot, and so on, redoing all this line plot, and crossing it all out, and so forth, and saying, "Well, let's see, this item Dharmapad, I don't think that item ever existed, let's see, now, this one was wrong, oh God."

No, let him have a break. Because the next thing you know, he just becomes very very confused. Those are his items you're monkeying with, and that's what's made him crazy for a long time. So there he is. So give him a – give him a break. You figure it out, you do it, you do it accurately, and if you all of a sudden realize that it's not going right, don't keep on making a good show of it, but get rid of the pc or take a break or something like that, and figure out what the hell is going wrong.
And you'll find out that you'll be very speedy. This is very fast. This is a very fast way to approach things. The way to lose time is to go on and do something wrong because you don't know what you're doing, and you're not sure, and you keep on and make a bluff, and you keep on plunging, and you keep on plunging and you keep on getting things wrong. And the next thing you know, well, it just gets down to a point of where it's four, five, six, seven, eight, nine, ten weeks go by and you're still wrong all because you went on doing when you should have been out there taking a chew of tobacco.

Now, there's how to handle this technique, that's the kind of a technique it is and that's going to make Clears. And there's no sense in sitting around saying, "Well, it isn't going to make Clears, in my hands," or "It isn't that – and Ron is wrong." Because you'll never be able to convince me. You know, so you might as well, might as well just stop trying and succumb to the thing, because I have, you know? I've said, "Well, that's it. That's it." And I've got awful good subjective reality on this. I've got, maybe, about four items to go out of about, I don't know, there are about fifty items in this, this second GPM, and I've got about four to go. This goal's about ready to blow.

So, I say, you're never going to convince me, so you might as well stop making these mistakes because they're not impressed at all. So just go on and do it right, make some Clears, get going, because you're needed out in the field and you're needed Clear and you're needed so that you can clear. So let's just – let's wind it up and put it on a high whine, and start flying, huh? Okay?

Thank you very much.

Good night.
R3M:
Current Rundown By Steps

A lecture given on 26 February 1963

Well, how are you tonight? This, I think, is the 26th of February, AD 13. And Saint Hill Special Briefing Course lecture.

[part missing]

All right. The subject of this subject matter is very important to you. We've always had very precise technology, leaving as little as possible to chance in processing. But frankly, with the advent of Routine 3M, you move into a new level of precision. This is the type of a precision that if you don't do it, you get involved more than you possibly could imagine. All you've got to do is do this wrong and it is no longer precise.

Therefore, don't go plowing ahead with it until you can do it right. The other part of it is, is of course if you don't do it, you won't learn how to do it. There's the old gag, you know, about "My little boy Jimmy can't go swimming till he learns how." And I'm afraid that's the case here.

Well, the place to learn listing is in 2-12. And the place to learn auditing is in an Academy. And the place to learn the finishing touches of auditing is the Saint Hill Special Briefing Course. Once you've been over those jumps, why, you should be able to do 3M without too much trouble.

But in actual fact, Routine 3M is going to be done on an awful lot of people and by an awful lot of people and that means that you are going to be involved, actually, in straightening out a lot of cases. So, all you have to know to straighten out a case, in actual fact, is where wasn't Routine 3M done?

Now, right now I sympathize with you. You've been doing Routine 3M up until this time without an immediate step rundown of Routine 3M. And that's arduous. That's probably very difficult. Probably nothing more difficult than picking your information from several different bulletins and sources.

The rules of 12A, as far as listing are concerned, apply to Routine 3M and all the material has already been released. It has not, however, been assembled with tremendous precision until this exact moment. And we have HCO Bulletin of 22 February AD 13, which is "Routine 3M, Brief Rundown by Steps," as the first actual bulletin of this. This'll be in your hands shortly. But the... you notice that 23 February – well that's... pardon me, 22 February, you notice that that is a few days ago. This is the 26th. And it seldom takes me that long to write a bulletin. But in this particular case I've been going over this thing and throwing away all of the nonessentials.
You'll be quite interested how very simple, in actual fact, that Routine 3M turns out to be. It is only your idea of how complicated you ought to get that will keep you from doing 3M. In actual fact, the more figure-figure you do and the more figuring you do and the more worry-worry and this sort of thing you do, the less 3M you're going to get done.

3M will not compromise with the exact precise following of its steps. There's no compromise for this and when you don't follow its steps, you start to worry.

Now, 3M is a very rapid process and the only time that you'll find that it becomes a lengthy process is when you have not done it. And when you haven't done it, it will become very lengthy. I have already seen a whole session devoted to straightening up one goof; where in actual fact you should have been able – in that session – you should have... the auditor should have been able to find 3 or 4 RIs, actually, the whole session was just burned up with one goof. Didn't do what it was supposed to have done and then therefore it was worry, goof, upset and so forth.

Well, the way not to worry with this – because worry is something that will go along with this – the way not to worry with this, is to know it. And you do have these steps on HCOB 22 February, and there will be much more information out on this. But in actual fact I'd like to impress upon you that most of this other information is just in the line of keeping you from worrying.

I'll give you a piece of information that isn't in this bulletin so you can get the level of magnitude: Although the pc has represented a rocket reading item while listing – although the pc has done this, the appearance still of two rocket reading items on the list, or two R/Sing items on the list, means the list is incomplete.

Now, that's something you might worry about. Don't you see? You say, "Well, there's 'a big bad man' and 'a very terrible man.'" And the pc is trying to get across a concept there. And when it was listed, why, "a big bad man" read, and then immediately "a very terrible man," it also rocket read, and it's quite obvious there that he had the concept of a vicious being and he has given two titles to it.

Now, you go back to nulling. See, that's all right – two rocket reads – all the rocket reads you want on listing, you... that you see going down on your meter. I mean, that's the point.

But now you're nulling. Now you come to this item, "a big bad man," and it goes psheew! – rocket reads. And then you check it, "terrible man." You see, that was the next-to-the-last item. They lay both together. The next-to-the-last rocket reading item; you read that, it goes psheew! And then you get your next item, "a very terrible man," and you say, "Well, there's something wrong here."

But of course, that actually is a represent of one for the other. So you say to yourself, "Well, it's all right." So you read "a very terrible man" and it goes psheew! And the pc says, "Well, they're both the same item." And you buy this. You'll notice that it is a variation and a difference from your bulletin. It says there mustn't be two rocket reading items on the list.

Now, I've actually seen this, and I've actually tested it, and if two variations of the same item read, the list is incomplete. In other words, the rule does not get jumped. The only
thing that gets jumped there is you figure – you figure yourself into a hole. Well, actually, there aren't any of these figure-figures to be done. And that's one of the first things I'd like to impress on you: there aren't any to be done.

You say, "All right. Well, he said 'a big bad man,' and then, of course, he had this concept of this person. He said 'a very terrible man.' So therefore if he said 'a big bad man,' and then 'a very terrible man,' they, of course, would both rocket read. And when I read these two, then that, of course, is an exception to the rule." No, it isn't. It isn't an exception to the rule.

See, that's how – how bound in concrete this is. And that's why I made my opening remarks – you've been used to precision, but you've been used to exceptions to the rule. And there aren't any exceptions to these rules.

Something very fantastic has happened here. We actually have the total anatomy of the GPM. We have its frequency. We know what it's supposed to do, and what it – what it isn't supposed to do. And Routine 3M just parallels it, just like that. Goes right straight down. If it doesn't work just like that, you've goofed. That's all. You've done something in 3M that is wrong. And you go back and you look at it. You'll find out what it is. You didn't take the tone arm action out of the list, "Who or what would oppose a catfish?" That's all. And there was wild tone arm action there, and you didn't complete the list, and you go over the list, and you find that the third rocket reading item from the end is the item. And it goes psheww! And it was the third from the end.

Well, that's a variation from the rules. And you say, "Well, I got a rocket reading item, so I went ahead and used it." And then you find out about two items later the whole basket folds up. That's it. It's gone. You haven't got any rocket reading RIs. And you list the list and nothing reads and you extend the list and nothing reads. And you sweat and swear and go into nervous prostration and have to get processed for ulcers, and what have you got? Well, you just haven't done it by the rules, so the rules don't apply. In fact, nothing applies.

In fact, it's a case of why did you ever get up that morning.? Because you actually will spend now... The time spent on 3M is when you haven't done it right. And then you will find, "Well, this week we'll try to get the pc straightened out. And we will prepcheck, and we will do this and that, and we will do another big goals oppose, and we will do this. And the pc is still ARC broke and we can't get anything much to read. Let's do something new. Yeah, let's – let's now find another goal. Let – let's go back to 2-12. Let – let's do something else, something new. Let – let's be wonderful. Let's invent something new. Let's – let's run him on O/W on a mouse. We had a mouse at some time."

No, that's the way not to do it. No, you just go back and you find out where 3M jumped the rails. And you pick it up at that point and you put it back on the rails. And it then will run.

And the only thing that happens is the frequency of the bank gets upset, whereas your twenty-five item plus, see, doesn't work. Every now and then from here on through that particular GPM – it'll fortunately only last that one GPM – you will confidently complete a list to twenty-five items beyond the last RR or R/S, and no TA action, you get it all complete. And you read the last rock slamming item. You read the next to the last rocket reading item. You
read the rocket reading item, *huh*, and it doesn't fire. And you read the one above it and it doesn't fire and you read the one below it and it doesn't fire. "Oh, my God, what have I done?"

Well, don't blow your brains out. You made a mistake someplace up the line, earlier, which you have corrected. But now, the frequency is thrown out and your whole action, as it tells you in this bulletin – when that sort of thing happens, you go back and make sure that something wasn't opposed backwards. That's your first step. And make sure that it wasn't the item above it and the item below it and two above it and two below it – that's item, not rocket reading item – make sure that you didn't goof there. Make sure it doesn't exist on there between that one that didn't read that was supposed to and the end of the list.

You can do all those things, but there's a test that gets you out of this. Read the item you're listing from. And if it gives the faintest tick, your list is not complete. It's all taken care of in here if you just do it right.

You get the idea? You get the idea? That's the only thing that'll happen. It won't upset the frequency of the bank to the point where it's no longer the last rocket reading item, you know? It's – always goes on being the last rocket reading item that you saw while listing. It's just that it shook things up and the pc now has to list further. You don't now add fifty on it or something stupid like that. You just have to cope with this. In other words, that's the only thing that goes wrong.

Another rule – another rule that goes throughout this – it's also stated in this bulletin – is when you've got your hands on an RI, you keep going. If you've got an RI you keep going. Now, strangely enough, that doesn't mean an RI that came from a list where five RIs came from. You understand? That means an actual RI gotten by the rules.

You've got this thing firing. I don't care whether it was goals oppose or otherwise. You've got this thing going. You've got it going. Well, there it is, it came up properly, it checks out, it gives you a nice rocket read, *bang*. Use it. As long as you've got one of those things, don't go getting one from the goal. You understand?

Now, you know what happens? You've got a beautiful RI and it goes *Psheww* every time. And you say, "Well, I don't know. I just don't know. It just came up a terminal when it should have come up an oppterm," and figure-figure yourself to death, see? You've already goofed someplace or another, and you upset the frequency of the bank. The other thing that upsets when you get the frequency is you sometimes start getting terminals when you should get oppterms, and so forth. That doesn't matter. You just go on and test them and use them.

Each RI that comes up can be a terminal or an oppterm, you always have to test it. It isn't how it was listed, it was how it tested. Always.

So, you say, "Well, that – that isn't so good." As a matter of fact, I got a cable this morning from somebody who just left here. And he got out to a very far place and he sent me a cable this morning. And he said, "I have just done a goals oppose list on a certain pc and the goals oppose list came out and the rocket read was only a half an inch long, so I think it's best that I go back and do another goals oppose list." Well, you know what he'll get from a new goals – that old goals oppose list if he does another one? He may or may not get the one that comes up next. He will get a fundamental and you probably could do goals oppose and get the
item and the next goals oppose and get the next item and another goals oppose and get the
next item and another goals oppose and get... But how tough do you want to make it?

Because, you see, the item can appear anywhere on a goals oppose list, and only ap-
pears as the last rocket reading item on an RI list. Goals oppose lists take longer.

In addition to that, it might not join up. And if it didn't join up, *huh-huh-huh-huh*! You're left there with two rocket reading reliable items. Well, now, the best-laid auditors can make themselves sick, gasping and so forth, worrying about all this. The point is, what do you do? Well, I'm afraid you take the biggest rocket read that you can get at any time. You under-
stand? When you make a choice, choose it by the length of the rocket read. You will make these goofs. They will occur. That's sure. What's inexcusable is not knowing when you have goofed and in not doing something about it to straighten it out.

So you do wind up with two RIs. Let's... here's one way to get them. This was done on
me by accident. One way to get two RIs is, you get right down to the end – the goal is "to
catch catfish" – and the last terminal that you get from the pc is "the goal to catch catfish." And the oppterm is "no catfish." And the pc says, "But that's it. That's it." As a matter of fact, if you happen to be looking at your meter, if you had looked at your meter that session, you would see the thing swinging with a free needle. Might only be free for a moment, but it
would have been free. And there it would be, a weird phenomena. A free needle. And he says,
"The goal 'to catch catfish' would oppose catching... 'no catfish.' Yeah, perfect."

You've already gotten about twenty items on this. You see, it's never the first two. You
got about twenty items, the pc says, "That's it, it's blown. It's – everything's disappeared. All
these catfish – can't smell a thing. Everything is beautiful. I mean, I'm... feels wonderful."

And you say, "Well, I'm not sure. Just to make sure, I better oppose this big beautiful
RI. I still have an RI on 'no catfish.'" It's not a mistake. It's not a mistake, because nothing bad
will happen. So you say, "Catfish," and you test it out, and you make it just exactly what it is. And you make it just exactly... It's an oppterm. And you say, "All right. We're going to list
now 'Who or what would oppose cat... who or what would catfish oppose – oppose catfish?'" Excuse me. Nice oppterm. We list this, "Who or what would oppose catfish?" And we go on
down the line, pocketa-pocketa-pocketa.

Pc says, "Some new mass is coming in." Well, look. Doesn't say anything about it in
here, so you just keep going. It's all right, so mass comes in. It's perfectly all right. Do it every
time. "Who or what would oppose catfish?" and "Who or what would oppose no catfish?" is
the right line.

And you land with a – "a horseshoe curve." And you say, "What happened? Horseshoe
curve?" Well, don't worry yourself to death, you've got the basic rule. The fundamental rule is
when you've got an RI, you determine if it's a terminal or an oppterm, and you oppose it. So
you determine this thing, "horseshoe curve." You determine that that happens to be a – it's
another oppterm. And you say, "Who or what would oppose a horseshoe curve?" And you
come up with "a blinking millionaire."

Where the hell are these catfish? Not a fish market in any direction. Pc smells differ-
ent, everything's different. Well, the rules say go on and oppose it, so you say, "A blinking
millionaire. All right." And it happens to be a terminal, so "Who or what would a blinking millionaire oppose?" And it winds up with "the whole wide world."

Boy, you never could have gotten further from catfish and you say to yourself, "Oh, my God. Look what I've done! I mean, I had a free needle. Had a free needle and I didn't prepcheck it. I didn't do anything at all and I didn't straighten it out, and I had a first-goal Clear, and he's gone. And – and now I've got this other thing, and I don't know what it's all about. And I don't know where I've gone and what it's done. And in this bulletin it says – it says – it says – uh ... Well, something in here someplace must cover the thing. Golly. 'When the needle goes free, just tell the pc and keep going, don't bother with a Prepcheck. Just keep doing steps 8 to 13 as long as you can. But realize that you are probably now – you are probably now on a new goal channel. When you have 2 or more RIs, that the pc knows, by step 13 above, do not fit the old goal, do a brief new goals list for an RR goal.' Oh, yeah, well, all right, uh-ha-ha. Hoooh!" You say, "All right..."

The pc's – the pc's been sitting there – and he doesn't know about this, you know – and you say, "What – what – what goal do those fit?" And the pc... this is how fast this takes. This is a ten or fifteen minute step, see. You say, "What goal does that fit?"

And he says, "Oh, to be rich. To have a lot of money. To be broke. To have nothing," – pshseww! – pshseww! pshseww! pshseww! So you take that down, and you right away put it down quick on the auditor's report and go right on with that next RI, you understand? And it's as easy as that. You can just work yourself to death. You can just worry yourself to death with this stuff. It looks terribly complicated.

Look. Don't kid yourself. You do it wrong and not follow this bulletin, you're not only going to worry yourself to death, you're going to cost the pc his next two hundred trillion, see? He's going to slog along in the horrible mess that he's in now. But as far as that's concerned, if you do it right, it's just bang-bang-bang. And don't go – don't go finding things to worry about.

Now, let's examine why, why auditors and even people... You know, by the way – by the way, do you know we had some staff members here the other day, administrative staff members who were trying to rejoin the human race? Can you imagine it? As if they'd have them, you know. Pretty wild. And they said, "In view of the fact that the administrative Scientologist is not a professional auditor, but only a Scientologist, why, I think we ought to be permitted to do a simple process."

You know, I received the shock of my life. That's the first time I ever heard that a Scientologist could exist that wasn't an auditor. A real Scientologist or somebody who had an HPA or an HCA that didn't consider himself capable of handling processes. He wanted a simple process. Well, this is a simple process. This is a very simple process. That's all right. We'll – we'll cut this out of the tape after this lecture, and so forth, so it won't go all over the world. I was ashamed of it myself, you know, I was ashamed of it. I – actually, Prepchecking is difficult compared to this.
Now, look-a-here: A pc has got a bank. First we called it the reactive mind. Then we found the anatomy of this reactive mind; it's the GPM. It's a whole sequence of GPMs which make up ze grande GPM. Each one of those things is fundamentally founded on a goal. And they're a conglomeration of identities which are counter-opposed. And these identities are hung up on the postulate-counter-postulate of a problem, and they're hung up with great delicacy. Actually, they're killing the pc, but they're hung up with great delicacy.

In two hundred trillion years he's had a very finite number of these things hang up. They aren't an infinite number. They're very finite. Some kind of a wild guesstimate of the number of rocket reading reliable items to be found in the first and second goal: seventy – seventy RIs. Wow, that's not very many. But that's because it's only this accidental hang-up that gives him this fantastic charge between one and the other. That's what you're trying to take apart.

I don't care whether you are doing general O/W or the CCHs or Prepchecking or anything else, you're trying to take the charge off of the case. And as long as that charge stays there, that case is going to go wog. And it is simply that charge. It isn't the knowingness of the pc. It isn't how the pc makes up his mind. It isn't the new postulates the pc recovers. It isn't this, it isn't that, it isn't anything. All it is, is get the charge off between those two. What happens? They're carefully balanced, postulate-counter-postulate, action-counter-action, mass-counter-mass. There they are – crush! And they hold this tremendous quantity of mass in suspension.

And you discharge that read between them, by finding them and opposing them, and finding a new one and opposing it, and finding a new one and opposing it. That's the whole action. And this charge will go posheww! And it can no longer maintain itself. It's impossible. It'd take him another two hundred trillion years to stack it up again. And let's hope after he's been a Scientologist he'd be smart enough not to. Let's hope he runs out his overts.

Well, what happens? It's just that mechanism in the bank. Here's a goal and this gives him something to do and he becomes a rrruph to do it. And the rrruph is opposed to this over here. But then this rraah that opposes him over here demands that he become a wikk, and then the wikk, of course, to get on in life, finds itself very involved with a splat. And there we are, bang-bang. It's got a spiral staircase. He lives from one type of identity to the next trying to achieve this goal and trying to get rid of its opposition. That's all he's doing.

Now, look, if you had it on the clock how long it – taken me to make that explanation to you, that is all there is. You understand? Now, out of this comes a fantastic complexity. Fantastic. Out of this we get locks and we get engrams and we get secondaries and we get the emotional Tone Scale and we get this and we get that, and we get the service facsimile and we get everything that we have ever had, out of that mechanism where it pertains to aberration. The other direction – like the Philadelphia Lectures, the examination of a thetan back in 52; postulates, counter – or just postulates, the anatomy of a thetan, as a thetan, just, you know; that's him, what he can do, what he consists of. That's truth. That isn't aberration.

But as far as we've handled mechanisms of aberration, we're still talking about the GPM, and we're just talking about this charge. Item A, item B – rrruh – the charge, one to the other. Oddly enough, you don't have to do a single thing to them. You don't have to run their
withholds off against each other. You don't have to do this, you don't have to do that. All you've got to do is get the charge off it, psheew! There's the charge, when you've got it off the meter and it's listed down, those things can't stay together anymore and you find the pc's no longer interested in them. He cognites and they're gone.

It isn't the cognition that makes them gone; it's the fact that you blew the charge. It's all it is. It's a totally mechanical operation. It's very interesting to the pc. He comes up with all kinds of phenomena.

In fact, an auditor, if he sat and went through the phenomena the pc comes up with, could practically go blahw! He could go mad trying to catch up with these phenomena. Because it's fantastic quantities of phenomena. But what he's trying to do is just get the charge off between item A and item B, item C, item D. Item E opposes item F. Item F is opposed by item G. So on and so on and so on and so on. It's the number of items you get, and they very mechanically surrender. One hundred percent surrender through Routine 3M.

Now, you list a pc too long without finding his goal, and he's going to start getting uncomfortable. He's going to wonder, "What has a blinking millionaire got to do with a horseshoe curve? What does this refer to?" He has no point of referral.

Oddly enough, although it pesters him and it upsets him, you possibly could go fifteen, twenty, thirty items, RI to RI to RI to RI. He'd be more and more upset, you understand, and his mass wouldn't be as-is-ing well and you'd have more trouble with it, without knowing his goal. And all of a sudden he says, Aaaaahh! He says, "To have nothing."

And you say, "What's that?"

"Well, that's the goal. That's – that's the goal of all this – 'to have nothing.'"

So, all right. And you'll see that you have been building a little bit of mass on the tone arm and this will now drop off You're operating without the goal, builds up mass, because if you know the goal, of course it helps as-is the mass.

But what you're into here is an action which is tremendously repetitive in its action. You do this and you do this and you do this. Now, as you – as you look this thing over, you say, "Well, there must be more to it than that." And that's one of your downfalls. No, there isn't more to it than that. There are certain rules of auditing and there are certain best ways to do it and there are some opinions about whether the auditor should smile graciously as he receives an item or smile grimly if he sees an item or not smile. You'll find schools developing along the line, but actually it doesn't matter. So there's a lot of figure-figure here that doesn't matter.

Now, why does an auditor do more than he's called on to do? Well, I'm afraid that he has a tendency, being human, for a while here, a short time... you want to take a last look at being human, by the way. I'd take a good look at being human. I'd go out and be human for a little while. You won't get a chance, very shortly.

And what's he doing? Well, let me tell you a law. The physical universe is built on a games condition and the optimum game in the physical universe is described by exactly these rules: minimum ease of entrance, followed by maximum involvement. That are the two steps
of a game. That's the physical universe idea of a game. That now, that isn't the ideas of a game in Scientology. I'm just telling you how the physical universe treats this thing.

In other words, if you have something that's no trouble to enter, no trouble at all to enter, and you've got – you've got with this "no difficulty of entrance," you've got an immediate involvement, which becomes more and more and more and more involved and there's just no way of getting out of it. And eventually you look around and it's just – we're all locked in here and there's no doors. There's a chicken that they... a guinea hen out in the Midwest that they used to capture because the chicken never looked down. And you could get it to pick corn off the ground right in through a tunnel. And as long as you had a box there that had a hole for them to walk in at the bottom, the guinea hen would never walk back out the hole again because they're just built that way. That's a total MEST universe bird. The bird would just look up after that, and be trapped. And you reach in through the hole and pick out the guinea hen. You see? That bird had been too well educated. The bird itself was cooperating with the involvement.

Now, these are just two steps. That's the only requisite to a successful (quote) MEST universe game (unquote). That's totally successful. You just have something that takes no trouble at all to enter and gives maximum continuing involvement after it's been entered, which has no end product, and you've got it?

Now, I was talking to Reg the other day, he – mentioned this to him and he says, "Huh!" He says, "Well," he says, "there's a good example of that." He says, "A fellow stops on the street and looks in the window of a store. And if that window is just all kinds of stuff piled all over the window, everything going up this way, the guy's sunk." Of course, it's a terrific involvement of his attention. He walks in.

Some other store, Tiffany's, something like that, why, there's a single pearl sitting on an ocean of black velvet and you never find anybody stopping. And if they do stop, they say, "Isn't that nice?" and walk on. No, Tiffany's involvement has to do with "Are you a member of the four hundred? Can you afford to pay far more than you should pay?" The involvement is, "Is your credit good enough?" You see, all of those. Those are all involvements, but they use a different type of involvement than some merchandising house that is a chain store. Macy's or something like that – you go by the window and here's some baby's pants and down here is a hot water bottle and then there's a machine gun peeking out from underneath a pair of lace-trimmed pedal pushers, you know? And there's a beach ball over there in the corner, and so forth, and back of the beach ball are live alligators. And isn't that intriguing, you see? And the guy looks. The next thing you know, he's walking into Macy's.

See, there's no difficulty in stopping in front of the window and he gets maximal involvement in the thing. Get the idea? Well, these are the rules by which you have... can measure any continuing game that is purely a MEST universe game.

Income tax. The ease with which governments entered in upon income tax. I swear, there's probably no slightest difficulty where it began, which is in Karl Marx's "From each according to his ability to pay. To each according to his need." That was the Marxian rule of taxation which has been written in all through the West, now.
About 1909, I think it was. And I swear, it – he probably had no difficulty whatsoever writing those words. He wrote them in German. No difficulty. There wasn't the slightest difficulty writing them. He probably threw himself off another bowl of hashish, or whatever he used to do and wrote those words. There was no difficulty there. There was no difficulty reading those words.

Finally a lot of people say, "Oh, that's -- that's very easy. There's nothing to that," and they amended a few constitutions and passed some laws. And the years went along and you had this thing called income tax and everybody got... started to get poorer because you didn't dare make a profit because you'd pay it out in tax. And – and then the government started hiring more and more people and more and more people. They – finally they got one income tax collector per citizen, which was the optimum ratio. And then they finally involved in income increment of increase profits return. That's filed in addition to a "form 6892B-hup." And then that, of course, has to be filed only by the professional accountant. The unprofessional accountant files "1682-44ump." That's the form he files, you see. Only that has to be then refilled because it is always kept on the other file. And finally, do you know, nobody can pay an income tax.

They talk about tax evasion. It isn't tax evasion. It's just impossible to pay an income tax. You say "Impossible," you say, "It's easy. You go down and pay an income tax." If you work nine till five and have your pay deducted by your employer, he's got all the difficulty. If you yourself are making your own coffee and cakes and the government can't put the bee on some employer or something like that, you're in trouble the whole way. You talk about involvement!

Now, just try and walk down to an income tax office and say, "Here's my income tax. Give me a quitclaim for all taxes." If you did that, you'd probably precipitate a complete investigation of your affairs going back to why your grandmother had to marry. And it just is impossible.

You pay a tax of this year. Therefore, you've got to pay next year another type of tax, but more tax because you paid the tax this year, and so on. You finally -- guys get so desperate, they can't pay the tax, don't you see? It's all a total involvement. So then they start tax evasion because if they pay the tax, then they're hooked. Not just hooked, but you can't pay the tax, so they had better evade not tax paying, but tax collection. And they're evading an involvement of tax collection. You see that idea?

Now, you look over any one of these corny games that has gone on and on, and you say, "Isn't the world mad! You know, the world has gone utterly mad!" No, the world hasn't gone utterly mad, the world has gone utterly MEST universe. And the lower on the scale a thetan gets, the more he starts approximating the laws of the MEST universe. That's... you can count on that -- the more he acts like the laws of MEST. And the only time you're going to get anything done with anybody as a thetan and so forth, is somebody who still has some section that doesn't act according to the laws of MEST. He can still think. MEST does not think.

But this law of involvement is definitely there and it waits as a trap for the unwary auditor. And he's liable to follow it; unconsciously and unknowingly, he is liable to follow it. The ease of entrance. You know, get any old goal. The pc's apparently happy. Everything is
fine and then you get any old goal and you list this goal and you list the goal on down. It's perfectly easy for the pc to have sat there in the chair, you see.

And then the auditor unconsciously starts following a dramatization of the law of involvement. And he just starts throwing new things into the session. You see, it's anything but this goals list. See, he didn't really check out the goal. He didn't do this, he didn't do that. He's involving – it was very easy for him to become involved; it's very easy for the pc to become involved, so this will become more and more involved. And the immediate impulse of the auditor is to do something new and more involved. You understand that? That's a MEST characteristic of a game. Becomes more involved and more involved and more involved and more involved. And we go on and on and on. And you'll find out that a very bad auditor who's pretty "mesty" will just keep involving the pc more deeply.

Every time he does something wrong, he will do something else that is new and do something wrong with it and then do something else that is new and then do something wrong with it and then do something else that is new and do something wrong with... You get the involvement? And the next thing you know, the pc is going, "Ohhh-owwww..."

Fortunately for us, 3M is sufficiently strong that all you have to do is go back and take the earliest step of 3M that was done – which is probably in this case, as I was just describing to you, a goals list – get that list listed down properly and do it right and all the liability comes off it.

Supposing you had the pc's right goal and got a wrong item off the source list because somebody was a real knucklehead, and so forth, you only have to find the right item off that. I don't care if 3M was done for seventy-five consecutive hours by a complete knucklehead that wrapped the pc around not only telephone poles but fireplugs – we don't care about that – you go right back to the earliest wrong area that you can find and work out in that area 3M. Wherever you can get into that area and get the proper 3M action, the rest of it straightens out.

Because we've whipped this game of the MEST universe. But there's still to some degree, here and there, more frequently than you would believe at first glance, going to be some impulse to just involve the pc more deeply. You see that? You... just a dramatization, you understand? You'll see somebody sitting down and the person just isn't thinking right and they just will think in the direction of deeper involvement. Not straightening out anything. "Let's just do something new. Let's just do something different. Let's just do something wrong. Let's do this."

And that involves the pc more and more deeply and more and more deeply and more deeply and more deeply and more deeply, and it involves the auditor in more and more worry, and more and more worry and more and more worry. And eventually the pc's running a fever of 190 and the auditor is running ulcers that are a foot in diameter, and so on. That's... just recognize it. Just recognize it. You've taken a very powerful technique which is addressed to an individual and you've followed the MEST universe curve of a game, which is ease of entrance and increasing involvement.

The thing to do is go back and put 3M on the road. Now, 3M at first glance appears to go along this line, and that's a fooler. And that's why it's going to be very successful. It's very easy to start it, you just say to somebody, "What's your goal?"
"Oh-ho, what's my goal? Oh, boy. Oh, gee," you know, and he'll answer.

One of the ways of involving him is get him all interested in what his goal is, and then write out 8,642 goals and get a whole long, overlisted list – the tone arm's a long time been stuck on the goals list and so forth – and then get him all *blah* and so on, and then lose the goals list. Don't expect me to say you're a good boy if you do that. Don't expect me to do anything about that but swear.

I, by the way, have recovered several languages in which to swear. So you better be... watch out.

Anyhow, the crux of the situation is that as you go along this line, there appears to be a deeper and deeper and deeper involvement. Yeah, the pc is getting good and involved. And you can start worrying about how deeply the pc is involved while the case is running perfectly all right. Now, get that. See, there's the other danger. See, not only can the case run all wrong and the auditor sit there with total complacency, but you can get a reverse of this, of the case is running beautifully, you're getting RIs, the pc's going, "Oh, my God!" You know. "Ahhh. What a terrible mass that is!" You know, and then he gets another RI and so on, and he changes his mind about it and he goes on and he's getting lighter colored and that sort of thing.

But the tone arm starts going up. "Oho-ho! Oho-oo-oo! Oho-oo-oo! The tone arm's – oh, it's up to 5 – 5, and the blowdown on the new RI was only to 4.75. Oooooooh! Oh, God! And-and-and-and the new RI – as we list the thing, the tone arm goes to 5.75. Oh, God, so we go on, here, and we've got a blowdown to 5.6. Ahhhhhhh." This is something to worry about, see. You look at the pc; pc's all right. He's going along quite hap... But look at that tone arm, man.

"And we get the next item and it goes to 5.75 and there's no tone arm action at all. Ahhhhh. And-and-and we get only a blowdown of 5.6."

Say anything about it in here? No. Then what you worrying for? You understand? What you worrying for?

It says a blowdown when you get the RI. How much is a blowdown? Well, it's as much as a blowdown is. How long is a piece of string? Let me tell you something: This is pure phenomena. You don't need it desperately but it'll keep you from worrying. Most of the stuff you see released now will just be in the direction of keeping you from worrying. Because I know what you – what you'll worry about.

Every – every single one of these GPMs goes a cycle. Every single one of them goes a cycle. The pc starts in down here, and he usually rides around 3.25. And it's perfectly all right. He goes up, and he gets a little bit of a 3.75, and it blows back to 3.25. And then your next couple, three, four RI lists that you get, the thing has been going up to 4 and has been blowing down to 3.5. And you get a couple of more, and it goes up to 5 and it blows down to 4.5. And then it will go up to 5 and it will blow down to 3... to 4.75. And it'll go up to 5, and it'll blow down to 3.5. And then it will go up, up-up-up-up-up to 4.75, and it'll blow down to 3.25. And then the next RI – three or four – you get, it will go up to 4.25 and it'll blow down to 2. And then it will come up here and as you list, go up to 3.25 and then blow down to 3. And then it
goes up to 3.75 as you list, and then when you find that RI, it blows down to 3. And then it sits there and you list and it sits at 3. And it blows down to 3 from 3. And you say, "God, I'm not getting any blowdown." There's – there's one you could worry about, you know. "It's just sitting on Clear read and I'm not getting a blowdown. And the needle – oh, God!" Go up to the D of T, "Oh, my God, do you – do you – do – I can't read the needle now. It just keeps going floppity-floppity-flop from one side to the other. Can't read it. Can't even get the rudiments in on the pc and all the pc does is sit there and grin. Hmmm!"

You'll do it. You – you'll say to this girl or something, "Look. You cleared him."

"Oh?"

So, she says, "That's fine." So she gets into the next GPM, see? Same cycle repeats. The tone arm goes up, and it blows down, and it goes up higher, and it blows down less, and it goes up higher and it blows down less, and it goes up higher, goes up higher, and even higher than you've seen it before. I don't know – and then finally blows down, and then starts to blow down closer and closer to Clear read. Item after item behavior.

In other words, there's a point in any GPM where you've got a high, stuck, mean tone arm that doesn't blow down much. What you worrying for? It's just phenomena. You're going to sweat yourself to death on a lot of things. You say, "This pc – this pc's eyes – black, black, black, you know. Oh, my God, the pc's eyes are black. Every morning she'd come in, black! Black! Black as the ace of spades. Every morning!" By God, I found out she was using mascara. Honest, she can't run out mascara until the person's a fourth- or fifth-goal Clear. You're going to find all kinds of things to worry about.

But I'll tell you what you'd better worry about. I'll tell you what you'd better worry about, and this is a fact: You better worry about doing a departure from these "Brief Rundown by Step" rules. That's what you worry about. Worry about departing from that.

And when you do something and it doesn't come out with this result, then you've goofed. How do you know you have departed from the "Brief Rundown by Steps, Routine 3M" – or any other concise 3M bulletin as they come out along the line? There'll be more of them issued; they will be lengthier, more concise. They'll be this, they'll be that, they'll be the other thing. How would we know, now, that we have departed?

Well, it didn't come out right, so we'd better go back and find out what isn't being done. And where wasn't it done first, and get it done there first, and then we find out that what we've just done wrong will come out right. A pc can take quite a beating.

Now, there's one other piece of phenomena that I can give you that will save you a lot of worry. When you first find the pc's goal and you do a source list, all this business about the pc turning black or something like that, or getting off-colored if something is wrong, is violating by that original step. When you get a pc's goal, when you get a pc's goal and that pc is listed out on a source list all the way through, don't be very amazed if the pc gets black. Because most of them will. The GPM is moving out of them and their skin tone goes awfully sooty. I've seen it now, case after case. What you start worrying about: as you find RI after RI, they aren't getting any lighter. There must be something wrong there, so you go back and find your "Brief Rundown by Steps," look it over and find out where you – where you de-
parted from this line. And you generally will find that you didn't pick the right RI off their four rocket reading items on the source list, all rocket reading. Source list incomplete.

There are various conditions. There's the condition of overlisting. Oh, you can be a complete idiot on overlisting. You can list ninety pages when you should have listed ten. You just list the list. A list is as long as it should be. And how long should a list be? Well, actually you ought to get no TA motion – and that's a relative statement – but no TA motion and fifty items beyond that, and fifty items beyond the last R/S on the list or RR on the list, whichever is last. You'll find out that that is how long a list is, and your item will be on it.

There are two types of lists. One of the things you haven't looked at yet – there are two types of lists in 3M and in 2-12. There are two types of list. One is the goal oppose list, or the source list, and that has entirely different rules of operation and mechanics. And then there's the RI oppose list, which is the reliable item list. And that has different mechanics. And you'll find out in the "Brief Rundown by Steps" that steps 1 to 7 of this 3M step rundown are devoted to a source list and handling of source list and getting the thing started, and steps 8 to 13 are totally dedicated to an RI list. They're two different types of list; they behave differently. All you have to know is the behavior for each one.

There aren't a lot of randomities going to jump up and put them in the face. I've been auditing and getting audited and doing research auditing and watching folders here and working and working with this for a very, very long time and I had a terrible time whipping up enough constants. There had to be enough constants so there wouldn't be a lot of variables. And fortunately, I found these constants and put them down here. And be guided by the constants, not how variable they get out around the perimeter and you will do fine.

Now, you've only got one clearing procedure. And I wish you had eight or nine or ten, but in actual fact there's only one and that is 3M. And it doesn't have very many steps. This thing has only got fifteen steps.

Probably the absolute rules of one kind or another boil down to being less than twenty, something like that. They're very few. Bank behavior is very constant. It's not actually very much to learn.

The thing that you want is familiarity. The thing that you want is confidence. The thing that you want is to know that is the way it is and see it in front of you operating that way and know that you can pull it off. That's the main thing you need. And I'm afraid an auditor has to go through all of these steps of the horrors of it all and worry and chew his fingernails to the elbow, and give it all up and try to blow the brains out, and just this – oh, you know, because it's just all too difficult.

And I had an auditor, left here – you remember Irene; she wrote me from Perth. I got the letter today. And she's had a cognition. For all of her training, three years of very hard, intensive auditing, she's had a cognition that it's a very simple activity and the more simply you do it the more results you get and the less complication you add into it, why, the better it is. And it's taken her three years and she's now cognited more or less – I think that was the paraphrase of it anyway – that auditing is a simple activity.
Now, now she's already done the cognition. It isn't necessary for you to cognite. Just know it, realize it's simple and you've got it made and you'll make Clears.

Now, what you want out of this is Clear. What you want out of this is to be Clear. What I want out of this is for you to be Clear and for you to make Clears. We can do that. It just all depends on your constancy, carrying forward the ethical approach – if something reads it reads, and if it doesn't read it doesn't read – and you'll produce them.

The technology is there, you're there. Let's get the show on the road. And realize that when you get a pc involved – I already know the MEST rule of games, which is easy entrance and deep involvement. Remember, I already know that, so I'll be looking at you.

But basically, what I want to look at is the number of Clears you make, and I want you so Clear that when they tap you on the shoulder, you just ring for hours.

Okay? That's it. Thank you very much.

Good night.
TV DEMO: CASE REPAIR

An auditing demonstration given on 27 February 1963

Here we are with a demonstration. And we're going to give an auditing demonstration here tonight that I hope you will appreciate. But, of course, we're auditing the television station general manager, electronics expert and janitor. And so therefore, whatever happens here on TV that seems a little bit peculiar to you, why, you will know why.

**LRH:** All right. Have a seat, Reg. And let's see this meter. All right. Now, Reg, the subject of this activity here is totally involved with doing a case straighten-up.

**PC:** All right.

**LRH:** The only thing I'm going to do is just go over everything that's happened on your case here.

**PC:** Mm-hm.

**LRH:** ... and so forth. Okay? You needn't pick up the cans yet unless you'd feel more comfortable with them.

**PC:** I'm happy.

**LRH:** You're happy with them. All right. Now, if you'll notice here, we've got another area. This is another camera down here and it's flipped over so that we've got a... show your papers. See? Pretty good, huh? Reg is pretty good at this sort of thing. Of course, he's not listening to this broadcast so it's all right for me to praise him; I wouldn't dare do that to his face.

Okay. Now, Mr. Williams, you've been auditing Reg here. And the situation deteriorated into the finding of an item which didn't get found and didn't check out. That is the case of a non-checked-out item.

**Aud:** Right.

**LRH:** There is a lot of things I'm going to go into with relationship to this, because there's a lot of auditing been done here on the case since I last audited you. And we'll see where we are, just to give people an idea of how to check this back. But also because I'm interested in where you've gotten to.

**PC:** Thank you.

**LRH:** All right. Now, our main work here starts in and what I want to do... You very often, by the way, you know, you'll have to be – you'll have to be doing cases to which you have no auditor. So this is very easy tonight because I have Mr. Williams here to interpret his own writing and a few other things of that character. Now, I left this case way back here on an item "a murderer." Right?

**Aud:** Right.

**LRH:** And that fired very nicely. And nice big rocket read on it. And then – oh, oh, oh, I see some errors here. Now, "Who or what would oppose a murderer?" for completion; then assess the questions "Would a murderer oppose... a (blank) oppose a murderer?" All right. That's beside the point. But we had this, anyway, and we
were giving a brief tiger – first a prepcheck on "a murderer" and then on the goal "to know." We had here a auditing session – an auditing session of 3 October of last year and we see here that we had Prepcheck on murderer and so forth, and then tiger drill buttons on 1 October HCOB, on the goal "to know," which was, according to this, firing well. Now, did you see that TV demonstration?

**Aud:** Yes.

**LRH:** Yeah. Did you see the goal "to know" firing?

**Aud:** Yes, a – a – a few times I saw it fire.

**LRH:** Yeah. All right. That's where we went to. Now, what happened here? Now, we got into a situation – this is in no way a court-martial.

**Aud:** Thank you. [laughs]

**LRH:** We're not interested in court-martiaing you, no matter how richly deserved!

**Aud:** Thank you.

**LRH:** All right. So you're not up for anything here. But I'll show you how one of these things goes. Now, let's just look forward here and see what happened. And as we go over these lists and articles – you picked up the case apparently on about the 22nd of October. Right?

**Aud:** Right.

**LRH:** And we've got here this and that and the other thing. And you did some tests for completeness. Now, here's a represent on "a murderer." Ha-ha-ha-ha, that's the first thing I saw, ho-ho-ho-ho! Of course, that's a representation of a rock slamming item.

**Aud:** Mmm.

**LRH:** So that's what happened to its read.

**Aud:** Yeah.

**LRH:** Right? What does a murderer represent to you? And of course, that went no place. And any item you would have gotten off of that one – wow, man.

**Aud:** That's right. No item on that.

**LRH:** Well, there wouldn't have been. So that's what happened to "a murder," as an item. And then we went into a Prehav level "Dislocate"; and I don't know if there was an item here or not.

**Aud:** I got a – a ticking item, I remember.

**LRH:** Yeah.

**Aud:** I used it as a – as a – a List One.

**LRH:** Yeah. Then you eventually did something with this list up here someplace. Where are we at here? Tiger Drill. And we went up here to "Dislocate," probably wrong. Now, we went to – we found something: "a bad manager." How well did that R/S, do you remember?

**Aud:** No that – I think "a bad manager" came off the "Dislocate" list.

**LRH:** Oh, it did, huh?

**Aud:** And we – we really treat that as a represent. This was that experimental rundown.

**LRH:** Oh, all right. We'll neglect it. We'll neglect that. Let's look forward here now. Don't worry about it, huh? I see...

**Aud:** Now here's some more work on "a murderer."

**LRH:** And here's some more work on "a murder." This was "murder." Now, the original list was then extended.
Aud: Yes.

LRH: The original "What isn't part of existence?" was extended. That was where "a murderer" came from. And of course, its read was gone and we got out the end of the list. Now, I don't see where that list is. Must be before that.

Aud: That it there? There?

LRH: You've got a missing list here someplace.

Aud: No. Not there.

LRH: Yeow. There you are.

Aud: There. "Who or what wasn't part of existence?"

LRH: Yeah. And you got "a murderer." Is that right?

Aud: There. Assessed item "murderer."

LRH: All right.

Aud: And that's the continued list.

LRH: And then you opposed a murder ...

Aud: Murderer.

LRH: ... and uh ...

Aud: Murder.

LRH: Yeah, that's it. And you - "What would a murderer oppose?"

Aud: ...murderer oppose?

LRH: And "What would oppose a murderer?"

Aud: No, that was a test listing. I test – that was two headings, a test list ...

LRH: All right.

Aud: ... and "Who or what would oppose murder?" was the ...

LRH: Yeah, that was your oppterm. And you got down to that and you got something off of that.

Aud: Now, that's got out of order.

LRH: That doesn't matter. We're not much interested in it, to tell you the truth.

Aud: Oh, I know what happened, Ron. I got the – I made a – had a two-item package there. And then ...

LRH: Oh ...

Aud: ... then I checked "an impos- tor." No, then I went back later, soon as the four-item came out, and I made a four package out of it.

LRH: Oh, all right. All right. And "an impostor" came up here. Your old friend.

Aud: That was a test listing to see if we could get anything on "an impostor." Nothing.

LRH: And there was nothing.

Aud: No.

LRH: All right. And we move on forward. Lot of stuff here of one kind or another. I'm sorry to be knocking your items around.

PC: That's all right, Ron.

LRH: I saw right away that that wasn't quite all right. And we found "a gentle- man" in this package.

PC: Mm.

LRH: Right.

Aud: Right.

LRH: Right. And we got "a gentle- man" opposed and we got something on that. And this moves on down and then we got "uneducated people."
Aud: "Society".
LRH: And then you did a "life ...
Aud: "Society."
LRH: … "society." All right. That gave you a package. So you finally had a line plot of, says here, "murder" with a terminal "gentleman" – "a gentleman," and "society" versus "uneducated people." That's fine. And then "life consists of" and you found an item, "finding out." All right. That's fine. And you did something with it? What?
Aud: "Who or what would finding out oppose?"
LRH: Ah, I don't see this list.
Aud: It came up with – it came up with "sleeping."
LRH: Hm?
Aud: And the item that opposed that was "sleeping."
LRH: Oh, all right. All right. Gee, that's a long enough list there. Yes, and you got that "sleeping." Okay. Good enough. Now. These lists are a little bit in reverse here, that's why we're having a hard time.
Aud: Oppose "sleeping."
LRH: And then oppose "sleeping," and you got what?
Aud: Uh, "a selfish person."
LRH: Yeah, well, you should have a line plot that gives those. I point that out as somewhat negligent. Unless it's in here someplace. But that would be an earlier line plot.
Aud: And I didn't take it any further than that in view of this note here. I decided to go on to the goal.
LRH: Yes. Yes. Yes.
Aud: It didn't seem to be getting anywhere... Well, in other words, I assumed that the goal – getting the goal was more priority...
LRH: Yeah.
Aud: ...than fiddling around with that little package.
LRH: Absolutely, absolutely.
Aud: So the next session I tried to complete that package. And I took the goal "to know."
LRH: All right. And it reacted every time, once with an inch...
Aud: Half an inch.
LRH: ...half an inch latent RR. And you got sporadic RRs. And then you listed "Who or what would the goal 'to know' oppose?" Well now, of course, a goal that has been that left alone could be expected to be sporadic. So that would be of no criteria. You go ahead and list it and test list it and see if you could get something out of it. Now, you evidently got something out of it here. "What would the goal 'to know' oppose?" And now we're getting down to what is very, very interesting to me. And I will simply bundle up these other papers and lay those aside. That's all right.

And we will take a look here at this situation. Now. This is 22 February 63, is what we have brought this up to. But we have a goal here, list: "What would – who or what would the goal 'to know' oppose?" And this came up with, I think, the item "secrecy."
Aud: Yes.
LRH: And – acquainting ourselves with this situation – and we've got "secrecy." And where is the check out slip? Item checked out by Brian: "secrecy." RR,
sometimes one inch, sometimes a half an inch, sometimes a quarter of an inch. But, nevertheless, apparently it was an RI and it was firing. Now, where did that occur on this list? That's what's very important. Where did that occur on this list? Let's find out what this looked like.

**Aud:** I think it was about page 6. Yes, page 6.

**LRH:** All right.

**Aud:** That's the goal oppose list.

**LRH:** That's correct. And you had RRs on TD and you had RRs on nulling, huh?

**Aud:** Yes.

**LRH:** All right. Now, did you make a test of this for term or oppterm?

**Aud:** Yes.

**LRH:** And it was determined it was a what? Here is oppose "secrecy."

**Aud:** Well, frankly, I couldn't get a good test out of it. I couldn't be absolutely...

**LRH:** Oh, there you're -- there you're right there in good company. Because none of these early goals give a good test. None of these items. And you have to be very slippery about it. And you have to test them very gently. And this is too hard a list for a test list. You actually mustn't test list 3M. Completely different than 2-12. Mustn't test list it. Make up your mind. Now, there are several things that can help you make up your mind -- that's all right -- can help you make up your mind, several things. But this, you see, as a four-page test list, would be absolutely guaranteed to knock your frequency of the bank appetite over tin cup.

**Aud:** Hm.

**LRH:** So that you'd find yourself now having to extend the next list.

**Aud:** Ah.

**LRH:** You get the idea?

**Aud:** Yeah. Yeah.

**LRH:** So this is the kind of thing you want to look for. So there -- this would upset -- this would upset this list right here because it... we've got "Who or what would oppose secrecy?" and we've got this and this and we've got this all on a wrong way list. If it is a wrong-way list. But now, let's take a look at this list and see if we have an increasing incidence of R/S. Pc doping off, pulling missed withholds, pc remarked cognitions on this and that, like concerning his state. Now, what kind of a -- what kind of a... Here's one of the ways to check this thing. What kind of a list do you make when you are doing an oppose list? Let's see, this is, "Who or what would oppose secrecy?" So we want what kind of a list he does as a terminal list, don't we? And the goal "to know" gives us a terminal list. And what the dickens sort of a thing does he list off a terminals list? That is important. This is an oppterm list -- the goal "to know" oppose -- this is an oppterm list.

But here's our -- here's our determination here. And I already know this to be, studying the case, "a judge"? Read those.

**Aud:** "A judge, an honest man, a truth seeker, an investigator, a researcher, a straightforward man, a brave man, an open man, an open-minded man, a man with an open mind, a cheat, a briber" -- I'm sorry -- "a library, Scientology, a seeker after, truth, policeman, the law courts, courts of law," and...

**LRH:** I know this pc. I know this pc and that's a nice terminals list. Where's
the RRs?

Aud: There aren't any.

LRH: What's this – RR?

Aud: It's one RR.

LRH: It says R/S, R/S. Well, it's an interesting list, but it didn't give any RRs. Is that what we assume?

Aud: Yeah.

LRH: All right. Now. We got that list which actually shouldn't have been done, which occasionally you find yourself doing.

Aud: May I have a look at my - my reports?

LRH: There's your reports.

Aud: Yes, that's the first list I did.

LRH: "Secrecy."

Aud: Yes. I – first of all, I tested it treating "secrecy" as an oppterm. Then when that didn't go so well, I ran the other way.

LRH: Hm-mm. And how didn't it go so well? What happened?

Aud: Well, it's just the – the – the nonappearance of a lot of RRs. In other words, here, that – that's a question mark RR. There's two reads there I just didn't see because of the body motion on that one. Some surges here.

LRH: Mm.

Aud: Now, actually, there's just the one question mark RR there. Oh, and there's a question mark RR on page 1 and a question mark RR on page 3.

LRH: "An honest man," huh?

Aud: Mm.

LRH: All right. Got the pc right here. Pick up the cans, would you, Reg. Is it all right with you if I make a check on you?

PC: Yes.

LRH: Especially if I put the plug in. [PC laughs] All right. Now, let's take a look at this item here that was apparently the last something or other on this list and let's see what we've got. Okay? This is not very important what we're doing here. But there was an item there, so let's see if there wasn't anything about it.

PC: Mm-hm.

LRH: Okay. Is it all right with you if I start a short check?

PC: Sure.

LRH: All right. Here it is. Start of check. All right. Now, we have an item, "an honest man." All right. Now, uh – what's this incipient RR?

PC: Oh, I – I – sorry, I was ahead of you, Ron. I was starting to see – to see if there was any form of suppressions or something on here and – uh ...

LRH: Yes? Yes?

PC: I – I was just sort of...

LRH: Oh, all right. All right.

PC: I was looking at the item, incidentally.

LRH: Good. Good. I probably added another suppression to it by doing that.

PC: All right.

LRH: All right. Here we go. On the item "an honest man," has anything been suppressed?

PC: Well, what I suppressed just then, I just caught myself, was that – uh – am I fighting honest men? In other words,
is it – is "honest men" an oppterm? That was the thought that I had when you asked me what was going on.

**LRH:** Oh, all right. Thank you. On the item "an honest man," has anything been suppressed?

**PC:** Okay, there's something here. Um – I've always strived so hard to be honest and it's been so – not so much out of – I don't want to put a halo up here, but it's more out of – uh – that's the only thing you dare to do is to be honest, you see.

**LRH:** All right. Okay.

**PC:** I don't get anything else right away, Ron.

**LRH:** All right. Very good. Let me check it on the meter. On the item "an honest man," has anything been suppressed? That's pretty hard to tell. I'm going to ask that again, it's equivocal read. On the item "an honest man," has anything been suppressed? I'd say yes.

**PC:** All I'm getting here is that I'm not 100 percent honest, as I told you before, when it comes to income tax.

**LRH:** Oh, all right. Okay.

**PC:** That suppresses an honest man if anything does.

**LRH:** All right. Very good. Okay. Now, on the item "an honest man," has anything been suppressed? Oh, I can't make anything out of that particularly. Do you think that's flat?

**PC:** I haven't got any answer, Ron.

**LRH:** Very good. On the item "an honest man," is there anything you've been careful of?

**PC:** Oh, I've always been very, very careful to be honest. Um – if I'm being dishonest, uh – I have been very, very careful to make sure I wouldn't get found out. Um – very careful to be – to give the impression of an honest man. And uh – I'm being very careful now not to give the impression that I'm a dishonest man, because I'm not, really.

**LRH:** All right. Okay.

**PC:** That about covers it.

**LRH:** All right. Very good. On the item "an honest man," is there anything you've been careful of?

**PC:** I'm always careful to prove that I'm an honest man – to um – um – put my cards on the table all the time.

**LRH:** Okay. Good. On the item "an honest man," is there anything you've been careful of?

**PC:** I don't get anything else.

**LRH:** Very good. I'll check that on the meter. On the item "an honest man," is there anything you've been careful of? All right, I don't think there was a read on that. On the item "an honest man," is there anything you've failed to reveal?

**PC:** Failed to reveal that I threw a bit of paper away today that perhaps if I was 100 percent honest I wouldn't have done.

**LRH:** All right. On the item "an honest man," is there anything you've failed to reveal?

**PC:** No, I don't – um – don't get anything else.
LRH: All right. Very good. I'll check that on the meter. On the item "an honest man," is there anything you've failed to reveal? Well, that's not anything I can read offhand. Do you think that's flat?

PC: I was just sitting here, but I – yes, I think it's flat – I was just sitting here and this seems to be making me feel a very dishonest man for some reason.

LRH: All right. All right. I'm sorry.

PC: It's all right.

LRH: Okay. Very good. All right. On the item "an honest man," has anything been invalidated? Get anything?

PC: No, I didn't get anything right away.

LRH: All right. Very good. On the item "an honest man," has anything been suggested? Yes, there is a suggest on that.

PC: I've always suggested that I'm an honest man. And – um – I know I – when I was very young, I had the idea that it would be very nice to be – to go down as an honest man. And – um – I suggested it would be a good idea to be very honest in business and so on, which I have been. Like the only way to be.

LRH: Hm.

PC: I overstepped the mark in that direction. But sheer for profit, I mean.

LRH: All right. Okay. On the item "an honest man," has anything been suggested? I don't think there was a read on that. Okay. On the item "an honest man," has a mistake been made? Yes, there's apparently a mistake there.

PC: Um – that – the only mistake I can get is something it might be that I sometimes get this tied up with "a man of integrity." It's very much the same thing, but – um – well, that would have described it better.

LRH: Hm. All right. On the item "an honest man," has a mistake been made? All right. That would appear to be more or less it. On the item "an honest man," has anything been protested? I didn't see anything clearly read on protest. On the item "an honest man," has anything been decided? There's probably a decide there. This is all guess work on this meter, by the way.

PC: Um – well, I probably deci...

LRH: All right. Good enough. Good enough. You got that?

PC: Yes.

LRH: All right. On the item "an honest man," has anything been decided? You think of another answer to that? Lot of… lot of enturbulence to this meter.

PC: Um – well, it is the sort of thing that is said that you decide to be honest: I've decided to be honest in future. But uh – I can't – um – ever recall that dishonesty… Well, once as a child I was dishonest and got caught out very badly. That's right, I stole some change that's – from some shopping I've done – taking it or something like that.

LRH: Mm.

PC: And uh – got caught and was very badly punished. But, so I just sort of decided then that in future I should be honest.

LRH: All right. Very good. All right. I'm going to read this item now: an honest man. An honest man. An honest man. Well, I would say offhand there's probably an R/S under this someplace, but
that is definitely not the item. Okay? You can put down the cans for a moment.

**PC:** Yup.

**LRH:** All right. Now, let's cross that out as TD, no dice. And now let's take up the item itself, "secrecy," and see what we get here. Although from the amount of jumping around here, probably the wisest thing to do is take this goal "to know," and see if I can get a fire out of that and then take up the item "secrecy." And then we will take up some of this material here toward the end of your list and we will check this secrecy oppose end of list. Okay? And we'll see what we can find on there, because there is something on that.

**Aud:** Hm.

**LRH:** Because I noticed you went page after page, you see...

**Aud:** Interesting.

**LRH:** It's so clean. See, these additional pages are clean. I maligned you you had completed the list. So you can put it down in your diary, "Ron maligned me and admitted it in public." [auditor laughs]

**Aud:** I'll never be able to use that motivator again.

**LRH:** Yeah! Yeah!

**PC:** It's recorded.

**Aud:** Is it? Oh, good.

**LRH:** Yeah. All right. The list is complete. But somewhere before this list was ended, you see, an item has appeared. It's for sure the item is there somewhere. And you will find – because it's an RI oppose list – that the item undoubtedly will fall on the matter – this is the wrong list – undoubtedly will fall on the last... that's oppose secrecy, your test.

**Aud:** That's secrecy oppose.

**LRH:** Yes. And somewhere here – there's page 9, now, there's apparently no action clear on out to the end here, you see, to page 12.

**Aud:** But this is treating secrecy as the term here, Ron.

**LRH:** Yes.

**Aud:** It's all right, is it?

**LRH:** Well, quite, what's the matter?

**Aud:** We've just treated it... That's – yeah, I see.

**LRH:** That list is now scrubbed.

**Aud:** Right. That says I was treating it as an oppterm.

**LRH:** That's treating this list here – we're treating this list here as oppose secrecy. And we've just found out it can't be an oppterm, because we took your last reading item... Now, if I wanted to be very, very clever here and if I wanted to do exactly what I was teaching everybody to do, I would take these. What's that?

**Aud:** "A microscope." And that did R/S. So did that one R/S.

**LRH:** So, we got "a microscope." What's this next one? "A mirror"?

**Aud:** "A mirror."

**LRH:** And what's the item above this?

**Aud:** That's cognitions. Yeah, "a drawing."

**LRH:** "A drawing."

**Aud:** See, that was after pc doping off, pulling missed withholds.

**LRH:** Oh, all right. So I to some
degree took that into effect. So this couldn't be a pull-over.

Aud: Hm.

LRH: See? So we'd have to go – you're supposed to go above and below. See? All right. Pick up the cans, would you Reg, and just let me read these. Just see where we stand here, see if we can get anything at all. I'm just being supercareful now; this is almost idiot carefulness – in view of the fact you had cognitions just before this and this was your very next item.

PC: Mm.

Aud: Hm.

LRH: And did you see that thing R/S?

Aud: Hm.

LRH: Small R/S.

Aud: See, it's marked R/S there on the list.

LRH: See.

Aud: Yeah.

LRH: Well, I know. But just because it's marked on the list, it shouldn't R/S when it's read back.

Aud: No, not if you've got a complete list.

LRH: No.

Aud: Not that I...

LRH: So there's something awful wrong with this list.

Aud: So it's definitely incomplete.

LRH: Well, it would be either incomplete or...

Aud: Wrong way to.

LRH: ...or wrong way to. And because it didn't RR anywhere and when you did it the other way to, you did get RRs...

Aud: Yes.

LRH: ...then we immediately assume that it was...

Aud: The other way.

LRH: ...other way. Even though we shouldn't have done this list in the first place. See?

Aud: Yeah.

LRH: We shouldn't have done this oppose secrecy list. If we hadn't done it, by the way, you'd only do this just a few items at the top. See?

Aud: Mm.

LRH: Your trick is, look at the pc, see. Is the pc getting any darker?

Aud: Mm.

LRH: You know, that kind of thing.

Aud: Mm.

LRH: As a list. And I don't care if he's going off and talking and that sort of thing. Still, look at the pc. You can tell just after a few items: it's that fast. See, you can tell all of this. All right. Now, we're going to go into the goal here, the goal "to know," and see if we can do anything about that, Reg.

PC: All righty.

LRH: Is that all right with you?

PC: Mm-hm.

LRH: And we're just going to drill that up and see what we've got here. All
right. On the goal "to know," has anything been suppressed?

**PC:** All the mistakes I make are suppressed. Hopes about the goal are suppressed. Um – anything I don't know is obviously suppressed.

**LRH:** All right.

**PC:** Mm-hm.

**LRH:** On the goal "to know," has anything been suppressed?

**PC:** I've suppressed thoughts that maybe didn't read all that well.

**LRH:** Mm. All right.

**PC:** Can't think of anything else on this.

**LRH:** Okay. On the goal "to know" – I'll check it on the meter now. On the goal "to know," has anything been suppressed? Oh, I think there's another suppression there of some kind or other. This meter's a little bit hard to read here tonight.

**PC:** Mm. I apologize.

**LRH:** No, no, no, no. No, no – it isn't you. It isn't you so much.

**PC:** Well, whenever I don't let other people know things I'm suppressing the goal "to know." Um – and I had to suppress such things as I – um – it's an overt not to know. If – um – well, for example if you want something, and I should be one step ahead of you, I should know. It's almost theetie-weetie in reverse, do you see?

**LRH:** Oh, I see.

**PC:** I should know. And it's – I always feel guilty if somebody finds something before I do, or anything like this. It really is... people might find this hard to believe – but I feel that way – that I ought to know first. And – um – I ought to know.

**LRH:** All right. I'll check that on the meter. On the goal "to know," is there anything you've been careful of?

**PC:** I'm always very careful to try and to know. And this does work in reverse that I'm also careful not to let people know, uh – on some things um – in particular, the wife and so on, that I'll be very, very secretive about this. This seems to be a flip on it. But it's um – this seems to work that I have to know myself but other people don't have to know. I suppose it's probably a win if I know and somebody else doesn't. And uh – so I'm – I'm careful when I'm keeping other people in the dark on anything.

**LRH:** Hmm. All right. On the goal "to know," is there anything you've been careful of?

**PC:** I can't think of anything.
the meter. On the goal "to know," is there anything you've been careful of? Yes, there is another one here.

**PC:** Well, I was careful to um – come into Scientology. That's what came up right away. Because – uh – this was right up my... I didn't realize at the time but I've since realized it that – uh – Scientology is the science of knowing how to know and so, of course, when I saw this, this seemed terrific to me. And I didn't – and I – whenever I was running PE course this would be the sermon: If you want to know anything, boys, you join Scientology. Do you see? And this was a terrific entry point for me. And I was very careful to take it up.

**LRH:** All right. Very good. On the goal "to know," is there anything you have failed to reveal? Unless you've thought of something. On the goal "to know," is there anything you've been careful of? Oh, I wouldn't say – there is no read there. On the goal "to know," is there anything you've failed to reveal?

**PC:** Um – to other – as far as other people are concerned I've failed to reveal, as I was telling you earlier on. Um – this hasn't come up lately, but I have gone to great lengths to substitute "to know" – uh – with um ... I've always said, "Well, I don't know, but I always know where to find out." So that's – uh – I like notebooks and – or notebooks and books of reference, which I rarely go to but which I like to have there. And I can always find out. I always prize myself that I've got that far on knowing, that I know where to find out.

**LRH:** All right. Good. On the goal "to know," is there anything that you failed to reveal?

**PC:** Well, this – um – this works out as far as – um – somebody else's goal is in direct opposition to mine or apparently is in direct opposition. And I've never revealed it either to myself or to anybody else quite how this works out because it's extraordinary. Somebody has the goal "not to be found out," you see, and my goal is "to know."

**LRH:** Uh-huh.

**PC:** And this opposite seems to apply quite a lot in cases and uh – I've always sort of felt shy of even examining this in too much detail, you know, because it might reveal something. So as far as revealing it to myself that... Are you – are you with me on this?

**LRH:** Yes, yes, I got it.

**PC:** Good.

**LRH:** All right. Check that on the meter again. On the goal "to know," is there anything you've failed to reveal? I don't think that read. Did you think of another?

**PC:** The only thing I thought
generally was that – uh – anything I don't reveal, of course, is an overt act. So I should confess. And I mean, uh – uh – as you know from experience, I mean, take that customs business, I daren't...  

**LRH:** Oh, yes.

**PC:** ...come through with anything because I would give... We were thinking it was on "impostor," at the time, but it actually is on this goal "to know." Do you see?

**LRH:** Oh, all right.

**PC:** Because I'd give the game away. I can't really feel it's an overt not to reveal that I know it. You see?

**LRH:** Oh, yes. All right. On the goal "to know," is there anything you've failed to reveal? Boy, there is – there is something there, now, now.

**PC:** Well, what I just thought of then was, now there is a dirty trick; I just – I just committed an overt on you, you see, I'm getting you involved in the customs. They'd think you and I are running a terrific customs racket, do you see? [pc and LRH laugh]

**LRH:** Okay. All right. On the goal "to know," is there anything you have failed to reveal? I didn't get a read on that one.

**PC:** No.

**LRH:** That's clean now. All right. On the goal "to know," has anything been invalidated? Looks clean to me. On the goal "to know," has anything been suggested? I'd say so.

**PC:** Oh, um – what I'm getting now is, there's not-know and know. And uh – if is – not-know is higher on the scale than know, or to know, and then know. And um – that – that's actually a suggestion to me. I haven't got a firm reality on it myself, but I can see the sense of it. But I – I started to look at it again. That's something that has been suggested to me and I sort of accept it.

**LRH:** Mm. Mm.

**PC:** Before I can have a goal "to know," I must obviously have had a goal to not-know or something to that extent.

**LRH:** All right. On the goal "to know," has anything been suggested? There is another suggest.

**PC:** Well, I suggested the goal was mine when we were on TV. Um – when you, upstairs, when we found this goal.

**LRH:** Uh-huh.

**PC:** I suggested it.

**LRH:** All right. On the goal "to know," has anything been suggested? All right, I don't think that was one. Okay?

**PC:** Uh-huh.

**LRH:** On the goal "to know," has a mistake been made? I didn't get one there. On the goal "to know," is there anything you have been anxious about? Yeah, I think so.

**PC:** Well, I'm a bit anxious about whether this goal is in or out and whether it is my goal. I mean the usual anxiousness that goes on with goals, I suppose.

**LRH:** All right. On the goal "to know," is there anything you've been anxious about? I'd say, yes, there's another one.

**PC:** Well, I'm forever anxious. I mean, this is a – a terrible anxiety all my life on not... if I don't know anything. But uh... and I can see that many a time I got ARC broken just because I don't know. People come and ask me a question, if I
don't know the answer, I often find that I'm getting ARC broken with them. Because they – and then I accuse them of running a not-know on me, you see. Uh – and this happens. So anx... I mean, that's one long anxiety with this goal, Ron.

**LRH:** All right. On the goal "to know," is there anything you have been anxious about? I think there is another one. Doesn't have to be, but uh...

**PC:** Well, I – I'd have to dig for it. I haven't got anything

**LRH:** You don't think. All right. Let me test it again. I might have slipped on that. On the goal "to know," is there anything you've been anxious about? Yeah, there is one there.

**PC:** Um.

**LRH:** You'd better dig.

**PC:** Right. Um.

**LRH:** There.

**PC:** I – I know. I was a bit anxious when Peter was checking it um – out for the first time on this.

**LRH:** Uh-huh.

**PC:** Bless his heart, there's probably, and I put it there, a little doubt as to whether it was reading, do you see?

**LRH:** Uh-huh.

**PC:** It was equivocal or something like this. And so I've probably been a bit anxious whether it has been in fact a goal that should be run. Yes, I think so.

**LRH:** Very good. All right. On the goal "to know," is there anything you've been anxious about? Well, I didn't get a thing there. Okay?

**PC:** Uh-huh.

**LRH:** All right. This needle's getting cleaner, by the way.

**PC:** Good.

**LRH:** On the goal "to know," has anything been protested? I have a protest here.

**PC:** I protested, um – that it should be run, I think, when we were messing around with something else on the begin – beginning of the intensive with – uh – with Peter.

**LRH:** Uh-huh.

**PC:** Uh, and I've been protesting "to know" is a very difficult goal to carry around on your shoulder. I can't get anything else.

**LRH:** All right. On the goal "to know," has anything been protested? That's equivocal. Can you think of another one?

All right. I'm going to ask that again. On the goal "to know," has anything been protested? I'd say there's another protest in there someplace.

**PC:** Um – well, I think it – it's – this comes down to protesting about – um – people who've got a goal "not to be found out" letting everybody know everything, and I've got a goal "to know" and being very quiet about it.

**LRH:** [laughs] All right. Good enough, Reg. On the goal "to know," has anything been protested? That's nice and clean. Okay?

**PC:** Uh-huh.

**LRH:** On the goal "to know," has anything been decided? Ah, yes!

**PC:** Well, I decided it was my goal "to know" all along. Soon as we got a tick on TD, I decided, that's mine, that's the
lot. I'm quite certain on that.

**LRH:** All right. All right. On the
goal "to know," has anything been decided?
There's another decide, I think.

**PC:** Yes. This – quite likely. This
is on what I – I – you once said to me that I
was a great decider and – or something
along those lines. And I often wondered – I
have since wondered whether cognitions –
(quote) "cognitions" I've had, have in fact
been decisions.

**LRH:** Oh, yes.

**PC:** Such as, uh – decide that this
is a heavy goal and it must be very difficult
to carry this goal around. And then uh, this
is the way it hits you. Whether, in fact, I
sort of have a look and decide these things.
So it's quite likely there's a lot of decisions
on the – on the line here.

**LRH:** All right. On the goal "to
know," has anything been decided? I don't
think that did a thing. Okay?

**PC:** Uh-huh.

**LRH:** How do you feel about this
now?

**PC:** Fine.

**LRH:** All right. Let's get in the
counter button just for fun here, which is
"not-known." On the goal "to know," has
anything been not known?

**PC:** Hm. I thought I'd be saying
no.

**LRH:** Uh, what comes up here is
that I don't um – get a bit foxed on knowing
what not-know is. And that is not-know; it's
all to do with... Of course, that comes be-
fore the goal "to know."
**LRH:** Oh, this is bothering you a little bit?

**PC:** Yes, this does bother me a bit.

**LRH:** Ah, I see.

**PC:** I get this conception; I mean, I can see that high – higher up. But this state in between knowing this, presumably, and then not-know and then to know, just bewilders me a bit. And that is certainly not known.

**LRH:** All right.

**PC:** ...and until your needle's floating it would be.

**LRH:** All right. Is there a protest on the question?

**PC:** No. No. No.

**LRH:** No. Just – just – just is that concept?

**PC:** Oh, it's just that concept.

**LRH:** All right. All right. Sorry I misunderstood you.

**PC:** No, that's fine.

**LRH:** But I have understood you.

**PC:** Good.

**LRH:** All right. On the goal "to know," has anything been not known? You know, there's – there's – there's something sneaking around the edges. And it's probably that I am announcing an item. Somewhere on that bank there probably is an item, wouldn't you say? Because I'm starting to get a dirty needle on it – I mean, a dirty read on it. I'm going to leave that one alone if that's all right with you.

**PC:** All right. Yes.

**LRH:** All right. Okay. Now. Now, let's take this up. You can take a – take a break there, a moment, Reg. Now, let's take this up here. We've cleaned up the goal. We're not going to bother getting the goal to fire right this minute: we'll take that up in a moment. We've got here: secrecy. Hm. And I want you to indicate what's your last R/S on the list. Now, what is that word?

**Aud:** That's a question mark, that was nei... that's not an R/S or an RR. I checked that. It's "Invigilators." And I missed the read – it went off the meter or something – I came back and checked it. It never, to my knowledge...

**LRH:** All right.

**Aud:** ...has done anything; apart from that, I didn't see it.

**LRH:** All right. Now. From page 12 forward... Now, we've got this item, "dissemination," where does that come on this list? There it is. Well, now, look here, that's on page 7, is that your – actually your last RR on the list?

**Aud:** Mm.

**LRH:** All right. Now, I – I just had a cognition now.

**Aud:** I wondered what you meant when you said there was an RR after it. Now I see.

**LRH:** Ah! Ah.

**Aud:** Ah! Ah.

**LRH:** Ah! That's on page 7. And that's the last RR on the list.

**Aud:** All right. Now, I – I just had a cognition now.

**LRH:** Now what's that.?

**Aud:** I wondered what you meant when you said there was an RR after it. Now I see.

**LRH:** You had it folded backwards. I didn't look to see what your page numbers
were. Some auditors don't even number pages, you know. Now, that read, didn't it? And then did you add to the list?

**Aud:** Dissemination? No.

**LRH:** Have you added to the list since you tested "dissemination"?

**Aud:** No.

**LRH:** You haven't?

**Aud:** No.

**LRH:** And it read?

**Aud:** It gave a – it went like this. It gave a ragged sort of a – a rocket over. And that's the best I've had.

**LRH:** You mean this width?

**Aud:** No. No. No. You're the – you're the auditor.

**LRH:** All right. And that's the best what?

**Aud:** That's – that's – when I called it in – initially, that's what it did. It went – it sort of, it – it took off like a rocket but went and then did these little sort of jerks.

**LRH:** Well, what's the RR afterwards?

**Aud:** Ragged. That's got a question mark after it because I wasn't sure. And I...

**LRH:** And then over here somewhere it says "Adding to list."

**Aud:** No. Restarted list. That's the next session. In other words, that's the listing I did in that session. And then, look, I'm still getting – I got a little bit of TA there. So the next session restarted...

**LRH:** But this thing read. This thing read. This read.

**Aud:** It gave a ragged – look, I wrote on it, ragged rocket read. I got a rocket read on the Careful button when I ran a... the three-left-hand-button Prep-check on it. And next session I... before the next session I had Reg checked by Brian and he was checked on TV and there was no rocket read on there. So the best we've had on it, just calling it, is a – is this ragged motion. And I saw an RR on buttons. And then I – I- in that session I then big tiger drilled it and it went out completely. I couldn't get anything on it.

**LRH:** All right. In a case like that there are two things wrong. You have picked the wrong item off of your source list. That's the only two things that can be wrong now, see: you picked the wrong item off of your source list or that is the item. And it's been abandoned.

**Aud:** Hmm.

**LRH:** See, that's – because it read and because it RRRed on TD, can't be anymore. Your list is adequately completed here. How many pages beyond this have you gone? Seven. Eight.

**Aud:** One, two, three. Three pages.

**LRH:** See? And you haven't got another single read. Now, you just sit there and count the number of items from "dissemination" to the end of the list. Count for me.

**Aud:** ...It's fifty to there... A hundred. Do you want it exactly?

**LRH:** Gaa. A hundred! No other RR.

**Aud:** Right.

**LRH:** And you go a hundred and it read. You understand how you work this out?
Aud: Yes.

LRH: There's no sense in prowling around the rest of this list. Why isn't there any sense to it? This is 3M we're talking about now, not 2-12. See, here's the item, here's the item, "dissemination." Saw it fired. Fired on the drill. The list has been completed, completed, completed, completed. All right. We go back and sort out the number of things; we can say, "All right, secrecy is opposed wrong way to and we've got the wrong list or something of the sort." But, no, "secrecy" gave no RRs of any kind whatsoever.

Aud: Right.

LRH: So, it's a dead-end list.

Aud: That's right, so...

LRH: We tested the only read on it that was anything: it was nothing. You saw me drill it.

Aud: Uh-huh.

LRH: So that's a scrub. So this says there's nothing can be done about this except that's the item. Or one more possibility because of just this, these are just the only things: you grabbed the wrong one off the source list. Or it could be one more thing: wrong goal.

Aud: Uh-huh.

LRH: See? But that's highly unlikely because you are in the goals channel.

Aud: Hm.

LRH: Because you are getting RRs. So if you're getting RRs, that must be the item. You understand? I mean this couldn't be anything but the item. It's RRed on TD, you've completed the list, you did get "secrecy" checked out, it did fire, it's been opposed, obviously, right way to.

Aud: Yeah, well, why doesn't that check out?

LRH: I don't know. We will very shortly find out. All right. Do you understand the logic of this?

Aud: Yes, I see that.

LRH: Yeah. There's always that kind of logic, see. It can't be something else if that fired.

Aud: Hm.

LRH: See, because if something else fired, it would mean your list was incomplete. You understand?

Aud: Yes.

LRH: Only your list can't be incomplete because you've gone a hundred beyond it with no further read.

Aud: Hm. I'm – I'm pretty – I'm very positive I didn't miss one. Well, I mean, I could have missed one. But I – that would be – I was watching like a hawk, I was watching that meter. Particularly right from that moment on.

LRH: Oh, we're not worried much about that. Don't you see that you couldn't have missed one?

Aud: Yeah. Right.

LRH: You see how it proves itself without your sweating yourself to death?

Aud: Uh-huh.

LRH: You understand this logic? You'll see – sooner or later you'll see some auditor: well, that only read for a little while, so, therefore, we'll take over this list and we will check all of the things over and we will null everything on this list. And the guy's already extended the list a hundred items so he can't extend it any further. You know you can't extend these things more
than about twenty-five and then maybe you'll get another RR when you extend it. And you extend it another twenty five after that RR. You've just about had it.

Aud: Hm.

LRH: It won't stand any more strain than that.

Aud: Hm. Hm.

LRH: See, you can't go on listing the way you do with 2-12. The brakes go on right at that point, you understand?

Aud: Hm.

LRH: And you did have one that did read.

Aud: Right.

LRH: So we say, pc – pc very queasy. We say pc very queasy, pc suppress very easy. Pc have goal. We want to know. He doesn't know. He wants to know. We don't know.

Aud: Uh-huh.

LRH: Must be something like that going on. Furthermore, secrecy, and so forth. There's one – one more faint possibility: that somehow or another you got on the RR channel and you haven't got the right goal.

Aud: Hm.

LRH: See, that's another faint possibility.

Aud: Hm.

LRH: And we will see that possibility right now. But because that fired on the list and because the list has been extended...

Aud: Hm.

LRH: ...there's not another thing you can do about it. Now, if that hadn't fired at all you would then go above and below and above and below to make sure that the rocket read hadn't been sort of transferring. And you'd test all of those items.

Aud: Uh-huh.

LRH: And then you'd null it on out to the end of the list. And you'd find out you'd goofed one someplace and it'd now fire. You understand?

Aud: Right. Ron, I do have a confusion on this. I – I've got a withhold now.

LRH: What is your question?

Aud: Why could – this – why, because that read, couldn't there have been another one here reading?

LRH: There can't be.

Aud: I don't see that. I've got to admit that.

LRH: You went 100 beyond your last read.

Aud: Yeah, but suppose I'd missed one?

LRH: But you went 100.

Aud: Yeah. I'm being stupid, I know, but...

LRH: It's just too far.

Aud: Why?

LRH: Well, all right. Supposing you'd missed one. Supposing you'd missed one.

Aud: Yeah.

LRH: The list has not been added to.

Aud: That's correct.

LRH: So if two appeared on it the list would be incomplete.
Aud: Yes, that's correct.

LRH: This can't be incomplete. The list would be one, two... Now, look-a-here, here's the end of the list.

Aud: Uh-huh.

LRH: And we go one, two, three, four, five, six, seven, eight, nine, ten, eleven, twelve, thirteen, fourteen, fifteen, sixteen, seventeen, eighteen, nineteen, twenty, twenty-one, twenty-two, twenty-three, twenty-four, twenty-five, twenty-six.

Aud: No, it was just body motion so I – I checked back and it was dead – deader than a mackerel.

LRH: You understand. But these are not added to.

Aud: No.

LRH: You didn't add these to the list.

Aud: No, I didn't. How do I know that list is complete? That's what I don't...

LRH: You've gone for pages here without a read.

Aud: And there couldn't be just one read that I missed?

LRH: All right, if there was a read you're sunk. You'd have to be stone-blind.

Aud: Yeah. Oh, in other words, it's chronically incomplete if there's one more.

LRH: Well, it isn't chronically incomplete or anything else.

Aud: If there was. Look, I...

LRH: We count on the fact that you were at least looking at your meter down the lines here.

Aud: Yeah well, I'm damn sure I was.

LRH: But you've gone on and on and on. Now, because one thing has read...

Aud: Yeah.

LRH: ...you understand, if another one now reads after that your list is incomplete. So that isn't it either. You understand?

Aud: I don't. I'm sorry.

LRH: Yeah. I had – I had a hard time getting this through Mary Sue's head and everybody else has had a hard time. If there's two items on the list, it's incomplete.

Aud: Agreed.

LRH: So if the second item occurs on the list, that isn't it.

Aud: The list is incomplete.

LRH: So why are you monkeying with it?

Aud: To complete it.

LRH: Well, look, this is either now the item...

Aud: Uh-huh.

LRH: ..."dissemination" is the item

Aud: Uh-huh. Yeah. Oh, I see, or the list's not about to complete, is that it?

LRH: No. No. No. That's nothing to do about it. It's simpler than that. Now, there's the item and it seemed – it's been seen to fire.

Aud: Yes.

LRH: You got it? It's been seen to fire. Correct?

Aud: Yes.

LRH: So that if any item occurs all the way down here and all the way down here and all the way down here and all the way down here to that point, since the list...
has not been added to since you tested that...

Aud: Yeah.
LRH: ...the item is not on this list if that isn't it.
Aud: Right. Yes. Now, I see that.
LRH: You see that?
Aud: Yes.
LRH: So the only possible test is, then, to make a continued listing of twenty-five items.
Aud: Yes, I get that.
LRH: Looking for an RR.
Aud: I get that.
LRH: This is the only possible way you can test the list.
Aud: Yes.
LRH: So either "dissemination" is it...
Aud: Yep.
LRH: ... or you add twenty-five to the list to see if you get an RR.
Aud: Right.
LRH: And if you don't get an RR in that, then "dissemination" was it and you go on and use it.
Aud: Right. I – I can see this now.
LRH: You understand?
Aud: Yes.
LRH: So the only actions to be undertaken here is "dissemination" to be checked to see if we can't pep up a read out of it.
Aud: Uh-huh. Yeah.
LRH: Or, if we can't, add twenty-five to the list, see if there's a read on the twenty-five. Because in that space on 3M you'll have gotten a read, see?
Aud: Yeah. Uh-huh.
LRH: And if that meter doesn't flicker during that additional twenty-five...
Aud: It's wrong source.
LRH: No. No. No. "Dissemination" is it.
Aud: Oh, "dissemination" is it. Or if it isn't, wrong source. Yes. It would be – if it didn't – if – oh, yeah, yes, yeah, I see. At twenty-five it must be there.
LRH: Correct. It's the only thing that's been seen to read on the list.
Aud: Right. Yes. Yes. Yes.
LRH: You follow me?
Aud: I do follow this now. I've got it.
LRH: You've got this?
Aud: Yes.
LRH: So all this 3M – well, we saw that read and it only read for a moment, so now we're going to null the rest of the RI list. This would be true of a source list, you'd go all over the darn thing, you see. You see, you'd say, "I – well, we'd better null from that down on to the end, don't you see, and we'd better do this and we'd better do that." You see how all that proves nothing?
LRH: If you did find one from "dissemination" to the end of the list... See, the list has not been added to.
Aud: Yes, that's correct.
LRH: So if there is one there, just
so you understand there, it can't be it.

Aud: Yes. That's right. I understand.

LRH: So the action you're about to see me undertake is what you would undertake on that. I'm sorry, Reg.

PC: That's all right.

LRH: Pick up the cans, would you? That's okay. I beg your pardon. I'm just looking this over to see exactly where we stand here. I'm not trying to teach him anything. I'm trying to whet this thing out. You feel all right?

PC: Yes.

LRH: Is this upsetting to you in any way?

PC: No.

LRH: All right. Are you – I'm going to say your goal. To know. All right. To know. To know. All there was, was one tick and a speeded fall. Okay?

PC: All right.

LRH: Now. Let's take this item "secrecy" and make sure there's no tick on "secrecy." We're not looking for a rocket read, all we want's a tick if it's there. Secrecy. Secrecy. Pretty hard to tell. Secrecy. Secrecy. I don't know whether that's reading or not. Secrecy. Secrecy – looks like it's reading.

Aud: Something is reading.

LRH: All right. On this item, has anything been suppressed? It shouldn't read. Rudiments in or not, it just shouldn't read. This is one of your test steps of 3M the way it's been released.

Aud: I checked this on Friday. It was null.

LRH: And what happened?
LRH: All right. All right. Thank you. On the item "secrecy," has anything been suppressed? ...Something's suppressed there?

PC: Well, I suppressed arguing with you. You had suggested that "dissemination" wasn't on the goal line. And I suppressed arguing with you that it was. I could well see that "dissemination" was on the goal line. To me.

LRH: All right.

PC: And I was quite happy about that and I thought, well, it's silly to argue about it because it's my cognition and not Ron's. I mean, we have varying cognitions on it. And so that was suppressed.

LRH: All right. Very good. On the item "secrecy," has anything been suppressed? I'd say there's another one.

PC: Well, I think I suppressed admitting that I am a – a – an excellent suppressor. I mean, I've got a wonderful excuse now that I've got this item. Yes, this is what it is, this item gives me a terrific excuse, you see; I can say, well, it's all right, I suppress, it's my item. And this is rather a dirty get-out, you see.

LRH: Oh, all right.

PC: I think that's gone on. I've suppressed that.

LRH: All right. On the item "secrecy," has anything been suppressed? There is one there.

PC: Uh – this has a lot to do with the term suppression, which I have heard you say is a "forget." Um – I look upon suppress as more overt than a – than a forget; forget seems to me to be something that you haven't got a lot of control over at this stage of the game. That one uh – forget... Well, there's a lot I've forgotten which on that score has been suppressed. But I can't think of anything that I have deliberately suppressed or forgotten.

LRH: All right. Okay. On the item "secrecy," has anything been suppressed? Well, now, it's banging on a suppress and the item is reading.

PC: Mmm.

LRH: Give me another suppress.

PC: Um – I wondered whether I suppressed the um – its opposition when I came on TV in here the other night. Probably, I must admit that I did, but how, I don't know, when I was trying to – uh – get "dissemination" reading. That is on the item suppress – that is on the item "secrecy," you see, "dissemination" is.

LRH: Was I going to – I don't quite get quite how you suppressed this or where.

PC: Well, here because it didn't read when it came to be checked out because it read for Peter.

LRH: Oh, that's right. You've been on television elsewhere.

PC: I beg your pardon. Yes, I came in – yes, we came in here on Friday. Brian was checking out. We thought we were going to show them rocket reads, you see.

LRH: Bells ring.

PC: I'm sorry.

LRH: All right. Very good. On the item "secrecy," has anything been suppressed? All right, I still got a reaction. It's another one, however. There.

PC: Well, I think when I was listing it I suppressed – um – despair and even protest because the list seemed to be going on a long while.
LRH: Oh, really.

PC: Uh-huh.

LRH: All right. On the item "secrecy," has anything been suppressed? Boy, there is a suppress on that! And you think that that is because the item itself means suppress. Is that right?

PC: Secrecy can mean suppress, yes.

LRH: Is that what I understood you to say a moment ago?

PC: Yes, that would – uh – secrecy would be a suppression.

LRH: Uh-huh.

PC: It would be the big suppression. You suppress everything into secrecy.

LRH: All right. On the item "secrecy," has anything been suppressed.? All right. Secrecy. Secrecy. Secrecy. Secrecy. I don't know whether that's reading or not. On the item "secrecy," has anything been suppressed? Boy, there is a suppression, just a pure garden-variety of suppression on this item "secrecy" now. What is it?

PC: Well, I'm very secretive. I don't know if this is it. I'm very secretive out of – uh – fear, very often that – uh... and the fear is one of these – uh – unexplainable things that I just don't know. I might not come and tell you something that I don't want to keep to myself, and yet when I come to tell it to you it just won't come out.

LRH: Hmm.

PC: That's why I say – therefore I say well, I'm secretive. I – I can't. Well, the same thing, to take it outside here, to go and speak to my wife: I get there and I just wouldn't be able to talk to her. I can't – and you know, I pick up a pen and I – and I just can't pick up the pens to write. I mean, it's this bad. And it's fear or something, it's one of these things I just can't explain. But, therefore, I'm secretive. And I feel this is wrong, you see. But um – there you are.

LRH: All right.

PC: Hell of a suppression on – on the – well, a hell of suppression on my life over it, is one big suppression.

LRH: All right. On the item "secrecy," has anything been suppressed? All right. There is a different one, that's another one.

PC: Uh

LRH: Is this being protested?

PC: Uh – it – it seems a terrific.... I can well believe it's reading because there must be one... there should – an infinite number of suppressions on this item.

LRH: Uh-huh.

PC: And, uh – uh, I just – it might be a little while cleaning this up because – uh – to hear you say secrecy, what to me means suppression, and that's making me suppress all along, all the time. You see?

LRH: Uh-huh. Hm. All right. On the item "secrecy," has anything been suppressed? On the item "secrecy," has anything been suppressed? All right. Unless you can think of a ready answer, I'm going to drop that one.

PC: Right.

LRH: All right?

PC: Uh-huh.

LRH: All right?

PC: Yes.

LRH: Very good. I'm just going to read it just straight here. Secrecy. Secrecy.
This is reading, Mr. Williams, which probably gives us the source of our trouble. That has not listed down. Your proper action is to continue that twenty-five items. See if you find something else. Continue it maybe a little bit further – see if you find something else.

**Aud:** Uh-huh.

**LRH:** If you don't find anything on those, go back to the source list. Because there's something awful wrong on an item that won't list down.

**Aud:** Uh-huh. Yes, I thought of that.

**LRH:** Yeah. And it is reading. The button shouldn't be charged on this thing.

**Aud:** Hm. No, that's charge.

**LRH:** Your last action in desperation, if you lost everything in all directions and you could find nothing else by extending your source list, you know, couldn't find anything and so forth, why, would be to try to carry on with this item because you've seen it rocket read.

**Aud:** Yeah.

**LRH:** Usually you don't get into this much trouble. But early on – early on on a goal that's having a hard time firing, see. I'm amazed that this goal's got a tick on it or anything like that, you see, that might still be just greased out.

**Aud:** Uh-huh.

**LRH:** As easy as that. But he, not knowing whether this is his item or not, not knowing really whether secrecy is out or not, or in, you know – disoriented on the thing – is giving an example here because this needle is going back and forth here into a perpetual God-elp-us, you notice. It's been very hard to read. It's not your dirty needle [pc laughs] you used to have, you know, that's not it. This is just a wild swing. And it's doing it constantly one way or the other. And it's smoother now than it was. And what have I done? I've drilled the goal "to know"; I drilled "secrecy" a tiny bit. But actually that "secrecy" shouldn't be reading, see? It just shouldn't be reading. We shouldn't have to tiger drill it to make it not read, see. You don't tiger drill these things, you list them.

**Aud:** Uh-huh. Incomplete list.

**LRH:** Apparently. Simple. Now, the chances of your having a wrong goal here are very remote. Because it has been seen to fire and you haven't got enough items yet to make this goal read well.

**Aud:** Uh-huh.

**LRH:** It'll take you as many as twenty-six goals – pardon me, items to run it out. And it might just take five, six, seven accurately found, instantly found, you know, very smooth, easy-on-the-pc items and the goal will be firing like crazy. Got that?

**Aud:** Yeah.

**LRH:** So, that's all there is to that.

**Aud:** Hm.

**LRH:** All right. You can straighten these out in due course. Now. Let's put in a little bit of rudiments here, shall we? For the end of this demonstration.

**PC:** All right.
has anything been suppressed?

PC: Don't think so. You can have my all. Except what I've suppressed on secrecy.

LRH: All right. All right. In this demonstration, has anything been suppressed? All right. I changed the word there from that, to checkout to that. In this checkout, has anything been suppressed? There has been something suppressed here.

PC: Uh – yes, you asked me and I suppressed the nature of the paper I threw away.

LRH: All right. Very good. In this checkout, has anything been suppressed?

PC: I don't think so.

LRH: All right. I'll check it again. In this checkout, has anything been suppressed? All right. That's clean. In this checkout, is there anything you've been careful of?

PC: Careful to cooperate. That's about all.

LRH: All right. In this checkout – I'll check it on the meter. In this checkout, is there anything you've been careful of? I'm afraid there is one there.

PC: Well, I was very careful to try and follow the discussion between you and Peter on this complete list. Because I was up here, you see.

LRH: All right. In this checkout, is there anything you've been careful of?

PC: I was careful to look for answers. And... I don't get anything else.

LRH: All right. Very good. I'll check that on the meter. In this checkout, is there anything you've been careful of? There is another one.

PC: Oh, careful to give a good impression, I think. Yes.

LRH: Oh, all right.

PC: Yes.

LRH: All right. In this checkout, is there anything you've been careful of? I've got another one.

PC: Uh – I was careful when I was speaking about Peter, not to accuse him of doing something wrong. Because I don't think he did at that time but I tried to wrap it up nicely when I came out with that one.

LRH: All right. In this checkout, is there anything you've been careful of? Another one.

PC: Well, I was careful, I think, at one stage not to mention somebody's name.

LRH: Yeah. All right.

PC: I hid that one for a bit there, but still.

LRH: Okay. In this checkout, is there anything you've been careful of? I don't think there was anything there. All right. In this checkout, is there anything you've failed to reveal?

PC: Well, I didn't reveal all the suppressions that – obviously that were on that – on the secrecy. But on the other hand, I couldn't say that I've revealed all that I was aware of. Put it that way.

LRH: All right. All right. In this checkout, is there anything you've failed to reveal?

PC: No.

LRH: All right. I'll check that on the meter. In this checkout, is there anything you have failed to reveal? I've got a kick on that. What is it?
PC: Well, I was – I failed to reveal to Peter at times I didn't think he was speaking loudly enough to get into that microphone. Because he's over there and the microphone's there, you see.

LRH: Oh, I see.

PC: I was trying to give him signals at times. Perhaps I failed to reveal to him what I actually wanted was for him to speak up so that everybody could join in.

LRH: All right. In this checkout, is there anything you've failed to reveal? There's another one.

PC: Something to do with the fear of – uh... something to do with the fear of telling of – of saying things. Oh that – that it doesn't apply to everything. There's some – I've never been able to work out what the line is that I get scared about talking, see, to people about. But it's just something I – and there doesn't seem to be a common denominator. I mean, there's lots of things I'm quite open about and there's no difficulty in talking to people about it. Some things, and I haven't sorted this out, no doubt it will come out in the goal "to know," when I'll – I run that out, but it's – uh – it's certainly there and I think it's something to do with showing myself up in a bad light and so on. And I didn't reveal all that I've just told you, but that's as far as I know on that subject.

LRH: All right. Okay. In this checkout, is there anything you have failed to reveal? I don't think there was anything more on that.

PC: Good.

LRH: Okay. Now. In this checkout, has anything been invalidated? I didn't get anything except a latent something or other. In this checkout, has anything been suggested? There is a suggest.

PC: You suggested – you suggested one time – you didn't mean it – but I got the suggestion that I'd got a dirty, filthy needle there. I was a bit concerned about this.

LRH: Oh, all right. I'm sorry.

PC: I've done a bit of suggesting – I'm a bit uh – I did notice that the tone arm was rather low and I – and uh – suggested there must be something wrong with being checked out on TV that gives me this very low tone arm.

LRH: Uh-huh.

PC: And I was a bit puzzled about that.

LRH: All right. In this checkout, has anything been suggested? All right. I don't think there was anything there. In this checkout, has a mistake being made? I'd say yes. Just to be careful.

PC: Oh, yes. It's to do with murder or murderer. And uh – you found "murderer." And as you know, I always disputed and protested this to some extent. And you said you got witnesses and so on. And I always had the thing where I couldn't pass it, and when he came up with "murder" such as it was, I said, well, that was the item, it was "murder" not "murderer." I didn't mind buy a "murder," but "murderer" didn't – never seemed ... I don't see any real reason for this, but "murder" seemed to fit so much better, do you see? And so this was again mentioned. And you said, after Peter said it was "murder," you again said "murderer," do you see, down the line... and uh - when actually the item found was "murder." I don't know – uh – possibly a bit of a missed withhold. I don't know whether you really appreciated the item that you
found was "murderer," but the item Peter ran was "murder." And uh – they're two different things.

**LRH:** All right. Very good. Very good. Okay. In this checkout, has a mistake been made? All right. I don't think there was one there. In this checkout, is there anything you have been anxious about? Oh, I think so, at a guess.

**PC:** Anxious about tone arm. Anxious about Peter's speaking loudly enough. Uh – anxious for Peter sometimes that he wouldn't get on. Anxious that we got a – a decent read for them out on the other side. Uh – a bit about uh – anxious about Mary Sue because I took away her screens upstairs. Um, oh, I think that's the lot.

**LRH:** All right. Very good. In this checkout, is there anything you've been anxious about? Oh, dear. Let me see. Let me give that again. In this checkout, is there anything you've been anxious about? I think there is. One more.

**PC:** Yeah, I've been anxious about this – uh – feeling of fear that comes up even in... on these sessions, on TV, and I can't make it out because I can't see... It seems – uh – I've no – I've no sympathy for the students when they come here. There's nothing and I - and I'm quite happy to come and sit down here and do it. And yet once I sit down here and you start asking rudiment questions and so on, and – yaaaaa, and I feel so filthy and secretive, and so on. And yet – I – I don't get this at all. I've been anxious about that.

**LRH:** All right. In this checkout, is there anything you've been anxious about? Do you think there's another answer there? I couldn't make it.

**PC:** I have – I haven't got one.

**LRH:** All right. Let me check it once more. In this checkout, is there anything you've been anxious about? Yes, there's another.

**PC:** I was anxious that that would read there because I thought we cleaned it, you see, and this always happens. Peter gets an equivocal and it always reads the next time.

**LRH:** Oh, I see. All right.

**PC:** And I get anxious about it.

**LRH:** In this checkout, is there anything you've been anxious about? Oh, I don't know. Anxious about. There is another one.

**PC:** I was anxious about the time once.

**LRH:** Oh, yeah.

**PC:** Uh-huh.

**LRH:** All right. Very good. In this checkout, is there anything you've been anxious about? Well, I don't think that had anything on it at all. All right. In this checkout, has anything been protested? Yes.

**PC:** I was probably protesting um – Prepcheck or the drilling of uh – taking suppress off "secrecy."

**LRH:** Hm.

**PC:** I don't know of any other protest at all.

**LRH:** All right. Very good. In this checkout, has anything been protested? That looked clean to me. And in this checkout, has anything been decided? There's one.

**PC:** Well, you decided to set a course of action in my case. Uh – and I think I've decided something on this – there
must be something more on this question of fear, I think a... decision.

**LRH:** All right. Very good. In this checkout, has anything been decided? I don't think there was anything there. All right. Now, how are you doing?

**PC:** All right. I feel quite – uh – quite perky as a matter of fact. As we went through these rudiments I did really come up quite a bit.

**LRH:** All right. Very good. It would be unusual to put all these in, in a checkout, but I thought you deserved them.

**PC:** Thank you.

**LRH:** All right. Is there anything you care to ask or say before I end this checkout?

**PC:** Uh, no, thank you.

**LRH:** All right.

**PC:** Thank you very much for giving it to me. I appreciate it.

**LRH:** Good enough. Here it is: end of checkout.

**PC:** Thank you.

**LRH:** Okay. There we go.

Well, you've seen something of a straighten-up tonight on a case. And I've simply reviewed the case. But the truth of the matter is, is there is no large read on this goal. That doesn't at this stage of the game, however, mean a thing. If rocket reads are being actually observed and checked out on this case, that's no excuse not to go along and follow the thing through. But it might be a little more difficult than it first appears.

Now, the main difficulty which is being caused on this case and why this... I wanted to find out why Peter here was writing down lots of question marks and having trouble on what read and that sort of thing. Now, I see the reason for this. The reason for this is that somewhere in 2-12 they must have kicked in some sort of a needle pattern of some kind or another or the pc was upset about some incomplete package or upset about something there one way or the other.

And what I would do with this pc is to give a good interested – interesting approach, which is a nice smooth Prepcheck. And I would do that this way: I would take goals, listing, auditing, auditors, something like this, and I'd make this little list. I'd make this little list and write it down and then I would assess it over here on the meter. And I'd give it a nice assessment and find out which one of these things went pow! And then I would run an eighteen-button Prepcheck on it. Just like that. And I'd be sure to give this pc a very, very, very smooth auditing session, smooth auditing approach. I would give them everything in the world to build up ARC, confidence squared up, get anything he's worried about. Don't you see? Any one of these things, you see. I'd make him feel good. Particularly I'd pull any missed withholds from auditors and that sort of thing.

But I wouldn't pull it in any naggish fashion. You understand? I'd pull it very smoothly. It's not that this pc is in bad shape: this pc isn't in bad shape. But some of these 2-12 packages have apparently roughed this pc's needle up. Because I know this pc's needle and I have it smooth as glass. And that doesn't mean that Peter did anything wrong particularly or otherwise, but something somewhere along the line here has roughed this thing up. And I
would try to get rid of that needle pattern and after that audit him on a very smooth, clean needle.

That's the first thing I would do. That doesn't necessarily take a long time. That pays good, heavy dividends, don't you see? Because then you're operating with a pc who has some good confidence in the auditor, and so forth. I'd go along – it wouldn't take too long, take maybe at the absolute outside two three-hour sessions. I mean two two-hour sessions. Because that's done rather rapidly.

Then I'd come back here and I'd test list this item "dissemination." I would just simply go another twenty-five, something like that, watching this new, clean needle we have here and make sure that we didn't have a rocket read as we went that twenty-five. And if we didn't have, then I would take "dissemination," which has already done a rocket read on checkout – Tiger Drill, but it wasn't checked out – and I would take "dissemination" and I would establish whether or not it was a terminal or an oppterm and I would list it down to a new item. And I think I'd find that we were approaching closer and closer into the bank that the goal would read better and better. Just go on down the Spiral Staircase as long as I could get rocket reads. And that would be the criteria.

That is everything that I would do. I wouldn't do anything new, novel, strange, anything else. I would just do – find out what it is that's worrying this pc, whether it's goals or listing or auditing or auditors or whatever it is that's worrying him. Give him a Prepcheck on that particular subject. Good, high ARC with the auditor. Go back in, list this thing the additional twenty-five items that proves it up. No read on the twenty-five items, obviously "dissemination" is it. Take "dissemination," terminal or oppterm, oppose it on down the line.

And of course, the only thing about it would be if I never got a new rocket read and the lists were all bare and something was dead wrong. I would then assume something was awfully wrong with the source list. And I would go back to the source list on the goal and I would sort that out. And I would complete it and only assessing the new items that I put on the list completing it, go over those and see what I could find.

That's everything I would do with the case.

But we're looking too far ahead. This case is perfectly all right and it probably will work out that "dissemination" simply has to be opposed. And you'll see that it won't take the auditor too long to do this.

But in actual fact, this case has had too much... too many question marks thrown in his way. He's worried a little bit about this, he's worried about that and, of course, he's stuck right here in this "secrecy." Well, this thing is still kicking. The fact that it's still kicking, that it had been listed down in the session we agree, possibly was clean. Well, that was good enough, but because it doesn't have an oppterm that thing is going to keep kicking. Don't you see? That's enough to make it tick. But it's also enough to make one question whether or not the list was complete in the first place. That's everything we know about it.

All right. Now, that's it. And thank you very much.

And good night.
Well, good evening.

We have a lecture here tonight on the GPM. And this is the 28th of February, AD 13.

Now, the difficulty with this lecture that I'm about to make to you is it's liable to bring your GPM loose from its moorings. And if so, I'm very sorry for that. I'm very sorry for it, but we will be able to pick it up as we go along, so don't feel too upset.

GPM – what is this? What is this? The Goals Problem Mass is what it stands for. Why is it the Goals Problem Mass? It is that mass which accumulates after the postulation of a goal resulting in problems. Only these problems are not the problems of postulate-counter-postulate, but they're identity-counter-identity.

In handling the GPM, we are actually handling identities.

Now, let me put you in focus with regard to where we have gone in processing. The first processing resulting in Clears was simply a Key-Out Clear – getting somebody to confront his bank and his actions on a gradient scale. And that is as old as 1947.

Now, as we move forward we find that Clears – as we move forward in this technology – we find that Clears were not continuous, permanent and stable as the years went along and that anything from three days to many years after being cleared, something would bite. Something would cave back in. Something would happen and they would cease to be Clear.

All right. What is this something? Well, this something is actually what made them a non-Clear in the first place – the Goals Problem Mass.

Now, an individual goes through this type of cycle and action: He makes a postulate. He becomes an identity to make the postulate stick, and in the process of doing that, he is opposed by various elements out of his own fancy or the determination of others which causes an opposition identity to materialize. And the presence of the opposition makes the individual believe that to accomplish his goal he must now become another, different identity in order to handle the new opposition which has appeared.

And because he is this new, different identity – all in the same goal – new opposition, a new opposition identity occurs in his vicinity. And because this second opposition has now occurred, he believes that it is incumbent upon him – either because he is losing or winning – to assume a third identity in sequence. He assumes this identity and as soon as he assumes that this new identity, he now has a new opposition form ...

Well, I'll give you an idea. We mean opposition like this: A man decides to be a smoker. Let's not put it on the GPM basis, let's put it very finite. A man decides to smoke. He therefore becomes an identity known as a smoker.
You've seen them in the ads. They look very placid. If they smoke cigarettes, they chase pretty girls. And if they smoke pipes they chase fireplaces. You know? And we've seen this. Whatever this identity was, he's assumed this identity and then he gets married and his wife objects to his being "a smoker"; so now he has an opposition known as "a wife." So he assumes a new identity which is "a dominating husband" in order to handle the identity "wife."

But now we have a new identity show up. We have something called "the Ladies' Aide Society" – And his wife has joined that. And their combined forces are going to cause him to stop smoking. So now he has to become "a wealthy self-determined individual." You see that? And the Ladies' Aide Societies then get a bunch of quacks – members of the AMA – together and they say that if you smoke it produces cancer. They don't know what produces cancer but they say that smoking does. They... you see that's the ghost-shirt messianic thing. They have no solution to it, they can't cure it so they pick on something and they say, "Well, everybody spits in the water so that's what causes typhoid fever." They don't know. You see?

So, now he has a counter-identity called "the American Medical Association." You see? And that's an identity. So, this fellow now in desperation to handle this situation, becomes "a political genius," you see. Because you have to be a political genius these days to handle the AMA. That's the only place where they operate effectively. Don't operate effectively in the operating room anymore, only in Congress.

So here he is now "a genius," you see, "a political genius." Now, the political genius runs into an opposition party. So, you have an opposition party – "the Democrats." You see, that's the next oppterm. And that's about the high tide of the whole thing.

Let us say not... no reference to the number of items you really have. You've got a deterioration of this situation. He now starts getting lesser identities and the opposition on the subject starts to get bigger.

So, he says – he becomes then "a ward politician." And the opposition, in this particular case as a ward politician, becomes "the nation." And then he becomes an idea called "political bribery." And his opposition is "the world." And then he becomes a fellow who wouldn't... can't stand the idea of smoke and the opposition is "the atom bomb."

You see? This is the – the term-oppterm list I'm giving you. But I'm giving it from the goal upwards. Not as you the auditor, contact it.

All right. Well, let's take it now at the point of the... "a fellow who can't stand smoke" versus "the atomic bomb," which is the most smoking thing which there is on the planet, you see. And those are the first two terminals you run into. That's, pardon me, the first two items you run into – RIs. And the first terminal you run into for the preclear is "a fellow who can't stand smoke." And the opposition you run into is "the atomic bomb." So, as you list this goal oppose list you run into the atomic bomb and he says, "That's the most smoking thing I can think of. The goal is 'to smoke' or 'to be a smoker,' so therefore I am the atomic bomb." Of course, you are immediately backwards, instantly backwards. Because the first items you run into, the goal has gone into a deterioration on the terminal side and an amplification on the oppterminal side.
So, the amplification of the oppterm means that it is the top dog type of item, and the individual as the term is the degraded type of item.

You never quite know what you are going to run into. It isn't fair for an auditor to totally make up his mind so that no listing or anything else can prove him wrong because it's the mechanical facts of listing. I'm just talking now about the GPM, not so much how you audit it. That is what it looks like. That is what it looks like from a standpoint of making the postulate "to be a smoker," going through these various phases as terminals and meeting these various oppositions.

Well, now we know that a problem – the reason it's called a Goals Problem Mass, is we know that a problem is a very balanced situation. A consistent problem is one – is consistent and continuous only because it is so well balanced between its two poles. In other words, the amount of violence contained in each one of the sides of the problem are more or less equal. So the problem continues.

Well, when we look at a GPM we find actually that it is composed of black masses. And that is said advisedly. You say "What is a mass?" Well, a mass is a mass. If you had a bunch of black cotton or something of the sort heaped up in the middle of the floor, that is what the GPM looks like.

Of course, that whole black mass is composed of these little parts – these terminals and opposition terminals – and each one of those is a black mass. Well now, we say problem – a problem consists of postulate-counter-postulate which means an intention versus an intention. And the husband wants to go to the movies, the wife doesn't want to go to the movies, so we have a problem. And if their – if their determination were equal, it would be an unresolvable problem. There are these determinations – were exactly equal and it would hang just like that. And it would go on interfering with their married life. And it'd become more and more solid and more and more reinforced and it would hang up.

Now, actually problems are almost impossible to balance in this fashion. One side is stronger than the other and they over-balance. Therefore, the residual of two hundred trillion years is composed of a few sections, a few goals and a relatively few of these items. Because they have to be so delicately and intricately balanced. The opposition is hung up against the terminal, and these things have to be very, very, very carefully delicately balanced in order to ride forward.

You'll notice the odd part of it is that if you want something to ride forward in time, you make two counter-opposed efforts. You have to have effort A versus effort B counter-opposed. And if you get those things counter-opposed, they will ride – it will ride forward in present time.

Now, the whole GPM is tending to ride forward in present time and its characteristic is instantaneousness, because it has no time in it. That is because every time one of these firm identities has been opposed by a firm opposition, and where the balance necessary to a hang-up has been achieved, we got a timeless situation.

This thing started drifting forward in time. With each click of the clock we weren't able any longer to overbalance one and the other. So there they are, fist against fist, incapable
of being disturbed. Nothing disturbs these things. And then we get two more on top of this and two more on top of this, so those are jammed and then two more on top of this and two more on top of this and those jam. And we eventually get this situation which is riding forward in time.

Actually, this goal has produced literally billions of identities but those aren't the identities which we process; billions of them, but they didn't hang up in time. Do you see that? Because they weren't accurately and exactly opposed. They didn't hang up in time. Only those which hung up in time are those which have to be addressed. What happened to these other identities? Well, they just dropped off and as-ised and skipped it and so forth.

And that's fortunate for you because two hundred trillion years, if you write it down on the wall and figure out that an identity was achieved – oh, every three or four – three or four times a century or even if an identity was achieved once every hundred years, you'll find out that you have an incalculable number of identities which have an incalculable number of oppositions. And you just would never be able to process them. There are just too many. Numerically, it is just too many.

But fortunately it's only those that were exactly balanced, the terminal is exactly intentioned against the opposition which is exactly intentioned, that match it with absolute precision that permits all this thing to drift forward for – well, the first one has been drifting forward for two hundred trillion years. That's how old it is. Pretty moldy.

That's... but it's what saves us in processing this thing is the almost incalculable rarity with which you got a total hang-up. We don't always have the problem, "I want to go to the movies" and "You can't go to the movies." We don't just have that hanging. In life ordinarily the husband says, "Well, honey, actually I think we ought to go to the movies because as we were passing the drugstore I was going to get you a box of candy." And she says, "Well, I think we better go to the movies, huh?" And, or conversely – conversely she breaks out a rolling pin, hits him over the head and of course he can't go to the movies or anyplace else. In other words, the problem resolves itself there, see? One side overweights the other side.

But you get a tenuous holding of one against the other – no matter what violence was interchanged, they tenuously hold against each other and exactly balanced – that problem has never been solved. So the GPM could be said to be that accumulation of identities and oppositions which have never been resolved from the beginning of time.

Now, of course some of those originate in relatively modern times. But the earliest of them has been with us since the beginning of time.

Now, what – what... why do we call this then the Goals Problem Mass? Well, we call it the Goals Problem Mass because it's generated by the effort on the part of the thetan to execute a goal he has postulated. That's goals. Problem because it is in terms of an identity versus another identity which has hung up as a problem. And we call it mass because this pair banging against each other has given us in the bank, mass – Goals Problem Mass. And that is why it is called that.

All right. By the way, it's a brand-new discovery in Scientology so there is no similar terminal to be... I mean, no similar designation. There aren't even words for these terminals,
for opposition terminals. I mean, this has to be new nomenclature because there is absolutely nothing to measure up to this. These things have never been observed before in the human makeup.

For instance we're new, as it's new, as this: We were the ones who identified a field. What is a field? You know a black field or different moving field or that sort of thing. What is this? We're the first one that ever found out people had it.

And actually although a few people have called attention to... I think beginning about at 1913 somebody mentioned the fact that some people could see pictures. I think that's about the earliest reference on it.

The lock, secondary and engram are all original with us. And then we take it one step deeper and we get the mass which is the result of having an identity, and we call that a circuit. And oddly enough it'll continue to talk, it'll continue to think, it'll continue to do a lot of things when energized and we find people with these circuits and so forth. Those circuits are fringe – that we normally see in operation – are fringe parts of the GPM and we're actually looking at the GPM when we look at circuits.

Well, we are the ones who have found these things and therefore our terminology for them is quite new. But it can be nothing else because, never having been discovered anyplace else, it of course had no terminology.

Now, look at the cycle of processing, getting back to that. First we started to make Clears by accustoming people to look at their banks and be able to see that bank. And just these little pictures. And to the degree that they could confront those pictures you would get a key-out. That is to say the individual would no longer let them bother him. And going in on a gradient scale, you could do this today – it's long and arduous – you could get the individual more and more accustomed to confronting his bank. And more and more accustomed to it. You could show it to him, get him so he could see it, so he could face it. And the next thing you know he'd see more and more things in it and more and more things in it, be less and less flinching. And next thing you know his needle on the E-Meter over here – his needle would go clean and you would have a Keyed-Out Clear. You could do that today.

Actually you can tackle the GPM this way. You can take 3M and you can call off items... Well, you don't have to. You can just say – after you've listed the list you can say to the preclear, "Which one of these is your item?" He tells you the wrong item. He never tells you the right one, by the way. Well, not unless he's about one goal down, you've already got his – his cognition level is picking up and he's beginning to see these things. Auditors shouldn't be dissuaded, however. They should go on and get the item that reads.

But anyway, you say, "Which one of these is your item?" and he will inevitably – particularly on the first goal and part of the second – call it wrong. And now if you took that item and you opposed it – you know, it didn't read – and you opposed it in some way – you're doing listing as auditing – and you got another list and you said, "Which one of these is your item?" And the individual said, "Well, it's that one." That's wrong, too, because this list, by the way, doesn't RR. And then you said, "All right. Which one of these is your item?" And the individual would say, "Oh, so-and-so." There's some chance that you would produce a Keyed-Out Clear. This is quite interesting but there's some chance that you would do so.
There's always an equal chance or maybe a superior chance that you would continue to drop him through into heavy areas and earlier GPMs which made him go clank! You know, I mean, just – just caved him right in, just dragged him into zones and areas where he had no business being.

So this is no sure cure method. But you're going to hear from time to time as the years go on, some wild Indian jumping up suddenly and learning how to make a Keyed-Out Clear and trying to pass for the real thing. We've been making Keyed-Out Clears now for sixteen years. There is no particular reason to make any more of them.

Now, they've been enough worry to us. Thank you.

The... what I'm getting at here is our first address, then, was really to locks. And I almost fell out of my auditor's chair back in 1947 or 48 when I found out that people could confront their birth. Now, those engrams weren't run. See? They could see prenats. They could see this, they could see the other things. And actually it was less confront. I was throwing them into it more and more heavily. See? And I was not building them up and when I started to train auditors, they didn't handle this smoothly and the next thing you know we were involved totally with mechanics. And we were not involved in any way, shape or form with the preclear. You see the difference? So therefore we got PCs going into engrams which were very hard to run indeed. And this got us into Dianetics in 1950.

Now, we can do some marvelous things running engrams. There is no doubt about that. And it's quite remarkable running engrams. But do you recognize that every individuality which this individual has had all the way along the track, every person he has been, had a complete bank?

Now, look at that. Do you know how much bank there is in this current lifetime in a PC? Well, there's a lot of bank, man. There's lots of pictures, lots of locks, lots of secondaries. And you sit down to run out just one lifetime, all the engrams in one lifetime, and you're really biting off a large chaw of tobacco. That's a big bite. I don't think you could do it. Takes too long.

You realize that every thirty, forty, fifty, sixty, seventy years, he's accumulated – if he were in a body line – he's accumulated a complete bank. You know, a complete bank as we see it in a lifetime. And that for every, well, let's say three times a century or once a century or some intermediate figure, from here back two hundred trillion years at least – see, two hundred trillion years at least – for every one of these lifetimes, he has a complete set of what he has in this lifetime. You understand how many pictures that is? It gets into some astronomical figure. And if you had to erase each one of those pictures you'd be in a bad way as an auditor.

In other words, erasing the whole bank got mixed up with keying out the bank. And the defeat of Dianetics was simply – to the degree it was defeated – was simply undertaking to wash out, to erase the whole bank, not to key it out. You understand, a big difference there.

The early techniques were very feathery, they were very lightweight, the PC did just exactly what he could confront. I can remember vividly getting a PC to go out and walk in the office, three, four, five, six times and shut his eyes each time and see if he could see a picture of the office. Until he finally could see a lock of the office. And then I'd ask him if he could
confront it and what he could confront in that. In other words, I made him make his own pictures.

These were people with fields and so forth but I hadn't myself seen a field, so I didn't know how to get people out of them when I found they were in them. I could get people out of them as long as I didn't know they were in them. You see? But then, when it was finally pointed out to me by people that they were in fields and therefore couldn't see pictures, I bought this because I'd never had any difficulty before.

I remember one time – Mary Sue had a big win this way one time. We were just fooling around out in Phoenix and she said she'd never felt any effort. Ah! Old Effort Processing you know? So, I said, "Oh, you never felt any effort. Well, let's see..." So I had her go around – you know she's quite featherweight – and pick up the heavy end of the couch. And then walk back and see if she could feel the effort of picking it up without picking it up. Got that? And I made her do this and then feel the effort of doing it and then pick it up. And she was actually... You know, Phoenix is sort of warm. But she finally – she got away from it and she – and she could feel the effort. She could get the idea of the effort. And it's the first time she ever had any idea of effort. Actually, she hasn't had any trouble with any recognition of it since.

That was actually the type of processing which the earliest processing was. "Walk in the room and close your eyes and see if you can see a picture of the room. Oh, you couldn't. All right. Go on. Go on outside and walk in the room, take a look at the room and shut your eyes. Now, just tell me everything you did coming in the room and everything you did coming in the room and every... Can you see the picture? You can't do it yet. All right. Go outside and walk..." You got the idea? It was just the idea you can got pictures and you can confront them. That was the whole idea.

Here – effort – you can lift up the couch and then go over and get the idea of lifting up the couch and feel the effort of lifting up the couch after you've lifted up the couch. You see? Actually, that's getting the mental image picture of the effort is what – really what it is.

It – as a kid you probably have leaned against two sides of the door with the backs of your hands. You ever do that? You get your two backs of your hands against the two jambs of the door and say, "Hold yourself there very solidly," you tell some other kid. The second that you do this and step out of the door, the residual effort in the muscles will make your arms go up without volition. Well, that's quite interesting because that's actually not a muscular action that's taking place; that's a mental image picture action. You've postulated that the arms go out and they haven't gone out; so therefore, the image starts running out. You can do that with effort. You can do it with all these things.

Now, that was key-out. That was key-out as opposed to erasure. You have a big difference here because this is where we started making Key-Out Clears, 1947. And key-out clearing is successful but it isn't stable.

Now, the two things which had to be brought together occurred then with the first book, which is the erasure of a mental image picture. And usually this was done with – well, without much ARC with the pc. And when there was not much ARC with the pc you didn't get a chance to build up anything with the pc. His confidence did not increase. Yes, you could
get rid of the immediate somatics. You could get rid of the illnesses which were coming di-
rectly from that engram. Yes, they were being caused by a specific engram which could be
located. And, yes, the individual wasn't likely to have them again. Yeah, all these things are
true. But the pc's ability to confront the bank had not been especially raised. And in view of
the fact that it had not been raised, you did not get the Key-Out Clear phenomena. But look,
this started us on a long run.

Next thing you know, we're into past lives. Very unpopular subject, very unpopular
subject. People don't like to be reminded of their last death rattles. That's about all it amounts
to. It isn't that the church or state is against it. They obliterate their memories and they sell
everybody on the idea you only live but once. That sure makes nothing out of people doesn't
it? You're only seventy years long when actually you're two hundred trillion years long. That's
a method of making nothing out of things.

So, we got into past lives and that was very unpopular. I remember old Joe Winter. He
made a classic statement. "I would rather err with Galen than be right with Hubbard." And
they actually passed a ruling that we mustn't investigate past lives one time. And it was very,
very fascinating. Imagine a – uproar. The popularity of technology.

Any time you worry about popularity when you're doing research, why – and pervert
the truth just so that you can be patted on the back as a very smart fellow or something of the
sort or a very agreeable fellow or a well-liked fellow, you're heading for being a very badly
hated fellow.

So there we were – there we were into the soup. And with the idea of erasure, address-
ing this to past lives – myself and other auditors were engaged all through 1951 exploring the
length and breadth of the track. Exploring the length and breadth of the whole track. Wow!

The FDA is probably spinning itself in right now on the old book History of Man or
What to Audit. That was one of the books they seized over there. I hope they read it. I hope
they read it and get overts – get overts on it you know – and say, "It isn't true, this Grim
the next – I hope it doesn't key out. I don't wish them any hard luck, I just hope they get stuck
there forever. Anyhow, you could imagine it. They get overts on a book like that. See? God,
some people are adventurous.

Anyway, we concluded, "Nah." I concluded no. Yeah, we could find thi... I have found
things on the track, that Grim Weeper amongst them, that you can get sixteen dials of drop –
sixteen dials – one, two, three, four, five – all consecutive, consecutive falls. Just down,
down. In other words, a whole tone arm drop like this down, down, down, down, down,
down, down, down. This thing going on, falling, falling, falling, falling, falling. That's just
one fall on one of those old engrams. You like that? That's steep, man. That's what some of
those beach engrams will fall.

Do wonderful things with them. I audited a guy nine hours one time. I did a lock scan.
I did an engram scan in order to lock him up in the engram he was stuck in. An old trick.
Found the engram he was stuck in. He was stuck as a clam at high tide with the sunlight shin-
ing in his face. And my golly, what it didn't do for that bird. It took about nine hours to erase
this engram. Marvelous change in the individual. Heard from him the other day, by the way,
he's getting back on the bandwagon again. He feels he's been out of it too long, and so on. Well, there are remarkable effects to be gained from that.

And that was the main trouble. You could get terrific effects, but we weren't making Clears. What happened to the Clears, you know? Well, what happened to them is that we were on a different approach – different approach. We were trying to erase the whole ruddy lot. And actually I backed off and began to investigate something else. And this became Scientology. I finally found out what we were investigating. We were investigating a spirit. I don't care whether you call it a thetan or not. It's just the spirit, in final analysis. And we found that the spirit was the man. Now, by George, you know that's quite a discovery, because it's long since been forgotten.

These people going around talking about "my spirit." "I know that I'm out of my head," we heard the early theetie-weetie say, "because I am over there in that corner." Oh, yeah, you're over there all right, ho-ho-ho. No, the man is the spirit. All there is alive in man is the spirit. He is. And probably it's the first time in twenty-five hundred years – studied the subject of exteriorization. There was undoubtedly no successful study of it before.

Psychiatry, by the way, had heard of exteriorization. They considered it an insane manifestation which was some sort of a delusion, because people would tell them they were out of their heads at a distance. And they knew this was crazy, so they never investigated any further than that. But it had been remarked that some people were in this condition.

Now, this study had to... was this much of a hill climb. Man no longer believed, in this period of time – man no longer believed that there was such a thing as a soul. I mean, in – probably in early Christianity it would have been a ball. Probably some of those fellows still thought of themselves as spirits. They didn't say, "I will have to be good because my spirit won't go to heaven," or something you know. They probably thought of themselves as spirits. They said, "Well, if I'm not good I – I, me, getting out of my skull – won't go to heaven." That's the way they probably figured it. But all that had been lost.

And not only that had been lost, but man had totally lost a grip on this thing called the spirit. It was something esoteric. They believed in God because they had been taught to and so on. They had no reality on the situation at all.

Nineteen fifty-two saw an advent of exteriorization. And that was for the first time in twenty-five hundred years that we have any record of at all. Buddha was the last one who was dealing with this. Now, we didn't come into this because we were following Buddha. We came into this because we were studying the truth. That's always something to remember. We are not necessarily the inheritors of Buddhism, although you're liable to lay yourself a wide-open trap there. We walked into the side and found that there were certain truths and that this condition had existed and had been known twenty-five hundred years ago and was called bodhi. Bodhi, hence Buddha. And called bodhi because when he first did it and blew out of his 'ead, he was sitting under a bodhi tree. And that's where we get Buddha.

Well, when I was fooling around with this, why, it was sitting under a yucca tree, so we should call it "yucca." See? We should all be yuccas. But I don't think that sounds very good, so we'll skip that.
I didn't have such an approach to it. The only approach I had to it at all was the fact that I was trying to locate what was it that was looking at these pictures, because I found the pictures were absolutely inexhaustible in number. That's a terrible fact. You'll find that they're infinite in number and nobody could erase them, no matter how good your technology of erasure was; you certainly better find out what you're erasing with. And what we were erasing with was a thetan, a spirit. We were – it was the thetan who was doing this. So, of course, I thought, "Isn't this interesting. All we have to do is exteriorize this fellow from the middle of all these pictures and he'd be Clear." And sure enough you can produce a – well, right now you could produce a one-minute Clear very easily. You could tell somebody to be three feet back of his head and then tell him to be three back of the black mass he was in and he would be. In very... lots of cases he would be.

The first auditing process on exteriorization which has great validity was the command – was figured out by Evans Farber. And he came up and he sat up all night outside my window until I finally would come out and listen to this command. And I did and he fed it to me and I went three feet back of me 'ead. And there was yucca trees thereabout and a few palm trees. I guess it's – the conflict is whether or not we should be called palms or yuccas, you see, that makes us abandon both, you see?

And he says, "You see, it works. It works. You were right, you know. You can exteriorize, and here's the command. It's 'try not to be three feet back of your head.'" Of course, he'd run into the negative flow and he'd figured it out very carefully. He'd taken some of the recent PABs and he'd figured it all out and he figured out the exact command that would produce this phenomena and bang! So I blew him out of his – he blew me out of my head and I blew him out of his head. That was two Thetan Exteriors we had to our credit and so on.

Anyway, all this was very interesting, but nobody would stay outside. Sometimes they'd stay outside for three days. And then they'd be driving down the road a hundred feet above their car and they'd hit a traffic light or something of the sort and then they'd forget they were driving the car and go off and look at something or other and the traffic jam would occur. And somebody would start manhandling the body into an ambulance. Something like that would occur, or just start to occur, and the individual would say, "Oh, no, no, no. Nobody's going to take my body away from me," and he'd go back in his head and you couldn't get him out again. You say, "Try not to be three feet back of your head," and he'd say, "Ha-ha-ha-ha."

Well, out of this I developed the theory of havingness. It was obvious that havingness was more important to a thetan than entrappedness. Isn't that interesting? But of course somebody who is trapped in the middle of spikes doesn't like to be trapped. But somebody who is only mildly uncomfortable doesn't mind it so much and when it comes to losing the body and going out of communication with everybody and losing the game and getting death restimulated and all that – well, they'd rather stay in their heads.

This still has an interesting series of workability. I had an insane woman one time, exteriorized her, had an intelligent conversation with her, got all the facts of the case and what it was all about, she went back into her head again. I did that on several occasions.
Here's the point. The point is that exteriorized out of his bank the thetan is sane, and in his bank he's nuts. That's it. He has tremendous abilities. And the funny part of it is, as you'll find in the Philadelphia Lectures, a thetan's abilities are all measured, taped, everything else. We know what a thetan can do. All that sort of thing. See? I've researched all that and all our work since has been sort of in reverse.

Now, recently – 1958, 1957 – we start producing Keyed-Out Clears using techniques which were a cross between being able to confront and a mechanical erasure. See? The two techniques at the same time still produced a Keyed-Out Clear, but using them both in combination a Keyed-Out Clear was produced. Do you see that? All right.

Now – I want you to get this now – with 3M we're producing an erasure Clear. See? This is – this is a different, see, this is a different thing. It's an ultimate, near ultimate. You see why? Well, having found the exact mechanics of this GPM, I can make all these masses, you see, as you audit the fellow, suddenly discharge and of course they can't hang up. And the next pair of masses – they suddenly discharge and they can't hang up. Do you know what you do every time you blow a couple of those items? Well, there probably isn't just one lifetime packed into one of those items. It may be dozens, it may be hundreds of lifetimes and every one of those lifetimes has a bank as long as this current lifetime's bank. Ha-ha, we're blowing – we're not blowing locks, we're not blowing engrams, we're not chipping off a few circuits; we're blowing packages of lifetimes.

And actually you can do it in thirty-five minutes, finding one item. Isn't that remarkable? Because I found out the only way it can hang up, there's no way for it to reassemble itself. And I myself now have got terrific subjective reality on how this is done. You blow it – nothing can hang up and they just go. They don't go back on the track, they just go, because there's nothing making them hang up and nothing generating the creativeness inherent in them, so there's nothing to keep them created. And that's all. That's actually what you're doing. It's astounding. It's an utterly astounding fact.

Every time you look at one of these things... All right. We've run into this item called a smoker versus a wife. See? And we find this RI "a smoker." And we find – this is the bottom two on the chain, we've come all the way down the chain and we find the opposition "a wife." Well, the charge when it goes off of this meter is the only charge that was holding both of those pair in suspension. And in view of the fact that the... when the meter charge went out you had nothing to keep them in suspension in time. And that wasn't much charge. It just went ffist-ffist-ffist and ... 

You get to the wife, the goal itself is probably your next thing up. And the next item you get is the goal "to be a smoker." And that goes pshew-pshew-pshew and fire. And you're not going to find anything of that GPM sticking around to amount to anything. There would be a few little locks and a few little this and that. In other words, we've gone right down the center channel of that GPM. That's what's caused the blow.

These GPM items are each one a package of lifetimes, each one, several identities usually crowded into each one. And they've summated one way or the other under some heading and therefore they register on the E-Meter. And the oppositions – there's just countless numbers of oppositions connected with that one opposition phrase. These two things are in
total balance with that rocket read, they blow one against the... each other and they're gone. There is no way to hold that. There is no goal there to hold it. There is no bottom two terminals to hold it. The rest of the GPM goes. But you've got to come all the way down or you don't find the bottom terminals so you blow this charge, this charge, this charge, this charge, blow the bottom two charge, blow the goal charge and that's the end of that GPM. You'll sit there and look at a free needle.

Now, you haven't got a Keyed-Out Clear. This guy isn't going to cave in in another three years. There's nothing... He's going to have to live two hundred trillion to get that many accidental hang-ups, see? It's not permanent. It's only probably worth another two hundred trillion. See? Now, I'll buy that. That's good enough for me at the moment.

Now, here's the composition of the GPM. When you first enter the case you find a person who is usually so agitated in this lifetime that you couldn't even find the basic goal of it. You've got to give him some auditing to smooth him out to get him up so that he can confront things enough so that you've got this lifetime. One of the best answers to that is Problems Intensive, something like this.

Now, when you start – you start making a goals list, the goal itself, being a postulate, can be read all through this GPM. So it's the commonest read to the GPM. So, that's why you can find a goal reading before you can find an item reading. It travels on the wings of thought. And it's a common denominator to a whole GPM. Very simple.

Your next action, then, is to find this fellow's goal and you'll get this goal firing. Now, what would this goal oppose and you'll run into either the first terminal or oppterm. Each item found has to be a terminal or oppterm on its own merits, not because of how it was opposed. And then from that you find the next item. And sometimes people wanting to make things complicated give me a headache.

Today I found out that people are packaging 3M with four items. You don't do 3M that way. You have a big line plot and this is terminals and that's oppterms and you just put down every terminal you find and every oppterm you find on the line plot in the chronology of "found." And that is what you do. And if that is too simple, I'm sorry, but that is the way it is.

You don't make four-way packages and then take each one that is left over and try to oppose it independently and get every... Oh, Christ! You know! Why do something like that? Look, all it is is a "Spiral Staircase." You enter this – you find the goal by reaching to the bottom of this thing with an E-Meter and find the common denominator to it all. And then you find out what the goal opposed and it runs you into the top of the "Spiral Staircase." And then that gets you to the next terminal and then that gets you to the oppterm and that gets you to the terminal and that gets you to the oppterm and that gets you to the next terminal and that gets you to the next oppterm, that gets you to the next terminal and that gets you to the next oppterm and that gets you to the goal and it all goes – it's going boom, boom, boom as you're getting these things and then it all goes pshewwww! And that's the end of that and you got a free needle. Now, why do you want to make it more complicated than it is? It's awful simple.

"Yeah," you say, "but every once in a while you wind up with something that won't package." Oh, do you? Well, if you find something here that won't package, you're going to find an extra item over here that would fit up there anyhow and the pc will recognize it. So
why worry? Just put them down chronologically. Put them all down chronologically on your terminals and oppters on the plot and it will all come out right eventually. The thing sometimes will get down to here and the terminal that was missing up here will suddenly come off of this. But if you put it here, it also belongs here, but the pc will say, "Hey, that belongs there." So you just write it in there, too. Don't get so complicated, man. I worked it out so it's so simple, now you're going to spend the rest of your life making this thing involved?

Look, the MEST universe doesn't need your help; it's got us involved enough already. It's actually a very simple mechanism.

What happens when you get to the bottom of this GPM? What's it look like from there? I'll tell you a secret. The next GPM alongside of it is what the first GPM would not oppose. And the next GPM below that may be an opposite to the second one found. But your GPMs run in pairs, just like items run in pairs and your GPM is hung up on the counter-interaction of the goals. Only it's hung up on a four-way packet so you've got a positive and you've got a negative and you've got a not-oppose-not-oppose. The first two GPMs you'll find are on the postulate "not-oppose each other." I don't care what the goals are, they just won't oppose each other. They're pals. And they're hung together by affinity and the couple below them are hung together by opposites. But this tells you something interesting. It tells you that when you first enter the pc's goal channel you actually might enter any one of the four goals. Any one of the first four goals.

Now, somebody – eager beaver around the organization, actually ought to build a GPM so they can see what it looks like and use colored spheres. And if they used colored spheres, these colored spheres would look like this: You'd have a rope of spheres. These are green – green spheres – all hung together. And with toothpicks or something they would connect another rope of green spheres with black stripes. That's just to show you it's the same GPM but the black striped ones are oppters. Cowboy in the black hat, you know?

So you'd get these two ropes and they're hung together. The goal is down at the bottom and then they go terminal, oppterm, terminal, oppterm, matching each other knickety-knock up to the top of this thing. All right. That's two ropes of spheres. That's one – one GPM section or cycle. See? That whole thing is hung up on one goal.

Now, let's take some – two more ropes just as though we strung these great big – oh, you know like croquet balls or something – and we strung these things all together. Let's have – let's have pink ones, pink croquet balls. And let's make two ropes of pink croquet balls and hang them together with toothpicks, the two – two opposite balls on the rope. You see – rope A, rope B. So the first ball on rope A is pinned against the first ball on rope B, don't you see? And that goes down, balls opposite balls till we get to the bottom of this thing and at that point we have another goal. An entirely different goal but oddly enough these two – two chains of two are interrelated.

So, we've got these – we've got these two GPMs. Well, we hang them smash together like that! They – actually, their items don't oppose the items across, but the goals at the bottom are connected, they're pals, they have affinity.

Now, lets take two more such sets. In other words, a set of two ropes of spheres with a goal at the bottom. And another set of two ropes of spheres with a goal at the bottom and we
hang them onto the bottom of these first two. Now, we've got four sets haven't we? We've got four goals. Do you see that? We've got four goals. One goal influences two ropes of similar color, which each item of which opposes the item on the other rope. You got that picture? All right.

In doing a Goals Assessment you will have many things fire. You're liable to see many rocket reads – two, three, four, five. Some of these things fire very slightly. Some of them fire quite well. Do you know that you actually could be – do you know that you actually could be on one of the other three, rather than the first one up.

Now, as we hang up this GPM, let us say that the pink one here that I described first, is number one up. And the other one hangs just out of phase with it, just a little bit lower. But do you know its goal will also read with an occasional rocket read. It may be tiny, but it occasionally will read. The one you want is the pink one and that'll rocket read every time.

And yet you're liable to enter this thing on the basis here of the second GPM. You see? And you're only going to get little reads and that's going to sweat you to death, running that one. It'll follow all the rules but you've... you're running the little tiny one and you should be running the big one, see, because it looks small to you because the reads aren't very big. Really you'd get – it'd be very easy running this first one, the pink one, whereas you're running, maybe, the red one that I described.

Now, oddly enough, theoretically you could also get down to the lower two. And boy, that would read a flick once in a blue moon. And if you tried to run one of those things it would practically kill the pc. You would never get it to rocket read to amount to anything. It would be more like a tick or something, but you'll have a trace of it.

Now, you get a family of goals, then, which have these GPMs connected with them. It's a family of goals. And these goals will all have something in common. "A smoker" is, let us say, is your top goal that was ready to be plucked. But right alongside of it and just a bit junior to it as far as your meter reads the first time, but actually far beefier when you really get to running it, is a second goal, "to be a fireball."

Now, actually a fireball won't oppose a smoker and a smoker won't oppose a fireball. It's a not-oppose situation.

And then we get down below "a smoker" and we find its associated goal – this third GPM pair of ropes that I was talking about; that third one and we're going to have something like "to be a pure man without bad habits." This is just talking off the cuff, you see. And that's going to oppose "a member of the YMCA," see? "To be a member of the YMCA." We don't care what the... what these goals are. There's four goals. These two down here won't oppose each other and the two close to the top up here, they – they won't oppose each other. But there's an opposite one down underneath it. Isn't that interesting?

So, they go – these goals go by association, but not-oppose is the keynote. But they all have something in common, even though they're opposites. You understand?

The first pair that you run into is, "to have real bad habits." The next pair you get will be, "to have real good habits." There'll be something about the next pair. Each one of them will have that in common. And that's how they get locked up, one upon the next.
I consider it quite interesting that there's a frequency amongst GPMs which is the message I'm giving you this evening which is rather amusing, because you're all engaged in trying to find the first goal, see? I'm already telling you, well, the GPM goes in frequencies. You're trying to find the first pair of the dumbbell that goes together. You got a goal oppose and, gee, will that ever fire and will you ever find the next one against and so on. I'm just telling you offhandedly that there's four sets of these things which are set in amongst themselves and that isn't the end of it, not by a long ways, because there are other of these GPMs. Your saving grace is, is the deeper you go, the higher toned the pc is. It's a mechanical proposition. It isn't so much a matter of confront. It's what he's confronted, although you have to hold his morale up to keep his meter reading.

And you got these next ones. And of course there's other sets of GPMs, but not an infinity.

Now, I consider it very interesting that the possibility exists of getting the first goal that you get on this pc of being actually the second goal ready to be run. That's the misbehavior, the difficulty of the goal, that sort of thing. There may be a very available goal which is right up to the top which you've just missed. Well, what I'm telling you about all this – if you have two GPMs which not-oppose each other, if your first item that you encounter – that's the top items – is senior in opposition and junior, you see, and degraded in terminal, see, the oppterm is more smacking of the goal than the terminal. That's the truth of the matter. You see, the pc is pulled less and less away from the goal and the opposition has become more and more like the goal as he has accumulated masses. Well, I consider this very interesting because it gives you a way to get goals. You can dream up things of that, because he considers his own goal is an opposition.

In other words, the opposition terminal is more germane to his goal than he is. So you get such questions as, "What goal would be impossible to achieve?"

All right. Let's say you find a goal that sporadically goes bang and that sort of thing and won't really prove out and won't rocket read, you realize you might have the not... because you said impossible to achieve, you might have this second mass over here. You might have the goal of it. It's not ready to be run yet. But you say, "What goal would not oppose the goal you just found?" And all of a sudden he will give you immediately the family goal, you know, that is ready to be found. Do you see the gates that this opens to goal finding? This is a theoretical lecture, a descriptive lecture, not a lecture of a whole series of techniques. I'm just showing you here.

Now, what about this top one? Well, you get such questions as "What action in present time makes you go frantic if you fail at it?" See? You'll find out that's always the common denominator of the goal ready to be run. It is very common in present time, he considers it part of his life. He possibly won't even put it down on the list because it is so much a part of his life and he does it all the time anyway. And that is his personality. But you just ask him what does he get frantic about if he can't do it and he will present you with his goal.

You take a series of actions like that, you could assess these things and then write goals for the point that you got. You... I'm not trying to give you a technique. I'm just showing you here that there – if you know these mechanics which I have just given you on the subject
of goals – if you know these mechanics – then there's a possibility that you could work the pc's goal out.

In other words, he considers – he may only consider that his goal would be difficult to achieve, or he may consider it's something he doesn't want to have to achieve, or something he would find it very tiring if he found to do, or something that would make him very frantic if he did. Why? Because its most representative terminal which is closest to present time is very, very weak. And the most representative terminal to the goal – the goal itself is the oppterm, so therefore he must be fighting at this stage of the game, the enemy. And so you will find it work out, he's fighting – he's busy every day of his life fighting the enemy. It's his own goal.

Imagine the poor fellow that had to go up against Kaiser Bill or Hitler who had the goal to conquer Earth. Yet, of course, he knew of course that was very evil, even though it was his own goal. So you get his goal, you say, "All right" – you knew that this made him very unhappy – you say, well – you get Hitler, see, as an oppterm that fires-and you say, "All right. What goal did Hitler have that would be... that you would find very antipathetic?" And he gives you "to conquer Earth," and that rocket reads because that is the pc's goal. You get the idea? You get the mechanics, the way it is?

Now, supposing it just went tick and it rocket read once and then you couldn't get it to rocket read again. Then the chances are that you're in the family of goals that's ready to be found but you've got the goal of one of the other GPMs. Well, you possibly could do something like this: You could find out what wouldn't oppose it or what would be the opposite of this goal that rocket read once and the pc gives you the right goal to be run.

In other words, I'm showing you that there are elements here and there are mechanics here and – in the anatomy of the GPM – which bid fair to make goal finding easier and to make the GPM run out very, very well. Because you try to run out the wrong GPM first and you're going to be in bad trouble, because your reads are going to be bad and everything's going to be bad and you're going to have trouble all the time and the frequencies are going to be the same but you won't be able to read the meter-a lot of things like that are wrong.

But as far as the GPM is concerned, it is a mechanical proposition and all you have to do is just get the charge off each pair of items and then after you've got this GPM run – you don't run one GPM against the other GPM but after you've got GPM one run you go to GPM two – that's from the top down counting and you get its discharge, GPM three will be ready to come up, GPM four will be ready to come up. You dish around for another goal. You'll find another set that is just waiting there to be run, and you get those things apart. And it's just blowing charge, because you blow that charge, you've blown up these accidental hang-ups which are almost impossibly, mathematically, for them to have existed.

That this problem – think of it ... And this is what led us into the discovery of the GPM, is I realized that a problem which has endured for two hundred trillion years – oh, man, that must be the most delicate balance ever known to man. That must be a pin versus a pin, both of them meeting with their points. To travel ahead this long, the balance must be so perfect that none of his livingness – not getting shot or killed or ruled by Kennedy, nothing, see –
would absolutely unsettle this for two hundred trillion years. Well, this is kind of a weird con-

traction.

So I sat down and figured out what kind of a contraption that would be that would en-
dure that way and came up with the GPM and it worked. Therefore, we have a mechanical

address.

Your job is just to get these consecutive points missing. In other words, blow the

charge between these two items and they go! You don't have to do anything more with them.
It's like Humpty Dumpty. All the king's horses and all the king's men couldn't put Humpty

Dumpty together again. But there's nothing easier than to drop an egg. All you – all I'm asking

you to do is drop a few eggs. Simple.

All right. By knowing this anatomy and giving you now what I've – know of the GPM

objectively, theoretically. I extrapolated all this from the top of the thing and then imagine my

surprise to walk in and find it this way and even neater. It gives you a way to find goals. It
tells you what you can do with goals that you have found occasionally. It tells you what kind
of a terminal to expect coming up. It tells you, really, what you have to do in running the
thing. It tells you what you're looking for. In other words, it gives you a lot of data and should
give you a lot of success.

The material contained in clearing will actually only be complicated to you to the de-
gree that you try to make it complicated. Now, in just the last hour and five minutes or some-
thing like that, I have been able to describe to you, bangety-bangety-bang, I think, so that you
could duplicate it. Certainly if you heard the lecture again, you could, dead easy. I think
you've got a good grip on what this is. I think you see what you're going up against and so
forth. This is – this, man, is the riddle of the ages. What makes man the way he is? I mean,
what is the bank? What is the reactive mind? What is all these things? What are they com-
posed of and so forth. Well, it's actually in actual fact contained in this very, very short lec-
ture.

The thing is not a very esoteric subject. You try to get more involved in it than you're
involved. You try to involve it more than it needs to be involved. You try to put it together in
packages which are the square root of forty-two because that was after all the Talmud's figure
– I don't know where you got all that – and you're going to have lots of trouble. I don't want
you to have trouble with the thing. The thing is very simple.

All you do is go down the "Spiral Staircase" and blow all the item packages that you
run into. You don't go packaging things; you just blow them. You ask the pc every once in a
while if it confronts this and if that oppterms that and if the goal refers to that. That's just to
keep him happy, not to get anything done. And you get on down to the bottom of the thing,
the goal blows and you're into the next GPM and you do the same thing and you run that out.
And you've got a permanent erased Clear.

This is a new thing. It isn't a Keyed-Out Clear and so actually we're on the border of
OT, because frankly you never would have made an OT with a Keyed-Out Clear. Because the
whole bank that I have just described to you stood as a barrier between him and the accom-
plishment of those activities. And at any time he committed an overt that referred to that bank
it would have keyed in with him again. So, the route is open to OT which would be the route to total freedom. And that has just opened up here in the last few months.

Thank you very much. Thank you. Good night.
Okay. Here we are on the 5th of March, AD 13. And how are all you today? We have a lecture here, Saint Hill Special Briefing Course, and we have a bit of news. A bit of news. I was talking to the Z Unit today, I mean, part of the Z Unit has been relegated to the W Unit to learn how to do a Z Unit, you know? And I was talking to the Z Unit today and they – they didn't really think that, you know, you get Clear – the part that was relegated to the W. Feeling good because they hadn't had any auditing, you know, that kind of an approach. That sort of nonsense. Anyway – anyway the people in V Unit, of course, are the ones that are getting Clear. And I suppose that's as it should be. The ones that are supposed to get Clear, you see, are in Zed Unit, so the ones in V Unit get Clear. It's this type of dispersal that makes this universe interesting.

And out of the full Z Unit, seven have had goals found, six with no goals found. Five of these last are on W Unit at presence [present] and three goals have come out of the V Unit. That's very, very recent figures, and that of course refers to just the last few weeks I'm sure.

Now, some, of course have come in here with their goals found but doubtful and not checked out, so we're doing all right. We're doing all right. And I had an interesting remark from Sydney, which is trying to slide these days into Sydney harbor, and I had an interesting remark from there that the two auditors that were keeping their head above water and keeping things going and doing very well were of course two auditors who had had their goals found. So it makes a considerable difference to a person to have had his goal found. And that of course tells you why the five auditors are – from Z Unit who ought to be in Z Unit getting Clear, who haven't had their goals found – are in W Unit at present.

The gist of this is it's awfully easy to get Clear these days. All you got to do is know how to audit. And that's the only thing you have to know how to do. And the better you can audit, the more probable it is you'll have your goal found. And that's for sure.

Now, I have been taking a very, very good look at the GPM, and I've been taking a very, very good look at items. I've been taking a very good look at these various things. And I have a considerable reality on what the GPM looks like and what the GPM is all about and there are a lot of things to know about the GPM. But one of the things to know about it is that you can handle it. And the other thing to know about it is that it's built with tremendous mathematical precision, the darnedest mathematical precision you ever wanted to have anything to do with.

But because it is built exactly as a thetan would not as-is – you understand this – because it is built as a thetan would not as-is, therefore it's impossible to confront. That is to say, the thetan never has confronted it and therefore you're busy flinching. But I don't think you are flinching. And as I told another unit today, it's the thetan has trouble confronting it and it's
an awfully good thing that I'm not a thetan. I think that's very fortunate, fortunate... That's a joke. That's a joke. There's a person there in the front row that didn't think that was a joke. They wondered, well what is he then? Well, I'm me.

Now, you understand that if a... there's a certain frequency of things that a thetan wouldn't naturally see, then he'd pack one of these things along, and he'd just add to and add to and add to. He runs along on a different set of values. I'll give you an idea of the way one of the things happen. This is how one of the things happen – one of the things that happen. He gets an idea that total meditation and attacking nothing will get him through. Well, that's an interesting idea. So, you realize that he is opposing opposing things. See, he can't win. He develops this terrific philosophy, you see, he just knocks his brains out, you know. Walks all over the Himalayas, climbs Mount Everest with one fingernail and does all this kind of thing. Sits there and regards his navel and makes himself a petty officer. And the whole thing then boils down to the fact that his supermeditation, his superpeacefulness, his super-superness has all added up to the fact that he is opposing opposing things. That's quite interesting, isn't it?

Well, that takes that type of philosophy in order to back up one of these banks and so forth. So somebody – somebody has agreed that he will get through the universe if he opposes nothing, and therefore he is opposing things. Well, I think that's marvelous. Because of course what is he doing? He's stacking himself up a beautiful GPM. If he won't oppose anything he's drawing back from them, isn't he? Well he's still going to have an outflow. He's still going to oppose things, he's still going to get opposed. He's still going to get into groupers. He's still going to get things messed up most gorgeously.

So everything he's tried to think of as a solution to the Goals Problems Mass has added to more GPM. And it all comes down to the original postulate that any cure eventually has to be cured. And the GPM's solutions were of course the compounded cures of how you get along for life, see. The cures of the problems of life became the problems of the GPM.

It's very funny, you find some fellow who can't drink. He can't drink. One of the reasons he can't drink is because it develops a terrific backache. Every time he takes a drink he has a backache. All right, what's this? Well, this is a GPM action, of course, but we're speaking about drink. All right, he can't drink because drink gives him a backache. Obviously at one time or another then, drink was the cure for backache. But now taking a drink gives one a backache. That's interesting, isn't it?

So all solutions result in new problems. And the composite of this little axiom all by itself becomes the GPM. And the only odd part of it is, is the frequency is so constant and the difficulties are so constant. But then all thetans here at this time in this place must have something in common or they wouldn't be in this time stream. And the thing they have in common is the composition of the bank and the first ten Axioms. They have these desperately in common, actually have all fifty-five in common – fifty-six. But that set of Axioms going full out, based on particularly Axiom One and Two and Three, given those, and recognizing that all a solution ever does is develop new problems, you get of course the GPM. And because people of this same size and stature, and length of time on the track are here, why you get the same order of frequency.
So they've never confronted these problems, they've never confronted these oppositions, and they've developed a certain series of agreements about these oppositions at various times and places which winds up in the Goals Problem Mass. And it winds up with remarkable similarity. I think – consider it's quite wonderful. Take the twenty-five rule: Go twenty-five beyond your last RR or R/S. Yeah, well, the other day we tried to break that rule. We said, "Well look, we're getting into the second GPM, beginning of the third GPM – I mean, well heavens, the pc is putting the RR on the list as item three. Well, why not just pick these things up, see? It's the third item he puts on the list. Well, why not pick these things up, and we'll compromise by going only twelve beyond." Ha-ha! And we goofed, and goofed, and got some wrong items, and things went backwards, and went back and checked it over. And do you know, that if the twenty-five rule had been insisted on and continued, every one of those goofs would have been spared. Isn't that interesting?

In other words, the incomplete list would have been a complete list if the twenty-five rule had been obeyed. There was never twenty-five items between RRs on a continued list. When we continued a list we never had twenty-five items to the next RR – you understand that? Although you can continue almost any list and get a new item. That's a peculiarity of Routine 3. You can... if you got a slight tick left on your source list or something, as you go back and inspect it, you already have found an item off the source list and used it. Well, you continue the list which you already did and you'll get a couple of new RRs or something like that and then you'll get twenty-five to a blank. See, you've had twenty-five but then you're asking for a new item. You can always pick up a new item off of any old item that ticks.

Well, now, you daren't do this in Routine 2. Now, Routine 2 is the perimeter of the bank. This is the technology of the GPM's perimeter. Routine 2 handles the oddities and frequency of lock items, which are simply locked up on the actual central items of the GPM. You can relieve these and get away with it. Which is quite interesting.

In actual fact, Routine 3M is easier to do than Routine 2-12 because there is one thing you can do with 3M that you cannot do with 2-12. There's a little difference in this. The frequency is different; you've always got to go fifty items beyond the last RR and R/S. And you remember last week, I was telling you about this staff member down here, this staff member that said, "Well, we... they should be relegated to prepchecking in their staff auditing because – because after all they – it – were in an administrative position, couldn't be expected to be professional auditors."

Well, you remember I told you something about that. This is in confidence, of course, I wouldn't want them to hear about this. But said this, see, and I asked them just a couple of days ago, I said, "Now, on that pc you're auditing you found this RI and are completing the package and so forth in this Routine 2. Did you go fifty items beyond?"

And he says, "Well, well not really, I guess so, I'd-I-did-I-I-so on." I said, "Did you count them?"

"Well, no, I just went a few beyond and so forth..."

Well, what do you know! They accidentally found the item. He hadn't counted them. He didn't think it was necessary to count the items. So you'd say that the difference between a professional auditor and somebody who was merely an administrative Scientologist, the dif-
ference, the basic difference is that the professional would count the number of items. And he
wouldn't make any mistakes. And the fellow who wasn't, you see, he wouldn't count the
items, you see. Actually I don't know how...

Look. There's just certain targets to be attacked. You see, here you've got a bank pe-
rimeter, you've got this big bank perimeter, one kind or another, and then you've got the core
of the bank. And here's the core of the bank and it obeys very precise laws and in auditing
them you'll never find any variation in these laws if you do it right. See? And if you do it
right, simply means it's just following the rules.

All right, here's this core and then it's got a lot of lock items around on the outside of
this thing and in Routine 2 you hit the lock items of the first GPM, inevitably. That's what
they are. They're lock items and that gives you an R/S. When you hit the core it gives you a
rocket read. Sometimes you can get a broken-backed rocket read where it goes "Pssww-
ssww." Well, it's a rocket read which at the drop of an eyelash would turn into an R/S. And
you actually can drill some R/Ses and cause them to turn into RR's. Well that's an item that's
out here, that is a core item, but is out on the edge of the fringe. That's perfectly all right, do
that, it's still a rocket reading item. But it shows up as an R/S and then you put in the big mid
ruds in on it and what have you got? You've got a rocket reading item.

Well, about halfway between these two things you'll get a broken-backed rocket read.
And it goes, "Pssww-ssww." And it goes halfway – it doesn't know whether to slam or rocket
read, actually. You'll sometimes get a half slam. Somebody out in Los Angeles thought that if
a first slash of a rock slam up, went, pssw up like that, then that was an oppterm. And first -
and if a rocket read went down, pssww like that, then, well, that was a terminal. Unfortunately
it's more difficult than that and also unfortunately there are no up-flashing rocket reads. All
rocket reads are in the direction of fall. They always go to the right. And if anything starts up,
pssww! suddenly like that, it's just the first slash of an R/S and you drill it a little bit and it'll
either disappear or become a real R/S. I wish there was something that did that, but unfortu-
nately a terminal and oppterm look quite alike.

Anyway, to go back on this other thing. You always have fifty items beyond. Well,
why is that? Well, you're not in as fundamental an action. But, let me tell you something. Let
me – let me tell you something that's quite important to you. Routine 2 has something about it
that is very, very dynamity. If you take a source list or actually an RI list and you pull an item
– it's less an RI list but it's certainly a source list – and you pull an item out of that and you
use it and then you decide that you didn't get anything off of that or it was wrong, maybe it
was wrong, maybe it wasn't the last item, maybe the list wasn't complete. But you've pulled
that R/S item off there and you've monkeyed with it a little bit and you decide that isn't it and
then you continue that same list, you'll shut off the R/S and RR of the pc and if it's not untan-
gled you've left him for the next two hundred trillion. You got it? Now, that's pretty, pretty
horrible, isn't it?

We learned that the hard way. We did it. I did it. And I traced it back to find out what
this is. Oddly enough, there's something that goes along with this that we'll call the sad effect.
The pc has been sad since. That is the sad effect. The sad effect actually comes from an over-

SHSBC TAPES 201-300

1225

04.02.15
whelm or ARC break. But this is – something is goofed. And the pc's had an R2, R3 ARC break and then this has been overwhelmed. And the pc goes into sadness.

But you can't find an R/S on this pc. You cannot find an RR, you can't find a goal, you can't find anything, you see. Nothing reads. Well, you go back and you look for a list on which something was picked off and then the list was continued neglecting the thing that was picked off. Now, we're not interested in whether it was neglected. We're not interested in whether it was continued or which of these things caused the R/S and RR to turn off. We don't care whether it was the neglect of the item or the continuance of the list, you understand. But you're liable to turn the R/S and RR off of that pc and nobody will be able to get an R/S or RR on in that pc. And they – we goofed.

When I issued 2-12A, I had 2-12 – 2-12 was almost perfect. I said you'd better continue those source lists so that they were complete, because we were getting such wild variations on the rules. And on every one of those source lists where an item was grabbed prematurely and the pc had it as an item and something was done with the item and then it was abandoned and then the auditor went back and continued that list as in 2-12A to get a complete list, some of those R/Ses and RRs diminished or shut off.

Well, that's a very sad thing. 2-12A as an improvement on 2-12 is a symptom. It is a symptom. It's a case of my old enemy Alexander. You've heard of him, Iskander the Great of the Two Horns. Chesty chap. Probably not a bad fellow. But he went out to Injia and of course Western civilization, Western history doesn't realize he conquered India and settled it and gave it an administration that the Greek administration of India lasted. He – well history's forgotten that. They like to tell you that – because they're downgrading such chaps – that he went out there and he got as far as he could go and turned around and came home. About all we know about this, because it's Asiatic and we have never been interested in Asiatic history, was that he said he had no more worlds to conquer. Well, even though he was an old enemy of mine, I'm afraid I have to quote him. So far as processing as you have known it is concerned, let's look at this symptom. We had 2-12. I got some learning – learned some listing rules out of 2-12A, patted up the listing rules just a little bit, found out it was always the last R/S on a – on a complete list and so dispensed with nulling. But in actual fact beside that discovery of the frequency of the list – and on a source list it can be any place on the list, you understand, but on an oppose RI list it's always the last R/S. And we – we were at that point looking at no more worlds to conquer, as far as ordinary auditing is concerned.

In other words a fantastic thing has happened here. We had a more perfect process in 2-12 than in 2-12A. Isn't that interesting? I find it very interesting. I did a tremendous amount of research on 2-12. I knew about what 2-12 was all about and just because I discovered the frequency of listing applied, the frequency of listing in the GPM by the way, and then went – by doing 2-12A and discovering the frequency of listing on the 2, Routine 2 list, and applied it to the GPM and found out it was almost the same but that there was a frequency of listing. Aside from that – being able to spot it – there wasn't even an improvement, there was a worsening.
There's a time to come, there's a time when you are baking a cake when you have finished adding ingredients. And you add one more cup of flour and one more pint of cloves and one more keg of whisky and it spoils the cake.

See, there is a time to stop making a cake and start eating it. And I'm afraid that's now. Well, I'm always the first one to tell you when I've goofed. And well, I'm sure that's why – that I'm a friend of yours and you're a friend of mine. Because I wouldn't dare tell people who weren't my friends that I'd goofed, you know, they make too much out of it. But the truth of the matter is that we were there. And we are there, as far as that process is concerned.

But because this process is actually harder to do, if it is hard to do at all, it actually should be relegated to cases you can't get on the road and to rock slammers. Because it's too easy to do Routine 3M. Right after that, because I had the data now on listing, already had the data of the GPM, already had that pretty well neated up, I'd just been looking for the magic auditing commands and I found the frequency of the bank and that was it, we were there.

Well, it suddenly got easier than Routine 2, don't you see? And there we were, with a full Clear. Now, you understand that a Keyed-Out Clear parks you on the near side of the bank and that OT lies through the bank. This is a horrible thing to have to confront. When you've got a Keyed-Out Clear you still, to make an OT, have to go all the way through the bank and that's why we haven't made any OTs. You see that? So you can't afford a Keyed-Out Clear if you're going to send the guy all the way. Or you're not going to. Actually you don't want any Keyed-Out Clears because they don't last. They're like the Democratic Party in the United States.

Now, your Keyed-Out Clear still has, between himself and OT, the whole GPM. And he's not going to skirt it and go. Whenever he tries to do something that is an OT attribute and does it very much, heh-heh! Tsk! That bank keys in and he's no longer a Keyed-Out Clear, he's a mess. He's not as bad off as he was before but he simply no longer has a free needle.

In other words, we still had with Clear a barrier between Clear and OT and that barrier was the GPM. And the only answer to that is run the thing out. Well, if the frequency is better, as far as auditing is concerned, when I say frequency, it's how many items on the list and how sound and solid is it that you're going to find that the last RR on the list fires and all this sort of thing. In other words, these positive points, and if there are less variations in 3M than there are in Routine 2, and if you have to know less, what's the idea of taking the locks off the GPM if you can take away the GPM? All right.

Now, that means then, that Routine 2 should be relegated to a type of process or use for cases we can't get whizzing, can't find any goals on, can't do something with, or an out-and-out rock slammer who of course can't come anywhere near a session; you know, can't get an improvement in a session. But even an out-and-out rock slammer could probably be held in place long enough to find his goal and that probably would change him and finding his first few items would probably cure him from being a rock slammer. I just think it's more poetic to run Routine 2 on a rock slammer. That's pure sadism.

But anyway, the upshot of the situation is that Routine 3 turns out to be easier than Routine 2. But Routine 2 is actually easy enough. But there was that bug in Routine 2, that if
you don't complete a package and if you continue a list which at... the item has already been found on, you're very likely going to shut off the RR or R/S of the pc. You follow that?

I'll give you an idea. Supposing one day we found a great, big, slamming item called "mental science" on the List One and then with enthusiasm we abandoned it and completed List One. And took it on down and the... all of – pretty soon after a while we didn't have any more R/Ses and we said the list was complete and we went back and looked for other R/Ses and nothing was R/Sing, and the pc felt very sad. Well, that's a liability. That's a liability. It's only approximated in Routine 3M by neglecting to find the pc's goal. If you neglect to find the pc's goal and go on and on and on and on and on down into a GPM, eventually he'll get so jammed up his tone arm – his tone arm will be up here at 5, way up to the top of the dial, way up here. Somewhere up here, stuck, needle stuck, no more RRs, no R/Ses. How the hell are you going to find somebody's goal? Well, you already found his goal before you get him into this condition, it must be somewhere on your auditor's reports. It must be a rather recent thing to have done this to him, but you can on... that's about the only way I know of that you could shut off an R/S or an RR with Routine 3M. It's just utterly neglect to find the pc's goal and drive him all, oh, two-thirds of the way through a GPM with no goal found. That would louse him up but good. Next thing you know you haven't got any R/S, no RR, nothing like that, nothing fires on the list, the old list, everything is dead, the meter's totally flat. You get – you get the mess you'd be in. But then, of course, that's such a wild violation of it that one would hardly look for it.

But it's easier to do this with Routine 2. With Routine 2 you can goof. There's another thing that will happen with Routine 2, which gives it a liability and it'd be less than honest to tell you it wasn't a liability. You can get the fellow's item. You know, you got a – you found an item on a list and it was just a little old item and you've heard the third-of-a-dial rule, and it was the only R/S that could be found on the pc and you opposed it and he came up with another little R/S that didn't... "But I don't want anything to do with it, you know, just a bum R/S it says, aw, it's – skip it."

Now, you try to find goals on this poor sod. *Awk!* You will get the goal of the last terminal. That's the only goal you will get. Inevitably you will get the goal of the last terminal. If the last terminal is "the enlightened ones" you will get the goal "to enlighten." If the last terminal you found with Routine 2 – these are rock slamming things – if the last terminal or sometimes optterm that you get that's slamming as an item, even a little tiny one, you've hung him, see. He's hung up in the bank at that point. And you'll get – well, I'll give you – I'll give you one out of an R3M action.

Supposing it was "success." Supposing it was "success" that you found and you try to do a goal and you will only get the goal "to succeed." You understand? You've limited the view of the goal. Let me put this over again so as not to confuse you: Routine 2, we're talking about, Routine 2, you've taken a source list – you found a little old item on this source list that didn't amount to a hill of beans and you opposed it and then you heard that it had to be a third-of-a-dial rock slam, so you left it. Now, you try to find the pc's goal. I don't care how many other Routine 2 lists you did, you try to find the pc's goal and the last item in was "the enlightened ones," you're going to get a goal on this pc that isn't the goal, it's not going to rocket read, it's not going to behave like a goal either, so don't worry about that. But the only
thing that you could get to stay in and stick and mess up and that reads in any way whatsoever, looks promising, is this goal "to enlighten." It might even fire once, or a rock slam or something. It's the only goal you get to fire.

It's -- you got the... you got an incomplete package. Well, I wouldn't -- I wouldn't worry much about this, when I was doing Routine 2, but if I don't readily find a goal on a pc on whom Routine 2 has been run, I look for the package that wasn't carried around to four RR -- or RIs, because I, you know, I couldn't find the goal, I don't borrow trouble, ever. I couldn't find the goal, I'd look back for some Routine 2 that was... didn't have a four-way package, particularly a list on which a nice juicy item had been grabbed and it was incomplete and then the list had been continued. I'd look for this and repair that and then go on. There actually aren't a whole lot of other things that go wrong. I mean, you haven't got an unlimited number of things that go wrong.

But, you've done Routine 2, you've got a two-way package, now you can't find the pc's goal. Let me emphasize that, you can't find the pc's goal, you're just trying and you can't. Don't borrow trouble because this condition might exist and you still could find the pc's goal. Look there, the old Routine 2 and by George, what do you see? You see something on which they found two packages and neglected the last one. Or the last item they found on the thing, there were two items found and the last of them found didn't match up good, so they didn't go on. You find that list was incomplete and/or you got a four-way package the way I saw the other day. They got a four-item package except three of the items came off one list.

Sure enough, the only goal that the pc could give was the last item, the last Routine 2 item. He gave the goal of that item. That's the only thing that fired on the list. Interesting, huh? All you have to do is complete it, and make sure that you got it all the way around. But it has that liability. This can happen.

Now, if you see a pc who's very sad and continuously sad and has gone on being sad for a long time, then somebody has found an item on a list, monkeyed with the item and then continued the list, but that was the item on the list, you understand? The item will still be sitting there, the item will still have some R/S on it, even though it was opposed. It's abandoned. Or you will find that somebody has found an item on a list, has opposed it, got another item but hasn't completed the package. Those are about the only two things that can go wrong in Routine 2. If you know those things you can get R/Ses back on that have shut off and so forth.

But life also shuts off R/Ses, and fortunately there's another way of picking that all up and that's just give the pc marvelous, excellent auditing. Prepchecking and that sort of thing on and on and you make him feel better. But actually this is a much longer job and shouldn't be attempted. What should be attempted is the repair of the Routine 2. It's a mistake to leave extant any loose items in Routine 2. They should be completed. The package should be made up with four RIs and that way you won't have much trouble finding the pc's goal. But unless you complete that, such a package -- there might be one of them, there might be two of them left incomplete -- unless those are completed on the pc, whether now reading or not, the pc's RR or R/S may shut off and you'll not find the goal. Or you may just be able to find the goal of the last item there and you can't find any other goal because the pc's stuck. See that?
But at the same time this is a workable tool because we are not villains. In spite of the American Mess Association – that's a – that's an organization over there that owns the government. They operated on so many senators and left their tools in so many congressmen's guts they eventually now are able to take the companion tool which they keep in a laboratory and electric shock it and the tool left in the stomach of the senator or congressman vibrates, you see and they all vote the right way. That's the way that's done. It's whole track magic, actually.

Anyway, this organization – this organization to the contrary, things we do in Scientology are not evil. Life can wrap somebody's Routine 2 around the corner and that's why you must continue to know your Routine 2. You've got that?

So Routine 2 shouldn't exist actually as a process on which we would engage enthusiastically, unless we couldn't do 3M. And we've still got something however we can do, called Routine 2, that's so similar to 3M that it's very easy to know. It has a different frequency. It's fifty items instead of twenty-five beyond the last reading item. You're not operating against a goal, a few things like that. You get a package of four in Routine 2, you don't get packages of four in Routine 3M. Rrrrr. You get packages of thirty or packages of fifty or however many items there are in the GPM. That's the size of the package – is the GPM, see.

And Routine 2, when you can't get an R/S or an RR to turn on in 3M or Routine 2, it's been turned off by life. So therefore, you sure better know what Routine 2 is because Routine 2 applied against the person's life will turn back on the rock slam and rocket read. Life being much rougher in South Africa than other places, none of the offices down there are able to get on any R/Ses. I consider this very interesting because all they'd have to do is take some kind of an assessment of somebody's life.

You know, "What has your life consisted of?" Ha-ha! That's all they'd have to say, "What has your life consisted of?" And do a list or something like that. Or "What isn't part of your life?" Either one, one or the other. Life has turned off the person's R/S and RR. When you can't get an R/S and RR on a person then you must consider that life has turned it off.

Well, strangely enough the goal will usually shine through. That's weird, it's almost the last thing to go out, so you have a good chance that the goal will rocket read anyway. So you wouldn't start with Routine 2, you'd start with 3M. And then 3M is now unsuccessful because in listing goals on the meter, we see no R/Ses. No R/Ses. No RRs. And we continue to list until we get a motionless tone arm. We have no R/Ses; we have no RRs. We must assume at that point that life has turned this person's R/S and RR off to such a degree that the goal is not available. It's there, but it won't read. What do we do? What do we do?

I know that's a pretty – that's a pretty rough assignment. That's not going to happen in lots of cases. You had better choose some zone or area in that person's life where the person's Routine 2 has gone awry. And instead of giving you a long, long number of pat lists, just let me say that the Routine 2 has gone awry. What do you mean the Routine 2 has gone awry? Well, I don't know, he used to fight with his wife and she's dead. Well, isn't that an incomplete series of items? Hmm? He was in the army. And there aren't any battles anymore. And yet he had to be a member of the peacetime forces under duress for a long time. That sort of looks like he had an oppterm and then somebody continued the list.
Well, same condition. Well, knowing that and knowing that life is a Routine 2 in its way, and if there are incomplete packages and a lot of other things, it seems to me you could fool around with somebody that you couldn't get an RR on or an R/S on and you could get it back on just by going over his life and turning it back on by completing some of the items. How would you complete the items? Well, "Who or what in your life have you – would you rather not fight with? Who in your life have you fought with?" Something like this. And all of a sudden something starts firing. Well, carry the package on around the line. You get some... one thing to fire, carry it on around four times; you get back to the beginning on the thing, you'll be able to go down this old goals list that you did and just calling it off, maybe calling each goal twice or something like that, all of a sudden, just to be sure, why, one of those goals that didn't read before now RRs. Simple, huh? Well, that's why you should know Routine 2.

But – I would say this: If you can do 3M on somebody don't monkey with Routine 2. But if you can't do 3M on somebody and nobody can find the goal, then you've got to do Routine 2. You got that? So therefore you have to do Routine 2 well, so as not to cut off somebody's RR or R/S. That's about the size of it.

Now, the only thing that has to be corrected in 3M that I know of, that is anything serious that would cause 3M to go awry, is this one. Now, I'm going to give you this awful fast. I told Zed Unit there and they were all very happy about it, but let me give you what you have to do: Never, never, never, never prepcheck, never, never, never, never, never, never, list as a source list – you can list it as an items list when it comes up but not as a source list – with anything in it except the exact statement of the goal beginning with "to." Now, you got that? Never list anything else. Now, what do I mean by that? Don't ever list for a source list on the goal oppose list, step 2, the formation step there, that's what's changed. You don't take those four lines. I'll tell you why in a moment.

The source list is always on the goal, "to catch catfish" – "Who or what would 'to catch catfish' oppose?" I don't care if the pc can't answer it, that's all you dare list and you never prepcheck a goal in any other way than "On 'to catch catfish,' has anything been suppressed?" You see that? "On to catch catfish has anything...," you know, "...been...," you know? You never say, "On the goal to catch catfish..." You never list the source list, for instance, "Who or what would the goal to catch catfish oppose?" Never. Never, never. You never list, "Who or what would somebody or something with the goal to catch catfish oppose?" Never. Never. It's a goof.

And you never list "Who or what would catching catfish oppose?" Never, never, never. And you never prepcheck and you never call the goal and you never put the mid ruds in on the goal in any other way than "On 'to catch catfish,' has anything been suppressed?" You understand? Why? Well, I was swimming around the bottom of the GPM the other day – that's the third GPM, I'm almost there at the bottom of it – and I went twenty-four items deep in it without its goal and I know all about this. Ha-ha! Oh bla blob blub, see. Christ, don't let it happen to me again! This was wild. Awful! I never went down so far and came up so... I felt like one of these skin divers, you know, whose flask of air has been filled with chlorine gas, not oxygen, you know, something like that. I was down at the bottom of the... it's something like swimming in the bottom of the Philippine Deep. Swimming around down in the bottom of this thing, I was struck by something very peculiar, and you'll find this very, very interest-
ing, too. There are reliable items in, I dare say, everybody's GPM called, "the goal to catch catfish," whatever the goal is, you see.

Interesting, isn't it? That's an RI. It's not the goal. And there's a -- there'll be an item, "somebody with the goal to catch catfish." That will be an item, a reliable item, somewhere down near the bottom of the chain. And there'll be a reliable item, "catching catfish." There will be, "people who catch catfish," but there will also be "catching catfish." Hoooh! And way down at the bottom which started the whole thing, is just the goal all by itself, and that's all you can use, "to catch catfish." That starts the channel. You've got that at the bottom. But then up, just up from it somewhere is "somebody," "somebody with the goal to catch catfish," you understand and across from that or up the line a little bit further is "catching catfish." That's another terminal RI. And there'll be another one, pretty horrible to contemplate. There'll be another one there, "somebody or something with the goal to catch catfish," don't you see?

And there's -- in other words, anything but the goal is liable to be an RI. Now, the funny part of it is you won't run into this on the first -- you could get away with it almost all the way through, perhaps on the first GPM because in the first place the item is so deep that it won't read and isn't even restimulated on the first, second GPM, something like that. It's way down the line, it's maybe item twenty-three from the top. Terrific. Twenty-three RI's deep into the GPM you get this item, see. "Somebody with the goal to catch catfish." Or "the goal to catch catfish."

Twenty-three items deep. So you can of course find the goal and prepcheck it, you see, "On the goal 'to catch catfish' has anything been suppressed?" And that will be just fine. But you get about halfway down through the bank and you're saying, "On the goal 'to catch catfish' has anything been suppressed? Well, that didn't read." Needle's getting rather tight. "On the goal 'to catch catfish' has anything been suppressed? Well, that needle is rather tight and so forth and there's nothing on this, has anything been suggested? Is there anything you've failed to reveal? Has a mistake been made? Is there anything you've been careless about? Anything you get..." There's no reads on this anyplace and the goal isn't firing, therefore it's gone. Well, yeah, you're not prepchecking the goal, you're prepchecking a reliable item, "the goal to catch catfish." Ha-ha-ha-ha.

Now, if you did a clear test, not knowing this, you would be in trouble. Because the line for the clear test must be "Who or what would 'to catch catfish' oppose?" Otherwise you're going to overlist the item by listing "Who or what would the goal to catch catfish oppose?" You're now going to overlist the item, which is in the bank, "the goal to catch catfish." And of course you're not going to get any reads, so you're going to say the guy is Clear as a bell. You hit him and he goes thud! You see? You see that thing?

Well, actually I probably never would have tumbled to this or really found it out or anything else, or had anything to do with it or had it get in my road in any way, if I hadn't goofed by going twenty-four items deep into the 3rd GPM without a goal. And then it was getting pretty desperate. Things were getting very desperate. And all of a sudden the tone arm went up to 5 and the R/S and the RR and everything else turned off and we were looking for the new goal and we listed about two hundred goals and I was going this way and this way
and whoa! Where... what's this and so forth and nothing moved, no TA action and then all of a sudden I cognited on the fact, well, that was the goal. We found it clear back there, only it has since been called "the goal." Ha-ha-ha! So therefore it wouldn't prepcheck because there is an item in here, ha-haha, which is the same as the auditor is using on the pc to find the goal. The pc of course, gets this confused with the item when the goal has been – so the goal won't read.

Well, you ordinarily wouldn't notice this because I would have... you had to have gotten into trouble. It isn't anything that is catastrophic, but nevertheless this could happen. That you're trying to clean up the goal to get it to fire and you're two RIs away from, "Somebody with the goal to catch catfish." And you want a list because you've run out of RR and so forth, and you want to list this again and you were using "Somebody or something with the goal to catch catfish," or something like that. You'd restimulate this item.

Actually, it has to be very exact. Well, I think that's very interesting. It's caught by a fluke. It isn't actually too much of a mistake, because right at the top, the goal "to catch catfish" is twenty-three RIs away. And it isn't likely to restimulate, so you ordinarily wouldn't notice this. You'd have to get into some kind of a jam down at the bottom of the bank without a goal and keep running into this foolish item. This item you see, this item. Well of course the... it was the goal. Except the goal to read had to have the garbage knocked off of it. And then if we just read the goal we were all set. Don't say the goal. So just leave out "Somebody or something with the goal," "the goal to..." All those things, because they're items.

You talk about – you talk about a gimmicked-up mess, you know, a thetan really gimmicked himself up with this kind of stuff, you know, man. I mean it's marvelous, the frequency with which he did it. But of course we're all traveling the same track, we've gotten into the same traps, we're ordinarily playing pretty much the same game and we've fallen for the same swindles and we've perpetrated the same swindles on one another. So it's no wonder that the thing compares as nicely in frequency, but this one is really one that if you – if I hadn't found it, if I hadn't found it, some of you guys would get looped around the telephone pole. You'd feel sad, "Well, the GPM isn't composed like this, see, it's all clear, there's no RR and no R/S on the pc's – on the pc's meter, so therefore, the pc must be Clear, except the tone arm is at 6.0 and the needle is stuck in the exact middle of the dial. And yet we can't get anything to read." No, you've shut off the pc's R/S and RR. The goal isn't even cleared up.

The rule is, don't use anything but "to..." when you're designating. It's always "Who or what would, 'to catch cat-...?'" I don't care if the pc can't list it, just bully him! He says, "Oh, you have to say the goal! The goal! I can read the goal! I can read 'something or somebody that would have this goal,' I can read that, I mean, I can answer that, but I can't – but I can. . ."

You say, "Son, I'm very, very sorry and life is sometimes cruel, many are called and few are chosen. You happen to be chosen because you're sitting in the auditing chair. Answer the question. 'Who or what would to catch catfish oppose?'"

"Oh, well, you put it that way" and he'll go ahead and do it.

Otherwise, you can collapse the bank, see, on something like this, you probably can restimulate it. If you pull this gag as a Prepcheck, halfway down through the bank, two items away from that, your Prepcheck would be beautifully flat, your needle would get beautifully stuck and you'd all come out all right because you'd find it in a couple of minutes anyway
when you went on down the line, but you would be upset for that length of time. And the possibility exists that you will sometimes miss a goal. That's a possibility. I... it wouldn't happen ordinarily, but you sometimes will miss a goal. You're saying, "All right. Now, we're going to check this out. Now, on the goal to catch catfish has anything been su..."

No, hell! Nothing's been suppressed on the goal to catch catfish, it's twenty-three items down the bank. How can anything be suppressed on it? It's just in total concrete, so you get no read and "On the goal to catch catfish, I'll now read the goal." And you say, "To catch catfish, to catch cat..."

You can also make a mistake. You say, "Well, we're checking an item. We're checking an item here." And the pc – and he thinks the item – when the auditor reads the item why, it doesn't rocket read, but when the pc thinks the item it does rocket read. No, the difference there is the auditor isn't calling the wording of the item. There's nothing like this, you understand? You understand? If the auditor calls the item correctly the item will read on the meter. But the pc is thinking something else, which is what causes the thing. He's got a word or two tacked onto it – ha-ha-ha-ha! That's why it's reading, see.

The pc thinks the goal "to never know my own mind," you see. And the auditor is... calls off, "to never know." And the pc thinks to himself, "to never know my own mind" – rocket read, you see. And the auditor notices then that when he – when the auditor calls the goal, "to never know," why, the pc gets no RR. But when the pc thinks the goal – the auditor dubs this in. He says, 'Well, the pc thinks the goal 'to never know' the pc thinks the goal 'to never know,' he gets a rocket read. But when I say the goal 'to never know' I don't get a rocket read. Now, what is all this about?"

Well, what it's all about is the pc is thinking, whether he knows it or not, "to never know my own mind." All right, now the auditor is calling off the goal which has ceased to rocket read because it's exhausted and the pc is thinking – the auditor's calling off, "to catch catfish" and the pc is thinking "the goal to catch catfish" which is rocket reading. In other words when the auditor calls something out and it doesn't read but when the pc thinks of it and it rocket reads, then the auditor isn't calling what the pc is thinking. You got that? You'll see that phenomenon in lots of cases. I don't think you can audit a case without running into that once or twice somewhere down the line. And just enquire what the pc's thinking. That's the one out of that.

But this other one – this other one, you got to lay that in, in brass. I'll get out a bulletin and correct the thing. There's only one other correction on that particular 3M bulletin that I might as well mention in parting here and that is that it says it only has to read once. There's four words missing out of that bulletin. It says it, in the checkout of the goal, it only has to read once. You understand? That's once in three times said consecutively. You see, on the original words, was once in three times read, see. It's the three times read consecutively, once. Only one of those needs to rocket read in order for a checkout to pass. Well, there's various reasons for that. It may read twice for the auditor and only once for the checkout person.

Now, checkouts in general are best done by the pc's auditor reading the thing to the pc in the auditing place – in their auditing places – and seen by an Instructor who is not auditing the pc. And that will save you a great deal of time on checkouts. In other words, the auditor
goes and gets a Supervisor or an Instructor and brings him back, sits down, straightens up the item and calls it on the pc and the thing is seen to rocket read by the Instructor who then reaches over and initials the auditor's report to the fact that he has checked it out, checked out item so-and-so, such-and-such. He's just seen it see. He's seen it read.

Now, I probably have mixed you up by talking about Routine 2 and Routine 3 indiscriminately. In actual fact these are simply, well, they're – they're cousins. Their rules are so faintly different that it is almost impossible to differentiate in other... any other way that one is the outside perimeter of the GPM and the other's the inside perimeter of the GPM.

Almost everything that you say about 3M is true about Routine 2. But there's one thing that isn't: You can always extend the 3M list. You found an item "fishhooks." And so you found it and there it sits and whether you did anything with it or not you could extend the goal oppose or the RI list and you can find "fishing lines." And it RRs and you can put them both on the line plot and the pc is not in the least bit damaged. In other words you can find a second item. If there's a tick left on the source you can always find a second item. You can even take a source-point with no tick on it and extend the list and very often wind up with another item and it won't jam up the pc and it won't upset him.

In actual fact, you should never do more than one goal oppose list, don't do more than one goal oppose list on 3M, because you get extra dead-ended things. But you can always extend 3M lists. You can't do that with Routine 2. You can't do it.

One other thing I'd like to say is when do you find the new goal? The new goal must be found at the rocket reading blowdown. There is a blowdown on the meter complete with rocket reads when you get down to the base of the goal. And it goes psww-psww-psww-psww, psww-psww-psww-psww. And it blows itself on down and it blows itself down from maybe 4.5 and it goes down, down, down. You will see a couple of these maybe. Early on it goes from 4.5 only to 4 with a psww-psww-psww. And you'll also see the pc cognize the thing with rocket reads, occasional rocket reads. But this is a real vicious one. And it goes right on down to Clear read from wherever you were. Psww-psww-psww-psww-psww-psww-psww-psww-psww. In other words, the meter's rocket reading all the way and you're bringing it down with the tone arm and you just see that thing firing, all by itself. The pc isn't thinking anything, man. It's just pow-pow-pow-pow-pow-pow-pow-pow-pow-pow-pow-pow-pow-pow-pow-pow-pow-pow-pow. It looks like the dog-gonedest bunch of rocket reads you ever saw in your life. And it's all going off automatically. And it'll come right down to the pc's Clear read or somewhere near it, or even below it.

Well, at that point you stabilize the item you've just found, by just saying that's it and so forth, and that's fine and put it on the line plot, and that sort of thing. And right at that point you find the pc's next goal. That's the place to ask the pc for his next goal.

matter, you've probably got your goal on the list. So you go back over them rapidly and you just read them once and see which one RR's and the one that RR's you give it a Prepcheck.

Now, the funny part of it is that you actually can get the goal of an item if your pc is messed up in any way. You can get the goal of an item. And the way it'll behave is it rocket reads a little bit, you know. It may rocket read a half a dozen times, start R/Sing and then diminishes and then goes down and disappears. It's an... that's the goal of an item about to be found. So there's got to be a little Prepcheck on this goal, you see. Now, the real one just keeps rocket reading. It just keeps rocket reading and then it'll get suppressed and then it'll come back and it'll rocket read some more and it'll get suppressed and it'll come back and rocket read and the more you prepcheck it, why the better it rocket reads and so forth, and it doesn't go off into an R/S.

You can take an R/S and by a brief mid rud Prepcheck create right in front of you an RR. You can always do that.

But anyway, to be – to be very precise about this, that's when you ought to find the pc's goal, with a list and with a little Prepcheck of the new goal and all that sort of thing. And then you go right on doing what you were doing. You go right on down the same Spiral Staircase and you'll find out that there are various things there to be opposed. You don't do a new oppose list. It's just that the next item or two coming up are actually under this new goal, they're not under the old goal. And therefore you don't have to stop, you just go on down the Spiral Staircase.

But look, never go more than two items if you can help it and four at the absolute outside, into a GPM without finding somebody's goal. Don't go, absolutely don't ever go more than four, let me tell you! That's going to be tough enough. Preferably two is about all you want, and preferably find it when the needle goes free. And you get a free needle after – right after this blowdown. There's when you should find your next goal. Don't carry on into a GPM without a goal, because you're now dragging a thing called a missed withhold, called one goal. And that's really miserable.

Now, there's nothing more much that I have to communicate to you; I communicated it all at once here, except this. Except this: Just because a GPM formed by reason of your never having confronted these problems but only the solutions, just because a GPM formed, because you didn't ever confront it, is no reason you can't confront it and is no reason at all you can't audit it with great ease.

You hear me that? That – that's important. Because an auditor gets the idea, because of course the whole GPM is based on the fact that it is unconfrontable, because it had to have solutions, because one couldn't confront the problems, you understand? Therefore, the auditor being ordered to run it starts to get very nervy indeed. And he may think it's utterly impossible and that it goes by some other rules and goes into a terrific dispersal, simply because he's asking to be confronted to – being asked to confront this thing which he never before confronted. He's got a GPM so he's never confronted it. Well, my answer to that is, confront it! Just because you never have is no reason you can't. And the auditor as an auditor has simply got to confront it, that's all and clear up whoever he's clearing and so forth and then he'll have a Clear on his hands.
It is not only not impossible to do, it is probably the easiest and most rewarding auditing you will ever do, because there's actually nothing much there to confront. That's probably the biggest trick of all.

Okay? I hope that brought you up-to-date, I always try to give you the latest dope and in particular anywhere I have goofed even slightly, I tell you before you tell me, that's my motto.

Thank you very much, and good night.
WHEN FACED WITH THE UNUSUAL DO THE USUAL

A lecture given on 7 March 1963

They say "RHIR-RHIP." You ever hear of those? Well, work it out. "Rank Has Its Responsibilities. Rank Has Its Privileges." Amongst my privileges I don't rank being late.

Anyway – anyway, this is what? This is the 7th of March? Ah, there's going to be some people in Z Unit that wish this lecture never took place. Anyway, the 7th of March, AD 13, our lucky year. No sarcasm intended. And Saint Hill Special Briefing Course lecture.

We're going to take up this evening the subject of "When Faced With the Unusual, Do the Usual." This is a hard lesson to learn. Some of the people that have never learned this include psychiatry. That's why they never got anyplace. And hear me now. The more unusual the situation, the more usual the remedy. Don't go Qing-and-Aing. That's one thing you must not do. Just because the situation is a desperate – is no reason you should become desperate. Just because the situation is unusual is no reason you should become unusual.

Now, by George, when you look it over, you will see that every desperate remedy that has ever been developed by man stemmed from the fact that the practitioner simply Qed and Aed with the patient. It's gotten to the point in psychiatry where when the patient goes crazy the psychiatrist goes crazy. That's the way of it, so forth. They're always talking about they don't have enough psychiatrists. They should add to the line, "They don't have enough psychiatrists out of padded cells."

They have a supply of psychiatrists that's always being eaten up. Now nobody's running down psychiatry. I'm just telling you why they can't make people sane. It's a matter of: They're faced with the unusual, so they do the unusual. And they've always done the unusual. You go in and you say... This fellow's practicing Freudian analysis. Yes, he practices Freudian analysis, but he practices the Jungian twist on Adler's work as represented by Karen Horney. Only he does it a bit different.

I remember one psychiatrist I interviewed. These poor guys, man, they really need auditing. And we'll probably have that job one of these days. Anyhow, the guy told me he was a Horney man. I was very interested in his being a Horney man, and I said, "Well, good, I see you have a book there by Karen Horney. I... have you ever read it?" And he said, "No." And I said, "Have you ever read any books by Karen Horney?"

He said, "No."

I said, "Well, what type of analysis do you do?"

And he says, "Horney."
This same poor fellow was running up and down a corridor one day, and he says, "You've got to give me permission to electric shock that patient. You've got to give me permission to electric shock – you've got to, got to, got to give me permission to electric shock..."

I said, "What's the matter? What's the matter? What's the matter?"

"She won't eat."

"All right." I said, "Well, will she eat if you electric shock her?"

"Well, no."

I say, "Well, why do you want to electric shock her?"

"Well, you've got to."

And I said, "Well, what – now just a minute. What happens to these people when you don't electric shock them?"

"Oh, they get out of here three weeks before they do when you do electric shock them." He said, "If you're doing research you should keep records like that. We have all the records. I can show you. I can show you. We keep records. If you don't electric shock the patients here, they get out three weeks earlier."

I don't know. A little further sounding out, I find out he wasn't even supposed to be curing them. All he was doing – he was supposed to be electric shocking them.

Now, look-a-here! These fellows – these fellows need help, and one of these days they're going to get our help – unlike the AMA; they forfeited all the help they're ever going to get. But learn something from this, please; learn something from this. Every time something happened, they did something else equally unusual. And they were faced with plenty of un-usuality. And they kept on doing the unusual.

Now look, there might at one time or another, have been a technology known as psychiatry. See, there might have been one. Nobody would be able to trace what it is now. And it's certainly not being effective.

I know they're using their ineffectiveness right now to take about sixteen billion dollars off the US government in order to build more institutions to hold more people that they can't heal. There are more people insane today than there ever were before. The psychiatrists themselves say this. Psychiatrists also say that they don't know anything about what they should do to these people. They also say that they should be continued to be permitted to do it, which I don't think is reasonable. We'll have to help them out someday, too.

Now, look-a-here. If every time in some technique that you're doing on a pc, every time you see something that looks very unusual to you, if you go on and do something as unusual, you're going to have that pc wrapped around more telephone poles than there are. You're not going to make any Clears. That's the penalty you will pay for it. Just like that. You will not make any Clears – none. I'm telling you! I'm not kidding.

The reason I was late for this lecture is Mary Sue and I were going over the auditor reports, and – she'd gone over the auditor reports, she was going over these cases with me. She's getting to be the expert these days on 3M. She's cocky, you know. She's up there way beyond
any auditor in the business. Here she is, one of these old-time HDAs, you see, and she's way out in front. She probably has more experience now on 3M than any auditor anyplace. Oh, and... "probably" – she does have! She's found somewhere close to a hundred – a hundred RIs by 3M. She's also found a lot of goals. Not on just one case – she's found them on lots of cases. She knows what she's talking about.

And some of the things she's found going on here are quite interesting. One case going down the line, everything's working out all right more or less on this pc; he's going along okay. Let me say it's going along in spite of. And they go back to check out an item that was found earlier and the pc suddenly says, "I – here's a goal here. I don't want this on the list." But you know, "Here's a goal, I don – and – uh..." The auditor put it down on the list. It was an item, rather, and he says, "I don't want that on the list, that's a goal." So they put it over here.

They don't go on trying to find the item that they were looking for. They mess around with it. It's firing earlier and late. So everybody present all say, "Well, give this goal you just found a Prepcheck."

What? What's that? The pc's goal fired at the beginning of session, goal's still firing, pc comes up with another goal, auditor sees that it rocket reads while he's calling the item, and he says, "What are you thinking about?" because the fire is early or late.

Pc says, "Oh, I'm thinking about that other goal. What'll we do about it?"

"Well, we'll prepcheck the other goal."

Look, you could do this, too: You could not only prepcheck the other goal, you could run a goal oppose list on it and then abandon that halfway and not find any item on it. Oh yeah, you could. And then you could go on down the line and decide his 2-12 needed repairing and you could repair that. And then you could give him Problems Intensive one way or the other. And then you could run a couple of engrams, too. But that isn't what you're supposed to be doing! You're here finding an RI. Find it! That's all!

Well, what's this? So he thought of a goal. So it rocket read. So put it down in the auditor's report. What else? Nobody's seen any blowdown of this old goal, it's still rocket reading. You're going to abandon the goal and get off on another goal? Well, the clue of it is, is every goal that this pc's ever had has rocket read. You give him goals, they rocket read. What's all this? What would you do a thing like that for to a pc? You're in the middle of finding an RI. Well, find it, and then find another RI, and find another RI. So the pc says he's just had a cognition that his grandmother laid eggs. Well, don't run an engram of his grandmother laying eggs. Find some more RIs.

What's all this? What would you do a thing like that for to a pc? You're in the middle of finding an RI. Well, find it, and then find another RI, and find another RI. So the pc says he's just had a cognition that his grandmother laid eggs. Well, don't run an engram of his grandmother laying eggs. Find some more RIs.

Now, let me tell you something. We just had a goal found in New York. We just had a goal found in New York. I don't know who quite found or checked out the goal that ran a little bit of the end of the – of the line, but one of the staff members there received a Problems Intensive, went free needle on it. They did a couple of 2-12 items and his goal popped up and there it was. Tough, huh? Tough. Difficult. Very difficult. You know who did the auditing. A nine-year-old boy in the Academy. It's interesting, isn't it?
Now, nothing shows up an auditor – nothing shows up an auditor like a fantastically precise process. You recognize the trouble isn't with the process today. It's fantastically precise. And the more precise the process, the more you figure-figure on it, well, the goofier it's going to get. You understand the situation?

This is one of these situations whereby there is the process taped, taped, taped. Actually the RR always comes up with the same frequency, the same phenomena are always present, there it is, there it is, there it is, you do this, you do that, you do that. There's no variation on this. The only variation you put there is by going stone-blind and not watching the thing or running goals that don't fire and things like this, you run into trouble. Those are all unusual circumstances. They shouldn't exist.

Now, I'm going to talk with some of the auditors who have been doing some of this auditing, and I wish Allen would go back to the back of the room there and on the gray phone and dial "05." Dial "05." Wait for the dial tone and dial "05." And that'll phone me here, and then we'll have a little conversation.

We're getting very stylish on the radio these days, you know. We've – I don't know, I – I haven't had an accurate report on it but I think that radio broadcast went off just fine the other night in New York. I know I had a cable the following morning, that thanked me for my intervention. It wasn't a matter of me intervening; it was me making sure my orders were carried out. And I don't know how many hours we've been on the air now. Old Johnny and other people, getting on the air. They're doing a good job, too. They're doing a good job, too. [a phone rings, Ron picks it up]

Hello. How are you, Allen? Terrible situation here that puts you on the – on the tape and so forth this particular way. But you know, I was looking over Harold Duford's case here. All right. You got fifteen RIs found. And you've now run into no rocket reads. Isn't that right? That's great! How do you suppose that happened? What's your idea of it?

[...] Well, yeah, we know that, but what do you think happened?

He says he goofed somewhere. That's – that's, we know that.

What do – what do you think happened?

[...] Come on, come on, come on – you must have some idea of what happened, Allen. Don't be coy. Don't, don't be coy just because you're talking to every Central Organization in the world right now. I – I'm not trying to make you nervous, Allen! Your professional reputation isn't at stake yet, you're not out of Z Unit.

Come on, what do you think is wrong?

[...] Failed to complete one. All right. Let me read you the finding on this. "He has been instructed to check over the line plot." Is that right? "And pick up the item that was listed wrong way to or an incomplete list." Did you dig it?

[...] Well, what instructions did you get? You got instructions to check over the line plot – go on.

[...] Yeah, all right. Go on. You found no items reading.
WHEN FACED WITH THE UNUSUAL
DO THE USUAL

[...] You got nothing on this item, huh? Did you list it the same way to you did the day – the way before?

[...] Oh, you did, huh? Was it rocket reading? It was just a dirty read? Well, that's very interesting. You've had fifteen RIs off this case. Don't – you think one of these items back there is backwards?

[...] But you didn't think about that, did you Allen? Now, when you went over this list, when you went over this line plot, what did you do, Allen? How'd you go over it?

[...] How'd you check them over? He checked over every item.

[...] Gave a brief Tiger Drill on each item, and then what happened?

[...] You found one ticking. Yeah, all right [...] Yeah [...] Uh-huh [...] Yeah [...] Right [...] Yeah.

[...] It was just a dirty read on this line plot, and you went over it again today. You did yesterday and went over it, and it didn't tick when the Instructor was there, so you went over it all again today, and it did tick. All right, go on.

[...] A dirty read, incomplete list, so? [...] Uh-huh. You didn't get this idea of something being backwards, did you?

[...] All right. Now did you – did you get the goal to fire?

[...] Oh, the goal hasn't fired. Well, that's interesting. When was the goal last at the Clear read?

[...] Oh, he's never been at the Clear read throughout these whole fifteen items, huh? Where is he usually? At 7?

[...] He's around about 4 or 4.5, and never moves away from there?

[...] It did drop close to the Clear read at some point? When was that?

[...] All right. "An individualist." And how long ago was that? How many items ago?

[...] Six items ago. And it dropped to Clear read?

[...] And of course you get the goal to fire every session before you start listing or anything, don't you?

[...] Oh, you don't? Ohhhh. Oh, well! When was the last time you saw this goal fire? Or did you just bail out of the airplane without a parachute?

[...] Last Friday. How many items ago was that?

[...] The Friday before, you saw it fire? In other words, you've seen it fire before "an individualist" but haven't seen it fire since, is that right?

[...] It was after? How much did it fire?

[...] Very slight? Well, what is fire-a tick?
When Faced with the Unusual

DO THE USUAL

[...Quarter of an inch. And that was "an individualist." [...] Yeah, well it was after the "individualist" you saw this goal fire a quarter of an inch? [...] Before or after? You're sure it was after he found "an individualist"?

[...Not 100 percent sure?

[...] Well, the only way you can wrap somebody around a telephone pole like this is run into a GPM without a goal. Otherwise it all goes off according to Hoyle. Looks like to me you missed step 15 somehow or another. But because the pc's rudiments are out and everything is all jammed up and the goal hasn't been cleared, it looks to me like you just got yourself a beautiful case here of having run off over the edge. That's the only thing it looks like to me. Now, you go any further over that, you're going to turn off the pc's RR. And where where you be? You'll not only be hunting, you'll have a hell of a time, man. Well, what's his next goal?

[...What's the goal of the next GPM? You're fifteen items down the line-you should be in sight of it.

[...] Ah! He said today his goal was "to be a prime cause." Did it rocket read?

[...] He never said it?

[...] Yeah, what did it do?

[...] He did what?

[...] Just roughed the needle up.

Well, here you go. The only thing I know that could happen like this is your GPM went Clear several items ago. Exactly at the point of what? Probably "an individualist." You saw it blow down to Clear read.

[...] And then you went tearing right on down the line, into the next one — and the next one, and the next one and the next one, and the next one and your rocket reads have been getting smaller and smaller ever since "an individualist," haven't they? [...] Yeah.

Why don't you find the pc's goal, unwrap him from the telephone pole and get the show on the road, huh?

[...] All right. You'll find it very easy to find his goal, by the way — very, very easy to find his goal. You just have to find where the other goal finished. And then take the goal for the items afterwards. And when you give good Prepchecks — if you give a good Prepcheck now, Allen — any time you give a good Prepcheck on that sort of thing, you'll have your needle free enough and the rudiments are in enough so that you get the free needle phenomena.

[...] All right — yeah, yeah! It's a fact. As you go by it. But you're dealing with 3M, man, and the only thing I know that can lock a tone arm up that high — and have no goal reading, and no items found, and everything closing down — the shades of night are falling — actually, the only thing that'll turn back on the RR is he hits dead on his goal. He probably already knows what it is and you'll find out you've gone several items by it.

There is no number of items in a GPM. See, no constant number. Do you know there can be only two items in a GPM?
Hm-hm! That's grim, isn't it?

All right. Well, I'm sure you'll get ahold of it. And don't think I'm scolding you. And this won't damage your reputation. They'll say, "Well, he's a good auditor. Ron kept giving him hell until he finally could audit." Okay, Allen. Bye now. [hangs up]

All right. I hope you got that now, did you? It's interesting, isn't it? It's not very mysterious. I don't think it's mysterious. Of course, you could say that the – you never did have the pc's goal. That would be pretty desperate. But I don't think a pc could go on having an RR that long without it shutting off, if you didn't have his goal.

No, somewhere up the line he finished off – somewhere up the line, six, seven, eight items, ten items, something like that, that was the end of that GPM, only he didn't get his free needle phenomena, he didn't see his blowdown, he didn't see all these things happen, because apparently – perhaps his rudiments weren't in enough for him to notice it. And he's not seen it before, so he might not even have known what it was. And he said, "Yes, well it did, on an individualist,' blowdown. Get down to Clear read." That was probably it. Every item he's gone since that point from there on has been an item in the direction of disaster. Oh, he's got these items, they are the items of the next goal, everything is fine, it won't kill the pc. But undoubtedly, since GPMs don't act in several different ways, he's just gone past the second goal, that's all.

Now, how he managed it, I don't know. But he'll get the pc back on the road again. He'll get a goal and it'll turn on again.

It's quite interesting, though, that you can shut the whole thing right off – just like that. No rocket reads, nothing. Bang – off. Meter frozen up here at 5, won't move. Nothing. Gone. What? Well, you went through one GPM and landed in another GPM, and if you weren't alert you didn't see the free needle, and you didn't see the blowdown. The free needle may only last for three and a half seconds. And if you're not accustomed to looking at a meter while the pc is cogniting, you'd never see the rocket reading blowdown.

That's all I can think of would have occurred, that ever since that time the needle has been getting smaller and smaller, and the reads smaller and smaller, and now they're gone. Well, the only thing I know of can happen is you jammed the second goal. I know. I've got experience on it. You overrun one of these GPMs into the next line, you're in trouble.

All right. Let's see, where's another goof on this? Where's another goof? "On reviewing the list..."

Oh, I'll just read you this next one, this isn't too bad. Maybe I'll take this up. Maybe I'll take it up with the auditor. Seventeen RIs have been found. That's pretty good, huh? Seventeen of them. Right down into that goal. But the auditor may have goofed at the last reliable RR found, as he abandoned the list. "And on reviewing the list, I (Mary Sue) note that he failed to check two items marked with an RR (question mark), about twenty-eight items from the end of the list, and I see no markings around the last RR to indicate that he has checked these." And he's abandoned the list.
Well, I don't know, we probably would better let the boy speak for himself. Dick, go to the back of the room there and ring up "05."

Now, listen. Let me tell you something about a list. You could do a wrong way to on which you see few or none reads [phone rings] and have no item on the list, but that's very, very unusual. Any list has an item on it - complete or not complete. You see the item doesn't appear after you've completed the list. It was on it. Actually, the definition of a complete list is one item reading, don't you see? Just one.

Hiya, Dick. Sorry, take some time here. I don't mean to scold you, Dick. You've probably run into something here that's over your head. Let me – let me tell you something. You're running into one here that auditors just keep running into and running into. And that is they abandon lists before they check over and under and on and so forth. In other words, they don't examine the whole list. You don't casually abandon a list, you understand? What you do – what you do is check your last rock slamming item on the list; it shouldn't read. Check the next to the last RR; it shouldn't read. Check the last RR; it should read. All right. Now, you've given – told the pc each time that it did or didn't. And if you've checked that last RR, it didn't read. But it's the last RR.

We're dealing with terrific mathematical precision. It's the last RR on the list. And if you were on the ball on listing, you'd know which one was the last RR to list, you see?

All right. Now, what you do then if that last RR doesn't list, as it occasionally does, you go over it and under it. But this is not a source list, so it's down there toward the end of the list, isn't it? Now, you don't take these lists that oppose rocket... reliable items – you don't take these lists, you know, and just say, "Well, it can be any place on the list," because it never is. It's always the last on the list. The last RR on the list, see?

If that last RR doesn't read, you read one above, one below. Two above, two below. That's items, you see. If you haven't got it then, and your next to the last rocket reading item didn't read, then it's obvious that the read is not any earlier on the list, right?

So the read must be somewhere from two above or three above to the end of your list, right? So you just go on down that, one by one, if that kind of a situation happens. And you just go down one by one, and you see any kind of a needle tick or anything of the sort like that, give it a brief Tiger Drill. And you'll find your RR. But don't ever abandon one of these lists.

Now, you're seventeen items deep. And you're liable to be running into trouble here. Where is this tone arm running?

[...] Well, your case is in wonderful shape. You must be doing an awful good job. Watch for that blowdown, though, man. Is that goal reading at the beginning of every session?

[...] All right, but it is reading? And you do check it at the beginning of every session? All right, now, don't fool with this one, that thing's going to blow down to 3, that needle's going to go briefly loose, and you're into the next bank here before you know it. You're in a danger zone right now, you know? Got it? [...] Yeah?
[...] All right, for God sakes, take it. I – I tell you, there's one thing you always take off a pc – a goal. Yeah, okay! Good enough, Dick. You'll make it with this one. You, and if – is the needle pretty loose?

[...] What?

[...] Yeah, his tone arm's been well up – well below.

[...] Yeah. About five items ago he had a blowdown of that character. Ha-ha-ha – how do you know you're not into the second GPM?

[...] Yeah, he couldn't quite fit – he couldn't quite fit – a couple of items ago he couldn't quite fit one to the goal. Man, you're in the next GPM already; get out of there. Just get his goal, get it all polished up, and keep on going. You'll have nice big rocket reads and everything'll be fine. Okay? All right, Dick. You're not doing too bad.

You would have – you would have drowned in another about three items, you would have said, "Where's the man's rocket read? Where's his goal? Where's this? Where's it? Where? Where?" Then you would have been saying, "Mary Sue – the pc's rocket read is shut off."

Okay, Dick. Bye now. [hangs up]

All right. Now you see, consistently and continually on these reports we find auditors are not checking the list thoroughly. You understand there are two types of list. There's a source list and there is an RI oppose list. Now an RI oppose list is always the same. If your item was listed right way to, it's the last RR on the list – bang, every time – just like that.

But if that last thing doesn't RR, the pc could have been thinking another item while he listed an item, don't you see, and it could have been slightly above and below. So you always go over and under on these RI oppose lists. Over and under one, over and under two. Not two RIs or two R/Ses, you know – but just items. If that's not it, just let's make sure, there, in that zone from the next-to-the-last RR – actually, if you want to be awfully safe it's from the next-to-the-last RR to the end of the list. The item is there someplace. That's a matter of about thirty items. So you have to read them down, take the one that dirty reads, prepcheck it and you'll find your item.

But you have to be awfully wrong to find no item. Do you know that the only time you ever find no item on a list – you've got to get this through your heads; this is Routine 2, Routine 3 – the only time you ever find an item on – no item on a list – the only time you ever find no item on the list is when the item's already been found. Then you will – if the item's already been found. You're joining two lists. But the pc will put the found item on the list – and if it's already been opposed someplace else it won't fire. You understand that?

But that doesn't mean that just because some item that's already been found goes on the list that you won't find an item on the list, you understand, because pcs habitually are putting their old GPM items on the new lists. They just do that. They say, "That also fits," see. But don't easily abandon a list, see, just don't do that.

Now, a source list of course is something else. And in both Routine 2 and Routine 3 you will find your source lists are consistently and continually difficult. Who ever said a
source list wasn't difficult? Well, who ever said it wasn't difficult to make a Clear? It's easy to follow directions. But it's a miracle that you can do it!

Now look, all you're doing is producing, every time you produce a Clear, a miracle the like of which has never been seen before on Earth. So you want to do it easy? All right. I'm trying to make it – I'll cooperate with you. I'm trying to – trying to make it so you'll do it very easily. There's no doubt about this. I'm not being uncooperative in this. But you cooperate with me! And when – when I tell you it's the last RR on the list, and if it isn't, you go over and under until you find that thing – why, do it! Don't go off, abandoning lists.

Now look, consistently, here's case after case, this same thing is being done with.

Source list is something different. You check over those rocket reads on a source list. You've also got to check over the R/Ses on a source list. And here we find the most heinous crime of all. Terrible. The auditor has already gone to no TA motion, and gone her – I assume, fifty beyond the last R/S on the list, and couldn't find the item on the list, so is continuing the list. No, no, no, no, no! You can't do that.

How can you find no item on a source list? You tell me! There's always an item on a source list. The only thing can be wrong with a source list is there are too many items firing on the source list. You're trying to cut it down to one. Well, it's on that list someplace, that's all. Don't go continuing the list! Not on a goal oppose.

What do you mean, you can't find an item on the list? That's impossible. It would mean the whole GPM had already been cleared. And therefore, why are you auditing it? You're going to find an item on a goal oppose list. When you find no item on the list, why continue it? No item is going to appear on it magically, because there is an item on it all the time.

Haven't you realized that that read is moving down that list as the pc lists? The read moves right down that list just as nice as you ever saw. It's always on the list, or it's a wrong list or a wrong goal.

But you're not accustomed yet to checking over and under these – these rocket reads. Now, that's as elementary a thing as that. There is a read on the list, you're not accustomed to checking them. The read is there, there it is.

There are goofy things going on. I won't particularly go into these things, but they are all kind of wild departures from the situation. It says you read over and under. Well, if it says you read over and under, you read over and under. There's no reason to do something else.

So the item you're getting from the pc looks kind of shaky. You know, you're not getting your rocket reads in the right place. And you say to the pc, "Are you thinking about something else?"

"Yes," he says, "I'm thinking about the goal, 'to catch catfish'."

Now, you – what are you going to do then? What are you going to do, huh? You're going to dump this RI – the thing that's going to make him Clear – and pick up this goal?

Oh, he says he's thinking about the goal. All right. Write it down over here and say, "I got that. I got that. Now we're going right on with this RI," and check that RI out. That's the
business you're on. Look, don't disperse! And this business of overlisting because there's no item on the list is utterly silly. There's always an item on the list. The trouble is with a list there are too many items on the list. That's always the trouble with a list – too many items on the list. And you pick up the wrong item.

You've got to null these source lists, man. You've got to null them all the way down. You can't go monkeying around with those things. If you don't know what RRed, you don't immediately pick up an RR, bang, bang, off the source list and find out that nothing else is RRing on the source list, you've got to null the lot. Don't fool with it.

And as far as – as far as a pc is concerned – as far as a pc is concerned, he isn't different. He's not different! He talks different. He talks with a different accent. He talks this way, he talks that way. Some are slow to give items, some are fast to give items. It's all the same bank or he wouldn't be here in this time strata at this time. You understand? So what are you doing looking for differences?

Now, your willingness to persist on a case is something I congratulate you on. I think it's remarkable. I congratulate you on your persistence on a case. But do you know that persisting on a case because you don't know what else to do is doing the unusual?

Look, what are you – what are you – what are you trying to do with a GPM, huh? What are you trying to do with one? You're trying to run it out. Well, you say you're trying to find RIs. Now, if you go on the basis that all you have to do to clear somebody is to find RIs, you're going to get in real trouble. Because that isn't what you're trying to do. You're trying to find RIs in order to knock out a GPM.

Well, what built the GPM? A goal built the GPM. So therefore you've got to knock out RIs aligned to a certain definite goal – somebody's going to make too much out of this because they always align automatically to the goal – but you're going to find... you're finding RIs aligned to a certain goal, which results in the disappearance of the GPM. And that's all there is to that. That's all.

Well, what if you've done it? What if you did it? We've apparently got two cases here at Saint Hill right this minute, who were Saint Hill Clears, and two auditors have very happily passed up full honors. Because I would have shaken them by the paw and given them a send-off to end all send-offs, you see.

First one on 3M, see, on the course. See, I think that would be terrific, see. I made it some time ago. I had the same trouble. The auditor plunged on through. Only I was very alert, and I said, "That has went!"

Fortunately, I labeled my items when I came up the track very exactly. I labeled them very, very carefully. But the auditor who made the first Saint Hill Special Briefing Course student Clear on 3M might have been Dick, or it might have been Allen. And that's why I had these two gentlemen on the telephone tonight.

But unfortunately instead of being able to congratulate them for having made the first – I don't know which one did it, you see. We could probably compare the auditor's reports or something like that. And we might be able to find it, which one really drags the honors. But the reason I had them on is to see if either one of them would claim the honor. Isn't that nasty?
Instead of that you heard them apologetically protesting, "I'm sorry I've done wrong, Ron. I'll do better in the future," and so forth. Yeah, this was just expected, of course. But the point I'm making here is that these two guys, either one of them had the honor of making the first 3M Clear on this course. There are other Clears have been made on the course, but by other processes. And they passed it up.

We can't give them the honor now because they never reported it. Now, you're witnesses! You're witnesses! I called them up. You saw me, right on the phone here. I called them up – I talked to them, you know? And you know what was waiting for them? You know what was waiting for them? A Class IV with honors. And they'd be lucky now to get a Class III, I think. But anyhow... No, they'll probably do better than that.

But if either one of them had said, "Hey, Ron, you know, I was auditing this afternoon. I suddenly found out – I suddenly found out that we'd left the other goal, and it was all run out, and it didn't read anymore." And it, by the way, it continues to tick. The old goal continues to tick. You've actually got to prepcheck the lot sometimes to get it out, unless it's closed out, you understand.

And the fellow, all he had to say – all Allen had to say was, "Hey, Ron, you know I was checking over the case this afternoon, and I accidentally happened to read the February 22nd bulletin. And it was lying there and I didn't have anything to do, and I happened to read it. And I noticed that last Friday, or I think Friday a week ago, I had a blowdown to 3 from a normally high-tone-armed pc, and so forth. And I checked it out today and I found I couldn't find the old goal. The pc gave me an old – new goal. It's rocket reading. I – I may not have been able to prepcheck one out and straighten him out, but I've made a first-goal Clear." What do you know! Pc won't feel very good unless it's prepchecked out. It's all right to avoid it at this particular stand. It's just an interim state of making the pc feel better.

Or Dick could have said, "Say, Ron. You know, pc's been worrying – worrying me the last few days. But, by golly, this afternoon I figured out what happened. I - I looked, I saw this bulletin, you know; it was lying there. And it was in red ink on white paper, and – and I picked it up. And I was checking into it, you know, and so forth. And there was another bulletin there, and it said something about a Clear test and so on. So I just for fun ran down a goal oppose on the old goal, you know, and nothing read! And nothing read. And the pc gave me his new goal. And apparently last week some time we had a first-goal Clear."

And I would have said – I would have said, "Well, Dick, a Class IV with honors." Yes. Well, we can all look back on our track – we can all look back on our track and recall what might have been – what might have been. That doesn't mean these boys aren't doing a job; they're doing a perfectly good job. But I had to have witnesses. I had to have witnesses here to the effect that they could have made a claim, and so forth.

I just had a dispatch from Suzie. I'm sorry, but Allen – Allen doesn't have – have any luck these days. He's only getting Clear. I suppose that's lucky. But here's a long report on Allen's case. Now, this is a wonderful example in doing the unusual now.

"Nineteen items have been found and the auditor's gone back to the first RI found on the goal oppose list, which was 'barren planets.' And while listing on it the pc put item 'to be alone' on list and then told the auditor to remove it. And when the auditor tried to check the
last RR on the list item, 'barren planets,' pc began to RR priorly and latently on item. And the auditor asked what was happening. And the pc said he was thinking of the goal 'to be alone.' And the auditor consulted with Fred, and Fred did not check up the item found but told the auditor to do a brief mid rud Prepcheck on the goal 'to be certain.' And it had only a needle agitation on it. And I checked with the auditor, and the auditor has seen no free needle or on goal 'to be certain' or on any item list off the goal 'to be certain,' nor has there been any constant RR-RR. (You mean the blowdown by RR phenomena.) And yesterday and today at the start of the session the goal 'to be certain' was RRing and I told the auditor to get them from 'barren planets' and continue on more items. There are several possibilities here, that this and that and the other thing and the other thing and the other thing...

Well, I'll tell you what it is. Allen went Clear and nobody noticed. See, it happened to me. You know, I was a first-goal Clear and for just time enough to eat a few peanuts and drink a Coca-Cola. But I was smart enough to recognize it and the auditor was smart enough to notice, and so we had a third candidate and so forth – we had a third candidate on this. Pedro, get on the phone. Get on the phone and call me at "05." Would you do that Pedro? ...

Come on, Pedro. Come on. I'm waiting! Everybody's waiting. Do you realize every Central Organization in the world is waiting for you to get ... [phone rings] There we are!

Hello, Pedro. Pedro, I just wanted to tell you because you didn't report to me a first-goal Clear I won't be able to give you Class IV with honors for it either.

[...] You – you reported a possibility of one? You did? When did you report it? You did? You reported a possibility of it on your auditor's report today?

[...] You hadn't seen the blowdown or the rock slam? You hadn't seen the rocket read blowdown? Oh, well, it's awful murky in the chapel in there sometimes.

*Voice on phone:* Yeah... No! There wasn't one!

You don't think there was one?

*Voice on phone:* No. I know for sure that as far as when the preclear was on the meter there wasn't one.

And you took this as a possibility but you didn't check it out, is that right?

*Voice on phone:* No, no, no, no. What happened was this: Um – we re... uh – redid the – whole line plot ...

Yeah.

*Voice on phone:* ... this morning ...

Yeah.

*Voice on phone:* ... you see, at the beginning of the session.

Right.

*Voice on phone:* So, after we had done it ...

Redid the whole line plot this morning at the beginning of the session, and after you'd done it?
Voice on phone: After we'd done it, I checked the goal before I started listing.
And you checked the goal before you started listing?
Voice on phone: Yes. The goal didn't read.
And it didn't read?
Voice on phone: Yes. I gave it a light Prepcheck.
Uh-huh.
Voice on phone: Still didn't read.
Uh-huh.
Voice on phone: Uh – and as the case had been difficult before and rocket reads had been vanishing, Mary Sue had said that there was a possibility of items being represented. And all the rest – and I had a good rocket reading item, too.
Yeah.
Voice on phone: I just went on without the goal reading.
You went on without the goal reading.
Voice on phone: Yes, I went on with what I had rocket reading to oppose.
Yeah. Yeah.
Voice on phone: Now, in opposing that the preclear just said to me, "I thought of the goal 'to be alone. '"
All right. And while you were doing this, opposing the next one, the pc thought of this goal.
Voice on phone: Yeah, and then I supposed, "All right. Now, is that an item on the list?"
Yeah.
Voice on phone: And he said, "No, it's not."
Yeah.
Voice on phone: So I said, "All right. Now, who or what oppose barren planets?" - which was the item that – uh, was opposed.
Yeah.
Voice on phone: And carried on from there not taking any notice of the goal.
Took no notice of the goal?
Voice on phone: No. Just said, "All right, all right. I've got it here that you thought of it. But now carry on listing."
All right. What'd you put on your auditor's report about Clear?
Voice on phone: No, no. I mean uh – one minute ...
Boy, he's trying to talk his way out of this one! All right, go on, Pedro.

Voice on phone: That's all right. I'll manage it.

Yeah. You – you... very good, huh? Go on, Pedro.

Voice on phone: No, after that, when the list went twenty-five items on top of the last RR and all the rest of it, and the list was left to be checked till the last item – so – uh – the last item did not check.

The last item didn't check, huh?

Voice on phone: Yeah. And we checked around it, all the rest of it – two up, two down – and there wasn't anything there.

Uh-huh.

Voice on phone: So – uh – after we had this checked ...

That wasn't, by the way – just for the record, here, that wasn't a continuing RR spiral staircase. That was an item he'd grabbed off an old goal oppose list which was still firing.

Voice on phone: Yeah.

Yes, and he found its oppterm and it all went *whir-clank*, and he couldn't get anyplace from there.

Voice on phone: Yeah.

Okay.

Voice on phone: Well, after that – uh – uh – I – I gave the preclear a break and I mentioned to Fred what had happened about the goal.

Yeah.

Voice on phone: And Fred said, "All right. You carry on with your list, get your item out of this list, and then we'll have to check the goal."

Yeah. Yeah, yeah, you have to check the goal. Go on.

Voice on phone: Which was what we did.

Yeah.

Voice on phone: And on checking the last item on the second time, uh – uh – after having added to the list, and checking the last RR on the list ...

This was back – this last item that you found on the list is back on this old goal oppose list that had been bypassed?

Voice on phone: Yes.

Yes. It had been bypassed, and then you had opposed it.

Voice on phone: Yes. Yes.

And it all blew up in smoke.

Voice on phone: No. No, no. Wait a minute -then ...
He – you won't – you won't make it, Pedro, but go ahead.

*Voice on phone:* Yeah, I will. [LRH laughs] *And I was checking this item.*

Yeah, you're checking the item.

[...] Yeah.

[...] All right. That's all right. That's fine. Yeah. Fine. Fine. It's all right.

[...] Yeah. I'm still waiting to find out if you put on your auditor's report that your pc was a first-goal Clear. That's what I'm waiting for.

*Voice on phone:* Well, I didn't observe it...

Yeah. All right.

*Voice on phone:* ... but then there was this possibility and that his old goal wasn't reading anymore.

His old goal wasn't reading anymore.

[...] Yeah.

[...] Well, then you – you passed up the Class IV with honors. I'm sorry, Pedro. I'm sorry, Pedro. I don't know anybody I would rather have seen get it, really. That's all right. But clean him up tomorrow, you'll find out you too have shot several items beyond the vanishing of the old goal. You've – you're several items beyond it.

And there – for some little time your pc has not quite been able to fit the old goal to the new items you were finding.

[...] Yeah, he wasn't able to fit that in?

[...] All right. All right. Maybe – maybe so. Maybe so. Too bad, Pedro! Anyway, that's the way it is. Okay, Pedro. Good night now. [hangs up]

Well, there we are, there we are. Tonight, I could announce to you and can announce to you, that three first-goal Clears have been made on the Saint Hill Special Briefing Course in the last week or so, and because everybody was being unusual, nobody noticed it.

Now, what I want you to do now on those auditors is let's – let's dust up this old goal and let's get a bit of a Prepcheck in – tomorrow's Prepcheck day anyway – and get the old goal cleaned up and sparked off. Except everybody but Duford. Now, we don't want Duford getting pushed around on anything. We simply – who – it's his – he's the one that's losing the ... Yeah. Yeah, it's Duford. He's got his rocket read almost squeezed out. He's gone that far beyond the first GPM. So what he's got to do is – just spend your whole time tomorrow in getting Harold's goal. The sooner – the quicker. And when you've got his goal and got him going, why, you can clean up the old GPM sometime or other – we don't care when. Because you're many items deep, and you'll turn off his RR if you don't find that goal in a hurry.

All right. So this is sort of like this. The road now is so easy and it is so straight that an auditor going down it doesn't even notice when he's gone by the milepost, but keeps on going a half a GPM before the vanishing of RR's and the difficulty of the case and the high tone arm
alerts to him that he has already made a first-goal Clear and never gotten any plaudits for it of any kind whatsoever. You'll find this is quite ordinary. But please, for gosh sakes, realize it.

And to the three I talked to tonight, my deepest condolences, and in actual fact, my heartiest congratulations in spite of the fact that I had to tell you about it without even examining your pcs.

Thank you very much. Good night.
R3M: HOW TO FIND GOALS

A lecture given on 19 March 1963

Well, good evening. Good evening. We – I haven't seen you for a while, and you look – you look better. You look better.

All right. This is the what? This is the 19th?

*Male voice: 19th.*

Nineteenth of March, AD 13, Saint Hill Special Briefing Course, lecture.

Well, I'm glad you're here. And in the old days – in the old days – it was much tougher at Saint Hill. The new star-rating system – rating system on bulletins, tapes and so forth – will make an enormous difference, because it takes off the equalized importance of all books and tapes. Permits you to get through many more tapes and bulletins and acquaint yourself with material that you might not get acquainted with and puts the stress and emphasis on exactly the material which you are using. And you will find that is very handy.

So we expect, we expect all these new students – we expect all of you new students to get up into Z Unit at the end of about the fifth week and quickly bypass the remainder of those who are now in V and X Units – and Y, yes. So do that for me, will you? All right.

Now, the lecture this evening has to do with how to find goals. I think you'll find that's a very important lecture – how to find goals.

But before we go into that, why, I would like to give you – I would like to give you a little brief rundown on what's happened in clearing. I just had a telex from London. Ray is holding the fort. She only has one Class IV I think at the moment. And she's having a terrible time because people are finding goals and items in an awful rush. And they had one girl who has been stuck at 5 TA and there've been telexes back and forth between me and London concerning this girl and so on. And they finally found her goal. So that's the end of that, and so on. Actually, nothing worked on her, you know; 2-12 didn't work and nothing worked; a real sad tomato the whole way. Well, they found her goal.

Well, anyway, Ray is in bad trouble because she's so much on the qui vive checking out other people's goals. And there are several people right on the verge of first-goal Clear, you see, and she's keeping an eye on these people and so forth. And she's got supervisitis, see, and she hasn't had any time to worry about her own case or get any auditing on it. And this is bothering her considerably.

And this state of affairs, actually, is happening in a great many places.

South Africa doesn't seem to be worried about Clears at the present time, and – sssssss – South Africa. Melbourne – Melbourne is having a spate of enthusiasm here on the subject of clearing. Also Sydney and also Perth. And they're being just a little bit enthusiastic.
Every once in a while one of you guys out in Z or something: "We've just blown Joe's second goal. Ha-ha!" You haven't even found all the items in the first goal, you see? "We've just blown the second goal!"

Mary Sue gets one about every three or four days. "Dear Mary Sue: We have just blown my second goal. The auditor found it. It rocket read twice and so forth and then it blew. So that's my second goal."

Well, it isn't done that way. If you can't present a line plot that looks like the March 13th line plot* to accompany each goal blown, it hasn't blown. A line plot just like that, by the way. The items can have different names. We'll permit that. They can be different goals. But don't you vary from that line plot.

So we take these two-goals things with a bit of reservation. Do you understand? We take that with a bit of reservation. But, nevertheless, we have to congratulate them.

Actually, what happened is, is we finished training up Ross Turnbull and Denny was already holding the fort out there, and Ross Turnbull has been straightening up things in Melbourne very nicely and doing a beautiful job. And he went up to Sydney and, all in a space of about an hour and a half or something like that, found about forty or fifty items, goals; got all kinds of people auditing again. It was the most fantastic record you ever saw. I mean, an hour and a half, no; it was several days. But he really did a job, see. And that's the immediate result of that. Pretty good, huh?

Melbourne, HGC pcs. Now, they have a new idea in Melbourne. They have a new idea in Melbourne I want to call to your attention. They're starting to give good auditing on clearing to HGC pcs. And I would like to recommend this as a new and novel policy.

Well, allowing for the fact they haven't even found all the items in the first GPM, we know they're doing it right because we trained Ross up pretty well. So there you are. There you are. What have you got to say about that, huh? I think that's a good – a good send-off down there in view of that fact that they've just had a lot of upsets and troubles of one kind or another, why, to get technical up like that, that would – took quite a lot of doing.

And now, of course, we're changing Academy programs so that with this new bulletin rating system works in these Academy programs – similarly to Saint Hill – they'll be graduating students around there. Next thing you know clearing is going to be a great reality.

You know this is the dark – the dark time for Scientology, actually. You probably don't recognize that because it all looks bright from where you sit. But as we go forward, the mere fact of having made the grade puts in a stable datum that causes a tremendous amount of confusion. There's the "Foolish Drug Administration" in Washington, DC, knocking the spots off of all Scientology in the United States. They've even stolen our last Ability out of the mails in the post office and copied the names and addresses off of it. Interesting, isn't it? Something like that.

---

* Editor's note: refers to HCOB 13 March 1963 II which isn't in the Red Volumes. The line plot referred to is given in the appendix of this transcript.
And then their FDA agents at vast expense are going all over the country visiting all the Scientologists in this country asking them to make incriminating statements about the amount of polio money that they get. You know? Of course, we don't do any of these things so it must be very disheartening to them. But I think they can probably invent enough to cause us trouble.

In Australia, our firm of solicitors in Australia, "Rylah and Rylah" – because we don't dare mention solicitors' names, you know, the implicating, you know, slander, and that sort of thing. Anyhow, this firm "Rylah and Rylah," who are related to the attorney general of Victoria, failed to ask for an extension for the filing of HASI, Limited. Understand Limited – HASI Limited. No, it is not in business in Australia and actually isn't in business in active trading in other parts of the world to amount to anything. And they were supposed to ask for an extension. And the accountants – our accountants down there told them to ask for an extension and they didn't do it. And now they've resigned off the case because we're going to be sued for not having asked for an extension. I think that stinks. They'll be sued of course. But that permits the newspapers to come out, "HASI, A Big Swindle!" See? Ah, it's nonsense. Of course, we sue the newspapers.

Here stateside, in the States we've got plenty of suits coming straight up against papers and that sort of thing. We're in for a fight.

But the main thing that's wrong is Scientologists are being hit individually. Not anything happening to them; they're just being questioned and mauled around. And, of course, one doesn't really care to associate with a government investigator. I mean, you know – smell, you know, and so forth.

And the difficulty with this whole thing: its commotion. Just commotion. Doesn't mean any real trouble in Australia. I mean, what can they do? In the final analysis they could fine HASI or something like that – HASI, Limited. It isn't even trading in Australia. It hasn't committed any crime. We haven't done any of the things that the Food and Drug Administration of the United States says we've done, you see. They are actually doing us a big favor but it – because they are suing us for things they can't prove.

Now, the Food and Drug Administration can lose suits. That's an interesting, too. They just lost one in Florida in a federal court which had been two years in length and is a food against Dextra Sugar. And Dextra had claimed that sugar contains vitamins which act as a food supplement. And the Food and Drug Administration sued them. And that's been going forward for two years and all this sugar is still seized – was still seized in warehouses. And finally the judge says, "You guys are nuts." You know, he said it in some legal language or another, but he – in essence he said, "You guys are nuts," and gave Dextra back its sugar and that was that. In other words, FDA can lose in a federal court.

Now, that suit that they brought was far more convincing than the suit they brought against us. And we're very, very active about this and we're going to have a few heads.

But, understand me, at this time, just at the time clearing, actual clearing, has emerged on Earth, after having been sighted diffidently, twenty-five hundred years ago, first time, why, here's all this organizational commotion going on. Some of the principals involved, like
Denny Gogerly blames himself for not having run out items out of his bank which he found which made him wide open for motivators of being sued.

Well, that's all right. You needn't blame yourself for it. We've all got these things. The sooner we get rid of them, the less motivators we're going to collect. That's for sure.

But look. Here's the technology. The organizations are still there. Excellence of technology and clearing people and getting right down to it and really doing a fine technical job is the only thing that's going to beat this rap. Because you think that's just – that's just two activities going on in the world.

Don't you think there'll be others? Yes, indeed, there will be others. And we had better be strong enough and good enough to meet them. Therefore, our technical has got to be up; and our technical is our only saving grace. And that's the only thing that'll save our bacon.

And we're running a race right now between the commotion and enturbulation which can be generated in a highly psychotic world. And, of course, both of these suits in Australia and the United States are suits brought by psychotics. I say that advisedly, because they aren't even at the firm that is doing the business. How much more psychotic can you be than that? They're going to squash Scientology by suing some Scientology organization or issuing warrants against one which doesn't exist. That's just one of the things.

But, look, if we don't get ahead technically and if we don't just get right down to it and every pc we audit, bang, bang, bang, bang, clear them – no nonsense about this, just clear them – why, this enturbulance that we generate by putting this stable datum in the world could actually swamp us. I say that advisedly. These are actually the dark days of Scientology. I see them from where I sit. You don't see them from where you sit.

If you did, every session you gave would not be some session wherein you hoped Ron was right or that 3M worked. It would be a session for blood, man! If we don't operate in that operating climate, we can be heard of no more. This is touch and go.

All right. So it's very appropriate in that atmosphere – don't let me worry you. Don't let me worry you. But don't sit around so darn complacent about the whole thing. And when you give somebody a session and you don't get any win for the pc and he's not any closer to Clear by the end of that session, realize you're playing with fire. I don't care what pc it is or why you're auditing the pc, that pc is no closer to clearing at the end of that session then at the beginning, you're playing with fire. You haven't got that time to burn, that's all. You just haven't got that time to burn.

Next time you sit down in front of a pc here on course, do the usual in the direction of Clear. Things happen – things happen in your sessions. Aaaah! Fft! Psft! An auditor does a – does an RI oppose list and he gets to a flat spot. He's got twenty-five items. No RR. He got no tone arm action. Nothing. He goes back, he takes an R/S and starts nulling forward and doesn't bother to do anything. Goes right over this flat spot and nulls on down into the rest of the list – this with 3M? Aw, for God sakes!

Let's take the next to the last RR on the list and walk forward from there, I mean, down the list from there and if we haven't found a DR that we can drill, that we can put the big mid ruds on and get to fire – there's something on that list firing because the list RRed.
And if we haven't found a dirty needle or something that we can get to fire in just those few short items, we're wasting time.

The way you people overlist these days – aaah! What are you doing? What are you doing? Do you know how long a 3M list is? Huh? Do you know really how long a 3M list should be? Oh, about, absolute outside about – this is not a source list because you only do one of those on a case and that can be nineteen, twenty pages – your ordinary 3M list is something on the order of sixty items, fifty items.

What you doing, man? There's a little short list and, bang, there it is! And what's the matter with you that you keep going by – keep going by items?

Do you realize that you take a terminal – you're trying to find the oppterm – you overlist from that terminal: you not only go past the oppterm, you go into the next terminal and can go into the next oppterm and can go into the next terminal? Do you realize that? Well, what have you done? You've just lost about four items for the pc, just like that. What are you doing all this overlisting stuff for? It's nonsense, you know? Nonsense. Bypassed items – you won't clear any pc that way! You're just there to find items.

You get down to your fundamentals and you find out that your fundamentals are very simple. There's nothing much to these fundamentals. They're very simple. You're supposed to sit there and do a list and when you see the meter rocket read or R/S when the pc says an item you mark the item and you go down here. Actually, what you're trying to do is get the read off the question you're answering the pc and get the item you want on the list. That's what you're trying to do. You make me give you all sorts of mechanical rules by which to do this, but in essence, that's all you're trying to do. You're trying to list something down long enough so there's no read left on the question, "Who or what would oppose a screamer?", or "Who or what would a screamer oppose?" – using that line plot – and you're just listing until there's no read left on that question and until you've got an item that reads.

And do you know that by the time you get to the third bank that can be as few as four or five items? What are you doing with these fifty-page lists, man? What are you trying to do? It's incredible. Get on the ball, use some of your native initiative. What are you trying to do?

You've got a question here and you're just trying to list this question down until you get an item on that list. That's – that's all you're trying to do. You're trying to list the question until it doesn't read. That it stops reading is no guarantee you've got the item on the list because it may take you three or four more items before it goes down. And you're not trying to bypass oppterm... you find – find a terminal on a list on which you're supposed to get an oppterm.

Do you know the oppterm is on that list? You've just gone by it. You've got to go back and pick it up. It's an RR item earlier on the list. And you – it'll only tick now. You've got to tiger drill it. You've got to get the big mid ruds in on the thing. And it'll fire again.

What are you doing losing the pc's items for him? It's overlisting. You're just going down the line fifty pages, a hundred pages, thousand pages, and so on. What are you trying to do? I don't know what you're trying to do.
Actually, all you're supposed to do is find the exact pattern of items that I gave you in HCOB, March the 13th.

Now, how do you go about doing that?

Well, you'd better go about doing that the simplest way you can to do that and do it the most accurately you can. So, get on the ball, man.

I admit that it was a patch-up of a bank, but the other evening Suzie found in a five-and-a-half-hour session nineteen items. That's interesting, isn't it?

Well, what you doing?

One item per week! Now look, an item is a thirty-five minute proposition.

But I'm not berating you on the subject of items. And I've given you a lot of preliminary this lecture and you're probably all hanging on the rails – how to find goals.

I've had a remarkable breakthrough here on the subject of finding goals. Now, there is the tough area. That's the rough one: finding somebody's goal. Because it's an absolute necessity that you find this person's goal. You've got to find this person's goal; there's no monkey business about this. You can't go on finding items without finding somebody's goal; you're going to shut off his RR and R/S.

So I've been working on how to find goals. It's very easy to find goals. But after you've found goals – after you've found somebody's goal – it is no trick to clear him.

Do you remember that squirrel process that we had – I talked to you about in Washington? You know? The little girl was okay, that's perfectly all right to use initiative on that line. Show you where these things wind up: it took thirty hours to patch up the case she cleared in seven and a half hours. I think that was pretty good, huh? They found the rest of the items and straightened it up. They – she'd done a key-out on these things.

So you can do foolish things with this; but only when you're trying to shortcut and monkey up the basics and fundamentals of what you're trying to do.

Now, finding goals is the first step of 3M. And your next step, of course, is simply finding the items in the GPM and getting those all listed up. And the only way you're missing doing that is by overlisting.

A year and a half ago we beat everybody over the head consistently and continually because they all – always underlisted. They'd have twelve items on the list and, 3D Criss Cross, they did nothing but underlist. See?

And we beat everybody over the head for underlisting and screamed at them and so forth and gave infractions and raised the devil, and now all they can do is turn us in hundred-page lists. I think maybe we trained everybody too well. Something on that order.

But the truth of the matter is, what does clearing consist of? It consists of finding a goal and listing it out to get the items in 3M. Oh, yeah, it's not – it's not easy, but it is just an action. And if you could grip what you're trying to do, you'll do it fairly rapidly. But if you don't get a grip on what you're trying to do, you're not going to do it rapidly.
Now, your biggest barrier has been in finding goals. That's the biggest barrier and will continue to be the biggest and hardest job. But people can find goals. People have consistently been finding goals for a long period of time.

Now it's become absolutely vital that we find goals rather fast. And I've been studying this very hard. I've been trying to get a bulletin out on it for the last few days and it's so easily and quickly said, however, that I'm sort of defeated at getting this bulletin out. I try to list all the number of ways of finding goals and all that sort of thing. Seems rather arduous and I don't want to get out a goals bulletin that just gives us just this one little piece of information. I'd like to get out a more embracive bulletin.

But the truth of the matter is, goals is just another specialized method of listing. And that's all it is. And it's listing against a certain result. And goals listing is far, far, far more difficult than listing items out of a GPM. That's simple. There's nothing to it unless the auditor is just totally knuckleheaded and hasn't a clue what he's doing. Goals, though, this is something else. This is something else.

We've had various methods of goals listing. One of the most easy and certain ways we had in the past to find a goal was in 3GA – 3GA goals methods. There we did something like, "Who or what have you detested?" got a list, did a represent of the resulting item and listed goals against that. That was more complicated than we needed, by the way. All you had to do was say, "Who or what have you detested?" and do a list and list goals against the resulting item. It was quite interesting to do this.

Well, that was one of the soundest methods. But people have trouble finding rock slams and so forth on some cases. And on some cases the goal, well... the R/S and RR have already been shut off, so that method is not particularly open. So it is in many cases limited.

So how do you go about finding somebody's goal? Now, that's the main trouble. Now, you're making trouble out of finding items in the GPM. You can make lots of trouble out of finding goals because it's an infinitely harder operation. More difficult. It's tough. And the penalty for running the wrong goal is fry your scalp. Not my penalty. It's what'll happen to the pc if you run the wrong goal on him. So this is a very important technology.

Now, you've got, in your bulletin and things, almost anything you need to – well, you've got anything you need now to run (with the issuance of the last bulletins) to run 3M flawlessly, making no mistakes. See, this is easy. I can tell you how to clean up a GPM after you've found the items in it and how to patch it up and missing items and do various things like this and how to run Clear tests and all various things like this. But the technology's been released now. Well, this isn't true of goals.

Now, you can learn to do that listing after you've got the goal. But, remember, everything depends on the goal. So you'd better straighten yourself up on the subject of listing and get so that you can list just like that, man! And just get the item, bang, you know, and know that's it and fill in your line plot – bzzzt-bzzzt-bzzzt-bzzzt, bang-bang-bang, that's the end of that GPM. See? That's easy.

Why?
You have a guide. You have a guide. And that guide is a goal. You know exactly where you are going.

Oddly enough, you only run into trouble when you run over the bottom border of the GPM into the next GPM. As soon as you run over the border into the next GPM you're without a goal so you're in trouble because you have no guide.

You keep finding items in 2-12, you keep finding items just on and on and on in 3M without a goal – and you can do it too: you can have the pc's goal for the first GPM and with great enthusiasm and unbeknownst to either you or the pc run right over into a foreign GPM and start finding items in this foreign GPM. And all of a sudden nothing rocket reads and the pc's rocket read is gone and the pc's been all ARC broke for the last couple of sessions and the auditor says, "Well, we just should keep on going because it's just his meanness; he is dramatizing some of the items." Well, he might be dramatizing some of the items but what you've done is you've run into a GPM without a goal and you're finding items without the pc's goal.

That's the only thing that can really hang a case up, is running items without a goal. And you can take that and mark it down in letters of fire inside your skull. You find items without a goal, you're in trouble. Therefore, a goal is very important. A goal is a very important activity.

So, therefore, there will probably be lots of work done on how to find goals. I would say there's tremendous quantities of work.

We did a lot of electronics work on this and Dale just wrote me and told me that he had a better method of reading an oscilloscope and he could read things with a magnitude of about one to a hundred with a Mark V. That's pretty good. He could read a hundred times more sensitive than a Mark V. That's fine. I'm glad of it.

But that is not the zone of expansion. That is a zone of expansion; be very valuable if we could do it. That isn't what we need! I don't care how sensitive an instrument you've got – if the pc has not told you his goal, you're not going to get a read on it. Now, just figure that out.

Oh, it'd be nice. It'd be nice. You could probably detect – it would be very useful. Don't let me run it down. But what you need is a method of getting the pc to put his goal on a list. And I've been developing information along this line and I've been putting some things together with this. And I'm quite cheerful about the whole thing.

Seems to me – seems to me that getting the pc to put his goal on the list is far, far more important than any other activity that we could conduct.

Now, I expect to see goals finding move up into a very fine art and a very exact science and so forth. And I've made a breakthrough which puts it through in that direction. We've got lots of methods of finding goals, you understand that? But you need some very positive methods of finding goals.

Now, one of the methods of finding goals is to take – I'll show you how (just an adventure in goals finding; method of finding goals) – you get the pc to do a goals list and then you keep nulling goals on the goals list until the pc ARC breaks. And then go back through...
the last session's auditing and find out which goals still tick and do a represent on those goals until the pc gets the right goal. You see, he'll ARC break not because his goal is on the list but because a near miss is on the list.

All right. That would be a method of goals finding. I'm just showing you some adventurous lines of doing this. You'll use this, by the way. I've used it myself. I find it quite fascinating. If you go by a near wording of the pc's goal on a list, the pc can be expected to ARC break in the next session. That or the next session, see, he'll ARC break on it. Well, that's a goal's method. Show you how wild these methods could be.

You'll use the method some time; don't just laugh at it. You'll say, "Well, gee, you know, this pc has been all ARC broke ever since the November 3rd session. Look at these folders! You know? Look at the folder. Look at the auditor's reports here. Look at these auditor reports. Been a sad character and hasn't been reading on the meter and had upsets with the auditor ever since that session. Oh, he was finding goals in that session and here are the goals list of that session. And they all went out."

Well, yes, they all went out. But the auditor wasn't quite watching as closely as he might have been because one of them was still ticking. And that was not the pc's goal; that was a near miss.

I'll give you an idea. The one of them the pc put on the list was "to eat catfish." And the pc's goal is "to catch catfish." And you go over the top of it, the pc'll ARC break because, you see, it's a near miss. It's a nearly found out. And it acts just like any other withheld... missed withheld and the pc gets upset. So it's a near wording of the goal.

I have actually had a... looked back into this and this is a fact. This is a fact. We thought before and were defeated on this, that we'd gone over the actual goal. We knew that was the case. That always ARC breaks the pc. His goal is "to catch catfish." The auditor goes down the line, "To catch catfish," you know? "To catch catfish. Anything on this goal been suppressed?" You know, and the meter falls, you know, off the pin. And the auditor says, "That's clean," and goes on to the next goal. Heh-heh-heh-heh. Sometime during the next half an hour the pc's going to say, "You know, the way you're acknowledging me is terrible! Your meter is – your hand on the meter is bothering me." This, that, criticism, criticism and the next thing you know a full-blown ARC break. That was the exact goal that was gone over.

But, look, it's more intimate than that. It's more intimate than that. You can go over the goal "to catch fish," and the pc's goal is "to catch catfish," see, and the pc will ARC break. Well, that's a method of goals finding, then, isn't it? I consider that fascinating. It opens the door more ways than one.

It tells us – although we're never supposed to represent a rock slamming item – you can always write three or four or five goals after any goal. We're not representing it; we're trying to get various wordings of that exact goal. That's interesting, isn't it? More goals are missed by not quite the right wording.

What happens when you take the pc's first GPM goal – it's all ready to be found, you see, and there it is – and this GPM goal is "to scream." That's going to be the goal you're going to find. And you get the goal "to be a screamer."
Do you know when you tiger drill that thing it fires, bang! "To be a screamer" is what you've found. The actual goal is "to scream." See? "To be a screamer" – bang, rocket read, bang! Then it doesn't rocket read. The rocket read now disappears. It R/Ses. R/Ses. "To be a screamer" – R/S, R/S, R/S. And sometimes you even get a dwindling R/S; on a goal that close you'll get a dwindling R/S. Next thing you know it only goes tick, tick, tick. Where did it go?

That was the pc's actual goal, it should have ticked, then when drilled with the left-hand buttons – Suppressed, Careful of and Failed to reveal – should have given a rocket read and then when prepchecked should have given a much better rocket read on it. Should have kept on rocket reading. That's the pc's goal, see?

But this goal, it didn't behave that way. It goes bang, bang, tick. Well, it ticked in the first place, you drilled it, it went rocket read, rocket read, rock-rock-rock-rock-rock slam, rock slam, rock slam, narrower rock slam, narrower rock slam, narrower rock slam, tick. Right in front of your eyes. You've got a goal there which is almost the wording but isn't quite.

So when you see that, don't blow your brains out. Say, "Give me some other wordings for this goal." And amongst them he will give you "to scream." And when he gives you that, if you're... list on the meter, see, he gives you that, that goal is going to go psheew! It'll be a little bit suppressed, however; and it'll only go that one fire maybe and then it doesn't fire and it doesn't fire. And then you get the buttons in on it, the left-hand buttons, just the three of them – Suppress, Careful of and Fail to reveal; just those – and it just sits there and rocket reads from there on out. Interesting, isn't it?

Has your pc's goal been a near miss? Huh? Have you nearly found it?

Now, there's one type of goal that's probably very easy to find, and that's an Axiom 10 goal. Let's say, "To impress people," and it goes psheew! psheew! rrump, tick, rocket read, tick, tick, tick, slight blowdown, reads with a slight DR, nothing can be done with this thing now. You see? "To impress people."

"To shoot people." Rocket read, tick, gone.

"To drown people." You can get off on the line of doing something to people, don't you see? Actually, it's an Axiom 10 type of goal.

If he was a Scientologist you say, "Give me some Axiom 10 goals." Just do a little list of Axiom 10 goals. You get something like "to create effects." Bow! It rocket reads every time. You see? See what you've been doing?

Now therefore, in finding goals you must maintain an out-hard list. And not spend the rest of your life tiger drilling something that only gives a consistent tick. You understand? You get a goal – you list a goal (I don't care now what method you're using) you list the goal against the meter. You take this list and null it by elimination. Take the last three or four in, put in the left-hand buttons on them (Suppress, Careful of, Fail to reveal), do a Prepcheck with those, you know – repetitive, repetitive buttons, not just fast check on those last three. And one of them goes psheew!

Well, now you've got a career. Now you've got a career. If your... if you don't care what happens to Scientology and you don't... it doesn't seem to matter whether we ever clear
anybody up or not, this is the course you will take: "Oh, well, I saw it rocket read once!" I know because I myself have made this mistake, see. I'm not now talking without experience in this. You can invest the next twenty-five or thirty hours on that damn goal. You can! You saw it rocket read. Wow! Cut my throat, see? You saw it rocket read. Ahhhaaa.

Now just go on and prepcheck it. Give it another Prepcheck. You know? Then give it another Prepcheck. Then you don't know what to do, so give it another Prepcheck. See? And then put in the session rudiments for all those sessions and give it another Prepcheck. It won't go out! It now only ticks, but it just won't go out. You understand? Well, just call that a goal that goes out hard. And you put it over here on the goal-that-goes-out-hard list. And don't you spend more than about fifteen minutes on the thing. That's the secret. It rocket reads, you polish it up, can't get it to rocket read again but it still ticks, it isn't going to go out, so forth; put it over here on this goals-that-went-out-hard list. John Jones, pc. And put the date each one of them went out hard. And when you're doing this list – you're doing his lists – no matter what else you're doing, keep that goals-that-went-out-hard list. You understand?

Now, if the goal was ever seen to rocket read, also mention that on your goals-that-went-out-hard list. "Rocket read, March the 3rd," so forth. See? It doesn't mean anything that it rocket read beyond that it's a near miss.

You keep trying to find the pc's goal and every time you get one that, when you put in the left-hand buttons on, you can't get it to rocket read again but it did something interesting. Actually the whole definition is that you can't get it to disappear. You put it over here on this list.

Now of course, if you find a goal that not only won't disappear but sporadically, every now and then, rocket reads, you've got the pc's goal. So don't put it on the goals-that-went-out-hard list. Understand? You put that on your auditor's report as the pc's goal found. And then get it checked out by somebody. And it'll rocket read for that person, too.

Now, if it doesn't rocket read for that person, don't immediately assign the fact that the Instructor or the Auditing Supervisor is suppressive. The facts of the case are if it won't rocket read for the person who is checking it out, it just belongs over here on the goals-that-went-out-hard list. You understand?

Don't make a career out of it. There's how you fail to find goals – by making a career out of those that go out hard. No. Put them on a special list – and I'll show you the reason for that in a moment – put them over here on a special list, give any data about that goal, "The goal 'to catch catfish' fired three times in tiger drilling and R/Sed."

Of course, you're a complete knucklehead if you actually didn't do something else right there at that moment, see. "It fired three times and R/Sed and finally dwindled and..." whuuuuh! Probably the goal is "to catch fish." See, it's near; it's almost dead-on. See? But it's just enough off so that it doesn't keep rocket reading.

Now therefore, let's lay down a few principles here. First and foremost: The pc does have a goal that can be found relatively easily. That's your first principle.

Now, it's taken me a long time to learn that principle, so it'll take you a long time to learn that principle, too, so that you get a good subjective reality on it. The pc does have a
goal that can be found! That's an interesting principle to lay down with that amount of vio-

But you know the auditor that isn't used to finding goals, he sits there and he says, "Uhh-hhu. Um – well, I don't know whether this... maybe the pc's goal can't be found, you

Now, you know, the goal is the only part of the case that is instantly findable if it is on

It is the easiest thing to find on the case if the case is in shocking bad shape. That's an-

Now, here's another basic principle: Goals processing is the only processing that is to-

What's going to limit you?

Well, for instance, until you find a goal and get a bank clear, you can get one of the

SHSBC TAPES 201-300 1267 04.02.15
In other words, it's like any other Prehav level: it's been overrun. You understand that? So it's a limited action. It's not something you're going to run into. So stop worrying. Because you're going to clear this guy, you see. Soon as you get a GPM out of the way, why, the ceiling is off. All of the Prehav buttons are now completely free again and they'll all run to flat spots.

But I'm just telling you that even Prepchecking of that particular type, depending as it does on what were originally Prehav level buttons, has a zenith. But goals processing does not have. You can always find a goal.

Now, there's only one reservation, is at any given time there is only one goal to be found. So we reverse what we just said and say that it is unlimited. I'm saying you're trying, you see, can be unlimited. But it does have a ceiling, which is finding the pc's goal. After you've found the pc's goal you won't be able to find the pc's goal. You won't be able to stall anymore. You'll have to clear him now.

Now take it over into overlisting. Take it out on him by overlisting, bypassing items in the GPM. That's all you can do after you've found his goal. That's the only way... That's mean of me, isn't it? I actually have more confidence in you than that and I'm not sarcastic that way about your auditing. His, yes. But – you know, or – and his, yes, but not – not yours. Okay? You'll go right on and clear him, won't you? All right. Thank you.

After you've found the pc's goal, you can't find the pc's goal. The only thing you can do from there on is clear him. You got that? That is the goal.

But there is a point just short of finding the pc's goal which you can go on forever. And it's one of those things – Mary Sue in instructing here and so forth has gotten very tired of this one. In fact, she – I'd say every few weeks I hear this remark, "Prepchecking it forever!"

Some pc is doing some hard sell, you know: "My goal is to enliven space opera." See? And you know, he'll – in there with the hard sell. Well, it was seen to rocket read in 1961, early in the year, once. And they have now run up 275 Prepchecking hours on this goal and the pc is turned over to a new auditor. And the new auditor starts to prepcheck this goal. Oh yes, it happens. Now, that's a method of not finding the pc's goal: prepchecking things that aren't his goal, that he merely hopes is.

So we get the next principle: It is up to the auditor to find out if it is the pc's goal. See? That's up to the auditor to find it out. It isn't the responsibility of the pc. It's the auditor's responsibility.

Now, if you look over goals finding in these various lights, you will find out that it's a rather simple activity, providing you're in there trying to find the pc's goal.

Now, I'm working on Routine 2GX. And I'll be talking to you about that later. Now, that is a Prepcheck which possibly will make the pc spit his goal out. And very possibly it will work and possibly it won't work.

But there is a workable process now on the subject of goals which is a relatively simple process. And this can be run forever – until, of course, you find the pc's goal. If you're
unlucky enough to find the pc's goal, of course, you can't run this process anymore. Because the only way you can find the pc's goal again and do all that again is after you've gotten rid of the whole GPM that that goal is connected with, which is seventeen, twenty, thirty items, something like this. And when you've gotten rid of that GPM, see, then you can go through it all over again. But you have to get rid of this – well, you have to go to the work of getting rid of this GPM before you can go at the endless business of finding the pc's goal again. See? So it's... it'd be happy... I'm happy to be able to tell you that it doesn't completely end with the finding of one goal.

Now, how do you go about finding this goal?

Well, you'd better find it.

Well, how do you find it?

Take the oldest item, valid, invalid, rumored, thought of, hoped for, rocket read or rock slammed or was never even found on a meter – we don't care what or under whose authority it was found or anything else; we care nothing about these things. Found in some ACC, you see, we don't care where. Let's get that one. That's the first one ever found; that's the first reliable item for goals finding as far as we're concerned. See? Probably doesn't even belong to the bank, but it might. Who knows? It doesn't now have to read, no other conditions attached to this thing. We don't have to know if it's a terminal, if it's an oppterm, anything. Don't have to know anything about this. And we find this, get the pc to tell us or get it out of his auditor's reports. We take that one.

We find the next item of this character and the next item of this... anything ever found on this pc. We don't care if it was a Dynamic Assessment. We don't know how it was found. We don't care if somebody dreamed it up. We don't care if it was something an auditor got a tick on so that he could one day run O/W on it. We don't care what it is. It's anything that was ever found on that pc.

And we put this on a list. We put these items on a list as accurately as we can, but regardless and without losing any. Get a whole list of these things and bring it right on down to present time. And include on it all R2-12, 2-10, 3GA Criss Cross, whether gotten from a rock slamming item or not, we don't care. In other words, let's just pick up all this debris, let's get the whole lot. That's our first step in modernly finding goals.

Our next step is an elementary one that is so elementary it's horrible. We take the meter and we put down a sheet of paper and we take the first terminal and we simply list from the question, "What might the goal of a (whatever the item is) be?" That's our question, "What might the goal of a..." You know? Let's say the first item ever found was a rock. "What might the goal of a rock be?" See? Get the idea?

And now, how long do we list that?

Well, there's a couple of you – I'm kind of mad about overlisting, so I won't make any bright cracks about it. But if I catch you going nineteen, twenty, thirty, seventy, eighty, ninety, two hundred pages with that goals list off of the rock, I'm going to – well, I'll give you a psychiatric consultation. How's that? Because it's a little, short list. It's a little dinky list, you know, about so. Maybe two columns, maybe two sheets of paper.
And, look, every few items the pc gives you... You've got to learn this trick because it's a new trick in listing, and it's a trick which is in goals finding and it'll be a trick in the later banks of the GPM and so forth. Not for the first one; you can still count on your twenty-five for the first one. Twenty-five after the last R/S or whatever – or last RR. But it's the trick of reading a question to see if it reads. Not tiger drilling it so it will read, but seeing if the question will read. "What might the goal of a rock be?" That's your question. And you're only going to list goals until that question reads clean. Got it?

That doesn't absolutely guarantee that the goal, if it is to be on that list, is on the list. There's no absolute guarantee of it. So do two, three more. You get the idea. You'll find out that if it reads, the list is not complete, but that it is clean does not mean the item is on the list yet. It's almost, maybe. Do two or three more. Do a few more beyond this – beyond this clean point for that item. And then knock it off. You're through with that item until you – unless you just have completely horrible, bad luck.

Now, you listed these things on the meter, didn't you? And you watched this meter carefully for RRs and R/Ses. And you marked each one of those goals when they R/Sed and RRed. You got it? "What might the goals of a rock be?" And you read that occasionally asking the pc the question. You also read it on the meter, don't you see. You say, "What might the goal of a rock be?" And you see that that doesn't read and so you say, "All right. Well, give me two or three more and I'll end this list." Something like that. And you do. And make sure that you get the RRs and R/Ses, see?

And then – you got that now? You got that?

Now, you don't pick the R/Ses and RRs off or do anything stupid like that. You take this sheet of paper which is in front of you now and you simply put your meter right back where it was and you null that list by elimination pocketa-pocketa-pocketa-pocketa-pocketa. You'll find it's a clean needle list. Just null them. And any read of any kind that you get, you leave it in. You call each one three times. Remember the old three bark proposition? Maybe the pc didn't hear it the first time. So you say, "To be a catfish. To be a catfish. To be a catfish." Don't say – don't scream it at the pc; use a fairly normal tone of voice. "To be a catfish. To be a catfish. To be a catfish. All right." And don't bother to tell him it read or it didn't read. You don't care anything about that.

Now, if it got no read of any kind – and there's big adjudications on this. "Well, let's see, if it ticked once and then didn't tick twice, then is it in or is it out?" You know? Well, we'll hold some courts on that so that we can finally decide some findings concerning it. I just tell you the thing has to be in. Actually, if it reads two times out of the three, it's for sure in. And if it reads on a tick on the third one, it's probably in, too. But it's adjudications of that character you'll have to get used to.

Now those things, we take them down the line and we take them – the whole list. We've done this item, "What might the goal of a rock be?" We've done a list on the thing against the meter. Those things are marked with RRs and R/Ses. We don't pay any attention to the RRs and R/Ses. All we do is null the whole list by elimination, bang. That leaves us maybe – we go over it maybe twice and things go out and we're left there with maybe three goals.
And on those three goals we put in the left-hand buttons of the big mid ruds – Suppress, Careful of and Fail to reveal – and we do it more or less by a Precheck basis. And – simple. This is real simple. Because if it's ever going to rocket read, it's going to rocket read because you got those three buttons off of it. You understand? You can put in all the rest of it, but that's after a goal has proved itself up a bit and you're curious about it.

All right. And none of those three fired. They didn't fire, didn't respond, didn't anything. But also one of them didn't lose its tick. Got that? Didn't lose its tick. Never fired. It falls occasionally, it behaves peculiarly, but you don't have rocket reads on it. You transfer that goal over to the goals-that-went-out-hard list, say what item it came from, that it did or didn't rocket read and so forth. And you put it over there and then you take this whole sheet and you attach it to your goals folder for the pc and you forget about the rock. You got it? You just forget about that. That's gone now. That's gone.

And you take the next item in sequence, that is the next oldest item the pc has had, and you do exactly the same thing. You got it? And you exhaust all of the items you've got for that pc up to the time when you actually do find the pc's goal. You got it?

Now, the only variation that happens is if you get one that rocket reads, rock slams, fires, doesn't fire, ticks, get all the big mid ruds in on the thing again and see if it does anything else. And if it just ticks, you say, "This goal is awful close to it." So you do a little represent on that goal. You got it? You take another little sheet of paper, see, and you say, "All right. Now, we have this goal here 'to be a screamer.' Can you state this in other ways? Or can you give the same sense in other ways?"

And he finally says, "Uh – to listen, to howl, to screech, uh – to scream, uh – to yell, uh – to make a noise, to be noisy, uh..." and so forth.

You say, "That's fine." Because, of course, in the meantime listing on the meter you've seen this thing, "to scream," rocket read. And you say, "All right. Now, I want to give you this goal. I want to give you these goals." And you just do the same action you've done with the other goals. In other words, you go over them, you null them, and so on. And you'll see this goal, "to scream," fire. And you say, "All right." And you null them out. And now we... Three of them fire, now one of them is firing. To scream. You say, "All right. Now, on 'to scream'..." Remember, today, it isn't ever, "On the goal 'to scream,'" or anything like that. It's 'On 'to scream,' has anything been suppressed?' You know? "Is there anything you've been careful of? Is there anything you've failed to reveal?" And this thing is firing on its mid rud buttons. And you say, "Ha-ha-ha-ha, it's firing on its mid rud buttons!" And bang, bang. And then all of a sudden it fires because of course, it's been suppressed by finding the near miss. Don't you see? And it'll fire and it'll fire and it'll fire and it'll fire and it'll fire and that's it. And you take it and get it checked out and it'll fire and it'll fire and it'll fire. And the real goal on a case is the only thing that just keeps on firing from there on out. Got that?

We do that to every item the guy's got. Every item you can dig up on the case. Don't find new items because someday you'll turn off his RR and R/S.

What if the RR and R/S has been turned off on the case by finding too many items by some eager beaver?
It doesn't matter. The goal will still RR. If you find it, it will RR. See, it's the only safe process there is, actually, is finding goals. Interesting, isn't it?

Now, I've said it's the only safe process there is. Let me emphasize it just a little bit further. It is one of the best processes there is. If you were never going to find a goal, it would be good auditing. Because every goal you find and everything you straighten out for this pc and every goal you get rid of for the pc and every goal the pc lists makes him read a little better on the meter, feel a little better, get rid of a few more somatics.

One of the – one of the rules that goes with this – there aren't very many rules; there aren't any beyond what I've told you – the pc turns on a severe somatic or sen on a goal, why, run the buttons. Run the buttons on the thing till it goes off. But that can get you in a trap. The pc can sell you a goal that way and it never rocket reads. So clean it up as best you can.

Actually, you can practically cripple a pc, but also you can run a goal like "to create" and almost take his head off. It never rocket read, but you just for some reason or other keep on drilling it and, of course, it is the pc's goal – in the tenth GPM. Of course that's a strong enough goal to blow his head off anyhow.

Now, you keep putting these goals-that-went-out-hard over on this list. And you don't forget that goals-that-went-out-hard list, because you probably – you very well may have his second goal or his third goal or his fifth goal for the GPM on that first list. That's very interesting. And one of the things that auditors are doing is finding the goal that belongs to the second GPM before finding the goal on the first GPM and therefore they don't get beautiful rocket reads and the pc just gets prepchecked forever and this is a bunch of nonsense.

Why?

Well, it's the pc's goal all right. And of course he'll ARC break if you tell him it isn't his goal because it is his goal. But it belongs to the second GPM or the third or the fourth or the fifth. You see? Of course it won't go out. But it won't rocket read either. And it's sure not ready to run, man. If you were to run that you'd plow him straight in, because he's no more ready to go into that second GPM than he is to jump off the Empire State Building with complete impunity. That's too much for him. So you keep that goals-that-go-out-hard list and you'll eventually find the pc's goal.

Now, this is a terrific way to do an intensive. Terrific way to do an intensive.

Now, what about raw meat? What about raw meat?

They don't have a bunch of items, do they? Well, why don't you find some? Why don't you find some?

How would you go about finding these?

Actually, you don't have to do very much to find some kind of items. You could – you could find them as lously and as sloppily and as stupidly as some items have been found in the history of Scientology. You know? You could do that. You could say, "Well, who haven't you really liked?"

And he says, "Well, I don't know. I don't know. Do-do-do-do-do. Oh, Aunt Jezebel. Oh, yeah, sure hated her guts."
Didn't RR. Doesn't R/S. Doesn't do anything. He hated Aunt Jezebel.

So you ask, "Well, what's Aunt Jezebel's goal?"

You ask why. Well, you only need to look at the March 13th line plot to find out why. The oppterm is far more likely, you see, to carry the pc's goal than the terminal. And the older it is, the earlier it was found on the pc's case, the more likely it is to be an oppterm that carries the goal.

Now, what if you went through all these lists and all of these items – suppose you only had five – and you went through all of these and you didn't find them; you didn't find anything.

You know, the least productive lists and the lists that'll give you the least action were the terminals. And the lists which gave you the most action were the oppterms. That's interesting, isn't it?

So you now could take this hatful of items that you found, separate out those that didn't give anything that even whispered, and call those things terminals and then list goals with another question. "What goal would 'a failure' be an overt against?"

Now, you can almost take the very low-toned sounding items, and those too would probably be the end-of-bank terminals, and you can run that question. You run it the same way. You do exactly the same things. You just make a little list here, "What goal would 'a failure' be an overt against?" And, of course, the pc gives you the proper goal for that. You've got another crack at it with the same terminals. You got the idea?

We just list them at first, though, and your most success will simply be treat them all as just items. List them all with the same question, "What might be the goal of" You'll find that. You'll at least find the family of the pc's goals because eventually you'll have them sitting over here on the goals-that-went-out-hard list. And that will give you the family of goals that the pc has.

I wouldn't depend too much on deduction of this sort of thing. But anything I ever saw rocket read, I'd get different versions of. You follow that?

Well now, that is actually a goals intensive. And it's not the action to find the pc's goal; it is auditing to better the pc. You see that? It's just auditing to better the pc. He'll get closer and closer to realizing his goal the more of this auditing you do. The more goals you process, the more goals you get rid of, the more goals you straighten up, the happier you make the pc in this, the less you worry him, the more likely he is to put his goal on the list. So the action is to get the pc straightened up so that he will put his goal on the list. You see that?

The biggest trouble in goal finding is the pc has not put his goal on the list! You see that? That's the trouble with goal finding.

Why hasn't he?

Well, he isn't close enough to it yet.

How do you put him close enough to it?
Get him to go through goals. And drill them and straighten them up and he'll have a ball. In other words, a goals intensive. Just sit down and audit him through finding goals.

And fortunately, that has a termination point. Because when you find the PC's goal – as you will – why, you can't do any more goals finding; you'll have to run 3M and clear him. I'm sorry, but that's true. Because the only time you can do more goals finding and run this goals intensive on him, of course, is when you've gotten rid of all of the first GPM. And now, when you've gotten rid of that, of course, you can go back and give him some real auditing, which is goals finding again.

The trouble is it gets interrupted after the first GPM. The pc's – you're just about to go through this and list goals on the next oppterm that you found and the next bank and you're just all straightened out and he says, "My goal is to catch catfish."

And you, "Aaaah, damn. Nuts!"

Once in a while, though, you'll lay an egg. PC puts his – puts his goal on the goal-as-an-RI-oppose list. That's the last item on the bank. It doesn't fire on that list. You go over the top of it, the PC ARC breaks, you can't understand what's wrong. You have to take it off the list before it fires again. It's very interesting. It won't fire while on the list; you've got to take it off the list to make it fire again. Little oddities of that character you'll run into.

Now, what happens if the PC doesn't have any items at all? And you don't care to go into any old 3GA or any action to get some items off the PC to list goals against?

There is still the oldest known goals method, which is, you just list a whole bunch of goals, list them on the meter just as you would, watch for your RRs, keep the PC listing goals, keep him listing goals, listing goals, listing goals and eventually, why, tone arm action tends to go out of the thing and the thing fires and you explore around and follow the same rules I gave you for the other one. You can then even find goals without finding any items.

This PC gets a favorite goal, he gets stuck on the goal, you say, "Well..."

You can even move him off that by listing a bunch of goals, "What goal would you have after the goal (something) had failed?" (The one he's stuck on.) And he'll move into the next bank and you got TA action back on your goals.

You can always restore TA action back on your goals by getting the bank before or the bank after the goal he is enamored with. See? And you'll get all kinds of interesting combinations of things.

The point I'm making here is that goals finding is processing. You had better treat it as processing. And the better it is as processing, the more likely you are to find the pc's goal. That is the basic message in all this. Goals shouldn't be a hectic, screaming finding that only has a result if you find the pc's goal. It is actually processing. It is good processing. If it is well done, the pc comes way up scale – even when you haven't found his goal, you see, if you're really doing it well and not annoying the pc. The pc comes way up and all of a sudden, one day, he says, "Oh," he says, "Waaaah! My goal is..." and you've got it. More than one pc has done that.
You can actually bring the pc into a frame of mind where he'll present you with his goal if you just keep finding his goals efficiently and handling them efficiently and so forth.

Now, that's the biggest barrier in clearing people, is finding people's goals. And the basic breakthrough on this thing is just a simplification of how you do it and using the oldest items that a pc has and listing them in that fact and nulling his list in little, short lists and listing the questions clean, getting enough goals to clean the question. You'll eventually find the

TV Demo: Rudiments and Havingness Session and Short Lecture

A lecture and demonstration given on 20 March 1963

LRH: We're going to give you a demonstration of rudiments and havingness. Just simple; put in the rudiments and run a bit of Havingness and that's it. Now, I'm not going to follow any particular breed of session or anything, I'm just going to do it the way it's being done these days. That's good enough, isn't it?

Now, we've got a bit of randomity here, perhaps. I think you can see the meter however, and you've got another picture, and all this should work out very well. Okay?

There's actually nothing very fancy going to happen here, so don't hold your breath. But you might notice, you might notice as we went along that it is an auditing session, and actually, we got tired of looking at those X Unit sessions so we decided we'd do one for you, okay? All right.

All right, now let's forget about the audience. And your chair's okay?

PC: Yes.

LRH: All right. Room all right to audit in?

PC: Yes.

LRH: After all this sweat?

PC: Yes.

LRH: Okay. Pick up the cans, please. All right. Squeeze the cans. All right. Good enough. What I'm going to do here is just put in your rudiments.

PC: Mm-hm.

LRH: Since the last time I audited you.

PC: Oh, dear! [PC and LRH laugh]

LRH: And run a bit of Havingness.

PC: Right.

LRH: And perhaps put the rudiments in for the session, we'll see how that is – get very redundant here – and end it down. How's that?

PC: It's fine.

LRH: Very good. All right. All right with you if I begin this session now?

PC: Yes.

LRH: All right, here it is. Start of session.

PC: Right.

LRH: All right, has the session started for you?

PC: Yes.

LRH: Very good. All right. What goals would you like to set for this ses-
PC: Well, to clean up the period since the last time you audited me.

LRH: All right.

PC: And, oh, feel better at the end of the session.

LRH: Very good. All right. All right, here is the first question here. When is the last time I audited you?

PC: Must be about three weeks ago.

LRH: Oh, yeah.

PC: Three weeks ago in this very room.

LRH: Mm-hm. All right, very good. You got that spotted.

PC: Yes.

LRH: All right. Now, since the last time I audited you, has anything been suppressed?

PC: Well, my auditor must have been a – done a good job on me because I don't see a thing in... see anything there. But undoubtedly I have suppressed a lot. Um – suppressed – um – I was going to say – um – well, suppressed concern over the way the staff co-audit's being going at times. Um – suppressed – um – well, suppressed worrying you about it occa... on occasions. Um – I don't get anything else that I've deliberately suppressed, there's nothing readily coming to mind here.

LRH: All right, all right, thank you. I'll check that on the meter. Since the last time I audited you, has anything been suppressed? All right, I have a read here. There it is. There. There.

PC: Well, that was right at the beginning of the – when you said you were going to audit me. I – um – suppressed looking at anything I'd done recently so that...

LRH: Oh, all right!

PC: You very – you very considerably sort of left it to the last minute so I didn't stir everything up beforehand. But even in that second, as I went out to the – to phone over about this picture, I can recall sort of thinking, well, have I not suppressed it, anything – any thoughts of looking back at all over anything that would likely come up in this session at all.

LRH: All right. Okay. Since the last time I audited you, has anything been suppressed? All right, did you think of anything?

PC: No.

LRH: All right. Now, since the last time I audited you, is there anything you have been careful of?

PC: Well, I've been careful – um – as far as my auditing has gone, not to – um – self-audit out of session. And I have quite a thing on this, I don't like – I like to forget the session as soon as I've gone out of it and some people think it – may think this is not interested in my case, but I am, but I don't like to think about it too much out of session, I think that's the place to do it. An ideal preclear, you see?

LRH: Uh-huh.

PC: But I've been careful not to overdo this anyway because inevitably something does come up, you do start to look at these things, but there's one way I've been careful. Something I've been careful of. Um – I was careful of the way I drove my car, I just remembered. I did tell you something about this when a police-man pulled me up and thought I was a new
driver. After thirty years I thought this was a bit much. Um – uh – very careful, possibly too careful over – in auditing, and – um – very careful in the – in the checks I've done to really make sure that these things are reading and so on and to go over them. Careful to try and – try and get all the data that you've given us lately. Um – I feel quite free otherwise on my carefulness.

**LRH:** Very good. All right, I'll check that on the meter. Since the last time I audited you, is there anything you have been careful of? I have a read there. What have you been careful of? There. There. There. There.

**PC:** Um – this was careful not to worry you today – um – about this uh – what you're going to do on TV tonight, and I left – consequently I left it last minute, probably by design on your part, but anyway, that's how it went. That's what I've got there.

**LRH:** Um-mm.

**PC:** I was careful not to bother you earlier on, and – oh, I made and – with that I made all the provisions that I possibly could so that whatever you decided to do, it only meant a little bit of sweat to get it on.

**LRH:** All right. Okay. Since the last time I audited you, is there anything you have been careful of? All right, I have another one here.

**PC:** Well, that is careful not to – um – uh – not to upset people – um – by reason of my job, or go over – go offline as it were.

**LRH:** Mm, mm-hm. All right. Since the last time I audited you, is there anything you have been careful of? Have you thought of another one there?

**PC:** No, I haven't thought of anything else there.

**LRH:** All right, all right, good. Good. It's a very equivocal read and we'll just skip it. All right. Since the last time I audited you, is there anything you have failed to reveal?

**PC:** I've failed to reveal where I'm uh – um – living to my wife and family. Um – I've failed to – well, I've failed to reveal on quite a lot of occasions what I'm really – what I'm really thinking. I've – I do that quite a lot, but it's uh – um – if I disagree with somebody I might not come right out with it and say so, that's – uh – I just don't reveal it. I find this is a very dangerous thing to do, because I find that later on, that I've uh – uh – said something that is wrong anyway and so that it's not a good idea to go and blurt out immediately what you think.

**LRH:** All right.

**PC:** I think that's it.

**LRH:** Hm?

**PC:** I think that's the lot.

**LRH:** All right. Since the last time I audited you, is there anything you have failed to reveal? All right, do you have another answer there of any kind?

**PC:** I don't have one ready.

**LRH:** All right. Take up the next one. Since the last time I audited you, has anything been invalidated? Think of one offhand?

**PC:** Uh – I've invalidated Peter's auditing on occasions, to him. Um – I've invalidated myself a lot, but this is – this I think – I can't think of the things now, because I've cleared these pretty well in session with Peter because they've been com-
ing up on these various goals we've been running. So I can't think of anything else right away. Not unless I dig, dig, dig.

**LRH:** All right. Since the last time I audited you, has anything been invalidated? I have a read there.

**PC:** Well I got – I immediately get this – my driving with this policeman when he came and told me that I'd gone around the corner too slowly or something. Um – now that also... I was involved – I was involved in a slight accident going back last Friday, going back to London. Somebody hit me smack in the b... in the rear, and – um – I invalidated myself because when I got out of the car, there's a pathetic guy, he'd smashed his car – the front of his car – like nobody's business. All I've got is a little bit of beading damaged on mine. Good old Jags, they've taken it. But – um – I invalidated myself because when I thought I must have done something wrong for this guy to have hit me in the rear. I mean, the insurance was a cut- and-dried case in my favor. But I thought, well, what did I do here, didn't I give enough warning I was going to pull up or something like that, and so on. But there was an invalidation there. This came up after the other car incident.

**LRH:** Oh, all right. Okay. Since the last time I audited you, has anything been invalidated? All right, did you have an answer?

**PC:** No.

**LRH:** Very good. Since the last time I audited you, has anything been suggested? I think that's one.

**PC:** Well, I'm always suggesting things. I've made lots of suggestions – send you up suggestions, you must get fed up about various things. And they uh – to do with the congress that's coming, to do with this course and so on. Yes, there's lots been suggested. Um – don't think there's any bad suggestions done there, I just think that's the lot.

**LRH:** All right. Since the last time I audited you, has anything been suggested? I think there's another read there.

**PC:** Well, you're suggesting now that there's trouble up in that corner, because it's rattling, I think. You seem to be looking at it. Actually it's the pipes cooling off and it's one of the ghosties of this room.

**LRH:** All right.

**PC:** Sorry for that!

**LRH:** Okay. All right. Did you have another one?

**PC:** Um – I didn't have another one, but I'll find one. Um – well, I've suggested – um – uh – various courses of action to students when they've come up with their uh – preclear's cases to me during the day.

**LRH:** All right. Very good. Check that again. Since the last time I audited you, has anything been suggested? All right, I don't think there was a read there. Did you have an answer? All right. Now, since the last time I audited you, has a mistake been made? Equivocal. Think of an answer?

**PC:** I didn't have one.

**LRH:** All right. All right. Let me check it again. Since the last time I audited you, has a mistake been made? I don't think there's a read there. All right. Since the last time I audited you, has anything been protested?

**PC:** I don't think so. I don't do much protesting, really. Um – no, I don't
LRH: All right, all right. Since the last time I audited you, has anything been protested? Oh, I think that probably was clean. Since the last time I audited you, is there anything you've been anxious about? You got an answer?

PC: Uh – anxious for some of the students on this course, at times and their progress. Um – I'm anxious now uh – with the, um – slightly, with the uh – doing these rudiments in front of everybody. Um – I don't get anything else here that I'm really anxious about.

LRH: All right, very good. See if I have a read here. Since the last time I audited you, is there anything you've been anxious about? I'm afraid there is a read there.

PC: [laughs] Um ...

LRH: There. There.

PC: Um – yes. This is – um – yes, this was an anxiety that came up to do with the course today, following on the – um – new system of checkouts, and also the new s – new pro... the new – um – timetable. And I was a little bit anxious lest we got off too far uh – from what – went too far and – um – got too much again onto the checksheets as – in various ways, do you see?

LRH: Hm.

PC: I could see this possibility happening today.

LRH: All right. Since the last time I audited you, is there anything you've been anxious about? I don't think there's much, unless you've got an answer straight off.

PC: No, I haven't. No.

LRH: All right, okay. Now, one more. Since the last time I audited you, has anything been decided?

PC: Um – well, yes, I – well, lots of things have been decided, um – what comes immediately to mind – I – um – decided to rearrange the co-audit schedule um – decided to make suggestions to you about the timetable and so on. Um – I don't get anything else beyond – I mean, one can go into such things, "Well, I decided to get up this morning." But I can't remember sort of making that decision. I can sort of recall making the decision to alter the – alter the – um – timetable and so on, and – um – and to despatch you on various things and other people. Um – oh, I decided today to go to the post office to collect some cigarettes that were sent to me from America at long last. Uh – that's about it, I think.

LRH: All right. Since the last time I audited you, has anything been decided? I have a reaction on that.

PC: Well...

LRH: There... There... There.

PC: Um – yes, I think I'm getting on this. It's – um – my father telephoned me on last Saturday morning. I haven't seen him for some while and he was – um – had got a very good excuse for me to go over and see him because he wanted something signed and I decided I didn't want to go over there. Uh – this is an overt, this decision as I see it, and – um – so I just said, "Well, put it in the post and so on, and I'll handle it." Um – which I did. I think that must be the decision. Mm-hm.

LRH: All right, good enough. Since the last time I audited you, has anything been decided? All right, there is another decision.
PC: Yes, I – this comes off on the same thing. It's – um – the – uh – this is the, uh – Norman, my boy – um – he'll be home soon and I was wondering – um – whether to uh – see him – um – whether to sort of arrange to see him, and I decided to make no move in the matter.

LRH: To make no...?

PC: No move...

LRH: All right.

PC: ... in that direction.

LRH: Very good. Okay. Since the last time I audited you, has anything been decided? All right, I don't think there was a read on that.

PC: Good.

LRH: Okay. Now, let's get in the random rudiment.

PC: Right.

LRH: All right. [PC and LRH laugh] All right, I'll take it easy on this. [PC laughs] All right, since the last time I audited you, has anything nearly been found out? Probably a read there.

PC: Well, I – I – um – I seem to give myself away all over the place. I don't think anything has been nearly found out. Hm – there's something around. Um – yeah ... um – yes, it's – it was Norman again, he came up – he came up to my office last Saturday morning and – um – uh – he – I wasn't there or – I don't know what time he came. I heard afterwards he'd been up. And – um – he nearly found out I was there and it's – more or less found out what I'd been doing and so on, had he come along. I felt, you know, when I'd heard he'd been up, well, you know, what would have happened? And – um – I think that was what was kicking there.

LRH: All right. Now, what made you believe it was nearly found out? Anybody say or do anything there?

PC: Yeah – um – Marjorie, my wife, wrote to me and said he'd been up, you see, and so on, and that was the thing that made me – that was the moment when I wondered, "Corbli" you know, "what did he..."

LRH: All right.

PC: "... what would have happened then?"

LRH: Okay. Now, let me see this. Since the last time I audited you, has anything nearly been found out? There may or may not be a read there.

PC: Well, I think this is possibly the – um – the rest of the last answer, that...

LRH: Oh, yeah.

PC: ... sort of came up. I was about – I was looking at it and – um – one doesn't feel too good about this and uh – about the family situation and uh – I suppose had he come up, I felt I might have shone up in a bad light, and that's what was...

LRH: All right.

PC: ...nearly – nearly found out, you see.

LRH: I see, all right. Okay. Let me check that again. Since the last time I audited you, has anything nearly been found out? All right, you had an afterthought there, what was it?

PC: Just I think it's clean.

LRH: All right.

PC: I didn't – um...

LRH: All right.
PC: I didn't have anything else there at all.

LRH: All right. Well, we're going to let that go for now. Okay?

PC: Right.

LRH: All right. Now, let's go on – we're going to run a little bit of Havingness here.

PC: Mm-hm.

LRH: Now, I want you to squeeze the cans. Boy! Put your cans up on the table. Give us a can squeeze. Are we even plugged in? It's pretty bad. Give us a – squeeze the cans again. Uh-huh, all right. Now, I've just shot your havingness to ribbons with those.

PC: All right.

LRH: Yeah, well, how did I do that?

PC: Uh – I think this is my uh – um – inherent fear that I get of audiences, comes up.

LRH: Oh, yeah?

PC: I mean, I'm never comfortable. I mean, you're – uh – always terrific envy of you, you can go and sit, an audience and – or anywhere and just talk away. I mean, I can do – uh - I can talk away if I'm on my little room or to a very small circle. But put me in front and most times I'm lost, and I just – one of these guys who always makes the speech afterwards that one should have made on the occasion when it's much better, you know?

LRH: All right. Let's take a look at that again, squeeze the cans. All right, well that's very good. Now, put your cans down. And our Havingness Process here is "Feel that object," isn't it?

PC: Yes.

LRH: All right, very good. Feel that cloth.

PC: Right.

LRH: Thank you. Feel that can.

PC: All right.

LRH: Thank you. Feel the top of the microphone. Thank you. Feel that ashtray.

PC: Mm-hm.

LRH: Thank you. And feel that can. Okay, pick up the cans would you? Now, squeeze the cans.

Oh, that seems to be much better. That's going to be improving very nicely. All right, put them down. We'll run some more of this, okay?

PC: All right.

LRH: It's working.

PC: Good.

LRH: All right. Feel your lapel. Thank you. Feel the badge. Thank you. Feel your hair.

PC: Mm-hm.

LRH: Thank you. Feel your necktie. Thank you. Feel that curtain. Thank you. Feel that wall.

PC: Mm-hm.

LRH: Thank you. Feel that cloth. Thank you. Feel that ashtray. Thank you. Feel your tie clip.

PC: All right.

LRH: Thank you. Feel the back of the meter. Thank you. All right, feel the table cover. Thank you. Pick up the cans. All right, squeeze the cans.

Oh, that's getting fine now. We'll run some more of this, you're doing won-
derful. Put the cans down. All right, feel your watch. Thank you. Now with your right hand feel your left hand. Thank you. Now with your left hand feel your right hand. Thank you. With your right hand feel your left hand. Thank you. With your left hand feel your right hand. Thank you. Feel the top button of your jacket. Thank you. Feel the ashtray. Thank you. Feel your right shoulder. Thank you. Feel your left shoulder. Thank you. Feel your right ear. Thank you. Feel your left ear. Thank you. What have you got?

PC: *Nothing.*

LRH: All right. Feel the cloth. Okay. Pick up the cans. All right. Squeeze the cans. Oh, that's getting fine, that's fine. That's fine, all right, put them down again. All right, feel the cloth. Thank you. Now feel the desk through the cloth.

PC: *Mm-hm.*

LRH: Thank you. Now feel your right knee through your trousers.

PC: *Yes.*

LRH: Thank you. Feel your left knee through your trousers.

PC: *Right.*

LRH: Thank you. Feel the curtain.

PC: *Mm-hm.*

LRH: Thank you. Feel the wall underneath the window.

PC: *Mm-hm.*

LRH: Thank you. Feel the base of the microphone.

PC: *Right.*

LRH: Thank you. All right, feel those two cans.

PC: *Mm-hm*

LRH: Thank you. Feel your right index finger fingernail.

PC: *Yes.*

LRH: All right, feel your left index finger fingernail.

PC: *Right.*

LRH: Thank you. Feel the back of the E-Meter. All right. Feel your right sleeve. Thank you. Feel your left sleeve. Thank you. Feel your right shirt cuff.

PC: *All right.*

LRH: Thank you. Feel your left shirt cuff.

PC: *Mm-hm.*

LRH: Thank you. Feel the desk through the cloth.

PC: *Mm-hm.*

LRH: All right. Pick up the cans. Hurray! All right, squeeze the cans. Ah, that's good, that's good. That's fine. All right, let's run a little more of this tone arm action out of that. Are you doing all right?

PC: *Yes, very well.*

LRH: Anything you care to say?

PC: *No, going very well.*

LRH: All right, that's fine. Let's run some TA action out of this.

PC: *Fine.*

LRH: All right, put the cans down. All right. Feel the two cords.

PC: *Mm-hm.*

LRH: Thank you. Feel the base of the microphone.

PC: *Right.*

LRH: Thank you. Feel the microphone cord.
PC: All right.
LRH: Okay. Feel the spread there – the backdrop.

PC: Mm-hm.
LRH: Okay, feel this end of the table.

PC: Mm-hm.
LRH: All right, feel this end of the table.

PC: Right.
LRH: All right. Feel the underside of the cloth.

PC: Yes.
LRH: All right. Now, up underneath the cloth, feel the top of the table.

PC: Right.
LRH: All right, very good. Now, through your jacket and shirt, feel your left shoulder.

PC: Right.
LRH: All right. Through your jacket and shirt, feel your right shoulder.

PC: Right.
LRH: All right. Feel the end of your nose.

PC: Mm-hm.
LRH: Okay. Feel your forehead.

PC: Right.
LRH: All right. Feel your right eyelid.

PC: Mm-hm.
LRH: Okay. Feel your left eyelid.

PC: Right.
LRH: Okay. Feel the center of your forehead.

PC: Mm-hm.
LRH: Okay. Feel your chin.

PC: Yes.
LRH: All right. Feel the back of your head.

PC: Mm-hm.
LRH: All right. Feel your tie.

PC: All right.
LRH: Okay. Through the cloth, feel the desk.

PC: Right.
LRH: All right. Feel that edge top of the E-Meter.

PC: Right.
LRH: All right. Feel this side of the E-Meter.

PC: Yes.
LRH: Okay. Feel this side of the E-Meter.

PC: Yes.
LRH: All right. Pick up the cans. All right. Squeeze the cans. Let's do that again. Squeeze the cans. Well, that's pretty loose. Once more, squeeze the cans. That's increasing your havingness but I'm going to try another process, okay?

PC: Right.
LRH: It's not stabilizing it.

PC: Mm-hm.
LRH: All right, put the cans down, now we're just going to run "Notice that"

PC: Right.
LRH: And we're only going to run five commands of it.

PC: Mm-hm.
LRH: All right. Notice that fire.

PC: Yes.

LRH: Okay. Notice the TV screen.

PC: Right.

LRH: Okay. Notice the overhead lamp.

PC: Right.

LRH: All right. Notice the backdrop.

PC: Yes.

LRH: All right. Notice the table.

PC: Yes.

LRH: All right. Pick up the cans. Squeeze the cans. Well, that's very interesting but that reduces your havingness.

PC: All right.

LRH: All right, very good. All right, put the cans down. All right. And now we're going to run "Touch that object."

PC: All right.

All right. Squeeze the cans. That's pretty good! That's pretty good. Let's squeeze the cans again. Yeah, that seems to be pretty good. Now, let's go on with that a bit, huh? All right, put the cans down.

All right. Touch the top of your head. Okay. Touch your right eyelid. All right. Touch your left eyelid. Okay. Touch this cloth. Okay. Touch that ashtray. All right. Touch that can. Okay. Touch that can. Okay. Touch that wire. Okay. Touch that wire. All right. Touch the top of the E-Meter. Okay. Touch that badge. Okay. Touch your right ear. Okay. Touch your left ear. Okay. Touch your nose. Okay. Touch your forehead. All right. Touch your chin. All right. Touch your tie. All right. Touch your jacket. All right. Touch the cloth. All right.

Pick up the cans and we'll see if we're – this winning streak is holding. All right. Squeeze the cans. That's the process! All right, that's fine. Put the cans down, we're going to run this one some more. This is a good one.

PC: Good!

LRH: All right. Now, touch that microphone. Okay. Touch the top of the E-Meter. All right. Touch the glass face of that dial. All right. Touch the E-Meter tone arm. Okay. Touch the sensitivity knob. All right. Touch the auxiliary sensitivity control. All right. Touch the Transit-Set-Test. All right. Touch the trim knob. All right. Touch the back. All right. Touch that hook. All right. Touch that hook. All right. Touch that hook. All right. Touch the E-Meter cord – or cords. All right. Touch your tie clasp. All right. Touch the badge on your jacket. Okay. Touch your tie. All right. Touch the microphone. All right. Touch your hair. All right. What have you got there?

PC: I don't know, this seems much easier. I had a little cognition that uh – there seems to be less contact with stuff than "feeling." Feeling is – touching is a briefer thing...

LRH: Mm.

PC: ...briefer contact with what we're doing.

LRH: Right. All right. Touch that ashtray. All right. Touch that can. Okay.
Touch that can. All right. Touch the end of
the table through the cloth. All right. Touch
the other end of the table through the cloth. All right. Touch the back of the
table. All right. Touch this edge of the ta-
ble. All right. Very good. Touch your
chair. Okay. Touch your right shoulder
through your jacket and shirt. All right. Touch your left shoulder through your
jacket and shirt. All right. Touch your
chin. Good. Touch your right cheek. Good. Touch your left cheek. Good. Touch your
right ear. Good. Touch your left ear. All
right. Touch the microphone. All right.
Touch this cloth. All right. Now, how are
you feeling?

PC: Well, very good.

LRH: All right. You're feeling a bit better, aren't you?

PC: Yes, much better!

LRH: All right, pick up the cans
and let's check this process. Yeah, that's
giving you a little more stability of tone
arm. All right, squeeze the cans. All right,
that's fine. All right. One more time,
squeeze the cans. All right, that's fine. All
right. Now, that was the last command of
that process. All right?

PC: What happened, did it...?

LRH: It's fine. It still works.

PC: Good.

LRH: It still works. All right, now how are you doing in general?

PC: Very well.

LRH: All right.

PC: Very well.

LRH: I notice your needle seems
to have calmed down, here. Looks pretty
good. Looks better. You're thinking some-
thing, what are you thinking?

PC: Nothing.

LRH: All right. Now, the only
thing I am going to do now is just end the
body of the session.

PC: Right.

LRH: All right? Okay?

PC: Mm-hm.

LRH: All right, have you made
any part of your goals for this session?

PC: Yes, I feel better, certainly.

LRH: All right.

PC: And, uh – done some clean-
ing up of the intervening period. Yes.

LRH: Okay. All right. I did that in
reverse because it's a rudiments and hav-
ingness session, you know?

PC: Right, yes.

LRH: All right, now, is there any-
thing you care to ask or say before I end
this session?

PC: Well, thank you very much.

LRH: All right. All right if I end
this session now?

PC: Yes.

LRH: Okay, here it is. End of ses-
session.

PC: Right.

LRH: All right, session ended for
you?

PC: Yes.

LRH: All right, tell me I'm no
longer auditing you.

PC: You're no longer auditing
me.

LRH: Very good. Very good.
Okay. Now, we'll give these good people a break, and we'll excuse you from the auditing room. I'll just talk to them here for a minute, you don't have to go.

All right, let's take a look at this now. The pc's Havingness Process is almost equal between "to feel" and "to touch." But there was less stability in the one than the other – less stability in "to feel" than "to touch" – and you could run either one of them or back and forth. But "to touch" was giving him a better stable gain than "to feel." I think you saw it.

In other words, pc's Havingness Process can look to be perfectly all right and there is a better one. Interesting, eh? All right, the rest of the situation here, as far as rudiments and havingness are concerned, is you saw there at the beginning – if you'll excuse my saying so – because of not liking to be in session, particularly, for a large audience – and I think it's very decent of him to volunteer for these sessions. Let's give him a hand, shall we? All right, thank you.

Now, it's very decent of him to volunteer this way, because he has his own problems with stage fright and that sort of thing, and you noticed that needle. You noticed that needle. Well, that tells you – that tells you that his auditor's been nagging him a little bit on the subject of rudiments or something. There's something going on there, otherwise that needle would have been glacially smooth, or should have been. Or, we'll give his auditor a break and simply say that the needle was simply rough because of the audience.

But you noticed at the end of the session, beyond his wondering about something – which you saw as a tick – tick which was spottable there otherwise the needle was clean and flowing.

Now, exactly what did we do? Were there any great significances came off in this session? No. Was he badgered? Did I nag and nag and nag? Well, actually, the needle there at the beginning of session practically couldn't be read. So who am I to nag him because I can't read his needle? You understand? You get that point of view?

Now, a lot of auditors simply punish the pc because they can't read his needle. Well, look, if you can't read a pc's needle easily he's in a state of mind when you mustn't punish him! So, therefore, take what he says and get out of there. He might even have had a missed withhold, but look, here's the test – he's not mad at me, is he? See, he's not mad at me. So he couldn't have had a missed withhold. You see, that's a better test.

And, there we had some rudiments and we had some Havingness and the pc's happy about it and he didn't get nagged and his needle smoothed out. I want to show you that you don't need an axe to clean up a needle. That's what's important. You think that a needle gets cleaned up because you pick up all the thoughts of the pc, see? That's wrong.

A needle cleans up because the pc has more confidence and more ARC with the auditor. Just put it down to more basically, more ARC. That needle is as clean as the pc feels ARC with his auditor. Now, just think of that for a minute. It isn't cleaned up on the significance of
what he told me. Do you understand? The whole operation was he was more willing to talk to me in spite of you. Now, when you look that over, it cleaned up his needle. Do you see that?

Now, of course this can go too far the other way. A fellow has a very dirty needle and he won't talk to the auditor. Funny part of it is if his ARC eventually comes up, he will then tell the auditor. But he won't. So the first requisite of a rudiments and Havingness session is always, always, always, always, always to build ARC with the pc by reason of auditing.

You can give a pc with a dirty needle and bad havingness and low tone arm and a high tone arm, anything else, you give that pc three nice rudiments and Havingness sessions. At the end of that he ought to have a smooth needle, his tone arm ought to be more stable and more reasonable and the pc's havingness ought to be more stable. Now, that's just a fact, that's all. I mean, it's not what you did, don't you see - it is how you did it.

This raised havingness because it raised ARC. But look, I want to show you something. I was taking all of these answers and his havingness dropped. Why did his havingness drop? Well actually, he was having to answer them to you, too. That's basically why. But I could have gone ahead and raised that up again in spite of all that, don't you see?

The significance of all this is that the Havingness Process which didn't require him to divulge anything to all of you was then more instrumental in smoothing out the needle than the mid ruds were. Hey, how do you account for that? You see, that's no significance, you see? Now do you understand a little bit more about rudiments and Havingness and the why of rudiments and Havingness? It isn't the significance of what you get. It's that the pc feels more confident in being audited by you. And if you're the kind of an auditor who cleans cleans and the pc's got a thought that he wants to tell you and you won't let him tell you, you see, he says -- you say, "Well, is there anything been suppressed?"

And the pc says, "Well – uh..."

And you say, "Oh, well, I didn't get a read here. Thank you."

Well, bang! There goes the whole thing, you see? It requires very adroit and very smooth handling.

But you should be able to take a pc and give him one, two, three sessions, with just rudiments and Havingness, make him feel better, and his ARC will increase. That is not because he feels better; he feels better because his ARC increases to a point where the pc reads very beautifully on the meter and has a very smooth meter, you see? Where his havingness stays up and so forth. You should be able to do that.

You see, it's not what you got done with the pc – not what you got done in terms of significance. Not what big withheld did you get off of him in terms of significance, but just that you gave him a very smooth session. Now, that is the first requisite of all auditing. If you cannot give a pc a rudiments and Havingness session which winds up with a smoother, cleaner needle at the end than at the beginning, then brother, you're not going to be able to do 3M. Do you follow that? You're not going to be, because it's a first requisite of auditing is to be able to audit.
I hate to give these horrible platitudes away with... But the first requisite of auditing is to be able to audit. It is not what you audit, it's if you can audit. Do you see that?

Now, on that firm foundation you can do anything. The pc will go over Niagara Falls in a barrel, as far as the bank is concerned for you, because he's got confidence. He knows you're not going to desert him and you can pull him out. In other words, you have to get a pc to be able to confront his auditor before he can then confront his bank. Do you see that?

So, it is just this basic fundamental idea of auditing. It is just how you audit. It's just the smoothness with which you audit. And it's just that your pc is – feels better at the end of it and he has been able to confront your auditing, he's been able to confront your auditing session, and as soon as he's able to confront your auditing session he feels that, oh, you can throw him into the bank, you see?

The big mistake most people make with raw meat is not to audit raw meat. They really don't audit. They kind of monkey around, you know? They just fool around. They don't really put them into session, they sort of... No, give the guy a full dress parade auditing session, but do something relatively insignificant or nonsignificant. And you'll find out he feels quite good. Why? It's the old effect scale at work, isn't it? The person gives this feather touch and he feels better. The auditor's in there with a battering ram doesn't make the pc feel better. So what are we looking for here? In the rudiments and Havingness or in that type of session, all we want is basic auditing to work to make the pc feel better. That's all. Do you see that?

Well, you should have been able to get out of this session tonight that the pc felt better on the Havingness than he did out of the rudiments and Havingness – I mean, he did out of the rudiments. Why? Well, he had all of you to get his rudiments off to and he didn't know what that – well, level was, because he's been mean to you all week. So as – in short, why, his havingness tended to drop a little bit there. All right, but that wasn't because we missed any reads or anything like that, there's no significance to it.

If I were to give him two, three TV sessions, just rudiments and Havingness, you'd find out that the rudiments would have increased his havingness. Why? Well, because he then would find out that he could get these things off in front of you. You see? In other words, he didn't feel he could get them off – I've tried to make an objective example of this tonight – he didn't feel totally that he could get them off and his havingness fell.

All right. I gave him straight Havingness and he's not having to get anything off with you, he's just responding to my auditing command and I'm not getting him in trouble and his havingness goes up. I even changed his auditing command. I've run three auditing commands on him; three different processes. Doesn't make for any constancy or stability. Still it came up.

And what's all this mean? It means that if your basic auditing is excellent and if you are excellent as a basic auditor, making the pc feel better and smoothing out the behavior of that needle – if you can do that you can run any process in the world. But if you're not a smooth basic auditor, God help your pc when you're trying to run 3M and you've "cleaned up" all – except for three quarters of its items – the first bank, and you've "cleaned up" all – except for half of its items – the second bank, and you've gone fifteen items into the third bank without its goal – oh, you'll do things like this, I know. I know you!
All right, listen. Look, if you're basically a good auditor and if you're smooth, hah! You say, "Hey, wait a minute! I – something's goofed around here somewhere." And you can find the pc's third goal and go back and put the other two GPMs together and he'll be smiling the whole time.

He'll be telling his friends, "Well, my auditor's doing a wonderful job!" You're doing a lousy job, you see? You should be hanged for the job you're doing; leaving half-cleaned-up things behind you and all that sort of thing. But no, your basic auditing was so good you could get away with it, you follow that? You'll find some people, (quote) "do 3M perfectly," and their pcs are in agony, and some people do 3M terribly and their pcs feel fine. What's the variable? Well, the variable is the fact that some auditors can audit very smoothly and make people feel better and others can't. And, the pcs of people who are having a hard time with their basic and fundamental auditing, of course, feel worse than the others. Do you get the difference?

This is an important factor for you, and if you at any one time think that rudiments and Havingness is a practice session, then you will never find out how to clean up a pc's needle.

Now, it's true that you can occasionally find an item that cleans up a needle right now. That's true. But in actual fact your most consistent method of cleaning up a needle and making a pc read on a meter is to raise the pc's ARC. A pc – ARC determines whether or not he reads on the meter. When he – you ever notice, a pc in an ARC break does not read on the meter. All right, we'll take that as a gradient scale of auditing. If a pc doesn't have high ARC with the auditor, he doesn't read on the meter. If he has ARC with the auditor, he reads on the meter. And if he has marvelous ARC with the auditor, he reads marvelously on the meter and that's all you can say about it.

So your basic auditing is where you take off from. If you think you can fly airplanes with no landing fields, well, more power to you! More power to you! But when you run out of gas, don't tell me I didn't tell you. Because you will be in a bad way because you haven't got basic auditing to fall back on. Now, there's what you should be studying when you audit: smooth auditing, basic auditing and so forth.

I'm not setting up this session particularly as a paragon of virtue in the way of auditing, but you noticed the pc was not worried, he wasn't harassed, he felt fine about things, he was willing to talk to me.

Now, that's all I have to say on the subject. But that's a rudiments and Havingness session. I leave it to you whether the session you have just seen bears any resemblance to the rudiments and Havingness sessions which we have seen recently on TV. And frankly, I gave this demonstration tonight because I couldn't stand it anymore! Okay?

So, on a lecture like this we always end with "Go thou and audit badly no more!" Okay? That's it. Thank you very much, that's all of the program for this evening.

Good night.
Good evening. How are you? This is the 21st of March, AD 13, Saint Hill Special Briefing Course.

Okay, well, how are you? Oh, that's – that's good. That's good, fine.

Well now, this evening's lecture concerns the 2Gs. The 2Gs. Routine 2Gs. And this lecture is an off-the-cuff lecture about these very valuable processes, but the first announcement on it that has some importance is that goals finding – goals finding – not goal running – goal finding becomes a Routine 2 process.

Now, why is that? Probably startles you a little bit, but the reason for this is that the most therapeutic and the least dangerous auditing that you can give anybody is finding goals. That's very interesting, isn't it? In other words, the most unlimited – up to the point of finding his goal, of course – and least dangerous process is goals finding.

Now, if you do something with the goal, that becomes very horrifying if it's the wrong goal. You – you understand that? That – nothing has changed about that at all. But because things were so terrible and so grim and so awful, and pcs caved in so hard when you ran them on a wrong goal, our tendency up to now has been to safeguard goals, just as an identified subject. Just safeguard goals, you know? And that's been the... an identification. But actually there's nothing, nothing dangerous at all about finding goals. And therefore, it is quite safe to put goals finding in the hands of the most amateur auditor. So he goes over the goal. So he leaves the goal behind him. Well, so the pc will ARC break. But we can even teach him this datum.

Now, that's about the only dangerous thing that will happen in finding goals. It's running goals that is dangerous. You take a wrong goal and run it, and you'll wish you hadn't. Therefore, with this distinct proviso that one must not run the goal he has found, a Routine 2 trained auditor is now authorized to find goals.

You see, something funny here has happened. Something very remarkable has happened. It takes, now, much more time to find the goal in some cases than it does to run the goal. And some goals are very, very hard to find indeed. And a great deal of preliminary work has to go in on the case and so forth, so this puts a tremendous burden on Saint Hill auditors.

Well, their function – a Class IV Auditor – of course is to check out goals and to see that they get run properly, but when you give them the whole burden of finding goals, and they have no assistance in finding goals at all, it puts an immediate ceiling on the amount of service which a district office, a Central Organization or a field auditor can provide.

Now, goals finding can be taught, and you find that it's quite simple. It doesn't mean, however, that it is easy to find a goal. That is to say, "It is easy to find a goal on every pre-
clear." This – this is not the message. It – on some preclears it is very, very far from easy to find a goal.

But let's look at it this way: The actions now entailed in finding a goal are relatively easy. All you have to do is do those actions and you will find somebody's goal.

Now, it may take – it may take hours, but that's unlikely – more likely tens of hours, and in some cases weeks and weeks and weeks, and in some cases months, to find a goal. This is – this is according to our findings on this. But this, of course, makes it very feasible to turn loose HPAs/HCAs onto the action and operation of finding goals and getting them checked out and so forth.

Now, you notice there's been very, very little released on the subject of finding goals here for the last few months. I've actually been working on processes which found goals. And in working on those processes, I've made some interesting discoveries, and some of those discoveries are very oversetting to some of the older things which we believed.

Such as this: The first one I gave you, that you can go on finding goals and trying to find goals and trying to find goals, and you deliver more gain auditing to the pc than in doing anything else. That's interesting, isn't it? You'll do him more good than even a Problems Intensive. And that's rather considerable.

So what – what do we – what do we find ourselves with, here? The necessity to codify goals-finding processes and reduce them to a very precise activity that can be taught, and make those processes relatively simple, and train people in them. Now, they're about to teach some HCS Courses in the United States, and I think about as far as they'll get in teaching these is teaching somebody to find a goal.

Now, this discovery that goals finding is the least damaging and the most therapeutic – short of clearing – auditing that a pc can have, winds us up with this consideration: that we should have a series of designations which are simply goals-finding designations, and include in those everything that we do on the subject of finding goals. And use in them everything that is of use and interest on this subject.

Now, a Problems Intensive has never had a designating number. It was just a twenty-five-hour intensive that they found would be of some use. Now this – this intensive, this Problems Intensive, we have to include in our general, overall scheme of things, so long as it is problems that we are addressing in that. But in actual sober fact there are a few pcs that you will find around that, the moment we address this Problems Intensive wholly and completely to the subject of goals, will plow in, just like that. Why?

In other words, we'll give some pc a Problems Intensive that is addressed in the direction of purposes, you know, and we give it across a span of time. That is to say, we say, "Since 1950, has... how has a purpose been suppressed?" – something like that. Well, unfortunately we're going to find that some banks are messed up. The person possibly might be living his second GPM in his present time existence. In other words, he already – he has sort of suspended efforts on the first GPM and he isn't increasing that, and he's in actual fact sort of living in the second GPM.
In other words, it's been terrifically restimulated, and the more we run Problems Intensives on a period of time having to do with present time, you understand — present time — the more we have to do with present time on this person. You know, "In present time on this problem" or something like that, or "...on this purpose has anything been suppressed?" — why, the better off we'll be at large.

Now, this doesn't mean that it wouldn't operate on many pcs and so forth, but in view of the fact that it, on a few of them, it won't operate, that is enough to sweep away a time consideration with regard to a goals-type Problems Intensive.

You probably don't completely grasp what I'm talking about, and some of you — one of you had a new one going the other day. You give me a hard time, you know, trying to catch up with you, you know? You — you — as the one you got going out there now, I mean not "you," all of you — just — just — just you — there, that's sitting in that chair there. "It read for me, it rocket read for me, but it doesn't rocket read for the Instructor." I — I — that's — that's the sort of thing we get going.

But on this matter of the first GPM and the second GPM, we'd better clarify. We mean the first GPM contacted by the auditor. We cannot number the GPMs from the year 200 trillion years ago — the year zero, in other words — we can't number them forward as the first GPM, the second GPM, the third GPM, so forth, because we don't know how many there are — so therefore we could never number the present time GPM.

Now, the case is entered at the present time GPM, the one he is in now, and that is the first GPM. On some cases, however, the present time GPM is the second GPM — the person has suspended operation on the first GPM — and so we have to have a better definition.

And we'd say the first GPM is the latest GPM on the track, and the second GPM is the next to the latest on the track, and the third GPM is third from the latest on the track, and I don't know what number the GPM is back at the year 200 trillion. On some pcs it will probably be number 52; and on some pcs it'll be number 31, don't you see? So to get a consistent numbering, when we say the first GPM, we mean the one which is nearest or the latest formed — let us say, that way — it's the latest-formed one.

It's the goal of that one that you have to have, but some pcs have skidded their wheels. They've listened to speeches by the Democrats or they've — they've looked over Australian legal procedure or something like that, and they've skidded their wheels. And they've gone back to the second GPM and are living this life in the second GPM. You understand that?

They've met an oppterm, let us say, in the second GPM of sufficient magnitude to cause them to be the terminal of the second GPM. You understand? That's horrifying, isn't it? Well, I'll tell you why it's horrifying. Because if you found the goal that they are living at this moment, it wouldn't run. That makes some pcs more difficult to find goals on than others. You follow that?

Now, what — what is more complicated is that the first GPM may or may not be fully formed. You may have only the first eight items of the first GPM formed, or you may have only the first sixteen items of the first GPM formed — because of course the pc, normally is forming these things progressively as you move on up the track. Well, as we were saying last
night, it is really too bad that we didn't have somebody at various points of the track, and he
took a gun and he said – he said with this gun – he said, "Everyone will now postulate his
sixty-fifth GPM goal" – bang! You see, and we all did it at once. Only it didn't work that way.

Some fellows postulated theirs thousands of years ago, some billions of years ago, and
some trillions of years ago. So this of course makes – this of course makes it an uneven num-
ber.

Now, the only thing missing, if you look in the May – March 13th bulletin 63, and you
look at that line plot, some GPMs aren't formed – let us say, theoretically – they aren't formed
any further forward than "a cabaret singer." That's the top item you find in the thing. So it's
not very reliable finding it, we'd ask him – we'd find this terminal; we'd say, "Well, what is
the goal of a cabaret singer?" or "What is the goal of a hostile audience?" don't you see, and it
doesn't answer up well for the goal. Cabaret singer, they'd say, "To sing; to exhibit myself; to
experience life; to appear on TV, you see; to be Miss America," – something like that. And
pretty soon, why they'd come around on it and they'd – "Ah, well, it – there isn't any goal
there." Don't you see?

If it was formed all the way to the top, of course, because you've got the overt – the
goal as an overt at the top – against "a mute." What goal would be an overt against a mute?
And the pc would tell you almost at once "To scream." And what is the goal of the most
screamish? Naturally, "to scream." But halfway down the bank what have we got? Hooh-
hooh. We've got a cabaret singer versus a hostile audience. That's the pair. Interesting.

What is the goal of a hostile audience? "To hiss, to boo." "Never to scream."

So it's tough to find these things when they're amputated. That's an amputated GPM.
You'll find everything below that, however, is – is quite standard. It's just that it's bobtailed.

Now, that's a complication. Now, the pc let us say, who has one of these bobtailed
GPMs, easily skids. And let us say that – that next goal below there, by the way, is "to be
happy." It was never put in on that March the 13th bulletin – and you get "a miserable sod."
That's the – the terminal, you see, "a miserable sod." And the pc is accustomed to being a
miserable sod, he was that for quite a while, and he didn't complete the thing "to scream."
He'll move on forward there, his next life or something like that.

But just at the present time he's grinding to a slow halt being a miserable sod and "be
part of the Kennedy clan in Ireland," you know, something like this. And there he is, a mis-
erable sod. And he's confronted all the time with happy people – happy people. Oh-ho, brother!
He can't stand it, you know? Just happy people – rrr-rrr-rrr! Maybe he had an aunt or some-
thing who was a happy person, you know, who went around all the time being happy, you
know, with exclamation points, you see. You couldn't hear yourself think in the house, you
know? She, of course, his – his aunt would just be mad at everybody who wasn't happy, you
see.

And so here you've got this oppterms, "happy people," and you've got the terminal, "a
miserable sod," and you go listing terminals – and you've done some 2-12 on this character or
something, you see – you get this goal "to be happy." Well, it ticks and it clicks, and it – zzzt,
goes out. And you spend thirty-six hours prechecking it, and it doesn't shape up.
And finally somebody sees it rocket read a couple of times, and they say, "Well, let's list it. Let's list it." So you start listing the thing with a heavy grind, and you – it finally delivers up – finally delivers up "happy people." And the rocket read on the goal was about three-eighths of an inch. By the time you get to "happy people," well, it'll be about a quarter of an inch. And you get "a miserable sod," and it's going to be about an eighth of an inch, and then you get your next item; and – and so on, and the pc has got somatics and so forth.

Funny part of it is, it almost runs, but you've just got trouble, trouble, trouble. What'd you do? By accident you have picked up the second GPM. You haven't picked up the first GPM.

By the way, the goals that go out hard – the goals that go out hard – are very often goals of the third, fourth, fifth, sixth GPM, you see.

But you start – you're trying to run this second GPM. Well, my golly, there's all those terminals in the first GPM above it, don't you see? The second GPM with one of these bobtailed first GPMs will almost run. But you've got bypassed items. As a matter of fact, you haven't just got bypassed items, you've got a bypassed GPM. And life can look pretty grim to the pc. But the goal is not behaving well.

One of the things that this goal has to do is fire better. If properly handled and not overlisted, not overlisted – you get too long a source list, and you get all the G... all the items, all the RIs in the bank are on the goal oppose list, you know. You could practically go back down the thing and find every RR item that gave a dirty read. Drill the thing, you get it to fire nicely, and so forth, it'll be... you could almost dissemble a whole GPM off one of these overlists, you know? And bypassed items like mad. Sometimes there'll be as many as two and three items, additional on one of these item oppose lists which are overlisted.

The gaiety with which some auditors run through flat spots and get more RRs and all this sort of thing, the way they fool around, of course they get bypassed items. Well, getting a lot of bypassed items will upset a pc, but nothing will upset a pc more than missing a whole GPM.

Well, this makes the finding of goals difficult on some pcs. The average pc that you run into – he'll be in his first GPM and you list the goals one way or another, and you find his goal, bang – and it rocket reads a little bit occasionally, and then you list it and it gets rocket reading items and it's all better. And how you go on down the bank and the rocket read now is a half an inch and the rocket read is an inch and a quarter, and the rocket read is two inches. See, the more items you find, the more it rocket reads. And then the goal starts to fire with an R/S and an RR alternately. You know, you call it, bang-bang-bang, and "to scream," RR; "to scream," R/S; "to scream," RR. And next thing you know, why this thing is firing early and late. It's "to scream" ... pssww! And "to..." – pssww! It doesn't fire on time. It's in a messed-up bank.

See, I mean the bank is unable to support that charge any more, and then the goal goes to a tick and you keep running it and you get on out the bottom of the bank and you're away. That's the way a goal should behave as it goes on down the line. It's all given in that March 13th bulletin.
But some pc, you get ahold of him, you get this goal, you see, "to be happy." It rocket reads. You precheck it, it rocket reads, it's okay. It does all right. It checks out. Pc is kind of unhappy about it, but it checks out. And you get the first item and you get the second item and you get the third item, and by that time the goal read is almost microscopic. And you get the fourth item, you get the fifth item, you get the sixth item – you can't detect anything on the list. Everything is disappearing. Pc's RR is going off, and so forth. It's a mess.

And so you slug away; you've got headaches, you know. Eventually you get smart and decide that you're going to find another goal, and you do, and you find something that practically explodes in your face, see. And it just runs like mad. And you find a few items, they all rocket read and it all comes off and the goal does a blowdown and so forth; you've gotten rid of your first GPM.

But that a pc can be dramatizing a terminal or oppterm of the second GPM, and actually have a first GPM where the goal is to be found, adds randomness. What kind of randomness? It means you try to precheck his present time, and you're prechecking the second GPM. I think – think that's quite fascinating, don't you? All of present time is connected with the second GPM. At least that appears to me to be the way some of these banks may lie.

So you try to do a Prepcheck, you try to do a Problems Intensive, you try to do auditing on this character – and he's always ARC broke. Why? Because you're in the middle of the second GPM. That's life. Life to him is the second GPM. Well, he was busy forming the first GPM and he was going on all right, but because the second one is so handy he dropped back into the second one's goal. He said... his mama, for instance, told him he had to be good, and so forth, and the second GPM's goal is "to be good." In other words, he gets dropped back.

Well, you try to do a Problems Intensive on this person, from a date, you'll get away with it as long as it's problems. But the second it becomes purposes, you're in trouble. You're in bad trouble. Because you say, "Since 1950, how has a purpose been suppressed?" And it darn near tears the pc's head off. Why? Because since 1950 they've been living in the purpose of the second GPM and that is an intolerable area. It's just as though he were trying to run the first GPM while the p... or trying to run the pc through the third GPM, you see, while you had the second GPM intact. Oh man, it – it's just blahh!

So what's this mean? Well, in the first place – in the first place, it means that goals finding is very difficult on some pcs. And this isn't any majority of pcs. And it means that a pc you're having trouble – an awful lot of trouble finding the goal on by standard methods, has got the – a couple of GPMs mixed up and you're having trouble with him that way. It also means that you have to be terribly permissive the way you run any kind of an intensive. And a goals intensive would have to be run without regard to a time span.

So we get what is designated right now as 2GX1. And that is a Goals Intensive by Prepcheck. And that is very, very, very, very permissive.

Now, eventually a bunch of reworked buttons will be put out, but the... you can use those eighteen buttons. You have to have "blunted," "thwarted," "perverted" in there as buttons when you're handling purposes.
The way you do this is you just sit the pc down in a chair whether he's connected to the E-Meter or not, and you give him a Purpose Intensive there. That's the Goals Intensive by Prepcheck – 2GX1.

How do you do it? Now listen to me. Now listen to me. The commands of this are very dangerous – and they mustn't be changed around. You change them around and you're going to wind that pc around a – the nearest telegraph pole. If you were to say, "What purpose have you suppressed?" you're going to run up stacks and stacks and stacks of missed withholds because he won't tell you how he suppressed it. And that'll all amount to missed withholds and your pc practically goes rigid, turns into board, and he'll eventually not even be able to talk. Why? Because you're running five, six, eight, twelve missed withholds every command that you give him.

So it's very important to follow this command. It's very tricky the way it's been worked out. You've got to get the overt against the purpose, but it is not necessary to get the purpose. You understand? You're not interested in what the purpose in the answer is – you are interested in the overt. You have to stay interested in the overt. Otherwise – otherwise, the pc is going to have the overt from you as a missed withhold. That's one important fact. And the next important fact I've already given you, is it mustn't be run against a time span. There must be no present-time time span. Why? Pc might be in the second GPM. You don't know.

So, give him a very, very permissive type. That doesn't mean that he doesn't have to answer the questions. But give him a very permissive type of command. See, the wording of the thing's got to be very permissive. It's got to get the overt. It doesn't have to get the purpose.

All right. The command, then, is precisely this command: It's not "since" anything, it is simply "How has a purpose been (mid rud button)" by permissive Repetitive Prepcheck. Keep driving him on. This thing is going to take a long time. You get the idea? You're not going to clean up this first button on Suppress – well, under three hours, or something like that. It's going to take time.

And you're actually looking at about a twenty-five-hour intensive. And you just take all of those mid rud buttons, which of course in 2GX1 will be shifted around to fit the idea of purpose. Most of the old ones are left in, and these new goals things are added. And you just run this as a Prepcheck. It's just, "How has a purpose been suppressed?" see, and then, "How has a purpose been invalidated?" And, "How have you been careful of a purpose?" See, it all must be "How – how," not ever "What" – never. Never, never, never, never, "What" – it's catastrophic.

Now, supervised – supervised to the degree that they flatten these questions, and that the auditor stays pretty muzzled, and that that auditing command never, never, never varies over to a "What" – "What purpose" you see – but must stay on "How a purpose ______?" You've got just about the finest co-audit process you ever wanted to look at. And that is a natural for co-audits. Pc finally runs down and doesn't have any more, and so forth – well, let him go on to the next button. You see, it can be run actually meterless, if you're running that kind of a co-audit.
Now, that's going to show you up some – some interesting views. In actual fact, the person whose goal is in an area he has now retreated from, temporarily, will actually be able to find enough in present time that is an harmonic on the first GPM to be able to run it. But if you force it with the present time or an "In this lifetime" or "Since 1950," or anything of that character – if you enforce this, and force him to answer that auditing command as though it is with an ax – this lifetime – you're making him run the wrong goal. Interesting, isn't it? On some cases you'll actually run the wrong goal.

It's taken quite a bit of threading around and that sort of thing to – to get these data, and they're quite valuable.

But then on the surface of it, Routine 2GX1 is just about the simplest idiot's delight that you ever had anything to do with. That's just that – there it is. It is just, "How has a purpose been suppressed?" "How has a purpose been suppressed?" "How has a purpose been suppressed?" "How has a purpose been suppressed?" for about three hours, you see. And then "How has a purpose been invalidated?" "How has a purpose been invalidated?" you see, and on and on and on.

And you'll find the pc cycles, and you want to cycle him back up to present time; you use the cyclic rules in this thing, you know. I mean a lot of the old auditing rules come in. But actually you can't go very wrong with the thing, providing you don't say, "In present time." Got it?

Well, that's 2GX1. That's conditional numbering, too, by the way. But probably hold true. Now, you say, well what happens to the Problems Intensive? Well, we've had a Problems Intensive for quite a while and hasn't had a number, and it is not vital that you run a Problems Intensive to find the goal. You'll find Problems Intensives on a great many people will locate the goal, but on some people, because you're using present time, you're not going to find the goal, and it's not going to unburden. It'll do them a lot of good, but it's not going to find any goal.

So therefore, the old twenty-five-hour Problems Intensive does not belong in the 2G series. What's the G stand for? "Goals," of course.

All right. Now, that sets the case up, loosens them up so they can get an idea of goals. And that basically is the most elementary process I know to set a case up to find goals. Now, that's still got an X on it, and that'll be taken off in due course, or the process will be shifted or adjusted to account for any other variables. But as far as I can see at this present moment, early tests – not on that process but on all the processes that didn't work – demonstrate that that's about the only one that will.

Now, our next – our next item here on these is what for years has simply been listing and finding goals. You've all been doing that. You know all about it. But that becomes 2G2. There doesn't have to be any X connected with it because we know it of old. Well, what does it consist of? You write a list of goals – you take a list of goals off the pc – and you null the list, and you put in the big mid ruds on the goals which remain ticking on the list. That's the most elementary form of it. There is a more elementary form, but it very often misses the
goal. So we're not going to say that it is the most elementary form. It isn't the most elementary form.

It's simply the oldest. And that is to say we write a list of goals – the oldest form was we took a short list of goals, read them over, found out which one dived the most on the meter and called that the pc's goal. It's not very accurate.

The next one is we made a long list of goals and we eliminated, and that one – with no Tiger Drill; we didn't have it then – and that one which still ticked we called the pc's goal. That was very susceptible to wrong goals. An awful lot of right goals were found that way, but some wrong ones were found that way, too.

Now, that old elementary system – that old elementary system is not the best goals system. Nor is it the most elementary or fundamental. The most fundamental system on finding goals is simply to list some goals on the pc – null those goals by elimination, calling each goal three times in case the pc's attention is wandering; take those that still tick – because you see, the odd part of it is, is even though the goal has been invalidated and that sort of thing the invalidations add up to a read by elimination; and do the whole lot, get two, three, four, five, something like this, that have a DR on them or a tick left on them that didn't go out by elimination; and just put in the big mid ruds on each one of those.

There's a shorter method than that, which is just to put in the left-hand buttons on each one, which is Suppress, Careful of, and Fail to reveal. But on an operation of this character you'd better put in the big mid ruds, because you may have a pc who's protesting or deciding or that sort of thing, and it's safest to put in the big mid ruds.

So that is, in actual fact, the most elementary goals finding method. Now, when we list the goals if we list them on a meter, we don't change the process. It is simply that we can mark in an RR if we see it or an R/S if we see it. And that helps the auditor because he's not going to take a goal that he saw an RR on and give it a light dust-off, don't you see? So that is simply a security. You need a meter, but the listing on the meter is not absolutely essential to 2G2. Not absolutely essential, but a neat 2G2 would list it on the meter, and you would see whether or not these goals RRed or R/Sed as you wrote the things down. You got that? And when it's being done by an auditor, that – that would be – that would be fine.

In actual fact, the reason why we say it isn't absolutely essential that we do that is you're going to find a co-audit practice occasionally will be to list somebody's goals, and even though we give the person a meter to list them on, the designations which they give are not necessarily accurate. And therefore it doesn't matter what these things are designated, you still do the same things. See, whether it's listed on the meter or not listed on the meter, you do the same action. Just listing it on the meter helps you out. And that action consists of first, to list the goals from the pc. Some pcs have goals lists they've already done and that sort of thing, well, that can be included, but shouldn't at this stage of the game be encouraged. That's not 2G2.

And you take some goals; you list them, then when you've got this list in a section or a full list or with tone arm action or without tone arm action – we don't care anything about the tone arm action – we don't care how many goals we list, we don't care if we list a hundred goals, we don't care if we list a thousand goals; we don't care anything about that at all. But
the suggestion is to keep it down – keep it down to a couple of pages. Just keep it down to a couple of pages. In other words, we do a couple of pages of goals, we null those two pages of goals, we put in the big mid ruds on those that still DRed or ticked. And then we take another couple of pages of goals, and then we null that couple of pages of goals and so forth, and put in the big mid ruds.

In other words, this is based on a finding. Over the years we have found that, as one of you is doing to a pc at the present time, about the cruelest thing you could do to the pc is to list goals and never null them. That's a very cruel thing. And if you've got a long cumbersome list, the auditor's tendency is not to null it because it is just too long and hard.

Now, in view of the fact that in most pcs the goal occurs in the first 150 goals listed, you can see there that – that's a fact; they're the first 150 listed. That if you list those things in little sections – you know, just a couple of pages, front and back of the page, you know, that sort of thing, and then null them, and so on – you're never going to get into a big high-tension situation with the pc. Pcs get very anxious. They put their goal on the list and you're nulling this 500 goals list, don't you see. You say, what happened to the 850 goals list? Well, what happened to yesterday, see? We're talking now about 2G2. And it has nothing to do with what we were doing.

So you list this list; you null this list; you put in the big mid ruds on what you've got left. You watch – bang, you'll eventually see some fireworks on the thing. Well, most of your goals are going to be found that way. Just as elementary as that. Just no more – no more upset than that.

When you've got 2G2 up to a thousand goals and you haven't got the pc's goal, let me tell you something: That pc is in the second or third GPM in present time and present time has nothing to do with the first GPM. You see this? So this pc is dislocated as far as the bank is concerned, and the goal isn't readily available. This is your first conclusion.

Now, what do you do? Well, you could keep this up – I don't really see any reason to keep it up beyond about a thousand goals because I've seen those pcs who have gone above a thousand goals still haven't put their goal on the list. I haven't seen them put their goal on the list till up to about three thousand goals. Five thous... I know one pc who had about five thousand goals and didn't get his goal on the list. I finally had to dig it up out of a – so on, by other means.

But there – there's a limit then to 2G2. If you easily find the pc's goal by this method why do anything else? If you don't easily find the pc's goal by this method, and the auditor actually knew when the meter read and when it didn't and actually could null a list somewhat, there isn't really any point in continuing 2G2. Frankly, to continue it beyond five hundred, you start wasting time.

But let's put it on as an absolute limit of a thousand. And let's put it on, if you're going to do 2G2, at an absolute minimum – absolute, just minimum, minimum of two hundred. Because the average is that, well, it's some percentage of pcs – I don't know, some guess – half the pcs you run into have their first goal in the first 150 goals they give you. And that actually is the totality of this action. That's the totality of it.
Now, administration enters in here. You're going to turn goals-finding loose, for God's sakes preserve the lists. Impress people with the necessity of writing down the full goal, as given by the pre-c. I ran into some old South African ACC goals lists. Goals lists? That was pretty good. I mean, it was the first ones taken down there. This is what taught me. They took a piece of paper, see – they took this piece of paper – and they... let's take a goal, "to be a railroad foreman," see, and it says, "RR 4." And that's written this way, see. And then over here it's "to be a kchunh!" And then over here, it's "like run like anything." And over here someplace is "queen." To be a queen? To shoot a queen? What? See?

No, get them to take the full goals down in an orderly column, with the pc's name and the date of the list on the top, and null it with the standard method of nulling. X's and slants in other words – R/S, RR, and so forth. And preserve that list. It's valuable.

That's the main danger in goals finding is not that some student auditor or HPA or somebody like that is going to goof and not find the fellow's goal. We don't – couldn't care less. So he goes over the top of the fellow's goal. The trouble – the trouble that comes up ...

We've had – we've had goals list after goals list that somebody's gone back and nulled the goals list and they found the goal in the first seventy-five goals. You know, somebody had just ridden right over the top of it, reading like mad.

No, the trouble comes when they take that piece of paper and don't put it in a folder, and when they wrote it down in the first place didn't write the full goal down and didn't date it and didn't put the pc's name on it, and didn't put it in the folder. And when they didn't do that they put the pc in trouble. That's what made the trouble.

The only way you can get a pc in trouble, then, with 2G2 – the only way you can get him into trouble – is to fail to write down the full goal as given by the pc, put the pc's name and date on the thing, and to put it in a folder, and then to keep the folder and don't lose it. That's the main – the main thing that has to be taught on that along with everything else you teach. Don't fool with that, because a pc is actually put in danger by this.

The odd part of it is, is sometimes it's such a failure to them not to have their goals found that they – they never put it on a list again. For instance, I've looked over I don't know how many thousands of goals; and you know, I never put my first goal down on a list the second time. It wasn't until the auditor was one day nulling or listing – listing some goals, and listed another goal, and I'd spotted a spot where I'd thought of the first goal, and all of a sudden gave the first goal, and I think the thing read a dial-wide rocket read. I – I said, "That's – that's – that's my goal, you know. That's – that... Wait! Whoa, whoa, whoa! That's my goal, see?" It had already been checked out and hadn't fired, about – I don't know, three, four, five times. Been on a – it had been on a list for over a year. It's within I think the first 130 goals or something like that. It's one of the very, very early goals. I've forgotten what number it is; maybe it's number 98 or something like that.

Now, all during that year I'd – just had never put it on another list. I put everything else on lists, but not that one. So those early lists are quite important, and they must be kept, and you must impress on anybody who does this that the list must be accurate, must be dated, must have the pc's name on it, and must be kept and made available to future auditors. That pc must know that that is a valuable piece of paper. He won't think it is, but he's got to have it
that way. He's got to realize that it is available and the auditor must, must realize that it is very valuable. That's 2G2.

All right. Now, 2G3 consists of taking any and all items that have ever been found on the pc – I just described it to you in the last lecture I gave you – any and all items ever found on a pc by any means or any method of any kind, and you list goals on them, "What might be the goal of a" – just as though they were all oppters. You know, the oppters – the early oppters have the pc's goal. And then, if you don't find it then, why then you list every item of any kind ever found on the pc, and anybody used it for anything whatsoever, you list it with "What goal would be an overt against it?" and "What goal would be an overt against a...", you know. And you – you list every item that way. Why? You list terms and oppters.

In other words, 2G3 does not differentiate between a term and oppterms. It only differentiates between two actions: Listing any item ever found on the pc – "What goal might be the goal of" or "What might be the goal of a" whatever the item is. And then if the goal is not found in that way, then we treat the whole thing as an oppterms, the way we used to treat oppters. That is, "What goal would be an overt against" every item on the list. Actually, that's best used for terminals. As you look at that March 13th line plot you'll find out why.

So anyway, this operation is a very easy operation. And once more, about the only crime you can commit with it is not to null the pc's goals once listed. So you actually don't write down the goals of fifteen items, and then null them all. You don't do that – you don't do that. You – you write down the "What might the goal of a catfish be?" You write and list until the question is clean, and usually that is never more than fifty, sixty goals, something like that, at the absolute outside. Then you take that fifty or sixty goals as a unit and you don't go on to something else now – you take that one and you null it, and you put the big mid ruds against the ones that are still left. And you're going to get some commotion there and that will be it.

All right. You go on and on and on that way. And eventually if you don't find the pc's goals using all these things ever found and so forth – if you don't find the pc's goal, by saying "What might the goal be?" you see – you say, "What goal would be an overt against" and you list them all that way. And you eventually pick up the person's goal. But take one item at a time, and list it as though that's all you're ever going to do, and finish up that cycle of action and so forth.

It's a very cruel thing to list goals on a pc and then not null them. This is a very bad thing. I know, because my pc has done a lot of long lists, wrote in her own time and so forth, and I've never nulled these things. She, I mean, every once in a while is bringing these things up, and that sort of thing.

Now, you do that piece by piece, then. It's all little piecework. And any moment you're liable to turn up – well, you list from the earliest item forward. Earliest item. Why? Well, it's much more likely to have been the top item – the top oppterms of the GPM if it was found on the pc a long time ago.

So 2G3 takes care of old-time people who have had a lot of things found on them, so therefore is a somewhat specialized process. Well, where does that put us with raw meat that has no items of any kind whatsoever? Well, it puts us into 2G4. And 2G4 is the new name of
Routine 2-12. Only it's a different process than Routine 2-12, because it does not require that you find any item on it and oppose it. Now, it's merely the first stages of 2-12, but actually it's also 3GA Criss Cross.

Now, I don't mean to leave you in a confusion, because it's one of these – one of these elementary actions – elementary action indeed. You make a list, use the 3GA titles. For the same reasons I gave you earlier in the lecture, you do not use present time or present lifetime or any such questions, because you're dealing with goals and the pc might be elsewhere than in the first GPM.

So here we have a situation where we make a list. Well, those are the old 3GA Lists. There's no particular reason I should give you a whole bunch of lists on this. But I'll give you an idea of the type of list these things are. "Who does everybody more or less dislike?" or "Who or what does everybody more or less dislike?" And you'll find the pc will give you the top oppterm. You see, it's simple, huh?

Well, you lo... you run a list, and you hope that the auditor will see it RR or R/S or do something active, and find out that that is the item. But in actual fact, in actual fact – I correct something here. I said it's the – it's – it's not the full of 2-12 in this 2G4 – it's only the vague shadowings because there's more of it as you go up in higher numbers. This one – this one is very simple – very simple. You have the guy, "Who or what does most everybody dislike?" or "detest?" or something of this sort, and you hope he sees some of these things R/S. And he gives you a long list of these things, and you hope that the R/S is more or less accurate. So we get in agreement with the pc. We don't depend upon the auditor's meter read, see. We don't depend on his nulling the list, we don't depend on him finding items. We have him get in cahoots with the pc and have the pc agree that certain one of these things certainly are... do match up to the situation. In other words, we let the pc examine the list. They go over it to-gether.

And he'll usually pick the rock slamming items, but that's beside the point. Do you know how many items we can pick off that list? Well, we can use five, we can use six items off that one list. Then, of course, we had our old headings "Who or what have you detested?" and "Who would you rather not associate with?" and also "Who do people not associate with?" you see, "Who or what do people not associate with?" You've got various types of 3GA headings. But none of these are present life, see. You don't say, "In this lifetime," or "In present time" or anything like that, because you might run into this scrambled GPM phenomena.

And how do you use those? How do you use those? I know it horrifies you. You say you take five items off this list and list goals against each one of the five items. Yes. You don't find the item for the list. You got the idea? That's left to 2G5.

Now, if somebody's really sailing, he notices there's some R/Ses on this thing, he can make a four-way package if he hasn't found the goal yet. He can actually find the item on this, oppose it, oppose it, and oppose it – and get a four-way package, and you have 2-12 in full. Total use of 2-12. That's what it's relegated to.
Now, because its numbers have been popularized so, we'll keep on calling it that. We'll keep on calling it 2-12, but remember that in goals finding, and when it is used for goals finding, it is totally dedicated just to finding some items on which you can list goals.

And you see now, that's a built-up series of added complications. You see that? The actual action of listing some goals and then nulling the goals and putting in the big mid rud, you see – that was 2G2. The actual action of taking a hatful of items and listing goals against those, and doing 2G2 on them, see? And then the actual action of getting a list and picking some things off of this list to list goals against, you see, is actually 2, 3 and 4. And now taking that and building a four-way package with it is 2G5. You got it? So actually it's the same item with the added complication of an additional number, the added complication of additional number, the added complication of additional number, and of course you get the tougher and tougher case. You see that?

So if you don't find the goal by this method, then you find the goal by the next method. And if you don't find the goal by the next method you find the next method. Well, how low down does this start? It starts with 2G1. And you'll find out a certain number of pcs after you have given them 2G1, all of a sudden look at you fixedly, their eyes widen, and they say, "My goal is:"

So that, of course, is the simplest method of goals finding. You didn't – you didn't do anything. And there it rocket reads and everything, and it – and you're all set. So that's – of course that is the most fundamental method of goals finding.

Of course, 2G1 can be so simple that you say, "How has a purpose been suppressed?" "Well, with you sitting there not listening to me when I tell you that my goal is 'to catch catfish'," it rocket reads, and you've got the pc's goal.

I can see some auditor – he's all set here for the next hundred hours, he's studied, you see, he's got this all taped, beautiful shape, and he says, "All right. Now we're going to start this intensive. Now, how has a goal been suppressed?"

"By your refusing to listen to me that my goal is 'to catch catfish'" – pssww!

And "To what?"

Terrible, isn't it? But also, look at the plight of the other fellow who has gone up – clear up to 2G5, and he still doesn't have the pc's goal, and he is getting old and bowed, and it looks like it's a professional activity.

Well, by that time – by that time, let us hope, and let him hope, that I have by that time invented 2G6. That's the only answer I can give you! Anyway, you see, those are the old goals finding methods all brought forward – all brought forward from the simplest to the late.

Now, all of these have worked. And there are certain sins that accumulate to each one, and that is failure to administer, and the other is failure to null what you've listed. That's always cruel.

Now, this can be taught and this can be done. And as a matter of fact you're looking at a preview of the schedule you will be on next week, because we intend, now, by our plot-out and so forth, to find the goal of the person in the X Unit. And not let them out of the X Unit.
until he does have his goal, and to bung him over into the Y Unit at the earliest, after his goal has been found.

So this is – becomes very important. You're going to get a rearrangement of – of schedule based against the reality of exactly what you're doing. It doesn't change or discredit any of your checksheets, and it doesn't cost you any lost ground. The... "In these lectures, is there anything you have been anxious about?"

Anyway – anyway, all – all – all good fun aside, there – there are the 2Gs, and we'll be doing those things in the X Unit. And in the Y Unit you'll be studying your – your 3M and getting ready to run it. You should realize that it is one thing to find the goal, it is quite something else to run one. And running a goal has become a hazardous profession. It's not – it's not that it is difficult to do; it's that auditors list so enthusiastically, they slide over the top of RIs and they bypass items on their lists, and they do various things like this; and it makes it more complicated than it should be. It is really very mechanical. It is the auditor making it complicated that is giving us trouble at the present time, and we can get around that, too.

But the point – the point is here that we mean to find the person's goal in the X Unit, and run it in the Z Unit. And it immediately and directly breaks down the course into Routine 2 and Routine 3, doesn't it? Well, you say, "Well, what happened to V Unit?" Oh, well – well – well, that's expiring. That's expiring as of Monday morning. It will be a thing of the past because too many people have been relaxing I am told, and flunking themselves down to the V Unit so they get some auditing. The V Unit ran itself up an enviable record of finding goals, and so forth -- and that's supposed to be done in the X Unit now, so there we are.

A student first coming in, is not going to be given even a grace period now, he's just going to go straight onto rudiments and Havingness. As soon as he's got his rudiments and Havingness – that's rudiments, Havingness and See Checking. Soon as he's got this down so he looks good, he moves straight and directly up to the X Unit – we start working with his goals, he finishes up his checksheet. As soon as he's got his goal and his checksheets are finished, he goes into the Y Unit, he studies in the Y Unit – nothing but study in the Y Unit – gets all ready to go into the Z Unit and run goals.

That's the way I'm streamlining the situation. And it'll work out a lot better for you.

We're going for blood on this. We want goals, we want Clears, and there's no time to goof around on it. So I'm arranging the schedule just to that degree to make sure that it moves on forward.

Now, you see, you don't think you ever cause anything, you see, and I've had my ear to the grindstone – I think it was my ear – and I heard some of you complaining about lack of checkouts or complaining about this and complaining about that, and you complained yourself into a brand-new schedule, so it's all your fault. It's all your fault, and I haven't anything to do with it. But I'm running a goal at the present moment, my fifth – and the goal is "to be responsible," so you will – you'll forgive me – you'll forgive me if I'm slightly aberrated on the subject at this particular moment. It's all your fault. Okay?

All right. Well, that's all we have, and I hope you can put this – this Routine 2 information to very good effect, and I hope where you're going that you can teach HPAs and
HCAs how to find these things, and you'll notice that they stack right up with each additional step following in behind the next so there's no waste of motion on it. Finding goals has been researched over a period now of two or three years, and I think you'll find it's pretty good.

All right. Well, thank you very much. Thank you very much, and good night.
CASE REPAIR

A lecture given on 26 March 1963

How are you doing? How are you doing?

*Audience: Fine.*

That's much better. That's much better. Got to get a little live response around here someplace.

Now, the reason this lecture is late today has nothing to do with me, so don't blame me. As you know, I'm running the goal "to be responsible," and so I'm not responsible for very much here, don't you see? And you're – you're all responsible. So why did you make the lecture late?

I have a very, very good announcement to make. The 26th of March AD 13, the Saint Hill Special Briefing Course is on this date entering the – or has completed the hundred – hundredth week of the course. This is the hundredth week of the course. You wouldn't think we could last that long, huh? I mean, the Instructors, and myself and so forth. That shows that we have tremendous survival capacity, tremendous survival capacity.

Now, during that time there have been 192 students enrolled, 130 students have been and gone, and there are 62 students on course at present. Interesting, huh? Now, this is a nice anniversary, and in this anniversary I expect to make some Clears in order to celebrate it. And that means you! Hear? You got that? All right. Get Clear this week. Okay. All right.

Now, we're doing pretty much okay. And it's a fitting note to begin this lecture, a fitting note, to give you a lecture on case repair. Case repair.

Now, worry is the occupational hazard of the auditor doing Routine 2 and Routine 3. It's so much so that there is even a worry rule. And to paraphrase the rule, if the pc is doing okay, don't worry, and if the pc isn't doing okay, worry. In other words, don't worry – to give you corollaries – don't worry yourself and the pc and start worrying about things and diving around on things unless there's some reason to do so. If the pc looks bad and feels bad and so forth, well, that's the time to start worrying. And the other extreme is don't neglect to straighten up a pc who isn't doing all right. Don't just keep plowing madly on, finding more items, hoping for the best, pc ARC broke, flu, upset in general, and all this sort of thing. Don't just keep going on and on and on doing new things, new things, new things. No, get back, take a look at it, and find out what's wrong, because there's always something very specific that is wrong. The worry rules.

You'd be amazed – you'd be amazed how upset some auditors can get. How marvelously upset they can get over a pc who's doing just fine. And you'll be equally amazed at the complete wooden-Indian, God-help-us-all, press-on, press-on, press-on of some auditors whose pc is all curled up in a ball, has turned completely black and the lists aren't running and
they're not even in the same goal anymore, and so on, and they aren't even able to get the pc on the E-Meter because he can't curl his hands up. And here this auditor is, trying to find new, new items and so on and never repair anything. *Thayh!* It's quite interesting.

I want to interject a comment there, because I may forget it when I give you another lecture on goals. Is – Mary Sue made this, and I'd like to interject it. There are two other types of auditors. They're the type of auditors on the routine 2Gs. There's the type of auditor who sets down the pc's goal given him. You see, the pc said, "Oh, I've got a goal, I've got a goal, I've got a goal," and so forth, and the auditor just sits it – puts it down over here and moves it aside and never does anything else with it. He doesn't know why he's doing 2G. And there's the other auditor who never does 2G1, but only sits there and does 2G2. You get the idea? The pc keeps giving him goals, so he keeps doing 2G2, and he gives goals, 2G2, and so forth, and there it is. Marvelous, isn't it? Never does any 2G1.

Well, there's a happy medium. There's a happy medium. When the pc gives you a rocket reading goal you check it out, and when the pc gives you goals and so forth, why, just put them down. And if the pc gets too trying on the subject, he's just nothing but trying to give you goals, trying to give you goals, and there doesn't happen to be anything rocket reading there or anything, and you haven't completed your 2G1, why, just say, "Well, you know, in the first half hour of this session, why, I'm going to check out the goals that you have given me, and in the remainder of the session we're going to do just 2G1. If you think of a goal, of course, why, we can put it down, but it won't be checked out."

In other words, there's ways to handle this situation. Mary Sue authored that observation. It was a direct observation, not a cynical comment. The other – the other thing here is that an auditor very often doesn't quite know why he is doing 2G1. And goes through all the eighteen buttons twice in two hours of auditing and he's done 2G1. That's pretty marvelous, you know?

I don't think I could get the Suppress button flat on a preclear in under one session. That's kind of a different look.

Well, of course, that's a prejudiced look. It's prejudiced and so forth. My pcs are usually in-session. Well, anyhow... That's a – that's a snide comment, isn't it? No, it's just when – when you can't get the pc to answer the question, the pc isn't giving you anything factual and so forth and giving you a big brush-off on 2G1 and that sort of thing, and saying, "Well, oh well, yes, I've suppressed a lot of purposes. I'm suppressing your purpose right now of trying to run 2G1. All right."

And the auditor says, "Oh, okay, I don't get any read on that, that's fine. And all right, have you invalidated – how have you invalidated a purpose?"

"Well, I guess I just invalidated your purpose now, for trying to run 2G1"

"All right. That's clean, that's clean."

That has nothing to do with why you run 2G1. As a matter of fact, a pc who operates that way is the one who has to have the most 2G1. Why? Because their overts come right into the session against the purposes of the auditor who is simply trying to run a process which will deliver the goal into his hands.
All right. So in goals finding – in goals finding, we begin the activity of creating a case folder, creating a case background as we audit this person, we create a line – or goals plot, and we get our Auditor's Report Forms, and all of that sort of thing, and that goes forward. And this is all germane. This is all germane to case repair, but case repair doesn't get crucial until the person has had that goal run.

Now, normally, simply finding a wrong goal on a pc – it's "so what?" If nobody does anything with the goal, perfectly all right to have found the wrong goal. Who cares? If nobody does anything with the goal. And the repair of it's very easy, if nothing has been done with the goal, repair is very simple. All you've got to do is prepcheck it. Or even if something's been done with it, just give it a Prepcheck and that straightens it out.

And most case repair however does begin in the finding-the-goal area because sometimes the pc has had found on him a goal that wasn't ready to be found. It doesn't rocket read or do very nice things, you know. And somebody's forced it off on him, and the bank they're – the GPM they're running has nothing whatsoever to do with the goal that has been found and so forth. Well, then you have to case repair it back to finding a goal, when this kind of thing exists.

So the 2Gs do come into case repair. They do come into case repair. Because you could take somebody who found a wrong goal and his R/S and RR disappeared and that sort of thing, and they've run down a bank and they can't seem to find a goal and that sort of thing... Well, the thing to do is just to recognize that the case has been run off the rails most gorgeously, and that the proper action is to straighten it up from a goals point of view.

If however you did have a goal, it did fire and you did get a blowdown on it and so on, and you've merely run more items and strays out of another bank and so forth, you of course still are engaged in 2G1, but you tend not to look on it as that. You look on it as part of 3M. The action which you should undertake when a case has had one goal run and it has disappeared or something has happened with it, the actions which should be undertaken are all resident in the 2Gs. They're actually not 3M actions.

Well, what do you do? You have to list goals against items, and you have to list goals, you have to null old lists, and sometimes, sometimes you have to run 2G1 on the person because their goal was so faint in the first place, because 2G1 had not been run, you see. And therefore it was the wrong goal or something like that. You have to prepcheck an old goal that you can't make any sense out of. So case repair can begin in the action of Routine 2G. In other words, if you had a line plot in front of you and you didn't even have the goal for that line plot... I saw one the other day. You didn't think this will exist. This goal actually did not compare to the line plot. The goal was "to experience" and the line plot on it had something on this order: It had "people who do what I tell them," I think. That was the dominating theme of the line plot. And here was – here was this goal "to experience."

What did it have to do with the plot? Well, either – maybe one or two of those items did belong to the goal "to experience," but then they had strayed off into some other GPM through reversing – you know, they reverse oppose something, and flipped over. They did a skip, and they went over into this other GPM. When they got over into this other GPM, they just kept on finding items, finding items, finding items, and the pc kept trying to say faintly –
or maybe they omitted the "how does the goal compare to it" step because the pc usually says, "Well, of course it compares to it; it's the reverse of it." And the auditor finally says, "Well, the step is not necessary."

And he's got a goal "to be a ballet dancer," see, and they run across an item "a steam locomotive." And the auditor is omitting "How does this – how does this goal – how is this goal related, or how is this item related to experience – to 'to experience'? How is this item related to it? Steam locomotive." Or "How is it related to the goal 'to be a ballet dancer.' Steam locomotive. Ballet dancer."

And the pc says, "Steam locomotive? Ballet dancer? Well, a steam locomotive couldn't do ballet, could it? I don't know. Don't know. I don't know how it relates to... Let's see, steam locomotive and ballet dancer. I don't know, maybe the... maybe... maybe the steam coming out of the funnel, maybe the steam coming out of the funnel, maybe... maybe it looks like a ballet costume. Yeah. Must be. I guess."

Well, the press-on type of auditor says, "All right. Well now, let's oppose it. Now, let's see, is it a terminal or an oppterm?" and so forth, "Who or what would oppose a steam locomotive?" Well, they're running this bank over here which is "to be powerful." See? And they get all these items for the bank "to be powerful," and they're sitting here with the goal "to be a ballet dancer." There's one item on the line plot, or two items or three items on the line plot that have to do with a ballet dancer, and all the rest of them have to do with "to be powerful," you see? "Hydroelectric plants." "Hydroelectric plants." "Tremendous, crushing force." "Powerful people." "People who smash you," and so forth, and the auditor's sitting there, you know – if he was doing this step; if he didn't omit it – he'd say, "All right. Now, how would the item 'smashing people' compare to -relate to the goal 'to be a ballet dancer'?"

"Well," pc – "Well... I guess he makes a smashing impact on the audiences, I guess. Smashing impact on the audience."

And the auditor says, "Oh, all right, it does relate. Does relate. Good." Down it goes on the line plot. He's sitting here looking at the E-Meter one session. He notices his RR's have been kind of small, and all of a sudden he can't get an RR. There's no RR on any list, there's no RR here, there's – the needle is just sort of something, and the tone arm is up here at five and a quarter, and what's he done?

Well, he's run 3M in such a way as to make it necessary to repair the case with 2G. You get that?

Now, the goals check, 1963 Issue II says that the first action – this'll continue to be the first action in checking out a Clear – is, does the goal relate to the line plot? And that'll seem silly to a lot of you, but you're going to be disabused of it, man. You'll be out in some organization or Keokuk or someplace, an auditor is going to turn up with this line plot, and it's going to have "Hydroelectric power plants. Steam locomotives. Crushing, smashing force. Inexorable pressure. A poor little weak erk." And the goal of this is "to be a ballet dancer." It's just by inspection.

How do you repair this case? You find the goal of the items which you've got. Or if you've got a goal that fired and was inspected and seen to fire, you find the items that apply to
that goal. So, the items that apply to the goal, of course, is a 3M action. To find the goal for
the items you've got is in actual fact a 2G action. And you just go at it and just find the goal.

You've got a lot of items, and you just go ahead with your 2G actions and you find the
goal for them.

But basically, you should try to find items for a goal if the goal was a proper goal and
if it did fire. And you will greatly appreciate when you've doing this, having some Class IV
initial down in the corner of the auditor's report. Not a separate sheet floating around some-
place, but right on the auditor's report the day the goal was found, or a few days later when
they went and got it checked out, and right down there in the corner, it says, "Checked out,
RRed, so-and-so, so-and-so, signed – initial." And you say, "Oh." Or name. You
say, "Well, it's checked out by a Class IV Auditor." Therefore – therefore the action is to find
the items which belong to this goal. But if there was no checkout, and somebody said, "Oh, it
rocket read all right. The needle just went all over the place, you know? It rocket read. Yeah.
It rocket read when it was found; it went just like that."

You say, "Oh, brother, where are we at?" Well, I can tell you where you're at. You've
got a hatful of items that may or may not have validity; you have an auditor who didn't know
a rocket read; you've got a mess on your hands, and you will be very pleased at that time as
you look with some horror at this mess – you'll be very pleased to remember this primary da-
tum of all case repair. Now, this datum applies to running an old goal which has already been
listed out on 4 lines, 16 lines, 40 lines and 114 lines. It's been listed out till you can't get a tick
on it anymore, but it did produce at one time a free needle with all this listing.

This applies to somebody who had a wrongly worded source list, it applies to some-
body who suddenly cognited on what the first ite m was and made up his own line plot. We
had somebody here do that the other day, by the way. He didn't cognite on the first item; he
just made up the balance of his line plot. And he's pretty sick, too. That's all right.

These wild actions, you know – these wild actions are all of them – are all of them in-
capable of deranging the GPM. You say, "What?" You're handling a nearly indestructible
commodity called the GPM – or the GPMs. We should call the whole bank the Goals Prob-
lems – Goals Problem Masses and one GPM the Goals... a Goals Problem Mass. In other
words, "the" and "a" would be different and "masses" or "mass." In other words, call one sin-
gle GPM which consists of one goal and a packet of items – call that a GPM, and all of these
many goals, you see, each one with their system of items, and so forth, why, call that aggrega-
tion the GPMs. And I think we'll have a little bit easier time communicating.

Now, a GPM or the GPMs are almost completely impervious to improper 3M. Now,
you can just hang that up as a stable datum. The pc can be made pretty green, purple and pink.
The pc can be listed backwards and upside down. The pc can be made pretty sick and be
caved in most magnificently. Fine, fine job of press-on has been done on this pc, you see, he's
been pressed on up to the point of where he's practically in the hospital. And you say, "Oh,
my God, look at the extent of the damage."

Well, remember something, remember something: The human body is not the GPM
and the thetan isn't the GPM; what hasn't suffered any damage there of any kind whatsoever is
the GPM. And that is a good datum for you. Well, the pc hasn't been destroyed or anything
like that, he can still talk occasionally. If he's fed a quick brandy and then you listen, you
know, closely, he'll be able to say – he'll be able to say, "A cat." And you get another item for
your list, you know, and feed him another quick brandy, you know, and get two items a day
for four or five months, and you eventually get the new source list, you see, and he feels bet-
ter. Sarcastic.

If the pc feels bad, if the body feels bad, if it all is caved in, remember this is your sta-
ble datum. The GPM is impervious to anything but perfectly done 3M. That should make you
feel good. It doesn't make the pc feel good.

Oh, you can throw the pc into various parts of the GPM. Yes, you can get splinter
items. Yes, you can list things backwards and throw him into other banks. Yes, you can pro-
duce the full effect of being in a grouper. Yes, all these things can be done to the pc, and
they're not uncomfortable but they don't disturb the order of sequence or anything else of the
GPM. Isn't that remarkable.

You've run the whole goal out. There's a big blowdown. The goal doesn't even tick
anymore. And yet you're absolutely certain looking at this line plot that less than half of the
items on this line plot – which only has twenty items on it and none of the fundamental bot-
tom items – this whole line plot, only half of it refers to this goal. Where's the rest of the goal?

You say – well, here's the worry type at work, see. "But, my God, how can I find any
more items or run any more items? How can I possibly do any of this? Because look here,
look here, I mean, the goal hasn't got any further charge on it. Therefore, I can't find the rest
of the GPM because the goal hasn't got any charge..." Yes, you can go finding items as long
as there are items to be found, whether the goal responds to your read or not.

In fact, practically everything you're ever going to worry about is covered rather mag-
nificently, succinctly and so forth, that the GPMs or a GPM is impervious to anything but
absolutely correctly done – correctly done 3M. And that should hearten you. Because at any
stage of case repair, everything that's been done right with 3M will remain right, and every-
thing that's been done wrong can be remedied. And you'll find out that the correct is sitting
there. Isn't that interesting.?

Remember that now when you start doing case repair and it'll keep you from doing a
lot of silly weird things and keep you from worrying, that's for sure. Because, all right, this
character comes in, and he's got this, and you've got the goal. And the goal's apparently been
run out. And they've done a source list for every item. (Well, somebody will, sooner or later.)
Done a source list, and they found an item, and then they've done a source list and they found
an item, and they've done a source list and they found an item, and they've done a source list
and they found an item. Well, they've done it the hard way. They've done it the hard way. All
you need to do is find where it didn't work anymore. And at the point it didn't work anymore,
you're going to find that the GPM was totally impervious. And where did it stop working?. It
stopped working on the second source list.

And did they find any items after that? Yeah, they found some ticks, and they found
some rocket reads, and they opposed them and they did this and they did that and they found
some things, they found some things on the bank.
Well, don't disturb – ever disturb an existing line plot. You can haul items off of it and put it on some other line plot, but don't ever disturb an existing line plot. Anything that you've... been found on the pc has been found. There's another big stable datum in case repair.

So, they found a steam locomotive in this goal "to be a ballet dancer." All right. You can put a ring around it if you want to; it doesn't seem to belong. And sooner or later you're running this case and somebody's running the case and they say, 'Here's a goal 'to be powerful.' Ha-ha. I wonder if he got any items anywhere else in this case, and so forth. 'Steam locomotive.' Ha-ha."

Let me tell you something very peculiar that a steam locomotive has been found and exists on another line plot does not alter the GPM so far as 3M is concerned. And the GPM called "to be powerful" will be found to obey all the rules of 3M. And everything has to be done to it that has to be done to it. Isn't that interesting?

Let's say you found item 1, item 2, item 3, item 4, item 5. Let me say all these things have been found, and they already existed and so forth. When you do your – your goal oppose list for that GPM... And yes, you do two goal oppose lists for the GPM, which I'll talk about in a moment. When you do the goal oppose list for the goal "to be powerful," it'll land you right exactly where you're supposed to be if you've done it properly.

Yeah, but you say, 'Good God, in 2-12 they found a 'harelipped lightning bolt.' And they found 'weak as a catwhisker,' and they found all these vital items. All these vital items have been found, and there they are, and sure they belong in the line plot. And that undoubtedly upsets because that'd be the top terminal and that'd be the top oppterm. And, oh, life is too cruel here. Look all this stuff's been found, so therefore I'm going to pick it up in the middle of the bank."

No, you're not going to pick it up in the middle of the bank, you're going to pick it up in the right top oppterm or the right top term. Simple, huh? It is simple.

It doesn't matter what's been found. It doesn't matter how many skips have been gone into in the bank. It just doesn't matter. I'll give you some kind of an idea of this: I had a goal that we got into and ran about twenty items in, ran it clear – and didn't find the goal for it, and then became aware that there was a goal for it. And there was a bunch of randomness of one kind or another, and we found the goal to the next bank. And we finally came back and found the goal for this thing.

And ran it on down and finished it up, and so on, all was going along fine. Ha-ha! On the case repair – on the case repair on that particular goal, because no source list had been done on it and so on, and it'd landed in the wrong spots, we found nineteen items. The nineteen correct items. The nineteen correct items for that bank were found. Even though twenty items had already been found in the bank and it had appeared to run. Now, you got that? See? Why worry, man?

Look, you know that a thetan has been sitting around here for a couple of hundred trillion years. You realize that there have been psychiatrists all over the track? I mean, you probably didn't realize that it was a stupid universe, but it is. Been psychiatrists all over the track; they've been electric shocking people. Well, that certainly should have upset the GPMs,
shouldn't it have? Huh? You know, the idea of a cure is a hundred billion kilo-megavolts or something, you know?

And you've got all this blast pistol and glare fights, and this person was through World War I, and World War II, too. And in addition to that was standing in the middle of Hiroshima on that memorable day when the US collected a motivator.

What the – what the hell, you know? This is a pretty – this is a pretty bad thing here. And this pc – this pc is going to – going to respond properly? No, his bank will be scrambled. Been electric shocked, he's had... well, back about two hundred thousand years ago he had eighteen prefrontal lobotomies, four transorbital leukotomies and had to listen to a lecture by Kennedy. The guy was completely brainwashed, utterly, see.

All right. Now, what's this bird all about? What's this bird all about? That didn't upset the GPM; that's the stuff it's made of.

The one thing it can't stand... And I've got to give you a lecture someday on exactly how the GPM is formed, exactly why it is formed, exactly why it is always of that pattern, exactly why, exactly why, exactly why. It's the most remarkable story you ever saw. If you want to know exactly what it is, read Book One, and wherever it says "engram" in the explanation of why people have engrams, why, you just put in its appropriate place "item" or "GPM" and you've got the whole explanation. It's quite interesting.

But I'll give you – I'll give you a lecture on this sometime. There is a reason he postulates each goal. The only thing that I have ever been in error about – I said many times that he had no reason to postulate these goals. Well, in actual fact on very close examination, he each time had a reason to postulate the goal. And it was borne out from the goal he had just survived. And he carries that on over his postulation of his next goal.

But he doesn't just postulate them from nothing. That is the first goal of the bank, is postulated from nothing. Nothing else is.

All right. Now, this – this character has lived through all of these things, this character has actually been subjected to the socialist economic principles of Galbraith, he's read a book on economics by Lord Keynes, he's been educated in several different schools and places and at numerous times in his life he couldn't find the decelerator switch in time to keep the ship from plowing into a sun. He – in other words, he's had a ball.

This didn't upset his GPM. The only thing that can upset a GPM is just this, just this: is a perfect mechanical auditing – this doesn't mean mechanical auditing, but a perfectly mechanically arranged, exactly right approach with an E-Meter and so forth, and there goes the GPM, zzz.

It can't stand the precision which we give it because we know exactly how it hangs together. It actually hangs together more or less by violence or lack of it. So it's very accustomed to violence, and it's very accustomed to mistakes. And it's very accustomed to all kinds of things. But you... frankly it'd be nearly impossible – absolutes are unobtainable but it'd be nearly impossible to make a sufficient auditing goof to actually upset the GPM.
On the other hand, you could make the pc very unhappy so it'd make it hard for you to get him in an auditing chair. You might be sufficiently knuckleheaded – I doubt it. It'd take a lot of duress – you might be sufficiently knuckleheaded to knock off the mock-up, don't you see. You could affect the morale of the pc with regard to auditing, strenuously. You could affect the body – the body is more resilient than you would suppose. But in actual fact the handling of a GPM correctly handles it, and slightly incorrect handling doesn't handle it, and doesn't even derange it. I think that stands very much in your favor.

You start doing one wrong and you actually ... I don't know what the count of items you could find in the thing is concerned. It is just go... will go on and on and on and on and on. And some of those items will be right, but the bulk of those items needn't ever have been found. That's why you get the varying length. The varying length of a GPM has to do with how long the goal served the pc as a survival mechanism. Its success, in other words, as a survival mechanism. And that doesn't vary it very much.

The difference of line plots, however, gives an apparent difference in the number of items in the GPM, because it's how many extraneous items does the auditor find and put on the line plot, that – still in that GPM but really needn't have been found – that would have blown if you'd found the right item. So you can put extraneous items in a line plot.

You can also put strays in a line plot that are from some other goal. You don't recognize they're from some other goal and they go into the line plot, and it isn't till you're straightening them up afterwards, after they've done three or four and you're neating up line plots, and you all of a sudden, "Where the hell does steam locomotive come from?" you see? Thooh! There's a steam locomotive sitting right there staring us in the face, and it's an oppterm, and it's got "a drunk engineer" as its terminal. And you say, "Where did they come from? Where did that pair arrive from?"

You look around for a while, you may not even have the goal yet. But you'll eventually find the goal and eventually you will find "to be powerful," something like that, and you'll be all set.

So stop worrying about the damage an auditor can do to the GPM because it is still sitting there – if it's grossly misrun, it is still sitting there ready to be run right. And that's a wonderful datum. It's still sitting there ready to be run right.

All right, we found item 1, item 2, item 3, item 4, item 5, item 6, item 7, item 8. Now all of a sudden we couldn't find any more items and we got "a steam locomotive" sitting in the middle of the line plot. Well, where did that come from? Where did all this go from? And we go back and we find that this one is ticking and that is R/Sing and another one's ticking. And we say, "Wha – whoa, whoa, whoa, whoa, whoa, whoa, whoa. What's going on?"

Well, your immediate conclusion is, is "Well, my God, we've messed up the GPM to such an extent that... And we can't find anything right. You know? Write off one pc." Pc'll feel like this, too. He'll be sure that he's now now'll be written off.

What's the truth of the matter? You go back and you look this over and you find something as flagrant as this: When they did the first source list for that GPM, they did it with a wrong wording, because the pc said he couldn't answer the right goal wording. Instead of
"Who or what would 'to be a ballet dancer' oppose?" Why, the auditor's Q-and-Aed, and he said, "...'being a ballet dancer' oppose." "Who or what would 'being a ballet dancer' oppose?"

This of course has opposed an item. Naturally there's an item in there called "being a ballet dancer."

And he's handled this now as a source list. Since it'll kind of act like this and can be overlisted — you see, any list can be overlisted. And he'll write it out, and eventually he'll get something that opposes it. And sure enough, he'll wind up with something opposing it.

But after he's opposed a couple of these RI lists he all of a sudden winds up with nothing and it's all backwards, or he's skipping the bank, and nothing is working right. He's done a wrong source list. What is your proper action? In all case repairs, no matter what state of running the GPM... See, you're not running a pc in the first place, you're running a GPM. The pc and you are cooperating in the running of a GPM. And at any stage of auditing on a GPM, you'll find the first wrong action behind you that can now be found — the first wrong action behind you that can now be found — and correct it, and do it right, the way it should be done. Well, we — you can just apply it and apply it and apply it and apply it. I mean, there it is. It goes back as early as the source list.

You found twenty-seven items in this GPM, and it's all been very difficult, and you've also found some strays and skips and have things backwards. It was all very, very difficult. And you eventually — why, you get very wise, and you go back and you look at your source list. This first goal oppose list, see. You look at this source list, and you look at that thing, and you say, "Oh, I don't know, I said, 'Who or what would "to be a ballet dancer" oppose?' And I — I listed it, but nothing's run right since. The first item that I found, which is 'elegant dancing' — obviously an oppterm — wound me up with a terminal 'to eat pork.' Deteriorated form of ballet dancing. Or is it?"

You don't even have to know that much about it. Go back and look at the mechanics of the source list. What's it look like? What's it look like? Well, along about that time, why, the auditor, let's say, has heard a lecture on don't overlist. Don't run the pc into the ground with listing. So he's done a perfectly valid — perfectly valid source list. Done a perfectly valid source list. Perfectly valid. It's eight pages. Eight pages of goal oppose, it's all answered properly and so forth. And there's even fifty items there on which no R/S or RR is marked — is marked.

Well, you realize — do you realize that if you went over any section of the list and found something else rock slamming or rocket reading, the list was incomplete. "Hey," you say, "but we've ruined it. We've ruined everybody. We've ruined everything." Now, in Routine 2 you can't make goofs like this. You can take some item off of a Routine 2 list and oppose it, and then you can't get anything else on the list to fire and it's all disarranged.

But 3M isn't like that. 3M is much more rugged. The actions of... in the GPM are much more rugged. He had an incomplete source list. Well, let's complete it. Let's complete it. All right. And at page thirty-nine, only then have we got an area of fifty items beyond the last RR or R/S, and no tone arm action. Page thirty-nine! Well, we skip back and we look at all the RRs, and they don't fire, and we find this mysterious thing has happened, that something
fired someplace on the list that we don't have anything null. So we eventually null the whole list, and there it is. And there it is, gorgeously. It's "ballet dancers." Quite obviously.

Fires like crazy. We oppose it properly. We keep opposing it, everything starts running off, bing-bing-bing-bing-bing. Goes right on down to the bottom of the bank and there we are, bang. Yeah, but you've already found seventeen items into this GPM. Obviously it was all disarranged, everything has gone to pot, hasn't it? No, it didn't disturb the GPM.

Let's say you found all the items to the bottom of the GPM and you even have the goal as an RI at the bottom. You've gone that far. And the thing is still all charged up and so forth, and you suddenly say, "Hey, do you know that we've never done a goal oppose list to start this GPM?" Do you know that you can now do a goal oppose list to start the GPM, and a goal oppose list to end the GPM? This is getting phenomenal, isn't it?

In other words, if a piece of it's missing, you can always put it there. You can always do the right action.

Now, your stable data for case repair – your stable data for case repair – is to take the auditor and put the fear of Ron in him. That's always the first action. First action. You say, "You realize – you realize Ron's nearly an OT now. And if he heard you doing things like this, ohhhf" You know that sort of thing, I mean, you know, put it in like that. You don't have to take responsibility for it, you see. As long as I don't hear about having to take responsibility for it, why, I will.

So your next – your next action after you've done that... You can also – you can also pick up one of the – one of the better looking girls around the organization or something like that, and tell the auditor that this girl – you'll arrange it so this girl will never again speak of him or to him, or something like that. You know, you can work up things by which he will realize that he should read his bulletins. And you get him to study up on his bulletins and read over his bulletins.

Now, if he's being too zzzzz about it all, you'd better have him read his bulletins. All right. Have him read bulletins, supplementary bulletins, anything else that he's got on the thing, and have him get this thing fairly straight.

Because he's got some data in crosswise. So don't just straighten up every blunder this auditor makes, straighten up the auditor. You got that? Straighten up the auditor and his blunder. Got that?

Now, right now there's some excuse. There's some excuse because you haven't got all the materials you could have. Data is still snuggling in. The job is getting easier and easier to do. There are little, short, quick cuts that are being found – that I'm finding that are not just shortcuts of doing 3M, but actually more accurate methods of doing 3M which cuts out extraneous material. And we're still left with our basic stable data on source lists, but we're not left with the stable data on RIs. For instance, it's nonsense to run a long RI list now. But that's a horse of a different hue, and I'll give you a bulletin on it. The point – the point I'm making here is the guy has got to know what has been found to be runnable. Now, you read the first three bulletins back in 1963, and it is now 1985, and he hasn't read any of the rest of them. That would be quite catastrophic, wouldn't it, trying to run 3M? So you straighten him out and
then straighten out what he's doing. There's your stable data. Because if you don't get him and coax him every time to review his material on the thing and go over this, and so on – if you don't coax him also to do that – then all your action will multiply on straightening out cases. In other words, he'll keep fouling up cases which gives you more and more wasted auditing, more and more wasted case repairs; more and more wasted this. You want to send him always back and refer him to a bulletin and insist he read it. You got that?

Your next action on a case repair, just looking it over, is handle the thing as though you were giving him a Clear test or something like that. The steps are given in there. Compare the goal to the line plot. Do they make sense? Does the line plot got anything to do with the goal? Read the goal. Put in your left-hand buttons on the thing. Get it to fire. See if it fires. See if it ticks. Later in the bank, of course, it won't fire anymore.

Then go over your line plot and read from the bottom to the top or from the top to the bottom. Read each item against the meter. Just read them against the meter. Well, let me tell you, if one of the items that should have come from a source list now RR... now rock slams, it's been opposed but now rock slams, brother, that is the most incomplete source list that anybody ever ...

Just the fact that the item off of the source list rock slams is enough to tell you that the source list was improperly handled. I mean, it's just one-two. See? It was opposed, and the charge did come off of it and the question didn't read anymore, see.

All right. That – a harmonic of that carries through the remainder of your – of your actions here on this plot. So here is your stable datum. Any item that reads, no matter how slightly – you got that, now – any item that reads, no matter how slightly, after itself being opposed, in actual truth came wrongly into being. It came off a wrongly done or handled list. That is just your stable datum. One, two, three, four, five, six. You see? That takes care of everything.

In other words, the list is wrong. "Oh, yes," you say, "what about these wrong way oppose?" Well, I'll get to that in a minute. If the thing rocket reads after having been opposed, beautifully, that still really is no guarantee of a wrong way oppose. That is a guarantee that the list on which it appeared – you know, the list just behind it on which it itself occurred – was wrong. Got that? Now, what you want is the earliest item on the line plot which now reads. You say, "With or without Tiger Drill?" I don't care which; doesn't enter into it. The thing has to be charged in order to have Invalidate read. You realize that?

You find the earliest in that sequence of auditing that ticks and look behind it, look at the list on which it appeared and do that list correctly.

There'll be something wrong with that list. It'll be overlisted or underlisted or listed wrong way up or down or something. There'll be something wrong with that list. That's the list you're looking for. That's the list. It isn't how long a list is, how short it is, how beautiful the handwriting on it is, none of these things enter, it is simply that list. That is the one you want. And don't let anybody disturb that stable datum. There's something wrong with that list.

All right. If you don't find something wrong with that list, you had better recheck earlier items found. Because you haven't found – you're not exploring the fundamental error. In
other words, there's a... if you can't find it off of that list immediately behind, then you look earlier for another one that ticks, because there's going to be something wrong with those. There's going to be something wrong with those. And as you go up the bank, if there's apparently no top on the goal or something like this, you know that the item just isn't on the list at all.

But in actual sober fact, in actual sober fact, you don't – there's no variations to this – you find the earliest one that was put on the plot – that was put on the plot, see, that's in chronological order of finding; not the earliest one or latest one in the bank or anything like that – get the earliest one that was put on the plot that ticks, and then correct the list from which it came.

You'll find inevitably and invariably and always that there is something wrong with that list. I don't care whether it was the source list, I don't care whether it was the first RI oppose, the second RI oppose, the third RI oppose, there's always something wrong with that list.

Now, what about these wrong way to oppose? Well, you worry more about wrong way to oppose than you should. It isn't true that it's something that you should neglect. That's not true. But a wrong-way oppose, most frequently has this phenomena connected with it: It throws you out of the GPM. It throws the pc right out of that GPM into another GPM, and you get what we will call a stray.

And this stray looks entirely different than the rest of the plot. So when you find a stray on a plot, then you trace back and locate which one was wrong-way opposed that gave you the stray. Where's the first stray on the plot? And that is the way you check your wrong-way opposes.

Now, normally you try to list an item wrong way to, the mass comes in on the pc and the needle tightens up, and a lot of undesirable things happen, and it's pretty obvious. Also, calling the item to the pc with the line question one way and the line question the other way usually winds him up with an idea of which one turns on the most mass. And you don't want that one. You want the reverse one.

One of them makes him feel easier, the other one, so on. Some pcs out of pride will direct you to the wrong item and the test is not very good. But in actual fact you yourself should know by inspection and your location in the bank whether it's a term or an oppterm. Have you got that? You ought to get good enough to just recognize it by significance. You, a trained auditor, recognizing that all GPMs follow the same pattern as the one in the March thirteenth bulletin – those lower items and so forth; they're all in that sequence and so forth – should recognize where you are. And if you've cut in, down deep into the bank with the wrong source list, or something like this and it starts all going unsatisfactory you will find the first source list item that you found and put on the plot is still reading. So it goes back to the first correction.

Now, what do you do with all these items you have on the plot? You leave them on the plot. You don't take them away from the pc, you say, "There is his items. There are your items. That's it," he's all happy about it, they're his items, fine. And you just proceed from the new correct item you find on the list that was incorrectly done. Just as though you had not
found any other items. And you'll find out that your plot just keeps on beautifully. And that's true for all stages of case, that's true for all cases, that's true for all GPMs. I don't know what more you can need as a repair datum. Quite remarkable.

You'll find in – I know this, that you'll find if an item R/Ses when you read it back on the line plot and you get an item that R/Ses – one of those RIs now R/Ses – that the chances are it came from the source list, and the source list was incomplete. And the source list was a total mess. And it was nulled backwards and upside down and a few other things like that. There's something wrong with the list the item that ticks comes from and the item that gives you a stray was a reverse-opposed.

These are stable data in case repair. And all case repair should include in it – if you yourself are supervising auditors – the case repair should include an admonition to the auditor to review his material. He's probably re... he's probably missing something. Try to teach him yourself a bit, tell him to reread his material, keep him pushed on at it, and all of a sudden light will dawn, bells will ring, sirens will go off, a steam engine will vanish out of his immediate vicinity.

Now, there's your action. Get him educated, repair the case, see. Now, if you yourself are doing it, and you're trying to repair a case, don't repair a case that doesn't need repair. That's worrying too much. Don't fail to repair a case that you yourself are auditing, don't fail to repair a case that needs repair. Don't just keep blundering on.

Now, you have the ARC break assessment, you have other things, and you will come to learn that every time you goof badly is when the pc has a small, slight ARC break, or a big roaring one and you fail to do an assessment off of the ARC break bulletin. You always thought you knew what was wrong, and it's very remarkable that you will find out that you didn't. You will spot what is wrong in the immediate vicinity of it, you'll say, "Yes, I picked up the wrong item. Yeah, I bypassed the fellow's goal, obviously."

No, no, I'm afraid that isn't what you did. You probably did something else. Like, you didn't complete the list, or you didn't do something else. And it'll show up. The judgment of the ARC break assessment is better than the auditor's. That's true of all auditors. That's true of me. True of all auditors. It's – the judgment of that is better than the auditor's judgment any day of the week.

It comes up, and it says you have a wrong GPM. Well, God, you know you're in the right GPM. The thing is all worked out. Here you've got this goal, and you've got these items and so forth. "Wrong GPM! Ha-ha-ha-ha! Nuts!" Here you have this goal "to be a ballet dancer" and you've got "smashing power," "steam locomotives." There they are, right there, and so forth. So you say, "Obviously there's no reason to do an assessment."

But I've seen some blunders made recently, all done by an auditor who assumed he knew what was wrong because it was so obvious in front of his face and then pressed on with that assumption. And then really went wrong.

Because he didn't pick out what was wrong. What was wrong was a missed withhold. All right, but it was of a slightly different character than he thought. He thought he had the wrong goal, or he bypassed a goal. No, he just bypassed a GPM, that was all. He thought that
he'd reverse listed something. No, he didn't reverse list something; he hasn't -- he's not picked the item off of a list three lists ago. It shows up something else.

The real rough ones are withheld from both the auditor and the pc. That's the real rough ones that really cause you trouble.

Well now, that's case repair. And I could give you 8,760 laws and you could memorize and spend the rest of your life memorizing them all. In actual fact there aren't this many rules and laws in case repair. There are just those rules and laws in case repair. And you could also do some other things with case repair. You could also run cases so that they always have to be repaired. But the real method of repairing a case is to run it by perfect 3M in the first place. It's my job to give you perfect 3M. And it's your job to see that it works for you, too.

You'll find out this indestructible thing, the GPM, will only surrender to exactly correct Routine 3M. It's the only thing in the universe that makes a dent in it. That safeguards you, because you can learn 3M, I can teach it to you. And on the other hand, if a case is run totally wrong, why, all you have to do is run it right. And the only thing you have to do with case repair is find out where it wasn't run right, and then you've got it taped. And take the earliest action of it that wasn't run right, correct it, and the case all straightens out.

3M looks very dramatic, you're liable to get very, very nervous, you're liable to develop ulcerosis glaucoma magna. But actually, you're probably worrying too much. You've probably got too many conditionals. There's all kinds of "Well, gee-whiz, you know, the pc kept blinking his eyes in the session, and I knew very well there must be an oppterm there of some kind or another." Yeah, the pc kept blinking his eyes in the session, yeah. Probably couldn't have done anything else. The auditor turning the sheets over for the listing kept hitting him in the face. I mean, you just worry too much. You understand? There's too many cockeyed significances. There's too much worry-worry-worry, think-think-think, figure-figure-figure.

Now, what you want to think is, "Are you doing exact Routine 3M?" It's my job to show you exactly what routine 3M is. And then you recognize when it isn't done. Because there's 7,865 ways per square inch of the pc's bank area that it can be done wrong. That's by actual calculation.

Okay, you couldn't imagine all the ways it could be done wrong. Man has been trying to do something to his reactive mind and his bank and make a dent upon his fellows for two hundred trillion years; you've got the pc sitting in front of you with an intact GPM. Isn't that marvelous? I consider it's absolutely wonderful. What's only more wonderful than that is we get the exact key to the lock and delicately and adroitly turn it in exactly the right place and open the door to freedom.

All right. Well, that's the way you repair one. I hope that it'll do you some good. I know that I've had quite a time working out its principles because there were so many things that could be wrong and weren't. And these were the principles that stood up. You will always have exceptions to it, and the exceptions will inevitably be the creation of somebody who didn't know 3M in the first place. Okay?

Thank you very much, and good night.
TV DEMO : SEC CHECKING
WITH COMMENTS BY LRH

An auditing demonstration given on 27 March 1963

Well, how are you today? How are you today?

We've got a demonstration today. We're going to be sec checking somebody, showing how you dig something up. Your attention is recommended to the fact that the auditor is not there to miss withholds on the pc. This is not a definition of an auditor.

What's the date, by the way? Twenty...

_Female voice: Twenty-seventh._

Twenty-seventh of March 1963.

And the art of Sec Checking is very, very well established. It's one of the finest arts that we have. But it is to a large degree an art. It is restimulating the material to be picked up. And then picking it up.

I think somebody here recently went through a – in one week of four hours of auditing – I think that was right, wasn't it – one week of four hours of auditing, went through the last two pages of the Joburg, a Form 6A and what else?

_Female voice: And a student Prepcheck._

And a student Prepcheck. Oh, boy! That's really remarkable. I don't know how he did that. In the first place, it isn't that we want to audit slowly, we want to audit thoroughly. And thorough audit is very much the point.

Now, one of the things which you will find, one of the things which you will find consistent and so forth is that a good auditor gets something done. He audits the pc in front of him. He gets something done. And it's _not_ getting _through_ the Prepcheck; it's getting _through_ to the pc.

Withholds restimulate. They are actually not there. They have to be keyed in. And I think you will see some of that happening now.

Now, let me see if we're ready downstairs here. Yes, we're all ready downstairs, and we're about to see some Sec Checking. Okay? There we are.
Auditor: Hmm? Is that right?

PC: Nearly. This will do.

Aud: Okay, Leslie. Well, what we're going to do in this session is that I've got here the uh – Joburg, the last two pages of the Joburg...

PC: Hm.

Aud: ...which I understand has been flattened on you over the – in the pavilion.

PC: Well, we got something alive on it.

Aud: You still got something alive.

PC: Something alive.

Aud: All right. So what I'm going to do, I'm going to check down this list, to see what's reading or not, and then if we get through that, then I've got some more questions I'm going to put to you, to clean those up as well.

PC: Yeah.

Aud: All right?

PC: Yes.

Aud: Okay. If I can get some of these questions alive, that's good for both of us, all right?

PC: All right.

Aud: Good. All right, now, that's fine, thank you. Just give the cans a squeeze. Thank you. Let them go. All right. Just once more and let them go – right. Thank you. All right now, I'm not going to put in Model Session here, if we do need it however, I will, but I'm not going to put Model Session in. Is that all right with you?

PC: Yes, it's all right.

Aud: Okay. Now, is there anything you want to tell before we start, at all?

PC: No, except that we were having trouble cleaning up something this morning and I felt a bit sort of shaken since. I was quite sure this morning I didn't have a missed withhold that they think I had.

Aud: Okay. All right. Now, anything else?

PC: No.

Aud: Good. All right, now how about this room? Is it all right to audit in this room?

PC: Yes, it's all right.

Aud: All right. Very good. Now, is it all right with you if I begin this session now?

PC: Yes.

Aud: Okay. Start of session! Session started for you?

PC: Yes.

Aud: Very good. What goals would you like to set for this session?

PC: To clean up anything that's been missed.

Aud: Good. All right, any other goals for this session?

PC: Just to do my best.

Aud: Good. All right, is there anything else?

PC: I think that'll – that'll be all right.

Aud: That'll be all right, very good. All right. Good. All right, now we're going into – straight into the questions here, and the first question I'm going to ask
you is: Do you know any communists personally? All right. That's the question I'm going to ask you. Now, tell me what does this question mean?

PC: Well, it means, do I know anybody who I know is a communist.

Aud: Hm-hmm.

PC: And I think it means in this life.

Aud: All right, thank you. All right, well now, here's the question. Do you know any communist personally?

PC: No.

Aud: All right. Did – a good look at that?

PC: Well, if I – if I do, I don't know that they are.

Aud: Hm-hm.

PC: I mean, I might know somebody who is a communist unknown to me, but not known to me.

Aud: All right, thank you. Has anybody told you – think who might be a communist or anything, do you know?

PC: Well, I just thought of one preclear who gave us a bit of trouble about a year ago, but I don't think he was a communist.

Aud: All right.

PC: I just thought of him then.

Aud: Okay. Is there anybody else?

PC: No.

Aud: All right. I'll check this question on the meter now.

PC: Hmm.

Aud: Do you know any communist personally? All right. You possibly have an answer there, do you?

PC: No, no – I just felt nervous and wondering if it would read or not.

Aud: Hm-hmm. All right. Okay, I'm going to check that question.

PC: Yeah.

Aud: We had an equivocal read there.

PC: Yeah.

Aud: Do you know any communist personally? There is a read here.

PC: The only thing I get there is something which has come up in processing before.

Aud: Hm-hmm.

PC: It's some – came up on this question, some past lives stuff, that's very confused and I'm not sure about it. But that's all I get.

Aud: All right.

PC: Hmm.

Aud: What actually do you get here?

PC: I usually think of Lenin and...

Aud: Hm-hmm.

PC: ...sometimes Karl Marx.

Aud: Yeah.

PC: ... and I used to get the idea that I had had something to do with starting communism.

Aud: Hm-hmm.

PC: And it gave me a horrible scare ...

Aud: All right.
PC: ... and I backed off that one.
Aud: Okay. Now, I'll ask you the question, do you know any communist personally?
PC: No.
Aud: All right. I'll check it on the meter. Do you know any communist personally? All right, do you agree that's clean?
PC: Hmm.
Aud: Okay, thank you. All right, now, the next question I'm going to ask you is: Have you ever injured Dianetics or Scientology? That's the question I'm going to ask you. Now, tell me, what does that mean to you?
PC: Um, have I ever damaged it or hurt it in any way, or...
Aud: Yes...
PC: ...um – injured – it could mean have I prevented it from advancing, like I really feel it shouldn't advance, by...
Aud: Hm-hmm.
PC: ...by not doing things, too.
Aud: All right. Okay. And on the question "On Dianetics," what's this mean to you?
PC: Well, I haven't had very much to do with Dianetics except for...
Aud: Hm-hmm.
PC: ... trying to sell the book to a few people.
Aud: Right.
PC: Hmm.
Aud: And Scientology?
PC: That means just the general science all over the world?
Aud: All right, okay. Now, how long have you been in Dianetics or – and/or Scientology?
PC: '59.
Aud: Since 1959?
PC: Hm.
Aud: All right. Okay, well, have you been working in an organization or something?
PC: No, with Eddie, in the franchise center.
Aud: Hmm.
PC: Uh – I did – did a little bit of auditing in Melbourne.
Aud: All right. Okay, well, now, I'm going to give you this question. All right. Have you ever injured Dianetics or Scientology?
PC: Well, the thing I thought of there, straight away, was uh – the preclear I had in Melbourne ...
Aud: Hm-hmm.
PC: ... auditing her.
Aud: Yes.
PC: I was – I had to leave Melbourne and go back to New Zealand and I hadn't completed her intensive. She still had missed withholds at that time.
Aud: All right.
PC: It wasn't a break of agreement there, but the fact was that I felt that I could have done a better job auditing her than I did do.
Aud: All right. What did you actually do there?
PC: Well, I left Melbourne while she still had missed withhold.
Aud: All right. Okay. Any other doingness there?

PC: I didn't use my own judgment...

Aud: All right.

PC: ...in the sessions.

Aud: Very good. Anything else there?

PC: No, I don't think so. I think that's all.

Aud: All right, okay. I'll give you the question again. Have you ever injured Dianetics or Scientology?

PC: Yes, by being slow with dissemination.

Aud: All right. Now, when was that?

PC: Thing I thought of there was once – uh – we were going to put an advertisement in the paper for a course in something and I slowed Eddie down in doing it in some...

LRH: You notice that rock slam – that rock slam there that she's turning on over this question. You notice that it's early and late. That is quite common.

PC: ...very banky sort of way, and...

Aud: Hm-hmm.

PC: ... oh, no, we won't do it just yet, you know, sort of – I said something like that, and we actually put it off.

Aud: Yes, all right. Okay. Now, I didn't quite hear what Ron said then and I wondered if he could repeat it.

PC: Yeah.

Aud: All right.

LRH: I said it was just early and late, that rock slam, and that she does have a rock slam there on this subject – but it doesn't get instant when they do that on a Sec Check. You can expect it to turn up and turn off, and she's really shadow boxing with something. That's all I said.

Aud: Thank you.

LRH: You bet!

Aud: All right, now. I'm sorry, I didn't get – quite get the last of your communication there.

PC: I've forgotten what I...

Aud: All right, okay. I'll tell you what I'll do, I'm going to give you this question again. Have you ever injured Dianetics or Scientology?

PC: I didn't get any definite answer there, nothing that ...

Aud: Hm-hmm.

PC: ... I've definitely done.

Aud: All right. Um – what – were you looking at there?

PC: Well, what I was looking at before was uh – slowing Eddie down in getting an advertisement put in the paper advertising testing, that might have been.

Aud: Hm-hmm.

PC: Sort of a back-off of confronting new people.

Aud: All right. Okay.

PC: And I – and I was successful in doing it. I realized it was an overt.

Aud: Hm-hmm. All right. Anything else you did around that time?

PC: No, I didn't get anything there at that time.
Aud: All right. Well, let's have another look. [PC laughs] All right. Have you ever injured Dianetics or Scientology?

PC: I feel as if I have, but I don't get anything there.

Aud: All right. Well, what are you looking at there? Something there.

PC: Just – just a feeling of grief.

Aud: Hm-hmm. All right.

PC: The – the thing is that I feel that I've done wrong, and – and – to do with Scientology and Dianetics, is in – in not making myself get a bit of necessity level on it and start things.

Aud: All right.

PC: That's the thing I feel.

Aud: Okay, when didn't you – when didn't you do this thing?

PC: Oh, I haven't done that all the time. Ever since I came into Scientology, all the time, it's been constant really. I – I do a little bit, now and then.

Aud: Yes.

PC: And when I do, I usually do – well, a good enough job to know that I ought to do a bit more, you see?

Aud: All right. Give me an example here. What's that?

PC: Well, that was 1960, before we started practicing Scientology.

Aud: Hm-hmm. Yes?

PC: And feeling we ought to start. I think it was 1960, I'm not quite sure of my dates.

Aud: Yes. All right.

PC: But at that particular time we were having a bit of confusion, Ed and I, and Ed was a bit down, and I had the feeling that I ought to do something.

Aud: Hm-hmm.

PC: Sort of get cracking, you know, quite strong, and I just didn't do it. But I – I knew I should have done it a certain time, and then I sort of forget about it.

Aud: Yes, well what was it you didn't do here, at that time?

PC: I'm getting a bit mixed up.

Aud: Yes, well...

PC: I – I didn't run a PE Course.

Aud: All right, okay.

LRH: That's a pumping needle, by the way, you see there, class, that's a pumping needle.

Aud: All right. Now. What was at – at that time, what was it you actually did?

LRH: It can also be caused by somebody having their cans against their clothing while breathing.

Aud: There.

PC: It would be – the thing I did would be, say, just go out to the pictures or something like that and do a...

Aud: Hmm.

PC: ..just do lazy sort of things instead of doing something worthwhile.

Aud: Yes, very good. Very good. Can you give us a specific time when you did this. An incident?

PC: Gee, I've got this shut off.

Aud: All right. Okay. Some time when you went to the pictures.

PC: I just get the idea of – of going in the truck, you know, just being –
having my body in the truck, moving toward the picture theater some time, but I couldn't tell you exactly when it was, it must...

Aud: Yeah.

PC: ...have happened dozens of times.

Aud: All right, now you're telling me that you got this feeling you – what was it you were doing? What was this general thing you were telling me here?

PC: Doing things like being irresponsible, going to the pictures, instead of getting here.

Aud: All right, have you got one time when you went to the pictures?

PC: Well, the – the time I've got when I – I had this urge to do something was ...

Aud: Yes.

PC: ...coming home from the pictures. I've got that time.

Aud: All right, what happened there? What was it you did?

PC: Oh, I think I'm starting to see a bit of daylight.

Aud: All right, very good.

PC: There's more to this, this – this – I was processing Eddie at the time...

Aud: Right.

PC: ...and he was getting upset as a – as a preclear.

Aud: Yes.

PC: I think that was what it was.

Aud: Hmm.

PC: And – um – this is before missed withholds, you know.

LRH: See that needle go clean?

PC: ...and uh – the cause would be in giving – giving bad auditing and no results, because he was confused and didn't want to – didn't want to start until he was sort of more sure.

Aud: Yes.

PC: And I had this urge to do something, real strong this time, and I probably made him feel guilty about it, but the fact was I had done an overt before that.

Aud: Yes.

PC: Because if I had done good auditing he would have felt all right.

Aud: All right. So what – where was this overt to here then?

PC: I don't know which overt you want.

Aud: The actual overt you got in mind when you said you'd done some bad auditing on him.

LRH: See, this is ...

PC: I don't have it there, except that I – just a general idea of – of a bit of confusion near his processing.

LRH: See that needle dirty up again the moment that she started talking about this bad auditing.

PC: And...

LRH: Moving on down toward what she really did.

PC: Once I blew of from him in the session.

Aud: I beg your pardon?

PC: Once I blew from him in the session...
Aud: I see, yes.

PC: ...probably around about that time.

PC: Uh...

Aud: Hm-hmm.

PC: The – the one – I've got one there now.

Aud: Good.

PC: I've done it after this, too. I – I did this a – a few times.

Aud: All right.

PC: Uh – first one would be – uh – I was trying to get his case going and I'd be running a process – "What part of that scene you are looking at can you be responsible for?" or something like that

Aud: Yes.

PC: ...and he got upset in the session, you see, and I'm trying to get this process going and I got angry because he was angry and I blamed him, you see?

Aud: Right.

PC: It just went – and I think I said, "You can go to hell," and I just left. And I realized when I got to the door – I was in a real rage...

Aud: Hm-hmm.

PC: ... what I'd done, and I came back.

Aud: Yes.

PC: I don't even remember if I ended that session or not. But I did go back.

Aud: All right. Okay. Now, is there anything else you did to that – in that session?

PC: Oh. Break the Auditor's Code.

Aud: All right. Anything else? Anything else there?

PC: I – I didn't get anything. There must be, but I sort of ran up against a blank wall.

Aud: All right. Well now tell me, when was the first time you blew sessions on this preclear? That's it.

PC: There was twice, very close together and I don't know whether the one I'm telling you about is the first one. I think it is the first one.

Aud: Well, what was the other one here, then?

PC: The other one was – uh – one – early one morning.

Aud: All right.

PC: Quite close to that time, probably within two months.

Aud: All right. Now, what happened on that occasion? Hm-hmm? You have got something there.

PC: Not – not anything yet.

Aud: And what happened in that session? The other session where you blew? It's there. It's there.

PC: Oh, yes.

Aud: Hm-hmm.

PC: Uh – he – he got upset about my auditing.

Aud: All right. Okay.

PC: And I just – I just didn't confront that.
Aud: Hm-hmm.
PC: So I blew.

Aud: All right, and what had you done then in here?

LRH: Notice the auditor properly called that a motivator, see? "He got upset and I blew," so now we got to get the overt, see?

Aud: There it is.
PC: I didn't want to audit him.

Aud: All right. Now, the – when – when was that? That.

PC: I – this was all the same time. It was the – the one... it directed me to another one, there were two close together

Aud: All right.
PC: ...and this is the one morning before I went off to – to school.

Aud: Right, fair enough. Now, what had you done in this session? There. There. There you are.

PC: I get the feeling I haven't got it yet.

Aud: Okay, just have a look there, something you did. There you are. There.

PC: Oh, I thought I started the session late.

Aud: All right, okay. Well, is that what you did?

PC: I'm not sure, but that's what I've got, that's what came up...

Aud: All right.
PC: ...just then, when you said "that."

Aud: All right. Okay. Now, is there anything else in that session that you did? Something there.

Aud: Oh, all right.
PC: I don't remember what.

Aud: Okay. Let's have a look at this. What – what was said in this session that led to this? Something there.

PC: Uh – all I got there was the idea of Ed saying to me I wasn't doing something right, and I can't even remember what I was doing or what it was I wasn't doing right.

Aud: All right. Okay. Now, what was before that, was it, that you weren't – that you'd done in this session? Before he said that to you? ... You've got something here.

PC: Not seeing anything yet.
Aud: Hm-hmm. Let's have a look. Was it an auditing flub?

PC: Well, it would be an auditing flub.

Aud: Hm-hmm. All right.
PC: Would be an auditing flub.

Aud: Well, what was the auditing flub?
PC: Not understanding the preclear.

Aud: All right. Okay. What didn't you understand there?

PC: I'm getting a bit of – bit of it back.

Aud: Hm-hmm, good.

PC: Um – I didn't listen fully and – and acknowledge his difficulty.
Aud: All right.

PC: There was some difficulty with processing...

Aud: Yes.

PC: ...in Scientology, and his case. At that time he felt that he could help other people with Scientology but nobody had helped him, you see?

Aud: Right.

PC: And – uh – it used to come up a lot in sessions.

Aud: Yes.

PC: And now I think it's – feel that that would be what it was.

Aud: What would it be, actually, then?

PC: Well, I must have done something that he – made him feel awful, the preclear was feeling lousy anyway, that's for sure.

Aud: I didn't quite hear that.

PC: I must have done something to make him feel bad, because the preclear would have been feeling really bad in the session.

Aud: Oh, all right. Okay.

PC: And – and got a failure...

Aud: Hm-hmm.

PC: ...somehow or other, about auditing.

Aud: Yes. Now, was there something on this you didn't understand or something that you did in the session?

PC: Oh, I didn't understand it.

Aud: Oh. All right. Now, where – um – well, tell me this, which house was this a – did this session take place in?

PC: Oh, this was in – uh – uh – River Road, 574 River Road.

Aud: All right. Is it a big building? Small building?

PC: No, a medium-sized house.

Aud: All right. How many rooms in it?

PC: Oh, I don't know how many rooms – one, two, three, four, five.

Aud: All right.

PC: Five major rooms.

Aud: All right, now which room were you auditing in?

PC: We were in the front – the front lounge.

Aud: All right. Tell me, how's that room furnished in?

PC: Oh, I get that view all right!

Aud: All right.

PC: A carpeted floor and a settee and the sofas.

Aud: Hmm, yes. Very good. All right, have you got the picture of that, when you – when you had this session with him?

PC: Yeah. Yes.

Aud: All right.

PC: It's getting better.

Aud: Good. Anything – um – distinguishing – anything distinguishing about the preclear that day?

PC: Only being upset, I guess.

Aud: Yes, all right, well, his attire or his clothing?

PC: I seem to think he had on his green jersey, but that's what I think.
Aud: All right, very good. All right, now have a look at this session, see what it was you did ... It's kicking here ... All right. How you doing?

PC: Uh – all right.

Aud: Good.

PC: I'm sort of just looking, trying to find something.

Aud: Yes, all right. Well what – what process were you running? What sort of auditing were you giving him on this occasion?

PC: It would be what was out at that time, I think.

Aud: Well, what would be – what was it – what were you running in the session.

PC: Gee, it's hard to recall. Could have been Havingness and Confront.

Aud: All right.

PC: Or it could have been uh – uh – one of those routines.

Aud: Well, all right. Was it one of those routines?

PC: There was another one, another – another routine there and I'm trying to pick it up, what it would be.

Aud: Hm-hhm.

PC: Hmm. I'm not sure.

Aud: All right, now what – what were you doing at the moment when he – when you started to get – when he started to get ARC broken then?

PC: Running a process, I'd be running a process when it happened.

Aud: All right. Okay. And what were his words to you?

PC: I'm not sure whether this is right or not, but...

Aud: Hmm.

PC: ...I get the idea...

Aud: Yes...

PC: ... of him saying, "I don't think this is doing me any good."

Aud: All right. Okay. Now, what was it – what would it be that wasn't doing him any good then? What process were you running at that time?

PC: Christ! I don't know.

Aud: All right, how's this doing – going?

PC: It's a bit hard to get – get what it is.

Aud: All right. Well now, tell me, this wasn't the first time you'd audited this PC?

PC: No.

Aud: All right. Now, were there some earlier sessions when you'd audited this PC?

PC: Yes.

Aud: All right, now, in any of those earlier sessions that you got something that you'd done wrong in them?

PC: Plenty of things. I hadn't blown in those earlier sessions, but...

Aud: Pardon?

PC: ...I hadn't blown...

Aud: No, all right, okay.

PC: ...in those earlier sessions, but plenty of things.

Aud: All right. Now, was there an earlier session you can recall here, with this PC?
PC: Well, it – it might be the first or second session I gave him.

Aud: All right, now how's that session seem to you? What did you do in that one?

PC: We were running uh – overts and withholds.

Aud: Good. All right, yes. Now, what – uh – what did you do in that session?

PC: Well, I'd be running "What have you done to me," "What have you withheld from me?" That would be what I'd be doing.

Aud: All right. Now, how did that session go?

PC: First session went all right.

Aud: Good. Your second session?

PC: Second session...

Aud: Yes?

PC: Ah yeah, the second session was when I started getting uh – uh – some trouble with the ARC...

Aud: All right.

PC: ...in the session.

Aud: Very good. Now, what was it you did in that session?

LRH: There's an additive in that first session.

PC: All I can get in the second session was, uh...

Aud: Hmm.

PC: In the second session I gave him uh – we were – were at this time, we weren't married...

Aud: Hmm.

PC: ...and we were just going together, and I was a bit keener than Eddie was at that particular time.

Aud: All right.

PC: And in the second session, some of this started coming up as his withhold, you see...

Aud: Yes.

PC: ...in that session. But I didn't do anything wrong in that session, I just acknowledged and went on. But I felt shaken up, but I might have done something before that.

Aud: All right, very good. Well, what about the first session then, that you ran? Yes? [pc laughs] Hm-hmm, yes?

PC: I've looked at this before, and...

Aud: All right.

PC: ...the first session I ever gave him, the only overt I could – I can think there, is quite a – quite a good-sized one, really ...

Aud: Hmm.

PC: ...and it would be – would be teaming up – I sort of suggested that we audit each other...

Aud: Hm-hmm.

PC: ...and the – the teaming up there was sort of for Scientology, but the – my main goal uh ...

Aud: Hm-hmm.

PC: ... was second dynamic goal, I sort of – sort of fell for him, you see. And I was really...

Aud: Yes.

PC: ...after him...

Aud: All right.
PC: ... in a cunning sort of way. So the auditing would be as a means for that, really, underneath.

Aud: All right. Now, was there anything in your auditing, along these lines? Second dynamic lines at all?

PC: No, not at that point, I don't think, no.

Aud: Hm-hmm.

PC: I was only running overt-withhold on me.

Aud: All right.

PC: Oh, well, I get his overts off on me, and he won't fly!

Aud: Pardon?

PC: I get his overts off on me and his withholds, and he won't fly.

Aud: All right. Okay. Is that it?

PC: Oh, yes, well, that's part of it.

Aud: All right, now, is there anything else in that session?

PC: No, I don't see anything else there.

Aud: All right. Well now, how about this pc now? And the subsequent ARC breaks? Still something there.

PC: He didn't really start ARC breaking...

Aud: Hmm.

PC: ...him... himself, until that's – probably about three or four sessions, and maybe even a week later.

Aud: All right.

PC: I think it would be within a week, really.

Aud: Okay. Now, after the first session, what about the second session? Is there anything you did in that session? Yeah?

PC: I don't get anything I did, I was just looking at the session...

Aud: Hm-hmm.

PC: ...just – just looking at it there.

Aud: All right. Now, was that – how – what was the purpose of running that session?

PC: The purpose would be to clean up the overts and withholds, get the – get it clean.

Aud: Yes. Very good. All right, now any other purpose as far as you were concerned?

PC: No, no, the – actually the other one I told you about, I didn't consciously fully realize it about that at the time, but...

Aud: Hm-hm.

PC: ...I could see it afterwards...

Aud: All right.

PC: ...that it was there. But it wasn't – uh – I had it nicely suppressed.

LRH: [talking to auditor]

Aud: Um. Uh-huh. Uh-huh. All right. Okay, well now, why did you come into Scientology then? What was the original idea of coming into Scientology?

PC: Uh – the original idea of coming into Scientology.

Aud: Hm-hmm.

PC: I had read a little bit about it in a book.

Aud: Yeah, hm-hmm.
PC: And got a bit interested...

Aud: Yes.

PC: ...and I then heard a bit about it from my father, just a little bit.

Aud: Right.

PC: And then I saw – I was very bored and dissatisfied with my job...

Aud: Right.

PC: ...and so I wrote to the Christchurch Scientology people to find out if they had a course. And that's – that's...

Aud: Yes.

PC: ...primarily – I think that was the first reason why I came in.

Aud: Yes, all right. And you wrote for the course, then what did you do?

PC: Pardon?

Aud: You wrote for details of the course...

PC: Yeah.

Aud: ...then what did you do?

PC: I went to the PE Course!

Aud: Right, yes. All right.

PC: And Eddie was running it. That's where I first met him.

Aud: Oh, I see.

PC: That's where I got my eye on him.

Aud: Pardon?

PC: I said that's where I got my eye on him.

Aud: All right.

PC: Sounds awful, doesn't it?

Aud: Okay. Thank you. Now, what – uh – then – was there any purpose then of continuing on?

PC: No, no, I don't think I had any strong second dynamic feelings until probably partly through the week, I sort of thought "Oh, he's nice," something like that.

Aud: Hm-hmm.

PC: And I thought, gee, you know, nice boys like that in Scientology...

Aud: Hm-hmm.

PC: ...you see. But first of all I really was sure at that time that Scientology was something.

Aud: Good, all right.

PC: Yeah.

Aud: So what was your – what happened after the PE Course, what was the next move?

PC: I – I went on to a co-audit...

Aud: All right.

PC: ...in Christchurch. And did the extension course.

Aud: Okay. Now, why'd you go on that co-audit? Yes?

PC: I went on that co-audit with the – with the reason – I don't want to own up to this one.

Aud: All right. Yes?

PC: Because I thought he might audit me.

Aud: All right, okay. All right. Now, any more on that?

PC: No, he didn't.

Aud: All right. Okay. So that was the original purpose there, was it.
PC: It would be part...
Aud: All right.
PC: ...would be partly, not wholly.
Aud: All right, okay. All right. I'm going to check this original question again now, all right?
PC: Hm-hmm.
Aud: Have you ever injured Dianetics or Scientology?
PC: I feel a lot better about it, but I don't really see one.
LRH: Yeah, nice and clean, isn't it, huh? Nice and clean.
Aud: All right. I didn't quite hear what you said here.
PC: I – I feel a lot better about it.
Aud: Hmm, right.
PC: But I don't know if there's anything there or not.
Aud: Well, we got a nice clean needle here now, all right?
PC: Yeah.
Aud: Okay.
PC: Yeah.
Aud: All right.
LRH: You can close it off.
Aud: All right, now, uh – it's a nice point to finish up...
PC: Hm.
Aud: ...on the session, so if it's all right with you I'm just going to finish the body of the session now.
PC: Yes, that's all right.
Aud: All right. Anything you want to say before I do uh – finish the body of the session?
PC: Well, I've had a little look for this before...
Aud: Hmm.
PC: ...since missed withholds came out, with Ed, but I haven't had a good a look at the whole sort of picture like this before.
Aud: All right. Okay.
PC: Yeah.
Aud: All right. Well then, have you made any part of your goals for this session?
PC: Hmm.
Aud: Which was to clear up anything that has been missed, and to do your very best.
PC: Hmm.
Aud: All right.
PC: Yeah.
Aud: How'd you make out in those?
PC: I feel good about that.
Aud: All right. And on this one "to do my best"?
PC: Yes.
Aud: All right. Now, are there any other gains you've made in this session you'd care to mention?
PC: I didn't feel too worried about the audience.
Aud: All right. Very good. All right, anything else?
PC: Only – only a comment.
Aud: On goals and gains I was
asking you if...

**PC:** Yeah, yeah.

**Aud:** You want to make a comment? Do so.

**PC:** Oh, just – just a comment that it was so much easier to get – get to it when – when we went earlier.

**Aud:** Hm-hmm.

**PC:** I got – couldn't get that later one at all.

**Aud:** All right. Very good.

**PC:** Yeah.

**Aud:** All right. Okay. Now, I'll just check your havingness, all right?

**PC:** Hmm.

**Aud:** Just – uh – good. Now, give the cans a squeeze, would you? Let them go. All right, now, your havingness is down. What is your Havingness Process?

**PC:** "Touch that" or "feel that," I think they work.

**Aud:** All right, okay. Put the cans down, then, would you? All right, I'm going to run "touch that," okay? Touch that table. Good, all right. Touch that cord. Good. Touch the top button of your jacket. Very good. Touch your right cuff. Good. All right, touch your nose. Fine. Touch your hair. Very good.

All right, pick up the cans. Okay. All right, now, good. Now, give the cans a squeeze. Okay. Let them go. All right. And once more. All right. Well, we're almost back to where we started there and I'm going to leave it at that. How do you feel about that?

**PC:** I feel all right.

**Aud:** All right, very good. Now, is there anything you care to – uh – end of Havingness Process. All right, is there anything you care to ask or say before I end this session?

**PC:** No, just thank you.

**Aud:** All right. Is it all right with you if end the session now?

**PC:** Yes.

**Aud:** Okay, here it is: End of session! Session ended for you?

**PC:** Yes.

**Aud:** Very good. All right, tell me I'm no longer auditing you.

**PC:** You're no longer auditing me.

**Aud:** Good. All right, thank you.

**PC:** Okay.

Well, there you have an example of Sec Checking, actually, with a first cousin to the withhold system. Pressing it back to the earliest time, picking up the earliest charge and carrying it on forward.
I want to call to your attention, very distinctly and very definitely, that there is a wealth of difference between Sec Checking and getting mid ruds in or some other type of activity.

Now, you get the mid ruds in, something like that, or clean up something, it is simply for the perfunctory, the perfunctory purpose of getting a session going, getting things out of the road, momentarily, so that you can carry on with what you're doing.

In Sec Checking, you are doing auditing with this type of action. You're doing auditing with it. In doing a Prepcheck, such as on purposes, you are doing auditing. That's different, don't you see? You're doing auditing of the pc's case with the process. In other words, with Sec Check questions and with Prepchecking – doesn't include Prepchecking a goal or something like that – but in Prepchecking – by which I mean you're trying to find times when well, you're trying to find out how certain purposes have been suppressed and that sort of thing – you are actually doing the auditing with the Prepcheck. You understand?

So on, however, goals running or 3M or some other process, you are simply using the mid ruds; you're simply using the mid ruds to brush the pc off of it – so they won't get in your road, do you understand?

Now, you can either audit with these things – as you just saw a demonstration of – you can either audit with these things or you can just set a pc up so they can be audited. Do you see that? In other words, there's two distinctly different uses to such things as a Sec Check question or a Prepcheck question, do you understand? They are two distinctly different uses.

The one use is to get auditing **done** with it. And of course, that's hammer and tongs. That's get the earliest one on the chain. That's this, that's that, that's the other thing, you see. Steering the pc's attention, finding out if there is anything. Restimulating the pc, if you please, to find out if there's anything that can be picked up and then going ahead and picking it up.

And then on the other side – on the other side – we have their use, very permissive, just lightly brush off, "In this session has anything been suppressed?" "In this session has anything been suppressed?" Pc says no, you say, "All right, I'll check it on the meter: In this session has anything been suppressed? That doesn't read on the meter." And away we go. You understand?

Now, that same question, that same question, used on the subject of purposes might go very well this way: "How has a purpose been suppressed?" The pc says, "Oh, I don't get anything on that." Oh, no! We're doing a Prepcheck, you see, we're using this thing to get auditing done. So we have to say "Well, what do purposes mean to you?" "What are purposes all about?" "What's suppression?" "Did you ever have any purposes, like that? Do you suppose there... any purpose was ever suppressed? Anybody's purpose was ever suppressed?" Anything like that.

Pc says, "Oh, I see what you mean. Yes, well, I've badly suppressed my father's purposes, and so forth." Well, of course, you realize by the limits of the question you can't just have "What purpose was suppressed?" That's a bad process. You have to say – it's like "Look around here and find something you could go out of ARC with." Spin the pc. So you have to say, "All right. Now, how did you suppress that purpose?" And all of a sudden, why, the pc is
giving you answers. You don't have to keep badgering the pc – that isn't the point, you can just keep giving the question, as long as the pc gives you answers.

Your tone arm sitting there, as you've had tone arm motion and so forth, and the pc all of a sudden puts on the brakes and he says, "That's all!" Well, all you've run into is something the pc is unwilling to tell you. So you just have to go ahead and find out if this is the case. It's – pc has something there that he doesn't want to tell you.

There's a difference here, in other words. When you use Sec Checking and Prepchecking for the purpose of auditing, you are pressing the question home to the pc. You are making sure that the pc understands that question. You're making sure that the pc knows this question applies to his life. And you're trying to pick up the earliest incident that is available and carrying it on forward. You've walked the pc down a chain, and so forth. You get auditing done, in other words, with this question.

But, over here, on the other side, just rudiments and Havingness. All right, well, we just do a light brush-off, with the rudiments, we make sure they don't read on the meter, we run some Havingness on the pc – pc comes up smiling. We don't badger the pc at all. Do you see that is a difference? Two entirely different modes of auditing. The mode of auditing done in W is very different than the mode of auditing done in Z. You have to learn both modes of auditing. You need both of them.

How are you going to pull somebody's missed withholds, to set him up so they aren't going to explode in your face all the time while you're trying to do 3M? Well, you'll have to take up the whole question with him, you have to restimulate these things, in other words. You have to discuss these things with him. Sec Checks, of course, are very good to do this with.

Now, your concept and understanding of this is invited. You haven't – you actually can't be called an auditor unless you can see check and press it home. You understand? And you actually can't be called an auditor if you don't know this other method of just a light brush-off and dash on. You understand? Because you're trying to get your Routine 2, Routine 3 processes done these days, don't you see? Well, you're not trying to press anything home.

But let's take the borderline process, which is your 2G1. And that pc just goes on answering, answering, answering smoothly. But if the pc isn't answering, you have to know how to press that question home and get it answered. So it's at 2G1 that you have the great divide between these two things. It's a part of each, you understand?

Now, where a pc is having difficulty and a rough needle and a lot of things are very poor about the situation, where all these things are going on – pc is uncomfortable, and so forth, about life – you can straighten them out with a Sec Check. And your procedure would be more or less the way you saw it.

But as I press home to you, it is an art. It is an art. It's not a – it's not a one-two-three – four-shift, one-two-three-four-shift, one – you have to audit the pc in front of you. Pc's saying, "Rah, I don't rah, rah, rah, gahr and I've never done anything to Dianetics and Scientology, except, of course, I'm pretty critical of the way you're auditing me and I'm pretty critical of the organization," and so on. Well, realize that there must be an overt beneath the criticism,
that's one of the stable data of Sec Checking. It's up to you to find that chain of overts. And it's up to you to get the bottom chain of overts. It's up to you to release those overts. You notice this girl went down to female Clear read on this. Well, one of the things that happens on Sec Checking is that a high tone arm gets cancelled out. And you get them coming down on it, if you do good Sec Checking.

So it's quite an activity all by itself. And it's a distinctly different activity than that carried on in Routine 3 and finding goals and that sort of thing. Do you see that?

Now, you have to learn both kinds of auditing and learn when to use each. And I hope that you've got some idea of that now.

There's one remark I'd like to make technically, rather than post it on the board, and that is that 2G1 is not run on the needle. Sec Checking is run on the needle. 2G1 is right part of its old ancient grandfather – and I'll give you more talks about it – was Routine 2 Prehav levels. And that is all run on the tone arm. And you run it up to a high tone arm, more or less stuck, and then shift to your next level. And it's all done on the tone arm. It is not done on the needle. No part! Nothing! And no part of the auditing commands are run on the needle in 2G1. Do you understand that? Only the tone arm. And you have to be able to persuade the pc to answer it a few more times. As long as there's tone arm motion going on, you have answers.

Now, there's 2GPH, which is the original Routine 2 Process, which is by Prehav level, applied to purposes. And you will be learning that one, too.

But I'm just calling that to your attention because those early 2Gs are all tone arm. All tone arm. Not needle. Sec Checking, rudiments, Havingness is all needle, not tone arm. You got the idea? They're quite distinctly different. Not only different processes – they use different parts of the E-Meter.

All right. Well, I'm very pleased with that demonstration and I think we ought to give Reg and Leslie a big hand.

Thank you. Thank you very much, and good night.
The GPM

A lecture given on 28 March 1963

How are you today? This is the 28th of March, AD 13. I don't have any messages here saying any of you people have gone Clear or anything like that here today. I guess you must be all slowing down, huh?

Well, it's getting towards the end of the week. Spring's here. That's it – spring. You're suffering from spring fever.

We have a new arrangement here today. We've got a – I got a board here I can draw you some pictures on and it's about time, because if you can't get it verbally you can always get it through pictures, huh? 7

All right. Now, let's see. Want to talk to you today about the GPM – the GPM. The composition of the GPM – or the GPMs – and the composition of any single GPM actually marvelously enough can be found in Dianetics: The Modern Science of Mental Health in the description of how an engram is formed. And we're right back to basics. Every time we've had anything that was true and anything that was very useful and usable to us, it is traced back, oddly enough, to the dynamic principle of existence is to survive. That is the primary take-off point, to survive.

And of course, the oddity of that problem is, how can a thetan be so fixated on the effort to survive when actually he can't do anything else. And that is his basic problem. His basic problem is he can't do anything else and therefore he works at it.

Truthfully, some thetan worries about will he get through or will he make it. He worries about that in processing. Well, I've been wrapped around a few telegraph poles myself in processing, pioneering the way, as you very often are. Pioneers fall into ice crevasses and that sort of thing. I've had my share of ice crevasses.

But the basic problem here is that you haven't got any other place to go. That's something for you to remember. That's something to keep in mind.

Some pc says, "I don't know whether I should be processed or not. Ha-ha-ha-ha-ha." Huh! That's silly. That's a silly thing. "Whether I should be processed or not."

Well, you see, he in actual fact hasn't got any choice in the matter. He's definitely in trouble. He may tell you he isn't, but he is. And he's trying very hard to survive.

There one time after I wrote the first book I thought there was a dichotomy here. And I thought that it was succumb was the opposite to survive. And it isn't. There isn't any. The trap of this universe is you can't quit.

---

7 [Editor's note: The diagrams mentioned by Ron in this lecture can be found in HCOB 2 April 1963, DIAGRAMS ILLUSTRATING TAPE OF 28 MARCH 1963, New Technical Bulletins Volume VII]
Now, we've had – we've had a student who arrived over here and he isn't a student, really and he's been playing footsies with the idea that maybe he shouldn't go on course. He thinks maybe he ought to quit. Did you ever try to quit? Let me tell you something. You can't. It's not possible to quit. You'll always rise up again and try again because there isn't anything else you can do.

Now, if you digest that basic datum, "How can a man quit?" – you go back on the track and what do you find? You find he's still trying to fight the Battle of Antietam or something. He's still trying to fight this battle. He has not been able to quit.

You go back a hundred thousand years and he's still trying to play the game of knighthood was in flower. Only right now he's still trying to play this game. He wants to be a gentleman or he wants to treat the ladies nicely or something of that sort. What's this impulse stem from? He's still trying. Well, this game's been over for ages.

In fact the first game of this nature I know is about a hundred trillion years ago. And there's another sort of knighthood-in-flower game earlier on the track than that even. And he hasn't ever quit. Oh, become degraded, become miserable, become bogged down; but he never quit. He can't! Even though he says, "Well, I quit. Well, that's it."

Well, let's take a businessman. And the government officials are all over the shop and all day and all night, every day and so forth, and the tax people and the licensing board and the food surveyors and the this and that-a's, and he's always mixed up in some way or another, and he just can't get the help to go on. And after a while, why, he says, "Well, the hell with it, I'll quit." Ha-ha-ha-ha-ha. Let him try, let him try.

You know you always can pick up such a person a few months later, and you can ask him whether or not they should have quit. Well, you see, they've had to work twice as hard, because all the papers that had to be filed have now got to be refiled and so forth. And a bankruptcy or something like this is the most overworked activity you can possibly engage in. People come around and they say, "Well, how about this tin of sardines that you didn't sign a receipt for in 1952?" He says, "1952, tin of sardines. Were we even in the sardine business back then?"

"Oh, well, yes. Yes, yes, yes, yes. Well, you'll have to figure that out," and so forth. He can't quit.

You take a box fighter. He has been in there shifting around in the ring and he's gotten himself well up toward the championship, and so on. And then one fine day, why, he loses a fight, so he says, "I'll quit, I'll quit." Only he hasn't got any finance with which to quit. And here he is fooling around trying to quit and he has a few minor fights so he can have enough money to quit, you know. And he has a few other fights so that he can have enough money to quit. Eventually, here he is a sparring partner, you see, for five dollars to go three minutes, or something like that. And he hasn't been able to quit there and eventually there he is walking around in the street with the birds going tweet, tweet, tweet on every side of him, still trying to quit the fight game.

These fellows who quit the war are all very interesting to me. They quit the war. They stopped fighting the war. They stopped, and by God they're still in the war.
Every place a thetan has ever been, he is still trying to be, or trying not to be. But as far as an absolute succumb, this he cannot obtain. And his basic problem on the track is that he can't quit. I say that very advisedly, he is not permitted to quit.

I remember one time pulling a gag on the stellar organization. There's an organization they used to have. You know, they used to have ships on the sea before they had missiles. You probably wouldn't remember that; it's a long time ago. And they had these ships and they went around and shot at each other, that sort of thing. Interesting game. And I finally worked out how to be left alone. I decided I was tired. And day after day, why, I just laid down on the job. I was on a base and I didn't care anything about it, and so forth. And – why, I really got reamed out, I was supposed to be in there every morning and read that bulletin board and that sort of thing. I found out about as close as you can come to quitting and I said... This commander – I mean, he had gold lace and all sorts of things – and he says to me, he says, "You're supposed to be here every morning. You're supposed to read that bulletin board. You're supposed to go out here and muster oh-oh-ah-rruoww, you know, rocks and shoals, perils of the sea."

And I looked at him and I said, "Oh, Commander, it's been a long war."

"Oh," he says, "you can't talk like that. You can't talk like that. Oh, come on now. Well, we can find an easy billet for you and so forth, and be a good boy and so forth, and you can't just quit, you know." And God, after that, why, anything I wanted on the base they let me have because they thought I was about to quit. So all life actually conspires to keep people in there pitching.

Now, a thetan exteriorizes out of some mangled body that has unfortunately got in the road of some scientific achievement and he gets out of the skull and he looks around and he says, "I've quit." Well, he may have quit, but what are you and I doing as auditors finding this guy still exteriorizing, and still trying to quit. I don't care whether – if it was a hundred trillion years ago or otherwise; we find the engram of him doing that. Isn't that interesting?.

Now, engrams – engrams are there to provide methods of survival – methods of survival. There's a long discussion of this in Dianetics: The Modern Science of Mental Health. He's long since found out that he can't quit so he adapts methods of survival. And these methods of survival are quite interesting. He learns lessons which he instantaneously applies. The one thing he finds out is that life permits him no time to confront. If he were given unlimited time to confront, he could then work out any situation he is likely to encounter. Do you see that? You know that with a reality? If you just had time to confront everything in your environment you would then be able to get yourself enough familiarity with it, in order to handle it.

Well, the one thing which this universe and life omits in the platter of goodies they give you – the one thing they omit – is enough time to confront. That's the main thing – enough time to confront. That's the whole crux of the situation.

Lacking enough time to confront you have to develop instantaneous reaction. Gradually the individual becomes convinced that he no longer has time to confront, so therefore he builds a house which will instantaneously react on given stimuli.
Here's the way this works. Fish swims into an area which has a yellow sand floor and gets bitten. So he just solves the whole problem of being bitten – he hopes, since he can't solve the problem; he didn't have an opportunity to confront it, and he just never seems to get around to having enough time to confront being bitten – that every time he gets over a yellow sand floor he goes away. That is his solution to the problem. Yellow sand floors are dangerous so you don't stay around them, you leave. So he has this engram and he keeps this engram up so that if he doesn't leave over yellow sand floor, if he doesn't leave, he experiences the pain of being bitten. So when he experiences this pain he is reminded that he had better leave, so he gets out of there.

You see that mechanism. That's an engramic mechanism. Then he develops a crazy jerry-rig-built house whereby when he sees a certain stimuli he then replies with a certain response. And you've got a stimulus-response mechanism which is built in in the form of engrams.

Father speaks loudly: drop food on floor. Well, it's a good answer. It sure shut the old man up. He stopped talking about that, didn't he? Huh? So there's a whole little series of pictures here that go along with this and they operate as a stimulus-response basis. It's all survival mechanism. It may not look that way, but it is.

Remember all the data of the service facsimile? The service facsimile was one the fellow used to get out of trouble. This is how he operated. Well, it was very useful, very useful. By observing a certain stimuli he recognizes danger may be present. Lacking the time to adequately confront that danger, he is now placed in a situation by the engram of reacting in some way or feeling the pain of former accidents.

In other words, he sees the stimuli and he gets the response. And he either executes the response or he forces himself instantaneously to execute the response by inflicting upon himself pain – pain, unconsciousness, something like this. There's always... these things are infinite in the number of ways they can be worked out. This is all discussed in Dianetics: The Modern Science of Mental Health.

Well now, what's this got to do with the GPMs, or a GPM? Well, we're dealing with the engram on a very easily recognized and recognizable level. But the engram is hardly a lock on to an item in the GPM. Every single item in a GPM is to some degree active and the RIs are compulsively active and they all have the same purpose. When confronted by a certain situation, the thing to do in order to survive is the terminal RI. When confronted by the oppterm RI one then assumes the terminal RI. This is survival. One knows what to do.

When confronted with too many loud voices one becomes... or when confronted by a hostile audience, one becomes a cabaret singer. That's the dictates of the RIs.

Well, what about this goal? Well, a thetan was going along minding his own business and he finally found out he couldn't trust himself. That is always the common denominator of the formulation of any pattern such as a GPM, an engram or anything else. The lesson he learns is that he cannot trust himself. He did not have enough time to confront, so therefore he could not properly react. That's elementary. He found out that his efforts in some direction became nullified through an incompetence in himself.
Well now, it's slightly more gruesome than this. That's his first determination before he enters these things. But before he enters that, there's a slightly earlier one. And that is he gets the idea of possession and protection. This is compounded later by using things to create an effect with. But early on he is simply trying to protect what he has. And he protects what he has and eventually he has areas as a thetan, you know, like King of the Wood, talked about in Frazer's *Golden Bough*, so on. He plays this game of King of the Wood and he's protecting the wood, don't you see? And somebody comes along and decides to cut down the wood and he protects the wood.

He's playing a game there of havingness, and havingness is an integral portion of this. And then he finds out he can't trust himself to protect the woods, so he fixes up an automatic mechanism. When confronted with an axman, he becomes a storm, something like that. Opperm, axman; terminal, storm. All right. That's a solution to the situation and he'll put it into effect. He knows that he won't have enough time to confront the situation and analyze it. He's lost trust in himself as an analytical mechanism. He has made mistakes is what he has done, so then he no longer can quite be himself. In other words, he can only continue to be himself as long as he had a reliance upon his own judgment and upon his ability to protect things which he considered his.

Those are the mechanisms on which he is operating. And when he finds out that he cannot trust himself, he has made a mistake. He then, as a being, himself, a thetan, tends to degrade and tends to become some other thing. And these, then, are repeated over and over with – that is to say, his disasters are repeated over and over with consecutive removals.

Here you have the individual himself, right here. Now, here he is. And as himself he is being perfectly happy here, he's – so on – got a nice halo and so on. He's just a happy thetan and he's not bothering anybody particularly – so on. Somebody comes along and they say to him, "That halo looks silly."

And he says, "Well, it's worn by all the very best saints," and so forth.

And they say, "It's still silly."

And he says, "Well," he says, "I'm – I'm – got a perfect right. I have a perfect right to wear this halo." And he gets mixed up in a glare fight of some kind or another and so on. And instead of being himself, here, totally capable of having a halo or not-halo, he becomes fixedly – he becomes fixedly an identity: a thetan with a halo confronted by a critic. So a critic; here appears a critic. When confronted by a critic he becomes a thetan with a halo.

Now, he's had some wins this way, don't you see? He's had some wins this way. He finally manages to spread the word around that thetans with halos are actually – are actually the chosen of the big thetan. And the critics are actually daring the wrath of the big thetan if they criticize thetans with halos. He's had to then adopt a secondary thing over here which is an imagined force or an imagined power.

But, he's now an identity. That's an item. He's no longer, actually... feels safe as just himself. See, he's protecting the havingness of the halo and he is (quote) "a thetan with a halo" (unquote).
Well, that'd be some kind of a way backtrack sort of a glare fight area thing and we wouldn't have any GPMs yet. But he finds out through many encounters of this character, he finds out that, eventually, that he had better have a purpose in life. And that is about the first identity that he assumes that he never really gets rid of. And the common denominator of all thetans who have ceased to trust themselves is a thetan with a purpose. It is easier to survive with a purpose, he thinks, and he's got this all worked out, but he's always a thetan with a purpose. Therefore he never becomes himself. He never becomes himself. He's always a thetan with a purpose.

What is this purpose? Well, it's any postulated action which he feels will get him out of the trouble he's been in. That is his purpose. And one of these purposes is characterized just that way. It's a postulated purpose which will get him out of the trouble which he has been in.

Now, I covered that briefly. I said here he was, and one day he mocked up a halo and somebody — somebody criticized it and so forth. Well, eventually, eventually, he will have a goal "to be godly." He's now a thetan, not only with a halo, but he'll have a purpose.

Of course, this is way back. Later on he gets this idea of having a purpose, and he'd better have a purpose or else. That's the thing, to have a purpose or else. So he says — about the time he adopts God here — he says "to be holy" or "to be a holy person" or something of that sort.

Well, "to be holy," this is perfectly all right. There's nothing wrong with this, but in the process of "to be holy" he starts out as a thetan with a purpose. There he is, he's a thetan with a purpose. All right. That's fine.

Now, what's his next action? Is to assert the purpose. He's doing this all for survival, don't you see? He's already learned the lesson that he can't trust himself. He's already learned the lesson that he had better protect things and he's already learned the lesson that the real way to survive is to have a purpose. So here he is, thetan with a purpose.

Now let's take our next progressive action here and he isn't a thetan who has a purpose, he's a thetan who is a purpose. Now, this we just have as the stated purpose. This'll just be the purpose here "to be holy."

But this, by the way, will be an all-dominating thing, and he'll call this "the goal to be holy." Now, this becomes the thing, you see. That's becoming more — more important than he is. And now let's take it one more stage — one more stage here — and we've got a purpose and then we also have him as somebody. "Somebody with the goal to be holy" or "somebody who wanted to be holy," something like this, and we get the first three stages of evolution of a goal.

First it's just the goal. You see, it — all by itself, it's just the stated postulate. And then the postulate gets a little more massy and becomes, "the goal to..." And then — gets a little more massy, "somebody with the goal to...," you see. And that succeeds in every case. There is no variation from this.

Now, he goes further than that. And as he goes up the line here, he eventually finds himself in a very fine state of affairs. Let's take it the way you find it.
Here's a purpose and over here some kind of a provocation and here is the goal, stated as the goal – purpose, you know; "the goal to..." That has some kind of an opposition. And then over here, here is, "somebody with the goal to..." and more opposition. And then, so on, and then so on, and then here he is, his terminal lines, don't you see. Well, a lot of these things – but when we look this over we find out that he is down here, he's down here, and that's just the stated purpose. And then it becomes "the goal to..." and then "somebody with the goal to..." And now look, if this is holy, this will be "a holy person," see? The purpose is now getting more and more massive, don't you see? It's interiorizing more and more.

In other words, the more he conflicts with these things over here – these opposition terminals which are the difficulties he finds in life – the more he conflicts with these things, why, the more massive he himself becomes and then of course conflicts with something else and then the more massive he becomes, and then he conflicts with something else and the more massive he becomes. He conflicts with something else, don't you see? And then to assert that he becomes more massive like this, and there he goes, you see. Rather fascinating the way this thing winds itself up along the line.

In other words, he's asserting this same thing based on the fact that he can't trust himself, based on the fact that he wants to protect or defend something or to survive in general, and based also on the fact that he can't quit.

Now, he gets up the line here and... well, "a holy person," you see. And now he's liable to go into some postulate character like this. He's "being holy." You see? He can't quite be a "holy person," but he's "being holy."

Well, that's fine, that's fine. Now, what's our – what's our evolution up here at the top, as we get into the top of this thing? Here he is "being holy," and what he's confronting here, what he's confronting, you see, is "critics" was the first one, you see. And then "critical people" was the next one. And when we get up here, why, we'd say "sneering, overwhelming people." And then over here, see, this is "being holy" – in sequence to the other one that we just had – this is "being holy." And over here are "critical church people."

Oooh, what's this? Well, his purpose is beginning to cross over here, don't you see. Is – he's getting a cross-over purpose. So he's – now he's got, "critical church people," you see. Waah, what's this? Golly, he's now fighting, "critical church people," so what you resist you tend to become. And he gets up here and he's got here a new identity which is a crusader. Well, that's not quite a holy man, you know, that's somebody who fights.

And over here – over here he's got, "religious bishops who excommunicate," or "excommunicators" or something of the sort. And now as we go on up he finally gets to these top terminals and here you have him being "a critical thetan." That's "a critical thetan," see, and then over here what do we find? We find "holy people." You see the evolution of what he did there, see. And here we have "a critical thetan."

Now, what have we got? What are we looking at? We're looking at the bottom-to-the-top proposition. We're looking at a situation here where the individual is being called on to defend mass. He postulates himself new identities in order to do this. He can't trust himself, so he has to postulate these new identities to keep it going. And of course he starts in fighting
critics and he gradually mingles his identity until the whole thing crosses over and changes over.

Well, what do you know? This is still a survival situation, just as the bottom of the thing was a survival situation.

How did you handle a critic? That was his problem. And he solved it by becoming a holy person and he winds up here fighting holy people.

Now, there is the course of existence as far as he's concerned. To some degree he becomes these, too, don't you see? So he's less and less his goal, and more and more the enemy becomes his goal.

Now, you ask, in running off goals you say, "All right" – here's opponent – "What would be the goal of holy people?" See? And he'd say "to be holy." Bang. and you'd get the thetan's goal. You ask, "What would be the goal of a critical thetan?" He'd say "to be critical." And it won't check out because that's actually the goal of the opponent throughout.

Now, this is very interesting. These things contain... I haven't drawn the complete number of items which are actually to be found in one of these GPMs, whatever it is, twenty, thirty, forty. And it all takes... how long it takes them to graduate, you see. And here he goes right up to the top.

Now, when he gets here he's got a new problem, he's got a new problem. He no longer considers this a survival activity. This he doesn't like. It's a violation of his own purposes. So he has to do something new, and this becomes extremely important to him.

Here's the bottom of one of these – here's the same two that you just saw. Here's "holy people," right here, and here's "a critical thetan." This game is worn out. This game is worn out. The old game, you see, that's gone. That's gone. He's not got anything more to do with this.

How do you get out of a spot like that? How do you get out of a spot of being "a critical thetan?" Well, you do it by postulating – you go into a sort of a blank area and you say, "I'm completely lost now. I haven't got a goal. It's all gone." Get into this blank area – you've still got, however, over here, "holy people."

How do you handle these dogs? Not as a "critical thetan," that's all unsuccessful and he feels pretty degraded. No, he's got to postulate a new goal. A new goal has got to be postulated here which handles these "holy people."

How are you going to postulate this goal? Well, you just up and postulate it. But you see postulating and insisting upon is quite interesting. You don't just sit off – you've got – probably got an idea of a thetan sitting off in space, in the blackness of space saying, "Oh, I think I will postulate a goal. Yes, 'to be a good boy.' Yes, that's what I'll do. All right. Now, that's postulated."

No, man, that isn't the way that goal is postulated. That goal is postulated something on this order, see: He says, "It's gone. I just feel like the devil, you know. And everything's gone to pieces here. And these confounded 'holy people.' God! What are you going to do about them? There's only one thing that would work, I'm sure, only one thing that would
work, only one thing that would work. *Haarrrrrrrrrrrrr!* To be a devil. *Ha-ha-ha-ha-ha-ha.* That would work. Yes, yes, yes. I think ... I think I'll try it out tentatively."

"Well, how are you today father? You probably don't recognize me. I'm a devil."

Oh, holy people say, "Eeek! God almighty."

"Oh," he says, "that's terrific." He says, "That'll handle them." So he says, "To be a devil. All right, that'll handle it. *To be a devil. To be a devil. To be a devil.* I'm going to be a devil. *I'm going to be a devil, a devil. Now, you got that now? You hear me now? Me, you know. Listen! I'm going to be a devil, a devil, a devil. *Rrrrr-rrrr. I'm going to be a devil.* I've got to concentrate on that, you see. *To be a devil, that's the thing to be. Brrrrrr.*"

Finally – finally, "That's pretty good, you know, that's pretty good, and it handles this. There, it handled it." And he finds he's now the enemy of "good people."

He's got a new enemy. He handled these "holy people" but now all the "good people" in the community turn on him as a man and they say, "Oh, oh. *He's a devil. Ho-ho-ho.*" And he recognizes these are good people so he begins to detest good people. So he dramatizes this one. And of course he has to become "the goal to be a devil" and he runs into "self-righteous people," and then of course he has to be much more – more mass involved in the thing. And he's got to say, "I am somebody who is a 'somebody with the goal to be a devil.' That's who I am. I'm somebody with a goal to be a devil, who else I am, that – that's me, somebody with the goal to be a devil. I mustn't forget that." And of course runs square into "inquisitors." And there we go again. And what does he finally wind up at the top of the next bank? (Just amputating this.) Winds up at the top of the next bank "devilish people – a good thetan."

You see how this goes? It's his effort to survive. You don't even have to mild it up to the point of saying, "the effort to have a game." You understand? It is frankly, very correct, that at the bottom of this bank it is a violent effort to survive. He's finished. He's absolutely finished at this point. He's a critical thetan. He hates himself. He is faced by holy people; he can't stand that. It's an intolerable pair, so he postulates himself a brand-new goal.

Now, how come thetans do this? How come they do this time after time after time with such great regularity? How do they do this? Why do they always do the same thing? Well, they are faced with exactly the same problems.

The problems are identical. You have the problems of this universe; you have the problems of formulation of MEST and mass, matter, energy, space and time; you have the thetan's effort to cope with this situation; you have a common denominator that he actually can't quit; you have a common denominator that he will wind up not being able to trust himself; you have the common denominator that he inevitably will try to protect some of this MEST and as a result he winds up with the identical solutions.

And it actually rattles off on a whole set of axioms. These axioms are unwritten at the moment, but they are a whole set of axioms like the MEST universe axioms. And they consist of now-I'm-supposed-to's or laws. And he actually forms his GPM by law. And that law is all

---

8 Editor's note: "bank" is here used to mean "one GPM"
agreed upon and... at any time that it's this and that. Actually they are very simple laws and they are based on the very elements which I gave you earlier in the lecture.

Now, that's how that GPM parades. To some degree, you see, each time, he becomes "holy people." To some degree he becomes here, "good people." To some degree he becomes, in each case, the opposition terminal. So when he's finally through – when he's finally through this mess and mass and potpourri – we have you, and actually have me. And when we start going on the backtrack, what do we run into? We run into the top of the bank (or we should), and we find the thetan in his most degraded form opposing an exalted opposition terminal. And then by opposition we go on down through and we finally come down to the bottom and in every case you find "somebody with the goal to be a devil." Some... you'll find "somebody with the goal to be a devil" or "somebody who wanted to be a devil." You'll find in every case an item down here which will be "the goal to be a devil." In every case you will find right here "to be a devil." That's inevitable.

Over here you get variation. This is variety at the bottom of the bank. You say, "Well, listing these things out, if the pc knew they were there he could simply put them on the list." Yes, pcs who know they are there put them on the list. But the trick is just this – if you're not overlisting madly – the one that belongs in the position will fire.

Let us say at this position of the bank we've got an item here, "a devilish fellow," see. This is this item here, that's "a devilish fellow." All right. And the pc says, "Well, let's get down to the bottom of this thing and get the show on the road and let's put 'to be a devil' on the list," see. Well, he'll also, of course, list "a devilish fellow," and he'll list two or three other things. And he'll also list "to be a devil." And it won't fire. What'll fire on your short list is "a devilish fellow."

All right. Very well and good. Our next action in here when we come down, the pc says, "Well, I – I – I know what this would be. I know what this would be, this is obviously 'somebody or something who wanted to be a devil.' That's obviously that." So he puts that and two or three other things on the list. And if he, at that same time put on "the goal to be a devil," and "to be a devil," on the same list, only the one in sequence will fire.

You're saved from this embarrassment. We don't care how he... well he knows the bottom of the bank. In fact, I'd prefer him to know that there are three down there at the bottom of the bank. When he puts them on the list, if he's way up here somewhere, "a devilish fellow," they just don't fire. You say, "Well, that's the goal. Of course that will fire." No, the goal won't fire as an RI when expressed as an RI with... if it's not in proper sequence.

In other words, it will come out by 3M\(^9\) correctly unless you are overlisting. But that's what occurs on the bottom of a bank. And there's a border between these two banks like that, and you actually go over the border of the banks. Well, it's – they're two different GPMs. They exist as great big black masses all in their own right, which is a compounded squeeze-together of all of these items I've been talking about. In other words, one goal, one black mass.

---

\(^9\) Editor's note: 3M = Routine 3M
Well, what happens – what happens if you have four or five goals all jammed together? No, they still come apart – one goal, one black mass; one item, one black mass; one... inside the goal but part of the black mass. In other words, every GPM is a black mass. And the GPMs, if they're apart or separate or stuck together or anything else, constitute what looks at first glance like a mass; but as the pc begins to run them his perception picks up, he begins to recognize one mass from another mass. Quite interesting.

Well, why are they so burned down? Why are they so black? Well, it's just that he's exhausted all the energy out of them, that's all. You'll find he'll still dramatize these things. They are apparently moving on forward into present time and always under formation. He's always in some stage or another of the GPM in its formation. He's always forming the top of it, but he also very often dramatizes that which has gone yesterday.

You see, he couldn't quit, so he's just as likely to use this goal of his, "to be holy," in some given circumstance. Well, he goes into a church and all of a sudden he's restimulated. He feels kind of weird and kind of sick, but he's restimulated. He goes into this church and at first he – well, let's say he starts to church as a career. And, oh, he gets along all right. He goes to church for a little while, he goes a lot – a lot of Sundays, a year or two, or something like that and one day he starts to feel kind of sick. He gets into the – sits down in the pew, and he starts to feel kind of sick. And he looks around and suddenly he realizes that that priest is pretty critical, pretty critical of him. Or maybe the priest did say a critical thing. And he's all set, you see.

And the next thing you know, why, he gets this horrible feeling that he had better do something devilish. Inexplicable. All of a sudden he does something devilish. In other words, he just picked up an old area in an old GPM – was restimulated momentarily – he lived through it, did its responses and so forth.

Why? Because it's the now-I'm-supposed-to. He's got a whole system of now-I'm-supposed-to's. And these now-I'm-supposed-to's routinely will give him the right answers and the right responses for any given condition instantaneously without further inspection on his part. He just knows what to do, man, and then he will survive. The only trouble is these things have never been very survival and formulated to match the times of Charlemagne, they don't go very well in the days of Khrushchev. They don't match anymore.

"I know what I'm supposed to do – a swordsman. Ha-ha. Golly, ain't nobody wielded a sword for a long time." He feels sort of out of place. He feels upset. He is faced with something and it says to him that he must be a swordsman, but, thhuh, he can't make it. He goes and reads books about sword collections. That's about as close as he can come to it. The more he reads, the more he's got to read. The more he reads the sicker he gets, but he's still got to read these books about sword collections. But he's in an interplay here of the universe around him and these things still have survival answers.

This girl is faced by a loud man and she knows what to be. She knows what to be – a cabaret singer. And she goes ahead and tries to be a cabaret singer and fails at it most gorgeously. Whereas the girl could probably be an opera singer with no difficulty at all. The one – see, opera singer, that isn't – wasn't going to be very upsetting. But a cabaret singer – oh-ho-ho-ho, that's the thing she's got to be and can't make.
You'll find people all the time trying to do things that they can't do, whereas they can
do something superior to them superiorly and won't do it. That's one of the puzzles of human
behavior. Well, those puzzles of human behavior are contained in this.

You can explain these things by engrams for the excellent reason that that which sticks
and has a command value in an engram is actually one of these GPM items underneath the
engram kicking in. And when you ran the engram you actually ran it off the top of the GPM
item and it didn't trouble the pc. Old repeater technique, or something like that will as likely
as not, as often as not, key the thing out and free it.

This is why processes have worked where they have worked, and also why they have-
n't worked where they haven't worked. Because these items here, the fellow has lived. He's
lived those things with ferocity. Those goals haven't just been, "Well, I now think I will put a
goal in 'to be a devil.' Yes, I think I will postulate that. All right, 'to be a devil.' That's postu-
lated." Ah, God no, man. He worked at the postulation of this goal day in and day out, week in
and week out, year in and year out. And he just got it so it would stick. Never, never again is
he going to be caught in any such situation as into be holy. Never. Never. "To be a devil.
That's the thing to be, to be a devil. Now, you hear me now; you hear me now. Now, listen –
to be a devil," and so on. This is to... in other words, he trains himself into the thing. And then
of course he inevitably gets its enemies and then he partakes of those enemies, and then he
partakes of those and those and those and finally this thing betrays him and he can no longer
have that goal or basic purpose.

A thetan has a basic purpose – a thetan has a basic purpose when a thetan can no
longer trust himself after trying to protect something in the physical universe. That gives him
a system of goals and out of that system of goals you give him the piled up system of items
which you get in a GPM.

When a GPM fails to survive anymore – I mean, to serve anymore as a survival
mechanism – when the GPM fails our next immediate action after that is to create a new goal
and to go the limit on it as long as it is useful. And is... when that one wears out and one is no
longer able to see anything in it but a totally degraded form, to achieve the next – to postulate
the next goal to solve the GPM that's just past. So we just have nothing but a solution to a
solution to a solution to a solution. In other words, the cures become the illness.

Now we go back and look over this situation, and we find out that the reason this fel-
low can't stand this universe, can't stand closed places, can't stand anything in a dress, can't
stand this and can't stand that and yet can't stay away from them is because of this goal "to be
holy." And the reason he can't do that, of course, is because he's got a goal "to be a devil."

I'm sorry, if anybody has these actual goals I'm sure they will be found. I'm not using
synthetic goals in this lecture. But there's the whole mechanism. There's the whole mechanism
of the GPM. There's why it exists. There's how it evolves, and so on. It is far simpler than you
would believe.

Now, when you realize – I said why they were black – when you realize that this item
here, the "goal to be a devil," may very well consist of lifetimes, each lifetime having a full
array of pictures, and that that has all been burned down and charred to nothing but cinder by
the hammer and pound of existence, you'll see why it's a black lump and you'll see why the
GPM is a black lump. Actually, the GPM is a lump of burned up residue, but its postulates are still there, the charge is still in it, and it still separates and it still squares away.

Now, as you recognize, an individual has gone through a great many very weird and terrible adventures on the course of postulating a goal and becoming the various items in the G... in a GPM. And you recognize also that he has been through GPM after GPM after GPM in order to get where he is today, and so on. And he's got a lot of overts, and he's got a lot of difficulties on the backtrack and he's having a lot of difficulties in present time – that it is not easy, it is not easy to find the goal, to find the top item, to go back on exactly the right number of items and to walk all the way through the GPM, to never skip, to never jump out into another GPM, to get down to the bottom of the GPM and list it out and find your next goal, and so forth. None of this, none of this could be considered to be easy. It isn't easy. But oddly enough, these GPMs are so much a carbon copy, one to the next, from pc to pc, they only vary in the significance of the goal and the significance of the items. They don't vary in the pattern of the goal.

You'll find the person's goal there and you'll find the – the item, "the goal to be a devil," or "the goal to catch catfish," or "the goal to be a tiger." "Somebody or something who wanted to be a tiger" – you'll find that there. You'll find out up here "a tigerish person" or "a devil" or something like that. And we go up the line and we get up to the top of the thing, we inevitably find in this column of terminals, we find "a saint," something like that. "A saintly person," something. It's totally reversed from the situation.

We find out that the similarity of items in this GPM here, well, let's say we have an item "people who care for nothing." Notings pile up more than anything else. We have "people who care for nothing" as an oppterm here. And down in "the goal to be good," "people who give up nothing" or something. And those two items are liable to collapse one on the other. And because they're liable to collapse one on the other the GPMs bang.

In other words, very similar items sometimes group. And you'll be auditing along minding your own business and all of a sudden the pc will go whoop, or whoop, or urp, and so on, and he'll have felt a couple of GPMs smashed together.

You'll have excited – through some wrong listing, or something of the sort – you'll have excited a similar item in another GPM and have collapsed it on.

Well, all this is avoided – the randomity is avoided – by being particularly careful to get the items that belong in sequence in sequence. And that is normally done by not overlisting on an RI oppose list and not underlisting on a source list. There's nothing much to it. You can even find on the last R... the goal as an RI oppose is a source list and you can even find the next goal on that if that last source list from here down into this bank is completed.

There's all kinds of mechanical arrangements here and we haven't even really begun to exhaust the number of possibilities that you could do to get a GPM. It very possibly is not necessary to do a goal oppose terminal to get this top GPM up here. You just say, "All right. Tell me an item, who or what would be the least likely to have the goal 'to be a devil'." And

---

10 Editor's note: Source list: the first list in the sequence of tackling a GPM where you list who or what would oppose (the goal). Also called goal oppose list.
the guy says, "a saintly person." It RRs and you put it in as a beginning terminal line. I mean these things – these possibilities are great, but they are – are mostly assistive in recovery. If you do the goal right in the first place you don't run into these things.

And then there's the admonition that in actual fact you should make a Clear before you try to make an OT. You'll find auditors will go on at a fantastic rate of speed GPM after GPM and they never clean up the GPM they're in and they never look for these various items. They don't try to get the pc. They don't – they find something still ticking so they just list it further. They don't go back and patch it up. They don't try to find any of these bypassed items. They don't try to get these bottom items in the goal line. They don't try to neat this thing up before they go along. As a result you've got three or four or five GPMs alive and they frankly are maybe not as easy to patch up as it would have been if you had just patched up one and done it right in the first place. You haven't lost any time. You can patch these things up. You can take care of them.

The way to take care of them best, however, is to know the anatomy of the GPM. To know what you expect to find in the pc. Not go on expecting that every pc is different, that every pc is going to have a different pattern, that all of these things are going to be so difficult, and so on.

Well, I saw a GPM just today which – well, I won't try to quote the items out of it, but it's something like this, the goal "to be a lady," and the first oppterm, "a steam locomotive," and the first terminal, "astronomy." Well, come out of it. I mean, how does this relate? The auditor has banged off into three different GPMs. He's got a goal for something, but he hasn't got any terminals for anything. In other words, he's very dispersed on the thing.

No, if you know, you get experience as to what these are all about and you know what the thing should look like and you know whether you're right or not and you know how this thing should add up, you'll all of a sudden become aware of the fact you've skipped something – both by the pc's ARC break and behavior and so forth, and because you can't go on, and for other reasons; but also because you just know your stuff on the anatomy of a GPM.

The easiest way to run a GPM is know what you're running. I've given you the picture of the GPM, its basis, modus operandi and repetitive characteristics of the GPM. If you know these things quite well you won't have too much trouble clearing anybody.

How many GPMs are there? I don't know. You've sure been around long enough. I can hear you now on Marcab and on this place and in that age and that age. "All right. So that's failed. So I can no longer be a holy person, and so forth. I'm going to be a devil. Yes, to be a devil. Now, listen carefully, to be..." You know? You've been doing it for a long time.

I don't know how many GPMs you'll cook up in somebody. I'd say the more complicated the GPM first found sounds as a goal, the more GPMs there are in the bank. I think you'll find out that's a working rule. If the first one – the first goal you find of a person is "to be somebody who plays a pipe on various clouds and looks sad," I think you've got an awful lot of GPMs in the bank.

There's the other factor. The first GPM you encounter is sometimes truncated there, so you just have a new thetan, he looks like. His behavior will be very brash. Next one will be
truncated up here someplace and he'll be a conservative. He'll be backing up the conservative. And up here someplace it just happens to be where you find him in that GPM. And you get him up here at the top ranks of the thing, he will inevitably be a beatnik.

It's funny how coincidentally we have so many people who are just winding up their banks in this present society at this particular time. But remember we also have the new ones.

So that we have somebody cycling down the track. At some time we'll have the fellow being a great success. Well, he's in this part of the bank, the lower part. He'll be a rather conservative mediocre. He's in this part of the bank. And we'll have somebody very degraded. He'll be in this part of the bank. Actually his current conduct depends to a large extent on where he sits in his first GPM.

All right. Well, that's all the data I had for you on the subject. I hope it'll do you a lot of good. I know it's been very difficult to dig the stuff up and get it hinged together and make sense and get processes that make it work. But we're at this point and the information is there and it is stable and it's yours.

Thank you very much. Thank you. Good night.
Well, how are you today? Let's see if you're there. How are you today?

Audience: Fine.

All right.

All right, this is what? This is the 2nd of April, or the 3rd? Or the 5th? The 2nd of April AD 13, Saint Hill Special Briefing Course, and we have a lot of material here for you today.

But the first thing I'd like to show you is the prototype of the new listing meter. A listing meter. And been designing this, and Fowler and Allen have been throwing the nuts, bolts and electrodes together, and here we have the item. The item. Interesting, huh? There's a new listing meter here, huh?

Well, what's this all about? What's this all about? Well, I'll show you a better picture here on the other screen. There is a listing meter. Now, it goes this side down, as you list on the paper, it goes that side down, and you've got two panes of glass. Here, and here, and you've got your needle across here, and you've got two rows of dots. See the two rows of dots, there? See them? Now those, of course, are closest to the paper, and it actually fits at about that angle. And it's on a little s... little stick, here. See this little stick? And it tips like this. You can see it – see, it tips over here. The cans – the cans go on here, and they plug in over here to the side like that, and your wheel – your wheel, see – is back here. Back. See, the back side, and the tone arm reads are inside the dial there.

And so you get your needle action and your tone arm reads, and as you put it down here, you take a pencil, and you put your list underneath this glass. You see, this thing is hanging up like this and you actually rotate your tone arm over here, with your finger, and you go on and list, and of course as you look at your paper you are looking through the two glasses at the dial, don't you see? So as you list, if that needle twigs, ticks, rocket reads, rock slams or anything else, you of course see it without moving your eyeballs any off of what you are writing immediately below it. Don't you see that? See?

To show you the position – there's your paper, there's your pencil, and you look down through there and you see exactly what you're writing, so that you get something like this, don't you see. And you see that through there, and of course you can see your needle, your needle swings back and forth across that check mark. Pretty good, huh? That is the new listing meter. That is a prototype of this. And this does not replace the Mark V. This is a cheap meter. This is a very, very cheap meter, and it's skinned down, and it only has two sensitivities, and you skin this thing down to a very elementary meter design and elementary parts. And it doesn't cost very much money.
Now, the reason why it doesn't cost very much money is it's not good enough, you know, to put good close rudiments in or do sec checking or something like that. It's pretty good though, by the way. Only a Mark V will do something like that. But it's actually good enough for a co-audit to put in rudiments with. And you actually, because these things are cheap, you could have a lot of them for co-audit. You wouldn't want to buy a whole bunch of Mark Vs for a co-audit, they'd beat them up something terrible. No, what you want is a bunch of these listing meters. The price of this has not been released at this particular time, it's going into production as soon as I put in 12, 14 hours of auditing with the meter, and take any little refinements and so forth that need to be done, and there we go.

Now, this is all very interesting, but what does this do to the Mark V? Well, it doesn't do a thing to the Mark V. You need that for various things, and this is sufficiently cheap that you just put it in as part of your kit. You would also want a Mark V to audit with, man, particularly if you're security checking.

My idea was – a Mark V, you know, is quite expensive because the components in it are fixed to go forever and all that sort of thing. And that's the modern Mark V, it has really been groomed in that way. But this listing meter – so some co-audit member has an ARC break and busts one of them over somebody's head, well, you charge him the price of it or something like that, then. He isn't ARC broke. Mark V, you'd weep, man!

But you could buy – you see, you... they should have – if you're running a co-audit, you should have one of these listing meters for every team. That is, if you've got 30 people you need 15 listing meters if that's the way you're going to do it. And of course that's an awful outlay. So I've been laying it on here to get a real cheap meter that was beautifully designed, but basically one that would do a power of good as far as listing is concerned so that you wouldn't miss reads and wouldn't give yourself any agitation or anything like that.

Well, that's a – that's enough of the commercial here. The situation with regard to meters is pretty good. The US government, by the way, is sort of running up the white flag over in the States on that thing. That's confidential but I could tell you because I know you won't tell anybody. It'd be very shameful, you know, if the government had to quit. They apparently are.

Okay. Now today's lecture concerns the GPM and is consecutive to the last lecture which I gave you on the subject of the GPM. What do we mean by GPM? It is the Goals Problem Mass. Now you can call it – a GPM is a Goal Problem Mass. Sequitur. G, P, M – Goal, Problem, Mass. Pc postulates a goal, this gives him problems and he accumulates mass. And when he's accumulated so much mass and this thing has gone on and on and it's all worn out, and it's deteriorated in meaning, why, he postulates another goal and he gets another problem series, and he gets another mass.

Now, the whole thing was originally detected, by the fact that the only thing that would keep a pc from progressing in an auditing session was if he had a present time problem. I deduced from that, that there must be something very weird about problems. And I kept studying problems until I eventually had this drop out of the hamper. The whole existence of the GPM was deduced. It was deduced in its entirety, before anybody ever saw one. Which I
think is quite interesting, because it is a considerable triumph for research to have the thing actually exist.

Now nobody's trying to foist this thing off on you. If you don't have one – if you don't have one, why, you're pretty lucky. Also, you're not human. But anyhow, the GPM was a deduced mechanism, and it's on this basis which you find back in 1950 and forward – I don't think this definition existed till about 55. But it was postulate-counter-postulate. In other words, you cannot have a problem unless two people or two things have two opposing postulates or ideas. And then you get a problem.

A problem is of a dual nature. It has a duality, a problem does. And you have this expressed in the GPM as the terminal – which means the pc – and the oppterm – which means the enemy.

Now why are these things expressed? You very often will find a proper name. Actually, your name will undoubtedly rocket read in present time when you get to the top of your GPM. I had the rather horrifying experience, just last night, of having my own name rocket read like mad when we had approached it, and in actual fact suddenly greeted present time. I hadn't seen present time for some time, and it was terribly unfamiliar and so on, and I didn't like it very much. But the pc's present time would be the top of his forming GPM. That's his present time. Now actually, he slides up and down this to some slight degree. He becomes his last life, or this life, and he postulates his next life, sort of, and in postulating his next life, or one hoping, you know, what he's going to become or afraid of what he might become, he tends to have an element slightly into the future of the MEST universe present time.

So the GPM that comes right on up to present time, MEST universe, but may exceed it somewhat, or may not quite reach it, because the pc has his own present time as regulated by the Goal Problem Mass in which he is situated. The top of that would be his present time and anything back from the top of that would be his past.

Now, you get the oddity that a pc could be in his own past, and you'll find this is rather uniform and consistent. Now we've known this for years. The whole book Dianetics: The Modern Science of Mental Health talks about engrams and somebody being stuck on the time track. Well, that's a pc in his own past. You see, that's a time track and that's his time track. And it's quite different than the MEST universe time track. It parallels it and it approximates it, but it doesn't answer up point for point with the MEST universe.

In other words, you can be a little bit ahead of present time in the MEST universe, you can be a little bit behind present time in the MEST universe with the top of the GPM, and then the pc isn't necessarily at the top of his own GPM. In other words, he got tired forming this thing, and for this half a lifetime or something like that he's skidded and he's using a slightly earlier item. Of course, he's still forming the GPM. But it's a sloppy thing.

I'll give you an idea here. Here's – here's MEST universe present time, you see. Now, the pc's GPM in which he is situated might be just a little bit forward of this present time because he wants to become a cowboy in his next life. That's not his goal, that's just an ambition stemming from the goal "to be active." And he says, "Well, this lifetime, that's too tough," and he doesn't want anything much to do with it, he's being a, bwahhh, something or other. He's up – he's up here. He said, "I'm going to be a cowboy, see, in my next life," and he hasn't be-
come a cowboy, but he... actually you'll find a little item up here, "cowboy." You got that? He's already forming the next item that will become a good sound terminal. And you will find it and it will run.

In other words, the pc – pc's GPM extends up with his hope and this rather tends to make somebody believe that the GPM was all formed 200 trillion years ago, and he's just living along this track. Well, that's irresponsibility to end all irresponsibility. I was looking at that the other night.

In other words, here he is in PT and he's John Doe. There he is as John Doe, and John Doe particularly – it's a goal "to be active" – and he particularly detests – because of the goal and so forth – active people. See, in other words, he was active down here. But now he's become more sedentary, and here's this oppterem, now, the goal has finally turned around on him, he's getting ready to leave this GPM. And John Doe, and he doesn't like active people.

So this one over here is an idea called "active people." Now this is how a thetan doesn't have to think. This is sloppy thinking to end all sloppy thinking. Brother, you've really taken the cake, the prize, the croix de guerre, all possible decorations for sloppy thinking. Because what you did was instead of having to analyze "Bill is an active person, Joe is an active person, August is an active person, and therefore antipathetic to me because I don't like my goal anymore, which is clear down here in the bottom of all this," we say, here – we just say "active people." And then that makes a group summary. That is the big think. That tells you that people who think in terms of "the people" – no individuals, "the people" – they're nuts, you know. They're nuts. Including Khrushchev.

I don't think I'd audit Khrushchev if he asked me to, because I think he'd be too nuts. He believes in a thing called "the people," which means he's dramatizing one of these things and it has nothing to do with people. This is the sloppy think, do you understand? The sloppy think. We don't want to have to think about Pete, we don't want to have to think about Gillham, we don't want to have to think about George, so we just think about "people," see, or "men."

You've seen girls like this. You've made a pass at some girl sometime or another – not any of you of course – but you made a pass at some girl or another, and she said, "All men are alike." Actually, this is taken up in Book One. It's quite interesting that we had it so pat. "All men are alike." And you say, "Huh!"

Actually, she's got something over here – "men." See? Now this doesn't – doesn't make it necessary – remember what I told you about confront in the last lecture? Well, this doesn't make it necessary to confront anything, don't you see, so that she can then just group classify anything that wears pants as men. And one of you girls comes up with a pedal pusher and you're just like all other men, you see. You're wearing pedal pushers or something like that, slacks, you know. Well, you wear pants, so you're a man. And she never looks to find out if you're a man or a woman, she says, "All men are alike and therefore you're brutal."

Now, somewhere around here we're going to have another one called "brutal people," see. We don't have to confront anything, we don't have to find out anything about people, we don't have to do anything else. If people are people, they're brutal people. You see the idea?
We don't have to differentiate at all. So this is why we get A=A=A as such a dominant character of the reactive mind, and this carries through forward to time. I have said advisedly that the thetan is on his own time track, just as time, but in actual fact the more he lives this thing, the more he group thinks. In other words, he – that means a different thing in advertising, it means – it means a number of high-paid executives sitting around getting no ideas, and that's group think. And that's not what I mean.

Classification. He thinks by classes. He doesn't think in terms of Bill or Pete or anything. So he thinks of time that way. So that all time becomes a time. And every time is instantaneous time so in actual fact as you run the fellow back he can't tell if it's yesterday or today or tomorrow or anything. He's got all time classified. Just as he has this whole item here, let us say, it is "all men are alike," see, and that's just "Men," you know, why, we've got another – other items which similarly group everything that has anything to do with the goal.

He just says, "Well, that's – belongs to a certain class of things, so therefore that's all that and I don't have to inspect that." And actually he's against it, because he is being this thing here which is against that class, so he is a class and he is against a class and there are no individuations and that carries through and forward to time.

So there is no individuated time in the GPM. It's quite interesting. It all seems like right now. You go back a hundred trillion years and you may have track with pictures on it which parallels this which is hanging outside the GPM and you say, "Oh, yeah, that was a hundred trillion years ago. It seems – well, it seems a long time ago." You're looking at this picture. The second you get into this thing called "ladies of the court," see, that's an item in the GPM. Here would be "ladies of the court," see. And here it is, actually, oh, back here ages ago, a hundred trillion years ago, see. And it seems like it's right here. Right here, right now. Right here, right now. "Ladies of the court" has no time differentiation. That's because there is no differentiation in these things.

In other words, these items are "men" versus "women," you see? And one item includes all men, and the other item will include all women. And a thetan just says, "Well, we don't have to think about this, the best thing to do is just to realize that bricklayers are bad people."

Well, anybody then could be classified who was bad people, would be a bricklayer. He thinks so, too. You know? He'll get a twinge. They're bad people, they must lay bricks, you know? It's true. But that's the non-think-characteristic because there's no confront connected with it. There's havingness without a confront. And you get a havingness without a confront, you get this type of classification. You understand?

So therefore, as you come up the bank, as you come up the bank, these items successively entered into, formed and so forth, are usually postulated from the past into the future like this, see. Here he is now, and here he goes into the future, and he thinks "I'd like to be a cowboy." See, "active people." So everything's going to become cowboys up here. But he hasn't entered that, so it's not really nicely heavily formed. There's not much mass on it yet because there's no livingness and no track connected with it.

But he's going to pass out of this period of present time and he's going to move into something that he's already figured out. He's begun to get the inkling here, you see, this – let
us say, this item in present time is "sedentary People" – he's begun to get the inkling that sedentary people are capable of holding you back. He's gotten this idea here, so he'll be something on the order of an "active person." He finds out he can't be quite a cowboy, so he's going to be an "active person facing people who hold you back." He's already had these two items up here slightly into the future. He's getting an inkling of them, but he hasn't lived through them yet. There's the way he figures out his bank, in other words.

And therefore you find this bank wildly and widely classified. It's all – it's all in classes. It's all in postulates or concepts. And this is why concept therapy was so effective when it was effective, if you'll remember 1952, something like that. By the way, the chiropractors down in Texas took it up – I think they've still got it. We abandoned it for the excellent reason that it apparently had some bug connected with it. Well, the bug connected with it is we were actually pulling the postulate out of one of these GPM items, without pulling or confronting the mass out of the item. And therefore Concept Processing – I recognized there was something a bit wrong with it, so I didn't push it anymore.

Now that's what happened. Now of course, you actually couldn't, even by concept therapy, disarrange this GPM very much, but you sure could key somebody in on the back of his own track. So there is no time identified, there is no mass identified in these things, that is to say he doesn't identify it as 1952 or something like that. What he identifies is 1952 is a hundred trillion years ago, you see. That's as far as his differentiation is capable of, he's got a total identification of two dates. He doesn't then confront and single out the identity of a single date.

I'm sorry for the use of the word "identify" and "identity" but English has moved over from differentiating a oneness into a total confusion of a oneness with all other onenesses. So you don't have a word which actually follows through on that.

Now, what's this all about here? This means that we've got a goal here, we've got a goal here "to be active." And the first thing up from that, he's simply now living the goal "to be active." So you have "the goal to be active," but it has certain enemies. And those are probably something like "inactive people" or "being inactive." And then he moves up here and he's become "somebody with the goal 'to be active'" and "somebody with the goal 'to be active'" of course opposes with "people who are inactive." So it's "people who are inactive" or something of that sort.

And then he gets up here a little bit higher and he's got "an active person" or "somebody who is active." And that opposes, of course, something banal like "somebody who is inactive." And then we go up here a little bit further and he gets – he's getting so he's fought these inactive people.

"That what you resist, ye become," to make a Biblical utterance out of it. Because it was never more true. Of course, all the time he has the goal "to be active" he's fighting inactive things. What's eventually going to happen to him? As he goes up the line on this terminal column he is going to become less and less and less active, and more and more prone to being very sedentary.

So you get up here at the top, you got something like "a person who hates activity" or "a person who can't move" or "a person who can't be active," is usually the type of terminol-
ogy it has, and of course what does it faces? It faces as an oppterm "active people." In other words it's a total reversal goes through this GPM.

This is always the case. Don't get fooled now and say, "Well, the case I'm auditing is different." That's just an excuse because you can't find his goal or something.

The case you're auditing, it does just that. He doesn't do anything else, otherwise he wouldn't be on this time track at this time, and he would be in some other universe or something of the sort. So that's what we're talking about, we're talking about these conceptual items. There is the pc's concept of his own identity based on his goal, and his own identity is at first his goal full-out, he is his goal, and then he becomes somebody that has the goal, and then he becomes somebody that represents the goal, and then he becomes somebody that isn't getting along very well with the goal, and then he becomes somebody who isn't very much in favor of this goal, and then he becomes somebody who is against the goal and then somebody who just can't perform the goal at all.

Now, on the oppterm side, the enemy becomes somebody who is highly antipathetic to this goal, becomes somebody who isn't so antipathetic to the goal, becomes somebody who isn't... is kind of neutral on the subject of the goal, and eventually somebody who is rather in favor of this goal, and then eventually is somebody who would have that goal and be active with that goal. And that's the evolution of the oppterm.

Now, the evolution of the terminal is the deterioration of the goal, the evolution of the oppterm is, of course, an improvement of the goal. He just goes from total wouldn't – oppterm wouldn't have the goal on a bet, to the oppterm is the goal. That's nothing to do with the fact that people change, but the person's idea who has these ideas change with regard to his opposition. And for every one of these pairs, you have a problem.

Now, you could even articulate what the problem is and fool around with it a lot, but you don't have to actually – you bleed the charge, the pc sees what it is. You've got, on the goal "to be active," you've got this person over here, let us say he's come up to a point of "somebody with the goal 'to be active'" and who does he face? He faces "people who are inactive." So he's classified.

Now, what's this conceptual thing? "People who are inactive." Well, this is... he just classifies everything, see. He just says, "Well, Joe, Bill, Pete, Mary, John, Oscar, government clerks, businessmen, people who sit down in chairs, loafers, bums, skid row, sailors don't move around on ships very much so they must be inactive," and so forth. And in other words, that whole thing is this item: "People who are inactive." Sweeping, isn't it? Sees one of these things, his hair goes up. He says, "Waahhh! Awful! Grrrr!" He doesn't know why. See, because he's not really articulating it analytically, he is simply talking about it.

He'll talk about the next one up, but not the one he's in. He's already forming the one that's up by forecasting his opinions. That which you resist you become, so as the person dramatizes his goal and postulates these opposing terminals, he of course gradually becomes the opposition, eventually becomes an inactive person. And there he is at the top of the bank as an inactive person.
Now what happens to him? Now what happens to him? Well, that's very interesting, you can always predict the goal, they run off completely, one, two, three, four. Here he is at the top of the bank. Let's say this is the top of the bank here. And here he is, "an inactive person" – this one over here. And these are "active people," over here. See, so he's opposing those. Now this is your bank band in here.

Now, this thetan with the goal "to be active" at the top of his terminal line is, of course, no longer capable of doing anything with this goal at all. He's got too many overt acts on the subject, you see. He's had too many oppterms and so on, so he has become the oppterm, so he's an inactive person. And over here you have active people.

All right. It's very easy to predict what he's going to do. Now a thetan, in actual fact, doesn't live the bank one, two, one, two. He's always himself, they're always themselves. What he does actually is become this one slightly. You get a continuous closure, and he becomes inactive people, and then he becomes the other one slightly. So he actually moves on a kind of a zig-zag up the line. He's always slightly into the oppterm and out, and then slightly into the next oppterm and out, and slightly into the next oppterm and out. You can see how he would do that, because he resists these things he becomes, and they monitor his own conduct.

So therefore you see very clearly here that an active person, he was an active person, he's become an inactive person. What's he going to do when he postulates his next goal? You've got "active people" over here. Now you'd say, well, maybe he should postulate his own goal back. No, no, you're going to get something slightly off. It's going to be something antipathetic about active people that he has learned in the wisdom of his long track experience.

So he's going to look at that and he's going to find life at this point utterly and completely intolerable. He's going to be degraded because of course he has of course denied his own postulate. Remember that many times said? He's denied himself. He's denied himself. But of course he is his own postulate to be active, and here he is being inactive, so he's denied himself, so he feels very degraded and he doesn't like this.

So not liking this, and having... wanting very little to do with this, he wants to get rid of that goal. He wants to get rid of that goal. And here he has the character, you see, of an inactive person. Faced with active people. So he solves the problem. He solves the problem. And he postulates a goal up here, right here, he postulates this goal and that goal is "to be quiet." You can predict what next goal he will – you can't say what it is, but you're going to get something weird going. When you try to finally figure out what the pc's next goal is, you're figuring it backwards, you see, from above down below. When you go back up the other way, you can see cleanly and clearly exactly what that pc's goal would be. The next goal he postulates, of course, is "to be quiet." Obvious. Second you see it. It's never anything like "to be a troubadour." Nuh-uh, uh-uh, uh-uh. Wouldn't have anything to do with "to be a tank driver." See, it wouldn't be anything to do – "to have a harem with 19 wives." You know, now that we've turned loose Routine 2 on goal finding, I think you're going to see some of these.

The most embarrassing goal that the pc comes up with, of course, ticks slightly. And some uneducated auditor who doesn't know very much sees that tick, doesn't realize that it's just embarrassment, the fellow giving up "to have a – to have a harem of 17 wives," you see,
something like this, you see. And he says that's the pc's goal, and you know those things never are.

Pc – you've got this bank, it – you're trying to find the upper bank or you're trying to find this bank – you've got this bank up here and you're trying to find the lower bank under it, well, it's not offering you much problem now, because we've got mechanisms which find the next goal, bang, without you having to do a thing. But he's never here "to be a singer." That goal isn't there, see. That goal would not be – wouldn't even be "to dance," you see, because here's what makes it up – these top terminal-oppterm. That top terminal-oppterm is what makes it up. That tells you what the next goal's going to be. And that's what the next goal's going to be. It's not going to be something else.

He postulates it all on his own. He thinks he's free and clear and he thinks he has been totally disassociated from any influence in having postulated this goal, as soon as you run back the bank you see why he's postulated every one of them. He'll tell you he postulated it free and clear, own free will, prime postulate, had nothing to do with anything, then you get back and you find out this goal "to be quiet" was immediately succeeded by the goal "to be active." They don't go plus and minus. They don't go plus and minus. You can't say a goal "to know the truth" would be followed by the goal "to know nothing." You can't say that that would be.

The goal "to know the truth" might be preceded by another type of goal. But it would be a goal that had to do with secrecy. I'll tell you such a goal: "to be a gambler." "To be a gambler." And, uuhhh eee oohhhh, he doesn't want anybody to know what he's doing. Only it might be a little more frightened than that – "to be secretive," how about that? Well, that's of course followed by a goal something like that "to tell people," or "to teach people," or something, don't you see. But there'll be a combination in between these. But sometimes it's more subtle than that. Sometimes it is simply – well, let's say this – "to be an executive." Well, that... rare that such goals occur, but it's "to be an executive." Then it's followed inexplicably with the goal "to be truthful." But when you see the two together you will understand. You will understand, because of course, as a manager, or as an executive, or as a government head or something like this, there are many things you can't tell people. And you eventually get to a point where you don't like people who are too broadcast in their opinions, so on. The US government now has practically thrown the press out of the Pentagon and everything, they – I think there'll be a camp eventually in Washington, as the government goes along its wild career. It'll be 30 or 40 miles out from the city and it'll be inhabited by newsmen, and that's as close as they're permitted to the Capitol. Nobody's permitted to give them news these days.

So you keep holding back news, don't you see, you keep holding back news, and you eventually get an oppterm, you see, which has to do with the exact reversal to hold back news, and even though you were an outflowing-type character to begin with, well, this will mount up. So you get an influence building through three or four GPMs, don't you see.

The guy was "to be outspoken," you see, and this is followed by "to be reserved," you see and so forth. And that will eventually deteriorate to the person – "to never say a word." Because you get the cumulative effect of these things. They're not "positive-negative." They're not "oppose-not oppose." That does not work out. It's just what the person postulated
originally and what he became on his experiential track, and then what he took on for randomness—these are all determinable from the exact goals that you find—and then that sequence lands him in another sequence which of course goes through the same deterioration and that lands him in another sequence. Each one of those sequences is a separate GPM with a goal at the head of each one of them.

These things are not intermixed. You can collapse one end of the GPM on the other, you can mix them up like dough, you can throw four GPMs together, you can think that one GPM goes ahead of the other GPM when it goes behind it, it eventually turns out. You can scramble the bank most gorgeously on a pc, but actually only by finding more goals than you have run. I don't mean there's any danger in finding goals. Ordinarily only one goal fires at a time, but I proved the other evening that two goals can fire at the same time.

What you're looking at here is the gradual deterioration of a thetan. You're looking at the dwindling spiral. What he postulates, he tries to become, but in becoming it accumulates overts on things that aren't what he postulates. Things are bad because he has postulated what's good. And then this of course results in a deterioration, a degradation where he's concerned, so he postulates a new goal, this selects... this preselects out for him his enemies, because an enemy is somebody who doesn't have that goal, and then he gets a deterioration up the line and eventually that goal passes out of his existence and control into the hands of the oppterm—it looks like in the bank. So he postulates a new goal and as he goes along, the whole consecutive pattern of a GPM takes on a rather consistent note.

You don't have somebody with a goal "to be a lady," also with the goal "to make heavenly voices." These would not be the same thing to a—it wouldn't be the parts of the same bank. Why? Well, "to be a lady," as it deteriorates, of course goes into other things. And it might possibly de... go up to a religious goal of some kind or another, we could expect that sort of thing to happen. But the truth of the matter is that if you've got a religious-type goal creeping in along the line, it's also whole-hog. I mean, it'll be common to all the GPMs. It'll be something about it: to be bad, to be good, to be devilish, to get around people, to trick people, to be honest, to make people be honest, to... this kind of thing. There's a consistency running all the way through the thing that has to do with regulating behavior. And you could probably get a common denominator of all goals—it's probably flavored by the first goal the pc ever postulated. But you don't have that goal and you won't have that goal for a long time.

So you will—the only thing you will notice is that they are—they're of a family. They're of a kind. The guy has a certain type of activity. Well, this gives you an experiential track for the pc. These—one on your 2, Routine 2Gs, you keep putting down goals that go out hard. You'll notice after a while that there is a consistency. You maybe got an Axiom 10 thetan on your hands, you see, and it's all on this subject, all on this subject, one after another. Axiom 10, Axiom 10.

Or they move up and down, maybe, the Axioms. But they're cousins, and bank to bank they're actually brothers or dichotomies or you can see that they're similar. And the various similarities here can be taken advantage of by the auditor. You have to study these things for a while, and you all of a sudden will say, "Yeah, what do you know." Well, I was just looking over a list, a goal oppose list, just a little while ago, and I didn't see the terminal or oppterm
The top oppterm, top terminal – I didn't see them on that goal oppose list. But the... I looked over an unnull list, which is most likely to achieve the goal, and there staring me in the face was the top oppterm. How do I know it's the top oppterm? Well, let's say the goal is "to eat jelly cakes." What's the top oppterm? "Eaters of jelly cakes," of course, I mean, you know – I mean it's very difficult to figure this out, see. Once you know.

The idiocy of all of this, however, is what has prevented man from understanding it or having anything to do with it. It's based on the solid mechanic of postulate-counter-postulate. Problem. Guy has a problem. And you get all the consequences of the overt-motivator sequence, the non-communication, the cut communications, the withdrawal – all of these various things – can't reach, can't withdraw, must reach, mustn't withdraw. All of these things are consequent to these masses. And they're in nice little packages all by themselves, and they go on up the line to the top.

Now the funny part of the top is that the pc will start exteriorizing from the masses when you get him close enough to present time. He can feel himself exteriorize from them, mass by mass. He all of a sudden recognizes that he isn't himself, his own name, and he recognizes that he isn't this future thing. He's liable to do a sort of a pop, an exteriorization pop. And even though you've run up to the top of the bank, in some way or another, when you've really got the top of the bank, you can expect the guy to sort of get an idea that he's going pop, exteriorizing. And he'll run something else down the line and he's going to go *uhhp* and exteriorize. And he'll start coming out of this thing.

Well, he's been in it for a long time. You run these banks on down to the bottom, find the next goal, run that on down to the bottom, find the next goal, run that on down to the bottom, find the next goal and run that on down to the bottom, find the next... that's all there is to clearing.

The individualists amongst us, however, have managed to vary the GPM only to this degree: the only variation I think you will find in GPMs is where they stop. I'll give you an idea of just that. Where do they stop? Where does a GPM stop? Well, let us say this is a full goal. Now, I'm not going to draw as many here as you would actually have in a goal, see. This is a full goal, and here's your bottom of the goal (that has an item here, too, by the way). And here's your top terminal-oppterm of the next goal, you got that? Here's the top terminal-oppterm of the next goal and of course that goes on down this way, and this goes this way, and here we've got this other bank.

Now the question is how far north in this thing does the pc go? Does he go this far? Is this all the items he's got? Or does he go this far? Does he go this far? All the way? Or, has he been very cute and postulated another goal up on top of this one, that only has that many in it? *Huh-hooohh.*

So we find this goal and we get this top oppterm and we run the thing down and we're running it all out and about this time, my God that thing has got a lot of mass and it's very difficult and it's having an awful time running it. But you go ahead and you run it out the bottom and you skip this and you try to find the next goal and it's all very difficult. You can find the next goal, but he's dragging an awful lot of mass with him and so forth. Finally you get
bright and you take this goal and try to find out what this goal is, and that may be much harder to find than the goal under it. And you try to find that goal up there.

Well, that's a horse of another hue. In other words, these conditions can exist. You can have a goal which – a Goals Problem Mass which has maybe four items in it, and then a full bank here – you can have a full bank, and of course if you've got a full bank, then you've just got nothing but full banks from here on. The number of these doesn't particularly – isn't particularly significant. This is your terminal column, this is your oppterm column.

All right, does the thetan's bank look like that? And are you here? Or are you here? Is that where you came in? Do you still have a piece of a goal up here? Well, the thing to do is to find the top of this goal with the goal you did find. Don't let go of the goal you found. You find the top here. And then come on down, and you can ask him on the meter, very cute, whether or not there's a goal above this one, and you'll get a tick if there is. And it's as simple as that.

And because you've got this one, and because you've got this one, you can actually give them questions that figure out what this goal is. Let's say this is the goal "to leave," why, naturally this oppterm here is "to leave." Well, now what's – "people who leave," and what's the next one? Well, I don't know. Possibly the next one is therefore, "to stay around," something like that. You're not quite sure what it's going to be, you can't predict it that it is what it is, but you can get various lists and predictions and guess at it and shoot at it and so forth.

You'll eventually get these two terminals, if you list upwards. You can go all the way through this bank and on repair you'll find yourself all of a sudden going backwards up into this bank. You can go both ways in a bank, which might be very interesting to you. And you can list one all the way to the bottom and then patch it up and find yourself listing the top and all of a sudden go wheeep, and you'll think you're going over here to some lower bank, but actually you're not, you're landing in that bank. You probably are landing in a lower bank, if you were inexpertly overlisting and that sort of thing, you're going elsewhere.

But you'll eventually find this little thing, and then up here, you'll find the pc's PT. Now here's what's particularly horrible: is in this zone of this little truncated bank, or in any part of the GPM which is present time, is formed that far, at the top of the top GPM you will find – you remember hidden standards and things like this – well, you'll find all of the pc's hidden standards, you will find all of his chronic somatics, you will find all of his worries and yaps lie in the few top buttons that are nearest to present time.

So, look at this horrible thing: You could come in here, run this whole bank, get its top oppterm, everything else, and you're going down this line, and the pc's dragging mass along, mass turns on easily, and he's saying, "Ohhh," and so on, "but when are you going to do something about this lumbosis? When are you going to do something about the lumbosis? The lumbosis, the lumbosis" – God, you've heard – never heard of anything but the lumbosis. After a while suspect what's going on. You haven't got his present time items or otherwise he wouldn't be talking to you about this, man.

The thing to do, you'll find one of these items ticking or something of the sort, is start going back up and see if you can locate just a little bit more close to present time.
Now the bank, as I say, might be in this state whereby there's just a little piece of a goal – it'd have a regular goal and everything – and then there's a whole GPM and then followed in sequence by the remaining GPMs, or it can be like this. This makes life much more interesting. Now here we have just your regular GPM, see, but it's truncated. Instead of a whole top going over a border to a little smidgen of a goal, you've got half a GPM. Now, you list "most likely," and it lands you, of course, in the bottom of the terminal column. Huh-huh. Toward the bottom of the terminal column. Because of course that's the most likely thing to make the goal. And so you say, "Well, let's list the least likely," and that's going to land you, of course, in the bottom of the oppterm column, and you don't want to be in the bottom. GPMs are always run from the top down. You get as high as you can go in them and run lower. Don't try to get as low as you can go and run higher. You can do it, but after you've tried it a few times you'll realize it's much harder to do than from top down.

But the horrible part of it is sometimes you have to start below the top and go lower, then do a patch up, realizing something is missing in here, find a bypassed item and start listing against it, and you'll find yourself going higher. And you'll go on up and find the top of the bank.

So it's not impossible. But recognize that the hidden standards, the PTPs, the chronic PTPs, the pc's chronic somatics, all of these various things he matters and yaps about and that are the realest to him, are contained in these items which are nearest to PT, and that it is very difficult to hit those dead-on if you have a half-formed bank. Why? There isn't any "most likely" to achieve the goal. There isn't any "least likely" to achieve the goal at the top of the bank.

Let's give you an example. It's the goal "to be excited." Well, of course, the least likely to succeed is "an unexcited person," and that probably is the bottom of the oppterm column for that goal, and the most likely to succeed is "an excited person" and that of course is the bottom of the terminal column. Oh, I think this is getting very interesting, because of course we are at the bottom of the goal, and we already know what's at the bottom of the goal, we've got "the goal to...," we've got "somebody or something with the goal to...," we've got the goal itself, we've got things at the bottom of the goal, and we could always go in at the bottom.

No, we want up on the top. So, on this goal "to be excited" – this goal "to be excited," we have "a lukewarm person" facing "lukewarm people." That's the pc's present time. Of course, it's halfway through. The overts have run him down to a point of where he's halfway away from the goal, and of course the oppterms have moved up to halfway to the goal, and you've got a middle ground here, and you've got lukewarm – "a lukewarm person" facing "lukewarm people," and it doesn't have anything to do with being excited at all. Do you see what you face there anatomically?

Well, trying to get that band, trying to get that half-formed GPM is much tougher than to get this one, because you can get this one, even though the pc's screaming and moaning that he still has mass, and he – not mass on the items, but he still feels bad, and he's still worried about Agnes, he's just worried about Agnes all the time and he just can't seem to get unworried about... Well, "Agnes" is a rocket-firing oppterm in his present time, and you just haven't
lead up to it yet. Of course he's worried about Agnes, he sees her every day. She's an oppterm in the flesh. You see – you see what?

He himself, he himself may be a terminal or an oppterm – he also may be an oppterm. So what – how do we find this? How do we find this? Well, that gives you problems. Of course there are many solutions to such a problem. I'm just giving you what – the problems that you face in looking at it.

So a GPM PT for the pc may be at any time of the forming of it. It could be the first two items. It could be the next six items. It could be the – it could be all the way to the top. It could be two over into the next bank. You know, I mean – where – what's his position? Because it's the same picture, just line up the GPMs of three or four goals one after the other, and then just cut in anywhere in the first one or two and that's where you'll pick up the pc. But of course you've got the special conditions of a partially formed goal. Partially formed GPM.

It all comes under the heading as not very complicated, just a partially formed GPM, and the top of that GPM is present time for the pc. That's what you've got to reach, and that's what you're listing for.

In trying to audit somebody, you're trying to get to PT and go down. That is what your mission is, is to get as close as you can to PT as a blind strike in, and then go down a bit, and then perhaps move it back up to PT by various mechanisms, and then clean it all out and get that little item that's dogged into the future, whatever that is. And then when you've got that all straight, then go for broke going down and you just – after that it's just a – it's just a sailing breeze, there's nothing to it, it's very simple. You can always go down.

The toughest part of the case is the beginning of the case, and that's where you're the most ignorant, and where your pc is the least educated, the most nervy, and the hardest to audit. Isn't it horrible the way life is? But that's why man has never cracked this thing. The hardest portion of it to crack was the beginning of it. And of course at the beginning, anybody trying to crack it has the least knowledge of it. And so it's operated simply as a big double-door shut-in-the-face mystery. It isn't actually much of a mystery.

It's... people are, and they become, and they can postulate, and they have an opinion about others, and that's all based on their pattern of goals. And they dramatize these things like crazy.

Now there are many special cases of actions, there's various things that can happen when you're auditing. It's not my purpose in this particular lecture to give you a whole bunch of things that can happen or not happen or anything. I'm just talking to you about anatomy, how the GPM is formed, where you find the pc when you first enter the GPM, and it is simply anatomy of the GPM. That is quite important to you. The more studying you do on this, the more experience you get on this the easier it is, in actual fact. The most worrisome time is when the auditor is the least skilled, and the toughest end of the case, of course, is when the pc's case has not been entered, because you don't know where you are in the case.

And those things are the most difficult ends of it, but if you can just get over that big hump – the big hump of your own lack of skill at the beginning and the pc's lack of knowingness about where he is or what he's doing – the tough end of the auditing is then overcome,
because when you've slid over those two barriers of the auditor's lack of skill and the pc's unknownness, you all of a sudden find yourself sitting on a high road. And it's very easy to go down that high road, clickety-clickety-click, poppety-poppety-pop. You learn more and more and more, you learn more and more about GPMs, you learn more and more about it and the pc is of course easier and easier to audit, and of course the next pc you get ahold of, there's not much of a hump, but you're able to go over that hump because you've gotten more experience. The next thing you know you do like I was doing a little while ago: I looked on a list to see if the pc's item was on the list before I nulled it. You know, that kind of an operation.

"Pc's item on this list? Uh – mmm, hmm, hmm. How far formed is this pc's GPM? Let's see, these are the lists he's listing. And how well formed are these GPMs? Well, his first GPM is – oh, it's not formed yet. It's only about halfway. Ah yeah, here's an old goal oppose list. So, it's about a half-formed GPM." How would you know that? Well you don't find any – you don't find anything that's likely top term, or oppterm or top terminal and so forth. And it's all sort of lukewarm. That's what you got. You'll get so that you're acquainted with it. And there's nothing like doing something with it to get acquainted with it, and you threw up your hands in horror and said, "Oh, my God, this thing is so complicated, and uhuhhhhh and the pc ARC breaks so terribly, and it's so dangerous if we audit him wrong" and that sort of thing.

Well, all these things are true. All these things are true. It is true that it takes a long time for a pc to be picked up off the pavement and get going, and it's not something you do in a half an hour, and it's true that you'll have bad times and that you will have times when he feels wonderful all day and the next day, God almighty, why the hell did he ever... He never really says why the hell did he ever enter Scientology or something like that, he always says what the hell did he ever postulate such a lousy goal for, you know.

This is the hazards of the business. You're at the tough end of the line. Learn anatomy. Learn what these things look like. Get it through your skull what these things are all about. And soon as you understand what these things are all about, then you understand what you're doing. And when you understand what you're doing, it falls apart. I would say that probably the toughest part as far as I'm concerned – as far as I personally am concerned – I should think that the toughest part of clearing is finding a goal, from my experience. The toughest part of it is not auditing items, or finding out where you are. It's tougher to find a goal. And look what we got – the ammunition we've got today to find goals. So in actual fact, if you can find a goal accurately on a pc, I do – I wouldn't quail at the rest of it at all.

Okay, there's anatomy of this here GPM, and I hope you get acquainted with it.

Thank you very much, and good night.
ANATOMY OF THE GPM

A lecture given on 4 April 1963

How are you today?

This is the fourth of April, AD 13, 1963. I've forgotten what Roman year it is, offhand. Haven't calculated it out lately. Nobody's using that calendar. But, Scientologically, it's the year of the win. That's for sure.

This is another talk today on the GPM – the anatomy of which I am getting to be quite an authority. And this is one of the more interesting pieces of bric-a-brac that a thetan can pack around. And you're making a steady acquaintance with it, which might serve you in some good stead.

I don't know if you've put together for yourself or tried to take a look at the significances of what you're trying to do or what you are doing in essence, or realize the antiquity of the project in which you're engaged. Man's been trying to do this for a very, very long time and has been successfully drowning himself in the process. And on the whole track you have been trying to do this for a very long time. It's quite interesting now that it is occurring and that something is happening.

And if you're having any trouble at all finding goals or finding the bank or finding items in the GPM, let me invite you to this interesting sidelight. Do you yourself have any idea of what you're tackling? Or are you just going through a bunch of confused motions? That's something you should ask yourself. You say, "Well, all this theory is all very well and good, but what I want to do is get down and audit."

Well, that's fine. But are you in the position of a radio repairman who doesn't know anything about the radio he is repairing? And if you are in that position, you're going to be very worried and very upset and very distressed and so forth.

It is essential to audit a pc today on the ramifications of goals and the GPM – it's essential to know what you are attacking. I know that sounds very banal, but in actual fact some of the mistakes you are making aren't banal, they're idiotic. It simply shows a lack of acquaintance with what you are trying to do.

You're trying to clear somebody, you're trying to clear a thetan. Very good. Why isn't he Clear? Well, he isn't Clear because he misguidedly or otherwise tried to protect or get rid of or acquire havingness. He had some misalignment on the subject of havingness. And then he decided to think, not confront. And his thinkingness is dominant so that he now finds it totally unnecessary to know what he is attacking – he merely classifies it all under a big group or class of thought – "All men are alike," "All woman are alike," "All women are evil," "All religion is bad," this sort of thing. So he gets a classification. So he knows now what is dan-
So you see that in auditing a GPM – I'm not saying you're doing this – but there is every tendency there to not confront. Why? You as the auditor have some tendency not to confront what you are doing – and certainly the pc has a fantastic... tendencies not to confront because he's running straight through "not to confront." That's why he has an item.

This item is "bad women." Great. Great. So he has an item "bad women." What does this essentially mean? This means his inability – fostered by himself and by reason of postulating a goal and so forth – to confront women has enormously been reduced. So now he is in a situation where he doesn't have to think about individual women, he just thinks about bad women. And there he is, he's got it all thought out now. He doesn't have to think any further. Somebody says, "Woman." He says, "Well, that's bad women. And what do you do to counter bad women? Well, you become a debaucher," (whatever a debaucher is, you see) "and that's the pattern of behavior you go through in handling women."

Somebody says, "Women: you become a debaucher." That's dead simple, see? You've got – you've got, in other words, a total packaged answer. There's the stimuli – women – so now we know the package response and we're all set.

It's almost as simple as, "car – mechanic." When you look at a car then you are a mechanic. You'd better be a mechanic if you look at a car. So the terminal is mechanic and the oppterm is car. If you're mad at cars, then the thing to do is become a mechanic. I don't know if you've had your car repaired lately but I think that's usually the pair that you'll find in most of the garages. If you're mad at cars you become a mechanic; then you can really wreck them.

Now, what's this amount to?

This means that you're auditing a pc whose confront is very poor on the subject that he is being asked to confront on. His confront is very poor.

Now, you as an auditor – Q-and-Aing with the pc and taking his directions and so forth – are taking the directions of somebody who can't confront on the subject he's being audited on. And although every now and then the pc is right – particularly when he cognites on the item or something like that- he's right, you know? Bang! That's it. Something like that.

Providing the meter says he's right, too, why, he's right.

But what – what in essence are you doing when you Q-and-A and fumble and...

Now, this pc may have a very fine confront on the subject of anything under the sun but what you're auditing him on. The very fact that it is his bank says that he has a no-confront on it. Well, fortunately, you the auditor don't have the same bank. So, therefore, you can confront on the subject that the pc can't confront on. This is fortuitous. But that is what you are there and that is what you are for – to keep the pc headed in the right direction.

Now, there isn't really any excuse for fumbling around on the subject of the GPM and goals because the data is now all known. That we've got the data, there it is. I mean, the GPM has certain anatomy, goals line up in that particular line and items are created in that particu-
lar way and, well, that's all there is to it. I mean, there it is. How do you list? You list in a cer-
tain way. And how do you find items? You find items in a certain way. And there are certain
rules which apply and so forth. And if you really know what a GPM is and really know what
the goal is and how it lines up and all this sort of thing, it's really a very easy job. It's nothing
to lose a night's sleep over. It's a very easy job. You know you're there or you don't know
you're there.

But to what degree are you taking advantage of the knowledge which we already
have? To what degree are you taking advantage of this knowledge?

Well, to a very slight degree, indeed. To a great extent you're still fumbling with "How
many do you list?" "What should the meter say?" and so forth. You have not surmounted to-
tally at this stage – you've not surmounted, probably, in its totality – all of the things which
you're handling or the complexity of these things. In other words, you're not handling them all
at once; you're still trying to get the tone arm centered so that you can null, you know. And as
a matter of fact, what are you nulling?

Well, others of you have this grasp. And you've already collided with the situation and
understand what you are going up against.

Now, the reason I'm stressing an understanding of this is what you're doing is terribly
simple. It is an idiot's simplicity because, of course, you're handling something an idiot put
together. I mean, a thetan becomes a complete idiot when he starts postulating goals and cut-
ting down his confront and doing a bunch of package thinking and all this sort of thing – get-
ting himself in the soup, turning on all kinds of somatics, having all sorts of trouble, running
into unsolvable problems and eventually denying his own goal and cutting his own throat and
saying, "Well, that's it," and so forth, "I've – I've postulated this goal 'to be a catfish,' and here
we are a few eons later and, oh, I hate catfish!" you see? And so, he's mixed up. He's the
original mixed up kid.

Now, despite the fact that the Freudians in their defeat at the hands of aberration and
such studies of the mind said that you had to be aberrated in order to get along at all – well,
that has no validity at all.

I've had some interesting experiences in that myself. I had an oppterm "conventional
music." Ha, that's very interesting in one of these banks had an oppterm "conventional mu-
sic." If the music was conventional, why, it had nothing to do with me. It had to be unconven-
tional music. Well, it didn't rule out music – but it certainly ruled out any ability to look at a
piece of music and get anything out of it. I had to remember it and go around sideways and
move down the corners of the thing. And, well, not just this item but just as general confront
picks up – well, I find out now I can listen to a piece of music and play the piece of music – I
don't even have to have the music. Conventional, it doesn't matter.

And the funny part of it is, auditing is improving my ability to play, more than practice
is improving it. Well, as far as I'm concerned, being well conversant with the fields of the arts
– writing and all that sort of thing – knowing the limitations and agonies of actual profes-
sional application in these fields – I know exactly what was blowing my brains out all along
the line. And they were aberrations. They were aberrations on the subject.
Well, I – there's no such item, but "long books." Supposing I'd had an item "long books." Well, good heavens what would I do? Every time I thought, "Oh, I've got to write a long book!" you know, I just would have quit. All kinds of somatics would have turned on. Would I have been able to write a long book? No!

Now, as far as being able to fight things and get mad and raise the devil in life and have a game and all that sort of thing – why, getting rid of the GPM in certain spheres doesn't seem to have interfered with that at all. I mean, I'm twice as mad as I used to be at certain things. Reading the paper this morning, I think the Kennedy administration won itself another medal.

But I begin to see what is aberrated conduct. Not according to some unconfronted standard. I begin to see what is actual aberrated conduct and am able to predict where that's going to land somebody. You see? And am very far from destroying the game – I find myself getting more and more involved in what's going on and in present time.

And the normal thing that is avoided by somebody who has an awful lot of items and so forth is present time. He's involved with games that don't exist. Well, did you ever try to play in a tennis court with no racket and no ball and no net and no partner? I think you'd look silly. You might be there in a tennis court, but there you are racing back and forth and fanning the air and so forth. And there's no interchange, there's no scoreboard, nothing. Well, that is a very good picture of what most people are involved in doing.

There's somebody sitting there and he goes like this a lot. [taps with his fingers on the table] See? He goes like this a lot. Nobody can quite understand why he goes like... Well, he's being a writer, you see? That's as close as he can come to it anymore, you know? He's still got an item. He should be going like this, but actually this is as close as he comes to it, see. Or maybe – maybe he's an old kettle drummer or something. We don't know. But he is playing some game that doesn't exist. And let me assure you, there's nothing that is less fun and there's nothing that looks more ridiculous than somebody who is playing a game which no longer exists.

Now, the fixed character of goals and the fixed character of items in the GPM give us an enormous number of games which a individual obsessively plays, which don't any longer exist. He has no reason to be playing these games. They aren't any fun and they make him feel awful and nobody else is playing these games. And he rather tends to draw out of contact with all of existence. Well, what's this – what am I talking about here, basically?

Well, I'm talking about the fact that he doesn't need this GPM. Which I think is rather plain.

But getting rid of it is a highly uncomfortable activity and very confusing to the pc – extremely confusing to the pc. He's in the middle of all sorts of items which give him all sorts of weird values. He's susceptible to ARC breaks that he himself doesn't understand what they are. He's going up against ideas and postulates that in a large part were quite germane in some other age and time, but no longer apply now. He understands them. He can understand them still and he knows what they do to him. But they don't look to him much like games. That's because the game is no longer extant. And he's a prisoner of his own postulates. And life, accordingly, is quite unnecessarily unhappy and miserable.
Life – life's bad enough without having some false misery and false nonsense added up onto it. You could probably cope with life all right if you didn't have all your old tin cans and chains and so forth that you were dragging along with you. You don't even have to be up to OT to cope with life, once you begin to see what it is all about and stop misemoting on certain subjects that have nothing to do with your life.

Well, be that as it may – this is no dissertation on aberration. This is just a dissertation on the subject of this GPM and these goals that an individual postulates. He postulates these goals and then he accumulates a certain set of items. And then he eventually turns against the very goal which he himself has postulated – finds that in... he is now in a deep state of degradation because he's denied himself completely – has to turn around and postulate another goal to get himself out of the mess. And then eventually it wears out and he is going up against, again, his own postulate. So he now has to postulate another goal. Oh, this goes on and on. And he's just getting unhappier and unhappier and he's less and less able and less and less powerful – and he is less and less capable of governing himself.

He is governed by a series of unseen, unknown voices, impulses, urges, pains that demand that he do certain things which might have been all right when knighthood was in flower or when he was a space patrolman but don't quite work out where he is at the present time – manager of a knitting factory. You see, it doesn't quite go. He's having a hard time – he's giving himself this hard time.

What we are trying for, in essence, is a self-governed individual. We've spoken a great deal about self-determinism and other-determinism, but unless an individual is capable of exercising his own true self-determinism he is then incapable of self-government. And so he will always be subjected to various tyrannical exterior forces. He is incapable of continuing on through life under his own steam. He has to be nursed along and all kinds of things.

Well, you see that regardless of the power this individual could generate – regardless of his ability to knock over radio towers and the domes off capitols and so forth as an Operating Thetan – regardless of all of this stuff, regardless of his ability to make wine turn into tea at two thousand yards at a spot glance. All that's very intriguing, but let's look at it within a framework which is far more comprehensible. This individual is a liability to all about him unless he himself is capable of self-government. That's interesting, isn't it?

Now, a control of his own environment does not necessarily mean a violation of the rights of everyone in that environment. But certainly on the fact that he operates on the greater good for the greater number of dynamics and he solves his problems on that basis – when he is capable of self-government he has crossed the biggest hurdle in the direction of a controlled or happy environment. He is looking all about him, as he lives, through his environment for enemies that victimize him.

Well, I think that's very interesting. Because standing right in the boots that he is standing in as he looks around that environment is his own worst enemy. Now, that isn't just an item – that is a fact. That is a fact. Buildings won't fall on his head anywhere near as hard as he himself is falling on his head. Life cannot do anything to him at all, actually. But he himself can accomplish his own destruction. And that is true of every human being alive. And
this is the kind of world we live in – where everywhere we look we see people bent on their own destruction.

I have this experience continually. People race along over some level plain toward some deep cavern or chasm – and they're going along madly in the direction of the lip of this cliff and they're about to fall into this chasm. And I say to them, "Hey, hey, hey, hey!" You know? "You go along that way about another fifteen, twenty feet, you know, and you go over!"

And the fellow says, "I guess I know what I'm doing!" Boom!

And you say, "What do you know!"

It happens rather continuously. I mean, there's hardly a week goes by but what across my desk isn't evidence of somebody who's going to go over the cliff!

I still as a matter of form say to them, "Hey, there's a cliff there." You know? And as a matter of form, sit back and listen to the dwindling scream.

It's almost – it's almost as if pointing out to them ways and means of self-destruction gives them the direction that they want to travel. Well, it's interesting living around such people.

Now, we in Scientology are a cut above that. The definition of a true Scientologist is – nothing very esoteric that one would want to use in the papers and so forth because only a Scientologist would understand this definition. And that is this: No matter how mad he gets, no matter how upset he gets, no matter what outrageous things he is doing, a true Scientologist knows back of it that he is doing it and has an inkling – he may not know exactly why, but he has an inkling – that it is because of something he has done that makes him do it. He never quite loses sight of his own causative hand in his own fate. "Well, here I am, mad as the devil at this car!" Well, he may go right on kicking the tires, you understand – he doesn't necessarily totally control himself on the subject – he may go right on kicking the tires and cursing out the car. But somewhere back here he says, "You know, I must have done an awful lot of lousy things to cars to be treating a car this way!" You know, he still has, he still has that little thing.

He may be fighting with his wife. Or she may be fighting with her husband. And mad as hops, you know, just "Trah-rahr-thrah! And wipe it out man!" You know? And at the same time, you know, kind of "Well, what have I done to him or her that is making me act this way?" That is never quite lost sight of. It may not be strong enough or powerful enough to monitor or control the conduct, but it is there.

A Scientologist is somebody who knows he is capable of understanding his motives. Not just the overt-motivator sequence – he's capable of understanding his motives. And you could put that down as the definition of what makes a Scientologist different than raw meat. A Scientologist knows that he is capable of understanding his motives. If he went just a little bit deeper and thought just a little bit harder about it and looked just a little bit harder, why, he would know why he was doing this thing. He knows that there is an explanation to what he is doing.
Well, now if a person who is calling himself a Scientologist really has never grasped that one fact – he's going to have an awful lot of trouble grasping what the GPM is all about.

Why?

Well, he doesn't think there is a cause.

Now, I – to my shame, we only have – we do have a student right now who really doesn't know that overt acts cause people to blow. He doesn't know this – he hasn't got this down. And he let somebody blow. Well, he's got a ways to travel.

Well, why doesn't he know that?

Well, that's because he himself doesn't quite have this one datum: He doesn't know that he himself is doing the things he's doing because of something he has done. He doesn't really believe that he is capable of understanding his own motives. You see? So not being totally cognizant of this one fact – not really thinking or believing that he is capable of understanding his own motives or handling himself or controlling his own motives or picking up his own overt or any of this sort of thing – then he doesn't think that the other fellow has caused his own difficulties. So, of course, he can't audit the GPM.

There's nothing more manifest in the world than the GPM as a confirmation of a person causing his own trouble. That's no reason to condemn him.

Scientologists don't do that. But it's also – there is – also there is no reason not to understand it. A fellow made a postulate – he said, "I'm going to square this all up. 'To be a pirate.' That's what I'm going to do – I'm going to be a pirate. To – being a pirate! That solves all of this – that just solves everything. I'm going to be a pirate. Yes, that solves all the trouble I've been having. I'm going to be a pirate!"

And a few trillennia later, he sees a pig going down the road with a ring in its snout. And he faints and has a heart attack. Everybody says, "Look at what the hot weather has done to him."

No! The hot weather – the hot weather might have assisted all this. But who did it to him? He did it to himself Way back down the track he said, to be a pirate. And, of course, pirates wear rings in their noses. There it is. Who did it? He did it.

Well now, you can't go around condemning this person for having done it to himself unless you are capable of establishing – for his reality and yours, too – what he did to himself and in such a way that it eradicates that causation in the past. Well, you don't have to blame him if you can eradicate it.

Well, all of these causations for his (quote) misfortunes (unquote) are initially and basically resident in the GPM. Now, those of yesteryear have actually far more force on him, than those of today. But because they exist in yesteryear and because today has in it all of the force contained from yesteryear till now – it seems to him that those items in which he exists here – that these items he exists with in present time... Draw a GPM here – and this is the PT situation. These items here in present time – oh, those items are terribly important. Maybe he's sitting in something that says, "Women – women who look like beatniks." You know? Maybe that's the oppterm, see. Now, he's going mad. He doesn't even know he's got this. He's
formed it up, but he's going mad on this subject. And his wife's a very neatly dressed girl and everything else and he's always calling her a beatnik and she never can figure it out and he never can figure it out. And here are these items here – a chronic present time problem – chronic present time problem, always, always, always, riding along with him, riding along with him.

He has another one. He has another one. He knows, you see, that the source of his ulcerous condition, you see, is because he eats too much harsh food. No, no. That's the somatic "all women are beatniks."

And what does he have to be?

He has to be a Turk in order to combat this in some aberrated way.

Well, there's his ulcers and there's his opposition. And he begins to think the whole environment is against him when in actual fact it's just "women are beatniks." He sees some uncombed hair – he gets ulcers. Bang, bang, just like that – one, two!

Well, this isn't actually causation. This is an effect. He's being the effect of these items. The fact you can run them out and discharge them is quite remarkable.

But way down here – let's take another bank, you see. These banks are lots of items long. Here's another bank, here's another bank, here's another bank, here's another bank, another bank, here's another bank. You get the idea? It goes on like this. Way back here somewhere, down below in this bank down here – he has a goal "to be a man." Naturally, this one creeps up through charge all the way up to the top here and causes women to be antipathetic to him.

Now, when you audit him, what are you looking for?

Well, actually, you're looking for one bank at a time. That's all you're looking for. That bank is monitored by the goal, the first goal, and that is the thing you are looking for. This bank has a goal. Now, this top bank may be complete or it may be incomplete. But it is only incomplete from the top down. It will be perfect in form right up to PT.

But where is the PT? Is the PT at where the goal is expiring or is it halfway through?

We don't know that. You would establish that.

But he's postulated a goal. Now, it is that goal which is available. And the first action is to find that goal.

Why is that the first action?

Because if you find too many of these items without finding that goal, you turn off the pc's R/S and RR, he cannot orient, you don't know what kind of items you are looking for – you shoot out of the bank and all kinds of wild, weird things happen. So let's put first things first: Let's find the goal. Let's find the goal for the first bank.

Now, we may be unlucky and find the goal for the second bank when we're looking for the goal for the first bank and actually run quite a bit of the second bank before we find out that a first bank exists. All right. You still have done nobody any damage. You'll start up and try to find the top of this thing and you'll run into another goal. All right. But that's a mis-
chance. In the bulk of the cases you operate with, you will find that goal, of that first bank. That's what you will find.

And having found that you will find his immediate explanation of what is wrong with him. He is causing a condition in life which pervades every part of life he is living – monitored, of course, by the fact that all this has gone before. But you're not interested in all this that's gone before – you are only interested in this first bank, the one closest to present time. Not the first one formed on the time track – that's so-o-o Lord knows how long ago. You're interested in the one that was formed just the other trillennia, just the other day. You want that goal.

All right. Now, having found that goal, you want the packages, the items – the pairs of items. These are always in two, in 3M. They are not in four as in the fringe areas that you get in 2-12. They're always in two. And they follow a certain pattern. And there they are – they're already there to be run. You have to find the goal in order to run them. And then having found the goal, what are you looking for?

You're looking for the highest oppterm in the bank.

Well, in a truncated GPM, one that is cut off at the top, the highest oppterm will not be very violently stated and it will be more difficult your first list. When you do this first list on other banks which are complete, you will be amazed at how easy it is. But because not all the items are formed at the top of the GPM yet, you may have some difficulty with this. But the bulk of the cases you won't have any difficulty with it.

Now, you're looking for certain items. And you find those items by following certain rules. You think, "Well, we had an awful lot of rules and we threw those away." No, we didn't. Just last night somebody in the Z Unit actually nulled a list that I think had seven RRs on it, each one of which fired during nulling. Well, we could have a real idiot's picnic out of this, you know. You mustn't have two firing at the same time on a list, but it's all right to have seven firing on the list. That's idiot. You want one firing on a list, you see. You've got certain rules. The second you find two are firing on a list, man, extend the list. Nobody's broken those rules down. Extend the list till you only got one firing on the list.

Now, I just saw another folder that horrified me. Twice running I have checked the list, twice running I have checked the list – unbeknownst to the auditor, I put the pc on the meter. Mean of me. But this auditor – this auditor had item, item, item, item, item, X, and then – this is the way the list looked. Well, of course, it had many items along...

Aw! Aw, please! For a year and a half I've been telling you – for a year and a half I've been telling you, "Goddamnit, don't do that!"

Why?

Because the list is not discharged!

What are all these stroke, stroke, stroke, stroke, stroke, stroke, stroke, stroke, stroke, X. What is that?

The first thing it says to you is the list is insufficiently listed to take the charge of it off.
Nobody's changed any of the listing rules. You've been overlisting for the most part and skipping items. But please, stop that.

And then you know what I found? You know what I found?

I found that those marked R/S and those marked RR were still firing halfway.

Aw, what does this mean? That means that we had a dishonest auditor. A dishonest auditor.

And I just decided to come down on this with a thud. And I have.

Do you know what an X means? Do you know what an X means?

It doesn't mean this didn't R/S. It doesn't mean this didn't RR. It means this does not produce any reaction of any kind on the meter. And when you put an X down in front or behind an item, I want you to have said and be true to your statement: "This does not produce a reaction on the needle." That is what X means – this produces no reaction on the needle.

Well, you say, "That's impossible. I mean, you go down these lists and and they do produce reactions on the needle."

Oh, wake up, for Christ's sakes. I've only been trying to teach you this for a year and a half! The list is not complete! It's charged!

"Oh," you say, "we're liable to overlist."

Let me tell you something: The bypassed item is more likely to occur early on the list than late on the list.

If you're going to pick an item that will bypass an item, you understand, it's liable to occur earlier up here. More likely to occur. It doesn't always – sometimes it's the first item on the list and it bypasses no items. Let's say it's this one – this fourth one down here from the top – let's say it's this one, huh? All right, what about that one? It's "a gee-whizzer" – "a gee-whizzer." Ah, but "a gee-whizzer" isn't due to come up for another three items. It's part of the bank but it isn't due to come up for three items. What we want is "a what-notter." And "a what-notter" – my God, "a what-notter" is clear down here. That's "a what-notter." In other words, the next item we want is "a what-notter." And if you list to this one – the second item, "a gee-whizzer," and then take a fully charged list and null it – you'll get some kind of idiot's performance like this, by the way – you've never listed it down to where the next item on the list occurred.

Why?

Well, look-a-here now, let's look at our definitions. Why is this? And excuse me for swearing because I just – if I could just teach you the ethics of the situation – they include never giving the pc an item unless it fires – see, the item's got to fire – and never putting an X down so long as a goal or an item even goes tsk! no matter how slightly. You understand?

It can have a faint roughing of the needle as you call it. You'll find that quite common in goals – you couldn't get it to tick for the life of you. And if you examined it at 128 sensitivity, you'd find as you said it there's a slight, tiny roughness of the needle. Well, you can't get it as a read – it won't read and nothing else will read.
But we're talking about something that goes tick, man. You know? Tick! Tick! And you'd put an X down across something like that? Ooooh, you've just told a lie! That is a lie—and a very vicious one! Because it says that this list here was improperly listed and improperly nulled. And it is covered up by the fact that an X is put there.

This X is put there? Oh-ho! Why? Why did we put an X there? In the first place, why would we try and out, you know—in, in, in, in, in, X? What are you doing nulling a list like that? I mean, you know how a list nulls?

This is the way a list ought to look. There's nothing much to these lists. The list as you null should look something like this if you're going to null a whole list. That's the item.

Now, how do you get one like that? How do you get one like that?

Well, by listing it until it's null.

Oh, but what happens if you overlist it?

Well, the pc protests it. And then you have a dirty needle.

No, I'm afraid you have to know how to audit. There's no substitute for knowing how to audit.

The two things that go out and give you a dirty needle are Protest—now put this down well, because these are—these are I think—I don't think I ever stated these both consecutively and together: Protest and Decide. Protest and Decide are the buttons you have to get in every now and then—on a pc that's prone to have a dirty needle on everything and you can't null on. He's protesting. Fail to reveal, of course, gives you the dirtiest needle—that gives you the most twiggle-twiggle, but we're not interested so much in that. But it's Protest and Decide that foul up a list. The pc has decided that the item isn't on it. The pc has decided that there is no item on it. The pc has decided that the auditing question is wrong. The pc has decided something. And you'll continuously have a reaction. And the pc is protesting, you'll continuously have a reaction.

Well, what's this mean?

The Protest and Decide are all the buttons you need to get in, in actual fact, when you're nulling. You show the pc the list for anything he's done to it or something like this. And he eventually starts—if the pc is being overlisted, he'll protest and decide. You mostly don't have to get them in at all—just lean across and show the pc—you say, "Hey, hey, take a look at these things, you know? Have you done anything with—you had any thoughts on this list?" Not "Have you invalidated anything,"—that's getting in a button. "Have you had any thoughts on this list?"

The pc looks it over. "Oh, I thought that 'to be a cockroach,' I thought that was a very funny goal. Ah, ha!"

You say, "All right. Your needle is now clean again."

But do you know that no amount of rudiments or anything else—no amount of them—will clean up a list which is still charged. Learn that. Learn that.
And no amount of rudiments will clean up a list that has been listed... overlisted into
the ground, that the pc is going out of his head on. It'll just continue with a dirty needle.

In other words, there's two extremes – there's underlisting and there's overlisting. Don't do either one!

How long is a list?

Well, a list is long enough so that it nulls properly and has an item on it. That's how
long a list is.

Well, how can you tell if something is underlisted?

Well, if you have a bunch of dirty needles and zzzt and brrrp, and if the thing is an un-
clean needle, a very dirty needle as you go down the line – and if two items occur on the list –
in other words, you get two rocket reads or an R/S and a rock slam or two R/Ses on the list
and so forth – you know the list is not complete, so you have to continue it.

Well, what's an overlisted list?

Well, the pc is just kind of in apathy about it all and upset and sort of audited into the
ground, and it all is sort of tight and the mass is tight and the needle is tight, and the auditor's
just been a nut. That's all. The auditor had a complete list and didn't know when to stop.

Well, this asking the question for a test is all very well, but it is a rough rule of thumb.
You have to add five more after the thing cleaned up or you'll very often miss the item. The
item was about to go on but isn't on yet – but because it's about to go on it doesn't act as
charge on the needle – and, therefore, the question is freed of that burden and you'll find it'll
go on in the next few.

It's not a matter of judgment – it's a matter of pure mechanics. An overlisted or an un-
derlisted list are equally difficult to null. You get a terrific protest going, you see, if you start
overlisting and you get a continuous dirty needle. It's as simple as that. I mean, these are mat-
ters of judgment. These are matters of observation.

What are you trying to do?

You're trying to find the next consecutive item. Or you're trying to find the pc's goal.
That's what you're trying to do.

And in order to do that, you have to pay attention to this other phenomena. The other
phenomena is that if you can't null a list, why you've either overlisted it like mad – at which
time the pc has already decided the item is on the list – which gives you a continuous read,
and the pc is protesting like mad because he says the item is on the list. And with both of
these things – with both of these things at play – you of course, can never null the thing.

In addition to that, overlisting has a tendency to suppress the actual item. And you've
just wasted an awful lot of time.

Now, you also can put more items on the list than you actually need. You might even
get the wrong one firing or something weird might happen on an overlist.
Well, an underlist is easily detectable because more than one item RRs or R/Ses – or everything on the list is live. You call these things and so forth. Well, if you call this item here and it gives you a little tick and a flash and so forth, well, don't put an X down there, man. Why? It's not out! You see, it isn't that it doesn't RR and therefore is out. Heh! No, no, it has a reaction on it and therefore is not out. And I don't care what you're looking for, the rules and laws of listing remain what they are. No, sir, you'll never have the item.

Now, let's go a little bit further. Let's go a little bit further and let's find out something about the GPM. Let's know something. You probably already do, but let's make sure you do. What are you doing when you've got a goal "to be a lady" getting an oppterm "steam locomotive" and a terminal "astronomy"? What are you doing? Why? Why do you even stop? I mean, why do you even – why do you even read anything back to the pc, man? You know it's wrong! Well, what are you doing? Where are you? You know? You're supposed to be the auditor.

"Is this your item? I've got something here that RRs." Sure you've got something that RRs – you've got something that RRs from fifteen banks away. And it RRs. Well, sure, anything that didn't belong to the goal.

Now, look-a-here. Look at this "most likely" list. You're going down this "most likely" list, going down the "most likely" list, going down the "most likely" list and so forth. And finally, why, you think, "Well, that's about it – that's the end of that." It's "to be a lady," you see. And you've got items like "chemistry sets," "cockeyed jazaboos," "porphyry and granite," "astronomy," "steam locomotives," and so forth. "Aaaaaaah list must be complete. I guess I'll null it. Ah-hah-ha, ooooh – there it goes – there's the one that rocket reads, 'a steam locomotive.' All right, that's the hottest thing in your bank, 'a steam locomotive.'" And then we oppose that and we oppose that and we don't have any RR left on the pc.

Well, why?

You aren't even operating in the bank, "to be a lady."

What item do you want?

Look, know your GPMs, man – know your GPMs. What item do you want? You're not going to evaluate for it and give it to the pc. But you're sure going to list till you get this kind of thing.

Now, look, the pc's confront is not very good. The pc's confront is too bad. And the pc is not going to recognize – the pc's not going to recognize his items until he's listed long enough to find his items. Let's take this "to be a lady," and we're getting items like "porphyry and granite," "crab tarts." This is as close as he can get to his goal. You see?

You've just got to list until you find something on there that – "women who are ladies," or something like this. Don't you see? You get what I mean?

"Oh," you say, "oh, well, this is pretty – looking pretty good now. 'Women who are ladies' and there it is." We start nulling this thing off and all of a sudden, why, "women who are ladies," pshew! Well, we know what the top oppterm is – we already know the script. If it's a goal "to be a lady," the top oppterm is going to have something to do with being a lady. And
the pc is now very much opposed to it. See that? "Being a lady," "ladylike actions," "women who are ladies."

It's only in this middle ground of a GPM – if you're looking at a line plot – it's only in the middle ground of the GPM that it departs at all. And then it'll have something that's quite germane. It'll have something like "to be a lady," "niceness," "mannerliness," something like that. That's... be your middle ground.

But the items that you're looking for, for top oppterm as you list this list down here – it's got to have something to do with a lady. And I don't mean something to do – women who are very beautiful and sweet. I mean, it's got to have "a lady" in it. You understand? A lady! Or ladies. You know? English – English words. "A" space "l-a-d-y" – that is part of the terminal, or "ladies," l-a-d-i-e-s, is part of it, or you haven't got anything. So what are you doing picking it up? What are you doing?

I mean, that's adding the auditor in there to a terrific degree. But on your "most likely" list you're getting everything under the sun, moon and stars but something which has the exact wording of the goal in it one way or the other? Well, what's your top terminal on "to be a lady?" It isn't actually "to be a tramp." It'll be "somebody who wants nothing to do with being a lady," or something like that, don't you see? "Somebody who can't be a lady" – that will be the top oppterm. I mean, it's so simple!

And somebody here recently on an audit had an item on a goal "a person with this goal." Ah, but look, that's never part of the bank. "Somebody with the goal 'to catch catfish.'" Yeah, oh, yeah, that's it. So the pc hadn't stated it. The pc hadn't stated it. Well, how do you get around this? Obviously, if you tried to null this list – you see, it mechanically confirms the significance of it – if you tried to null this list, most likely, and it didn't have anything on it – lady, a ladies, you know – if it didn't have stuff like this on it – it isn't going to be discharged. Why? Because you haven't got any of the GPM's items on the list – what's going to discharge it? See? It's as simple as that. It isn't going to discharge by some... because you're charming as an auditor. It's going to discharge because it's got something on it that belongs! Simple.

You know, I could probably steer a pc by lengths of lists straight through a GPM without a halt or an upset, on just how many are listed and – you know, and checking it up – how many RR, and that the list is nullable and not more than one fires. In other words, steer them through, totally blind, with no assistance of any kind from the significance of the item.

But I could also steer them through one with no RR – hardly a meter. How? Well, I know what a GPM looks like. Well, you... down there at the bottom you've got the goal just stated as a goal. That's simple. You've got a – at the top of the thing you've got the reverse side of the goal. You've got, "people who catch catfish" – that's become an enemy, something like that. Or "catfish catchers" – that'll be up the top of this thing. The oppterm is established therefore. And then the terminal, the top terminal that is up at the top will be "somebody who doesn't want anything to do with catching catfish," or some such statement as that. Down on the terminal side of the thing you've got the goal as an RI, "to catch catfish." The next item up from that is "the goal to catch catfish." The next item up from that is "somebody with the goal to catch catfish" or "somebody or something with the goal to catch catfish."
it'll be "somebody with a goal to catch catfish," and then above that "somebody or something with a goal to catch catfish." And then "a catfish catcher."

Well, we've taken care of now a great many items. The rest of those items will be germane. They will not have "catfish" in them or something like that, but they'll all be germane. You might even go so far afield as "people who don't like fish," or "people who won't eat," or "people who hate sports." You might -- you might even have something like that. Or you might have "unluckiness," you see. But you're getting pretty far afield.

The middle ground of a GPM is -- the bottom of the oppterm column, and the middle of the GPM is left to question. The rest of it is not left to question. It could be rephrased just exactly looking at the goal. You look at the goal, you could actually write those things -- I say you'd better not -- but you could actually write them in on the plot. That's what... you practically could write them in. There's a -- slightly different ways of stating them. A pc could even become aware of these things and the goal will discharge and everything will be fine.

But if you know what you're heading for and if you know what you're trying to get on your line plot and you know what you're trying to list, why, it assists you enormously not to make stupid mistakes. So follow it all mechanically, do it all mechanically, obey all the mechanical rules -- and to that add your good sense. "To be a lady" -- oppterm: "a steam locomotive" -- terminal: "astronomy." "Well, Ron, I... here's the GPM, I've got her line plot okay. I've got her line plot fine here."

"Where's the rest of the items?"

"Well, she didn't have any, as a matter of fact. That's the whole GPM."

You're going to see some of these. You're going to -- it's going to be your unpleasant duty to point out to an auditor that somewhere he has bypassed everything but the goal. He's fortunate. He still has the pc's goal -- it still rocket reads. But everything else has been bypassed. The GPM and all items in it.

Not only has he done this, but he has also gratuitously added the contents -- the odd and random contents -- of two or three other GPMs.

There's ways of checking this. If an item ticks, it came wrong way off a list. That is to say, you go back on the line plot and you check all the items on the line plot, you find something ticking -- the list it came off of was too complete or incomplete, one or the other. You've got to adjust that list, get another item -- throws you back into the GPM. It's actually not very hard to do.

You remind me of somebody who is sent out into the front yard to find a dozen white stones amongst the gravel. And the white stones are there. And you keep coming back with gray stones, pink stones and green stones and saying, "Look, there they are. The pc's sort of messed up, was sick all day yesterday, but here's this beautiful green stone: 'a steam locomotive.'" And heh-heh -- you're just not using your good sense.

You go out in the front yard, you're supposed to find a dozen white stones. All right. You even know they're white. You can pick them up, you could almost pick them out. You hardly have to audit the pc at all to put together his line plot. Of course, if he put the pc -- if he
put his own line plot together without the thing being run and discharged, he'd be one of the sickest pcs you ever had anything to do with. But that doesn't have anything to do with the fact that you know what should be there. And if you're not getting what should be there, boy, you're doing something wrong. Then the mechanical rules are out, too.

What you're doing is spectacular to such a degree that it has never been done on the track. This is just unknown information. Never been done. Twenty-five hundred years ago they banged a few guys out of their head. We did that the other day on the Long John television program to the benefit of the whole New York audience. I sent a cable over and I said, "Bang somebody out of his head."

Well, there was a professor sitting there who was saying, "Nyaa, nyaa, nyaa. Scientology..." and so forth. And Thomas's wife, according to a report I had – told him try not to be three feet back of his head. And, by God, there he was. Made very good radio.

I wonder how many other people in New York City tried not to be three feet back of their heads at that moment. I imagine there were a couple of taxicabs hit other taxicabs about that moment.

But actually that's as far as – besides some codes and morals and things like that – that's about as far as Buddhism went. You know what they told you to do in Buddhism after that? Although we're the inheritors of all the empire of Buddhism, in actual fact – we should not be blind to what the Buddhist did – he got overwhelmed by the GPM. Oh, you think so? You don't think he did, huh? Ha-ha-ha-ha. What do you think nirvana is? You've seen pictures of nirvana, haven't you? Populated, totally populated – big circular mass that you're supposed to go into and become one of all with everything.

He collided with the GPM, but he didn't know what it was. He thought it was heaven.

Well, we're way beyond that. What we're doing is so spectacular that it's totally out of – completely out of the range of believability that we have at... accomplished this thing. And yet we are – and are accomplishing it, we have accomplished it – there we are. Aha! But what happens now? Are you supposed to sit there in total reverence just because this is enough to overwhelm every thetan in this universe? Are you supposed to now sit there in a state of overwhelm?

I don't think you are. You know the score! You can become the master of this thing. Well, why not do so? You're on your – you're on the way out from this. You've won. What are you doing cowing before, kowtowing to and being a slave on the subject of the great, overpowering GPM? No, you've got it – you've got it made. Well, go ahead and audit it. Learn more of it. It's not formidable. All you have to do is an honest job of auditing today and a sensible job.

The GPM merely proceeds from a goal. You clean up the GPM for that goal. You find the next goal. We've even got easy ways to do that. And as soon as you've got the goal to the next GPM, then clean up with a Prepcheck the GPM you're working in. Go on and find the items of the next goal.

Oh, it's not easy on the pc. But as soon as you get the stunt, it's awful easy on the auditor. And the easier it is on the auditor and the more cleverly an auditor can do this and the
easier it is for an auditor to do this – the easier it is on the pc. You go on down the track at a high rate of speed.

This can be done. This is being done. We are being successful. It's time for you to wake up and take a look.

Despite the GPM, you now have permission to confront.

Thank you very much.

Good night.
TOP OF THE GPM

A lecture given on 16 April 1963

How are you, how are you?

Well, this is the what? The 16th of April AD 13, Saint Hill Special Briefing Course.

Well, today I could talk to you about a lot of things. I could talk to you about quite a few things. Talk to you about goals. Talk to you about GPMs. Talk to you about the basics of auditing. But I'd rather talk to you at the moment on the subject of the GPM. I, frankly, have been somewhat holding you back from getting too enthusiastic going down the bank because you omit the tops of some of these goals and the results can be quite catastrophic. And believe it or not I didn't know what the top of a goal was exactly like, even after doing a dozen GPMs – I still couldn't guarantee what the pattern of the top of a GPM was.

Now, I finally managed to get this squared up.

Now, I've been restraining some of your enthusiasm for going down into a bank, and knocking a bank together out of any old thing and then going on and finding the next goal and then going on and finding the next goal and then going on and finding the next goal and running part of that bank and then going on and finding the next one.

This perhaps is forgivable from the standpoint of research. I myself have had to do it. That's no particular reason you should or your pc should.

Now, some of the banks that we get in here, and we've seen some actual banks of one kind or another, some of these banks are the most incredible hotchpotches, and potpourris which I think you have ever seen. They are absolutely incredible. In the whole bank there are nothing but a few locks and numerous pieces of other GPMs. This is quite interesting.

We just had one in here from California that was enough to fry your hair.

Now, this applies very much to goals finding. And you know, I wouldn't – I just wouldn't let a pc have the goal "to create," the goal "to do," "to be," "to have," "to be cause," "to cause," any such goal. I just wouldn't let the pc have it. It appeared on the list, I wouldn't touch it. I'd just go right over the top of it and go somewhere else. That sounds strange, doesn't it?

Well, let me tell you, after I'd had ten banks very thoroughly run, a lot of items still in them and so forth, the goal "to create" got onto a list, and the auditor started to drill the goal "to create" and the whole bank started to beef up. And listen, I'd had ten banks run – ten – and the goal "to create" appears somewhere at about bank fifteen.

Well, in other words, with that many banks run I still couldn't even stand to have the goal "to create" be drilled, you know; to be tiger drilled. Why?
Well, in actual fact these goals are quite ancient, and the earlier you get on the track, the more force and velocity there is in the energy and enthusiasm with which a thetan mocked these things up, and you get a recurrence of that when you go back too early on the track.

Well, let me tell you something: The goal "to create" is two hundred and sixteen trillion. That's the beginnings of it. And that goal is a multitrillion year goal. And you're going to take some pc that can't even sit still in an auditing chair and you're going to find this goal on him and you're going to run it. Ha-ha! I think – I don't know where the goal "to be" is, but I think it's before that.

Now, naturally the wickedest goal in the bank is the goal "to create." But you are going to take the goal "to be," the goal "to create," the goal "to cause," the goal "to be cause," and you are going to run this on somebody that... ha-ha-ha. No you're not. You're not going to make it. Why not? It's too early, too early. You could probably steer him through it one way or the other and you might come out the other end with a live pc; might be, if you were lucky and it's all straightened up.

But you get goals in here of one kind or another and... I'm just giving that business about the big goals on the pc's list. The pc's just being enthusiastic and ambitious. His goal is probably "not to breathe in mouse's nostrils," and you're going to run on him the goal "to create." Ha-ha, that's silly, you see. I mean, it's beyond the reality of the pc. Don't you see?

Now, a goal tends to present itself by it's context. Most of the goals found as the first goal found are designed to be found.

Let's take one. The goal "to know," of course, presents itself like that. Why? Because you want to know somebody's goal so he says "All right, it's the goal 'to know,'" you get the idea. It's a pretty early goal. Not unrunnable, but pretty early.

Let's take another example. Let's take the goal "not to be detected." Well, you say, "How does this present itself?" Well, because it's got "someone who wants to be detected," or something like that, in its top oppterms which the pc is dramatizing. So they give you this goal "not to be detected," because the pc wants to be detected.

The goal "to find," of course, is a natural. The goal "to know the truth" is another natural. These goals – do you understand what I'm saying to you – they tend to present themselves because of their significance.

Now, goals behave in significant ways, but the running of a goal has to do with significance only to the degree of getting the right items, not whether a pc cognites or not. We don't care whether he cognites. All we want to see is that meter rocket reading. And that's all we want to see. And the amount of recovery the pc will make is simply the number of banks and the amount of charge which we remove from the case.

The pc's confront goes up in direct ratio to the amount of charge removed from the case. And his confront does not go up – does not, definitely not go up – on the amount of confronting he does of the bank.

This is a – this is a peculiarity about the GPM. In other words, you couldn't familiarize somebody with the bank – it's entirely a proposition of charge. Well, this becomes (quote)
"quite important" to us. It tells us that the pc is going to be as able as we find GPMs and run them out; not as able as they are significant. Do you understand that?

We have two pcs. One is to have a goal "to be good," the other has a goal "to be a bad man." Well, all right, we run those out. We get an equal recovery as far as the actual status of the case and the ability of the case is concerned; which is comparable. In other words one GPM equals one – so many ergs of recovery. Don't you see?

Now the fact that one has a different experiential track than the other has nothing really to do with auditing. This fellow has an experiential track which has – never has anything to do with business. All down the track he has nothing to do with business. Well, of course, he's going to wind up with an experiential track which to some degree omits business, but at the same time has experience with business because it's a direct opposite. You spend half your time in a GPM doing the opposite to the goal. So the significance of the goal is not of very great importance.

Now, the significance of the goal, however, means something to the auditor. It means that a goal which is so worded is more likely to present itself than a goal that isn't so worded.

All right, let me give you an example. If a pc had the goal "to present this goal to the auditor," that is the goal which the pc would give to the auditor and the auditor would find on the pc. Well, in lesser degree this is true all the way down the line. So that mediocre goals, or quasi-quasi goals, are rather difficult to find because they don't dramatize their own presentation. Do you understand that? To that degree significance is important.

Now, significance is also important in wording up the GPM. That's very significant because the right items in a GPM are worded a certain way and wrong items aren't.

Now you get a GPM and somebody has allegedly had found on him, "to create." This is his first goal, see. Oh, ah, anybody see it read? I doubt it. If anybody saw it read, it read for a moment and the pc quietly expired, but they went ahead and found some items. Well now, they found the item "steam locomotive," "a lady," "astronomy," "pigties," and one we saw this morning had the marvelous thing of... the goal "to create" I think had in it, or some such goal – the goal had in it the name of the auditor. I know we had it... the auditor had the same name two hundred and sixteen trillion years ago. See, it's ridiculous.

In other words he didn't find any part of the goal "to create." They found the goal "to create," but didn't find any part of the goal "to create."

Now do you see what happens when you go too far backtrack with one of these goals? Well, it isn't enough to abandon some pc's goal that is rocket reading, just to say, "Well, that's too far backtrack." No, the thing to do is to have confidence that you can plow the pc through anything, providing it rocket reads. But plowing him through that much backtrack, well it just wouldn't happen, it just wouldn't happen, you'd never get him into it. You'd find a whole lot of lock items of one kind or another unless you piloted him very directly.

Now, I am not saying that you should abandon the pc's goal that is rocket reading because it is too early track. But I'm saying that the pc's goal, run, is going to give you a great deal of difficulty. Most of these whole statement goals which are brave and upstanding like "to confront," you know. That's a great goal. That's a nice goal. That's way back on the track,
and the goal you are looking for in actual fact is a lot more modern. A pc isn't as full of vine-gar in modern time. He's got reservations as to how much power he has. He'll have a goal something like "to get along all right," or "to get along," or a goal "to get out," or a goal "to quit," or a goal "not to quit unless I have to," you understand? Or a goal like "to make it somehow," "to not be sad." Ooh, you know, I mean these are interesting goals or there may be some minor goals the PC knows he can do, which is "to reforest Earth," or something. Or, no, that's pretty ...

The goal that I'm talking about is – the later it is on the track the more significance it is going to have.

That doesn't naturally hold true, because the escape goals, the not-confront goals – not the goal "to be free," that's probably pretty early – but the escape goal like "to never go to school," see, something like that. Such a goal as that is more likely to be in present time, and such a goal as "to confront," "to do," "to be," "to have," "to create," "to cause," "to be cause," goals of that character are very early track.

In other words the whole simple thought is backtrack, and the more complicated, non-confront forms are present time-ish. You got the idea? Present time could contain a goal such as "to be a man," you see? All right, that's a finite goal. On this PC the goal presents itself "to cause," and the auditor drills this goal "to cause," and can never get the thing to go out. It won't go out and it won't rocket read, and it won't do this and it won't do that. Well it can't be run, don't you see. But "to be a man," that can be run. That is runnable, and because it is runnable the individual is able to get through it.

All right, so much for that. Now the later a goal is on the track, the more the PC was likely to dramatize it. And the most important goal to the PC is the one which includes present time. And the top of that goal may not be there fully because it may not be fully developed. He may not have lived all the way through that goal yet, but nevertheless what top that goal has will be the hidden standard; will be the chronic present time problems of the PC. You see that?

That's as far as the whole track is concerned. In other words, the PC is much more likely to dramatize a recent goal than an ancient goal. You got that? All right. Now that looks at the whole GPMs. See? All of them.

Now, the later an item is in a GPM, the later an item is in a GPM, the more likely it is to be dramatized and the less reality the PC has on it. And that is also true of the whole track. The PC has less reality on a modern goal than an early goal. A PC has less reality on the top of a GPM than its middle.

Now you ask – now this has a great deal to do with running – you ask a PC, you say, "Oh, give me an item in your GPM," you see. It's "to decide," you see, it's "to decide," and he gives you "maybe." In other words, it's not "not decide," and it's not "to decide." He'll give you the crossover area.

PCs tend to give you the middle of the GPM, and left to their own devices more likely give you the middle of the track. They dramatize, however, the material latest in the GPM, and the material latest on the track.
Well now, that's – this is all data. This is actually vital data. It isn't the type of data which you think you can get along without because you can't.

Now, Mary Sue did the rather fantastic (I don't know how many auditing hours she put in over Easter), but she did the rather fantastic thing of running a fifty GPM bank in seven and a half hours, which is the average time of an RI every nine minutes, which includes all breaks, arguments, administration, upsets, everything. One every nine minutes. A seven-and-a-half-hour sprint which encompassed the whole of one GPM.

Now, I don't know the GPMs have less in it. They probably – some of them may have less items in it – in them – than this particular GPM. But there were at least fifty items in this GPM, and the reason there were at least fifty items in it is – I know we didn't miss many because missing one was something like being blasted out of the chair. The second you missed an item, why, the whole world sort of went *nyaah*, and the corners of the room went out of plumb, and got sick at my stomach, and so forth. This body did not like it at all.

Any one of these items in this GPM was the equivalent charge to a bank later on the track – than a whole GPM later on the track. This thing is a crusher. I'm speaking from experience. I'm speaking of the goal "to create," and we ran it out last night in a seven-and-a-half-hour sprint. Rather fantastic.

Why did I have to do this? Well, we actually took the goal "to be cause," "to cause," and the goal "to create," to get early enough on the track to get the plot and form of the GPM. Why? Well the later – the later items are terribly obscured, awfully nailed down, and awfully hard to get at. They do not reveal themselves easily, and we had run all the way back down, I think "to create" is about the fifteenth GPM I've run.

We haven't prepchecked these things. We haven't cleaned up all the items in them, but this one we did clean up well in order to get the pattern of the GPM.

Well, we've been struggling along in that direction, and I've been trying very hard to get it and suddenly it came to view why the top of the GPM is missing. And the top of the GPM is missing for this excellent reason: (I don't know if you can see this or not. The top items of the GPM, the first fourteen items – that is to say, the first twelve items down from the top of a GPM, I said fourteen because I know the next two), but the first twelve items are simply positive-negative.

In other words, we've got one here which is a noun, you see, and that's the noun. And over here we have "no" noun. Now, if a pc dramatizes – you see this is your – this is your oppterm, and this is your term. Now, if the pc dramatizes the top of the bank more easily than the bottom of the bank, ha-ha-ha-ha-ha – what happened to the top of the GPM? This gets very interesting. What happened to it? Well, "no noun" overlaid "noun." A top oppterm was "noun," you see. Let's say it was "to scream," you see. So this is "scream," or "screams." Now this would be "no screams." The top terminal is just "no screams." Simple as that.

Well, with these two collapsed on each other, every time the pc looks at "screams," he says, "No, it's not screams," you see. He says, you see, "Screams, well it's no screams," so there aren't any screams.
Now the next one is a – is the goal with an "-ing" form followed by a "no" same, see. So that's "screaming," and every time the pc would look at it, this top being collapsed, term and oppterm, the terminal of course is "no screaming." So every time he looks at "screaming," well he sees immediately then that there – it's no, you know, it's – there's no screaming. You see, it's not there. And that's true of the first twelve items of the top of a GPM. Every one of them is cancelled out by the fact that it's a direct negative.

You've got the top five oppterms, and they are all followed by negatives. And they go, the next one here goes "-ers," and it's "no -ers," and the next one is, horribly enough, "-ingness; -ingness," and this is "no -ingness," and then it is "-ishness," and then "no -ishness," and then finally, "-ivity," and I think – of course I haven't compared this to the top rungs as far as the upper goals are concerned – but I think there is a whole constant because this is in "das master plan" that you chumps laid down. I don't know what the hell is the matter with you people. What did you – what did you do that for? You know, that's silly.

Anyhow, here's this – here's this puzzle. The next one down from that on the oppterm side is "beings who 'goal'," or "people who 'goal'," depending on what part of the track you are on. You know, if you are on the early track there aren't any people. You might have been back there sometime, you might have noticed there are no people. And of course on this side, why of course it's "a being who never 'goals'," or later on the track, "someone who never 'goals'."

Well anyhow, what's all this positive-negative proposition? Well, it's just a gradient scale of how the goal increases. Now of course, these – I might have these, one or two of these turned around, but what you are looking at here is the, is the first real look at one of these GPM tops. And the idiocy here of course is this negative all on the terminal side. The first – I said five, that's not correct. One, two, three, four, five, six, the first six terminals from the top and the first six oppterms from the top exactly compare except the terminals have "no" in front of them, or "not."

Now you get a beingness form goal like "to be – to be slap happy," and you then get the "-ing," of course is "being slap happy." And this of course is "not being slap happy" over here. I'm talking about the second from the top, the top and then the next one to it. This "goal –ing" means of course "being slap happy," and the negative version is "not being slap happy."

Now some of you unfortunate people who have cooked up a goal which is "to skate on the Empire State embankment unless the police catch up with me," nevertheless have all these goal forms as far as I can find out, and how you squeeze all that into a single goal form I don't know.

But here's – here's the weird one about this thing. We've got "to be slaphappy," you see. Well how do you get it into an "-er" form? What are the "-ers?"

Well, oddly enough the bank wasn't laid in in English. I don't know if that ever occurred to you or not, but you haven't been speaking English very long. And what you are doing is approximating in English just thetan-thought concept which exists without semantics. So much for Hayakawa and Korzybski. Semantics isn't the end-all of everything, it's just what semantic sits on the thought concept, because a thetan can hold this thought concept. And of course these thought concepts are not expressed in English, and you get such a thing as "being
slaphappers," or some such thing, "being slaphappers." And you get "slaphappingness," "be-
ing slap happeningness." And you get "slap happyishness." And you get "slap happyivity." That
sounds like gobbledygook, but you're going to be the most amazed person in the world when
you find it start rocket reading on your pc. "Oh, ho," he says, "what's this, what's this, what's
this?" Well it's because he didn't live the bank in English. He didn't live it in any language,
and that you could get it into English at all is fabulous.

Now this "-ishness" is quite interesting. It's different than – well let's take, let's take
"create," see. We have "creating, creators, creatingness," that's all perfectly happy. And we
also have "creativity." Well this one in here, what's this "-ishness?" Well actually you have
"creatishness." It means the tendency, the tendency toward creatingness. And that all matches
up in English to the actual thought concepts that are in it, which I think is quite amusing.

But anyway there's the top of the GPM, and of course each one of those things has a
suitable negative. And "to skate on the Empire State Building so the police won't catch me,"
oh brother, you've got a job on your hands. How do you make that into a noun? Well it's not
"skating upon the top of the Empire State Building so the police won't catch me." It's probably
"skated" or it's probably, well, it will be something on the thing that says the nounal form of
skate, to skate, you see. And maybe that's a "skut." But whatever it is, you take "to bring all of
my money home to my mother." You see? This noun form becomes "brought all my money
home to my mother," see. Some such expression, but it is what it is and it will not be "pay-
check." You understand? See, it won't be a different word. It'll be "brought all of my money
home to my mother," you see. It'll be that sort of thing. It might even be, "brought-home-
money," you see. But whatever it is, it is what it is, and fits under that noun form.

Now, right across from it of course is "not it," you see. "No," "no brought money
home to my mother." Something of that sort, and that will express this concept.

Now of course it's very easy "bringing money home to my mother," and "not bringing
money home to my mother." "Bringers of money home to my mother," and "no bringers of
money home to my mother." "Bringiness of money home to my mother," "no bring-" or
"not," (no or not) "bringing home-" "bringiness home to my mother," "bringiness money
home to my mother," "bringiness money home to my mother," "not bringiness home...
money home to my mother," and "bringivity." And you say, "Oh, that isn't English." You're
right, you're right, you didn't lay these banks in in English.

I think it's quite amusing. And of course the joke is on the poor pc who has such a goal
as his first goal, and the poor auditor who finds the goal, knowing he had better find the goal,
not "to be," or something like this, but find the goal "to be a good, sweet, little fairy who
makes children happy."

Ha-ha! Well of course you just keep working on the verb form of it till it fits in. Now
it's got to rocket read, and the odd part of it is you'll find it does rocket read.

Now there is a school of thought of "What is Ron doing entering my bank this way?"
Well, I'd say you've got an awful – you've got an awful slow reaction if you have that school
of thought. But what have I been doing for thirteen years? That's just bum; you just noticed.
What do you think of somebody that just noticed he's being processed after thirteen years?
Anyhow, the thing is what it is. It isn't what I say it is. And you'll find out that your pc will stay very comfortable, will feel very good and everything is fine if you run the whole GPM with no nonsense about it, and you get the whole GPM. And the pc will feel very strange indeed if you don't run the whole GPM. And if you can catch a pc with a late goal and run the whole thing, or even if the goal – whatever the goal he gave you, catch the early goal and struggle with it if you have to – and you run the whole thing and you get it beginning with the top oppterm and go right on through without bypassing a single item, work it right on down to the bottom of the GPM, do your RI oppose list at the bottom of the GPM to get rid of that goal as an RI, do all that, prepcheck it up, you'll check it up – check its items, make sure nothing's ticking, just everything in it, prepcheck it up; you're going to feel marvelous, you're going to feel marvelous.

But if you leave the top there, find a bunch of items that belong to another bank and get the goal discharged somehow and get down to the bottom of it and try to prepcheck this muck that won't prepcheck. So then you go and find the next goal and do the same thing with it, and find the next goal and do the same thing with it, and find the same goal and do the same thing with it, and the next goal and do the same thing with it, you're going to have an awful uncomfortable pc.

Now your pc is going to be uncomfortable enough with a goal entered and a couple of bypassed items in it. How do you think your pc's going to feel with four or five or six or eight unfinished GPMs? Well he's going to feel pretty grim. Therefore it is very, very important for you to know the anatomy of a GPM, because let me let you in on something here. Do you know that nobody listing straight in a GPM, including me, has hit the top. They hit the middle beautifully, but they never hit the top. They never hit the top. They just never put it on the list. That's remarkable when you come to think about it. Well that's because it's too late on the track.

Now the things will fire if you present them to the pc. So you get a thing called "directive listing" which – in which you direct the pc's attention to what you want for what particular spot on the thing.

Now, this goes contrary to what we have done formerly, but it's not evaluative because you're not saying, "your item is," you say, "Give me the noun form of your goal." And the pc doesn't give it to you, he gives something else. Well keep taking down what he gives you. Keep telling him, "No, no, no, the noun form. What is the noun form of 'roaring'?")"

And the pc says, "Oh, roar."

"No, that's the verb form. Oh no, it's also the noun form isn't it? Roar. Yeah, well, I'll put that on the list: roar."

Okay, it rocket reads. That's it. You are away. Test the thing and so forth. And you say, "Now give me the negative form of that."

And he says, "negative roars." And you say, "No, no, no, no," and he said, "Well, not roaring."

"No, no, no, no, the negative form," you know, "like 'no roar'."
He says, "Well all right, if you want to put it that way, no roar."
You say, "That rocket reads."
He says, "It does! Well, what do you know about that."

You know they protest sometimes for a moment or two. "What are you doing entering my bank? How do you know what I've been doing all this time?" It's about time we found out what he's been doing all this time.

Anyhow, you steer him — steer him into your proper forms for these, and you'll find they will fire promptly and properly in sequence.

Now, in keeping with this, here is very good news. Early on the track where they are hardest to run there are no items in the bank, no items in the bank, none, which do not contain the goal as part of the wording. Got that? There are none.

So if this holds true on up the track and forward into present time, then you won't get any more goals whereby you have "to be a lady," oppterms "steam locomotive," terminal "astronomy." See? "To be a lady." Well, it's just "lady," or whatever it is. I don't know what "lady" is in its noun form. You'll have to figure that out some day. It's not gentlewoman.

And there it is, you say the thing sits there and then it goes down the line "imperfect being a lady," "active... active lady being." You get this kind of thing. It's got "be a lady," "be a lady," in one form or another. It's "people who are ladies." It's "someone," it's "someone who would never be a lady." You got the idea? It's "lady," "lady," "being a lady," "be a lady," "ladying," so forth. It's just "being a lady," "imperfect ladies," and so forth, and it doesn't even get down to "tarts." It's just the "hopelessness of being a lady" is a low oppterms, don't you see? It's just a "lady, lady, lady, lady, lady." You get, you get the pc's item and it doesn't have the goal expressed in it one way or the other. If the whole bank follows the basic pattern of the very early, big, beefy banks, why, then we'd say it appeared in each one.

Now, we can't guarantee this is the truth in all of the later banks because we might get a variation. But I have found this to be the case, that you can pick off lots of locks that will RR and apparently disappear when you actually have left sitting right there the key item.

Let's take — let's take the item of "being a tiger." All right, we've got this item, and it's got a lock on it, and it's "imitating large animals." And you get "imitating large animals," and by George it borrows the rocket read from "being a tiger" and rocket reads and you can oppose it, and then you promptly get lost and you don't know where you are going.

In other words this gives us a very, very set and patterned action on a GPM.

Now there's a little bit better news. There's a little bit more news about this, and it's good news, is the lower oppterms, the very low oppterms repeat the very high terminals. So that you again get no noun, and no nourcing, or no goaling, and so forth in two or three items down there along the line.

And the only thing that doesn't really contain the goal expressed in the item on a whole GPM is the last couple of oppterms, the early oppterms, and of course they savor of the earlier goal. And you probably will find in the last one or two oppterms that you get a different phraseology entirely. But that makes it awful easy to pilot one of these things. You can
ride one of these things right on down, and it's all done by the drill. You test them, you test the question and you find out if the item is still reading and you go ahead. You don't test for terminal or oppterm because it's pretty obvious if you're doing it this way. And you make sure that it RRs and you carry on.

And with this pattern I began to suspect something, and can now tell you as an abso-
lute lead-pipe cinch. Now look, this does not apply to a source list. A source list has to be tiger drilled. But if you have to tiger drill an item or put the big mid ruds in on an item to get it to fire, that is not the item you want. Now, that's revolutionary isn't it?

In the first place I haven't been putting in anything on items for a long time. But it suddenly occurred to me that you're all drilling items to get them to fire. You get it on a list and then you drill it to fire. If you've got to drill it to fire it's not it, because you can make almost any item on a list fire. How do you like that? You could tiger drill anything that RRed on listing and you could make it fire again, momentarily.

Well, you mustn't drill these items. There is where you are taking up all of your time. It's all in the senseless drill. I couldn't figure out what you were doing, but now I know what you were doing. You're drilling items, and you mustn't drill items, you just mustn't do it, because if it didn't fire, it isn't it.

Well now, let's take this goal here, "to scream." And you put down "scream." Well hell, that's out of the blue. The pc is saying, "Aw, scream, what's this, scream, what's this?" Noun form of the goal, so forth. You say it a couple of times, it'll RR. Oh, you might touch it up, take the suppress off, because they just suppressed it. Take the protest off because they just protested it. Something like that. You know it's there. Oh, it's forgivable. You've got to make it fire. But if you say, "All right, give me the negative form, who or what would oppose scream? Or screams? Who or what would oppose screams?" And the pc puts down everything under the sun, moon and stars, and you're going to have to tiger drill something to make it RR. Ha, ha, ha, ha, ha, it's just "no screams." If you get, "no screams" on the list, bang that's going to fire. You're going to see it fire. You're going to say it, it fires. That's it, that's all there is to it, bang.

There is no "null the list and go on down and null the list and get on the mid ruds. All right let's get on some mid ruds (let's see, we can waste another ten hours of auditing). Let's get in the mid ruds on all of the items in the bank, and so forth, and see if we can get the mid ruds in on the pc. So we see the pc is biting his fingernails. Let's get the pc in on biting fingernails, mid ruds, biting fingernails. Ee-ee beinsstu-huh."

What the hell's the matter with you? You haven't got the item, that's why.

Now look, as you go down the bank this is going to serve you in very good stead, because it's a number one test. I'm not just making fun of you. You're a knucklehead, and I – but I love you anyhow.

If you can't get something to go on the list, pshhhew, which when read back goes psshhhhew, see, if you can't get that thing going pow, you haven't got the item. Most marvelous test in the world. You get the item without drilling. If you can get the item without drilling, it's the item.
Now this has its limitations because you can get other items without drilling. You are
down in the middle of the bank, the pc can give you fifteen dozen locks, all of which fire,
one of which belong there. You get the center item and however it fires.

But the pc does this trick. You list for a while, and the pc isn't satisfied with the final
result. You call it, it fires. Pc says, "Oh no, that couldn't be it. It turns on mass, and it does this
and that and the other thing." And you'll notice that – you don't depend on the pc's telling you
– your tone arm is up here at four and a half, and when you give him the item, and you read it
back to him, not when he finally accepts it, particularly, if it's the right item, you get a blow-
down. It comes right down, that tone arm. That tone arm doesn't come down, you go on listing
for a while. Only guide his listing, and get him to put the thing on the list straight. Soon as
you've got the thing on there straight, once more the thing will fire, but the old one won't fire.

Now, you learn to work around with this fact that they fire without TD and you will be
clearing people. But as long as you put in Tiger Drill buttons on items to get them to fire, as
long as you null lists to get them to fire, you're going to wind up with the wrong item.

Just because something fires when you call it does not make it the right item, but if
you have to tiger drill it to get it to fire it is pretty much of a cinch to be a wrong item.

Now, the only thing about this is, is once in a while, about one item in fifty, the pc has
been sitting there chewing on it one way or the other, and has been refusing it. Let's say well,
we found it in bank one, and it turns up again in bank three, and the pc has been chewing on it
in bank one. Well you suddenly remember we've had this item on several lists before and it's
always been refused, and we see it on this list again. Yes, it could be that it is suppressed
enough so that it won't fire. But don't be deluded. Don't, don't be deluded by this, because the
chances are even if you do get it to fire it's still wrong for the spot you're trying to put it in.

It's one of these things. That an item does fire, bang, when you read it back to the pc, it
is not a guarantee. That you have to tiger drill it to get it to fire it is practically a guarantee
that it is not the item.

And there's where all of your clearing time on 3M is going. There's where it's all go-
ing. You are just not getting the items on the list.

Well, the reasons why you weren't getting the items on the list of course have to do
with the fact you didn't have the top form of the GPM.

Now, on actual listing tests, and on a great many pcs, and a great deal of experience of
this with this, I can tell you that the pc's bank is too heavily charged at the beginning of the
case for the pc's confront to be capable of giving you the item. That's it. It... he's just too
charged up. There's nothing wrong with telling him what the item is or running a bunch of test
items in on him, you know. Is it "bringing the truth?" "bringing truth?" you know. Write them
down on the list. Ask him if you can put this one down on the list, and that one. We'll eventually
work out some where it doesn't upset the pc particularly, and you'll eventually get some-
thing to fire, and there it is.

Now, when you get away from the top, the pc's confront comes up because the bank
isn't as jammed in the middle. But you now know that you've got to have items with the goal
in them, expressed in them if all banks follow the track of the original banks on the track.
All of this is very interesting information. It is all quite usable in auditing. I have been actively slowing down your going into too many GPMs and jumping over and so forth, until I was sure that we had something that looked like the top of the GPM. This is another good try at this. This is not a guarantee that the goal "to be a self-appointed archangel in the Christian Science church" – which is very late on the track – this is not a guarantee that it will have all of these tops. But look, if you've got all these tops you can test for them, and if they don't fire, they don't fire.

And then in the next goal that you get down to, why, you've sure got all these tops again, and you can test those things out. My money is on the fact that they will continue to fire all the way down, because it's a gradient scale on the oppterm side, it's a gradient scale from the extreme accomplishment of the goal down to the nonexistence of the goal. And on the terminal side it comes from the nonexistence of the goal, increases down to the goal itself. And this looks to me like a very good rendition of this.

Now, there may be some other common points about this, and I'll be studying them and so forth. But knowing now what this dozen at the top here are if there are any more items or patterns around in there that might get missed it won't be very serious. So you can go ahead and plunge on with this.

I'm quite intrigued with the fact that the GPM is this pattern. I'm quite intrigued. And I was very intrigued to find out that in the goal "to create" that the pattern was very fixed, and that the pattern was extremely patterned. And that made me very suspicious, because when did a thetan learn how to do this if two hundred and sixteen trillion years ago he was obeying the perfect pattern?

Well, I'd say there were a few goals before this, and I expect sooner or later to run into the beginning of track with some such goal as "to know how to put a GPM together."

But anyway there is as far as we've gotten on this pattern.

Now, tests for the top terminal, for the top oppterm, rather, tests for the top oppterm have been very successful and we've made some good progress on that. The top oppterms we got we didn't get any higher on those we already had been testing than "bringers," or "people who – people who 'goal'," or something like that. But we did get the "e-r" form, which was still two from the top. We want the noun form, itself.

I don't mean to muddy you up on that because all this will be published and these things will be rewritten. Before I rewrite them, however, I'm going to check a lot of later banks and get the information exactly fitted together, and it will be released at that time.

But this is good enough to use, and I think that it's very interesting that we had one pc who came in to see me today and he had a goal, and he told me, he told me that he – that nothing was doing him any good. And he had a goal "to be good." And I said, "Well, it doesn't do you – it does you no good. Is that right?" And he said, "That's sure right." And I said, "Well, then it's no good, isn't it?" And he said, "Aw, that's so true." And all of a sudden he... I said, "Well, that's your top terminal isn't it?" And he said, "Yeah, I guess it is," and he stopped saying any more about it. Now that's a mean thing to do to you, but I thought it was just too good.
Of course somebody with a goal "to be successful" has got a top terminal – is "no success," and he's dramatizing it like crazy. So if you are beating your brains out as an auditor wondering what's the matter with this guy, well, it's just "no success," you see. And if the guy had a goal "to find," and you'd just be beating your brains out because you've got "no finds." And if you had a goal "to know," you'd probably have "no knowledge" up here, and the pc's going to hit that awful strong because that's him.

Only one other little datum I might give you is the goal fires much better with the pc in a terminal than an oppterm. Isn't that interesting? Then you get back on the track later. I think that's fascinating. The pc definitely comes up the terminal side, and definitely faces all the way the oppterm side, just going into it slightly.

Well, that's some more data on the GPM, and now that we've got it pretty well taped, and we've got it pretty well figured out so that you can get through it – actually you could get through it before without losing your skull – but now that you can get through it, now that you can get through it, those in the X Unit will find it's perfectly safe now to find your goals. Perfectly safe and so you've got till Friday because it's awful hard to run a GPM without the goal, and if you haven't got your goal by Friday well, we'll have to put you into the Y, and then put you into running GPMs without the goal. It ruins the case, you know, to do that, so don't put us up to that, don't make us guilty of that terrible overt. Go ahead and find the goals before Friday. Okay?

Thank you very much.

Good night.
DIRECTIVE LISTING

A lecture given on 18 April 1963

How are you today?
Thank you. Well, this is the what?

*Male voice: The 18th.*

The 18th of April, AD 13, Saint Hill Special Briefing Course, and I'm going to talk to you now about directive listing and R3M2. The situation is evolving very neatly on 3M. Situation is well in hand. And if you want to be interested in something, or if you want to have more worries than you have at the present time, just audit some 3M. This is a guaranteed – this is a guaranteed method of absorption and worry. You can have more heart failure auditing as the auditor, doing 3M than the pc ever dreams of.

Now, pcs are very anxious to go down the bank, very anxious to run the GPM, and they get very ARC broke and they hate to be stopped, and, all of this sort of thing. And the auditor on his part, why he's – he's in one of these mental states which is, well, it's pretty grim! It's pretty grim! I'm getting my licks in now, on running it. I know what of I speak!

Now I myself didn't get much reality on auditing Routine 3M by being audited on it. And one of the reasons for that is, is I have probably one of the most indestructible RRs that ever emerged! You can be thankful for that. I miss a few items, or a couple of GPMs even and nothing much happens. The only time my RR ever went off was when I'd found – been put through a bank and found twenty items, without having the goal for that bank, it appearing that the bank was part of another bank. And my RR went off and we found the goal for it, for those twenty items, and of course it went right back on again and there's been no further trouble.

So I don't have a reality, subjectively, on the delicacy of most pcs' RRs. And yet I have now auditing experience that, shows me very definitely that pcs' RRs are very delicate. And you miss... well it's this delicate: You miss a couple of items, you know, bypass a couple of items and you find all of a sudden the pc's RR is dwindling, getting smaller, and will suddenly disappear, and you can't find any items on this pc. And that's apparently fairly ordinary.

The experience is more than just my auditing experience; it's been happening in Z Unit rather consistently. I began to see what the auditor is up against there, in this situation, because there are only two things – now get this – there are only two things that can cause an RR to get smaller. That is successive item after successive item, an RR can get smaller, shorter. And that is a symptom of danger. And only two things cause it.

And the first of these is not having the goal for the GPM you are running. Well, now with the new directive listing, which we are using, this liability becomes much less. Because the items you are getting in directive listing are taken directly from the context of the goal.
And, this only leaves the possibility that the goal might be slightly misworded. Instead of "to be successful" we have a goal "to succeed," don't you see? I mean we could be that close in.

But if this were the case, the goal would have R/Sed a lot on being checked out. Beware of these goals that R/S a lot. They RR and then they R/S – that doesn't apply to a goal halfway through a bank, because a real goal halfway through a bank will R/S. But, when you're checking and finding goals, you'll find a goal that R/Ses. And they've got a lot of R/S turns on with an occasional rocket read, you can be absolutely certain that that goal is slightly misworded.

In other words, instead of, "to be a kingpin" you see, it's "to kingpin," give you an idea. Instead of, "to run a restaurant" it'd be "to be a restaurant," you get the application of it. In other words, there's something slightly wrong. Instead of "to be a cook" – "to be the cook," you see? And that much error, that much error in the wording of the goal will cause a goal on checkout to do a lot of R/S, and once... starts in by an RR or two, and then does an awful lot of R/S, and then goes blooey, and you can't get it to do anything else. Well, that kind of a goal by the way is very valuable – very valuable in Routine 2. You find a goal that does this, all you've got to do is tell the pc to give me some variations in the wording of this goal. And, if the pc starts out, it's "to be a cook," see, you've got this goal "to be a cook," and the pc starts out, "Well, to like food. To prepare food easily," well, all right, let him go on. But what you want is just a variation in the wording of the goal. Not a goal of similar context, you see, we don't want the similar concept, we want a varied wording.

Because it's something – we know that "to" and "cook" are probably right. But is it "to cook"? or "to be a cook"? or "to be the cook"? Which one is it? Now this gets us into directive listing on goals which is where we properly pick the thing up. Now when we have the goal that way, we mustn't suggest goals to the pc, because this upsets the pc like mad. But if we've got a goal, which is going bing-bing, and R/Sing, and it RRs every once in a while, and then it goes R/S, then we can't get any RRs out of it, we know what we've got our hands on. And about the only thing that's going to cure this, in the final analysis, is directive listing.

We tell the pc, "All right, give me some goals of a similar context." He says, "Well, to like food, to eat, to never have anything to do with animals, to run a farm, to be the director of price control in the government, to elect the president. To..." Well, look – look, this pc's confront on the subject of goals, and so forth, is about the same as it is in the bank, which means, terrible! See? It's because his confront is measurable directly proportional to the amount of charge you get off the case by running a bank, you see. And it's not directly proportional to the amount of confront that a pc does in a bank.

Now you can make a pc just confront lots of goals and do lots with goals. You can make a pc do all these things. But, the truth of the matter is, his confront comes up because you are in actual fact in the bank situation. You're in a dropped charge – it isn't the number of goals, it's the number of goals you discharge. In other words, by find... in finding goals, you must keep your tone arm action going.

If your tone arm action ceases, in the finding of goals, and you do list after list after that without finding one, then the pc's attention has hung up on a favorite goal. And you must
get rid of that favorite goal. It is either the goal, or if you've never been able to get it to do anything, and so forth, you must change the pc's position in the bank.

And you do that by saying, "What goal would you postulate after 'to catch catfish' had failed?" There is the wording which is used – "What goal would you postulate to catch... after 'to catch catfish,' had failed?" That's... you'd do this list, you see, and then null it the same as any other way and all of a sudden you'll find your tone arm motion has been restored.

Tone arm action ceases when you've gotten the pc's goal and gone across it or the pc has stuck on a favorite goal which is not due at this time to be run. It's his goal, it's somewhere in the track. But it can't be run. So you must move his attention. Well, the.. one of the ways to do this is directive listing. Directive listing is directive to the degree that you just say, "Tell me the goal after this other goal has failed," that directs his attention, don't you see?

Well, we can go a little bit further than this. And we've got this goal, "to be a cook" and it RRed, and then it R/Sed, and then it went out, and nobody's heard anything about it since. Well, one of the ways of handling that is to make the pc give us another wording for that goal. And we can do this quite directly. And the pc's given us this long concatenation which finally winds up "to elect the president," and it isn't anything to do with being the cook. You've got to bring his attention back, "No, give me some goals with the word 'cook' in them. Cook. Cook." And the pc says, "Oh, well, oh, why didn't you say so?" you know, and, "to be a cook, to be the cook, to cook, to have nothing to do with cooks, to never cook." Aha! That one RRed. And you say, "Thank you very much," and you tiger drill that one, and that's the goal.

That's quite interesting. But one of these near misses requires direction of the pc's attention to the right wording to make it run.

Well, now to get back to what I was talking about, the only thing that while you're running the GPM with Routine 3, that can cause an RR to shut off – there's only two things: Is to get a wrong item or bypass an item, or list one wrong way to. This is all under the heading of actually wrong item, because a bypassed item means you got the wrong item, because you didn't get it in sequence. And, the wrong way to, well, you called a terminal an oppterm. So that again is a wrong item – and, so on. So, it actually comes under the heading of, you've handled even a right item, so as to make it a wrong item, or you bypassed the right item. You've done something. Just in that immediate framework. Nothing further than that. And you'll find the pc's RR is getting narrower on the subsequent items, if you find them at all. In other words, bypassing an item, or getting a wrong item, or listing one wrong way to, you can then give the same phenomenon as would appear if you were running a wrong goal.

Now we are running the goal "to be a cook" – this would be a wrong goal. "To be a cook," and we get the top terminal, top oppterm, and so on, which would probably be "cooks" or something like this. And, we get "cook" or "cooked" or something like this. And it's "to be a cook." It doesn't look wrong, does it? And, then we'll get down to the next one, we get the – we have a little trouble getting the top terminal. All right, that's fine. And then we get the second oppterm from the top and oh, we get that all right. And then we get the second terminal from the top, and we suddenly begin to realize that this pc's RR is getting awfully small. Well, of course, we haven't got the right goal.
If we go on getting RRs, why, the RR will shut off. We go on getting RIs, the RR will shut off. The shut-off RR, then, is adequately telegraphed to the auditor. The auditor knows all about it. You see, it isn't true that different RIs have different lengths RRs. That's not true. They're basically all the same length. And if you got an inch and a quarter RR on the top optterm, you should get an inch and a quarter or even a little better on the top terminal and it should be an inch and a quarter on the second top optterm, and an inch and a quarter on the second top terminal. In other words, we should go on there, and if anything the RR should improve a little bit, and certainly it should improve on the goal.

Well now, if the reverse happens, if we get a shortening RR, we know that one of two things are wrong. We've either gotten a wrong item or we have got a wrong goal. Now, with directive listing it isn't likely that we are going to get a very wrong goal. That is rather ruled out.

One of the ways we would become aware of this is the pc keeps putting down, "steam locomotives," and we're trying to run this "to catch catfish." And, what's going on here? And we keep directing him into catching catfish, don't you see? And we want a "caught catfish," or whatever the top optterm is. And it just doesn't fire. And the top terminal is, "no caught catfish" or something of the sort, and that doesn't fire well. But we start getting other things firing, and, so forth. And we just can't seem to make it.

Now because auditors do have a lot of trouble making this, your first assumption is not that you have a wrong goal. But this is definitely a possibility. You can't get the items which would ordinarily belong to that goal into that GPM, and they don't fire; obviously, there must be something wrong with this goal. Of course, if you really want to ARC break a pc, start challenging a right goal; that's... sometimes even challenging a wrong one! This is one of the liabilities of the business.

And the other one, and much more likely, is that you've gotten the wrong top optterm, or the wrong or... and the wrong or the wrong top terminal, and the wrong, or even the right top optterm and the right top terminal, and the right second top optterm, and then you caught the next one and by accident listed it wrong way to or something, and – wow, I did that. And immediately on the third top optterm why, I didn't have any items. I didn't have any RR or anything. And I got a couple of little things on the list that RRed, but the RR from being about an inch long, was suddenly only about a quarter of an inch long. And then on the next – next item it didn't exist at all! Just nothing RRed. We had nothing but long falls.

Well, now there are those amongst us I am very sorry to say, who would say at this point, "Well, it's the pc's item and it doesn't really have to read anyway, so we'll just go on and find it." Yeah, you'd better blush! This – this is nonsense. Because the auditor has simply blinded himself to the fact that something is wrong and should be corrected.

So you know if you get a shortening or a vanished RR, there's one thing that is true: There's something is wrong! And, the something wrong is with the items or the goal. And the second one you take, and look at of course, is the goal. You try to correct the items first. Now, if you've run this thing, six, eight items down into the bank, and it's all running fine, and they're right according to the lineup, and so forth well, of course, it isn't a wrong goal. It couldn't be a wrong goal, or it wouldn't have gotten that far. You wouldn't have found those
items RRing. That's it – I mean, let's say, it's "to be a catfish" and "catfishishness," and so forth. Stuff like this is turning up in there. "Being a catfish," you know, RR, or "being catfish," RRed like mad. "The beingness of catfish," see, that kind of thing, you know.

This sort of thing all RRed. Well, you can't have a wrong goal there, don't you see? So it must have been that you omitted an item, or you got a wrong item, or you faked an RR, or you did something, and goofed. And the first thing to suspect is that your top oppterm and top terminal, since they're the most variable – now, from being the most fixed they've become the most variable – but your top oppterm or top terminal are wrong.

And the thing to do in that particular case, is go back and experiment with them, and see if something else fires in their place. And if that isn't the case, see if you haven't skipped a pair. You might have skipped a pair, don't you see. There might have been a terminal and an oppterm. Maybe the third oppterm and the third terminal, maybe you just skipped that pair. And somehow or other patched up so that they crossed in. And you got two bypassed items. Look for something like that. And, of course, the most obvious thing to look for is – you evidently – you will do this, sooner or later, because I just did it last night. Just carelessly list one backwards. Just like that. Even though it's staring you right in the face. All of a sudden the pc's wrapped around the telegraph pole, all ARC broke, and nothing going anyplace, RR diminishing, dwindling, everything going to pieces.

In other words, now that we're listing by pattern with directive listing, you're pretty safe in running Routine 3M. It's very safe. Now, running it without a discovered pattern, was not safe. Because the pc's confront is not up to it. And you'd just miss things all over the doggone place if you did that.

So there is only two things that can be wrong. And the most likely is that you've got a wrong item, subhead – you've bypassed an item. Subhead – you've, opposed one wrong way to or subhead – you've got... you just picked up the wrong item. That's your most likely. And then the other one is, of course, that you've got a wrong goal. But if of course the proper 3GM [3M] wordings according to the pattern you have, has been firing on the pc, the possibility of that goal being wrong is very faint – very faint. And you shouldn't rack the pc up with it. But you mustn't rule that out as a possibility.

Well, that's about the only thing can go wrong. Now, if you want to know whether or not every RI should RR, and "Isn't it all right just to kind of apathetically go across the ahhhhhh, the meter moved a little bit, and yeah, well it's supposed to be there, and so I'll just give it to the pc..." I know what you're up against. I had a tendency... I've had a tendency to do this, you know. It's obviously the right item. Turning on somatics but it won't RR.

Well, that leads straight to disaster. Because you're not going to get anyplace from that point there on. The thing you've got to do is stop right where you are, correct the thing that prevents the RR from occurring. And that will be something that went just before, just ahead of what you are doing.

Nope. If you run a straight pattern, and if you run that pattern right on down that RR will improve, it'll get better, it'll get sparkier and spunker, the goal will read better, and everything will go along beautifully. Soon as you miss one of those things, as soon as you miss,
your RR will get smaller, and, tend to disappear, you don't get rocket reading items on your list and so forth.

Well that's the liabilities of 3M. But if you'll see that, as a prevention of doing something wrong, you can get in a happier frame of mind. Don't curse at it! Apparently, on the bulk of the pcs you will be auditing, you know right away when something is wrong, because you lose your RR. Well, you take old ironsides, he didn't ever lose his RR, so this has never come up, see? He had twenty items and most of them wrong – twenty items into the bank, without the goal. And, my RR shut off. Well, that's kind of the way it is.

But RRs apparently aren't that strong. They're fairly delicate. Now let me give you another – another item here, on this same subject. A pc in running 3M, if you're running from the top down, if you haven't picked up the goal, "to cause," or something like that off the backtrack, and you're trying to run this on this poor pc; if you've got his present time goal, it's got pain in it! It hurts! Those items hurt! He's very delighted to have them, and get rid of the somatics, because he's had them for a long time. But it hurts! And every time you say that item to him you turn on somatics.

Let's say it's, "catching catfish," you see. And, you found this, and when he put it on the list, it fired, and when you called it back once, it fired, and so forth. You're going to run into this kind of a situation sometimes. You're going to call it again. "Catching catfish," you know, you didn't see the RR, it only went a full dial, and smoke came out the corner of the meter. And you call it again, and you want to make sure – you want to make sure, you want to be certain. You want to be certain. Whereas you don't have any certainty, you want to be certain about this, you see. So you call it again – so you call it again. So, you know – you know, perhaps the second time you call it, it's not going to be there as an RR. Third time it certainly isn't going to be there as an RR. And the fourth and fifth and sixth and seventh and eighth, ninth, tenth, eleventh, twelfth, thirteenth, fourteenth and fifteenth time you call it brother, it's not only not going to be there, the pc's going to hate your guts! Because every time you say it, you're blowing his head off! That's an interesting thing. You ever think about it, that the pc has something to do with the session.

I've tried to teach some of the people in W Unit this – that the pc has something to do with the auditing session. I'm having some success. Having some success. We're going to rig up something that when the pc dies a large bell rings, or something like this, so the auditor will be aware of something having happened. I'm sorry to be sarcastic. But I myself audit the pc in front of me. A little demonstration which we saw last night, I didn't see the pc in front of the auditor being audited. I saw the auditor going through the forms of auditing. And that I always frowned on.

The forms of auditing should be used. But, of course, the pc is there to be audited. You don't abandon the forms of auditing, you just get good enough, so that you can audit the pc in spite of the form of auditing, and because of the form of auditing, and you're going to be all right. And, by the way, you'll find it's much better to use that form of auditing. Of course, there was one student who got much better results, he was permitted to audit up in East Grinstead. He didn't like being there – at that time we were separating, doing some course separation. And, they had to stay around awhile after they were terminated. And this pc took... was
taken up to East Grinstead, and audited, and they got along much better, because the auditor was permitting the pc to eat stick candy all during the session. Well, the pc did much better, that's true. It's true, the pc did much better. That pc – no bad auditing came anywhere near the pc. The pc wasn't in-session, didn't get any auditing, and an auditor who would do that to a pc, or let a pc do that, would probably audit the pc very badly anyhow. Man, to keep the pc interested and sitting there, you have to feed him stick candy. I don't think that's the right way to go about it! Anyway – anyway, I'm in a vicious mood today!

The situation with regard to the discipline of auditing, is the pc in front of you feels. The pc in front of you has nerves. Now, of course you're clearing him, and eventually he won't have any nerves, or be connected with any, and he'll be just doing fine! But at the moment you're auditing him, could I call to your attention the fact that the pc has a sensibility as to what is going on. And, you take an item that is anyhow strong enough or big enough to aberrate 90 percent of his life, and you're going to say to him – you're going to say to him, "Catching catfish! Catching catfish! Catching catfish! I'm trying to see if that rocket reads! Catching catfish! I didn't see if it rocket reads or not – catching catfish! I – it's – I – you see, I – I have to confront you when I say it, you know, and I don't get a chance to look at the meter, so I'll – I'll look at the meter again. Catching cat... no I didn't see the meter again – uh... " so forth. And you say, "Well, that doesn't RR! " Well, the question is: Did it RR? Well yes, when you called it the first time, it RRed. And after that the pc – a lot of pcs will do this, it isn't just a few of them, they put on the brakes! They do a total suppress. And they say, "No! No! Get those goddamn catfish off of me!" See? And the auditor says, "I want to see if it reads. Catching catfish! Catching catfish! Catching cat... it isn't reading yet – catching catfish! Cat..." Oh, my God, he's got these knives going through the pc's chest, you see, and the pc is trying to hold this stuff up. So what happens? You don't get any read.

Now, after that nonsense, you could put in your mid rudus. By all means put in the big mid rudus, and preferably even an eighteen-button Prepcheck, that would be good and time-consuming, and you get this thing all put in, you see, and you finally get it all straightened up, and you say once more, "Catching catfish!" You get a rocket read, see. So then you say, "Catching catfish! Catching catfish! Cat..." And the pc says, "No! No! No! No! No!" He may not even be sitting there saying anything, you know. But internally that's the way he's going. "No!" You know? Because it's an oppterm. He's been fighting them all of his life!

So, you say, "Well, that doesn't rocket read. Well, probably have a wrong goal. Probably have the wrong GPMs. Probably have the wrong reactive mind! Probably have the wrong thetan! Possibly even have the wrong – probably even have the wrong auditor! Maybe we're in the wrong room!" See, you could trace it back like this. And what does it come from? Comes from the fact that you should understand in running 3M that items have \textit{kksssrmm} in them. They got \textit{skkkrrrr}! And the more you say them, and the more you chant them at a pc, and the less certain you are, and the more nonsense you go through, the less likely you are to keep a rocket read on.

You could say it this way: I'm studying the delicacy of RRs. And the delicacy of RRs are this: The pc listed it, you give the pc, "I'll give you the next rocket reading... next-to-the-last rocket reading item on the list," – the next-to-the-last, so the pc doesn't make a mistake. And you say, "Fishhooks! That doesn't rocket read." "That doesn't read," you would say.
"And now I will read you the last – the last rocket reading item on the list. Catching catfish! That rocket reads. That is your item. Now, would 'no catfish,' or 'no catching catfish,' or 'not catching catfish,'" whatever it was, "oppose catching catfish?" And the pc says, "Oh, yes, yes!" And you get your blowdown – Zzzzzrrrrrm! Sometimes you get your blowdown earlier.

And, then you say, "All right, thank you. How does that relate to the goal?" And the pc says, "Oh! It's an absolute negative of the goal. Catch... well, no, it makes the goal, but somehow or another I'm against it." Whatever it is. And you say, "Thank you very much!" Write it down on your auditor's report, write down your next question, "Who or what..."

"Now here is the question," you say, "Who or what would oppose catching catfish?" And actually that's all the actions you take in 3M. See? You don't take other actions. No. You get it... your trouble occurs when you've gotten yourself all set, you say, "I'll read you the last rocket reading item on the list," or usually, now we have directive listing, "the only rocket reading item on the list," and, you say, "All right," the pc's put it down, pc all very bright, and you say, "Catching catfish!" And, it doesn't rocket read! Ooooooooh! And according to pattern that's what belongs there, oh-oh-oh-oh-oh!

Well, try to get some more items that measure onto it more closely. But watch it, man! If that's the item that really belonged there, you gonna stray somewhere! And it didn't show up till just now. So try to get the right item down. Do everything you can to get the right item down. And if you still can't get the right item down, recognize that you have got a wrong item ahead of you, usually, or you've done something silly with something just back of this! Don't try to take it out with the item "catching catfish." In other words, don't go at it on the basis I was just showing you.

"Catching catfish! I will read you now the only rocket reading item on the list: Catching catfish! Catching catfish! Catching catfish! Cat – catching catfish... On this item, has anything been suppressed? On this item, is there anything you've been care – careless of? On this item, is there any foolproof? On this item, should we use Neverleak? On this item, za-bwa-bla-wrarahrarah, yap-yap-yap!" I mean, I'm telling you! There's no point in it, man! There's no point in it.

That's the right item. It's the only rocket reading item on the list, you completed your listing, you call it, you're going to get an RR. If you don't get an RR you're wrong. Doesn't do you any good to try to drill it, or pray to Allah, or throw coins out there in the wishing well, it won't do you a bit of good. It's a wrong item.

And something before that is wrong. It'll – either you didn't get the item on the list, or an item just ahead of this is wrong, and the first thing you consult of course, always, is the list you are working on right at the moment. And you try everything you can to make that work out. And if that doesn't work out, and you can't get a rocket reading item off that when called back to the pc, then it's an earlier item that is flubbed up. You've missed something, or you've done something there.

That's what you put your time in on. Is looking for what's wrong right here with the 3M. Not trying to get this thing to read. And you call it once. Don't you call it six, seven, eight, twelve, fifteen, eighty-two times.
Now, this brings us down, if we're going to be that sharp, this brings us down to directive listing. Now, what happens when the pc says, on the goal "to catch catfish" the pc says, "That's the '-ers form' – yes, on the plot there, that's the '-ers form.' So, therefore that's Er-catchers! Ha-ha! Yeah! That's – that's the item. Er-catchers! Uh-" so on. You gonna let him flounder around, burn up all your auditing time that way? No you're not! You say, "Yes, it's the -er form, that – that's right. Now just for fun, take a look at this..." and you make out what it is. In other words, you've got to know the item better than the pc. Because the pc is down in the middle of the bank. He can't confront it, because he's under all the duress of charge with relationship to this item. But you're not! And you can figure out what that item is.

Now, I'll give you a couple of lessons on this, on directive listing. Two things I've learned, is gobbledygook isn't right. I mean, he tries to give you some gobbledygook of some kind or another, just to comply with the form.

And they aren't words that make any sense whatsoever. They don't make sense. It doesn't matter if they're not English, but they don't make sense! Don't expect them to read! They might even read! But you're shortly going to run out of RR.

Let me give you – "It's the -er form." Well, the only thing you can seem to get there is a "catcheter." You don't know what it is, pc doesn't know what it is, nobody knows what it is, and for some mysterious reason it rocket reads. So you say, "Ha, well that's it." And you finally find out that it's just a plain "catfish catcher," see? And, you'll find out that it's – the item actually makes sense! The item makes sense! And you're going to see sooner or later people with directive listing trying to make gobbledygook work.

I had an – I had an example of this – I had an example of this. I had a couple of words on a line plot, when I was auditing, and they didn't make much sense, and I let them go by! They didn't make any sense to me and by George, we had a wrong item! And as soon as we got the thing straightened out and they did make sense, and so forth, they rocket read, and we went ahead beautifully.

The point I'm stressing here, is even though you have those forms, don't try to gobbledygook it. Because gobbledygook won't work. But sometimes it looks a little gobbledygooky, let's get the idea of "to be Catholic." Let's say that somebody had a goal like that. Got it down in the Vatican or somewhere, they got implanted, and "to be Catholic," you know. And you get down to the "/-ness" form of the goal. And you say, well that's obviously "the beingness of a Catholic." But by George, that doesn't work! And you finally find out that it's "Catholic-ness." Makes sense, doesn't it? Catholicness. It isn't an English word, but it's a perfectly decent concept. It's the "/-ness"-ness of being a Catholic. See? And Catholicness, you'll find out will fire right at that point, very nice.

So, trying to bend it around, or the pc trying to bend it around – "Cathness – uh – catholness, uh-uh-uh-uh-nesscath! Uh..." Isn't going to work! It just isn't going to work! Yet you'll see pcs try this. Well, you've got to be good enough as an auditor to look at that thing, and say, "Well, his goal is to be a Catholic, uh – what would it be? '/-ness' form of the goal, the beingness doesn't seem to operate here. It's Catholicness!" So you finally, after he gets, "cathness" and "nesscath" and "Nescafé," you finally say, well – you finally say or say even earlier than that, you say, "Let's try Catholicness."
"Catholicness!" he says! "Catholicness! Ha-ha! Didn't think of that! Ha!" Of course he never thought of it. That's why you're the auditor and he's the pc. Because he's right in the middle of the living lightning. And it's living lightning, man! And you can't think! You wait till you run a bank on somebody someday "to be stupid." You really want to have a picnic! Oh-ho-ho-ho! It's hard enough to think in some kind of a bank "to be bright!" But in one of these banks, "to be stupid," – it's gorgeous!

And what are you going to run into! What are you going to run into? You're going to run into gobbledygook! He's going to try to follow the form, but he can't make it integrate, and you've got to sit there as the auditor, and direct his attention to what he ought to put down there. Otherwise, what's going to happen? You're going to start running out of RR's, you're going to start bypassing items, the next thing you know something is wrong way to, and the next thing you know you may be over in some other bank. There's no telling what's going to happen!

Now look! The liabilities of a wrong item are so great – the liabilities of a bypassed item are so great – the liabilities of straying into another bank are so great, in terms of just the mechanics of auditing, trying to hold the pc in-session. In terms of the number of somatics and the amount of pressure that turns on, on the pc. The... in terms of ARC break and so forth, these things are actually so magnitudinous that you must do everything possible to prevent them. And that's what directive listing is for.

Now, you've got the bank. You've got the – you've got a bank pattern. Now, the bank pattern you've got at this particular stage, is not, perhaps, the perfect bank pattern. It's awful close to it – it's awful close to it, particularly in its upper and lower reaches. The upper, fourteen, or even the upper eighteen or twenty, and certainly the lower dozen – omitting the two lowest oppterms, which vary on every goal, that's very, very set. That's very, very patterned.

Now, how patterned the middle ground is, I can't actually guarantee. Nor can I guarantee that something hasn't been bypassed through that goal, because I don't particularly suffer from this sort of thing. But I tell you why, why that bank is issued. It's issued just for directive listing. Now, it's actually my fifteenth GPM. I think it's the fifteenth. It's some such number. And I was running out earlier GPMs and straightening them out very neatly, and I became aware of the fact that we had to know some data. And amongst the data that we had to know is did you get knocked off if only half of the bank was run, or that sort of thing. That's all in a guinea pig frame of mind. And also, I realized that we had to have the basic fundamentals of a bank. Well, the way to get the basic fundamentals of the bank was just to sit down and grind them out under every possible combination. And, I would say this sounds very heroic, and I could say, well, I gave my all for you, and so forth. I could go into it that way. As a matter of fact it was an auditor flub! The auditor started looking this over that far back on the track. And I complained. I said I'm in the middle of the living lightning, here, man! And we're going to establish the character of the bank back this far on the track? Haahaaaaahhh! Because we certainly should know the character of the bank. And the auditor went ahead and established – started running this bank. So, that bank is so bad, and so beefy, that of course you had to get the right pattern, or you would have got killed in the pc's chair by the amount of charge. So I didn't have much choice!
But anyway, I was going back on the track to see if we couldn't establish what the exact pattern was. And if you'll notice, there was a lot more to the GPM than there appeared earlier. And with the number of cases now I've seen run in the top hampers – nobody finds them! Just nobody finds them! And early on in the first few banks I ran I didn't find them.

So it's an unconfrontable situation. Because there's too much charge. And confront is in direct ratio to the – to the amount of charge taken off. And the pc can confront the more charge is taken off. So anyway, I went all the way back on the track, and there I was, and I got all the data, and stretched it out, and one of the reasons I'm very chary about putting it around is that's the most wicked thing – the bank – that there is. Which is of course "to create." Rrrrrr!

Of course, every one of its items that has a positive create form in it is busy creating. And they can create more mass and more answers and more this and more that so it's obvious that if you took it out of that bank, and that bank evaporated, why then of course you have a correct rendition of what the pattern is. Now much to my amazement, it holds true later on the track and it holds true on other pcs. Not because they're told so. The point here, in actual fact, is if the pc isn't run, guided very closely to this pattern, his RR goes off. So therefore the pattern has value. Now there will be other patterns, I'll pick them up, I'll straighten this one up, and absolutely shape it up, and there will be patterns for various types of goals. Don't you see? But you can extrapolate it from the just "to (verb)" form of goal. You can – you can figure out what it is, because it's all the same. And it's a perfect pattern. Now directive listing, then, has to do first with the accuracy of the pattern. Directive listing was not very successful when you didn't have a successful pattern. And when the auditor doesn't know what he's trying to do, you don't of course have very successful directive listing.

Now, an auditor who gives a pc a bunch of gobbledygook, "Nescaf" and other things like that, that's for the birds. But an auditor has to give some suggestions because the pc is just not likely to pick it up. Actually, the pc will go on listing and listing and listing and listing, and will practically list himself into the ground. Where as a matter of fact all he has to put on the list is one correct item, and bang! The charge is gone! That's it! Sometimes they have to list a few more to get the edge of it off.

But the point I'm making here is that directive listing is kind. And, nondirective listing totally permissive, psychological approach to life, you know, "What do people do? Oh, they just do. Yah!" – isn't going to get you anyplace! Because you – understand where you've got the pc, man! You just poured him over Niagara Falls in a barrel! And just as he left, you put in the next Fourth of July's entire stock of fireworks and a match! You put the lid on, and over the Niagara Falls he goes! And you're not going to help him out, huh? Whoa, brother! Of course, if you've got it in for him, why, go ahead, by all means, say, "Go on and list!"

Now, the main thing that's going to give you trouble at least for a while unless we get absolute patterns straightened out on it, things going to give you trouble is the top optterm, and the top terminal. Now, these are characterized as the final achievement of the goal. It is the nounal, final achievement of the goal. That is what the top optterm is. And the top terminal is simply negative – negative whatever that was. It's a negation of it.
Now, at... this leaves an awful lot to be – to be looked at. And because it's first on the bank, and it's first right up the top, and it's the first thing you're going to find, if you find it wrong, as you drag on through, your RR's going to shut off before you've gone five, six items. All of a sudden you've got no RR. Well, you don't look always at those to be wrong. But you look up toward them, and if you cannot find anything has been wrong way to, and nothing has been bypassed, and it all seems to be straight, and you haven't had any trouble, look for what you had trouble on. Look for the longest list you had to do, you know. That's an awful good tip. The earlier longest list, and so forth, good tip on that. You finally have to come back up to the top oppterms and top terminal and take a look at them again, and see if you can get something else functioning.

Because they're the most likely to have thrown it out. Now what are they? Well, actually they're what they are in the pc's aberrated consideration, having postulated the goal. He postulated the goal, so what is the final form of it? Now, he's going to try to sell you all kinds of final forms that don't have anything to do with the goal.

Well, he... I'll give you an example. You've got the goal "to be a tiger" and he's going to give you "a brilliant, beautiful animal." Nuts! It never will be! See? It'll be "tigers" or "the tigers" or something like that. Nor will it be "tigerness." That's a lower action – that's a lower item, see? And it's not going to be "tigerishness" or anything like that. It's not going to be one of those lower items. It's going to be something like "tigers," you see?

When we know some more about this, it'll be even we found a lot of them right. I don't think it's such a thing as "been tigers" or "becoming tigers" or something like that. But, you get into a – into some randomity. Now that's dead easy on "tigers." "To be a tiger." Oh, for heaven's sakes, that's nothing. Find that any day of the week. How about a goal like this – how about a goal like this: "To be the object of a whirlpool." Now, what's the top of this thing? Well, you say, "Obviously it's the object of a whirlpool." But that's probably the last thing that'll ever occur to the pc. It'll be "a whirlpool," is probably the first thing the pc will try to give you. All sorts of things of that character. But these goal wordings are tricky.

Now you take "to be the cook." Now you get "to be the cook." "The cook" is – what's the top of the opterms? It's probably "the cook" or something of that sort. Well, fine. It's what rocket reads, of course. Now you oppose that and what do you get? Well you've got a number of combinations, and they're liable to vary from pc to pc. But it's not "never the cook," but it might be. "Not the cook," "No, the cook," you've got these various negative choices, you see. And, remember that you can have a combination of this sort: "the not-cook." You can throw those negatives into the body of the thing.

And possibility is that you sometimes get a negative that turns out to – a double negative turning out to be a positive. That mustn't be ruled out as a possibility. It might make sense. But those two will most easily rocket read. Almost anything will rocket read up there. Oh, even the wrong one will rocket read, ooh! Isn't that horrible! Ooooh! Naturally, in a bank, "to catch catfish," "catfish," "caught catfish," "a catfish," "a caught catfish," "a cat-fish catcher," all of these things are liable to produce an RR. So your RR is not too reliable.

Your best test is having gotten them, they RRed, they opposed properly, your RR then didn't dwindle in finding subsequent items. So those things should be considered to be in a
state of being tested, even when you're up to about the twelfth RI in the bank. This bank is running all right, this bank's running fine, along about number six, nothing untoward had happened, I would start to relax about the top oppterm and the top terminal. But I'd keep them in mind that long.

Now, as far as wrong goals are concerned, there isn't much probability of finding a wrong goal or listing a wrong goal. Because the worst you would get would be the two top items that would be wrong and it'd suddenly become apparent to you that something was awfully wrong here somehow or another. But you should have been forewarned. The goal probably R/Sed – the thing has never been seen to read properly. There's something else goofy about this thing. And – and get this as the positive test – by the time you get down to the sixth or eighth item, the goal ought to be reading like a buzz saw. It ought to be reading beautifully.

The goal does not read well in the first four items. Well, of course, that's kind of late. But listen! If you found these items and they did rocket read, then you have a goal that is quite similar to them, even if it is the wrong goal, and it should be very easy, just on the process of saying, "Give me some variations for this goal" to get the right goal.

Well, I hope I haven't worried you too much! This is a worrisome subject! And I hope I haven't disturbed your sleep or this evening's session! In actual fact, if you look over the very few things that can be wrong, you will then stop being nervous about all the other nonsense that you may worry about. Because only those things can be wrong that I have enumerated and talked to you about in this lecture.

Actually, the most fun in auditing I think I've ever had is auditing 3M. And the most interest and the most violent a pc has ever been will be manifested in 3M. The pc's very interested. You can't stop a pc from going down a bank, or getting audited to Clear, with anything, once he's started. Once he's started you won't be able to stop him.

You can find somebody's goal and then he isn't too keen to have the first item found. But one fine day, if you want to see some bird who has found his goal – his goal has been found, and he doesn't seem to want to be audited from that point on, just get him in a casual conversation on a meter, and see if you can't find his top oppterm. And he won't stop then – that'll be that! That'll be that. If a goal is very close to present time it turns on lots of somatics. And they keep him very interested, keeping ahead of his own somatics.

All right? Well, that is the score with regard to directive listing. And that's a lot of the whys and wherefores back of directive listing. It is not a method of evaluating for the pc. You don't evaluate for him. You just tell him what the next item is he should put down.

Thank you very much.

Good night!
GOALS

A lecture given on 23 April 1963

Thank you. Thank you.
Thank you very much. This is the what?

_Audience: The 23rd._

Twenty-third? Somebody says it's the 24th.

_Audience: Twenty-third! April!

Yeah, well what GPM is it the 23rd of? [laughter]

All right. This is the 23rd of _abril_ ante [after] Dianetics 13. Pretty good, huh?

And we have some goals here. I want to congratulate those that found them, but it's pretty easy to find a goal, and why do I have to tell you, "Go on, find the goal!" you know? You know, you're supposed to know that all the time.

Going to talk to you about goals. I'd rather talk to you about the GPM. It's always more interesting talking about the living lightning you happen to be mixed up in at the moment. I'll just make a little note of that on the side. It's tricky, man. We're all tricky! Boy, we're tricky! _Tsk!_

Nuts! I just found out that not only does the goal decline to the point of the goal – but a thetan not being able to quit, now carries it on for a few millennia – just to be sure. He really gets all the good out of that goal that he possibly can. It's something like running – running a tire until its original casing is off, you know – and then retreading it, and running it until the retread is off – and then retreading the retread, you see, and running it off. And that's what he does with a goal.

You say, "Here's a goal 'to want'." So immediately of course the top is "want" and "not want," right? Obviously. Just like that. The hell it is!. There's about twenty more items above that point. And there's an ultimate-accomplishment opterm that is something like "everything wanted." And then that goes down through all the ",-ivities." "Everything wantedness. Everything wantedivity." With all the negatives on the terminal side. I consider this very fascinating.

In other words, the thetan gets all of the good he possibly can out of a goal. He even runs it in past tense. And I don't know what span of millennia that goal has been dead while he is still using it.

I had a wonderful example of this – the goal "to go away" becomes "gone away," becomes "gone." And "gone" then declines through all of the ",-ivities" and ",-ishnesses," you see.
Oh, it's remarkable. But imagine running on a goal that is "gone." Yeah, life is strewn with tombstones, you know, the "goneishness," you know – makes you inhabit cemeteries for a few millennia, you know. If you want to really feel good, go down to the cemetery, you know, and look at all the tombstones, so forth. That's good goneishness!

Oddly enough, this only appears on the opptermside of the fence – this decline of the goal. Of course, the goal has no opportunity to decline before the goal is postulated. So it just runs out on the opptermside, so you only find these "gone" and "gone away" and that sort of thing over as oppterms – and you find the "no – no gone," you see, and, "not gone," and "not goneishness" and all of this thing over on the terminal side – which I consider is quite interesting.

So these goals – you got a goal like "to have an audience," you see. Now, you'd consider that, well, an audience would be the final opptermside and you've succeeded, you see – something like that. And maybe that's true. It'll be some word like "audience," that's for sure. But much more likely to be "audienced." It has already happened, don't you see? So now we've got "audienced."

When you were first postulating goals and made up this pattern – it would have been more courteous of all of you to have done it in accordance with English syntax. And we wouldn't have to be bending English around corners and circles and so forth – because I know of a goal right now that everybody is very sure that "good" must be its top opptermside because in English there is no word which is "good" which can decline from "good." Don't you see? So, it's probably a coined word, like "goooded." Or "goood-ied." Or "goood-ly." It won't become "a saint," or something like that. They – always it's the same word, but it can have another thing in front of it – like it everything" or "absolute" or something like that.

We have somebody around here that's been saying all the time "Well it's, absolute is up there at the top." Yeah, that's right. There is something up there, above that level, about twenty items up, which has something like "absolute." And I got another one here that's been saying, "The pure light of..." "The pure light of..." you know. And everybody got awful tired of hearing this, but the thing would probably rocket read, you know, "The pure light of truth." It's something like that, it's "truthed" however, is probably much more appropriate. "Truthed" or some such thing.

But anyway, there's where these goals go. And what happens to a goal after it's dead? Well, it's carried on for another twenty items. Remarkable! Why don't you give up, you know?

Say, "Well, that's it. That's it. I postulated this goal – postulated this goal, "to be a saint," and uh – I became a saint, so now... uh – uh – that's fine. And then I – then I finally started..." see, here's your first decline. You'd think the guy – well, he became a saint, and he should say, "All right. Now I'll be a devil." you know? "And let's have a ball here for a while as a devil."

No, no, he doesn't do anything like that. Now he begins, while declining as a saint – to fight all of the ideas and attributes of a saint – until he finally fights the goal "to be a saint," and that's his worst enemy. And you'd think well, he's gone as far as he can go now. Oh, no,
not a thetan. No, no, no. Ha-ha-ha, no, no, no. There's a lot of rubber left on that casing yet! Can't throw it away.

I think that these electronics boys who... You ever been in an electronics man's basement or backyard, you know? All of the scrap metal, you know, and old pieces of wire – he snipped this piece of wire off in 1943 – and it's a piece of coaxial cable, you see, and it's about that long. And it might have some use. The only use for coaxial cable is if you have twenty or thirty feet of it, you see, and he's got this piece that long. And that has taken its company with all the burned out condensers, capacitors and charred rheostats and all that sort of thing.

So when this goal is dead – it's good and dead, you see – he... it's – his worst enemy, now, is this goal – now he carries on, you see. And the worst-enemyness of this goal now declines, with him refuting this all the way. You see, the goal goes downhill, now, and may go through two stages. Let's take the goal "to go away." It becomes "gone away." Well, you'd say, "Well, that's it – he's had it, you know."

Or let's take – it wouldn't be this word "to be sainted," it'd be something on the order... It wouldn't be "deified" but it'd be like "deified." You know, "canonized," only it won't be the word "canonized." It would probably be "sanctified," you see. "Sanctified." So he hits "sanctified." That's his worst enemy now – anything that is sanctified.

Well, you would say, "All right." Now he's got lots of ideas, all he's got to do is postulate himself a new goal and get on his way. Oh, no! No, no! He isn't going to do that. Man, do you realize there's still some fabric inside that casing? You know, you can still get a few more miles out of this goal. So he now – it shifts over to "sainted," see, or something like that. Or it'll be something like, "superlatively sainted," see. And boy, he goes all the way downhill on that, to the final drugs and dregs of the situation. And then he's there, he can't go any further after this. There's nothing left of him. There isn't enough left there, you see, to oppose anything. It isn't that he runs out of things, but it makes these – it jumps these things up to about eighty to a hundred, something like that, RIs. You better start finding one a minute, that's all.

I've been holding you, keeping you from going into a lot of early banks, and grabbing a lot of early goals and splattering yourselves all over the track, and you'll thank me for it someday; you might not be thanking me for it now.

But I've been suspecting all the way along the line that we hadn't the top. I ran into it head-on and I've been working like mad, trying to get the thing squared around. It's clean as a wolf's tooth, now, between there and the next bank. There isn't anything – there's always been a little shadow of blackness or something in there to the next bank. And then much to one's astonishment, you see – this little shadow of blackness opens out to be ten items. Small matter of ten items, you know. Any one of which, dropped off the pc's line plot, will cause him to moan and scream.

The big discovery that has been made on all this, of course, is that these goals are patterned one to the next, and that they are patterned pc to pc. And that is the big discovery of just the last two or three weeks. I never dreamed this was possible. But it's a damned good thing – we're just lucky. Because, let me tell you trying to get a pc to confront any part of a bank – trying to get him to confront any part of the bank is almost impossible. You just have to put his paws right on it, man. You have to put his paws right on it, and you say, "That is it.
This is what you are listing for." So he will list in that direction – he's got a prayer of getting it.

I was just examining a list of a pc who's gotten quite ill trying to find his top item – and he's been going around feeling very bad about it and so forth. And I just examined his list and I don't think it's on that list. And yet the list is about eighty, ninety items long. And it's not on that list.

And this is just history, as far as this is concerned. I look in vain on these lists to find what should belong on the list – if the pc is just permitted to list permissively. And that we have a plot that orients this thing is a godsend.

More important than that, the plot itself is getting very rapidly shaped up. I would normally take off a year or two to shape up something of this magnitude with this much meaningness. And you guys are riding right on my heels, and I can hardly keep my shoes on, you know. I mean, you keep stepping on my heels and I keep sliding out. And it's just flat out. As a matter of fact I've left the better part of fifteen banks just discharged slightly – about a tenth discharged, or something like that – in order to pick it up on a part of the track where it is in an unmixed-up state. And I've finally gotten back far enough to where it is fairly obvious what it is – and just won't go together unless it is exactly right, you see.

That isn't the worst of the plot. The plot is there's a switcheroo on your composite goals. You get down to the goal level and then it all switches. And you have, "have a gameishness" is opposed by "no game-haveishness." I think that's so cute! And then it turns around the other way, and makes "no game-haveishness" is the oppterm, I think at this stage, opposed by "have a gameishness" as the terminal. In other words, it's a double-switcheroo. Ugh!

So, when we announce that four goals have been found today, why, the people should be very happy. They're not going to be run into a brick wall or off the end of a cliff – but they should realize, and their auditors should realize what they're – what they're facing now on such goals as these.

For instance, on Ian, right away the auditor's – if we didn't have this data – is likely to grab something on the order of "infallible." That's the top oppterm. You know, and he goes along, just fine, you know? Meter reads, and he's getting blowdowns, and all of a sudden the pc is getting nastier and nastier. (Oh, Ian of course never gets nasty, we know that.) But gets nastier and nastier, and uses more and more livid language, and snarls, and so forth – and yet it's all going according to Hoyle – everything's going along just perfect, everything's fine – except of course we took off from about the upper-third of the bank. We didn't take off from the top.

Now, you have the interesting factor of trying to figure out what is the past tense, ne plus ultra, nounal version of "infallible" in a limited language, which doesn't composite easily like English.

See, all these things are in there as concepts. They're not expressed as words – Korzybski to the contrary. And you very often will find a goal on a pc and the pc, "Eechhh, found I had a goal – a goal – and so on and so on and so on." And all of a sudden he'll say, "Yeah! You know – yeah, yeah!" What's this comm lag? It isn't that he's stupid. It's the fact
that the English words haven't met up with the thought concept. The thought meaningness, don't you see. The thought meaningness actually stays there and stands there without words.

I studied this back in 1952 for quite a while – how it wasn't in words – it was in thought concepts and the thought concepts matched the words. And it's all very interesting because it means that nothing is stored in words. But English, for instance, re-echoes against these words. English echoes, in the words – that echoes against the thought concept – and that activates your cognition, or your blowdown. And you'll find very fascinatedly – you'll find some item like "catch catfish," you see, "catching catfish," and that's fine. Pc understands that very well. And you get your – get your rocket read, your blowdown. Sometimes you don't even get your rocket read, once in a blue moon. "Catch catfish." Didn't read the first time. Then the pc puts his attention on you and it – and you call it the second time and it reads like mad. Well, he just didn't have his words into the thought concept, you see.

Well, that's all very well, and that won't happen very often on something like "catch catfish." But let's get into something, "Catch catfishishness. Catch catfishishness." "See, mmmm-aaaaah-mmmm-ah-mmmm." And you say, "Well, it rocket read when you said it. Doesn't rocket read now." And you say, "No blowdown here." And the pc, "Well, catch catfishishness... Oh, yeah! Yeah!" And he gets this sudden idea of somebody standing on the porch of some country store ready to go down to the river, you know. But he isn't going to go down to the river. You know? And he's all dressed as though he's going to catch catfish. And of course he isn't going to catch catfish, or something like that. But he's the very model of somebody who catches catfish, you see. And that's "Cats – uh – cat – Catfishishness." And pc will all of a sudden get this, and all of a sudden you get your blowdown. He didn't understand it! And you, sometimes you can't even wrap your tongue around it.

I don't know what language these were installed in, but they were probably never installed in any language, you see. It's a method of group thinking which applies to any language. A person can group a great many items under one heading, with this one concept. And therefore he doesn't have to think. And it's just handy computational idiocy. All he's got to do is take one concept, you see – and this covers all of that. But it's interesting how accurate and how precise these concepts are.

Now, these goals, then, have their first entrance point of understanding at the moment they are found. And ordinarily you do not find a pc's goal or get the pc to pan out well, until the pc understands the goal. He can have put it down, "to catch catfish," you see. Just, "Well, so-and-so and so-and-so, and to catch catfish, and – uh – and to hunt deer, and to be a great hunter, and to uh – uhhh – spend a lot of idle time." And he's just been going down a goals list, don't you see. And he gives you all these goals. And he didn't bother to look at this when he went by – but there was a little red flag out there and it triggered, you know. And that was it. You get back, you're nulling this thing, pc's sitting there, you know – what wall, you know – and you're nulling, you see. And you hit "to catch catfish" and your normal reaction is "I didn't put that on the list! I don't recall putting that on the list!" See, it's a heavily charged area. Very often you get this reaction. "Did I put that on the list?"

I remember I had one goal oppose list. It's very easy finding internal goals. There's nothing to this now. Just make sure your list is complete, and you'll have the next goal. But
it's so remarkable. Went... it hadn't happened to me for a long time that I didn't know I had put it on the list. And all of a sudden the auditor reads to me "to be lucky." I feel the sensation of a rocket read, you know. "To be lucky – I didn't put that on the list! Where'd that come from?" You know? And it seemed that it was totally extraneous to the subject matter. It had just slid in sideways, you see. And so it's sort of on an automatic action. See, this thing has charge but the pc hasn't inspected it in any way.

All right. You sometimes will go down a goals list, and you're busy nulling and so on, and you don't get a rocket read. But you just get a tick. Or a DN, or something like that, around some certain area. Or you get a DR on a goal. So you leave it in. Now you come back – by reading the goal again the pc's attention goes onto this goal – and now by putting in your left-hand buttons the pc's attention goes onto it very thoroughly. And because the left-hand buttons take the suppression off of it, and put his attention on it – why, you get a rocket read off of the right goal. That is the mechanism that's followed.

It isn't that these things rocket read just natural and native. It isn't inevitable, don't you see. It requires some attention and alertness on the pc's part. This becomes very manifest when you're checking goals while doing a GPM. You read this goal, and the pc is still all tied up there in "catch catfishiness." And he's still trying to, you know – he's still cogniting on it. You've got it, and you've got it on the line plot. You're writing up something. You're writing the line plot down or something like this. And he's still – "aaaaa-catch-caaah-hmmm-fififinnn." And you say, "All right, to catch catfish. To catch catfish. To catch catfish." And you say, "Well, that ticked once. Yeah." And you go on and put down, "Goal, one tick" you see. He didn't have his attention on it yet.

If you were – there's not any reason to yank his attention over onto this. But just as a – just to show you what I'm talking about, if you say to the pc – at this stage of the game – you say to the pc, "Uh – now, uh – listen – listen to me very carefully just for a moment there. What – what are you thinking about? Oh, yeah. Well, all right. You just listen to me very carefully, now, listen to me very carefully..." – don't even tell him you're going to read the goal. But "Listen to me very carefully." You've just gotten one tick off of this goal, see. And you say, "To catch catfish. To catch catfish. To catch catfish," – ah – two rocket reads. In other words – the pc's attention.

The right thing will tick, whether the pc is looking at you or not. See, there's enough of you penetrates to him to give a tick. See, you'll always get some response. Although of course that could winnow out, too. But ordinarily, the pc could even be doped off, and you'll get a tick on a right goal, see. He didn't even hear you read it, but you'll get this tick.

Now, his attention has to be brought onto this thing in order to get an RR. And the reason nobody saw RRs before was the absence of the left-hand buttons. You should recognize that it was the mechanics of Scientology itself that made possible for a goal to be sufficiently unburdened that it would rocket read. I predicted the fact that a rocket read would exist – that a goal would read differently – and then a very short time afterwards got some buttons together that would remove the pc's efforts to squash in a certain area – which are, of course, nothing more than Suppress, Careful of and Fail to reveal. And for the first time we started
seeing rocket reads. Well, that's because by taking the pressure off and putting the pc's attention on, we get the phenomenon of a rocket read.

Now, a heavily charged item, even with the pc's... the item is different than the goal, see. The item he's... very immediate. He's right in the middle of this thing, and he could be just, *blah*. And most of the time, you read "catch catfishishness" or – to him, or something of the sort, and *psheewww!* You see a nice rocket read.

Now, the goal read and all of the items that are immediately attached to a goal, are rocket reads. So that you actually have three allied types of read. There are three types of read which are cousins to one another. And the first is a fall. You didn't expect that one! The first is a fall and the next is a rock slam, and the next is the rocket read. But the fall, can turn into either a rock slam or a rocket read, and a rocket read does not necessarily convert through a rock slam, when it fades away, but may simply fall. A rocket read may then degenerate to a rock slam – and degenerate to a fall – or may simply, strictly and straightly, degenerate into a fall.

Now, a rock slam – a rock slam – may become a fall, but is actually more likely to become a dirty needle. Now, what you – what you must realize about this is you are looking at different meter manifestations. You're looking at different meter manifestations but these things all stem from a certain pattern or a picture. And if we get a good picture of this – I want to show you here what you're really finding – in the way of a – of an RI – what you're really finding here. Let's take an RI. And let's see exactly what – when these goals were found, exactly what was being activated.

Now, here's your RI, and we take that as an item. It has mass. It has actual mass in it, and it is to be considered as a sort of a core, as the center – let's say a ball bearing dropped in cotton. You see, it is the ball bearing, see? All right. Now, around the edges of these things...

You'll be awful baffled if you don't remember this little diagram. You can get more baffled running Routine 3 than anything else I know, because so many things sometimes rocket read. You take somebody with an RI like mine – which is practically indestructible and reads on anything – you give me an item at a distance of a quarter of a mile and say the item to me, and if there's a rocket read on it, it'll rocket read, you see. And this is very upsetting researchwise. You want to know what the next item is. You've got to find somebody whose rocket read isn't all that good if you're going to do good research. Because then only the one that's supposed to be there will rocket read, you see?

Now, here's a whole bunch of items around this solid center item. You see that? There's a whole bunch of items around that item. Now, these things are lock RIs. Those things are just locks, see. That's a lock RI. "Catfish," see, is charged – so therefore, "fishing pole" – no, not – "catfish" is charged, so therefore "sturgeon," see, might RI. But it isn't the... RR. And it isn't the RI, you understand?

So you've got all of these lock... Now, they're all over it. It's just as though we had cross-sectioned it in any direction. Now there's – these things RR. They all RR, but when you

---

11 Editor's note: the diagram can be found in HCOB 29 April 1963. As it is not in the Red Vols it has been attached for reference.
found "catfish," they won't any longer RR. In other words, they borrowed their RR – they borrowed their RR – from the charge in the core of the thing, which is "catfish." You see, they borrowed their charge. They don't have any charge of their own.

Now, around here – this by the way, is all Routine 3 stuff. Now we'll move over into Routine 2.

Now, here's another whole series, and these things have been mushed – they're probably very neat, geometrically. They're probably neat as electrons geometrically. But in actual fact, they have become mushed and crushed by grouping and that sort of thing – until they appear to be so much black tar soup. And I had one spring out at me the other night in its pure, pristine form, because something was being found out of sequence – and you talk about something hard, it was as hard as trying to bite on a metal shell! It hadn't disintegrated at all. And it was a little sphere.

Now, these, out here are again lock RIs, of the second rank. Those are all lock RIs, and here they are, and there's lots of those. Oh, there's lots of those. And they R/S. See, these are RRs – and these are R/Ses. You know, this is more than a graphic analysis. You usually just do your graphic analysis. But this is – this is anatomy.

Now, this RI, if you approached it this close – your second rank, those that lie right up against it – you'd get RRs. And if you approach it that much further away, one more rank out from the core, you get R/Ses. See?

Now, there's another rank, outside of this – much more numerous, as you can imagine – much more numerous. And these things can't be called RIs at all. We're too far out, and it'd just be nonsense. But they still have some of the connotation in it of this central RI. And they DR.

Now what are those things? Well, they're all the things on your list that you get a little DR on when you read them but nothing ever happens to them. See, they were there! Now, you can examine any series of lists done – if a great long list has been done, and somebody has kept careful record of all the DRs – and all – you would keep record anyway, of all the R/Ses and RRs – but if he'd kept all of the DRs that he saw, and it was all meticulously kept – and it was a very long list, very long list – until the needle was totally clean, you would have had this population.

Now, when you take this picture here – this April 23rd picture – when you get that, you actually are looking at everything the pc has put on the list – if he did a full list, which we're not doing now. See? And that'd be one of these... Well, it's not exaggerated – this be – but there have been lists as long as eighty-seven pages. Well, an eighty-seven page list would certainly contain everything connected with it. But actually, probably everything connected with several. A fifteen-page list, a twelve-page list, something of this sort, pretty well covers the population.

Now, as the pc lists, on a 2-12 type listing – he simply is taking and repeating the thought concepts which are popping out of these. And they pop out of here at random – but they... he actually will list off at some point where his attention has already been fixated by life in this mass. He'll start there and he'll list out to the perimeter, and he'll list back in again,
and he'll list out, and he'll list in. And it's a random pattern of listing, you see. And eventually his attention will have encompassed this – and the charge in the area will have been labeled onto the list – so therefore the list ceases to fire or read while listing. You see what that's all about?

Now, in finding a goal, you can actually take these things and find the identity of the goal. Now, how do you do this? Well, let's take one more step. Let's take one more step, here. This is – this is one. Now, let's just take one more step. We've got that much picture.

And this is a picture of RIs. Each one of these spots is an RI. And we'll just make a lot of these spots here. And you know that big plot I just gave you, number one there, each one of these little circles I'm making here is a complete one of those. See? So we get these things, and we get something on the order of about eighty to a hundred of those groups contained in one GPM. There are about fifteen – see, they're finite numbers – there's about fifteen pages of listing covers the bulk, carelessly, of one of those RI groups – if you wanted to list them all out – and therefore, there's about eighty of those RI groups in a GPM.

So I... that's just a forecast number. I'm sure the number will eventually turn out to be finite. I'm not in the position to say exactly what it is. So it is the number of RIs in a GPM times the average number of items listed on a pc to get a clean needle, in one of those areas – that isn't to four or five, you see, that's fifteen pages, or something like that – would give you the DRs, the R/Ses and RIs contained in a GPM. A very rough guesstimate sort of figure, just to give you the order of magnitude, is fifteen times eighty.

See, you're not actually looking at very many DRing, R/Sing or RRing items at all. You're not looking at very many of them. Somewhat on the order of magnitude of fifteen times eighty. Now, you don't have to find each one of these, you see. It's not necessary to do so. I'm just telling you what's there. This is what's in the pot of blackberries, which it resembles very closely sometimes.

Anyway, here's your GPM. Now, this then is covered in its entirety with a goal. See, that's a goal. And every one of the fifteen times eighty – which is your rough estimate number – is dependent on the central postulate called a goal. And they are all built up from the pc having made that central postulate. Every one of those is built just on that one postulate. And all of the behavior and nonsense he goes through is dead on that central postulate.

Therefore, when you are trying to find goals – you can list the goals of any one of those little DRing items, any of the R/Sing items, particularly the RRing items, and certainly the central RI – list the goals of, or the goals it would be an overt against – depending if it was a terminal or an oppterm – and you'll come up with the goal of that GPM. And it's goals finding.

Now, there's – these mechanisms I've just been talking to you about are the basic mechanisms of goal finding. You've got that anatomy, your big RI, with the cluster of R Rings and then the R/Ses, and then the DRs. And then you've got – whatever the number is – fifty, eighty, something like that – it's greater than fifty. It's about eighty some, maybe a little bit greater than that. You've got that number of those things contained in here. And all of those are covered embraceably by a goal.
Now, the problem of goals finding is only complicated by one thing – is lots of these little, little DRing items and lots of these RRing items. The secondary items particularly have their own goals. Well, I'll give you an idea of this. The pc has not postulated this goal, but he thinks of a streetcar – which is a DR, see – he thinks of a streetcar as having the goal to carry passengers or to clang or something like that, see. He thinks of it as having a purpose or a goal all by itself. So when he starts listing goals – let's get right down to goals, here, now – when he starts listing goals, he starts in toward not one GPM – and again, fortunately, a very finite number – he starts straight in against thirty GPMs. And you've got something on the order – I'm just giving you a general number here, but it is, it's very close to the factual number, it's an educated guess – you've got about thirty goals. Thirty of these GPMs.

And when they're all crunched together – let's get this now. You understand, we're getting up to – we're getting up to what to the pc looks like light-years of space. A little RI looks to the pc to be about that big – about a foot, fourteen inches something like that, see. Sometimes they're little fat sausages. They're quite finite in shape. Pcs get up to a point where they can confront mass, they describe these. And when you get the outer part of the thing peeled off, you'll see the center shell of the item. But in order to get a visio on that sort of thing, it has to be done very wrong. You have to find it all out of sequence, and get the pc to tear it to pieces with his little thetan paws. And after that he's rather unhappy because it's hitting him in the face by now – but the anatomy is there.

Now, all of these GPMs crushed together, see, give you an appearance – although each one you see is like this – give you an appearance of islands of masses, see? It looks like a channel at first glance over here – and then they are liable to be stuff that looks like side channels. And you say, "Well, here's one channel of goals, and over here on the right someplace, here's another channel of goals. What's this all about? Am I ambivalent?" Yeah, you're worse than ambivalent! But, but it's just the fact that they have grouped on each other. It's just one channel of goals.

So here's this terrific mass. Now, let's take – this is then goals. And we'll say something on the order of thirty goals – I don't even think it's that many.

All right. Now let's walk this lecture backwards. There's your pc sitting in the chair. What are you looking at? You're looking at a body, which hasn't anything to do with it. Except as masses collapse on the body, you get an unfortunate increase of body mass. And every time you miss an item or a GPM, you increase the body's mass somewhat, because it comes in against the body. When these items are all found and everything else, you decrease the body's mass. It's quite spectacular. Sometimes your pc will become almost frantic because he's putting on mass at an alarming rate. Well, you know that this is a direct index of having missed a GPM or missed a whole series of items in a GPM. It's not a very worrisome factor – because as soon as you find all of the items in the GPM, or all the GPMs in sequence-that mass factor goes. Pfiff! Vanishes.

You're looking at a body – which can be influenced by it, or which can experience the pain of items and so forth, but which it itself does not contain any items. Now, in the skull... Back in the days of Greece they used to go into the stomach. I don't know why you did that – must have been because the Greek always said his soul was in his stomach, and they still cook
well down there today. Yeah, I'd like to have some Greek soup. The thetan is resident in or about this body. Now, a thetan in very terrible condition, very terrible condition, is outside the body and can't get in it. So he's at some remote point from the body – and it may be quite remote – but he's still in communication with you via the body.

And then a thetan who is not in too bad a condition is in a body. And then a thetan who is in terrific condition is more or less permanently outside the body, but able to get in or out of it, and doesn't worry about it but can control it from a distance – and then in terrific condition doesn't need one.

So there's the gradient scale of what you're looking at. And the fellow who is sitting in that chair is either, then, way outside the body and can't get in it, or is in the body, or is somewhere between these two points. He is certainly not outside the body as a good being. The more he talks about being outside the body as a good being, the more you should immediately suspect that he ain't.

The worst case that Freud ever tackled, and the cases he said were just unsolvable, were what he called the "detached case." He didn't know quite what was going on, but he'd already scented the fact that the guy was unable to approach his body. And he called this fellow a detached body. The fellow was never in his own valence, he was also always remote from his valence. Lecture 28, I think, Sigmund Freud, talks about this. At the end he concludes that nothing can be done for these people. Well, that's past history. It doesn't even worry you. I mean, everything can be done for these people, so what?

Now, such a person's goal may or may not be a little harder to find but he might not sit still well for you to find his goal. And that would be the only difference, the only actual difference – but from pc to pc is not the state of case, but it's how quietly he will sit there and be audited, don't you see? And some pcs are sufficiently agitated and so forth, they won't sit there quietly and be audited. And other pcs in pretty good condition who are being loused up also won't sit still and be loused up. There's all kinds of gradients of this.

All right. There sits the pc, and there's the thetan. And the body is communication media for the thetan – and the pc's whole personality, beingness, attributes and so forth – are actually expressed as a thetan and are as alive as a thetan, and aren't as a body. So you don't have anything to do with goals... with bodies in goals finding at all. You're never going to run across the GE and its goals, or get anything crossed up here, so stop worrying about it.

Now, let's consider, then, exactly what you're addressing. Here is goals – the GPMs – the Goals Problem Masses. They are there in their numbers, up to about thirty, and they are all around. And they are at various distances from the pc. Again, finite. You always – probably in dealing with the mind, thought you were dealing with the infinite. You may have thought that you were dealing with fantastic uncalculably great numbers of things and engrams and things like this. And it's actually quite remarkable to get how finite these things are.

Now, to a pc sometimes it looks like some of these GPMs go out there light-years. And maybe they do. But they're not ready to be run. The ones that he is most intimately connected with will be within a range of about fifty feet. And the ones which you find are at the range of zero feet. He is in the one that is firing. These are all very finite measurements. You
needn't be interested in anything closer than fifty feet – I mean further away than fifty feet. You can't run it anyhow.

All right. So there he sits in his nobility in the middle of all these black masses. Why are they black? That's because the energy has been burned down in them. They've been originally manufactured of good energy – and postulated good energy, and then the energy and so forth has been consumed – and you are looking at the unburnable residue. The clinkers. And this energy mass, these masses are black, or gray. There are no pictures. You start seeing pictures – you're in the wrong bank or something.

There's free track that runs alongside of these things, and out here on the boundary someplace, you may have some sections of free track that the pc can run on. Well, it has nothing to do with anything you want, so you never do anything with a picture. That is an inviolable rule. Don't do anything with the picture – because the actual GPM's pictures have long since been crunched and crushed to exactly *blah*. They're not there. And he doesn't see any pictures.

That's... and he all – thinks of all of it as instantaneous and right now. Only after he's got one partially run he's liable to look at you rather stunned and say, "I just spotted how old this thing is! It's about 56 trillion years," which you don't even bother to inquire into. Until a moment ago, he thought it was right now – it's instantaneous. There is no time in the reactive bank, that is what is wrong with it. There is no time in it – so it groups. And that's why you can get an instant read on something that's 216 trillion. You know, it'd take a long time for a – for a read to travel up through 216 trillion, unless the bank itself was instantaneous.

Well now, it may seem instantaneous to the pc, but actually there is a time difference which is expressed on the meter. The pc in various sections of the bank will read in those sections of the bank because of the actual existence of time in the bank. Looks to the pc to be instantaneous, he'll swear it is, all the results are – but as a matter of fact you move him a little later or a little earlier in the bank, you move him to an earlier GPM, is the way this is expressed, and the later GPM will not now read. In other words, you can move him into the proximity of reads. This is not something you do – I'm just telling you this is possible.

All right. So there he sits, there are these black clouds, gray clouds and so forth, which are visible or invisible to him. Sometimes pcs can see these things. Sometimes they have to be processed quite a while – and they eventually come up and their perception on the bank rises to the point where they can see them. A pc who has no perception of these things whatsoever is a little more difficult to run than one who is high enough up to have perception of what's actually going on here.

So there are his goals. Now, you're trying to find – that one of these thirty goals that will read and can be run. And that's what you're trying to do with Routine 2. You're trying to put your paws on that goal which will read and can be run.

Now, in actual fact, of these thirty GPMs which are scattered about – again you understand that's just a guesstimate number – of these thirty GPMs that are scattered about, the bulk of them will not read on the meter because of the actual existence of some time in them. He is not necessarily in present time with regard to the GPM – and the GPM you get is not necessarily the present time GPM. It just happens to be the one he's closest to, and usually which is
worded "to be offered." "Never to be offered" will of course get offered on its – on its terminal, which is "to be offered." See? So a negative sounding goal will get handed up immediately, or a positive sounding goal is liable to be handed up immediately – like the goal "to find," see. Well, auditor is trying to find something, so he'll get the goal, "to find," see.

Now, the single difference amongst thetans is the significance of these goals. They have quite a few of them in common, particularly on the early track. But as they continue to live, their divergences of significance as to the character of the goal becomes different. So you find all kinds of different goals. And someday you will get very, very bushed, and very upset for this one reason: You will just realize that all of those goals lists that this pc is handing you – these fantastic numbers of goals that the pc is handing you – are almost infinite combinations. There's an infinity of word combinations and therefore it looks like an infinity of goals.

Well, don't worry about it, that's a finite number, too. The longest a pc has ever held out with a goal on straight listing is 5,000 goals. Finite number! It's considered rather uncommon and real rough for a pc to hold out 3,000 goals. Very uncommon. Average number of goals listed to a goal on the list is 153. One hundred and fifty-three goals, just listed straight, for the pc's actual goal to be found on the list. Pretty good, huh? That average does not include some of these heroic numbers of goals – the average is actually just taken with the small group, 153 goals. Starts listing goals, 153 goals later somewhere on that list you have the pc's goal.

What percentage of pcs is this true of? I wouldn't know offhand. But it's a much larger percentage, I know, than you would suspect. It's something like 50, 60 – some such respectable percentage.

This is the majority. Probably the bare majority of pcs this would be true of. And you just tell them to give you the goal and you're talking to them from altitude – and you write it down, you're not causing them any trouble at all, and when you go over the thing and null that list – if you do a good job of it and null the thing – why, you will take your... put your left-hand buttons in on what's left there with a dirty read, and you'll be staring at rocket reads. Actually, on such a list it's quite common to find four or five rocket reading goals.

All right. Let's get back to anatomy here. You're shooting at (a guesstimate number) of thirty banks – thirty GPMs. Thirty, of which twenty-five (another guesstimate number) are not available because they are too old or too stiff or too big or too overwhelming. Not because their meanings are too esoteric. The hardest goal I ever found had nothing to do with "be found" or "not found." That was probably the trouble with it. It was just a sort of a goal like "to drink water," you know. Gave me an awful lot of – hard time! Nothing in it offered, nothing took it away. And yet it had to be found because it was the nearest to PT.

So you're going in toward five available goals. Any one of five goals is liable to fall into your paws, any one of which will be a valid goal. You just do a list of those, stretched out along the track – you'll get any one of the top five – which of course cuts down the averages enormously. I mean, it cuts down the liabilities of, and difficulties of finding goals enormously. You can find any one of those five. You will probably find the one which has the most offering or refusing type wording. And you'll probably miss the one which is most inert
"Never to have my goal found!" Give me any pc who has such a goal, man, because of course his oppterm hands it up instantly. It'll be number one on the list.

"Never to have my goal found."

"That rocket reads, thank you very much, go over and get it checked out!"

"Oh, I wonder how that ever read! I know that's a very secret goal!"

Spare me the inert ones – "to drink water." Socially acceptable, no difficulties connected with it, and you just go on and on and on and on and on and on and on and you don't come across this goal. And then all of a sudden one day the pc is feeling in a very lukewarm state of mind, with no enthusiasm, not trying, he's very relaxed, and that little concept in his mind opens up and he says, "to drink water." Pow! That rocket reads and away we go.

So that's the first look you get at the pc. You've got five of those banks – five – not just one. You probably thought it was just one. You've got five, and you'll get the one of those five that is the most easily offered. And then you have a goal. Let's go to the next stage here, you have a goal. A goal! The pc considers it's very precious, very remarkable, cherishes it, pulls it to his bosom and cognites on it as he very well should.

He doesn't at this stage recognize the horrible fact that this goal has a very remote chance of being his first goal – very remote. It's the first goal to be run, and you will run it. If you got your hands on it and it rocket reads, run it, you understand? That's a rule. But it has a very remote chance of being his first goal on the track. Because it usually is offered as an offering.

Let's look – take these goals who have just been found here, and you'll see what I mean. First one has the words, "to find" in it – so naturally it was found. The next one is "to have an audience," – naturally the auditor is the audience, so the goal is offered. The next one is, "to be infallible." The thetan proves it by handing out the goal and saying it is right. And the next one is "to understand," and of course the pc has been trying to understand this goal for some time.

Such a factor is understood – comes immediately across. That has nothing to do with these goals. These are all valid, fine goals. Nobody's running these goals down, and thank you for giving me the use of them. I'll let you use my goals. [laughter]

Do you see that?

Audience: Yeah.

Now there's just a complete random selection. It's just the goals which happen to have just been found. Naturally they loan themselves to it.

Now, two of these goals have a narrowing RR as they're checked out. Well, I suppose you might as well go ahead and run them – but it means they are not up to present time. You got your paws on them, run them. And then the next thing comes in. You've got this – you've got the goal.

And by the way, you try to find the goals forward to present time, not back to the beginning of track! They're most easily found back to the beginning of track – but the ones you
want are forward to present time from where you are. Harder to find. All you do is list the reverse RI oppose list, however. You take the goal you've just found, find out what goal would oppose it and you'll get the goal above it.

You could actually take any one of these goals at this moment and do an RI oppose list on it – even though it is not run – reverse, you see; "What goal would oppose this goal?" – and you'll get the goal closer to present time. "What goal would this oppose?" – any one of these goals – you'll get the goal earlier than this. Because they're in an endless chain and interdependent one upon another.

All right. So we've got a goal. Now we're going to enter this goal – and we've got to go in up at the top of the bank here, with the top oppterm – and we don't dare enter it anywhere else. Because if we enter it anywhere else it won't discharge. The charge still has to be passed down. If you find the middle of a goal, and you then find the top of the goal, you still have to pass the charge through the middle of the goal you've already found.

All right. So you're going to find that goal, and you bring it all the way down through. And you are finding – in every case, where you find an RI there – you find your first picture here – you get yourself a cluster like this for every RI that you're finding in that bank. And they run something like eighty RIs in the bank. Multiply the eighty times fifteen – you'll get how many things you might have to list in that one bank if you didn't know what the central RIs are – because I'll let you in on it: the pc never will put down the central RIs. His attention is so bunged-off on each one of these.

You understand, this is a picture of each one of those. And this is a picture of a cluster of those. And that's exactly what you're finding, and exactly what you're doing in clearing. That's what you're looking for. That's the goal, then - the goal that you are looking for – is simply the goal of one of these – and that you can find at least five of those banks are wide open to have their goal found. And all you had to do is get into the goal channel and then by opposing goals or goal-oppose-goals-type lists, you could move up and down the whole channel. I wouldn't advise this, but you could probably plot out every goal the pc's got long before you run any RIs, if it didn't kill the pc.

Because I remember the first time the goal "to create – to create" was checked out. The big mid ruds were put in on it because it was ticking. And boy, that bank started swelling up and going zing, cross, creak! And it did no more than tick. It wouldn't rocket read, you see – it was too beefy to run. But the more it was drilled, why, the more uncomfortable and horrible it got. So, of course, the best answer is to run what you've got your hands on, and then try to move forward to present time. And then when you've got it all the way to present time, then pass the charge all the way back – which is by reading the line plot of the pc, practically – move right on back down the track, and here we go, and we will eventually arrive at the beginning of the track with the pc in a good condition.

And we will have discharged this mass, this compulsive mass. Because it is this mass which holds the thetan a prisoner in the universe – it is this mass which holds him a prisoner in his body. It is these masses, these significances, these clusters, which I have seen, which make the pc fixate and do aberrated things, and they don't help him a bit. He'll say, "Once
upon a time I could move around freely, and now I can't anymore. What has happened to me?" Well, he's just added a few too many GPMs onto the track.

Now, there's the full anatomy of what you're trying to do in running GPMs and goals. It's taken quite a while to put together that anatomy, but the end is in sight. And what you're trying to find when you're trying to find a goal should look, after this lecture, a little easier to you. You're not really shooting at a -- in the dark with a pin-gun, at a knothole 150 paces away in a high wind! You actually are standing there with a sawed-off shotgun, inside a barn, trying to hit the barn. The goal you will find will be the goal that the pc is most likely to offer up by its own wording -- and let's hope it's not so early on the track it half-kills the pc to be... to have the goal run.

If this did happen, there is still a remedy for it. Just goal oppose list -- you could boost him forward to present time on the whole line. If you -- if he could make it, if he could make it. If you could move him enough on the track by doing that. Possibility that will someday become a procedure which we use. But I haven't experimented with it, and right now I know that you can get away with it by running any goal you got your paws on. As long as you remember to go up toward present time, not the easy way, back toward the beginning. Because the whole bank wants to run back toward the beginning. And it won't. It'll go just so far, and then brrrr!

You even try to run a bank backwards, and the next thing you know... This happened to us last night. You try to run a bank backwards, from the bottom to the top -- and I cut in on a bank and tried to run it up to the top, and much to our embarrassment a couple of hours later I found out I'd been running from the top down. It looked like it was all the other way to, you know? But it wasn't. And in actual sequence, I was running toward the bottom of the bank.

The natural inclination of the bank and the thetan is to go in reverse to the way it was lived. And run back toward the beginning. And if you keep on doing this, and leaving banks in present time -- I'm afraid your pc is going to be terribly uncomfortable, because he keeps pulling all of his PTPs and hidden standards back through tough goals in the past.

But it's rather easy to run out a bank, do a good job on the bank, and then move forward to a bank closer to present time, the next bank, run that out, polish it up, and then move forward again. And don't be too surprised if you find out that you're ten banks from present time -- don't be too amazed.

If the pc tends to get sick and creak and have an awful time running a bank, just assume it's too early. Try to find the later bank.

All right. Well, that's a lot of gen. I'm awfully glad to talk to you out here today, and I hope that you... Let's see, you've got about twenty-six, twenty-eight more goals to go. Let's have those by the next lecture Thursday. Okay?

_Audience: Yes! Yeah!_

All right, good night!
Diagram from HCOB 29 April 1963:
Finding Goals

A lecture given on 25 April 1963

Thank you.
You keep that up, I'll feel you're glad to see me! Gee-whiz! [laughs]
All right, what is this, 25th of April?
Male voice: Yes.
AD 13, and Saint Hill Special Briefing Course.

All right. Well, we're at that time of Scientology when the gates are crashing open and open sesames are occurring all over the place. And the reasons why it has not been easy to get a pc rocket reading or started down the channel are gradually emerging. I'm doing an even more fundamental goals pattern. And fifteen, fifteenth goal, three hundred and five trillion. And the early track is quite – it's much greater in magnitude of charge. Late track, you get one of these RIs and you pull all the black cotton wool off the top of it and take a look at it, be about two, three inches in diameter – quite tiny. That's all the late banks and that sort of thing, that have crushed in on it, and all that sort of thing.

One of these earlier track ones and so forth – you know what a mine looks like? One of these big spherical mines? That's about the size of it. It's right in that order of magnitude. And charge is about a hundred to one over late track. Tells you why you shouldn't be pulling a pc through one of these early goals, even if you get your hands on it.

And you get a goal – you see, most of these early track goals are fairly standard. There are certain goals that are standard to every case. And the rest of the pattern is different. But certain of them – everybody has certain goals. You got goals about cause and goals about create, those are common. You'll have a goal something about a game, or something like that, that'll be in common. And these are all awfully early track. These are along about tenth, twelfth, fifteenth goals, see, they're way back. I don't think a pc could live through one. I mean, if you just grabbed him by the hair of the head and said, "Everybody has got the goal to create. All right, let's find the top oppterm, creation, that fires." Yawww! It's an interesting invitation to do so.

The lecture I'm giving you, however, is about goals, not so much about running the bank. Now, the first thing you should know about finding a goal is that the goal you will find will be the one offered, by its wording; that's the most likely. Most likely goal is the one offered by its wording, and the less offerish a goal's wording is, the longer it's going to take you to find it.

Now, we've gone previously on the basis that the goal "to be hidden" would be much harder to find, you see, than some other goal, and the easy goals to find were the neutral
goals, that didn't try to hide themselves and otherwise. But remember, that – now this is a new datum to you – seventy... I could tell you a lot about this. In later days, philosophers will philosophize on this subject. I can see tomes, now, that you can't see over, being compiled and lectured over, you see, I can see it now. Harvard – the Harvard study group, you see – you've probably written some of these textbooks, you see. And they philosophize on subjects such as this and let me just tell you that there's plenty there to philosophize on.

Seventy-five percent – that's a rough figure, but just to give you the order of magnitude – seventy-five percent of the RIs are anti-self in a GPM, leaving somewhere between fifteen and twenty-five percent of them beneficial from the goal.

Now, that's interesting, isn't it? There's... in other words, there's just this little percentage. Guy postulates the goal, you see, to be such-and-so and so-and-so and he makes this postulate and this only carries him... and the beneficial – the items beneficial on it – are less than twenty.

I can give you almost exactly the finite number of RIs or will be able to in another couple of days, in any goal. It's a number that won't vary. But it's somewhere around the eighty to a hundred area. Closer to eighty than a hundred.

Now, only the first few of these are driving the goal along towards success – and you might say, self-beneficial. Only that few. Now the remaining lot, all that tremendous column which is only one third of the terminals, as you go up the line – two thirds of those then, are dead against it. That's the terminals. And then the whole of the oppterm column is against it, all forty-plus of them. Isn't that interesting?

That means that you could make this loose statement that three quarters of the RIs are against the thetan and inhibit his livingness. And only about a quarter of them have any slightest possibility of assisting. And of course, they don't assist either because they're fixations.

Now, this tells you that if you were just running out somebody's goals, so that you could free up his attention, you would be justified in freeing up his attention, but you might run into the interesting cross-argument – well, what's he going to do without his goals? Every once in a while a thetan thinks of this. Well, what's he going to do without his goals? What's he going to do without these seventy-five percent anti-self RIs? That's the question! Well, the answer is he's going to do! Because he sure as the dickens hasn't been done, in any other way than down. You see, quantitatively then, seventy-five percent of the RIs contained in the bank are against self and have nothing to do with assisting this goal, but only impeding the goal and the individual. Something for you to recognize. That's a fantastic different percentage.

You'd say, well, fifty percent of them – it should be this way, you know: Aristotelian – there's just so much good in the world and there's just so much bad in the world. And all things achieve a balance of the mean, you see. And if there are fifty devils, therefore there must be fifty angels. And all this sort of thing, you know. And all things come down to a mean. Emerson, you see, carrying on this philosophy, could explain to you how if you're going to have five days of bad weather, you of course then are going to have five days of good
weather. [laughter] You go out here and talk to anybody around Sussex about the weather and they may sooner or later bring this on you: "Well, we've had an awfully wet spring, so it should be a dry summer," you see. This is the idea of averages.

Now, that idea of averages carries through into the normal view of one's own goals. That if it's done you some bad it's done you some good, you see. And it was really all for the best in this best of all possible reactive minds, you see. This, you'd look at it and possibly up to this instant, you yourself may have looked at it as a sort of a fifty-fifty proposition, you see. Well, those aren't the averages. This is something like the odds in a Las Vegas slot machine.

I... in a yacht club one time I had the job of ordering, according to the board's dictates – got the small job of ordering some gaming devices and so forth for club members. And I was fascinated listening to this checker-suited tough mug, who was giving me da lowdown on dese here machines, see? Now what we want? What we want? Did we want da twenty percent payoffs? See? Of course, you could fix it up so it was no payoff, too, see? [laughter]

There's little devices in the back of these machines so that it can be adjusted, so that they pay off on different percentages. And the average machine that you walk up to innocently and throw something in and pull the lever on, is rigged for a twenty percent payoff. See, dat's da law of averages, see? The reason the public plays them is they believe implicitly in the law of averages. They think fifty percent of the time you pull that handle you should win. Actually, it's only twenty percent.

Well, this view carries forward instinctively, rather, into a view of the reactive bank. If a fellow went to all this trouble to have a bank and so forth, it must be fifty percent good and fifty percent bad. And lo and behold, the actual figures – this isn't my opinion, see – the actual figures on the thing show that the payoff is very little bit better than the Las Vegas slot machine. You might have had a goal "to be beautiful." Well, that means that you've got something on the order of twenty or so, because those upper RIs really aren't very assistive: "An exhausted beauty," you know, something like that. So, you've got about twenty there that would give you the idea that you should be beautiful, see. And that leaves eighty-plus – or pardon me, it's somewhere between sixty and eighty – that just determine that the last thing in the world you want to have anything to do with is being beautiful. That's the slot machine. The slot machine percentage.

Now, undoubtedly professors in times to come will tell you – tell the – not you, but tell the public, this or future scholars this, in very flowery language. And will deplore any comparison to crude devices and practices. But actually there is no crude device or practice amongst man which is quite as rigged against man as the reactive bank. He's got a goal there "to be bright." Twenty percent of those RIs tell him to be bright, in varying degree. Mostly a decline. And the remaining RIs make him absolutely Rrrrr on the subject of anything bright or being bright or anything else.

This is basically the overt act-motivator sequence at work. Now, I'm investigating the early track, to find out what's this regularity – that's made me very suspicious. Frankly, I haven't learned too much in terms of the basic philosophy of Scientology and axioms and that sort of thing out of running goals. I knew all these already. But I have discovered a few new things and one of them, give you an idea, is quite important. If it weren't for this totally
agreed-upon overt-motivator sequence, if it weren't for this – which is one of the fundamen-
tals of the bank, and which gives us this overpowering anti-self percentage of RIs – and if it
weren't for the bank, which resulted from one's considerations of the overt-motivator se-
quence, the process of living would be therapeutic.

Now, the mystic, the mystic has been saying that you have to do some living, too. Every once in a while you'll find some Scientologist, he never quite got it out of the corner of
his skull. He tells you, well, it's all right to be processed, but you've got to do some living,
too, you see. They say this at – they say this about – mostly after they've just met a pretty girl,
or something like that. [laughter, laughs]

Now, the only – the only idea I've had that – run into, in running banks, that suddenly
reversed my concept of things on any point, has been this general observation that I've looked
this over and it rather makes me pop-eyed. If it weren't for the bank and you wanted to feel
better, you'd live a few days and you would feel better.

Now, to some degree a thetan is always doing this. I touched on this at the congress
but very, very lightly. A thetan's always doing this. Well, in a few days he will – the wound
will heal, you see. And the bruise will go away. He counts on this, you see. Well, the thing
that defeats it is the bank and the overt-motivator sequence. This other computation is de-
feated by this.

If you wanted to be Clear, if you didn't have a bank – sounds very funny, I mean – all
you'd have to do is live for a few years. This is quite remarkable; it's quite revelatory to me. It
doesn't sound like much of a point and as it stacks up against things like the Axioms and Fac-
tors, and things like this, it isn't much of a point. But it's rather a surprise to me to find out that
it is therapeutic to live in this universe. That comes to me as a terrific shock. Reverses my
ideas entirely!

In the absence of a bank, in the absence of a – of all these GPMs, why, if you wanted
to be bright, you would live a few years and if you wanted to be brighter you'd live a few
more, see? And if you wanted to be talented you would live a few more years and then you –
real talented, you'd just live a few more years, you see. Sort of take it easy on the line and
you'd wind up better.

Because the process of familiarization, as you know very well, is a highly therapeutic
process. You'll get somebody running Touch – Reach and Withdraw from a car and he can
drive the car better. Well, why doesn't this work in life? You add it up. You've seen it under
your own hands as an auditor, that a Touch Assist has banished some bruises and that sort of
thing. Well, why doesn't this work in life? Well, the thing that keeps it from working in life is
fundamentally the overt-motivator sequence which underlies the bank, and the existence
of the bank.

The fact that a bank has been built and maintained and added to, works against just
achieving higher levels of beingness in the process of livingness. And that is all that prevents
it. And this is quite – was quite revelatory to me.

You'd say this is not much of a point and it's true enough, it isn't much of a point. It's
one of these elementary things that doesn't change around the basic concepts of Scientology
any. But it does this, it does this: it puts a different complexion on this universe; and it puts a different complexion on what you might care to do; and it puts a different complexion on your future for the next two hundred trillion. See, this changes that. Your concept that the only thing you could do is get to a point where you could get totally out of this universe, or something like that – if you had such a concept – the only way you could ever win is to just get away from all this MEST and space and so forth – those concepts are, apparently, invalid. Which is a very hopeful happy note. I feel like a certain Pollyanna idiocy taking over, you see?

Now of course, the technology with which you are dealing, from a standpoint of processing, has not existed before. The laws or the put-togethers or anatomies of things, have been existing through the trillennia. These things as they are, don't you see? What is the composition of a time track? What is the behavior of an engram? What is the human behavior factor: given certain stimuli, what response will you get? All of this data is invariable. What are the laws of beingness, as you find them in the Factors and you find them in the Axioms? These things are strictly in concrete. Although they have not been known, although they have not been known, in general, they have been adhered to. And they are, in that relative sense, they are truth. They are the true things which have existed back of human behavior, reaction, liv-ingness, beingness, all these other factors.

Now, what you are handling that is new, and that hasn't existed in the universe before, is the know-how of handling this material. The know-how of knowing and handling this material. The know-how of handling another thetan. The know-how of putting together a bank. The know-how of running an assist; things like the Auditor's Code and that sort of thing. These are new.

Now, people in their confusion of course say, "Well, when Ron dreamed up all these Factors and so forth, when he dreamed up those basic Axioms – and it's mighty wicked of him to do that," you see.

Well, it's all very well for me to say, "Well I didn't dream those up." I didn't! I was there amongst you but you had your share, man! I distinctly remember, when the vote was taken, I distinctly remember your loud clear aye! [laughs]

"Shall there be a general agreement, on the subject of the overt-motivator seq...?" I remember your aye clearly! It was shattering!

Well, those basic laws we have had to dig up all the way along the line. But they are dug up.

Now, you should look at the other side of the fence: What has been invented in Scientology? What has actually been originated? What have I originated, and so forth? And that's your technical handling of the materials which have been discovered. An auditing session. The handling of the preclear. The this and that. You're entered in a new track there. And it frankly only to some degree is restimulative, because it'll bing in on somebody's goal, some-
body's goals will get in his road, one way or the other in auditing. Seldom assistive because of this 20-80.

Even if the goal, you see, was "to audit pcs," then you'd have eighty items, you see, that would say, "These damn pcs can't be audited and it'll kill me." See? So therefore, these things do not assist when they're in place. Of course, when they're pulled up you've got all the experiential track available and they suddenly are of tremendous value. Gone, they're valuable. Here, they're nothing. All in place they are nothing.

So, auditing a pc is something you're doing that is not a former action. And therefore should be clean, clear and learnable. And the more you work at it, regardless of the aberrations of the bank, why the better you ought to get at it. And when you get a bank gone – or two or six or ten – all slicked up, they'll be just nothing in your road at all. There's very little standing in your road of auditing a pc except a piece of bank here and there, a rock slam on something or other that's locked onto the top of the bank. But these things all can be overcome.

You recognize that everything that has been done in Scientology has been done in spite of the bank, you see. It's just been done on the basis of – well, hell, it can be done, there's no reason to be aberrated and there's no reason to react to it. Somehow or another, with the scruff of the neck, why, you pull yourself out of the – well, you find yourself unreasonably angry about something or other, and you start nipping and snarling around about one way or the other, grab yourself by the scruff of the neck and say, "Well, even though I don't know what might be biting me, this is certainly aberrated conduct," and do otherwise.

Now, in auditing – in auditing you get a consistent hammer and pound in Routine 3 and Routine 2 now, of your own bank as an auditor, because you're handling the bank materials to which you have to be risen superior, all the time you are handling them. Well, that takes some doing. You understand what I mean, don't you? You see. You're handling and restimulating the very materials which you must rise superior to. And the only thing I can point out to you along that particular line is, it's been done. It can be done and is done more often than you think. Mary Sue and I are having a bad time on some of this bank-plotting. If you think it's easy to sit in the middle of a bank and – not knowing its pattern, it is already too crushing to have much to do with – and not just find the item that fires, but then list enough additional items to cross-check to make sure that the RI has been knocked out, you see, on the basis that you won't get another item on that subject firing, or with a similar wording firing, if you've got the RI in the middle of the cluster that I showed you the other day. And you won't, either.

So, you not only have to find the RI, but you have to make sure there isn't any other RI in that position, see. And that causes more listing. And there's... you've already got your item, see. And things are going creak and falling apart and your skull is starting to slip along the center cleavage of it, don't you see, and somebody – mass is already too tight because you've missed a whole band above this and you don't know why. And now somebody says, "You have to list a few more."

You're just about feeling relieved, just having gotten rid of that one, you see, and you have to tackle it again, something like that. Or there's a little more charge here or something like this, you know. And cross-checking while getting better. Well, of course, tempers can get
rather sharp, under these circumstances; ARC breaks can become quite exclamatory. And auditor blows, and pc blows, and so forth, could very easily be reached under these circumstances. And things were going worse to worst by Tuesday night, they were getting pretty rough; things were pretty rough. Everything was going by the boards, so she and I took a look at each other and straightened it all out, and so forth, and it was – got it all sailing again.

Not because we'd audited anything out, don't you see. Because we said, "Oh, hell all – it's just bank!" you know? "Let's get the show on the road," see? Get the idea?

Don't think then that what you're going through is uncommon or is peculiar. I would say this: The only reprehensible thing – it is not reprehensible to have ARC breaks, it's not reprehensible to miss somebody's goals and get so restimulated, to do this, to do that, something or other, have ARC breaks and blow for twenty-four hours and lie quietly in the shrubbery sobbing, knowing you will be dead any day now; knowing it's all gone too far and that nobody is ever going to help you and Ron was wrong, you know! And all this kind of thing. Sad, sad, sad! The only thing reprehensible is not doing that, but when you have done it – picking yourself up by the scruff of the neck, sooner or later, in that period, and putting yourself back on the rails again, knowing that you can rise superior to it and surmount it. See. That's the only thing that's reprehensible, it's not doing that sooner or later, you see.

Blow, explode and break up all the furniture, see, that's all very well, but if in a week or so, at the absolute outside, you haven't gotten yourself by the scruff of the neck, just realize you're not rising superior to your bank. And the only thing that got us where we are is just rising superior. Without even any thetan bootstraps to grab hold of, see. It's quite important to know that. Because the road is stony. And goals, being an entrance point, can get very thoroughly in one's way.

Now, the goal you think you are going to find on the pc – reverting to this now – the goal you think you are going to find on the pc would be a neutral goal, right? Would be this – the lie in there. Actually, that is the hardest goal to find.

The length of time it takes you to find a goal on a pc is monitored by two things. First and foremost is the degree he is not rising superior to his bank. Now that first – that first is a very embracive statement. It looks like a small statement when you first look at it, but it's a very, very broad statement. He's not rising superior to his bank.

Now, let's take the full gradient of this – the full gradient. A person who has a goal that has the capability of driving him mad, if not risen superior to, would bring about madness. Correct? So the bird down in the loony bin – in the spinbin – who is mad, has not risen superior to his bank. You understand?

Now, it's the degree of charge and the significance is what makes a bank hard to handle. First and foremost: degree of charge on the bank, that's primary; and then the significance of what the bank consists of is secondary. Those are the two points. Those are two subpoints, not the two points I just mentioned a moment ago. You see, that's what keeps a person from rising superior to his bank. That's A and B under Point 1.
I want to repeat that, because it sounds terribly, terribly simple and you're liable to bypass it and say, "Oh yes, of course." But this means a great deal to you as an auditor. It's the amount of charge.

By... what do we characterize as charge? Well, it's actually electrical thought impulses. And there can be an erg's worth or a kilowatt worth, don't you see? It's measurable, you measure it on your meter all the time. You know what have we got, a hundred and twenty volts going through the power lines or two hundred and fifty volts? All right, well, that's just a quantity of flow. But is there enough power coming through that line to light a fifteen-hundred-watt lamp, or only enough to light a flashlight? In such general terms, we are speaking of charge, see. Lots of power and force, or little power and force, see.

And that's primary and the other one is significance. Now, confound you, don't get those reversed! Don't get those two importances reversed! Because if you do, you'll have been -- be continuing a mistake which we have been making for a number of years. We were giving charge secondary importance and giving significance primary importance.

Fellow had a goal, see, fellow had the goal "to spit." All right, another fellow had a goal "to spit." One spat all the time and the other didn't spit at all. You say, "Well, he's in different parts of the bank." No, no, no, the fellow who isn't spitting is not necessarily in a different part of the bank, but that goal may not be very heavily charged. See, the restimulative locks and the overts he's committed and so forth, all might be insufficient to hold tremendous quantities of charge there.

Now, secondarily, one of them just doesn't spit and we can assume the fact that he just doesn't, you see, or the fact that he has the goal "to spit" and he's running the negative opperms, so we can say that. But he's not worried about it either.

And the other one has a goal "to spit" and he just spits all the time, and there we are and so forth and nothing can stop him of it and he's been to the Mayo Clinic to have his spitter repaired and so forth. You know, they've done practically everything for him they could. There's the -- that's a difference of charge, see. One's got a very charged-up goal and the other, same goal, see, and it's not very charged up.

All right. Now, significance is secondary but still important. Still important. This is very much in the running. Now, this becomes important to you from a number of ways. If you can discharge a bank, no matter how, then the dramatization of the bank will drop. If you just take the significance out of the bank without removing the charge, the dramatization will continue.

Therefore, you're going to be very puzzled someday. You're going to see somebody that some HAS has run a full bank on and this is the bank "to fly." And, he's run this full bank and yet the person talks about flying all the time and flaps his wings and tells everybody he has a goal, you know, "I have a goal, you know 'to fly.' That's my goal, you know? That's my goal." And he's flapping his arms all the time, and running up and down the street. "That's why I do this, you know?"

No, that isn't why he does this. The other hidden part of the thing is, it's very heavily charged. So that his effort not to do it inflicts considerable pain and pressure upon him. The
bank contains a self-punishing mechanism. And when he doesn't obey the bank and its dictates, then he gets pain and he gets all kinds of spinniness, and sen and he gets sick. And the way not to get any of these things, he hopes, is to run up and down the street and flap his arms. In other words this thetan is protecting his body and beingness from the amount of pain, shock, pressure, incident to that bank. And if he disobeys these RIs, he goes up against this shock and pressure, and if he sort of tries to go along with it, it doesn't drop on his head. Do you see that?

Now some people – this is a very early thing, I've – telling Suzie last night this – this was Academy material of 1951, Wichita. There are two things that a thetan can do with an engram; and one of them is dramatize it in full and the other is get sick from it. I hadn't connected the two things up thoroughly, you see. Yet I could see, sort of, that if he didn't dramatize it, he'd get sick from it. So the actual taught statement was – is engrams have either mental or physical compulsion. And some engrams have a physical compulsion and the same engram in somebody else will have a mental compulsion. And thus you have some odd difference, thetan to thetan. Well, actually, you don't necessarily have an odd difference thetan to thetan, but you've certainly got a difference in the charge. In other words, the same engram, heavily charged, causes a person to be physically ill which in somebody else would cause him to dramatize only, see. He doesn't become ill from it, or even hurt from it. He simply dramatizes because of it.

Now, it is a basic difference in the being. The being is unwilling to face, confront or stand up to that much charge; he feels overwhelmed by it and feeling overwhelmed by it, therefore obeys it. And therefore you get a mental dramatization. So, you can either be sick or crazy. Wide choice!

Fortunately there is a third, which is rise superior to it. Now oddly enough you can rise superior, it isn't all mechanical the way the scientist would love you to think. You can rise superior to almost any quantity of charge if your intention to rise superior to it is – has as much charge on it as the charge you are facing. You got it? And you don't have to dramatize it mentally or suffer from it physically, particularly, but it's certain that in the process of rising superior to it, because you are bucking against it, there is going to be a certain amount of physical reaction. See, you might escape the mental reaction totally, but the physical reaction you probably could never, as long as you've got a body and so forth, never get totally away from. You'd say, "All right, I've got this – I've just got this idea that I've got to walk down the street sedately. To hell with it! I'm not going to go on walking sedately down the street." You've noticed that you're always being sedate when walking down the street, see – noticed this about yourself. Well, you've got some kind of an item, see. It's not necessarily as fundamental as a goal, it – you can actually – "A sedate walker" or something on the goal "to walk," you see?

And you say, "Well, I'm not going to do that. Not going to do that anymore. I'm going to walk anyway I please." And after you've gone fifteen or twenty paces, you've got an awful pain in your side and you wonder where that came from. And you say, "Well, I must be walking too fast; I must be getting short of air." No, no, you've refuted, you see, the dictates of that RI and it starts to key in physically, because you're exciting and protesting against the charge of it.
The reason a bank comes into action, then, is basically the eighteen buttons are being disobeyed in the physical universe. In other words a whole – that's true of the whole reactive bank, is the eighteen buttons. It's not much more than the eighteen, there are a lot of nuances and so forth. But, you could practically clean one with these. The eighteen buttons are being dismayed. See? You're invalidating, you know? Suppressing, protesting – the items that are connected with the bank, you see? And those things then, being pushed back out of sight and so forth, various physical and mental reactions occur.

Now, the pc – this is less – could be more tightly connected to the subject of goals, but I just want to give you an idea of exactly what you are looking at there, you see. Your next consideration then, recognizing that somebody can rise superior to charge, is recognize that nobody in a black sphere ever sees the outside of it. If he's in it, he never sees the outside of it. It really isn't necessary for him to crawl out of this black sphere to know he is in it, however. But the goal you want is the one the pc is in, which therefore is capable of exerting against him the most charge. And is therefore capable of making him dramatize it to the degree that he dramatizes it. And your best trick – and hear me now – your best trick in goal finding is to attain and maintain a high state of morale in the pc during the finding of goals, in such a wise he can rise superior to his bank.

Now, the number of goals which you have seen RR on an upset, chopped-up, can't-never-find-my-goal-type pc, are exactly nil. It isn't the pc is incapable of RRing, but the pc – you could almost go over the top of his goal, could practically read it straight into his teeth. He hasn't ever collided with this yet, without getting any much – very much needle activation. His reality is too low on it. If he goes up against this goal, if he ceases to dramatize it mentally or physically, in any way, he's going to get a kickback from it. So, he plays it safe, he doesn't rise superior to his bank and, "Uhh, uhh, to catch catfish, not really that goal, blah – nothing to do with me. No."

It will, however, fortunately tick. It never gets quite all the way out, see.

It'll tick; what a microscopic tick, sometimes. Sometimes you get a clang and then a tick and then it disappears and you can't make it read. But because it did something peculiar, you keep your interest on the thing and you start putting in your big mid ruds; now what are you doing? These contain the buttons which, going out in life, create a bank. So running these things out on the subject of that goal permits the person to rise superior to it, even fleetingly enough to get a reality on it and make it read.

Now, if you understand that, you will see why you have to do what you have to do in order to find a goal, and you could actually predict how a goal will work or run under your hands as an auditor. It's a creepy thing because you know that if you were just to get it on a long list and read the list in a very disinterested tone of voice with the pc not interested in it and nothing much interested anyplace anyhow, and no session in progress, the pc not being assisted by you as the auditor to hold his head up and so forth about existence, and he had no reality on it doing anything for him anyhow, you know, and this old wah wah wah, you could read it right on down the list and you'd probably go right on over the top of it, and it would – nothing would happen and it'd never react.
Oddly enough a little bit later, maybe a minute, maybe a page, pc starts to get nasty. But you could say, possibly, he could be so unreal on the subject that he wouldn't even have an ARC break. So you can't count on that either. It's a good indicator but it's not a perfect one.

So, what state do you find this goal in? Based on the remarks I've been making to you here, what state is this goal in?

It's quite interesting that you can find one at all. Because it is the least confronted, the most dramatized point in the present time area. But fortunately, it's also the most charged. And maybe the pc is so overwhelmed that he doesn't react much, but you can sometimes see the goal go ssswww, like you're letting the air out of a tire. Sometimes you can find a goal that isn't ready to be run. It's an earlier track goal that is pulled up toward present time, not ready to be run at all. It's not on the pc's goal channel, don't you see. And you hit the thing and the pc sort of cognites on it. And the air goes out of the tire and the pc feels much better and the tone arm action goes down and everything is fine and now you can't make the goal fire. That's fairly common. It's terribly beneficial, because it's opened the track and improved the pc's reality. You let the charge of the thing off like letting the air out of a balloon. And it probably had the line blocked and the pc's confront blocked. It wasn't the goal, but you were likely to find the goal soon afterwards.

You might have two, three, four of these things, even five of them, in the process of looking for a pc's goal. In other words, charge then also can apply to the solid goals line.

Let's just consider a list of twenty goals that the pc has got, twenty banks, or something like that, and the list – let's handle this as "a bank." And it has only the significance of goals, and just neglect the RIs entirely, just forget what's under all these things. And just treat him as a concatenation of goals. Unless you let some charge off the subject of goals you're not going to find a goal.

So once again, charge goes down and then the significance can emerge. Because charge can totally mask significance and is practically the only thing that does mask it. Although significance tells the pc how to be aberrated, it is charge and his inability to rise superior to it that causes him to act aberratedly or suffer physically from having a bank.

So you see, you can actually go up and down the parade of pcs' goals lists, every once in a while hit one of the goals on these channels or some lock goal on top of that goal.

Now let's say it's the goal "to catch catfish," and he's given you the goal "to bait fishhooks." And this "to bait fishhooks" is a goal of one of the RIs, you know, and it goes Pssswww! See, something like that. You get a nice blowdown, it all looks pretty, it all looks very nice, it's all beautiful; how interesting! But it wasn't his goal and you can't make it read after that. If it reads for a while with a rocket read and continues to read and won't ever go out and keeps coming in and going out and you just can't ever get rid of the thing, it's probably his goal. You should certainly test for top oppterm and that sort of thing on it if you can't get rid of it forever and you can't find his goal.

But normally, the whole subject of goals will release some charge. Then looking for any old goal – if you do it well as an auditor, holding up the pc's morale so that he can rise superior to his bank – will release charge and therefore permit significance to be viewed or
confronted. And then getting goals of a particular kind will bleed some more charge off the bank and all of a sudden you're sitting there looking at the pc's goal.

How long does it take you to accomplish these actions? You possibly look on the finding of goals as a matter of luck. Well, after my experience in this line, I find out I have been more spoiled by luck than assisted by it. I found quite a few goals in fifteen minutes on a pc. Leaves you in this kind of a frame of mind: "What the hell is wrong with auditors that they can't find these goals, see?"

I got my comeuppance. Took me two years to find one goal. Pretty good. So I had to get down and study this subject. What's this subject all about? Fortunately, it took me two years to find it, because I did make the study then and I got quite interested in it. And eventually, toward the end of that period of time, was sufficiently informed on the subject so that if I had to find that person's goal again it would probably only take me twenty-five, fifty hours, see.

And what's all this about? Well, the pc is not out here someplace, four or five feet away looking at this point which is his goal, and just won't give it to you. That is not the pc's situation or position. The pc is in the middle of this goal, being this goal, is this goal, and the last thing he could look at is himself. The old philosophers used to say, "Physician, heal thyself," "Know thyself," all this sort of thing, it – obviously the last thing you could see was yourself. Well, even with the help of mirrors it's sometimes difficult. So, you're actually not finding a goal, as your best statement of what you're doing. You're actually discharging a bank on the subject of goals and improving the confront of the pc until he can recognize what goal he is sitting in, with your assistance, and then you find the pc's goal.

And that's how you find goals. Now, the assistive character of a goal causes it to present itself. The goal which is hidden causes it to present itself: "to hide," you see. Why, it's got – it's got all these oppterms that tell it to present itself. They'd be – actually are the easiest goals to find. They're the ones that pop up at once. Well, they've got eighty RIs that say they should be found, you see. They say they should "not be hidden." And they only got twenty that said they should hide. A little more difficult goal to find is one which says, "Find me," because it's only got twenty saying, "Find me," and it's got eighty saying, "Things that get found are no damned good," see.

So, your neutral goal, however, your neutral goal is the hardest one to find. It doesn't get blown into view by any of its significance. It is as heavily charged, but it's usually quite abstruse, compared to the pc's behavior. You'll swear this pc – you'll swear this pc has a goal "to ride horses," see. You'll just swear that the pc must have such a goal, because the pc just talks all the time, about horses. Can't get off the subject of horses, can't get off of horses! Hates horses, gets walked over by horses, see for...

"Aw man!" you say, "Well, what's about horses here? What's about horses? Something about horses? Animals! Must be a fifth dynamic goal." You figure yourself wild, you see. You'll eventually find out, when you do find it, why you will say, "Well, I'll be a son of a gun," you see, you'll say – one day say, "What was all that about horses?" And all of a sudden you'll cognite, see. Well, it'll be something like "to never go anyplace." Way the guy is executing his goal is to be fond of horses, see. You know, death on cars. Death on airplanes, you
know? Telling everybody old methods of transport are best, see? That's just a method of never going anyplace.

And it'll be... So trying to track a goal down by the significance of the bank is one of the most thankless activities you can engage upon. By all means engage upon it, but just recognize that it is a thankless activity. It's lots of fun, it's like playing charades or something. But always be prepared to be knocked off your pins on how far you were out because you're never dead-on. It'll be – it'll be something which is as wide as "to never go anyplace" and "to ride horses," see. It looks quite wide, you see. And you just never would guess it. And the auditor that thinks goal finding consists of a large series of guesses and is a guessing game, and that he will find the goal if he is lucky, and won't find the goal if he isn't lucky, you understand, misunderstands to a degree what he is doing.

But because these other things are so attractive – the significance of it all is so attractive – because of these other odd bits into the situation; the pc's talk, you see, the pc's dramatizing, the pc's this, the pc's that. And you start following down, look at his 2-12 list, and you find out he just says nothing but children, children, children, children, children on the 2-12 list. "I wonder if this pc doesn't have a goal 'to have children.' Do you suppose so? 'To be a child.' So on, so on, so on, so on, so on, so on...

You finally find out the pc has a goal "to like new things." [laughter] It's just way out, man, always! And you just never would guess it, because the pc is of the least possible assistance.

You recognize, then, that the significance channel is limited to simply giving him the significance of items to list goals from so as to bring him in close, and the significance of items which occur on lists to list goals from, and the significance of listing questions. Like the most non-survival goal you can think of, you see, to list from. Very assistive list questions can be used, and so forth. Trying to guess the pc's goal, however, is a very thankless task and very time wasting and very exasperating. And the auditor's liable to become extremely exasperated trying this. He should recognize that these two things monitor whether or not you get the goal. It's the charge on the thing, and the pc getting the charge off or rising superior to it. See, he's got to rise superior to this charge. Or you've got to take some of the charge off. And actually you do both. You do both.

It makes a great deal of difference for a pc to find out where he's located in the bank. Even though he's located too early in the bank, you very often will find that you have to walk a pc forward to present time, just as fast as you can get him there through the banks. You don't dare go back, you don't dare go earlier, don't go into any earlier banks, because he's already handling one that's too much for him.

If he actually is handling a bank that is far too much for him, it is better for you to do the goal oppose list and move in to an earlier bank before you do anything more. You can actually move a pc up and down his goals channel by doing goal oppose: "What goal would oppose..." list, you see. "What goal would..." – You found the goal "to ride horses." "What goal would oppose to ride horses?" And you'll move him right up into his next bank.

But there's more air for the next goal when you do that and it's easier to do it with the charge off. So your first choice is to handle the goal that you got your hands on. But if it's just
FINDING GOALS

obviously impossible for him to handle this goal, you just can't make it any way, shape or form, don't struggle around with it, move him up the bank a ways. Recognize that the goal you've got was the one which was most offerable, or unofferable, according to its wording. Not because it was closest to present time. And therefore, you will move him forward, and you very well may find that you were looking for an inert goal, it doesn't offer itself, it doesn't refuse to offer itself, so therefore, there it is, you see. It'll be some kind of an inert goal of some kind or another which is "to be happy." There's an absolute killer to try to find. That goal is around. But it just sort of never turns up.

Now, when you find a goal which is a neutral goal, you want to kind of pat yourself on the back, because it was – it was found by taking charge off and by being a good auditor. Not because the goal walked up and said, "Hey! Whhitt whhitt! Hey-hey! Here I am! Here, here, here!"

"Oh! 'To be here!' All right, there you are."

That's the way you find goals. Any pc that doesn't put his goal immediately on the list, is either bucking an auditor who isn't raising his morale, or he's just so charged up in all direc-
tions it's almost impossible to do anything for him. The speed with which a pc's goal is found then, is monitored by the amount of charge, the significance and the degree that the auditor can raise his morale and discharge the general charge off the subject of goals. And you'll find it's easy. That's the way you find goals.

The fast way to find goals is not by a magic significance, but by very smooth, clever – cleverness must not be gainsaid – smooth, clever auditing, that keeps the pc winning all the time on the subject of goals, raising his morale, getting him to confront them, getting charge off that goal's bank, finding on little short lists of a page or two a goal that'll blow, blow the tone arm down. And then finding another one that will. And so forth. And he goes on and he removes charge. And all of a sudden as the pc's morale is coming up, why all of a sudden the pc says, "Heh heh! What do you know! What do you know, here's a goal. I've been sitting right here, it's 'to be here!' Ho ho ho! Here it is." Fine, great, you've got the goal.

That's what goal finding consists of, and it's monitored by the character of the bank. Goals ride over as a layer, over the whole of the GPM. And the subject of goals, then, lies as a layer over the whole of the reactive bank. And you can stick little pins in it here or there and get the charge off. And get the pc alert, and get him seeing things better, and hold his – hold him up and carry him forward, and the next thing you know you've got the pc's goal. It's not because you guessed it, it's not because you guessed it. We can't rule out luck entirely, but so far as possible, is you should just neglect it as a factor. It... because you'll find that pc's goal to the degree that you get the charge off, get the pc to confront the bank, and as you are assisted in the significance of the goal and, of course, as you hold the pc's morale up and keep him confronting and keep him happy about it and not frantically looking, "Oh my goodness, what are my goal – what's my goal? What's my goal? Oh! I'll just die if I don't have my goal by tomorrow."

Some auditors, "Well, I haven't gotten your goal yet, what's the matter with you? Why haven't you put your goal on the list?" and so forth. "Hmpf! You realize you're making me look bad?" you know. "Everybody's looking at us, hour after hour, month after month, no
goal. What's the matter with you?" You see? That's not the way to find the pc's goal, because it violates the morale factor and it doesn't get the charge off. It just caves the pc in further. Thing to do is cheer him up about how much progress we're making with his state of case and how much better he looks, now that we've been over a few goals lists. Keep leading him. And next thing you know, bang! There's his goal: "To be here."

Okay?

Thank you very much. Good night.
Thank you!

All right, this is the 30th of April, AD 13, Saint Hill Special Briefing Course.

Now, we had a record last week. We had a record last week. We had a – I think there were more than this but they weren't checked out in the week so we didn't count them – but we had a dozen goals found last week. A dozen.

So let's give them a hand, huh? [applause]

Well, I had an awful lot of trouble keeping my shoes on. It's very hard for me to keep my shoes on, because people keep walking on my heels and slipping them off! And, this has been – this has been technically quite a rat race because it's been necessary for me to take – oh, I don't know – I was telling Suzie this morning, my customary attitude toward this thing is take about a thousand years and go down on a desert island, you know, and figure it all out.

But due to the various stresses and strains involved with it that hasn't been possible so it had to be condensed into a few weeks! And the pattern of the GPM – that's been pure slaughter because trying to find this pattern has been – well, it's not only difficult to find the pattern but you actually have to hunt and punch through a bank to make sure that the pattern is in agreement, bank to bank, and you haven't got any time to run the banks, so therefore you have to pick up an early enough bank, you see, so as to tip the charge off later banks, you see, and look it all over, and that leaves your case in a horrible condition, let me assure you.

And you go back fifteen goals, with no fully run goals ahead of those fifteen goals, and it's a slaughter. Well, I don't mean to put up the poor victim to you or even tell you, you must appreciate the information. All I'm saying is that it's been a flat out proposition and we do have the information. And that pattern of the bank which you have now – it's horrified me in the past – but we continued to get new items. And I figured, well, some of these are certainly lock items on the items we've already gotten, so it was necessary to shake them all out – what were the actual items in the pattern of a GPM? And were all those items present in a GPM?

It's all shaken out now, except a little band which won't disturb you, since it's an easy band to find anything in, on the level in your bulletin there, "have a game." And, there's a little place where I drew wiggly lines across and said there might be some items in there. Well,
it's kind of mysterious why the noun of the GPM – top noun or action or conditional form, final achievement of the goal is what it is – it's sort of mysterious that that declines completely. You've got that completely declined. And then you go into the "ivities" and so forth for it, and then you get the goal as an oppterm and, well, you don't think these things are hard to find, man. I must have gone across eight banks without... and I said, "Someplace the goal becomes an oppterm! I know it!"

And I thought it might be at the top and it might be in the middle, but at someplace the goal became an oppterm. It was just in the cards that this would be true. And by George, it wasn't till I was about fifteen banks back that I finally found the goal as an oppterm. Wow! And there it sits, it's right in that position exactly.

Well, now, your goal declines through those same... fortunately, it repeats its pattern, and it declines totally, all the way down, and then goes into the "ivities." It declines – I mean it goes through "absolute" and "perfect" and so forth, then it goes down into the "ivities." And then the end of the goal suddenly takes over after you get – you've gotten down there, you've got the end of the goal like "to catch catfish." You've now got "catch catfish" you see, so you've got "catching catfish." And mysteriously the end of the goal doesn't decline. And I haven't been able to find any place it declines. It simply goes through its – the forms which you see there on the "have a game" plot.

That's mysterious! Why does it do this? But it doesn't decline anything I can find at this particular time. But I've got a lot of banks to run. I've got to clean up all these banks now that I've been through. And on my actual auditing time I figure out this will only take twenty-five hundred hours of auditing to do this because each item will have to be cleaned up now, and this brings me Clear – this brings you at least a one-goal Clear, you see, some time in the next few weeks, and it brings me Clear in 1973, you see. [laughter]

So, just be kind to me in the meanwhile, and don't make snide remarks about it because... The worst that happens on this sort of thing is body weight starts knocking you around. The front of your body takes a beating. And at times I thought the machinery of the body was going to cave in on some of this. None of that happens in the type of auditing which you're doing at this particular time.

It's the residue, the uncleared items and that sort of thing banging into the body which increases body weight. People will ask you about this and you occasionally – banging into a goal, unable to get its top oppterm, unwilling to spend the next two or three months of auditing just to get this character's top oppterm – you're perfectly at liberty to cut into it someplace when the goal is an oppterm and just force that blocked charge off and then force the lower blocked charge off and, you know, take the bottom of the goal off and then go back and find it because it'll now be in view. You see the strategy involved with it.

But if you do this, why, you will be aware of the fact that your pc's body mass will increase because you've got all that top bank and it settles down on the body. It wasn't part of the body's weight up to the time when it was restimulated and pulled in on the body, you see? But now it is, so that adds some body mass. And when you clean it up the body mass will go away, see.
This is one of the oldest findings in the field of havingness and in the field of living-ness. And this goes back, I think, to 1950 – well certainly, certainly 54. I remember it in 54 – on the subject of making mock-ups and pushing them into the body and increasing the body's weight and then taking and throwing them away and decreasing the body's weight – so that somebody or something was busy. And this was used as a proof of the existence of a thetan rather than the... and using the fact that the thetan did have something to do with the construction of mass and the creation of mass and that sort of thing – what was the source of energy and mass.

All of that was used, by the way, in confirmation of the early Axioms. And that was all axiomatic, theoretical work. Well, here we are facing the same principles again that if you don't clean up an RI before leaving it, you have residual mass and that residual mass tends to add itself to the body and the body tends to increase in weight. And when you have run this out, the body then decreases in weight. You can almost control the body's weight with RIs. It'd depend on how thoroughly you handle the situation.

Well, anyway, that isn't too much the point involved here. The point I am making is that the upper masses, or any GPM uncleared masses, tend to add themselves to the body's mass. Because they are... they pin down against the body more thoroughly than they have been. And, you see, here was a thetan and he's just been dragging these old tin cans and chains around, but if you don't thoroughly clean the thing up, why, the old tin cans and chains get added onto the body's mass and it will register on the bathroom scales. We're not talking about any esoteric mass; we're just talking about what weighs on a scale. It's as easy as that. And, you see, the stuff you're handling is finite mass just as much as that crayon is a mass, you see. It's nothing – "mental mass is different than physical mass." Well, it's – the only difference is it's thinner. It's less massy, and, that's about all. And somebody here the other day... Every once in a while on the backtrack they'd say – in Dianetics, Scientology – I'd mentioned something about mass and somebody'd say, "Well, I part company with Hubbard at that point, you know, on mass, seeing mass, and that sort of thing... Who can see mass?"

And a lot of people couldn't see mass. In fact, I think the bulk of people couldn't see mass. And we had somebody here in Z Unit the other day and all of a sudden a few RIs down a bank, and all of a sudden, "Hey! You know? There it is! You know?" That isn't all the mass that shows up. Sometimes very interesting things show up, like a complete spaceship or a steam engine complete with wheels and so forth. It's solid enough that you feel that you could reach over and kick it and it would clang.

That isn't a GPM. That's exterior to a GPM or has gotten mixed up in a GPM. GPM mass is normally a steel shell – looks like a steel shell – or is a sphere of some kind or another covered with a black or gray cloud. The mass on a half-discharged bank looks like gray cotton wool. A mass that's been black will turn into gray cotton wool sort of a look and it has finite, finite dimensions. It isn't something that's esoterically a million miles from here or something like that. It's seventy-five feet long and twenty-five feet wide and you could practically tape measure it. And it's actual mass.

And the funny thing is sometimes you get a wrong item. You'll throw a mass into restim for the pc and he all of a sudden is sitting there looking at a black mass that wasn't there a
moment ago. And it's one of the tests of whether it's a right item or not – is how much mass
did it turn on. I've used that a great deal in research. Something didn't turn on mass; some-
thing did turn on mass; something turned on no mass at all. Well, it was the one that turned on
a little bit of mass, the way the thing turned out.

It turned on a tiny bit of mass. And those that were very comfortable and turned on no
mass at all didn't turn out to be the item. They were outside the perimeter of the thing. And
this mass is... alternates. You've got a black bank and a gray bank and a black bank and a gray
bank as you look on down the track. Some of them black, some of them gray. You might say
they're positive-negative charges. And they're all stretched out. They look like black islands
of mass.

And a black bank, when discharged, turns gray and – that is, partially discharged it'll
turn gray – it's still got a couple of dozen items scattered through it that you haven't got,
something like that. It'll turn a dirty brown; that's one of the weirdest shades. It's sort of a bly-
yaaahh, 'urky, 'orrible mustard brown and it looks very floppy, and so forth. And you pull a
couple of more pins and that starts unraveling. And you pull a couple of more items... You
can see these things start to shake to pieces and diminish, and so forth, as they are run. And
it's very funny to stand off and look at a bank that you have just partially run, let's say it's two-
thirds of the items – or even less than that; half of the items – are out of the thing and watch
the bank start to shake and start going to pieces.

It's trying to go to pieces. And it goes zzzzzz. And it shakes and the corners shake
and it shivers and it sort of folds up and gets smaller and shivers some more and it can't quite
make it, you see, because it's still got an awful lot of items in it. But taking charge – it's al-
most geometric. I wouldn't say that it is geometric in its progression, but the first items off
take proportionately more charge off than the next items off and then these take proportion-
ately more charge off than the next items off. And if you're going down the bank toward the
bottom of the bank, when you get into the lower areas about the only dangerous thing you can
do is leave any of those lower RIs alive and walk off and leave the bank.

You can leave the upper ones alive and it won't kill the pc. See, that just squashes him
and puts him in the wine press and gets him published, one way or the other. It's uncomfort-
able. It's just physically uncomfortable to have these things left. But you get down to the bot-
tom of the bank and what holds the bank together are those bottom RIs. Goal, that one, has an
RI, you see. "The goal to _______ '' you know, that one has an RI; "Somebody or something
with the goal to _______ '' and a couple of those optterms.

You walk off and you leave those things, and man, you've had it because that bank
will stay stiff as a poker. You see, these are the fundamental keystones on which that bank is
built. And it's just there – it's just there, man! And if you were to leave those on and go over
the bank again, the bank would get stiffer. And by extrapolation – I haven't been able to take a
third time over a bank with the bottom items in, but apparently it would just go stiffer. In
other words, it gets to a point where it'll charge up if it is still held in place at the bottom.

It'll continue to discharge. If you take the top off, you can take lots of charge off the
bank, you see? The top items are not very vital. They're just uncomfortable; they're upsetting;
they're annoying. Pc keeps dragging them through the bank and they keep getting in his road.
And you get down in the lower third of the bank, without the decline of "perfect" and "absolute," you know, all that sort of stuff, and those things will start flying back up to the top of the bank. You've dragged them all the way to the bottom of the bank, you see. And you'll say one of those lower oppterms, you see – very low oppterms – and all of a sudden, why, one of these things will go bzzzzupp! And you'll say – you'll say to the auditor something silly. Let's say the top of the goal is "catfish" and you're trying to run off the decline of "catching catfish," you see. And, you'll say, "An absolute catfish – oh no, I mean – I mean – uh – uh – catching big catfish! No, I'm – uh – uh – catching – no, just catching catfish is what I'm trying to say!" In other words, those top items are pulled down. But if those bottom items are left in a bank, why, just nothing discharges. You get to a point of no return. You could run items and run items and run items and run items and run items and nothing, no charge is coming off the bank.

But the pc is getting more and more uncomfortable and the pressure is getting greater and greater and it's becoming very upsetting indeed. The keystone – the keystone – of the bank that keeps it in the channel is the lowest oppterm. That is the real keystone of the bank that keeps it in channel with the other goals. That is how that can be kept in. Because it is always a mixture between the goal you're running and the next earlier goal on the track. And it's a cross – that bottom oppterm is a cross between those two goals, you see?

Let's say "to know" – it wouldn't be – is the lower goal to "to catch catfish," see. All right, so that one in the bank, "to catch catfish," that GPM, that bottom oppterm is "knowing about catching catfish," you see. Or something like that. "Knowing about the nonexistence of catfish," or – it'll be something weird – but it'll be a cross between those two banks. But I say that's a keystone as far as the channel of goals is concerned. That's goal one, two, three, four. That's how they keep in sequence: that bottom-bottom oppterm.

But what keeps the bank stiff and what keeps the bank charged up is the goal. And there's a correction coming out on the plan of handling. I got a little more data on that – and picked up this other data about the stiffening of the bank. But you should run out – the only correction is that when you run down one of these banks, you shouldn't keep going earlier, you should go to present time. Well, all that's okay. But it's what should you do about these bottom oppterms? Well, you should run them. And what should you do about the lowest goal – that goal as an RI – what should you do about that?

Well, that's an enormous question. There's a terrific amount of theory could go on about what you should do about it. If you get the pc into the earlier goal, he, of course, is going to be so interested in it that nothing will do but he runs it. And the next thing you know you've got a pc six goals from the present time goal, you see, and he's now going earlier. And because you've got present time goals on top of it, they're going to follow him back just like the top of the bank is going to follow him back. And any time he peels off some RIs he's sitting there looking at a black wall. What's this black wall? Well, that's just the top goals following him down, see? You take any goal out of the sequence of goals, just at random, and try to chop it out, and as you run the top oppterms you run into the later goal on the track, you see, and as you hit the bottom you're going to run into the earlier goals on the track.
So what do you do about these bottom oppterms? Well, you've certainly had better run them. Well, how about that — how about that bottom oppterms? You can't get that unless you've got the next goal. Well, unfortunately, or fortunately, it's not necessary to get it. Just have the pc string a long bow at it and put anything that RRs and put it down, see, and adjust it when you come back down the track after having run to present time.

Well, what do you do about this goal as an RI? Actually, I made an actual test after the release of the bulletin which opened my eyes. I thought you could leave them on. Almost killed me. I thought you could leave it on. You can't do it, man! You got to list that. "On what goal would it oppose?" or "Who or what would it oppose?" and have the pc put some goals on as an answer to the question and get yourself a complete list. By George, don't leave that list incomplete! Go fifty beyond your last RR or R/S just as though you're going right down there and find that goal, see? You're going to find that earlier goal even knowing that the pc is liable to cognite on it. If he cognites on it, God help you, you see!

You can't let him run it. You mustn't let him run it because you've got to come back up to PT on these banks. Not go earlier, earlier, earlier, earlier, earlier because he starts running into stuff that the devil himself couldn't handle, you see? And he's got all these upper banks that are going to follow him down. So you can't let him go earlier. And if he gets that goal and suddenly realizes what the goal is, and that sort of thing, just talk him out of it. Say, "That's all very interesting! We're awfully glad to have this goal 'to be a game warden.' Awfully glad to have this goal! That's fine. That's fine. Thank you very much!" Make sure you complete the list even if he cognites on the goal because he'll ARC break, you see, if you don't complete a list. It's true of any list.

All right. Do that, RI – goal as an RI, oppose at the bottom and don't null the list. Just leave it as a complete list. Pc will be perfectly happy. And then go back up to the top of the first bank you run and find its goal with the opposite oppose and go on to PT. But what do you do with that? That's been one of the major problems. This doesn't look like much of a problem to you, but it looks like a big – it's looked like a big problem to me because there are many chances that you take in even approaching the earlier bank at all. And the main one is – the pc is so interested the top oppterms pop up. He even gives you the top oppterms, maybe. You look like you're running it, see, you're on your way and you say, "I have no other choice to run it," because you do have your hands on a goal. I'd say the temptation to run it is enormous and it just must not be done. It just must not be done.

You've got to take him around and go on top of the bank. And that list is always harder to do; it's more difficult to find the later goal than the earlier one. And you've now got two live goals firing. And for a long time I didn't know if you could have two goals firing. Well, I'll let you in on something: You can have fifteen goals firing all at the same time. So, don't worry about that! That worried me for quite a while but I found out that it was one of these points one didn't have to worry about.

Anyway, this situation – of what do you do with the bank, and so on – is all answered on the basis of what are you trying to do with a pc. Well, if you're trying to clear a pc, then you will audit the pc for the best auditing gains that you could obtain per unit of auditing
time. Not the most you can do mechanically per unit of auditing time but the best gain you can get per unit of auditing time.

Now, it is true that it is totally a mechanical proposition: The more items you get off a bank and the more banks you run, the less charge there is and the more the pc can cognize. That is true. That is true. There is nothing wrong with that at all. But when running a pc under special conditions that you yourself, as a Scientologist, recognize as special conditions – but nobody else would. You're running a thetan in a body and that just about ruins 90 percent of the things that you could do heroically. You got a body. It has a beating heart. It has lung machinery. It's constructed; it's a piece of electronic construction. And it gets in the road. And you're auditing a bank with a frail human body interposed between the bank and the pc. Now, that is what has given me trouble in research; nothing else has given me any trouble in research. Well, all these little minor points come up and stew about them for a little while and finally wrap them up and so forth. But the restraint point comes under the thing that the universe is most concerned with on these planets and that is care of the body – care of the body. What are you going to do, see?

Because the pc is put into danger to this extent: How are you going to continue to audit a dead body? And if you've got him halfway through a bank, he's sufficiently restimulated that he'd probably have difficulty picking up a new body. Do you see that? It's a neat point. Now, I don't intend any Scientologist be caught with this one, so if the body knocked off in the middle of running a bank, then how's this character going to function, see? He's all restimulated and so forth. Well, he'd undoubtedly be – go key out and be better off eventually, and so forth. But he feels terribly betrayed because the hope factor is way up, you see?

So therefore, auditing is monitored as to what gains you can achieve in spite of the fact that the pc has a body between himself and the bank. Now, this is not esoteric. This is simply very blunt – very, very blunt indeed. There is a body and there is the pc and there is the bank, you see. And what influences the pc tends to influence the body; and what the pc throws into restimulation throws restimulation around the body. And it's geographical. I mean, the pc's bank extends around you, the auditor, to the left and right and back and front as – probably as you're sitting in the auditing chair the pc's bank is up there, a mile or two – that is, the total bank – and back of him maybe half a mile, or something like this. It may be that big. It's hardly any bigger than that.

But the bank that you're running is right in the room that you're auditing in and his body's in that room, and so forth. Now, it isn't going to infect or influence your body. Don't worry about that. You could worry about that far more than is justified. But that bank, remember, is capable of influencing the body which is capable of influencing the E-Meter. How do you think the bank charge gets through to the E-Meter? Well, it gets through the pc's body – his hands – to the electrodes, to the wire, to the E-Meter, see? So you got a closed circuit going on there. Well, there are other closed circuits which exist in this, too, and the auditor is not much influenced with this bank. This bank is physically connected up to the thetan that you are auditing and it's not physically connected up to the auditor. Now, what you do run into, auditing in an uncleared situation is – in trying to figure out the pc's bank – you, you knucklehead, will occasionally remember what you had there or what it might be in your goal.
I've only seen this happen once in being audited as a pc. All of a sudden the auditor
ducked like somebody had hit her over the head with a sledgehammer, see. And a tremendous
somatic had practically taken off the side of her skull. And we were having a little difficulty
trying to work out this scale, you see. And she had said to herself – I finally got this off and
we continued on but she said to herself, "What – what – what would there be at this level in
my bank? Let's see. There would be a..." bang! You see?

Now, an auditor could very easily believe – an auditor could easily believe that he was
being influenced by the pc's bank or that it was doing something weird to his bank. But these
are on quite different wavelengths. And the collision factor there is so remote as to be totally
neglectable. But what does happen, he gets a restimulation because of his own think-think and
what he is doing and kicks his own bank into restimulation and he could make a mistake and
think that the pc's bank was knocking him around.

Well, the pc's bank could knock him around if he had an item "being knocked around
by the pc's bank." But this physicalness of the bank is saved by this – and this is just guess –
guesstimate stuff: theory. Not only can a radio have one... a certain wavelength, you see, but
matter can have a wavelength. Just stretch your imagination a little bit further. And there's
practically an infinite number of potential wavelengths. And the matter of the bank apparently
exists. You occasionally have met some human being that you have said "Soul mate!" see.
Every once in a blue moon you have suddenly run into somebody and have this feeling like –
very great closeness and you've met them before and you knew them, and so forth, and all that
sort of thing. Well, you've probably got a near-wavelength proposition. You find also this
person has the power of irritating you far beyond any other human being's power of irritating
you; or pleasing you far beyond the power of any other human being in pleasing you, you see.
What you've done is probably get one of these close – close tune-ins of harmonics. You have-
'n't even got the same wavelength, you see.

And then there's the possibility that you knew the bloke before. There are always –
that possibility exists. It isn't often that you meet the people that you know, and it... some –
some trickier Scientologist in the early days used to notice this – used to use this in order to
get the sympathy and interest of girls. This is one of their favorite tricks. I used to talk them
out of it if I possibly could. I said I disliked having to procure girlfriends for them as well as
clear them, and so I thought it was too much.

But the point – they would tell them, "Well, I've known you in a earlier life," don't you
see, and "Don't you remember... ?" something or other. And naturally people having lived
through all these periods get the period restimulated and all kinds of wild things can occur
from that point on. But that's crossrestimulation. It's just overtly restimulating somebody's
bank. It is true enough, however, that's the – that's the insane harmonic of the true fact, you
see. All things that are good have some harmonic way down below which is awful. And, this
"known you before" is one of these – one of these. Perfectly true! Perfectly true that around
you, you have run into some people you have known before. And that's – no doubt about this
 whatsoever. And any person that you feel very closely drawn to, concerned about, terribly
interested about, and that sort of thing, falls into either of these two: either you've got a close,
close wavelength harmonic going or you've known them before. And this is "you takes your
money and pays your chance." The thing is one or the other. But maybe you knew them before because of the close harmonic of the banks, you see, so that also works out.

People – you get some real idiocies. This becomes very unpopular very easily because some nut will ride it into the ground, you know. "I can't get off my overt because life after life all I've done is kill Ron," you see, and so forth and so on. Well, I just haven't been getting killed. It's a patent lie, you know? All kinds of wild oddball things can be dreamed up in this. And some true facts do exist, however, below the nonsense and you mustn't totally avoid them.

Now, you get people around who claim they are so affected by other people's energy and masses and so drawn down by it that they just can't stand to confront or audit somebody or speak to people in a group or something like that. Well, you eventually will run this down to the fact they're just dead scared, see. [laughter] They'll have some RI saying they mustn't speak to the group, you see, or people steal their energy or something like this, you know. The actual phenomenon is not at fault. It's the restimulative factor which is at fault.

Well, all of this stuff is very well worth knowing. You'll run into it one way or the other but it's questions you might be asking yourself about it.

Now, in handling a bank – this is a bank – you are associated with the problem of how you handle banks. Now, let's pull this down in its most finite, possible way. You've got the problem of the thetan plus body plus bank. See, that's your problem as it walks up to you, see? That's a thetan plus body plus bank. And that's the whole shooting match. That bank consists of free track that hasn't been drawn into the GPM. It consists of all of the goals, all of the GPMs, all of the locks, all of the secondaries, all of the engrams, the whole – the... all of the circuits; everything there, you see, plus the body, you see, which is in the road of all this. And then the thetan is also plus the physical universe and its present time problems. And how often as an auditor have you found it necessary to handle a pc's present time problem before you could audit the pc? Well, so that gets added on, too.

And you could go out by extrapolation and realize that you were, in auditing one pc – don't take this as anything but a joke – in auditing one pc, you recognize clearly that you are auditing the whole physical universe and everything in it, you see. That's the reductio ad absurdum. You feel like that sometimes. Some of these pcs [laughs] – how many PTPs they can get! Well, those are simply where the pc impinges. It is very seldom necessary for the auditor to handle the environment of the pc. But when you get into the field of the very neurotic, psychotic families that surround the pc – an insane pc, and so forth – you definitely are in a position where you have to handle the environment.

Well, we're not dealing in that particular sphere at this particular time and have no intentions to do so at this particular time. But some time later, after there've been some white flags raised over the center of the American Medical Association, Health, Education and Welfare building, and the Congress – which I think supports psychiatry, totally – I think when they get a few white flags raised up around there and allow free thought to exist again in the world, you may find yourself with some of these problems. They won't keep leaving it to the witch doctor, believe me, if somebody can do something about it, you see. As the years roll along they won't completely neglect this forever.
We're not in that business but it is a factor which should be part of your technology. You have to handle the environment in, that is, a severely insane person – you have to get that person so he can't knock himself to pieces so that he can be audited. This padded cell proposition, you see.

And now let's take the body. You know that if you try to audit a severely ill pc or try to do much more than give an assist to make him feel happier, you know that you're in trouble and – that is, in trouble with the body, and so forth – and therefore you shouldn't go around using Scientology to try to heal somebody. Well, let him get well if he can. Give him an assist, make him happier, bring him up to present time, do what you want to but don't bother to try to treat what is wrong with him. That is well outside your province. Similarly, in auditing him, don't knock him around to a point where the body comes in too much – for too much of a beating – it can stand quite a beating, I assure you – between the thetan and the bank. This again is a factor which you have to take into consideration. If you had this – this person walks up to you and he's just a thetan and a bank and somehow or another you can get him on an E-Meter, I assure you you could clear him much faster because you would handle him quite brutally. You would just chase him down the track, man! You'd pick up basic-basic and shake the bank out, you know, and then go back up to the beginning and knock out some of the goals and discharge everything that you could discharge and get your hands on and then come back up to present time, run it all the way back from present time to the earliest bank and you'd have an OT on your hands. In other words, you probably would proceed on some sort of an heroic basis like that.

It's in the cards if he can run the first bank out right now. Of course, you've taken the kingpin out of every other bank and therefore they run much easier, and so forth. Well, you can't do that with a body around because at the time he accumulated the first bank he didn't have a body. And his adventures were far more strenuous than a body can stand up to and the mental energy masses contained in those early banks do make – make no allowance whatsoever for a body.

This is why people get sick. They get restimulations of banks that the body can't handle and it knocks them around most ghastly. Now, you can make somebody quite ill by overtly chasing them down the track into early banks and badly handling them. And it's something that you must safeguard the pc from. Therefore, you find what you can get your hands on and get him up to PT and run the PT banks back. Before you've gone too far you probably will be auditing a thetan who is not interposing a body between himself and the banks. But if you run him back early, early, early, early, early you will have no choice but to continue to interpose this body between the thetan and the bank.

So the body is an unwanted chip in most respects but you need it as an auditor in order to get something to hold on to the electrodes. So regard it as a useful adjunct and put up with its liabilities; such as it gets hungry and it has to go to the bathroom and other things that get in the road of an auditor. Just thank the Lord that you at least have something to hook the electrodes on, and safeguard that to the degree of not interposing it into too savage a situation. Now, that doesn't require any adjudication on your part or any doingness on your part beyond this one thing: Stay with your standard procedures as they are developed because they contain these factors as an inherent part of auditing. These are taken care of to that degree and there's
no sense in your beating somebody up just to find out what would happen because it will happen!

The point I'm making here is that you run what you get your hands on that can be run and run it well with a minimum of stress on the body. And we just don't care how much stress occurs on the pc. Thetans are indestructible. So you just couldn't care less how much stress. Where that stress moves over into concern about the body, the fact that the lungs aren't breathing too well and the heart isn't beating too well and the skull feels like it's about to have a stroke, well, "ware shoal."

Now, what can you do that would produce those things? What can you do? There's very definite things that you could do that would produce those conditions. One is to fail to clear the bank you are working on but go dancing off to other banks because the fields were so green. Early or late, go dancing off to other banks, see. Fail to clear the bank you are working on.

The next one is refuse utterly to go earlier before you've gone later. In other words, run the banks closer to present time. Don't get persuaded into the backtrack banks.

Another thing is try, as far as possible, to run a bank from its extreme top to the bottom. Now, another point – that is completely aside from don't bypass items and that sort of thing – this is an adjunct to the last and modifies the last one – don't keep auditing the pc over and over and over and over finding nothing and not discharging the bank because that is very hard. So you see, between the last two I've given you there is the medium situation that you could take huge slabs out of this bank and still discharge the bank. In other words, your auditing must not continuously idle around on one unfound item with lose after lose after lose for the pc – hour after hour of hunt and punch, see. Knock it off. Knock it off. Find something that can be found in this bank.

Now, of course, we get down to the ordinary auditing precautions. Don't find a wrong item. Don't run a wrong goal – much more important than bypassing an item or something. Do a workmanlike job of auditing. And then, of course, we get this one – and this will sound odd to you – follow the pattern; your pc is not different. Your pc simply won't rocket read well at some portions of the GPM.

I had one last night on that last one that would amuse you greatly. I had a pc that said it was not "impartial!" – or no – it was not "incomparable," but "unconquerable." And that argument was so succinct! It was backed up by the fact that the only thing that was firing on the list was not "incomparable," but the thing that was firing on the list was "unconquerable." There was only one thing wrong with it. Every time "unconquerable" fired, three or four other items also fired on the same list. I just went by the rules of auditing and I got enough listing done and enough listing done and enough listing done, and by God, it turned out to be "incomparable."

Twenty minutes' worth of random listing and seven pages of actual listing later, it turned out to be "incomparable." So it's just charge which prevents the right item from firing. Your pc isn't different. Your pc is simply too charged up to fire. And you keep at it long enough and the pc will fire.
Now, although this is more or less a general talk on handling pcs and so forth, at the risk of overrunning this a little bit – I am going to – I'm going to show you a method of handling this which takes care of most everything I've been saying except handling the bank – banks. You know, run them forward, and so forth, which I've talked to you about. Now, just as the pc has many goals and many banks – a finite number fortunately, a very small number – so he has many RIs; many RIs in one GPM.

Now, instead of worrying about all the GPMs there are to run while you're auditing this pc, you should worry in this regard: how well you clear up the RIs you got your hands on. Just as if you half-ran half the banks, so if you half-run half the RIs in a bank, your pc sooner or later is going to feel queasy. The monitoring factor here is audit what you've got your hands on. You've got your hands on it. Well, audit it! Now, when I say audit it, I mean audit the pc in front of you. Don't run Routine 3 on a pc; audit the pc with Routine 3. And that goes for every auditing skill that we have.

For instance, I never see check a pc. Never been known to. I audit the pc with Sec Checking, see. I don't find goals on a pc; I audit the pc with goals finding. Now, if you keep that frame of reference, you'll win all the way. But if you simply run Routine 3 on the pc, you're going to run yourself right off a cliff someplace. This is "run the pc in front of you." I'm not talking about fixating your attention on it.

But what is the running of Routine 3 doing to your pc? And what are you doing about it? It actually doesn't mean that any more steps are added. It doesn't mean that anything new or peculiar particularly is done. But you've got a pc sitting in front of you. And that is a thetan plus a bank plus a body in a physical universe. Ghastly!

If the body wasn't there, you could probably do all sorts of things. But it is there! So how does this pc feel? I – shades of the 3rd or 4th London ACC – I said that you should be able to audit a pc straight through without a single somatic. That's a ne plus ultra perfection definition, you know. You audit so beautifully and so well and so smoothly that you pull him out of it all without him ever having sunk into it deeper than he's in. Of course, that is just a postulated theoretical ideal. But you know it's almost possible to do that with Routine 3? Sounds incredible.

If you do this – if you use everything you are doing at the moment you are doing it to clear the pc of what you've got your hands on, see, if you use that every moment to clear the pc of what you've got your hands on, you will then all of a sudden have a miraculous series of runs with the pc and you'll get something like this: The first RI takes two and an half hours. The next thirty RIs take a half an hour apiece. The next thirty RIs take twenty-five minutes apiece. The next thirty RIs take fifteen minutes apiece. The next bank takes you forty-five minutes to get your first RI. Takes you half an hour to get – each – to get the next half dozen. Takes you fifteen minutes each to get the next thirty. Takes you ten minutes each to get the next thirty. Takes you five minutes each to get the next thirty – using the same process every time.

Why? Because you are building on a gradient scale the thetan's confidence. And you're, of course, sending the case into the stars because you're clearing everything you lay
your hands on. There is nothing behind you to worry about. I am not now talking about an ideal. I'm talking about an attainable fact. This is attainable.

Now, there are mechanics involved with this attainability and there are ways to audit which attain this. The first rule you've got to follow is if you've spent a session or two trying to get somebody's top oppterm firing, whatcha going to do, make a career out of this top oppterm? So for some peculiar reason on this peculiar case, "Caught catfish" doesn't apply and you just can't get anything to fire. Well, look, you've got the whole goal "to catch catfish." You don't need that top oppterm. You've got the ending of the goal. You've got an item in there – "catching catfish." You've got the whole bottom of the goal as far as that's concerned. You've got "catfish catcher" over there as a terminal. You can cut in with that block and go on down.

By the way, no matter how hard you try to go up in a bank, you always go down. This will fool the auditor and fool the pc more often. They'll say they're going up in the bank and they'll just get a couple of items reversed, but they'll only be going – running down in the bank, which is quite interesting. You'll always... it's so funny, you sit there after a while and you look with your jaw dropped and you realize we're going down in this bank. And we've been trying to list up in it, see. Nope, you always go down.

Well, you've got all these points where you can cut in. Well, which one fires native and natural on the pc? Which one fires? Which one can you make fire? Well, you know they're there. You could unburden the case and go forward. This doesn't excuse you, however, from not getting the top oppterm the first time and following it through, you know. So what, you couldn't do it. Well, let's not take... make the next seventy-five hours of auditing the contest for finding something that can't be found. Assume there's some reason why it can't be found and find something that can be run because your first interest is to get charge off. You get charge off of that bank and the pc can confront it. You fail to get charge off of that bank and the pc can't confront it. And so, of course, you're just left there walking in the mud.

And if there's any doubt remains in your mind as to what the top oppterm is – you can't get the top oppterm and nothing seems to fire; you can't get any "absolute" form; you can't get any "perfect" form; you can't get these things – huhu-uuuh-liaaa-yaaa-ughhh! – don't make a career out of it man! Leave it to the politicians to make a career out of being inept! You're supposed to be effective.

Well, just stretch back and say, "Well, we're having a bit of trouble finding – finding this top oppterm. Can't seem to get anything to fire on this, and there's some discussion as to what it is and what it isn't, and all that sort of thing. We're going to cut in on the goal line and see if we can get that."

Well, of course, you had the goal firing so you can certainly get the goal as an oppterm firing and tear on down using the pattern of the bank from there, see? Tear that out!

But you get some slabs out of that bank! That's your first job. But when you've got your hands on it, clean it. Clean it up. Make sure it's right.

Now, a pc's bank doesn't go "absolute catfish," "catfish absolute," "perfect in-ness to catfishing," "eager catfish" "catfish eagering." It doesn't go like that. If... it'll go "catfish abso-
lute" or "absolute catfish" or "absolutely catfish" or "catfish absolutely" or "an absolute catfish." It'll establish a pattern and that pattern will contain certain things. And after you've got that pattern, man, there isn't anything varies. The next one isn't swap-ended, see. It isn't "eager catfish" in one place and in another place "degraded catfish," you understand? It doesn't say "eagerly catfish" and then "perfectedness catfish," see?

You got a constant. When you establish that pattern – which is your heaviest job – once that pattern is established that pattern holds. So you better make sure that the pattern is right and cleared when you get it, see? Now, it really doesn't go in the upper part of the bank – it varies somewhat in the lower part of the bank – but it doesn't go "not perfect catfish," "no catfish perfect," "catfish no eager," "eager catfish not" and "can't eager catfish," see, and "not degraded ain't" – nothing else present. Doesn't go like that! See, it just doesn't go like that. It'll go "no perfect catfish," see, and "no eager catfish," whatever it is.

If it's "eagerly catfish" it'll be "no eagerly catfish." Once that pattern is established that pattern continues. It doesn't bounce all over the place.

Now, you've got countless locks which fire. When you first enter a bank – let's got a bank "to have catfish catch tigers"; "tigers," "catfish," anything will fire and rocket read. You work on it long enough, any part of that goal wording will fire. Anything! Any combination of it. "Catfish catch tiger-ishness" will fire, see. "No – no havingness of catfish catch tigerishness"; that will fire. Anything fires! Why? Because you're looking at the whole mass. And it is so cross-charged, well, the pc's name will fire in it. Anything fires! Any kind of a combination will fire. You can find any top oppterm known to man or beast. You can take any part of the goal or any tense of any part of the goal and put it in as a top oppterm and it'll fire.

That's a horrible liability isn't it? Terrible! So that makes the top oppterm the hardest part to find. If you can't find it, for God's sakes take some charge off the bank so it can be found. Because after you've got the charge off then all of these weird combinations don't fire. Now it's getting simmered down. Just as the bank itself is a shell – just as an item, an RI, is a shell with a lot of RRing items and RSing items around it – as I've just given you in a bullet-in – just as you've got a cross section of that, so the whole bank operates that way and the most ridiculous things will fire. The more bank, the more things will fire. The more things will be restimulated, too, in life. The more bank he's got the more nervy he is.

It's just a matter of charge. If you can bisect charge out of there, if you can get – that's why you mustn't stand around with your hands in your pockets, you see, trying to find something, find something, find something, find something, find something, trying to find something and not find anything. You better go someplace where he can find something.

Now, you better clear everything you get your paws on. Everything you can get your paws on, clear it. Now, what's that mean? Well, that means if you get your hands on an RI, you clear it. Most of the pcs around will not fire first off on the pattern. Pattern does not begin by rocket reading. And therefore, auditors will be invited to believe that it's a different pattern.

---

12 Editor's note: HCOB 29 April 1963, "Routine 3, Directive Listing, Listing Liabilities"
– this pc has a different pattern. I don't pretend that pattern is perfect. That pattern's awful close in, though, man!

Now, your problem with all this other thing is first and foremost, very well may be, simply how to get the pc to rocket read at all on these items. That's the problem you may find yourself wrestling with. So therefore, you need technology that develops a rocket read. And let me recommend to you something on this order. This is – I'm just about to put out Routine 3N which includes simply things which you have, which is directive listing and random listing. These things are included in it.

Your pattern isn't very esoteric. But let's take something like this. Now, we know this character's item is going to be "absolute," but that "absolute" can also be "total" or "all." It all depends on what it is. The other words don't seem to vary – but perhaps that one can vary. I don't say that it can either. But, let's just take – let's just have "absolutely caught catfish." "Absolutely caught catfish." Let's just take these items, see, and tell the pc to give us the items. And we tell the pc to give us the items so we can put them on the list – we don't just put them on the list. And that's to blow charge, see. So we tell the pc "absolutely caught catfish," "catfish – caught catfish absolutely," "absolute caught catfish," whatever this thing is. We're going to get various combinations of this. This will maybe amount – this first one's going to be longer because we're establishing pattern and we're going to get all kinds of possibilities – endings and combinations – we can and so therefore it may amount to quite a few items. Be quite a few items on this. And after we got all these things down, we've carefully noted that one or two of them fell when the pc said them.

We didn't expect any rocket reads. Just don't expect any rocket reads at this stage of this operation, I mean, when you're doing this. Be gratified if something rocket reads, but don't expect any. You're looking for falls and you find out that "absolutely caught catfish" falls. Isn't that nice! In fact, we put it on a couple of times and it fell. Ha-ha! We know what our item is!

Now, we simply say to the pc, "All right, we've probably got the item on this list. Now, there are a great many secondary items, however, that you probably are very greatly interested in so I just want you to do some random listing on this and tell me the answers as fast as you can think of them – to this auditing question: Who or what would 'no caught catfish' oppose?" And the pc says so-and-so and so-and-so and so-and-so. You don't write down a thing. You just sit there with your meter in front of you and the pc going on and you giving him an occasional half-acknowledgment "Mm-mm, okay, fine."

He's listing, see. But you're not writing it down so he can list at a rather tremendous rate. And if he stops listing, you damn well get him started again by getting in Suppressed and Invalidate. See? That's always the way to get a person listing, is put in Suppress and Invalidate. And don't put them in prepcheckwise, see, just put them in on the meter – Suppress and Invalidate.

And he'll start listing again probably before you can get them in. And let him go on talking. And you let him talk until we no longer are seeing rocket reads and rock slams and DRs on this meter.
How long does it take? I don't know. How long is a piece of string? How charged is a pc? And you will eventually get a very smooth needle – one of the cleanest needles you ever laid your eyes on – beautiful, smooth, flowing needle. And you say, "All right, thank you very much," and you stop him listing at this point, and now you list "no caught catfish" question. You say this to him, "no caught catfish" to see if it reacts. And if it doesn't rough up the needle appreciably – that's appreciably, see, you don't have the perfection of cleaness, because remember there's still a pin on this, there's still the bottom of the bank – and you got no, you got no instant reaction on it and it seemed cl... it didn't rough up the needle. Asked the question, this doesn't rough up things very much. It maybe gives a tiny speeded rise or something like this. Don't bother with that. You say, "All right, now we're going to read to you your item," and we read a couple of these things that fell. We don't even ask him again, see. We read him a couple of these things that fell to see if a couple of them are rocket reading.

And when you call that "absolutely caught catfish" which you already saw fall, you're going to see the most beautiful rocket read you're ever going to see. And the pc says that's it and he cognites on it and everything is fine. Didn't rocket read before. Why not? Obscured by charge. Got that? You just follow that pattern. Item after item, terminal or oppterm, and you've got it made, man! I just was running this one over the jumps. And not using it for harassing the pc to get it on the list.

Two and a half hours it took to find an item. This other one took a half an hour. Apparently lengthy, isn't it? But that time will shorten. And what have you done in essence? You have discharged or cleared the RI you were working with. I'll give you another discussion of this as to the exact theory of all this and why this happens this way. But remember there's a charge where it faces one oppterm and a charge where it faces the other oppterm and there's another charge that connects it to the bottom of the bank and this item is surrounded by RIs – by potential RIs that you could get wrong – that rocket read like crazy. But they're just rocket reading items, they're rock slamming items and they're dirty reading items and you've got them on there by the ton! And before we started doing this it was customary in the top of the bank to have the tone arm ride high. If you do this one and clear every one of those RIs just this way, you will watch this confounded needle go on down here to clear read – even for a girl – and come back up and pump down and go back up and pump down. You can actually run – you don't have to run the tone arm action out of it – but you suddenly find yourself auditing the pc at clear read.

He puts a new item on the list, you go to a new section and he'll go up. But then by the time you've discharged it, he's at Clear read. When you gave him the item, you don't get much blowdown because it's blown down. You'll find something else. You'll find something else that's terribly intriguing – is – this is why you must do it – the item you are listing from will always RR again. And that is because the first time you gave it to the pc the charge suppressed it and only by listing it do you get the charge back on it in a clean pure state so that it can blow. In other words, it implodes before it explodes.

Quite fascinating. In other words, you're listing from "no caught catfish" and he... you put "absolutely caught catfish" on your line plot. You put this on your line plot and it falls. And you could read your meter at this moment and you wouldn't find "no caught catfish" firing. But you list it for five minutes and then read "no caught catfish" and it gives you a rocket...
read! Oh-ho-ho! But you've got the item on the list already. Oh, I think this is fascinating! In other words, there was that much blasting charge left on the thing; but there is a method to clean it.

I've often told you you might have to do something with the RIs but I didn't know what it would be. Well, what you do with them is list them. List them random. You don't write it down. Gives the PC the weirdest feeling when he's already trained into having his every word recorded, you know, to have the auditor just sitting there staring at the thing, you know. "Thank you, all right. Okay. All right. Well, that's enough now." Don't even write it down again.

But supposing you couldn't get anything to rocket read at the end of this thing. Then you'd have to work with the PC to get something on the list. But it will now rocket read. Previously, if you hadn't taken this step just the way I'd given it to you, you could get a half a dozen perfectly satisfactory RIs in the place of this one and therefore have a half a dozen chances to get wrong ones. And then your errors mount and you find it harder and harder and you think this is wasting time. No, his lists are going to get shorter and shorter. I've already seen this. In the first bank the lists were three pages; in the second bank they're two pages; in the next bank they're one page, don't you see? But list those RRs and R/Ses off of that RI just by making him answer the question and you're going to see some of the cleanest needles and some of the happiest PCs you've ever seen. And that tone arm will come right on down.

Now, if the tone arm doesn't come down, you goofed. You said, "Well, this PC is different. It wasn't 'absolute'." Or it'd -- "absolute" can vary because that's just blaa! That's just sabilaa! "It wasn't-it wasn't 'eager,' it was 'excited'." Oh, "excited" would fire! Oh, I guarantee "excited" would fire! So you put down "excited." Now, when you don't put it down at the top of the list you're going to get a very long list. The right item must be on the list first before you give any random listing. And that's why you put it down at the top of the list. You've already got the right item on the list so therefore the list will be relatively short and blow easily. Now, if you didn't put the right item on at the top of the list the PC would list for a couple of hours without putting the item on. See? You already triggered it. You already triggered it and made it collapse in on itself and then you've listed the debris off, see. You've done an heroic job. So this makes it up to you, the auditor, to know what item goes on the list -- ha-ha -- before the PC puts it on. You can consult the PC, you can get his opinion, but he will inevitably tell you, particularly early on in processing and so forth, "No, it is not 'perfect,' it is 'exquisite'." And "exquisite" will rocket read, unfortunately. "Perfect" won't, but "exquisite" will.

And after you've got the random listing, what do you find, you find yourself looking -- "exquisite" doesn't even read. He'll even tell you now, "well, it isn't" exquisite,' it's 'perfect' of course." In other words, he comes around that way. Then people can say, "Yes! PCs are forced to list according to this pattern! They're forced to list according to this pattern! And the pattern actually isn't what is in the bank at all!" See, they can have all sorts of arguments.

But here's the proof. You now can't get anything else to rocket read on that question. You can't get any more rocket reading items on it. But if you had taken "exquisite," if you had
gone back to it, you would have found out you'd get another half a dozen rocket reading items in that same area. Isn't that interesting? In other words what lists it flat is the pattern.

Now, when we transfer this into French, German, Swedish, Scandinavian, Chinese and other tongues, we're probably going to be in trouble. And even when we try to run it on a twelve-year-old child that has never heard of such a word as "incomparable," we're going to be in trouble, aren't we? Well, people have already been in trouble as auditors trying to run the mid ruds on an eighteen-year-old girl that just couldn't seem to get it through her head what "suppress" meant. So the auditor sat down and taught her the language. So we need a glossary which defines by dictionary, and with an idiot's definition, of every single word that is used in the bank. And I'm going to get one together or get somebody to get one together.

Now, we say, there's the definitions and these suffixes. What does "-ivity" really mean? Well, this is educating the pc, but unfortunately he won't go Clear unless you do! So some pc says – you have to give him an – give him a test, a literacy test, you see – and you say, "What does incomparable mean?" And he says, "Incomp... in-in – what? You mean uncononchible?"

I thought for a while, here, just a short time ago, that the – only literate people were ever going to get Clear. They were probably more educated when they laid these things in than they are now, but, then I suddenly realized, well, they can learn those words, they learn new words all the time. They can learn those, too. It's a finite number of words. All we got to do is write up a glossary that's well defined with a good idiot's definition following the dictionary definition. You know, a very clear dictionary definition and then an idiot's definition that gives it all in patty-cake. Eventually they would come up to being very fond of these words.

So there is your method of handling whereby you keep the body from getting knocked off while you're auditing the thetan, and this has the single practical aspect, of course, of continuing to have a pair of hands to wrap around your E-Meter electrodes. I wish to, however, call this to your attention because my earlier researches on a "thetan meter" – which was a small antenna, read by the magic eye type of response on a thetan – didn't pan out. Worked on it in 1952, 53. And the difficulty with this universe is that the fields of television stations, radio stations, and all that sort of thing, and the fields of a live body in the vicinity of that antenna can raise the devil with it. But it isn't so much the TV fields as it is the live body. And Lord knows where the thetan would have to be – no you, as an auditor, would have to be in order to audit the thetan. Now, he could be in the vicinity of the antenna but you would have to be – what do you know – over twenty-five feet away. You'd have to audit twenty-five feet from your meter. And then of course every wire that is run in toward the antenna sets up its own field. So I'm just recommending to you, to keep the pc alive and so that you can have a pair of hands to put on the E-Meter electrodes – and this is... I can't recommend this to you too strongly because it's embarrassing.

Now, we thought we would run into a problem whereby: how do you audit somebody OT? Well, that's very easy because all he's got to do is keep in touch with the body and you'll continue to get your rocket reads. But how do you audit a thetan that doesn't have a body to put on the meter? And we haven't got that solved and I'm pointing that out to you and strongly
recommending, therefore, that you clear the banks – that you contact and clear every item in the bank before going on to the next item and therefore you'll continue to have live hands on the electrodes.

  Okay? All right.

  Thank you very much.
Thank you.

Well, here we are at the what?

*Audience voices: Second of May.*

We've arrived at the 2nd of May. Gee-whiz. We got through another May Day, 1963, AD 13. We celebrated, last Wednesday, the 2nd anniversary of the Saint Hill Special Briefing Course, and the course is into its 3rd year as of now. And we turn out better auditors all the time. Turn out better auditors all the time. Even you! And our successes are – of the past aren't even comparable to the successes that we're going to have up the line here.

Now, today I'm going to talk to you severely – ordinarily I jolly you along, you know, and everybody looks...

Well, I hate to be this severe, but you are on the edges of the great adventure. And this separates the sheep from the goats, man. And separates the children from the characters who can do it. And you are adventured upon a period of auditing which requires far more precision, auditor presence and TRs than any auditing we have ever had.

There's certain ways to do this right, and there's certain ways to do it wrong. The number of ways to do it wrong far exceed the ways to do it right. Any time you have somebody in training, he can always invent some new ways to do it wrong, but it's very, very funny that he never invents – almost never – some way to do it right. Because the odds are very bad. The truth of the matter is that the auditing which you are embarked upon is in actual fact simpler than you would believe and simpler than you will believe for some time. And the main thing you are doing with it is far too much complication. That's all. Just the complexities you're adding into it are defeating you. And you're taking too much time to accomplish what you're accomplishing.

And the only difficult thing that you must learn – and I can assure you this is not easily learned – is with total, excellent ARC, totally control the pc in session. Now, that is asking a lot. Because the pc is walking – you know, these, the Hunha Kapunah Unah Unahs had – that's a tribe that were bred by the Hunahs after they were defeated by the Punahs – and they used to walk across live coals and other tricks like this. But man, this pc, he isn't just walking across a live bed of coals, see, he's walking across eternity. And he feels it.

And the least – the least rancor, upset, unsmoothness on the part of the auditor records itself very heavily on the pc during Routine 3. And you say, "Well, we'll be a good fellow and we will just audit permissively and go along with what the pc says." See, that's one answer to not making the pc upset. You've got several answers, you know. And one of them is just to sit there, you know, and be agreeable. And that is the worst answer.
Because the pc will dig himself into and get more ideas about digging himself into and get himself dug into more trouble if you follow his advice exclusively, than you can easily repair. I assure you of this. If he tells you that you ought to re-list some item and if he – if you do that, that's all right, you – very often you have to take his – the statement of what item it is that's bothering him, you see. But do you this and he gets dissatisfied and he says it's some other item and then he says it's some other item, and then you follow through and you do this, you see, and then you say some other item and so forth and all of a sudden you notice the pc is in a state of total collapse.

Well what put him there? The pc? No, it's just the failure of the auditor to exercise session control. No good blaming the pc and saying, "Well he dug himself in." I don't know, this... you sit comfortably under the palm tree on the bank of the stream, you see, and he swims through this river full of alligators, and you didn't tell him to go upstream or downstream, and he goes upstream and gets "et" and you say, "Well, he did it."

No, you're there to tell him how to get across the river, see. If the pc digs himself in, it's the auditor's fault. And it's nobody else's fault. There's nobody else to blame in the session. If the auditor fails to take the pc's advice, and gets into trouble thereby, it is the auditor's fault. If the auditor does take the pc's advice and gets into trouble, it is the auditor's fault. If the pc gives good advice, it's the auditor's credit, but it's his fault. Understand? And when you look at a session, don't look at it as a dual activity of mutually shared responsibility, in the great togetherness of all us wogs, you see? I mean, that's wogishness, see.

If you want to know what is responsibility on this planet, it is enough people in the same place. And that makes a responsibility. I mean, it's as weak as that. You see, they elect a lousy president in the United States and they say, well therefore the whole population took responsibility for electing the president so therefore it's nobody's fault. I think it's somebody's fault, see. But you wouldn't get any conviction in this particular line, you see.

So if you have five people together, immediately there can be no responsibility, you see, except the group responsibility of all five. Well, you have to get out of that way of thinking. It isn't an auditing group of two with mutually shared responsibility. It isn't, man! There happen to be two bodies there, but there's only one responsible factor, and that's the auditor.

And the pc isn't responsible for a living thing. Not one thing. You go around and say, "Well, he's a bad pc, or he's a nattery pc, or he's a this pc or he's a that pc." It's very strange that if you straighten out the points on the case that ought to be straightened out, he ceases to be a nattery pc. I think it's quite remarkable.

All right, now if he's a nattery pc or a good pc, maybe give him the credit for being a good pc, don't you see? You can go that far, but actually you can't give him the credit for being a nattery pc. Because as far as the session is concerned, why, the pc runs as the auditor says. The auditor never has the out of "the pc... something or other." The only time the auditor has an out is when a pc does something out of session that he ought to be brained for. I had a pc come to session once, I had the pc running beautifully, the pc came into session all caved in. Been all right during the last session, but was all caved in when he arrived at this session.

Well, the pc had taken it – had taken this interesting action. Had decided that something was it and had listed it. So happened that it was listed backwards, and no advises on
this, you see, pc had no advises. And had listed about 10 or 12 pages backwards on an item, you see, and thought, "Just a little more listing now and it'll be all right." But of course you start listing one backwards, a little more listing makes it that much wronger. And I didn't half-clobber that pc, see? "You chuckleheaded idiot," you know? I mean, this was the general course of my existence. The pc didn't do it again.

But what was I doing? I was exerting, then, auditor control out of session for auditing being done out of session. And the only way I could do it is, "If you do this just one more time," you know, blank, blank, blank, blank, blank, blank, see. The only way I could do, you see, was to impress the pc that this must not be done. Did. We never had any more trouble of that particular kind.

But it wasn't the auditor's fault if a pc gets themselves wrapped around a telegraph pole between session by some self-auditing action, except to this degree: In this case the auditor had not been expressive enough to meet that eventuality and had not smelled the fact that the pc was going to do it.

Now, you say, that's pretty – that's pretty far. Well, actually it is pretty far afield. That is stretching it just a little bit. Auditor responsibility is just being stretched a little bit. But the next time it didn't happen because auditor responsibility at that point asserted itself, and so this pc is doing things out of session, that are interfering with the session, therefore we must lower the boom and – took responsibility and lowered the boom.

Now this lowering of the boom can actually also consist of, "If you have just one more fight with your wife, if you talk to your wife just once more about your goal I'm going to give you the wrong top opperm and list you on it for hours, you understand?" [laughter] "So come off of this because I won't stand for it." That's asserted auditor responsibility, don't you see. You're perfectly within your rights to assert your responsibility that way.

You aren't responsible for the pc having walked back into the third or fourth session you gave him all spun in because they went home and told the wife, "My goal is..." and the wife said so-and-so and so forth, you can't be held responsible for suddenly realizing that he was liable to go home and tell his wife his goal and his wife was liable to invalidate his goal and et cetera. That's asking just a little bit too much. You see? But it is within your zone of responsibility that you find out he's doing such things, to lower the boom, see? Give him a heart-to-heart talk.

You don't give him these heart-to-heart talks in session, by the way; you end the session. And when you've given him the heart-to-heart talk you start the session again. But the point I... then they can never accuse you of having broken the Auditor's Code.

But this will go quite a distance. This will go quite a distance. You find out that somebody is doing something outside of session that is upsetting your auditing. Well, it isn't up to somebody else to tell him, it's up to you. Now, you can tell them persuasively or any other way, don't you see, but you've got to make it stick. That's taking responsibility for the pc in extremis. Anymore... "every Monday you come in here, every Monday you come in here walking on both sides of the room. What's going on? What do you do weekends? All right, I'll pull a few of those withholds. We're not in session. See? This is not a session. I'm pulling a few of these withholds, and just so-and-so... All right. Okay, so that's what you do, and that's
why. All right, now listen: I'll let you in on something. You're not going to do it again, you hear me?" And make it stick. Because they're getting in your hair as an auditor. Now, you have a perfect right to do that sort of thing. But how do you do it so that the pc doesn't hate your guts forevemore? This is where diplomacy comes in. So many people have died from it – that's... [laughter, laughs] All casualties of the last two world wars.

Now, these points of out-of-sessionness and so forth, well, take them up with almost any rancor that you want to. But the truth of the matter is, you start controlling a pc misemotionally, while he is running Routine 3, and this is a horse of another hue. You can just start looking mean during a session and you'll practically spin him. He can't cope with the bank. And it comes back to the old *Original Thesis*, those rules and laws in *The Original Thesis*: auditor plus pc greater than pc's bank, you see. But auditor plus pc's bank versus pc, you see, auditor plus pc's bank is greater than the pc, and you cave him in.

So it's an interesting point. How do you control a pc without enturbulating the pc or pushing the pc underneath the bounding billows? How do you do this? Well, it's a very smooth level of control. It's extremely smooth control that is required. And there is a type of control that works in it, which doesn't Q and A. And yet which doesn't leave the pc sitting out on a limb either. You follow the formula of acknowledging completely everything the pc says. You understand it and you acknowledge it.

Then you say, to the effect that, although what he is saying undoubtedly contains great validity, it happens at the moment that it is necessary to take this other course. But that if anything needs to be done which he said, you will take care of it afterwards. Or at some later time. You got the idea?

Now, actually, that isn't just a casual series of phrases I have strung together, it has a very hard-bound formula back of it. Pc says – doesn't matter what the pc says. Pc says, "There is a goal – there's a whole bank between the bank we are running and the last bank we ran."

And you say, "All right, you can see it, huh?"

"Yeah, oh, yeah, yessir, yessir. A whole bank in there, and we've just missed it clean, cold and it's it. And we're now running the next bank below that, and we shouldn't be there."

Now, if you adjudicate this on the basis of, "Should you do what the pc says, or shouldn't you do what the pc says" or, "The reason why you mustn't do things is because the pc said to do them," you'll make as many mistakes you see, as in following the pc's advice. What you must do is treat anything the pc gives you as data. And that is all it is. It is never an order, it is never an invitation, it's never a this or never a that. It's just data. And it's quite valuable data. Make a mention of it on the auditor's report: "The pc says there's a bank between these two banks."

Now the only reason a pc is going to become upset with you is not if you don't immediately find that intermediate goal and run it instead of the bank you're running, but if *the pc thinks you have missed the information*. Now you can underscore that. If the pc thinks you have missed the information, you now get into a very heavily ARC broke situation. Pc says, "But I told you there is a bank, a whole bank sitting there!" And he starts asserting the existence of the bank and he'll start keying it in.
Well, the wrong way to handle it is to just say, "All right, yes, all right, I know – I know – I know, well, go on and answer the question which we are doing right now." "Yes," he says, "but there's a bank, I've just seen it. It's – you know, it's between here and so on and on and the whole thing is caving in on me and it's terrible."

And you say, "Yes, well, thank you, thank you, good, all right. Now, just go on and answer the question which I am asking, you know..."

And the pc now, he says, "But I doo-rrraa-paa-rrreh..." Bow! See?

"Well," you say, "well, why is he so upset?" Well, he's so upset because you have evidently missed the information. He's not sure you've got this information. So your – just your ordinary toss-off, "Yes, okay, fine, thank you..." That isn't going to work. Because it'll create what is in essence a missed withhold. And the pc explodes accordingly and he explodes bank-sized missed withhold, see? Now, the way to handle that is to look at what I told you in the first place, you see.

"Oh. Oh. All right, I – all right. I got that. A whole bank. Okay. All right. Let me make a note of that." Put it on the auditor's report because it might be very interesting, and you might not go on auditing him for a long period of time. Draw a square around it, you know, so that it stands out plain. Say, "All right, I got that information. Any more about that?"

"Yes, so-and-so and so-and-so. I could even tell you its goal."

"That's very interesting. All right. Says the goal is 'to catch catfish.' All right. Good. All right. Good."

Now, this is possibly an approach, but I myself would not use it, so I'm giving it to you as where you could again perhaps fail. You say, "Well, is it all right with you if we keep on running the command which we are running now?" And I've heard so many of you use that that I'm injecting it as an – "Is it all right if we do that..." I never ask the pc if it's all right. He sat down on the other side of the auditing table from me, I just assume that at that moment he has said that it's all right if I do anything I do from there on in that session, see. I just assume if he'll sit down there to be audited – the only pcs I have any trouble with is that won't be audited and won't sit down. You see? I assume if he's sitting there, it's all right.

So I never ask him, "Is it all right if we go on doing what we are doing and do something with that later," see, I don't go into that gambit at all. I say, "All right, I'll tell you what. It so happens we've got our hands on a..." tell him the truth, see. "It so happens we've got our paws on this goal and we're this far into this bank. If we leave this at this particular time..." it'd have to be the truth or I wouldn't tell him this – "...if we leave it at this particular time, why, we're so many in, I don't think the other goal would fire. So I'll tell you what, this is probably going to be very uncomfortable, we know the other bank is there and so forth, and when we finish running this one, we'll get that one. All right?"

Pc will say, "That's fine." He'll go on with the chest mass falling all over him and having an awful time, but he'll go ahead and run that bank for you. You understand? It's on a basis of truth. And you treat anything the pc says as valid data. That is the secret of it all. Anything the pc says as valid data. Because he's the one who is observing it.
The pc is right far – about the data – the pc is right about the data far more often than you suspect. Right about the data. And about what to do with it, is a hundred and – not just a hundred, but a hundred and ten percent wrong. See, so you learn to differentiate. You learn to differentiate between an order to do something and just data. And you always be very happy to get the pc's data, and you pat him on the back about his orders. The diplomacy all comes in under the heading of orders, not about data.

If you handle the data this way, you never have to have any diplomacy, and actually, you won't get into orders. He only gets into orders when he's sure that you're not going to do anything about it.

Now, you better know this trick well. Because you're about to embark upon something – and I've prefaced this lecture on Routine 3 with this diplomatic approach to auditing, learning the lesson of controlling with a steel paw in a velvet glove. Learn that lesson well, because the only real troubles you're going to get into is feeling so insecure about what you're doing that the pc says to do something and you do it. And he's not a hundred percent wrong, but a hundred and ten.

Remember his data is always right, see? He tells you that there's an item "glumpelsks," and it's in a foreign tongue, and it lies immediately on the southwest corner of the item you're running. That's data. Good, fine. Now, it's just a question now of do you need this datum or don't you need this datum. That's the only thing. And what you do with the datum is your business, but just make sure you get the datum.

Now, if you – if you let a – this can go too far. If you let a pc start describing all the still pictures that are turning up, you will also wish you hadn't, because one of the ways of getting the pc in an engram is having described the largest object. It was the rule of the last largest object. "What was the last large object you saw in that engram?" He'll tell you and he's right back in the engram again, don't you see?

Well, you don't want him in an engram, so he's giving you data that it's there, I'd be more likely to turn it off something like this: "Well, now, we'll go on running this – and you tell me if it changes. Be sure and tell me if you... if it changes any." And he promptly forgets about it. I don't go on and ask him for details in those stuck pictures, don't you see. He's liable to give me all sorts of data about the lineup of the bank and how many items we've missed and how we should go and... but here's where it goes: "I'm very happy to hear that we've missed a pattern of four items that are lying someplace." There they are, he sees them, they're black. Everything else is gray. And he sees this patch of black.

And he says, "There's three or four items there."

I'm very happy to learn about that. I'm liable to make a little notation on the line plot. "Pc says there's four items here," see. "Four untouched items here." I'm liable to make that. And where I get in trouble – where I'd get in trouble, and where you would drown, is just right here: go back and get them. Take his order. "We had better get these now, because this is what's causing the ARC break that I've been having."

Oh, cut your throat, man! It's a much easier existence in the next few hours just mopping up a little blood. You differentiate the difference here? Pc says, "We've missed four
items." They're right there, he can see them. Fine. Cheers. And his next following remark is, "We had better get them because that's why I am so ARC broke." Cut your throat, man. If you take that order, you've had it. Not because of the mechanics that it throws him in control of the session and on self-audit, but it's just because it's not the thing to do! You see? It... you mustn't do that.

Now, if you – now, here's – listen to this: If you fail to take proper note of the data and understand it, it will almost always be followed by an order to do something about it because your failure to acknowledge the pc has thrown the pc on self-audit. And that is possibly what you haven't seen in the mechanics of this. You understand that? Your failure to take that data down or into account, or pay attention to it or acknowledge it, makes him feel that you're not in control of it. So he takes the session control out of your hands and orders you to do something about those items. See, so when you've failed on receiving the pc's data and paying attention to what the pc is telling you – you will then get your barrage of orders. And any time a pc starts giving you orders, you must realize that you have failed to take into account some data. And one of the ways to shut off the order flow, since the orders are, oh man...

Let's take somebody in the middle of a tar pit, with the tar all over him, don't you see, and have him direct the redecoration of the Louvre, see? It'll be just that silly. He isn't even there. He can see, but what he sees, we're not too sure of that. But we can take that because there's nobody else looking, don't you see. We're not any skull-looking there. Let's take the other thing of, however, he's in a state to audit? Oh, no. Uh-uh. He sure isn't. And the way to cure him of giving you orders is to find out what data you didn't receive. And you're liable to get a wildly vit... he's been very mildly ordering you to do things – you're liable to get a wildly vituperative number of things which he has been unable to communicate to you. See? You've got your missed withholds, straighten it out. You'll find out there's some vital data connected with it.

This is – this is one way of taking a pc's grab-control of the session back off of the pc. See? That's one way of returning session control to the auditor. This is find out what he hasn't found out about. Of course, you do this mechanically by just mechanically pulling missed withholds off the pc, but you should appreciate that you also have, "Well, just what have you tried to communicate to me you see, that I didn't understand?" or "What data here haven't I paid attention to?"

And he usually starts in at... it's very interesting to see a normally mild pc say, "Well, you silly idiot, you..." see, and here he goes. What he's doing is relinquishing session control. He gets it off, squared up, all of a sudden, why, he's brighter.

So, smoothness of auditing is how do you control the pc without ARC breaking the pc or chopping the pc, and it also includes, then, doesn't it, getting control back from the pc if you've lost it. And actually, that's the whole story of getting control back from the pc. Find out what the pc wasn't able to point out to you that he then has to do something about. Because his doing something about it is all wrong. He will never do the right thing with it, I assure you.

See, you could give him – you could give him the next five items, and say, "All right, all right, just – just add them up and move the charge down – down the bank, with these five
items." And if you check up what he's doing he will have opposed half of them backwards and forgotten the other half, you see. He's just not in shape to audit. That's all. I wouldn't even point this out to the pc. The question of his auditing would never come up. But if I found a pc giving me orders as an auditor, then I would simply try to find out what the pc has not succeeded in communicating to me.

I could do that with the meter, I could do it with persuasion; it might have happened in earlier sessions. But I would square that up right now.

Now, although the pc may be in an ARC break from other causes and reasons, I am likely to take that as the first step. Because the data connected up with this ARC break might be of great value. I would also do an ARC break assessment Routine 3 to find out what I had missed, but that is purely technical. Although it cures ARC breaks.

This other, how do you get control back from a pc, will very often form a considerable problem to you auditing in Routine 3. Pc is telling you, "You've got to do this, you've got to do that, you've got to – and we've really got to run into a later bank because this early bank that we are doing now is too much for me and we should run it later on the track, and we should do this and I've already told you that I've cognited on my goal in present time, and you should take this goal in present time and the top opperms of it are 'catfish' and 'catfish-no-catfish.' And we've got all that and so forth so you really ought to be kind of running that now, because after all I've told you and told you..." And you'll notice that all of his orders have got "I've told you and I've told you," let's find out what he told. He very often wasn't articulate while he was doing the "tolding" and you'll finally find out that he actually is heading for the – for the early bank because he hasn't been able to communicate to you, he thought, because your TR 2 might have been poor at the moment, or you didn't make note of it or something of the sort, that there's a whole slab of the material you have been doing he is in great doubt of. He just doesn't believe it, something like that. And he's gotten desperate about ever understanding it. So he's made a decision there that he'd better get an early bank that he can understand. And of course to do that would be utterly fatal. But the datum there that he hasn't understood it might come as a brand-new datum to the auditor. Oh, yeah? "Well I told you!" The hell he did, man, he never said a word about it. He was sitting there going on just as nice as you please, you see.

"Oh, yes, yes, yes, absolutely catfish, yes," he's going on about it, you know, "Oh, yes... Oh, yes, yes, I understand. Yes, yes, yes. Eager catfish. Oh, yeah, I understand that you know, oh, yeah." Now he tells you he hasn't understood a single one of them. Not only that but he tells you that he's told you he didn't understand a single one of them.

All right, so your reality is betrayed. Remember, he's running in the least reality, he's running in the exact hurricane middle of the reactive bank. There is nothing goofier than where he is at. It isn't that he is – is or isn't goofy, but the area where he is at the moment hobo-nobbing is Spin Corner, man! Crazy Avenue goes up in one direction and Dementia Praecox Boulevard runs in the other. [laughter] You're going to take this guy's orders, huh? Hah-hah-hah! This is silly. His data, always. His orders, never.
Very important for you to realize that, and the orders come when you haven't taken the data.

Now, we realize that banks are hard to run. Go ahead and realize it all you want to, and treat them with respect and so forth, but there's one thing you mustn't do. Now, you're going to misinterpret this and everybody's going to misinterpret this and get it all wrong. It'll be the source of argument here for years. I can see that, unless I make myself absolutely plain on this subject. Now – now, the wording of this is very carefully worked out, so don't write it down or quote it carelessly. Never rerun a partially run bank. Never rerun a partially run GPM. And that first word was "Never." And I point your attention to "partially." Now, let's get this real straight, because I don't want this datum to go to anybody's head goofywise, because it could be interpreted as "Never rerun a GPM," or that there's something bad about rerunning a GPM. There is nothing bad about rerunning a GPM. There is everything deadly about rerunning a partially run GPM. That one you mustn't do. Don't rerun a partially run GPM.

If you've got your paws on it, fur, claws and all, and you can continue it in the run, you continue running it right straight on through to the bitter end. What's the bitter end? The goal as an RI at the bottom of the bank, listed fifty items beyond the last RR and R/S. And when you've gotten that far, you can consider that the bank can now be rerun. You don't have to null that list to make the bank rerunnable. You understand what I mean, now?

Only then is it safe to rerun a GPM. Now, this means a great deal, it means a lot more than you think – you think of at the first matter. Means a great deal. You say, "What if it's wrong? What if the pc's ARC breaking?" I don't know, what if spring comes? What if the law of gravity works? Sure, a pc will ARC break. So what? They'll spin if you run it – rerun it. Uhhh!

You're going to get in nothing like the trouble you get into by running wrong upside-down backed-up mixed-up items, as rerunning a whole area to get the items right. Because that makes the bank more charged than it was. And it's then much harder on the pc. Charge in a bank runs from the top of the bank to the bottom of the bank. In consecutive order. And any time you take an area that you've rerun without running the rest of the bank – you take an area that you have run, and rerun that area, good, bad or indifferent, right or wrong, or anything else – any time you rerun that area, you just stack up a stiffening of the missed withholds. They're good and missed, now.

But there's a charge factor involved here. Because the charge runs from the top of the bank to the bottom of the bank, when you back up anything beyond a pair of items – quite allowable a pair of items because you're always working on a pair of items – you go any further back than that and start rerunning something, and not entirely understood by me at this moment – I'm simply telling you the empirical finding. This is not a theoretical finding at all. This is learned the hard way, you know? Any time you go back a few items and decide to rerun that little span again, without running clear to the bottom of the bank, you sort of let the water back in the battery, you know? Something weird happens. Just let me put it that way rather than try to give you a theoretical explanation that might not be right. Just something weird happens. The bank gets stiffer. Sort of like putting – you wash this shirt, see, and you
wash this shirt, and you look at it, and by golly the collar's still dirty. Well, in ordinary wash-
ing this wouldn't happen, but you wash it again and now it's too stiff to wear. It's very curious, curious; it's a phenomena.

It's as though the second wash water always adds a couple of gallons of starch. The bank beefs up. I can give you lots of explanations for this, but just take this as an empirical datum. The bank will beef up. The pressures will become greater on the pc. The stresses will become greater on the pc. The actual physical might of the bank apparently increases. Just take it as a datum.

Let's run – let's run from the top oppterm down to the goal. I'll give you an example, see? These are very concrete examples. We go from the – from the top oppterm down to the goal, I don't know, something, a matter of a fifth of the bank or something like this, see. Now, we've gotten the goal as an oppterm and we're going to go ahead through the rest of the bank. And all of a sudden – now these other remarks get very, very pertinent because we get a hard sell is liable to go on here – the pc's... this is visual, gets visual to the pc – he sort of looks up the bank and he says, "We've got uh – we've got uh – 'want catching catfish.' And that's wrong. That's wrong. That should be – that should be 'wantably catch catfish.' Oh, look. That's why I was ARC broke. Yeah. Yeah, look. I – that – that - yeah, that – that's wrong, so that makes the... no, the uh – that's wrong, and uh – oh, and there's a couple above that. A couple a – oh, no wonder I was so ARC broke. Look-a-there! You got about five items missing there, right in a row, you know? And uh – you must have given me the wrong item. Uh – 'cause there it is, and so forth."

And if you sit there casually listening to all this and apparently don't take it down any, and don't do anything about it, then the pc's going to start giving you orders about it. And the pc will say, "Well, we should go back up there – go back up there, to 'eagerly caught catfish,' and we should smooth that out and pass the charge down to where we are. Because if we keep going like this, why it'll just for sure mean additional ARC breaks."

And you say, "All right, thank you very much, well, we're going on now, and so forth..." And you see, that was... you've been practicing "die-plomacy," not diplomacy, and you're going to about get it, right in about two seconds, see. And you say, "Well fine, that's it, thank you, and we'll go on now, and we'll go on down the rest of the bank," and pc will say, "But look, I'm trying to tell you – I'm trying to tell you, there's this 'wantable – wantable caught catfish,' and that's wrong. Because actually there are about five items in that area and that's why I ARC broke in that area."

"Yeah, well thank you very much, well, we'll go on with this..." Of course his brains start spattering all over, and he says, "You've got to go back. Now I'll tell you what you do. You go back and – you go back and you catch that now..."

The next stage is, when you don't follow those orders, is he will go back and say, "See if this reads now: 'wantably caught catfish,' 'wantably caught...'just – just look at your meter. Get your eyes on your meter." [laughter] See what your inevitable cycle is? He not only gives you the orders, but he starts carrying them out! [laughter] And that's because somewhere along the line you haven't handled any of this.
Now, I'm actually giving you two data which go hand in glove, but they could form entirely separate lectures. The... don't rerun a partially run bank.

There are other reasons why you mustn't follow the pc's orders, but this is amongst the chiefest of them. Did you ever run engram or a withhold – they behave the same way – on somebody that wouldn't discharge? And seemed like the more you ran it, the stiffer it got? Why? Actually the answer is in Book One, and you'll find the answer's in the withhold system. You ain't got basic on the chain, that's why. The funny part of it is, the more you go over it the worse the pc's going to get with it.

You get this pc telling you about this withhold, see? He stole this car, see. And my God, every auditor he's had has had this withhold, and it's apparently getting up to be – you know, he's getting this withhold off, it's getting to be a total obsession. It's what's known – it has a technical name, it's the recurrent withhold. He gives it to every auditor and it comes up every third session, see? It's a recurrent withhold. He just keeps giving that withhold.

Now, if you were to look at that withhold very critically, you'd find out the pc is getting more and more obsessed with this withhold. That withhold is beefing up. Because hitting it causes all of the earlier withholds to be missed. It excites and activates the whole chain of stealing cars. And the more you try to get this particular car, without getting the first car stolen, the more you activate those lower ones and get missed withholds. Therefore, actually, no Prepchecking, or no Sec Checking can be done in total ignorance of the withhold system. You just can't do it, because on any given pc – of course, the key-out factors, anything keys out usually within three to ten days, but where a person is being consistently audited on the same item, same item, same withhold, same engram, same this... Oh, I – in the old days we used to have certain engrams, the pc would always come along with the engrams. The same engram, see. It was only a basic on the chain, that's all. Basic was still on there. It's enough to get out just the basic engram on that chain. You don't have to get the basic-basic engram of the case off, don't you see?

Well, because of the repetitive nature of the bank, in a goal "to game," you would have the word "game" being repeated the length and breadth of the bank. "To catch catfish," my God, "catfish" are all over this bank.

Well, oddly enough, you can get away with – and get some success on discharging a withhold or an engram on a one-pass. You know, you can always ask the auditing command once. You know, you can always – actually, you can always ask it a couple of times. But you can always ask it once. You can always pull the withhold once. See, you can always do it once. And the pc'll feel better, see. Oh, you can – you could get this one, Freudian analysis, poor devils, they must have run into this constantly. Because they dig and evaluate in these things, you know.

This guy would all of a sudden – which was... gave them their thing of – all of a sudden remember that his mother used to sing "Tipperary" in the bathroom. Ah! And he remembers this, and it cheers him up, see. Feels great. Feels great, you know, ha – remembers this. Ha! What the – what do you know! Oh, wow! Gee. Terrific! It's all right, man, this Freudian analysis really works.
Now the analyst says, "Now, what significance can you read into this, about that? And you give me a few more data, and give me some of your dreams so that we can integrate them with this Tipperary so that this Tipperary, we can make some sense out of this, see? Now..."

And all that gain goes, just like that. It's gone right now, see? It's out. Never to return. It's the wildest phenomenon you ever cared to do. I'm just talking about empirical actions now, that you can do as an auditor.

You say, "Well, what's the earliest recollection you have in your childhood?" see, something like this.

And the person says, "Oh, that's pretty good. Graduating from college." [laughter, laughs]

And you say, "Well, now, all right, that's – that's – that's fine. That's fine. What was particularly notable about that?"

"I was embarrassed when the dean gave me the diploma. Ha-ha! Come to think about it, I was. Well, what do you know? I feel better."

Fellow auditors, leave it alone. Let it drop with a soundless thud at that point. You see, this is so late. The fact that he got any gain or send out of it at all is miraculous. But just tapping it bled a little charge off of it, don't you see? But to hit it again will reactivate it. And then it'll hit all this chain of embarrassment. And you could go back into this incident and sometimes when it doesn't have a chain, you could run it as a little engram or as a lock, you see, and it'd clean up beautifully. And most of them don't have chains, so therefore you would get the idea eventually that you could run almost anything, you see, as an engram.

But let's say it's that unlucky chance that this one has a chain. Embarrassment goes all the way back to Freud, see. And you – you're going to hit this one, see? The dean gave him his diploma and there it was, and he's going to run that. And this one's got a real beefy chain on it, you see? Right along side of it you could have caught oh, incident after incident that you could have run, don't you see, because they're not in chains. And you get this one, and you run it, and he sees less to it now. Run it again, it seems more sticky. Seems more difficult to get to. He does it again, and he starts worrying more about this now. And he does it again, and he finds some more in it, but if you ask him about mass or if he knew about mass, you'd find the mass was beefing up. Why? You're hitting too late on the chain.

In other words, you could hit it for a moment, you could bleed the charge off of it and you could get out of there and you're okay. We know this from a long time auditing experience. On anything which has a long chain, similar actions, you see, repeated, repeated, repeated, repeated, if you don't get the basic on that chain, the chain will not blow. And trying to work later than the basic on it will cause a beef-up for lack of a better word, a strengthening of the mass, a increase of pressure, an increase of energy masses connected with it. You can run one of these things till everything gets three-dimensional, man.

Now, it's only to basic. You don't have to have the basic-basic for the whole case to dispel this illusion. You only need the basic on that chain, which is embarrassment, let us say, in this lifetime. The first time you were ever embarrassed. You get that, the whole thing will tear up. But if you keep hanging around with this late incident of embarrassment, that chain is
not going to tear up, that is going to get beefier. Now, I don't say that we are dealing with exactly the same phenomena when we deal with the GPM, that would be too great a conclusion. I'll merely tell you the same phenomenon is present in the GPM. But you can knock the charge out of items A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, in consecutive order. You can find the item, you see? You can list for the item. Everything is going to go along just very nice and so forth. You can get the random items off of them, you see, and blow the rocket read off the thing, and move down to the next one and so forth.

And if you go back, and you go back over A, B, C, D, E, F, G, H, I, J, K, or you just go back over G – let's adjust G. Let's go back and get the pc shadowboxing trying to find the right G when we've already got Q, see. You find this pc start to get desperate after a while. And if you did this very consistently, you would find that there was greater mass on his case now. You would increase the amount of apparent mass. Actually you haven't increased the amount of mass, there isn't any increase in the mass, you've simply made him more aware of the mass that was there.

For instance, if it made him slightly deaf going over A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P – I know my alphabet, anyway-made him slightly deaf, you know, to go over those. Now, you go back over G, you know, H, I, J, he gets – starts getting a heavier ear ring. See, you got away with it before, but now it's kind of rrrrrrrrr. And you go over these things again, you adjust them out.

Now, you will feel that this isn't true because occasionally you over rerun a little section and straighten it up and bring the charge down and you apparently will get away with it, because the pc was ARC broke because it was missed, see? Actually, you won't have gotten away with it at all. That area has increased because you've reactivated the bottom of the bank. That's where the apparent greater charge comes from. You see, you start hitting, and you hit it again and you hit it again. Well, if you were just coming along taking the charge off as you went on down, it doesn't have a chance to get activated, see. But by hitting this area, getting stuck in the quicksand, in other words, of this area, you keep hitting that and not taking any charge off the lower and keep hitting it and not taking any charge off the lower, then all that lower charge is getting into restimulation. And just about blows the pc's head off.

So you never rerun a partially run bank. You just don't do it. No matter what persuasions there are. You can go back and adjust a couple of items.

You very often have to adjust a couple of items. You're already adjusting one, at any given time, while you're running. You can... you sometimes find you have to adjust the item just before that. It just won't discharge; it just keeps on sporadically rocket reading or something like that. It wasn't right in the first place and that's why you can't get your next item. You keep trying to get this next item and trying to get this next item. You can't get the next item. Then we get bright and read the item just back of it and find out the thing's rocket reading. It's very embarrassing. Extend that list and adjust that and then take her from there and you're all right. That's a perfectly normal action, providing you don't take more than two thousand hours to get the right item just back of you. That's said in sarcasm.

There's your – there is your – the essence of the situation. Go back a block of six, six RIs? Oh, brother, cut your throat. The same thing. Because none of these RIs are ready to run.
At no time are you ever running an RI that is ready to run. They're never ready to run. They're supposed to be there forever. See, they've lasted this long, and so forth.

Well, the funny part of it is, is you can discharge the basic of the bank. Now, this means then that there's only one direction that you can run in a GPM. It also forces you to run in this direction, and that is from top to bottom. You cannot run from bottom to top. You think you're running from bottom to top sometimes, and then find out you're running from top to bottom anyway. Oh, he's getting the items all backwards, but try to run a – the pattern in reverse sometime if you want a picnic. You've got all of these words now, in sequence, and they're in the proper sequence, so keep feeding them to the pc, and try to move up in the bank.

He – the pc starts going aaaaah-uuuuhh. What are you doing? You see, you're moving away from basic. See, the fundamental RI on the bank of course is the goal at the bottom of the bank. And that's holding everything in place. In order to get it discharged you've got to discharge the rest of the bank. Well, that's done with the once-over-lightly, don't you see? You discharge every item in rotation as fast as you can and as well as you can, and on to the next item and discharge that and as fast and as well as you can, and on to the next item. And you'll win the whole way, charge will be blowing off, and the pc feels fine. That's necessary charge to remove.

Now, all of a sudden you go back, you move back. Let's go back a dozen items, and you're going to correct the bank, because now you have found correctness is necessary. You've had it. You start moving down that channel, now, yes, they will all fire again, you ought to consider that's mysterious, we were all over these things once and they're all firing again. It's because the basic charge on the bank hasn't been drawn, of course they'll fire again. Only, where are they getting that charge? That's leaking up from the bottom. So here we go.

Next thing you know, the pc's sort of looking very haggard and the eye circles get – first they come down to here, and then they come down to here, and then he's just – doesn't have a face any more, he just has one large eye pouch. All that comes from rerunning.

Now the one thing therefore that I have to teach you on the thing is, in handling auditing, to be very adroit and don't get yourself into a situation where you have a whole bunch of missed, bypassed items, and this and that and the other thing and so forth and a bunch of ARC breaks. You can become technically accurate enough so that you don't do that. But even if you did bypass some items and run into an ARC break, so that you can handle the situation well enough as an auditor, telling the pc, "Oh, well, yes, oh, oh all right, all right, that's wrong, huh? Okay. Let me make a note here, pc says it's wrong, and... all right. You say there's five more items up above 'want'? All right. Let's... pc says these items need to be corrected, all right. The next time we run this bank down from the top we'll correct them. How's that, huh?"

Pc says, "All right. Okay. Okay. All right, fine, fine." Right on. Don't try to overwhelm him with the fact that you're now going to go on over his dead body, don't you see?

Teach you those things, it becomes necessary that you know them well. There are many reasons why you should know them, but the principal amongst those reasons happens to be this fact about you can't rerun a partially run GPM. Can't be done. You get into trouble, pc
go upset, oh yeah, you can get the right items, oh, yeah, you can get it all corrected, oh, yeah, uuuuhhh!

Of course it'll all come off, and the consequences of having done so will all straighten out when you get to the bottom of the bank and so forth, but you'll have a very rough and uncomfortable time of it for a while.

You can't get the top oppterms – you've got a pair of items. Well, you can fool around quite a while with that pair of items. You can fool around quite a while, but if you can't get anything to fire after about five hours, man, you'd better cut in with the goal as an RI, oppose – as oppterm, you know, the goal as an oppterm, cut in and cut the bottom of the bank off of it. Tell the pc, "This is going to be very uncomfortable. The mass is probably going to follow you all the way down. We've missed all of those items. I think there's about fifty of them above where we're operating, and we've missed all of them. I'm sorry, but there isn't anything else we can do. And when we come back and get this, why, you'll get your top oppterm easily."

But let us suppose we just took the goal as an oppterm area out, and then so we've taken enough charge off the bank, now we're going to go back and find the top oppterm. Ohhhhh. Oh, no. That comes under the heading of rerunning a partially run bank. You must always run a bank down. If you start at any point, you must go south. There is no north running. For instance, if you cut it in as the goal as an oppterm, it's uncomfortable, fine, run it all the way down on the pattern but get it right on down to finding his next – doing his RI oppgoal as an RI opposed. But don't null it, because he'll get the next goal. And he'll be interested, and other things will happen that are catastrophic.

Now, I've tried – I've tried all versions of stopping short of doing just that, and the only step that – I give you this very seriously – the only step that can be omitted is nulling that final list to find the next goal below or earlier than the goal you're running. That can be omitted. If the list is complete, the pc will not ARC break, and all... you run the risk of his cognite – cogniting on the goal. Because practically all he's got to do is look over his shoulder and he can tell what it is.

But the pc will tell you what the goal is, and if you're plum foolish, you won't take enough note of it, and won't make enough – you know – receive it hard enough, make a note of it, and all that, that you've got that, that's fine and the pc will then assert that he's got to run it. And then if you still don't receive that well enough according to the pc, he'll run it. He'll start giving you the top oppterms. It's all under the heading of assert.

And you've got the top of your bank – of the one you just left isn't run. Now you want it, and everything's going to – ha-ha! No, thank you. No, you've got to go back up and finish the top of that off and pass your charge on down the bank and get that well discharged.

That, of course, is not as good a program as starting at the proper top and going all the way to the end, but is preferable to spending seventy-five hours trying to find two top oppterms. Because that soon gets into a position of rerunning a bank. It'll activate those lower RIs and it'll get more and more uncomfortable. The absolute time limit on it is something like about five hours. And if you can't find it in then you have no other choice. You've got to cut from under and get lower and go south. And then come back and get that top, cut the top off
Even though you have to pass the charge on down to the bottom again, it's a better plan to do it. And you will – takes you less time to do it that way.

Yes, it's uncomfortable to run a pc with a fifth of the bank unrune above him. Yes, it's uncomfortable. It's far more comfortable than to rerun and rerun and rerun and try and ffffzzz. Got to teach you one thing, is to overcome the sales tactics of the pc and his orders, so that you won't make the errors which he himself is bound to make. That's a definite professional liability, because he sounds so reasonable. Teach you the mechanics of that, and we've got to teach you also that the bank itself must be run, not fooled with. When you start running it, run it. When you get your hands on a bank, go man, go. Keep going.

Now, there are some here whose cases I have used to see whether or not these laws were generally holding true. And so forth. That is, I wasn't restraining them from going. But it's followed through consistently. They would have been better off in any case to have cut into that bank anywhere. They would have been better off just to have run a series of locks off the top of the bank than to have fooled around for the top oppterms.

"Well, what's the top item for this bank?"

"Well, I've got one here that's 'someone who – who coughs – who – who coughs.' Yes, 'someone who coughs.' Yeah, that's part of the goal 'To catch catfish.'"

"All right, that's fine. Now, is that a terminal or an oppterms? All right. Well, that's a terminal, 'someone who coughs.' Very good. Now what – who or what would someone who coughs oppose?"

"Oh, well, let's see, there's... 'dreamy days.'"

"All right, that's fine, that RR's."

I'm not kidding you. I'm not kidding you. It'd be better to go through the bank in that fashion. Of course, that's terrible to go through the bank that way, because you'll get strays and you'll skip. You'll all of a sudden find items like "steam locomotive," you know.

There are many ways you could run a bank. But the way you mustn't run one is to partially run one and then rerun it. Don't ever rerun a partially run bank. Don't ever try to repair a partially run bank. Only repair and run wholly done banks. Don't spend any time finding top oppterms – if it seems impossible, cut in and run something. I've got to teach you that when you get your hands on a bank you run the thing. You go, you know? Don't stand around man. You go.

I've had a lot of – a lot of cases, and done a lot of work on this and adjudication on this, I've got subjective-objective cases like mad, and that's the conclusion I have finally arrived at – finally arrived at. One, that the auditor has to be a sufficient diplomat, as to not find himself in a position – he's got to be able to handle a situation then, even though it is wrong, and keep going. You see? Becomes a requisite, see.

Tell the pc, "All right. Yeah, I – well – all right, okay, I got it. All right.

These are – we've missed those withholds. All right, we missed all those items, all right, well, we'll get them on the way back, is that all right with you?" Settle the ARC break that way, you see? You know? Learn to handle it without – without having to redo it. And the
other thing is, once you get your paws on a bank, go! Don't stand around, man, don't do it. Go! Get the next item and the next item and the next item and the next item – oh, so he can't start in at the top of the bank and find the item and the next item. All right, man, skip the top of the bank. Get in there and go!

You... it's something like walking across crust ice, see? You must not linger. And the pc will just shine if you do it rapidly and fast. And he will bog to the degree that you redo it.

Accuracy is absolutely imperative, so long as you run. But accuracy only and without item after item after item being found in good order – out. Pc ARC broke. Bah, the pc'll just go into a complete apathy. The pc is getting loses, the pc feels upset, the pc isn't up to getting in there and pitching now. The pc's enthusiasm is gone. The pc doesn't have the lift necessary to rise superior to this bank because he's being crushed by the fact that he's not getting anywhere, see? You mustn't just stand around and mill. Find a place you can go and go. And do it right when you come back through. You understand?

You get the right rocket reading items, of course your pc – you'll have no trouble with your pc at all. You've got the pattern of those items now, and that pattern's getting more exact every day. In fact I even know the exact words. Isn't that horrible? And it's getting so there's nothing left. It's "wantably" and "wantable." Ever hear of those words? I never did. Anyhow, they're in the bank.

Probably the character and the high-toned character of the bank and its parts of speech is what keeps modern language as what it is.

Anyway, well, there it is. I hope you can learn those things, but it... but take them to heart. They're the essence of running a GPM.

Thank you very much.
Thank you.

I appreciate that. Earned it.

And this is what? May the 14th, AD 13, Saint Hill Special Briefing Course.

Now, a pc's got his own goal and he's got a GPM of his own and so forth and you can find all that. And that's Routine 3M2 and that's a buttoned up piece of technology and recall it as a piece of technology and compartment it as a piece of technology.

You're about to get 3N and 3N you are more or less doing at this particular instant. It's simply a stripped down, directive Routine 3 which uses line plots and is as crude as: prop up the HCOB May 12th in front of the pc and prop up the copy of it in front of yourself and use that copy as a line plot. And when you direct the pc's attention, direct it by number. "Give me number one hundred and fourteen," and the pc does so because pcs lose their place very easily. And the next thing you know you've got the whole bottom of the thing having missed the whole top and the pc's ARC broken and neither of you know why until you suddenly figure out that he's missed. The auditor has to be very careful the pc doesn't miss.

And you don't check the goal and you don't pay any attention to blowdown. You run exclusively by rocket read. And you just drop all these little bits and pieces. Actually you're getting items almost as fast as you and the pc can talk. And it's about one a minute and you can tear up a bank so fast that it would make your head swim. And the pc just does fine, because he's not being plowed into it.

And the only time you random list is when you can't get something to fire. You can't get the right item to fire. And the way you random list is you carry a spare piece of paper over to the side, you transfer the item number only to the piece of paper and that is list number one hundred and thirty-two or whatever it is, you see. And that coordinates back onto your line plot. So you don't write, "Who or what would oppose something or other." You just write, "hundred and thirty-two," whatever it is and you just write the versions of it and you write those very rapidly. You're doing a goal – you're doing "remembered," so you do "r/" see, "r/d." Something like that, you see. And the best you do with that piece of paper is simply put its date on it, at the top, just to identify it, because it's going to be clipped into your auditor's report, don't you see. You've got to identify that piece of paper. You want to put your pc's initial on it. That's a little more thorough. And if you want to put a number on it, that's even more thorough – that is page number something or other and you've got very proper administration.

But that in essence is 3N. And what you want to do if you want to know what 3N is, is just figure out everything that you can drop out of the lineup in order to discharge items. Eve-
Everything that can be dropped out of the lineup to discharge items. And you just drop it out of the lineup. That's all. So it's just bow, bow, bow, bow!

Now, there is still one question which is – remains unanswered and I will have to check it out this evening and I haven't checked it out yet. And that is, do you even say, "Would something or other oppose?" But I can tell you that that's only once for every pair. It would be only when you got the terminal and then you'd say, "Well, would nix absolutely – uh – whatever." Not to restimulate you all. Very funny. Mary Sue started a gag the other night that I'm afraid Scientologists will be up to for a long time to come. She said, "It's absolutely fantastical how..." [laughs] And I said, "Absolutely, absolutelyable." [laughs] You start too much of that thing, people who are standing around you who haven't been audited will start to wheeze and cough and cave in, see. [laughs] These are dynamite words, man.

But if you would just figure what you could drop out of – of the patter itself and still keep wheeling just in the interest of speed, still retaining the fact that the items must be found, they must rocket read and they must blow. Why, then you've got actually 3N. And it's amazing how fast it can go.

Now, you remember at the congress I told you one a minute was a goal, see, a good level to hit for and that it would be very fine and we could run all these things very rapidly if we had it at one a minute. Remember that? Well, actually that was fairly accurate prediction. I hadn't done it as an auditor. I had seen it closely approximated while I was being a pc. But I thought it was scaled down and was actually putting the pc in a bit of danger for a while. There was no listing involved, there was no unburdening and then I found out what was causing discomfort. Discomfort was being caused by the inaccurate line plot. And the inaccurate statement of the word. That was what it was being caused by. In other words, bypassing items, you see, and not having the exact expression of the item there. That was what was wrong. And it wasn't the speed with which the items were being found. It wasn't the absence of random listing. You see? See how that added up.

So, I've been making some tests now of this bow, bow, bat, bap, bap, bap, rap, rapid, rapid, rapid, man. And I have been hitting a minute per item and see signs now because I've just redesigned the line plot because I was doing that writing. I was writing the items at one a minute, see. So I know that one a minute is easily achieved. Because you get this mimeographed line plot, why, of course, you can – you don't have to write everything down there. Your one a minute also accounts for occasionally having to fumble. See. Something you – didn't come quite right and you fumble for it and then you get it.

And I found out a pc just comes up shining regardless of what the tone arm did, with this reservation: When the pc starts suppressing and the auditor doesn't discover that the rising tone arm is from suppression then your rocket reads tend to kind of vanish and they get very small. Now, the proper behavior of a rocket read is when the pc says the correct item you should get gee-whizzer. It should just be absolutely gorgeous, you see. Upwards to half dial, you see, or greater. And then when you call it back to the pc – by the way, you don't say that rocket reads or anything because you've already given him his item without reading it back to him. You'll discover that the pc will fumble on this one.
So you tell the pc to give you this. The pc, you know, number hundred and thirteen, something like that, pc gives you number hundred and thirteen, you look at it, mark it on your line plot and say, "I'll now read to you (the only rocket reading item on this list, or something of this sort) – forgettable-antastical" and the pc rocket reads on the thing. And you say, "That rocket read." Don't even bother to tell him that's your item, see. Just, "That rocket read." Fine. The pc's happy about it. And then you say, "Who or what would oppose (what you just got)?" you see. And the pc says it – because he's usually got his place on the line plot; you verify that's what he got – says it; you get this gorgeous rocket read then. You see. And you go through this one, two, three. But you'll notice, when the pc gives it to you, you shouldn't say it first, because it should come off a piece of paper or something like that. See? You shouldn't say it first because the pc gets fixated on you. And when the pc says it, you've got a gorgeous rocket read. When you call it back you should have a rocket read about half that size and when you call it again, if you call it again immediately afterwards, it just goes tht! See. That's the way it ought to behave.

So, you start sweating around to make this thing rocket read again and if it does rocket read again, then you've bypassed some items or something is wrong or the pc's in a big suppress or something is all muddled up here. It bothers the pc for you to call it again. It bothers the pc for you to do so. So, if you want to do so, you say, "Let me – I want to check the rocket reads," or something. That sort of invalidates the item, don't you see? Nevertheless you occasionally will call it again and you will notice that that thing does follow that behavior pattern.

Now, if it doesn't follow that behavior pattern as a rocket read, you know something is pretty awful wrong here someplace. Pc's on a big suppress, disagreement with it and that sort of thing or the pc has wandered off some place or another and isn't giving you his attention. Now, that's about the only real difficulty that you'll run into: pc starts wandering. And you'll very often will do this trick: You will say, "Do I have your attention?" There'll be, "Oh, oh, oh, oh, oh that one. Yeah well, I'd already read the next five," so forth, you know. And you say, "All right." You say, "All right now, (whatever it was) fantastical," and the pc pang! You got your rocket read.

In other words, you shouldn't first question the fact that the rudiments are all out, that the item is wrong, so forth. See? Don't take that as your first one. Just take as your first choice, the pc just didn't have his attention on you, that's all. And you'll find these things just blow, blow, blow, bang, bang, bang, bang. You just opened up all the valves and steam's leaking all over the place, and that boiler's going to be flat very shortly. That's the score of this 3N. And you'd just be amazed how fast a bank bleeds down.

Now, when you run into trouble – when you run into trouble and you can't find the next item or something like that, the first thing to do is to find out if you're in the right place, not chivy up the pc. Because you've gone from forgotten to forgetting. You've missed about three-quarters of the bank or something like that. Very often even a seasoned auditor will find himself sitting there running the wrong block of items. Pc's made a mistake, you've taken a break, pc comes back, the page is folded some other way. The pc starts giving you another block of items entirely. All of a sudden you don't have rocket reads and that sort of thing. Well, there's a usual symptom that goes along with this which you may have heard of, called
an ARC break. The usual symptom is an ARC break, but even if there isn't an ARC break, there is one that is fairly reliable, is the pc feels sick at his stomach. When pc feels sick at his stomach, item have been missed. Got it? See? Stable datum. Or a bank has been missed; a whole GPM has been missed. Even though you're getting rocket read. Pc feels sick at his stomach, you've skipped. Skipped items, skipped a bank. You've bypassed things, in other words.

If you really want a pc to feel sick, omit to find the goal "to remember" after the goal "to forget." And start running "to go away" after you've run "to forget." Give you an example: all of a sudden the pc feels very queasy. He'll go on, you'll get your rocket reads. It's not running very well, but you'll get your rocket reads and so forth. And the pc will feel sort of green; he'll feel very pale about the whole thing. I mean if he doesn't ARC break you better cross-check what you're doing.

Now, the highway you're running is one of the best marked highways anybody ever heard of. Far superior to English road marking, far superior. I know everybody thinks English road marking is pretty good. But they should see California road marking. Particularly out in the desert where the signs have fallen into the sand. La Jolla eighteen miles, Death Valley three miles, signs all rusty and filled full of twenty-two bullet holes, that's usually... But the truth of the matter is that your highway is very, very well marked.

Now, what you are doing is in essence blind flying. Blind flying. You are flying by instrument. You can learn to fly by instrument and you will find one of these fine days when you've had a lot of these things run that you won't be running much by instrument. I just had the interesting experience just a few minutes ago of checking out a pc who was having difficulty (yours by the way), who was having difficulty in getting down the line and I didn't blind fly it. See. I flew on actual perception, not of what the pc was doing but my actual perception of what goes on. See?

Now, I added this datum: pc sick at his stomach, owww. No wonder "nix forgotten" would not fire. There's a "forgotten" up the line someplace earlier. There are RIs earlier. There are some RIs, I was plotting them out last night. There's "this is not the beginning," "this is the end," "no end," "the end" and so forth. I'm getting them all plotted up for you. And Suzie went into revolt. She says, "You're being the guinea pig pc all the time and you get to look at all these things," and that sort of thing and, "I want a chance, so you – tonight I want to get finished through this bank," and she did and so forth. And she says, "I want to get back and take a look at the beginning of those vestibule implants," and that sort of thing and plot them out. And by golly we did. We got a whole hat full of them. There's not very many of them back there, but they're enough to really confuse the situation. They tell you that the end of the incident, you see, that this is the end of the incident whereas in actual fact it is the beginning of the incident. See. And we plotted those out pretty good and we got some beautiful rocket reads.

So, of course, immediately just yanking your pc into "forgotten – nix forgotten" as a pair, of course, is bypassing all the vestibule implants. But you can do it. But here's a pc all of sudden we couldn't do this with, see? You can do this without getting the pc very sick. It's all right, he can run. But not this pc. Something was wrong. Well now, the reason you haven't
found the beginning of the incident – the reason I hadn't found the beginning of the incident – it starts several months before the actual implant, see? It's not the day before as you would expect. You're captured on Exnool and immediately transported, you see, and in twenty-four hours they've got you going to heaven, see. That isn't the way it is. That isn't the way it is. Apparently you're kept around in cold storage for a while. And there's about a six-months' lag here of some kind or another. They backlog. All great insurance companies and great empires have a tendency to in-basket-out-basket themselves out of PT. Don't you see. And you've probably been in- and out-basketed out of PT, don't you see. That's about all the seriousness there is to it. So actually the incident that you're looking for is several months – probably differs. It does vary from pc to pc, you see. But it's probably several months ahead of the actual implants. And if anybody was silly enough to get implanted at the moment he was being picked up to being implanted or something like that, of course, you've got a "forgotten" or something sitting way up there. So, you have to scout that sort of thing out.

But that early sequence doesn't run like the implants. It all just runs like an engram and that's why you're learning how to run some engrams. And even though you do have "forgotten" and something or other is occurring up there, you can still run those things just like an engram, get the sequence of them, see. Get the guy to check them off. That's not the vestibule implants, they have to be run just the way you run them.

But what would they be? They'd just be somebody saying it or something like this, don't you see. Key-in of some kind. So you'd have to unsnarl that area. And then there's always the chance that you haven't got the first incident, that you've got the second series or that the pc has as many as six or seven serieses. What a tough pc. He could go back through it that many times.

See, there's always these variations. So you want to make sure you've got the first one and that you've got the first of the first one. And then you'll never have any difficulty at all. If you do run into difficulty then it's just the rule which I just told you. You haven't got the first of the first, that's all.

The funny part of it is, you can cut into these implants almost anywhere and run a bank. That's what's amusing about it. It's very hard on the pc and his body. The easiest way to run it is to find the earliest part of the incident and run it all the way on through to the first vestibule implant. Run the vestibule implant, run the first goal "to forget" don't you see. Do it all in an orderly fashion. And it's like sawing butter on a hot summer day, see. There's nothing to it. It's not hard on the pc at all. But every time you miss an item – let us say your pc has an aversion to "-able" and has suddenly decided that to make this "absolute" – and it's the only thing you can get to fire. It isn't what the pc decided, but the pc's just dead against it and something or other, and all you can get is "absolute" to fire, see. Ahhhh, boy, you're going to hit the next bank and the pc's going to be in trouble on that item, see. And he's going to have a lot of mass on that item, you see. By the time you hit the next bank after that, now the pc's got three times as much mass, don't you see. And you have much less chance of getting the right item to fire. And the next bank you hit, you're going to have much more mass. And the pc's going to feel, every time he hits that item or area, you're going to errr-creak-errr, see. That's how it gets tough. Inaccuracy equals tough running.
You want to really pile up the electronic charge on your pc up to the stars, just buy a few "absolutelies" and "perfectlies" and you can sit there and suffer for the pc. The pc keeps saying, "No. No." You know. It's all "no."

"No." You can't get "nix" to fire. Very often you can't get "nix" to fire. The pc for some strange reason has a complete aversion to "nix." And then the pc is very upset about why he has a complete – well, he has it because it's in the implant. But for some reason or other you can't straighten this out and you can only get "no" to fire. All right. Run it. See. Do your best, but only take what fires. Do your best. And know that about the fourth, fifth, sixth bank you're going to be running, everything on the terminal side is going to start getting a little black. And by this time however you will have enough charge off that the pc will have reformed his ways and will start calling it "nix" and after that why it fires as "nix." But the pc will always, thereafter, have a little bit of trouble with the "nix" and "no" and so forth. Little black mass will appear around. But this is minor difficulty. It's only major if you never correct it.

Now, you must differentiate between the ideal and the workable. And you're going to move too far toward the workable or too close to the ideal. You'll err in choosing your route. It's almost impossible to choose it absolutely right. You'll err in choosing your route. A perfect run, an absolutely perfect run all the way is attainable. It is attainable. But a workable run will get you there. I mean one is "absolutely" and the next is "perfectible" and the next is "superiorable" and one is "nix" and one is "no" and then the next one's the wrong item entirely. You just got a lock and so forth. It's very sloppy, but remember it'll get you there.

But, the more you move from the perfect, that is the ideal, toward the merely workable the more trouble your pc is going to have. Now, don't expect to run a pc without ever having any trouble. That is an ideal which is absolutely, completely unobtainable. Pc picks up the line plot for the next session, you pick up the same zone. For some peculiar reason whatsoever you run "forgetting" for half an hour without finding it out. And of course, the banks are so charged up and those root words are so charged up that anything will fire. That's the danger. And all of a sudden hhhaaaaaaahhhah. Well, if it's completely the wrong word you've got no choice but to redo it, but oh boy, that's trouble, man, that's real trouble. Because when you go over the bank the second time, you're in trouble. Any time you go over a bank a second time without the whole thing and everything before it's discharged, you're in trouble.

Now, for instance, you could do the whole first dwindling of the top oppterm wrong, but getting charge off. Finish it out to the bottom right. Then go back and pick up the first incident as an engram. Get anything that's implanted or talked about there and then moved right on through to the vestibule implants there. Get all of those. And then correct the erroneous top oppterms, dwindling. Do that right now and that would run much better.

If you do that however, you pretty well have to pass the charge down to where you are. For some reason or other, charge passes on these things. If an item is found in the wrong place, when put in the right place it will fire again. When you've gotten a wrong item, when you get the right item it will fire again. All of those are safeguards. So actually everything would fire now; the whole GPM has some small fire on it all the way. You pass that charge down just by making the pc read the answers rapidly from his own line plot. You just ask him
– you just ask him the question, "All right. Who or what would oppose that? Who or what would oppose that?" And he keeps reading you, bang, bang, bang. You're just back and forth, back and forth. You're not writing anything now. And you're just passing charge.

And you can correct all these erroneous items. It's known as passing charge down the bank. So therefore you don't want to go too far into these implants on finding RIs. Get the first one because that improves the pc's ability to confront and remember. Get the first GPM. But you really shouldn't be going much beyond that first GPM before you go back and find that beginning incident and get it all dated and scouted out and get the whole beginning of the thing figured out and everything squared around and the vestibule implants and so forth. Because that gives you only one bank to pass the charge through to the next bank. Saves time.

So, a good operating plan-good operating plan is to take "forget," blow the charge of it off, go on back, find the beginning, months before. And move that right on through, totally discharged. Just clean up all that slick. Get that real straight. Get the vestibule implant so "this is the beginning," "that is the end," the pc begins to understand all this now. There is something there to understand but not these "absoluteables." You don't care if the pc understands this or not. They're just sound waves. Who cares. Electronic beams.

You know the Germans lost World War I, if for any other reason, by always shelling the crossroads at five minutes of the hour and five minutes of the half-hour as the remaining twenty-five minutes of that half-hour you could always move traffic through the crossroads, you know. You know, they always were predictable. They had terrific predictability. As much as anything else that is what lost them the war. World War II, they had almost made an art out of unpredictability, because they'd learned their lesson. Well, fortunately the boys we're dealing with didn't learn their lesson. Well, fortunately the boys we're dealing with didn't learn their lesson, as far as this is concerned. And they are predictable. And either through the carelessness, cynicism, sloppiness or otherwise, they have consistently and continually repeated these patterns.

Not only that, they have repeated the patterns of goals. I'm not saying they are different... didn't get different goal shifts. The patterns are the same. The only thing they changed is the additional series. And the only danger you face is that you've got a second series as the only series on the pc and therefore you haven't got the line plot for it yet because I haven't been through it and mapped it out. It's different.

For instance at that band I indicated on "to have a game" where I indicated there that there might be some items there, I was actually getting the items from the second implant series. And there the root word of the goal "to eat," something like that, there's a whole band in there of "eatable." Boy, they sure loved those "ables," didn't they? And that "eatable" runs as a dwindling. But those are entirely different adjectives. The top, second, dwindling, the formation of that GPM is quite different than the formation of the first series – what we call the first series.

Now, your dating doesn't mean very much as far as I'm concerned because it all rocket reads. But there are no dates in it that I can find anyplace. And naturally it would rocket read, as heavily charged and significant an area as this would rocket read, but I just for some reason or other don't trust the dates. But go ahead and get the dates because they are indicative, they are indicative. You can use those dates to differentiate between whether you got the ear... got
the pc's earliest implant. Now, I don't care what date you found as long as it means something to the pc. Now, if you get the right date down to the hour and minute it'll blow somatics all the way. You know the right date digit by digit will just blow somatics all the way, right on down to the second. Only remember, when you're dating a second, you have to date it from a specific time of operation.

You have to date if from, for instance, 5:36 today. See. Because the time you're taking to date, you see, you got forty seconds, well, you no more than got it out of your month, you see, than it's forty-two seconds, forty-three seconds, this clock is going on. Now, your minutes go wrong. Because the second that crosses sixty on the seconds, of course, you had an additional minute. And what's weird is you can blow somatics off those minutes and seconds. That's the only point I'm making. Which is the only thing that gives me any confidence in the date at all. I know then, that the date that is changing is changing because of the advance of time. Not because it's a strip in the implant that somebody reads. So, the keynote of dating is "ago." Now, if you date as though the date is in the implant even though the pc reads you a strip – this is a very common phenomena. A thetan is always mocking something up to read back to himself. If you're dating for a series of numbers, they aren't anyplace, remember, even though the thetan has got them on a strip.

And dating is just an "over" and "under" proposition of getting the gross order of magnitude and then approximations and then dead on. It's like artillery. You... gun spotters. They fire over and they say it's over, see. Fire under and they say it's under. And then fire a little bit over and then a little bit under and then they hit dead on. And that is the way you date. You try to miss the date. You try to miss it over, you try to miss it under, see. You get so fixated you forget that in dating you are trying to miss. So you want to go over and under and over and under. A little more over, you know, so you go well over, well under, a little over, a little under, dead on.

Now, when you've got a bracket between let us say – well, let's take some finite number, five thousand and ten thousand. You want to know if it is "about," you see. You found out that it was less than twenty thousand, you see, and that it was greater than one thousand. See, that's your wide bracket. Now, let's narrow it down. And finally by this narrowing we get a difference of five thousand. We finally find it's less than ten and it's greater than five. We finally find this out with our dating. See. We could work it up to this line. And then we say, "Is it about six? Or is it approximately seven? Approximately eight thousand? You see. Approximately nine thousand?" Well, you got approximately seven thousand. See? Now, we want to know, is it greater than seven thousand or less than seven thousand, you see, because it might be six thousand nine hundred. And you find out it's slightly greater than seven thousand. Now is the time to go into your next digit. See. Now you get your hundreds. Now if you want to know – you want to know is it more than five hundred, less than five hundred, you see. Less than seven thousand five hundred. You don't have to keep repeating this other number all the time. And you finally get it.

Now, one of the things that spoils dating completely is the fact the pc all of a sudden rips the date out at you. And if you're not on the ball to write that down, you ought to be shot. Because the pc can stand being pawed at with an E-Meter just so long and he says, "Oh well, I'm a thetan, I know." And he gives you, "Whoa! It's seventeen million eight hundred and
sixty-five billion seven hundred and thirty-four thousand, seven hundred and sixty-two bang and ooooo, thirty-two days and five hours and seventeen seconds." And it all, all reads on the meter. You know. Bang, bang. You get a blowdown. He's had somatics, everything else. That's the date, man. Don't keep pawing around with it. You be on the ball to write one of those things down when he hands it to you. And you write it down. You've got it, man. That's the date! And don't discourage that. And you very often get protest from a pc if he doesn't give you the date. You say is it greater than five thousand, less than five thousand. The pc says, "Well, actually it's less than five thousand." And you say, "All right. Is it greater than five thousand? I get a read on greater than five thousand." Pc now begins to read on Invalid-date, Suppress and Fail to reveal. So, you have to keep him talking, see. You have to keep your rudiments in a bit on dating. Otherwise you get mistakes. "Have you thought of any date?" "Are you having any disagreement with that date?" You know. "Well, no not really. Actually I thought it was two hundred and thirty-four thousand, seven hundred and sixty-five was the right figure." You haven't even gotten to those yet. You can almost count on this as a mechanism for your pc as well in-session. You haven't squashed him completely.

So dating gets spoiled. The fine art of dating is always being upset by the pc's recognition of the date. But that's highly desirable, that recognition of the date because when he does give it to you it blows a stream of somatics. And zoom!

I can't find anything in these implants that resemble numbers. There are no numbers, there are no dates. Nothing like that. I can't find anything in them. But, I still question it. See. I still question it. I'm starting to accumulate a little bit of evidence now that apparently the two serieses are not just a trick sequence. See. A trick sequence, you know. It would be typical of the situation to say, "Well, this is when you were implanted at forty-three trillion. And then this" – you know, five seconds later – "is your implant at seventeen trillion." And they're quite similar. Well, I'm still prepared to find something like that. But apparently evidence is accumulating to the contrary, that they were different.

And what keeps the thetan so loused up in this – all these implants, what keeps them so fouled up from one end to the other is the fact that all of his own facsimiles have been pulled into it. Is one of the marvelous, most marvelous groupers that was ever invented and is about the only grouper of that magnitude that the thetan has anything of on the track. It is a real honest to God grouper.

Now, his own facsimiles pull in. So you send him to the top of the stairs and he's got railway stations, bus stations, escalators, department-store escalators, everything, dirty stairs, clean stairs, green stairs, pink stairs and they all are sort of a dirty gray and he can't see them and they're shifting and he puts his attention on anything and it shifts and it becomes something else, don't you see? You say, "Go to the top of the stairs," and he, sometimes, he finally gets to the stairs, he rather easily most of the time, he gets to the stairs and then if he can just keep these other stairs from coming in on him, why he's all right. He's got the stairs. And then it gets easier and other things blow off and the more charge you take off, the easier it is for him to orient it. Because it's that charge which is – makes things collapse.

Now, it doesn't matter. A thetan gets wild ideas about these implants. And it's very easy for the thetan to read far more complication and far more treachery into these implants
than actually exists. I know that's funny, because, boy, the treachery couldn't have been greater. But he can read more in than actually exists. And there is that to safeguard against as an auditor. He says, "Well, actually I was lured into this store. And I had been very active in (something or other), and the reason – and they had been out gunning for me for some time – and the reason I was implanted with a goal 'to spit' was because I had advocated the Chew Tobacco League, and so on and they wanted to get even with me and so..." That's all for the birds. And you can just don't bother to tell them about it, but just let – just work him until he gets a straight idea of what it really was all about.

And the more goals you discharge the better idea you'll have. Confront comes up mechanically, not by the amount of confronting done on the bank, but by the amount of charge removed from the bank. Confront is proportional to the amount of charge removed from the bank, not to the amount of confronting done on the bank.

So you could spend an awful long time getting the pc to confront this bank, because this of all things has interlocked charge and nothing else has interlocked charge, except the GPM itself and its charges aren't interlocked this way. They're not interlocked savagely this way.

3M2 is actually quite easy and quite pleasant compared to anything you're running here. But all of these implants lie directly across any hope of freedom or getting better. I've seen these things in one fragment or another in pcs now for many, many years and didn't really understand what this was. You can also get a better idea of their technology than it's... is true, see. You can get a better idea. You can think their technology was better than it was.

Probably it worked out this way. Some scientific whiz-bang figured out the wavelength of a thetan, see. And he figured out the wavelengths of various articulate thoughts and figured out how to pull a thetan out of his body with actual MEST-energy wavelengths. This is probably what he figured out. A high level technical society, you see. It'd make Cape Canaveral look like a child's toy pond, you know. And... but he figured this out, there was a big figure-out, made a breakthrough of some kind or another on this. Probably done from a highly mystic level. And then knew intuitively that there was something about grouping and knew that the way to get somebody confused was to tell them two things slightly out of phase, which were contradictory. And then didn't know any more than that. And you will inspect the line plot and out of your knowledge of Scientology you have a tendency to try to correct that line plot, see. "What is the proper gradient here?" Don't you see? "What would fit in here?" Don't you see? Ha. The difference is is you're now smarter than they were, see.

Similarly, knowing Scientology, you can read more plot into what they were doing than is there, see. Now, as far as their knowledge is concerned, their knowledge probably ended with this datum. They had personal experience on this, so this datum was common data. This was known by the man in the street. That when you kill a thetan, (quote) (unquote) "kill," see, he immediately goes out of his ruddy 'ead and goes on back to base and picks up another body and in a few weeks, why, you're meeting him as the machine gunner in the spaceship, see. And now, he probably has a lot of technology having been killed by you, you see. He probably knows something about it. And therefore he's twice as mad and he's very revengeful and he's very dangerous.
So when you kill an enemy – this is the problem – how do you prevent consequences when you kill one of the enemy? See, how do you prevent that consequence? And this was probably serious enough as a problem – and has been as a problem on the whole track for a very long time – that it caused them to invest enormous scientific – call it, well, brains. Yeah, let's call it brains. They invested enormous scientific brains, skill, research, finance, weaponry and so forth into solving this one problem. And that was the problem they were trying to solve. They didn't know life as a whole or the origin of the universe or anything like that. But they knew this problem. So they went ahead and solved this problem. And they also had a sequence of dramatization sort of a thing, they knew something about a gradient scale. They knew something about that. And they figured it out electronically until they could get an articulation of thought on a conceptual level. Something like that. Although I'm prepared to find that it's simpler than that.

All right now, now when they kill somebody they provided means to pick him up and capsule him and transport the capsule of all things to an implant station and put him over the jumps. Everybody when he first goes into this thinks he's walking, you know. Ha! He isn't walking. His body is charcoal way back there someplace or another. But he hasn't quite lost the illusion, don't you see, of having a body. And he's put on something like a theta trap or the capsule itself is sent through, don't you see. He's actually let out of something and is onto a pole and the pole rolls through, is really what happens. You'll see the single monorails on the visios. You'll see the monorails of the poles. And the fellow thinks that he's walking here and he's walking – he isn't walking anywhere, he's got a pole. The pole will move a few RIs and then stop, see? And wait for a few more RIs and then move again. And, so you get these funny things and it goes downstairs in the first series and through tunnels in the second series of implants.

Anyway, their technology level is quite interesting to inspect. And at first I was prone to upgrade it. But I think it is awesome in the field of weaponry and awesome in the field of knowledge of energy. I don't think it was too good in the knowledge of life. I think it is full of holes. Otherwise you wouldn't have found this duplicative sequence. See? They had the problem, however, of having to do mass implantations. So they just laid it all out on the drawing board and that was the way it was. And maybe somebody blew up these implant stations at some time or another and somebody had to lay them out again from – the plans weren't quite as complete now and they laid out a different series of RIs. That's about all that happened. They put it all below ground, they left nothing above ground. And so forth. It rather betokens the fact the place was possibly bombed at sometime or another. It was hit. This of course you know is just on top of a mountain and hasn't anything to do with what they want you to believe, a floating island in the sky. Which is what I thought it was at first.

Anyway, to give you any kind of a rundown about this, just enough – I was just giving you data. When you yourself have perceived quite a bit of this you find it much easier to pilot a pc through it. The only point I'm making with you. And your own – your activity right at the present time as an auditor is comparable to blind flying. But you have a very accurate meter and you've got an excellent line plot and you've got... that thing was really hell to come by but we've got it, see. And that's right down the line. There's a couple of little errors in it, in that original one. They're mostly typo rather than otherwise. There's someone who never – some-
thing or other ... Actually that wording contains "is." Someone who is never "...ing." That is the right wording for that. Then there's another one down a little bit lower on the opponent side. It's "importance." And it's actually "importances." And so on. Not many errors in it. But they're typographical type errors. They're not plot errors.

All right. And having that material and the fact that your pc will proceed through it willy-nilly and knowing why a pc won't proceed through it, is you've missed something, knowing the symptoms of that, why you can navigate this thing. And the navigation of it is repaid by the fact the pc's confront comes up and up and it's easier and easier to navigate. And the toughest part of it, of course, is the start of it. Always. And after you've been over the jumps and through it and been over a few of these goals and that sort of thing, why I'm afraid that your sneer level will be well up, because – so on.

I'm getting – it's kind of shocking when you first run into bits and pieces and parts of it, you know. You kind of go huhhh and your face goes all radiation burn or something like this and you "Huhhh, oh, no, no" and so forth. Well, I guess that's the way you're expected to feel. And I've been through that. You know. It's the ghastly feeling, "Oh, no, these are implants. My God, how do I tell them." You know, this kind of feeling. And, "What am I going to do now," you see. And I realized after about twenty-four hours or something like that, well, that's the way I'm supposed to feel about them. [laughs] So the devil with it. And all of a sudden realize that we've been presented with a silver platter – on the keys to the secrets of the universe. Just there. Bang. Because what'd it do? It gave us common first goals. It took away all of the scrabble at the beginning of an intensive. And in actual fact when you get good at this, when you really get rolling hot at this sort of thing, you'll be able to take a pc at the beginning of an intensive and run something like a bank a session. See. Coo! This is how far our technology has moved on up the line, you see. And you know how it is moved and you know what a difference it makes. And I'm awful glad you went through it. Otherwise you wouldn't have a good reality on what there is there to climb, see. I'm glad you went through it.

The thing is a problem, as I say, in blind flying at the present moment. But it's not the type of flying that goes into the deeper and deeper dark. It goes into the more and more light. And eventually, why, you'll be proofed against all of its shocks and twists and turns and confusions. And it's sort of it's sort of horrible auditing the thing, actually when you first start in and you haven't got the bank run and you're running it on somebody, you know, particularly that lousy bank "forget," you know. And you say the "Hhhhhh – What the hell was I saying?" you know. As an auditor, you know. But that's gone fairly rapidly too and you'll strike it occasionally on other goals.

It's almost a progress by the square. It's not a lineal, a gradient progress, you know. It's a progress that's very steep. You take a look at somebody who is only a short time ago – a short time ago has had this and that – a lot of them have been creaking around one way or this and they've run half a bank, see. Well, their viewpoint shifts on the thing. And you run a full bank on something like this. What you don't hear is what it was like before, what it was like before.

You're up against an old phenomenon I remember talking about back in 49. Trying to figure out: Why didn't anybody ever thank you for running one out – an engram. And I said,
"Well, it is negative gain. It's gone," you see? And in view of the fact that his difficulty is gone, he's no longer dwelling on it. So I called this negative gain. So he therefore is very often less appreciative than he should be, you know. You just get through making somebody a first-goal Clear or something like that and they ARC break on you. You know? And why are they ARC breaking? Well, you – you are trying to find the start of the next goal or something like that and you miss an item. And you feel like saying, "Look-a-here. What the hell is going on around here?" You know. Do this for you. You haven't done anything for them, they're... [laughs] That's gone now. On this side of stuff always collect your fee in advance.

Anyway, the... it's not true that people don't appreciate it. They'll all of a sudden take a long backwards look at this and they'll say, "Hey, you know this guy's really done a job on me," you know. Well, now one of the things – one of the things that you have to keep track of as you're going along the line is the fact that a withhold at this level or running these particular incidents is no longer good enough to clean up a session.

Now, you bring the pc's tone arm down at the beginning of session as part of 3N with pulling some missed withholds. But you straighten out the session at its end if the pc feels rough at all with either overt or O/W. Because the pc actually feels pretty bad for having chopped you up when you're trying to do things for him like that. And that's buried and that is what is wrong with a pc who stays ARC broke. He's had an ARC break. It startled him out of his wits! He didn't realize he was going to ARC break. You miss a couple of items. You get something backwards or something like that or you distract his attention when he's all worried or confused about something. And he ARC breaks, bang! And he surprises himself more than he surprises the auditor. And by the end of session he is well cognizant of that as an overt. And if you don't get an opportunity to pull the overt aspect of those ARC breaks off, you make a pc pretty confounded miserable. Because he actually knows that he's acting like a heel. And it weighs on him. I mean he tries to justify acting like a heel and all kinds of things go on along the line. Pcs inevitably ARC break, but give them an opportunity to recover from them.

The best recovery on it as a general process that we've had for a long time is general O/W, if you just got to run it as a process. But in actual fact if you just hunt and punch around on, "What have you done in the session?" you see. And, "Have you done anything in the session?" you see. "Have you tried to make anybody guilty in the session?" And all of a sudden the pc is quite relieved to get these off if the auditor isn't accusative in asking the question. And the pc straightens out then. The pc feels much better. And the pc will snap back to battery.

Invalidation of an item, invalidation of suppression and in suppressions of items and that sort of thing leaves somatics on the bank and so forth. An... whereas you'd think it would be ideal then to run mid ruds on every item that you find, nooo, I'm afraid that would hold up the parade to such an extent that it would ruin the pc. So, therefore you have to be alert to the rudiments going out. And the pc inevitably feels he is being harassed. Why does he feel he is being harassed? Because in the incident he's being harassed! And he transfers the incident mood to the auditing session. He's being confused and harassed so he thinks the auditing session is going to confuse and harass him. And there are characters around who won't be audited anywhere close to this. And you're going to run into them, you're going to run into them.
They're not going to come near this. They won't be audited on any part of this. The only thing that saddens one is just realizing the fellow with the handout to him of freedom from all this is simply choosing – shudder – to remain in the darkness forever. That's awful grim to me.

But as far as my policy is concerned: You do all you can to get them audited and when it starts to amount to time which could much better be spent on people who will be audited, at that time you forget them. You just let them go along with their goal "to forget." Savvy? Don't pull – don't pull the religious gag of "The wandered sheep is more precious," you know, "than the decent person." Don't pull that gag, see. Because it actually has caused enormous trouble and has been a terrible stumbling block for the Church and so forth. They spend oh-oh-oh-oh, any quantity of trying, you see, trying to get back this wandered sinner, you see, back into the fold. And they turn around and some wolf et up the flock, see. That's no good.

Socialism is doing the same thing. You pay any quantity of time to the indigent bum, you see, who can't work, isn't worth anything anyhow. And you know, you give them big pay, and you take care of them, you give them housing and so forth and so on. He won't work and he won't help anybody, he won't do anything for anybody. But you just spend all of your legislation, all of your finance, all of your planning and so forth, taking care of that one guy, see. And then you look around one day and the guys who are working and the guys who are carrying the load, are just worked to death and they just fall with exhaustion on the lineup. Well, that's not – that's not workable. And I'm not talking about this – whether this is decent, indecent, right or wrong, nice or not nice. I'm just saying that it isn't workable to spend too much time on somebody who won't be processed.

Now, there's one thing. You cause an ARC break through an auditing error, I'd invest quite a lot of time to straighten that out, see. But how about this guy that you're just spending time on trying to get him audited, see? Ah, at some point, give it. Person has a certain amount of choice along this line. That's my advice to you about this particular problem because you'll continuously run into this problem. You'll have somebody on staff who won't be audited, won't be audited, won't be audited. "Oh, all right, I'll do it. Aaaahhhooooo terrible, I think it's all terrible and so forth. Oh, I don't know." Oh, well. Spend some time arguing about it by all means, but don't be late for any other-body's sessions. Do you know what I mean?

When people all of a sudden realize that is your policy, they won't be quite as retreative. They won't be... have to be coaxed quite so hard. There was somebody raising the devil down in Australia the other day. He was going to sue the organization because it had run three goals on him and hadn't found all its RIs. Oh, come off of it. I've survived worse than that any day of the week. So I don't know whether it handled the situation, but I'll tell you what I did write him. I said, "You be good or we won't audit you again, ever." [laughs, laughter] Always remember you're in the driver's seat along this line as an auditor. Always remember. Down deep, a person knows.

All right. Well, now I've covered a great deal of – of ground here. I wish I had a few more hours of lecture after a few breaks and so forth to cover some more of the ground, but this is rather hard to do. I want to give you some sort of an idea of this at all and I am giving you just the bare bones of technical essentials which you'll need to carry on at this exact mo-
ment. The speculative horizon with regard to this sort of thing – let alone actual data we've had – but the speculative horizon, you see, just stretches out there. You ever been on the Pacific Ocean? You look an awful long distance on the Pacific Ocean and you'll find space, you know. The speculative horizon is like that. It's way out, man. Boy, I mean we've collided – we've collided with data which is highly debatable as to whether it will be popular or unpopular.

And I'm afraid I have to go along with the first Foundation decision I made, back in 1950 when they had that Board meeting and told me I wasn't to research on any more past lives. I don't think they ever did get that end of the building back together again. The bricks are still cracked. [laughter] And I said, "Well, psychology and other activities in the field of the mind have always had a large eye on popularity. And they would actually throw away materials which didn't agree with things. They'd throw away the things which didn't agree. And that's why they've not come up with any answers. They consult this thing of the popularity of a datum, the acceptability of a datum and have therefore compromised truth. So you either accept truth or popularity."

Now, this leaves you with only this problem; how do you present then, if you've resolved that far and got your mind settled in, how do you present the truth in its most acceptable form? [laughs] That's the problem you're left with. And that will probably require a lot of talk about. I could have lectured to you today on the probable source of the human race, the probable origin of what has been known as religion on this planet. Now, that's – that's – that's grim. That's a grim subject. That's a mighty unpopular subject. That's upsetting to one and all.

Now, we have the argument, just because there's been a false heaven with implants on it, does not mean that all heavens are false. You see, we get that immediate argument, because if we say, "heaven," somebody is going to think, "nix heaven." [laughter] Then, if we say, "Nix heaven, there is no heaven," immediately we're going to get the other – the oppterm in restim and everybody is going to say, "There's heaven," see, and so forth. And I think we should follow an impartial attitude that says it doesn't matter whether there is actually a heaven or a not-heaven, you see. We have our own views on this subject, or something like that. Now, how did you get on this planet and why and what were you before you came on this planet. We could also give a considerable talk about this, although not too much data is known on it now. I have more than a good idea of what happened and why you're here and what you were. And then, therefore, what the character of Earth has been and why its history has been this particular way. And a lot of things are falling together.

And you ever watch one of these animated cartoons where they have a – well, I don't know, there is a broken-up candy bar or something like that and it suddenly assembles itself? You know, you see all the parts come in, you know, like that? I've been looking at this huge vista, you see, of infinite numbers of pieces to the puzzle with a good alignment of this, that we were all doing on. We were doing fine with this alignment and we had these pieces and we could be absolutely sure of these, but where did it go over there and where did it go? Well, we better not pay too much attention to that. Let's get these pieces here and so forth. And what's happened to us is horrible. An animated – I mean, I picked up a piece over here that said GPM and worked out the various mechanics of the GPM as they actually exist on the whole track! That's perfectly sincere work. That isn't out of that implant, see?
And then started to move this piece into the puzzle and we all of a sudden got this cartoon assembled. Everything started racing in toward this puzzle. I could no more stop it now with a barricade. I couldn't stop it, you see. This puzzle is just sitting there assembling, see. It's going click, click, click, click, click, click! [laughter] And it's embarrassing! I'm sitting here with the most unpopular data imaginable, you see. [laughter] I feel like saying, "Hey, hey, don't you realize I got to talk about this?", you know. [laughter] Well, that's our problem. I imagine we've got this problem for some time to come. But remember something, there – just regardless of the embarrassments in this, regardless of this and that. Oh, I mean I could look around right now and realize there are even embarrassments here about this and so forth, you know. Regardless of all that, there's diamonds and jewels falling out of this of great price. And you needn't ignore those because they are very, very important. One of them – the first one you saw was, well, everybody has a common first goal. Bang! There went Lord knows how much indefinite auditing. See, it just went, just like that. All right. There are other things like that happening.

What we've got here in the field of dissemination, I don't know quite what it means yet, but it's certainly a hundred and thirty-two carat, sixty-four faceted, cut diamond, blue-white. Because nobody ever had a common denominator of dissemination before. Common denominator of dissemination.

Well, people get wilder on this subject than anybody you ever heard of I imagine that we – to the end of our lives we'll never hear the bricks stop being thrown on this subject. I imagine that it... we've started an Armageddon of sorts in the field of thought. Because this thing is going to have concatenations. This thing is extremely painful to some people and extremely exciting to other people and some people say, "Gee" you know, "Gosh" you know, "Really?" "Hey, I knew it! I knew it!" you know. And he goes off into his personal experience, "Every time the old man picked up a strap and so forth and told me I was never going to go to heaven I knew it!" [laughter] "I knew it! See? I knew there wasn't any such place. Yeah well, those Scientologists are right. You see." And some other person who has gotten a big send from religion, you see, and has actually benefited and has a... gotten peace and quiet and so forth from existence, you know and so forth. They're going to say, "Well, those people are absolute barbarians, savages and blasphemers." Don't you see.

Oh, man, I don't think the brick dust is going to settle for a long time on that one. I don't think it's anything that you could trap. I mean I don't think you could stop it. I don't think we any longer have the power of saying, "All right. This data is going to be held as confidential. We're not going to talk about that." I don't think we have the power of doing that. We could probably withhold it. We could try to withhold it. We could do something or another at considerable consequences to ourselves. I don't wish to risk anybody on this – those consequences, so the devil with it.

What does it mean? I mean I could lecture to you for a number of hours on the subject of what does it mean. It's the last few days, you see, of releases one way or the other. It's a culmination, it's the automatic assembly of this and that. Well, it sure means an awful lot; sure means an awful lot.
And to show you people can do it and that Saint Hill does turn out good graduates, you know, you've got a new Instructor now, and – stand up a moment, Ann, and say hello. [applause] Now, Ann got... we make good auditors, ACCs and Saint Hill and so forth. We sure do. I take full credit for it. And bad auditing, take no credit for it at all, I mean... But Ann walked into 3N just on the last twenty-four hours or something like this and just got the briefest of briefing and so forth and sailed in on Reg last night and ran one hundred and thirty-two RIs. Is that your first session?

*Female voice: Yes, sir.*

That's her first session, see. Pretty good, huh? So it can be done. I'm not saying, "Where have you been?" But I'm saying that's pretty good. So it can be done. So, freedom is in view. This is something that then is doable, you can do it very easily, very well. The finite end view of it is right in sight. You've got certain technology you've got to learn and so forth. But I would say that a Scientologist, did not need too much grooving up on what we're doing right this minute in 3N if Ann, as good an auditor as she is, can take a very brief, momentary briefing, "Oh, this is how you do it" and sit down and find a hundred and thirty-two RIs on a PC in her first session of running it.

And I tore through a bank here in the last few hours of auditing and straightened out a bank and got Mary Sue up to first goal and so forth. So, I'm saying "Well, now there's your..." Got her up to first-goal Clear and shining and so forth. And so, I now have done it using the exact tools that you're doing and you were using. And reality is growing on this thing. It's getting easier. It's not quite as difficult to do. It is simpler to handle various PCs with it. Your PCs are not as hard to handle with this as other things. It's not as hard on PCs.

All this thing is culminating into the fact that we've got what? Well, we were saying perfectly happily we spend oh, I don't know, quite a few hours to first-goal Clear. See? We were happy to spend that. And we counted on a few more goals and the person would be a lot better off and so forth. Man, do you know what we're looking at right this minute? We're looking at about two hundred and fifty hours to OT. That's another piece that has suddenly fallen into line.

Now, you were a pretty hot article before you ran into this – until you went to heaven. You were. You were pretty good. You knew you lived more than once. You could transfer bodies at will. You had a lot of tricks. You were rather prone to be combative. You... But actually this is... you were way up already compared to where you are now. Therefore, one returns a thetan to a wiser and better state, which is a fantastic game. You see, you'll know a lot more now, with these incidents cleaned up than you ever would have known if the incidents had never been received. And although what time you've spent since you received them, may have been hell (not a pun), you can make a better thetan. I mean the guy is better off. The guy is more experienced. He has more direction. He'll have more judgment, certainly. His experiential track has been improved and then he suddenly is able to cash in on his experiential track.

So, beings such as we are dealing with right this minute have never been seen before in this universe. So this isn't just a patch-up of the old. This is a new kickoff of one kind or another. Now, whether those guys that did this are still around, whether that empire is still
going or whether our own empire is still going, these are questions we don't know. And probably won't know for some... weeks. [laughter]

Thank you.
TV Demo: Blocking Out and Dating Incidents

An auditing demonstration given on 15 May 1963

LRH: Okay. This is a demonstration – this is a demonstration of probably the only difficult piece of auditing which you will have to do on running these implants and so forth. And it is a demonstration purely of dating and blocking out the first incident, the first engram.

The – well, you're back to 1950. But we know so much more about running engrams today than we ever did then, that actually, if you get a few very stable data, why, you'll be all right.

This is not a demonstration of engram running. This is a demonstration in blocking out the early items and exploration of the track immediately preceding the first implant. Okay.

Now, your chair is fine?

PC: Uh-huh.

LRH: Is it all right if we audit in this room?

PC: Yes.

LRH: Very good. And, give me a can squeeze.

All right. Bang. That's fine. Now, what I'm going to do here is just try to block out the early part of this track, if I can. Nothing very tense.

PC: All right.

LRH: All right? All right with you if I begin this session now?

PC: Yes.

LRH: Okay. Start of session. Has the session started for you?

PC: Yes.

LRH: Very good. What goals would you like to set for this session?

PC: Oh, to block out the early part of the track.

LRH: All right.

PC: Get the date and work well.

LRH: Okay. Very good. All right. Now, you've just successfully completed the handling of the first GPM.

PC: Yes.

LRH: And I think that's very well. As you realize, there's undoubtedly data ahead of this.

PC: Uh-huh.

LRH: And let's see if we can find it, huh?

PC: All right.

LRH: All right. Now, the beautiful part about this is you don't have to do very much regression and all that sort of thing because it's right there. Now you're... that's not an instructive note, I mean, as far as you're concerned.

PC: Uh-huh.

LRH: Now, we're going to look for the point of capture. And we're simply going to date from the beginning of the goal "to forget," which you have already run. It's the top of the stairs...
PC: Uh-huh.
LRH: ...the top of the stairs in the vestibule there.
PC: Uh-huh.
LRH: I don't know if you had any visio on it or not, but that will register. It's from the top oppterm of the goal "to forget."
PC: Right.
LRH: That's the part we're dating from. We're just going earlier than that.
PC: Right.
LRH: And that we're taking as zero.
PC: Right.
LRH: And I want to know now if your first contact with these people that did the implanting was on the order of years earlier.
PC: All right. Was it on the order of months earlier?
LRH: All right. Apparently on the order of years earlier. All right. Now, is it tens of years earlier?
PC: Tens of years earlier? Would it be on the order of hundreds of years earlier than this top oppterm of the goal "to forget." Hundreds of years earlier?
LRH: Tens of years earlier? Or just single years earlier?
PC: I get a little more reaction on that. Now is it more than five years earlier?
LRH: Less than five years earlier?
PC: Well, I get no read. What did you think?
LRH: Six. Is it six years earlier?
PC: I've got - I'm getting six - comes up.
LRH: Six. Is it six years earlier?
PC: All right. We're getting a little more fall on that. Six years earlier? All right. Now, let's be a little more specific here. Apparently we're running into a little more mud than I care to have here. Let's find the capture.
PC: Right.
LRH: Let's date the capture. Now, this is the first series. Did you have two series? Two series? One series?
PC: Just one? You only had one?
LRH: Huh, is that right?
PC: Well, it started out, I believe, and then found there were four.
LRH: Four. Were there four series? Four times you went back through this?
PC: Well, I get a fall on that. Did you go back through that four times? Three times? Two times? One time?
LRH: One time? Two times? Three times? Four times? This is very equivocal here. She said – found that there were four.
PC: Uh-huh.
LRH: Right. Four complete tours through this?
PC: Yes. I'm a sucker.
LRH: Four complete tours? Huh? Four complete tours? Or four complete engrams? I mean, four complete GPMs? Four complete tours?
through? Is it four times?

Apparently. Apparently. There is some verification on this. This is pretty muddy.

PC: I'm getting a pain here.

LRH: All right. Very good. Very good. Seems there's sure more than once anyway.

PC: All right.

LRH: All right. Now, referring to the first one.

PC: Uh-huh.

LRH: The first time, the bank you've just run. And we've got a point of capture there someplace. Right?

PC: Uh-huh.

LRH: Is there a point of capture? A point of capture? Yes. Now, is this point of capture months before? Months before the first goal?

Years before the first goal? Months before the first goal?

Weeks before the first goal? Days before the first goal?

Ah. Days before the first goal.

PC: I'm getting to feel I'm being pinioned with the arms.

LRH: Oh, yeah.

PC: Yeah, the arms are quite...

LRH: Very good. All right. This is days before the first goal. All right. We've got that to that. That reacted. All right. Was it five days before? More than five days before? Less than five days before?

Was it more than five days before the first implant? Was this capture more than five days before the first implant? Less than five days before the first implant? More than five days? Less – was it five days?

PC: Uh-huh.

LRH: All right.

PC: Sorry. I meant to tell you.

LRH: All right. Very good. Five days before.

All right. Very good. That's fine. It's five days before. All right. That's a speedy one. All right.

Now we've got that point, have you got any impression of what might have happened there five days before?

PC: Well, something to do with my arms. I was pinioned somehow with my arms. So I was very shaky. Um – I don't get anything else. Suffocation. Um – I got a feeling of being – um – I don't think it is, but the nearest I can get to it is a sack thrown over my head and pinioned um – other ways.

LRH: All right.

PC: But it's more of a – it's not a sack, it's more of a... um – it's balloon fabric.

LRH: Oh, yes.

PC: It's silver balloon fabric sty.

LRH: Right. Right. All right.

PC: Um – had me – had – me arms are pinioned. Funny getting this arms business.

LRH: All right. Now, just two minutes before that, where were you standing.

PC: I was going to say on a mountain.

LRH: All right. Good. Go ahead and say it.

PC: On a mountain.

LRH: All right. That's got a little
bit of a fall on it. Okay. And what happened?

PC: Pains across me shoulders.

LRH: Ah, yes.

PC: Um – I'm sorry, I've lost where I'm supposed to be.

LRH: All right. Well, that's all right. That's all right. Let's go to seven days before the capture. Seven days before the capture.

PC: Tenseness went off.

LRH: Yes.

PC: Um...

LRH: You have any somatics there?

PC: No. No, they – it was a sort of relief. I seem to have lost somatics. There's a slight suggestion of somatics in the back again now.

LRH: Oh, there is a slight suggestion in the back.

PC: Uh-huh.

LRH: All right. Very good. I've got that. Now, let's just move back a little bit further.

PC: Mm.

LRH: Let's go back a year before the first implant – before capture. A year before the first oppterm. A year before the first oppterm.

PC: Now I've got a picture that I've had before. It's never been run. It's come up in auditing and it – it again is in a mount... a mountainous country and it seems to be in um – a what do you call it? It's not exactly a valley, it's a hollow in the mountains. And there's – um – the mountain towers up behind it, but there are high hills or rocks in front.

LRH: Uh-huh.

PC: And um – I think there's a woman there.

LRH: Oh, all right. All right. You've seen this before?

PC: Uh-huh.

LRH: Well, good enough. Anything else you notice about that?

PC: Well, the woman seems to be my boss for some reason or other.

LRH: Oh, yeah.

PC: And um, she's wearing the sort of clothing that is not... um – um – more Grecian type.

LRH: Uh-huh.

PC: Dark haired.

LRH: Uh-huh.

PC: Young, attractive.

LRH: Uh-huh.

PC: Powerful.

LRH: All right. Very good. Now, your somatic: do you have any electronic somatics at all?

PC: No electronic.

LRH: The same of a year before. You sure then? How's that one that you just mentioned? That's gone at this point?

PC: No, I've got uh – uh – something across the – a tightness across the stomach now.

LRH: All right. Very good. That's all we want to know.

PC: Uh-huh.

LRH: All right. Let's go two years before the top oppterm. Two years before the top oppterm.

PC: That turns on the shoulder – across the shoulders immediately.

LRH: All right. And what do you
see there at two years?

PC: Um – don't really see it. But I seem to know there's a – um – chariot type of thing. It's the wheels particularly, like the wheels of a gun carriage. Uh – I'm afraid that's all I can tell you.

LRH: All right. That's fine. That's fine. That's all fine. Now, let's take it at three years now, three years before this top oppterm. Three years before this top oppterm. Now, what do you – what do you... what can you tell me there?

PC: Um – same scene. Same area. Not – not the same scene, the same area it seems. Um – old man. Not sure whether it's me or not.

LRH: Uh-huh.

PC: But rather um – unkempt uh – and not primitively dressed.

LRH: Right.

PC: It c... it could be Father Time or something.

LRH: Oh, yes. All right. Okay.

PC: Don't know what's amusing about it. I want to laugh.

LRH: Oh, all right. Now, is that all of that?

PC: Yes.

LRH: All right. Good. Do you have a somatic there?

PC: No.

LRH: No. Let's inspect that very closely there...

PC: All I've got is a feeling of brightness uh – above my eyes – in front there.

LRH: What do you mean brightness?

PC: A bright light. Brightness above my eyes. It's – it's...

LRH: All right. Very good. Now, let's find a point there – let's go to five years before the top oppterm. Five years. You've got something?

PC: Don't get a thing.

LRH: Well is it just...

PC: Just black. Not – not exactly black. I would say hazy.

LRH: All right. Very good.

PC: Misty.

LRH: Very good. Now, let's take it to ten years before that top oppterm. Ten years before the top oppterm, now.

PC: Now, all I get now is a quivering in the eyelids. The eyelids seem to be quivering.

LRH: All right. Very good. Now let's take it one century – one hundred years – before the first – top oppterm.

PC: I'm out in space – doing nothing.

LRH: Thataboy.

PC: Feeling about just out in space and there's planets around and so on. Nothing very distinct, but that's the...

LRH: All right. Do you have a somatic there doing nothing in space?

PC: No. When you asked me if I get it – when – I'm not aware of a somatic until you asked me.

LRH: That's all right.

PC: Then I seem to get this across the shoulders again. It's not – nothing very bad, but I'm just aware particularly just right across the shoulder there.

LRH: All right. That's okay. That's just what I'm looking for.

PC: Okay.
LRH: All right. Is that present in the hundred year earlier?

PC: No – it's – now I'm getting more as if I'm – you asked me about electronics, I'm getting more as if I'm being electric shocked, you know. I could easily turn on this shaking with the body.

LRH: Uh-huh. Uh-huh. Therefore at a hundred years there you do have an electronic sensation?

PC: Yes. Yes, definitely.

LRH: Very good. Let's take it two hun...

PC: Now, I'm getting a somatic down there as well.

LRH: All right. We'll find this.

PC: Uh-huh.

LRH: Two hundred years before the top oppterm? Two hundred years before the top oppterm of the first implant? Two hundred years? What have you got?

PC: I was just aware of the somatic now across the shoulders without you asking me for it. Um – there's nothing at all. Blank.

LRH: That area's blank and shoulders lashed up. All right. That's fine. What's – what have you got there?

PC: Well, it's just – I've got this, um – I mean this is even where I am...

LRH: Uh-huh.

PC: ...this terrible feeling of puzzlement, of bewilderment.

LRH: Yes.

PC: That's – that's present.

LRH: All right. All right.

PC: Can't make it out.

LRH: That's all right. All right. Let's go three hundred years before the top oppterm. Three hundred years. What do you got?

PC: I'm not puzzled.

LRH: Good.

PC: And um – seem to be in – as if I've been blinded with light. And it's like the afterglow of when one's been blinded by light. If you – you know if you get a bright light flashed in your eyes and you shut them you can still see a bright glow. Or at least I can.

LRH: Um-hm, uh-hm.

PC: And this is the feeling I'm getting here. Now it's just darkened up slightly.

LRH: All right. That's excellent. Tell me anything more about three-hundred-year point there?

PC: No.

LRH: All right. Let's go to four hundred years. Four hundred years before the top oppterm. What do we find?

PC: Um – a feeling of going back. A feeling about my eyelids being vibrating again. And uh – sort of um – they're not actually halos, but uh – something going away from me in the form like dwindling halos and they're gradually going away.

LRH: Uh-hm.

PC: Dark. It's like um – it was purple. Var... various colors and so on like, uh, auras people have.

LRH: Oh, yeah.

PC: Things like that. Not very distinct.

LRH: All right. Do you have a somatic there at four hundred years?

PC: No somatic there.

LRH: No somatic?
PC: No.
LRH: But you see these electronic...
PC: Yes.
LRH: ...things departing?
PC: Uh-hum. Yes.
LRH: All right. Very good. Very good. Now, you make any guesses here of what this might be in relationship to what?
PC: Well, the guess is that I've – I had a feeling I've just come out of a body or something – um – and am a bit bemused by it all and a bit lost.
LRH: Uh-huh.
PC: Uh – it's an area, I would say, of unconsciousness, if anything. Or uh – be – conscious unconsciousness is the best way I can describe it. As if one was aware when one was unconscious, this is what one would be aware of.
LRH: Oh, I see.
PC: Ah, this is double Dutch maybe but it's er – it's so shadowy and vague, you see, there's nothing to look at, nothing to do, no sensation, nothing to feel. But yet one is aware...
LRH: Uh-huh.
PC: Uh – it's an area, I would say, of unconsciousness, if anything. Or uh – be – conscious unconsciousness is the best way I can describe it. As if one was aware when one was unconscious, this is what one would be aware of.
LRH: Um, very big. Very, very big.
PC: These bicycle wheels are – I called them – they're half the size of a man, but they look very small in relationship to this whole thing. It's like um – the plane appears to be pitched up like the Dakotas that's, you know, pitched up a lot and they've got – the tail comes down rather low and the front is propped up. I can't see the rear of it though.
LRH: All right. Very good. What's your relationship to this plane? Who are you?
PC: I'm a mechanic.
LRH: All right. All right, do you have any somatics?
PC: When you asked – when you asked me, at that point I got a pain in the back of the neck.
LRH: Okay.
SHSBC TAPES 201-300 1517 04.02.15
PC: Yes, it's military. It's the – I don't know why I know this, but it's the color of military stuff. It's grayish.

LRH: Uh-huh. Oh, very good. Now we're getting some pay dirt. You've got some pain in the back of your neck there though.

PC: Uh-huh.

LRH: All right. Now, let's take a crack at this at two thousand years before the first implant.

PC: Somatic in the right ear immediately.

LRH: All right.

PC: Um – I'm in the air now. This is air and there seem to be – I can't locate... Hm – I've got, um, a view of craft in the air and they're shaped like um – delta – delta craft. That's right.

LRH: Mm-mm.

PC: Delta craft. They're a long way away. I'm – and I'm – plane I'm in is in part of this formation. I'm having trouble with my eyes, I can't see. I want to screw up um ... Somatics around the eyes.

LRH: All right.

PC: Something to do with difficulty in seeing here.

LRH: Um-hm.

PC: I ought to be able to see and can't, is what I get. And I'm sort of trying hard to find – see or find out something. But I've got this – I'm forward in a plane. Um – and over on the – don't know – on the right ...

LRH: Yes.

PC: ...um, there's this other delta-like plane. It's a long way away. I don't see why I'm so worried about that. That's all I've got there.

LRH: All right. Fine. Fine. Take it half an hour later.

PC: Still watching. Still watching that plane.

LRH: All right. Then take it two hours earlier than you first squinted your eyes at it there.

PC: We're pointed at the sun. Sun's blinding us.

LRH: Oh, I see.

PC: We're being uh – being out-maneuvered. Out-maneuvered and um – I don't know what – and somehow we've got directed into the sun. And this is nothing to... a sun or the sun – and it's got us confused.

LRH: Um.

PC: Um – the other plane isn't there.

LRH: All right. That's fine. Okay.

PC: No. Just this uh – feeling of bright light in me eyes.

LRH: All right. Otherwise no electronic sensations?

PC: No.

LRH: Very good. Very good. Now, we found a point here where we have no electronic sensations. Okay?

PC: Right.

LRH: Now, move forward toward present time to the first heavy electronic sensation from that point. There we go! Good.

Good. Now what – now move just before that was received. All right. What have you got to say?

PC: I was unconscious.
LRH: All right. Okay. Now is this – I'm going to date this "earlier than the implant." Okay?

PC: Right.

LRH: Is this on the order – is this more than a thousand years before the implant began? Yes.

Is it greater than 1500 years before the implant began? Yes.

Is it greater than 1800 years? Yes.

Is it two thousand years? No.

Is it greater than 1900 years before the implant? Yes.

PC: 54.

LRH: 1954? 1954 years?

PC: Um.

LRH: Is that what you got?

PC: Um.

LRH: All right. That's it. That's 1954 years before implant. Okay? Very good. Now, go just – go to about 1900 – no, go to 1955 years before the implant.

PC: Hm-hm.

LRH: Got that? Now, what're you doing there? There you got it.

PC: I've got a pain in my head.

LRH: Yeah.

PC: Um – it's right on the crown of my head. It goes, oh, like a shape of a skull cap...

LRH: Uh-huh.

PC: ...pain, type of pain.

LRH: Uh-huh.

PC: Um – something's trying to show up. Uh – it's...

LRH: Yeah.

PC: ...well, it's like the end of a sparkler. You know those fireworks...

LRH: Attaboy.

PC: ...we had with sparklers.

LRH: Attaboy.

PC: Um, I just sense that there.

LRH: Good. Good. Good. Let's take it at 1955 and a half years before the implant. 1955 and a half years. Anything going on there?

PC: Only...

LRH: All black?

PC: ...a jerking – just uh – want to jerk my head.

LRH: All right. Now...

PC: Um...

LRH: What?

PC: Trying to work out – I feel I'm doing it. It's... I'm watching something.

LRH: Okay.

PC: It is uh – something that is taking my attention and I – yes, it's – I'm watching something moving across the – the horizon or something.

LRH: That's it. All right. Fine. Now, uh...

PC: Getting rather hot.

LRH: All right. Let's move back to the first moment you are aware that there is something to look for at 1955.

PC: Well, this seems to be an old story of mine. But it's come up again very strong that I've been blinded and I can't see.

LRH: Oh, yeah. All right. All right. Let's move it to 1957 years before the implant.

PC: Getting hotter.

LRH: Yeah, that's it. Any visio
PC: Something's trying to peek through, um, um, this sparkling thing again. Um, oh, and getting somatics across me – bottom of me shoulder blades.

LRH: All right.

PC: And um – this that I'm looking at is um – is about an inch long and is glowing, white hot, and um – has, uh – I seem to have got rid of something, I don't know what...

LRH: Uh-huh.

PC: ...and uh – has little sparks – rays coming off of it, not very big. Um.

LRH: Uh-huh.

PC: Quite geometrically arranged, but they're not – um – they're not stationary, do you see? They're coming off – it's like you'd see the fields of magnet – field of magnetism or something like that.

LRH: Right. Right. All right.

PC: I've got this pain across the chest.

That's – you're right where you're supposed to be.

PC: Good.

LRH: All right. 1955 and a half years. All right. That's a very important date. 1955 and a half years. All right. Now, let's move back to 1956 years before the top oppterm.

PC: I'm just being messed up.

LRH: Hm.

PC: Um – I've got a head somatic now.

LRH: Uh-huh.

PC: And I've got – this halo's going away again.

LRH: Right.

PC: And somebody's out to confuse me, mister!

LRH: Yes, sir. All right.

PC: And uh – what they've done is they've got me in something and I can't see out. And I'm being moved around and I can't do anything about it. I'm just moved around. There's nothing to look at and it's pretty – well, I get fed up with this.

LRH: Hm, hm.

PC: Um – nothing to do, nothing to – nobody to speak to, nothing to say, nothing to look at.

LRH: Uh-huh.

PC: Um – feeling of getting pains though. They give you that to make sure you know you're there.

LRH: Uh-huh.

PC: And a flushed feeling in my face. But I haven't got a face. I've got a flush feeling in what...

LRH: All right. All right. Very good. Now, let's move it to 1956 years before the top oppterm of the first implant.

PC: I'm sorry I didn't hear what you said.

LRH: All right. Move to 1956 years before the top oppterm of the first implant.

PC: Uh-huh. Now I'm getting the impression of um – a capsule. Ah, it doesn't seem to be very big. It seems to be the size of – I don't know if you know the sweet we call the licorice comfit – but it's about an inch long and it's got uh – it's got a base. It's more like an acorn base to it –
it's longer, you see, it's just like the licorice comfit. And it's got this base to it like an acorn has before it's... um – comes off the tree and then we make little pipe shells out of them.

LRH: Uh-huh.

PC: And it's – um – seems to be upside down, it's at that angle and uh – yes, it's glowing. Um – it's a milky color – milky color, but the cap – the uh – base of it is, uh – darker color. It's not glowing there.

LRH: Hm-hm. All right.

PC: Now there's some – they're fooling me again with this. Or somebody is. Because they – it's changed its color; it goes red. And I'm getting the feeling of uh – a flashing feeling as if it's uh – me eyes lids are going on, you know, I'm getting this flashing feeling as if it's um – like the light coming out of a movie camera that has a – movie projector that hasn't got a film in it.

LRH: Oh, all right.

PC: Don't like that.

LRH: I got it. All right. Very good. Now, obviously here something has happened between two thousand years and 1956 years. There's something in this – this forty-four-year period.

PC: Mm-mm.

LRH: Have you got any inkling of that? That's not a good question, but I mean just – just offhand. Can you tell me anything?

PC: Well I'm a little bit uh – they – I'm – I've had me time mucked up here. Could you just tell me where I'm supposed to be there, then?

LRH: All right. That's fine. I'll give you – I'll put you right there. Let's move to 1958 years before the top oppterm of the first implant.

PC: Well, now I'm getting some uh – idea of some scenery.

LRH: All right.

PC: Uh – uh – it's um – a land of milk and honey is what I want to say. And that's not suggestion because – not something suggested to me, it's uh – it's that sort of land; it's very light and milk creamy. And this damn capsule seems mixed up in this picture somewhere.

LRH: Yeah.

PC: Um – the – this is rock formation but it – rock formation, but it's rather beautiful. It's more like um – opal color, a pale opal color, and it looks as good a quality. Um – and it's uh – it's almost dazzling. But very attractive, very, very beautiful. Um – this is a – this is a scene from somewhere. This is what you see and – oh, well this is – this is something – I know, this is something like an aerodrome.

LRH: Oh, yes.

PC: And this – I think it was a case of perspective with this acorn thing. This is a – this is some form; I've never seen anything the likes of this. This acorn thing or capsule thing is some form of spacecraft or something. And um – I – this place I'm in is like – I've got me back looking out the back to this. But I imagine it's a rather an enormous pillared terrace to this aerodrome and this thing is stuck out over on the right there.

LRH: Mm. All right. Let's move back 1958 years before the top oppterm plus three hours. 1958 years.

PC: Now I'm inside.

LRH: Attaboy.

PC: Um – get the impression of – they don't make aerodromes like this –
bloody silly. That black marble – marble -
they must have had a lot of this material to
use up. You see? I mean, we have to – oh,
dear, it seems out of place. It's all... There's
nobody there though.

**LRH:** All right.

**PC:** It's an empty hall. Um –
more recently I've seen – Empire State
Building decor.

**LRH:** Oh, yeah.

**PC:** And all very lush, but no –
very aesthetic, I think, is the word ...

**LRH:** Uh-huh.

**PC:** ...but no um – utility pur-
pose to it. And yet it must be. It seems to
be counters, but they're not counters. You
know what I mean, you know, table count-
ers.

**LRH:** Uh-huh.

**PC:** Or it's lit through the –
through the walls or something or the
counters there.

It's going a bit hazy now.

**LRH:** All right. That's all right.
That's fine. Did you invalidate something
there? You suppress something?

**PC:** I did. I was going to say it
was lit through the floor and that would
have made me a liar because I'd said ear-
lier it was a black floor.

**LRH:** A-ha.

**PC:** And uh – so – yes, all right.
Now, I was trying to get an explanation of
that. And then I – then it went ...

**LRH:** All right. Do you have a

somatic there as you're looking at that?

**PC:** No.

**LRH:** Attaboy. Now we're getting
somewhere. All right. Now move to – it's
going to be a little bit forward here – move
to 1958 years, two hours.

**PC:** Well, I seem to be sitting in
the porch of this place. Um – pillars
around me, looking out across a very vast
expanse. Nothing there though.

**LRH:** Uh-huh.

**PC:** Everything is deserted. I'm
the only person around here.

**LRH:** Uh-huh.

**PC:** I'm a – well, you know, I
feel – I've got the feeling that – all right,
everybody else has died and uh – this is all
mine now. And um – so what? I mean, it's
no good to you.

**LRH:** Oh, I see.

**PC:** Uh – I'm just sitting there a
bit disconsolate about it all. I'm using a lot
of words I don't usually use, by the way.

**LRH:** All right.

**PC:** "Disconsolate" isn't a word I
normally use.

**LRH:** All right. Very good. Now
we're going to move forward from that
point there, one hour.

**PC:** Yes.

**LRH:** What do you see there?

**PC:** Still sitting there, man.

**LRH:** Still sitting there.

**PC:** Yes.

**LRH:** Okay. Now...

**PC:** There's nothing to do!

**LRH:** 1958 years and one half
hour from the top oppterm.
PC: Well, I want to say there's an explosion.

LRH: Yes.

PC: And then – and then I think that's silly to say that.

LRH: All right. That's fine.

PC: But I don't – get an impression of it.

LRH: You get an impression of it. Now what's the exact moment of that explosion there? Was that – has it just happened or...

PC: Uh...

LRH: Is it happening?

PC: No. It w... No, I can tell you it was just – how did I know that? It was just about to happen when I said I got the impression of the explosion. Oh, the explosion's a long way – not a long way, but some way away. And I'm – when you said that I was aware of the explosion, it the – hadn't reached me. Do you see what I mean? No it...

LRH: That's it.

PC: ...blast or something.

LRH: That's it. Now you got that point there?

PC: Yeah.

LRH: All right. Now, move to 1958 years and one-half hour – that's where you are, is that right?

PC: Right.

LRH: Now move to 1958 years and one hour before the top oppterm.

PC: Well, I'm still sitting there.

LRH: All right. There's nothing happened there?

PC: No.

LRH: Right?

PC: No.

LRH: Okay. Well, what – what's visible from where you are there?

PC: Well, I'm just sitting in this porch. And there's pillars around me. And I'm just sitting there minding me own business, doing no harm to anybody, I assure you, and um – looking out over this – what could be – well it would be an enormous aerodrome. Enormous!

LRH: Mm.

PC: There – there's practically – I mean if you can – it's like the – perfectly smooth land, no – hardly any inundations in it at all; it just goes almost – oh, I see, is a mist. It the – there's a limitation on how far you can see, so I can't see any horizon or limit. It goes off into mist. There's something hidden there.

LRH: All right. Very good. Now, let's call the moment you are sitting there on the porch just "that moment on the porch." Okay?

PC: Right. Yes.

LRH: All right. Now, rapidly move through – rapidly move through the next six hours.

PC: Well, very quickly I got the impression of a crack, bang, crash, wallow and I'm tied up. I've got this um – feeling in me arms being pinioned again. And I'm...

LRH: That's a boy.

PC: ...I'm tied up.

LRH: All right. All right. Now, just let me check something here. Has – at that moment that you have there now...

PC: Yes.

LRH: ...has this ever happened be-
PC: Not that I know of.

LRH: No, I did – let me check it once more on the meter. Has it ever happened before? No, it's dead. All right. That's fine. Now, return to that moment on the porch.

PC: Yes.

LRH: All right. Very good. Now, this is just for scouting purposes – I want you to rapidly scan through the next three days. Just go ahead now, rapidly scan through the next three days and tell me where you arrive.

PC: Somatic in the chest or rather lower down there. Darkness. Uh – can't see, um. Well, I'm unconscious. There's been um... oh, I – there's this tying up business somehow or other – I can get that.

LRH: All right. OK.

PC: I get the feeling I've been tied up.

LRH: Uh-huh.

PC: And um – I just realized what – just had a little cognition on the unconsciousness here is – that this is – this is running – I know I'm running a period of unconsciousness. But yet I'm aware. Do you follow me?

LRH: All right. All right.

PC: This is a – quite a look for me.

LRH: All right.

PC: But I – in those three days I'm unconscious.

LRH: All right.

PC: There's nothing going on and there's nothing to see. They've – I'm bottled up.

LRH: All right. That's okay.

PC: Or, you know – that's all I can tell you.

LRH: All right. Thank you. Now move back to that moment on the porch.

PC: Right. That's fine.

LRH: All right. You got that now?

PC: Yes.

LRH: All right. Now...

PC: I've got something extra there now.

LRH: What have you got?

PC: There's a – you know, they had some funny machinery in those days – there is – there's a big plane out on this aerodrome. It is an aerodrome. And it's got four fuselages.

LRH: Uh-hm.

PC: Four. And they're not – it's like – I don't know what the propulsion is. It's not jets, but they're – it's in the shape of that delta I was telling you and these four enormous fuselages, one or two on each – in the center – and they sort of uh – raked back.

LRH: Uh-huh.

PC: Well, that's out there.

LRH: All right. Okay. Now, just move rapidly through the next two hours.

PC: Well, I'm – I'm backing off something here.

LRH: Uh-hm.

PC: Um – there's an explosion or something happens out there. The plane is there and something happens out there that's an explosion of some sort.

LRH: All right.

PC: Which – there's a pretty big
bang, man.

LRH: Uh-huh.

PC: It's a pretty big explosion. I'm getting the feeling now of stuff going up in the air, a shower, a real shower of this stuff coming up.

LRH: Uh-huh.

PC: Um – I was going to say, I don't know, I got hit on the head with a – yes. I got on – hit on the head with something, it was shrapnel, I should think. It was what I – we call shrapnel.

LRH: Yes. Yes. Yes.

PC: Bloody funny, you know, the other day I hit my head in precisely the same spot. Um – sorry I've flipped out for a minute.

LRH: Oh, that's perfectly all right. Move back to that moment on the porch.

PC: Right.

LRH: Got that now?

PC: Yes.

LRH: All right. Very good. How are you doing there on that porch?

PC: That's all right.

LRH: Well, fine. Now, move forward to the first thought that is launched into this. Is there a thought launched into this someplace? Is – anybody say anything?

PC: "You can't see."

LRH: Oh, is that so? All right. Now, let's move forward to the moment when that thought is launched there. Where's that thought coming from?

PC: Well, I... you asked me, I'll tell you. It's come from a bit of this – this – from this explosion stuff.

LRH: That's interesting, isn't it?

PC: This whack on the head is – is a thought.

LRH: Um-hm. Um-hm. Are you say... what – what do ...

LRH: Now, what did you say the thought was?

PC: "You can't see."

LRH: That's right. Now is there a contradictory thought to that?

PC: There's a flash of bright light. I can see a bright light.

LRH: Oh, I see. All right. Very good. Is there any other contradictory thought there?

PC: Uh – "This isn't true."

LRH: All right.

PC: "You don't know what you're doing."

LRH: Right.

PC: Um – "You can't think."

LRH: All right. Any contradictory thoughts to those?

PC: "You know!" uh – it's a vicious one, that one.

LRH: All right.

PC: Um – "You don't know where you are. You know where you are." Um – "I'll get you."

LRH: Uh-huh.

PC: I get suggested "You're free to do as you choose."

LRH: Yes. Yes. All right. Any other thoughts you can pick up there, just go ahead and give them to me.

PC: Um – "Waste not, want not."
LRH: All right.

PC: Um – "Be careful. Be very careful." Um – "be..." – well, it's "Have a go."

LRH: Oh, yes.

PC: Which, I don't know, it – it's contrary to "be careful." You know, "be careful" and then "Oh come on, have a go." You know?

LRH: All right.

PC: Bright lights and darkness.

LRH: Uh-huh.

PC: Uh – "Don't believe it. It's true. " Um – there's something around here I can't get. "Well, there's something around here I can't get." All right.

PC: Um – "You've got it there."

LRH: Um-hm.

PC: Uh – well there – no, it's "There it is."

All right.

PC: "There it is."

LRH: Uh-huh. Any contradictory thought to it in any way?

PC: I thought that – that con... seemed to contradict the one I gave before.

LRH: Oh, yes. All right.

PC: Getting a bit of soma... I'm feeling easier and lighter. Um – aware of an itching on me neck.

LRH: All right.

PC: Um – I don't get any other thoughts at all now.

LRH: All right. That's all right. That's fine. Move back to that moment on the porch.

PC: All right.

LRH: All right. How's that now?

PC: Well, we've got the aero-plane there.

LRH: Right.

PC: And that's fine.

LRH: All right. Now, is it all right with you to move a couple of days earlier than this?

PC: Yeah.

LRH: All right. Move a couple of days earlier than this.

PC: Well, we're inside this building and it's marble and so on. And it's counters. It seems – I think there's some – there are some people around. This seems like a very busy – uh, wait a minute. I'm getting a lo-o-o-ong tunnel showing up and – and it's kind – it's shaped with arches that come up like that.

LRH: Uhhm.

PC: And this goes a long way. I don't think there's – nothing significant about it at all; it's just the architecture of the place. Probably runs around. It's um – it's a passageway around the perimeter of this building. Uh – goes on here? This just seems like an air terminal.

LRH: All right.

PC: Very lush.

LRH: Um-hm. What are you in this place?

PC: Was going to say a janitor.

LRH: All right. Good.

PC: Seems that – that seems to me that I seem to be – I was going to say I feel I – janitor gives it a very good word for it, yes. Look after the place and keep it clean or part of it or something.

LRH: All right. Fine. All right. Is that perfectly comfortable where you are there?
PC: Yep.

LRH: Is it all right if we park it there for the moment?

PC: Yep.

LRH: All right. Very good. Anything else you want to say about your identity or whereabouts of this or anything?

PC: Well, I don't think I really am a janitor.

LRH: All right.

PC: This - this - I don't belong here, really. I'm an interloper of some sort.

LRH: I see.

PC: I mean, it could be a spy or something of that nature, but I don't - I wouldn't swear to that. But it's that sort of thing. I don't really belong here.

LRH: Uh-huh.

PC: And it's strange to me. And it's like - yet I'm spying out the land, I want to say. But it's um, you know...

LRH: Uh-huh.

PC: It's not really - I don't really belong to me. I may be wearing janitor's stuff or got the appearance of a janitor, but that's perhaps an easy thing to do.

LRH: All right. Very good. Now, this seems to be very good. Now, move forward to present time. Okay.?

PC: All right. Uh-huh.

LRH: All right. How are you doing.?

PC: Fine.

LRH: All right. Very good. I think we have something resembling our basic incident here.

PC: Thank you.

LRH: What do you think about it?

PC: Well, it's all very confusing.

LRH: Yes, isn't it.

PC: Very confusing.

LRH: Let me give the exact start of the blast to your auditor. And that's 1958 years and one hour. We got an orientation there. That's good. I'm glad for that. All right. How do you feel about it?

PC: I feel fine.

LRH: All right. Very good. Now, is it all right with you if we end the body of the session there?

PC: Yes.

LRH: Very good. End of the body of the session. Have you made any part of your goals for this session?

PC: Well, I've worked hard.

LRH: All right.

PC: Think we've done all we set out to do. Haven't we?

LRH: Get the date.

PC: Yes.

LRH: Yes. Block out the early part of the track.

PC: Yes.

LRH: All right. That's fine. Any gains you care to mention?

PC: Well, I've certainly experienced going back a long, long way. I was certainly experiencing that.

LRH: Um.

PC: And um - you know that's very, very interesting experience and the - so on.

LRH: All right. Very good. Anything else you care to say there?

PC: No. I think that's it, then.

LRH: All right. Now, let's squeeze
those cans.

Ooooh. Squeeze the cans again. Oh, man, that's wild. Let's see, what was it? Touch that or...

PC: Yeah.

LRH: Touch that. All right. Is it all right with with you if I run a little bit of Havingness?

PC: Yes.

LRH: Okay. Put the cans down on the table. All right. Touch that corner.

Thank you. Touch the top of the microphone.

Thank you. Touch the top of that can.

Thank you. Touch the cord.

All right. Good enough. Touch your tie.

Thank you. Touch that corner.

Thank you. Touch the back of the E-Meter.

All right. Pick up the cans.

All right. Squeeze the cans.

That's improving, but we've got to go on a bit further. Okay?

PC: All right.

LRH: Put them down, please. Touch the base of the microphone.

All right. Touch your watch.

All right. Touch that chain.

All right. Touch the top of your pocket.

Right. Touch these two upper points of your lapels.

Thank you. Touch that corner of the table.

All right. Touch that corner of the table.

All right. Touch the two cans simultaneously.

Thank you. Now, how are you feeling?

PC: I feel all right.

LRH: Is there anything you haven't told me that you care to tell me?

PC: No, um – sometimes wondered whether I was dubbing in and was fighting against dubbing in while I was doing it.

LRH: Oh, all right.

PC: But I don't think I was.

LRH: All right. Good, good. All right. Touch that shoulder.

Thank you. Touch that shoulder.

Thank you. Touch that top of the table here.

All right. Pick up the cans and let's see if we're winning here.

Yes, we're winning nicely. All right. Squeeze the cans.

All right. And one little bit more and we will be able to do it. Put the cans down.

All right. Touch that – touch that sleeve.

All right. Thank you. Touch that sleeve.

PC: All right.

LRH: Thank you. All right. Touch the button of your jacket.

All right. Touch the knot of your tie.

PC: Uh-huh.

LRH: Thank you. Touch the lapels of your collar.
Thank you. Touch your two ears.

All right. Thank you. With your right hand, touch your left hand.

Thank you. With your left hand, touch your right hand.

Thank you. All right. Touch the table.

Okay. Pick up the cans.

Now, we're getting here. Squeeze the cans. That's all. That's it. All right, that was the last command.

**PC:** Good.

**LRH:** Very good. Now is there anything that you would care to ask or say before I end this session?

**PC:** No – well yes, thank you for the – for the session. I've enjoyed it.

**LRH:** All right. You're quite welcome. Is it all right with you if I end this session now?

**PC:** Yes.

**LRH:** Okay. End of session.

**PC:** Thank you. Thank you very much.
Thank you.

All right, this is what?

*Audience: 16th May.*

Huh?

*Audience: 16 May.*

Sixteen May? Sixteen May AD 13. Thank you. I got to get some backflow, you know? Saint Hill Special Briefing Course, lecture on the subject of – as it develops. [laughs, laughter]

Ah, I've been scouting around and trying to keep a quarter of an inch ahead of you, and that's difficult. But you pretty well got this taped. It's very funny, you know, sometimes we develop a big piece of technology or something of the sort, and all the record of the development is there and there's no summation. I very often never make a summation at the time it becomes passé, see? It's superseded in the course of development by a new development, don't you see? And therefore, concentration and economy of research time – if we had the – both the time and the resources of, oh, I don't know, the Stamp Salvage Collection Department of the Bureau of Infernal Ravening of the US government – if we just had that appropriation, you see, we might be able to do it a little more broadly. But it's always up to me to make a summation.

And it was with great astonishment that I found out that we had never made a summation of engram running! Of all of the key things to leave a summation missing on! There were tremendous things learned about engram running and – over a long period of time – and it was never summated. And I was quite interested last night – before session, I was trying to get a start on a bulletin which summated engram running – and I was quite interested how easily it was summated. There's no wonder you're a bit confused about engram running, because it changed over a period of many years. There were many types of engram running, there were many things done at one time in engram running which were found unnecessary in other times. Various mechanics and improvements came and went. And out of all of this, actually, a very simple method of engram running exists.

There's not many laws of engram running. I'm not going to give this lecture on the subject of how simple it is to run an engram, because the summation of it is a very precise activity. I'm going down the line and giving the various terms and laws and so forth. And one of the things I discovered on the thing, that I think you'll find very interesting, is we have never changed a basic tenet of auditing.
That is, you've never successfully audited anything but the time track. There is nothing to audit but the time track. And there is no grand key to the release of things but the time track, and it is a time track.

Probably people think of engrams as something stowed in the pc's wits like cordwood, you know? They're just stowed there, and then there's over in this department, you see, in this file cabinet, there's a big bunch of stuff over there. There's some round cylinders of some kind or another and those are valences. Then down in the basement someplace else, why, we have something else stowed there – machinery. And then locks. Locks: that belongs to an entirely separate division; has nothing to do with anything. And secondaries: well, they're sort of stowed out in the woodshed. You know, and that they're pieces and bits of things and that they're not related and so forth.

Actually, they're simply different phenomena of the time track. And in trying to summate the thing, I made that little discovery. And it seems to be terribly elementary but it might serve to orient you pretty well on what you are doing. It is a time track. It is the continuous record of time of the individual since the first moment he began to experience, straight on through till now; an uninterrupted 3D, fifty-two perception movie. And things happen to that movie, and it gets grouped and becomes unavailable to the pc. Becomes unavailable to the pc for various reasons: his inability to confront and the fact that the track itself can get grouped. Like you took a can of motion-picture film and it's all stretched out there, and so you just start taking it and crumpling it up in your hand in big wads, and so forth. And various things can happen to this consecutive record of experience. Various things happen to it. And all that auditing ever does is straighten it out and make it available and as-is it. Now I think that gives you a simplification of outlook.

I was quite surprised. I was sitting there and suddenly it dawned on me I could make a very simple statement of exactly what we were auditing, what all these things were. As you go along on this track, you get a moment of pain and unconsciousness. All right, that's just another record. It's consecutive with the next moment which is perhaps not of pain and unconsciousness.

Chains, they don't exist in separate slots and compartments, they're just sections of the film which happen to be interrelated. A guy is hit over the head with a hammer, therefore every incident of hitting people over the head with a hammer and being hit over the head with a hammer and being hit over – what – well, just being hit over the head with a hammer makes a chain that is a related series of experiences. And they interrelate in the association of the individual and actually tend to pull this time track down on top of one another. So you've got a whole group – a grouper there, so the track actually gets looped at this point. And then you've got the basic time the individual was hit over the head with a hammer, you've got the basic time the individual was – hit somebody over the head with a hammer, and then you've got all the times that he saw a hammer, see? Or thought somebody was going to get hit with a hammer, or something like that. Those constitute the locks, and they pack down on top of this thing, see?

You eventually get a solid wad there that looks like a piece of black God-'elp-us, and there it is, and the pc of course does not have that experience available. So when the experience becomes unavailable to him, it has a command value over him. He does not know what
it is, and when he comes near it, it has a tendency to operate as a command level. A hammer is telling him what to do, in other words.

And there's only two classes of things involved in this time track – only two classes of things – and one is – you might call the mechanical things, which is matter, energy, space and time, see, and their interrelationships and so forth, see? There's the matter, energy, space and time which is this track, you see? And then there's the significance. So the time track is basically composed of matter, energy, space, time and thought, and that's all the time track is composed of.

Now, people who can't confront any part of their track – and one of the reason the psychologist can't even deal with this thing at all – I'm not berating the psychologist. We'd train him if we could. We'll have to, one of these days. He has a bad record with us. We don't just have a bad record with him; he has a very bad record with us. He can't learn and he goes off into wild departures and so forth. We've had quite sincere psychologists studying at the Academies. I mean, it's not just a brush-off.

And one of those blokes that I know of over in the States, I don't know, I think he was there for about six months and he hadn't finished the Comm Course. That's right. First week, he was terribly interested, terribly interested. He went away and I'm sure it did him some good. We couldn't make a Scientologist out of him, and we just sort of dusted it off and forgot about it – too hard to do. Too many good people around that you could make Scientologists out of, you know, you could train how to audit. There was no real point in breaking our necks with this.

Well, this actually doesn't establish any rancor on my part at all. If a bunch of psychologists and so forth wanted to be set up for the training course, I would put them through a training course. But I would just make sure that it was commensurate with our experience with psychologists, which is to say, ten-year course, something like this. [laughter] I wouldn't miss! I wouldn't miss. They'd be happy, we'd be happy and everything would be happy.

I'd just as soon process a psychiatrist, process a psychologist; it's all the same. But remember that this bird did not make discoveries of the time track or this particular area, the very woof and warp of which the mind is made, simply because he conceives it all to consist of only thought. See, his confront is down to a point where he thinks the brain contains thought.

Now, this is kind of silly. It's like walking down the street and saying there's nothing on this street but opinions. Street is all full of opinions, and if you just get all these opinions on this street, you're all set. Whereas it is no opinion that is pushing the pc's face in. It's somebody's fist. Well, maybe the fist might have been pushed, you see, on the time track because of somebody's opinion, but the fact of the matter is it's not an opinion that's pushing his face in, it's a fist.

The time track, therefore – I'm just making this point here very strongly because you'll come up against it – is not imaginary. It should not be treated as an imaginary thing.

Is a deck of cards imaginary? No. What is real? Well, what is real has mass and weight and so forth, and so does a time track. You're into vague philosophic mutterings when you
start saying, "What is reality?" What is reality? Oh, my! Boy, you could put on your long white robe and walk all over Greece from one end to the other making a good living almost in any century by just continuing to ask this question in a somewhat deliberative frame of mind, you know? "What is reality?" You know? If you put enough, if you put enough schmaltz in it, you know – [laughter] would have had it.

Well, we have a pretty good idea of what reality is, but it does not really form too much of our technology – descriptions of reality. And we take the shortcut to it and we say reality is what is – you know, what is. Then we shortcut the idea of, well, is it because we're thinking it is or is it because we're not thinking it is? You know, just bypass all that garbage pail full of reasons not to look at reality. Just recognize that it's a not-confront. However it got here, it is! See, it just is. And it's sort of a – do more philosophers out of a living, this sort of a – of a direct approach. I mean, you can't make a living saying, you know, "Reality is."

Well, you say, "Yes, yes, but who made it?" Well, that's not germane. See, the point we're interested in, immediately, is where we are and what we are looking at. You see, that's the main point.

Now, the secondary point is where did it come from, and a tertiary point is what's going to happen to it? But these are all not main points. The main point is we're here and we're looking at it, see? And what we are here before and looking at, Scientologically – just to cut the Gordian knot – is. See, it just is. There isn't any discussion, then, of whether the pc is imagining that he is looking at a brick wall or is he looking at a brick wall? Well, it is. You see? Now, what is it the product of? Well, in the physical universe a brick wall is the product of a bricklayer, a brick maker, the economics of the society – let's take it back step by step – a clay bank, which is part of the planet, which was made and put here. And then we get to a divergence of opinion: Was it put here religiously or by the Galactic Construction Company, you see? But that's actually all the importance it has. It is here. Well, what put it here?

Well, we have another peculiarity as we go along. We – there are some peculiar things which make a Scientologist a Scientologist. And you all fall into this category. You probably don't think of these things very much, but you know that what is, is and – as far as you're concerned – and where it came from is a slightly different question, and that you don't necessarily have to go into these fantastic ramifications, you see? And we also sort of amongst ourselves have agreed that nothing is holy. By which I mean, nothing is proof against being inquired into. That's a very healthy state of mind, man! Because that does not Q-and-A with the unavailability of sections of the time track, don't you see?

And when people have said, "Well, there are certain things you mustn't inquire into," they're just doing a Q and A on the unavailability of existence or is-ness. See, they've just done a Q and A with it.

Now, recognizing all those things, we see then that the time track has remained undiscovered, undescribed, forms absolutely no part whatsoever of modern mental studies, forms no part of the materials of psychiatry, and so forth.

Now, we must ask why. And it's because the thing has tricks of unavailability and the beings who are working in this field do not have a confront sufficient to look past that unavailability. So you have to be just a little bit tougher to be a Scientologist, and that's the way
it is. These guys weren't quite tough enough. They took something – the time track – consisting of matter, energy, space and time, and thought, and said it was all thought. And this of course leaves everything inexplicable. See?

People think they are living in a house.

Well, the bird who is saying this: "These people think they live in a house. Therefore, they are utterly mad because there is no house."

And then people have gone around and made him feel the walls, you know, and said, "Look, there is a house here, you know?"

"Oh, no, no, there's no house."

Do you recognize that's the lockout as far as this research line has gone. Now, what's the reason for that? Well, the time track has a great many tricks by which it becomes unavailable. And the first of these tricks is that "there is nothing in a mind but thought." And recognize that, as that is a trick of debarment. If there's nothing in the mind but thought, anybody who says he's looking at a brick building (in the mind) of course isn't looking at a brick building; it must therefore be imaginary; so therefore he is living in the field of illusion or delusion; so therefore he must be slightly mad.

Now, this line of thought is very productive for appropriations, because I think sixteen billion dollars has just been appropriated in the United States with which to erect some experimental stations – by which they mean, by the way, research and development sections. That means they're going to train some attendants there; that's what they mean by this, that's all. I've read the bills, actually. That's not just a crack; that's what they mean by it.

It's all on this basis: "Well, insane people must be mad because they say they are seeing things." Well of course, this compounds the insanity. Because then the person who is supposed to be treating the insanity says, "No, you are not seeing these things." So he makes the track less available.

So the direction of sanity lies in the capability – the capability – of confronting the time track and the present time environment. And for any individual, for any one individual, existence consists of the physical universe present time – the physical universe present time and everything that is in it at this exact, precise, present time instant – and the time track, which consists of everything that has been. And that is the total is-ness as far as this thing called reality is concerned, see?

Now, you can speculate on what the time track has been, by reason of the state it's in now, but that actually is not an is-ness, you see? What condition is it in? Furthermore, you go around England, you'll see mounds of dirt – furrows on a hillside. You'll see mounds of mossy, overgrown whatnot. You look a little bit closer and you'll see that it's some old fortification. Be a Roman camp or a medieval castle that has long since gone to dust and the socialists, you see? And there it is.

Well, it's a lot of fun, you see? It's a lot of fun to add some significance to this thing, you know, and say, "What has it been?" See? But that is not its is-ness. Now, it's perfectly all right to stand as lo... as a matter of fact it's a wonderful game to stand and look at this pile of
stone and say, "What has it been?" I know I've done some of the most learned, marvelous – absolutely astonished myself by the brilliance with which I could reconstruct out of a single mound of stone the tremendous civilization which went before, you see? And the power of the fellows who erected it, and so forth. I remember one particular time I was so overwhelmed by my own brilliance and learnedness in this particular direction that I hardly heard the farmer at all when he said, "Well, yes, that's the silo we built last year. It fell down." [laughter, laughs]

Now, that is a suppositional reality, see. Tremendously subject to error, but not outlawed for that reason. But recognize its is-ness, which is just suppositional is-ness. It's the is-ness of suppositional is-ness.

Now, every once in a while on the track you've met some fellow in a conical hat who was saying, "Abracadabra, hocus-pocus, if you just gaze into the pot here, I will tell you the future!" Oh, that's great. That's great. Quite a game in itself. It's probably a lot of complexities. But it's suppositional; all futures are suppositional. The odd part of it is that if they – if they're suppositional enough, they come true.

I remember with some shame telling a fortune at a party to some people – I used to tell lots of fortunes. It's very funny, you know. You look at somebody's facsimiles. This is very funny, you know? And you pull a wise face, you know, and you can take a look at the facsimiles and saying, "I see you living in a house which is very close to a railroad track, you see, and there are some tall trees there – some very tall, slender trees – and it's right there at the corner of the roads. And let me see now, let me see, now, don – don – don't – don't interrupt me. It's Acacia Manor. Yes. I see you living at this house."

"Well, that's fantastic! We just went out to look at such a house, today. In fact, we're going to buy it."

Of course, the character wasn't going to buy it till you said he was going to live in it, you know? [laughter, laughs] And as a party trick, one time, I told a couple I saw them both being unfaithful and separating – you know, just dealing the cards out – and they both obediently did. And I felt very ashamed of myself. [laughter, laughs]

The future is always enforceable from altitude and authority, and so forth. You get somebody like Toynbee. He can predict the future, he says, you know? He's got some formula that nobody knows but Toynbee, and he can predict some sort of a future out into the future, and he can tell by that that this, that and the other thing is going to happen. Of course, he's actually found a trick method of making a postulate stick, you see? He's making a postulate stick by saying, "That is the way it is going to be because I can read the future." See, that's just a trick method of making a postulate stick. But it doesn't escape the fact that it's a suppositional reality.

So if you break existence down into is-ness and potential is-ness, you can probably break down this potential into several categories and you could probably make quite an interesting German graph out of this thing, you know? You could extrapolate it out, cover the whole wall before you got through. And you could break this down into numbers, types, categories, subclasses, and then subclasses of subclasses, and then subclasses of subclasses of subclasses of subclasses. Pretty soon nobody would know what you're talking about. So I prefer to leave it at that, you see? There's is-ness and there's suppositional is-ness.
Now, the time track often gives people the feeling that the "was" can return. And they think if they run back just a few hours, years, millennia down the track, they will once more find themselves standing up at the battle of Bennington and getting their head shot off or something of the sort, you see? And this makes them very nervous about going back.

Well, I once saw a line of redcoats and a line of militia standing up, exchanging shells, and for about, oh, I don't know, it must have been the space of a minute or so, they were total 3D in a much greater reality than the physical universe had had to me recently, you see? I mean man, that was solid! That was solid, you know? And I expected these guys... And for a moment, I thought I had returned back down the time track, on the physical universe time track, and found it all there yesterday, don't you see? I didn't realize I was going down my own time track. And good heavens, man! You could smell the mildew in the wigs, you know? And it was – it was all marvelous. And you know, I was all ready to duck from the next volley. Probably it's there so solidly because I didn't duck from the next volley.

But next thing you know, just looking at it, the is-ness of it turned out to be what it was, which was simply the is-ness of my own time track. And at that moment, it fitted itself into perspective. It was an exaggeratedly solid piece of my own time track. More solid and more real because of the awareness jammed into the moment of time, don't you see, than otherwise.

Now, you could mock yourself up futures and so forth. You can do all sorts of things, but again, what you're mocking up is suppositional.

Now, there's one more class that you have to take something of a look at; it's "what is created." And it's this whole business of creating that really tends to rock people, because you see it's half real and half suppositional. And it's the borderline between the two.

Now, it almost depends on the person who says he is going to create something. Well, somebody says he's going to build a building, you know this fellow does build buildings and so forth, well, then you – it's very close to reality, his statement that he is going to build a building. See, it's quite close to reality, because you know he will... build the building. In fact, you can already see the cornerstone, you know, that sort of thing. That's a good reality.

And some guy down in the loony bin, why, he says he's going to plant ten thousand acres of forest, you see? Well, that's hardly even a suppositional reality. You know darn well he's never even going to look at a tree, much less plant a forest. So you know that thing is never going to exist. And it won't ever exist.

And so this matter of suppositional reality and creation come together. But remember that a creation is just a suppositional reality until the moment it is created. At the moment it is created, for whatever period it may endure, it is. See? So it is an is-ness; anything created is an is-ness for whatever period it endures.

Now, all of this is quite pristine pure, from whether it is good for people, bad for people, nice to do, not nice to do, or anything else. These again are adjudications of what is. And that's the opinion of what is, but that's part of the thought of reality.

Now, thought is not separate from reality. Thought is woven solidly into reality and thought is part of the is-ness of reality. For instance, BBC – ITV down here – finally begin-
ning dimly to learn their lessons on programing. And they've conducted, I think it was, a ten-million-dollar-pound test. They went to vast expense to find out who viewed television and what programs they liked. They went into great expense: They built a small studio, they bought a television set (I imagine even paid for it) and hired some children and bought some candy and comic books and got some furniture and put it in there, and then drilled some spy-holes in the wall and turned on canned programs, you see, so the children could watch the programs or talk to each other or eat the candy or read the comic books. And they very carefully noted – I think there's – oh, probably two or three thousand pounds of the appropriation must have been just paper to carry the notes of the reactions of the children at various points of the programs, and so forth. And they finally learned – the final lesson was (and this is why they're going to continue it: they've learned something) – they learned that little children do not like to look at older children's programs and that older children do not like to look at little children's programs. [laughter] And so it was pretty brilliant. And that's why they take your favorite program off every Saturday night, you see, and throw it away. [laughter] See, they've got a long way to go. They've got a long way to go.

Police pull this trick all the time. Every once in a while – around Washington one time, we were doing Union Station – this walk-about process – and were going down to the airport, and so forth, and run it on airplanes and all that sort of thing. We were doing this for quite a while. We found out at the end of about a week that the "Federal Boys Institute" and the Narcotics Division and Interstate Commerce, and so forth, detectives had been hanging back in the wings and behind sofas and chairs and back of pillars – squadrons of these fellows, you know, had just been haunting every Scientologist and his preclear, and so forth. And at the end of the week, why, they finally grabbed one and they had already determined that they were not a new airline that was smuggling dope. I don't know how they determined that. I guess they saw they didn't have any airplanes in their pockets or something.

It never occurred to them to ask anybody. This is the point I'm making, you see? It never occurred to them to establish an is-ness on a situation or to ask anybody, because they couldn't, for some reason or other, view the thought in the is-ness. See? So they're way up around the bend; they can't even view the thought in the is-ness. So don't think that it just goes to a point where people can only view the thought in the is-ness; you can get further than that, where people can't even view the thought in the is-ness, you see, and can't even ask for what thought there is in the is-ness.

Now, there are certain opinions abroad in the world today with which we may or may not agree, but they happen to be part of the is-ness of this world. Now, whether they could be changed, that again is not part of the is-ness. They are. These thoughts are.

Now, the ironmonger who weaves this sign with the curlicues, and so forth, has had a thought when he wove that set of curlicues on this sign, you see? He had a thought when he did it. And you get back and you take a look at this and you're actually looking at iron set in space, you're see it – perceiving it by energy reflected, don't you see, and there is a time that you're looking at it in, you see, and you look at it for a certain period of time – and all of this is-ness goes together. But most people overlook the fact, the curlicues are – the curlicues are in actual fact an expression of thought which is part of the physical universe. So there's a great deal of thought woven into the physical universe that is part of its is-ness. Doesn't have
to be written up, "go here," "go there," "this is a bear," but certainly either the bear making himself a bear, or somebody else making a bear, is expressing the thought of a bear. See, he's using matter, energy, space and time to express the thought of. So that thought is expressed by the formation of matter, energy, space and time, and if we look this over, we'll see that the thought is an integral part of nearly all physical universe put-together. To some degree – to some degree – thought is a part of the physical universe and is part of its is-ness.

So we say the physical universe, then, consists of matter, energy, space, time and thought. And the time track consists of matter, energy, space, time and thought. And just as your broadest classifications, you have now made the simplest statement that can be made concerning a time track or the physical universe. That is the simplest statement that can be made.

Now, we can complicate it; we can complicate it tremendously. We can get the suppositional is-nesses, we can get the befores and afters, you see, we can get the purposes, you see, the additive utilities, and of all things, the aesthetics.

Now, we really go mad when we get into aesthetics, you see? But the devil whispered, "Is it art?" you see? And that devil is always standing alongside the shoulder of every artist or anybody engaged in an artistic pursuit. You see, the little girl doing her sampler, see, and so on, saying, "I think that looks nice. That really looks nice. And I'm going to make it so-and-so, and it's going to look nice." And she gets to look at it, "Yeah, but is it artistic?" you know? "Is it art?"

You see the concert pianist beating his fingertips off at the concert, and you very often are utterly astonished afterwards to find out that he does not consider that this is art. He could do much better or he has done much better or he will do much better. But is he doing better right now? Well, you seldom find that he is ever doing better right now. He's always on some suppositional kick.

Well, the degree that an individual is on a suppositional kick measures directly his confrontingness – his ability to confront. The amount of suppositional is-ness that is added to actual is-ness measures directly the individual's ability to confront.

Now, that's a very involved and complicated statement, because it's almost too broad to embrace. This fellow goes down and he takes a look at this watercolor – down at the art gallery – he takes a look at this watercolor and he says, "He should have..." Well, that "should have" has measured the amount of not-confront he is doing at the – of the watercolor. See? It's quite interesting.

Therefore, you get into this in the area of critical and you speak of people as being high-criticals. "This fellow has a high critical," you say, you know? A very critical pc. Common term amongst auditors: critical pc. Well, it's the degree that he is into suppositional and not into is-ness that is critical. He's not confronting to the degree that he is critical.

You say, "What's happening?"

"Well, it sort of looks here that it might have been..." (that's quite acceptable – all these things are quite acceptable and quite ordinary in auditing) "...but, it sort of looks here – I – there's – I don't know. There's some kind of a wreck out here. I think there has been a wreck." It's quite ordinary to have him then find out that it's not even an airplane in front of him but a building. See, he has said – he's given you the suppositional, see? He hasn't given you the is-ness of it. Well now, the time track straightens out and erases in direct ratio to the amount of is-ness confronted by the pc. And that's how sane and capable somebody gets. It's measured directly by that: the amount of is-ness the individual is capable of confronting.

And he's having as hard a time as he is moving from is-ness to suppositional. Now, in view of the fact that his track is in terrible condition, you have two things at work – you have the pc's own feelings of incompetence and you get the unrecognizableness of the track. And these two things come into combination to make a cat's breakfast.

See, the pc is sure that if he confronts it, something horrible is going to happen. He's sure of this. You know, so he "h-o-u-l-e-aahh" you know, he "auheeaeh-w-w. I don't know whether I want to be processed or not." You see it in the extremity of, the pc doesn't want to report for his session. See, that's merely an expression of, he's moved over into suppositional, to that great degree. See, he supposes that it's not confrontable. He supposes that the auditor is not going to be able to do anything for it. He supposes the auditor won't be able to handle it. He supposes this, he supposes that, you see? Well, all the time he's supposing, he's not confronting.

Now, the pc's come downscale and sort of given up on the idea of being able to confront very much anyhow over a long, long period of time. You can more or less measure this and call it state of morale because it's quite volatile. It will shift with great rapidity.

A thetan's state, you see, is actually not pinned mechanically by anything. It's just where he is and what he is doing, don't you see? It's not really pinned mechanically by anything. You see, he's not made less of a thetan or more of a thetan. But when you surround him as intimately as the time track with a tremendous amount of threat, suppositional unconfonfrontability, he is continuously enforced into a state of low morale. He doesn't think he can do anything. As a matter of fact, he can't! It's part of the is-ness of the situation.

See, he knows what'll happen. He's surrounded by jack-in-the-boxes to a point where he's touched this one time and it's knocked him flat and he's touched that and it's ruined something and he's touched something else and it's blown him down. And his attention is still terribly fixed on something else and he knows he mustn't take his attention off of that. And then he knows also that if he doesn't take his attention off of it, he's going to go to pieces, you see? And then he's forgotten that he has his attention on it.

He's in a frightful state. But you get his feeling of degradation – because of his capability, you see, what he feels it is – but then you've got the actual state of the bank, which is 'orrible! It looks like a bunch of mad theater managers have rushed in and grabbed all of the motion pictures that have ever been shown, you see, and mixed them up with a stick and set fire to them, see? And a thetan standing in the middle of this debris – you see, it hasn't even got a bright flame left in it, you know? And there he is in the middle of this debris and he
knows that if he moves or sparks or does anything, something horrible will occur. And every bit of this has retained in full its command value over him.

Just the fact he's standing in the middle of it, is enough to depress him. But at the same time, it's all the old tin cans he's got. It has value. It's all his knowingness, it's his record files. He's like somebody who has become totally dependent on the record department and then the record department has been bombed. He can't even find out his own name, rank and serial number, don't you see, without the record department.

Well, that dependency and the reason that came about is also included in the record department, so he can't even find that, you see? It's all there and he's gone into a terrible state with regard to all this. It's booby-trapped. It jumps apart. If he puts a beam on it, he sticks.

And he sort of feels funny because there's a hand that vaguely shows out from underneath a black plate and he doesn't know whose hand it was; he doesn't know where it's from; he doesn't know when it happened… [sighs] But he knows he'd better keep an eye on it. [laughter]

And we've used other methods to approach this problem of the time track. Amongst those other methods were exteriorization. "Try not to be three feet back of your head." I don't know how many taxi drivers went out of their heads and their cabs climbed the curb in New York when they pulled that gag over the air, you know? That was pulled over the air and was done quite successfully. "Try not to be three feet back of your head" – over the radio.

And it's all very well and the odd part of it is, the thetan is free. You'll have some fantastic experiences, but you can get a synthetic state – a temporary, momentary state of a thetan which approximates his actual state if he didn't have a bank – by exteriorization. I've exteriorized people – they've lost their stammer, their lumbosis, everything else. The only person I had trouble with when I exteriorized him, it didn't cure his cough. And then we found out he was coughing. Didn't have any chest to cough with, but there he was out there, fifty, sixty feet from the body, coughing.

But that state doesn't last – doesn't last, because the individual is in a state of low morale at the time you do it. And even though you get him away from the bank, you've just taken somebody away from the central control office and made him leave all of his files behind and he sort of thinks that those files can be straightened out and he definitely knows that he must have them in order to know anything and he goes along just so far and then he'll jump or get scared or something will happen, he'll snap back into his head. You can do this to an individual two or three times and then he won't come out anymore. He's very suspicious about it.

Everybody, however, can be made to exteriorize. But you've exteriorized them out of the bank to a marked degree, but of course the bank follows them. You can exteriorize somebody out of a body and then exteriorize him out of his bank. See, just tell him to be three feet back of the mass that he's associated with. "Be three feet back of your head. All right, you've got a black mass there? Oh, all right, that's fine. Be three feet back of the black mass."

The individual gets a foretaste of what it is like not to be pushed in on all sides by these black masses and things, see? But it's a momentary foretaste, because he'll take his at-
attention off what he thinks he should hold his attention on, he'll collapse back into the bank, the bank collapses back into the body and now, he says he doesn't want that experience again. Actually what it does is restimulate dying. This is more or less what he does at death. But he takes the bank with him at death.

Now, the only possessions a thetan has consist of this bank. He really doesn't own anything else at a moment of death on this planet due to the laws of inheritance and other mechanisms. Various times on the track a thetan has tried very hard to straighten this up – when you died, you didn't lose everything, see? And it has been more often true on the track that you didn't lose everything than it has been that you did. But – so a thetan is actually conditioned into this and he considers it a considerable deprivation. So he very – makes very sure he keeps that bank very close to him, because it's the only possession he knows he can hold onto. Yet it's in terrible state and he doesn't want it in that kind of state. It's really no use to him, but he hopes it will be of use to him, and he couldn't get away from it anyhow.

Well, the approach of exteriorization is frankly a failure. You can do remarkable things exteriorizing people, but it is a failure. You better know something about exteriorization; it'll always help out an old buddy who's just been knocked down by a freight train or something of the sort, and there he lays gasping his last. Well, tell him to be three feet back of his head, you know, and go on his way.

Various exteriorizations: Some guy is in perfectly good shape and he's just accidentally fallen off the bridge and drowned. And they're working on him with Pulmators and he doesn't start breathing again. If you happen to be around and he hasn't been dead very long – he doesn't smell yet – just say to him "Hey!" [whistles] "There's nothing wrong with the body, pick it up!" All of a sudden the chest... [pants] [laughter] It's quite remarkable. It's part of the mechanics of existence.

But as far as a solid processing mechanism, it doesn't exist as practical processing. It's more of, this is a piece of the is-ness of existence. Thetans do this kind of thing; you can do this kind of things with thetans. And once upon a time, every time you lost a body on Erxes, you went and picked up a new one on – at home base, you know? You're always going back and picking up your body – picking up a new body. You didn't necessarily lose your identity. You'd be surprised the research... the searching security regulations which sometimes would be stressed home on somebody picking up a new body. You didn't want enemy troops in there picking up one of your own uniform bodies. And the security: "What's your name? Oh? You know Joe? What's the name of the bar at Yakkung crossroads? What's the name of the bar? What's the name of the bartender?" You say you come from there, "What's the name of the bartender? What's his favorite joke?" "Ah! Have this man shot!" [laughter, laughs]

In fact it's quite unusual – and one of the reasons why you rebel against it and people are very anxious and willing to be processed – it is very, very unusual for a person to totally forget his identity just by reason of death, and you haven't been doing it very long. You don't lose your whole identity and everything you've ever been just because you kicked the bucket. So the way it's going now, thought is passing out of everything, and the identity passes out and the thetan not only loses his physical universe possessions by reason of death but he also
loses his identity by reason of death. And he doesn't like this. He thinks this is a can't-have-
no-have proposition. He is not in favor of this at all.

And therefore, he tends to pull even more tightly on the time track. You see, you've
denied him a new record, so he's grabbed this record, see?

Well, every time somebody wanted to get even with him on the whole track, some-
body booby-trapped the record; somebody threw a bomb into the file room. That was the way
it was done.

You go down here to the loony bin and you can find people around there and they're
screaming about being jumped by demons and there's a great bird that comes every night and
perches on the bottom of the bed and pecks at him. Psychiatrist strokes his beard: "This man's
insane."

"Why is he insane?"

"He sees a bird."

That's the end of it. If he sees, he's insane. Now what kind of a record... approach is
this? This is just a further denial of record, isn't it? That's the way you really make them spin.
"Oh, you got a bird that comes and sees you every night? Ah-ha. Good."

Scientologist would have an entirely different approach. He'd probably tell his buddy,
"Christ, what dub-in, you know?" [laughter] So he says to the guy, "Yeah, yeah? What kind
of a bird is it?" And he finds out more about this bird. He's liable to find a honey of a series of
incidents of some kind or another. But the trouble is, if you approach them from that bird,
you're liable to go straight into one of the doggonedest, awfullest messes of raarrr that any-
body had anything to do with. You've pulled him right into the middle of it. He'll eventually
collide with this bird in processing. It's not necessarily the start of his processing, however.
And you certainly don't invalidate the bird. That's the last thing you better do, because what-
ever it is, it is. He saw it, so it is.

Now, we don't care whether other people agree that it is, or they don't agree that it is.
That's all whether or not we agree to reality, which is another method of making a quick buck
walking up and down the land with a conical hat. That's philosophic balderdash.

I mean, the more – the more you can keep off of these wild byroads, you see? "Well, is
reality really something that everybody agrees to? It isn't, because there are people around
who don't necessarily agree to the reality. So therefore, it couldn't be that it really isn't real."
Well, that's just a method of making it unreal for somebody else, isn't it?

Reality is a miracle that it is mutual in the physical universe. That's the miracle. It's
fantastic that it is a mutual reality. And that is the biggest proof of its is-ness: its mutual real-
ity.

Now, the funny part of it is, banks have a mutuality. They are not necessarily all dif-
f erent. Because the tricks that have been used to wreck the file room have not been very
many. And those that were really capable of messing up the film and bending all the reels up
and bashing the cans in had to be pretty heroic. It really took some doing. It really took some
doing. And the technology which you have, I don't care whether you're listing for items, run-
ning valences, doing an assist – I don't care what you're doing – you're handling the time track, or a piece or a portion of the time track. And you have never escaped this fact. Because it is the only tried and true approach to sanity and to recovered ability, is straighten out the guy's time track.

We have approached it in many ways; we have tried to find out who is mocking up this time track. Well, obviously the thetan is mocking it up. But that's again a suppositional reality. We can use mock-up processing; we can take over the automaticity of the creation of this track. The thing wrong with it is, is he can't find out about it, and it really gives him no opportunity to confront it. The confront factor is dropped to a marked degree by this create approach.

You say, well, let's take over the automaticity of his creation of the bank, all of a sudden he hasn't got a bank, therefore he's Clear. Well, that's a very good theory. There's nothing wrong with it at all. All I can say is that after many years of hard tries, why, we have never been able to make it satisfactorily and uniformly work. As far as I'm concerned, it's a locked road – barriered. The trick that barriers it is that when you get the individual to create, he very often strikes the button – and oddly enough, there is a goal "to create" in this GPM we're handling – and he'll hit buttons like that, and all of a sudden he goes into – the bank goes into obsessive create and it practically crushes the individual. Everything beefs up, gets hard, uh-rrr-aurghh! And it happens so often and so frequently that Creative Processing had limited usages. It was useful, but its usages are limited and it does not result in Clears who will stay Clear and we're interested in that.

So it all comes back to the fact that those processes which effectively handle, straighten out the time track, put something there to confront – that is to say untangle it enough so that it can be confronted – raise the morale… Remember, this is – this is an adjunct to this; it isn't enough just to straighten up the track. You've got a pc there, too, you know, and if you lower his morale too much while straightening up his track, why, track doesn't straighten up. You understand? Because you're actually not raising the thetan's confront at the same time. That's for… our processing has got to be rather delicate.

And the only thing we get into is just this: his suppositional is-ness is so great because his confront is so low in this particular zone or area. After all, look how low it must be. All the "great savants" of the field of the mind never even suspected this track, except Freud. And he said that the body contained some sort of a record or blueprint of its immediate past. Freud did say this: the body contained some such thing. I consider it very interesting. He never went ahead and explored it. And he went into the suppositional reality that it made everybody barbarians and very vicious people to have this. What his conclusions are I'm not entitled to say, because I have not studied his conclusions because they again are a suppositional reality. I can only tell you that he did, however, remark that there was such a thing.

And back about 1914, 15, there was some chap back there who remarked on the fact that there was such a thing as an engram – that a moment of unconsciousness was recorded all the way through. It's a very small portion of a book, printed back then. I heard about it about 51, something like that.
Guys trace on this and they get the hell out of there. They don't want anything more to do with this, see? They trip over some corner of this thing, and then they say, well, *da-da-da...* It's the two-dimensional worm trying to describe a three-dimension. And the third dimension, it's *um-wah-mm.* Everything's flat! We know that! And yet here's this pole. Occasionally they'll say, "Well, we... you run into something if you go across that particular side of the two-dimensional plate. You bump your head." And most of them say, "Well, it's impossible to bump your head, because there are only two dimensions." And then they say, "Well, then there's nothing there." It doesn't occur to most of them to say there might be three dimensions. In such a way, why, that is-ness gets blocked out and barred out.

We should examine how it does, because it's a very simple answer. How does the existence of the time track get completely wiped away? Why do the great savants never remark on this particular piece of property which can be found in every and any human being, and the handling of which is the only road that we can discover, or that ever has been discovered, which straightens the person out? What is this? Why is it?

It's the same reason that you sometimes have trouble in an auditing session. These things are in two divisions. There are two things here. One is the suppositional reality of the pc sometimes presses him forward – of course, we're... I'm now not talking about the reasons he can't see the track; that's pretty obvious, the unavailabilities and the tricks of it, and so on. No, I'm talking about the pc who is sitting in front of you – his suppositional reality is very low but very great. You see, it supposes; his "I guesses" about the track are terribly thin. And if you don't develop those things along a very smooth line and very smoothly – you know, he supposes he has a black mass in front of his face, you see? He doesn't see the black mass. Actually, all you've got to do – not make the track more solid for him, but just keep going around in the area and take what the pc says, you see, and keep working with it and this thing will start to unravel and the pc will come up and you'll find less and less supposition. He says after a while, "There *is* a black mass in front of my face." Don't you see?

Well, the principal barrier that you get if you're inexperienced in this line is that you suppose, if the pc is so vague, that you can't get anything. You take it that the pc doesn't know what's there, then you won't be able to find out what's there. You don't recognize that he is just so far down on suppositional is-ness that he is not approaching is-ness. Whatever the tricks of auditing are and how you audit engrams, it is the process of familiarization – gradient scale. You've got to raise the morale of the pc with regard to it and raise the available thing to confront. And familiarization with it and running it, and so forth, tends to unravel the track and stretch it out and make it available to him and his morale comes up at the same time and you get to an is-ness. And you don't recognize that it's all a gradient – all a gradient from can't to can. See, it's just a gradient. Pc says, "Oh, I don't know anything about this. I never heard of such balderdash. Ron says there's an incident here of some kind or another and I never heard of such a thing." It's horrible for him to say such a thing.

Very shortly afterwards, he starts to look. After all, he's been given a little piece of data, something to look at and he looks – by golly it's there, you know? And he says, "Hey! You know? Ha-ha!" You know, it makes him feel better. He can see it and it is there to be seen. He looks at it a little bit more, there's more there to be seen now, you see? And then he
feels better about seeing and there's now more to be seen because you've gone over and developed the track.

You see, it's at once a problem of getting a viewer and a stack of pictures together. You see, you've got to get the viewer so he can see the pictures. You see, that's your Auditor's Code and morale of a pc and all that sort of thing, and coaxing him along and giving him the right orders, you see – that's for the pc. And then you go over the technology of arranging the pictures. And the way you arrange them is just stroke them. That's all. Just stroke them enough times and stroke the right picture and you say, "There, that's a nice picture. Yeah, that's a nice picture. Yeah, get that one all fixed." All of a sudden the pc says, "My God, there's my bird!"

You say, "Yeah? What do you know!"

"Yeah," he says, "yeah, that's familiar, that bird. There he is. Tsk, tsk. That's pretty good. Let's find out some more about this," see?

Well, if you've done it smoothly, then the pc's morale is up so he can look, and if you've handled the bank right, why, that's been rubbed up so that it can be looked at. It's this gradient approach – it's barred out by the fact that it's terribly simple; there really isn't anything very involved about it. And that's one of the things that makes me impatient in teaching people how to run engram, is they always want to know the command with which you run an engram. I don't know! Give me a command for petting a cat, I mean… [laughs] All the rules of auditing have to be obeyed, and so forth, and it gets to look pretty complicated after a while, but it isn't complicated. You're running a Touch Assist on a picture.

Of course, your pc can't touch the picture and feels that you won't let him touch the picture – he's going to have an awful hard time touching it. And then if you don't give him the right picture to touch, of course he can't touch that. And one of the big boons you have in technology is, I've been finding out what pictures can be touched, which then produce a tremendous resurge and start untangling this track, by finding out what are the principal things – two things found out: What are the principal things that have the track snarled? And which of them can be touched? See, there's two problems there. You see, what is snarled and what do you touch to unsnarl it? See, those are two distinctly different problems.

The auditor tends to Q-and-A to some slight degree with the fact that an engram contains pain (and he doesn't want to inflict pain on the pc, of course) and contains unconsciousness (and of course, you can't see anything when you're unconscious). So all the great savants of all history have simply Qed-and-Aed with the pain of the engram and on the time track and unconsciousness. And they've simply remained unconscious of it – unwilling to approach its pain and of Qing-and-Aing with its unconsciousness. And that's why they have never said, since time immemorial, every being has a time track. It's just as – just as elementary a piece of nonsense as that. They say, "Well, you can't see it and you can't do anything with it and there's really only thought in the head anyway." And there's lots of ways they approach this thing, but they're actually just doing a Q and A. The thing is unavailable to the being, so the savant supposes it is unavailable to him, don't you see? He doesn't want to have anything to do with that pain, so he leaves it alone, and because there's unconsciousness in it, he remains unconscious of it. And I'm afraid the problem is no more complicated than that.
But the auditor mustn't fall for this, see? In the first place, I don't think a thetan can go unconscious. I don't think there is a level at which you could say absolute unconsciousness takes place. It's quite interesting. You run somebody through an engram where he knew he was unconscious all the way through the engram and he doesn't remember what happened in the incident. Well, that doesn't mean he was unconscious in the incident. Just means he can't remember what happened in the incident. He might have been conscious all the way through. And you start running this thing through as an engram and all of a sudden he finds out during those moments of unconsciousness he was conscious of things going on. The only real tragedy of life, I suppose, is that absolute unconsciousness and absolute unknowingness are unobtainable.

Well, the auditor must realize that there is no slightest portion of that time track that isn't available. And he should go into no "I-don't-know-anything-about-it" simply because the thetan he's auditing, of course, doesn't know anything about it. This is the expected state. He'd be a Clear if he knew all about it! Well, you – then you're saying, "Well, I can't audit him because he doesn't know anything about it." You're saying, "Well, when he gets to be Clear, I'll give him a session." [laughs] It's all by gradients.

There's a great deal of technical information about this. There's reasons he can't view the track and the reasons the track is unavailable to him are very mechanical. I don't think you would be very excited about viewing a door that every time you walked up to the door it crashed open and broke your nose. I think after a while you would get out of the habit of walking up to this door. And after a while you would say, "That door doesn't even exist. I'm not even going to go in that part of the room." Because the violence that is contained on the time track cannot be, again, underestimated. Boy, it's there! It's there. It's violent. And you can hit portions of the time track that'll kick a pc right out of his head if you forced him into them. Bow! It's a sledgehammer proposition.

Let's take a second-series-goal GPM and let's force the pc into the top oppterm and then keep hammering and pounding the pc from the top oppterm down with the wrong pattern. Give you the shudders yet?

What makes it gruesome? It isn't that the auditor is pushing the pc; he's not doing anything to the pc that's very bad. What's doing the pushing is the bank. It's solid and tough at that point. Well, the magic of it is, is if you get the earliest moment of the earliest GPM, it runs like hot butter. It runs like nothing. Pow-pow-pow-pow-pow-pow-pow-pow-pow-pow-pow-pow.

Do you realize there's just as much charge on it as there was the later one? See, as a bank, there's just as much charge on that bank as there was on the later bank. I consider this quite interesting. You can't run the later one, you can run the earlier one. Why? When you're running the later one you're trying to run that and all the banks that come before it. The pc can confront one bank, you're asking him to confront twenty. You're asking him to stomp right into the charge of twenty banks. He can't do it, so he gets a big lose. So if he says, "Look," he

---

13 Editor's note: refers to the Helatrobus implant or "Heaven implant" which according to the findings LRH made a short time before this lecture was given in two series.
says, "I can't confront the bank. Look, the bank is too tough for me." Therefore, it's important not to give him loses early on.

There's various approaches of this kind. This is all technical know-how. This know-how is very simple know-how. It's not very difficult know-how. You go into too much suppositional and you have trouble. But I'll tell you that an auditor has success in auditing if he has a good idea of the mechanics of engrams and the time track, if he kind of knows what this is all about. The next thing you know, why, he's in there sailing. Somebody else keeps asking for a rote command. They say, "Give me a rote command. Do you say, 'The somatic strip will return [snaps fingers]' or do you say, '[snaps fingers] The somatic strip will return,' or do you say, [snaps fingers twice]? Just exactly how do you say this?" I'll show you a person that doesn't know the mechanics of what he's handling.

Somebody gives a double command. This is the most serious thing in engram running, it confuses the living daylights out of the pc. It's almost impossible not to give a false command at one time or another because you're right on there. And to give a wrong command, you find out about it before the pc has a chance to get snarled up with it, that's the only sin, is not to catch it.

For instance, the demonstration which you had, I told the pc to go to the point where the pc was, just one time? It confused him. Well, that's not very serious. I immediately remedied the thing and he got it all straightened out and there we went and see, we were on our way. What if I'd said to him, "Go to the beginning of the incident when you go to the end of the incident because the beginning of the incident is the place where we don't start," and then gotten provoked with him because he didn't execute the auditing command? Well, I certainly wouldn't have known very much about the bank to do something like that.

But you wouldn't make a mistake like this – this is a gross error: You say to the pc, "Go to the beginning of the incident where the birds are." He doesn't know the mechanics and behavior of an engram, see? Well, what's wrong with the command? It seems like a perfectly innocent command. You see, this is a mistake almost anybody would make. Yeah, but the beginning of the incident was where the birds are. That was the beginning of the incident a half an hour ago. So the auditor thinks that while he handles an engram nothing happens. See, he thinks nothing ever changes. Well, why is he auditing the pc if he's never going to get any change, see? Well, he thinks nothing is ever going to change. So he thinks the birds are going to be the beginning of this incident from here on out. Well, the birds are never the beginning of the incident, even the second time.

So you say, "Go to the beginning of the incident," and you suddenly make this command, "Go to the beginning of the incident where the birds are. Go to the birds. Go to the beginning of the incident." And you ask the pc, "What's the matter? What's the matter with you?"

"What – what do you want me to do? Do you want me to go to the beginning of the incident or go to where the birds are?"

And the pc is all fogged up and he can't give you the data very good and he just neglected to tell you that there is an incident the day before the birds arrived, when there was an edict that you mustn't shoot any birds issued. And he's just discovered this and may even have
mentioned it, but you didn't get its time. And you didn't realize that was the day before. That is now the beginning of the incident.

So you've told him to go twenty-four hours deep in the incident while going to the beginning of the incident, don't you see? And he gets very, very confused. You got things like through and to. You wouldn't think that through and to would make this much difference. You say, "Move to the moment of the birds. All right, now move to the period three days later." And you say, "All right, now what happened as you went through the engram?"

The pc says, "What engram? Moved… What – what are you talking about?"

"What happened as you went through the engram?"

"I didn't go through the engram."

"Well now, all right, you didn't follow the auditing command. Ha-ha! [laughter] Guess I'll clobber him," see?

The bank follows the hop-hop-jump, you-think-you're-there-and-you're-there system of the thetan, see? You moved to the end. Well all right, you're at the end, see? You're at the beginning, you're at the end; there's nothing in between. So when you're scouting, you always use to and when you're running an engram, you always use through. It's little, simple points like this.

Actually, to some degree, it is my fault for not having made these things as brilliantly and shiningly clear as I might have, some time or another. But as I say, the subject was never summated. I frankly didn't ever think we'd need it again – just per se running an engram.

Now, I found out that it makes it tremendously easier to run the bank and that on a very few pcs you will be unable to run the bank unless you get an early engramic incident out of the road.

And I also found out that if you can run the overt engram that relates to these GPMs just as an engram, that a fantastic amount of charge will come off the implants themselves, naturally, and therefore they run like – very much like hot butter.

I had a little bulletin for you. Found a datum here you might be interested in. That particular outfit was down toward the center of this particular galaxy and was founded at 52 trillion, 863 billion, 10 million, 654 thousand, 79 years, and I can't give you a much closer than that, because when places get founded is – more or less becomes part of their lies. But it was founded a that time, and it was destroyed on the date 38 million – 38 trillion, 932 billion, 690 million, 862, 933 years ago, by the 79th wing of the 43rd battle squadron of the galactic fleet.

It was not the – part of the galaxy. It was a wildcat activity sitting there. They used to drag Magellanic clouds out of the center hub of the galaxy, let them follow the lines of force and just let them come over a system. Then when they got around to it, they'd send planes in with speakers, and so forth, and give the place the business. But the place very often was totally caved in for thousands of years by these Magellanic radioactive clouds which would just engulf the particular system. You got the idea? I just give you that in brief, just as a matter of interest, because I don't think – I've now got good data on the dates – these dates we're getting...
are accurate. I have now compared them up the track and squared them around. These are the dates.

Now, you're not likely to find any implant earlier than or even near 52 trillion and you're certainly not going to find an implant closer to present time than 38.9 trillion. And if you find any other kind of an implant, you're probably looking at a different kind of implant or somebody dramatizing it someplace else, so it'll be a subgrade proposition.

So that is the span and period of these particular things. I gave you this second date, 38 trillion, because actually that was quite a battle group that went in to clean up this particular activity. You might have been part of it. Makes a very lovely overt engram that keyed you in like crazy.

But that was not part of the galactic government. They were a bunch of guys that had the dream of everybody in the universe being good. And they are the people who used the Ice Cube. And you've all run into the Ice Cube. We often wondered who was the author of this sort of thing. Well, the Ice Cube was used by these people; I don't say that they authored it. And therefore, you get all this beach scenery and so forth, for people on this planet that came up through the Ice Cube, see, as well as other methods.

But I just thought I'd give you those dates because they are of some small interest, and that isn't going on now. There is something going on now or you wouldn't be here and you wouldn't have governments on this planet the way you have them, as lousy as this. But that's a horse of another hue and has nothing very much aberrative connected with it in comparison to the magnitude and so forth. This is the one that really keyed in the people's time track.

But there's one thing that I'd like to point out to you. In finding the original incident on the thing, a basic on a chain is the basic on a chain. See, it's not what I say it is or what you say it is or we hope it is, see? The basic on the chain, then, that you're looking for very often may sail back into God-'elp-us. And I found a basic on this chain last night which was of great interest to me. It was simply an assassination attempt of a radioactive bomb thrown in a carriage. That's the basic implant chain. See, you move the pc – the rule – you move the pc back before, back before, back before, to where he doesn't have any somatics, heh-heh-heh-heh, to what didn't have any part of these people at all, but that one got keyed in. That became basic on the chain. Got the idea?

If you're lucky, it'll simply be the first time they saw these Magellanic clouds come in over the planet and somebody made an unsuccessful attempt to pick them up or something like this. Something of that sort. And you run that, you get the pc ahead of this and he's got no somatics. All right, you run him into it and you find your first incident. Don't be surprised if your first incident expands earlier, don't you see? But if you run into it, you get your first incident out of the road, the rest of it runs relatively easily. But don't be too amazed if the first incident is actually not on the same chain but has become terribly interlocked with the chain and you can't do anything else until you do it.

I believe somebody was running that last night. And he finally got to some kind of an incident that didn't apparently have any relationship to this at all. Apparently had no – nothing to do with it. See? But it was some sort of a beam or blast in the face that left the fellow with
a hanging somatic of some kind or another that then connected up into the implant chain and away we go, see?

Well, the good news I have for you is just that these guys aren't around. But the point I'm really making is that your individual address to the problem of engram running, if it's giving you any trouble at all – the blame is partially that I never made a summation of engram running, and the only difficulties you're having is just lack of appreciation of exactly what it is you're handling. It is not a matter of the rote command; it's a matter of understanding exactly what is this thing called a time track, exactly what are you handling in the individual and exactly what keeps you from handling it and permits you to handle it. And you get that taped, why, all of this becomes very, very easy.

Don't blame yourself too hard. Along about 1958, 59 or something, I should have sat down and said, "Well, let's see, what's everything we know about engram running?" Well, I didn't bother to do so, because I didn't think we'd ever be running them again.

It's with great delight now that I find out we know far more about engram running than has ever been published, just by basis of summation, actually summatable in a very few pages.

Okay? Thank you very much.
THE HELATROBUS IMPLANTS

A lecture given on

21 May 1963

Thank you. People of Earth, we come in peace. [laughter] We bring a plowshare, not a sword.

But we won't use any clouds to spread the message. Oh, I see you characters haven't been really up to the front of the track yet. All those Helatrobus Implants of course came out of clouds originally, you know.

And this is the 21st of Mayo, AD 13, Galactic ye... well that's beside the point.

You don't look to me like you've been making the progress you ought to; you just don't look to me like you've been making the progress. But possibly if you'd taken a retread in the Keokuk Central Office, maybe you would have made better progress.

An interesting problem has presented itself, and so forth: Every once in a while an industrious D of T will treat an HPA like some body in a co-audit, you know, and give them all the latest tapes and materials and just overwhelm them but good, you see, and never teach them how to audit. And would you like to be handling the material you are handling without knowing how to audit? Be rough, wouldn't it? Well, the degree that we don't make good auditors and the degree that we can't give Saint Hill training to as many as possible, we are actually holding back Scientology.

You're in just a little bit of a breathing space right at the present instant. This is just a little bit of a breathing space.

I was playing tag with the atomic war and the enthusiasm with which certain misguided degraders wish to launch off the bomb and all of this sort of thing, actually stood across our track rather hard and it caused a tremendous acceleration in research which ordinarily would have been plotted out across a much longer space of time and gives us something of an emergency characteristic on this, because we've still got to beat this line. We've still got to beat this, and these characters don't know what they're doing. I can imagine them now, you know, saying – saying, "Well, to be happy or not to be happy. You know, I – I don't know.

I can see Kennedy walking around now. "Well, is it really the beginning of heaven or the end of heaven?" You see, and so on. He's going over and see the Pope. And there's the Pope sitting there, and so forth, and he's got an electronic that is cutting his guts out, you know, and he's saying, "Bless you, my uhh – son, bless you, my son." You know? A wild...
game going on and these are the characters who are telling you whether or not you can launch a bomb or not launch a bomb. You see?

So there's no good sense involved in any of this and it's sort of in the cards and we're winning, we're winning hands down. Now, our technological advance at this particular time is sweeping on much faster than I can give you all of the fine bits of, so that I can give you the technology and the way you arrive at the technology.

And this is the best that I can do. Now we've long talked about Clears and so forth, and that's fine. There is nothing wrong with that, and there are Clears and so forth. And we can make Clears by our own definition and as far as the public is concerned, why, this is a very interesting advance. And as Peter once told me, he says, "Man," he says, "but I need this" he says, "to interest people out in the public. Don't go knocking out this grade of Clear." See?

Well, he's perfectly right, see, perfectly right. But in actual fact the state of Clear is not only attainable but is being attained today here and there without any – hardly any remark at all.

Now, for instance, in the last eight and a half hours of auditing I've found three goals and run three banks on a pc. Three complete GPMs. Well, this is a – this is rather a dizzy rate of speed. Don't you see? All right. Now, you haven't got any time to celebrate. That's what's wrong with that. [laughter] You're achieving these things and there's no chance to – to state to the pc, "Now you have to break out the champagne," you see, because it usually happens in the middle of session; by the middle of the next session, or the end of the session he's already gone beyond it. You're achieving these various points.

Now, if you're achieving this now, you might be quite interested in the fact that states of beingness undreamed of before exist immediately before you. They're in your very immediate future. Before Christmas, probably, if you keep your nose to the grindstone and keep your case going. You're – you're right there.

Now, the technological win is tremendous and there are only about five percent of the cases you're going to run into that are going to give you a bit of a thetan ache because they don't have what I choose to call now, because it was the nation or small government that did these things – Helatrobus – not to be confused with Helatrobe. Helatrobe is the Galactic Confederation. It's Helatrobus. Call these things the Helatrobus Implants for lack of a better designation because 43 trillion isn't accurate for all cases, don't you see, and that sort of thing. You can't give it by a time date and there is no reason to keep calling it by a time date. Let's call it by something that was less well known, but that we can identify. Call them the Helatrobus Implants and it tells you these are the implants which begin with the electronic clouds over planets and – and the dichotomy, plus and minus, and so forth, and sweep on through in a certain series. And people have been through them once, twice, three, four times and they have – we have the patterns of the first series very accurately. We'll shortly have the patterns of the second series.

All that makes very easy auditing. We even have a technique that handles this now: 3N, which has just been released and that's the same pattern that you've been using, speeded up a bit. And there's even a shortened version of that which you will need very soon.
You need this – you'll go right on needing this from here on out with a pc. You'll need what's called 3N, but 3N has to be shortened after a pc has gone for three or four banks because the pc's running too fast. And for instance, I've gotten a pc up to a point of the RI blows on statement. This pc has been very carefully textbook audited and is now blowing on statement.

There's no – you call it back and it doesn't even flick, so you have to say, "That rocket read." See, "It – that rocket read." But why? Because, well, it rocket read when they said it, but you haven't even got a tail on the rocket read a lot of the time. You've got the accelerated start. But instead of a tail on it, you've got a blowdown. See, the thing doesn't have a chance to do a complete rocket read; it disintegrates.

It does an accelerated beginning; goes like mad, the tone arm moves down, pc says, "Fine." You read the thing back and it's quiet as a mouse. You can't get a tick out of this thing. You haven't even opposed it yet and you can't even get a tick out of it.

All right. Well that, of course – after a while when a pc's doing this, it's a waste of time to read the RI back to him, so you get 3N-2 which is an abbreviated form of 3N, just like 3N is an abbreviated form of 3M-2, don't you see? But you won't be using 3M-2 on these implants because the other is too easy.

Now, what can you cut out? Well, I just leave it up to you. What can you cut out? Because your job – let me tell you this very straight from the shoulder – your job is to make sure that the charge is blown out of that RI and that is your job as an auditor.

And let me – let me put a bug in your ear right now, don't you let any pc talk you out, with ARC breaks or anything else, out of getting that charge off. You understand? Because the pc will natter, the pc will yap, the pc will this and will that about your reading it a second time, how you're cross-checking or doing anything like that. Because you can do these things without losing too much speed, but the pc starts suppressing his cognitions in order to make speed, you see. Suppressing this, suppressing that and all of a sudden you've got a little fluky RR that goes *flick-pow*, and you see it stop. It's – it's a choked down. Pc's suppressing almost as fast as he's giving it to you. And you say the pc is very nattery and the pc is this way and that way, and therefore you mustn't go in and clean that up. Well, you've been defeated as an auditor the moment you make that conclusion. You got it?

Let the pc yap because your payoff – your payoff comes in the next two or three GPMs and if you've done that well in the first that you're running, then your blows through the second are easier, the third, the fourth GPM, and you're just flying by enunciation and recognition. You understand?

And you'll be running maybe a GPM every forty-five minutes of auditing time. You got that now?

Now, all you have to do is get a "Nelson eye" on the E-Meter – a Britishism. He put the telescope to his blind eye. They told him to withdraw, you see, and he said he didn't see anything. There is where your danger lies because this thing chokes; you didn't get a nice RR. You say, "Well, I'll let it go, because the pc is running so well and this pc gets so nattery and ARC breaky every time I stop him," and reason, reason, reason, reason, reason.
Now you're – just made tremendous quantities of work for yourself. Every time you strike that item again in the next bank you're going to find out that you didn't clear the charge of it in this bank. Not only are the next few RIs going to be impeded but that item in the next bank comparably is going to be badly impeded and you are going to stack the case up. You hear me?

Now ARC breaks won't stack the case up, but unblown RIs will. And it's your job as an auditor to get that charge off. And that's your job, and don't let any pc talk you out of it. See, you've got two choices on running these days. You've got two choices that you can make, and one of them is wrong. And that is have the pc always happy and cheerful and the other is have the charge gone. And you just forget about that first choice. Because how anybody could run the Helatrobus Implants and be happy and cheerful, I don't know.

Oddly enough, after a while they will be happy and cheerful but only if you get the charge off early on, so nag them all you want to.

Now, you can nag them to a point where the charge won't blow. See where your judgment lies? You can get them so upset and so enturbulated and so jumped up that the charge won't blow. You've gone the wrong direction, don't you see? But then that was a necessary thing. You're making mistakes then in order to do this.

You get yourself a good clean RR that's disintegrating at the end and it's blowing. It's obviously going. This RR is going to be gone and you read it back and you read it back and then you say, "Well, it didn't RR again."

And you read it back. And you say, "Are you doing anything? Thinking about anything? It didn't read. I'll read it again, 'Wantably fantastic.' It didn't read that time. What's the matter?"

And next thing you know the pc is saying, "What's hap – ? Whaaawhi – where am I going?" you see. Well, you made a mistake.

The place to really get skilled is to recognize the quality of RRs. Now some HPA thinks, "Well, I'm doing pretty good; I've learned what an RR is." You take off from there. You get pretty good and learn what a choked RR is and what a disintegrating RR is, and then you'll be in business.

You get some RRs; you could actually see the pc suppress them as they happen. For a moment there you can see that RR stop. And you can say to the pc, "What happened?"

Pc says, "Well, it wasn't much, I – well, I just had a little cognition." For interest of speed of run, they start suppressing their cognitions. Almost fatal. Don't you see? And you say, "That's fine. Thank you," call the item again and by golly there'll be the full RR. See? You have to learn to interpret an RR. There is nothing anybody can do to help you really, beyond you finding out what one is. These wide, loose disintegrating RRs speed rapidly at the beginning. If you don't get the instant spurt at the beginning, you'll never see it as an RR because it hasn't got any RR on the end. It's disintegrated already. You see an RR as it goes over, has a hook tail, and many an auditor gets so educated into recognizing an RR by its hooked tail that when he gets to a disintegrating RR he sees no hooked tail but he missed the spurt beginning.
Now of course, the meter is already in motion at the time that the auditor starts to interpret it. You see, he's used to having his attention caught by the fact that the thing is moving. He gets his attention... so he says, "If it – needle starts moving then I should look at it and see if it's an RR." Well, of course then he only sees the end of it and it looks like a fall. Ah, but it had a spurt beginning. He's looked at a disintegrated RR. The thing has disintegrated before it's gone. See, that thing has blown. It's blown completely. There's nothing – no smoke left on it.

You call this thing again and it doesn't fire at all. And you say, "Well, I must have the wrong item. Let's random list for forty-five minutes." Oh, hell's bells, you could run a whole bank in forty-five minutes. It's nonsense, you see? Why? That's because the auditor doesn't have his attention on the meter to catch the beginning spurt.

See, an RR is characterized by a spurted accelerated beginning which is... gives it its name. It looks like something taking off – you know, like being shot – shot away from its start. It's a spurting beginning. It goes *psshh*, see. And then its other characteristic is a curled end. After it gets passed over here, it go *khihh!* And an RR is always characterized by these two things. Beginning goes *psshh*, and the end go *slhhp*. All right, the disintegrating RR doesn't go *slhhp*, it only goes *psshht*.

All right, so if you have to have your attention caught by the meter already being in motion, you miss the beginning spurt so you don't know if you've got an RR or a fall. Then you'll see an RR start off beautifully. You can gauge the speed of an RR, of how far it will run, by just watching it. You can get used to that. And it starts off beautifully, it goes *psshht*, and it – it didn't go anywhere. That's a choked RR. And there's a suppress, or a cognition suppressed, or the pc has done something there. Pc has suddenly wondered if it was "covitiviwi-wibibly" or something, see – halfway through having said it. Something has happened here. And that RR isn't blown and it won't blow until you ask the pc what happened and get rid of that suppress and then the pc says, "Well," the pc says, "Well, I was so-and-so, and so-and-so, and I thought it might be because there's two here on the sheet and so forth, and I thought it might be and therefore so-and-so."

And you say, "All right. Now, I'm going to say the item again. 'Inevitable catsfish,' 'inevitable catsfish.' All right. That rocket read." And it will. It rocket read beautifully. Where was the charge? The charge is insisted on. You must realize that these RIs don't have any more charge on them than you see on the meter. Just mark that down. This meter is not indicating the presence of charge. The rocket read doesn't tell you that there is some charge someplace. Just do a total associate. See? The rocket read is the charge. All the charge that is going to come off of that thing is seen in and has velocity in that rocket read. That is the charge. Now, you could be very pedantic and say, "Well, actually the thetan in the facsimile is subjected to certain impulses which causes him to impulsify and the 7.5 volt or 9 volt current which is being passed through the corporeal resistance chamber known as a human body is therefore modulated and monitored by the various circuits which are approached from the right-hand electrode and which terminate in the left-hand electrode, and there's a magnetic influence so that you get a visual response in the ohmmeter" – oh – damn-iter.
Some poor dear in Scientology every once in a while tells me, "Huh, but you talk so much about electricity, I – heh-heh – I don't know anything about these things." I always shake them by the hand and say, "That makes two of us." [laughs] Other people pretend they know something about it, see? Well, this is an interesting piece of magic you've got here in an E-Meter. That's for sure. This is an interesting piece of magic and isn't it interesting that it doesn't exist elsewhere on the whole track.

Oh, recording devices, and detective devices and thisas and thatas and the other thing all exist on the whole track. And there's all kinds of things and my old pals in certain sections of this universe – well, in the Galactic Confederacy particularly – would be absolutely horrified if I said, "Well, we developed a meter we don't have here," because their pride is that they have all the equipment that was all... has ever existed or that will ever be developed, and they know every electronic activity that has ever existed or will ever exist anywhere.

And that ends their modesty on the subject, see. And you say, "Well, here's a box of tricks that does something that none of our meters do." It wouldn't be a popular statement but it'd be a true one. It's quite remarkable that it does it. So let's not worry why it does it. Let's not worry at all why it does it. Let's worry much more succinctly about the information it gives the auditor. And the information it gives the auditor is: There is something there, there is nothing there, or what is there is beyond the pc's reality. It gives us there is something there that will be real to the pc. And that's all fine. We know all that.

But let's take the next step that this thing is charged and is discharging. Now you've customarily, in the past, read this on your tone arm. Well, you don't read these Helatrobus Implants on your tone arm. We don't care whether the tone arm moves or not. Just skip it out in 3N. That's too much bother. Because you do a bank or two and the tone arm starts moving down no matter how high the thing has been stuck, and all the charge that was on the original bank you were doing is coming off, it's coming off on the needle. But you'll also see the needle action reflect over onto the tone arm. So that is all the charge there is on an RI.

Don't imagine that sleeping beneath the surface is a slumbering volcano that something else can trigger. No, sir. There is no such thing. When you read one of these things and it goes pssheww and then you read it again, ordinarily early on in a case you only get half the RR or thereabouts and when you read it again you get a fzzt, very tiny RR, about a quarter of an inch, and when you read it again it goes thi, tick. That's early on in a case. Well, what happened to the rest of the RR? You've got to recognize that something happened to this RR, otherwise you'll be nagging the pc to find out what happened to the RR. Well, the RR evaporated! That's what happened to it.

Now, you've got to tell the difference between an RR that evaporated and an RR that was choked to death because they look different on the meter. And you just have to get your eye educated to be able to tell the difference. And it's pretty hard to do and it's not a hundred percent precision. I had to study in a meter, I don't know, hour or two or three, and certainly something on the order of about five or six hours of auditing, paying attention to just this one thing until I finally got the subtle nuances of difference between them. So it's a case where experience is a very good thing to have.
Well, we can make some very good general statements. You can see the back break on one of these things, too. Although what that means is just no more choke, see? And then you'll run into this one: The thing fell when he said it and then you had him give you another version, "coveting-a-tivably" and something, and "erradicably catfish" and "wingabingably catfish," and all of a sudden you'll see this fantastic rocket read on something that has nothing to do with the price of oranges, you see? And you say, "Give me the original item again," and you get a gorgeous rocket read. In other words, you had a rocket read sitting on top of it.

Something in his own existence had pressed down on this thing and had transferred the read from the RI to this other thing. In other words, it ate up the rocket read. And the rocket read was encysted and this one was therefore, wasn't on your plot. That's always what happens when you can't get a plot item to read. It isn't that the plot item isn't there; electronics were broken down that way. The Helatrobus boys really ought to get the manufacturer's seal of approval and the service seal of approval because I have been looking in vain to have one of their damn squawk boxes not fire. It's obvious with that many squawk boxes and electronic implant boxes in any existing series that — well, it is obvious that their repairmen weren't all that good because they're on cables and so forth. Particularly those strung outside. Those that are on the last implant of the first series, that were just there open to the weather.

Oh, I consider it very remarkable that they stay in operation. I keep looking for a hole to occur in the line plot. Don't you see? I've had my eye open on this now for the last two or three thousand items, you know. Everything working. "Wantably, fantastically, catfishably" and pow — it's working. There it reads.

So I just dropped it out of the line that there's something wrong with the electronic implant equipment as the pc went by. See, I dropped that out. The reason I bring that up, that might occur to some of you.

"Well, I guess that box wasn't working that day," see? Well, it's always possible that that is true, but I haven't found it to be true. They always worked. They should get the manufacturer's seal of approval and so forth. Their production boys and their service unit should have gotten the leather medal pinned on with a blanket pin very deep. [laughs]

But the point I am making here is that there's something wrong with the way the pc has approached this thing and as your pc gets to flying on down the line, you less and less will have trouble with this.

The point I'm trying to make to you: You do your job well at first and your job gets easier. And you do a lousy job at first and your job will not get easier, and it might even get harder.

Now, the point where you make speed is to do your originals and earlies right and then you'll make more and more speed, more and more speed, more and more speed. It goes faster and faster and faster and faster and faster. And don't pull colossal blunders like letting your pc miss an item which remains fully charged even though he hit it, you know. You couldn't get any rocket read so just went on by it and then find your pc leaping into the second series. The source of all skips is a missed RI and there's two ways to miss one. Just not have it at all or not discharge it.
In other words, a skip – flying into another bank, flying elsewhere, bouncing off the track, not being there in the incident anymore – is caused by missing an RI, either by not calling it at all – we go from "covetably" to "inevitably" or something of the sort and we don't get the "nix" in, see; or we call it, it didn't fire, we don't get the charge off of it and simply go on.

The next action the pc is liable to do is skip. You skip something, so he Qs-and-As and he may go into the identical or the similar implant of the second series. And you suddenly find yourself running the second implant series. And you wonder, what's all this? The pc is being torn to ribbons, nothing is RRing right, the thing is – the words aren't right and all of a sudden he says, "Impassably and insurmountably, inevitably catfish." And you say, "That isn't in the line plot." It's in the second series – not those words are in the second series; I haven't got the second series plot. I've got some of it though. And you say, "Where did all this come from? What happened? What happened? What happened?" Well, a good way to do that is to get your pc oriented early as to his surroundings. Have him close his eyes and take a look.

He doesn't want to look very much. When you first start to run it he will tell you it's terribly unreal, and he can't see very much. And after you have done a bank or two his reality on visio will be getting greater and greater and better and better. And it's usable by the auditor.

Now, pcs go up steps and down steps in the first implants and they don't always just go down. They sometimes also go up because that's more confusing. They don't turn around in the middle of a set of steps and go the other way but they'll start a bank and it'll go backwards to the last bank – so forth. So this is all very confusing. But you get a pc – so don't tell him you always go downstairs because sometimes they go up, see? And sometimes the opp terms are on the right and sometimes they're on the left which also makes it interesting and sometimes a pc is sitting there with a line plot and says, "This line plot ought to be printed in reverse, you know." Well, you can say it's printed right for at least half of the GPMs. Because it is. About half of them, it is reversed. See?

Now, as the pc goes along you can actually – and you can overdo this – you can make him put too much attention on and work him into it, and yap at him and nag him, and so forth, but it helps you out and you say, "Take – take a look there, what do you see?"

And he says, "Well, I see a flight of steps."

And you say, "Well, are any of them gray?"

"Yeah," he says, "there's one down there that's gray."

That's an RI you didn't get.

"Are any of those steps black?"

"Yeah, well there's one over here that's black and the rest of them closer to me are white."

Brother, something's wrong here. Something's missed, see. Oh, that's pretty crude repair. I myself don't use it. But I like to hear a pc tell me, "Those steps are all white now." Oh, that's very nice, that's very nice. That tells you you haven't got a speck of charge left behind
you because those charge – those steps were black as ink the first time you went over them, see. But RI by RI they turn white, see? Interesting isn't it? You can even orient the pc.

This is real trickery. I mean, these guys really set it up well. This is real trickery on a part of an auditor. Tricky, sneaky. Before you list for the next goal, have the pc close his eyes and tell you what he sees. Find the next goal and its top oppterm. Then have the pc close his eyes and tell you if he's in the same locale that he was in before, because if he's in a different locale you've missed a whole bank. Tricky, huh? You get what I mean?

These banks usually end at the top or bottoms of stairs. You've just gotten the last item, you see.

He closes his eyes. "All right. Where are you?"

"Well, I'm on this landing."

"All right. You got that? Oh, you're on the landing. That's fine. All right." Now we're going to get the next goal and we get the next goal and as soon as we've got it and then we've got its – the top oppterm of it, we have the pc close his eyes again and we say, "Now where are you?" "Well," he says, "I'm in the same place, but just one step down." "That's fine." Tricky. That's using the scenery to confirm the fact you don't skip anything.

You'll find out the pc has never had any visio. These implants are marvelous to run because the pc has never had any visio, has never seen anything, has never heard anything, has no sonic, has no visio, has no tactile, no kinesthetic, nothing; and he's been in this state ever since anybody has ever tried to run an engram on him. Now, this has been the bane of everybody's existence. You run him halfway through a bank or a quarter of the way through the first bank, and all of a sudden he's got dim visio. You run him all the way through a couple of banks and boy, he's got visio. You run him through three banks and he's got kinesthesia. You can hear these crazy – he can get one of these crazy theta poles wobbling. He can feel it wobble. See, and he'll come up to full sonic on this. Quite remarkable.

We've sweated for years, all kinds of trickery to turn on the perceptics of a pc. Well, it's in the Helatrobus Implants right on the button. You run them, you got it.

Well, you can use the scenery of the implant to orient the pc and tell whether or not you've missed items. In fact there's a lot of trickery involved in this. See? As far as the auditor is concerned, he can get pretty slippery. Now, I don't ask you to get this slippery, but on certain flights of stairs, apparently, there are electric switches on the walls that tell you what goal the next bank is turned to. That's pretty good, isn't it? It's not in English, but the pc understood the language when he went through. Parel told him, "Well, I know it's undoubtedly the right goal because it's marked up there on the wall." The way you turn over the switch over to the goal, "to be happy." Apparently this shifted all the relays and everything that was going on in the squawk boxes by just shifting one lever.

I like to think that one of the operators accidentally threw the activation switch one day while setting up one of the series of goals. I like to think that happened. Anyhow – because actually the controls were on the landings and stairs. Pretty tricky.
Now, all of this is very good news and it's very good news from several quarters. One, the Helatrobus Implants are incredible. It's unbelievable. Man in the street can run them, however. You just find "to forget" on the top opperms and just go along with your 3N patter. Give him the thing. You don't have to write it all out for him. You shouldn't write somebody's whole bank out for him. He should have to think it out that much to keep him in the incident. You understand?

You can give him the number and so forth, and you just tell him how to do this. He maybe even have had to go home and read his dictionary and study to find out what "-ably" was, and so forth. But he doesn't know anything more about it than that. And he'll run this thing, and he'll run just about so long, and all of a sudden he'll start telling you that this was a long time ago. And that this was this, and this was that and he'll really start holding forth on the subject.

In other words, it runs as gently as that. It requires no education. But the incredibility of it keeps it from being believed or usurped and used for evil purposes until we can control it. You'd be surprised the degree that we use incredulity as a protective security mechanism in Scientology. Just never forget that. Because it's a marvelous one, it's a marvelous one.

"Oh, that Scientology, it's balderdash! Those people believe – that cult believes..." and so forth. I very often feel like just patting those horses' heads just very smoothly and nicely and neatly and saying, "Good show, brother, good show. Thank you." Because they're operating as a security screen far more effective than any security screen any of us could devise.

You realize that the psychiatrist has just now found birth and prenatals. He's been chewing away on birth and prenatals for some time now and he'll eventually graduate up to it, but what's to stop some Russian from putting these – one of these banks on a tape recorder and playing it off to somebody? What's to stop them? They don't think they'll go nuts. The only thing that will stop them is because, "Well, those Scientologists, they have some ridiculous beliefs." And that actually will protect us right up, straight up to the point when we don't need any protection, which point will happen suddenly. So don't always revile this type of an attitude. Recognize that it has its uses. It wasn't designed that way but it does have its uses.

You realize that we might very well be under the gun of some government or we might be here, we might be there. We might be... Or there might be barbed wire around Saint Hill here until you couldn't get a mouse through or an English rabbit. You know, guards all over the place. "Hup 2, 3, 4. Blah-blah-rahah-grrr-grrr" – all this stuff – "I'll just show... halt where you are – hush, hush," see? Can you imagine what that would do to you? Supposing – I just heard today that somebody more or less didn't talk to the public about implants. You know, guards all over the place. "Hup 2, 3, 4. Blah-blah-rahah-grrr-grrr" – all this stuff – "I'll just show... halt where you are – hush, hush," see? Can you imagine what that would do to you? Supposing – I just heard today that somebody more or less didn't talk to the public about implants. Well, all right. The factor of incredulity tends to slow them down a little bit. They're afraid somebody will get in their faces. But remember this, they're putting themselves on a withhold. I almost classified the line plots. Then I said, "No, I won't put anybody on that much of a withhold on this stuff, because it's too tough. It would be too tough on them." We'll just continue to depend upon incredulity.

Now, that factor doesn't keep you from auditing a pc, however. You don't have to tell the pc anything. Ian is auditing a pc in here that never heard from nothing and she ran down through the bank "to forget" gorgeously. Feels fine. Feels wonderful. Doesn't even know
where she is. Didn't know at the time, so what's the difference? You don't have to totally educate the pc except maybe in word endings or something like that in order to run them cold.

Take the milkman out here, sit him down, get "to forget" to fire, get "forgotten," get "nix forgotten." He says, "What's this 'nix'?'"

"Well, that's just what you say at this stage." [laughter] And you say, "All right. Now give me number 3 there on the paper I gave you. You have to fill in the 'forgotten' after it."

And he says, "What's that mean?"

"Well, that's – doesn't matter what it means. Say it." All right. That's fine. That rocket reads beautifully, and so forth. There we go on 3N. Just roll it. See? Keep rolling it.

This guy goes on and he says these things, says, "sss – ssss – ssss." He ends up at the other end of the line.

You say, "Now, we have to find what the next goal is," you know.

"Goal?"

"Yes, yes. Now, who or what would 'to forget' oppose? Just keep telling me."

"Oh well, you want it that way." And he goes on and he gives it to you, whatever it is – "remember," and so on.

You say, "That fires. That's – that's it."

He says, "You know, I've got a feeling that is it." [laughter] Take him right on down. I don't think you could run him halfway through the first implant but what he says, "Now, wait a minute now. This happened a long time ago. Now, I know you're going to argue with me, but it's sort of like this; I get an idea I was living on this planet, see? And that's funny because, you know..."

So you see, that incredulity might deny you some pcs and may give you some catcalls but it doesn't actually keep you from auditing anyone. You understand?

You don't have to sell them on whole track before you audit them on whole track now because they're sitting right there, man. They're right there. They've been there ever since. And it flies. And your job as an auditor is just to do a technically perfect job on the thing. The only rough spot in auditing all these is auditing a goal you have that you haven't had run, that is about to be run on you. Things tend to go kind of solid. But fortunately, there was quite a lot of variation in these goal patterns and you don't follow that.

It would be quite strange to have three banks simultaneous between auditor and pc. That's a lucky break, isn't it? They change the thing often enough to keep it from being too restimulative while auditing. All right.

This, then, gives the auditor a little bit of pause. The only place you really run into this is "to forget." Therefore, one of the first duties an auditor has is to get the bank "to forget" run out very cleanly indeed and he'll feel fine because the second bank doesn't much restimulate while you are auditing the thing. I've audited one of these recently on a bank that wasn't run out, and I felt like I was getting me 'ead knocked off, and knew what it was and knew why.
And it was uncomfortable. But that was remediable because the bank, to be restimulative to that degree, must be very ripe and ready to be run almost at once anyway, don't you see?

So it's coming straight up and it will be run. That's the only liability there is to this stuff.

Now, the fact that they can all be audited out very rapidly gives you no alibi whatsoever not to get them audited out. You haven't got any excuse at all not to audit them out. Now, the only excuse you – pardon me, you do have one excuse not to audit them out: if you don't have them.

Now, how many people have got these? Well it's the wildest kind of a guess, but I think we're up to about 5 percent don't. Don't have the Helatrobus Implants or it's over their heads. It's a very small percentage. And we've certainly moved up in percentage because everybody under the sun, moon and stars we've been grabbing hold of have got these, but we do have our 5 percent. Used to be a far, far greater percentage, don't you see, so we've closed it down to that degree.

Now, what do you do with that 5 percent? You are going to have a certain amount of trouble with some of the 95 percent because they’ve only got the second implant, see, or something like that. I could anticipate running into some trouble of that character, but that isn't any trouble because they audit just like the first implant, except they have a different pattern. Until you get that pattern in your hands, just dog it off somehow or another and do the job.

What about this remaining 5 percent? What can you do for those fellows? They fall into two categories based on the mechanics of the time track. They fall into categories that do have the implants but cannot approach them and those that don't have and so they aren't there to be approached. There's no implants to be run.

That is to say, there's implants on the case, but they are not the Helatrobus Implants. And that fellow to some slight degree is slightly out of luck, because he's got implants that are just as vicious as the Helatrobus Implants one way or the other but they aren't the same pattern; they don't have patterns of that character; you can't handle them in the same way and he's under that much liability and so forth. That's sort of bad luck. Bad luck.

Well, how did this fellow escape them? Well, he didn't escape them by being tough and hairy-chested, you know, and not being picked up and all that sort of thing. No, he escaped them because he's from another galaxy. He ain't not native to this 'ere galaxy. You may find somebody who is native to this galaxy who never went through it. He was in so lousy a condition they ignored him, or something of the sort. [laughter, laughs] I think you'll find that very rare, if it exists at all.

Now we have to take up the possibility – not the possibility, we have to look at the factor. We have to look at the factor of the fact that this is a rim system that we are in right now. This is Sun 12 and it is a rim, tiny, microscopic, terribly insignificant little bunch of space dust. Not to do it down particularly but compared to other systems, galaxies, confederations and that sort of things and other possessions of confederations and so forth, this is noth-
ing. That's why it's left alone. But it stands pretty well alone. It's peculiarly isolated. This is also true of most of the stars out in this end of this wheel.

You know the galaxy is a big wheel and the galaxy has a hub and it has a rim and we are very close to the rim. You look down into the southern horizon, you notice the stars in the southern hemisphere look terribly big and terribly bright. Well, it isn't that they are so much terribly bigger than other stars. That's just the end of the galaxy that you are looking at. That's the end. There's just that many between us and no more this galaxy, see?

It's very close, and people wishing to get rid of troublesome characters, captives, anybody you can think of... You know, around city dumps, you know, they always have trouble around cities because people start using certain areas of the city for dumps, you know? And they take – use it as a dumping ground for the ice cube and for other thing: unwanted beings, unwanted people, unwanted personnel.

Like you overthrow the old regime, you see, and you throw them through a good, stiff implant that mixes them up so they can't tell north from west and you throw them into an ice cube capsule of some kind or another. And what do you do with them? Well, the primary threat to a system is the strength of a thetan. That's the primary threat in the view of some very aberrated character. He thinks the main danger in the planet, or main danger in the system or the galaxy, or so forth, is a free thetan.

The possibility also that a person in – who is acting as a doll, or something like that, can exteriorize from where he is and go home, pick up another body and come back and raise the devil with him.

In other words, these people are – have o verts so they try to protect themselves from the vengeance of a free thetan and they compound the possibility and the potentiality of this particular universe as a trap, and they make these people very thoroughly trapped. Well, they dump them. They dump them pretty well far from home. They try to – don't even try to – they don't dump them close in, they dump them way out.

Well, Helatrobus threw any people that it implanted as far as possible. Oh, some of them were – wandered back, and some of them stayed around, and some of them didn't get badly affected and reported back and that sort of thing, but they also dumped people pretty far out.

So this particular system got dumping, and the Marcab Confederacy and some of the other stars around here just got a terrific concentration of people being dumped from the Center of the hub, you know. They don't want to go over to the next galaxy, so they just take it out to the edge of the city, you know.

All right. And this is close enough to other galaxies that ambitious characters over there trying to get rid of people out of their galaxies and systems, and so forth, would also use these rim stars. Now you get down toward the Center of this galaxy and the possibility of finding somebody without the Helatrobus Implants, of finding any foreign implant system, will probably be totally negligible. Probably nonextant, you see?

But out here you got a mixed bag and we don't know what they did in the next galaxy. See?
Now, science fiction writers following the cue of some chap, I've forgotten his name
now, Einstein, Beinstein, something like that, who said that $MC^2$ over $C$ wouldn't go,
man, and that the speed of light could not be excessive. And actually I was looking up some
speed tables the other day, and a trillion light years per day is not full throttle on a space
wagon. So there's traffic between galaxies and there's traffic between islands of galaxies and
other islands of galaxies. Interesting.

Has a lot – you say, well, this is science fiction. No. No, no. No. The only part of sci-
ence fiction there are, is the mistakes the science fiction writers have made while writing
about their own past. They've made a lot of errors there.

The truth of the case is that it's – it has a lot to do with you as an auditor, suddenly.
Not that you have to embrace science fiction, but you have to look at this possibility. You've
got to face up to the is-ness of the thing. Man's greatest trouble in solving his own problems,
see, he didn't have enough on the ball to face up to the is-ness of existence. And the reasons
for that are very plain, short, succinctly stated. That case which evinces the greatest unreality
about things is that case most subject to bank solidification in an effort to remember.

That's a technical statement I just made and has a lot to do with your engram running.
It's directly proportional. His effort to remember increases the solidity of his bank, which is
painful to him, which then brings about his statement concerning unreality.

See, that's proportional. The amount of unreality evinced by a case, then, is propor-
tional to the amount of solidity caused in his time track by his efforts to remember. If his bank
goes solid every time he tries to remember something this becomes painful, so then he count-
ers this by saying it is unreal.

This fellow that tells you, "I don't believe in past lives" is saying, "My time track goes
solid when I try to remember." And it has an awful lot to do with you as an auditor, because
that case that evinces great unreality must be given very gentle handling and you cannot run
an engram on that case. Not only – you must not run an engram on that case, because the bank
will go solid.

Now, you could take almost anybody here and run them through an engram once. Let's
take a late-on-the-chain engram. We could run them through the engram once. We'd get away
with it. We can run them through twice; we can get away with it. This is not a basic on a
chain, see? We run it three times, it starts to get kind of solid. And we run it four times and by
golly that's getting awful solid. And we run that engram five times and $rrahrrrv$. It's getting
tough, man. And we run it six times, we'll just freeze him in it. It takes three to ten days for
the thing to key out and go soft again – which it will do.

Now, that's true of anybody here. I'm talking about something late on a chain, you un-
derstand?

Those engrams have always given us trouble. They've always been sticky, and it even
says in Book One, don't run 'em. You have to brush them off enough sometimes. You can
always take a case through them once, you know, to get back early. By the time you've taken
them through two, three times you wish you hadn't. The bank's going solid.
Well now, this case of tremendous unreality goes solid on one pass. You practically can't examine the bank. It's practically as much as your life's worth to even date this character. If you could perfectly and accurately date without any flaw in your auditing, yes, it would soften up the bank, but if you're clumsy in dating and you date this fellow without any great reality anyhow, the little errors you make will throw him off enough to beef up the bank and he gets a greater unreality than before.

There is a coordination between unreality and solidity which is reversed. The greater solidity, the more unreality the person will advertise. Even though the engram gets very real to him when it gets solid, general bank solidification and so forth brings about unreality. Why is this? Because the basic mechanism of the time track has the liability of making the thetan go solid. How does a thetan cease to be Clear and start going solid? How does he become solid? Probably by making a time track in the first place, of course. And the more this track is jammed, and the less he has to do with it, of course the less is as-ised about it.

Well, that's just general time track. Now, what about implants? Why do we specialize in implants? It's because an implant is the product of an ARC break plus solidification. If you wanted to run old ARC Break Straightwire – "Recall an ARC break. Recall an ARC break" – you would find the guy sitting eventually 3-D in an implant. This guy sees a theta trap. That's a warning to him that he's not wanted around here, and it causes an ARC break. And all these traps and such devices and so forth and betrayals are basically ARC breaks.

Now, the method a thetan uses to handle an ARC break is to bring about an unreality, which he usually does with a "not-is," don't you see? And it becomes the common denominator of the bank then to have an unreal bank because if it gets real it hurts too much. So your effort to persuade him that this is real, that he is looking at, of course does him a tremendous disservice because it hurts like the mischief. The only safeguard he has against being caught in a solid bank, you see, and being upset by a solid bank, is by saying it is not real and not permitting you to find anything real on it. Now, that type of case is going to give you some trouble, because you will try to prove to the case the reality of what you're doing. And because what you are doing is real, you can do that very easily and it just results in a total overwhelm of the case. You can all too easily prove that what you are doing is real.

So when somebody starts telling you about how unreal it all is, if you're running the Helatrobus Implants you go right on running them, man, because that will do the most for him that can be done, you see. The most that can be done for the case is get those implants run – real or unreal. But you can't find those implants and he says it's terribly unreal and all is unreal and everything is unreal and you can't find "forgotten" and "nix forgotten" and so forth, and you just can't get any place like this, brother, you watch it!

One of two things is true. You either have your paws on somebody who is not a native of this universe – I mean this galaxy. He's a native of an adjoining – adjoining galaxy, and you don't know the pattern of his implants; or you've got on your hands somebody who has been so implanted so often that just the thought of five minutes ago gives him a headache. Why does it give him a headache? Because he thinks of five minutes ago and the action of remembering causes solidification of the bank which causes pressure to come in and he got a headache.
So his only protection against this is to make you unreal and not-is it. His last weapon on the bank is to not-is and in the absence of his not-is he damn near dies. You see? What do you do with him? Well, this is not... I haven't time to give you all the data on some of the material I've been unearthing with regard to this, but I've been developing quite a bit of little odds and ends of technology concerning the time track and its automatic nature and its state of manufacture and that sort of thing.

I just realized just this afternoon that we have a straightwire process that does an awful lot for this case. We're making him remember and the track is going less solid. I'll be developing quite a few... I'll tell you just to – not to leave you on the hook.

There is an involuntary intention. I've discovered an involuntary intention. You have involuntary muscles and you've got habit patterns and training patterns and all this sort of nonsense. Well, add to – up that in a thetan to an involuntary intention. He wants to open the door and so he just bluh opens the door, see. See, he involuntarily opens the door. In other words, he just opens the door.

My father used to answer telephones this way. Plunk. You know. And Telephone rings; plunk, you know. Telephone appears, you know, off the hook, and so forth. Actually you've intended it up there. You got the idea? It's been intended into a new position. Well, that's an involuntary intention, and apparently it's the same mechanism that increa... creates the time track. It's an involuntary create. You see?

So that's an involuntary intention and it belongs to this set of thetan muscles – if you'll forgive me – which operate without intention, without knowing intention, but have a sub-awareness intention. And a thetan can do this. He doesn't have to have a bank, machinery or anything else. He just simply can do it. Well, that forms the time track.

Now, solidification of the track is caused by combat of the postulate "be solid." You see? Everybody wants you to be solid. You don't want to be solid. That makes enough fight right there to solidify something. Well, it goes worse than that. The solidification mechanism is composited by remembering, naturally, and you as an auditor are actually handling, when you handle the time track, the involuntary intention of the thetan. That's what the time track is: It's an involuntary intention to create. It just responds automatically. And you say go here, go there, do this, do that. And he has pictures. Where do pictures come from? Well, they come from this involuntary intention. You're just handling that mechanism.

Well, you can handle that mechanism, directly. You can handle the mechanism directly. And if you could get a case unbailed enough – this is actually the plot – you get a case unbailed enough and go early enough on the time track, and you can actually snip the whole track, see. It just rolls up like it's just nowhere now. See.

It's the existence of the time track that makes memory impossible. But it is the obsession to remember which makes the time track – involuntary intention – take place in the first place, see?

So any goal like "to remember" raises hell with solidification. Or any implant that louses up – and they all do – a thetan's memory or sense of time, result in the solidification of the time track by taking over the involuntary create that brings about the time track. See that?
So you say, "What – " you say to the pc, "What instinctive action has been regretted?"
I don't care what fancy wording – just as long as it adds up to that sense. In other words, what
involuntary action have you engaged in which you then choked off and made an enemy out
of? See? What instinctive action was regretted? What instinctive action have you disliked?
You know, anything you wanted to go at it, you've got a straightwire process, which actually
runs implants. It runs them at the rate of a snail racing madly alongside of the quarter horse of
doing the Helatrobus Implants, but you nevertheless – there is a door open.

In other words, the door is not slammed tight in these fellows' faces, even if they are
not native to this uni... this particular galaxy and even if their sense of reality is so great that
all this could happen. And I'll develop a few of those processes and oddly enough I don't think
the patterns are innumerable.

I think possibly maybe five or six different case patterns. Maybe more than that, but if
you come up against one of them as an auditor, and you decide the only thing you can do is
just run engram after engram after engram. Watch it man, because you're going to get a solidifi-
cation of the track and you're going to get that pc in trouble. So don't go in for this engram
after engram after engram, you see. Hit them lightly with a feather. Now, if you are lucky
enough to be able to get a basic like 350 trillion years ago and it's an overt and it's basic on a
ch... oh, you're in man. You can handle that, because of course that will erase, and so forth.
But how about this fellow who is very unreal? You going to get a 350 trillion incident when
he can't get breakfast? You're sure not, you see.

In other words, it's all done with the feather. You run into the case that hasn't got the
Helatrobus Implants, you handle with a feather, huh? Don't go charging and barging around.
Open that case up gently and I'll try to give you some straightwire processes and things like
this, that gradually, gradually pet the shadow of the cat.

Okay? Well, there's a lot of stuff turning up on this, that and the other thing – It's all
very interesting. It mostly comes under the heading of phenomena and data and that sort of
thing. And I've recently been understand... been studying the power, activities and habits of
an Operating Thetan, just from an intellectual basis but with some view of reality, which I
really haven't had on this too well before. I find we have here a fairly complex being and a
very, very formidable one. His ethical level and that sort of thing, deteriorating, was what got
him into trouble in the first place. So when you put him back together again, of course, his
ethical level will have to be put back together again, too. Otherwise, he'd just get into trouble
and get everybody else in trouble.

But the point I'm making here is that the state of OT is so far above anything we have
ever dreamed of, that I say our breakthrough – our breakthrough along this line is tremendous.
So tremendous that we had better start getting our house in order. Not to protect ourselves
from OTs, that isn't the point. But it means that a political breakthrough is – puh.

You have any trouble eating breakfast? See, we would be shooting mice with an ele-
phant gun, don't you see? And we're not about to attack anybody or do anything bad like that.
But we might have a few heart-to-heart talks.

So actually, I have had to be plotting up in front of us a bit politically about where did
we go and how do we relate to, and I find some very interesting data. Probably some of you
have past connections of one kind or another when you suddenly say, "Huh, I wonder how I forgot that?" You probably have to go take care of these things. But the basic thing is that this planet is peculiarly susceptible to be a rehabilitation base and so forth at this part of the universe, and I think that can be sold to even most of the confederations. I don't think we have to sell it to much of anybody else; I don't think they'll be in a position to argue. They've only got atom bombs. We've got OTs.

Okay. Thank you very much.
TV DEMO: ENGRAM RUNNING – HELATROBUS IMPLANT GOAL

An auditing demonstration given on 22 May 1963

This is the Saint Hill Special Briefing Course, 22 May 1963.

This is a demonstration of item running off of the line plot of the Helatrobus Implants. And I'm giving you this demonstration so that you'll know what to do with these various types RRs.

Now, in view of the fact that this demonstration will be taped and on this tape there are no rocket reads – will be seen on the tape, you can take it from me that if I called a rocket read and I said, "That rocket read," I had a great big rocket read. If I went on, all the charge was gone off of that; it wouldn't bang again if you hit it with a club. And these are no choked rocket reads or otherwise. But I'm sure that I may run into some of these and you'll see me handle these.

I'm running a goal here – it's one of the GPM series. This one happens to be the goal "to be serious." And it's the fourth goal in the lineup on this particular pc. The goals change their pattern after the goal "to remember."

Now the thing for you to watch on this thing is the speed and the carefulness and the width of the RR. These are quite important. If you don't get the charge off of that case, that case is never going to run well. But, if you carefully get the charge off early on running GPMs, the case will very shortly begin to fly. And the way to get a case to fly is to handle it easily at the beginning.

Now, this is the easy series in that this case has already been well audited and well handled and is at the present moment flying through these GPMs.

Later on in a week or so, I'll do you one on a difficult pc and I'll show you how to get a case going in that. But right now I want to show you the pattern and show you how this is handled. All right.

LRH: Okay, your chair's all right? Now, is it all right to audit in this room?
PC: Mm-hm.
LRH: Okay?
PC: Mm-hm.
LRH: Anything you care to change?
PC: No, it's all right.
LRH: All right. Very good. Okay. Squeeze the cans. Thank you. Very good. All right, your havingness is okay. Your tone arm is sitting at 3.0. Put in the reality factor here – although this is a TV demonstration, I
don't want you to do anything different than you would do in an ordinary session.

PC: Mmmm. All right. Very good.

LRH: All right. You don't have to make me any trouble so I can show them.

PC: Okay.

LRH: All right. And I'm just going to go on down this bank "to be serious" and you're the gainer by having a few RRs - a few more RIs found.

PC: Hmm-hm. All right.

LRH: Okay? All right. Is it all right with you if I begin this session now?

PC: Yes.

LRH: Okay. Start of session. Has the session started for you?

PC: Hmm-hm.

LRH: Very good. What goals would you like to set for this session?

PC: To find as many RIs as possible.

LRH: All right.

PC: To run some charge off the bank.

LRH: All right.

PC: To work well.

LRH: Okay. Is that all?

PC: Hmm-hm.

LRH: All right. Very good. We got 5:13. Your tone arm is at 3.0. All right. Now, if you remember, in your last session you had "to be serious" and we had found that and I had confirmed it by finding the top opp term "seriousness" and the lineup coming down.

PC: Hmm-hm.
LRH: Mm? All right.

PC: Sort of getting used to the room a bit.

LRH: All right.

PC: We don't normally audit in here.

LRH: No. Okay. Any thought like you might louse up your case or anything like that?

PC: Oh no. Uh-uh.

LRH: All right. In this session has anything been decided? In this session has anything been invalidated? Yes, what's been invalidated?

PC: Well, I don't know which one you ran into trouble on. I suppose – it was one of the items – that's, perfectly seriousness?

LRH: Yes.

PC: Oh.

LRH: That's right.

PC: All right.

LRH: Okay.

PC: Mmm.

LRH: In this session has anything been invalidated? All right. That's clean. Okay. Now, I'll read to you this item: Perfectably seriousness. All right. On this item has anything been suppressed? On this item has anything been invalidated? On this item is there anything you failed to reveal? Yes, what?

PC: Oh, well I thought uh – yes, I did. Actually, this was, sort of before the session. I thought well uh – it was a shame that this was one of my more ghastly goals. You know. Serious – to be serious. If it had been the other one, it would have been more pleasing, you know?

LRH: Oh, all right.

PC: And so uh – I sort of to that degree maybe have suppressed "to be serious," the goal, you know and uh – I thought it would better if I'd run "to be happy," the other one that I had.

LRH: Oh, oh – all right. Okay. All right. Anything else on that? There's something.

PC: No, I don't think so.

LRH: All right. Anything else you failed to reveal? There is a failed to reveal here.

PC: I don't like these cans and they're sticky. Other people have held them in their hands and they are all gooey.

LRH: Oh, I'm sorry. I'm sorry I didn't bring your cans down. Okay, is there anything else you failed to reveal? All right. That's clean. All right. I'm going to read to you item number four again to make sure this is discharged: Nix absolutely seriousness. All right. That's clean as a wolf's tooth. And now I'm going to read to you the only item I have on this list: Perfectably seriousness. All right. That rocket read very nicely. Okay. And who or what would oppose perfectly seriousness?

PC: Nix perfectly seriousness.

LRH: Very good. I'll read to you the only item I have on this list: Nix perfectly seriousness. All right. Now did you have some thought on that? Some suppress? Yes?

PC: I don't know. I really thought what a ridiculous thing that, you know, um – perfectly seriousness – as if seriousness could be perfected. You know?

LRH: Oh, all right.
PC: That's what I thought – how weird.

LRH: Okay. I'll read you that item again. Nix perfectly serious. All right. Doesn't seem to be anything much left on that. Is there anything else however? Any other difficulty? Yes, what is it?

PC: No, I just was wondering if you were getting nice RRs. You know.

LRH: All right. Anything else? You have any cognitions? Anything like that?

PC: Nah.

LRH: All right. You did have a cognition?

PC: No, I just – it's just uh – um – well, I couldn't imagine someone going around trying to be perfectly serious. You know?

LRH: Oh, all right.

PC: Even if they were dramatizing, it would be terribly difficult to do.

LRH: Oh, all right. Okay. Thank you. I'll read you this item again: Nix perfectly serious. All right. The item is clean.

PC: Mm-hm.

LRH: And who or what would nix perfectly serious oppose?

PC: Superiorably serious.

LRH: All right. Very good. I'll read you the only item on this list: Nix superi-orably serious. All right. That rocket read. And who or what would nix superiorably serious oppose?

PC: Incomparably serious.

LRH: Very good. Now, what did you get suppressed there?

PC: I invalidated it as I was saying it – incomparably serious.

LRH: Yes. All right. Anything else?

PC: No, I don't think so.

LRH: All right. Very good. I'll read you this item again. Incomparably serious. All right. That rocket read. And who or what would oppose incomparably serious?

PC: Nix incomparably serious.

LRH: Very good. Similar difficulty there?

PC: No. No, I looked – as I was saying it, I looked down to the next one. I'm sorry.

LRH: All right. All right. I'll read you this item now. Nix incomparably serious. All right. The item is uncharged.
PC: Mm-hm.

LRH: And who or what would nix incomparably seriousness oppose?

PC: Fascinateably seriousness.

LRH: All right. Very good. And that got suppressed in the process of looking down?

PC: Oh, did it? Well, tha... that's another one that has the two there you see? So I thought – immediately I looked at it and I thought well, fascinatingably, you know, seriousness? Or is it fascinatably seriousness?

LRH: All right. Very good. Thank you. Let me read to you this item: Fascinatably seriousness. All right. That rocket read. And who or what would oppose fascinatably seriousness?

PC: Nix fascinatably seriousness.

LRH: Very good. All right. You'll begin to think I'm nagging you shortly. Because what did you run into there? I didn't get a good rocket read.

PC: Didn't get a good rocket read? Mm. I hoped I would say it all right.

LRH: Oh, I see. Is that getting in – sort of in your road on...

PC: Well I did think, well, it's being recorded and I should say these items properly, you know. So I mustn't stumble – allow my tongue to stumble, you see?

LRH: All right. Very good. I'll read to you this item: Nix fascinatably seriousness. All right. That rocket read beautifully. All right. And who or what would nix fascinatably seriousness oppose?

PC: Highly acceptably seriousness.

LRH: All right. Give me that one again, would you please?

PC: Mm-hm. Actually I sort of thought of my mother there, you know? Anyway – highly acceptably seriousness.

LRH: All right. Very good. All right. I will read you this item: Highly acceptably seriousness. All right. Anything suppressed there? All right. Well, that item rocket read and that one's fine.

PC: Mm-hm.

LRH: Who or what would oppose highly acceptably seriousness?

PC: Well, nix highly acceptably seriousness.

LRH: That's right. That was discharged. Now, who or what would nix highly acceptably seriousness oppose?

PC: Recommendably seriousness.

LRH: All right. Very good. Now, on this item has anything been suppressed?

PC: Well, I suppressed it in that I didn't know – I didn't think we had gotten the other one.

LRH: Oh, all right. Anything else on that? Okay. All right?

PC: No. That's fine.

LRH: All right. Recommendably seriousness. All right. Now that item has been clobbered.

PC: Well, I had some variations pop up. Recommendably seriousness and recommendably seriously as you, you know. – um – I always seem to have trouble with this one, don't I?

LRH: Yes.

PC: Yeah. Well, recommendably

SHSBC TAPES 201-300

1575

04.02.15
LRH: All right. That rocket read and I'll read to you the only item on this list: Recommendably seriousness. All right. That had a beautiful rocket read. And who or what would oppose recommendably seriousness?

PC: Nix recommendably seriousness.

LRH: Very good. I'll read you this item. Nix recommendably seriousness. All right. Nothing's been suppressed there?

PC: No, it didn't.

LRH: Well, it rocket read beautifully.

PC: Mm-hm.

LRH: I'll read it again: Nix recommendably seriousness. No, that's discharged. Very good. Now, who or what would nix recommendably seriousness oppose?

PC: Acceptably seriousness.

LRH: Very good. I'll read you this item. Acceptably seriousness. All right. That has rocket read. And who or what would oppose acceptably seriousness?

PC: Nix acceptably seriousness.

LRH: Very good. Now what was choked about that?

PC: Well, I thought that is very true because a lot of people, you know – things are not really acceptably serious. You know, if you're at a ball you shouldn't be serious. And if you're at a movie that is supposed to be, you know, a comedy – you shouldn't be serious.

LRH: All right.

PC: Mm-hm.

LRH: Got it?

PC: Yeah.

LRH: All right. Now, I'll read you this item again: Nix acceptably seriousness. All right. There is more on this.

PC: Well, no one is very acceptably serious to me!

LRH: There we go.

PC: You know.

LRH: There we are.

PC: It's just that I can't particularly abide people who are so fantastically serious.

LRH: All right.

PC: You know? And normally, when I get into situations where I'm supposed to be acceptably serious, you see, why, I've normally found them most amusing in a sort of a – um – I'm – I guess I'm dramatizing the terminal side more than I am the oppterm side.

LRH: All right. Very good.

PC: Because I'm always not very acceptably serious...

LRH: All right.

PC: ...about anything.

LRH: Okay.

PC: Mm.

LRH: All right. I'll read you the only item on this list: Nix acceptably seriousness. All right. I got a prior read that time – what happened?

PC: Well, I thought, well, that's gone.

LRH: Oh, all right. All right. Read it again: Nix acceptably seriousness. All right. Very flat. That rocket read.

And who or what would nix accepta-
bly seriousness oppose?

**PC:** Engrossably serious...ness.

**LRH:** All right. Give me that again.

**PC:** Engrossably seriousness.

**LRH:** What's the matter?

**PC:** I thought I – I actually – I found myself saying "engrossably serious," you know?

**LRH:** Oh yes. All right. On that item has anything been suppressed? On that item has anything been invalidated? All right. Anything you failed to reveal on it? Yes, what did you fail to reveal?

**PC:** Oh, well, I thought that's an amusing one and I thought that um – um – uh – you know, a lot of people do get engrossedly involved in their seriousness. [laughs]

**LRH:** All right. All right. Now I'm going to read you this item: Engrossably seriousness. All right. That's undoubtedly discharged. I'll read it again however: Engrossably seriousness. There's still some more on that.

**PC:** Still some more on that? Well, I think about people being serious about the mating habits of moths and this sort of thing, you know. They're certainly getting engrossed into these sort of things and I can't quite understand it, but they certainly do and um – oh, people get involved in even uh – sort of stamp collecting and I think that's sort of a rather ridiculous activity, but they certainly are engrossed in it. I have a protest on that – I mean people being engrossably serious about things.

**LRH:** All right.

**PC:** Um.

**LRH:** Okay. I'll read you this item: Engrossably seriousness. All right. That rocket read. And who or what would oppose engrossably seriousness?

**PC:** Nix engrossably seriousness.

**LRH:** Very good. Sort of a choked RR.

**PC:** Well, I think I've been sort of waiting to say nix engrossably seriousness. You see?

**LRH:** I see, right. That read.

**PC:** Because I've been protesting the other one.

**LRH:** Oh, all right.

**PC:** Um.

**LRH:** Good. I'll read this item now: Nix engrossably seriousness. All right. That's discharged. Thank you. And who or what would nix engrossably seriousness oppose?

**PC:** Vitalably seriousness.

**LRH:** Very good. Now what...

**PC:** I said vital-a-b-l-y seriousness.

**LRH:** All right. Okay. Let me read you this item: Vitalably seriousness. All right. Now, what uh – what have you got on that?

**PC:** Well, that's the one that I always sort of mispronounce. I always say "vitably."

**LRH:** Mm.

**PC:** You see and – and you can't distinguish the "I" in it. Although I think, I think I'm saying the "I," always.

**LRH:** Mm.

**PC:** So, no, it's vitalably seriousness.

**LRH:** That rocket read. Very good.
All right. Let me read to you this item: Vitalably seriousness. All right. You had something else on your mind.

PC: Yes, I thought nix vitalably seriousness.

LRH: All right.

PC: Sorry.

LRH: Let me read you this item here: Vitalably seriousness. All right. That's discharged. And who or what would oppose vitalably seriousness?

PC: Nix vitalably seriousness.

LRH: All right. That's already banged. Any suppression on it?

PC: No, except I've sort of been sitting here. I feel like I'm – I'm under compulsion on the – on the terminal side here. This is one of the goals that uh – is – that uh – I'm all for the terminal side and all against the oppterm side.

LRH: Oh, all right.

PC: Whereas in some others, like, I'm all for the oppterm side and not for the terminal side.

LRH: Okay.

PC: So I just was waiting to say it. You know.

LRH: All right. Let me read you this item: Nix vitalably seriousness. All right. It's discharged. And who or what would nix vitalably seriousness oppose?

PC: Eagerably seriousness.

LRH: Very good. What happened there?

PC: I've sort of been waiting to say it, you know?

LRH: All right.

PC: Eagerably seriousness.

LRH: Okay. Any other suppression? Yes?

LRH: Hm?

PC: It's awful stuffy.

LRH: All right. Anything else? Yes.

PC: No. I just did notice that it was terribly stuffy in the room.

LRH: Yeah, well all right. Anything about that particularly? Any withhold?

PC: No, just withholding that uh – I do feel hot.

LRH: All right. Okay. Let me read you this item: Eagerably seriousness. All right. That has rocket read. And who or what would oppose eagerably seriousness?

PC: Nix eagerably seriousness.

LRH: All right. Very good. Now, what happened there? There?

PC: I began to feel a bit tired.

LRH: Hm?

PC: And it is hot.

LRH: All right.

PC: Or else I'm feeling hot.

LRH: All right. Let me get a change in this room here. Okay?

PC: Mm.

LRH: Oh, hell. Somebody has gratuitously boomed this up to six. Feel better?

PC: Phew! Better. Yes. Thank you.

LRH: All right.

PC: Phew! I was beginning to feel like I couldn't breathe or something. Mm.
That's much better.

**LRH:** All right. Any suppression on that? Anything else about that? Yes.

**PC:** I thought – I looked around and I thought well, maybe it's the enclosed section of the room and then I thought well maybe the heat's coming from the television set over there. I didn't see the stove.

**LRH:** Well, all right.

**PC:** I thought well, I've never seen a television set get so hot like this.

**LRH:** All right. Anything else about this?

**PC:** No. I think that's all.

**LRH:** You have something to say?

**PC:** No, not on this. Of course, the television is electronics, isn't it? Mmmm.

**LRH:** All right. Very good.

**PC:** Beaming out at me over there.

**LRH:** All right. Anything else you care to say on this?

**PC:** No.

**LRH:** Okay. Let me read you this last item: Nix eagerly serious. All right. All right, on this item has anything been suppressed? Yes?

**PC:** Well, I suppose it was sort of suppressed while we were, you know, fixing the stove and the room.

**LRH:** All right. On this item has anything been suppressed? Yes? There.

**PC:** Well, nix eagerly... seriousness.

**LRH:** Mm.

**PC:** I never quite got it – the chance to really say, well, that's it. You know.

**LRH:** Oh, all right. Okay. On this item has anything been suppressed? All right. In this session has anything been suppressed? There's something here.

**PC:** I'm just wondering what all the trouble is about, a little bit.

**LRH:** All right. I'm sorry.

**PC:** Has the item rocket read or not?

**LRH:** The item has rocket read.

**PC:** Oh. Well, all right.

**LRH:** I'll read you this item now: Nix eagerly serious. All right. That item is discharged. Okay?

**PC:** Mm-hm.

**LRH:** Okay. Now, who or what would nix eagerly serious oppose?

**PC:** Enthusiastically serious.

**LRH:** All right. Very good. Anything wrong with that item?

**PC:** Didn't look at it until after I'd said it.

**LRH:** Hm?

**PC:** Didn't look at it until after I'd said it.

**LRH:** All right. I'll read you this item: Enthusiastically serious. All right. On this item has anything been suppressed? On this item has anything been invalidated? All right. In this session, has anything been protested? Yes. I have a read.

**PC:** Well – well, we're sort of having to spend so much time...

**LRH:** Yeah.

**PC:** ...doing things.
LRH: All right. In this session has anything been protested?

PC: The heat of the auditing environment, I thought.

LRH: Mm?

PC: The heat of the auditing environment.

LRH: Oh, all right. In this – is that all right now, by the way?

PC: Yes, it's fine. Thank you.

LRH: All right. In this session has anything been protested? Yes. Still another protest. That is to say, there is another protest. There.

PC: Well, I suppose it's just not my auditing room, where I'm normally audited, do you see. And um – I'm very – uh – I like my environments, you see, that I've become accustomed to.

LRH: All right.

PC: And uh – this is uh – not my auditing room.

LRH: All right. Very good. Got it.

PC: Hm.

LRH: All right. Let me read you this item again: Enthusiasticably seriousness. All right. What did you think of?

PC: I wondered if it rocket... read...

LRH: All right.

PC: ...or had rocket read.

LRH: I've seen it rocket read.

PC: Mm.

LRH: Enthusiasticably seriousness. Enthusiasticably seriousness. All right. It's not now reading. Very good. It has rocket read. That was your item. All right. And who or what would oppose enthusiastically seriousness?

PC: Nix enthusiastically seriousness.

LRH: Very good. And I'll read you this item: Nix enthusiastically seriously. All right. That has rocket read. And who or what would nix enthusiastically seriously oppose?

PC: Enjoyably seriousness.

LRH: Very good. Now, what's going on here?

PC: I invalidated it as I said it. I thought, "Oh, who would ever enjoy being serious?"

LRH: All right. Very good. I'll read you this item: Enjoyably seriousness. All right. I haven't seen a rocket read at all on this one. Why don't you give me enjoyingly.

LRH: All right.

PC: And just plain old enjoyably seriousness.

LRH: All right. That rocket read. All right. I'll read you this item: Enjoyably seriousness. All right. That has rocket read. And who or what would oppose enjoyably seriousness?

PC: Nix enjoyably seriousness.

LRH: All right. Now what's the trouble with that one?

PC: I thought well, at last – ahh, that's... right.

LRH: All right.

PC: You know. Nix enjoyably se-
LRH: Very good. And I'll read you this item: Nix... nix enjoyably seriousness. All right. Now what – has something else happened here?

PC: Well, I suppose what it is, is that it seems like uh... Let me tell you this – um – it seems to a degree that I don't know a bit what is happening, you see. Like I don't know did it RR or didn't it RR. Is it a choked RR or what. I'm sort of – feel like I'm missing out maybe a bit. I don't know what's wrong.

LRH: Oh, all right.

PC: Mm-hm. Mm-hm.

LRH: All right. Let me read you this item again: Nix enjoyably seriousness. All right. That RR'd when you said it, you see.

PC: Mm-hm. Mm-hm.

LRH: And however it's a choked – this is choked down on this. It isn't behaving too well. And you're understandably a bit upset on the demonstration and so forth.

PC: Mm-hm. Mm-hm.

LRH: You don't ordinarily run like this. And, however, we're making it.

PC: All right.

LRH: All right. Take a look at your visio there. Let's see what you can see... What was that?

PC: Oh! I – I'm confused. I don't know whether I'm going up or down the steps.

LRH: Oh yes?

PC: Hm-hm. At the present moment. But it seems like – um – it seems like I'm going down. Because I've got the white. It's turned white back of me. It's all black in front of me.

LRH: Oh, I see.

PC: Hmm.

LRH: All right. Any muddy areas in that black back of you? What were you going to say?

PC: I'm going back – I'm going down the stairs...

LRH: Oh, all right.

PC: ...backwards.

LRH: All right.

PC: All right. Now I've got myself located.

LRH: Okay. Are there any areas of gray in that white?

PC: Yeah, just right here on uh – nix enjoyably seriousness.

LRH: All right. And what's wrong right there on that one?

PC: I don't know.

LRH: All right. Has it been suppressed? Yes.

PC: Hm.

LRH: What's the suppression?

PC: Well, I guess I didn't know whether I was going up or down in this one until right there, maybe.

LRH: All right.

PC: And I sort of got myself oriented – I'm going down the stairs backwards now.

LRH: Oh, all right.

PC: Hm.
LRH: Okay. Let me read you this item: Nix enjoyably seriousness. All right. That has rocket read. I've got to check, however, one little thing here. On that item has anything been suppressed? No. On that item has anything been invalidated? No. All right. Nix enjoyably seriousness. What was that?

PC: Nix enjoyably seriousness! It went white.

LRH: All right. It fired.

PC: Yeah. It went white!

LRH: It went white.

PC: Hm.

LRH: Just like that? All right. Thank you. All right. Who or what would nix enjoyably seriousness oppose?

PC: Pleasurably seriousness.

LRH: Very good. I'll read you this item: Pleasurably seriousness. Now, is there something wrong with that item? I'm sorry to have to chivy you up and I shouldn't use the word wrong. But is there anything at odds with that item? Has it been suppressed?

PC: Well, one can't very much have pleasurably – be pleasurably serious. Can one? You know.

LRH: Oh, all right.

PC: Mm.

LRH: All right. Very good.

PC: Oh, I guess one can, sometimes.

LRH: All right. Anything else?

PC: No, that's all.

LRH: All right. Let me read you this item: Pleasurably seriousness. All right. That rocket read. There's still a choke down on it. [a ticking noise starts] Got any clue as to... Oh, are you being distracted by the environment again?

PC: Yeah. I was wondering what that is.

LRH: It's nothing.

PC: It's a pipe.

LRH: Yeah. Anything else about that?

PC: No, that's all.

LRH: All right. What else?

PC: And then I looked at your – saw your watch and I thought well, you've only got a short while more to go here and...

LRH: All right.

PC: That's all.

LRH: Okay?

PC: Mm-hm.

LRH: All right. Let me read you this item again: Pleasurably seriousness. All right. That rocket read. And who or what would oppose pleasurably seriousness?

PC: Nix pleasurably seriousness.

LRH: Very good. All right. We're having the same trouble with that one?

PC: Well, nix pleasurably seriousness.

LRH: All right.

PC: Not pleasurably seriousness. No pleasurably seriousness?

LRH: Ah, it's all right. I just wondered if anything was suppressed on it, and so forth. Okay. I'll give you this item: Nix pleasurably seriousness. All right. On this item has anything been suppressed? On this item has anything been invalidated? Yes. You're having a bad time?
PC: Mm.

LRH: Upsetting you. I appreciate it is rough – auditing in this environment.

PC: Mm. No, I guess I just wondered if – what the trouble was on it, or something, I guess.

LRH: Oh, all right. Okay. [a hissing noise starts] Let me read you the item again: Nix pleasurably seriousness. All right. There was a little kick left in it. Who or what would nix pleasurably seriousness oppose?

PC: Agreeably seriousness.

LRH: All right, very good. On this item has anything been suppressed? It didn't fire.

PC: It didn't fire.

LRH: You pretty distracted?

PC: Well there's that thing – piff and piffing – and there's the uh – um – television making that high electronic sound...

LRH: Oh, I see.

PC: ...over there, you see and...

LRH: Yes, yes.

PC: ...I am coming up and trying to go through this implant and – uh – and actually that electronic sound is terribly high and it hurts my ears, that's all.

LRH: Is that so?

PC: Yes.

LRH: All right. All right.

PC: Mm.

LRH: Okay, let me read to you this item: Agreeably seriousness. All right, anything else on that?

PC: I don't think so.
PC: Well that di... it – distracts me.

LRH: All right. Let me shut that off.

PC: [laughs] It's better.

LRH: Is that better?

PC: Yes.

LRH: All right. Okay. Now, it's all right.

PC: Mm.

LRH: In this session has anything been protested?

PC: Well, we certainly are in an electronically involved environment, I thought, here.

LRH: All right.

PC: You know, what with the – uhm – that tube up there humming, and the – and that humming and everything humming around, and then all the televisions in the room over there humming, and I thought, "My word, what a humming environment." That's all I thought. It's – it's electronic!

LRH: All right, very good. Okay, now.

PC: Hm.

LRH: Feel better?

PC: Yeah, I do.

LRH: All right. Let me read you this item: Agreeably seriousness. All right. That's still trying to rocket read. Take a look at the step, now, on which you see it.

PC: Yeah, it's agreeably seriousness.

LRH: Mm-hm. All right. And that step has discharged. Okay, thank you. And who or what would oppose agreeably seriousness?

PC: Nix agreeably seriousness.

LRH: All right. All right, on this item has anything been suppressed? Yes!

PC: Well I sort of suppressed it all along while trying to find the other one because of course you get the one and then in the – in the implant it goes pft-pft, you see?

LRH: Hm.

PC: And so this pft over here has been held up for getting this pft off over here.

LRH: Oh, yeah. Very good. Let me read you this item: Nix agreeably seriousness. All right, that rocket read. Let me make sure now that there is no further suppression. Nix agreeably seriousness. All right. There isn't a breath on it, on the take.

PC: All right.

LRH: Okay? And who or what would nix agreeably seriousness oppose?

PC: Dedicately seriousness.

LRH: Very good. And – thank you. Give me some variations on that.

PC: Dedicativeably seriousness.

LRH: All right.

PC: Dedicatedably seriousness.

LRH: Right.

PC: Dedicatingably seriousness.

LRH: All right.

PC: Dedicationably seriousness.

LRH: Very good. Dedicationably?

PC: Mm-hm.

LRH: All right.

PC: And dedicately seriousness.
LRH: All right. Very good. Let me read you this item. Dedicatively serious-
ness.

PC: Dedicatively seriousness. That's it.

LRH: All right. Let me check these items now. Dedicatively serious-
ness. All right. And let me read you the other item: Dedicatively serious-
ness. There's something wrong between these two items? Now did you suppress in some way that because it had two on it?

PC: No, except you know, that um – I normally had the "tiveably" and that sort of changed over in the past two banks.

LRH: All right.

PC: Um – dedicativeably seriousness.

LRH: All right. On this item has anything been suppressed? On this item has anything been invalidated? On this item is there anything you failed to reveal? All right. Have you had a cognition about it? There.

PC: Yes, I thought – uh someone is dedic... dedicated, you see, to seriousness. Dedicativeably seriousness.

LRH: I don't quite understand that.

PC: Dedicate – you know? One's dedicated to seriousness.

LRH: Oh, I see.

PC: Maybe it's dedicatedly seriousness.

LRH: Oh, all right. Well let's see what it is. Dedicatedly seriousness. All right. Dedicativeably seriousness. What are you doing? You running it over in your mind?

PC: No.

LRH: All right. And dedicatedly seriousness. All right. We haven't got the item yet.

PC: Dedicatedly seriousness?

LRH: Mm-mm. Dedicativeably seriousness. All right. Dedicatedly seriousness.

PC: I keep getting "dedicated to seriousness," you see, so I...

LRH: Well, give me dedicated to seriousness.

PC: Dedicated to seriousness.

LRH: Very good. Give me anything else you can think of there.

PC: Serious dedication. [laughs] That's it.

LRH: All right. Good. Anything else?

PC: No, that's it. That's – that's what was sitting on top of it.

LRH: Oh, all right. I'll read you this item now. Dedicatively seriousness. All right, that was trying to rocket read. Let me check the other one and make sure that it isn't in: Dedicativeably seriousness. All right, and your item is dedicateably seriousness. All right, that rocket read. It has had some other rocket reads – one kind or another, but it's still suspicious as the item as it's got a bit of suppress on it. Is there anything else – ? That? There – there was something.

PC: The only thing I'm thinking about is – is that I'm sort of sitting here holding these cans, and it feels like I'm – because the cans are so sticky, it feels like I'm holding sort of two unwrapped candy bars in my hands and they're getting all messy and dirty.

LRH: All right.

PC: I have never felt such sticky
cans in my life.

**LRH:** All right.

**PC:** Right? So that – I'm suppressing that. You know, it's all for – I feel like throwing them down and going and washing my hands. A bit – not drastically so but it is – it is a bit of a PTP sitting here with – feeling these sticky cans.

**LRH:** All right. Good. Now I'm going to read you this item again: Dedicately seriousness. All right. That rocket read.

**PC:** All right, good.

**LRH:** And who or what would oppose dedicateably seriousness?

**PC:** Nix dedicateably seriousness.

**LRH:** Very good. It didn't rocket read when you said it.

**PC:** I wondered if I'd said it with an "ed." Nix dedicateably seriousness.

**LRH:** All right. Very good. I'll read you this item: Nix dedicateably seriousness. All right, that has rocket read. On that item has anything been suppressed? Anything been invalidated? Anything you failed to reveal? All right. Very good. That is your item. Nix dedicateably seriousness. All right and that fired...

**PC:** Mm.

**LRH:** ...very nicely. All right. Who or what would nix dedicateably seriousness oppose?

**PC:** Commendably seriousness.

**LRH:** Very good. Now what happened with that one? That didn't rocket read.

**PC:** Commendablebly seriousness. Commendab – commendably seriousness.

**LRH:** All right. And who or what would nix dedicateably seriousness oppose? Just to...

**PC:** Commendably seriousness.

**LRH:** All right. Anything else you may know?

**PC:** Happiness.

**LRH:** Hm?

**PC:** Happiness.

**LRH:** All right.

**PC:** No one knows happiness. Prims and propers.

**LRH:** Hm?

**PC:** Prims and propers – serious people.

**LRH:** Mm-mm.

**PC:** Deadly serious people. Deadly serious people.

**LRH:** All right.

**PC:** You can be so serious you can be dead. Hmm.

**LRH:** All right.

**PC:** Mmm. Commendably seriousness.

**LRH:** All right. Very good. Let me read you this item: Commendably seriousness. All right, that's trying to rocket read. Ah, as a matter of fact it has rocket read, but you're sitting on something. I'm not quite sure what it is here. It's got this squashed. Now, what is it?

**PC:** Hmm. I don't know.

**LRH:** There's something there. All right. In this session has anything been protested? In this session is there anything which you failed to reveal? In this session
has anything been suppressed? Yes, yes. Yes, what's been suppressed?

**PC:** Well I suppressed for quite a while only the sound of the – just the sound of all the electronics and the "hummm-hummm." I suppressed the – the stickiness of the cans.

**LRH:** Right.

**PC:** And then also uh – are you asking suppress or protest?

**LRH:** Suppress.

**PC:** Another thing I've suppressed, is I wondered who owns this E-Meter and keeps their cans in this condition.

**LRH:** Well, all right.

**PC:** You know? I would like to sort of find out who is responsible and tell them to wash their cans.

**LRH:** Okay. In this session has anything been suppressed?

**PC:** Yeah, I'd suppressed I didn't want to seem like an old, you know – nag, nag, nag because I'm moaning about the auditing environment, but those things were disturbing me.

**LRH:** All right.

**PC:** And then um – also I would – hope that we wouldn't have any trouble, that we'd go along swimmingly, you see?

**LRH:** Mm-hm.

**PC:** Like it usually does. And then, it's not. I suppose it's on television and... That's all. That's it.

**LRH:** All right, very good. Let me read you this item: Commendably seriousness. All right. That's rocket reading. But is giving suppressed read.
items in general? Numbers of items found?

**PC:** No, no, no, not worried about number of items found.

**LRH:** All right. Now that rocket read.

**PC:** Mmm?

**LRH:** Nix commendably seriousness did rocket read. I'll read it again: Nix commendably seriousness. All right, that has rocket read.

**PC:** Hm-mm.

**LRH:** Okay? And who or what would nix commendably seriousness oppose?

**PC:** Desirably seriousness.

**LRH:** All right. Very good. It didn't rocket read.

**PC:** All right.

**LRH:** Give me some variations on it.

**PC:** Desiringably seriousness. Desirably se... Desirefully seriousness.

**LRH:** Mm-hm.

**PC:** Desirously seriousness.

**LRH:** Mm-hm. What was that one?

**PC:** Desirously seriousness.

**LRH:** All right.

**PC:** And desirably seriousness.

**LRH:** All right. Good enough. Now, on this item has anything been suppressed? Yes?

**PC:** Turning it the other way around. Seeing how it goes that way.

**LRH:** Hm?

**PC:** Turning it the other way around. Saying a serious desirability, or something.

**LRH:** All right. Now, we running into the second implant here?

**PC:** Well, maybe.

**LRH:** All right. How about the first one? I get this first one on this thing. Desirably seriousness.

**PC:** Desirably seriousness.

**LRH:** All right. Now, we running into the second implant here?

**PC:** Well, maybe.

**LRH:** All right. How about the first one? I get this first one on this thing. Desirably seriousness.

**PC:** Desirably seriousness.

**LRH:** All right. Now, we running into the second implant here?

**PC:** Well, maybe.

**LRH:** All right. How about the first one? I get this first one on this thing. Desirably seriousness.

**PC:** Desirably seriousness.

**LRH:** All right. Now, we running into the second implant here?

**PC:** Well, maybe.

**LRH:** All right. How about the first one? I get this first one on this thing. Desirably seriousness.

**PC:** Desirably seriousness.

**LRH:** All right. Now, we running into the second implant here?

**PC:** Well, maybe.

**LRH:** All right. How about the first one? I get this first one on this thing. Desirably seriousness.

**PC:** Desirably seriousness.

**LRH:** All right. Now, we running into the second implant here?

**PC:** Well, maybe.

**LRH:** All right. How about the first one? I get this first one on this thing. Desirably seriousness.

**PC:** Desirably seriousness.
you had a cognition on this item? There's something there.

**PC:** No, just that seriousness is desired in certain places and at certain times – that's all. And I can imagine some people wishing that some people, you know, would be more serious; or someone himself wishing, "Oh, I wish I could be more serious about things." And, you know, say like he's studying for medicine or something like that and – and he decides that he better be serious about it all. And, well, people can decide to be serious. You know?

**LRH:** All right. Very good. Okay, now let me read you this item: Desirably seriousness. All right. That item hasn't given a satisfactory rocket read.

**PC:** Hm.

**LRH:** It just hasn't.

**PC:** Is it desired-ably seriousness?

**LRH:** All right.

**PC:** Desiringably seriousness?

**LRH:** All right.

**PC:** Um, wanted seriousness?

**LRH:** All right, on this item has anything been suppressed? On this item is there anything you failed to reveal? All right, on this item has anything been invalidated? There's a maybe on invalidated.

**PC:** Well it hasn't rocket read, so to that degree it's been invalidated.

**LRH:** All right.

**PC:** Um, no I can't think of anything else.

**LRH:** All right. Very good.

**PC:** Desirably seriousness!

**LRH:** Mm-hm. All right – doesn't seem to be much charge left on it. Desirably seriousness. All right, there is a small rocket read on this, but it however is a persistent rocket read.

**PC:** Mm.

**LRH:** It keeps persistently giving a small rocket read.

**PC:** It's never given a big one yet?

**LRH:** It's never given a big rocket read.

**PC:** Mm.

**LRH:** Now, is there a big protest against seriousness being desirable? Yes.

**PC:** Mm.

**LRH:** Huh? When did you first spot that – in this session?

**PC:** Well, I'm just protesting seriousness period, you see. I'm dramatizing the oppterm's no, no, no, no, no, no – no seriousness. And I of course protested the goal when I was being run through it, too, you see?

**LRH:** Oh!

**PC:** I didn't like it, you know?

**LRH:** Mm-hm.

**PC:** And um – particularly after "to be happy," you know?

**LRH:** Mm-hm.

**PC:** I felt, well even if these people are crazy, at least uh – at least I – and I'll probably end up coming out of this thing all messed up but at least I might be happy! [laughs] You know? But look at this "to be serious," you see? And then the next goal they put me through is "to be serious" and that – then that sort of throws all hope that I'll even have anything – any benefit from
this whatsoever! You know, I could see myself coming out of this, if they'd left me with "to be happy," coming out sort of compulsively euphoric or something like that and well, although that may have been an aberrated state, it was at least a happy aberrated state, do you see what I mean?

**LRH:** Mmm. Mmm.

**PC:** And then they put this in, and this is an unhappy, deadly type of thing – even though I didn't like it!

**LRH:** All right.

**PC:** So desirably seriousness – I didn't desire this thing at all – the whole time I was saying it.

**LRH:** All right. Let me read you this item now: Desirably seriousness. All right. It has rocket read. The rocket read is getting very tiny now. Is there anything else you might – wish to tell me about the desirability of being serious?

**PC:** Well I used to desire to be serious myself! You see? When I'd go to church, I would always laugh and um – and I used to sit there and desire that I could be serious. Oh, yes! And then one time you ran a process – um, it was some group processing – this was in Phoenix, Arizona – and you were running um – "Be serious," you know? And the minute you said that, gave that command, I started laughing. And I laughed and I laughed and I laughed and I laughed and I laughed; and I couldn't stop laughing – and every time you said, "All right. Be serious," I would burst out in more peals of laughter! I thought that was the funniest thing! You know? Every time I tried to be serious, I would laugh! And uhm – so, and in these circumstances, in this lifetime, every time I've tried to be serious, I always end up laughing, you see?

**LRH:** Oh, I see.

**PC:** And I think it's terribly funny, but I know I shouldn't – I should be serious!

**LRH:** All right.

**PC:** I've wanted to be serious! Well, I thought other people were quite serious; and I thought that was part of being an adult, too. Adults could be told that they were different from children because they were so deadly serious. [laughs] And then when I was able to view adults a bit better, I thought they were grimly serious and I didn't want to be like that, you see?

**LRH:** All right.

**PC:** I've wanted to be serious! Well, I thought other people were quite serious; and I thought that was part of being an adult, too. Adults could be told that they were different from children because they were so deadly serious. [laughs] And then when I was able to view adults a bit better, I thought they were grimly serious and I didn't want to be like that, you see?

**LRH:** All right.

**PC:** So, desirably seriousness.

**LRH:** Okay. All right. Let me read you this item here and see what we've now got: Desirably seriousness. All right. That rocket read beautifully.

**PC:** All right. Well, thank goodness.

**LRH:** And a great big one! And who or what would oppose desirably seriousness?

**PC:** Nix desirably seriousness.

**LRH:** Good. All right. Let me read you this item: Nix desirably seriousness. All right. That has apparently blown its charge. There is anything else you care to say about it?

**PC:** No, I'm glad to get that off. I feel a bit of relief.

**LRH:** All right. Let me give it to you again just to make sure there's nothing on it: Nix desirably seriousness. All right. Just – there was just a tick left. Okay. Nix desirably seriousness. All right. Now, who or what would nix desirably seriousness oppose?

**PC:** Wantably seriousness.

**LRH:** All right. Okay. Is there any-
thing about this "wantably seriousness"?

PC: No, it's another like "desirably," but it's – I feel better about that. It's "wantably seriousness."

LRH: All right. Very good. I'll read you this item: Wantably seriousness. All right. And you've said it twice and it blew it to pieces apparently. But I think there's a little more trouble with it. "Wantably seriousness." Got a little more tick on it than I'd care to have here. Yes, what's that thought that's coming across on this? ... There. There.

PC: Well, I just was uh – just wondering about it. That's all. Well, I sort of got the idea that someone uh – you know – seriously wanting – you know? A little bit of reverse on it – on the item. Sort of uh – you know how people – this is not wantably seriousness I'm thinking about – but people wanting things seriously, you know. Like they'll stand and they'll – they'll look in, uhm – well, women say; going window-shopping and they'll – they're so serious, they'll stand there and look at all the things and they're – they're wanting! You know? They're serious about wanting – it's a reverse look on the item – that's all.

LRH: All right. Very good. Let me read you this again and see if we've got anything on it: Wantably seriousness. That rocket read very nicely. That was your item and that was the last item we're going to find.

PC: All right. Jolly good.

LRH: All right. Okay. Well we got – we found quite a few anyhow...

PC: Mmm! We've found that...

LRH: ...in a short period of time. From 3 to 39!
LRH: Mmmm.
PC: And um – I can run it without dying of laughter, so I must be improving on it!
LRH: All right. Okay.
PC: And I had a good session.
LRH: Any more?
PC: I think that covers it.
LRH: All right. Very good.
PC: Oh, I feel better about the auditing environment, too. It seems all right now.
LRH: All right. Okay. All right. Squeeze the cans. All right, your havingness is just a hair down.
PC: Mm-hm.
LRH: Put your cans down. All right. Touch that cloth. Thank you. Touch the top of the microphone. Thank you. Touch the top of the can. Thank you. Touch that paper. Thank you. Touch that chair. Thank you. Pick up your cans. All right. Squeeze your cans. Let's do that again – squeeze the cans. Well, it's not quite as good as it was beginning of the session. Put them down; I'm going to run a bit more here. All right. Touch that cord.
PC: Mm-hm.
LRH: Thank you. Touch the back of the E-Meter.
PC: Mm-hm.

LRH: Thank you. Touch that microphone stand.
PC: Mm-hm.
LRH: Thank you. Touch the side of the ashtray.
PC: Mm-hm.
LRH: Thank you. Touch the top of the cans; both of them. Thank you. Pick up the cans. All right. Squeeze the cans. All right; we're going to leave it at that. Your havingness came up.
PC: Mm-hm. Okay.
LRH: All right. 6:13. And you're down here at 2.75; you had very good tone arm action.
PC: Good! All right.
LRH: All right. Is there anything you would care to ask or say before I end this session?
PC: Thank you very much; appreciate it.
LRH: All right. Is it all right with you if I end this session now?
PC: Mm-hm.
LRH: Very good. End of session.
PC: Thank you.
LRH: All right. Tell me I am no longer auditing you.
PC: You're not now auditing me.
LRH: Very good. Go ahead.

All right. Before you disband and come apart at the seams or something like that, I want to call to your attention something: The pc did get harassed; the pc did get ARC broken, and the pc did get upset; but the pc came out of it all right because I straightened it all up. I stayed with the pc and straightened it up. You understand that?

And did you see, toward the end there, the fantastic rocket read that was buried underneath? Commendably seriousness. Did you see that rocket read? And if that thing was reading...
somewhat, the same kind of a rocket read that some of you cookies have been getting lately? Oh man – *aurrrruhhhh*. You shouldn't do that! Did you see that rocket read buried underneath there? Well you had one of your little, tiny rocket reads – actually that was a three-quarters of an inch rocket read – that thing. But did you notice that it read persistently. Now, why did I pick on it? Because the rocket read was choked. Now you saw disintegrating rocket reads; you saw choked rocket reads; you saw flicks; you saw things that didn't rocket read at all. And you saw them all brought up to a wide, crashing rocket read without a tremor on the item afterwards when I crosschecked it.

Now, of course this pc was being audited under very difficult circumstances and as a demonstration and so forth, running out a bank and so forth, and this is very tough. But in spite of that, let me point something out to you: that my job as an auditor was to get the charge off and I did – regardless of the pc's ARC breaks or anything else.

Now by golly, if you will stick to it and if you will work like that and you'll do like that and you'll get that charge off, without unnecessarily harassing the pc and so forth, and learn – be sensitive to your meter; work with the pc and so forth, you'll have a pc flying in no time.

Actually, you didn't see the benefit that we got out of this immediate case. Because I could have audited her here now for the next hour and found myself about 150 items. How? Well, the pc was beginning to run; just beginning to run. We got the environment settled down and we got some other things straightened up. But this was a tough bank and the pc ran it and we bled what... an awful amount of charge off of this thing.

I also want to call to your attention – I asked her to take a look at the steps and gray areas and masses and that sort of thing, and at the end, it was her contest with the bank even more than her contest with the auditing room which was crystallizing on this situation. That was what was holding her up. It's always the Routine 3. The auditing session environment can be straightened up with benefit, but it's the Routine 3 in the final run that is lousing the session up. Always remember that.

All right. Now, there was a demonstration. I intended this demonstration to be that of easy run and instead of that, you got a demonstration of a hard run. Your demonstration of an easy run would simply be: Bang, bang and the thing blowing down in all directions, but because of the strange environment, why this pc who ordinarily runs well, was running badly. All right.

There it is. And I think you ought to give the pc a big hand, because she took her case at risk.

Okay. Thank you very much and good evening.
Well, thanks for bringing me up to present time. What is present time?

Audience: Twenty-third of May.

Twenty-third of May, AD 13, the year of the OT. Everybody is calling it the year of the Clear, and we never had a chance. We ran over that, you know.

Well, we could say that we've started the ball rolling to a very marked degree in Australia and California. We've got things pretty well going around the world in general. There are some rough spots. I was presented with a bunch of government type corporation data and tax structure data, and so forth, today and was actually trying to get some time in a little bit earlier in trying to put this stuff together.

This is very amusing. Every now and then an accountant or somebody of that sort wonders why I have not paid more attention to this particular facet of our activities. The only lesson I have learned is when I let the control and copyrights of Dianetics and Scientology get out from under, it gave some very aberrated wog a wonderful idea that he could knock us all off and it caused a lot of trouble. So that's about the only thing I've been careful of, and the idea of putting together Earth type corporations, government type corporations, you see, has always been rather amusing to me. I'm afraid that's the truth of the matter.

And at a very much earlier time in the development of Dianetics and Scientology, I was able to look this over and realize that there wasn't any government on Earth that had any right to give us a license to survive. They all try to assert this right, don't you see. And I didn't go into any vast games condition with them. But it was the realization that we needed a structure fitted to our needs rather than a mildewed, Earth type corporation that made me somewhat lackadaisical in breaking my neck to put together Earth type corporations, you see?

And I've now collided with the necessity of setting up a better corporate structure. And the Earth type corporation, of course, must be there, because of taxation, because of this and because of that and so on. But to expect an Earth government to protect us one way or the other is laughable. It isn't like setting the lion to protect the lamb; I'm afraid that is not it, you see? It's setting an ant, you see, to guard the citadel. And it – it just – it doesn't – you know, it's just silly.

So I am faced with this and quite a few other problems at this particular time. And with everything else you say, well, how could he be faced with those problems, too? Well, I manage to get faced with a lot of problems.
I learned the other night that a present time problem is only caused by not having enough time. That actually blew all my present time problems. It was just a cognition. If you want to know why you've got a present time problem, well, you just don't have enough time, do you see? Time factor is missing out of it, so therefore it's a present time problem. It's as simple as that.

Now, very many things come up and looking over and examining the state of planets and civilizations before the Helatrobus Implants... call them the "Heaven Implants," public will understand it a little bit better. But they are the implants implanted by this – wasn't even a confederacy, this interplanetary nation called Helatrobus – little pip-squeak government, didn't amount to very much. They had gold crosses on their planes, like the American Red Cross or something of the sort. And everybody thought they were nice, ineffectual people. Nobody could trace down who was doing all of it. They had developed some technology. This technology probably was not totally unknown around about the place, but nobody put it together or combined it with an energy which was peculiarly commanding upon a thetan.

Now, that energy was cold energy. And that's probably the big mystery about it – you wonder what this energy was. Actually it's frozen energy. It's based on the fact that certain energies do not thrive in sub-sub-subzero temperatures. And this is a cold energy action, so therefore your pcs get very cold and get very hot and so on while running it.

Now, they were able to put significance very directly into this energy so that it tended to talk, and which was an interesting electronic trick. But all of that so commands your attention that you overlook another factor. They had figured out, above all things – this is fantastic – something which looked to everyone else like a natural phenomenon. And I can see the learned, MIT-type scientist now, sitting around explaining the presence of radioactive clouds. We call them in Earth's astronomy lingo a Magellanic cloud. Those exist in tremendous profusion toward the center of a galaxy. There are tremendous quantities of these huge radioactive clouds.

Anybody that's ever been through planet-building or anything like that recognize these things. It's the cloud that you bung a big mass into to make it fission and collect all the particles to become a sun. And anyway, these are in enormous profusions toward the center of a galaxy. Now, when we say galaxy we mean one of those wheels which you see in the astronomy textbooks. And when we say an island of galaxies or an island galaxy, or so forth, we mean six or eight of these wheels, and they're clustered together. And this universe is composed of a galaxy, a collection of galaxies isolated from other collections of galaxies, you see? They've recently started to call these things "island universes." I don't know why, but that fits in with Earth technology on the thing.

Well, anyway, one of these great spinning wheels has, of course, in it just literally billions of stars. I don't know what the factor is. I was going to say trillions; don't – perhaps not that high – maybe it's higher. And every one of these stars is capable of having planets. And it's a greater oddity to find a star without planets than it is with one. The egocentric characteristic of man dictates Earth as the only planet that goes around a sun. I consider this very, very interesting, but it just shows you how bad off you can get after you've been implanted. Anyway, the system of stars in its greatest aggregate, of course, is visible as this thing called a
galaxy. And you'll see pictures of them in astronomy textbooks. You want to get one of these kid's astronomy textbooks, if any of this is beyond you. As an auditor you may have need of the data to know what the devil the pc is talking about. Not because you tell the pc, but there it is.

And one of these great wheels tends to be rather oblong and the stars tend to be massed up toward the hub. They're not a sphere, they're a flat wheel. They've got a hub, and they've got a rim, and this pattern of stars scattered in.

When you look up toward the Milky Way, and when you see the whitest portion of the Milky Way on a clear night, you're looking straight at the hub of this particular galaxy. And when you look in the opposite direction, you're looking at scattered patterns of cl... of stars, even though some of them are quite large, and you're looking out away from the hub. And doing that you recognize that Earth is an awful long way from being at the center of this galaxy. In fact it is classifiable as a rim star.

Now, these galaxies in composition are, of course, a great condensed radioactive cloud of some kind or another that existed at one time or another and you've got a condensation. And this condensation brings about a sun, and then because of the orbital influences of bits of matter and so forth, these collect around the edges of it and are formed as planets. And these planets sometimes shatter, they have political accidents or something, and you'll get a belt of asteroids. And the planets vary in numbers, and classified at a higher level of astronomy each type of star has its own classification, depending not so much on its order of magnitude, although that is there, too, but on the brilliance per mass. It's the brilliance per mass of a star. So that you get actually coal-black stars. They look coal-black. You get up right close to them and you find out they're red-hot. Well, that's been referred to as a dead sun, or something like this. And it's pretty grisly if you ever happen to not navigate correctly, because they get in your road most God-awfully. They don't radiate enough to be detected.

And that moves up to your dull reds, the dull-red sun – you can see these things. Let's see, where is there one around here? There's – which one is it? Aldebaran, I think, is a dull-red one. There's one up there in Taurus, the constellation Taurus, and it is bright red. And then you move up from that, you get to a yellow sun. And that is more or less the characteristic of Earth's sun; it is – tends to be more yellow than otherwise. And then you move up to a higher radiation factor, and you get a white sun and you get a blue sun. Those are the various radiation factors. Your white and blue there may be interchanged. But the point I'm making is, is there's different brilliances, and then there's different masses for these brilliances. And all those – these things have some relationship.

Now, you go down into the tropics in a meat body, you're liable to get ultraviolet poisoning. Because the sun's rays are so directly ahead that you get too much ultraviolet. Well, around a brilliantly blue sun, of course, these types of rays are just pounding away all the time, all the time, all the time, and you'd fry in the type of body you're in. Nevertheless, just because a meat body is at a highly critical temperature and mass level – that is to say, it can only live on a planet of so much mass, it can only live on a planet of so much heat or cold, you see, is no reason why life forms or bodies, which have two arms and two legs and a head and so forth – no reason why bodies don't exist that can stand these extremes. And the upshot
of this is that the science fiction writer is always trying to tell you about… You see, the science fiction writer's memory is faulty, and he gets himself all restimulated and so forth, and he doesn't remember straight. Some of them remember it quite well, but then they reverse their time – we wouldn't quite know why that is – and put it all into the future, which I consider quite interesting. They, of course, wouldn't know anything about the implants that turn every... all time backwards.

Now, I imagine in the days of Columbus, you go along the docks, you'd hear some old salt who has been actually outside the breakwater explaining to some young aspirant as to why Columbus cannot reach the other side of the ocean, and you hear tales of monsters and that sort of thing – because you mustn't go out there, you see – and the horrible monsters of the sea, and they have huge tentacles and they gobble you up, you see, and they swallow whole ships, and all of this sort of thing. You would have found that very current in Cadiz, the port of embarkation there, just before Columbus' sailing.

Well, it's worse than that. These tales were probably spread by the Phoenicians, who made regular voyages from the Mediterranean to England to pick up tin and didn't want anybody else cutting in on their racket, see? And so they talked about these monsters that existed at sea, and it was all terrible, and you didn't dare venture out through the Pillars of Hercules, or out of the sight of land, because you'd get et up.

Well, mothers have the same trouble; they tell their little children if they aren't good that somebody will get them, or the bogeyman or something like this. In other words, this is a standard mechanism about the bogeyman and the terrible beings and all of that sort of thing. It's a standard mechanism that's used for various reasons in various places. And that has existed through this universe. So that most people have parked somewhere in their consciousness the idea that if they went to the planet Gyppo, you see, that there they would find huge tubelike creatures, you see, that would *pfssss* suck you all up at a *gluph*, see? And – you know, bogies. And the science fiction writer, being the furthest from reality on the situation, is liable to perpetuate the bogey faster than he perpetuates fact. I should not decry him because he's done a very good job.

But the truth of the matter is that most planets are inhabited by and lived on by and run by animal forms quite similar to Earth's. Actually they classify – they're classified by rings. So many planets out from a yellow or twelfth-rate sun has a certain type of flora and fauna for each one of its continents. You see, it's all classifiable. But you get this modified, then, when you go out into the next planetary ring and you get this modified when you go into the next planetary ring, you see? But it's more or less classified. It's pretty standard, it's what can adapt to that particular type of environment. And although I don't think you'd have very much pleasure out of kissing a girl from Jupiter – that's a heavy-gravity planet, and if you stepped on the planet Jupiter in one of these meat bodies that you presently have, you would become a pancake promptly, you see? And what atmosphere it has lies in seas of liquid air and so on. You might say that this is somewhat rigorous as an environment, not completely similar to Russia but… So you do get these various variations. And it's not all that horrifying, however.
You find somebody running around the planet Jupiter, he'd be built to withstand that climatic condition, and that gravitic condition and so forth, and his legs might be a bit modified and his arms and that sort of thing, but he probably would look like an Eskimo. The truth of the matter is, then, that the universe is not a strange place filled full of terrifying beings of one kind or another, but in actual fact is a rather pleasant place, except where people have been very, very busy making it an unpleasant place.

Now, if you face up to what has happened to meat bodies and what has been done with this universe, you could become very disheartened and you could become very caved in, and you could say well, this universe then is fully and completely a trap, until you recognize that this factor has occurred: The thetan is helped all the time by MEST – all the time, all the time, all the time, all the time by MEST. It gives him consecutive scenery, gives him location; these are all things which he does not – is not just been overwhelmed by, but things which are actually things that he likes. It gives him a permanent, persistent structure of matter. He can put up a little shadow of a house today or something like that and it's there tomorrow, you see? If he forgets about it, it doesn't disappear. All kinds of problems that a thetan had have been solved by this universe and he's on a one-way help flow when he gets too far down. Universe helps him; he doesn't help the universe.

Somebody who is in that frame of mind, you can simply ask this simple question: "How could you help the physical universe?" You get the degree it helps him; makes a stuck flow. All right, "How could you help the physical universe," see? And he's liable to comm lag on that first answer for a little while, but he suddenly will come up with a whole bunch of answers and he'll suddenly feel better about this universe.

In other words, if the universe is anything, it's too good for you. And people can't stand this, so they decide the MEST universe is evil. So every once in a while you'll get some bloke that decides to make it a very evil place. And he'll get some wild, weird idea of what is wrong with it. What he thinks is wrong with it is inevitably that it has free beings in it. He always comes to this conclusion, if he's that degraded, and therefore starts to get very busy to make beings unfree. The net result of this is chaos.

The origin of the universe in the first place is probably – and this is very hypothetical, even though we have found this type of thing time and time again, it hasn't been too well explored – probably was a collision of home universes. Everybody was busy building a universe, and it wasn't in any time period and its collision, one by one, and another by another, would form this big universe. It's probably made out of fragments of home universes – some such thing.

Well, the problem of why everybody stays in present time is one of the more fantastic problems. And I got a short breakthrough on that not very long ago, which was just this as a breakthrough: There's a vibration; a response to a vibration. And that response to a vibration is so uniform that from one end to another of this universe you have one present time. I don't care if it takes you a long time to reach some other galaxy, it's still vibrating in this exact instant. Or even if its light takes so long to get from it to you, that cuts no ice. In this very split second it is vibrating at exactly the same vibration not only that this universe, this galaxy, you see, is vibrating at but that you and your bank are vibrating at. In other words, your bank
is a bank because it has a vibration of MEST. Interesting, isn't it? The only variation in that vibration is time, so therefore you can move somebody on his time track and you can get different sections of the vibration.

One time or another somebody was overwhelmed by or did a lot of overts and overwhelmed others with vibration. It was a very minute vibration, now; we're talking about a very minute vibration. Not the vibration of sound, that's terribly coarse; or even supersonic sound, or even the vibration of that; we're talking about the vibration of a light particle. We're talking about the vibrations of the L-ring of the electron. We're talking about a vibration now which is unimaginably far away and forgotten as far as a thetan is concerned. And the unison of this vibration of matter is something to which the thetan responds. All of that is very hypothetical, but I've been looking for things which would detach a time track, and this was an hypothesis I came up with which might explain the phenomenon of present time. And I couldn't think of anything else that would explain the phenomenon of present time, offhand.

Now, the time track itself is formed by an involuntary intention. Now, in studying the power of an Operating Thetan, I have had very many pauses in my thinking. I knew intellectually the power of an Operating Thetan. This I knew and have discussed it, and you'll find it in various books and writings and lectures and so forth about Operating Thetans. And we all know what we're talking about when we talk about Operating Thetan. That's what's another weird thing, you see? Something that interdefines itself. But instead of just this intellectual appreciation of the data, I myself have in very recent weeks, have been exploring the actual potentialities of an Operating Thetan. And I was giving a demonstration the other day in the Instructor's meeting. You take the cellophane off of a packet of cigarettes and set it down all by itself, and ask somebody to pick it up without denting it. And don't let it dent even slightly. And he actually won't be able to do it. If you don't believe me, why, make it as an experiment sometime. It's quite impressive. You think, well, you can get your fingers on it, and so on, you'll always see a flutter of dent. You can't handle it delicately enough to pick it up without denting it. It isn't just the structure or fabric of it; it's the fact that if you could actually exactly measure the exact pressure to put on that cellophane packet, you could pick it up without a dent occurring in it and without any collapse of its wall or side.

That's probably the basic problem of an Operating Thetan. And that problem itself may give him his time track. This is a wild bow, isn't it? I mean, how do you make that connection of logique? Well, it's this way: The power of an Operating Thetan is such that if he were to pick up a steel cylinder capable of resisting several hundred pounds to the square inch, he would have that same problem that you have with the cellophane.

His problem is, how does he touch things without crushing them? He picks up this steel cylinder and he looks at it and it's got a dent on both sides. And you actually should practice this with some cellophane – with this cellophane cigarette wrapper, to get the exact sensation of being careful that an Operating Thetan has in handling MEST. You'll find it quite restimulative.

Now in handling this then, he seeks another method of handling. After you've politely picked up a little boy's toys for him, or some friend's mock-up to give it back to him, you see, and it's now lying there in a remarkable state of crumple, you get the idea that you're quite
destructive. This brings about the idea of destructivity. As Suzie said the other day, "I think the reason they do this is they're just jealous of an Operating Thetan." People who haven't that level of action then are coaxed into believing that an Operating Thetan – or a free thetan is a better designation, because we knew of ourselves as free thetans, you see? There were various kinds of thetans and a free thetan was somebody who was free of a body. He wasn't free of organizational commitments or ethics, but he was free of a body; he didn't require any body.

Now, this would coax them to believe that a free thetan was destructive. And they would then lay this into him and even trap him with the idea of making him touch something to break it up and even build something that looked strong but was fragile to convince him even further, don't you see? That's your first trap. Because it caused the free thetan to pick up a new trick, instead of squash things by picking them up – doing things by intention.

Now, we've always thought of that as primary, and it is not primary, it is secondary. The postulate and action through a postulate is secondary to action through energy. You have to be able to do both. It is more natural for a thetan to pick up this crayon by picking it up – not necessarily mocking beams to pick it up, but by picking it up. You understand? Just picking it up. But if his idea of his own destructivity is so great, he then will develop a secondary means of picking it up. And this secondary means of picking it up is operation by intention. He'll pick it up by postulate; he'll pick it up by intention – he will intend it up. You understand? And he can do that, too, but it imposes a great restraint on him and is in actual fact a great downgrade from simply picking it up.

You sit over something and strain at it to make it move and this will tend to prove to you that you can't make things move anymore. Where as a matter of fact that is quite unnatural, what you're doing – intending to make this move. Intending to make this move. That's quite unnatural. Your actual bent is just to move it. Just move it. Do you get the difference? There is a world of difference. And the reason one stops moving it is because he's afraid he'll destroy it. There won't be anything there to move, except some powder. So he develops this trick, which we call an intention.

Now, this intention he trains to become involuntary. The involuntary intention. Now, that is very far from imaginary – the involuntary intention.

You have involuntary muscles which make your heart beat, involuntary breathing arrangements – we're used to this sort of thing. Now, I don't know, they taught me in school about voluntary and involuntary meat bodies one way or the other, and I used to get awfully mixed up as to which was the ones which went off by themselves and which was the ones that didn't. Let's just bypass the mix-up and let's say that it is a type of muscle which you don't have to pay any attention to to have it work or continue to work. It's a non-intentional action, you see? Same thing as you're saying when you say an involuntary intention.

You intend things. Get that as a big difference. To intend this piece of chalk to rise. A thetan can do it, but he doesn't have to touch it and doesn't touch it. He intends it, and it will rise. And that's very downscale. That's monkey business and nonsense. That's the same as putting yourself on a fantastic withhold. You'll get that same sensation when you do this one with the cigarette packet cellophane. Take it off the cigarette pack and after you've seen that
you can't pick it up without making it ripple in some way or another, then do the rest of the exercise and sit back and get the idea of intending it to rise. And you'll at once get what you once did with other things.

Now, on the involuntary intention, it sounds very funny, an OT answering a telephone. You say, what would he be doing answering a telephone? Well, he'd be doing everything answering a telephone. Telephones existed before Alexander Graham Bell. Oh well, I don't know that that's true. But anyway, the telephone is actually a problem to an Operating Thetan: things are fragile; they short-circuit; their lines fuse.

Now, once in a while you'll see this come up in a co-audit. It came up the other day in some co-audit some place or another; I've forgotten if it was in New York or Sydney. But they threw the goal "to forget" into the co-audit, and one of the first reactions was somebody fused an E-Meter. Melted the lines. We've had, before, somebody drive a hole through an E-Meter electrode but not fuse an E-Meter. That was the end of that. So I think probably we'll have to put a fuse... [laughter]

Well, what did that? That was actually some involuntary reaction on the part of that thetan was triggered. Here he is sitting here in a meat body, holding himself down and being good, and somebody just suddenly triggered this, see, and he went psssheww, see, and that was the end of those leads. Melted. Yeah, but you can only do that in a blast furnace. Blast furnace! We were talking about power, heat; we're talking about a thetan.

Well, unless you understand this as too great an exerted power and force within the ethical limits of the individual, then you will never understand the problems an Operating Thetan has. Strong men and big people very often have these problems. They're afraid they'll hurt somebody and they always go around talking about hurting somebody and so forth, you know? And they pick up the little woman in their great blast of enthusiasm, you know, and they set her down and they're just about to say "Dear, I brought you a box of candy to celebrate the anniversary," and she's standing there with two cracked ribs, you know? What they never get through their thick skulls is that really she didn't object. But the point I'm making here is a thetan, in dealing with himself, is dealing with somebody who is stronger than the fragility with which he is surrounded. And he compensates for this by reducing his power.

Now, let's talk about this telephone again. How do you answer a telephone as an OT? Well, the right way to answer a telephone is simply to pick it off of its cradle and put it up somewhere in your vicinity and talk into it. That's very simple, isn't it? But supposing you get mad at somebody on the other end of the phone? You go crunch! And that's so much Bake-lite. The thing either goes into a fog of dust in the middle of the air or drips over the floor. How about the telephone line? Well, that fuses of course if you say into it "Now listen! Oh, it's – oh." Severed your connection. [laughter] That was the end of that.

All right. Now, there are two solutions to this. And this is the solution that the Operating Thetan ordinarily took and was wrong. And that's to develop an involuntary intention. When the telephone rings it springs into the air in his vicinity and he talks. It actually will spring into the air and stay there. In other words, he's got an automatic action. Ring telephone, telephone springs into the air, you talk. Got that? Involuntary intention. He's got a postulate then which does things without his having to actively intend them.
There's nothing wrong with this, but why an involuntary intention? Well, that's to keep from crushing telephones. And that makes it very easy to answer telephones, and the telephone stands there in the air and you think this is very tricky. Well, that's all very well. That's all very well. But it's that same thing that gives you a time track. Apparently there's no difference between an involuntary intention to act and an involuntary intention to duplicate and an involuntary intention to create. And that's probably the genus of the time track. That's hypothetical. The other I'm giving you is absolutely actual, the telephone bit is the McCoy.

I'm trying to get at the basis of this time track, you see, to strip away the whole time track. It gets into a... this, so you mock things up according to certain vibrations and it gets to be an automatic intention. And then he doesn't know what this automatic intention is. And then somebody comes along and gives him things for the automatic intention to mock up which are things that would be bad for him, or they jam the machinery of his automatic intention, don't you see? And they make him fight his own automatic intention. And the next thing you know, he's got a messed-up time track, and the next thing you know, he's solid. And the next thing you know, he picks up a meat body. See how it goes?

But the withhold begins with the piece of cellophane. Steel is cellophane.

And the other solution that I just spoke to you about is surround yourself with things that don't go boom! Get the idea? What's the idea of having a telephone that you can't pick up? That goes to powder of Bakelite and fused wires every time you pick it up? Well, the devil with it. It's something like you're trying to play croquet with a lady's watch as a mallet. You wouldn't do that ordinarily. You'd go out and find a croquet mallet. Well, you see a telephone like this that you're supposed to use all the time, recognize what's happening to you and put something there that you can handle – that's a simple solution – and you won't be going downhill. If you find yourself on a big withhold all the time, what are you doing? You're withholding. You know the basis of withholding. That sets you up to all sorts of things.

But the main thing it sets you up to is this mechanism of automatic intention and that sets you up to an automatic time track. Next thing you know, why, somebody's running out your engrams. Who's putting the engrams there? Well, you are. How do you stop putting the engrams there? Well, there isn't any way to stop putting the engrams there unless you eventually track it back to your automatic intentions and get your early track material which undoes this. But you're not going to undo this time track so long as it's so charged you can't come near it or run anything with reality. Don't you see? You've fixed up your own theta trap just because you've been betrayed by theta traps. All sorts of things like this occur.

All right. Now, that's – that's that – so much of that. But what's this got to do with this galaxy and that sort of thing? Well, it has a lot to do with this galaxy. I don't think you could go into an ant house, one of these anthills, with human fingers and rebuild these various places where they lay their eggs and store them, and I don't even think you could pick up very many ants with human fingers without crushing some. Well, what's the idea, see? What are you trying to do? What are you doing fooling around with an anthill? That's one of the questions.
Now, these questions actually have to be answered from a technical viewpoint. But they have a great deal to do with the organizations of Scientology. A very great deal to do with that. Oaah! What's this? Where are we going? Because the second we look at the character, the actual true character of an Operating Thetan, we'll recognize what we are dealing with here. We see very clearly that all this could be very — uah! — upsetting in various directions. I think we have some responsibility in at least heading it off in the right direction and organizing it to some degree. And this is the only point of upset which I feel about this, is early on, conceiving that free thetans were very dangerous and should be shot down in their tracks, people such as this group in Helatrobus started laying in implants and picking people up and weakening people down and doing all this sort of thing and all this nonsense and worked on it very hard. What industry! Think of what would have happened if that industry had been devoted to a worthy cause. And this you possibly have not run into, but you will eventually before these implants. Planets were surrounded suddenly by radioactive cloud masses. And very often a long time before the planet came under attack from these implant people, waves of radioactive clouds, Magellanic clouds, black and grey, would sweep over and engulf the planet, and it would be living in an atmosphere of radioactivity which was highly antipathetic to the living beings, bodies, plants, anything else that was on this planet.

Now, this period might be as long — well, it could be billions, certainly, quite ordinarily a million years before the first capture of your pc or something like that, and certainly was a hundred or two. All of a sudden these otherwise clear skies that would ordinarily have merely rain clouds in them would become radioactive. And this was explained by the wise savants of the day; they were — sat there stroking their long, useless diplomas. They explained it as a disintegration of the universe, natural phenomena and so on. How did they explain it this way?

Well, the hub of a galaxy has in it a great deal of radioactive material. It's not that it doesn't have stars and planets in it that are perfectly free from this, but there just happen to be more Magellanic clouds scattered around there than other places. And a universe has vectors of force. They go out like a — not really like an Archimedes spiral, but I don't know quite what the geometric figure is. It's the line that goes from a center out to the rim in a curve and hits the rim at an oblique. You've seen some old wheels — spring wheels and so forth are made this way sometimes.

Anyway, there are lines of force in a galaxy. And these cookies had actually found how to detach matter along a line of force. And so they'd set a Magellanic cloud loose along one of these lines of force and it would swing out of balance and move on out and engulf a system. And then swinging out further would engulf another system. And would spend an awful long time hanging around the system as it went by, you see? And frankly, these clouds would get to systems which they didn't come near for maybe thousands and thousands of years. They didn't direct these clouds intimately, they just set them loose and they would drift out through space. And these wise professors (I've never trusted a professor since) would sit around stroking their diplomas saying, "Well, this is the natural consequences of the disintegration of a galaxy. A certain period in the life of a galaxy, the Magellanic radioactive masses at the interior of the hub begin to disperse themselves out toward the rim. And this is known
as the Keplin-Spreplin law and the Booplum-Booplin law, and the calculations are $M$ to the gup-gup squared or the rippety-rip-bop to the tenth power."

Everybody sat around being very, very amazed, see? The truth of the matter is somebody was letting them loose. And because of that scientific theory, nobody found out about it for a long time, that it was being done. Because it was incredible that anybody would do it. The natural law of it was not known, that you could do it.

And so planetary systems would become engulfed in radioactive masses, gray and black. And the earmarks of such a planetary action was gray and black-gray, towering masses of clouds. These Magellanic clouds would not otherwise have come anywhere near a planetary system.

Well, there's such a thing as the Dark Horse nebula in Orion today. You can maybe see some pictures of that in astronomy books. Well, that is one huge radioactive black mass, towering up there. It's, oh, light-years across, you see? It's heavy, it's thick. Well, any piece of that, of such a mass existing at the hub, any chunk of the Dark Horse Head nebula set loose in the galaxy would spin on out and engulf systems.

Now, when a system had been engulfed – and they had it on their timetable – they would send ships in. And they had little orange-colored bombs that would talk, and speech and so forth was frozen into electronic capsules. It was all very clever. The utter insanity, you see! This makes it so incredible nobody believes it, you see, and that was one of their greatest protections. Why would anybody go to this much trouble?

So the clouds would talk. And here you'd have a gray cloud going by and it'd be saying, "Hark! Hark! Hark!" you see? "Watch out! Look out! Who's there? Who's that?" You know? Sounds like a fun house. Or somebody would find his front yard all full of black spots that looked like rabbits and he'd come within them and they'd suddenly explode. And all the vegetation would start dying off around there, and he'd say, "Ouugh, something's going wrong here." Or they'd plant something up like this: They – you'd see a big tangle of barbed wire on the edge of the seacoast and a wrecked aircraft, and a pilot in a doll body pinned on a theta pole. And he'd say, "The poor fellow! I wonder what happened to him?" you know, and he'd go over and here's this aircraft and so on. "He must have crashed," and investigated this thing – what's wrong here, see? Of course, it's just a plant. You walk into it and the ground all of a sudden starts going crack-bap-grap! and saying various things. Well, the thetan didn't know what the devil was happening.

For some reason or other, the symbol of aircraft goes through all of this – weaves its way through this. Aircraft. They looked like Pan American planes – rather stub-winged. Well, actually that begins much earlier. That's back around eighty-some trillion, you will find aircraft being used as part of implants. Because the aircraft is the translating symbol of "you need a machine to get you off a planet or into the air." You can't just levitate, see?

Anyway, here you might find, then, that for some years or for thousands of years or for even some much greater, higher figure of years, that a planet had been engulfed with radioactive clouds and nobody had done anything at all on that planet. It went along like that for a long time. And then all of a sudden one day there was an orange burst and it said,
"Hark! Hark! Look out! Watch out! Come here! Go back!" you know? "Come here! Can't come here!" It's always the double, you know? "Come here; can't come here." Where we get, I guess, the idea of double talk. And then they'd hang around.

Now, don't think that your pc, as a thetan, was picked up the first time. Oh, they'd try and they'd tug at him, and they'd pick him up and try to pull him into the sky. It was very clever. They had some means of contracting a beam. Traction beam. These guys were pretty smart electronically, way advanced. And he'd resist it. But in a year or two, why, he'd ran into another one of them, and again he'd resist it. And a while later he'd run into another one of them, and again he'd resist it. And then he – finally he hasn't got his attention on it and he's already been weakened down and he's collapsed a bit himself already, and he's beginning to worry. And the beam goes tsccup! and pulls him up into the sky, encloses him in a capsule and there he goes.

One of the ways this was done: A small capsule evidently could be placed at will in space. It shot out a large bubble, the being would grab at the bubble or strike at it and be sucked at once into the capsule. Then the capsule would be retracted into an aircraft. Very interesting technology. All of this assaulted his credulity. He couldn't understand what was happening. Nobody had ever seen anything like this before. Puzzled him.

And then, of course, they'd ship him off, and anywhere between the next month or six months or something like that they would shoot him into this period of the implant area, and fix him on a post in a big bunch of stuff – probably looked like railway sheds, I haven't had a very good look at it myself – put him on a post and wobbled him around and ran him through this implant of goals on a little monowheel. Little monowheel pole trap. And it had the effigy of a body on it. You see, he didn't have a body and was put on the pole trap; the pole trap has a body on it. They didn't care whether somebody was used to having bodies or not used to having bodies. And away he'd go through this thing.

Well, he'd eventually get off of it and go home, and then sooner or later he was liable to have been picked up again. And this time he would be found much weaker and they would throw him through. Now, whether they could identify somebody who had been implanted once, which I rather think was the case, and send him through a second implant series because he'd had the first one, or not, I don't know. We'll know when we find our first person with only the second, and so far we haven't. We have found two and we've found four, but we have not found one or three. We'll know more about that, but that's not particularly the subject of my lecture today.

Now, the Helatrobus Implants (call them the Heaven Implants for the public), these things were preceded, then, by a tremendous period of unrest. You could imagine what would happen on a planet which has been going along its peaceful ways minding its own business – no trouble, no wars, nothing like that – and suddenly its clouds turn into radioactive masses. Well, maybe there wasn't a great deal of trouble for a while, but then all of a sudden you'd have these orange bursts suddenly coming down out of these clouds, representing God and chariots, or something, you know, and all kinds of rumors being thrown around, and talking, this and that. After that period, the planet would be almost totally in revolt. No organized government was possible, people were going out sacrificing themselves, everybody was in a
terrific state of gloom or fantastic warfare, they would fight anybody they laid their eyes on because they didn't know what was happening. Trying to hold the fort during any period such as that was well nigh impossible.

During those days, planetary forces usually consisted of territorial or terrestrial officers, terrestrial governments and galactic officers who more or less didn't interfere particularly in the terrestrial affairs but supervised its activities. You had a higher level of technology. In other words, a terrific chaos, terrific chaos. Looked like this planet during the last couple of wars, during the last half-century. You had this kind of an operating atmosphere, you see? Madmen suddenly get up and say, "Down with the Jews!" you see? "Kill all the Jews!" and so forth, and then we'd have all kinds of people piled into the front-line trenches shooting at all kinds of people or something, you see, and mad stuff going on. And troops got madder and madder, and everybody got crazier and crazier, and things were more and more armed, and so on. So it got to be usual, almost, that your brave boys were charging over the top just fine and they turned around to a man and shot you. Got so you just didn't know what to do, what to control, anything, see? That's that period before the implants.

You had a very worried thetan by that time. Now, what were these planets like before the implant occurred and before all this nonsense took place? Well, occasionally some eager beaver would show up and plant a few theta traps. Various things would occur from time to time and cause an ARC break and so forth. Actually it didn't disturb too much. There have been periods of tremendous activity in the past, but the time when the Helatrobus Implants took place were a period of great tranquillity which had gone on for quite a while. These planets were pretty peaceful.

And if anybody wants to say then that free thetans are the cause of revolt, upset and unrest on a planet – ha-ha! He had better examine the facts off the track and find out that it was only when they were threatened and made unfree that the government of planets became a chaotic mess and you got such loathsome things as the government of Russia, or the United States as it exists today. Just a bunch of corn. These were bad boys. "Appropriate sixteen billion dollars for the psychiatrists. Electric shock everybody. Oh, they don't like us, well tell them they're insane, and..." you know, I mean, just corny, you know? Nuts.

That is the atmosphere – that is the atmosphere of an ungovernable area. That's the atmosphere of hysteria. You're going to find the world going crazier and crazier in that particular direction. Why? Because radioactive fallout is adequate enough to start keying it in. Various other little symptoms will fly up in the air. We are not looking at a calm future on this planet. If we weren't sitting here today doing our job, Lord knows what would happen on this planet. Now, I don't wish to overemphasize it because it's there. This planet would be a billiard ball in just a few years and anything left would just be a madhouse.

But we have some responsibility in this direction ourselves. What do you think a thetan feels like when he suddenly finds himself freed, or a third free and perhaps able to operate some much and sees around him the symbols which have been carried forward on the track which destroyed his civilizations in the past? Now, what do you think his reaction is going to be? I consider this very interesting, and this becomes to you and me, boys and girls, a very interesting problem. Because I've gotten mad a few times about it myself. It's all right
for me to say, "Well, actually it isn't the Kennedy government that planted the Helatrobus Implants." And I can say this to myself, you know, sit there very rationally, and say, "Well, they didn't do it," you see, "and they're just implanted, too, and the reason they act this way and so forth is they're just implanted, too, and just implanted, too… Why the hell do they have to carry along all of the symbols?" you see? "Why do they have to act this way?" you see? "They don't have to perpetuate the misery that this created in this universe." And the next thing you know, I'm roaring mad about the whole thing, you see?

Well, all you'd have to do with something like that is just let go of some of your voluntary intentions, you see? [laughter] Well, I can appreciate this frame of mind. I can appreciate this frame of mind.

This planet is in sort of a situation of, at least for a while, where they're damned if they do and damned if they don't. Because if we start in with our program, we can do everything we possibly can to make it go smoothly. Now, I'm sure that it will, over any kind of an operating period of time, go quite smoothly. But this does not avoid a period of chaos. We can make that minimal, and should. And if we plan like mad and work like mad in that direction, we will make it minimal. But I don't think we can eliminate it. Because the chaos out of which all this travail was born was in itself too chaotic. Some of that will restimulate, one way or the other.

Look at it this way: The planet is doomed if we don't operate. So therefore we should do all we can to operate smoothly and orderly. And my attention is therefore on organizational concerns which have very little to do with the legality of corporations under governments.

How do we move through such a period? Oh, I leave it to your imagination what might happen. You remember the fisherman and the genie? You know, the first time they let him out he said, "The first man that lets me out, I will reward him with the riches of Earth." And nobody let him out for ten thousand years. So in the next ten thousand years he began to nurse a grouch. And he says, "The next ten thousand years, if somebody lets me out, I will… ha-ha-ha-ho!" see? And the very clever fisherman asked him to get back into the bottle. But I don't think that was clever of the fisherman.

No, thetans are mad; down deep, they're mad. You get them halfway through one of these things, you'll find out they'll start getting madder and madder, not more apathetic and more apathetic. They philosophically have been understanding everything, and they've understood it thoroughly and so forth. Well, as long as they have that much rage in their hearts, their ability and power will, of course, be remarkably curtailed just by the nature of the situation. That in itself is to a marked degree a safeguard – they who have power who can control it. That stands in our stead and in our favor.

But if we're just totally irresponsible for what we are doing and just let it happen, and don't make any plans of any kind whatsoever, and make no organizational structures of any kind whatsoever to handle anything, not hook anything up in any way, but just let it happen on a big, broad chaos, I think we will greatly have slowed down our forward progress over the thing, and I think we have some responsibility for straightening that out before it happens.
It even answers up to the state of the universe. We're not even interested in that island of galaxies over there, or the galaxies which are up the line, next galaxy, or something like that. We're not even interested in that. We'll find ourselves, however, in almost immediate collision with the forces and powers of this galaxy. This is inevitable. If Earth hasn't already cut her own throat – she's been sending out space probes; she's about ready to fire on the moon. Her actions are quite interesting. And it's only her extremely isolated position and condition and other people's comm lags that won't do anything about this at all, so there's another factor immediately interjected into the situation. Earth has blasted herself off into meat-body space opera. [laughs] Nuts, you know! Absolute nuts. It's impossible to make them do it, you know? But there she is, attempting this sort of thing. Somebody may not appreciate this.

Now, we talk about the man from Mars, and that sort of thing, and we say this is very far-flung and this is very unreal to the people of Earth. As a matter of fact, it is so unreal to the people of Earth that the last time anybody announced a landing from Mars – Orson Welles's broadcast – they practically tore everything to pieces in the United States.

Well, that didn't interest me. That didn't interest me at all that they tore things up in the United States; we've had a lot of science fiction around and that sort of thing; people could be worried, they'd be hysterical and so forth. No, what interested me was that in Quito, Ecuador, that had no space opera, that had no tradition along in this line (it might not have been Quito, but it was one of their big cities), their main radio station put on Orson Welles's landing of the men from Mars. And the people rose up in the streets as a spontaneous action and tore that radio station, a skyscraper, to bits and killed seventeen people in the process. Bang! Well, this answered an interesting question for me. These people we call the "natives" of Earth, they're blood brothers as far as this is concerned and they know all about this, otherwise they wouldn't become that hysterical.

So there are several factors that confront our immediate future. These are political and organizational factors; they have to do with facts of things as they are, not as things as we would like to have them. Well, if we handle the things as they are, it may possibly come about that we can also have things as they – we would like to have them. But I'm afraid we have to take it in that order and plan and work accordingly. And if we do, everything will be well.

Of course, your job at once is to make somebody Clear, make somebody OT. Of course, you're trodding on my heels. See, this is happening fast. People who couldn't handle 2-12 can handle this material we're issuing right now. Oh, they handle it in a very knuckle-headed fashion, I assure you, but they are handling it.

Therefore, this process that we are using and these processes we're using are far more workable. They're fast and finite. And therefore with everything else I have to do, I've got to look at this other side of the picture. What happens next? Well, let's hope it'll be as pleasant as possible.

Thank you.

*Audience: Thank you.*
HANDLING ARC BREAKS

A lecture given on
28 May 1963

Thank you.

Thank you. Well, it's a good thing you put me into a good mood with all that applause. Reports I've been getting on the Zed Unit for the last twenty-four hours – practically unpublishable. We'll take that up in a moment. I know, you'd better look sad, because it's pretty sad news.

All right, this is what?

Audience: 28th.

Twenty-eighth? 28th of May, AD 13.

All right. Now, this lecture is not for people with weak hearts. If you can't take it, why, I advise you to go over into the other building there, where they have a speaker, and turn it off. [laughter, laughs]

This auditing dissertation here actually is possibly passed by, by the student who is doing other types of auditing, but it applies to him very much.

I've discovered the common denominator to ARC breaks. And that common denominator of all ARC breaks – all ARC breaks – is bypassed charge. That's the common denominator to all ARC breaks. And that includes, therefore, all misemotion exhibited by the pc at the auditor.

Now, we should define an ARC break as the pc's transfer of attention from the bank to the auditor and a dramatization of the bank directed at the auditor. And that is an ARC break.

Now, you can get the mechanics of an ARC break just by dropping your E-Meter, or something of the sort, and just calling the pc's attention off of his bank onto the auditor. The ARC break might not take place, but you have approximated the mechanic of what happens. And the probability is that it will take place. See what I mean?

So, we get down to this fundamental, which is not terribly important at first glimpse: but dragging the pc's attention onto the auditor, you see, and onto the session is a precipitating factor even though the pc doesn't dramatize. You see, that's beside the point. You've dragged his attention onto the session. Well, that's an ARC break in sort of reverse.
Let's show you something; you go like this: [makes clicking noises]. [laughter] You've not laid a fundamental for the ARC break, but you've approximated one of its mechanics, don't you see? You've dragged the pc's attention onto the auditor.

Well, very often when you do that, you leave the charge of the session not held back. See, the charge of the session now is not being as-ised, and therefore provides a background booster, and the pc "row-rows" at the auditor, see, or becomes annoyed or something of the sort, don't you see?

Well, so not even that one falls outside this definition. It's bypassed charge. See, pc's attention is on his bank, the auditor does something weird, attracts the pc's attention off the bank. Then, you see, you've bypassed some charge. You've left some charge there, the pc's attention is not on the charge but the charge is restimulated. Do you get that as a simple mechanic?

So that in normal course of human events you're talking to this same pc out of session, you know, and you drop an anvil on his toe or something of this sort, and he'll argue with you about it, but he won't ARC break. You see? It is not, then, that a social faux pas has taken place that causes the pc to ARC break. So an auditor very often feels terribly reserved and preservative of the social amenities and all of this sort of thing, and walks around on tiptoe in a session being terribly polite and so forth. Well, you see, that isn't necessary to prevent an ARC break. You see?

But this mystery is presented: In common course of human events, you make some crack at this person, and they, make a crack at you and you yap-yap, and that's all there is to it, you see? And in a session, you make the tiniest inference about this person and all of a sudden he's splattering all over the walls with an ARC break.

Well now, if you understand what you have done, you understand this matter of bypassed charge and so forth, this most flagrant example – the easiest to observe, don't you see; the easiest to observe and actually not of any really very vast importance but I've just given as an example to show you what this is: In the session he's got his attention on charged areas. And then you take his attention off the charged area and put it on the auditor, you bypass charge and that's what causes the ARC break, see?

He's about to tell you "… and then they drowned me in a well." He's saying, "And I – I – I'm standing here, and I'm looking down into the thing, and there's somebody grabs me by the arm, I can feel his arm, and he's about to throw me over…"

And you say [operates a switch on the meter very noisily], "Just – just a minute. Let me see if I can get some charge on this. Let's see," [repeats the noise] "I – I beg your pardon, my meter – I don't know, I guess I forgot to charge the thing," or something like that. And the pc goes splatter!

Oh, that's very obvious, you see, what's happened there. See, he's got all this charge he's sitting down on, and all of a sudden his attention comes off of it, and you in effect have bypassed the charge right there.

Well, now, the other part of it is he is being cause over the charge, right? As long as he's running it he's being cause over it, see? All right. Now, the moment that his attention is...
flicked off of it he is now the effect of that charge. And any tone level or Know to Mystery Scale level higher than the chronic tone of the pc... Now, get this; you know what chronic tone is, the old Know to Mystery Scale? Boy, we're back amongst the familiar tools here these days, you know? The Know to Mystery Scale, the Expanded Tone Scale, you see – all of those things – quite valid, see? And let's say the pc is at apathy as a chronic tone – that's pretty high, by the way. Very few pcs are there; they're more or less kind of wood, you know? They're way down below that.

The other day I suddenly realized that I was feeling continuously apathetic, and I thought something is happening, my auditing is doing me in or something of the sort. I went around like that for about twenty-four hours and then suddenly realized it was I, a free thetan, who was feeling apathetic. All of a sudden, you know, any consequences of it blew, you see? And I realized suddenly I was feeling much better than I had for a long time. See, I hadn't felt like myself, a free thetan, for some time. You know? You get the idea? I mean, gradually the Tone Scale had come up, you see, not as Ron or human being, you see, but had gradually come up, up, up. See, I'd feel pretty good as Ron, you see? Fine, feel very high-toned. But I'd come up, up, up, and I didn't get the sneaker of it. And the first emotional response you get to it is feeling apathetic. You know, "Well, guess I'm not worth much. Look what they're doing over in the States these days, you know? People talking about rerunning Kennedy. You know?" I was kind of thinking about things that way, you know? And all of a sudden: "Hey, that's me!" you know? [laughter] "Me! That's me I'm feeling about! " And it felt wonderful. Was a great feeling after that. I went around and enjoyed it, you know? [laughter]

Well, actually, a pc will come up through degradation as a chronic tone, and actually will come up from unconsciousness as a chronic tone. We had a pc over in the States. I mean, it isn't anything esoteric, you know; he just lies there conked out all the time. You try to audit him and he – conk – you know? And audit him and – conk. And talk to him – conk – you know? And he's actually existing above his chronic tone. His chronic tone is unconsciousness. And so this boy, of course, processed – you process him now to get rid of his unconsciousness – well, cut your throat; you'll never get anyplace, you see? You just have to generally process his case with processes which are real to him and bring up a general case advance, and the unconsciousness will disappear. You see that as a different look?

That doesn't mean that there are chronic tone levels of maladies, you know? You don't have maladies as chronic tone levels, but anything above – anything above – the pc's chronic tone, you see, being higher than the pc, can be cause over the pc and therefore become a dramatization.

There is nobody more amazed than the pc to find himself in raging anger in a session. He's absolutely flabbergasted! Well, some charge gets bypassed, and he doesn't know where to look, he doesn't know what charge is bypassed, he doesn't know where he looks – he doesn't know where to look. He looks at the auditor – the auditor doesn't even have to fiddle with the E-Meter, see? He looks at the auditor and there is something, you see, and anger or something like that, being higher on the Tone Scale and contained in the incident which has been missed, causes the pc to dramatize. And the pc is actually as helpless as a dish towel in a hurricane. He's totally helpless. He says, "Ohh – aww, what's going on?" And he's shouting and screaming at the auditor, you know?
Well, you can get somebody who is dramatizing effort. You know, he's got to pick up the chair and break it in half, you know, something like that? Well, that's a pretty low-level dramatization, that particular one. Anger is more common. Bored is something you very often don't recognize as a dramatization. PC is getting along fine, and all of a sudden ARC breaks and feels very bored.

Now, similarly, you could go further and find a pc ARC break into a total manic. I have never seen this, but by extrapolation, you could say he would become very manic, you see—terribly, wildly enthusiastic, with glaring eyeballs, you see? Be an ARC break.

So an ARC break, then, comes about whenever charge is bypassed, which then puts the pc at its effect-point. And the pc then dramatizes the charge that has been bypassed. This is actually far simpler than it sounds. I'm just giving you all of the ramifications of it—giving you all of the ramifications of it. These are the mechanics involved in the thing.

Now, the remedy for an ARC break is to locate and indicate the bypassed charge, at which moment the ARC break ceases. Now, that could be interpreted by a Q-and-A artist as meaning you have to go and run the bypassed charge right now. You see, he goes into a do. No, that gets into impossibility. You find yourself fifth on the chain. You are running the fifth engram and the pc is ARC breaking on the chain, and... well, then you would interpret it and say, "Well, you can't possibly run the fifth engram because the pc will ARC break," you see? Some Q-and-A artist would interpret it at once, you see, in that category. And you will find them doing so no matter if I've said so. And if you'll just remember I've told you this and remember this particular mechanic, you can prevent this other consequence from taking place.

And the consequence is this: Well, the pc is ARC breaking, running this engram, so therefore you have to at once go run the earlier engram. And that is not what I have told you. If that were the case, then to prevent everybody from ARC breaking would require continuous auditing. See, that is not the remedy. The remedy is to find and indicate the bypassed charge. And the ARC break ceases, [snaps fingers] right like that. Find and indicate the bypassed charge. It's actually as simple as that. Nothing to it.

Now, you are, all of you, cognizant of the trick of turning off somebody's anger at you by saying "somebody's missed your withholds." Sometimes it doesn't work. Sometimes it doesn't work. The person just gets more insulted. Well, that's because a missed withhold isn't the source of the bypassed charge. You just indicated the wrong bypassed charge.

But this fellow does have missed withholds, somebody has missed a withhold on him in session, he doesn't even know this, and he's ranting and raving at you, or something of the sort, and you say, "Boy, somebody missed a withhold on you, man." He cools right down.

It isn't, as you might think, that it introverts him so that he immediately begins to look around inside of his skull, "I wonder what the missed withhold is," and so pulls him off of your neck. That isn't what's happened there. You take a good, close look at it. Get some experience on this and get some reality on it yourself, and this material will really be in your grasp.

Now, sometimes you've said to somebody, "Well, somebody missed a withhold on you, man," and the person has said, "Goddamn, don't you pull that on me!"
Well, it wasn't a withhold that was missed, see? Somebody missed a goal. Get the idea? And if you were to pursue it right then and say, "Well, let's see, was it – it was probably a goal that was missed. Probably somebody missed a goal on you – missed a whole GPM. Somebody missed a whole RI. Somebody's missed some RIs on you." And he's just about to let out of his mouth a horrendous scream and follow this thing through, and he all of a sudden says, "I wonder if it could have been a missed RI? Probably was." See?

So the trick of turning off an ARC break is to find and indicate the bypassed charge. But it must be the charge that was bypassed. See, that's where the accuracy comes in. And that makes you an artist.

Now, it's still within the realm of scientific approach – still within the realm of scientific approach because there are only a few charges that can be missed. See? There's engrams and GPMs and goals and RIs, an engram more basic on the chain or an incident more basic on the chain, or a failure to acknowledge, or a refutation of reality, or a rejection of affinity. This character is feeling you're a pretty good auditor and you say, "Ah, nuts!" see? All right, he's got a charge there of affinity, see, and that isn't acknowledged and you bypass it. You rejected it. So you get this thing firing back in your face. Don't you see what that is?

Now, these are not mechanisms which are totally relegated to session, but they relegated themselves to life. Now, you're a Registrar and somebody is coming in, or you're signing up pcs. (All of you have to wear a Registrar's hat at one time or another.) And you're trying to get somebody to get some auditing, you're a Registrar, see? And there you are one fine day with a yow-yow-yow and a scream-scream-scream standing in front of your face: Seventy-five hours of auditing have been delivered – he feels terrible! He says, "Oh, I could kill everybody in the place," and he ought to go out and sue everybody, and he's going to inform the government that so on and so on and so on – yap, yap, yap, you never hear such a thing. Don't worry too much about the threats, because the person totally lacks direction. Person will go halfway down the steps and change his mind and do something else, don't you see? They're incapable of carrying forward a program that has any cohesion or direction, see?

Now, you actually are very foolish to engage this individual in any reasonable conversation, because it's not a reasonable situation. That attitude is wholly the product of bypassed charge. And as Registrar, you simply should hunt and punch around till you find the bypassed charge. That's all, just hunt and punch around till you find the pc's bypassed charge. All of a sudden the thing expires. It just goes, because you've found and indicated it.

Be perfectly all right to just grab a meter, and – trying somehow or another, to get him to hold the cans – and just give him the standard sort of an assessment: "Did somebody run an engram too late on the chain?" you see? "There's a more basic engram run? Oh, clang. That fired. Ah, yes. Well, somebody was running an engram on you and there's an earlier engram."

"Oh, is there? Yes, you know, yeah."

Where's all this rage? Well, you see, the rage is an automaticity. And I have told you often, often, often, the tenuous character, the extremely delicate, balanced character of neurosis and psychosis – and such other nasty words – makes it almost impossible not to undo it. Because it is incapable of continuation. It is set up in such a delicate balance that almost anything can make it slip, if it's effective. You understand that?
You see, some guy is down in a padded cell someplace, and he's a "raving gamaniac" and he is screaming away and throwing stools at the warders and so forth. And although I don't blame him for throwing stools at these blokes, this is the point: His condition is not a condition of terrible, difficult, hard, mean, impossible-to-reach, go-on-forever dramatization, see? That is not true. Actually, the difficulty of maintaining such a state is almost impossibly difficult. You can make it go bzzzt! And all of a sudden it no longer hangs in balance and can't go on dramatizing.

You've heard me talk to you before about the slip: old ARC Straightwire, the way you can knock apart a neurosis – the difficulty of maintaining a neurosis. Old ARC Straightwire has broken up more neuroses than you can count. See, it – too difficult for the pc to go on being neurotic on this particular point.

And this, of course, is at wild variance to the commonly held belief. The commonly held belief is a person is psychotic – well, that's it, they've had it, you see, and they're psychotic, and that's all you can do about it. You can't do anything about it, you see, because it's a very tough, vigorous, dangerous, enduring condition. See, that's the commonly held belief. They believe that a neurosis is a fantastically arduous thing.

Read a funny story: Somebody – people send me clippings all the time. I get lots of clippings (appreciate them). And one of the clippings I got the other day was a yap-yap about a psychiatrist; it was very funny. It seems like he'd been treating this fellow – he's telling his story, you see? And he'd been treating this fellow for four years at an hour a day. And when the fellow – he'd had a tremendous success, the psychiatrist was saying, because when the fellow first came to him, why, he just felt terrible all the time, because he just had this urge to kill somebody. And so he gave him an hour's treatment every day for four years, and at the end of that time, why, the fellow walked into the office, and the psychiatrist knew he'd had a wonderful success because the fellow said he just felt wonderful, he just felt wonderful, he'd never felt better, and so forth, and that neurosis that he had been working with, that always used to make him feel terrible, now made him feel wonderful. And as the fellow pulled the iron bar out of his pocket, the psychiatrist said… And that was the end of the story. [laughter]

In other words, there are two things, you see, that argue in favor of a lie in this direction: One, the absence of technology and the absence of understanding of these states combines with the professional need of tough cases. You see, if psychosis wasn't unsolvable, you wouldn't find the – and very tough and very enduring and very terrible – you wouldn't find the US (ha!) government shelling out sixteen billion quid (or bucks or whatever they're using these days) to build themselves up endless numbers of sanitariums, and ten research centers. They're going to build ten research centers and so forth. And they might even get up to prenats in these things, you know, because they'll probably use our work. And man, look at the kitty! Sixteen billion, see? And that's just the initial appropriation. That's going to cost five billion a year afterwards. The armed-forces construction program of the United States is only 1.6 or 1.8 billion. Give you some weird perspective? That is fantastic.

Look at the vested interest in psychosis being incurable. These nuts that are in charge of the nuts will never do anything, of course. It's worth too much to them not to. Somebody
comes along and said, "All you have to do is find and indicate the bypassed charge and the Person go fitt! and he's sane."

"Oh," they'd say, "take that nut out and kill him, ha-ha-ha-ha! He's about to cost us sixteen billion hard-earned legislative bucks! Ha! Shoot him."

It's not for nothing the FDA is mad at us. You see, they don't for a moment believe any of their charges. See, they have made a comprehensive, thorough investigation all up and down the land, and they haven't found one single human being who ever was told that an E-Meter would cure anything. But they've invented the statements. Why? Well, we constitute a fantastic threat to a fantastic vested interest.

These are not men of goodwill. They're caved-in dramatizers themselves. Never make that error. You can very easily make that error. These guys are dramatizing. I don't know -- much care what they're dramatizing, but they themselves are doing a heavy, hard dramatization, by which they say, "We can do what we do without conscience, because man is after all an animal and is nothing." See, so they spread the plea that man is an animal and is nothing as an effort to get over committing overts. So this hangs them with being an animal and being nothing.

I imagine that if you took thirty psychiatrists -- I know it's unpopular to talk about these people, but if you took thirty psychiatrists at random, at least one of those thirty would be sitting there barking. If you just called on thirty in a row.

You think I'm kidding -- try it sometime. I'm not kidding. These people need help probably worse than their own patients. How would you like to be up against something that you advertisedly considered incurable, totally damaging, nothing could be done about it, and you're collecting money right and left to do something about it? Krrrrr! That's a pretty nasty position for anybody to work himself into.

Now, we probably cut those blokes off by my continuous saying this and that, we probably deny them help one way or the other. But every time I have ever tried to work with any group of psychiatrists or anything of the sort, the only thing they'll send me is one of their number who has already gone potty. This bird's around the bend or something like that. And I've never been able to teach them anything. And they actually have worn out their welcome with me, that's all. But I would still help them today.

That's beside the point. The point I'm making on the thing is that you can work yourself into a position where you consider an ARC break unremediable, terribly powerful and overwhelmingly destructive, so that you will label certain pcs as ARC-breaky pcs. You can fear this ARC break, you see? You can become afraid of these ARC breaks occurring. And that can make you unwilling to audit, or if you don't even go that far, will rough you up enough to do a stinking auditing job, which of course causes more ARC breaks. You got that?

So unless you corral the ARC break, unless you yourself get a good reality on handling the ARC break, unless you understand this one and you develop the skill necessary to find and indicate the bypassed charge -- that's the only skill you've got to develop -- you'll get into a position where you'll audit for a while and then feel like it isn't worth the candle and
man is no good, and go the route, man! Another half a century you'll be telling Congress, "Well, we need sixteen billion dollars because – to handle the nuts."

You see, what you've got to break through with you is, one, a condemnation of ARC breaks. They don't mean anything; they're not diagnostic in any way, shape or form. They're not diagnostic, that's all. They don't tell you the ease with which a pc runs or the unease with which he runs. They tell you nothing. See, the pc who runs like a well-oiled player piano may ARC break all over the ceiling. And some pc that you couldn't get a gain on with a building jack never ARC breaks at all. So, you see, it's no indication at all. There's no index there.

The pc who is very easy to audit very often is the pc that is very hardest to get a gain on. And the pc who is very difficult to audit very often gets the highest gains. So, you see, these are not coordinated factors. So this is something that should tell you that temporary or permanent conditions of misemotional stress are something that you have to face up to as an auditor or just get out of the auditing chair. It'll catch up with you sooner or later, man.

I catch myself every once in a while in some kind of a session. You know, pc says, "Row-row, row-row-row-row, row-row-row-row-row." See? "You just ask me for one more of those suppresses on this RI and I'm going to blow! Because there aren't any suppresses left on the RI!" You get that kind of an approach?

I say to myself, "This pc's trying to convince me that I mustn't take the charge off the RIs. This pc is in a big sell." See?

Well, actually that would be the inevitable effect of it. I eventually would say, "Well, all right." And, "All right, that rocket read," you know. "It rocket read," and so on. Get the next one, the next one, the next one, and so on. All right. Yeah, you've finished the bank. * To hell with you," you know? See?

You're doing the very thing you must have done in the first place that caused the ARC break. And you got to get some wins on this, auditor – you got to get some wins on this. This one you got to get wins on.

I want you to get a confidence that when a pc goes row-row-row, that you can find the bypassed charge, either just by knowing what it must be because it couldn't be anything else because you weren't doing anything else, don't you see? And checking on a meter, or going into a full dress parade of assessment to get the bypassed charge – however you get that bypassed charge – find it and then by indicating it to this pc, realize the tool that is in your power. By the fact that the mere indication of it turns off the ARC break, right like that. You didn't do a thing about it except indicate it.

How do you indicate it? You say to the pc whatever you say to the pc that indicates it, that's all. I mean it's as elementary as that. There isn't any hidden magic here. It's not like that if you... "I can teach you now how to make gold. And the way to learn how to make gold, the way to make gold is to go up at twelve o'clock on a night of the full moon, and sit down on a punky stump with two pounds of lead and one pound of arsenic. Rub these two together, and

* Editor's note: "bank" here and in several other places in this lecture is used in another definition than the usual one and means "one GPM"
if you don't think of the word *hippopotamus* you will find you have made gold." See? Impossible – completely impossible assignment.

Now, this is not an impossible one. This lies well within your reality, your action, your ability and so forth. There isn't anything else spotted here, see, that is esoteric or outside. I didn't mean to degrade your reality or anything like that; I'm saying, just, it's something that you can have a reality on right now. The only times you'll miss on this, you very often will pick it up a session or two later. You had an ARC break, *bow!* and you couldn't find anything to – and then nothing happened, and you couldn't cure the thing, and *blooww!* and you couldn't do anything about it. And two sessions later you find out – my God, you had passed a whole GPM. You all of a sudden remember, "Hey! Two sessions ago when I jumped that bank, you know, I got that next goal, and – ha-ha! And we just found out that in between there is the goal 'to spit.' Hey, what do you know. Ho-ho!" And you say to the pc, "Hey, what do you know about that." And the pc gets very calm all of a sudden.

You very often find out a couple of... some time afterwards what the bypassed charge was, and that will make you very enthusiastic on what I'm saying just now. You'll get more enthusiastic than that, because you find out it's an invariable fact. It doesn't vary. Why didn't you find the bypassed charge at the time the charge was bypassed?

Now, the rest of it is, you actually shouldn't let an ARC break endure more than two or three minutes, because ARC breaks multiply by the square. They're not a lineal development. You let an ARC break run one minute and it doubles. You let it run two minutes and it quadruples. You let it run three minutes – you get the idea? There it goes. This thing is developing on a very steep curve. And you actually owe it to the pc – not because you're afraid of it, but because you'll have more trouble and waste more session time – you owe it to the pc to get in and turn it off fast.

Now, you see, a whole government can be intimidated by a riot. The United States government is actually being conducted today by riot. The only people who get any attention or get anything passed are those people who riot. See? The Japanese government went by the boards because there was a riot. Somebody went down and slipped a few yen to a few students and they went up and went *yow-yow-yow*, and Eisenhower was unable to visit the country, and so forth (because, after all, students are pretty dangerous, you know?). And can't have all that shouting, you know, and so forth, and the government fell.

This government – my hat's off to this government. They "Ban the bomb," you know, and the police go out and pick them up and put them away. And they "Ban the bomb," and the police go out and pick them up and put them away. And I don't think there's been a ripple in Parliament. I don't think Parliament has even heard about it. It's very, very remarkable. They've gotten used to that over here, see? So they're not being run by riot. Get this as a method of government: running a government by riot.

There are many methods of government which I have studied from time to time and been called to my attention, and so on, which aren't in the civics textbooks. You know? You elect the mayor, and the mayor does this and the aldermen do that and all that sort of thing. These aren't in the civics textbook, but they are basic methods of government. Government by assassination: There are many texts on this subject. Texts!
The government of Japan, for some vast, vast, vast period of time, was run by the Black Dragon Society.

Some bird dramatizing the Helatrobus Implants. I think they're called the Sharif Mohammedans or something like that, they were at the time, from which you get the word assassin. Old Hashshashin, the Old Man of the Mountain, used to kidnap young fellows and tell them that when they got killed they could come back to paradise. He'd give them a few days in paradise, you know, and he'd get a lot of good-looking dolls and rivers of milk and honey and all that sort of thing, and the guy up there – that's where you get the word hashish too. They'd get this young fellow in some cafe and feed him some hashish, take him up there, and these babes would chuck him under the chin for a few days, and then the old man with the false halo would come around and say, "Now, son, the way you get back here and live forever in perfect enjoyment is to do exactly what we say."

"And what is that?"

"Well, go get yourself killed, of course."

"Well, how am I – get myself killed?"

"Well, you have to assassinate the sultan of Persia."

Well, the young fellows look at these girls and all the curves, and he'd say, "Tsk, tsk! Why not?" See? And the next drink of wine they slipped to him, why, it'd have some more hashish in it, and he'd wake up in the capital of the shah. Next time the shah walked through the streets or rode through the streets or something like that, there he was and off went the shah's head, see? Of course, the guards would kill the fellow, but that was exactly in the plans. And a lot of young fellows got surprised by not being able to find the top of this mountain again, and there they were.

But that was government by assassination. And all the Old Man of the Mountain ever had to do was just indicate to the Chinese head of state that he'd like a couple of camel loads of gold, please, and they would be on the way at once. Everybody was terrified of this person. Government by assassination. Any policy could be laid down, anything else, because of this fear of assassination.

This lasted a couple of hundred years, by the way, and it's oddly enough, a direct dramatization of the Helatrobus Implants.

The Helatrobus Implants didn't have that as a purpose. They just had a purpose as doing you in – it was far more elementary. But – that's why they're so easy to deal with. They're so monomanic on the subject. You were supposed to be human, have a body, not fly around anymore, not trouble anybody. And then you were supposed to have such diverse purposes that you could never unite on a single cause. Easy to govern. Yes, I must say so. But, of course, the Helatrobus government never got around to establishing the government they had then set up. Rest their bones, rest their bones.

They must have had the whole galaxy laid out for a total conquest. And they were too covert to ever take over. Covertion became the order of the day, you see? They could never
assert dominion of what they'd set up. Interesting. Interesting point. I see that that saddened you. Don't worry about it, don't worry about it. We can straighten that up.

Anyhow, getting back on this other: You realize that if you governed all of your actions by reason of ARC breaks, you'll get a government of Scientology by ARC break. And you as an auditor, in your auditing actions, will be governed by ARC breaks. Do you see that? Do you see that? That's why I was taking this political excursion, just to show you there that it is possible to have your actions governed by that.

You are never governed by that which you can handle with ease. So therefore the greater the facility you develop in handling ARC breaks, the less you are governed by ARC breaks, until you're not governed at all by ARC breaks. It just becomes another phenomenon. Pc's nose is running or he starts... tears leaking out of his eyes, hand him a Kleenex. Has an ARC break, why, locate and indicate the bypassed charge. Bang-bang, you see? And keep on with what you're doing. You got it?

Now at first in developing these activities, you will make mistakes as to what the bypassed charge is on, and your faith will quiver and grow faint. And you'll say, "The ARC break must be caused by something else, because look, I found and indicated the charge and the pc still has an ARC break. Therefore there must be something about this that Ron did not tell us."

No, there was something about it that you didn't hear. You have to find and indicate the right bypassed charge. There are only a few of them, but you have to find the right one. And the ARC break vanishes at once. Therefore, there is no reason under the sun to have ARC breaky sessions. No reason to keep a pc ARC breaking.

Now, those pcs who have continuously ARC broken sessions can be run on a process which is the three-way ARC Break Process. I'm not talking now about they have an ARC break, you run this process. You get that one wrong way to and I'll get cross, because we used to have processes to handle the ARC break. But they won't handle the immediate ARC break, you understand? We're not interested in a process that handles the immediate ARC break. We got that technology and it's much faster than a process.

But somebody whose bank is mixed up because of ARC breaks has this other ARC Break Process. And an auditor who has gotten himself stuck around and messed up because he has just run too many ARC breaky pcs, with this run on him, finds it all stripped away. "In session...," "in auditing...," you know, "what attitude has been refused?" You know, the "In auditing, what reality has been rejected?" "In auditing, what communication has not been acknowledged?" It's that trio. And they'll straighten up, using "In auditing" as a prefix, more auditing than any quantity of mid-rud buttons.

I've gotten a repetitive process which upscales this. We needed a repetitive process at this time for many reasons. But there is a doll, because this one even runs an implant. You see, we have good history on this process, because this is old ARC Straightwire. 1958, the only thing that'd go into implants and open them wide open was ARC Break Straightwire. Remember that process, 1958? All right, this is the immediate successor. And here's one of the most worked-over areas of repetitive processes known. It's based, of course, on the whole technology of the ARC triangle. Now I'm giving you the rest of the technology.
Why does it work, you see? Because it does nothing but spot bypassed charge. That's
how I redeveloped it and redeveloped it, you see? And I got it redeveloped along this line.
And there's trick ways of clearing the auditing command and so forth I'll put into your hands
so that you can do an assessment on certain words, so the pc has a complete understanding of
what you're doing. And this is a doll. It isn't any too little, two-bit process. In fact you will be
doing it on Fridays.

Well, what I'm getting around to here is your attitude on the subject of ARC breaks
must never be one whereby you're driven by the ARC break. Because you'll be driven, man,
into not getting the items clean. You'll be driven into taking the pc's orders, because a pc ARC
breaks just for so much time and then starts to issue orders because his duress is so great,
and those orders are the direct result of dramatizations. So, the orders are the significance. See,
he's dramatizing the significance contained in what you just put him at the effect of. See, not
only is he capable of dramatizing the emotion of the bypassed charge, but he's also capable of
dramatizing the significance contained in the bypassed charge. And therefore it's a very dan-
ergous thing to take the orders – it's very dangerous to the pc to take the orders of a very ARC
broke pc. Very dangerous – to the pc, not to you.

So what's this add up to? This adds up to two things: that you should learn to handle
bypassed charge, and be good enough as an auditor not to ever bypass charge! Period! How
do you do that? Well, just get hot, man.

How can you bypass charge? You can bypass charge by not finding any. You get a pc
who is on suppress, suppress, suppress and is all upset and going sideways, and you try to
find the next goal. You're pressing on with the session in the teeth of some kind of a weird,
apathetic ARC break or a low morale, see? So you do this list, only he never puts the goal on
the list. He puts some other goal three goals down the bank on this list. You take that goal,
you see, because you can't do anything else and so forth, and you just really can't do a good
job on it. So you take this goal and you bypass a couple of GPMs. Now, brother, you're going
to have a picnic.

See, you were driven into auditing somewhat carelessly or apathetically or defensively
or something of the sort, so you did a bad job of auditing and then you laid in more charge –
bypassed, see? You lay... you didn't lay in more charge, you bypassed more charge. See? The
harder you are driven into doing a bad job, then the more charge you bypass. So then you try
to find the top oppterm of this new one you found; it doesn't fire. Got two GPMs ahead of it.
Or you try to find its terminal, and that takes you two sessions.

What do you think the magnitude of built-up charge is by this time on the bypassed
charge? The bypassed charge is always prior to the charge you were working, you see – al-
ways prior. What do you think this does? Well, it just confirms the bypassed charge.

The reason you can't get anyplace with what you are doing is because you have by-
passed charge. And therefore look on the ARC break as a blessing in disguise. It tells you,
even more accurately than the meter, that you have bypassed some charge. Well, it tells you
you haven't got basic on the chain of the engrams, regardless of the meter. "Is there a more
basic incident on this chain?" The meter doesn't do a thing; it just sits there and does nothing.
If the pc ARC breaks, well, brother, there is a more basic incident on that chain. In other words, he can look deeper than the meter, see?

You've said, "All right, now let's pick up the first incident. Good. What are you looking at?"

"Oh, I'm looking at the clouds going by here."

"All right. Good. Now, see anything else around you?"

"Yeah, I see this black cord that seems to be coming down from the sky."

"All right. Now go to the moment just before that black cord reaches the ground or reaches toward you."

Pc ARC breaks. Well, you say, "Well, I'm – I was just sitting here trying to run the basic engram on the chain, and it said on the meter that it was the basic engram, and – and – huh-uh-mm-mm."

Don't feel so damn pathetic. You asked him to go to the beginning, so that restimulated it. And then he didn't get there, and he saw a picture that was the fifteenth incident. And you started to run the fifteenth incident; there were fourteen before it. So the pc ARC broke.

Now, you say, "Well, I've got to run this incident, because I can't get any trace of the earlier incidents unless I run through this one once. So therefore I don't dare run through this one once because the pc will ARC break." Not unless you haven't heard a word I said in this lecture. See, you won't be able to if you haven't heard a word I've said. You will always have to run the basic and, of course, it's not available. It's seldom available till you've peeled off a couple off the top of it. Look at the trouble you're having trying to get the first goal on the first series. Look at the trouble you're having. Why are you having trouble? That's because you've got to audit a few later ones to get the charge off enough to find the first one.

Well, all right, isn't that automatically bypassed charge? No. It's bypassed charge, but you've already cured the ARC break. How? You told the pc, "I can't find the first goal right now and it's undoubtedly there; we're going to run the one we've got our hands on." So you've already found and indicated the charge. So the pc won't ARC break, of course, because he knows there's charge up ahead.

All right. All you have to do is find and indicate the basic... the fact that there is a basic on the chain. Well, the pc ARC breaks... start to run this chain. You just try it on for size.

You say, "Well, you know, the engram that we've just started into here, that's evidently late on the chain, isn't it?" And you look at your E-Meter and it'll fire right about that time, because you said, "Now, we're going to run the one we get through so we can get back earlier."

"Oh, well – oh, yes? All right, fine." And the pc'll go right through it.

He'll run – he'll run the eighty-ninth on the chain, as long as he knows not even that it's the eighty-ninth but that there's an earlier one on the chain. It's that elementary. It's that elementary.
Now, why does a pc ARC break when you're putting in rudiments? Well, the rudiment is out in the incident that you are running, and of course that's prior to the session. You try to put the rudiment in in the session; it is out in the incident, so of course you've bypassed the charge, so therefore the pc ARC breaks and said, "All you're doing is sitting there running mid ruds and mid ruds and mid ruds, and you're mid-ruding me to death." See, that's just another case of bypassed charge.

Pc ARC breaks in mid ruds, you say... you don't have to find it. In fact, you better hadn't. There's probably a suppress in the incident. See, you're running Suppress and the pc ARC breaks. You say, "Well, in the incident we'll probably run there's probably a suppress."

And the pc – "Oh, yes!" That's the end of the ARC break. You understand? You get how many ways this cookie crumbles? See? It's the number of ways this pie can be cut. It's always bypassed charge.

And what's that make you for chickening off on cleaning an RI? What's that do, when because the pc is so ARC breaky and restive that you don't get all the charge off of... out of an RI? What does that set up? What does that set up for the next two or three RIs? Learn to think in those terms. It sets up an ARC break, of course. Because you didn't get the charge off the RI, the next RI now has bypassed charge behind it. Least that'll happen is your pc's morale goes down, and you can't get the charge off the next one. And you get a cumulative error. See? But, of course, you are so protective of your skill as an auditor you never say to the pc, "Hey, I don't think I've gotten any of the charge off the earlier incidents in this bank."

And the pc says, "Oh, no? Haven't you? Well, careless of you." And that's the end of that ARC break.

Look at the cumulative error. Item one: you got it to fire; it fired over a sixteenth of an inch, sensitivity 128 on the meter. "Well, that's the end of that one. All right, what opposes it? 'Nix scrambled eggishness.' You know? "All right, that fired a sixteenth of an inch." So you say, "Good. All right, let's take the next one, number two. 'Absolutely scrambled eggishness.' You know? "Well, that ticked. Well, that's good enough. There probably wasn't any charge on it. Probably the speaker was out that day. So let's get the next one. 'Nix scrambled eggishness.' Hm – hm. That fell slightly." (Tone arm went up so you got "tone arm action" on it!) [laughter] "Oh," you say, "well, I better get industrious. 'Perfectably scrambled eggishness.' I better get industrious and I'll really clean this one. This item been suppressed? Protested? Upset? Anything – anything been Upset? Invalidated? 'Perfectable scrambled eggishness' – anything been perfectabled?"

And you're sitting there looking at the wildest ARC break you ever heard of. "Where did it come from? Just because I'm trying to put in a couple of rudiments on 'perfectable scrambled eggishness,' this pc is ARC broke because he doesn't want me to..." Looks mysterious, doesn't it? Well, it comes from "nix absolutable," "absolutable nix," and the top oppterm.

Want to set up an ARC break? You can set it up perfectly mechanically. Just start going down the list, just drop one – just drop an RI. See? Notice the pc is a little abstracted and say, "Give me number thirty-one." Ticks. You say, "All right, that's fine. Give me number thirty-two." This pc will get a weird look in his eye. And certainly by thirty-three, thirty-four
or thirty-five, you will have a God-awful ARC break on your hands. And then you say, "I didn't take the charge off number thirty-one. Didn't take the charge of it off."

"Oh? Oh."

I wouldn't say you'd do this to any pc, but you actually could. And it's just as predictable as that. One, two, three: You bypass the charge, keep it a secret, ARC break.

Now, you start struggling around with a pc and ramming around one kind or another and harassing the pc and chewing the pc up, after you've bypassed two and three-quarters banks full of no blown charge, and what do you think you're going to be able to do with this pc? Exactly nothing. You're going to get nothing to discharge, you're not going to be able to run a session and so forth. What's your remedy? Your remedy ordinarily is find an earlier goal and run it well.

What if the pc is so bogged down by this time that you can't get up to an earlier goal? Well, run this ARC Break Recall Process for half a session, your pc will be able to find some earlier goals. Yeah, well, that's a crude remedy.

Any trouble you have with Routine 3 today is caused by bypassed charge. Any ARC break that you're having is caused by bypassed charge which has neither been found nor indicated. It's all under the heading of bypassed charge. Get a reality on it. How many ways can you bypass charge? Then you'll be able, not only to run a smooth session, but you'll have everything blowing, left and right, all the way on down.

There are numbers of ways to run charge off of RIs – numbers of ways to do it. But don't take the charge off of a GPM, your next GPM isn't going to fire. Don't take the charge off of four or five consecutive RIs, the sixth isn't going to fire. That's all.

Now, don't yammer at the pc on the seventh, trying to get it to discharge. Well, that's nonsense. How can it discharge? Pc is all of a sudden... his morale's down, he's ARC broken and so forth. The perfect way to keep these implants from running is to bypass charge. Then you're not going to get anything to run.

Well, I've even given you a weapon that puts the pc back together again so you can bypass the charge you've left on the bank. And that's your ARC Break Process, and that's marvelous anyway. The only thing known that'll cut into an implant like a band saw. Good Straightwire process – sit there and run it for a while, pc's that upset. But find out the charge reason first. Cure these ARC breaks before running a process.

Now, there's the trouble you is havin' – if you have any trouble with pcs, and if you have any trouble running banks; it all comes under that one heading of bypassed charge. You're going to have ARC breaks and no rocket reads. Everybody was sitting marveling at the big rocket reads I was getting on that TV demonstration. Well, it might strike you as very interesting that it was one of the most difficult sessions I have given for a very long time and those were the smallest rocket reads I have had for a long time. It was very difficult. The pc was very restimulated by the amount of electronic hum on the television cameras, because she was going through an electronic implant that hummed. Therefore wasn't firing very well. And I fought that on down the line and there was a bypassed charge of a cognition which almost caused an ARC break, and finally gave you the cognition, only it had been bypassed. And
then you saw some rocket reads that were really rocket reads. You saw a lot of rocket reads; those things were clean.

There's way... many ways to blow RIs. This is not a lecture on how to blow RIs. But let me tell you that if you start bypassing charge early on, you're going to find no charge later. And let me tell you something else: Don't buy an RI that doesn't rocket read a full dial. Got it? Just don't buy them. Let's see that thing fire, man! Let's see it really fire. There isn't a pc made that won't give you a dial rocket read per item. Now, how much charge do you think you've left on the bank? How long do you think your pc will remain ARC unbroken?

All right. Now, I told you you wouldn't like this lecture, but there it is.

Thank you very much.
PROGRAMMING CASES

PART 1

A lecture given on 29 May 1963

All right. This is what, the 29th? Twenty-nine May AD 13, Saint Hill Special Briefing Course.

This is a lecture on programming cases – a subject that you don't know anything about, never heard of before. Oddly enough, it's the least understood – you've heard of it, but it's the least understood activity in Dianetics or Scientology.

The antiquity of this subject is as antique as the discovery of the engram, because there's hardly any time at all intervened between the original discovery of the engram and the discovery of the mechanism of basic. So these are hand in glove. But because nobody's called it something different, nobody really separates it out or pays enough attention to it.

Programming is the overall action taken to resolve the case, regulated by the state of the case and the necessary steps. Possibly not a very neat definition – I could get you a neater one, and probably will.

Let me expand it a little bit more; a guy has a stubbed toe. You're going to give him an assist. You give him assist. You get those steps now. He has a stubbed toe. You're going to give him an assist. You give him an assist. You got that? All right. The stubbed toe is what you're directing the auditing toward in order to release it or benefit the case. The fact that you said, "I'm going to give him an assist" is the totality of programming. See, all of the steps of programming are inherent in that one little statement, "I'm going to give him an assist." And then you give him an assist and that is auditing. And you must separate programming out from auditing. And if you don't understand these as separate subjects, you're going to lay some ostrich eggs, and it's very hard to support ostriches.

Now, what goes into this statement, "I'm going to give him an assist"? How much adjudication goes into it? Well, one of the first adjudications is time. Time. You only got a half an hour to audit him, see.

Your next adjudication is "What will he stand for?" That is, "What will the case accept as auditing?"

Your next is "What will the case progress on as auditing?" In other words, "What auditing will make this case progress?"
Your next one is, is your order of actions. And it comes back again to time – "When are you going to start the auditing?"

Now, programming could be relegated to this dismal a cutback: "I start my sessions at two and end them at four. Now I have programmed the case."

Well, you'd be amazed how often that is the totality of programming. Just time alone, that's all. "I've only got a half an hour to audit him, so I will..." See, totality of programming. Time limits it so that you can't do very much. So that's the monitoring factor in programming and so on.

Well, all this is all very well, but before you're going to make any Clears, you have to have a very good grip on programming and there's a lot to this business of programming. It's all right to have a technique that will make a Clear. If you don't program it, it won't make a Clear.

People can walk up the front steps of Central Organizations, all be run on the exact technology; if programming is omitted for each case, you're going to get yourself 60, 70, 80 percent, and you're going to lose 20, 30 percent of the cases on gains.

Simple. This is a simple fact. This is one of these idiot facts – "I mean, everybody knows there is such a thing as pavement, so you walk on the pavement." Because it's an "everybody knows," the next thing you know there's no pavement and you're not walking on anything. You see? It has to be put there. The programming has to be put there. And one of the primary jobs of a Director of Processing is programming, not yakking with the auditor on what technique is going to be used.

Now, the funny part of it is, it tends to stay on automatic, because I know this subject so well, handle it's factors so rapidly, that I've never bothered to put a sidewalk there for you where you don't know of it. It's one of these things that's very easy to do. You, too, will find it easy to do. But unless you know it's there to do, you won't do it. And therefore, you will miss on a lot of cases and you'll say, "Well, technique XZ 77-HUP doesn't work." Why? "Well, we ran it on eighteen cases and it only fixed up about fourteen of them and that's not good enough," and so forth. But was it programmed? There's the question to ask: "Was it programmed for the case it was being run on?"

Now, that's very important. This is something on the order of saying, "Aircraft. Aircraft. We're going to fly aircraft, and so forth," and we just take for granted forever that there's a sky. So we don't bother to learn anything about the sky. Sooner or later we get into space opera, and we find out we've run into the limitations of that, and ho-ho-holy cats now, we'd better know about the sky! See, we've got to know a lot about the sky now.

Orville and Wilbur,14 fresh out of the last space opera society they were with, and anxious to get up in the air again – having been well restimulated by theta traps, which has the basic symbol, an airplane… Oh, you didn't know that? I thought that was interesting. See, an airplane carries the symbolic message that a thetan needs mass to rise, which is a lot of...

---

14 Editor's note: The brothers Orville (1871-1948) and Wilbur Wright (1867-1912), American aircraft pioneers who on 17 December 1903 made what are generally regarded as the first powered, sustained and controlled flights at Kitty Hawk, North Carolina.
Well it's... [laughs] So the airplane becomes a symbol of gravity, having to bear on a thetan. Do you ever notice how fly boys tend to put on mass when they get up around their thirties, and so forth? It's quite an interesting fact, but it's just that the airplane is a symbol of theta traps.

All right. So they fly around in the sky, and they go out and they make a flight of a hundred yards, or something like that, and it's all up in the air, and they don't crash when they landed, and they must come down in a place which is not lower than the place they took off from. In other words, they made a flight. And believe me, they sure took the sky for granted.

And boys have been going on, now, taking the sky for granted, and so forth, and they just – it got this far – they program to this degree: "It's raining and cloudy, so we won't fly." Get that as World War I programming for flight. Idiocy, see.

All right. They get up to World War II, why, they're flying above the weather, and they're doing all sorts of interesting things, so they have to have a prediction of what the weather is going to be. Taking off and landing in rain didn't bother them so much anymore. But targets and that sort of thing – they got more and more involved in what they laughingly call meteorology here on this planet. The prediction of tomorrow's Weather Bureau mistakes. [laughter] Actually, this whole subject is not in its infancy; it hasn't been born yet on this planet.

I can take a look at my desk barometer any day of the week and get a better weather forecast than I get over the Telephone. The... I'm being hard on the boys. Every year they get a little bit better. They're finding the sky, too.

And then all of a sudden we get into passenger traffic left and right across the Atlantic, and we hear "above-the-weather flight," "radar-spotted weather," you see, and so on. They're still finding clouds. They haven't found the sky yet, see. Then they shot off a few cosmonauts, who became naught in Russia with great rapidity, and they found a great deal there called "the sky." And five dead cosmonauts later, the Russians must have decided that they should know something about it. But because they had lots of cosmonauts they probably haven't bothered.

But the point is, they send people up into the Van Allen belt – named after Van Allen. Who the hell heard of him? And – I don't know, maybe he was the fellow who invented radiation fallout or something. In other words, they shoot people up into these areas, and they get scorched or something happens or something of that sort, and they're in the big vagueness of "There is a sky." They're still on this thing here, see.

In other words, they're just gradually, one by one as they run into this, getting aware of the fact that there's something out there called "sky," and there's a lot to know about it. And actually, they haven't even got the seven-year-old-child's version of crime detection textbooks, you know, or something like that. It's just from nowhere yet. It's a tremendous amount of technology. Yet they might know how to fly airplanes, see. They might do a pretty good job.

These cosmonauts or astronauts – you notice all of them are getting slack-jawed, you know, from this spinning around. Watch the pictures of them. They spin them around in circles until they get slack-jawed. How do you become a space jockey? Well, you spin a guy
enough in a wide circle to accustom him to being slack-jawed, that's as near as I can figure out what man was about there.

Everybody knows he'll get terribly sick unless you make him sick. You see, they're well up on this kind of thing. And they can fly these little capsules and jet planes, and guided missiles are beginning to land here and there, and so forth, so they probably think they're pretty sharp.

But what sky are they flying in? What about this sky?

And that's just about the same relationship that auditing has with programming. You can fly the pc through most anything, see. But is there any sky? And if you don't know there's none there, you're going to have an awful time. And a perfectly simple case is just going to go bzzt in your hands, because it isn't programmed.

And you can take this bird; he's sitting right there. You can get almost anything to fire. You can get almost anything to run, and at the end of fifty hours of auditing, you've got a pile of junk on your hands. Something went wrong. What went wrong? You did all of your auditing perfectly. You did it exactly the way you were supposed to be taught and yet the pc crashed. Why? Programming, programming. It's a fine art. It's based on rather fantastic principles, and it isn't any guesswork. It's based on some of the oldest auditing principles we have, and the most neglected.

It's very doubtful if there are very many auditors present who know these data, and yet they're some of the most aged data we have. It's – some of this data is onward to sixteen years old. Pretty creaky.

But these are the criteria. "Yes," you say, "I've run into that in Book One, and I've run into it here," and so forth. But you haven't run into it as a huge beacon in the middle of the sky. You've run into it as a little fact you might trip across, and that's this: The behavior of the time track and the disabilities of pcs in relationship thereto and the abilities of pcs in relationship to the time track. And that is what forms the bulk of programming. It's just contained in those little data right there.

What is the time track? Well, there's a long bulletin on this subject. Most – I've spoken to you about it recently. Actually, it's a lineal 3-D record of all the activities of a thetan, potentially in 3-D, full color, with fifty-two perceptions. It's a long movie. And as the film goes through, some of it you could call an engram, and some of it you could call a lock, and some of it you could call a secondary, and some of it you could call this. But it's all the same movie, but some of these incidents are more powerful than others and some of them have a capability of destroying the movie or appearing to destroy the movie. So that you pick up reel sixteen and apparently the next consecutive picture is reel eighty. What the hell goes on between reel sixteen and reel eighty? This is no way to conduct an entertainment, everything missing between those two points. And yet with improper programming you will never find sixteen to eighty. You go ahead and audit with great industry reel eighty, reel sixteen; where's the rest of it?

Well, just ignore that and don't undertake any programming that will arrive at that. He – your pc – somehow or another he's getting lots of auditing, but nothing is happening to
his case because the programming is missing. Why is it – why this tremendous effect? Well, actually what's wrong with him is between reel sixteen and reel eighty. And you're assiduously auditing, let us say, reel eighty to reel one hundred, and you only audit reel eighty to reel one hundred. Quite interesting.

Well, the word "programming" is something you should remember, because a time track can be likened to a very long motion-picture show. So therefore, there's nothing better than calling it programming.

But how do you get this thing exhibited? Now, if it was just a piece of film that you put in a projector and ran through and you only had to patch it up occasionally, you'd be in clover. But that isn't the kind of film it is. This film can have a total effect on the pc. He lives this movie. When somebody gets shot in the picture, he feels the bullet.

Well, this is really a very fantastically personal sort of motion picture that you're running. There's nothing impersonal about it unless the pc is halfway around the bend, and then he can be so detached, you see, that it doesn't have any effect on him. He doesn't get well either.

In fact, it goes so far as you can only run those portions of this motion picture which are totally personal to the pc. And the moment you start to run things which are too impersonal to the pc, you have a hard time of it. And that's what is known – "You run the pc at his reality."

Well, you'd be surprised how far you can exceed the pc's reality and get something run. You grab a Helatrobus Implant and start running it – glugh! He's got no reality. He's lived but once, see. Here he is living but once, huh-ha!

Every life he kicks the bucket and lives but once again, and blind as a bat on the subject of what he's done yesterday and can't do tomorrow. And oh, he's having a hell of a time, you see. Here he goes.

And sometimes a pc absolutely gets down and pounds the desk. See, he's so infuriated at your terrible doctrine that people have lived before and something Scientologists "believe," you know, that sort of thing. You could take this character and throw him into the middle of a Helatrobus Implant; start running the implant. Some time later (however fast you run the RIs), he suddenly looks up and says, "I've got news for you. This didn't happen this lifetime, and it happened to me." And that's what's so interesting about the Helatrobus Implants – the personalness of them.

So your program is not monitored – this is the other mistake you can make – the program is not monitored on what the pc has a reality on before you audit the pc, but is monitored by what the pc can obtain a reality on during auditing. And that's what we call the reality factor of programming. What can you run on him that he can obtain a reality on during auditing? Not, what is real to this lunk... this guy? You know, he's been going around saying, "Well, everybody is a machine. And if I don't implant this pc in present time, then he won't be able to run back to early incidents, you see, because he'll have no impulse to do so."

In other words, you omit the volitional factor. You omit the factor of change in the pc. See, you say, "The pc can't change. The pc can't assume a new viewpoint. And the pc has very
little volition in which to assume a new viewpoint," and so forth. Well, if you neglect all of those things, – then you would only run what the college faculties on this planet at the moment would permit. See, I know what they would permit. They would permit the student life of the student body to be audited. See, that's all. They would only permit to be audited on the pc that which they themselves fully and thoroughly agreed to be reality.

So never fall for that trap in programming. You want to audit in the direction that the pc can obtain a reality. But you always want a new reality on the part of the pc, not the reality the pc has.

Well, it does you no good, actually, to say, "Well, the pc has a very good reality on this carpet, so therefore we will audit him on this carpet for the next four or five intensives." You see, that's idiocy.

No, let's audit the pc – well, let's just make a forward program on this. Let's audit the pc up to being able to have a reality on the composition of mest into carpets. Ah well, that would be a different trick, wouldn't it? Oh! Just look at the number of complexities you'd have to run into to get a total reality on a carpet. And you probably could devote four or five intensives to it. See?

Now, we don't, then, take off with the pc's reality as an accomplished fact. This is – yesterday's mental sciences made this mistake all the time, all the time in their programming; made this mistake continuously and they shouldn't have made this mistake. They audited or processed or treated from the viewpoint of their own immediate reality and on no other viewpoint and therefore came to the conclusion nobody could change.

It's something like tying a horse up and tying every hoof to the ground and then announcing to one and all that horses won't run. And stand there and beat the horse, and the horse doesn't run, and you say, "You see, it proves itself. The horse can't run."

You've audited the pc, then, only and totally from the platform of the pc's current or extant reality and have not permitted the pc to exceed that in any way. Bum programming, absolutely backwards.

Now, a lot of remarks could be made along in this particular direction on mistakes that could be made in programming, but it is not quite as esoteric even yet as you might think. It is much more concise and much more scientific.

Programming is based one hundred percent upon these exact things: The capability of the auditor (that is number one, not number two), the capability of the pc to receive auditing, the amount of time available in the auditing and the maximum result to be obtained – given those upper factors that I just gave you – the maximum result to be thereby attained. That's programming.

In other words, it takes into effect what can be accomplished. And you can add one more line to that end one that you put down: Increase of A, R and C. In other words, that's the maximum result that can be obtained is always measured in increase of A, R and C, not just in the increase of ARC. Increase of A, increase of R and increase of C. That's different, isn't it?
See, we've gotten so portmanteau with ARC, we forget that it's a highly technical action. In other words, given those earlier factors that I gave you there – the capability of the auditor, the capability of the pc and the amount of time available – we can then determine the last factor, which will be an increase of affinity.

Now, what the hell is an increase of affinity? Well, there's the Gno [Know] to Mystery Scale, and the wusser [worse] somebody is off, the lower he is on the scale. The whole Tone Scale is part of the Know to Mystery Scale. That's why I use the Know to Mystery Scale rather than say Tone Scale. The whole middle guts where it says "emotion" and so forth, and so forth, that's actually your forty tones in there and it goes below those, see?

This you should know about the Tone Scale: That a person has no personal reality, but may have an intellectual reality, on those tones above his position. He has reality only on those tones below his position. That's – his tone is known as chronic tone.

Now, there can be chronic tone as a body plus thetan, or there can be chronic tone as a thetan. And chronic tone of body plus thetan can be apparently at enthusiasm, whereas tone of thetan is at unconsciousness and is off the Tone Scale. Do you get these data?

This is not brand-new data, but it's quite interesting because I'm punching it up to you hard. This is not just nonsense data that it's nice to know; this is the breath of life when it comes to programming.

Any level above the chronic tone is susceptible of being dramatized. Dramatization is a thetan or thetan plus body performing evolutions not under the thetan or thetan plus body's control. Nonvolitional action.

Older mental studies so concentrated on nonvolitional actions they thought there was nothing else but nonvolitional actions. So you just have to omit those particular studies because there are volitional actions and they lie below the chronic tone of the individual on the Tone Scale.

Now, you've got the volitional actions, then, of body plus thetan – see, a chronic tone of body plus thetan. And then you've got another position which is the chronic tone of the thetan which is lower than that of the body plus thetan. So that tells you very often that you have to process the body plus thetan like mad to finally bring the thetan off the launching pad.

And they dramatize... the body plus thetan is susceptible of dramatizing any level above the chronic tone, but is most susceptible to the half-tone above. That goes in harmonics as you go on up.

A – we have just covered A. See, that's A: affinity of the A, R and C, in that last one. What do you mean, then, by "increasing the affinity"? Well, you mean definitely raising the person so that he is less susceptible to dramatization and has a reality on more tone levels below him. See, if you raise him up one tone level, then you've added one more level on which he has reality and you've subtracted one level that he may dramatize.

See, so he'll dramatize one tone level less, and he'll have reality on one tone level more. You get the idea? He's just gone up one slot on the ladder, so therefore, you've put an-
other rung under him. He won't dramatize the rung where he is, and previously he was the effect of this rung.

Now, are you processing a body plus thetan? All right. If you're processing a body plus thetan, then this gain is on the old finite scale that only goes up to about four. Body plus thetans never cycle above four. That's apparent tone. Apparent tone.

That means that someday you're going to get an awful surprise. You're going to have this boy really flying, man! Just flying. His affinity is way up there at four, see. Affinity right up there at four, enthusiasm; everything's fine. Rah! Rah! you know. Get the show on the road. Bang! And all of a sudden he comes down and he crashes – apparently crashes – and drags himself into session man. "Trrrah!" Tone arm hasn't even gone up. Nothing happened between sessions. Had a good sleep last night and yet you can practically see the degradation dripping off of him.

Degradation is kind of oily and greasy. And you can practically see it drip off of him. And he may go along like this for a little while and then he may realize or you may realize – he'll get, eventually, reality on it – you've processed a thetan up to degradation. And maybe there were some intervening levels, but he didn't notice and you didn't notice. You processed him from unconsciousness to degradation. Only degradation is so spectacular that somebody noticed. You're now processing a thetan; you're no longer processing a body plus thetan. There's where he takes off if you're eventually going to go in for Route One.

How far up that scale does he have to go to perform Route One? Well, he has to go as far up that scale as the chronic tone of the thetan has to go up that scale. You see that?

So there is your portmanteau picture, just an offhand sort of picture, of an increase or gain of case as you call it – case gain in terms of affinity.

That's a case gain. So given those earlier three factors I gave you, why, you've got him up along as best you could there to that. But you did not achieve a case gain unless you did something with A. Got it?

Body plus thetan had to come up in tone or a thetan had to appear or something had to happen here, don't you see? That's a case gain. That's a real case gain.

R – reality. Well, everything was pretty unreal to this fellow. What do we mean, "unreal"? Oh well, that's a nice, wonderful word – unreal. That's just a dirty word. Undefined and unclassified in any way, it's just a dirty word.

You know, you can measure the reality of a person so fast it'd make your head swim. There is matter, energy, space, time and significance. Those are the five elements which really compose a universe. And you can always use significance as a measure. Even though you haven't affected the matter, energy, space and time, you can tell the – I mean, you haven't observed them as changing – you can tell an observation of the significance.

This person, when you start to process him, cannot understand. His life and conversation is full of "cannot understand," see. He cannot assume any viewpoint but his own and his own is nonextant. He's... easily gets very reasonable about the most unreasonable things. You can test somebody's reality rather easily, simply in a solution of problems. All of psychologi-
cal testing is directed, whether they know it or not, in the direction of observation of significance, the realities of significance, and they measure their changes that way.

It's at that little bridge point where these two subjects collide that we can thereon use this, because it is a measure of the significance. You'll find out this fellow is capable of understanding a little more. Now, this is measured, sometimes, in terms of appearing overt. His overt will appear. He'll realize that certain things he did were overt. Well, why is this? Well, that's because his understanding has increased. He is more capable of taking the other fellow's viewpoint. And taking the other fellow's viewpoint, he realizes his overt can now knock his own block off. See? And therefore, one of the symptoms of this is a fellow begins to suffer. An increase of reality – the fellow begins to suffer from his overt. He suddenly realizes that something he never thought was so bad before was not quite so good!

You know, that's a big gain, see. That's a big – that's a reality gain. Get the idea? So you know he had a reality increase because he can understand more, and the mechanism of understanding more, of course, puts him into the line of being more responsible, and he's got a different view of things. And he'll cognite on this and that.

Now, cognition is actually the process of a changing reality of significance, and that is what a cognition is and why a cognition is so necessary to a case gain. You yourself know by experience that that pc that doesn't cognite, doesn't make a case gain. Well, why – what's the cognition? You think it's properly quantity of cognitions. It isn't quantity of cognitions at all. It isn't that. He's simply giving you a dress parade of significant reality changes, see – the reality of significance.

"I never realized before…" "Say, what do you…" "Say, uh-huh!" you know.

Well, I'll give you an example: I had one black... last night, I said, "You know, the reason black mass affects a thetan is because he's never taken responsibility for creating it. What thetan would ever want to create black mass?" See, I was trying to get rid of some black mass, and I suddenly take a look at it and it sort of faded away with that, see.

But from such an observation – although that seems to be a very – actually, is a more fundamental observation than just a cognition, because I've been trying to get at what the hell black mass is for a long time as a technical fact. But the auditor could have said at that point, "I have just made a case gain," see. Now, you put down the goals and gains of the pc at the end of session. Did you ever look on it that you were doing a sort of a psychometric test at that moment? It's all contained in the significance of reality.

And the pc's few cognitions he's had in the session, that's fine, but he himself understands something more or sees something more or sees that he might or the future may be or – you know, something. That's measured your case gain for you.

You see what that is? So you don't have to say, "He can see MEST better. The room all looks brilliantly bright to him, so he has had a case gain." See, you don't have to look at it like that. As a matter of fact, I had people turn brilliantly bright to me one time. I was over in New York in 1950, I was doing quite a bit of research and I hadn't been getting any sleep to amount to anything. And it didn't have any great importance to it, but I stepped off a bus and all of a sudden people went bright as could be. They got awfully solid and awfully bright.
Well, an auditor, if he'd been using that to measure whether or not there was a case gain in progress, would have made a hell of a mistake. What I had had happen was a key-in of the Helatrobus Implants! It was the action of getting off the bus. And for a moment everybody looked terribly bright – I didn't like it. And it went away in the next few minutes. You get the idea though?

That wasn't a case gain, and that, therefore, isn't what we mean by reality. That will come in due course – the ability to mock things up and that sort of thing – but now you're talking about high-scale theta abilities and those are pretty obvious.

You're going to get most of your reality changes on a pc, at the level you're operating in, are going to be at the level of significance and are going to turn out as case gains or cognitions. And don't expect the pc to say, "I have had a wonderful session," and expect that to be a case gain because it is not – the pc might have been audited down to propitiation.

But the pc all of a sudden says, "You know, I think my mother must have had a hard time." Ahh! Ahh! Not because he realizes he is now guilty or something of the sort, but because he is now a little more capable of assuming the viewpoint of his mother. And you say, "Hey, you know, we've made quite a gain in this session here, quite a gain right there," see.

Now let's take up C. That's pretty obvious; the pc won't talk to you at the beginning of session, will talk to you at the end of session. I mean, that's so obvious that you almost specialize in it. Pc will talk to people; pc will communicate better. And there's where you get your solid walls. Actually, it doesn't belong under reality, it belongs in communication. He's more willing to communicate, so he can see better. It's not that he finds reality more palatable that he can see better; it's just simply his communication is better.

Sight, sound, touch – all of these various things, one right after the other are phenomena of communication. See, the phenomena of reach and withdraw: It's the reach and withdraw of the light particle. It's the reach and withdraw of this and that. It's the ability and willingness to receive. All of this sort of thing adds up into this factor of communication. See, reality can be reality even if you can't see it.

I think you've got a pretty good idea right now that Saint Paul's is pretty solid. Hm? Therefore, you can conceive of the reality of Saint Paul's – see, that it's solid. All right, that's fine. That isn't a case gain. Well, why isn't it a case gain? Well, you just conceived of the reality of Saint Paul's and Saint Paul's is solid. And – but if you could see Saint Paul right now or if you got a mock-up of Saint Paul's or if you could just look at Saint Paul's right now or see Saint Paul's right now and see how solid it was and feel how solid it was, that's a communication gain. See that?

Now, that can be a fantastic thing. You're taking off, perhaps, with a totally delusory case. He thinks the room is full of polar bears. Well, at the end of session can he see them better? Have they cleaned up any? I'm afraid that would be a case gain. But if you're operating from the platform of reality that the room is not full of polar bears (circa Freud, you see), so therefore you must get rid of the polar bears out of the room, you, of course, have dropped his communication. He can't communicate with you, but he can communicate with these polar bears.
Now, if he could communicate with the polar bears well enough, he wouldn't have to communicate with the polar bears and they'd depart. That's the way to get rid of polar bears.

It's horrible, some psychiatrist picking bugs off of some patient on the basis that the patient doesn't have any bugs and therefore, before he's got the bugs he must get rid of the bugs. See, that's operating from the platform of reality of there must only be this reality, and unless we can hold the status quo of this reality, we have not won in processing.

And I stress that – not because it's funny or that I want to clobber our poor, sick brothers – because it has been the criteria in all mental activities for the many trillennia. And an auditor may be holding on to it with both fists and not realize it, see, that our only gain would be from the platform of where we are. See, if we can continue the alteration to making things more like they are, here, now, then we're getting case gains. I'm sure that's the wonderful way to clobber people. See, because then one of the things you're doing is holding him on the time track.

Now, I am afraid the other side of where you're going and the other side of the coin lies through a lot of hell and a lot of dark canyons. It's whether or not the pc can get a reality and can get reality enough on those dark canyons in order to get through them. In other words, whether his communication factor rises sufficiently to go through. Can he communicate with these things? Well, it requires quite a bit of him. So there's your communication factor all contained in that fourth one that I just gave you.

Now, that's long and lugubrious, and this is a long and difficult subject, programming. It's not something that you could wind up. But there's what you're trying to achieve by programming. And if I just tell you "Well, program everything," you know, and then not give you anything you're trying to achieve in programming, why, it'd be almost as bad as barking and condemning at you, you see, left and right, for not doing something you're not told what it is.

See, here's what you're trying to achieve: You're trying to achieve a case gain. Therefore, I've gone at long length to tell you what's a case gain. How do you achieve that gain? Well, the technical facts that have existed over these long and many years are very few. You can almost put them in a thimble. They're outside of the technology of auditing and therefore get forgotten, overlooked, because they belong in the subject of programming.

And that is these hard, fast, technical data, and they are: Unburdening. Basics. And disentangling basics. And it's in those actions that programming is done. Unburdening. Now, I'll amplify it a little bit. Discovery of basics and eradication of the basic by discovering what basics can be found before basic that disentangled the basic you're trying to untangle. Ah, I thought you'd wake up.

Basic on a chain contains in it elements which are not basic to the basic.

You've got the basic engram that gives you the absolute basis of all laryngitis or FDA-osis or something. I'd better be careful to use healing things because they don't want...

By the way, you know, we're going to have to have the FDA arrested. Do you know why? They're the only people in the United States that are claiming that an E-Meter can heal and cure things. [laughter] And they mustn't maintain those things, you see. It's a criminal
offense. So we're going to have to have them arrested, since they are the only ones maintain-
ing it. Poor old FDA. Remember to whisper a little prayer as you... that they all go to heaven at the time... [laughter, laughs]

Now, you're running this basic and you run it as an engram. It is basic on the chain that you're running. Let's say it's automobile accidents, and goddamn, it's got an elephant in it! Well, it is the basic on the chain for automobile accidents and will release and everything in it will release except this confounded elephant! So what are you going to do, run this engram and leave an elephant sitting there, saying, "Well, that's not part of the basic, boy, so we can't have anything to do with that. You just go on and live with this elephant"? Is that what you're going to do? Your pc's going to ARC break. Why? Because when you found the elephant you found a more basic chain, not on automobile accidents but on elephants.

So you're running the engram through quite happily and then you run into an ele-
phant – you've got to slip this elephant's basic. That could be done rather readily. You can do it almost with dating. You can find the first elephant. And the amazing part of it is, is the ele-
phant will disappear out of the basic that you're running. You've gotten rid of him, he's gone. Do you understand?

The actual operation of running basics is not the same operation as running any other engram. You run a basic by finding everything basic to the basic. And by the time you've got through, you've practically cleared somebody, unless you've got him so tangled up and lost your place in the book! But you take a basic apart in terms of basics, if you really want to take it apart.

Oh yes, it's basic on the chain of automobile accidents. Yes, that's fine, but it happens to have a wife in it and an elephant and a motorcycle. Now, it's less complicated than it looks, because it's also got pavement in it, and it's got emotion in it, and it's got suppresses in it, and it's got everything else. And if you went ne plus ultra ad absurdum on the whole thing you'd find a basic for everything that was contained in the engram. But even if you did and even if you found the basic for each one of those basics it would blow up! It isn't that you can go too far, it's just simply that you can sometimes become too ridiculous.

By the time you've found basic on motorcycles and basic on a wife and basic on an elephant, this thing has went. Run what engram? See, it's too in... it, as a basic, will blow if the basics are blown of it. Do you understand? Because a basic will almost blow by inspection unless it's held down by an earlier basic. But an earlier basic on what? On something con-
tained in the basic. Oh yes, you can get the basic theta trap, but it's got particles of energy in it and the pc goes nattering about these particles of energy. You haven't got basics on particles of energy. Well, you go, bzzzz, bzzzz, clip, tip, pow, pow... The pc's very interested in it, is your test of whether or not you'd handle it. And you go sloop, doop, bang, "Basics on parti-
cles of energy?"

"Oh, yeah, here's a big overt in glare fight, and I go brzzzz, maw, glu. Good God! Yeah, what do you know about that! Well, how terrible! Yeah, well, that's it and so forth. Yeah, well, all right."

And you say, "Okay, now let's go back and run some more of that basic," and by the way, he isn't bothered this time by the particles of energy. That's gone.
In other words, you slipped the basics out of the basic, and this takes some very slippy engram running. Very interesting. If you can keep track of it, you are very successful; if you can't, why, the whole track collapses and the pc goes mad, but that's all right because you've still got another action.

Now, the first action that you should undertake on a case is the most advanced action—this is in programming—is the most advanced action which can be undertaken in your estimation. In other words, always enter a case more boldly than you think is absolutely necessary, and you will nearly always be right. Just enter a case more boldly than you think is wise. Got that?

Otherwise, if you don't maintain that point of view, you will never find the ceiling at which the pc can operate because you'll go at it at such graduals, and your underestimations will cost so much time. Because going at it more boldly, if you get away with it, you're just fine. If you get away with it, you're way into it now, man, and you're all set. And you're doing that with the Helatrobus Implants. A guy can run an implant; hmmm, go man go. The pc falls on his head and can't manage it and so forth, pull back. Run some implants later. And that doesn't even really depend on whether or not the pc could run the implant. It's—remember it's regulated by these other things; could the auditor run the implant, see, and that sort of thing. It's just those little factors I gave you there on programming are all relative to this.

But always go in a little more boldly! Give the auditor a little more process than you think he can handle if you have to. Always run the case just a little steeper than you think is absolutely wise and you'll head for more gains faster, see. You can always pull back today. You don't sacrifice a case. The case isn't "ruined forever!"

Now, these technical facts—I'll go over them again—are simply unburdening and running basics and taking basics apart. Now, you could say unburdening, finding a chain—and you'd probably be more subtle about this, more orderly—unburdening, finding the chain you want, finding the first basic of that chain and then slipping the first basic to pieces by finding some basics for that basic. You understand?

Now, that's programming. I don't care what case you're handling or if you're using CCHs, you're still on that program. Now, it's "What part of that program can you enter?" Now, let me be a little more concise, although I will give you a full lecture on it tomorrow.

What part of that can you skimp and what can you press home on? How many corners can you turn sharply?—all within the reality of the factors of the auditor, the pc and the ARC gains the pc makes. You got it?

But actually, don't think there is more to auditing than unburdening, finding a chain, finding the basic on the chain and taking apart a basic, because there is no more to auditing than that. I don't care what process you're using. Pat-a-cake—famous process; used to be run in the Foundation by people who couldn't audit. Sitting there having a conversation with the pc, being very careful—everybody being very careful, not to go anywhere near an engram. Its old name they used to give it was "pat-a-cake."

All right. They still—they still have some programming. Their program is not to unburden because it's too dangerous. They didn't even think about going to engrams. See, they
just wouldn't even unburden, because there's no telling what you might find underneath that rock, see. "Don't pick up any rocks, man! That's dangerous!"

Now, what does it essentially consist of? It essentially consists of taking off charge. And the reason I gave you the first time, unburdening, finding basic and so forth. Because ordinarily you run back a chain and run enough off a chain – run enough off of it so that you can get earlier on it, so that you can run enough off of it, so that you can get earlier on it so that you could lay your paws on the basic. And if the basic is too pistol-hot and the pc can't sit there, well, just indicate that you're going to take care of this shortly and then you go forward from basic very ra... I mean, go later than basic, see, very rapidly and you strip the charge off after basic.

Now let me give you an idea. You find the first GPM implant – here's programming: to find the first implant – that's your goal, see – and to strip it down and knock it out. That's what you're trying to do. Find the first GPM. I don't care what else you think you're trying to do; that's what you're trying to do.

And you get landed with a pc that can't – you can't get a single RI or goal to fire on of any kind whatsoever. What do you do? Well, you have to make – the fact that he might not have the Helatrobus Implants, according to the estimation of how goosey he is as a case. You know, "Can you remember yesterday? What did you have for breakfast this morning? Oh, that makes you nervous?" Well, he's got the Helatrobus Implants. You get it? Not that "he was nervous" gave him the Helatrobus Implants, but this guy has just got such a heavily burdened case that he's just too goosey to go anywhere near anything dynamitey like that, see.

So you see, you have to unburden this to get to the implants. Well, how long do you unburden? Well, you unburden until you can get your hands on an implant and not one second longer. And as soon as you get your hands on an implant, we don't care if it's the last one, you run it. How thoroughly do you run it? Well, you run it thoroughly enough to blow charge of it off. At least one dial wide disintegrating RR per item, and that is the absolute minimum that you can run one.

Grinding out the engram... Well, you haven't got basic if you have to grind, grind. It isn't releasing and nothing's releasing and you grind and you call items. And urrrrr! nothing happening and so forth and nothing RR. (And the pc is awake; that's necessary to the auditing!) What do you do? Well, you've probably got too early an implant. You say, "Hey, we're trying to go early." No, no you're trying to unburden. Well, let's pick up the last one in the second chain if we know what it is and let's run that one with a fast pass. Or let's do something with some Straightwire that gives him some locks, or let's find overts on this thing, don't you see? Let's see if we can chase him earlier and find the first contact. That's all unburdening, don't you see.

Well, let's run the "three command process" for a while and see if we can dish this out and lay open some other things. We're just trying to get our hands on an implant. Why are we trying to get our hands on an implant? So we can run some charge of it off so we can find an
earlier implant. Why are we trying to get that implant? So we can run some charge of it off and find some earlier implant. Why are we trying to run that implant? So we can find basic!

Well, what's basic? That's the first implant. What do you do when you get your hands on it? Sometimes it's so pistol-hot you can't run it. You have to come running later and run some charge off some of them later and then lay your hands on it again. You sometimes have to go later than basic, not earlier.

Why? You're asking a pc to walk through a wall of fire back to an area he's never been at before. Between basic and present time there's this wall of fire, and you're saying, "Well, go on through."

And he says, "But I can't find anything in here!"

And you say, "Oh, you idiot, go on," and so forth. What are you going to do? Just spend the rest of session after session after session, well knowing your pc's not getting any gains in ARC, trying to push him through this wall of fire. Why try to push him through the wall of fire? It's the wrong mission. You're trying to get him through the wall of fire. Hoo-hoo. How do you get him through the wall of fire? Well, put some fire out, of course!

How do you put some fire out? Well, you just – let's get back here where the heat can be felt and let's get some of that pawed off, and then let's get him a little closer and let's get some charge off a little closer. Finally, he's got a living flame in his hands and says, "Ho, ho! There it is, there it goes, there's another one and so forth and... I wonder what's back there?" you know. Scorch! [laughs] And retreats, and so forth, and you just take a little more fire off the track. It's all a quantitative charge. It isn't what the pc can confront; it's how much you can get discharged. It's a mechanical fact.

And you get him back through the wall of fire and he finds the fifteenth goal. And you think it's the first one and so does he. But then you get that discharged and you'll get the fifteenth [fourteenth] goal. And you get that one out and then you get that discharged. And then you can find the thirteenth, and then you can find the tenth, and then you can find the fifth. And he knows he's got the first goal now because – nothing before it. So you get that discharged. Discharge it RIs. And you move up, and all of a sudden you find yourself sitting there with the front goal, and this is hotter than a pistol! And it's got basics.

And you have to take everything out of it that is a basic. There's a theta trap in it that doesn't belong in it. Well, let's put it back on the track where it belongs, see. Let's date it and smooth it up. And let's clean this area out! By taking off prior charge to the basic, all of a sudden the basic collapses and what do you see next? Oh, you may have to run these implants but, heh! It's something on the basis of bzzzt! "Well, that's that one run." Get the idea? Pow-pow-pow-pow-pow-pow-pow-pow-pow-pow! "Yes, I've got that one."

It's tearing up, don't you see? It can't stay there if the basic is still in... is not in place. Basic can't stay there if it doesn't have certain basics holding it in place – basic elements, not basic engrams but basic elements holding it in place. Basic can't stay there without those basic elements. With those basic elements gone, basic can't stay there. If basic is gone, the rest of the chain can't stay there. You're walking a track backwards that can't be walked backwards, and that's why Scientology is magic.
But it's always done in a programming which will accomplish those ends. Unburden, find the chain you're looking for, unburden that chain, get the basic you're looking for, and then run back the elements in that basic, clip those basics out, that will disappear and the whole thing blows clean.

And that's what you're trying to do. You're not trying to run 8,765 GPMs because George has got that many. You're running enough GPM to let the pc earlier. And you — you'll underestimate how much charge you've gotten off, and you very often are wrong. You have to discharge another GPM before you can move up earlier again. And everything, now, is going creak! — the pc can just barely make it, barely hold his position and so forth. That's good enough. Got it?

That's what you're trying to do. Those are technical facts that have to do with the track, and they fit in with programming, not with auditing, because they tell you what you audit. You've always been wondering what you audit. You audit what you have to program. And how do you program? Just like I've been telling you.

And you're going to find some cases — put them down, they go halfway into the bank; you unburden four or five GPMs in the middle of the bank; you can move it earlier. "Ho! That's easy. Why didn't I go up here in the first place?" Well, of course, you couldn't have. Take that one apart, move a little earlier. That's easy. That's easy. Find the first one, bang! That's out, gone, boom! "What's these Helatrobus Implants? What are they making so much fuss about?" Well, that's just part of his communication and reality factors which I gave you in the first schedule of programming.

See how it's done? Without programming, you can do nothing.

That's the "pill system": no programming. That's the dream of every army in the world. This fellow walks up, puts out his hand, they put a pill in it, fellow takes pill — brilliant, trained fighter. Dream of every army in the world. Dream of every civilization that has ever existed.

Let me point something gruesome out to you: Those armies have all lost and those civilizations are no longer here.

Thank you.
PROGRAMMING CASES

PART II

A lecture given on 30 May 1963

Thank you.
Okay. How are you today?

Audience: Fine. Good.

You look slightly less human! ... Boy, you've got an awful comm lag. Since you've been over here in England, you know, this humor – my jokes have a harder time getting forward. Because you're developing this sense of humor, you know, that's got a comm lag, and you've got to stop that. I mean…

What's the date?

Audience: Thirtieth.

Thirtieth of May.

All right, 30 May AD 13, Saint Hill Special Briefing Course. And I'm going to talk to you today from the viewpoint of treating a GPM as an engram and treating the time track in general and handling cases in general.

Now, I think you'll find it rather interesting, because the data is very fundamental. This is actually a continuation of yesterday's lecture.

First thing that you should know on the subject of cases is a scale which will assist your reality on the reality of cases.* A scale. Now, this scale is not complete. Only the major points of this scale are mentioned. And there are interim points on this scale which are not mentioned. So you realize that you're looking at a scale which is a gradient scale, which has midpoints between the major levels given.

All right. Your lowest level on this scale – the out-the-bottom aspect of the scale – is just total unawareness. That's your bottom.

Your next level on this scale is the level of awareness of own evaluations. Now, that's quite an important level. It's a lot more to that level than you would at first look at. This is mental science as it has long existed. People are aware of their own evaluations. In other words, what they perceive is their own evaluation of what they perceive. You got that? And
you say that's an awful short look, man. But that psychiatrist walking around with somebody chattering about something or other and he becomes aware of his own evaluation of that person. That's what the psychiatrist becomes aware at, and that's what's held up psychiatric research. He has evaluated that person as crazy. So he is aware of his own evaluation of the person. See, he's aware of the fact this fellow is crazy. Now, that spreads over to such a degree that whenever he examines a patient, the patient is crazy, don't you see?

See, it's an incapability of observation, because it's an observation of one's own evaluation. And you see some of this in sciences. But you see it most flagrantly in the field of arts and aesthetics. And there it is really rampant. And you can say the less that is known of a subject, the more that subject has authority or evaluation as its sole reality or adjudication. See, the less that is known, the more that level, that I've just given you, is practiced. People become aware of their own evaluation and that is it!

This, by the way, is... material is utterly priceless when it comes to talking to somebody about Scientology. It's priceless, because you could break their backs with it. And it – they try to put up a fight on this subject and you're in amongst them so fast it makes your head swim, you see. I mean, it makes their head swim.

You realize that you say to somebody, "Well, we could make you feel better, and Scientology is such-and-so, don't you see."

And they say, "Well, I had an uncle once that didn't think you should ever examine the human mind." That's his opinion of Scientology, don't you see? Or "Anybody who is interested in the mind must have something wrong with them." See, you've heard all these various arguments, you see? Well, realize what you are looking at. Because look at where this level lies.

Now let's go to the next level. This is the next major level on this scale, which is dub-in of dub-in. And that produces a real ball. That level of reality produces a real ball. The guy has dub-in of his own nightmares, you see. Something like this, you know? He dubs in – he dubs in the facsimiles that he got while asleep. See, he dubs in the dub-in, you know. He's got dub-in already, see, but he – well, all he sees is a dub-in of the dub-in. And that is a ball, that one. That is a ball. That's like somebody forming his opinion from newspaper articles. You see how common this is? See, that's already dub-in.

Well, actually that's all – that possibly even could be called dub-in of dub-in of dub-in, because you've got this kind of a condition: The newspaper reporter was talking to somebody who wasn't informed. That's dub-in of dub-in, see? Then, of course, if you had somebody who dubbed in on everything he observed, his version of the newspaper article would be so fantastic as not to be recognizable. And that would give you a dub-in of dub-in of dub-in.

The person interviewed was dubbing – you know, like the AMA; an AMA authority speaking, you see? The reporter, he can't duplicate, so he gives some wild, hopped-up version of what this AMA spokesman said. All right, that's dub-in of dub-in.

* Editor's note: The scale referred to by Ron in this lecture was issued as part of HCOB 8 June 63, "The Time Track and Engram Running by Chains". 
And then, of course, if you – this becomes ridiculous – this is your substratas of it – if somebody came along and read this article, who also dubbed in – "AMA spokesman says men from Mars must not land." I mean, that's about the story you would get from the dub-in, dub-in, dub-in, see? And the AMA authority was talking about the fact that doctors must have more money. You see?

Now, try to follow down a line of evidence at this level, this dub-in of dub-in. Just try to follow a line of evidence at this and you get about the wildest thing, you see? You get somebody who hates to eat taking cooking from a bad teacher. Boy, this leads to more "Boston stomachs" than you can count.

All right. We are just now approaching unconsciousness as a thetan manifestation – as a thetan manifestation. The body plus thetan can go lower scale than a thetan. And a thetan's unconsciousness lies just above this dub-in of dub-in. That's a thetan's unconsciousness. See, a body plus thetan can stay conscious longer, apparently, than a thetan, you see, as far as awareness of being a thetan. Do you understand that?

All right. Regardless of the complications involved in that, you'll find somebody goes through a lot of boil-off above this point. And he gets some of the wildest stuff you ever heard of. This stuff is pretty wild. He can get everything pretty well combined into God-elp-us.

Now, our next level up is simply dub-in of the track. We're not too much interested in dub-in of the physical universe around us, but it gives us a test of what this pc or person is doing. But we're interested in it as auditors from the viewpoint of dub-in of the track. There is the facsimile – the facsimile is there. You must know this: the facsimile does exist. But what the person sees is a dub-in of the facsimile that is there. Sees a second facsimile, you see? Quite intriguing.

And now you get, as the next major point on this particular scale, a nonperception. We know this more generally as the level at black five, we used to speak of it. But it's a level of nonperception. Whether the person is seeing blackness or invisibility or small rockets or something of the sort, it doesn't matter – you know, little specks traveling across in the darkness or something like that. It doesn't matter what this visibility is, as long as it's a nonvisibility. See, what's the field there that expresses this nonvisibility, you see. Well, it's just an absence of time track, however that absence is created.

And then above this level, we get our next major level. We get a spotty, partial – perceptive glimpses of the time track. The person may have only visio on, or may have something else on, or may have something else on, but the rest of it is off, don't you see – and sees two pictures of the engram, but sees no connecting pictures in between those two pictures, and doesn't have any tactile or doesn't have any sonic or something like that. That's your partial perception of the time track – once more has to be mentioned.

And there is visible track. And that is your next-to-the-highest level – visible track. And as you can see, that is a gradient, because you actually got a state of Clear there or, that is – oh, I don't know how many goal Clear – fifty- or sixty-goal Clear, something like this. There's no interruptions of the track. Doesn't all go black on him. If it's black – if the period on the track is black, why, the person sees blackness, you see, but otherwise doesn't. Some of the perceptions may shut down occasionally and turn on again, but only shut down when
person isn't paying attention to them. Monitors the time track something like monitoring the physical environment. You're not necessarily aware of all of the noises that – or sights or perceptions or sensations that are taking place in the physical environment, don't you see?

Now, there's one level above that, and that's that there's no track. Now, you can see in looking at this scale that your "no track" becomes a mockery – lower-scale mockery. See, your "no track" becomes a lower-scale mockery there several times. So the first two levels of no track and visible track interchange as harmonics on down the line. So this makes it very easy for somebody casually observing this thing to make some rather horrendous errors in the pc. You can get yourself all tangled up as to exactly where this pc sits on this scale unless you yourself get some practical experience with this scale.

Now, that is the scale and that is a scale of perception of the time track. And these are the different varieties or the different aspects of that perception. One case perceives at one level, another case perceives at another level, another case perceives at another level. And that is what makes cases different. That is what makes cases different, one case to the next, and could to some degree be said what makes one case require longer in auditing than another case. So any estimate of the length of time a case would require in auditing should, in actual honesty, be made off that scale I have just given you.

Now, how would you determine levels on that scale? Now, you probably could work out a very rapid testing mechanism to recognize these various levels by using the physical universe. That's quite interesting. Use the physical universe. You'd have the pc look at a wall with a picture on it and then close his eyes and see a picture of the wall. What's he got? Well, what he's got is actually an upgraded aspect – upgraded – of that scale I just gave you. It's an upgraded aspect of it. It's better than that scale, but not much. See, the error is that the case looks better than it is.

So you tell a pc, "All right, look at that wall. Shut your eyes. Do you see a picture of the wall? What is the picture like?" And he'll put himself on the scale. And he actually puts himself on the scale about half a tone or a tone higher; because it's present time, he's not under duress for other reasons, and closer to PT, they very often are able to handle their track better. Don't you see? So your estimate after the pc has done this is still taken conservatively. But within that comment you will find that is pretty reliable. The person says, "What – what wall?" You know? Takes a picture of the wall – "What wall? Well, I don't have any picture of the wall." Well, that level tends to be more accurate than the other levels. Because you can spot him right there on invisible track. Just like that, see, with some fair accuracy. But at the same time, be prepared to have that case slip on the actual time track one half to one lower, see? The case does see a picture, and so forth, it's more likely to be a dub, see.

All right. Now, this is quite amusing, and this is an amusing exercise, because everybody tends to slightly alter the proceedings. Now, this gives everybody the feeling, when they first try this sort of thing, that they're much worse off than they are. Actually, none of these conditions are terribly serious, until you get down to that evaluation one.

When you get as far south as that, or into the next one, unawareness – and when you get down to those, that's pretty serious. That's pretty serious. Because you can't communicate with the bloke. He's sitting there wondering whether or not Scientology would meet the ap-
proval of his grandmother, and you're trying to run a case. I mean, a totally silly situation, you see? You're trying to audit and he's viewing his own evaluations. And I don't know if you have ever tried to run a pc who was totally unconscious – I mean totally unconscious: in a coma, lying in a bed someplace or something like that – it's quite remarkable, but all you can do is – you can do it – but all you can do is establish communication. You eventually can establish communication. But that is your first point.

Now, the establishment of communication at this particular level moves the person up to the next level. They think you are not going to do them well or something. They're, they're more impressed with their own evaluation of why you are trying to help them, something like that, you see, than they are in actually being helped. And they'll move up into dub-in of dub, and they'll move up into dub-in of track; they'll move up to invisibility; they will move up from invisibility into sporadic track and so forth. But it all depends on how you handle the case in order to get it moved up.

But let me assure you that the earliest stages there, the lowest levels of that, are not to be adventured upon with a happy smile and a jaunty cock of the hat. That's not something that you flick your lapels off neatly and say "Well, we'll knock this off in an afternoon." Now, knowing this, knowing this, I can save you a few loses based on an overoptimism. You'll occasionally... you'll, by and large, in the majority of the cases that you have anything to do with, be dealing with invisibility and sporadic track. That happens to be a very large number of the cases you'll be dealing with – invisibility and sporadic track. And that's very fortunate.

But you slip downsca... there on this case, you know, this case a... you know, and you look at this same case and because you've just had some magnificent wins on somebody who was – well, he couldn't see a thing, and you eventually got his facsimiles on and that sort of thing, and gave you a nice win. And you grab the next fellow and this fellow is saying, "I wonder if I really shouldn't have listened to my wife about being processed. I've – I've had some misgivings about it. You see, in my early life I had a great deal of religious training, and it has seemed to me, it has seemed to me that tampering with the soul..." Well, base your conclusions accordingly. You're not going to get the same win that you just got on the person you just processed. It's a rocky road from that point up to no track.

Now, I can't give you any fancy mathematical figure that gives you the multiple number of hours – and the figure would not be based on any real data and so would have no great value – but I can give you an educated guess and so on, that it goes by times from sporadic track. If you considered sporadic track one, your auditing time value – and this is just an educated guess – is, you see, twice for the total invisibility. You see that? And I would go so far as to say four for the dub-in of actual track, eight for dub-in of dub-in, sixteen for your evaluation, and thirty-two or thereabouts for your unconsciousness. All those numbers, what? Times as long to get a result.

Multiply thirty-two times – well, let's say it takes you – it's going to take you 150 hours to run out twenty implants – that's, well, that's number one. Let's say it's very clumsy and so forth, that would be terribly slow running and all that, and allows for all sorts of things, and an uneducated pc and I don't know what all, don't you see. But, going to take you
150 hours. Well, how long is it going to take you to handle an unconscious case up through the same thing. Well, that's thirty-two times 150. You see what I mean?

Now of course, what are we talking about? What case result are we talking about? That's the other thing that figures into this. Well of course, you're not going to hear me, from here on, talking about anything but OT – the only case result I'm interested in. We've already, we've already got the fait accompli on clearing and all that sort of thing and you can let somebody else talk about that, and you can beat the drum for it and you can pat people on the back for it and so forth. And just realize that that is not necessarily a rocky road and not necessarily an unactual road; you've all of a sudden taken off on a new line. And this line is, is we've got that level whipped. And you can talk about it all you want to to people and the public and that sort of thing, but realize that any effort to approach an ultimate in processing leads you straight toward OT and that's where it goes.

You're going to be throwing anvils over your shoulder as a thetan before you're through with this, so why worry about it? Of course, that upgrades the number of hours to such a result. And I'm looking at about five hundred hours to OT or something like that right about now. That's not an educated guess. But for what case? For what case? It's that case with the sporadic track – about five hundred hours. Because a person would be awful close to OT if they had a totally visible actual track, don't you see?

All right. Now, you've got this gradients of cases. You got that. I don't want to labor this because it's actually not a subject that you can labor very hard because it is based on very crude levels. These levels are quite crude. They're quite factual, but they're very broad. And they have lots of interims, don't you see. So there is the person who only half dubs in, don't you see, a dub-in, you know? And there's a person who sometimes can talk sensibly and the rest of the time talks in terms of his own evaluations, you see. And there's interim areas there. But somebody can have a lot of fun with that as a system of classification because it gives you a classification, and is interesting to you mainly in a crude estimate of the number of hours of what you can do. It's the number of hours that are required to do what you can do, but we have to say to what or to whom. And if all cases look alike to you, you've just been reading too much Thomas Jefferson. Nothing wrong with old Tom, but I'm afraid he didn't know too much about the mind. There's differences and those are the differences.

Now, do you notice that insanity and neurosis play no part whatsoever in that scale of case estimate? Ability to respond to a communication and all of that sort of thing play no part in that. There is no estimate there at all. No part of that. Well, why this sudden skip of what man fondly calls his fondest divisions of case? This fellow is insane and that fellow is neurotic and this other fellow is something else and so forth. And man is marvelous on this subject; he just thinks this is gorgeous. He never had such a time as classifications in these lines. Well, those classifications have no bearing in fact of any kind whatsoever, and are adjudications all from one level of that scale! See? So you have a much broader field of classification the moment that you step outside of observation of own evaluations, the second you stay out of that.

Now mental science, unfortunately, or perhaps necessarily, has been in that particular state for a very long time, and therefore you'll find most of its literature and so on is dreamed
up from that particular level and therefore is not factual. So that you get observational tests as being considered totally valid tests. Well, any test that has a human observer connected with it to adjudicate whether somebody passed it or didn't pass it and so forth is bound to be a bad test. Just bound to be.

How many times have you been flunked on TR 1, for instance, in the old days by a coach that couldn't coach? See? Well now, there it was a pass or a flunk by unedu... not even educated opinion, don't you see, that has a terrific variability and a terrific invalidity. And that was the reason for these new TRs which you are using. See, it just removes all TRs from coaching from that level of the scale. So therefore, you're free to make further progress than you were before.

Well, one of the things that knocks out insanity and neurosis as a proper evaluation of a state of case on anybody is because these are contained as goals in the Helatrobus Implants. And I think any wisdom that is based on the Helatrobus Implants is sort of – sort of headed for the junk heap.

The goals in there are quite alarming. I found a goal on my pc last night, "To get it." It's there! Interesting goal, isn't it? "To get it." Well, what does it – what does it refer to? What does it modify? Sickness? Havingness? Being unlucky? See, it's just one of those portmanteau things. But you don't have to have that type of goal, which is untranslatable or undeterminable. There's goals in that lineup that are quite determinable, such as "To be sick"! It's there. "To die." That's there. "To move," "To escape."

Nearly every one – any one of these implants has at some time or another been the source of the most learned treatises which explain all of man's ills. How many articles and things have you seen on "escapism"? So it's not valid material on which to adjudicate such things. And I'm afraid this whole subject of insanity is just about as valid as a Helatrobus Implant as a source of philosophy.

No, there's something else. There are the mechanics of livingness. And we have had these nailed down for a long time, and I'm rather proud of the fact that they have minimally been influenced by these implants. Here and there I have found an implant where something gave us a bad twist. For instance, there are several incidents in What To Audit, or A History of Man, that are taken from an implant given about four galaxies over. It starts with a goal, oddly enough, and then doesn't consist of a GPM type thing. They lay you down and show you endless pictures on a motion-picture screen. I just mentioned it the other day. Well actually, these – the actual engrams of these things can be found on the time track. The actual engrams, they do exist. But this was – the implant is what picked them up and restimulated them and kept them all in a bunch, you see. And What to Audit was influenced by that implant. But the remainder of our material is remarkably uninfluenced by this.

We have moved toward the Helatrobus Implants because they were trying to find something that would really aberrate somebody, and sooner or later we certainly would collide with the very best – the very, very best authoritarian minds on the whole track on how to do somebody in if we were trying to pick people up out of the mud. Sooner or later we'd cross – we'd do a crossroads with somebody who had been on an opposite tack. And that was
what happened there with the Helatrobus Implants. No, that's quite remarkable that we've escaped it to the degree that we have.

Now what, then, determines a person's level on that scale? And that is a point that philosophers could sit down and philosophize over for a very, very long, long time. You could start with the basis of the inequality of thetan power. One thetan has less thetan power than another thetan, see? You could theorize on the subject of "Well, this person's overts are different than that person's overts." You could have various reasons why they wind up at different positions on the scale. I don't necessarily pay much attention to these that I've just mentioned. But there is another one that you might pay attention to, is length of time in the universe. The older a person is in the universe, the further they are down that scale – which gives you some kind of a weird theory about – it obviates the idea or throws aside the idea that the universe was created by a sneeze at the same exact instant, you see, but predicates a cumulative universe that picks up the home universes of thetans at different times on the track. And people in better shape have been less long in the universe than people who are in terrible shape. Then this, of course, could be monitored by the number of overts committed, and the amount of overwhelm and it could be monitored this way and that way. But also could be monitored by a different status of thetan at the time of entrance into the universe. You could figure out a lot of things around this way. But you don't have to go into this line, because you're asking why. And we're not interested too much in why, because why has no bearing on it to solve it. We don't have to have why in order to solve it. And it's a good thing. It's just how do they get there in those different levels, see? And that's only one short answer. It's contained in one word: Charge.

Now, this is very lucky for you that this can be stated as easily as it can be stated. Very lucky for me, too. It makes a good communication level and so forth. But it's very simple. Charge is a quantitative thing like buckets of water. Let's say we could take all the charge off of a case and run it through an ohm meter and put up its additive. You know, I mean, put up the total amount run off. You know, your house uses – one house uses so much electricity and another house uses a different quantity, but they send you a bill. Well, that's based on the amount of electricity pumped into the joint by the light company. Or what their meter says is pumped in.

Well, you take the eighteen buttons, principally, and you keep pumping charge into a case by these buttons going out. You know, the case suppresses, asserts, protests, invalidates – you know, this is life. And button by button by button, why, this case is getting charge stacked up on him. It's residual charge. If you could… A thetan, however, is not a condenser. If a thetan were a condenser or something like that, you could discharge it with one short circuit. The psychiatrist's fond hope. That, unfortunately, can't be done because charge is built up on a case by intelligence, understanding, or lack of it, and therefore has to be taken off a case the same way.

And you see, if life consisted of matter, energy, space and time, without the additive of thought, all this would probably be very easy. You just pull so much mass off a thetan and so much space off a thetan and so much energy off a thetan and so much time off a thetan and you'd stack them all up and lay them over there. It probably all could be done mechanically.
But actually, unfortunately, there's this thing called thought. And thought is composed of many things, including volition.

And as a result, as the universe pumps the charge in on a thetan, he starts pumping the charge into others and into other things, inhibits himself from doing so, and you get the overts that cause withholds, and you get the charge encysted (c-y-s-t), and the composite picture of the number of things done to the being, held in place by the number of things done by the being as overts – that's what wraps them up and keeps them on the case, you see – and you get X amount of charge.

Now, you might make it a constant per case, except that it's growing all the time. It's a progressive constant. For instance, this year, why, he has "A" number of "spluggits" of charge, and next year, why, he'll have "A" plus one year's spluggits of charge, you see. And – this is the way it'll go – and then he gets into bad company the next year after and decides to join the FDA or do some other criminal action. And he'll suddenly add onto his case, you see, at an accelerated rate. It isn't just the amount of time a person lives, you see; it's also the person has volition. And he could speed this up and he could slow it down. And he does something like – criminal, like joining the FDA or something like that, you know, just completely sells out the human race and there he is. In the course of the next few years, he runs up as much charge as he's run in the last two lifetimes. So you have that much more charge per case, don't you see? And then he decides that he doesn't feel very strong these days, so he's going to sit the next few out, and he goes out, and – or he decides he's going to be... do good works or something and maybe he lives for several lifetimes without accumulating much more than just a few little ergs incidental to being in the universe, don't you see. He isn't viciously accumulating charge, in other words.

Well, that's the way it goes. It ebbs and flows. He gets active and charge accumulates more, and he gets inactive and accumulates less, and he runs up a lot of overts, you see, and he accumulates charge like mad, and he tries to do some good and maybe even gets rid of a little charge and various things happen. But it's always plus, always plus, always plus, always plus. And it wouldn't matter if it took a hundred trillion years to get one more erg plus, it will be plus. See, charge is always additive in the absence of Scientology. Charge is always additive.

That's the trick of this universe. That's the only thing that makes it a bad universe. You overcome that, you got it made, see? Then all the work somebody went to to put it here, you see, to be a trap in the first place, ha! You've had him, you see! You've got the universe and it's not a trap.

I think it'd be an awfully good joke. I'm in a very good frame of mind to just pull that joke, too. But the universe, basically, doesn't have to be aberrative, and isn't – if you just go out and admire it and so forth, you'll find it's therapeutic. In other words, you could drift along for quite a while, and do quite all right. But it's not going to drop charge off of you. It might make you volitionally feel better about the charge that is on you already because you can also have an attitude toward the charge. It doesn't vary the amount of charge, but you can have an attitude toward it.
Now, in view of the fact that an OT can kick out more "megatrons" than little boy Jack or Khrushki's legions could, this is very funny that charge would bother him till we figure out the basic overt of the thetan. Any overt a thetan commits is also mixed up with the energy a thetan is emitting. So all of his overts have particles connected with the overt. So the only way to really get him is to hit him with particles. See, it's the path of his overts. So naturally, you find these implants are mostly connected with particles. Particle flow of various types.

Now, what's this amount to? In the final analysis, we have a person who has "A" amount of charge – that quantity "A" – and quantity "B" and quantity "C" and another person quantity "D" and another person with quantity... see? We don't care – we don't care so much why they got this charge or what is the source of all of this charge. But we do care about the fact that they do have different amounts. And this rule is operative: The more charge a person has, the more difficult it is to release it. That quantitative rule applies. That's a gruesome fact, but that's what gives you your numerical relationship in "How long does it take to process somebody?" And that's why I've showed you there going up progressively on the scale. A person that's unconscious – how much charge? Unless this unconsciousness is caused by some artificial means, such as a pressure on the brain or something like this, which the moment it's relieved will relieve the unconsciousness, you then have a temporary condition, don't you see.

You have to differentiate between a temporary condition and a chronic condition. Duration of time – how long does a temporary condition have to continue in order to become a chronic condition? Well, ordinarily it's measured within the finite limits of one lifetime – temporary conditions – finite limits in one lifetime. When you exceed the limits of one lifetime, you get a chronic condition, if you figure it that way. So that ten minutes is part of a lifetime, see, and eighty-eight years for a person that ordinarily only lives only seventy, you see, is not part of a lifetime, so that becomes chronic.

And if you get your divisional line between chronic and that... not on man's viewpoint, which only gives you about sixty, seventy years to work with, or something like that, which is just a sneeze in eternity – you start working out on some more practical basis, such as, well, a much more practical basis to work with is a billion years. That's a little long. That's a little long. It's a nice span of time, though. It's a good, good healthy span of time. Half a billion years, well, I don't know. It's pretty hard to complete a cycle in a half a billion years. You can try. And you get it down to a million years, and of course, heh-heh! to get anything done in a million years and make it stick – that's really going some, man; you're really on your way; that's tearing the ground up in all directions.

The length of time since the birth of Chr... the alleged birth of Christ is so short – is so short, that before you've gone very long on the road to OT, you could probably remember what you had for breakfast in the year 2, and the... during the third day of the Saturnalia or something like that. Not that you would – probably cause you as much work to remember what you had for breakfast that morning as it does now to remember what you had for breakfast yesterday right now.
So that is a very finite period of time. That's a very short period of time. A couple of 
thousand years – nothing. I'd like a couple of thousand years just to sit on a rock and look at 
the scenery – one of my ambitions. Take off a nice vacation. I consider a nice, quick, short 
vacation about ten thousand years. I think that would be – that's nice. That would be nice, see. 
Give you a time to get fully accustomed to the view. [laughter, laughs] Catch your breath, you 
know. Or catch your beams. Get your beams untangled.

No, finite – finite or temporary conditions do result from a physiological error in the 
mock-up the person is packing around. See, the guy can't walk because he's got a broken leg, 
you see? Well, this can carry over to some degree in that he's liable to have a somatic in the 
next body's leg. But it doesn't carry over into the next lifetime he has a broken leg. So if you 
just consider a one-lifetime situation, or any fragment of a one-lifetime situation, as tempo-
rary, and things which extend over the period of one lifetime as chronic, then we're talking the 
same language. Not that you have to consider it this way at all, but it's a good language divi-
sion.

This guy is chronically something or other. Well, you're liable to hear some medico 
say he's chronically lame. And we get to the next change of case – the next differences of 
cases: Is this person always going to be a spastic no matter what body he picks up? Or is this 
person merely a spastic because of the condition of the body he picked up? See? Now, that 
makes a difference in your processing of that spastic, and enters in to an estimate of the 
amount of time a person is going to require in processing. Is this spasticity a chronic con-
dition or a temporary condition, by which we mean, is it just going to last this lifetime, or is it 
going to keep on going with this poor thetan, see?

Now, if it is so built and it is so strong as to be a chronic condition that goes on and on 
and on and on, lifetime after lifetime after lifetime, don't throw up your hands in horror and 
say nothing can be done about it, but just realize you're looking at a much greater span of 
time. A much greater span of time.

Now, how would you find that out? Well, you might put somebody on an E-Meter and 
say, "Well, were you deaf in your last life?" And it bangs, and you say, "All right, were you 
deaf in the life before that?" And it bangs. Well, you've all – you've made your estimate of the 
situation: This is a deaf thetan. Get the di fference between that and a body, you see, a thetan 
just occupying a body that happens to be deaf. Now, that's – that's all part of adjudications of 
the amount of time in processing.

It is not necessarily part of that scale, but causes you to make a closer examination of 
the person with regard to that scale. Because the more... you remember the old Tone Scale 
had neurological ills and that sort of thing on it and so forth. Well, they were simply to give 
you a tone level. It wasn't because the neurological ills were of any importance. The individ-
ual, who was susceptible to these things over a long period of time, of course, was lower on 
that scale I've given you. All this thing adds up then about eighteen dozen ways from the 
middle, and you can make a lot of figure-figure on this thing and you can get yourself a lot of 
answers. I'm just showing you some various ways of use of the thing.

But charge is what causes the scale basically to be that way. Now, you mustn't always 
be deluded into believing that because a thetan plus body is in a certain condition that the
thetan is necessarily low on that scale. I had a person who was absolutely sure they were psychotic one time, and I made some tests of this particular character, and that person was dead-on. And more – more definitely, that person could hold a position of two objects in space. *Hah-hah,* that person wasn't nuts. That person was simply in disagreement with the family and environment and they thought he was nuts. See? This was actually a very simple case. The person very easily belonged into the classification of a sporadic track; and therefore would have flown.

Going to make – you're going to make mistakes on this until you finally accustom yourself to it because it determines what you do with the person. And therefore, it's an essential part of programming to be able to estimate what you are going to program. And what you're going to program is the person's case. Therefore, you have to have some estimate of the case in order to program the case. And frankly, in going for OT, we have just left aside practically every method of measurement of cases we have for estimates in processing. See, we've just more or less thrown them all away because we've got a different target. Therefore, we have to make a reevaluation of cases. We have to have a new scale for cases.

Now, unless you can do this thing I've just given you here, unless you can, you know, add a case up in there and understand this one way or the other, then how are you going to program this case? Because a case is programmed in relationship to the amount of charge on the case. Now, I gave you some factors yesterday that also influenced programming as to who is going to audit this case and that sort of thing. They also influence programming. But basically, there is "B" units of charge on this case, and programming is simply how we're going to take the charge off the case.

Now, in view of the fact that it requires the cooperation of the thetan we are processing – if it weren't for that, it'd be easy, you see – it requires the cooperation of this being, no matter how faint that cooperation is, then an estimate of his ability as a case is also pertinent. But that's contained in the same package of scale I've just given you. Because each one of those levels has certain definite abilities and adjudications. They have very definite abilities, level by level by level and they just rattle off one, two, three, four. If you want to get a job done, don't give it to somebody who's unconscious. In other words, it's a direct relationship.

Now, if you want to find out something, don't send somebody who dubs in dub-in, see? So all of those things have direct relationships to the amount of time the case is going to spend, but that time depends on the programming. And the reason it makes it time is because the programming has to be different case to case, and the longer the period of time going to be spent, the more programming is called for here.

I can give you some very, very fast programs, one way or the other. You will see quite a few of these. I'll give you a sample program. We got a case who dubs in track. We found this out. Track doesn't seem to match up. Now, we can still run charge off of this case. We get big, dial-wide RRs on the Helatrobus Implants even though they're seeing the wrong scene and all this sort of thing. Well, if they can run it, run it. See? But that's sort of running with – well, that's sort of going for a swim in a shark-infested pool with no shark oil, because this case can go to smithereens very easily.
Programming for the case would at least consist of pulling the overts – this lifetime or any stretch of track in which they have any reality. Certainly would consider that. Making awful sure that the case had no withholds from the auditor, about this lifetime particularly. Making very, very sure that the case was audited in a pretty muzzled fashion and wasn't driven very hard. Don't ever force that case, man. That case says, "I don't – I don't – I just don't think I can face that next RI. Because all of a sudden, all of a sudden it's grown green whiskers," or something. "I don't think I can face it." No, I'm afraid that would be a case you would not say, "Say it again." That wouldn't be such a case. You'd just hit the silk, right there. You'd just hit the silk. And you return to an ARC break type process.

You'd run implants if you could get them to rocket read, but only so long as they were run easily. And you would fall back with great speed to patching up and putting together any roughed-up track because of running the implants. You'd always use "Since the last time I audited you…?" Get the idea? You'd always use this kind of thing. Make sure that you're not running a session with a withhold on it.

But that's dangerous. And you should realize that running that case that way is dangerous. And that would be a very extreme programming for the case, to actually run implants off this case. Very extreme programming. Now, you could do it; it's the fastest way; it's the quickest way to knock down the case condition and move them up a scale as a case, but it's one of these things, you know, that's right on the edge. Right on the edge.

And you'd also run the case this way: If you got your hands on a goal, you would run all the charge off the goal before you did anything else. And you couldn't run the case back too far without running them early. You know, you'd never pull such a trick as finding a goal and then trying to find a couple earlier than it. See, you'd never scatter around. You wouldn't drive the case hard to pull all of the charge off of the implant, you'd just be content with one long rocket read and then you would get out of there. Get that type of approach? In other words, this is all kid-glove stuff, see.

All right, let's take this – let's take this case with the sporadic, now. Let's take this case with the sporadic view of the time track. It's pretty accurate, that sort of thing.

Now, you can stack that case up awful hard. You can stack that case up awful tight. You can run – you can run a bank, and then you can move bank – you can move two, three banks forward, and then run back to the bank you've read – you just found, you see? I mean, you run all the RIs back to the bank you've already got clean. Then you could move him six goals forward from where you were. Just overtly, and find the tops of those GPMs, you see; run them through, crash. See, run them right back to the last one that you'd cleaned. You get the idea? In other words, going forward several goals and sweeping back to the clean area. And jumping forward several more goals. You could even go worse than this. You can even leave goals undone. The case is now starting to get pretty uncomfortable, but the case can do it. The case gets ARC breaks, but case can do it, do you understand? Because you're not running any danger. It's almost impossible to run this case into danger. The case could be pushed, hard. Get the idea?
The case that is an invisibility case can't be pushed anywhere near that hard. But still can't really be gotten into severe danger. It's not a – not a case of being able to knock them off and have them spin for a day or something like that. You get the difference of programming?

Now, you get this dub-in case – a safe way to program such a case is lots of track cleanup, lots of Straightwire, lots of pulling missed withholds, lots of straightening up track, you see, lots of havingness. And then we find and run an implant. Ready to cut and run and hit the silk any time the pc starts going this way, see? Get the difference of case handling?

Of course, doing something like that, look at the amount of time it costs you over and above just sitting there running implants, see.

All right. Dub-in of dub, that level of case – aw! Are you kidding? You let him near an implant? Oh, no, man. They would get so involved and they would spin so fast and they would spin so hard that you'd be hard put to put them back together again. Fortunately, the case isn't very general. No, that case is handled with Straightwire, ARC break processes, and build it up, man, keep going, give the case – never give the case a lose, give it nothing but wins, run it very lightly, very mildly, and run it just at that level where it gets session wins. Gets a win in session, a win in a session, a win in a session, a win in a session. You'll be surprised how tiny some of these wins are. They're wins. And you know that you're doing it too steep when they don't get a session win. That's too steep, and you drop right back down scale.

This is true of all cases, but particularly that case. No, it's not true of a person who has sporadically visible, correct track. He can have half a dozen sessions with no damn win at all, and you've gotten charge off all the way and he comes out of it. See, and he's had wins, see? But this case – you don't depend on that case that I just mentioned saying he has had wins. You couldn't care less whether he says he has wins or not. But this case – unless this case recognizes wins, this case's reality is not coming up.

Now, let's go a little bit further downscale and let's take the person who has own evaluations of own evaluations, and boy, you're sure getting toward a case that can only stand havingness. That's how extreme this is getting at this point. It's getting awfully extreme. So you're looking at CCHs. You're looking at – you're looking at various types of room-contact, present-time-contact processes. So some fellow says, "Well, I don't know. I've often thought you Scientologists might possibly have something, because I had a patient once who thought that you possibly might have something." What you going to do? Well, of course, if he has certain professional connections it might be a great temptation to say, you know, "All right, let's pick up 'die,' and 'nix die,' and oh-hah-hah!" and fire away. It might be a great temptation. But if you're going to help this case out, man, you're not going to run him anywhere near track. Because he doesn't know – he doesn't know what he's had for breakfast. He cannot differentiate an overt. His level of responsibility is incapable of detecting an overt. This kind of a case, by the way, can go down and rob a shop and then tell you all about it in session, but it never comes off as an overt. You've seen this type of response to Security Checking.

Well, there's where that case stands with relationship to implants. That's CCHs, and your risk is Straightwire. Now we're – we're really going to take a big risk with this case, see? We're going to run some Straightwire. Get the – get the different view.
And the case that's unconscious, of course, merely establish communication. If you can eventually establish communication, well, "Touch that pillow. Touch the bed," and move their hand accordingly – any type of communication or reach that you can establish that way (it's a sort of a downgraded CCH), you'll get to such a case.

Animal processing and so forth doesn't necessarily follow this, but again – follow on that scale – but it's again a question of establishing communication. And if you can get the animal to reach, why, he'll come up the line. I told you one time I gave up on a cat, just out of pure laziness and so forth, but I never did get the cat up to talking. I didn't spend many hours on the cat, but the cat got awful bright. A very brilliant cat after a while. There was no time in processing. Now, if I'd set – if I'd programmed that the way you should, why, the cat would come way up the line.

Now, I don't know how you'd process a beetle; at the moment I really don't know. Because his reality would be if you were going to squash him or that you're some kind of a giant or something. He wouldn't have any kind of a reality at all on the situation.

But there's cases. And there's how they – there is the data on which you program. That's how to establish the data from which you program. And in using the scale, in using the scale, use it adventurously. Always establish somebody's level on the scale optimistically, and fall back if you have to. Always be a little optimistic.

Now, there are lots of tests for this kind of thing. I'm sure a lot of tests will be developed along this basic line by which you can establish this much more easily. And probably these tests can be coordinated against the old OCAs and that sort of thing – against the behavior and the security. The old auditor's reports should be able to – you know, you've got the person's OCA, and you've got the auditor's report that had that OCA, and if we had enough time and so forth, we could undoubtedly get an OCA coordinated against this, but that will probably happen, too.

Now, the programming, then, is "How much charge?" And the reason for programming is to get as much charge off as can be gotten off with the pc winning. You get as much charge off as you can get off with the pc winning. And it's all a quantitative proposition, and you see this charge – you see charge coming off a case with the old meter. Every time that needle goes on a big downsurge or throws off a cracking big rocket read, or something of that sort, and every time you get – particularly, you get a blowdown of your TA – that's a big one; that's big stuff, you see – that's charge off the case. That's charge off the case.

Now, in view of the fact that all the charge isn't in restimulation at the same time, fortunately, you see this charge come off one rocket read and so forth and one blowdown at a time, but it's all adding up. Even though the TA tends to remain high on the case, you're still blowing charge off of the case, you see? And gradually, as you go along, if you added up the amount of charge for each RR and the relative number of dials of charge that went off for every blowdown – you got the idea – how many... how far do you have to put this tone arm down, and that actually is so many ohms; a rocket read is a registration of so many ohms of release of charge. If you went to all of this trouble, you actually would come up with a mathematical figure. See? And you could say, "We have taken..." At the end of two or three
intensives, we could say, "We have removed five volts," see, [laughter] or something like that, "from the pc."

But it's that precise, and that's what we mean by charge. Every time you see that thing blow down, that's just that many more microamps that have been registered and no longer apply.

Now, why is charge important? Why is it important? Well, that's answered very, very briefly. It's important because it's what restimulates when he tries to outflow and therefore prevents his outflow. So you see, charge on the case does not, then, give him something that he can release in a sudden zap, or something like that. That isn't it. The charge that he has to release that way is actually created by him at the moment of release. That's the creation of charge. It has nothing to do with residual charge. But if he tries to put out any kind of an outflow or tries to reach out, he's reaching out through this charge, and the charge reactivates because of his reach, and knocks his ruddy head off. Charge is what educates him not to reach.

Now, it has numerous reactions upon the thetan such as somatics, pain, pressure and all that sort of thing, but these things do not exist in the absence of charge. When the charge is gone, these things do not then activate. So a person can reach and he can do.

Processing, then, becomes a rather simple subject, if you look at it, there's just so much charge on this case, and you've got to release that charge. And we know the identity of some of the things the case has that does have a maximum charge on it, regardless of the significance. And then we're going to release that much charge off the case. That case, then, will get that much better. I mean, it's just a one-two-three-four proposition like that. Nothing very esoteric, so that "If we can teach this case to think pure thoughts, then at the end of that time he will be able to sit and regard his navel and bother nobody." See, we're not – we're not after that particular target.

We have found that if a person cannot reach, cannot communicate and cannot be active on their own self-determinism, that that person is ill, and more than that, is quite a menace to himself. And he does himself in; all kinds of things are going on that he has no control over; things look pretty awful.

Now, if you were to measure self-determinism on the scale I have given you, of course, total self-determinism is only present in the highest level I gave you. That's the only place total self-determinism is present. Because if a person were totally self-determined, he wouldn't have any automaticities and therefore he'd have no time track. So therefore, there'd be no charge on the case, so you have unlimited reach. And that's what we's heading fo' these days. So brethren, get off dat charge! [laughter]

Thank you.
Engram Chain Running

A lecture given on 11 June 1963

Thank you.
Well, how are you?
_Audience_: Fine. Thank you.
Good. This is what?
_Audience_: June the 11th.
June 10th.
_Audience_: 11th.
Eleventh? I lost a day. All right, 11 June AD 13, Saint Hill Special Briefing Course.

Part missing

Now, this lecture today – this lecture today – reminds me very interestingly of 42 Aberdeen Road, and Elizabeth, New Jersey, 1949, Bay Head, New Jersey. Quite reminiscent, because this lecture concerns engrams. And I finally found out why you can't run engrams. That's an awful slow take on my part. There's been something wrong with the communication; the communication of the matter. And I finally found out you've been trying to run engrams. And you never run engrams; you run chains of engrams. So we'll call this technology which I'm giving you Engram Running by Chains, well understanding that nobody ever successfully ran engrams any other way.

This is the way I ran engrams back in 1949. Let me tell you where it got crossed up. Oh, I fancied this up; this is very simple these days because we've got tremendous technology. I can give you a very close-to-rote series of actions that are very easy to do. Let me tell you where this got fancied up. You got it crossed up with repetitive processing: "Flatten the process." So, naturally, you have to flatten the engram, don't you? Hmmm! No, you only have to flatten the chain. You don't have to flatten the engram, you flatten the chain. But repetitive processing is what raised its ugly head and got you all mixed up on running engrams. "Flatten that process!" "The way out is the way through!" You know? That kind of thing.

So you apply that to a single engram; you're in a mess promptly for several reasons. Because it is only part of a chain of similar incidents, which in itself is only part of a time track which has all sorts of incidents on it. And you're essentially running a time track – not a stick, not a chunk of something. These things are all related. So therefore, all engrams are handled as parts of a chain of similar incidents. And you never handle an engram all by itself. Because they don't exist all by themselves. I've already said it's part of a chain and the chain is
part of a time track; how can you handle it all by itself? It's too closely related to these other two things to be handled.

Now, if it were just one item like a hunk of mud or something, you could bring it in and mix it in water and precipitate it and so forth, and then you'd pick up another hunk of mud, and handle it in some particular way, and then pick up another hunk of mud and handle it in some particular way. Well, that would be relatively easy. But unfortunately, the "hunk of mud" is a chain of engrams, is never a single engram. You've got to handle this thing as a chain and part of a chain.

Now, if you are a skilled auditor, you can pick up bypassed charge; you know why the pc is ARC breaking. You can find it out in a fast hurry. Pc ARC breaks, bang! Either you know what you're doing – know what just must have happened – or you can shake it out of the meter in an awful hurry and locate it and indicate it and the ARC break will cease. And until you have a reality on being able to do this as an auditor, you're going to have very upset sessions because the pc will ARC break inexplicably. You won't ever be able to find out why he's ARC breaking.

You'll have the trouble that we used to have in the old days where we had to have a process for an ARC break. Well, it might have gotten to it and it might not have gotten to it, and it was random. But now we could immediately and directly locate the bypassed charge that is causing the pc to ARC break. Now, that's very, very important to engram running because the bypassed charge is always the earlier incident on the engram chain, and you bypass the earlier incident on the engram chain, you get an ARC break. This is elementary, my dear Watson.

Charge. There, by the way, will be quite a few bulletins out on this; two have already been written – enormous things – and there'll be another bulletin on the material I'm giving you today. And these will be dressed up and put out into a new book on the subject. This lecture is the first release of this material. Therefore, I'm not releasing all of this material. I'm not telling you that in order to run an engram – I can tell you this, but not elaborate on it; let me say that – in order to run an engram you've got to know what the time track is and be able to handle the time track. You should know what you're trying to handle in terms of charge. What is charge?

Now, the charge, of course, is that electronic ping-bang that hits the pc in the blank and causes him to go bunk, or blows and causes him to get better. See, you pays your money and you takes your chance on charge. You either release the charge and the pc gets better or you encyst and stir up the charge and the pc blows his stack. You get the... there's two roads by which you can travel on charge, and there's no middle ground; there isn't any middle ground. Just forget the fact that you could go on and grind for eighteen years and get no change on the pc. The pc will either get better or get worse. He won't remain the same.

Now, what do we mean by getting worse? Actually, he might think better, and feel worse. You get the idea? His knowledge has increased, but the charge is still knocking his 'ead off. Now, you can get into that situation in engram running. You can lay open a tremendous amount of engram – engramic information. He can get all kinds of information – you
never blow any charge off of it anyplace. Well, that's because you weren't looking for basic; you were looking for information.

Many an auditor falls for this because the pc wants to know how come he was on the planet Yuk-zuk in a railway conductor's uniform, you see? What was he doing there? And that's all very interesting and we can assuage his curiosity to some degree, but if we go in for just assuaging the curiosity of the thing – dramatizing watching TV or something like that, you see – we unfortunately get into the situation where we're not following down an engramic chain.

So here, you see, is another great liability in running engrams. We get so absorbed in *dramatis personae* and that sort of thing, that we actually aren't running the chain of engrams at all, we are simply trying to find out. See, get that as a liability, because it is a liability. You actually can find out all about what this pc was doing on the planet Uk-zuk – you could find out all about it. The only trouble is the basic on it was on the planet Pan-wan, which was a trillion years earlier. You see?

So, engram handling is engram handling in that you want the chain of engrams which lead to the basic of that chain; you want to go down that chain and get the basic of the chain. Why? Well, every time you run an engram, you open up a little valve. We have a big joke around Saint Hill about the "weather valves." Workmen and I are always talking about these weather valves. And they get stuck open and they get stuck shut and various other things happen. We have our opinions as to who's doing it. We think it's Profumo now, [laughter] and so forth.

Well, if you could imagine an equally hypothetical series of valves: one between each pair of engrams, see? So let's take basic on the chain; that's engram 1. And then we get 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20 – a little valve between each one of these pairs, see? All right, you run number 20 on the chain and you unwittingly open the valve from number 19. And the charge contained in number 19 restimulates and leaks, to some degree, into 20. So you're trying to run the charge out of 19, by running 20. The charge is coming from 19; after a certain – a very short period of time, it's all coming from 19 now.

Well, now this is very interesting because it poses this kind of a condition: Number 20, if you continue to run it, gets sticky, solid; E-Meter action ceases; no tone arm action on running it. There's nothing on it, you see, it's just gum. Or it's getting more and more solid and it'll eventually collapse on the pc. What's making it collapse? Well, it's the charge in 19. And you could run 20 *endlessly* without ever taking any charge off 19. But this makes 19 potential bypassed charge so the pc will ARC break. Do you see that now? You opened the valve and then didn't do anything about it. So, the thing to do is to find out – by the way, you don't have to find 19, which is quite interesting; you can sometimes find 16. But let us just keep it in an orderly progression here, and we find 19.

Now, oddly enough, until we found 20, we couldn't have found 19 because it's as though we had a big barrier across the track. It's all the charge there in 20, don't you see, prevents us from seeing 19. And this is a very funny thing: We can say, "Give us the earliest engram on this chain" – this is inevitable – and they give you number 20, see? And the E-Meter only registers on 20 and 20 will register that this is the earliest incident on this line. It'll do
this consistently, you see, because the track is bariered. The E-Meter, the reality, nothing else can get back of 20.

So you – although you've asked for the earliest, that's true of the earliest part of the incident, you see? You always get more first part of the incident, you see; you can always find a few minutes earlier on an incident. Well, similarly, right on down to basic, why, you can always find an earlier engram.

See, even though your meter kept saying that it was the earliest engram, or even though the pc and the meter said that it was the earliest part of the engram – that nothing like this ever happened before – as soon as we sweep some of this debris away, well, we find out we're looking at number 19. It's now the earliest, see? And it'll continue to be the earliest till we clean it up a bit. And as soon as we've cleaned it up a bit, we've got number 18. And as soon as we cleaned 18 up, we now find the absolutely, regrettable first incident on this line. And what do we find? We find 17. And that is absolutely the first incident on this line; and we get 16. You see what I mean?

Now, if you recognize some of these – they're terribly interesting, but awfully simple, idiotic points. If you could take a hose – if you could take a piece of garden hose, or something of the sort, and put clamps on it, see, and put a block of wood across it, and say this is an engram, number 20, you see? Now run this engram and then loosen up this little clamp, and you will see that the water pressure which you've gotten into the hose, you see – it is in each one of these balloons along in the hose sections – will go into 20, from 19, see? It's just as fluidly and fundamental as that, you know? It's like pouring beer steins back and forth into one or the other… But the charge always flows late; charge always goes later, doesn't go earlier.

Now, it's quite interesting, many of these manifestations, but if two things come together, two pictures come together, then there is bypassed charge. In other words, if two engrams collapse or two pictures collapse – no matter what you're running in auditing. This is true of all auditing, by the way; it isn't a specialized subject. You got this bypassed charge, it'll cause two pictures to come together. For instance, you're looking there – a pc is looking at a lamppost. And all of a sudden there's another lamppost standing alongside it, and he knows they're not the same picture because they have different periods of architecture and so forth, and he says, "There's two lampposts here." The first thing the auditor knows is that charge has been bypassed. See? That's what causes the collapse. Got that? Now, that's the first thing he knows. See? Whatever else he knows, he knows that. Now, if charge has been bypassed, what's the pc going to do in the next few minutes? He's going to ARC break. Yeah. Sun rises – sun sets, bypassed charge – pc ARC breaks. Okay? Very inevitable.

So this tells you why some auditors – some auditors are capable of running smooth sessions and some auditors are... have ARC-breaky sessions. Well, it's just to the degree that some auditors pick up bypassed charge and some auditors don't pick up bypassed charge, see. That's the difference between this ARC break and no ARC break session.

All right. Now, out-of-valenceness – you know, "That's me over there" – is also a problem in bypassed charge. You will get this in running an engram. And you shouldn't make a mistake, because this out-of-valenceness is quite interesting. The engram he is in, if an ear-
lier engram is tapped – you see, he's in engram 20 and you've just clipped or tapped number 19, and it's bled charge now into 20 – it will simply cause a beef-up of the mass, you see, and it'll cause a strengthening of the somatic and that sort of thing. But it probably won't cause an out-of-valenceness.

An out-of-valenceness is a missing earlier portion of the same engram you are working. See? He starts getting two-pictureness. He's getting two pictures, that sort of thing: that's probably out of 19. You understand? But it also may be in 20. But for sure, if he goes out of valence, you haven't picked up the beginning of 20. There's another five days at the start of 20.

We know it was the beginning because the pc said so in 20. We know that was the start of 20 because we sent the pc to the beginning of it. And he takes a look at himself, and he says, "I'm way out of valence here." That is to say, "I'm over there." Well, he didn't go to the beginning of it, that's all. There's more beginning on this engram than he has suspected. And that's what – that's the charge that normally throws them out of valence. But that out-of-valenceness is also assisted by bleeding charge up from 19.

You understand what I mean by out-of-valenceness? That's very simple; that's very elementary: just as though you were four feet over, looking at your body sitting in the chair. That is the position the pc is running from. And you find some pcs are totally in this, all up and down this lifetime. They never can have any picture in which they are (quote) in their own valence (unquote). See, they're always out of valence all the way up and down the line. This case, by the way, also falls too low on the Reality Scale to run engrams.

But this happens to any pc: They flip out of valence. Well, what happened? Well, there's another earlier piece of this same engram is missing. And the pc gets a couple of pictures collapsed on one another, or pictures collapsing, well, you've opened the valve on 19 without finding 19.

Actually, all this sounds very complicated, but actually isn't complicated. You're dealing with charge, and if you regard charge as water or cream, or something like that, it behaves in exactly the same way: It flows, and it always flows later. Charge doesn't run back down the track, it runs up the track. Water falls; charge rises. About the only difference.

All right, now, let's look at this. We've got a pc. 'e 'its his 'ead. It gives him a 'eadache. So we run the engram – now let's take an elementary thing, see? We're bugged, see, on the subject that if you get your hands on something, you must flatten it, see; if you get your hands on an engram you must rub it out, see; all mixed up with "flatten the process," don't you see? They won't recognize that this…

Well now, let's look what happens here. So he 'it his 'ead, so we find out we'd better run this engram in which he 'it his 'ead. So we roll up our sleeves and we start in. Eighteen hours later we're still getting him walking into the cupboard and raising up too suddenly and banging his head on the door. And for some reason or other the pc is getting very unhappy and the cupboard is getting more and more solid in the picture and then it gets gummier and gummier, and then it's collapsing and so on – the pc is pretty natty – but you say, "No, look, I've got to run this incident," and the pc finally goes into apathy, gets too far downscale to have a headache and you've "cured his headache." [laughter]
Now, get that approach – get that approach. Now compare it to this approach: Pe 'as 'it 'is 'ead, and 'e 'as a 'eadache. You say, "All right. Good. Good." We block this incident out. He walked into the pantry and hit his head on the cupboard. All right. Fine. We start him into the pantry; we bring him through the moment he hit his head, and for some reason or another he just skips that whole section. His head comes nowhere near the cupboard, but we get him afterwards holding his head.

Now, what's this all about? Well, this means you've hit a chain of engrams called "'it on the 'ead." And why is that area where he can't hit his head – why is that missing? Well, the prior charge on being hit in the head is too great, that's all. That's simple. So you don't try to force him through and you don't need any interesting tricks to push him through it.

You find that was 20, see? Just find 19 and block 19 out, and we find out that he was working in the carpentry shop and raised up too suddenly one day and 'it his 'ead. There's no somatic there either, see? I mean, it's just all sort of, you know, thud. And then we find – we just get that, bang, and we get that – run him through it.

This is all done very formally, it isn't asking any questions like Straightwire, see? We zip him through it; we're moving the time track – dress-parade situation, see?

We get him there to 18. We find at 19 that there's an 18 and there – 18 there's a 17. That's the first time he ever hit his head, see, was 17. And then we find 16 and then we find – see? And we're lucky and we actually do find all the way down the chain – we find it's in this lifetime. That's why we were lucky, because we just started out to cure a headache.

And, by golly, we find him falling out of his perambulator with a dull thud, see? And it runs with full somatics, full perceptions. And we run it through and we run it through and we run it through and we run it through and we run it through. And it's all getting thinner and thinner, and it's less and less, and it's disappearing, disappearing. Nothing is toughening up, and with a clank, that's the end of that chain of being hit on the head.

Well, what happens? The engram disappears, we bring him back up to present time, all these other head-hits – you could touch on each one of those, too, if you wanted to. He'd get the clonk from each one of them. You hit him on the head all the way to present time. Every one of them would hit, see? And that's the end of this chain, and that's the end of his headache. See that?

Now, if we tried to approach it: "We are going to run the engram of him hitting his head," we have made an error by saying the engram. We have to say the engrams of him hitting his head. Now, a great deal can be said, snarlingly and meanly and viciously and so forth, about what terrible things auditors have done with running engrams, but the truth of the matter is I take full responsibility on the matter. I've pretty well desensitized that goal in the Hela-trobus Implants, "To be responsible."

But I actually hadn't made an adequate communication. You'll find all about basics, you'll find all about this type of mechanics in other material on engrams, but you won't find this differentiation: Repetitive processes? Ah, yes. Flatten them always. An engram? The only way to flatten an engram is to flatten the chain of engrams. So the communication factor is, is you don't run an engram, you run an engrams. See, you've got to run a chain every time.
Now, if you've done any Sec Checking and had any difficulty sec checking at all, it's because you weren't running on the basis of the earlier overt. Now, overts will follow this, and it's very good training finding overts; very good training. But the second that we lay a training restriction on it of "run only overts in this lifetime," we, of course, have inhibited the possibility of picking up the complete overt chain.

Well, "this lifetime," of course, is the biggest lie of all. A person's life is quite consecutive. And the first time you may find actually a basic on the fact of him hitting a mule over the head as his overt on the fifth dynamic, and you find the basic on this thing at two hundred and eighty-five trillion. Well, you will get, then, all aversion to mules tearing up. The overt chain, don't you see?

Now, that's not an engramic chain, that's just a chain of overt acts. But there are overt engrams. So there's two types of chains: there's the motivator series and the overt series. And oddly enough, it doesn't matter which you run, because the overt-motivator sequence is itself an installed sequence.

Oh, yes, that's a big swindle. But everybody is obedient to this particular swindle, and they behave that way below a certain particular level, so it's operable. So you can use it in processing; you can relieve things. And actually it is so operable, that if you don't get the overts off they don't progress. In other words, it's sort of the overts they have committed obscure the overt-motivator sequence as an installed mechanism.

You won't run into this overt-motivator sequence or undo it for – oh, my God – that's way back, and way deep, see? That's quite fundamental in livingness. There are other things like obsessive creation, and that sort of thing, they're equally... well, the overt-motivator sequence isn't as deeply laid in as obsessive create and that sort of thing. You think you've got it time after time, and there's still an earlier impulse to create, you see. And they're all engramic of one kind or another. They contain pain and unconsciousness and implantations and so forth.

But an overt chain is handled exactly the same way as a motivator chain. We couldn't care which we're running, except on a motivator [overt] chain you have to keep calling for an overt of this type, you see? And on a motivator chain you have to keep calling for whatever follows its line – identifies it.

Oddly enough, however, you can switch over from a motivator line to an overt line. You can switch from an overt line to a motivator line – doesn't matter which. But I personally would never bother to run the two at once unless the pc came up with it. Pc suddenly looks at
you studiously and says, "You know, I've got a lot of overts against hitting people on the heads." Well, all right. Fire away. But you're now going down an overt chain, don't you see? You'll get the same type of hit on the head. But unfortunately, you've also got to clean up the motivator chain of the same thing.

Now, what point am I making here? That engram running handles the most elementary laws of livingness and thinkingness, follows the most elementary rules itself and is terribly, fantastically uncomplicated. It is so uncomplicated that you're going to overshoot it every time. You'll never add anything to engram running but complication. Isn't that an interesting observation? It's awful simple. If I ever show you a demonstration of running engrams without giving you any reasons why, and so forth, you'd wonder how the hell this was happening, because apparently nothing was happening in the session. You'd say, "What's going on?"

The way I used to run engrams – the way I still run them and so forth – runs something like this: Crude date. Very crude date. Order of magnitude, you know? Eighty-nine trillion, something like that, you know. A little greater than eighty-nine trillion, that's the date, see? Takes you how long to get that, see? "Return to this incident at eighty-nine-plus trillion. All right. What are you looking at? Okay, thank you. How long is this incident? Minutes? Hours? Days? Weeks? Weeks. Good. Two weeks? Greater than two weeks, less than two weeks? Greater than four weeks, less than four weeks? Greater than six weeks, less than six weeks? Five weeks? Five weeks. All right, it's five weeks long. Very good. Now, just move on through this to the end." Pc, ten minutes later, comes up and says, "All right, I did."

"What's it all about?"

"Well, I don't know. I get something or other something or other something or other."

"All right, fine. All right, now is there any slightly earlier beginning on this?"

"Yeah, there's a little bit earlier beginning on it."

"Is it a day before? Two days before? Day before? Hour before? Hours before? Four hours before? Five hours before? All right. I want you to go about five hours earlier this time, all right? – for the beginning of the incident. Move to the beginning of the incident. Okay. All right, move on through the incident."

Five minutes later, pc says, "I'm there."

You say, "All right, what you got now?"

"Oh, it's a sort of a thrashing machine. And there's this long blue-and-white thing and it goes..." and so on, and so forth. "And somewhere – somewhere I must have run into machinery. I must have had something to do with machinery – this kind of machinery. Makes me dizzy. Just like this one; just like all these do – dizzy."

"All right, very good. We're now going to date an earlier incident in which you get dizzy with machinery. All right. Is it greater than ninety trillion, less than ninety trillion?"

Here we go. "All right, I got ninety-three trillion – not quite ninety-three trillion. All right, move to the beginning of the ninety-three trillion incident. Okay. What have you got there?"

"Oh, I'm just looking at this thing that's all black."
"All right. Okay. How long is this incident? Days? Weeks? Months?"

"Incident is five minutes long."

"Okay, fine. Fine. All right, move through to the end of this incident." "Okay. What's it all about?"

"I don't know, it's a machine. Roars! That's all. I'm scared by the roar of the thing, so I dump it off a cliff."

"Oh. All right. Now this – is there any earlier moment there on the beginning of this?"

Tick.

"How much earlier does this go?"

"Oh, it goes three days earlier."

"All right, that's fine. That's fine. All right, now that three-day point, now move to the beginning we now have there." "All right. Good! Now what are you looking at?"

"Oh, my God! There's acres of machines. They're all over the place here; they're all over the thing here."

"All right. Thank you. Move through this incident, tell me when you've reached the end."

I sit there and try to make as little noise as possible and pc finally comes up in the middle of it and says, "Ha-ha-ha! Took the thing and busted it – grrkk! – like a big water-melon."

I say, "Okay. Okay, continue." "All right, go back to the beginning of this incident now. Go to the beginning of this incident."

He says, "You know, you know, I don't think this is basic on this chain."

"Oh, all right! Good. Good. Good, machines that make you dizzy" you see? "All right, that's fine."

"A machine that makes you dizzy – no, I guess it's just machines. It's actually not machines that make you dizzy; it's machines that catch you."

"Oh, all right. All right. Let's get an earlier incident here. Now, is this earlier incident on machines that catch you, later than ninety-five trillion, earlier than ninety-five trillion?"

And you find out it's only a billion years earlier than the one you got before. Same procedure, same action, on and on and on. Pc comes to the next session, you say, "All right, now let's pick up this – we're going to pick up this ninety-five trillion year incident and run it now again – run it this time."

Pc says, "I-why-I- I don-don-I-don-I don't know, I don't get anything," and so forth, and so on. And so on, "I don't get the picture that I had before," and so on, so on, so on.

So you say, "All right, okay. Thank you. Thank you. Now, since the last time I audited you, is there anything you weren't willing to duplicate?" "No? Thank you. Last time I audited you, is there anything you weren't willing to duplicate? Thank you. Since the last time I au-
dited you, is there anything you weren't willing to duplicate? All right, that seems clean. All right, return to the beginning of the ninety-five trillion year incident. How's the picture now?"

"Well, that picture's perfect, thank you."

"All right. Very good. Move on through to the end of this incident, tell me when you get there."

You say, "Where's all this hepcat stuff," see? Where's all this – you know, and bing, and "What are you looking at?" and "Well, is there blue sky or a pink sky there? Well, where – what are you doing now? What are you doing? What are you looking at there? Where – where – have you seen anything? Oh, can't you see anything more than a house? Well, what's in back of the house? Is there anything in the basement of the house?" "What's in the center of the planet there?" Where's all this? It isn't there. There's nothing there except just these little elementary actions. Pc runs like a baby carriage.

Now, why won't pcs do this when they don't do it? Well, they're at the wrong place on the program scale I gave you. But you can even take a dub-in case and run them early enough to get before the dub. But that's asking for it, so you've got your ARC processes. And lower than that you've got your MEST universe processes; you've got these various things that can straighten up a pc and put him into a situation. Because let me tell you this, engram running is important for this reason: You aren't going to make an OT without it. See, it's that important. And we now have the underpinnings that we can move any case into a situation where it can run engrams.

Now, all this fancy stuff developed trying to run dub-ins of dubs on engrams; cases that were too heavily charged to run engrams. What's the common denominator of that program case scale that runs from no time track down to total unawareness? What's the common denominator of that thing? The common denominator of that thing is "no duplicate." It's right in the middle of the old communication formula.

Years ago I used to run into a case occasionally, you'd run him on an – you'd run him on process Z on Monday and it wouldn't bite on Tuesday, but another process would bite on Tuesday and on Wednesday another process would bite and on Thursday another process would bite. What was going on with this character? Well, I finally understood what was going on with him: The duplication was missing from the communication formula. He would not duplicate. It was dangerous to duplicate. And that actually is the swan song of this universe: That which you're unwilling to duplicate tends to go on automatic.

You could clean up somebody's auditing in a rather rudimentary fashion. Of course, this is like all high-level processes, it's not applicable because it's insufficiently fundamental to reach the reality of the pc in many cases. But sometime when you've given or had a rough session, something like that, or your pc has given or had a rough session somewhere else or something like this, just take a crack at cleaning up the auditing on this basis: "Since (you know, day before that session occurred) what were – have you been unwilling to duplicate?" "What have you been willing to duplicate?" "What have you been unwilling to duplicate?" And just run the process flat, and you'll all of a sudden find all the ARC breaks and everything else torn out.
We can show you a bad demonstration of auditing, a very bad demonstration of auditing on the TV screen, you're unwilling to duplicate that, and you fumble the first five minutes of your next session. You get the... see? That's showing the bad example. Get the idea? "Unwilling to duplicate" is the only thing it says, see?

All right. You get the idea that you can't duplicate MEST, you can't duplicate engrams, you can't duplicate this action, you won't duplicate that continuous state of being a tree, let us say, or something like that. This becomes very obsessive, begins to wear on you and you just start refusing the idea of duplicating a tree and the next thing you know, there you are, obsessively duplicating a tree because that resistance to duplication can be caved in.

Now, a person's ability to duplicate is what determines their ability to run engrams because the engram itself is a duplication of the actual event. And where they didn't duplicate the actual event – where they duplicated the actual event but then the picture they're running is an altered copy of the picture of the actual event, that is dub-in. So, they'll run through the engram, and it's this way, and they run through it that way. All engrams develop materials. All engrams develop surprising changes. And all engrams have a little bit of dub-in in one place or another. You get in the middle of this thing, you wonder, "What's the surgeon got in his hands? He can't possibly have a water gun, you know? Looks like a water gun, you know? What on earth is it?" It finally turns into a spoon or something else he's taking your guts out with. Anyhow... [laughter]

In other words, things look a little bit different. And particularly dangerous things – people don't want to duplicate dangerous things. Very easy on this planet to give somebody a bad name, you know, the public in general. All they got to do is start riding a saw and say so-and-so is no good, so-and-so is no good, so-and-so is no good, so-and-so is no good. Don't you see? And everybody – nobody must duplicate this person, you see, nobody must duplicate him. They all do it obsessively after a while. It's a sure mechanism of making bogeymen and then making everybody into bogeymen that didn't exist in the first place. You see, you can think up a lot of things and there's a lot of philosophy connected with this duplication, but just add it up to what engram running is all about.

A series of tests need to be developed for this sort of thing, of whether somebody can run engrams or not. The easiest way to find out whether somebody can run engrams or not is to try to run an engram on them. Now – and if they can't run one, why, you'd better uncork the ARC triangle, that's all.

But there's another way to do it. You say to some person, "One, two, three, nine, seven. What did I say?" And he says "You said uh – p – popcorn? Uh..." Aw, skip it, man. Of course, it's a possibility that you didn't speak loud enough for him to hear you, but if you spoke loud enough and you said, "One, two, three, seven, nine," and he said, "Popcorn? Popcorn? What's popcorn got to do with it?" Well, you'd better not try to run engrams on that person.

Now, the person who is totally unaware has tried to whip the mechanism of obsessively duplicating everything. That's his final answer, don't you see? Only trouble is his duplications then go on total automatic. And you'll find people around who have very, very heavy engrams indeed; they are all very heavy and they have no control over them of any
kind whatsoever and so forth. And the engrams also are very inaccurate. All life is an engram. Anything is an engram, so forth. But then the engram isn't the engram. They stub their toe and they go down the street and they've got a picture of being run into by a truck – in full 3-D, utterly overwhelming. Gruesome.

Now, you try to run an engram of stubbing their toe, it isn't there. They run this engram of being hit by a truck. Well, that's great, because if you run the engram of being hit by a truck, you unfortunately aren't doing the case a bit of good. You're just running off a copy of the copy of the copy of the copy, you see? I mean, you could get into that kind of nonsense.

Now, because there are such incredible things on the track anyway – such as the Helatrobus Implants, and all sorts of things – that people get huuuh! Tell some bud of the Freudian school about these things, he'd become very puzzled about this whole thing. As a matter of fact, in the second series there are some tumbler devices – tubes, in the second series – where the thetan on the pole is locked up in a sort of a curled-up position in the middle of a tube, with a lot of lights hitting him from one quarter or another. It's the perfect fetal position. And that's basic on the prenatals which we used to find. And those prenatals all fly to pieces if you hit this basic on the thing, you see? But there's so much incredible material that it would be very, very dangerous to determine on a pc whether or not he could run engrams by what was the fact of the case, see? This is very dangerous. We've tried this and it doesn't work. So, therefore, you need a better test and that test would be simple duplication.

You'd give him a series of questions of one kind or another. The old attitude [aptitude] test – our old driving test – is a doll because that gives you too little to understand and too much to understand, and so forth. That's a lovely test. A person who got a very bad score on that probably couldn't run engrams, you see, because it's a duplication test. That's how you'd find – not by the material the person runs, but by the person's ability to duplicate.

Now, another test of a person's ability to duplicate is on Monday, did they get beautiful rocket reads on a GPM, and on Tuesday, you couldn't get the needle to squick. That's an interesting condition. Well, they've hit something they're unwilling to duplicate, that's for sure; and you could probably turn it back on, that's for sure; and you can probably handle it, that's for sure. But you also are running somebody over their heads, that's for sure!

Well, what are we running over their heads? We're just running the ARC on this case. This case is too queasy to approach a whole lump of experience. They want to sniff around the edges of life, you know? You let them around the edges of life; don't let them around one concrete experience of being hit on the head with a cleaver, see. Let them sniff around the edges and find out if they're alive, you know? Let them run this thing way off, and their track will straighten out and become factual.

That doesn't mean that you're only using the ARC processes to improve somebody's reality. That isn't their only use. It just happens to be a very good shotgun process. It works at every quarter on almost anything, don't you see? It cleans up all kinds of things. It'll clean up

---

15 Editor's note: refers to the processes given in HCOB 27 May 1963, "Cause of ARC Breaks", in the section "ARC Break Processes"
auditing and it'll clean up track and it'll do this and it'll do that. And it can be phrased in different ways in order to meet different levels of case and you could do all kinds of things with this process – this new ARC setup that you have.

You can also do some interesting things with this duplication process. But you do the best in this physical environment. What part of this physical environment, what action or motion in this physical environment can the guy safely duplicate? When he finds out he can safely duplicate something, you've got the CCHs in a nutshell. That's the only thing you're trying to show him. That's why the CCHs have such a heavy power, when rightly used and such a weird effect when wrongly used. You make somebody feel like he's being punished for duplication, you run the CCHs wrong way to.

All right. So much for all that. We're talking about running engrams. Well, who can run engrams? Well, it's somebody who can get a picture of the actual event.

Now, how serious is this to you? Well, it's only serious to this degree: That if the case is not being successful in running engrams, you probably shouldn't be running them. Now, that I think is the most elementary adjudication that you can possibly make. But let's add to this adjudication, this one: Running them right; as long as you're running them right. If the case just doesn't seem to grapple with this at all and you just don't seem to do anything about it, or something of that sort, well, you're probably running the case too steep. That's the most elementary adjudication that can be made on the subject.

Now, engram running becomes very, very, very important to you because the Helatrobus Implants are actually a long chain of engrams which themselves have, each one, basics. And they tend to grab the whole track together at one point. You will only be able to run on some cases as few as six GPMs before you have to start running engrams, because the RR will shut off. The things are getting too solid; thing is getting too solid. In other words, charge is bleeding.

So let's get what determines – what determines when to go earlier? First, it's the auditor's observation that they ought to go earlier – that's always first. But the second one – and this must never be violated – is the pc's recognition that there is something earlier that tells you the curtain has lifted. And this you never ignore, and I do mean never.

Pc can state this in a thousand different ways and it all adds up to the same thing: There's something earlier. Pc says, "You know, I think there's another pole trap incident ahead of this." Now, that's very blunt, isn't it? All right, let's just find the other pole trap incident ahead of this, see? Simple. Pc says, "I don't think this could be the last one on the chain. It's too late." Well, go earlier. Pc says, "Where did I get the idea that I couldn't hold onto things?" Go earlier.

You're trying to get through these – you're trying to get from 20 to 19, and what is the last signal? What is the last signal – the signal that you just must not go beyond in running number 20 or number 19 or number 18 in its turn? The signal that you must not ignore is the inference that there's something earlier. Because if you ignore this and continue to scrub away on the one you are on, you are ignoring the fact that something went down there and opened that little valve and that charge is coming up here from now on.
And that charge is going to make the engram that you are trying so arduously to rub out more and more solid, more and more arduous, less and less runnable.

You've got to get back here and find number 19. Now, the second you find number 19, the charge that was leaking up goes *ffttt!* That's charge off, don't you see? But the later an engram is on the track, the less charge you can bleed out of it itself. Now, charge of course is a registry of the E-Meter. What is the registry on the E-Meter? Well, it's the motion of your tone arm, the motion of your needle. You're getting tone arm motion running these engrams – if you're not getting any tone arm motion running these engrams, just hope you can get back early enough to get some tone arm motion. If you never get any tone arm motion on it, all the way back, brother, you're taking no charge off the line at all; you are just restimulating mass and charge. You're just restimulating; you're not blowing anything. That condition, I don't think, however, will obtain very usually with you. You will – you will get little blows of one kind or another.

Those portions of the time track which have had the individual so much at effect that the person could not at all be cause, and attended by pain and unconsciousness, are called engrams. And the only way an engram is ever torn up is by relieving the thing which holds it in place. And the thing that holds it in place is always number 1.

There's 20 engrams in a chain, if you can't find number 1 – and you can find number 1 if you go down the chain – but if you don't even try to find number 1, and then don't erase number 1, then that chain will not blow up. But you'll see some of the funniest concatenations of charge release you ever wanted to see when you finally put your paws on number 1 and scrub it out good. Number 1 erases. The rest do not.

Now, because of the complex nature of the time track, there will be some portion of number 1, addressed to something else or some other subject, which may in itself not erase. Now you've got a new chain of engrams running back from number 1. Well, go ahead, run it back.

Don't get the idea of an *absolute* basic. There's only one absolute basic on the time track and that is called basic-basic, and it's going to take you a long time to find that one. That's... basic-basic is unburdened with steam shovels and gangs of coolies and working for Lord knows how long. The ants that were emptying that granary – that's a very good example. Fortunately, if you go ahead at it in a very businesslike fashion, you will eventually find basic-basic. The character of basic-basic is something I needn't go into at the present moment, but it contains these impulses which eventually became aberration.

Now, I want to call to your attention just rapidly here, some data. There are two things you can do with dating. You can relieve charge or just identify something. Now, if you get a total dating, it goes on down to the second. It's how many, you know, trillions, hundreds of billions, hundreds of millions, hundreds of thousands, thousands, hundreds, days, minutes, seconds ago. And if you get that accurately, and in no argument with your pc, you're going to have a pc there who *uhwuhh!* He gets somatics and the thing rights itself on the time track, and that's all very interesting. That's that type of dating; it's to relieve charge. You put something accurately on the time track and you'll get charge off.
Well, that's fine, and as an activity is quite an interesting activity in itself, but remember that dating also contains identification. You want to know about the incident that was eighty-nine trillion, four hundred and fifty million years ago. So you say plus or minus. And you've got one that was almost — almost, see — eighty-nine trillion four hundred and fifty million — you've got one that was slightly more than eighty-nine million and four hundred and fifty billion, or something like that, see.

And you just identify it. And sometimes your identification is as clumsy as "that — that ninety-trillion-year incident." Of course you're only hung when there's eight in a row. So then you have to get into ninety trillion, and you have to date these into the hundred millions or something like that (sometimes you have to date them into the hundred thousands), but that's differentiation. Mostly, mostly, you will be satisfied with your trillions. See, you say, "Well, that incident that was not quite eighty-nine trillion years ago." That's dating. That's sufficient. That identified it, don't you see? Fine, nothing wrong with that.

Now, let me give you this operation of blocking it out. This is known as blocking out an incident and it has just exactly these steps. It's a very precise action. You identify it by date. That's — you get the approximate date of the thing. See, that's an identification by date. You move the time track to that date (but of course your dating has already moved it there). You ask the pc what's there and the pc says, "Nothing. I can't see nothing." Pc says, "Green cats." Pc says, "Solid black automobiles are stacked around. Their license plates are number 869, 942, 747, 815. And there's a DC plate over on the other side," and so forth. "And that's there; that's what's there." And you say, in every case, regardless of what the pc said — and hear me now, hear me — in every case you say, "Good." You understand? You don't say anything else.

It's very interesting. The pc can say, "But it's all black and I can't see a thing!" and so forth. And you say, "Well, there's no reason to go on with that." He's there; he's there. So it's all black? So he doesn't know what it's all about? Well, hell, he didn't know what it was all about a few minutes ago either. Funny part of it is, time you run him through a couple of times — I've even seen a pc blow grief charge through something they didn't know what it was all about, cry all the way through the whole thing, and come back to the beginning and begin to find what it was all about. Do all some — sorts of weird things happening like this, don't you see?

So it doesn't matter what they say. This has no tendency on that; that does not influence the auditor's action at that point. Next thing you do: Find its duration. You know? "Is this incident minutes, hours, days, weeks, months, years?" Find its duration. Block its duration out fairly accurately, you know? If the answer is days, well, just get the number of days, don't you see? Don't go down to hours, minutes and split instants and galactic microseconds, you know? I mean, this is — this wastes time.

Find its duration, move the pc through it. Through. Get the difference of to and through. To get a pc at a point of the track you say, "Move to," and to get them to go through something, you say "through." If you want them to go through something, say through. Don't say, "Go to the end of the incident," because, of course, the pc just goes bang! and he's at the end of the incident. "Yeah, all right. I'm here at the end of the incident. What do you want?"
can see auditors now – I've already seen an auditor do this idiotic thing – said, "Well, go to the beginning of the incident." (snap)

"All right. Well, I'm here. What do you want?"

"All right. Now move to the end of the incident." (snap) Bang!

"I'm here. What do you want?" [laughter]

That's pure idiocy, see? You want the pc to pick up the incident, you had better move them through it. And let me assure you, that if it's forty days long, I normally say, "Move rapidly through the incident." [laughter, laughs] I like to be able to end my sessions on schedule.

But you move them through to the end, then establish what was there. Just ask the pc, "Well, what happened?" you know, when they come to the end of the thing. Anytime the pc says anything while they're going through the thing, you say, "Good," and one more word: "Continue." You want them to realize that auditing effect... command is still in effect.

When they get to the end of the thing – you've moved it through it once – you say, "What's it all about?" Funny thing – the pc doesn't talk to you; it's all right. Okay. Move them to the beginning of it; move them through to the end again. Simple as that. Never move them backwards through one. When they get to the end of the thing, why ask them again.

I've seen a pc go through one several times before they could tell me anything about it. Thing wasn't beefing up at all. Just, you know, "What's this?" It's a solid mystery. Don't be impatient, in other words. You don't vary this routine. Pc says, "I don't think I left." I'm afraid I'd be more prone to say, "You left all right. Run through it." See?

Now, if the pc keeps saying, "I'm stuck," and all that sort of thing, just forget the bouncers and deniers, man. You're just running somebody over his head, and you get them out of it any way you can and revert to ARC processes. Any time the pc is that much at effect, where the auditor has got to kick him around inside the incident and do all sorts of weird things and that sort of thing, you're simply running engrams on somebody who can't run engrams. There's no sense in my developing a technology for somebody who can't run engrams, for you not to run engrams with. You get the difference?

All right. Now, when he's told you all about it at the end, your next step is simply to find out if anything is a little bit earlier. You know? "Is there a little..." because the end always remains the end. You don't have to vary the end. If there's anything more they'll eventually tell you; but you don't care about it because the charge is always earlier, you see? But always suspect the beginning.

Pc says, "Well, I just got off the train and there they were, you know?" Aw, it's all right. Buy it. Sounds all right, and so forth. But ask before you send them through again, "Now is there any earlier beginning on this incident?" and so forth. Yeah, he was shooting at them out the window for a half an hour, you see, before he got off the train, you see? There's always that little, little tag beginning. And sometimes you're lucky and there is none, but it just doesn't matter; it's whether it registers or not. Send them back to that earlier bit and tell them to move through it again.
Now, up to the moment you tell them to move through it again, you've simply blocked the incident out. Now you know how long this incident is. The second time you tell them to move through it is, however, quite perfectly safe and can be included in blocking out an incident, but I just want you to know that it doesn't perfectly belong in blocking out an incident. You've actually blocked the incident out now.

But to finish this incident off, just move them through it again. They'll pick up some more stuff. That's the time they're going to tell you there's something earlier. And it doesn't much matter how many times you run them through an incident. Less than twice is suspect. That's maybe a little careless. But might very well – if the thing appeared to be awful gummy, and so forth, and messed up – once would be plenty. There's where judgment comes in. More than twice? Well, you're getting into questionable ground – very questionable ground. Trying to chug them into it and make them have more view of it or more picture or get more event out of it or do something else with it than they can do at that particular time? Nah! Verboten. It'll turn up in an earlier incident or you got no business running engrams. That's all there is to that.

Now, how long would you run one of these things? I think if a pc was terribly fascinated with the thing: "You know? You know, that's where I got shot, and that's where I shot Bill. Yes. That's right! And then this place id... hmmm – hmm – hmmm – hmmm. And I've often wondered whether or not, you know, hmm – hmm, this funny hole in my ear..." [laughter]

All right, that's dandy. That's dandy. I'm afraid I'd just go along with this as long as I was getting motion on my meter – getting some motion on my meter, had the thing going tick and tock and clock and bong, and he was still running through the thing and wasn't wandering off into the fields – I'm afraid I'd run that. But I would never run it longer than, "You know, I think we've had a fight before." All right. Hit the silk.

Now, if you do not bail out of an incident and find the earlier incident when the pc sights the earlier incident, you spoil the pc's ability to move back – you blunt it – and the pc will get tied up in this area of the track you're trying to run. And the only reason a pc gets tied up in an area of track is by insisting he stay there; you insist he stay there. He says, "Oh, God, I want out of this." Well, anybody who wants out of this, you've just – you've just gone near it and he sees that there's a whole bunch of threshing machines and they're cleaning up the wounded with these threshing machines, see? And he says, "Well, I – I can't have anything to do with that. That – that's – that's too much for me," and so forth. I'd say, "Okay." I let him bounce to present time and I run ARC processes.

In other words, I don't say, "Oh, come now. I'm sure that you could confront that part of the threshing machines," so forth.

But if a pc started telling me, "Eh, it's getting awful solid around here. Pressure is getting heavier! A little harder to run!" – I don't care if I was getting tone arm action or not – I'm afraid my action would always be "When did you spot something earlier?"

"Oh, well! Come to that, it was about an hour ago."
Yeah, he spotted an earlier incident. And I would realize that it was my fault, as the auditor, if the pc got tied up on the track that he couldn't get out of or was unable to run the chain, and so forth, because I would have refused to let him move earlier. That's the one cardinal rule of this.

Now, there are several things I've tried to teach you here today. And one of these: You're running an engram chain; you're never trying to run a single engram. The only reason you run basic, is not to get rid of basic. Sometimes basic is "I walked up and blew all of the powder out of the barrel." But nothing happened, see? "Yes, I walked up – well, of course they lost the battle is the reason for it – and I blew all the powder out of the barrel." That's basic, see? That's just bzz-bzz-bzz-bzzz-bzz-bzz-bzz-bz, it's gone. It's all the basic there was.

You look for basic to be the more powerful incident; it's never. It's the shorter incident, it's the simpler incident, but on that keystone – because the thetan never bothered to say that was important, you see – these other things built up, built up, tougher, tougher, bigger, bigger, bigger. You get that basic, the rest of them will tear right up. Just like one of these patent sacks, you know – a patent flour sack – you get the right – you get the right string? Well, here she goes.

All right. Now, you're running a chain. So don't think because you've read Book One or snapped your fingers over engrams you know how to run engrams.

Learn this as a brand-new skill. And it's a skill which we'll call engram chain running. And that is done by finding an incident, we don't care how. One of your best takeoff points – the Helatrobus Implants; run a few GPMs, then you're really making knots, you see? We don't care how we took off on this, whether we had to prepare the case for this or not, we got our paws on an engram. And then we block it out. And we get the earlier one and we block it out, and we get the earlier one and we block it out, we get the earlier one, we block it out. And eventually we've got nothing over here to block out. We then decide that we have our paws on a basic for this chain.

Now, as we now have a basic for this chain, this basic will erase. Okay? So we proceed to erase the basic and tear up the chain. Theoretically, if you kept wandering back, some of you could make an error of winding up eventually with basic-basic. Seemed like you never got your hands on a basic. Well, you eventually did get your hands on a basic, but this apparently is the first engram on the track or something like this. I would erase it and suspect that I had simply discovered a basic.

You see, when you discover basic-basic and erase it, all engrams and pictures disappear on the pc, so that is the clue to that.

Now, the next point is: Never under any circumstances prevent a pc from finding the earlier incident – never do it; that's courting disaster – even if you suspect the pc is telling you there is something earlier in order not to confront what he is going through. Because if he's trying to bail out of incidents because he's scared of them, I would watch this performance just once or twice and then I would decide that I was misguided to be running engrams on this case; and I'd prepare the case a little bit more and get him back into running engrams later, you understand?
Now, those are the cardinal points of running engrams and if you follow those things, you actually will be able to develop one fantastic amount of case gain because you'll be blowing charge all the way. It's the easiest running you ever did and the only mistake you're going to make with it is to depart from the little blocking-out routine which I have given you here; depart from the earlier routine, you fail to realize you're running a chain – you're not running a single incident – and preventing the pc from going earlier when the pc spots something earlier, or this mistake: just complicating it up, man. You know? The pc says, "I've got a picture here of a green house."

"Does it have gables?"

Blow your brains out, boy! You've done it; you've done it. You've finished it. You've wrecked the work. That's it. You've had it. You just opened your mouth once too often. Do you realize what happens? You've pointed the pc's attention to a large object, and the rule of the largest object goes into effect instantly at that point. And the pc will interiorize into that incident. Well, you didn't want him interiorized into it. What do you mean you didn't want him interiorized into it? You didn't want that incident all swelled up, fully charged, 3-D. How can you make an incident fully charged and 3-D? By making the pc look at it and look at it and look at it, and examine it and examine it; and then prevent the pc from going earlier and look at it and look at it, and look at the largest objects in it, and feel things in it, and so on. You're going to have a universe built around this pc to a point where you'll never get him out of it. Got it? Well, that isn't what you're trying to do.

If you were trying to discover the secret formulas of the Ka-bob civilization, and you got the pc into their formula security room, by all means follow this process! But make sure you don't do it with an OT, because he hasn't got any pictures to swell up. You actually could only do it safely with a Clear. And a Clear is so close to an OT if you've got him to a totality of Clear, you see – that's dead easy – that if you just made an OT out of him, he'd remember. You understand? So it becomes a very difficult thing to stay simple enough about.

I wanted you to get this data because actually there's never been a recapitulation of running engrams mostly because I never really had my fingers on why people had a hard time running engrams. And I find out there's a miscommunication concerning it, and I've given you that miscommunication, which is just the fact that people said, "Well, if you have to flatten the process you have to flatten every engram you laid your hands on." And I think that's where the whole thing broke down. Very easy to run them. I wish you lots of success with it. Thank you.

*Audience: Thank you.*

Thank you.
